**Product Description**

This Halcyon Classics ebook collection contains fifty science fiction short stories and novellas by more than forty different authors. Most of the stories in this collection were published during the heyday of popular science fiction magazines from the 1930s to the 1960s.

Included within this work are stories by H. Beam Piper, Murray Leinster, Randall Garrett, Robert Sheckley, Stanley Weinbaum, Alan Nourse, Raymond Z. Gallun, Robert Bloch, Marion Zimmer Bradley, and many others.

This collection is DRM free and includes an active table of contents for easy navigation.

Contents

RING ONCE FOR DEATH  
By Robert Arthur
THIS CROWDED EARTH  
By Robert Bloch  
THE LANI PEOPLE  
By J. F. Bone  
MIZORA: A PROPHECY  
By Mary E. Bradley  
THE DOOR THROUGH SPACE  
By Marion Zimmer Bradley  
FELONY  
By James Causey  
THE SKY IS FALLING  
By Lester del Rey  
STAMPED CAUTION  
By Raymond Z. Gallun  
CARD ... TRICK  
By Randall Garrett  
DAMNED IF YOU DON'T  
By Randall Garrett  
MECCANIA: THE SUPER-STATE  
By Owen Gregory  
BREAKING POINT
by James E. Gunn
THE SMILER
By Albert Hernhunter
THE LOVE OF FRANK NINETEEN
By David C. Knight
THE SIX FINGERS OF TIME
By R. A. Lafferty
MARS CONFIDENTIAL!
By Jack Lait & Lee Mortimer
THE RUNAWAY SKYSCRAPER
By Murray Leinster
THE WATER EATER
By Win Marks
BEYOND PANDORA
By Robert J. Martin
MOTHER AMERICA
By Sam Mcclatchie, M.D.
WHEN CAVERNS YAWNED
By S. P. Meek
THE LINK
By Alan E. Nourse
POLICE OPERATION
By H. Beam Piper
SONNY
By Rick Raphael
HOLES INCORPORATED
By L. Major Reynolds
WHERE I WASN'T GOING
By Walt and Leigh Richmond
DECISION
By Frank M. Robinson
THE PREMIERE
By Richard Sabia
OPERATION LORELIE
By William P. Salton
FELINE RED
By Robert Sampson
ZERO DATA
By Charles Saphro
WATCHBIRD
By Robert Sheckley
JIMSY AND THE MONSTERS
By Walt Sheldon
THE VILBAR PARTY
By Evelyn E. Smith
BRKNK'S BOUNTY
By Jerry Sohl
B-12's MOON GLOW
By Charles A. Stearns
GARTH AND THE VISITOR
By L. J. Stecher
VITAL INGREDIENT
By Gerald Vance
THE OBSERVERS
By G. L. Vandenburg
VULCAN'S WORKSHOP
By Harl Vincent
FORGET ME NEARLY
By F. L. Wallace
TO EACH HIS STAR
By Bryce Walton
THE WORLDS OF IF
By Stanley G. Weinbaum
THE SEED OF THE TOC-TOC BIRDS
By George Henry Weiss
THE CAVERN OF THE SHINING ONES
By Hal K. Wells
THE FIRST MEN IN THE MOON
By H.G. Wells
COGITO, ERGO SUM
By John Foster West
CAT AND MOUSE
By Ralph Williams
HOMO INFERIOR
By Mari Wolf
THE INFRA-MEDIANS
By Sewell Peaslee Wright
THE GOLDEN AGE OF SCIENCE FICTION VOLUME XI:
AN ANTHOLOGY OF 50 SHORT STORIES

HOMO INFERIOR
By Mari Wolf
The power of the old gods was certainly nothing for Mark and Edith—a modern, twentieth-century couple—to worry about. After all—everybody dies!

Twenty years had left no trace inside Sam Kee's little shop on Mott Street. There were the same dusty jars of ginseng root and tigers' whiskers, the same little bronze Buddhas, the same gim-cracks mixed with fine jade. Edith Williams gave a little murmur of pleasure as the door shut behind them.

"Mark," she said, "it hasn't changed! It doesn't look as if a thing had been sold since we were here on our honeymoon."

"It certainly doesn't," Dr. Mark Williams agreed, moving down the narrow aisle behind her. "If someone hadn't told us Sam Kee was dead, I'd believe we'd stepped back twenty years in time, like they do in those scientific stories young David reads."

"We must buy something," his wife said. "For a twentieth anniversary present for me. Perhaps a bell?"

From the shadowy depths of the shop a young man emerged, American in dress and manner despite the Oriental contours of his face and eyes.

"Good evening," he said. "May I show you something?"

"We think we want a bell," Dr. Williams chuckled. "But we aren't quite sure. You're Sam Kee's son?"

"Sam Kee, junior. My honored father passed to the halls of his ancestors five years ago. I could just say that he died—" black eyes twinkled—"but customers like the more flowery mode of speech. They think it's quaint."

"I think it's just nice, and not quaint at all," Edith Williams declared. "We're sorry your father is dead. We'd hoped to see him again. Twenty years ago when we were a very broke young couple on a honeymoon he sold us a wonderful rose-crystal necklace for half price."

"I'm sure he still made a profit." The black eyes twinkled again. "But if you'd like a bell, here are small temple bells, camel bells, dinner bells...."

But even as he spoke, Edith Williams' hand darted to something at the back of the shelf.

"A bell carved out of crystal!" she exclaimed. "And rose-crystal at that. What could be more perfect? A rose-crystal wedding present and a rose-crystal anniversary present!"

The young man half stretched out his hand.

"I don't think you want that," he said. "It's broken."

"Broken?" Edith Williams rubbed off the dust and held the lovely bell-shape of crystal, the size of a pear, to the light. "It looks perfect to me."

"I mean it is not complete." Something of the American had vanished from the young man. "It has no clapper. It will not ring."

"Why, that's right." Mark Williams took the bell. "The clapper's missing."

"We can have another clapper made," his wife declared. "That is, if the original can't be found?"

The young Chinese shook his head.

"The bell and the clapper were deliberately separated by my father twenty years ago." He hesitated, then added: "My father was afraid of this bell."

"Afraid of it?" Mark Williams raised his eyebrows. "The other hesitated again.

"It will probably sound like a story for tourists," he said. "But my father believed it. This bell was supposedly stolen from the temple of a sect of Buddhists somewhere in the mountains of China's interior. Just as many Occidentals believe that the Christian Judgement Day will be heralded by a blast on St. Peter's trumpet, so this small sect is said to believe that when a bell like this one is rung, a bell carved from a single piece of rose crystal, and
consecrated by ceremonies lasting ten years, any dead within sound of it will rise and live again."

"Heavenly!" Edith Williams cried. "And no pun intended. Mark, think what a help this bell will be in your
practise when we make it ring again!" To the Chinese she added, smiling: "I'm just teasing him. My husband is
really a very fine surgeon."

The other bowed his head.

"I must tell you," he said, "you will not be able to make it ring. Only the original clapper, carved from the same
block of rose crystal, will ring it. That is why my father separated them."

Again he hesitated.

"I have told you only half of what my father told me. He said that, though it defeats death, Death can not be
defeated. Robbed of his chosen victim, he takes another in his place. Thus when the bell was used in the temple of
its origin--let us say when a high priest or a chief had died--a slave or servant was placed handy for Death to take
when he had been forced to relinquish his grasp upon the important one."

He smiled, shook his head.

"There," he said. "A preposterous story. Now if you wish it, the bell is ten dollars. Plus, of course, sales tax."

"The story alone is worth more," Dr. Williams declared. "I think we'd better have it sent, hadn't we, Edith? It'll
be safer in the mail than in our suitcase."

"Sent?" His wife seemed to come out of some deep feminine meditation. "Oh, of course. And as for its not
ringing--I shall make it ring. I know I shall."

"If the story is true," Mark Williams murmured, "I hope not...."

* * * * *

The package came on a Saturday morning, when Mark Williams was catching up on the latest medical
publications in his untidy, book-lined study. He heard Edith unwrapping paper in the hall outside. Then she came in
with the rose-crystal bell in her hands.

"Mark, it's here!" she said. "Now to make it ring."

She plumped herself down beside his desk. He took the bell and reached for a silver pencil.

"Just for the sake of curiosity," he remarked, "and not because I believe that delightful sales talk we were given,
let's see if it will ring when I tap. It should, you know."

He tapped the lip of the bell. A muted thunk was the only response. Then he tried with a coin, a paper knife,
and the bottom of a glass. In each instance the resulting sound was nothing like a bell ringing.

"If you've finished, Mark," Edith said then, with feminine tolerance, "let me show you how it's done."

"Gladly," her husband agreed. She took the bell and turned away for a moment. Then she shook the bell
vigorously. A clear, sweet ringing shivered through the room--so thin and ethereal that small involuntary shivers
crawled up his spine.

"Good Lord!" he exclaimed. "How did you do that?"

"I just put the clapper back in place with some thread," Edith told him.

"The clapper?" He struck his forehead with his palm. "Don't tell me--the crystal necklace we bought twenty
years ago!"

"Of course." Her tone was composed. "As soon as young Sam Kee told us about his father's separating the
clapper and the bell, I remembered the central crystal pendant on my necklace. It is shaped like a bell clapper--we
mentioned it once.

"I guessed right away we had the missing clapper. But I didn't say so. I wanted to score on you, Mark--" she
smiled affectionately at him--"and because, you know, I had a queer feeling Sam Kee, junior, wouldn't let us have
the bell if he guessed we had the clapper."

"I don't think he would." Mark Williams picked up his pipe and rubbed the bowl with his thumb. "Yet he didn't
really believe that story he told us any more than we do."

"No, but his father did. And if old Sam Kee had told it to us--remember how wrinkled and wise he seemed?--I
do believe we'd have believed the story."

"You're probably right." Dr. Williams rang the bell and waited. The thin, sweet sound seemed to hang in the air
a long moment, then was gone.

"Nope," he said. "Nothing happened. Although, of course, that may be because there was no deceased around
to respond."

"I'm not sure I feel like joking about the story." A small frown gathered on Edith's forehead. "I had planned to
use the bell as a dinner bell and to tell the story to our guests. But now--I'm not sure."

Frowning, she stared at the bell until the ringing of the telephone in the hall brought her out of her abstraction.

"Sit still, I'll answer." She hurried out. Dr. Williams, turning the rose crystal bell over in his hand, could hear
the sudden tension in her voice as she answered. He was on his feet when she reentered.
"An emergency operation at the hospital," she sighed. "Nice young man--automobile accident. Fracture of the skull, Dr. Amos says. He wouldn't have disturbed you but you're the only brain man in town, with Dr. Hendryx away on vacation."

"I know." He was already in the hall, reaching for his hat. "Man's work is from sun to sun, but a doctor's work is never done," he misquoted.

"I'll drive you." Edith followed him out. "You sit back and relax for another ten minutes...."

Two hours later, as they drove homeward, the traffic was light, which was fortunate. More than once Mark, in a frowning abstraction, found himself on the left of the center line and had to pull back into his own lane.

He had lost patients before, but never without a feeling of personal defeat. Edith said he put too much of himself into every operation. Perhaps he did. And yet--No, there was every reason why the young man should have lived. Yet, just as Mark Williams had felt that he had been successful, the patient had died.

In twenty years of marriage, Edith Williams had learned to read his thoughts at times. Now she put a hand comfortably on his arm.

"These things happen, darling," she said. "You know that. A doctor can only do so much. Some of the job always remains in the hands of Nature. And she does play tricks at times."

"Yes, confound it, I know it," her husband growled. "But I resent losing that lad. There was no valid reason for it--unless there was some complication I overlooked." He shook his head, scowling. "I ordered an autopsy but--Yes, I'm going to do that autopsy myself. I'm going to turn back and do it now. I have to know!"

He pulled abruptly to the left to swing into a side road and turn. Edith Williams never saw the car that hit them. She heard the frantic blare of a horn and a scream of brakes, and in a frozen instant realized that there had been someone behind them, about to pass. Then the impact came, throwing her forward into the windshield and unconsciousness.

Edith Williams opened her eyes. Even before she realized that she was lying on the ground and that the figure bending over her was a State Trooper, she remembered the crash. Her head hurt but there was no confusion in her mind. Automatically, even as she tried to sit up, she accepted the fact that there had been a crash, help had come, and she must have been unconscious for several minutes at least.

"Hey, lady, take it easy!" the Trooper protested. "You had a bad bump. You got to lie still until the ambulance gets here. It'll be along in five minutes."

"Mark," Edith said, paying no attention. "My husband! Is he all right?"

"Now lady, please. He's being taken care of. You--"

But she was not listening. Holding to his arm she pulled herself to a sitting position. She saw their car on its side some yards away, other cars pulled up around them, a little knot of staring people. Saw them and dismissed them. Her gaze found her husband, lying on the ground a few feet away, a coat folded beneath his head.

Mark was dead. She had been a doctor's wife for twenty years, and before that a nurse. She knew death when she saw it.

"Mark." The word was spoken to herself, but the Trooper took it for a question.

"Yes, lady," he said. "He's dead. He was still breathing when I got here, but he died two, three minutes ago."

She got to her knees. Her only thought was to reach his side. She scrambled across the few feet of ground to him still on her knees and crouched beside him, fumbling for his pulse. There was none. There was nothing. Just a man who had been alive and now was dead.

Behind her she heard a voice raised. She turned. A large, disheveled man was standing beside the Trooper, talking loudly.

"Now listen, officer," he was saying, "I'm telling you again, it wasn't my fault. The guy pulled sharp left right in front of me. Not a thing I could do. It's a wonder we weren't all three of us killed. You can see by the marks on their car it wasn't my fault--"

Edith Williams closed her mind to the voice. She let Mark's hand lie in her lap as she fumbled in her bag, which was somehow still clutched in her fingers. She groped for a handkerchief to stem the tears which would not be held back. Something was in the way--something smooth and hard and cold. She drew it out and heard the thin, sweet tinkle of the crystal bell. She must have dropped it automatically into her bag as they were preparing to leave the house.

The hand in her lap moved. She gasped and bent forward as her husband's eyes opened.

"Mark!" she whispered. "Mark, darling!"

"Edith," Mark Williams said with an effort. "Sorry--damned careless of me. Thinking of the hospital...."

"You're alive!" she said. "You're alive! Oh, darling, darling, lie still, the ambulance will be here any second."
"Ambulance?" he protested. "I'm all right now. Help me--sit up."
"But Mark--"
"Just a bump on the head." He struggled to sit up. The State Trooper came over.
"Easy, buddy, easy," he said, his voice awed. "We thought you were gone. Now let's not lose you a second time." His mouth was tight.
"Hey, I'm sure glad you're all right!" the red-faced man said in a rush of words. "Whew, fellow, you had me all upset, even though it wasn't my fault. I mean, how's a guy gonna keep from hitting you when--when--"
"Catch him!" Mark Williams cried, but the Trooper was too late. The other man plunged forward to the ground and lay where he had fallen without quivering.

* * * * *
The clock in the hall struck two with muted strokes. Cautiously Edith Williams rose on her elbow and looked down at her husband's face. His eyes opened and looked back at her.
"You're awake," she said, unnecessarily.
"I woke up a few minutes ago," he answered. "I've been lying here--thinking."
"I'll get you another phenobarbital. Dr. Amos said for you to take them and sleep until tomorrow."
"I know. I'll take one presently. You know--hearing that clock just now reminded me of something."
"Yes?"
"Just before I came to this afternoon, after the crash, I had a strange impression of hearing a bell ring. It sounded so loud in my ears I opened my eyes to see where it was."
"A--bell?"
"Yes. Just auditory hallucination, of course."
"But Mark--"
"Yes?"
"A--a bell did ring. I mean, I had the crystal bell in my bag and it tinkled a little. Do you suppose--"
"Of course not." But though he spoke swiftly he did not sound convincing. "This was a loud bell. Like a great gong."
"But--I mean, Mark darling--a moment earlier you--had no pulse."
"No pulse?"
"And you weren't--breathing. Then the crystal bell tinkled and you--you...."
"Nonsense! I know what you're thinking and believe me--it's nonsense!"
"But Mark." She spoke carefully. "The driver of the other car. You had no sooner regained consciousness than he--"
"He had a fractured skull!" Dr. Williams interrupted sharply. "The ambulance intern diagnosed it. Skull fractures often fail to show themselves and then--bingo, you keel over. That's what happened. Now let's say no more about it."

"Of course." In the hall, the clock struck the quarter hour. "Shall I fix the phenobarbital now?"
"Yes--no. Is David home?"
She hesitated. "No, he hasn't got back yet."
"Has he phoned? He knows he's supposed to be in by midnight at the latest."
"No, he--hasn't phoned. But there's a school dance tonight."
"That's no excuse for not phoning. He has the old car, hasn't he?"
"Yes. You gave him the keys this morning, remember?"
"All the more reason he should phone." Dr. Williams lay silent a moment. "Two o'clock is too late for a 17-year-old boy to be out."
"I'll speak to him. He won't do it again. Now please, Mark, let me get you the phenobarbital. I'll stay up until David--"

* * * * *
The ringing phone, a clamor in the darkness, interrupted her. Mark Williams reached for it. The extension was beside his bed.
"Hello," he said. And then, although she could not hear the answering voice, she felt him stiffen. And she knew. As well as if she could hear the words she knew, with a mother's instinct for disaster.
"Yes," Dr. Williams said. "Yes ... I see ... I understand ... I'll come at once.... Thank you for calling."
He slid out of bed before she could stop him.
"An emergency call." He spoke quietly. "I have to go." He began to throw on his clothes.
"It's David," she said. "Isn't it?" She sat up. "Don't try to keep me from knowing. It's about David."
"Yes," he said. His voice was very tired. "David is hurt. I have to go to him. An accident."
"He's dead." She said it steadily. "David's dead, isn't he, Mark?"

He came over and sat beside her and put his arms around her.

"Edith," he said. "Edith--Yes, he's dead. Forty minutes ago. The car--went over a curve. They have him--at the County morgue. They want me to--identify him. Identify him. Edith! You see, the car caught fire!"

"I'm coming with you," she said. "I'm coming with you!"

* * * * *

The taxi waited in a pool of darkness between two street lights. The long, low building which was the County morgue, a blue lamp over its door, stood below the street level. A flight of concrete steps went down to it from the sidewalk. Ten minutes before, Dr. Mark Williams had gone down those steps. Now he climbed back up them, stiffly, wearily, like an old man.

Edith was waiting in the taxi, sitting forward on the edge of the seat, hands clenched. As he reached the last step she opened the door and stepped out.

"Mark," she asked shakily, "was it--"

"Yes, it's David." His voice was a monotone. "Our son. I've completed the formalities. For now the only thing we can do is go home."

"I'm going to him!" She tried to pass. He caught her wrist. Discretely the taxi driver pretended to doze.

"No, Edith! There's no need. You mustn't--see him!"

"He's my son!" she cried. "Let me go!"

"No! What have you got under your coat?"

"It's the bell, the rose-crystal bell!" she cried. "I'm going to ring it where David can hear!"

Defiantly she brought forth her hand, clutching the little bell. "It brought you back, Mark! Now it's going to bring back David!"

"Edith!" he said in horror. "You mustn't believe that's possible. You can't. Those were coincidences. Now let me have it."

"No! I'm going to ring it." Violently she tried to break out of his grip. "I want David back! I'm going to ring the bell!"

She got her hand free. The crystal bell rang in the quiet of the early morning with an eerie thinness, penetrating the silence like a silver knife.

"There!" Edith Williams panted. "I've rung it. I know you don't believe, but I do. It'll bring David back." She raised her voice. "David!" she called. "David, son! Can you hear me?"

"Not until David has come back.... David, David, can you hear me?" She rang the bell again, rang it until Dr. Williams seized it, then she let him take it.

"Edith, Edith," he groaned. "If only you had let me come alone...."

"Mark, listen!"

"What?"

"Listen!" she whispered with fierce urgency.

He was silent. And then fingers of horror drew themselves down his spine at the clear, youthful voice that came up to them from the darkness below.

"Mother?... Dad?... Where are you?"

"David!" Edith Williams breathed. "It's David! Let me go! I must go to him."

"No, Edith!" her husband whispered frantically, as the voice below called again.

"Dad?... Mother?... Are you up there? Wait for me."

"Let me go!" she sobbed. "David, we're here! We're up here, son!"

"Edith!" Mark Williams gasped. "If you've ever loved me, listen to me. You mustn't go down there. David--I had to identify him by his class ring and his wallet. He was burned--terribly burned!"

"I'm going to him!" She wrenched herself free and sped for the steps, up which now was coming a tall form, a shadow shrouded in the darkness.

Dr. Williams, horror knotting his stomach, leaped to stop her. But he slipped and fell headlong on the pavement, so that she was able to pant down the stairs to meet the upcoming figure.

"Oh, David," she sobbed, "David!"

"Hey, Mom!" The boy held her steady. "I'm sorry. I'm terribly sorry. But I didn't know what had happened until I got home and you weren't there and then one of the fellows from the fraternity called me. I realized they must have made a mistake, and you'd come here, and I called for a taxi and came out here. My taxi let me off at the entrance around the block, and I've been looking for you down there.... Poor Pete!"

"Pete?" she asked.
“Pete Friedburg. He was driving the old car. I lent him the keys and my driver's license. I shouldn't have—but he's older and he kept begging me...."

"Then--then it's Pete who was killed?" she gasped. "Pete who was--burned?"

"Yes, Pete. I feel terrible about lending him the car. But he was supposed to be a good driver. And then them calling you, you and Dad thinking it was me--"

"Then Mark was right. Of course he was right." She was laughing and sobbing now. "It's just a bell, a pretty little bell, that's all."

"Bell? I don't follow you, Mom."

"Never mind," Edith Williams gasped. "It's just a bell. It hasn't any powers over life and death. It doesn't bring back and it doesn't take away. But let's get back up to your father. He may be thinking that the bell--that the bell really worked."

They climbed the rest of the steps. Dr. Mark Williams still lay where he had fallen headlong on the pavement. The cab driver was bending over him, but there was nothing to be done. The crystal bell had been beneath him when he fell, and it had broken. One long, fine splinter of crystal was embedded in his heart.
The telescreen lit up promptly at eight a.m. Smiling Brad came on with his usual greeting. "Good morning—it's a beautiful day in Chicagee!"

Harry Collins rolled over and twitched off the receiver. "This I doubt," he muttered. He sat up and reached into the closet for his clothing.

Visitors—particularly feminine ones—were always exclaiming over the advantages of Harry's apartment. "So convenient," they would say. "Everything handy, right within reach. And think of all the extra steps you save!"

Of course most of them were just being polite and trying to cheer Harry up. They knew damned well that he wasn't living in one room through any choice of his own. The Housing Act was something you just couldn't get around; not in Chicagee these days. A bachelor was entitled to one room—no more and no less. And even though Harry was making a speedy buck at the agency, he couldn't hope to beat the regulations.

There was only one way to beat them and that was to get married. Marriage would automatically entitle him to two rooms—if he could find them someplace.

More than a few of his feminine visitors had hinted at just that, but Harry didn't respond. Marriage was no solution, the way he figured it. He knew that he couldn't hope to locate a two-room apartment any closer than eighty miles away. It was bad enough driving forty miles to and from work every morning and night without doubling the distance. If he did find a bigger place, that would mean a three-hour trip each way on one of the commutrains, and the commutrains were murder. The Black Hole of Calcutta, on wheels.

But then, everything was murder, Harry reflected, as he stepped from the toilet to the sink, from the sink to the stove, from the stove to the table.

Powdered eggs for breakfast. That was murder, too. But it was a fast, cheap meal, easy to prepare, and the ingredients didn't waste a lot of storage space. The only trouble was, he hated the way they tasted. Harry wished he had time to eat his breakfasts in a restaurant. He could afford the price, but he couldn't afford to wait in line more than a half-hour or so. His office schedule at the agency started promptly at ten-thirty. And he didn't get out until three-thirty; it was a long, hard five-hour day. Sometimes he wished he worked in the New Philly area, where a four-hour day was the rule. But he supposed that wouldn't mean any real saving in time, because he'd have to live further out. What was the population in New Philly now? Something like 63,000,000, wasn't it? Chicagee was much smaller—only 38,000,000, this year.

This year. Harry shook his head and took a gulp of the Instantea. Yes, this year the population was 38,000,000, and the boundaries of the community extended north to what used to be the old Milwaukee and south past Gary. What would it be like next year, and the year following?

Lately that question had begun to haunt Harry. He couldn't quite figure out why. After all, it was none of his business, really. He had a good job, security, a nice place just two hours from the Loop. He even drove his own car. What more could he ask?

And why did he have to start the day like this, with a blinding headache?

Harry finished his Instantea and considered the matter. Yes, it was beginning again, just as it had on almost every morning for the past month. He'd sit down at the table, eat his usual breakfast, and end up with a headache. Why?

It wasn't the food; for a while he'd deliberately varied his diet, but that didn't make any difference. And he'd had his usual monthly checkup not more than ten days ago, only to be assured there was nothing wrong with him. Still, the headaches persisted. Every morning, when he'd sit down and jerk his head to the left like this—

That was it. Jerking his head to the left. It always seemed to trigger the pain. But why? And where had he picked up this habit of jerking his head to the left?

Harry didn't know.

He glanced at his watch. It was almost nine, now. High time that he got started. He reached over to the interapartment video and dialled the garage downstairs.

"Bill," he said. "Can you bring my car around to Number Three?"

The tiny face in the hand-screen grinned sheepishly. "Mr. Collins, ain't it? Gee, I'm sorry, Mr. Collins. Night crew took on a new man, he must have futzed around with the lists, and I can't find your number."

Harry sighed. "It's one-eight-seven-three-dash-five," he said. "Light blue Pax, two-seater. Do you want the
"What license number, too?"
"No, just your parking number. I'll recognize it when I see it. But God only knows what level it's on. That night man really—"
"Never mind," Harry interrupted. "How soon?"
"Twenty minutes or so. Maybe half an hour."
"Half an hour? I'll be late. Hurry it up!"
Harry clicked the video and shook his head. Half an hour! Well, you had to expect these things if you wanted to be independent and do your own driving today. If he wanted to work his priority through the office, he could get his application honored on the I.C. Line within a month. But the I.C. was just another commuter train, and he couldn't take it. Standing and swaying for almost two hours, fighting the crowds, battling his way in and out of the sidewalk escalators. Besides, there was always the danger of being crushed. He'd seen an old man trampled to death on a Michigan Boulevard escalator-feeder, and he'd never forgotten it.

Being afraid was only a partial reason for his reluctance to change. The worst thing, for Harry, was the thought of all those people; the forced bodily contact, the awareness of smothered breathing, odors, and the crushing confinement of flesh against flesh. It was bad enough in the lines, or on the streets. The commuter train was just too much.

Yet, as a small boy, Harry could remember the day when he'd loved such trips. Sitting there looking out of the window as the scenery whirled past—that was always a thrill when you were a little kid. How long ago had that been? More than twenty years, wasn't it?

Now there weren't any seats, and no windows. Which was just as well, probably, because the scenery didn't whirl past any more, either. Instead, there was a stop at every station on the line, and a constant battle as people jockeyed for position to reach the exit-doors in time.

No, the car was better.

Harry reached for a container in the cabinet and poured out a couple of aspirin tablets. That ought to help the headache. At least until he got to the office. Then he could start with the daily quota of yellow jackets. Meanwhile, getting out on the street might help him, too. A shame there wasn't a window in this apartment, but then, what good would it do, really? All he could see through it would be the next apartment.

He shrugged and picked up his coat. Nine-thirty, time to go downstairs. Maybe the car would be located sooner than Bill had promised; after all, he had nine assistants, and not everybody went to work on this first daylight shift.

Harry walked down the hall and punched the elevator button. He looked at the indicator, watched the red band move towards the numeral of this floor, then sweep past it.

"Full up!" he muttered. "Oh, well."

He reached out and touched both sides of the corridor. That was another thing he disliked; these narrow corridors. Two people could scarcely squeeze past one another without touching. Of course, it did save space to build apartments this way, and space was at a premium. But Harry couldn't get used to it. Now he remembered some of the old buildings that were still around when he was a little boy—

The headache seemed to be getting worse instead of better. Harry looked at the indicator above the other elevator entrance. The red band was crawling upward, passing him to stop on 48. That was the top floor. Now it was moving down, down; stopping on 47, 46, 45, 44, 43, and—here it was!

"Stand back, please!" said the tape. Harry did his best to oblige, but there wasn't much room. A good two dozen of his upstairs neighbors jammed the compartment. Harry thought he recognized one or two of the men, but he couldn't be sure. There were so many people, so many faces. After a while it got so they all seemed to look alike. Yes, and breathed alike, and felt alike when you were squeezed up against them, and you were always being squeezed up against them, wherever you went. And you could smell them, and hear them wheeze and cough, and you went falling down with them into a bottomless pit where your head began to throb and throb and it was hard to move away from all that heat and pressure. It was hard enough just to keep from screaming—

Then the door opened and Harry was catapulted out into the lobby. The mob behind him pushed and clawed because they were in a hurry; they were always in a hurry these days, and if you got in their way they'd trample you down like that old man had been trampled down; there was no room for one man in a crowd any more.

Harry blinked and shook his head.

He gripped the edge of the wall and clung there in an effort to avoid being swept out of the lobby completely. His hands were sticky with perspiration. They slipped off as he slowly inched his way back through the crush of the mob.

"Wait for me!" he called. "Wait for me, I'm going down!" But his voice was lost in the maelstrom of sound just as his body was lost in the maelstrom of motion. Besides, an automatic elevator cannot hear. It is merely a mechanism that goes up and down, just like the other mechanisms that go in and out, or around and around, and you
get caught up in them the way a squirrel gets caught in a squirrel-cage and you race and race, and the best you can hope for is to keep up with the machinery.

The elevator door clanged shut before Harry could reach it. He waited for another car to arrive, and this time he stood aside as the crowd emerged, then darted in behind them.

The car descended to the first garage level, and Harry stood gulping gratefully in the comparative isolation. There weren't more than ten people accompanying him.

He emerged on the ramp, gave his number to the attendant, and waved at Bill in his office. Bill seemed to recognize him; at least he nodded, briefly. No sense trying to talk—not in this sullen subterranea, filled with the booming echo of exhausts, the despairing shriek of brakes. Headlights flickered in the darkness as cars whirled past, ascending and descending on the loading platforms. The signal systems winked from the walls, and tires screeched defiance to the warning bells.

Old-fashioned theologians, Harry remembered, used to argue whether there really was a Hell, and if so, had it been created by God or the Devil? Too bad they weren't around today to get an answer to their questions. There was a Hell, and it had been created by General Motors.

Harry's temples began to throb. Through blurred eyes, he saw the attendant beckoning him down the line to a platform marked Check-Out #3. He stood there with a cluster of others, waiting.

What was the matter with him today, anyway? First the headache, and now his feet were hurting. Standing around waiting, that's what did it. This eternal waiting. When he was a kid, the grownups were always complaining about the long seven-hour work days and how they cut into their leisure time. Well, maybe they had reason to gripe, but at least there was some leisure before work began or after it was through. Now that extra time was consumed in waiting. Standing in line, standing in crowds, wearing yourself out doing nothing.

Still, this time it wasn't really so bad. Within ten minutes the light blue Pax rolled up before him. Harry climbed in as the attendant slid out from behind the wheel and prepared to leave.

Then a fat man appeared, running along the ramp. He gestured wildly with a plump thumb. Harry nodded briefly, and the fat man hurled himself into the seat beside him and slammed the door.

They were off. Harry read the signals impatiently, waiting for the green Go. The moment he saw it he gunned his motor and got the car up to twenty-two and zipped away.

That's what he liked, that's what he always waited for. Of course it was dangerous, here in the tunnel system under the garage, but Harry always got a thrill out of speed. The Pax could do thirty-five or even forty, probably, on a theoretical open road. Still, twenty-two was enough to satisfy Harry.

He whizzed up the ramp, turned, headed for the street-level, then braked and waited for the signal to emerge.

Harsh sunlight pierced the smog and he felt his eyes watering. Now the street noises assailed his ears; the grinding of gears, the revving of motors. But at least the total volume was lower, and with the windows tightly closed against the acrid air, he could hear.

Turning to the fat man beside him he said, "Hello, Frazer. What's the urgency?"

"Got to get downtown before eleven," the fat man answered. "Board meeting today, but I forgot about it. Knew I wouldn't have time to wait for the car, and I was hoping I'd find someone who'd give me a lift. Lucky for me that you came along when you did."

Harry nodded but did not reply. At the moment he was trying to edge into the traffic beyond. It flowed, bumper to bumper, in a steady stream; a stream moving at the uniform and prescribed rate of fifteen miles per hour. He released his brakes and the Pax nosed forward until a truck sounded its horn in ominous warning. The noise hurt Harry's head; he winced and grimaced.

"What's the matter?" asked Frazer.

"Headache," Harry muttered. He menaced a Chevosto with his bumper. "Damn it, I thought they didn't allow those big four-passenger jobs on this arterial during rush hours!" Gradually he managed to turn until he was in the righthand lane. "There," he said. "We're off."

And so they were, for all of three minutes, with the speed set at fifteen on autopilot. Then a signal went into action somewhere up ahead, and the procession halted. Harry flicked his switch. As was customary, horns sounded indignantly on all sides—a mechanical protest against a mechanical obstruction. Harry winced again.

"Hangover?" Frazer asked, solicitously. "Try aspirystamine."

Harry shook his head. "No hangover. And I've already taken three, thanks. Nothing does any good. So I guess it's just up to you."

"Up to me?" Frazer was genuinely puzzled. "What can I do about your headaches?"

"You're on the Board of City Planners, aren't you?"

"That's right."

"Well, I've got a suggestion for you to give to them. Tell them to start planning to drop a couple of heavy
thermo-nucs on this area. Clean out twenty or thirty million people. We'd never miss 'em."

Frazer chuckled wryly. "I wish I had a buck for every time I've heard that suggestion."

"Ever stop to think why you hear it so often? It's because everybody feels the same way—we can't take being
hemmed in like this."

"Well, a bomb wouldn't help. You know that." Frazer pursed his lips. "Robertson figured out what would
happen, with the chain-reaction."

Harry glanced sideways at his companion as the car started forward once again. "I've always wondered about
that," he said. "Seriously, I mean. Is the story really true, or is it just some more of this government propaganda you
fellows like to hand out?"

Frazer sighed. "It's true, all right. There was a scientist named Robertson, and he did come up with the thermo-
nuc formula, way back in '75. Proved it, too. Use what he developed and the chain-reaction would never end. Scientists in other countries tested the theory and agreed; there was no collusion, it just worked out that way on a
practical basis. Hasn't been a war since—what more proof do you want?"

"Well, couldn't they just use some of the old-fashioned hydrogen bombs?"

"Be sensible, man! Once a war started, no nation could resist the temptation to go all-out. Fortunately, everyone
realizes that. So we have peace. Permanent peace."

"I'll take a good war anytime, in preference to this."

"Harry, you don't know what you're talking about. You aren't so young that you can't remember what it was like
in the old days. Everybody living in fear, waiting for the bombs to fall. People dying of disease and worried about
dying from radiation and fallout. All the international rivalries, the power-politics, the eternal pressures and constant
crises. Nobody in his right mind would want to go back to that. We've come a mighty long way in the last twenty
years or so."

Harry switched to autopilot and sat back. "Maybe that's the trouble," he said. "Maybe we've come too far, too
fast. I wasn't kidding about dropping those thermo-nucs, either. Something has to be done. We can't go on like this
indefinitely. Why doesn't the Board come up with an answer?"

Frazer shrugged his heavy shoulders. "You think we haven't tried, aren't trying now? We're aware of the
situation as well as you are—and then some. But there's no easy solution. The population just keeps growing, that's
all. No war to cut it down, contagious diseases at a minimum, average life-expectancy up to ninety years or better.
Naturally, this results in a problem. But a bomb won't help bring about any permanent solution. Besides, this isn't a
local matter, or even a national one. It's global. What do you think those summit meetings are all about?"

"What about birth control?" Harry asked. "Why don't they really get behind an emigration movement?"

"We can't limit procreation by law. You know that." Frazer peered out at the swarming streams on the sidewalk
levels. "It's more than a religious or a political question—it's a social one. People want kids. They can afford them.
Besides, the Housing Act is set up so that having kids is just about the only way you can ever get into larger living-
quarters."

"Couldn't they try reverse-psychology? I mean, grant priority to people who are willing to be sterilized?"

"They tried it, on a limited experimental scale, about three years ago out on the West Coast."

"I never heard anything about it."

"Damned right you didn't," Frazer replied, grimly. "They kept the whole project under wraps, and for a good
reason. The publicity might have wrecked the Administration."

"What happened?"

"What do you suppose happened? There were riots. Do you think a man and his wife and three kids, living in
three rooms, liked the idea of standing by and watching a sterilized couple enjoy a four-room place with lawn space?
Things got pretty ugly, let me tell you. There was a rumor going around that the country was in the hands of
homosexuals—the churches were up in arms—and if that wasn't bad enough, we had to face up to the primary
problem. There just wasn't, just isn't, enough space. Not in areas suitable for maintaining a population. Mountains
are still mountains and deserts are still deserts. Maybe we can put up housing in such regions, but who can live
there? Even with decentralization going full blast, people must live within reasonable access to their work. No, we're
just running out of room."

Again the car halted on signal. Over the blasting of the horns, Harry repeated his query about emigration.

Frazer shook his head, but made no attempt to reply until the horns had quieted and they were under way once
more.

"As for emigration, we're just getting some of our own medicine in return. About eighty years ago, we clamped
down and closed the door on immigrants; established a quota. Now the same quota is being used against us, and you
can't really blame other nations for it. They're facing worse population increases than we are. Look at the African
Federation, and what's happened there, in spite of all the wealth! And South America is even worse, in spite of all
the reclamation projects. Fifteen years ago, when they cleared out the Amazon Basin, they thought they'd have enough room for fifty years to come. And now look at it—two hundred million, that's the latest figure we've got."

"So what's the answer?" Harry asked.

"I don't know. If it wasn't for hydroponics and the Ag Culture controls, we'd be licked right now. As it is, we can still supply enough food, and the old supply-and-demand takes care of the economy as a whole. I have no recommendations for an overall solution, or even a regional one. My job, the Board's job, is regulating housing and traffic and transportation in Chicagee. That's about all you can expect us to handle."

Again they jolted to a stop and the horns howled all around them. Harry sat there until a muscle in the side of his jaw began to twitch. Suddenly he pounded on the horn with both fists.

"Shut up!" he yelled. "For the love of Heaven, shut up!"

Abruptly he slumped back. "Sorry," he mumbled. "It's my damned headache. I—I've got to get out of this."

"Job getting you down?"

"No. It's a good job. At least everybody tells me so. Twenty-five hours a week, three hundred bucks. The car. The room. The telescreen and liquor and yellowjackets. Plenty of time to kill. Unless it's the time that's killing me."

"But—what do you want?"

Harry stepped on the accelerator and they inched along. Now the street widened into eight traffic lanes and the big semis joined the procession on the edge of the downtown area.

"I want out," Harry said. "Out of this."

"Don't you ever visit the National Preserves?" Frazer asked.

"Sure I do. Fly up every vacation. Take a tame plane to a tame government resort and catch my quota of two tame fish. Great sport! If I got married, I'd be entitled to four tame fish. But that's not what I want. I want what my father used to talk about. I want to drive into the country, without a permit, mind you; just to drive wherever I like. I want to see cows and chickens and trees and lakes and sky."

"You sound like a Naturalist."

"Don't sneer. Maybe the Naturalists are right. Maybe we ought to cut out all this phoney progress and phoney peace that passeth all understanding. I'm no liberal, don't get me wrong, but sometimes I think the Naturalists have the only answer."

"But what can you do about it?" Frazer murmured. "Suppose for the sake of argument that they are right. How can you change things? We can't just will ourselves to stop growing, and we can't legislate against biology. More people, in better health, with more free time, are just bound to have more offspring. It's inevitable, under the circumstances. And neither you nor I nor anyone has the right to condemn millions upon millions of others to death through war or disease."

"I know," Harry said. "It's hopeless, I guess. All the same, I want out." He wet his lips. "Frazer, you're on the Board here. You've got connections higher up. If I could only get a chance to transfer to Ag Culture, go on one of those farms as a worker—"

Frazer shook his head. "Sorry, Harry. You know the situation there, I'm sure. Right now there's roughly ninety million approved applications on file. Everybody wants to get into Ag Culture."

"But couldn't I just buy some land, get a government contract for foodstuffs?"

"Have you got the bucks? A minimum forty acres leased from one of the farm corporations will cost you two hundred thousand at the very least, not counting equipment." He paused. "Besides, there's Vocational Apt. What did your tests show?"

"You're right," Harry said. "I'm supposed to be an agency man. An agency man until I die. Or retire on my pension, at fifty, and sit in my little room for the next fifty years, turning on the telescreen every morning to hear some loudmouthed liar tell me it's a beautiful day in Chicagee. Who knows, maybe by that time we'll have a hundred billion people enjoying peace and progress and prosperity. All sitting in little rooms and—"

"Watch out!" Frazer grabbed the wheel. "You nearly hit that truck." He waited until Harry's face relaxed before relinquishing his grip. "Harry, you'd better go in for a checkup. It isn't just a headache with you, is it?"

"You're not fooling," Harry told him. "It isn't just a headache."

He began to think about what it really was, and that helped a little. It helped him get through the worst part, which was the downtown traffic and letting Frazer off and listening to Frazer urge him to see a doctor.

Then he got to the building parking area and let them take his car away and bury it down in the droning darkness where the horns hooted and the headlights glared.

Harry climbed the ramp and mingled with the ten-thirty shift on its way up to the elevators. Eighteen elevators in his building, to serve eighty floors. Nine of the elevators were express to the fiftieth floor, three were express to sixty-five. He wanted one of the latter, and so did the mob. The crushing, clinging mob. They pressed and panted the way mobs always do; mobs that lynch and torture and dance around bonfires and guillotines and try to drag you
down to trample you to death because they can't stand you if your name is Harry and you want to be different.

They hate you because you don't like powdered eggs and the telescreen and a beautiful day in Chicago. And they stare at you because your forehead hurts and the muscle in your jaw twitches and they know you want to scream as you go up, up, and try to think why you get a headache from jerking your head to the left.

Then Harry was at the office door and they said good morning when he came in, all eighty of the typists in the outer office working their electronic machines and offering him their electronic smiles, including the girl he had made electronic love to last Saturday night and who wanted him to move into a two-room marriage and have children, lots of children who could enjoy peace and progress and prosperity.

Harry snapped out of it, going down the corridor. Only a few steps more and he'd be safe in his office, his own private office, almost as big as his apartment. And there would be liquor, and the yellowjackets in the drawer. That would help. Then he could get to work.

What was today's assignment? He tried to remember. It was Wilmer-Klibby, wasn't it? Telescreenads for Wilmer-Klibby, makers of window-glass.

Window-glass.

He opened his office door and then slammed it shut behind him. For a minute everything blurred, and then he could remember.

Now he knew what caused him to jerk his head, what gave him the headaches when he did so. Of course. That was it.

When he sat down at the table for breakfast in the morning he turned his head to the left because he'd always done so, ever since he was a little boy. A little boy, in what was then Wheaton, sitting at the breakfast table and looking out of the window. Looking out at summer sunshine, spring rain, autumn haze, the white wonder of newfallen snow.

He'd never broken himself of the habit. He still looked to the left every morning, just as he had today. But there was no window any more. There was only a blank wall. And beyond it, the smog and the clamor and the crowds.

Window-glass. Wilmer-Klibby had problems. Nobody was buying window-glass any more. Nobody except the people who put up buildings like this. There were still windows on the top floors, just like the window here in his office.

Harry stepped over to it, moving very slowly because of his head. It hurt to keep his eyes open, but he wanted to stare out of the window. Up this high you could see above the smog. You could see the sun like a radiant jewel packed in the cotton cumulus of clouds. If you opened the window you could feel fresh air against your forehead, you could breathe it in and breathe out the headache.

But you didn't dare look down. Oh, no, never look down, because then you'd see the buildings all around you. The buildings below, black and sooty, their jagged outlines like the stumps of rotten teeth. And they stretched off in all directions, as far as the eye could attain; row after row of rotten teeth grinning up from the smog-choked throat of the streets. From the maw of the city far below came this faint but endless howling, this screaming of traffic and toil. And you couldn't help it, you breathed that in too, along with the fresh air, and it poisoned you and it did more than make your head ache. It made your heart ache and it made your soul sick, and it made you close your eyes and your lungs and your brain against it.

Harry reeled, but he knew this was the only way. Close your brain against it. And then, when you opened your eyes again, maybe you could see the way things used to be—

It was snowing out and it was a wet snow, the very best kind for snowballs and making a snowman, and the whole gang would come out after school.

But there was no school, this was Saturday, and the leaves were russet and gold and red so that it looked as if all the trees in the world were on fire. And you could scuff when you walked and pile up fallen leaves from the grass and roll in them.

And it was swell to roll down the front lawn in summer, just roll right down to the edge of the sidewalk like it was a big hill and let Daddy catch you at the bottom, laughing.

Mamma laughed too, and she said, Look, it's springtime, the lilacs are out, do you want to touch the pretty lilacs, Harry?

And Harry didn't quite understand what she was saying, but he reached out and they were purple and smelled of rain and soft sweetness and they were just beyond the window, if he reached a little further he could touch them—

And then the snow and the leaves and the grass and the lilacs disappeared, and Harry could see the rotten teeth again, leering and looming and snapping at him. They were going to bite, they were going to chew, they were going to devour, and he couldn't stop them, couldn't stop himself. He was falling into the howling jaws of the city.

His last conscious effort was a desperate attempt to gulp fresh air into his lungs before he pinwheeled down. Fresh air was good for headaches....

It took them ten seconds to save Harry from falling, but it took him over ten weeks to regain his balance.

In fact, well over two months had passed before he could fully realize just what had happened, or where he was now. They must have noticed something was wrong with him that morning at the office, because two supervisors and an exec rushed in and caught him just as he was going out of the window. And then they had sent him away, sent him here.

"This is fine," he told Dr. Manschoff. "If I'd known how well they treated you, I'd have gone couch-happy years ago."

Dr. Manschoff's plump face was impassive, but the little laugh-lines deepened around the edges of his eyes. "Maybe that's why we take such care not to publicize our recent advances in mental therapy," he said. "Everybody would want to get into a treatment center, and then where would we be?"

Harry nodded, staring past the doctor's shoulder, staring out of the wide window at the broad expanse of rolling countryside beyond.

"I still don't understand, though," he murmured. "How can you possibly manage to maintain an institution like this, with all the space and the luxuries? The inmates seem to lead a better life than the adjusted individuals outside. It's topsy-turvy."

"Perhaps." Dr. Manschoff's fingers formed a pudgy steeple. "But then, so many things seem to be topsy-turvy nowadays, don't they? Wasn't it the realization of this fact which precipitated your own recent difficulties?"

"Almost precipitated me bodily out of that window," Harry admitted, cheerfully. "And that's another thing. I was sent here, I suppose, because I'd attempted suicide, gone into shock, temporary amnesia, something like that."

"Something like that," the doctor echoed, contemplating his steeple.

"But you didn't give me any treatment," Harry continued. "Oh, I was kept under sedation for a while, I realize that. And you and some of the other staff-members talked to me. But mainly I just rested in a nice big room and ate nice big meals."

"So?" The steeple's fleshy spire collapsed.

"So what I want to know is, when does the real treatment start? When do I go into analysis, or chemotherapy, and all that?"

Dr. Manschoff shrugged. "Do you think you need those things now?"

Harry gazed out at the sunlight beyond the window, half-squinting and half-frowning. "No, come to think of it, I don't believe I do. I feel better now than I have in years."

His companion leaned back. "Meaning that for years you felt all wrong. Because you were constricted, physically, psychically, and emotionally. You were cramped, squeezed in a vise until the pressure became intolerable. But now that pressure has been removed. As a result you no longer suffer, and there is no need to seek escape in death or denial of identity.

"This radical change of attitude has been brought about here in just a little more than two months' time. And yet you're asking me when the 'real treatment' begins."

"I guess I've already had the real treatment then, haven't I?"

"That is correct. Prolonged analysis or drastic therapy is unnecessary. We've merely given you what you seemed to need."

"I'm very grateful," Harry said. "But how can you afford to do it?"

Dr. Manschoff built another temple to an unknown god. He inspected the architecture critically now as he spoke. "Because your problem is a rarity," he said.

"Rarity? I'd have thought millions of people would be breaking down every month. The Naturalists say—"

The doctor nodded wearily. "I know what they say. But let's dismiss rumors and consider facts. Have you ever read any official report stating that the number of cases of mental illness ran into the millions?"

"No, I haven't."

"For that matter, do you happen to know of anyone who was ever sent to a treatment center such as this?"

"Well, of course, everybody goes in to see the medics for regular check-ups and this includes an interview with a psych. But if they're in bad shape he just puts them on extra tranquilizers. I guess sometimes he reviews their Vocational Apt tests and shifts them over into different jobs in other areas."

Dr. Manschoff bowed his head in reverence above the steeple, as if satisfied with the labors he had wrought. "That is roughly correct. And I believe, if you search your memory, you won't recall even a mention of a treatment center. This sort of place is virtually extinct, nowadays. There are still some institutions for those suffering from functional mental disorders—paresis, senile dementia, congenital abnormalities. But regular check-ups and preventative therapy take care of the great majority. We've ceased concentrating on the result of mental illnesses and learned to attack the causes."
"It's the old yellow fever problem all over again, you see. Once upon a time, physicians dealt exclusively with treatment of yellow fever patients. Then they shifted their attention to the source of the disease. They went after the mosquitoes, drained the swamps, and the yellow fever problem vanished.

"That's been our approach in recent years. We've developed social therapy, and so the need for individual therapy has diminished.

"What were the sources of the tensions producing mental disturbances? Physical and financial insecurity, the threat of war, the aggressive patterns of a competitive society, the unresolved Oedipus-situation rooted in the old-style family relationship. These were the swamps where the mosquitoes buzzed and bit. Most of the swamps have been dredged, most of the insects exterminated.

"Today we're moving into a social situation where nobody goes hungry, nobody is jobless or unprovided for, nobody needs to struggle for status. Vocational Apt determines a man's rightful place and function in society, and there's no longer the artificial distinction imposed by race, color or creed. War is a thing of the past. Best of all, the old-fashioned 'home-life,' with all of its unhealthy emotional ties, is being replaced by sensible conditioning when a child reaches school age. The umbilical cord is no longer a permanent leash, a stranger's noose, or a silver-plated life-line stretching back to the womb."

Harry Collins nodded. "I suppose only the exceptional cases ever need to go to a treatment center like this."

"Exactly."

"But what makes me one of the exceptions? Is it because of the way the folks brought me up, in a small town, with all the old-fashioned books and everything? Is that why I hated confinement and conformity so much? Is it because of all the years I spent reading? And why—"

Dr. Manschoff stood up. "You tempt me," he said. "You tempt me strongly. As you can see, I dearly love a lecture—and a captive audience. But right now, the audience must not remain captive. I prescribe an immediate dose of freedom."

"You mean I'm to leave here?"

"Is that what you want to do?"

"Frankly, no. Not if it means going back to my job."

"That hasn't been decided upon. We can discuss the problem later, and perhaps we can go into the answers to those questions you just posed. But at the moment, I'd suggest you stay with us, though without the restraint of remaining in your room or in the wards. In other words, I want you to start going outside again."

"Outside?"

"You'll find several square miles of open country just beyond the doors here. You're at liberty to wander around and enjoy yourself. Plenty of fresh air and sunshine—come and go as you wish. I've already issued instructions which permit you to keep your own hours. Meals will be available when you desire them."

"You're very kind."

"Nonsense. I'm prescribing what you need. And when the time comes, we'll arrange to talk again. You know where to find me."

Dr. Manschoff dismantled his steeple and placed a half of the roof in each trouser-pocket.

And Harry Collins went outdoors.

It was wonderful just to be free and alone—like returning to that faraway childhood in Wheaton once again. Harry appreciated every minute of it during the first week of his wandering.

But Harry wasn't a child any more, and after a week he began to wonder instead of wander.

The grounds around the treatment center were more than spacious; they seemed absolutely endless. No matter how far he walked during the course of a day, Harry had never encountered any walls, fences or artificial barriers; there was nothing to stay his progress but the natural barriers of high, steeply-sloping precipices which seemed to rim all sides of a vast valley. Apparently the center itself was set in the middle of a large canyon—a canyon big enough to contain an airstrip for helicopter landings. The single paved road leading from the main buildings terminated at the airstrip, and Harry saw helicopters arrive and depart from time to time; apparently they brought in food and supplies.

As for the center itself, it consisted of four large structures, two of which Harry was familiar with. The largest was made up of apartments for individual patients, and staffed by nurses and attendants. Harry's own room was here, on the second floor, and from the beginning he'd been allowed to roam around the communal halls below at will.

The second building was obviously administrative—Dr. Manschoff's private office was situated therein, and presumably the other staff-members operated out of here.

The other two buildings were apparently inaccessible; not guarded or policed or even distinguished by signs prohibiting access, but merely locked and unused. At least, Harry had found the doors locked when—out of normal curiosity—he had ventured to approach them. Nor had he ever seen anyone enter or leave the premises. Perhaps
These structures were unnecessary under the present circumstances, and had been built for future accommodations.

Still, Harry couldn't help wondering.

And now, on this particular afternoon, he sat on the bank of the little river which ran through the valley, feeling the mid-summer sun beating down upon his forehead and staring down at the eddying current with its ripples and reflections.

Ripples and reflections....

Dr. Manschoff had answered his questions well, yet new questions had arisen.

Most people didn't go crazy any more, the doctor had explained, and so there were very few treatment centers such as this.

Question: Why were there any at all?

A place like this cost a fortune to staff and maintain. In an age where living-space and areable acreage was at such a premium, why waste this vast and fertile expanse? And in a society more and more openly committed to the policy of promoting the greatest good for the greatest number, why bother about the fate of an admittedly insignificant group of mentally disturbed patients?

Not that Harry resented his situation; in fact, it was almost too good to be true.

Question: Was it too good to be true?

Why, come to realize it, he'd seen less than a dozen other patients during his entire stay here! All of them were male, and all of them—apparently—were recovering from a condition somewhat similar to his own. At least, he'd recognized the same reticence and diffidence when it came to exchanging more than a perfunctory greeting in an encounter in an outer corridor. At the time, he'd accepted their unwillingness to communicate; welcomed and understood it because of his condition. And that in itself wasn't what he questioned now.

But why were there so few patients beside himself? Why were they all males? And why weren't they roaming the countryside now the way he was?

So many staff-members and so few patients. So much room and luxury and freedom, and so little use of it. So little apparent purpose to it all.

Question: Was there a hidden purpose?

Harry stared down into the ripples and reflections, and the sun was suddenly intolerably hot, its glare on the water suddenly blinding and bewildering. He saw his face mirrored on the water's surface, and it was not the familiar countenance he knew—the features were bloated, distorted, shimmering and wavering.

Maybe it was starting all over again. Maybe he was getting another one of those headaches. Maybe he was going to lose control again.

Yes, and maybe he was just imagining things. Sitting here in all this heat wasn't a good idea.

Why not take a swim?

That seemed reasonable enough. In fact, it seemed like a delightful distraction. Harry rose and stripped. He entered the water awkwardly—one didn't dive, not after twenty years of abstinence from the outdoor life—but he found that he could swim, after a fashion. The water was cooling, soothing. A few minutes of immersion and Harry found himself forgetting his speculations. The uneasy feeling had vanished. Now, when he stared down into the water, he saw his own face reflected, looking just the way it should. And when he stared up—

He saw her standing there, on the bank.

She was tall, slim, and blonde. Very tall, very slim, and very blonde.

She was also very desirable.

Up until a moment ago, Harry had considered swimming a delightful distraction. But now—

"How's the water?" she called.

"Fine."

She nodded, smiling down at him.

"Aren't you coming in?" he asked.

"No."

"Then what are you doing here?"

"I was looking for you, Harry."

"You know my name?"

She nodded again. "Dr. Manschoff told me."

"You mean, he sent you here to find me?"

"That's right."

"But I don't understand. If you're not going swimming, then why—I mean—"

Her smile broadened. "It's just part of the therapy, Harry."

"Part of the therapy?"
"That's right. Part." She giggled. "Don't you think you'd like to come out of the water now and see what the rest of it might be?"

Harry thought so.
With mounting enthusiasm, he eagerly embraced his treatment and entered into a state of active cooperation.
It was some time before he ventured to comment on the situation. "Manschoff is a damned good diagnostician," he murmured. Then he sat up. "Are you a patient here?"
She shook her head. "Don't ask questions, Harry. Can't you be satisfied with things as they are?"
"You're just what the doctor ordered, all right." He gazed down at her. "But don't you even have a name?"
"You can call me Sue."
"Thank you."
He bent to kiss her but she avoided him and rose to her feet. "Got to go now."
"So soon?"
She nodded and moved towards the bushes above the bank.
"But when will I see you again?"
"Coming swimming tomorrow?"
"Yes."
"Maybe I can get away for more occupational therapy then."
She stooped behind the bushes, and Harry saw a flash of white.
"You are a nurse, aren't you," he muttered. "On the staff, I suppose. I should have known."
"All right, so I am. What's that got to do with it?"
"And I suppose you were telling the truth when you said Manschoff sent you here. This is just part of my therapy, isn't it?"
She nodded briefly as she slipped into her uniform. "Does that bother you, Harry?"
He bit his lip. When he spoke, his voice was low. "Yes, damn it, it does. I mean, I got the idea—at least, I was hoping—that this wasn't just a matter of carrying out an assignment on your part."
She looked up at him gravely. "Who said anything about an assignment, darling?" she murmured. "I volunteered."
And then she was gone.
Then she was gone, and then she came back that night in Harry's dreams, and then she was at the river the next day and it was better than the dreams, better than the day before.
Sue told him she had been watching him for weeks now. And she had gone to Manschoff and suggested it, and she was very glad. And they had to meet here, out in the open, so as not to complicate the situation or disturb any of the other patients.
So Harry naturally asked her about the other patients, and the whole general setup, and she said Dr. Manschoff would answer all those questions in due time. But right now, with only an hour or so to spare, was he going to spend it all asking for information? Matters were accordingly adjusted to their mutual satisfaction, and it was on that basis that they continued their almost daily meetings for some time.
The next few months were perhaps the happiest Harry had ever known. The whole interval took on a dreamlike quality—idealized, romanticized, yet basically sensual. There is probably such a dream buried deep within the psyche of every man, Harry reflected, but to few is it ever given to realize its reality. His early questioning attitude gave way to a mood of mere acceptance and enjoyment. This was the primitive drama, the very essence of the male-female relationship; Adam and Eve in the Garden. Why waste time seeking the Tree of Knowledge?
And it wasn't until summer passed that Harry even thought about the Serpent.
One afternoon, as he sat waiting for Sue on the river bank, he heard a sudden movement in the brush behind him.
"Darling?" he called, eagerly.
"Please, you don't know me that well." The deep masculine voice carried overtones of amusement.
Flushing, Harry turned to confront the intruder. He was a short, stocky, middle-aged man whose bristling gray crewcut almost matched the neutral shades of his gray orderly's uniform.
"Expecting someone else, were you?" the man muttered. "Well, I'll get out of your way."
"That's not necessary. I was really just daydreaming, I guess. I don't know what made me think—" Harry felt his flush deepen, and he lowered his eyes and his voice as he tried to improvise some excuse.
"You're a lousy liar," the man said, stepping forward and seating himself on the bank next to Harry. "But it doesn't really matter. I don't think your girl friend is going to show up today, anyway."
"What do you mean? What do you know about—"
"I mean just what I said," the man told him. "And I know everything I need to know, about you and about her
and about the situation in general. That's why I'm here, Collins.”

He paused, watching the play of emotions in Harry’s eyes.

“I know what you're thinking right now,” the gray-haired man continued. “At first you wondered how I knew
your name. Then you realized that if I was on the staff in the wards I'd naturally be able to identify the patients. Now
it occurs to you that you've never seen me in the wards, so you're speculating as to whether or not I'm working out of
the administration offices with that psychiatric no good Manschoff. But if I were, I wouldn't be calling him names,
would I? Which means you're really getting confused, aren't you, Collins? Good!”

The man chuckled, but there was neither mockery, malice, nor genuine mirth in the sound. And his eyes were
sober, intent.

"Who are you?" Harry asked. "What are you doing here?"

"The name is Ritchie, Arnold Ritchie. At least, that's the name they know me by around here, and you can call
me that. As to what I'm doing, it's a long story. Let's just say that right now I'm here to give you a little advanced
therapy."

"Then Manschoff did send you?"

The chuckle came again, and Ritchie shook his head. "He did not. And if he even suspected I was here, there'd
be hell to pay.

"Then what do you want with me?"

"It isn't a question of what I want. It's a question of what you need. Which is, like I said, advanced therapy. The
sort that dear old kindly permissive Father-Image Manschoff doesn't intend you to get."

Harry stood up. "What's this all about?"

Ritchie rose with him, smiling for the first time. "I'm glad you asked that question, Collins. It's about time you
did, you know. Everything has been so carefully planned to keep you from asking it. But you were beginning to
wonder just a bit anyway, weren't you?"

"I don't see what you're driving at."

"You don't see what anyone is driving at, Collins. You've been blinded by a spectacular display of kindness,
misdirected by self-indulgence. I told you I knew everything I needed to know about you, and I do. Now I'm going
to ask you to remember these things for yourself; the things you've avoided considering all this while.

"I'm going to ask you to remember that you're twenty-eight years old, and that for almost seven years you were
an agency man and a good one. You worked hard, you did a conscientious job, you stayed in line, obeyed the rules,
ever rebelled. Am I correct in my summary of the situation?"

"Yes, I guess so."

"So what was your reward for all this unceasing effort and eternal conformity? A one-room apartment and a
one-week vacation, once a year. Count your blessings, Collins. Am I right?"

"Right."

"Then what happened? Finally you flipped, didn't you? Tried to take a header out of the window. You chucked
your job, chucked your responsibilities, chucked your future and attempted to chuck yourself away. Am I still
right?"

"Yes."

"Good enough. And now we come to the interesting part of the story. Seven years of being a good little boy got
you nothing but the promise of present and future frustration. Seven seconds of madness, of attempted self-
destruction, brought you here. And as a reward for bucking the system, the system itself has provided you with a life
of luxury and leisure—full permission to come and go as you please, live in spacious ease, indulge in the
gratification of every appetite, free of responsibility or restraint. Is that true?"

"I suppose so."

"All right. Now, let me ask you the question you asked me. What's it all about?"

Ritchie put his hand on Harry's shoulder. "Tell me that, Collins. Why do you suppose you've received such
treatment? As long as you stayed in line, nobody gave a damn for your comfort or welfare. Then, when you
committed the cardinal sin of our present-day society—when you rebelled—everything was handed to you on a
silver platter. Does that make sense?"

"But it's therapy. Dr. Manschoff said—"

"Look, Collins. Millions of people flip every year. Millions more attempt suicide. How many of them end up in
a place like this?"

"They don't, though. That's just Naturalist propaganda. Dr. Manschoff said—"

"Dr. Manschoff said! I know what he said, all right. And you believed him, because you wanted to believe him.
You wanted the reassurance he could offer you—the feeling of being unique and important. So you didn't ask him
any questions, you didn't ask any questions of yourself. Such as why anybody would consider an insignificant little
agency man, without friends, family or connections, worth the trouble of rehabilitating at all, let alone amidst such elaborate and expensive surroundings. Why, men like you are a dime a dozen these days—Vocational Apt can push a few buttons and come up with half a million replacements to take over your job. You aren't important to society, Collins. You aren't important to anyone at all, besides yourself. And yet you got the red-carpet treatment. It's about time somebody yanked that carpet out from under you. What's it all about?"

Harry blinked. "Look here, I don't see why this is any of your business. Besides, to tell the truth, I'm expecting —"

"I know who you're expecting, but I've already told you she won't be here. Because she's expecting."

"What—?"

"It's high time you learned the facts of life, Collins. Yes, the well-known facts of life—the ones about the birds and the bees, and barefoot boys and blondes, too. Your little friend Sue is going to have a souvenir."

"I don't believe it! I'm going to ask Dr. Manschoff."

"Sure you are. You'll ask Manschoff and he'll deny it. And so you'll tell him about me. You'll say you met somebody in the woods today—either a lunatic or a Naturalist spy who infiltrated here under false pretenses. And Manschoff will reassure you. He'll reassure you just long enough to get his hands on me. Then he'll take care of both of us."

"Are you insinuating—"

"Hell, no! I'm telling you!" Ritchie put his hand down suddenly, and his voice calmed. "Ever wonder about those other two big buildings on the premises here, Collins? Well, I can tell you about one of them, because that's where I work. You might call it an experimental laboratory if you like. Sometime later on I'll describe it to you. But right now it's the other building that's important; the building with the big chimney. That's a kind of an incinerator, Collins—a place where the mistakes go up in smoke, at night, when there's nobody to see. A place where you and I will go up in smoke, if you're fool enough to tell Manschoff about this."

"You're lying."

"I wish to God I was, for both our sakes! But I can prove what I'm saying. You can prove it, for yourself."

"How?"

"Pretend this meeting never occurred. Pretend that you just spent the afternoon here, waiting for a girl who never showed up. Then do exactly what you would do under those circumstances. Go in to see Dr. Manschoff and ask him where Sue is, tell him you were worried because she'd promised to meet you and then didn't appear."

"I can tell you right now what he'll tell you. He'll say that Sue has been transferred to another treatment center, that she knew about it for several weeks but didn't want to upset you with the news of her departure. So she decided to just slip away. And Manschoff will tell you not to be unhappy. It just so happens that he knows of another nurse who has had her eye on you—a very pretty little brunette named Myrna. In fact, if you go down to the river tomorrow, you'll find her waiting for you there."

"You're trying."

"I wish to God I was, for both our sakes! But I can prove what I'm saying. You can prove it, for yourself."

"What if I refuse?"

Ritchie shrugged. "Why should you refuse? It's all fun and games, isn't it? Up to now you haven't asked any questions about what was going on, and it would look very strange if you started at this late date. I strongly advise you to cooperate. If not, everything is likely to—quite literally—go up in smoke."

Harry Collins frowned. "All right, suppose I do what you say, and Manschoff gives me the answers you predict. This still doesn't prove that he'd be lying or that you're telling me the truth."

"Wouldn't it indicate as much, though, though?"

"Perhaps. But on the other hand, it could merely mean that you know Sue has been transferred, and that Dr. Manschoff intends to turn me over to a substitute. It doesn't necessarily imply anything sinister."

"In other words, you're insisting on a clincher, is that it?"

"Yes."

"All right." Ritchie sighed heavily. "You asked for it." He reached into the left-hand upper pocket of the gray uniform and brought out a small, stiff square of glossy paper.

"What's that?" Harry asked. He reached for the paper, but Ritchie drew his hand back.

"Look at it over my shoulder," he said. "I don't want any fingerprints. Hell of a risky business just smuggling it out of the files—no telling how well they check up on this material."

Harry circled behind the smaller man. He squinted down. "Hard to read."

"Sure. It's a photostat. I made it myself, this morning; that's my department. Read carefully now. You'll see it's a transcript of the lab report. Susan Pulver, that's her name, isn't it? After due examination and upon completion of preliminary tests, hereby found to be in the second month of pregnancy. Putative father, Harry Collins—that's you, see your name? And here's the rest of the record."

"Yes, let me see it. What's all this about inoculation series? And who is this Dr. Leffingwell?" Harry bent
closer, but Ritchie closed his hand around the photostat and pocketed it again.

"Never mind that, now. I'll tell you later. The important thing is, do you believe me?"

"I believe Sue is pregnant, yes."

"That's enough. Enough for you to do what I've asked you to. Go to Manschoff and make inquiries. See what he tells you. Don't make a scene, and for God's sake don't mention my name. Just confirm my story for yourself. Then I'll give you further details."

"But when will I see you?"

"Tomorrow afternoon, if you like. Right here."

"You said he'd be sending another girl—"

Ritchie nodded. "So I did. And so he'll say. I suggest you beg to be excused for the moment. Tell him it will take a while for you to get over the shock of losing Sue this way."

"I won't be lying," Harry murmured.

"I know. And I'm sorry. Believe me, I am." Ritchie sighed again. "But you'll just have to trust me from now on."

"Trust you? When you haven't even explained what this is all about?"

"You've had your shock-therapy for today. Come back for another treatment tomorrow."

And then Ritchie was gone, the gray uniform melting away into the gray shadows of the shrubbery above the bank.

A short time later, Harry made his own way back to the center in the gathering twilight. The dusk was gray, too. Everything seemed gray now.

So was Harry Collins' face, when he emerged from his interview with Dr. Manschoff that evening. And it was still pallid the next afternoon when he came down to the river bank and waited for Ritchie to reappear.

The little man emerged from the bushes. He stared at Harry's drawn countenance and nodded slowly.

"I was right, eh?" he muttered.

"It looks that way. But I can't understand what's going on. If this isn't just a treatment center, if they're not really interested in my welfare, then what am I doing here?"

"You're taking part in an experiment. This, my friend, is a laboratory. And you are a nice, healthy guinea pig."

"But that doesn't make sense. I haven't been experimented on. They've let me do as I please."

"Exactly. And what do guinea pigs excel at? Breeding."

"You mean this whole thing was rigged up just so that Sue and I would—?"

"Please, let's not be so egocentric, shall we? After all, you're not the only male patient in this place. There are a dozen others wandering around loose. Some of them have their favorite caves, others have discovered little bypaths, but all of them seem to have located ideal trysting-places. Whereupon, of course, the volunteer nurses have located them."

"Are you telling me the same situation exists with each of the others?"

"Isn't it fairly obvious? You've shown no inclination to become friendly with the rest of the patients here, and none of them have made any overtures to you. That's because everyone has his own little secret, his own private arrangement. And so all of you go around fooling everybody else, and all of you are being fooled. I'll give credit to Manschoff and his staff on that point—he's certainly mastered the principles of practical psychology."

"But you talked about breeding. With our present overpopulation problem, why in the world do they deliberately encourage the birth of more children?"

"Very well put. Why in the world do they deliberately encourage the birth of more children?"

Arnold Ritchie seated himself on the grass, pulled out a pipe, and then replaced it hastily. "Better not smoke, " he murmured. "Be awkward if we attracted any attention and were found together."

Harry stared at him. "You are a Naturalist, aren't you?"

"I'm a reporter, by profession."

"Which network?"

"No network. Newzines. There are still a few in print, you know."

"I know. But I can't afford them."

"There aren't many left who can, or who even feel the need of reading them. Nevertheless, mavericks like myself still cling to the ancient and honorable practices of the Fourth Estate. One of which is ferreting out the inside story, the news behind the news."

"Then you're not working for the Naturalists."

"Of course I am. I'm working for them and for everybody else who has an interest in learning the truth." Ritchie paused. "By the way, you keep using that term as if it were some kind of dirty word. Just what does it mean? What is a Naturalist, in your book?"
"Why, a radical thinker, of course. An opponent of government policies, of progress. One who believes we're running out of living space, using up the last of our natural resources."
"What do you suppose motivates Naturalists, really?"
"Well, they can't stand the pressures of daily living, or the prospects of a future when we'll be still more hemmed in."
Ritchie nodded. "Any more than you could, a few months ago, when you tried to commit suicide. Wouldn't you say that you were thinking like a Naturalist then?"
Harry grimaced. "I suppose so."
"Don't feel ashamed. You saw the situation clearly, just as the so-called Naturalists do. And just as the government does. Only the government can't dare admit it—hence the secrecy behind this project."
"A hush-hush government plan to stimulate further breeding? I still don't see—"
"Look at the world," Ritchie repeated. "Look at it realistically. What's the situation at present? Population close to six billion, and rising fast. There was a leveling-off period in the Sixties, and then it started to climb again. No wars, no disease to cut it down. The development of synthetic foods, the use of algae and fungi, rules out famine as a limiting factor. Increased harnessing of atomic power has done away with widespread poverty, so there's no economic deterrent to propagation. Neither church nor state dares set up a legal prohibition. So here we are, at the millennium. In place of international tension we've substituted internal tension. In place of thermonuclear explosion, we have a population explosion."
"You make it look pretty grim."
"I'm just talking about today. What happens ten years from now, when we hit a population-level of ten billion? What happens when we reach twenty billion, fifty billion, a hundred? Don't talk to me about more substitutes, more synthetics, new ways of conserving top-soil. There just isn't going to be room for everyone!"
"Then what's the answer?"
"That's what the government wants to know. Believe me, they've done a lot of searching; most of it sub rosa. And then along came this man Leffingwell, with his solution. That's just what it is, of course—an endocrinological solution, for direct injection."
"Leffingwell? The Dr. Leffingwell whose name was on that photostat? What's he got to do with all this?"
"He's boss of this project," Ritchie said. "He's the one who persuaded them to set up a breeding-center. You're his guinea pig."
"But why all the secrecy?"
"That's what I wanted to know. That's why I scurried around, pulled strings to get a lab technician's job here. It wasn't easy, believe me. The whole deal is being kept strictly under wraps until Leffingwell's experiments prove out. They realized right away that it would be fatal to use volunteers for the experiments—they'd be bound to talk, there'd be leaks. And of course, they anticipated some awkward results at first, until the technique is refined and perfected. Well, they were right on that score. I've seen some of their failures. Ritchie shuddered. "Any volunteer—any military man, government employee or even a so-called dedicated scientist who broke away would spread enough rumors about what was going on to kill the entire project. That's why they decided to use mental patients for subjects. God knows, they had millions to choose from, but they were very particular. You're a rare specimen, Collins."
"How so?"
"Because you happen to fit all their specifications. You're young, in good physical condition. Unlike ninety percent of the population, you don't even wear contact lenses, do you? And your aberration was temporary, easily removed by removing you from the tension-sources which created it. You have no family ties, no close friends, to question your absence. That's why you were chosen—one of the two hundred."
"Two hundred? But there's only a dozen others here now."
"A dozen males, yes. You're forgetting the females. Must be about fifty or sixty in the other building."
"But if you're talking about someone like Sue, she's a nurse——"
Ritchie shook his head. "That's what she was told to say. Actually, she's a patient, too. They're all patients. Twelve men and sixty women, at the moment. Originally, about thirty men and a hundred and seventy women."
"What happened to the others?"
"I told you there were some failures. Many of the women died in childbirth. Some of them survived, but found out about the results—and the results, up until now, haven't been perfect. A few of the men found out, too. Well, they have only one method of dealing with failures here. They dispose of them. I told you about that chimney, didn't I?"
"You mean they killed the offspring, killed those who found out about them?"
Ritchie shrugged.
"But what are they actually doing? Who is this Dr. Leffingwell? What's it all about?"

"I think I can answer those questions for you."

Harry wheeled at the sound of the familiar voice.

Dr. Manschoff beamed down at him from the top of the river bank. "Don't be alarmed," he said. "I wasn't following you with any intent to eavesdrop. I was merely concerned about him." His eyes flickered as he directed his gaze past Harry's shoulder, and Harry turned again to look at Arnold Ritchie.

The little man was no longer standing and he was no longer alone. Two attendants now supported him, one on either side, and Ritchie himself sagged against their grip with eyes closed. A hypodermic needle in one attendant's hand indicated the reason for Ritchie's sudden collapse.

"Merely a heavy sedative," Dr. Manschoff murmured. "We came prepared, in expectation of just such an emergency." He nodded at his companions. "Better take him back now," he said. "I'll look in on him this evening, when he comes out of it."

"Sorry about all this," Manschoff continued, sitting down next to Harry as the orderlies lifted Ritchie's inert form and carried him up the slanting slope. "It's entirely my fault. I misjudged my patient—never should have permitted him such a degree of freedom. Obviously, he's not ready for it yet. I do hope he didn't upset you in any way."

"No. He seemed quite—"Harry hesitated, then went on hastily—"logical."

"Indeed he is." Dr. Manschoff smiled. "Paranoid delusions, as they used to call them, can often be rationalized most convincingly. And from what little I heard, he was doing an excellent job, wasn't he?"

"Well—"

"I know." A slight sigh erased the smile. "Leffingwell and I are mad scientists, conducting biological experiments on human guinea pigs. We've assembled patients for breeding purposes and the government is secretly subsidizing us. Also, we incinerate our victims—again, with full governmental permission. All very logical, isn't it?"

"I didn't mean that," Harry told him. "It's just that he said Sue was pregnant and he was hinting things."

"Said?" Manschoff stood up. "Hinted? I'm surprised he didn't go further than that. Just today, we discovered he'd been using the office facilities—he had a sort of probationary position, as you may have guessed, helping out the staff in administration—to provide tangible proof of his artistic creations. He was writing out 'official reports' and then photostating them. Apparently he intended to circulate the results as 'evidence' to support his delusions. Look, here's a sample."

Dr. Manschoff passed a square of glossy paper to Harry, who scanned it quickly. It was another laboratory report similar to the one Ritchie had shown him, but containing a different set of names.

"No telling how long this sort of thing has been going on," Manschoff said. "He may have made dozens. Naturally, the moment we discovered it, we realized prompt action was necessary. He'll need special attention."

"But what's wrong with him?"

"It's a long story. He was a reporter at one time—he may have told you that. The death of his wife precipitated a severe trauma and brought him to our attention. Actually, I'm not at liberty to say any more regarding his case; you understand, I'm sure."

"Then you're telling me that everything he had to say was a product of his imagination?"

"No, don't misunderstand. It would be more correct to state that he merely distorted reality. For example, there is a Dr. Leffingwell on the staff here; he is a diagnostician and has nothing to do with psychotherapy per se. And he has charge of the hospital ward in Unit Three, the third building you may have noticed behind Administration. That's where the nurses maintain residence, of course. Incidentally, when any nurses take on a—special assignment, as it were, such as yours, Leffingwell does examine and treat them. There's a new oral contraception technique he's evolved which may be quite efficacious. But I'd hardly call it an example of sinister experimentation under the circumstances, would you?"

Harry shook his head. "About Ritchie, though," he said. "What will happen to him?"

"I can't offer any prognosis. In view of my recent error in judgment concerning him, it's hard to say how he'll respond to further treatment. But rest assured that I'll do my best for his case. Chances are you'll be seeing him again before very long."

Dr. Manschoff glanced at his watch. "Shall we go back now?" he suggested. "Supper will be served soon."

The two men toiled up the bank.

Harry discovered that the doctor was right about supper. It was being served as he returned to his room. But the predictions concerning Ritchie didn't work out quite as well.

It was after supper—indeed, quite some hours afterwards, while Harry sat at his window and stared sleeplessly out into the night—that he noted the thick, greasy spirals of black smoke rising suddenly from the chimney of the Third Unit building. And the sight may have prepared him for the failure of Dr. Manschoff's prophecy regarding his
disturbed patient.

Harry never asked any questions, and no explanations were ever forthcoming.

But from that evening onward, nobody ever saw Arnold Ritchie again.

3. President Winthrop—1999

The Secretary of State closed the door.

"Well?" he asked.

President Winthrop looked up from the desk and blinked. "Hello, Art," he said. "Sit down."

"Sorry I'm late," the Secretary told him. "I came as soon as I got the call."

"It doesn't matter." The President lit a cigarette and pursed his lips around it until it stopped wobbling. "I've been checking the reports all night."

"You look tired."

"I am. I could sleep for a week. That is, I wish I could."

"Any luck?"

The President pushed the papers aside and drummed the desk for a moment. Then he offered the Secretary a gray ghost of a smile.

"The answer's still the same."

"But this was our last chance—"

"I know." The President leaned back. "When I think of the time and effort, the money that's been poured into these projects! To say nothing of the hopes we had. And now, it's all for nothing."

"You can't say that," the Secretary answered. "After all, we did reach the moon. We got to Mars." He paused.

"No one can take that away from you. You sponsored the Martian flights. You fought for the appropriations, pushed the project, carried it through. You helped mankind realize its greatest dream—"

"Save that for the newscasts," the President said. "The fact remains, we've succeeded. And our success was a failure. Mankind's greatest dream, eh? Read these reports and you'll find out this is mankind's greatest nightmare."

"Is it that bad?"

"Yes." The President slumped in his chair. "It's that bad. We can reach the moon at will. Now we can send a manned flight to Mars. But it means nothing. We can't support life in either place. There's absolutely no possibility of establishing or maintaining an outpost, let alone a large colony or a permanent human residence. That's what all the reports conclusively demonstrate.

"Every bit of oxygen, every bit of food and clothing and material, would have to be supplied. And investigations prove there's no chance of ever realizing any return. The cost of such an operation is staggeringly prohibitive. Even if there was evidence to show it might be possible to undertake some mining projects, it wouldn't begin to defray expenses, once you consider the transportation factor."

"But if they improve the rockets, manage to make room for a bigger payload, wouldn't it be cheaper?"

"It would still cost roughly a billion dollars to equip a flight and maintain a personnel of twenty men for a year," the President told him. "I've checked into that, and even this estimate is based on the most optimistic projection. So you can see there's no use in continuing now. We'll never solve our problems by attempting to colonize the moon or Mars."

"But it's the only possible solution left to us."

"No it isn't," the President said. "There's always our friend Leffingwell."

The Secretary of State turned away. "You can't officially sponsor a thing like that," he muttered. "It's political suicide."

The gray smile returned to the gray lips. "Suicide? What do you know about suicide, Art? I've been reading a few statistics on that, too. How many actual suicides do you think we had in this country last year?"

"A hundred thousand? Two hundred, maybe?"

"Two million." The President leaned forward. "Add to that, over a million murders and six million crimes of violence."

"I never knew—"

"Damned right you didn't! We used to have a Federal Bureau of Investigation to help prevent such things. Now the big job is merely to hush them up. We're doing everything in our power just to keep these matters quiet, or else there'd be utter panic. Then there's the accident total and the psycho rate. We can't build institutions fast enough to hold the mental cases, nor train doctors enough to care for them. Shifting them into other jobs in other areas doesn't cure, and it no longer even disguises what is happening. At this rate, another ten years will see half the nation going insane. And it's like this all over the world."

"This is race-suicide, Art. Race-suicide through sheer fecundity. Leffingwell is right. The reproductive instinct, unchecked, will overbalance group survival in the end. How long has it been since you were out on the streets?"
The Secretary of State shrugged. "You know I never go out on the streets," he said. "It isn't very safe."

"Of course not. But it's no safer for the hundreds of millions who have to go out every day. Accident, crime, the sheer maddening proximity of the crowds—these phenomena are increasing through mathematical progression. And they must be stopped. Leffingwell has the only answer."

"They won't buy it," warned the Secretary. "Congress won't, and the voters won't, any more than they bought birth-control. And this is worse."

"I know that, too." The President rose and walked over to the window, looking out at the sky-scraper apartments which loomed across what had once been the Mall. He was trying to find the dwarfed spire of Washington's Monument in the tangled maze of stone.

"If I go before the people and sponsor Leffingwell, I'm through. Through as President, through with the Party. They'll crucify me. But somebody in authority must push this project. That's the beginning. Once it's known, people will have to think about the possibilities. There'll be opposition, then controversy, then debate. And gradually Leffingwell will gain adherents. It may take five years, it may take ten. Finally, the change will come. First through volunteers. Then by law. I only pray that it happens soon."

"They'll curse your name," the Secretary said. "They'll try to kill you. It's going to be hell."

"Hell for me if I do, yes. Worse hell for the whole world if I don't."

"But are you quite sure it will work? His method, I mean?"

"You saw the reports on his tests, didn't you? It works, all right. We've got more than just abstract data, now. We've got films for the telescreenings all set up."

"Films? You mean you'll actually show what the results are? Why, just telling the people will be bad enough. And admitting the government sponsored the project under wraps. But when they see, nothing on earth can save you from assassination."

"Perhaps. It doesn't really matter." The President crushed his cigarette in the ashtray. "One less mouth to feed. And I'm getting pretty sick of synthetic meals, anyway."

President Winthrop turned to the Secretary, his eyes brightening momentarily. "Tell you what, Art. I'm not planning on breaking the proposal to the public until next Monday. What say we have a little private dinner party on Saturday evening, just the Cabinet members and their wives? Sort of a farewell celebration, in a way, but we won't call it that, of course? Chef tells me there's still twenty pounds of hamburger in the freezers."

"Twenty pounds of hamburger? You mean it?" The Secretary of State was smiling, too.

"That's right." The President of the United States grinned in anticipation. "Been a long time since I've tasted a real, honest-to-goodness hamburger."

4. Harry Collins—2000

Harry didn't ask any questions. He just kept his mouth shut and waited. Maybe Dr. Manschoff suspected and maybe he didn't. Anyway, there was no trouble. Harry figured there wouldn't be, as long as he stayed in line and went through the proper motions. It was all a matter of pretending to conform, pretending to agree, pretending to believe.

So he watched his step—except in the dreams, and then he was always falling into the yawning abyss.

He kept his nose clean—but in the dreams he smelled the blood and brimstone of the pit.

He managed to retain a cheerful smile at all times—though, in the dreams, he screamed.

Eventually, he even met Myrna. She was the pretty little brunette whom Ritchie had mentioned, and she did her best to console him—only in dreams, when he embraced her, he was embracing a writhing coil of slimy smoke.

It may have been that Harry Collins went a little mad, just having to pretend that he was sane. But he learned the way, and he managed. He saved the madness (or was it the reality?) for the dreams.

Meanwhile he waited and said nothing.

He said nothing when, after three months or so, Myrna was suddenly "transferred" without warning.

He said nothing when, once a week or so, he went in to visit with Dr. Manschoff.

He said nothing when Manschoff volunteered the information that Ritchie had been "transferred" too, or suggested that it would be best to stay on for "further therapy."

And he said nothing when still a third nurse came his way; a woman who was callid, complaisant, and nauseatingly nymphomaniac.

The important thing was to stay alive. Stay alive and try to learn.

It took him almost an additional year to find out what he wanted to find out. More than eight months passed before he found a way of sneaking out of his room at night, and a way of getting into that Third Unit through a delivery door which was occasionally left open through negligence.

Even then, all he learned was that the female patients did have their living quarters here, along with the members of the staff and—presumably—Dr. Leffingwell. Many of the women were patients rather than nurses, as
claimed, and a good number of them were in various stages of pregnancy, but this proved nothing.

Several times Harry debated the possibilities of taking some of the other men in his Unit into his confidence. Then he remembered what had happened to Arnold Ritchie and decided against this course. The risk was too great. He had to continue alone.

It wasn't until Harry managed to get into Unit Four that he got what he wanted (what he didn't want) and learned that reality and dreams were one and the same.

Then he remembered what had happened to Arnold Ritchie and decided against this course. The risk was too great.

He had to continue alone.

It wasn't until Harry managed to get into Unit Four that he got what he wanted (what he didn't want) and learned that reality and dreams were one and the same.

There was the night, more than a year after he'd come to the treatment center, when he finally broke into the basement and found the incinerators. And the incinerators led to the operating and delivery chambers, and the delivery chambers led to the laboratory and the laboratory led to the incubators and the incubators led to the nightmare.

In the nightmare Harry found himself looking down at the mistakes and the failures and he recognized them for what they were, and he knew then why the incinerators were kept busy and why the black smoke poured.

In the nightmare he saw the special units containing those which were not mistakes or failures, and in a way they were worse than the others. They were red and wriggling there beneath the glass, and on the glass surfaces hung the charts which gave the data. Then Harry saw the names, saw his own name repeated twice—once for Sue, once for Myrna. And he realized that he had contributed to the successful outcome or issue of the experiments (outcome? Issue? These horrors?) and that was why Manschoff must have chosen to take the risk of keeping him alive. Because he was one of the good guinea pigs, and he had spawned, spawned living, mewing abominations.

He had dreamed of these things, and now he saw that they were real, so that nightmare merged with now, and he could gaze down at it with open eyes and scream at last with open mouth.

Then, of course, an attendant came running (although he seemed to be moving ever so slowly, because everything moves so slowly in a dream) and Harry saw him coming and lifted a bell-glass and smashed it down over the man's head (slowly, ever so slowly) and then he heard the others coming and he climbed out of the window and ran.

The searchlights winked across the courtyards and the sirens vomited hysteria from metallic throats and the night was filled with shadows that pursued.

But Harry knew where to run. He ran straight through the nightmare, through all the fantastic but familiar convolutions of sight and sound, and then he came to the river and plunged in.

Now the nightmare was not sight or sound, but merely sensation. Icy cold and distilled darkness; ripples that ran, then raced and roiled and roared. But there had to be a way out of the nightmare and there had to be a way out of the canyon, and that way was the river.

Apparently no one else had thought of the river; perhaps they had considered it as a possible avenue of escape and then discarded the notion when they realized how it ripped and raged among the rocks as it finally plunged from the canyon's mouth. Obviously, no one could hope to combat that current and survive.

But strange things happen in nightmares. And you fight the numbness and the blackness and you claw and convulse and you twist and turn and toss and then you ride the crests of frenzy and plunge into the troughs of panic and despair and you sweep round and round and sink down into nothingness until you break through to the freedom which comes only with oblivion.

Somewhere beyond the canyon's moiling maw, Harry Collins found that freedom and that oblivion. He escaped from the nightmare, just as he escaped from the river.

The river itself roared on without him.

And the nightmare continued, too....

5. Minnie Schultz—2009

When Frank came home, Minnie met him at the door. She didn't say a word, just handed him the envelope containing the notice.

"What's the matter?" Frank asked, trying to take her in his arms. "You been crying."

"Never mind." Minnie freed herself. "Just read what it says there."

Frank read slowly, determinedly, his features contorted in concentration. Vocational Apt had terminated his schooling at the old grade-school level, and while like all students he had been taught enough so that he could read the necessary advertising commercials, any printed message of this sort provided a definite challenge.

Halfway through the notice he started to scowl. "What kind of monkey business is this?"

"No monkey business. It's the new law. Everybody that gets married in Angelisco takes the shots, from now on. Fella from State Hall, he told me when he delivered this."

"We'll see about this," Frank muttered. "No damn government's gonna tell me how to run my life. Sa free country, ain't so?"

Minnie's mouth began to twitch. "They're coming back tomorra morning, the fella said. To give me the first
shots. Gee, honey, I'm scared, like. I don't want 'em."

"That settles it," Frank said. "We're getting out of this place, fast."

"Where'd we go?"

"Dunno. Someplace. Texas, maybe. I was listening to the 'casts at work today. They don't have this law in Texas. Not yet, anyway. Come on, start packing."

"Packing? But how'll we get there?"

"Fly. We'll jet right out."

"You got priority reservations or something?"

"No. The scowl returned to Frank's forehead. "But maybe if I pitch 'em a sob story, tell 'em it's our honeymoon, you know, then we could—"

Minnie shook her head. "It won't work, honey. You know that. Takes six months to get a priority clearance or whatever they call it. Besides, your job and all—what'll you do in Texas? They've got your number listed here. Why, we couldn't even land, like. I bet Texas is even more crowded than Angelisco these days, in the cities. And all the rest of it is Ag Culture project, isn't it?"

Frank was leaning against the sink, listening. Now he took three steps forward and sat down on the bed. He didn't look at her as he spoke.

"Well, we gotta do something," he said. "You don't want those shots and that's for sure. Maybe I can have one of those other things instead, those whaddya-call-'ems."

"You mean where they operate you, like?"

"That's right. A vas-something. You know, sterilize you. Then we won't have to worry."

Minnie took a deep breath. Then she sat down and put her arm around Frank.

"But you wanted kids," she murmured. "You told me, when we got married, you always wanted to have a son —"

Frank pulled away.

"Sure I do," he said. "A son. That's what I want. A real son. Not a freak. Not a damned little monster that has to go to the Clinic every month and take injections so it won't grow. And what happens to you if you take your shots now? What if they drive you crazy or something?"

Minnie put her arm around Frank again and made him look at her. "That's not true," she told him. "That's just a lot of Naturalist talk. I know."

"Hell you do."

"But I do, honey! Honest, like! May Stebbins, she took the shots last year, when they asked for volunteers. And she's all right. You seen her baby yourself, remember? It's the sweetest little thing, and awful smart! So maybe it wouldn't be so bad."

"I'll ask about being operated tomorrow," Frank said. "Forget it. It don't matter."

"Of course it matters." Minnie looked straight at him. "Don't you think I know what you been going through? Sweating it out on that job day after day, going nuts in the traffic, saving up the ration coupons so's we'd have extra food for the honeymoon and all?"

"You didn't have to marry me, you know that. It was just like we could have a place of our own together, and kids. Well, we're gonna have 'em, honey. I'll take the shots."

Frank shook his head but said nothing.

"It won't be so bad," Minnie went on. "The shots don't hurt at all, and they make it easier, carrying the baby. They say you don't even get morning sickness or anything. And just think, when we have a kid, we get a chance for a bigger place. We go right on the housing lists. We can have two rooms. A real bedroom, maybe."

Frank stared at her. "Is that all you can think about?" he asked. "A real bedroom?"

"But honey—"

"What about the kid?" he muttered. "How you suppose it's gonna feel? How'd you like to grow up and not grow up? How'd you like to be a midget three feet high in a world where everybody else is bigger? What kind of a life you call that? I want my son to have a decent chance."

"He will have."

Minnie stared back at him, but she wasn't seeing his face. "Don't you understand, honey? This isn't just something happening to us. We're not special. It's happening to everybody, all over the country, all over the world. You seen it in the 'casts, haven't you? Most states, they adopted the laws. And in a couple more years it'll be the only way anyone will ever have kids. Ten, twenty years from now, the kids will be growing up. Ours won't be different then, because from now on all the kids will be just like he is. The same size."

"I thought you was afraid of the shots," Frank said.

Minnie was still staring. "I was, honey. Only, I dunno. I keep thinking about Grandma."
"What's the old lady got to do with it?"

"Well, I remember when I was a little girl, like. How my Grandma always used to tell me about her Grandma, when she was a little girl.

"She was saying about how in the old days, before there even was an Angelisco—when her Grandma came out here in a covered wagon. Just think, honey, she was younger than I am, and she come thousands and thousands of miles in a wagon! With real horses, like! Wasn't any houses, no people or nothing. Except Indians that shot at them. And they climbed up the mountains and they crossed over the deserts and went hungry and thirsty and had fights with those Indians all the way. But they never stopped until they got here. Because they was the pioneers."

"Pioneers?"

"That's what Grandma said her Grandma called herself. A pioneer. She was real proud of it, too. Because it means having the courage to cut loose from all the old things and try something new when you need to. Start a whole new world, a whole new kind of life."

She sighed. "I always wanted to be a pioneer, like, but I never thought I'd get the chance."

"What are you talking about? What's all this got to do with us, or having a kid?"

"Don't you see? Taking these shots, having a baby this new way—it's sort of being a pioneer, too. Gonna help bring a new kind of people into a new kind of world. And if that's not being a pioneer, like, it's the closest I can come to it. It sounds right to me now."

Minnie smiled and nodded. "I guess I made up my mind just now. I'm taking the shots."

"Hell you are!" Frank told her. "We'll talk about it some more in the morning."

But Minnie continued to smile.

And that night, as she lay in the utility bed, the squeaking of the springs became the sound of turning wheels. The plastic walls and ceiling of the eightieth-floor apartment turned to billowing canvas, and the thunder of the passing jets transformed itself into the drumming hoofbeats of a million buffalo.

Let Frank talk to her again in the morning if he liked, Minnie thought. It wouldn't make any difference now. Because you can't stop us pioneers.

6. Harry Collins—2012

Harry crouched behind the boulders, propping the rifle up between the rocks, and adjusted the telescopic sights. The distant doorway sprang into sharp focus. Grunting with satisfaction, he settled down to his vigil. The rifle-barrel had been dulled down against detection by reflection, and Harry's dark glasses protected him against the glare of the morning sun. He might have to wait several hours now, but he didn't care. It had taken him twelve years to come this far, and he was willing to wait a little while longer.

Twelve years. Was it really that long?

A mirror might have answered him; a mirror might have shown him the harsh features of a man of forty-two. But Harry needed no mirror. He could remember the past dozen years only too easily—though they had not been easy years.

Surviving the river was only the beginning. Animal strength carried him through that ordeal. But he emerged from the river as an animal; a wounded animal, crawling through the brush and arroyo outside the southern Colorado canyon.

And it was animal cunning which preserved him. He'd wandered several days until he encountered Emil Grizek and his outfit. By that time he was half-starved and completely delirious. It took a month until he was up and around again.

But Emil and the boys had nursed him through. They took turns caring for him in the bunkhouse; their methods were crude but efficient and Harry was grateful. Best of all, they asked no questions. Harry's status was that of a hunted fugitive, without a Vocational Apt record or rating. The authorities or any prospective employers would inquire into these things, but Emil Grizek never seemed curious. By the time Harry was up and around again, he'd been accepted as one of the bunch. He told them his name was Harry Sanders, and that was enough.

Two months after they found him, he'd signed on with Emil Grizek and found a new role in life.

Harry Collins, advertising copywriter, had become Harry Sanders, working cowhand.

There was surprisingly little difficulty. Grizek had absentee employers who weren't interested in their foreman's methods, just as long as he recruited his own wranglers for the Bar B Ranch. Nobody demanded to see Apt cards or insisted on making out formal work-reports, and the pay was in cash. Cowhands were hard to come by these days, and it was an unspoken premise that the men taking on such jobs would be vagrants, migratory workers, fugitives from justice and injustice. A generation or so ago they might have become tramps—but the last of the hoboies had vanished along with the last of the freight trains. Once the derelicts haunted the canyons of the big cities; today there was no place for them there, so they fled to the canyons of the west. Harry had found himself a new niche, and no questions asked.
Oddly enough, he fitted in. The outdoor life agreed with him, and in a matter of months he was a passable cowpoke; within a year he was one of Grizek's top hands.

He learned to ride a bucking jeep with the best of them, and he could spot, single out, and stun a steer in forty seconds flat; then use his electronic brander on it and have the critter back on its feet in just under a minute.

Work was no problem, and neither was recreation. The bunkhouse offered crude but adequate facilities for living; old-fashioned air-conditioning and an antique infra-red broiler seemed good enough for roughing it, and Cookie at least turned out real man-sized meals. Eating genuine beef and honest-to-goodness baked bread was a treat, and so was having the luxury of all that space in the sleeping quarters. Harry thrived on it.

And some of the other hands were interesting companions. True, they were renegades and mavericks, but they were each of them unique and individual, and Harry enjoyed listening to them fan the breeze during the long nights.

There was Big Phil, who was pushing sixty now. But you'd never know it, not unless you got him to talking about the old days when he'd been a boy in Detroit. His daddy had been one of the last of the Union Men, back in the days of what they used to call the Organized Labor Movement. He could tell you about wage-hour agreements and the Railroad Brotherhood and contract negotiations almost as if he knew of these things through personal experience. He even remembered the Democratic Party. Phil got out when the government took over and set up Vocational Apt and Industrial Supervision; that's when he drifted west.

Tom Lowery's family had been military; he claimed to have been a member of the last graduating class ever to leave West Point. When the armament race ended, his prospects of a career vanished, and he settled down as a guard at Canaveral. Finally, he'd headed for the open country.

Bassett was the scholar of the outfit. He could sit around and quote old-time book-authors by the hour—classic writers like Prather and Spillane. In another age he might have been a college professor or even a football coach; he had an aptitude for the arts.

And there was Lobo, the misogynist, who had fled a wife and eleven children back in Monterey; and Januzki, who used to be mixed up with one of those odd religious cults out on the Coast. He bragged he'd been one of the Big Daddy-Os in the Beat Generationists, and he argued with Bassett about some old-time evangelist named Kerouac.
Best of all, though, Harry liked talking to Nick Kendrick. Nick's hobby was music, and he treasured his second-hand stereophonic unit and collection of tapes. He too was a classicist in his way, and there was many a long winter night when Harry sat there listening to ancient folk songs. The quaint atonalities of progressive jazz and the childishly frantic rhythms of "cool sounds" were somehow soothing and reassuring in their reminder of a simple heritage from a simpler age.

But above all, these men were wranglers, and they took a peculiar pride in the traditions of their own calling. There wasn't a one of them who wouldn't spend hours mulling over the lore of the range and the prairie. They knew the Great Names from the Great Days—Eugene Autry, Wyatt Earp, the legendary Thomas Mix, Dale Robertson, Paladin, and all the others; men who rode actual horses in the era when the West was really an untamed frontier.

And like the cowboys they were, they maintained the customs of other days. Every few months they rode a bucking helicopter into some raw western town—Las Vegas, or Reno, or even over to Palm Springs—to drink recklessly in the cocktail lounges, gamble wildly at the slots, or "go down the line" with some telescreen model on location for outdoor ad-backgrounds. There were still half a dozen such sin-cities scattered throughout the west; even the government acknowledged the need of lonely men to blow off steam. And though Ag Culture officially disapproved of the whole cowhand system, and talked grimly of setting up new and more efficient methods for training personnel and handling the cattle ranges, nothing was ever done. Perhaps the authorities knew that it was a hopeless task; only the outcasts and iconoclasts had the temperament necessary to survive such loneliness under an open sky. City-dwelling conformists just could not endure the monotony.

But even Emil Grizek's hands marvelled at the way Harry lived. He never joined them in their disorderly descent upon the scarlet cities of the plain, and most of the time he didn't even seem to watch the telescreen. If anything, he deliberately avoided all possible contact with civilization.

Since he never volunteered any information about his own past, they privately concluded that he was just a psychopathic personality.

"Strong regressive and seclusive tendencies," Bassett explained, solemnly.

"Sure," Nick Kendrick nodded, wisely. "You mean a Mouldy Fig, like.'

"Creeping Meatball," muttered cultist Januzki. Not being religious fanatics, the others didn't understand the reference. But gradually they came to accept Harry's isolationist ways as the norm—at least, for him. And since he never quarreled, never exhibited any signs of dissatisfaction, he was left to his own pattern.

Thus it was all the more surprising when that pattern was rudely and abruptly shattered.

Harry remembered the occasion well. It was the day the Leff Law was officially upheld by the Supremist Courts. The whole business came over the telescreens and there was no way of avoiding it—you couldn't avoid it, because everybody was talking about it and everybody was watching.

"Now what do you think?" Emil Grizek demanded. "Any woman wants a baby, she's got to have those shots. They say kids shrink down into nothing. Weigh less than two pounds when they're born, and never grow up to be any bigger than midgets. You ask me, the whole thing's plumb loco, to say nothing of psychotic."

"I'dunno." This from Big Phil. "Reckon they just about have to do something, the way cities are filling up and all. Tell me every spot in the country, except for the plains states here, is busting at the seams. Same in Europe, Africa, South America. Running out of space, running out of food, all over the world. This man Leffingwell figures on cutting down on size so's to keep the whole shebang going."

"But why couldn't it be done on a voluntary basis?" Bassett demanded. "These arbitrary rulings are bound to result in frustrations. And can you imagine what will happen to the individual family constellations? Take a couple that already has two youngsters, as of now. Suppose the wife submits to the inoculations for her next child and it's born with a size-mutation. How in the world will that child survive as a midget in a family of giants? There'll be untold damage to the personality—""
"How do you know?" Bassett demanded. "Maybe it's all a lot of motivationalist propaganda."
"We have seen them on the telescreens, no?"
"They could be faking the whole thing."
"But Leffingwell, he has offered the shots to other governments beside our own. The whole world will adopt them—"
"What if some countries don't? What if our kids become midgets and the Asiatics refuse the inoculations?"
"They won't. They need room even more than we do."
"No sense arguing," Emil Grizek concluded. "It's the law. You know that. And if you don't like it, join the Naturalists." He chuckled. "But better hurry. Something tells me there won't be any Naturalists around after a couple of years. Now that there's a Leff Law, the government isn't likely to stand for too much criticism." He turned to Harry. "What do you think?" he asked.
Harry shrugged. "No comment," he said.
But the next day he went to Grizek and demanded his pay in full.
"Leaving?" Grizek muttered. "I don't understand. You've been with us almost five years. Where you going, what you intend to do? What's got into you all of a sudden?"
"Time for a change," Harry told him. "I've been saving my money."
"Don't I know it? Never touched a penny in all this time." Grizek ran a hand across his chin. "Say, if it's a raise you're looking for, I can—"
"No, thanks. It's not that. I've money enough."
"So you have. Around eighteen, twenty thousand, I reckon, what with the bonuses." Emil Grizek sighed. "Well, if you insist, that's the way it's got to be, I suppose. When you plan on taking off?"
"Just as soon as there's a 'copter available."
"Got one going up to Colorado Springs tomorrow morning for the mail. I can get you aboard, give you a check—"
"I'll want my money in cash."
"Well, now, that isn't so easy. Have to send up for a special draft. Take a week or so."
"I can wait."
"All right. And think it over. Maybe you'll decide to change your mind."
But Harry didn't change his mind. And ten days later he rode a 'copter into town, his money-belt strapped beneath his safety-belt.
From Colorado Springs he jetted to Kancity, and from Kancity to Memphisee. As long as he had money, nobody asked any questions. He holed up in cheap airtels and waited for developments.
It wasn't easy to accustom himself to urbanization again. He had been away from cities for over seven years now, and it might well have been seven centuries. The overpopulation problem was appalling. The outlawing of private automotive vehicles had helped, and the clearing of the airlanes served a purpose; the widespread increase in the use of atomic power cut the smog somewhat. But the synthetic food was frightful, the crowding intolerable, and the welter of rules and regulations attending the performance of even the simplest human activity past all his comprehension. Ration cards were in universal use for almost everything; fortunately for Harry, the black market accepted cash with no embarrassing inquiries. He found that he could survive.
But Harry's interest was not in survival; he was bent upon destruction. Surely the Naturalists would be organized and planning a way!
Back in '98, of course, they'd been merely an articulate minority without formal unity—an abstract, amorphous group akin to the "Liberals" of previous generations. A Naturalist could be a Catholic priest, a Unitarian layman, an atheist factory hand, a government employee, a housewife with strong prejudices against governmental controls, a wealthy man who deplored the dangers of growing industrialization, an Ag Culture worker who dreaded the dwindling of individual rights, an educator who feared widespread employment of social psychology, or almost anyone who opposed the concept of Mass Man, Mass-Motivated. Naturalists had never formed a single class, a single political party.
Surely, however, the enactment of the Leffingwell Law would have united them! Harry knew there was strong opposition, not only on the higher levels but amongst the general population. People would be afraid of the inoculations; theologians would condemn the process; economic interests, real-estate owners and transportation magnates and manufacturers would sense the threat here. They'd sponsor and they'd subsidize their spokesmen and the Naturalists would evolve into an efficient body of opposition.
So Harry hoped, and so he thought, until he came out into the cities; came out into the cities and realized that the very magnitude of Mass Man mitigated against any attempt to organize him, except as a creature who labored and consumed. Organization springs from discussion, and discussion from thought—but who can think in chaos,
discuss in delirium, organize in a vacuum? And the common citizen, Harry realized, had seemingly lost the capacity for group action. He remembered his own existence years ago—either he was lost in a crowd or he was alone, at home. Firm friendships were rare, and family units survived on the flimsiest of foundations. It took too much time and effort just to follow the rules, follow the traffic, follow the incessant routines governing even the simplest life-pattern in the teeming cities. For leisure there was the telescreen and the yellowjackets, and serious problems could be referred to the psych in routine check-ups. Everybody seemed lost in the crowd these days.

Harry discovered that Dr. Manschoff had indeed lied to him; mental disorders were on the increase. He remembered an old, old book—one of the very first treatises on sociological psychology. The Lonely Crowd, wasn't it? Full of mumbo-jumbo about "inner-directed" and "outer-directed" personalities. Well, there was a grain of truth in it all. The crowd, and its individual members, lived in loneliness. And since you didn't know very many people well enough to talk to, intimately, you talked to yourself. Since you couldn't get away from physical contact with others whenever you ventured abroad, you stayed inside—except when you had to go to work, had to line up for food-rations or supplies, had to wait for hours for your check-ups on off-days. And staying inside meant being confined to the equivalent of an old-fashioned prison cell. If you weren't married, you lived in "solitary"; if you were married, you suffered the presence of fellow-inmates whose habits became intolerable, in time. So you watched the screen more and more, or you increased your quota of sedation, and when that didn't help you looked for a real escape. It was always available to you if you searched long enough; waiting at the tip of a knife, in the coil of a rope, the muzzle of a gun. You could find it at the very bottom of a bottle of pills or at the very bottom of the courtyard outside your window. Harry recalled looking for it there himself, so many years ago.

But now he was looking for something else. He was looking for others who shared not only his viewpoint but his purposefulness.

Where were the Naturalists?
Harry searched for several years.

The press?
But there were no Naturalists visible on the telescreens. The news and the newsmakers reflected a national philosophy adopted many generations ago by the Founding Fathers of mass-communication in their infinite wisdom—"What's good for General Motors is good for the country." And according to them, everything happening was good for the country; that was the cardinal precept in the science of autobuyology. There were no Arnold Ritchies left any more, and the printed newzine seemed to have vanished.

The clergy?
Individual churches with congregations in physical attendance, seemed difficult to find. Telepreachers still appeared regularly every Sunday, but their scripts—like everyone else's—had been processed in advance. Denominationalism and sectarianism had waned, too; all of these performers seemed very much alike, in that they were vigorous, forthright, inspiring champions of the status quo.

The scientists?
But the scientists were a part of the government, and the government was a one-party system, and the system supported the nation and the nation supported the scientists. Of course, there were still private laboratories subsidized for industrial purposes, but the men who worked in them seemed singularly disinterested in social problems. In a way, Harry could understand their position. It isn't likely that a dedicated scientist, a man whose specialized research has won him a Nobel Prize for creating a new detergent, will be worldly enough to face unpleasant realities beyond the walls of his antiseptic sanctum. After all, there was precedent for such isolationism—did the sainted Betty Crocker ever enlist in any crusades? As for physicians, psychiatrists and mass-psychologists, they were the very ones who formed the hard core of Leffingwell's support.

The educators, then?
Vocational Apt was a part of the government. And the poor pedagogues, who had spent generations hacking their way out of the blackboard jungles, were only too happy to welcome the notion of a coming millennium when their small charges would be still smaller. Even though formal schooling, for most youngsters, terminated at fourteen, there was still the problem of overcrowding. Telescreening and teletesting techniques were a help, but the problem was essentially a physical one. And Leffingwell was providing a physical solution. Besides, the educators had been themselves educated, through Vocational Apt. And while they, and the government, fervently upheld the principle of freedom of speech, they had to draw the line somewhere. As everyone knows, freedom of speech does not mean freedom to criticize.

Business men?
Perhaps there were some disgruntled souls in the commercial community, whose secret heroes were the oil tycoons of a bygone era or the old-time Stock Exchange clan united under the totems of the bull or the bear. But the day of the rugged individualist was long departed; only the flabby individualist remained. And he had the forms to
fill out and the inspectors to contend with, and the rationing to worry about and the taxes to meet and the quotas to fulfill. But in the long run, he managed. The business man worked for the government, but the government also worked for him. His position was protected. And if the government said the Leff Shots would solve the overpopulation problem—without cutting down the number of consumers—well, was that really so bad? Why, in a generation or so there'd be even more customers! That meant increased property values, too.

It took Harry several years to realize he'd never find Naturalists organized for group action. The capacity for group action had vanished as the size of the group increased. All interests were interdependent; the old civic, fraternal, social and anti-social societies had no present purpose any more. And the once-familiar rallying-points—whether they represented idealistic humanitarianism or crass self-interest—had vanished in the crowd. Patriotism, racism, unionism, had all been lost in a moiling megalopolitanism.

There were protests, of course. The mothers objected, some of them. Ag Culture, in particular, ran into difficulties with women who revived the quaint custom of "going on strike" against the Leff Law and refused to take their shots. But it was all on the individual level, and quickly coped with. Government medical authorities met the women at checkup time and demonstrated that the Leff Law had teeth in it. Teeth, and scalpels. The rebellious women were not subdued, slain, or segregated—they were merely sterilized. Perhaps more would have come of this if their men had backed them up; but the men, by and large, were realists. Having a kid was a headache these days. This new business of injections wasn't so bad, when you came right down to it. There'd still be youngsters around, and you'd get the same allotment for extra living space—only the way it worked out, there'd be more room and the kids would eat less. Pretty good deal. And it wasn't as if the young ones were harmed. Some of them seemed to be a lot smarter than ordinary—like on some of the big quizzeshows, youngsters of eight and nine were winning all those big prizes. Bright little ones. Of course, these must be the ones raised in the first special school the government had set up. They said old Leffingwell, the guy who invented the shots, was running it himself. Sort of experimenting to see how this new crop of kids would make out....

It was when Harry learned about the school that he knew what he must do. And if nobody else would help him, he'd act on his own. There might not be any help from organized society, but he still had disorganized society to turn to.

He spent the next two years and the last of his money finding a way. The pattern of criminality had changed, too, and it was no easy matter to find the assistance he needed. About the only group crime still flourishing was hijacking; it took him a long while to locate a small under-cover outfit which operated around St. Louie and arrange to obtain a helicopter and pilot. Getting hold of the rifle was still more difficult, but he managed. And by the time everything was assembled, he'd found out what he needed to know about Dr. Leffingwell and his school.

As he'd suspected, the school was located in the old canyon, right in the same buildings which had once served as experimental units. How many youngsters were there, Harry didn't know. Maybe Manschoff was still on the staff, and maybe they'd brought in a whole new staff. These things didn't matter. What mattered was that Leffingwell was on the premises. And a man who knew his way about, a man who worked alone and to a single purpose, could reach him.

Thus it was that Harry Collins crouched behind the boulder that bright May morning and waited for Dr. Leffingwell to appear. The helicopter had dropped him at the upper end of the canyon the day before, giving him a chance to reconnoitre and familiarize himself with the terrain once again. He'd located Leffingwell's quarters, even seen the man through one of the lower windows. Harry had no trouble recognizing him; the face was only too familiar from a thousand 'casts viewed on a thousand screens. Inevitably, some time today, he'd emerge from the building. And when he did, Harry would be waiting.

He shifted behind the rocks and stretched his legs. Twelve years had passed, and now he'd come full circle. The whole business had started here, and here it must end. That was simple justice.

And it is justice, Harry told himself. It's not revenge. Because there'd be no point to revenge; that was only melodramatic nonsense. He was no Monte Cristo, come to wreak vengeance on his cruel oppressors. And he was no madman, no victim of a monomaniacal obsession. What he was doing was the result of lengthy and logical consideration.

If Harry Collins, longtime fugitive from a government treatment center, tried to take his story to the people, he'd be silenced without a hearing. But his story must be heard. There was only one way to arrest the attention of a nation—with the report of a rifle.

A bullet in Leffingwell's brain; that was the solution of the problem. Overnight the assassin would become a national figure. They'd undoubtedly try him and undoubtedly condemn him, but first he'd have his day in court. He'd get a chance to speak out. He'd give all the voiceless, unorganized victims of the Leff Law a reason for rebellion—and offer them an example. If Leffingwell had to die, it would be in a good cause. Moreover, he deserved to die. Hadn't he killed men, women, infants, without mercy?
But it’s not revenge, Harry repeated. And I know what I’m doing. Maybe I was disturbed before, but I’m sane now. Perfectly logical. Perfectly calm. Perfectly controlled.

Yes, and now his sane, logical, calm, controlled eyes noted that the distant door was opening, and he sighted through the ‘scope and brought his sane, logical, calm, controlled hand up along the barrel to the trigger. He could see the two men emerging, and the shorter, plumper of the two was Leffingwell. He squinted at the high forehead with its receding hairline; it was a perfect target. A little squeeze now and he knew what would happen. In his sane, logical, calm, controlled mind he could visualize the way the black hole would appear in the center of that forehead, while behind it would be the torn and dripping redness flecked with gray—

“What are you doing?”

Harry whirled, staring; staring down at the infant who stood smiling beside him. It was an infant, that was obvious enough, and implicit in the diminutive stature, the delicate limbs and the oversized head. But infants do not wear the clothing of pre-adolescent boys, they do not enunciate with clarity, they do not stare coolly and knowingly at their elders. They do not say, "Why do you want to harm Dr. Leffingwell?"

Harry gazed into the wide eyes. He couldn't speak.

"You're sick, aren't you?" the child persisted. "Let me call the doctor. He can help you."

Harry swung the rifle around. "I'll give you just ten seconds to clear out of here before I shoot."

The child shook his head. Then he took a step forward. "You wouldn't hurt me," he said, gravely. "You're just sick. That's why you talk this way."

Harry leveled the rifle. "I'm not sick," he muttered. "I know what I'm doing. And I know all about you, too. You're one of them, aren't you? One of the first of Leffingwell's brood of illegitimates."

The child took another step forward. "I'm not illegitimate," he said. "I know who I am. I've seen the records. My name is Harry Collins."

Somewhere the rifle exploded, the bullet hurtling harmlessly overhead. But Harry didn't hear it. All he could hear, exploding in his own brain as he went down into darkness, was the sane, logical, calm, controlled voice of his son.

7. Michael Cavendish—2027

Mike was just coming through the clump of trees when the boy began to wave at him. He shifted the clumsy old Jeffrey .475, cursing the weight as he quickened his pace. But there was no help for it, he had to carry the gun himself. None of the boys were big enough.

He wondered what it had been like in the old days, when you could get full-sized bearers. There used to be game all over the place, too, and a white hunter was king.

And what was there left now? Nothing but pygmies, all of them, scurrying around and beating the brush for dibatags and gerenuks. When he was still a boy, Mike had seen the last of the big antelopes go; the last of the wildebeest and zebra, too. Then the carnivores followed—the lions and the leopards. Simba was dead, and just as well. These natives would never dare to come out of the villages if they knew any lions were left. Most of them had gone to Cape and the other cities anyway; handling cattle was too much of a chore, except on a government farm. Those cows looked like moving mountains alongside the average boy.

Of course there were still some of the older generation left; Kikiyu and even a few Watusi. But the free inoculations had begun many years ago, and the life-cycle moved at an accelerated pace here. Natives grew old and died at thirty; they matured at fifteen. Now, with the shortage of game, the elders perished still more swiftly and only the young remained outside the cities and the farm projects.

Mike smiled as he waited for the boy to come up to him. He wasn't smiling at the boy—he was smiling at himself, for being here. He ought to be in Cape, too, or Kenyarobi. Damned silly, this business of being a white hunter, when there was nothing left to hunt.

But somehow he'd stayed on, since Dad died. There were a few compensations. At least here in the forests a man could still move about a bit, taste privacy and solitude and the strange, exotic tropical fruit called loneliness. Even that was vanishing today.

It was compensation enough, perhaps, for lugging this damned Jeffrey. Mike tried to remember the last time he'd fired it at a living target. A year, two years? Yes, almost two. That gorilla up in Ruwenzori country. At least the boys swore it was ingagi. He hadn't hit it, anyway. Got away in the darkness. Probably he'd been shooting at a shadow. There were no more gorillas—maybe they had been taking the shots, too. Perhaps they'd all turned into rhesus monkeys.

Mike watched the boy run towards him. It was a good five hundred yards from the river bank, and the short brown legs couldn't move very swiftly. He wondered what it felt like to be small. One's sense of proportion must be different. And that, in turn, would affect one's sense of values. What values applied to the world about you when you were only three feet high?
Mike wouldn't know. He was a big man—almost five feet seven.

Sometimes Mike reflected on what things might be like if he'd been born, say, twenty years later. By that time almost everyone would be a product of Leff shots, and he'd be no exception. He might stay with people his own age in Kenyarobi without feeling self-conscious, clumsy, conspicuous. Pressed, he had to admit that was part of the reason he preferred to remain out here at Dad's old place now. He could tolerate the stares of the natives, but whenever he ventured into a city he felt awkward under the scrutiny of the young people. The way those teen-agers looked up at him made him feel a monster, rather.

Better to endure the monotony, the emptiness out here. Yes, and wait for a chance to hunt. Even though, nine times out of ten, it turned out to be a wild goose-chase. During the past year or so Mike had hunted nothing but legends and rumors, spent his time stalking shadows.

Then the villagers had come to him, three days ago, with their wild story. Even when he heard it, he realized it must be pure fable. And the more they insisted, the more they protested, the more he realized it simply couldn't be.

Still, he'd come. Anything to experience some action, anything to create the illusion of purpose, of—

"Tembo!" shrieked the boy, excited beyond all pretense of caution. "Up ahead, in river. You come quick, you see!"

No. It couldn't be. The government surveys were thorough. The last record of a specimen dated back over a half-dozen years ago. It was impossible that any survivors remained. And all during the safari these past days, not a sign or a print or a spoor.

"Tembo!" shrielled the boy. "Come quick!"

Mike cradled the gun and started forward. The other bearers shuffled behind him, unable to keep pace because of their short legs and—he suspected—unwilling to do so for fear of what might lie ahead.

Halfway towards the river bank, Mike halted. Now he could hear the rumbling, the unmistakable rumbling. And now he could smell the rank mustiness borne on the hot breeze. Well, at least he was down-wind.

The boy behind him trembled, eyes wide. He had seen something, all right. Maybe just a crocodile, though. Still some crocs around. And he doubted if a young native would know the difference.

Nevertheless, Mike felt a sudden surge of unfamiliar excitement, half expectancy and half fear. Something wallowed in the river; something that rumbled and exuded the stench of life.

Now they were approaching the trees bordering the bank. Mike checked his gun carefully. Then he advanced until his body was aligned with the trees. From here he could see and not be seen. He could peer down at the river—or the place where the river had been, during the rainy season long past. Now it was nothing but a mudwallow under the glaring sun; a huge mudwallow, pitted with deep, circular indentations and dotted with dung.

But in the middle of it stood tembo.

Tembo was a mountain, tembo was a black block of breathing basalt. Tembo roared and snorted and rolled red eyes.

Mike gasped.

He was a white hunter, but he'd never seen a bull elephant before. And this one stood eleven feet at the shoulders if it stood an inch; the biggest creature walking the face of the earth.

It had risen from the mud, abandoned its wallowing as its trunk curled about, sensitive to the unfamiliar scent of man. Its ears rose like the outspread wings of some gigantic jungle bat. Mike could see the flies buzzing around the ragged edges. He stared at the great tusks that were veined and yellowed and broken—once men had hunted elephants for ivory, he remembered.

But how could they? Even with guns, how had they dared to confront a moving mountain? Mike tried to swallow, but his throat was dry. The stock slipped through his clammy hands.

"Shoot!" implored the boy beside him. "You shoot, now!"

Mike gazed down. The elephant was aware of him. It turned deliberately, staring up the bank as it swayed on the four black pillars of its legs. Mike could see its eyes, set in a mass of grayish wrinkles. The eyes had recognized him.

They knew, he realized. The eyes knew all about him; who he was and what he was and what he had come here to do. The eyes had seen man before—perhaps long before Mike was born. They understood everything; the gun and the presence and the purpose.

"Shoot!" the boy cried, not bothering to hold his voice down any longer. For the elephant was moving slowly towards the side of the wallow, moving deliberately to firmer footing, and the boy was afraid. Mike was afraid, too, but he couldn't shoot.

"No," he murmured. "Let him go. I can't kill him."

"You must," the boy said. "You promise. Look—all the meat. Meat for two, three villages."

Mike shook his head. "I can't do it," he said. "That isn't meat. That's life. Bigger life than we are. Don't you
understand? Oh, the bloody hell with it! Come on."

The boy wasn't listening to him. He was watching the elephant. And now he started to tremble.

For the elephant was moving up onto solid ground. It moved slowly, daintily, almost mincing as its legs sampled the surface of the shore. Then it looked up and this time there was no doubt as to the direction of its gaze—it stared intently at Mike and the boy on the bank. Its ears fanned, then flared. Suddenly the elephant raised its trunk and trumpeted fiercely.

And then, lowering the black battering-ram of its head, the beast came forward. A deceptively slow lope, a scarcely accelerated trot, and then all at once it was moving swiftly, swiftly and surely and inexorably towards them. The angle of the bank was not steep and the elephant's speed never slackened on the slope. Its right shoulder struck a sapling and the sapling splintered. It was crashing forward in full charge. Again it trumpeted, trunk extended like a flail of doom.

"Shoot!" screamed the boy.

Mike didn't want to shoot. He wanted to run. He wanted to flee the mountain, flee the incredible breathing bulk of this grotesque giant. But he was a white hunter, he was a man, and a man is not a beast; a man does not run away from life in any shape or size.

The trunk came up. Mike raised the gun. He heard the monster roar, far away, and then he heard another sound that must be the gun's discharge, and something hit him in the shoulder and knocked him down. Recoil? Yes, because the elephant wasn't there any more; he could hear the crashing and thrashing down below, over the rim of the river bank.

Mike stood up. He saw the boy running now, running back to the bearers huddled along the edge of the trail.

He rubbed his shoulder, picked up his gun, reloaded. The sounds from below had ceased. Slowly, Mike advanced to the lip of the bank and stared down.

The bull elephant had fallen and rolled into the wallow once more. It had taken a direct hit, just beneath the right ear, and even as Mike watched, its trunk writhed feebly like a dying serpent, then fell forward into the mud. The gigantic ears twitched, then flickered and flopped, and the huge body rolled and settled.

Suddenly Mike began to cry.

Damn it, he hadn't wanted to shoot. If the elephant hadn't charged like that—

But the elephant had to charge. Just as he had to shoot. That was the whole secret. The secret of life. And the secret of death, too.

Mike turned away, facing the east. Kenyarobi was east, and he'd be going there now. Nothing to hold him here in the forests any longer. He wouldn't even wait for the big feast. To hell with elephant-meat, anyway. His hunting days were over.

Mike walked slowly up the trail to the waiting boys.

And behind him, in the wallow, the flies settled down on the lifeless carcass of the last elephant in the world.

8. Harry Collins—2029

The guards at Stark Falls were under strict orders not to talk. Each prisoner here was exercised alone in a courtyard runway, and meals were served in the cells. The cells were comfortable enough, and while there were no telescreens, books were available—genuine, old-style books which must have been preserved from libraries dismantled fifty years ago or more. Harry Collins found no titles dated later than 1975. Every day or so an attendant wheeled around a cart piled high with the dusty volumes. Harry read to pass the time.

At first he kept anticipating his trial, but after a while he almost forgot about that possibility. And it was well over a year before he got a chance to tell his story to anyone.

When his opportunity came, his audience did not consist of judge or jury, doctor, lawyer or penologist. He spoke only to Richard Wade, a fellow-prisoner who had been thrust into the adjoining cell on the evening of October 11th, 2013.

Harry spoke haltingly at first, but as he progressed the words came more easily, and emotion lent its own eloquence. His unseen auditor on the other side of the wall did not interrupt or question him; it was enough, for Harry, that there was someone to listen at last.

"So it wasn't a bit like I'd expected," he concluded. "No trial, no publicity. I've never seen Leffingwell again, nor Manschoff. Nobody questioned me. By the time I recovered consciousness, I was here in prison. Buried alive."

Richard Wade spoke slowly, for the first time. "You're lucky. They might have shot you down on the spot."

"That's just what bothers me," Harry told him. "Why didn't they kill me? Why lock me up incommunicado this way? There aren't many prisons left these days, with food and space at such a premium."

"There are no prisons left at all—officially," Wade said. "Just as there are no longer any cemeteries. But important people are still given private burials and their remains secretly preserved. All a matter of influence."

"I've no influence. I'm not important. Wouldn't you think they'd consider it risky to keep me alive, under the
circumstances? If there’d ever be an investigation—"

"Who would investigate? Not the government, surely."

"But suppose there’s a political turnover. Suppose Congress want to make capital of the situation?"

"There is no Congress."

Harry gasped. "No Congress?"

"As of last month. It was dissolved. Henceforth we are governed by the Cabinet, with authority delegated to department heads."

"But that’s preposterous! Nobody’d stand still for something like that!"

"They did stand still, most of them. After a year of careful preparation—of wholesale exposes of Congressional graft and corruption and inefficiency. Turned out that Congress was the villain all along; the Senators and Representatives had finagled tariff-barriers and restrictive trade-agreements which kept our food supply down. They were opposing international federation. In plain language, people were sold a bill of goods—get rid of Congress and you’ll have more food. That did it."

"But you’d think the politicians themselves would realize they were cutting their own throats! The state legislatures and the governors—"

"Legislatures were dissolved by the same agreement," Wade went on. "There are no states any more; just governmental districts. Based upon sensible considerations of area and population. This isn’t the old-time expanding economy based on obsolescence and conspicuous consumption. The primary problem at the moment is sheer survival. In a way, the move makes sense. Old-fashioned political machinery couldn’t cope with the situation; there’s no time for debate when instantaneous decisions are necessary to national welfare. You’ve heard how civil liberties were suspended during the old wars. Well, there’s a war on right now; a war against hunger, a war against the forces of fecundity. In another dozen years or so, when the Leff shot generation is fullgrown and a lot of the elderly have died off, the tensions will ease. Meanwhile, quick action is necessary. Arbitrary action."

"But you’re defending dictatorship!"

Richard Wade made a sound which is usually accompanied by a derisive shrug. "Am I? Well, I didn’t when I was outside. And that’s why I’m here now."

Harry Collins cleared his throat. "What did you do?"

"If you refer to my profession, I was a scripter. If you refer to my alleged criminal activity, I made the error of thinking the way you do, and the worse error of attempting to inject such attitudes in my scripts. Seems that when Congress was formally dissolved, there was some notion of preparing a timely show—a sort of historical review of the body, using old film clips. What my superiors had in mind was a comedy of errors; a cavalcade of mistakes and misdeeds showing just why we were better off without supporting a political sideshow. Well, I carried out the assignment and edited the films, but when I drafted a rough commentary, I made the mistake of taking both a pro and con slant. Nothing like that ever reached the telescreens, of course, but what I did was promptly noted. They came for me at once and hustled me off here. I didn’t get a hearing or a trial, either."

"But why didn’t they execute you? Or—"" Harry hesitated—"is that what you expect?"

"Why didn’t they execute you?" Wade shot back. He was silent for a moment before continuing. "No, I don’t expect anything like that, now. They’d have done it on the spot if they intended to do so at all. No, I’ve got another idea about people like you and myself. And about some of the Congressmen and Senators who dropped out of sight, too. I think we’re being stockpiled."

"Stockpiled?"

"It’s all part of a plan. Give me a little time to think. We can talk again, later."

"Looks as if there’ll be ample opportunity in the future."

And there was. In the months ahead, Harry spoke frequently with his friend behind the wall. He never saw him—prisoners at Stark Falls were exercised separately, and there was no group assembly or recreation. Surprisingly adequate meals were served in surprisingly comfortable cells. In the matter of necessities, Harry had no complaints. And now that he had someone to talk to, the time seemed to go more swiftly.

He learned a great deal about Richard Wade during the next few years. Mostly, Wade liked to reminisce about the old days. He talked about working for the networks—the commercial networks, privately owned, which flourished before the government took over communications media in the ’80s.

"That’s where you got your start, eh?" Harry asked.

"Lord, no, boy! I’m a lot more ancient than you think. Why, I’m pushing sixty-five. Born in 1940. That’s right, during World War II. I can almost remember the atomic bomb, and I sure as hell remember the sputniks. It was a crazy period, let me tell you. The pessimists worried about the Russians blowing us up, and the optimists were sure we had a glorious future in the conquest of space. Ever hear that old fable about the blind men examining an elephant? Well, that’s the way most people were; each of them groping around and trying to determine the exact
shape of things to come. A few of us even made a little money from it for a while, writing science fiction. That's how I got my start."

"You were a writer?"

"Sold my first story when I was eighteen or so. Kept on writing off and on for almost twenty years. Of course, Robertson's thermo-nuc formula came along in '75, and after that everything went to pot. It knocked out the chances of future war, but it also knocked out the interest in speculation or escape-fiction. So I moved over into television for a while, and stayed with it. But the old science fiction was fun while it lasted. Ever read any of it?"

"No," Harry admitted. "That was all before my time. Tell me, though—did any of it make sense? I mean, did some of those writers foresee what was really going to happen?"

"There were plenty of penny prophets and nickel Nostradamuses," Wade told him. "But as I said, most of them were assuming war with the Communists or a new era of space travel. Since Communism collapsed and space flight was just an expensive journey to a dead end and dead worlds, it follows that the majority of fictional futures were founded on fallacies. And all the rest of the extrapolations dealt with superficial social manifestations.

"For example, they wrote about civilizations dominated by advertising and mass-motivation techniques. It's true that during my childhood this seemed to be a logical trend—but once demand exceeded supply, the whole mechanism of stimulating demand, which was advertising's chief function, bogged down. And mass-motivation techniques, today, are dedicated almost entirely to maintaining minimum resistance to a system insuring our survival.

"Another popular idea was based on the notion of an expanding matriarchy—a gerontomatriarchy, rather, in which older women would take control. In an age when women outlived men by a number of years, this seemed possible. Now, of course, shortened working hours and medical advances have equalized the life-span. And since private property has become less and less of a factor in dominating our collective destinies, it hardly matters whether the male or the female has the upper hand.

"Then there was the common theory that technological advances would result in a push-button society, where automatons would do all the work. And so they might—if we had an unlimited supply of raw materials to produce robots, and unlimited power-sources to activate them. As we now realize, atomic power cannot be utilized on a minute scale.

"Last, but not least, there was the concept of a medically-orientated system, with particular emphasis on psychotherapy, neurosurgery, and parapsychology. The world was going to be run by telepaths, psychosis eliminated by brainwashing, intellect developed by hypnotic suggestion. It sounded great—but the conquest of physical disease has occupied the medical profession almost exclusively.

"No, what they all seemed to overlook, with only a few exceptions, was the population problem. You can't run a world through advertising when there are so many people that there aren't enough goods to go around anyway. You can't turn it over to big business when big government has virtually absorbed all of the commercial and industrial functions, just to cope with an ever-growing demand. A matriarchy loses its meaning when the individual family unit changes character, under the stress of an increasing population-pressure which eliminates the old-fashioned home, family circle, and social pattern. And the more we must conserve dwindling natural resources for people, the less we can expend on experimentation with robots and machinery. As for the psychologist-dominated society, there are just too many patients and not enough physicians. I don't have to remind you that the military caste lost its chance of control when war disappeared, and that religion is losing ground every day. Class-lines are vanishing, and racial distinctions will be going next. The old idea of a World Federation is becoming more and more practical. Once the political barriers are down, miscegenation will finish the job. But nobody seemed to foresee this particular future. They all made the mistake of worrying about the hydrogen-bomb instead of the sperm-bomb."

Harry nodded thoughtfully, although Wade couldn't see his response. "But isn't it true that there's a little bit of each of these concepts in our actual situation today?" he asked. "I mean, government and business are virtually one and the same, and they do use propaganda techniques to control all media. As for scientific research, look at how we've rebuilt our cities and developed synthetics for food and fuel and clothing and shelter. When it comes to medicine, there's Leffingwell and his inoculations. Isn't that all along the lines of your early science fiction?"

"Where's your Underground?" Richard Wade demanded.

"My what?"

"Your Underground," Wade repeated. "Hell, every science fiction yarn about a future society had its Underground! That was the whole gimmick in the plot. The hero was a conformist who tangled with the social order—come to think of it, that's what you did, years ago. Only instead of becoming an impotent victim of the system, he'd meet up with the Underground Movement. Not some sourball like your friend Ritchie, who tried to operate on his own hook, without real plans or system, but a complete sub rosa organization, bent on starting a revolution and taking over. There'd be wise old priests and wise old crooks and wise old officers and wise old officials, all playing a
double game and planning a coup. Spies all over the place, get me? And in no time at all, our hero would be playing tag with the top figures in the government. That's how it worked out in all the stories.

"But what happens in real life? What happened to you, for example? You fell for a series of stupid tricks, stupidly perpetrated—because the people in power are people, and not the kind of synthetic super-intellects dreamed up by frustrated fiction-fabricators. You found out that the logical candidates to constitute an Underground were the Naturalists; again, they were just ordinary individuals with no genius for organization. As for coming in contact with key figures, you were actually on hand when Leffingwell completed his experiments. And you came back, years later, to hunt him down. Very much in the heroic tradition, I admit. But you never saw the man except through the telescopic sights of your rifle. That was the end of it. No modern-day Machiavelli has hauled you in to play cat-andmouse games with you, and no futuristic Freud has bothered to wash your brain or soft-soap your subconscious. You just aren't that important, Collins."

"But they put me in a special prison. Why?"
"Who knows? They put me here, too."
"You said something once, about stockpiling us. What did you mean?"
"Well, it was just an old science fiction idea, I suppose. I'll tell you about it tomorrow, eh?"
And so the matter—and Harry Collins—rested for the night.

The next day Richard Wade was gone.

Harry called to him and there was no answer. And he cried out and he cursed and he paced his cell and he walked alone in the courtyard and he begged the impassive guards for information, and he sweated and he talked to himself and he counted the days and he lost count of the days.

Then, all at once, there was another prisoner in the adjacent cell, and his name was William Chang, and he was a biologist. He was reticent about the crime he had committed, but quite voluble about the crimes committed by others in the world outside. Much of what he said, about genes and chromosomes and recessive characteristics and mutation, seemed incomprehensible to Harry. But in their talks, one thing emerged clearly enough—Chang was concerned for the future of the race. "Leffingwell should have waited," he said. "It's the second generation that will be important. As I tried to tell my people—"

"Is that why you're here?"
Chang sighed. "I suppose so. They wouldn't listen, of course. Overpopulation has always been the curse of Asia, and this seemed to be such an obvious solution. But who knows? The time may come when they need men like myself."

"So you were stockpiled too."
"What's that?"
Harry told him about Richard Wade's remarks, and together they tried to puzzle out the theory behind them.

But not for long. Because once again Harry Collins awoke in the morning to find the adjoining cell empty, and once again he was alone for a long time.

At last a new neighbor came. His name was Lars Neilstrom. Neilstrom talked to him of ships and shoes and sealing-wax and the thousand and one things men will discuss in their loneliness and frustration, including—inevitably—their reasons for being here.

Neilstrom had been an instructor under Vocational Apt, and he was at a loss to explain his presence at Stark Falls. When Harry spoke of the stockpiling theory, his fellow-prisoner demurred. "It's more like Kafka than science fiction," he said. "But then, I don't suppose you've ever read any Kafka."

"Yes, I have," Harry told him. "Since I came here I've done nothing but read old books. Lately they've been giving me microscans. I've been studying up on biology and genetics; talking to Chang got me interested. In fact, I'm really going in for self-education. There's nothing else to do."

"Self-education! That's the only method left nowadays." Neilstrom sounded bitter. "I don't know what's going to become of our heritage of knowledge in the future. I'm not speaking of technological skill; so-called scientific information is carefully preserved. But the humanities are virtually lost. The concept of the well-rounded individual is forgotten. And when I think of the crisis to come—"

"What crisis?"

"A new generation is growing up. Ten or fifteen years from now we'll have succeeded in erasing political and racial and religious divisions. But there'll be a new and more dangerous differentiation; a physical one. What do you think will happen when half the world is around six feet tall and the other half under three?"

"I can't imagine."

"Well, I can. The trouble is, most people don't realize what the problem will be. Things have moved too swiftly. Why, there were more changes in the last hundred years than in the previous thousand! And the rate of acceleration increases. Up until now, we've been concerned about too rapid technological development. But what we have to
worry about is social development."

"Most people have been conditioned to conform."

"Yes. That's our job in Vocational Apt. But the system only works when there's a single standard of conformity. In a few years there'll be a double one, based on size. What then?"

Harry wanted some time to consider the matter, but the question was never answered. Because Lars Neilstrom went away in the night, as had his predecessors before him. And in succeeding interludes, Harry came to know a half-dozen other transient occupants of the cell next to his. They came from all over, and they had many things to discuss, but always there was the problem of why they were there—and the memory of Richard Wade's premise concerning stockpiling.

There came a time when the memory of Richard Wade merged with the memory of Arnold Ritchie. The past was a dim montage of life at the agency and the treatment center and the ranch, a recollection of lying on the river bank with women in attitudes of opisthotonos or of lying against the boulders with a rifle.

Somewhere there was an image of a child's wide eyes and a voice saying, "My name is Harry Collins." But that seemed very far away. What was real was the cell and the years of talking and reading the microscans and trying to find a pattern.

Harry found himself describing it all to a newcomer who said his name was Austin—a soft-voiced man who became a resident of the next cell one day in 2029. And eventually he came to Wade's theory.

"Maybe there were a few wiser heads who foresaw a coming crisis," he concluded. "Maybe they anticipated a time when they might need a few nonconformists. People like ourselves who haven't been passive or persuaded. Maybe we're the government's insurance policy. If an emergency arises, we'll be freed."

"And then what would you do?" Austin asked, softly. "You're against the system, aren't you?"

"Yes. But I'm for survival." Harry Collins spoke slowly, thoughtfully. "You see, I've learned something through the years of study and contact here. Rebellion is not the answer."

"You hated Leffingwell."

"Yes, I did, until I realized that all this was inevitable. Leffingwell is not a villain and neither is any given individual, in or out of government. Our road to hell has been paved with only the very best of intentions. Killing the engineers and contractors will not get us off that road, and we're all on it together. We'll have to find a way of changing the direction of our journey. The young people will be too anxious to merely rush blindly ahead. Most of my generation will be sheeplike, moving as part of the herd, because of their conditioning. Only we old-time rebels will be capable of plotting a course. A course for all of us."

"What about your son?" Austin asked.

"I'm thinking of him," Harry Collins answered. "Of him, and of all the others. Maybe he does not need me. Maybe none of them need me. Maybe it's all an illusion. But if the time ever comes, I'll be ready. And meanwhile, I can hope."

"The time has come," Austin said, gently.

And then he was standing, miraculously enough, outside his cell and before the door to Harry's cell, and the door was opening. And once again Harry stared into the wide eyes he remembered so well—the same wide eyes, set in the face of a fullgrown man. A fullgrown man, three feet tall. He stood up, shakily, as the man held out his hand and said, "Hello, Father."

"But I don't understand—"

"I've waited a long time for this moment. I had to talk to you, find out how you really felt, so that I'd be sure. Now you're ready to join us."

"What's happening? What do you want with me?"

"We'll talk later." Harry's son smiled. "Right now, I'm taking you home."

9. Eric Donovan—2031

Eric was glad to get to the office and shut the door. Lately he'd had this feeling whenever he went out, this feeling that people were staring at him. It wasn't just his imagination: they did stare. Every younger person over a yard high got stared at nowadays, as if they were freaks. And it wasn't just the staring that got him down, either.

Sometimes they muttered and mumbled, and sometimes they called names. Eric didn't mind stuff like "dirty Naturalist." That he could understand—once upon a time, way back, everybody who was against the Leff Law was called a Naturalist. And before that it had still another meaning, or so he'd been told. Today, of course, it just meant anyone who was over five feet tall.

No, he could take the ordinary name-calling, all right. But sometimes they said other things. They used words nobody ever uses unless they really hate you, want to kill you. And that was at the bottom of it, Eric knew. They did hate him, they did want to kill him.

Was he a coward? Perhaps. But it wasn't just Eric's imagination. You never saw anything about such things on
the telescreens, but Naturalists were being killed every day. The older people were still in the majority, but the
youngsters were coming up fast. And there were so many more of them. Besides, they were more active, and this
created the illusion that there were Yardsticks everywhere.

Eric sat down behind his desk, grinning. Yardsticks. When he was a kid it had been just the other way around.
And the rest of them who didn't get shots in those early days considered themselves to be the normal ones. And
they did the name-calling. Names like "runt" and "half-pint" and "midgie." But the most common name was the one
that stuck—Yardstick. That used to be the worst insult of all.

But now it wasn't an insult any more. Being taller was the insult. Being a dirty Naturalist or a son-of-a-
Naturalist. Times certainly had changed.

Eric glanced at the communicator. Almost noon, and it had not flicked yet. Here he'd been beaming these big
offers, you'd think he'd get some response to an expensive beaming program, but no. Maybe that was the trouble—
nobody liked big things any more. Everything was small.

He shifted uneasily in his chair. That was one consolation, at least; he still had old-time furniture. Getting to be
harder and harder to find stuff that fitted him these days. Seemed like most of the firms making furniture and
bedding and household appliances were turning out the small stuff for the younger generation. Cheaper to make, less
material, and more demand for it. Government allocated size priorities to the manufacturers.

It was even murder to ride public transportation because of the space-reductions. Eric drove his own jetter.
Besides, that way was safer. Crowded into a liner with a gang of Yardsticks, with only a few other Naturalists
around, there might be trouble.

Oh, it was getting to be a Yardstick world, and no mistake. Smaller furniture, smaller meals, smaller sizes in
clothing, smaller buildings—

That reminded Eric of something and he frowned again. Dammit, why didn't the communicator flick? He
should be getting some kind of inquiries. Hell, he was practically giving the space away!

But there was only silence, as there had been all during this past week. That's why he let Lorette go. Sweet girl,
but there was no work for her here any more. No work, and no pay, either. Besides, the place spooked her. She'd
been the one who suggested leaving, really.

"Eric, I'm sorry, but I just can't take this any more. All alone in this huge building—it's curling my toes!"

At first he tried to talk her out of it. "Don't be silly, luscious! There's Bernstein, down on ten, and Saltonstall
above us, and Wallaby and Son on fourteen, I tell you, this place is coming back to life, I can feel it! I'll beam for
tenants next week, you'll see—"

Actually he'd been talking against his own fear and Lorette must have known it. Anyway, she left. And now he
was here alone.

Alone.

Eric didn't like the sound of that word. Or the absence of sound behind it. Three other tenants in a ninety-story
building. Three other tenants in a place that had once held three thousand. Why, fifty years ago, when this place
went up, you couldn't buy a vacancy. Where had the crowds gone to?

He knew the answer, of course. The Leff shots had created the new generation of Yardsticks, and they lived in
their own world. Their shrunked, dehydrated world of doll-houses and miniatures. They'd deserted the old-fashioned
skyscrapers and cut the big apartment buildings up into tiny cubicles; two could occupy the space formerly reserved
for one.

That had been the purpose of the Leff shots in the first place—to put an end to overcrowding and conserve on
resources. Well, it had worked out. Worked out too perfectly for people like Eric Donovan. Eric Donovan, rental
agent for a building nobody wanted any more; a ninety-storey mausoleum. And nobody could collect rent from
ghosts.

Ghosts.

Eric damned near jumped through the ceiling when the door opened and this man walked in. He was tall and
towheaded. Eric stared; there was something vaguely familiar about his face. Something about those ears, that was
it, those ears. No, it couldn't be, it wasn't possible—

Eric stood up and held out his hand. "I'm Donovan," he said.

The towheaded man smiled and nodded. "Yes, I know. Don't you remember me?"

"I thought I knew you from someplace. You wouldn't be—Sam Wolzek?"

The towheaded man's smile became a broad grin. "That's not what you were going to say, Eric. You were going
to say 'Handle-head,' weren't you? Well, go on, say it. I don't mind. I've been called a lot worse things since we were
kids together."

"I can't believe it," Eric murmured. "It's really you! Old Handle-head Wolzek! And after all these years, turning
up to rent an office from me. Well, what do you know!"
"I didn't come here to rent an office."
"Oh? Then—"
"It was your name that brought me. I recognized it on the beamings."
"Then this is a social call, eh? Well, that's good. I don't get much company these days. Sit down, have a reef."
Wolzek sat down but refused the smoke. "I know quite a bit about your setup," he said. "You and your three tenants. It's tough, Eric."
"Oh, things could be worse." Eric forced a laugh. "It isn't as if my bucks depended on the number of tenants in the building. Government subsidizes this place. I'm sure of a job as long as I live."
"As long as you live." Wolzek stared at him in a way he didn't like. "And just how long do you figure that to be?"
"I'm only twenty-six," Eric answered. "According to statistics, that gives me maybe another sixty years."
"Statistics!" Wolzek said it like a dirty word. "Your life-expectancy isn't determined by statistics any more. I say you don't have sixty months left. Perhaps not even sixty days."
"What are you trying to hand me?"
"The truth. And don't go looking for a silver platter underneath it, either."
"But I mind my own business. I don't hurt anybody. Why should I be in any danger?"
"Why does a government subsidy support one rental manager to sit here in this building every day—but ten guards to patrol it every night?"
Eric opened his mouth wide before shaping it for speech. "Who told you that?"
"Like I said, I know the setup." Wolzek crossed his legs, but he didn't lean back. "And in case you haven't guessed it, this is a business call, not a social one."
Eric sighed. "Might have figured," he said. "You're a Naturalist, aren't you?"
"Of course I am. We all are."
"Not I."
"Oh yes—whether you like it or not, you're a Naturalist, too. As far as the Yardsticks are concerned, everyone over three feet high is a Naturalist. An enemy. Someone to be hated, and destroyed."
"Think I'd believe that? Sure, I know they don't like us, and why should they? We eat twice as much, take up twice the space, and I guess when we were kids we gave a lot of them a hard time. Besides, outside of a few exceptions like ourselves, all the younger generation are Yardsticks, with more coming every year. The older people hold the key positions and the power. Of course there's a lot of friction and resentment. But you know all that."
"Certainly." Wolzek nodded. "All that and more. Much more. I know that up until a few years ago, no Yardstick held any public office or government position. Now they're starting to move in, particularly in Europasia. But there's so many of them now—adults, in their early twenties—that the pressure is building up. They're impatient, getting out of hand. They won't wait until the old folks die off. They want control now. And if they ever manage to get it, we're finished for good."
"Impossible!" Eric said.
"Impossible?" Wolzek's voice was a mocking echo. "You sit here in this tomb and when somebody tells you that the world you know has died, you refuse to believe it. Even though every night, after you sneak home and huddle up inside your room trying not to be noticed, ten guards patrol this place with subatomics, so the Yardstick gangs won't break in and take over. So they won't do what they did down south—overrun the office buildings and the factories and break them up, cut them down to size for living quarters."
"But they were stopped," Eric objected. "I saw it on the telescreen, the security forces stopped them—"
"Crapola!" Wolzek pronounced the archaicism with studied care. "You saw films. Faked films. Have you ever traveled, Eric? Ever been down south and seen conditions there?"
"Nobody travels nowadays. I know that. Priorities."
"I travel, Eric. And I know. Security forces don't suppress anything in the south these days. Because they're made up of Yardsticks now; that's right, Yardsticks exclusively. And in a few years that's the way it will be up here. Did you ever hear about the Chicagee riots?"
"You mean last year, when the Yardsticks tried to take over the synthetic plants at the Stockyards?"
"Tried? They succeeded. The workers ousted management. Over fifty thousand were killed in the revolution—oh, don't look so shocked, that's the right word for it!—but the Yardsticks won out in the end."
"But the telescreen showed—"
"Damn the telescreen! I know because I happened to be there when it happened. And if you had been there, you and a few million other ostriches who sit with your heads buried in telescreens, maybe we could have stopped them."
"I don't believe it. I can't!"
"All right. Think back. That was last year. And since the first of this year, what's happened to the standard size meat-ration?"

"They cut it in half," Eric admitted. "But that's because of Ag shortages, according to the telescreen reports—" He stood up, gulping. "Look here, I'm not going to listen to any more of this kind of talk. By rights, I ought to turn your name in."

"Go ahead." Wolzek waved his hand. "It's happened before. I was reported when I blasted the Yardsticks who shot my father down when he tried to land his jet in a southern field. I was reported when they killed Annette."

"Annette?"

"You remember that name, don't you, Eric? Your first girl, wasn't she? Well, I'm the guy who married her. Yes, and I'm the guy who talked her into having a baby without the benefit of Leff shots. Sure, it's illegal, and only a few of us ever try it any more, but we both agreed that we wanted it that way. A real, life-sized, normal baby. Or abnormal, according to the Yardsticks and the stupid government.

"It was a dirty scum of a government doctor who let her die on the table when he discovered the child weighed seven pounds. That's when I really woke up, Eric. That's when I knew there was going to be only one decision to make in the future—kill or be killed."

"Annette. She died, you say?"

Wolzek moved over and put his hand on Eric's shoulder. "You never married, did you, Eric? I think I know why. It's because you felt the way I did about it. You wanted a regular kid, not a Yardstick. Only you didn't quite have the guts to try and beat the law. Well, you'll need guts now, because it's getting to the point where the law can't protect you any more. The government is made up of old men, and they're afraid to take action. In a few years they'll be pushed out of office all over the world. We'll have Yardstick government then, all the way, and Yardstick law. And that means they'll cut us down to size."

"But what can you—we—do about it?"

"Plenty. There's still a little time. If we Naturalists can only get together, stop being just a name and become an organized force, maybe the ending will be different. We've got to try, in any case."

"The Yardsticks are human beings, just like us," Eric said, slowly. "We can't just declare war on them, wipe them out. It's not their fault they were born that way."

Wolzek nodded. "I know. Nothing is anybody's fault, really. This whole business began in good faith. Leffingwell and some of the other geniuses saw a problem and offered what they sincerely believed was a solution."

"But it didn't work," Eric murmured.

"Wrong. It worked only too well. That's the trouble. Sure, we eliminated our difficulties on the physical level. In less than thirty years we've reached a point where there's no longer any danger of overcrowding or starvation. But the psychological factor is something we can't cope with. We thought we'd ended war and the possibilities of war a long time ago. But it isn't foreign enemies we must fear today. We've created a nation divided into Davids and Goliaths—and David and Goliath are always enemies."

"David killed Goliath," Eric said. "Does that mean we're going to die?"

"Only if we're as stupid as Goliath was. Only if we wear our telescreens like invincible armor and pay no attention to the slingshot in David's hands."

Eric lit a reef. "All right," he said. "You don't have to lecture. I'm willing to join. But I'm no Goliath, really. I never had a fight in my life. What could I do to help?"

"You're a rental agent. You have the keys to this building. The guards don't bother you by day, do they? You come and go as you please. That means you can get into the cellars. You can help us move the stuff down there. And we'll take care of the guards some night, after that."

"I don't understand."

The friendly pressure on Eric's shoulder became a fierce grip. "You don't have to understand. All you do is let us plant the stuff in the cellars and let us get rid of the guards afterwards in our own way. The Yardsticks will do the rest."

"You mean, take over the building when it's not protected?"

"Of course. They'll take it over completely, once they see there's no opposition. And they'll remodel it to suit themselves, and within a month there'll be ten thousand Yardsticks sitting in this place."

"The government will never stand still for that."

"Wake up! It's happening all over, all the time, and nothing is being done to prevent it. Security is too weak and officials are too timid to risk open warfare. So the Yardsticks win, and I'm going to see that they win this place."

"But how will that help us?"

"You don't see it yet, do you? And neither will the Yardsticks. Until, some fine day three or four months from now, we get around to what will be planted in the cellars. Somebody will throw a switch, miles away, and—boom!"
"Wolzek, you couldn't—"

"It's coming. Not only here, but in fifty other places. We've got to fight fire with fire, Eric. It's our only chance. Bring this thing out into the open. Make the government realize this is war. Civil war. That's the only way to force them to take real action. We can't do it any other way; it's illegal to organize politically, and petitions do no good. We can't get a hearing. Well, they'll have to listen to the explosions."

"I just don't know—"

"Maybe you're the one who should have married Annette after all." Wolzek's voice was cold. "Maybe you could have watched her, watched her scream and beg and die, and never wanted to move a muscle to do anything about it afterwards. Maybe you're the model citizen, Eric; you and the thousands of others who are standing by and letting the Yardsticks chop us down, one by one. They say in Nature it's the survival of the fittest. Well, perhaps you're not fit to survive."

Eric wasn't listening. "She screamed," he said. "You heard her scream?"

Wolzek nodded. "I can still hear her. I'll always hear her."

"Yes." Eric blinked abruptly. "When do we start?"

Wolzek smiled at him. It was a pretty good smile for a man who can always hear screaming. "I knew I could count on you," he murmured. "Nothing like old friends."

"Funny, isn't it?" Eric tried to match his smile. "The way things work out. You and I being kids together. You marrying my girl. And then, us meeting up again this way."

"Yes," said Wolzek, and he wasn't smiling now. "I guess it's a small world."

10. Harry Collins—2032

Harry's son's house was on the outskirts of Washington, near what had once been called Gettysburg. Harry was surprised to find that it was a house, and a rather large one, despite the fact that almost all the furniture had been scaled down proportionately to fit the needs of a man three feet high.

But then, Harry was growing accustomed to surprises.

He found a room of his own, ready and waiting, on the second floor; here the furniture was of almost antique vintage, but adequate in size. And here, in an atmosphere of unaccustomed comfort, he could talk.

"So you're a physician, eh?" Harry gazed down into the diminutive face, striving to accept the fact that he was speaking to a mature adult. His own son—his and Sue's—a grown man and a doctor! It seemed incredible. But then, nothing was more incredible than the knowledge that he was actually here, in his child's home.

"We're all specialists in one field or another," his son explained. "Every one of us born and surviving during the early experimental period received our schooling under a plan Leffingwell set up. It was part of his conditional agreement that we become wards of the state. He knew the time might come when we'd be needed."

"But why wasn't all this done openly?"

"You know the answer to that. There was no way of educating us under the prevailing system, and there was always a danger we might be singled out as freaks who must be destroyed—particularly in those early years. So Leffingwell relied on secrecy, just as he did during his experimentation period. You know how you felt about that. You believed innocent people were being murdered. Would you have listened to his explanations, accepted the fact that his work was worth the cost of a few lives so that future billions of human beings might be saved? No, there was no time for explanation or indoctrination. Leffingwell chose concealment."

"Yes," Harry sighed. "I understand that better now, I think. But I couldn't see it then, when I tried to kill him."

He flushed. "And I still can't quite comprehend why he spared me after that attempt."

"Because he wasn't the monster you thought him to be. When I pleaded with him—"

"You were the one!"

Harry's son turned away. "Yes. When I was told who you really were, I went to him. But I was only a child, remember that. And he didn't spare you out of sentimentality. He had a purpose."

"A purpose in sending me to prison, letting me rot all these years while—"

"While I grew up. I and the others like myself. And while the world outside changed." Harry's son smiled. "Your friend Richard Wade was right, you know. He guessed a great deal of the truth. Leffingwell and Manschoff and the rest of their associates deliberately set out to assemble a select group of nonconformists—men of specialized talents and outlooks. There were over three hundred of you at Stark Falls. Richard Wade knew why."

"And so he was dragged off and murdered."

"Murdered? No, Father, he's very much alive, I assure you. In fact, he'll be here tonight."

"But why was he taken away so abruptly, without any warning?"

"He was needed. There was a crisis, when Dr. Leffingwell died." Harry's son sighed. "You didn't know about that, did you? There's so much for you to learn. But I'll let him tell you himself, when you see him this evening."

Richard Wade told him. And so did William Chang and Lars Neilstrom and all the others. During the ensuing
weeks, Harry saw each of them again. But Wade's explanation was sufficient.

"I was right," he said. "There was no Underground when we were at Stark Falls. What I didn't realize, though, was that there was an Overground."

"Overground?"

"You might call it that. Leffingwell and his staff formed the nucleus. They foresaw the social crisis which lay ahead, when the world became physically divided into the tall and the short, the young and the old. They knew there'd be a need of individuality then—and they did create a stockpile. A stockpile of the younger generation, specially educated; a stockpile of the older generation, carefully selected. We conspicuous rebels were incarcerated and given an opportunity to think the problem through, with limited contact with one another's viewpoints."

"But why weren't we told the truth at the beginning, allowed to meet face-to-face and make some sensible plans for the future?"

Harry's son interrupted. "Because Dr. Leffingwell realized this would defeat the ultimate purpose. You'd have formed your own in-group, as prisoners, dedicated to your own welfare. There'd be emotional ties—"

"I still don't know what you're talking about. What are we supposed to prepare for now?"

Richard Wade shrugged. "Leffingwell had it all planned. He foresaw that when the first generation of Yardsticks—that's what they call themselves, you know—came of age, there'd be social unrest. The young people would want to take over, and the older generation would try to remain in positions of power. It was his belief that tensions could be alleviated only by proper leadership on both sides."

"He himself had an important voice in government circles. He set up an arrangement whereby a certain number of posts would be assigned to people of his choice, both young and old. Similarly, in the various professions, there'd be room for appointees he'd select. Given a year or two of training, Leffingwell felt that we'd be ready for these positions. Young men, like your son, would be placed in key spots where their influence would be helpful with the Yardsticks. Older men such as yourself would go into other assignments—in communications media, chiefly. The skillful use of group-psychological techniques could avert open clashes. He predicted a danger-period lasting about twenty years—roughly, from 2030 to 2050. Once we weathered that span, equilibrium would be regained, as a second and third generation came along and the elders became a small minority. If we did our work well and eliminated the sources of prejudice, friction and hostility, the transition could be made. The Overground in governmental circles would finance us. This was Leffingwell's plan, his dream."

"You speak in the past tense," Harry said.

"Yes." Wade's voice was harsh. "Because Leffingwell is dead, of cerebral hemorrhage. And his plan died with him. Oh, we still have some connections in government; enough to get men like yourself out of Stark Falls. But things have moved too swiftly. The Yardsticks are already on the march. The people in power—even those we relied upon—are getting frightened. They can't see that there's time left to train us to take over. And frankly, I'm afraid most of them have no inclination to give up their present power. They intend to use force."

"But you talk as though the Yardsticks were united."

"They are uniting, and swiftly. Remember the Naturalists?"

Harry nodded, slowly. "I was one, once. Or thought I was."

"You were a liberal. I'm talking about the new Naturalists. The ones bent on actual revolution."

"Revolution?"

"That's the word. And that's the situation. It's coming to a head, fast."

"And how will we prevent it?"

"I don't know." Harry's son stared up at him. "Most of us believe it's too late to prevent it. Our immediate problem will be survival. The Naturalists want control for themselves. The Yardsticks intend to destroy the power of the older generation. And we feel that if matters come to a head soon, the government itself may turn on us, too. They'll have to."

"In other words," said Harry, "we stand alone."

"Fall alone, more likely," Wade corrected.

"How many of us are there?"

"About six hundred," said Harry's son. "Located in private homes throughout this eastern area. If there's violence, we don't have a chance of controlling the situation."

"But we can survive. As I see it, that's our only salvation at the moment—to somehow survive the coming conflict. Then, perhaps, we can find a way to function as Leffingwell planned."

"We'll never survive here. They'll use every conceivable weapon."

"But since there's no open break with the government yet, we could still presumably arrange for transportation facilities."

"To where?"
"Some spot in which we could weather the storm. What about Leffingwell's old hideout?"

"The units are still standing." Harry's son nodded. "Yes, that's a possibility. But what about food?"

"Grizek."

"What?"

"Friend of mine," Harry told him. "Look, we're going to have to work fast. And yet we've got to do it in a way that won't attract any attention; not even from the government. I suggest we set up an organizing committee and make plans." He frowned. "How much time do you think we have—a year or so?"

"Six months," his son hazarded.

"Four, at most," Wade said. "Haven't you been getting the full reports on those riots? Pretty soon they'll declare a state of national emergency and then nobody will be going anywhere."

"All right." Harry Collins grinned. "We'll do it in four months."

Actually, as it worked out, they did it in just a day or so under three.

Five hundred and forty-two men moved by jetter to Colorado Springs; thence, by helicopter, to the canyon hideaway. They moved in small groups, a few each week. Harry himself had already established the liaison system, and he was based at Grizek's ranch. Grizek was dead, but Bassett and Tom Lowery remained and they cooperated. Food would be ready for the 'copters that came out of the canyon.

The canyon installation itself was deserted, and the only problem it presented was one of rehabilitation. The first contingent took over.

The jetters carried more than their human cargo; they were filled with equipment of all sorts—microscans and laboratory instruments and devices for communication. By the time the entire group was assembled, they had the necessary implementation for study and research. It was a well-conceived and well-executed operation.

To his surprise, Harry found himself acting as the leader of the expedition, and he continued in this capacity after they were established. The irony of the situation did not escape him; to all intents and purposes he was now ruling the very domain in which he had once languished as a prisoner.

But with Wade and Chang and the others, he set up a provisional system which worked out very well. And proved very helpful, once the news reached them that open revolt had begun in the world outside.

A battered 'copter landed one evening at dusk, and the wounded pilot poured out his message, then his life's blood.

Angelisco was gone. Washington was gone. The Naturalists had struck, using the old, outlawed weapons. And it was the same abroad, according to the few garbled reports thereafter obtainable only via ancient shortwave devices.

From then on, nobody left the canyon except on weekly 'copter-lifts to the ranch grazing lands for fresh supplies. Fortunately, that area was undisturbed, and so were its laconic occupants. They neither knew nor cared what went on in the world outside; what cities were reported destroyed, what forces triumphed or went down into defeat, what activity or radioactivity prevailed.

Life in the canyon flowed on, more peacefully than the river cleaving its center. There was much to do and much to learn. It was, actually, a monastic existence, compounded of frugality, abstinence, continence and devotion to scholarly pursuits. Within a year, gardens flourished; within two years herds grazed the grassy slopes; within three years cloth was being woven on looms in the ancient way and most of the homespun arts of an agrarian society had been revived. Men fell sick and men died, but the survivors lived in amity. Harry Collins celebrated his sixtieth birthday as the equivalent of a second-year student of medicine; his instructor being his own son. Everyone was studying some subject, acquiring some new skill. One-time rebellious natures and one-time biological oddities alike were united by the common bond of intellectual curiosity.

It was, however, no Utopia. Some of the younger men wanted women, and there were no women. Some were irked by confinement and wandered off; three of the fleet of eleven 'copters were stolen by groups of malcontents. From time to time there would be a serious quarrel. Six men were murdered. The population dwindled to four hundred and twenty.

But there was progress, in the main. Eventually Banning joined the group, from the ranch, and under his guidance the study-system was formalized. Attempts were made to project the future situation, to prepare for the day when it would be possible to venture safely into the outside world once again and utilize newly-won abilities.

Nobody could predict when that would be, nor what kind of world would await their coming. By the time the fifth year had passed, even shortwave reports had long since ceased. Rumors persisted that radioactive contamination was widespread, that the population had been virtually decimated, that the government had fallen, that the Naturalists had set up their own reign only to fall victim to internal strife.

"But one thing is certain," Harry Collins told his companions as they assembled in the usual monthly meeting on the grounds before the old headquarters building one afternoon in July. "The fighting will end soon. If we hear
nothing more within the next few months, we'll send out observation parties. Once we determine the exact situation, we can plan accordingly. The world is going to need what we can give. It will use what we have learned. It will accept our aid. One of these days—"

And he went on to outline a carefully-calculated program of making contact with the powers that be, or might be. It sounded logical and even the chronic grumblers and habitual pessimists in the group were encouraged.

If at times they felt the situation fantastic and the hope forlorn, they were heartened now. Richard Wade summed it up succinctly afterwards, in a private conversation with Harry.

"It isn't going to be easy," he said. "In the old science fiction yarns I used to write, a group like this would have been able to prevent the revolution. At the very least, it would decide who won if fighting actually broke out. But in reality we were too late to forestall revolt, and we couldn't win the war no matter on whose side we fought. There's just one job we're equipped for—and that's to win the peace. I don't mean we'll step out of here and take over the world, either. We'll have to move slowly and cautiously, dispersing in little groups of five or six all over the country. And we'll have to sound out men in the communities we go to, find those who are willing to learn and willing to build. But we can be an influence, and an important one. We have the knowledge and the skill. We may not be chosen to lead, but we can teach the leaders. And that's important."

Harry smiled in agreement. They did have something to offer, and surely it would be recognized—even if the Naturalists had won, even if the entire country had sunk into semi-barbarism. No use anticipating such problems now. Wait until fall came; then they'd reconnoitre and find out. Wait until fall—

It was a wise decision, but one which ignored a single, important fact. The Naturalists didn't wait until fall to conduct their reconnaissance.

They came over the canyon that very night; a large group of them in a large jetter.

And they dropped a large bomb....

11. Jesse Pringle—2039

They were after him. The whole world was in flames, and the buildings were falling, the mighty were fallen, the Day of Judgment was at hand.

He ran through the flames, blindly. Blind Samson. Eyeless in Gaza, treading at the mill. The mills of the gods grind slowly, but they grind exceedingly small.

Small. They were all small, but that didn't matter. They had the guns and they were hunting him down to his doom. Day of doom. Doomsday. The great red dragon with seven heads and ten horns was abroad in the land.

They had unleashed the dragon and his breath was a fire that seared, and his tail was a thunder that toppled towers. The dragon was searching him out for his sins; he would be captured and set to labor in the mill.

But he would escape, he must escape! He was afraid of them, small as they were, and great oaks from little acorns grow, it's the little things that count, and he dare not go a-hunting for fear of little men.

Jesse crouched against the dock, watching the grain-elevators burn. The whole city was burning, Babylon the mighty, the whole world was burning in God's final wrath of judgment.

Nobody believed in God any more, nobody read the Bible, and that's why they didn't know these things. Jesse knew, because he was an old man and he remembered how it had been when he was a little boy. A little boy who learned of the Word of God and the Wrath of God.

He could see the reflection of the flames in the water, now, and the reflection was shimmery and broken because of the black clusters floating past. Large clusters and small clusters. There were bodies in the water, the bodies of the slain.

Thunder boomed from the city behind him. Explosions. That's how it had started, when the Naturalists began blowing up the buildings. And then the Yardsticks had come with their weapons, hunting down the Naturalists. Or had it been that way, really? It didn't matter, now. That was in another country and besides, the wench was dead.

The wench is dead. His wench, Jesse's wench. She wasn't so old. Only seventy-two. But they killed her, they blew off the top of her head and he could feel it when they did. It was as if something had happened in his head, and then he ran at them and screamed, and there was great slaughter amongst the heathen, the forces of unrighteousness.

And Jesse had fled, and smote evil in the name of the Lord, for he perceived now that the time was at hand.

How the mighty are fallen.

Jesse blinked at the water, wishing it would clear, wishing his thoughts would clear. Sometimes for a moment he could remember back to the way things really were. When it was still a real world, with real people in it. When he was just a little boy and everybody else was big.

Strange. Now he was an old man, a big old man, and almost everybody else was little.

He tried to think what it had been like, so long ago. It was too long. All he could remember about being small was that he had been afraid. Afraid of the bigger people.

And now he was big, and afraid of the smaller people.
Of course they weren't real. It was just part of the prophecy, they were the locusts sent to consume and destroy. He kept telling himself there was nothing to fear; the righteous need not fear when the day of judgment is at hand.

Only somewhere inside of him was this little boy, crying, "Mama, Mama, Mama!" And somewhere else was this old man, just staring down into the water and waiting for them to find him.

Another explosion sounded.

This one was closer. They must be bombing the entire city. Or else it was the dragon, lashing his tail.

Somebody ran past Jesse, carrying a torch. No, it wasn't a torch—his hair was on fire. He jumped into the water, screaming, "They're coming! They're coming!"

Jesse turned and blinked. They were coming, all right. He could see them pouring out of the alleyway like rats. Rats with gleaming eyes, gleaming claws.

Suddenly, his head cleared. He realized that he was going to die. He had, perhaps, one minute of life left. One minute out of eighty years. And he couldn't fool himself any longer. He was not delirious. Day of judgment—that was nonsense. And there was no dragon, and these were not rats. They were merely men. Puny little men who killed because they were afraid.

Jesse was a big man, but he was afraid, too. Six feet three inches tall he was, when he stood up straight as he did now, watching them come—but he knew fear.

And he resolved that he must not take that fear with him into death. He wanted to die with something better than that. Wasn't there something he could find and cling to, perhaps some memory—?

A minute is so short, and eighty years is so long. Jesse stood there, swaying, watching them draw nearer, watching them as they caught sight of him and raised their weapons.

He scanned rapidly into the past. Into the past, before the time the wench was dead, back to when you and I were young, Maggie, back still earlier, and earlier, seeking the high point, the high school, that was it, the high school, the highlight, the moment of triumph, the game with Lincoln. Yes, that was it. He hadn't been ashamed of being six feet three inches then, he'd been proud of it, proud as he raised his arms and—

Splashed down into the water as the bullets struck.

And that was the end of Jesse Pringle. Jesse Pringle, champion basketball center of the Class of '79....

12. Littlejohn—2065

The helicopter landed on the roof, and the attendants wheeled it over to one side. They propped the ladder up, and Littlejohn descended slowly, panting.

They had a coasterchair waiting and he sank into it, grateful for the rest. Hardy fellows, these attendants, but then they were almost three feet tall. More stamina, that was the secret. Common stock, of course, but they served a purpose. Somebody had to carry out orders.

When they wheeled the coasterchair into the elevator, Littlejohn descended. The elevator halted on the first floor and he breathed a sigh of relief. Great heights always made him faint and dizzy, and even a short helicopter trip took its toll—the mere thought of soaring two hundred feet above the ground was enough to paralyze him.

But this journey was vital. Thurmon was waiting for him.

Yes, Thurmon was waiting for him here in the council chamber. The coasterchair rolled forward into the room and again Littlejohn felt a twinge of apprehension. The room was vast—too big for comfort. It must be all of fifty feet long, and over ten feet in height. How could Thurmon stand it, working here?

But he had to endure it, Littlejohn reminded himself. He was head of the council.

Thurmon was lying on the couch when Littlejohn rolled in, but he sat up and smiled.

"I greet you," he said.

"I greet you," Littlejohn answered. "No, don't bother to stay seated. Surely we don't need to be ceremonious."

Thurmon pricked up his ears at the sound of the unfamiliar word. He wasn't the scholarly type, like Littlejohn. But he appreciated Littlejohn's learning and knew he was important to the council. They needed scholars these days, and antiquarians too. One has to look to the past when rebuilding a world.

"You sent for me?" Littlejohn asked. The question was purely rhetorical, but he wanted to break the silence. Thurmon looked troubled as he replied.

"Yes. It is a matter of confidence between us."

"So be it. You may speak in trust."

Thurmon eyed the door. "Come nearer," he said.

Littlejohn pressed a lever and rolled up to the couchside. Thurmon's eyes peered at him through the thick contact lenses. Littlejohn noted the deep wrinkles around his mouth, but without surprise. After all, Thurmon was an old man—he must be over thirty.

"I have been thinking," Thurmon said, abruptly. "We have failed."

"Failed?"
Thurmon nodded. "Need I explain? You have been close to the council for many years. You have seen what we've attempted, ever since the close of the Naturalist wars."

"A magnificent effort," Littlejohn answered politely. "In less than thirty years an entire new world has risen from the ruins of the old. Civilization has been restored, snatched from the very brink of a barbarism that threatened to engulf us."

"Nonsense," Thurmon murmured.

"What?"

"Sheer nonsense, Littlejohn. You're talking like a pedant."

"But I am a pedant." Littlejohn nodded. "And it's true. When the Naturalists were exterminated, this nation and other nations were literally destroyed. Worse than physical destruction was the threat of mental and moral collapse. But the Yardstick councils arose to take over. The concept of small government came into being and saved us. We began to rebuild on a sensible scale, with local, limited control. The little community arose—"

"Spare me the history lesson," said Thurmon, dryly. "We rebuilt, yes. We survived. In a sense, perhaps, we even made certain advances. There is no longer any economic rivalry, no social distinctions, no external pressure. I think I can safely assume that the danger of future warfare is forever banished. The balance of power is no longer a factor. The balance of Nature has been partially restored. And only one problem remains to plague mankind."

"What is that?"

"We face extinction," Thurmon said.

"But that's not true," Littlejohn interrupted. "Look at history and—"

"Look at us." Thurmon sighed. "You needn't bother with history. The answer is written in our faces, in our own bodies. I've searched the past very little, compared to your scholarship, but enough to know that things were different in the old days. The Naturalists, whatever else they might have been, were strong men. They walked freely in the land, they lived lustily and long."

"Do you know what our average life-expectancy is today, Littlejohn? A shade under forty years. And that only if one is fortunate enough to lead a sheltered existence, as we do. In the mines, in the fields, in the radioactive areas, they die before the age of thirty."

Littlejohn leaned forward. "Schuyler touches on just that point in his Psychology of Time," he said, eagerly. "He posits the relationship between size and duration. Time is relative, you know. Our lives, short as they may be in terms of comparative chronology, nevertheless have a subjective span equal to that of the Naturalists in their heyday."

"Nonsense," Thurman said, again. "Did you think that is what concerns me—whether or not we feel that our lives are long or short?"

"What then?"

"I'm talking about the basic elements essential to survival. I'm talking about strength, stamina, endurance, the ability to function. That's what we're losing, along with the normal span of years. The world is soft and flabby. Yardstick children, they tell us, were healthy at first. But their children are weaker. And their grandchildren, weaker still. The effect of the wars, the ravages of radiation and malnutrition, have taken a terrible toll. The world is soft and flabby today. People can't walk any more, let alone run. We find it difficult to lift and bend and work—"

"But we won't have to worry about such matters for long," Littlejohn hazarded. "Think of what's being done in robotics. Those recent experiments seem to prove—"

"I know." Thurmon nodded. "We can create robots, no doubt. We have a limited amount of raw materials to allocate to the project, and if we can perfect automatons they'll function quite adequately. Virtually indestructible, too, I understand. I imagine they'll still be able to operate efficiently a hundred or more years from now—if only they learn to oil and repair one another. Because by that time, the human race will be gone."

"Come now, it isn't that serious—"

"Oh, but it is!" Thurmon raised himself again, with an effort. "Your study of history should have taught you one thing, if nothing else. The tempo is quickening. While it took mankind thousands of years to move from the bow and arrow to the rifle, it took only a few hundred to move from the rifle to the thermonuclear weapon. It took ages before men mastered flight, and then in two generations they developed satellites; in three, they reached the moon and Mars."

"But we're talking about physical development."

"I know. And physically, the human race altered just as drastically in an equally short span of time. As recently as the nineteenth century, the incidence of disease was a thousandfold greater than it is now. Life was short then. In the twentieth century disease lessened and life-expectancy doubled, in certain areas. Height and weight increased perceptibly with every passing decade. Then came Leffingwell and his injections. Height, weight, life-expectancy have fallen perceptibly every decade since then. The war merely hastened the process."
"You appear to have devoted a great deal of time to this question," Littlejohn observed.

"I have," answered the older man. "And it is not a question. It is a fact. The one fact that confronts us all. If we proceed along our present path, we face certain extinction in a very short time. The strain is weakening constantly, the vitality is draining away. We sought to defeat Nature—but the Naturalists were right, in their way."

"And the solution?"
Thurmon was silent for a long moment. Then, "I have none," he said.

"You have consulted the medical authorities?"

"Naturally. And experiments have been made. Physical conditioning, systems of exercise, experimentation in chemotherapy are still being undertaken. There's no lack of volunteers, but a great lack of results. No, the answer does not lie in that direction."

"But what else is there?"

"That is what I had hoped you might tell me," Thurmon said. "You are a scholar. You know the past. You speak often of the lessons of history—"

Littlejohn was nodding, but not in agreement. He was trying to comprehend. For suddenly the conviction came to him clearly; Thurmon was right. It was happening, had happened, right under their smug noses. The world was weakening. It was slowing down, and the race is only to the swift.

He cursed himself for his habit of thinking in platitudes and quotations, but long years of study had unfitted him for less prosaic phraseology. If he could only be practical.

Practical.

"Thurmon," he said. "There is a way. A way so obvious, we've all overlooked it—passed right over it."

"And that is—?"

"Stop the Leffingwell injections!"

"But—"

"I know what you'll say. There have been genetic mutations. Very true, but such mutations can't be universal. A certain percentage of offspring will be sound, capable of attaining full growth. And we don't have the population-problem to cope with any more. There's room for people again. So why not try it? Stop the injections and allow babies to be born as they were before." Littlejohn hesitated before adding a final word, but he knew he had to add it; he knew it now. "Normally," he said.

Thurmon nodded. "So that is your answer."

"Yes. I—I think it will work."

"So do the biologists," Thurmon told him. "A generation of normal infants, reared to maturity, would restore mankind to its former stature, in every sense of the word. And now, knowing the lessons of the past, we could prepare for the change to come. We could rebuild the world for them to live in, rebuild it psychically as well as physically. We'd plan to eliminate the rivalry between the large and the small, the strong and the weak. It wouldn't be difficult because there's plenty for all. There'd be no trouble as there was in the old days. We've learned to be psychologically flexible."

Littlejohn smiled. "Then that is the solution?" he asked.

"Yes. Eliminating the Leffingwell injections will give us a good proportion of normal children again. But where do we find the normal women to bear them?"

"Normal women?"

Thurmon sighed, then reached over and placed a scroll in the scanner. "I have already gone into that question with research technicians," he said. "And I have the figures here." He switched on the scanner and began to read.

"The average nubile female, aged thirteen to twenty-one, is two feet, ten inches high and weighs forty-eight pounds." Thurmon flicked the switch again and peered up. "I don't think I'll bother with pelvic measurements," he said. "You can already see that giving birth to a six or seven-pound infant is a physical impossibility under the circumstances. It cannot be done."

"But surely there must be some larger females! Perhaps a system of selective breeding, on a gradual basis—"

"You're talking in terms of generations. We haven't got that much time." Thurmon shook his head. "No, we're stopped right here. We can't get normal babies without normal women, and the only normal women are those who began life as normal babies."

"Which comes first?" Littlejohn murmured. "The chicken or the egg?"

"What's that?"

"Nothing. Just an old saying. From history."

Thurmon frowned. "Apparently, then, that's all you can offer in your professional capacity as an historian. Just some old sayings." He sighed. "Too bad you don't know some old prayers. Because we need them now."

He bowed his head, signifying the end of the interview.
Littlejohn rolled out of the room.

His 'copter took him back to his own dwelling, back across the rooftops of New Chicagee. Ordinarily, Littlejohn avoided looking down. He dreaded heights, and the immensity of the city itself was somehow appalling. But now he gazed upon the capital and center of civilization with a certain morbid affection.

New Chicagee had risen on the ashes of the old, after the war's end. Use of thermo-nucs had been limited, fortunately, so radioactivity did not linger, and the vast craters hollowed out by ordinary warheads had been partially filled by rubble and debris. Artificial fill had done the rest of the job, so that now New Chicagee was merely a flat prairie as it must have been hundreds of years ago—a flat prairie on which the city had been resurrected. There were almost fifty thousand people here in the capital; the largest congregation of population on the entire continent. They had built well and surely this time, built for the security and certainty of centuries to come.

Littlejohn sighed. It was hard to accept the fact that they had been wrong; that all this would end in nothingness. They had eliminated war, eliminated disease, eliminated famine, eliminated social inequality, injustice, disorders external and internal—and in so doing, they had eliminated themselves.

The sun was setting in the west, and long shadows crept over the city below. Yes, the sun was setting and the shadows were gathering, the night was coming to claim its own. Darkness was falling, eternal darkness.

It was quite dark by the time Littlejohn's 'copter landed on the rooftop of his own dwelling; so dark, in fact, that for a moment he didn't see the strange vehicle already standing there. Not until he had settled into his coasterchair did he notice the presence of the other 'copter, and then it was too late. Too late to do anything except sit and stare as the gigantic shadow loomed out of the night, silhouetted against the sky.

The shadow shambled forward, and Littlejohn gaped, gaped in terror at the titanic figure. He opened his mouth to speak, but words did not form; there were no words to form, for how does one address an apparition? Instead, it was the apparition which spoke.

"I have been waiting for you," it said.
"Y-yes—"
"I want to talk to you." The voice was deep, menacing.

Littlejohn shifted in his coasterchair. There was nowhere to go, no escape. He gazed up at the shadow. Finally he summoned a response. "Shall we go inside?" he asked.

The figure shook its head. "Where? Down into that dollhouse of yours? It isn't big enough. I've already been there. What I have to say can be said right here."
"W-who are you?"

The figure stepped forward, so that its face was illuminated by the fluorescence streaming from the open door which led to the inclined chairway descending to Littlejohn's dwelling.

Littlejohn could see the face, now—the gigantic, wrinkled face, scarred and seared and seamed. It was a human face, but utterly alien to the humanity Littlejohn knew. Faces such as this one had disappeared from the earth a lifetime ago. At least, history had taught him that. History had not prepared him for the actual living presence of a—

"Naturalist!" Littlejohn gasped. "You're a Naturalist! Yes, that's what you are!"

The apparition scowled.

"I am not a Naturalist. I am a man."
"But you can't be! The war—"
"I am very old. I lived through your war. I have lived through your peace. Soon I shall die. But before I do, there is something else which must be done."
"You've come here to kill me?"
"Perhaps." The looming figure moved closer and stared down. "No, don't try to summon help. When your servants saw me, they fled. You're alone now, Littlejohn."
"You know my name."
"Yes, I know your name. I know the names of everyone on the council. Each of them has a visitor tonight."
"Then it is a plot, a conspiracy?"
"We have planned this very carefully, through the long years. It's all we lived for, those few of us who survived the war."
"But the council wasn't responsible for the war! Most of us weren't even alive, then. Believe me, we weren't to blame—"

"I know." The gigantic face ceased in senile simulation of a smile. "Nobody was ever to blame for anything, nobody was ever responsible. That's what they always told me. I mustn't hate mankind for multiplying, even though population created pressure and pressure created panic that drove me mad. I mustn't blame Leffingwell for solving the overpopulation problem, even though he used me as a guinea-pig in his experiments. I mustn't blame the Yardsticks for penning me up in prison until revolution broke out, and I mustn't blame the Naturalists for bombing
the place where I took refuge. So whose fault was it that I've gone through eighty years of assorted hell? Why did I, Harry Collins, get singled out for a lifetime of misery and misfortune?" The huge old man bent over Littlejohn's huddled form. "Maybe it was all a means to an end. A way of bringing me here, at this moment, to do what must be done."

"Don't harm me—you're not well, you're—"

"Crazy?" The old man shook his head. "No, I'm not crazy. Not now. But I have been, at times, during my life. Perhaps we all are, when we attempt to face up to the complications of an average existence, try to confront the problems which are too big for a single consciousness to cope with in a single life-span. I've been crazy in the city, and crazy in the isolation of a cell, and crazy in the welter of war. And perhaps the worst time of all was when I lost my son.

"Yes, I had a son, Littlejohn. He was one of the first, one of Leffingwell's original mutations, and I never knew him very well until the revolution came and we went away together. He was a doctor, my boy, and a good one. We spent almost five years together and I learned a lot from him. About medicine, but that wasn't important then. I'm thinking of what I learned about love. I'd always hated Yardsticks, but my son was one, and I came to love him. He had plans for rebuilding the world, he and I and the rest of us. We were going to wait until the revolution ended and then help restore sanity in civilization.

"But the Naturalists flew over and dropped their bomb, and my boy died. Over four hundred of our group died there in the canyon—four hundred who might have changed the fate of the world. Do you think I can forget that? Do you think I and the few others who survived have ever forgotten? Can you blame us if we did go crazy? If we hid away out there in the western wilderness, hid away from a world that had offered us nothing but death and destruction, and plotted to bring death and destruction to that world in return?

"Think about it for a moment, Littlejohn. We were old men, all of us, and the world had given us only its misery to bear during our lifetimes. The world we wanted to save was destroying itself; why should we be concerned with its fate or future?

"So we changed our plans, Littlejohn. Perhaps the shock had been too much. Instead of plotting to rebuild the world, we turned our thoughts to completing its destruction. Our tools and texts were gone, buried in the rubble with the bodies of fine young men. But we had our minds. Crazed minds, you'd call them—but aware of reality. The grim reality of the post-revolutionary years.

"We burrowed away in the desert. We schemed and we dreamed. From time to time we sent out spies. We knew what was going on. We knew the Naturalists were gone, that six-footers had vanished from a Yardstick world. We knew about the rehabilitation projects. We watched your people gradually evolve new patterns of living and learning. Some of the former knowledge was rescued, but not all. Our little group had far more learning than you've ever dreamed of. Fifty of us, between ourselves, could have surpassed all your scientists in every field.

"But we watched, and we waited. And some of us died of privation and some of us died of old age. Until, at last, there were only a dozen of us to share the dream. The dream of destruction. And we knew that we must act swiftly, or not at all.

"So we came into the world, cautiously and carefully, moving unobtrusively and unobserved. We wanted to contemplate the corruption, seek out the weaknesses in your degenerate civilization. And we found them, immediately. Those weaknesses are everywhere apparent, for they are physical. You're one of a dying race, Littlejohn. Mankind's days are numbered. There's no need for grandiose schemes of reactivating warheads in buried missile-centers, of loosing thermo-nucs upon the world. Merely by killing off the central council here in New Chicagee, we can accomplish our objective. A dozen men die, and there's not enough initiative left to replace them. It's as simple as that. And as complicated."

Harry Collins nodded. "Yes, as complicated. Because the only weaknesses we've observed are physical ones. We've seen enough of the ways of this new civilization to realize that.

"All of the things I hated during my lifetime have disappeared now—the crowding, the competition, the sordid self-interest, the bigotry, intolerance, prejudice. The anti-social aspects of society are gone. There is only the human race, living much closer to the concept of Utopia than I ever dreamed possible. You and the other survivors have done well, Littlejohn."

"And yet you come to kill us."

"We came for that purpose. Because we still retained the flaws and failings of our former cultures. We looked for targets to blame, for villains to hate and destroy. Instead, we found this reality."

"No, I'm not crazy, Littlejohn. And I and my fellows aren't here to execute revenge. We have returned to the original plan; the plan Leffingwell had, and my son, and all the others who worked in their own way for their dream of a better world. We come now to help you. Help you before you die—before we die."

Littlejohn looked up and sighed. "Why couldn't this have happened before?" he murmured. "It's too late now."
"But it isn't too late. My friends are here. They are telling your fellow council-members the same thing right now. We may be old, but we can still impart what we have learned. There are any number of technological developments to be made. We can help you to increase your use of atomic power. There's soil reclamation and irrigation projects and biological techniques—"

"You said it yourself," Littlejohn whispered. "We're a dying race. That's the primary problem. And it's an insoluble one. Just this afternoon—" And he told him about the interview with Thurmon.

"Don't you understand?" Littlejohn concluded. "We have no solution for survival. We're paying the price now because for a while we wouldn't heed history. We tried to defeat Nature and in the end Nature has defeated us. Because we would not render unto Caesar the things which are—"

Harry Collins smiled. "That's it," he said.

"What?"

"Caesar. That's the answer. Your own medical men must have records. I know, because I learned medicine from my son. There used to be an operation, in the old days, called a caesarean section—used on normal women and on dwarfs and midgets too, in childbirth. If your problem is how to deliver normal children safely, the technique can be revived. Get hold of some of your people. Let's see what data you have on this. I'll be glad to furnish instruction—"

There was excitement after that. Too much excitement for Littlejohn. By the time the council had assembled in emergency session, by the time plans were formulated and he returned to his own dwelling in the helicopter, he was completely exhausted. Only the edge of elation sustained him; the realization that a solution had been found.

As he sank into slumber he knew that he would sleep the clock around.

And so would Harry Collins. The old man and his companions, now guests of the council, had been temporarily quartered in the council-chambers. It was the only structure large enough to house them and even so they had to sleep on the floor. But it was sufficient comfort for the moment.

It was many hours before Harry Collins awoke. His waking was automatic, for the tiny telescreen at the end of the council room glowed suddenly, and the traditional voice chirped forth to interrupt his slumber.

"Good morning," said the voice. "It's a beautiful day in New Chicagee!"

Harry stared at the screen and then he smiled.

"Yes," he murmured. "But tomorrow will be better."

THE END
CHAPTER I

The boxed ad in the opportunities section of the Kardon Journal of Allied Medical Sciences stood out like a cut diamond in a handful of gravel. "Wanted," it read, "Veterinarian - for residency in active livestock operation. Single recent graduate preferred. Quarters and service furnished. Well-equipped hospital. Five-year contract, renewal option, starting salary 15,000 cr./annum with periodic increases. State age, school, marital status, and enclose recent tri-di with application. Address Box V-9, this journal."

Jac Kennon read the box a second time. There must be a catch to it. Nothing that paid a salary that large could possibly be on the level. Fifteen thousand a year was top pay even on Beta, and an offer like this for a new graduate was unheard of - unless Kardon was in the middle of an inflation. But Kardon wasn't. The planet's financial status was A-1. He knew. He'd checked that immediately after landing. Whatever might be wrong with Kardon, it wasn't her currency. The rate of exchange was 1.2-1 Betan.

A five-year contract - hmm - that would the seventy-five thousand. Figure three thousand a year for living expenses, that would leave sixty-plenty of capital to start a clinic. The banks couldn't turn him down if he had that much cash collateral.

Kennon chuckled wryly. He'd better get the job before he started spending the money he didn't have. He had 231 credits plus a few halves, tenths, and hundredths, a diploma in veterinary medicine, some textbooks, a few instruments, and a first-class spaceman's ticket. By watching his expenses he had enough money to live here for a month and if nothing came of his efforts to find a job on this planet, there was always his spaceman's ticket and another world.

Another world! There were over six thousand planets in the Brotherhood of Man. At two months per planet, not figuring transit time, it would take more than a thousand Galactic Standard years to visit them all, and a man could look forward to scarcely more than five hundred at best. The habitat of Man had become too large. There wasn't time to explore every possibility.

But a man could have certain standards, and look until he found a position that fitted. The trouble was - if the standards were too high the jobs were too scarce. Despite the chronic shortage of veterinarians throughout the Brotherhood, there was a peculiar reluctance on the part of established practitioners to welcome recent graduates. Most of the ads in the professional journals read "State salary desired," which was nothing more than economic blackmail - a bald-faced attempt to get as much for as little as possible. Kennon grimaced wryly. He'd be damned if he'd sell his training for six thousand a year. Slave labor, that's what it was. There were a dozen ads like that in the Journal. Well, he'd give them a trial, but he'd ask eight thousand and full GEA benefits. Eight years of school and two more as an intern were worth at least that.

He pulled the portable voicewrite to a comfortable position in front of the view wall and began composing another of the series of letters that had begun months ago in time and parsecs away in space. His voice was a fluid counterpoint to the soft hum of the machine.

And as he dictated, his eyes took in the vista through the view wall. Albertsville was a nice town, too young for slums, too new for overpopulation. The white buildings were the color of winter butter in the warm yellow sunlight as the city drowsed in the noonday heat. It nestled snugly in the center of a bowl-shaped valley whose surrounding forest clad hills gave mute confirmation to the fact that Kardon was still primitive, an unsettled world that had not yet reached the explosive stage of population growth that presaged maturity. But that was no disadvantage. In fact, Kennon liked it. Living could be fun on a planet like this.

It was abysmally crude compared to Beta, but the Brotherhood had opened Kardon less than five hundred years ago, and in such a short time one couldn't expect all the comforts of civilization.

It required a high population density to supply them, and while Kardon was integrated its population was scarcely more than two hundred million. It would be some time yet before this world would achieve a Class I status. However, a Class II planet had some advantages. What it lacked in conveniences it made up in opportunities and elbow room.

A normal Betan would have despised this world, but Kennon wasn't normal, although to the casual eye he was a typical representative of the Medico-Technological Civilization, long legged, fair haired, and short bodied with the typical Betan squint that left his eyes mere slits behind thick lashes and heavy brows. The difference was internal
Possibly it was due to the fact that his father was the commander of a Shortliner and most of his formative years had been spent in space. To Kennon, accustomed to the timeless horror of hyper space, all planets were good, broad open places where a man could breathe unfiltered air and look for miles across distances unbroken by dually bulk heads and safety shields. On a planet there were spaciousness and freedom and after the claustrophobic confinement of a hyper ship any world was paradise. Kennon sighed, finished his letters, and placed them in the mail chute. Perhaps, this time, there would be a favorable reply.

CHAPTER II

Kennon was startled by the speed with which his letters were answered. Accustomed to the slower pace of Beta he had expected a week would elapse before the first reply, but within twenty-four hours nine of his twelve inquiries were returned. Five expressed the expected "Thank you but I feel that your asking salary is a bit high in view of your lack of experience." Three were frankly interested and requested a personal interview. And the last was the letter, outstanding in its quietly ostentatious folder—the reply from Box V-9.

"Would Dr. Kennon call at 10 A.M. tomorrow at the offices of Outworld Enterprises Incorporated and bring this letter and suitable identifications? Kennon chuckled. Would he? There was no question about it. The address, 200 Central Avenue, was only a few blocks away. In fact, he could see the building from his window, a tall functional block of durilium and plastic, soaring above the others on the street, the sunlight gleaming off its clean square lines. He eyed it curiously, wondering what he would find inside.

* * *

The receptionist took his I.D. and the letter, scanned them briefly, and slipped them into one of the message tubes beside her desk. "It will only be a moment, Doctor," she said impersonally. "Would you care to sit down?"

"Thank you," he said. The minute, reflected, could easily be an hour. But she was right. It was only a minute until the message tube clicked and popped a capsule onto the girl's desk. She opened it, and removed Kennon's I.D. and a small yellow plastic rectangle. Her eyes widened at the sight of the plastic card.

"Here you are, Doctor. Take shaft number one. Slip the card into the scanner slot and you'll be taken to the correct floor. The offices you want will be at the end of the corridor to the left. You'll find any other data you may need on the card in case you get lost." She looked at him with a curious mixture of surprise and respect as she handed him the contents of the message tube.

Kennon murmured an acknowledgment, took the card and his I.D., and entered the grav-shaft. There was the usual moment of heaviness as the shaft whisked him upward and deposited him in front of a thickly carpeted corridor.

Executive level, Kennon thought as he followed the receptionist's directions. No wonder she had looked respectful. But what was he doing here? The employment of a veterinarian wasn't important enough to demand the attention of a senior executive. The personnel section could handle the details of his application as well as not. He shrugged. Perhaps veterinarians were more important on Kardon. He didn't know a thing about this world's customs.

He opened the unmarked door at the end of the corridor, entered a small reception room, smiled uncertainly at the woman behind the desk, and received an answering smile in return.

"Come right in, Dr. Kennon. Mr. Alexander is waiting for you."

Alexander! The entrepreneur himself! Why? Numb with surprise Kennon watched the woman open the intercom on her desk.

"Sir, Dr. Kennon is here," she said.

"Bring him in," a smooth voice replied from the speaker. Alexander X. M. Alexander, President of Outsold Enterprises - a lean, dark, wolfish man in his early sixties - eyed Kennon with a flat predatory intentness that was oddly disquieting. His stare combined the analytical inspection of the pathologist, the probing curiosity of the psychiatrist, and the weighing appraisal of the butcher. Kennon's thoughts about Alexander's youth vanished that instant. Those eyes belonged to a leader on the battlefield of galactic business.

Kennon felt the conditioned respect for authority surge through him in a smothering wave. Grimly he fought it down, knowing it was a sign of weakness that would do him no good in the interview which lay ahead.

"So you're Kennon," Alexander said. His lingua franca was clean and accentless. "I expected someone older."

"Frankly, sir, so did I," Kennon replied.

Alexander smiled, an oddly pleasant smile that transformed the hard straight lines in his face into friendly curves. "Business, Dr. Kennon, is not the sole property of age."

"Nor is a veterinary degree," Kennon replied.

"True. But one thinks of a Betan as someone ancient and sedate."

"Ours is an old planet -- but we still have new generations."

"A fact most of us outsiders find hard to believe," Alexander said. "I picture your world as an ironclad society rather than external.
crystallized by age and custom into something rigid and in flexible.”

“You would be wrong to do so,” Kennon said. “Even though we are cultural introverts there is plenty of
dynamism within our society.”

“How is it that you happen to be out here on the edge of civilization?”

“I never said I was like my society,” Kennon grinned. “Actually I suppose I’m one of the proverbial bad
apples.”

“There’s more to it than that,” Alexander said. “Your early years probably influenced you.”

Kennon looked sharply at the entrepreneur. How much did the man really know about him? “I suppose so,” he
said indifferently.

Alexander looked pleased. “But even with your childhood experiences there must be an atavistic streak in you -
a throwback to your adventurous Earth forebears who settled your world?”

Kennon shrugged. “Perhaps you’re right. I really don’t know. Actually, I’ve never thought about it. It merely
seemed to me that an undeveloped world offered more opportunity.”

“It does,” Alexander said. “But it also offers work. If you’re figuring that you can get along on the
minimum physical effort required on the Central Worlds, you have a shock coming.”

“I’m not that innocent,” Kennon said. “But I am not so stupid that I can’t apply modifications of Betan
techniques to worlds as new as this.”

Alexander chuckled. “I like you,” he said. suddenly. “Here read this and see if you’d care to work for me.” He
picked a contract form from one of the piles of paper on his desk and handed it to Kennon. “This is one of our
standard work contracts. Take it back to your hotel and check it over. I’ll expect to see you at this time tomorrow.”

“Why waste time?” Kennon said. “The rapid-reading technique originated on Beta. I can tell you in fifteen
minutes.”

“Hmm. Certainly. Read it here if you wish. I like to get things settled - the sooner the better. Sit down, young
man and read. You can rouse me when you’re finished.” He turned his attention to the papers on his desk and within
seconds was completely oblivious of Kennon, his face set in the rapt trancelike expression of a trained rapid reader.

Kennon watched for a moment as sheets of paper passed through Alexander's hands to be added to the pile at
the opposite end of the desk. The man would do better, he thought, if he would have his staff transcribe the papers to
microfilm that could be read through an interval-timed scanner. He might suggest that later. As for now, he shrugged
and seated himself in the chair beside the desk. The quiet was broken only by the rustle of paper as the two rapt-
faced men turned page after page with mechanical regularity.

Finally Kennon turned the last page, paused, blinked, and performed the necessary mental gymnastics to orient
his time sense. Alexander, he noticed, was still engrossed, sunk in his autohypnotic trance. Kennon waited until he
had finished the legal folder which he was reading and then gently intruded upon Alexander's concentration.

Alexander looked up blankly and then went through the same mental gyrations Kennon had performed a few
minutes before. His eyes focused and became hard and alert.

“Well?” he asked. “What do you think of it?”

“I think it’s the damnedest, trickiest, most unilateral piece of legalistics I’ve ever seen,” Kennon said bluntly. “If
that’s the best you can offer, I wouldn’t touch the job with a pair of forceps.”

Alexander smiled. “I see you read the fine print,” he said. There was quiet amusement in his voice. “So you
don’t like the contract?”

“No sensible man would. I’m damned if I’ll sign commitment papers just to get a job. No wonder you’re having
trouble getting professional help. If your contracts are all like that it’s a wonder anyone works for you.”

“We have no complaints from our employees,” Alexander said stiffly.

“How could you? If they signed that contract you’d have a perfect right to muzzle them.”

“There are other applicants for this post,” Alexander said.

“Then get one of them. I wouldn’t be interested.”

“A spaceman’s ticket is a good thing to have,” Alexander said idly. “It’s a useful ace in the hole. Besides, you
have had three other job offers - all of which are good even though they don’t pay fifteen Ems a year.”

Kennon did a quick double take. Alexander’s investigative staff was better than good. It was uncanny.

“But seriously, Dr. Kennon, I am pleased that you do not like that contract. Frankly, I wouldn’t consider
employing you if you did.”

“Sir?”

“That contract is a screen. It weeds out the careless, the fools, and the unfit in one operation. A man who would
sign a thing like that has no place in my organization.” Alexander chuckled at Kennon’s blank expression. “I see you
have had no experience with screening contracts.”

“I haven’t,” Kennon admitted. “On Beta the tests are formal. The Medico-Psych Division supervises them.”
“Different worlds, different methods,” Alexander observed. “But they're all directed toward the same goal. Here we aren't so civilized. We depend more on personal judgment.” He took another contract from one of the drawers of his desk. “Take a look at this. I think you'll be more satisfied.”

“If you don't mind, I'll read it now,” Kennon said.

Alexander nodded.

* * *

“It's fair enough,” Kennon said, “except for Article Twelve.”

“The personal privilege section?”

“Yes.”

“Well, that's the contract. You can take it or leave it.”

“I'll leave it,” Kennon said. “Thank you for your time.” He rose to his feet, smiled at Alexander, and turned to the door. “Don't bother to call your receptionist,” he said. “I can find my way out.”

“Just a minute, Doctor,” Alexander said. He was standing behind the desk, holding out his hand.

“Another test?” Kennon inquired.

Alexander nodded. “The critical one,” he said. “Do you want the job?”

“Of course.”

“Without knowing more about it?”

“The contract is adequate. It defines my duties.”

“And you think you can handle them?”

“I know I can.”

“I notice,” Alexander observed, “that you didn't object to other provisions.”

“No, sir. They're pretty rigid, but for the salary you are paying I figure you should have some rights. Certainly you have the right to protect your interests. But that Article Twelve is a direct violation of everything a human being should hold sacred besides being a violation of the Peeper Laws. I'd never sign a contract that didn't carry a full Peeper rider.”

“That's quite a bit.”

“That's the minimum,” Kennon corrected. “Naturally, I won't object to mnemonic erasure of matters pertaining to your business once my contract's completed and I leave your employment. But until then there will be no conditioning, no erasures, no taps, no snoopers, and no checkups other than the regular periodic psychans. I'll consult with you on vacation time and will arrange it to suit your convenience. I'll even agree to emergency recall, but that's the limit.” Kennon's voice was flat.

“You realize I'm agreeing to give you a great deal of personal liberty,” Alexander said. “How can I protect myself?”

“I'll sign a contingency rider,” Kennon said, “if you will specify precisely what security matters I am not to reveal.”

“I accept,” Alexander said. “Consider yourself hired.” He touched a button on his desk. “Prepare a standard 2-A contract for Dr. Jac Kennon's signature. And attach two riders, a full P-P-yes, no exceptions - and a security-leak contingency, Form 287-C. Yes - that's right - that one. And strike out all provisions of Article Twelve which conflict with the Peeper Laws. Yes. Now - and finish it as soon as you can.” He touched another button. “Well, that's that,” he said. “I hope you'll enjoy being a member of our group.”

“I think I shall,” Kennon said. “You know, sir, I would have waived part of that last demand if you had cared to argue.”

“I know it,” Alexander said. “But what concessions I could have wrung from you would be relatively unimportant beside the fact that you would be unhappy about them later. What little I could have won here, I'd lose elsewhere. And since I want you, I'd prefer to have you satisfied.”

“I see,” Kennon said. Actually he didn't see at all. He looked curiously at the entrepreneur. Alexander couldn't be as easy as he seemed. Objectivity and dispassionate weighing and balancing were nice traits and very helpful ones, but in the bear pit of galactic business they wouldn't keep their owner alive for five minutes. The interworld trade sharks would have skinned him long ago and divided the stripped carcass of his company between them.

But Outworld was a "respected" company. The exchange reports said so - which made Alexander a different breed of cat entirely. Still, his surface was perfect - polished and impenetrable as a duralloy turret on one of the latest Brotherhood battleships. Kennon regretted he wasn't a sensitive. It would be nice to know what Alexander really was.

“Tell me, sir,” Kennon asked. “What are the real reasons that make you think I'm the man you want?”

“And you're the young man who's so insistent on a personal privacy rider,” Alexander chuckled. “However, there's no harm telling you. There are several reasons.
"You're from a culture whose name is a byword for moral integrity. That makes you a good risk so far as your ethics are concerned. In addition you're the product of one of the finest educational systems in the galaxy-and you have proven your intelligence to my satisfaction. You also showed me that you weren't a spineless 'yes man.' And finally, you have a spirit of adventure. Not one in a million of your people would do what you have done. What more could an entrepreneur ask of a prospective employee?"

Kennon sighed and gave up. Alexander wasn't going to reveal a thing.

"All I hope," Alexander continued affably, "is that you'll find Outworld Enterprises as attractive as did your predecessor Dr. Williamson. He was with us until he died last month - better than a hundred years."

"Died rather young, didn't he?"

"Not exactly, he was nearly four hundred when he joined us. My grandfather was essentially conservative. He liked older men, and Old Doc was one of his choices - a good one, too. He was worth every credit we paid him."

"I'll try to do as well," Kennon said, "but I'd like to warn you that I have no intention of staying as long as he did. I want to build a clinic and I figure sixty thousand is about enough to get started."

"When will you veterinarians ever learn to be organization men?" Alexander asked. "You're as independent as tomcats."

Kennon grinned. "It's a breed characteristic, I guess."

Alexander shrugged. "Perhaps you'll change your mind after you've worked for us."

"Possibly, but I doubt it."

"Tell me that five years from now," Alexander said - "Ah - here are the contracts." He smiled at the trim secretary who entered the room carrying a stack of papers.

"The riders are as you asked, sir," the girl said.

"Good. Now, Doctor, if you please."

"You don't mind if I check them?" Kennon asked.

"Not at all. And when you're through, just leave them on the desk - except for your copy, of course." Alexander scrawled his signature on the bottom of each contract. "Don't disturb me. I'll be in contact with you. Leave your whereabouts with your hotel." He turned to the papers in front of him, and then looked up for the last time. "Just one more thing," he said. "You impress me as a cautious man. It would be just as well if you carried your caution with you when you leave this room."

Kennon nodded, and Alexander turned back to his work.

CHAPTER III

"I'd never have guessed yesterday that I'd be here today," Kennon said as he looked down at the yellow waters of the Xantline Sea flashing to the rear of the airboat at a steady thousand kilometers per hour as they sped westward in the middle traffic level. The water, some ten thousand meters below, had been completely empty for hours as the craft hurtled through the equatorial air.

"We have to move fast to stay ahead of our ulcers," Alexander said with a wry smile. "Besides, I wanted to get away from the Albertsville offices for awhile."

"Three hours' notice," Kennon said. "That's almost too fast."

"You had nothing to keep you in the city, and neither did I - at least nothing important. There are plenty of females where we are going and I need you on Flora - not in Albertsville. Besides I can get you there faster than if you waited for a company transport."

"Judging from those empty sea lanes below, Flora must be an out-of-the-way place," Kennon said with a wry smile. "Besides, I wanted to get away from the Albertsville offices for awhile."

"Rugged-looking place," he murmured.

"Most of them are deserted. Two support search and warning stations and automatic interceptors to protect our property. Look! - there's Flora." Alexander gestured at the land mass that appeared below.

Flora was a great green oval two hundred kilometers long and about a hundred wide.

"Pretty, isn't it?" Alexander said as they sped over the low range of hills and the single gaunt volcano filling the eastward end of the island and swept over a broad green valley dotted with fields and orchards interspersed at intervals by red-roofed structures whose purpose was obvious.

said. "Grandfather named it. He was a classicist in his way - spent a lot of his time reading books most people never heard of. Things like the Iliad and Gone with the Wind. The mountains he called the Apennines, and that volcano's Mount Olympus. The marshland to the north is called the Pontine Marshes - our main road is the Camino Real."

Alexander grinned. "There's a lot of Earth on Flora. You'll find it in every name. Grandfather was an Earthman and he used to get nostalgic for the homeworld. Well - there's Alexandria coming up. We've just about reached the end of the line."

Kennon stared down at the huge gray-green citadel resting on a small hill in the center of an open plain. It was a Class II Fortalice built on the efficient star-shaped plan of half a millennium ago - an ugly spiky pile of durilium, squat and massive with defensive shields and weapons which could still withstand hours of assault by the most modern forces.

"Why did he build a thing like that?" Kennon asked.

"Alexandria? - well, we had trouble with the natives when we first came, and Grandfather had a synthesizer and tapes for a Fortalice in his ship. So he built it. It serves the dual purpose of base and house. It's mostly house now, but it's still capable of being defended."

"And those outbuildings?"

"They're part of your job."

The airboat braked sharply and settled with a smooth, sickeningly swift rush that left Kennon gasping - feeling that his stomach was still floating above him in the middle level. He never had become accustomed to an arbutus landing characteristics. Spacers were slower and steadier. The ship landed gently on a pitted concrete slab near the massive radiation shields of the barricaded entranceway to the fortress. Projectors in polished dually turrets swivelled to point their ugly noses at them. It gave Kennon a queasy feeling. He never liked to trust his future to automatic machinery. If the analyzers failed to decode the ship's I.D. properly, Kennon, Alexander, the ship, and a fair slice of surrounding territory would become an incandescent mass of dissociated atoms.

"Grandfather was a good builder," Alexander, said proudly. "Those projectors have been mounted nearly four hundred years and they're still as good as the day they were installed."

"I can see that," Kennon said uncomfortably. "You ought to dismantle them. They're enough to give a man the weebies."

Alexander chuckled. "Oh - they're safe. The firing mechanism's safetied. But we keep them in operating condition. You never can tell when they'll come in handy."

"I knew Kardon was primitive, but I didn't think it was that bad. What's the trouble?"

"None - right now," Alexander said obliquely, "and since we've shown we can handle ourselves there probably won't be any more."

"You must raise some pretty valuable stock if the competition tried to rustle them in the face of that armament."

"We do." Alexander said. "Now if you'll follow me" - the entrepreneur opened the cabin door letting in a blast of heat and a flood of yellow sunlight.

"Great Arthur Fleming!" Kennon exploded. "This place is a furnace!"

"It's hot out here on the strip," Alexander admitted, "but its cool enough inside. Besides, you'll get used to this quickly enough - and the nights are wonderful. The evening rains cool things off. Well - come along." He began walking toward the arched entrance to the great building some hundred meters away. Kennon followed looking around curiously. So this was to be his home for the next five years? It didn't look particularly inviting. There was a forbidding air about the place that was in stark contrast to its pleasant surroundings.

They were only a few meters from the archway when a stir of movement came from its shadow - the first life Kennon had seen since they descended from the ship. In this furnace heat even the air was quiet. Two women came out of the darkness, moving with quiet graceful steps across the blistering hot concrete. They were naked except for a loincloth, halter, and sandals and so nearly identical in form and feature that Kennon took them to be twins. Their skins were burned a deep brown that glistened in the yellow sun light.

Kennon shrugged. It was none of his business how his employer ran his household or what his servants wore or didn't wear. Santos was a planet of nudists, and certainly this hot sun was fully as brilliant as the one which warmed that tropical planet. In fact, he could see some virtue in wearing as little as possible. Already he was perspiring.

The two women walked past them toward the airboat. Kennon turned to look at them and noticed with surprise that they weren't human. The long tails curled below their spinal bases were adequate denials of human ancestry.

"Humanoids!" he gasped. "For a moment I thought-"

"Gave you a start-eh?" Alexander chuckled. "It always does when a stranger sees a Lani for the first time. Well - now you've seen some of the livestock what do you think of them?"

"I think you should have hired a medic."

Alexander shook his head. "No - it wouldn't be reason able or legal. You're the man for the job."
"But I've no experience with humanoid types. We didn't cover that phase in our studies - and from their appearance they'd qualify as humans anywhere if it weren't for those tails!"

"They're far more similar than you think," Alexander said. "It just goes to show what parallel evolution can do. But there are differences."

"I never knew that there was indigenous humanoid life on Kardon," Kennon continued. "The manual says nothing about it."

"Naturally. They're indigenous only to this area."

"That's impossible. Species as highly organized as that simply don't originate on isolated islands." "This was a subcontinent once," Alexander said. "Most of it has been inundated. Less than a quarter of a million years ago there was over a hundred times the land area in this region than exists today. Then the ocean rose. Now all that's left is the mid continent plateau and a few mountain tops. You noted, I suppose, that this is mature topography except for that range of hills to the east. The whole land area at the time of flooding was virtually a peneplain. A rise of a few hundred feet in the ocean level was all that was needed to drown most of the land."

"I see. Yes, it's possible that life could have developed here under those conditions. A peneplain topography argues permanence for hundreds of millions of years."

"You have studied geology?" Alexander asked curiously. "Merely a casual acquaintance."

"We think the Lani were survivors of that catastrophe - and with their primitive culture they were unable to reach the other land masses," Alexander shrugged. "At any rate they never established themselves anywhere else."

"How did you happen to come here?"

"I was born here," Alexander said. "My grandfather discovered this world better than four hundred years ago. He picked this area because it all could be comfortably included in Discovery Rights. It wasn't until years afterward that he realized the ecological peculiarities of this region."

"He certainly capitalized on them."

"There was plenty of opportunity. The plants and animals here are different from others in this world. Like Australia in reverse."

Kennon looked blank, and Alexander chuckled. "Australia was a subcontinent on Earth," he explained. "Its ecology, however, was exceedingly primitive when compared with the rest of the planet. Flora's on the contrary, was - and is - exceedingly advanced when compared with other native life forms on Kardon."

"Your grandfather stumbled on a real bonanza," Kennon said. "For which I'm grateful," Alexander grinned. "It's made me the biggest operator in this sector of the galaxy. For practical purposes I own an independent nation. There's about a thousand humans here, and nearly six thousand Lani. We're increasing the Lani now, since we found they have commercial possibilities. Up to thirty years ago we merely used them for labor."

Kennon didn't speculate on what Alexander meant. He knew. For practical purposes, his employer was a slave trader - or would have been if the natives were human. As it was, the analogy was so close that it wasn't funny.

They entered the fortress, passed through a decontamination chamber that would have done credit to an exploration ship, and emerged dressed in tunics and sandals that were far more appropriate and comfortable in this tropical climate.

"That's one of Old Doc's ideas," Alexander said, gesturing at the door from which they had emerged. "He was a hound for sanitation and he infected us with the habit." He turned and led the way down an arched corridor that opened into a huge circular room studded with iris doors.

Kennon sucked his breath in with a low gasp of amazement. The room was a gem of exquisite beauty. The parquet floor was inlaid with rare hardwoods from a hundred different worlds. Parthian marble veneer covered with lacy Van tapestries from Santos formed the walls. Delicate ceramics, sculpture, and bronzes reflected the art of a score of different civilizations. A circular pool, festooned with lacelike Halsite ferns, stood in the center of the room, surrounding a polished black granite pedestal on which stood an exquisite bronze of four Lani females industriously and eternally pouring golden water from vases held in their shapely hands. "Beautiful," Kennon said softly.

"We like it," Alexander said.

"We?"

"Oh yes - I forgot to tell you about the Family," Alexander said grimly. "I run Outworld, and own fifty per cent of it. The Family owns the other fifty. There are eight of them - the finest collection of parasites in the entire galaxy. At the moment they can't block me since I also control my cousin Douglas's shares. But when Douglas comes of age they will be troublesome. Therefore I defer to them. I don't want to build a united opposition. Usually I can get one or more of them to vote with me on critical deals, but I always have to pay for their support." Alexander's voice was bitter as he touched the dilate button on the iris door beside him. "You'll have to meet them tonight. There's five of
"That isn't in the contract," Kennon said. He was appalled at Alexander. Civilized people didn't speak of others that way, even to intimates.

"It can't be helped. You must meet them. It's part of the job." Alexander's voice was grim. "Mother, Cousin Anne, Douglas, and Eloise like to play lord of the manor. Cousin Harold doesn't care - for which you should be grateful."

The door dilated, and Alexander ushered Kennon into the room. The Lani sitting on the couch opposite the door leaped to her feet, her mouth opening in an 0 of surprise. Her soft snow-white hair, creamy skin, and bright china blue eyes were a startling contrast to her black loincloth and halter. Kennon stared appreciatively.

Her effect on Alexander, however, was entirely different. His face darkened. "You!" he snapped. "What are you doing here?"

"Serving, sir," the Lani said.
"On whose authority?"
"Man Douglas, sir."

Alexander groaned. "You see," he said, turning to Kennon. "We need someone here with a little sense. Like I was telling you, the Family'd - he stopped abruptly and turned back to the Lani. "Your name and pedigree," he demanded.

"Silver Dawn, sir - out of White Magic - platinum experimental type - strain four."
"I thought so. How long have you been inhouse?"
"Almost a month, sir."

"You're terminated. Report to Goldie and tell her that Man Alexander wants you sent back to your group."

The Lani's eyes widened. "Man Alexander! - You?"

Alexander nodded.
"Gosh!" she breathed. "The big boss!"

"Get moving," Alexander snapped, "and tell Goldie to report to me in my quarters."

"Yes, sir, right away, sir!" The Lath ran, disappearing through the door they had entered with a flash of shapely white limbs.

"That Douglas!" Alexander growled. "Leave that young fool alone here for six months and he'd disrupt the entire operation. The nerve of that young pup - requisitioning an experimental type for household labor. Just what does he think he's doing?"

The question obviously didn't demand a reply, so Kennon kept discreetly silent as Alexander crossed the room to the two doors flanking the couch on which the Lani had sat. He opened the left-hand one revealing a modern grav-shaft that carried them swiftly to the uppermost level. They walked down a short corridor and stopped before another door. It opened into a suite furnished with stark functional simplicity. It fitted the entrepreneur's outward personality so exactly that Kennon had no doubt that this was Alexander's quarters.

"Sit down, Kennon. Relax while you can," Alexander said as he dropped into a chair and crossed his sandaled feet.

"I'm sure you have many questions, but they can wait."

You might as well get some rest. You'll have little enough later. The Family will probably put you through the meat grinder, but remember that they don't control this business. You're my man."

Kennon had hardly seated himself in another chair when the door opened and a plump pink-skinned Lani entered. She was considerably older than the silver-haired one he had seen earlier, and her round face was smiling.

"Ah, Goldie," Alexander said. "I understand Man Douglas has been giving you quite a time."

"It's high time you came back, sir," she said. "Since Old Doc died, Man Douglas has been impossible. He's been culling the staff and replacing them with empty-headed fillies whose only claim to usefulness is that they can fill out a halter. Pretty soon this place will be a pigsty."

"I'll take care of that," Alexander promised. "Now I'd like you to meet Old Doc's replacement. This is Dr. Kennon, our new veterinarian."

"Pleased, I'm sure," Goldie said. "You look like a nice man."

"He is," Alexander said, "but he's just as hard as Old Doc - and he'll have the same powers. Goldie's the head housekeeper," Alexander added. "She's an expert, and you'd do well to take her advice on assignments."

Kennon nodded.

"Have a maid bring us a light meal and something to drink," Alexander said. "Have a couple of porters take Dr. Kennon's things to Old Doc's house. Find Man Douglas and tell him I want to see him at once. Tell the Family that I've arrived and will see them in the Main Lounge at eight tonight. Tell Blalok I'll be seeing him at nine. That's all."

"Yes, sir," Goldie said and left the room, her tail curling buoyantly.
"A good Lani," Alexander commented. "One of the best. Loyal, trustworthy, intelligent. She's been running Alexandria for the past ten years, and should be good for at least ten more."

"Ten? - how old is she?"

"Thirty."

"Thirty - years?"

Alexander nodded.

"Good Lord Lister! I'd have guessed her at least three hundred!"

"Wrong life scale. Lani only live about one tenth as long as we do. They're mature at twelve and dead at fifty."

Alexander sighed. "That's another difference. Even without agerone we'd live to be a hundred."

"Have you tried gerontological injections?"

"Once. They produced death in about two days. Killed five Lani with them." Alexander's face darkened at an unpleasant memory. "So we don't try any more," he said. "There are too many differences." He stretched. "I'd tell you more about them but it'll be better to hear it from Evald Blalok. He's our superintendent. Steve Jordan can tell you a lot, too. He runs the Lani Division. But right now let's wait for Cousin Douglas. The pup will take his time about coming - but he'll do it in the end. He's afraid not to."

"I'd rather not," Kennon said. "It's poor manners to be injected into a family affair - especially when I'm just one of the employees."

"You're not just one of the employees. You are the Station Veterinarian, and as such you hold an authority second only to Blalok and myself. You and Blalok are my hands, ears, and eyes on Flora. You are responsible to me - and to me alone. While I defer at times to the desires of the Family, I do not have to. I run Outworld Enterprises and all the extensions of that organization. I possess control - and the Family knows it. My men are respected and furthermore they know everything that goes on." He smiled icily. "In a way it's quite a healthy situation. It keeps my relatives under control. Somehow they dislike being disciplined before outsiders. Now think no more about it."

Alexander stood up and walked over to one of the windows opening onto the broad roof gardens, and stood looking at the sun-drenched greenery.

"Odd, isn't it," Alexander said, "how beautiful nature is and how simple things are in a state of nature. It's only when man interjects himself onto a scene that things get complicated. Take Flora for instance. Before Grandfather came here, it must have been a pleasant place with the simple natives happy in their paradise. But that's all changed now. We have taken over - and they, like other lesser creatures on other worlds, have been bent to our will and uses. I could pity them, but being human I cannot afford that luxury."

Kennon understood. He, too, had felt that sensation, that odd tightening of the throat when he first saw a Varl on Santos. The Varl had been the dominant life form there until men had come. Now they were just another animal added to humanity's growing list of pets and livestock. The little Varl with their soft-furred bodies and clever six-fingered hands made excellent pets and precision workmen. The products of those clever hands, the tiny instruments, the delicate microminiaturized control circuits, the incredibly fine lacework and tapestries, formed the bulk of Santos' interstellar trade.

He had owned a Varl once and had delighted in its almost human intelligence. But the Varl weren't human and there lay their tragedy. Two thousand years of human domination had left them completely dependent on their conquerors. They were merely intelligent animals - and that was all they would ever be until the human race changed its cultural pattern or was overthrown. The one alternative was as unlikely as the other. Humanity had met some fierce competitors, but none with its explosive acquisitive nature, and none with its drive to conquer, colonize, and rule. And probably it never would.

The little Varl were one race among hundreds that had fallen before the fierceness and the greed of men. But unlike most others, the Varl were not combative. Therefore they had survived.

Yet had it been necessary to reduce them to slavery? They would never be a threat. Not only were they essentially gentle and noncombative, but their delicate bodies could not stand the strains of spaceflight. They were trapped on their world. Why should they be forced into so subordinate a role? - Why was humanity so jealous of its dominance that no other species could exist except by sufferance? Why after five thousand years of exploration, invasion, and colonization did the human race still consider the galaxy as its oyster, and themselves uniquely qualified to hold the knife? He hadn't thought this way since he had given the Varl to his girl friend of the moment, and had blasted off for Beta. Now the questions returned to haunt him. As a Betan, the haunting was even more acute, since Beta had a related problem that was already troublesome and would become more acute as the years passed.

He shrugged and laid the thought aside as a slim, dark-haired Lani entered pushing a service cart ahead of her. The two men ate silently, each busy with his own thoughts. And behind the view wall of Alexander's apartment Kardon's brilliant yellow sun sank slowly toward the horizon, filling the sky with flaming colors of red and gold,
rimmed by the blues and purples of approaching night. The sunset was gaudy and blatant, Kennon thought with mild
distaste, unlike the restful day-end displays of his homeworld.

CHAPTER IV

Douglas Alexander was a puffy-faced youngster with small intolerant eyes set in folds of fat above a button
nose and a loose-lipped sensual mouth. There was an odd expression of defiance overlaid with fear on his pudgy
features. Looking at him, Kennon was reminded of a frightened dog, ready either to bite or cower.

But it wasn't Douglas who held his eye. It was the two Lani who followed him into the room. Every line of
their bodies was perfection that spoke volumes about generations of breeding for physical elegance. They moved
with a co-ordinated grace that made Douglas look even more clumsy by contrast. And they were identical, twin
cream-and-gold works of art. They were completely nude - and Kennon for the first time in his life fully appreciated
the beauty of an unclad female. To cover them would be sacrilege, and ornaments would only detract from their
exquisite perfection.

Kennon knew that he was staring like an idiot. Alexander's amused smile told him that much. With an effort he
composed his startled features.

The pair looked at him with soft violet eyes - and it was as though some psychic bathhouse attendant had
poured ice water down his spine. For he had seen that look before, that liquid introspective look in the velvet eyes of
cattle. He shivered. For a moment he had been thinking of them as human. And somehow the lack of that
indefinable some thing called humanity robbed them of much of their glamour. They were still beautiful, but their
beauty had become impersonal.

"Don't take these as representative of the Lani," Alexander said suddenly. "They're a special case, a very special
case." He glared at his cousin. "Damn your impudence," he said without beat. "I sent for you - not your toys. Send
them away."

Douglas sulkily thrust out his lower lip. "You can't talk to me like that, Cousin Alex," he began. "I'm just a"
"You head me, Douglas. Out!" Alexander's voice didn't rise but it cut like a whip.
"Oh, very well," Douglas said. "I can't fight you - yet." He turned to the humanoids. "You heard the Boss-man.
Go home."

The two nodded in unison and departed quickly. Somehow Kennon got the impression that they were happy to
leave.

"Just wait," Douglas said. "You can't boss me forever. Just wait. I'll reach my majority in five years. I can vote
my shares then - and then I'll fix you. You won't be so high and mighty then, Mr. Big. I'll throw in with the rest of
the Family. They don't like you too much."

"Don't hold your breath waiting for the Family to help you," Alexander said. "They wouldn't have anyone else
but me handle the finances. They love money too much. And until you get your inheritance remember one thing -
I'm master here."

"I know it," Douglas said, and then curiously - "Who's the oddball?" He gestured at Kennon with a pudgy
thumb.

"Our new veterinarian, Dr. Kennon."
"Oh - great! Now you tell me!"
"There's nothing like making a good first impression," Alexander said with ironic emphasis. "I hope he cuts you
off from the Lani. He'll have the authority to do it, since he's taking Old Doc's place."

"He can't. I'm an owner. I own-"

"You own nothing. You're a minor. And under the terms of Grandfather's will, you'll own nothing except an
allowance until you reach legal age. And that brings me to the reason I brought you here. Just when did you gain the
right to reorganize the household staff? Just when did you get the power to interfere with the experimental
program?"

Douglas flushed dull red and bit his lip. "Do we have to go into this in front of strangers?"

"Kennon's my agent," Alexander said coldly, "and he might as well learn about you and the others from the
start."

"Well - what do you want him to do - watch me crawl?" Douglas asked bitterly. "You'll make me do it. You
always do. Do you want me to beg, to say I was wrong, to promise I won't do it again?"

"You've done that already," Alexander said. "Several times. You need a lesson. I won't have you meddling with
valuable animals."

"And what are you going to do about it?"

"Put you where you can do no more damage. As of tomorrow you'll go to Otpen One."

Douglas paled. His lips quivered, and his eyes flicked uneasily as he watched Alexander's granite face. "You
don't mean that," he said finally. "You're joking."
"I never joke about business."

"But you can't do that! I'll tell the Family. They won't let you."

"I already have their consent," Alexander said. "I obtained it after your last escapade. You'll be happy out there.

You can play tin god all you like. Master of life and death on a two-acre island. No one will mind. You can also go
to work. No one will mind that, either. And Mullins won't mind as long as you leave the troops alone. Now get out
of here and get packed. You're leaving tomorrow morning."

"But cousin Alex--"

"Move! I'm tired of the sight of you!" Alexander said.

Douglas turned and shambled out of the room. His ego was thoroughly deflated and he seemed more frightened
than before. Obviously the Otpens weren't the pleasantest place in this world.

"They're a military post," Alexander said. "And Commander Mullins doesn't like Douglas. Can't say that I blame
him. Douglas is a thoroughly unpleasant specimen, and incidentally quite typical of the rest of the Family."

Alexander sighed and spread his hands in a gesture that combined disgust and resignation. "Sometimes I wonder
why I have been cursed with my relatives."

Kennon nodded. The implications behind the empty eyes of Douglas's Lani sickened him. There were several
ways to produce that expression, all of them unpleasant. Hypnoconditioning, the Quiet Treatment, brainburning,
transorbital leukotomy, lobectomy - -all of the products of that diseased period of humanity's thinking when men
tampered with the brains of other men in an effort to cure psychic states. Psychiatry had passed that period, at least
on the civilized worlds, where even animal experiments were frowned upon as unnecessary cruelty.

"You saw those two Lani," Alexander said. "Grandfather had them made that way as a birthday present for
Douglas. He was getting senile. He died a year later. You'd think a man would be ashamed to keep things like that
around -- but not Douglas. He likes them." Alexander's voice was tinged with contempt. "He knows they disgust me
-- so he parades them in. I could strangle that pup sometimes!"

"I wondered about it. I wouldn't like to work for a man who permitted such things."

"That was done before I took over. For the past three years there have been no dockings, no mutilations. I can't
see treating a helpless animal like that."

"I feel better about it," Kennon said. "I didn't think you were that sort."

"Understand me," Alexander said. "I'm always opposed to senseless cruelty and waste -- particularly when it's
dangerous. Docked Lani are the height of stupidity. Just because someone wants a pet that is an exact duplicate of a
human being is no reason to risk a court action. Those Lani, and a few others whose tails have been docked, could
be a legal bombshell if they ever left Flora."

Kennon was jolted. He had been thinking of mental mutilation and Alexander had been talking physical.

Naturally they would be dangerous property. Anyone attempting to sell a docked Lani would probably be thrown in
Detention and charged with slave trading.

"Did you ever figure the cost of taking a legal action through our court system?" Alexander asked. "Even the
small ones set you back four or five thousand, and a first-class action like a Humanity Trial could cost over a
million. Grandfather found that out. Sure, there are differences between Lani and humans, but a smart lawyer can
make them seem trivial until the final test and that would drag on for nearly two years until all the requirements
were satisfied -- and by that time the unfavorable publicity would drop sales to zero. The Family would be on my
neck for lost dividends, and I'd lose much of the control I hold over them.

"Sure, it's possible that prehensile tails could be produced by mutation, but so far as we know it hasn't happened
in human history. As a result, the tail serves as a trade-mark - something that can be easily recognized by anyone. So
we sell them intact." Alexander crossed his legs and settled back in his chair. "Shocks you, doesn't it?"

Kennon nodded. "Yes," he admitted. "It does."

"I know. You can't help it. Most of our new employees think the Lani are human - at first. They learn better, but
adjustment is always a strain. They keep confusing external appearances with the true article. But remember this --
Lani are not human. They're animals. And on this island they're treated as what they are -- no more, no less. They
are a part of our economics and are bred, fed, and managed according to sound livestock principles. Despite some of
the things you may see here in Alexandria, don't forget that. You are a veterinarian. Your job is to handle disease
problems in animals. Lani are animals. Therefore you will be doing your job. I was disappointed in your reaction
when you first saw them, but I suppose it was natural. At any rate this should clear the air."

"It does -- intellectually," Kennon admitted. "But the physical resemblance is so close that it is difficult to
accept."

Alexander smiled. "Don't worry. You'll accept it in time. Now I think it's time that you met the Family."

CHAPTER V

The main salon was crowded. The huge room, glittering with mirrors and crystal, floored with thick carpets,
and hung with rich drapes, had something of the appearance of a Sarkian harem. Although there were only five of
the Alexander family present, there were at least twenty Lani whose costumes ranged from the black G string and
halter of the household staff to the utter nudity of Douglas’s playthings. They were all female, and Kennon wondered
for a moment what a male was like.

Besides Alexander, there were two men and three women: Douglas, still with his sulky expression, an older
man in his late nineties who looked like Douglas’s eider brother, two mature women who could be any age from fifty
to three hundred, and a girl. She might have been thirty --- perhaps younger, perhaps older, a lean feminine edition of
Alexander, with the same intriguing face and veiled predatory look. There was a hardness about her that was absent
in the others. Kennon had the feeling that whatever this girl did, she didn’t do it half way.

"My sister Eloise," Alexander said in a low voice. "Watch out for her. She’s as deadly as a puff adder and she
collects men. The other man is Douglas’s father, Henry. The plump redhead beside him is his wife, Anne. The other
woman is my mother, Clara, even though Eloise and I don’t look like her. We take after Father."

"Where’s he?" Kennon whispered.

"Dead," Alexander replied. "He was killed twenty years ago."

"I'd like to present Dr. Jac Kennon, our new veterinarian," Alexander said into the hush that followed their
entrance. The introductions that followed were in proper form, and Kennon was beginning to feel more at ease until
Eloise sent one of her Lani with a summons. He looked around for Alexander, but the entrepreneur was the center of
a three-cornered argument, hemmed in by Douglas, Henry, and Anne. Henry’s voice was raised in bitter protest that
Alexander was exceeding his authority. He shrugged. There was no help there.

"All right," he said, "tell your mistress I’ll be along in a moment."

"Yes, Doctor," the Lani said, "but the Woman Eloise says for you to come, and she is not accustomed to being
disobeyed."

"Tell her what I said," Kennon replied. "I shall be there directly." He crossed to the table and examined it,
selecting a cluster of odd purple fruit which looked more interesting than it tasted. When he had finished he walked
leisurely over to where Eloise sat.

She looked at him angrily. "I am accustomed to being obeyed by my employees," she said coldly. Her dark
eyes, oddly like her brother’s, traversed his hard body like twin scanners.

He returned her appraising stare with one of his own. "I’m not your employee," he said bluntly. "I was hired by
your brother, and there’s a full peeper rider on my contract." His eyes traveled slowly over her carefully arranged
hair, her make-up, her jewelry at throat and arms, her painted finger- and toenails, and then across the slim small-
breasted lines of her body half revealed under her thin ankle-length tunic of Lyranian silk.

"Satisfied?" she asked.

"On Beta," he said bluntly, "your appearance would qualify you for a parasite camp. Six months of hard labor
would do you no end of good. You’re soft, lazy, and undisciplined."

Eloise gasped. "Why, you----" she sputtered.

"And perhaps next time you’ll learn to be polite," Kennon continued imperturbably. "After all, the superficial
attributes of good breeding are not too hard to counterfeit."

To his surprise, Eloise giggled. "You bite, don’t you?" she asked. "Remind me to remember that."

"I shall."

"Of course, your actions weren’t good breeding either."

"Admitted -- but I’ve never pretended to be what I’m not. I’m the son of a spaceship skipper, and I’m a
veterinarian. That’s all."

"That’s not all. You are also a man." Her face was sober, "It’s been some time since I’ve met one. I’d almost
forgotten they existed."

"There’s your brother."

"Alex? -- he’s a money making machine. Come -- sit beside me and let’s talk."

"About what?"

"You -- me -- your job, your life -- anything you wish?"

"That line isn’t exactly new," Kennon grinned.

"I know," she admitted, "but it usually works."

"I’m immune."

"That’s what you think." Eloise’s eyes were frankly appraising. "I think I could become interested in you."

"I have a job here. I don’t think I would have time to give you the attention you’d demand."

"I get bored easily. It probably wouldn’t be long before I would be tired of you."

"Perhaps -- and perhaps not, I can’t afford to take the chance."

"You seem confident."
"You forget. I was a sailor."
"And spacemen have a reputation, eh?" Eloise chuckled.
"At that, you might be right. I remember the first officer of--"she let the thought die. "But I became tired of him," she finished.
Kennon smiled. "I've never had that complaint."
"Perhaps you'd like to make the acid test?" she asked.
"Perhaps," he said. "But not tonight."
"Tomorrow then? Alex will be leaving in the morning. He never stays more than a few hours." Eloise's eyes were bright, her lips moist and red.
"I'll pick the time," Kennon said -- and added to himself, "If ever." Despite her wealth Eloise was no different from the port-of-call girls. If anything, she was worse since she had enough money to implement her desires. They were merely in the trade for business reasons. No -- Eloise would be something to steer clear of. Alexander was right. She was a mantrap. He stood up and bowed Betan fashion. "I see your brother is free now. He wants to brief me on my duties here. We were discussing it before we entered."
Eloise pouted. "You can always do that."
"You said yourself that Alexander never stays here very long. I would be a poor employee if I delayed him." He grinned knowingly at her and she smiled back with complete understanding.
"Very well, then. Get your business done. Your pleasure can wait."
Kennon steered Alexander over to an open window that led to a balcony. "Whew! he said. "I see what you mean."
"She's a tartar," Alexander agreed. "I suspect that she's a nymphomaniac."
"You suspect?" Kennon asked. "By this time you should know. Let's get out of here. I've had about all of your sister I care to take."
"Can't say as I blame you. I'll show you to your quarters. Maybe Old Doc left a bottle or two, although I suspect the old sinner hung on until the last one was empty."
"If he had to put up with your relatives as a steady diet, I can't say that I blame him," Kennon said.
"Careful, Doctor. You're talking about my kinfolk," Alexander said wryly. "At that, though, you have a point."
The two men slipped quietly from the room. Apparently none of the Family was conscious of their departure except Eloise, who watched them leave with an enigmatic expression on her narrow face.
They left the fortress through the rear gate and walked slowly down the winding path that led to the cluster of buildings in the valley below. It was a beautiful night, calm and clear with the stars shining down from the dark vault of the heavens. The constellations were strange, and Kennon missed the moons. Beta had three, two of which were always in the sky, but Kardon was moonless. Somehow it gave the sky an empty look.
A damp coolness rose from the ground as the evening rain evaporated mistily into the still air. Kennon sniffed the odor of soil and growing vegetation, clean pleasant odors in contrast to what he had left. In the distance a bird called sleepily from one of the fortress turrets and was answered by some creature Kennon couldn't identify. A murmur of blended sound came from the valley below, punctuated by high-pitched laughter. Someone was singing, or perhaps chanting would be a better description. The melody was strange and the words unrecognizable. The thin whine of an atomotor in the fortress's generating plant slowly built up to a keening undertone that blended into the pattern of half-perceived sound.
"Nice, isn't it?" Alexander remarked as they rounded another turn on the switchback path.
"Yes. You can't hear a sound from back there except for that generator. It's almost as though we shut those people out of existence by merely closing a door."
"I wish it were that simple," Alexander said. "But doors that can be closed can also be opened. Well - think you'll like it here?"
"I wish it were that simple," Alexander said. "But doors that can be closed can also be opened. Well - think you'll like it here?"
"I think so, providing I don't have to entertain your relatives."
"You mean Eloise? Don't worry about her. She's as fickle as the wind."
"I've never seen anyone so frankly predatory," Kennon said. "She worries me."
"They'll all be gone tomorrow -- except for Eloise," Alexander said with mock comfort. "Douglas is on the Otpens for a year, and the others are off somewhere."
"You'll be staying, I suppose."
"No -- I'm afraid I can't."
"I hoped you'd help me get organized. This whole thing has been something of a shock. I was expecting something entirely different."
"Sorry -- someone has to run the business. But Blalok'll brief you. Actually he's more qualified than I. He knows everything worth knowing about this place. We're going past his house in a minute--want to stop in and see
"It's pretty late."
"Not for Blalok. He's a Mystic -- a nocturnal. He's probably doing his work now."
"Perhaps we shouldn't disturb him."
"Nonsense. He's used to it. I visit him frequently at night."
"Sure -- but you're the boss."
"Well -- in a sense you are too. At least in the veterinary end of this business."
Alexander swung sharply to the left and climbed a short flight of stairs that led to the nearest house. Lights flared on the deep porch, and the old-fashioned iris door dilated to frame the black silhouette of a stocky, broad-shouldered man.
"Good evening, sir," he said. "I was expecting you. That the new vet with you?"
"Your pipeline's still working, I see," Alexander said. "Yes, this is Dr. Kennon -- Evald Blalok -- I wanted you two to meet."

Kennon liked the gray middle-aged man. He looked honest and competent, a solid quiet man with a craggy face and the deep-set eyes of a Mystic. His skin had the typical thickness and pore prominence of the dwellers on that foggy world from which he came. But unlike the natives of Myst, his skin was burned a dark brown by Kardon's sun. He seemed out of place on this tropic world, but Kennon reflected wryly that there was probably more than one misplaced human here, himself included.

"I've been going over Station Fourteen's records with Jordan," Blalok said as he ushered them into the house. A tall black-haired man rose as they entered.
"Skip the formality, Jordan. Sit down," Alexander said, "and meet Dr. Kennon -- Steve Jordan -- Jordan runs the Lani Division."
Kennon nodded acknowledgment as Alexander continued, "What's this trouble at Fourteen?"
"I don't know. We've got an epizootic of something. Another youngster died this morning, and there's three more that look pretty bad, jaundice, no appetite, complaining of muscular pains. Same symptoms as took the others. The one this morning makes the fourth this month, and we're only half through it."
"Are all your losses in this one station?" Kennon asked.
"No -- but it's worst there."
"I don't like losses like that," Alexander said.
"Neither do I," Jordan replied.
"This isn't Jordan's fault, sir," Blalok said quickly. "As you know, we haven't had a vet for three months."
"Two," Alexander corrected.
"Three -- Old Doc wasn't around at all the month before he died," Blalok said. "As a result we've got a problem. We need professional help."
"Well here he is -- use him," Alexander said. He looked at Kennon, a trace of amusement on his face. "There's nothing like getting into things early."
"Particularly when one comes into them stone cold," Kennon added. "It's a poor way to start a career."
"We can't afford to wait," Jordan said. "We need help."
"I'll see what can be done," Kennon replied. "Have you saved the body?"
"Every one of them," Jordan said. "They're in the hospital in the autopsy room."
That was sensible. A post-mortem might give us an answer. Where's the hospital?"
"I'll show you," Jordan offered.
"Count me out," Alexander said. "I have a weak stomach."
"I'll go along if it's necessary," Blalok said.
"There's a staff there, Old Doc trained them," Jordan said.
"Then it shouldn't be necessary," Kennon said.
Blalok sighed with relief and turned to Alexander. "We could check the records while those two are about their bloody work."
"I'd rather check a long strong drink," Alexander replied. "What with the Family and this, it's too much to take for one evening."

Kennon hid a smile. Alexander had a weak spot. He was squeamish. That was a good thing to know.

CHAPTER VI
Jordan opened the door of the two-story building below Blalok's house. "This is it," he said, "just outside your front door. Convenient -- no?"
"Too convenient," Kennon said, "also too quiet. Isn't anyone on duty?"
"I wouldn't know. Old Doc never kept the place open at night."
There was a stir of movement in the darkness, the lights flashed on, and a sleepy-eyed Lani blinked at them in
the sudden glare. She looked blankly at Kennon and then brightened as she saw Jordan. "What's the trouble, sir?"

"Nothing. We want to look at the Lani I sent down this morning -- Dr. Kennon would like to inspect the carcass."

"You're the new doctor?" the Lani asked. "Thank goodness you've come! I'll get the staff. I'll be back in a moment." She stepped quickly over to the switchboard beside the door and punched five buttons. Four more humanoids came into the room, followed a little later by a fifth.

"Where's the emergency?" one asked.

"He is -- it's our new doctor."

"More females," Kennon muttered to himself. He turned to Jordan. "Aren't there any males in this crew?"

Jordan stared at him with mild surprise. "No, sir -- didn't you know? There are no male Lani."

"What?"

"Just that," Jordan said. "Only females. There hasn't been a male on the island since Old Man Alexander took over. He killed them all."

"But that's impossible! How do they reproduce?"

"Ever hear of artificial fertilization?"

"Sure -- but that's a dead end. The offspring are haploids and they're sterile. The line would die out in a generation."

"Not the Lani--you can see for yourself. We've been using the technique here for better than four centuries, and we're still doing all right. Over forty generations so far, and from the looks of things we can go on indefinitely."

"But how is it done?"

"I don't know. That's Alexander's secret. The Boss-man doesn't tell us everything. All I know is that we get results. Old Doc knew how it was done, and I suppose you will too, but don't ask me. I'm dumb."

Kennon shrugged. Maybe -- maybe not. At any rate there was no sense in belaboring the point. He turned to the staff. Five of them were the same big-boned heavy-framed type that apparently did most of the manual labor. The sixth, the late arrival, was an elegant creature, a bronze-skinned, green-eyed minx with an elfin face half hidden under a wavy mass of red-brown hair. Unlike the others, she had been docked - and in contrast to their heavy eyes and sleep-puffed features she was alert and lively. She flashed him an impish grin, revealing clean white teeth.

Kennon smiled back. He couldn't help it. And suddenly the tension and strangeness was broken. He felt oddly at ease. "Which of you are on duty?" he asked.

"All of us," the redhead replied, "if it's necessary. What do you want us to do?"

"He's already told me. He wants that last carcass prepped for a post-mortem," the nightcall Lani said.

"Good," the redhead said. "I'll be nice to get to work again." She turned to face Kennon. "Now, Doctor -- would you like to see your office? Old Doc left a fine collection of notes on Lani anatomy and perhaps you could do with a little review."

"I could do with a lot of it," Kennon admitted. "Unless the inner structure of a Lani is as similar to human as their outer."

"There are differences," the redhead admitted. "After all, we aren't quite alike."

"Perhaps I'd better do some reading," Kennon said.

"You need me any more?" Jordan asked.

"No -- I think not."

"Good. I'll get back. Frankly, I don't like this any better than Blalok or the boss, but I'm low man on that pole. See you later."

Kennon chuckled as Jordan left. "Now, let's get ready for that cadaver," he said.

"Carcass, doctor," the redhead corrected. "A cadaver is a dead human body." She accented the "human."

Even in death there is no equality, Kennon thought. He nodded and the Lani led the way to a door which opened into a good-sized office, liberally covered with bookshelves. An old-fashioned plastic desk, some office cybernetics, a battered voicewriter, and a few chairs completed the furnishings. The redhead placed several large folio volumes in front of him and stepped back from the desk as he leafed rapidly through the color plates. It was an excellent atlas. Dr. Williamson had been a careful and competent workman.

Half an hour later, well fortified with a positional knowledge of Lani viscera, Kennon looked up at the redhead. She was still standing patiently, a statue of red-gold and bronze.

"Get a smock and let's go," he said. "No -- wait a minute."

"Yes, sir?"

"What's your name? I don't want to say 'Hey you!'"

She smiled. "It's Copper Glow - want my pedigree too?"
"No -- it wouldn't mean anything to me. Do they call you Copper or Glow? or both?"
"Just Copper, sir."
"Very well, Copper - let's get going."

* * *

The body of the dead Lani lay on the steel table, waxy and yellowish in the pitiless light of the fluorescents. She had been hardly more than a child. Kennon felt a twinge of pity - so young - so young to die. And as he looked he was conscious of another feeling.

It had been an open secret among his classmates that he had refused an offer to study human medicine because of his aversion to dissecting cadavers. The sarcoplasmic models were all right, but when it came to flesh, Kennon didn't have the stomach for it. And now, the sight of the dead humanoid brought back the same cold sweat and gut-wrenching nausea that had caused him to turn to veterinary medicine eight years ago.

He fought the spasms back as he approached the table and made the external examination. Icterus and a swollen abdomen - the rest was essentially normal. And he knew with cold certainty that he could not lay a scalpel edge upon that cold flesh. It was too human, too like his own.

"Are you ready, Doctor?" the Lani standing across the table from him asked. "Shall I expose the viscera?"

Kennon's stomach froze. Of course! He should have realized! No pathologist did his own dissection. He examined. And that he could do. It was the tactile, not the visual sensations that upset him. He nodded. "The abdominal viscera first," he said.

The Lani laid back the skin and musculature with bold, sure strokes. An excellent prosectress, Kennon thought. Kennon pointed at the swollen liver and the Lani deftly severed its attachments and laid the organ out for inspection. The cause of death was obvious. The youngster had succumbed to a massive liver-fluke infestation. It was the worst he had ever seen. The bile ducts were thick, calcified and choked with literally thousands of the gray-green leaf-shaped trematodes.

"Let's look at the others," he said.

Two more post-mortems confirmed the diagnosis. Except for minor differences, the lesions were identical. He removed a few of the flukes and set them aside for further study.

"Well that's that," he said. "You can clean up now."

He had found the criminal, and now the problem assumed the fascinating qualities of a crime hunt. Now he must act to prevent further murders, to reconstruct the crime, to find the modus operandi, to track the fluke to its source, and to execute it before it could do more harm.

Photographs and tri-dis would have to be taken, the parasite would have to be identified and its sensitivity to therapy determined. Studies would have to be made on its life cycle, and the means by which it gained entrance to its host. It wouldn't be simple, because this trematode was probably Hepatodirus hominis, and it was tricky. It adapted, like the species it parasitized.

Kennon leaned back from the microscope and studied the illustrations in the parasitology text. No matter how much Hepatodirus changed its life cycle, it could not change its adult form. The arrangements of the suckers and genital structures were typical. Old Doc's library on parasites was too inadequate for more than diagnosis. He would have to wait for his own books to be uncrated before he could do more than apply symptomatic treatment. He sighed and rose slowly to his feet. Tomorrow was going to be a busy day.

The door opened behind Mm and Copper slipped quietly into the office. She looked at him curiously, a faint half-shy smile on her face.

"What is it?" Kennon asked.
"Are you ready to fill out the autopsy protocol? It's customary."
"It's also customary to knock on a door before entering."
"Is it? Old Doc never mentioned it."
"I'm not Old Doc."
"No, you're not," she admitted. "You're much younger - and far more beautiful. Old Doc was a fat, gray old man." She paused and eyed Kennon appraisingly with a look on her pointed face that was the virtual twin of Eloise's. "I think I'll like working for you if you're as nice as you are pretty."

"You don't call a man beautiful or pretty!" Kennon exploded.
"Why not?"
"It just isn't done"
"You're a funny human," she said. "I called Old Doc beautiful, and he didn't mind."
"That's different. He was an old man."
"What difference does that make?"
"I don't like it," Kennon said, hitting on the perfect answer.
She stiffened. "I'm sorry, Doctor. I won't do it again." She looked down at him, head cocked sideways. "I guess I have a lot to learn about you. You're much different from Old Doc. He didn't snap at me." She paused for a moment, then drew a deep breath.

Kennon blinked.

"About that report," she said. "Regulations require that each post-mortem be reported promptly and that a record of the Lani concerned be posted in the death book together with all pertinent autopsy data. Man Blalok is very fussy about proper records." She drew one of the chairs to a spot beside the desk and sat down, crossed her long legs, and waited expectantly.

Kennon's mouth was suddenly dry. This situation was impossible. How in the name of Sir Arthur Fleming could he dictate a coldly precise report with a naked redhead sitting beside him? "Look," he said. "I won't need you. I can operate a voicewriter. You can pick up the material later and transcribe it."

Her face fell. "You don't like me," she said, her green eyes filling with quick tears. "Old Doc never---"

"Oh, damn Old Doc!" Kennon snapped. "And stop that sniveling -- or get out. Better yet -- get out and stop sniveling!"

She leaped to her feet and fled.

Kennon swore. There was no reason for him to act that way. He had been more brutal than necessary. But the girl -- no, the Lani -- was disconcerting. He felt ashamed of himself. He had behaved like a primitive rather than a member of one of the oldest human civilizations in the galaxy. He wouldn't bark at a dog that way. He shook his head. Probably he was tired. Certainly he was irritable, and unclad females virtually indistinguishable from human weren't the most soothing objects to contemplate.

He wondered if his exasperation was real or merely a defense mechanism. First Eloise, and then this! Confound it! He was surrounded! He felt trapped. And it wasn't because he'd been away from women too long. A week was hardly that. He grinned as he recalled the blonde from Thule aboard the starship. Now there was a woman, even though her ears were pointed and her arms were too long. She didn't pressure a man. She let him make the advances. He grinned. That was it. He was on the defensive. He was the one who was being pursued -- and his male ego had revolted. He shrugged and turned his attention to the autopsy report, but it was hopeless. He couldn't concentrate. He jotted a few notes and dropped them on the desk -- tomorrow would be time enough. What he needed now was a stiff drink and eight hours' sleep.

CHAPTER VII

Kennon stopped at Blalok's house long enough to tell the superintendent what was causing the trouble. Blalok scowled. "We've never had flukes here before," he said. "Why should they appear now?"

"They've been introduced," Kennon said. "The thing that bothers me is how Dr. Williamson missed them."

"The old man was senile," Blalok said. "He was nearly blind the last six months of his life. I wouldn't doubt that he let his assistants do most of his work, and they could have missed them."

"Possibly, but the lesions are easy to see. At any rate, the culprit is known now."

"Culprit?"

"Hepatodirus hominis -- the human liver fluke. He's a tricky little fellow -- travels almost as far as men do."

"I'm glad it's your problem, not mine. All I can remember about flukes is that they're hard to eradicate."

"Particularly H. hominis."

"You can tell me about it later. Right now Mr. Alexander's over at Old -- your house. Probably he's looking for you."

"Where's Jordan?"

"He went up to Station Fourteen. We'll see him tomorrow."

"I'll say good night then," Kennon said.

"I'm glad you're here. It's a load off my shoulders. See you tomorrow." Blalok waved a friendly good night and left the lights on long enough for Kennon to make his way to his quarters.

Alexander was seated in a heavily upholstered chair listening to a taped symphony in the stereo, his eyes half closed, an expression of peace on his face. An elderly Lani stood beside him. It was a comfortable picture.

The humanoid saw Kennon and gasped, a tiny indrawn sound of surprise. Alexander's eyes snapped open. "Oh -- it's you," he said. "Don't worry, Kara -- it's your new doctor."

Kara smiled. "You startled me," she said. "I was dreaming."

"On your feet?" Alexander interjected idly.

"I should have known you at once, Doctor. There's talk about you all over the yards, ever since you arrived."

"They know what is going on around here better than any of us," Alexander chuckled. "The grapevine is amazingly efficient. Well -- what's the story?"

"Liver fluke."
"Hmm - not good."
"I think it can be stopped. I looked at the records. It doesn't seem to have been here too long."
"I hope you're right. How long will it take?"
"Several months, maybe a year, maybe more. I can't say. But I'll try to clean it up as quickly as possible. I'm pretty sure of the fluke, and it's a hard one to control."
"Hepatodirus?"
Kennon nodded.
"That's an offworld parasite, isn't it?"
"Yes. It originated on Santos. Parasitized the Varl originally, but liked humans better. It's adapted to a hundred different planetary environments, and it keeps spreading. It's a real cutie - almost intelligent the way it behaves. But it can be licked."
"Good - get on it right away."
"I'm starting tomorrow."
"Fine -- I thought you'd be the right man. Kara! Fix the doctor a drink. We might as well have a nightcap -- then I'll go back to the house and listen to Henry and Anne's screams about poor mistreated Douglas, and then back to Albertsville tomorrow. Duty and the credits call."

With mild surprise, Kennon realized that Alexander was drunk. Not obnoxiously, but enough to change his character. Intoxicated, he was a friendlier person. If there was any truth in the ancient cliche about alcohol bringing out a man's true character, then Alexander was basically a very nice person indeed.

"Well -- here's your home for the next five years," Alexander said. "Eight rooms, two baths, a freshener, and three Lani to keep the place running. You've got it made."
"Perhaps -- we'll see when we tackle this fluke infestation. Personally, I don't think I'm going to have an easy time. Tomorrow I'm going to be up to my neck in trouble trying to save your profits."
"You'll do it. I have confidence in you."
"I still think you should have hired a medic."
"This isn't all of your job," Alexander said. "And besides I can't afford to do it. Oh - not the money, but it might be admitting that the Lani might be human. And we've gone to a great deal of trouble to prove they're not." He shifted uncomfortably in his chair. "There's a story behind this."
"I wouldn't doubt it."
"Maybe it'd be better if I told it. It goes back over four centuries. Grandfather was a clever man. After he had secured this island he became worried about the surviving Lani. He didn't want to be accused of genocide, since the Lani were so human in appearance. So he had his medical officer make a few autopsies. The M.D. reported that while there was similarity, the Lani were probably not human."
"That was enough for Grandfather. He requested a Court of Inquiry. The court was sitting in Halsey and the hearing was private. Even so, it leaked and Grandfather was highly unpopular for a time until the lab reports came in. It cost him over eight hundred Ems and nearly two years' time to finish the case, but when it was over the Lani were declared alien, and Grandfather had ironclad discovery rights."
"They really put him through the mill. Grandfather furnished the bodies and three court-appointed M.O.'s went through them with microscopes. They didn't miss a thing. Their reports are so detailed that they're classics of their kind. They're almost required reading for anyone who wants to learn Lani structure and function. The court rendered an interim decision that the Lani were nonhuman, and armed with this, Grandfather prepared the final tests which were run by a team of court-appointed medics and biologists, who made in vitro and live tests on a number of Lani female prisoners. The tests ran for over two years and were totally negative. So the Alexander family acquired Flora and the Otpens, and a legal status." Alexander stood up. "Well -- that's a capsule summary. The records are in the library if you'd care to check them."
"Why?"
"Just to prove we're honest." He moved carefully toward the door, opened it, and disappeared into the night.

Silently Kennon watched him descend the porch steps. He seemed steady enough. For a moment Kennon debated whether he should see him home -- and then decided against it. If Alexander needed help he'd have asked for it. As it was, it was better to leave things alone. Certainly he didn't know Alexander well enough to act as a guardian. He turned back to the living area. The stereo was playing something soft and nostalgic as Kennon sank into the chair Alexander had vacated. He let his body relax. It had been as full a day as he had ever spent filled with changes so abrupt that they were exhausting. He felt confused. There were no precedents he could apply. Neither his studies nor his travels had prepared him for living in a situation like this.

Legally and biologically the Lani weren't human. But they were intelligent, upright, bipedal mammals whose morphology was so close to man's that it had taken the ultimate test to settle their status. And being a Betan, Kennon
was suspicious of the accuracy of that ultimate test.

But the Brotherhood of Man was based upon it. The feeling of unity that pervaded mankind's expanding empire was its product. From almost the beginning of mankind's leap to the stars it had been recognized that men must help each other or perish. The spirit of co-operation against the common enmity of alien worlds and cultures transcended the old petty rivalries on Earth. Men -- all men -- were brothers in arms.

And so the Brotherhood was born -- and the concept born of necessity developed its muscles in a thousand battles on a thousand hostile worlds. And ultimately it evolved into the only form of central authority that men would accept. Yet basically it was not a government. It was an attitude of mind. Men accepted its decisions as they would accept the rulings of a family council, and for the same reasons.

The Brotherhood laid down certain rules but it did not attempt to enforce them. After all, it didn't need to. It also arbitrated disputes, admitted new worlds to membership, and organized concerted human effort against dangerous enemies. And that was all. Yet in its sphere the authority of the Brotherhood was absolute.

There was only one criterion for membership in the Brotherhood -- membership in the human race. No matter how decadent or primitive a population might be, if it was human it was automatically eligible for Brotherhood - a free and equal partner in the society of human worlds.

Kennon doubted that any nonhuman race had ever entered the select circle of humanity, although individuals might have done so. A docked Lani, for instance, would probably pass unquestioned as a human, but the Lani race would not. In consequence they and their world were fair prey, and had been attacked and subjugated.

Of course, proof of inhumanity was seldom a problem. Most alien life forms were obviously alien. But there were a few -- like the Lani--where similarities were so close that it was impossible to determine their status on the basis of morphology alone. And so the Humanity Test had come into being.

Essentially it was based upon species compatibility -- on the concept that like can interbreed with like. Tests conducted on every inhabited world in the Brotherhood had proven this conclusively. Whatever changes had taken place in the somatic characteristics of mankind since the Exodus, they had not altered the compatibility of human germ plasm. Man could interbreed with man - aliens could not. The test was simple. The results were observable. And what was more important, everyone could understand it. No definition of humanity could be more simple or direct.

But was it accurate?

Like other Betans, Kennon wondered. It was -- so far - probably. The qualifying phrases were those of the scientist, that strange breed that refuses to accept anything as an established fact until it is proven beyond a shadow of a doubt. After all, the human race had been spaceborne for only six thousand years -- scarcely time for any real differences to develop. But physical changes had already appeared -- and it would only be a question of time before these would probably be followed by genetic changes. And in some groups the changes might be extensive enough to make them genetic strangers to the rest of humanity.

What would happen then? No one knew. Actually no one bothered to think about it except for a few far-seeing men who worried as they saw.

Probably.
Might.
Possibly.
If.

Four words. But because of them the Betans were slowly withdrawing from the rest of humanity. Already the radiations of Beta's variant-G sun had produced changes in the population. Little things like tougher epidermis and depilation of body hair -- little things that held alarming implications to Beta's scientists, and to Beta's people. Not too many generations hence a Betan outside his home system would be a rarity, and in a few millennia the Betan system itself would be a closed enclave peopled by humans who had deviated too far from the basic stock to mingle with it in safety.

Of course, the Brotherhood itself might be changed by that time, but there was no assurance that this would happen. And mankind had a history of dealing harshly with its mutants. So Beta would play it safe.

Kennon wondered if there were other worlds in the Brotherhood that had come to the same conclusion. Possibly there were. And possibly there were worlds where marked deviations had occurred. There wasn't a year that passed that didn't bring some new human world into the Brotherhood, and many of these had developed from that cultural explosion during the First Millennium known as the Exodus, where small groups of colonists in inadequate ships set out for unannounced goals to homestead new worlds for man. Some of these survived, and many were being discovered even at this late date. But so far none had any difficulty in proving their human origin.

The Lani, conceivably, could have been descendants of one of these groups, which probably explained the extreme care the Brotherhood courts had taken with their case. But they had failed the test, and were declared
animals. Yet it was possible that they had mutated beyond genetic compatibility. If they had, and if it were proved, here was a test case that could rock the galaxy -- that could shake the Brotherhood to its very foundations -- that could force a re-evaluation of the criteria of humanity.

Kennon grinned. He was a fine employee. Here he was, less than a full day on the job, dreaming how he could ruin his employer, shake the foundation of human civilization, and force ten thousand billion humans to change their comfortable habit patterns and their belief in the unchangeable sameness of men. He was, he reflected wryly, an incurable romantic.

CHAPTER VIII

"Wake up, Doctor, it's six A.M." A pleasant voice cut through Kennon's slumber. He opened one eye and looked at the room. For a moment the strange surroundings bothered him, then memory took over. He stirred uncomfortably, looking for the owner of the voice.

"You have your morning calls at seven, and there's a full day ahead," the voice went on. "I'm sorry, sir, but you should get up." The voice didn't sound particularly sorry.

It was behind him, Kennon decided. He rolled over with a groan of protest and looked at his tormentor. A gasp of dismay left his lips, for standing beside the bed, a half smile on her pointed face, was Copper -- looking fresh and alert and as disturbing as ever.

It wasn't right, Kennon thought bitterly, to be awakened from a sound sleep by a naked humanoid who looked too human for comfort. "What are you doing here?" he demanded.

"I'm supposed to be here," Copper said. "I'm your secretary." She grinned and flexed a few curves of her torso. Kennon was silent.

"Is there anything wrong?" she asked.

For a moment Kennon was tempted to tell her what was wrong -- but he held his tongue. She probably wouldn't understand. But there was one thing he'd better settle right now. "Now look here, young lady--" he began.

"I'm not a lady," Copper interrupted before he could continue. "Ladies are human. I'm a Lani."

"All right," Kennon growled. "Lani or human, who cares? But do you have to break into a man's bedroom and wake him in the middle of the night?"

"I didn't break in," she said, "and it isn't the middle of the night. It's morning."

"All right -- so it's morning and you didn't break in. Then how in Halstead's sacred name did you get here?"

"I sleep next door," she said jerking a thumb in the direction of an open door in the side wall. "I've been there ever since you dismissed me last night," she explained.

The explanation left Kennon cold. The old cliche about doing as the Santosians do flicked through his mind. Well, perhaps he would in time -- but not yet. The habits of a lifetime couldn't be overturned overnight. "Now you have awakened me," he said, "perhaps you'll get out of here."

"Why?"

"I want to get dressed."

"I'll help you."

"You will not! I'm perfectly capable of taking care of myself. I've been dressing myself for years. I'm not used to people helping me."

"My -- what a strange world you must come from. Haven't you ever had a Lani before?"

"No."

"You poor man." Her voice was curiously pitying. "No one to make you feel like the gods. No one to serve you. No one to even scrub your back."

"That's enough," Kennon said. "I can scrub my own back."

"How? -- you can't reach it."

Kennon groaned.

"Weren't there any Lani on your world?"

"No."

"No wonder you left it. It must be quite primitive."

"Primitive!" Kennon's voice was outraged. "Beta has one of the highest civilizations in the Brotherhood!"

"But you don't have Lani," she said patiently. "So you must be primitive."

"Halstead, Fleming, and Ochsner!" Kennon swore. "Do you believe that?"

"Naturally, isn't it obvious? You can't possibly be civilized unless you take responsibility for intelligent life other than your own race. Until you face up to your responsibilities you are merely a member of a dominant race, not a civilized one."

Kennon's reply caught in his throat. His eyes widened as he looked at her, and what he was about to say remained unspoken. "Out of the mouths of humanoids--" he muttered oddly.
"What does that mean?" Copper asked.

"Forget it," Kennon said wildly. "Leave me alone. Go put on some clothes. You embarrass me."

"I'll go," Copper said, "but you'll have to be embarrassed. Only household Lani wear cloth." She frowned, two vertical furrows dividing her dark brows. "I've never understood why inhouse Lani have to be disfigured that way, but I suppose there's some reason for it. Men seldom do anything without a reason."

Kennon shook his head. Either she was grossly ignorant, which he doubted, or she was conditioned to the eyeballs.

The latter was more probable. But even that was doubtful. Her trenchant remark about civilization wasn't the product of a conditioned mind. But why was he worrying about her attitudes? They weren't important -- she wasn't even human. He shook his head. That was a sophistry. The fact that she wasn't human had nothing to do with the importance of her attitude. "I suppose there is a reason," he agreed. "But I don't know it. I haven't been here long enough to know anything about such things."

She nodded. "That does make a difference," she admitted. "Many new men are bothered at first by the fact that we Lani are naked, but they adjust quickly. So will you." She smiled as she turned away. "You see," she added over her shoulder as she left the room, "we're not human. We're just another of your domestic animals."

Was there laughter in her voice? Kennon wasn't sure. His sigh was composed of equal parts of relief and exasperation as he slipped out of bed and began to dress. He'd forgo the shower this morning. He had no desire for Copper to appear and offer to scrub his back. In his present state of mind he couldn't take it. Possibly he'd get used to it in time. Perhaps he might even like it. But right now he wasn't acclimatized.

* * *

"Man Blalok called," Copper said as she removed the breakfast dishes. "He said that he'd be right over to pick you up. He wants to show you the operation."

"When did he call?"

"About ten minutes ago. I told him that you were at breakfast. He said he'd wait." She disappeared in the direction of the kitchen.

"There's a nightmare quality to this," Kennon muttered as he slipped his arms into the sleeves of his tunic and closed the seam tabs. "I have the feeling that I'm going to wake up any minute." He looked at his reflection in the dresser mirror, and his reflection looked worriedly back. "This whole thing has an air of plausible unreality: the advertisement, the contract, this impossible island that raises humanoids as part of the livestock." He shrugged and his mirrored image shrugged back. "But it's real, all right. No dream could possibly be this detailed. I wonder how I'm going to take it for the next five years? Probably not too well," he mused silently. "Already I'm talking to myself. Without even trying, that Lani Copper can make me feel like a Sarkian." He nodded at his image.

The Sarkian analogy was almost perfect, he decided. For on that grimly backward world females were as close to slaves as the Brotherhood would permit; raised from birth under an iron regimen designed to produce complaisant mates for the dominant males. Probably that was the reason Sark was so backward. The men, having achieved domestic tranquillity, had no desire to do anything that would disturb the status quo. And since no Sarkian woman under any conceivable circumstances would annoy her lordly master with demands to produce better mousetraps, household gadgetry, and more money, the technological development of Sark had come to a virtual standstill. It took two sexes to develop a civilization.

Kennon shrugged. Worlds developed as they did because people were as they were, and while passing judgment was still a major human pursuit, no native of one world had a right to force his customs down the unwilling throat of another. It would be better to accept his present situation and live with it rather than trying to impose his Betan conception of morality upon Lani that neither understood nor appreciated it. His business was to treat and prevent animal disease. What happened to the animals before infection or after recovery was none of his affair. That was a matter between Alexander and his conscience.

Blalok was waiting for him, sitting behind the wheel of a square boxy vehicle that squatted with an air of unpolished efficiency on the graveled drive behind his house. He smiled a quick greeting as Kennon approached. "It's about time you showed up," he said. "You'll have to get into the habit of rising early on this place. We do most of our work early in the morning and late in the afternoon. During the day it's too hot to breathe, let alone work. Well, let's get going. There's still time to visit the outer stations."

Kennon climbed in and Blalok started the vehicle. "I thought we'd take a jeep today," he said. "They aren't very pretty, but they get around." He turned onto the surfaced road that ran down the hill toward the hospital and the complex of red-roofed buildings clustered about it. "About those flukes," he said. "You have any plans to get rid of them?"

"Not yet. I'll have to look the place over. There's more detective work than medicine involved in this."

"Detective work?"
"Sure -- we know the criminal, but to squelch him we have to learn his hangouts, study his modus operandi, and learn how to make his victims secure from his activities. Unless we do that, we can treat individuals from now to infinity and all we'll have is more cases. We have to apply modern criminology tactics -- eliminate the source of crime -- stop up the soft spots. In other words, kill the flukes before they enter the Lani."

"Old Doc never said anything about this," Blalok said.

"Probably he never knew about it. I was looking over the herd books last night, and I saw nothing about trematodes, or anything that looked like a parasite pattern until the last few months."

"Why not?"

"My guess is that he was one of the first deaths."

"You mean this thing attacks human beings?"

"Preferentially," Kennon said. "It's strange, too, because it originated on Santos so far as we know. In fact, some people think that the Varl bred it for a weapon to use against us before we conquered them. They could have done it. Their biological science was of a high enough order."

"But how did it get here?"

"I wouldn't know--unless you've hired a Santosian or someone else who was affected."

"We did have a man from Santos. Fellow called Joe Kryla. We had to let him go because he was a nudist. It made a bad impression on the Lani. But that was over a year ago."

"That's about the right time to build up a good reservoir of infection. The fatal cases usually don't show up before an area is pretty well seeded."

"That's not so good."

"Well, there's one thing in our favor. The Lani are pretty well concentrated into groups. And so far there doesn't seem to be any infestation outside of Hillside Station - except for two deaths in Lani recently sent from there. If we quarantine those stations and work fast, may be we can stop this before it spreads all over the island."

"That's fine, but what are you going to do now?"

"Treat those that show symptoms. There should be some Trematox capsules at the hospital. If there aren't we'll get them. We'll take the sick ones back to the hospital area and push therapy and supportive treatment. Now that we know the cause, we shouldn't have any more death losses."

"Old Doc didn't treat at the hospital," Blalok said.

"I'm not Old Doc."

"But it's going to mess up our operations. We're using the ward buildings to finish training the Lani scheduled for market."

"Why?"

"It's convenient. Most of the ward space is filled right now." Blalok said. There was a touch of disgust in his voice.

"They're well, aren't they?" Kennon demanded.

"Of course."

"Then get them out of there."

"But I told you--"

"You told me nothing. The hospital area is needed for something more than a training center. Perhaps Old Doc was trained in outcall work, but I'm not. I work from a hospital. The only things I do on outcalls are diagnoses, vaccinations, and emergencies. The rest of the patients come to the hospital."

"This isn't going to set well with Jordan and the division chiefs."

"That's not my concern," Kennon said. "I run my business in the best way possible. The patients are of more concern than the personal comfort of any straw boss or administrator. You're the administrator -- you calm them down."

"You have the authority," Blalok admitted. "But my advice to you is to go slow."

"I can't," Kennon said. "Not if we want to prevent any more losses. There simply won't be time to run all over the island dosing with Trematox and taking temperatures, and while that sort of thing is routine, it should be supervised. Besides, you'll see the advantages of this method. Soon enough."

"I hope so," Blalok said as he braked the jeep to a stop in front of the hospital. "I suppose you'll want to take some things along."

"So I will," Kennon said. "I'll be back in a minute."

"Plan on taking them?" Blalok said, jerking a thumb at the two Lani.

The minute stretched to nearly ten before Kennon returned followed by two Lani carrying bags which they loaded into the back of the jeep. "I had to reorganize a little," Kennon apologized, "some things were unfamiliar."

"Sure -- we know the criminal, but to squelch him we have to learn his hangouts, study his modus operandi, and learn how to make his victims secure from his activities. Unless we do that, we can treat individuals from now to infinity and all we'll have is more cases. We have to apply modern criminology tactics -- eliminate the source of crime -- stop up the soft spots. In other words, kill the flukes before they enter the Lani."

"Old Doc never said anything about this," Blalok said.

"Probably he never knew about it. I was looking over the herd books last night, and I saw nothing about trematodes, or anything that looked like a parasite pattern until the last few months."

"Why not?"

"My guess is that he was one of the first deaths."

"You mean this thing attacks human beings?"

"Preferentially," Kennon said. "It's strange, too, because it originated on Santos so far as we know. In fact, some people think that the Varl bred it for a weapon to use against us before we conquered them. They could have done it. Their biological science was of a high enough order."

"But how did it get here?"

"I wouldn't know--unless you've hired a Santosian or someone else who was affected."

"We did have a man from Santos. Fellow called Joe Kryla. We had to let him go because he was a nudist. It made a bad impression on the Lani. But that was over a year ago."

"That's about the right time to build up a good reservoir of infection. The fatal cases usually don't show up before an area is pretty well seeded."

"That's not so good."

"Well, there's one thing in our favor. The Lani are pretty well concentrated into groups. And so far there doesn't seem to be any infestation outside of Hillside Station - except for two deaths in Lani recently sent from there. If we quarantine those stations and work fast, may be we can stop this before it spreads all over the island."

"That's fine, but what are you going to do now?"

"Treat those that show symptoms. There should be some Trematox capsules at the hospital. If there aren't we'll get them. We'll take the sick ones back to the hospital area and push therapy and supportive treatment. Now that we know the cause, we shouldn't have any more death losses."

"Old Doc didn't treat at the hospital," Blalok said."

"I'm not Old Doc."

"But it's going to mess up our operations. We're using the ward buildings to finish training the Lani scheduled for market."

"Why?"

"It's convenient. Most of the ward space is filled right now." Blalok said. There was a touch of disgust in his voice. "They're well, aren't they?" Kennon demanded. "Of course."

"Then get them out of there."

"But I told you--"

"You told me nothing. The hospital area is needed for something more than a training center. Perhaps Old Doc was trained in outcall work, but I'm not. I work from a hospital. The only things I do on outcalls are diagnoses, vaccinations, and emergencies. The rest of the patients come to the hospital."

"This isn't going to set well with Jordan and the division chiefs."

"That's not my concern," Kennon said. "I run my business in the best way possible. The patients are of more concern than the personal comfort of any straw boss or administrator. You're the administrator -- you calm them down."

"You have the authority," Blalok admitted. "But my advice to you is to go slow."

"I can't," Kennon said. "Not if we want to prevent any more losses. There simply won't be time to run all over the island dosing with Trematox and taking temperatures, and while that sort of thing is routine, it should be supervised. Besides, you'll see the advantages of this method. Soon enough."

"I hope so," Blalok said as he braked the jeep to a stop in front of the hospital. "I suppose you'll want to take some things along."

"So I will," Kennon said. "I'll be back in a minute."

"Plan on taking them?" Blalok said, jerking a thumb at the two Lani.
"Not this time. I'm having them fit up an ambulance. They should be busy most of the day."

Blalok grunted and started the turbine. He moved a lever and the jeep floated off the ground.

"An airboat too," Kennon remarked. "I wondered why this rig was so boxy."

"It's a multipurpose vehicle," Blalok said. "We need them around here for fast transport. Most of the roads aren't so good." He engaged the drive and the jeep began to move. "We'll go cross country," he said. "Hillside's pretty far out -- the farthest station since we abandoned Olympus."

The air began whistling past the boxlike body of the jeep as Blalok increased the power to the drive and set the machine on automatic. "We'll get a pretty good cross-section of our operations on this trip," he said over the whine of the turbine. "Look down there."

They were passing across a series of fenced pastures and Kennon was impressed. The size of this operation was beginning to sink in. It hadn't looked so big from the substratosphere in Alexander's ship, but down here close to the ground it was enormous. Fields of grain, wide orchards, extensive gardens. Once they were forced to detour a huge supply boat that rose heavily in front of them. Working in the fields were dozens of brown-skinned Lani who paused to look up and wave as the jeep sped by. Occasional clusters of farm buildings and the low barrackslike stations appeared and disappeared behind them.

"There's about twenty Lani at each of these stations," Blalok said, "They work the farm area under the direction of the stationmaster."

"He's a farmer?"

"Of course. Usually he's a graduate of an agricultural school, but we have a few who are descendants of the crew of the first Alexander, and there's one old codger who was actually with him during the conquest. Most of our stationmasters are family men. We feel that a wife and children add to a man's stability -- and incidentally keep him from fooling around with the Lani."

A series of fenced pastures containing hundreds of huge grayish-white quadrupeds slipped past.

"Cattle?" Kennon asked.

"Yes - Earth strain. That's why they're so big. We also have sheep and swine, but you won't see them on this run."

"Any native animals?"

"A few - and some which are native to other worlds. But they're luxury-trade items. The big sale items are beef, pork, and mutton." Blalok chuckled. "Did you think that the Lani were our principal export?"

Kennon nodded.

"They're only a drop in the bucket. Agriculture -- Earth-style agriculture -- is our main source of income. The Lani are valuable principally to keep down the cost of overhead. Virtually all of them work right here on the island. We don't sell more than a hundred a year less than five per cent of our total. And those are surplus -- too light or too delicate for farm work."

"Where do you find a market for all this produce?" Kennon asked.

"There's two hundred million people here, and quite a few billion more in space-train range. We can produce more cheaply than any competitor, and we can undersell any competition, even full automation." Blalok chuckled.

"There are some things that a computer can't do as well as a human being, and one of them is farm the foods on which humanity is accustomed to feed. A man'll pay two credits for a steak. He could get a Chlorella substitute for half a credit, but he'll still buy the steak if he can afford it. Same thing goes for fruit, vegetables, grain, and garden truck. Man's eating habits have only changed from necessity. Those who can pay will still pay well for natural foods." Blalok chuckled. "We've put quite a dent in the algae and synthetics operations in this sector."

"It's still a luxury trade," Kennon said.

"You've eaten synthetic," Blalok replied. "What do you prefer?"

Kennon had to agree that Blalok was right. He, too, liked the real thing far better than its imitations.

"If it's this profitable, then why sell Lani?" Kennon asked.

"It's the Family's idea. Actually -- since the export type is surplus it does us no harm. We keep enough for servants -- and the others would be inefficient for most farm work. So disposal by sale is a logical and profitable way of culling. But now the Boss-man is being pressured into breeding an export type. And this I don't like. It's too commercial. Smells like slavery."

"You're a Mystic, aren't you?" Kennon asked.

"Sure -- but that doesn't mean I like slavery. Oh, I know some of those fatheaded Brotherhood economists call our system economic slavery -- and I'll admit that it's pretty hard to crack out of a spherical trust. But that doesn't mean that we have to stay where we are. Mystics aren't owned by their entrepreneurs. Sure, it's a tough haul to beat the boss, but it can be done. I did it, and others do it all the time. The situation isn't hopeless."

"But it is with the Lani," Kennon added.
"Of course. That's why they should be protected. What chance does a Lani have? Without us they can't even keep going as a race. They're technological morons. They don't live long enough to understand modern civilization. To turn those poor helpless humanoids out into human society would be criminal. It's our duty to protect them even while we're using them."

"Man's burden?" Kennon said, repeating the old cliche.

"Exactly." Blalok scowled. "I wish I had guts enough to give the Boss-man the facts -- but I can't get nerve enough to try. I've a good job here -- a wife and two kids -- and I don't want to jeopardize my future." Blalok glanced over the side. "Well, here we are," he said, and began descending into the center of a spokelike mass of buildings radiating outward from a central hub.

"Hmm -- big place," Kennon murmured.

"It should be," Blalok replied. "It furnishes all of our Lani for replacement and export. It can turn out over a thousand a year at full capacity. Of course we don't run at that rate, or Flora would be overpopulated. But this is a big layout, like you said. It can maintain a population of at least forty thousand. Old Alexander had big ideas."

"I wonder what he planned to do with them?" Kennon said.

"I wouldn't know. The Old Man never took anyone into his confidence."

Jordan came up as the jeep settled to the ground. "Been expecting you for the past half hour," he said. "Your office said you were on your way. -- Good to see you, too, Doc. I've been going over the records with Hank Allworth - the stationmaster here." Jordan held out his hand.

"You're an Earthman, eh?" Kennon asked as he grasped the outstretched hand. The gesture was as old as man, its ritualistic meaning lost in antiquity.

"No -- Marsborn -- a neighbor world," Jordan said. "But our customs and Earth's are the same."

"You're a long way from home," Kennon said.

"No farther than you, Doc." Jordan looked uncomfortable. "But we can compare origins later. Right now, you'd better come into the office. I've run across something peculiar."

CHAPTER IX

"There are twelve bays to this station," Jordan said. "Under our present setup two are used for breeding and the other ten for maturation. We rotate the youngsters around the bay -- a different bay each year until they're age eleven. Then they're sorted according to type and sent out for a year of further specialized training after which they go onto the farms, or to inhouse or export.

"Now here's the peculiar part. There's no trouble in Bays One through Nine, but Bay Ten has had all our losses except two that have occurred at the training stations."

"That's good news," Kennon said. "Our parasite can't have had time to migrate too far. We have him pinpointed unless -- say how many training centers are there?"

"Three," Jordan said.

"Quarantine them," Kennon replied. "Right now. Nothing goes in or out until we've checked them and completed prophylaxis."

Jordan looked at Blalok inquiringly.

"He's the boss," Blalok said. "Do as you're told. This is his problem."

"Why the quarantine?" Jordan asked.

"I want to get any carriers. We can check them with antigen, and then give Trematox."

"All that concentration in Bay Ten," Jordan said. "Does it mean something?"

"Blalok said that there was a Santosian in your division."

"Yeah - Joe Kryla - and come to think of it, he ran Bay Ten!"

"That's a help - now let's see what makes that bay different from the others."

"Why?"

"I'll tell you--but you may not understand," Kennon said.

"I'll take a chance."

Kennon grinned. "All right, you asked for it. The parasite that's doing the damage is a flatworm, a trematode called Hepatodirus hominis. As I've told Blalok, it's a tricky thing. Like all trematodes it has a three-stage life cycle, but unlike every other fluke, its life cycle is not fixed to definite intermediate hosts. Depending upon where it is, the fluke adapts. It still must pass through its life cycle, but its intermediate host need not be one species of snail, fish, or copepod. Any cold-blooded host will do. What you have here is a Kardonian variant which has adapted to some particular intermediate host on this world. Until now, its final host was either man or Varl. Now we have a third, the Lani. And apparently they are the most susceptible of the three. It never kills Varl. And humans, while they're more susceptible, only occasionally succumb, but the Lani appear to be the most susceptible of all. I've never seen an infestation like those Lani had. Their livers were literally crawling with flukes." Kennon paused and looked at
Jordan. "You following me?" he asked.
"Slowly and poorly," Jordan said. "You're assuming too much knowledge on my part."
Kennon chuckled. "You can't say I didn't warn you."
"Well -- I'm really interested in only one thing - how do you break the parasite up in business?"
"There's only one sure way -- and that's to break the life cycle. The technique is thousands of years old, but it's just as good today as it was then."
"Good -- then let's do it."
"To make a varrit stew," Kennon said, "one must first catch the varrit."
"Huh?"
"We have to learn the beastie's life cycle before we can break it, and like I said, it adapts. Its intermediate host can be any one of a hundred cold-blooded animals."
"Is there no place else where it can be attacked?"
"Sure, in the body of the final host, or on its final encysting place. But that won't eliminate the bug."
"Why not?"
"It'll still survive in its infective form and enough Lani will get subacute dosage to propagate it until the time is right for another epizootic. We have to kill its intermediate host -- or hosts if it has more than one. That will keep it from growing and will ultimately eradicate it."

Judson scratched his head. "It sounds complicated,"
"It is. It's so complicated that once the fluke becomes well established it's virtually impossible to eradicate."
"And you think it can be done here?"
"We can give it the old college try. But it's going to take some detective work."
"Where do we start?"
"With Bay Ten. We look it over real well. Then we check the diet and habits of the Lani. Then we check each individual Lani. Then we check the life cycle of the parasite. Somewhere along the line if we're lucky we'll find a weak point that can be attacked."
"That's a big order," Blalok said.
"It can't be helped. That's the way it is. Of course, we're lucky that we're on an isolated land mass. That gives us an advantage. We should be able to clean this up."
"How long do you think it will take?"
"It depends on how well the fluke is established. Six months at the minimum -- and I wouldn't care to guess at the maximum. However, I hope the minimum will be time enough."
"So do I," Blalok said.
"Well," Kennon said, "let's get on with it."
"I hope it won't interrupt our program," Jordan said.
"Of course it will interrupt it," Kennon replied. "It can't help it. Get the idea in your head that you're facing something here that can cripple you -- maybe abort your whole operation. You have a choice -- interrupt now or abort later. And half measures won't work. To eradicate this pest requires an all-out effort."
"But I can't see why we can't merely bypass Bay Ten--" Jordan said.
"Take my word for it," Kennon said. "You can't. There's no accurate way of telling how far this spreads until the death losses occur. Our tests for fluke infestation aren't that good. We have to work thoroughly and carefully. We can't be butting heads over this -- either we all co-operate or this whole operation will blow up in our faces."
"Look at the record. Six months ago you ended a year with no deaths from disease. Five months ago Old Doc and two Lani were ill. Four months ago one of the two Lani was dead and Old Doc was too ill to be effective. Three months ago Old Doc and the other Lani were dead, and before the end of the month two more followed them. Two months ago six died, last month eight, and so far this month you've lost four and you have over two weeks to go. Up to now they've all been from here, but two this month were at other stations. In six months if nothing is done, we'll be having losses there unless we're lucky. And the losses will keep on increasing. Apparently you don't know what it is to live with parasites - so let me tell you. It isn't pleasant!"
Blalok shrugged. "You needn't get hot about it," he said. "After all, you're the Doc -- and we'll co-operate."
Jordan nodded. "We will," he said. "All the way."

CHAPTER X
There is a special providence that looks over recent veterinary graduates, Kennon reflected as he checked the monthly reports from the Stations. Since the time he had laid down the law to Judson and Blalok, he had had no trouble from the production staff. And for the past four months there had been no further trouble with Hepatodirus. That unwanted visitor had apparently been evicted. At that, they had been lucky. The parasite had been concentrated at Hillside Station and had failed to establish itself in the training area. The intermediate host, it had turned out, was
a small amphibian that was susceptible to commercial insecticide. It had been no trouble to eradicate. Systemic treatment and cooking of all food had cleaned up the infective cercaria and individual infections, and after six months of intensive search, quarantine, and investigation, Kennon was morally certain that the disease had been eradicated. The last four reports confirmed his belief.

He sighed as he leaned back in his chair. Blalok was at last convinced that his ideas were right. The hospital was operating as a hospital should, with a staff of twelve Lani kept busy checking the full wards. Actually, it was working better than it should, since stationmasters all over the island were now shipping in sick animals rather than treating them or requesting outpatient service.

"Hi, Doc," Blalok said as he pushed the door open and looked into the office. "You doing anything?"
"Not at the moment," Kennon said. "Something troubling you?"
"No -- just thought I'd drop in for a moment and congratulate you."
"For what?"
"For surviving the first year."
"That won't be for two months yet."
Blalok shook his head. "This is Kardon," he said. "There's only three hundred and two days in our year, ten thirty-day months and two special days at the year's end."
Kennon shrugged. "My contract is Galactic Standard. I still have two months to go. But how come the ten-month year? Most other planets have twelve, regardless of the number of days."
"Old Alexander liked thirty-day months."
"I've wondered about that."
"You'll find a lot more peculiar things about Flora when you get to know her better. This year has just been a breaking-in period."
Kennon chuckled. "It's damn near broken me," he admitted. "You know, I thought that the Lani'd be my principal practice when I came here."
"You didn't figure that right. They're the easiest part. They're intelligent and co-operative."
"Which is more than one can say about the others." Kennon wiped the sweat from his face. "What with this infernal heat and their eternal stubbornness, I've nearly been driven crazy."
"You shouldn't have laid out that vaccination program."
"I had to. Your hog business was living mostly on luck, and the sheep and shrikes were almost as bad. You can't get away from soil saprophytes no matter how clean you are. Under a pasture setup there's always a chance of contamination. And that old cliche about an ounce of prevention is truer of livestock raising than anything else I can think of."
"I have some more good news for you," Blalok said. "That's why I came over. We're going to have another species to treat and vaccinate."
Kennon groaned. "Now what?"
"Poultry." Blalok's voice was disgusted. "Personally I think it's a mess, but Alexander thinks it's profitable. Someone's told him that pound for pound chickens are the most efficient feed converters of all the domestic animals. So we're getting a pilot plant: eggs, incubator, and a knocked-down broiler battery so we can try the idea out. The Boss-man is always hot on new ideas to increase efficiency and production. The only trouble is that he fails to consider the work involved in setting up another operation."
"You're so right. I'll have to brush up on pullorum, ornithosis, coccidiosis, leukosis, perosis, and Ochsner knows how many other -osises and -itises. I was never too strong on fowl practice in school, and I'd be happier if I never had anything to do with them."
"So would I," Blalok agreed. "I can't see anything in this but trouble."
Kennon nodded.
"And he's forgotten something else," Blalok added. "Poultry need concentrated feed. We're going to have to install a feed mill."
Kennon chuckled. "I hope he'll appreciate the bill he gets."
"He thinks we can use local labor," Blalok said gloomily. "I wish he'd realize that Lani are technological morons."
"They could learn."
"I suppose so -- but it isn't easy. And besides, Allworth is the only man with feed-mill experience, and he's up to his ears with Hillside Station since that expansion order came in."
"I never did get the reason for that. After we complained about the slavery implications and got the Boss-man's okay to hold the line, why do we need more Lani?"
"Didn't you know? His sister's finally decided to try marriage. Found herself some overmuscled Halsite who
looked good to her -- but she couldn't crack his moral barrier.” Blalok grinned. "I thought you'd be the first to know. Wasn't she interested in you?"

Kennon chuckled. "You could call it that. Interested -- like the way a dog's interested in a beefsteak. It's a good thing we had that fluke problem or I'd have been chewed up and digested long ago. That woman frightens me."

"I could be scared by uglier things," Blalok said. "With the Boss-man's sister on my side I wouldn't worry."

"What makes you think she'd be on my side? She's a cannibal."

"Well, you know her better than I do."

He did -- he certainly did. That first month had been one of the worst he had ever spent, Kennon reflected. Between Eloise and the flukes, he had nearly collapsed -- and when it had come to the final showdown, he thought for a while that he'd be looking for another job. But Alexander had been more than passably understanding and had refused his sister's passionate pleas for a Betan scalp. He owed a debt of gratitude to the Boss-man.

"You're lucky you never knew her," Kennon said.

"That all depends on what you mean," Blalok said as he grinned and walked to the door. The parting shot missed its mark entirely as Kennon looked at him with blank incomprehension. "You should have been a Mystic," Blalok said. "A knowledge of the sacred books would do you no end of good." And with that cryptic remark the superintendent vanished.

"That had all the elements of a snide remark," Kennon murmured to himself, "but my education's been neglected somewhere along the line. I don't get it." He shrugged and buzzed for Copper. The veterinary report would have to be added to the pile already before him, and the Boss-man liked to have his reports on time.

Copper watched Kennon as he dictated the covering letter, her slim fingers dancing over the stenotype. He had been here a full year -- but instead of becoming a familiar object, he had grown so gigantic that he filled her world. And it wasn't merely because he was young and beautiful. He was kind, too.

Yet she couldn't approach him, and she wanted to so desperately that it was a physical pain. Other Lani had told her about men and what they could do. Even her old preceptress at Hillside Station had given her some advice when Man Allworth had tattooed the tiny V on her thigh that meant she had been selected for the veterinary staff. And when Old Doc had brought her from the Training Station to the hospital and removed her tail, she was certain that she was one of the lucky ones who would know love.

But love wasn't a pain in the chest, an ache in the belly and thighs, an unfulfilled longing that destroyed sleep and made food tasteless. Love was supposed to be pleasant and exciting. She could remember every word her preceptress had spoken.

"My little one," the old Lani had said, "you now wear the doctor's mark. And soon no one will be able to tell you from a human. You will look like our masters. You will share in their work. And there may be times when you will find favor in their eyes. Then you may learn of love."

"Love," the old voice was soft in Copper's ears. "The word is almost a stranger to us now, known only to the few who serve our masters. It was not always so. The Old Ones knew love before Man Alexander came. And our young were the fruit of love rather than the product of our masters' cunning. But you may know the flower even though you cannot bear its fruit. You may enter that world of pleasure-pain the Old Ones knew, that world which is now denied us.

"But remember always that you are a Lani. A man may be kind to you. He may treat you gently. He may show you love. Yet you never will be his equal. Nor must you become too attached to him, for you are not human. You are not his natural mate. You cannot bear his young. You cannot completely share. You can only accept.

"So if love should come to you, take it and enjoy it, but do not try to possess it. For there lies heartache rather than happiness. And it is a world of heartache, my little one, to long for something which you cannot have."

To long for something which one cannot have! Copper knew that feeling. It had been with her ever since Kennon had come into her life that night a year ago. And it had grown until it had become gigantic. He was kind -- yes. He was harsh -- occasionally. Yet he had shown her no more affection than he would have shown a dog. Less -- for he would have petted a dog and he did not touch her.

He laughed, but she was not a part of his laughter. He needed her, but the need was that of a builder for a tool. He liked her and sometimes shared his problems and triumphs with her, and sometimes his defeats, but he did not love. There had never been for her the bright fierce look he had bent upon the Woman Eloise those times when she had come to him, the look men gave to those who found favor in their eyes.

Had he looked at her but once with that expression she would have come to him though fire barred the way. The Woman Eloise was a fool.

Copper looked at him across the corner of the desk, the yellow hair, the bronze skin, firm chin, soft lips and long straight nose, the narrowed eyes, hooded beneath thick brows, scanning the papers in his lean-tendoned hands. His nearness was an ache in her body -- yet he was far away.
She thought of how his hands would feel upon her. He had touched her once, and that touch had burned like hot iron. For hours she had felt it. He looked up. Her heart choked her with its beating. She would die for him if he would but once run his fingers over her tingling skin, and stroke her hair.

The naked emotion in Copper's face was readable enough, Kennon thought. One didn't need Sorovkin techniques to interpret what was in her mind. And it would have been amusing if it weren't so sad. For what she wanted, he couldn't give. Yet if she were human it would be easy. A hundred generations of Betan moral code said "never," yet when he looked at her their voices faded. He was a man -- a member of the ruling race. She was an animal -- a beast -- a humanoid -- near human but not near enough. To like her was easy - but to love her was impossible. It would be bestiality. Yet his body, less discerning than his mind, responded to her nearness.

He sighed. It was a pleasant unpleasantness, a mixed emotion he could not analyze. In a way it was poetry -- the fierce, vaguely disquieting poetry of the sensual Santosian bards - the lyrics that sung of the joys of flesh. He had never really liked them, yet they filled him with a vague longing, an odd uneasiness -- just the sort that filled him now. There was a deadly parallel here. He sighed.

"Yes, sir? Do you want something?" Copper asked.

"I could use a cup of coffee," he said. "These reports are getting me down." The banality amused him -- sitting here thinking of Copper and talking about coffee. Banality was at once the curse and the saving grace of mankind. It kept men from the emotional peaks and valleys that could destroy them. He chuckled shakily. The only alternative would be to get rid of her -- and he couldn't (or wouldn't? -- the question intruded slyly) do that.

Copper returned with a steaming cup which she set before him. Truly, this coffee was a man's drink. She had tried it once but the hot bitterness scalded her mouth and flooded her body with its heat. And she had felt so lightheaded. Not like herself at all. It wasn't a drink for Lani. Of that she was certain.

Yet he enjoyed it. He looked at her and smiled. He was pleased with her. Perhaps -- yet -- she might find favor in his eyes. The hope was always there within her -- a hope that was at once fear and prayer. And if she did -- she would know what to do.

Kennon looked up. Copper's face was convulsed with a bright mixture of hope and pain. Never, he swore, had he seen anything more beautiful or sad. Involuntarily he placed his hand upon her arm. She flinched, her muscles tensing under his finger tips. It was though his fingers carried a galvanic current that backlashed up his arm even as it stiffened hers.

"What's the matter, Copper?" he asked softly.

"Nothing, Doctor. I'm just upset."

"Why?"

There it was again, the calm friendly curiosity that was worse than a bath in ice water. Her heart sank. She shivered. She would never find her desire here. He was cold -- cold- cold! He wouldn't see. He didn't care. All right - - so that was how it had to be. But first she would tell him. Then he could do with her as he wished. "I hoped -- for the past year that you would see me. That you would think of me not as a Lani, but as a beloved." The words came faster now, tumbling over one another. "That you would desire me and take me to those worlds we cannot know unless you humans show us. I have hoped so much, but I suppose it's wrong - for you -- you are so very human, and I -- well, I'm not!" The last three words held all the sadness and the longing of mankind aspiring to be God.

"My dear -- my poor child," Kennon murmured.

She looked at him, but her eyes could not focus on his face, for his hands were on her shoulders and the nearness of him drove the breath from her body. From a distance she heard a hard tight voice that was her own. "Oh, sir -- oh please, sir!"

The hands withdrew, leaving emptiness -- but her heartbeat slowed and the pink haze cleared and she could see his face.

And with a surge of terror and triumph she realized what she saw! That hard bright look that encompassed and possessed her! The curved lips drawn over white, white teeth! The flared nostrils! The hungry demand upon his face that answered the demand in her heart! And she knew -- at last - with a knowledge that turned her limbs to water, that she had found favor in his eyes!

CHAPTER XI

Mixed emotion! Ha! The author of that cliche didn't even know its meaning! Kennon strode furiously down the dusty road toward Station One trying to sublimate his inner conflict into action. It was useless, of course, for once he stopped moving the grim tug-of-war between training and desire would begin again, and no matter how it ended the result would be unsatisfactory. As long as he had been able to delude himself that he was fond of Copper the way a man is fond of some lesser species, it had been all right. But he knew now that he was fond of her as a man is of a woman -- and it was hell! For no rationalization in the universe would allow him to define her as human. Copper was humanoid -- something like human. And to live with her and love her would not be miscegenation, which was
bad enough, but bestiality which was a thousand times worse.

Although throughout most of the Brotherhood miscegenation was an unknown word, and even bestiality had become a loose definition on many worlds with humanoid populations, the words had definite meaning and moral force to a Betan. And -- God help him -- he was a Betan. A lifetime of training in a moral code that frowned upon mixed marriages and shrank appalled from even the thought of mixing species was nothing to bring face to face with the fact that he loved Copper.

It was odd, Kennon reflected bitterly, that humans could do with animals what their customs and codes prohibited them from doing to themselves. For thousands of years - back to the very dawn of history when men had bred horses and asses to produce mules -- men had been mixing species to produce useful hybrids. Yet a Betan who could hybridize plants or animals with complete equanimity shrank with horror from the thought of applying the same technique to himself.

What was there about a human being that was so sacrosanct? He shook his head angrily. He didn't know. There was no answer. But the idea -- the belief -- was there, ingrained into his attitudes, a part of his outlook, built carefully block by block from infancy until it now towered into a mighty wall that barred him from doing what he wished to do.

It would be an easier hurdle if he had been born anywhere except on Beta. In the rest of the Brotherhood, the color of a man's skin, the shape of his face, the quality and color of his hair and eyes made no difference. All men were brothers. But on Beta, where a variant-G sun had already caused genetic divergence, the brotherhood of man was a term that was merely given lip service. Betans were different and from birth they were taught to accept the difference and to live with it. Mixing of Betan stock with other human species, while not actually forbidden, was so encircled with conditioning that it was a rare Betan indeed who would risk self-opprobrium and the contempt of his fellows to mate with an outsider. And as for humanoids -- Kennon shuddered. He couldn't break the attitudes of a lifetime. Yet he loved Copper.

And she knew he did!

And that was an even greater horror. He had fled from the office, from the glad light in her eyes, as a burned child flees fire. He needed time to think, time to plan. Yet his body and his surface thoughts wanted no plans or time. Living with a Lani wasn't frowned upon on Flora. Many of the staff did, nor did anyone seem to think less of them for doing so. Even Alexander himself had half-confessed to a more than platonic affection for a Lani called Susy.

Yet this was no excuse, nor would it silence the cold still voice in his mind that kept repeating sodomite -- sodomite -- sodomite with a passionless inflection that was even more terrible than anger.

The five kilometers to Station One disappeared unnoticed beneath his feet as he walked, and he looked up in surprise to see the white walls and red roofs of the station looming before him.

"Good Lord! Doc! What's got into you?" the stationmaster said. "You look like you'd seen a ghost. And out in this sun without a helmet! Come inside, man, before you get sunstroke!"

Kennon chuckled without humor. "Getting sunstroke is the least of my worries, Al," he said wryly. "O.K., where is it?"

"You look pretty bushed, Doc. Maybe you'd better rest awhile."

"And maybe it's an emergency," Kennon interrupted. "And probably it is because the staff can handle routine matters -- so maybe you'd better show me where you keep the phone."

* * *

"One moment please," the Message Center operator said. There were a few clicks in the background. "Here's your party," she continued. "Go ahead, Doctor."

"Kennon?" a nervous voice crackled from the receiver.

"Yes?"

"You're needed out on Otpen One."

"Who is calling -- and what's the rush?"

"Douglas -- Douglas Alexander. The Lani are dying! It's an emergency! Cousin Alex'll skin us alive if we let these Lani die!"

Douglas! Kennon hadn't thought of him since the one time they had met in Alexandria. That was a year ago. It seemed much longer. Since the Boss-man had exiled his cousin to that bleak rock to the east of Flora there had been no word of him. And now -- he laughed a sharp bark of humorless annoyance -- Douglas couldn't have timed it better if he had tried!
"All right," Kennon said. "I'll come. What seems to be the trouble?"
"They're sick."
"That's obvious," Kennon snapped. "Otherwise you wouldn't be calling. Can't you tell me any more than that?"
"They're vomiting. They have diarrhea. Several have had fits."
"Thanks," Kennon said. "I'll be right out. Expect me in an hour."
"So you're leaving?" Al asked as he cradled the phone.
"That's a practitioner's life," Kennon said. "Full of interruptions. Can I borrow your jeep?"
"I'll drive you. Where do you want to go?"
"To the hospital," Kennon said. "I'll have to pick up my gear. It's an emergency all right."
"You're a tough one," Al said admiringly. "I'd hate to walk five kilos in this heat without a hat -- and then go out on a call."

Kennon shrugged. "It's not necessarily toughness. I believe in doing one job at a time -- and my contract reads veterinary service, not personal problems. The job comes first and there's work to do."

Copper wasn't in sight when Kennon came back to the hospital -- a fact for which he was grateful. He packed quickly, threw his bags into the jeep, and took off with almost guilty haste. He'd contact the Hospital from the Otpens. Right now all he wanted was to put distance between himself and Copper. Absence might make the heart grow fonder, but at the moment propinquity was by far the more dangerous thing. He pointed the blunt nose of the jeep toward Mount Olympus, set the autopilot, opened the throttle, and relaxed as best he could as the little vehicle sped at top speed for the outer islands. A vague curiosity filled him. He'd never been on the Otpens. He wondered what they were like.

* * *

Otpen One was a rocky tree-clad islet crowned with the stellate mass of a Class II Fortalice. But this one wasn't like Alexandria. It was fully manned and in service condition.

"Airboat!" a voice crackled from the dashboard speaker of the jeep, "Identify yourself! You are being tracked."
Kennon quickly flipped the IFF switch. "Dr. Kennon, from Flora," he said.
"Thank you, sir. You are expected and are clear to land. Bring your vehicle down in the marked area." A section of the roof turned a garish yellow as Kennon circled the building. He brought the jeep in lightly, setting it carefully in the center of the area.

"Leave your vehicle," the speaker chattered. "If you are armed leave your weapon behind."
"It's not my habit to carry a gun," Kennon snapped.
"Sorry, sir -- regulations," the speaker said. "This is S.O.P."

Kennon left the jeep and instantly felt the probing tingle of a search beam. He looked around curiously at the flat roof of the fortress with its domed turrets and ugly snouts of the main battery projectors pointing skyward. Beside him, the long metal doors of a missile launcher made a rectangular trace on the smooth surface of the roof. Behind him the central tower poked its gaunt ferromorph and durilium outline into the darkening sky bearing its crown of spiderweb radar antennae turning steadily on their gimbals covering a vast hemisphere from horizon to zenith with endless inspection.

From the base of the tower a man emerged. He was tall, taller even than Kennon, and the muscles of his body showed through the tightness of his battle dress. His face was harsh, and in his hands he carried a Burkholtz magnum -- the most powerful portable weapon mankind had yet devised.

"You are Dr. Kennon?" the trooper asked.
"I am."
"Your I.D., please."

Kennon handed it over and the big man scanned the card with practiced eyes. "Check," he said. "Follow me, sir."
"My bags," Kennon said.
"They'll be taken care of."

Kennon shrugged and followed the man into the tower. A modern grav-shaft lowered them to the ground floor. They passed through a gloomy caricature of the Great Hall in Alexandria, through an iris, and down a long corridor lined with doors.

A bell rang.
"Back!" the trooper said. "Against the wall! Quick! Into the doorway!"
"What's up?"

"Another practice alert." The trooper's voice was bored. "It gets so that you'd almost wish for a fight to relieve the monotony."

A trooper and several Lani came down the corridor, running in disciplined formation. Steel clanged on steel as
they turned the corner and moments later the whine of servos came faintly to their ears. From somewhere deep in the
pile a rising crescendo of generators under full battle load sent out vibrations that could be sensed rather than heard.
A klaxon squawked briefly. There was another clash of metal, and a harsh voice boomed through the corridors.
"Fourteen seconds. Well done. Secure stations!"
The trooper grinned. "That ties the record," he said. "We can go now."
The corridor ended abruptly at an iris flanked by two sentries. They conferred briefly with Kennon's guide,
dilated the iris, and motioned for Kennon to enter. The pastel interior of the modern office was a shocking contrast
to the gray ferromorph corridors outside.
Douglas Alexander was standing behind the desk. He was much the same. His pudgy face was haggard with
uncertainty and his eyes darted back and forth as his fingers caressed the knobby grip of a small Burkholtz jutting
from a holster at his waist. There were new, unpleasant furrows between his eyes. He looked older and the
indefinable air of cruelty was more pronounced. He had been frightened the last time Kennon had seen him, and he
was frightened now.
"I'm not sure whether I am glad to see you, Kennon," he said uncertainly. "But I suppose I have to be."
Kennon believed him.
"How have you been?" Kennon asked.
"Not too bad until this afternoon. Things have been going pretty well." He shifted uncomfortably from one foot
to another. "I suppose Cousin Alex will skin me for this, but there's nothing else I can do." He licked his lips.
"You've been here long enough -- and you'll have to know eventually." He fidgeted and finally sat down behind the
desk. "We have trouble. Half the Lani were stricken about four hours ago. It was sudden. No warning at all. And if
they die----" his voice trailed off.
"Well -- what are we waiting for? Get someone to bring my bags down here and we'll look them over."
"Do you have to? -- Can't you prescribe something?"
"How? I haven't examined the patients."
"I can tell you what's wrong."
Kennon smiled. "I hardly think that's the way to do it. Even though your description might be accurate, you still
might miss something of critical importance."
Douglas sighed. "I thought that's what you'd say," he said. "Oh -- very well -- you might as well see what we
have out here."
"You can't possibly believe that I don't already know," Kennon said. "You have male Lani."
Douglas looked at him, his face blank with surprise. "But -- how did you know? No one on the main island
does except the Family. And we never talk about it. Did Eloise tell you? I noticed she was struck with you the day
you came, and the Lani who have come out here since have been talking about you two. Did she do it?"
Kennon shook his head. "She never said a word."
"Then how----"
"I'm not stupid," Kennon said. "That story you've spread about artificial fertilization has more holes in it than a
sieve. That technique has been investigated a thousand times. And it has never worked past the first generation. If
you had been using it, the Lani would long ago have been extinct. Haploids don't reproduce, and the only way the
diploid number of chromosomes can be kept is to replace those lost by maturation division of the ovum. You might
be able to keep the diploid number by using immature ova, but the fertilization technique would be far more
complex than the simple uterine injections you use at Hillside Station."
Douglas looked at him blankly.
"Besides," Kennon added, "I have a microscope. I checked your so-called fertilizing solution. I found
spermatozoa, and spermatozoa only come from males. What's more, the males have to be the same species as the
females or fertilization will not take place. So there must be male Lani. Nothing else fits. You've been using
artificial insemination on the main-island Lani. And from the way this place is guarded, it's obvious that here is your
stud farm."
Douglas shrugged and spread his hands in a gesture of resignation. "I suppose," he said, "that's the way Old
Doc found out too. We never told him, but he knew before he ever came out here."
"The only thing that puzzles me," Kennon went on, "is how you managed to eliminate the Y-chromosome
carriers within the sperm."
"Eh?"
"The male sex-determinant. Half the sperm carry it, but so far as I know, there's never been a male born on the
main island."
"Oh -- that. It's something that's done in the labs here. Probably one of the technicians could tell you. It's called
electro-- electro freezing or something like that."
"Electrodiaphoresis?"
Douglas nodded. "That sounds like it. I don't know anything about it. One of Grandfather's men did the basic work. We just follow instructions." He shrugged. "Well - since you know the secret there's no sense in hiding the bodies. Come along and tell me what's wrong."

It was a peculiar feeling to walk down the row of cubical rooms with their barred doors. The whole area reminded him of a historical novel, of the prisons of early human history where men confined other men for infractions of social customs. The grimness of the place was appalling. The male Lani -- impressive in their physical development -- were in miserable condition, nauseated, green-faced, retching. The sickening odors of vomit and diarrhea hung heavily on the air. Douglas coughed and held a square of cloth to his face, and even Kennon, strong-stomached as he was, could feel his viscera twitch in sympathy with the caged sufferers.

"Great Fleming, man!" Kennon exploded. "You can't keep them here. Get them out! Give them some fresh air! This place would make a well man sick."

Douglas looked at him, "I wouldn't take one of them out unless I had him shackled and there was an armed guard to help me. Those males are the most vicious, cunning, and dangerous animals on Kardon. They exist with but one thought in mind -- to kill!"

Kennon looked curiously through a barred door at one of the Lani. He lay on a bare cot, a magnificently muscled figure with a ragged black beard hiding his face. There were dozens of scars on his body and one angry purple area on his thick right forearm where flesh had been torn away not too long ago. Beads of sweat stood out on his forehead and soft moaning noises came from his tight lips as he pressed his abdomen with thick-fingered hands. "He doesn't look so dangerous," Kennon said.

"Watch it!" Douglas warned. "Don't get too close!" But the warning was too late. Kennon touched the bars, and as he did, the Lani moved with fluid speed, one huge hand clutching Kennon's sleeve and pulling him against the bars while the other darted for his throat. Fingers bit into Kennon's neck and tightened in a viselike grip. Kennon reacted automatically. His arms came up inside the Lani's and crashed down, elbows out, tearing the Lani loose. He jumped back, rubbing his bruised throat. "That fellow's not sick!" he gasped. "He's crazy!"

The Lani glared at him through the bars, disappointment written on his scarred and bearded face.

"I warned you," Douglas said. His voice held an undertone of malicious laughter. "He must be sick or he would have killed you. George is clever in a stupid sort of way."

Kennon looked into the cubicle. The Lani glared back and growled. There was a beastlike note in his voice that made the short hairs on Kennon's neck prickle.

"That fellow needs a lesson," he said. "You want to give it to him?" Douglas asked.

"Not particularly."

"Ha! -- man! -- you afraid!" the Lani taunted. His voice was thick and harsh. "All men fear me. All Lani, too. I am boss. Come close again man and I kill you!"

"Are they all that stupid?" Kennon asked. "He sounds like a homicidal moron."

"He's not stupid," Douglas said. "Just uneducated."

"Why is he so murderous?"

"That's his training. All his life he has fought. From childhood his life has been based on his ability to survive in an environment where every male is his enemy. You see here the sublimation of individuality. He cannot cooperate with another male. He hates them, and they in turn hate him. George, here, is a perfect example of absolute freedom from restraint." Douglas smiled unpleasantly.

"His whole history is one of complete lack of control. As an infant, being a male, his mother thought she was favored by the gods and she denied him nothing. In fact we were quite insistent that she gave him everything he wanted. By the time he was able to walk and take care of himself, he was completely spoiled, selfish, and authoritative.

"Then we took him and a dozen others exactly like him and put them together." Douglas grinned. "You should see what happens when a dozen spoiled brats are forced to live together. It's more fun. The little beasts hate each other on sight. And we stimulate them to compete for toys, food, and drink. Never quite enough to go around. You can imagine what happens. Instead of sharing, each little selfish individualist fights to get everything he can grab. Except for one thing we don't punish them no matter what they do. If anyone shows signs of co-operating he is disciplined severely, the first time. The next time, he is culled. But other than that, we leave them alone. They develop their personalities and their muscles -- and if one proves to be too much for his fellows we transfer him to a more advanced class where the competition is keener, and he learns what it is to lose.

"At puberty we add sex drive to the basics, and by the time our male reaches maturity we have something like George. Actually, George is more mature than either you or I. He has all the answers he needs. He's strong, solitary,
authoritative, and selfish. He has no curiosity and resents encroachment. He's a complete individualist. If he proves out he should make an excellent sire."

"But isn't he dangerous to handle?" Kennon asked.

"Yes, but we take precautions."

Kennon grimaced with distaste.

"Look at it objectively," Douglas said. "We're trying to select the best physical type we can in the hope that he'll pass his qualities to his offspring, and there's no better practical way to select the strongest and hardiest than by natural selection. We control their environment as little as possible and let Nature do our educating until they're old enough to be useful."

"Naturally, there are some things which we cannot provide, such as exposure to disease, to the elements, and to predators. The one isn't selective about whom it infects, while the others would tend to produce co-operation as a matter of survival."

"Isn't there a great deal of mortality under such a regimen?" Kennon asked.

"Not as much as you might expect. It's about twenty per cent. And there is a great deal of compensation from a management viewpoint. We would essentially the same physical end product as we would from a closely managed operation, plus a great saving in labor. Males, you see, are fairly expendable. We only need a few a year."

"It's brutal."

"So it is, but life is brutal. Still, it's efficient for our purposes. We merely take advantage of natural impulses to produce a better product. Grandfather got the idea out of an old book -- something about the noble savage, natural selection and survival of the fittest. He thought it was great - said there was nothing like relentless competition to bring out the strongest and hardiest types. And he's been right for centuries. Can you imagine anything much better than George -- from a physical viewpoint?"

"He is a magnificent animal," Kennon admitted as he eyed the Lani. "But it seems to me that you could train some obedience into him."

Douglas shook his head. "That would introduce a modifying factor, something bigger and more powerful than the male himself. And that would modify the results. We can control them well enough with knockout gas and shackles. And those things, oddly enough, don't destroy their pride or self-esteem. They think that we use them because we are afraid, and it satisfies their egos."

Kennon eyed the caged Lani dubiously. "This is going to be difficult. I must examine them and treat them, but if they're all as homicidal as this one--"

"You fight me man," George interrupted, his face twisted into lines of transparent guile. "I am boss and others do as I say. You beat me, then you are boss."

"Is this true?" Kennon asked.

"Oh, it's true enough," Douglas said. "George is the leader and if you beat him you'd be top male until some other one got courage enough to challenge you. But he's just trying to get his hands on you. He'd like to kill."

Kennon looked at the big humanoid appraisingly. George was huge, at least five centimeters taller and fifteen kilograms heavier than himself. And he was all muscle. "I don't think I'd care to accept that challenge unless I was forced to," Kennon said.

Douglas chuckled. "I don't blame you."

Kennon sighed. "It looks like we are going to need reinforcements to get these brutes under control. I'm not going in there with them, and I can't examine them from out here."

"Oh, we can hold them all right. Paralysis gas and shackles will keep them quiet. There's no need to bother the troopers. We can handle this by ourselves."

Kennon shrugged. "It's your baby. You should know what you're doing."

"I do," Douglas said confidently. "Wait here until I get the gas capsules and the equipment." He turned and walked back to the entrance to the cell block. At the iris he turned. "Be careful," he said.

"Don't worry, I will." Kennon looked at George through the bars and the humanoid glared back, his eyes bright with hatred. Kennon felt the short hairs prickle along the back of his neck. George roused a primal emotion -- an elemental dislike that was deeper than reason -- an antagonism intensely physical, almost overpowering -- a purely adrenal response that had no business in the make-up of a civilized human.

He had thought the Lani had a number of human traits until he had encountered George. But if George was a typical male -- then the Lani were alien. He flexed his muscles and stared coldly into the burning blue eyes behind the bars. There would be considerable satisfaction in beating this monstrosity to a quivering pulp. Millennia of human pre-eminence -- of belief that nothing, no matter how big or muscular, should fail to recognize that a man's person was inviolate -- fed the fuel of his anger. The most ferocious beasts on ten thousand worlds had learned this lesson. And yet this animal had laid hands on him with intent to kill. A cold corner of his mind kept telling him that
he wasn't behaving rationally, but he disregarded it. George was a walking need for a lesson in manners.

"Don't get the idea that I'm afraid of you -- you overmuscled oaf," Kennon snapped. "I can handle you or anyone like you. And if you put your hands on me again I'll beat you within an inch of your worthless life."

The Lani snarled. "Let me out and I kill you. But you are like all men. You use gun and iron -- not fair fight."

Douglas returned with a gas capsule and a set of shackles. "All right," he said. "We're ready for him." He handed Kennon the shackles and a key to the cell door -- and drew his Burkholz.

"See," the Lani growled. "It is as I say. Men are cowards."

"You know gun?" Douglas asked as he pointed the muzzle of the Burkholz at the Lani.

"I know," George growled. "Gun kill."

"It does indeed," Douglas said. "Now get back -- clear back against the wall."

Kennon unlocked the door.

And George rolled over, muscles bunched and driving! He hit the door with such force that Kennon was slammed against the wall, dazed -- half stunned by the speed of the attack. George -- he had time to think in one brief flash -- wasn't stupid. He had held his breath for the necessary two minutes!

Douglas jerked the blaster up and fired, but his target was too quick. George dropped and rolled. The sizzling streak of violet flashed inches above his body and tore a six-inch hole through the back of the cell. And then George was on him! The huge, marvelously fast hands of the humanoid wrenched the blaster out of Douglas's hands and jerked him forward. A scream burst from Douglas as George's hands closed around his neck. Muscles sprang into writhing life in the humanoid's huge forearms. There was a soft, brittle crack, and Douglas sagged limp in the iron grip that held him dangling.

"Faugh!" George grunted. He dropped Douglas as Kennon pushed the door back and came out into the passageway. "Maybe you make better fight," George said as he lowered his head into the muscular mass of his broad shoulders.

Kennon eyed him appraisingly, swinging the irons in his right hand.

This time the Lani didn't charge. He moved slowly, half crouched, long arms held slightly forward. Kennon backed away, watching the humanoid's eyes for that telltale flicker of the pupils that gives warning of attack. The expression on George's face never changed. It was satisfied -- smug almost -- reflecting the feelings of a brute conditioned to kill and given an opportunity to do so. The Lani radiated confidence.

Kennon shivered involuntarily. He wasn't frightened, but he had never met an opponent like this. A chill raced up the back of his legs and spread over his stomach and chest. His mouth was dry and his muscles quivered with tense anticipation. But his concentration never wavered. His hard blue eyes never left George's, searching with microscopic intentness for the faintest sign of the Lani's intentions.

George charged -- hands reaching for Kennon's throat, face twisted in a snarl of rage and hate. But even as he charged Kennon moved. He ducked beneath the Lani's outstretched hands and drove his left fist deep into George's belly just below the breastbone.

Air whistled out of the Lani's gaping mouth as he bent double from the power of the blow. Kennon clipped him on the chin with a driving knee, snapping George's head back and smashed the bearded face with the shackles. Blood spurted and George screamed with rage. One of the Lani's big hands wrapped around the shackles and tugged. Kennon let go and drove another left to George's ribs.

The Lani threw the irons at Kennon, but his aim was poor. One of the handcuff rings scraped across Kennon's cheek, but did nothing more than break the skin. Half paralyzed by the blows to his solar plexus, George's coordination was badly impaired. But he kept trying. Kennon wrapped lean fingers about one of George's outstretched hands, bent, pivoted, and slammed the Lani with bone-crushing force against the bars of a nearby cell. But George didn't go down. "He's more brute than man," Kennon thought. "No man could take a beating like that!" He moved aside from George's stumbling rush, feeling a twinge of pity for the battered humanoid. It was no contest. Strong as
he was, George didn't know the rudiments of hand-to-hand fighting. His reactions were those of an animal, to close, clutch, bite, and tear. Even if he were completely well, the results would have been the same. It would merely have taken longer. Kennon drove a vicious judo chop to the junction of the Lani's neck and shoulder. Brute strength was no match for the highly evolved mayhem that every spaceman learns as a necessary part of his trade. George had never been on planet leave in a spaceport town. He knew nothing about the dives, the crimps, the hostile port police. His idea of fighting was that of a beast, but Kennon was a civilized man to whom fighting was an art perfected by millennia of warfare. And Kennon knew his trade.

Even so it took longer than Kennon expected because George was big, George was strong, and George had courage and pride that kept him coming as long as the blazing will behind his blazing eyes could drive his battered body. But the end was inevitable.

Kennon looked at his bloody arm where George's teeth had reached their mark. It was hardly more than a scratch, but it had been close. George had his lesson and Kennon felt oddly degraded. He sighed, dragged George back into the cell, and locked the door.

Then he turned to Douglas. The howls of hate from the caged Lani died to a sullen silence as Kennon gently examined the limp body.

Douglas wasn't dead. His neck was dislocated, not broken, but he was in serious condition. Kennon was still bending over Douglas wondering how to call for help when three guards burst through the door, faces grim, weapons at the ready.

"What's going on here?" the leader demanded. "The board showed an open door down here." He saw the body-- "Mr. Douglas!" he gasped. "The commandant will have to know about this!" He took a communicator from his waist belt and spoke rapidly into it. "Arleson in stud cell block,-- Attempted escape. One casualty -- Douglas Alexander - yes, that's right. No -- he's not dead. Send a litter and bearers. Inform the commandant. I am making investigation on the spot. Out." He turned to look coldly at Kennon.

"Who are you--and what happened here?" he asked.

Kennon told him.
"You mean you took George!" Arleson said.
"Look in his cell if you don't believe me."

The soldier looked and then turned back to Kennon. There was awed respect in his hard brown eyes. "You did that! -- to him! Man, you're a fighter," he said in an unbelieving voice.

A stretcher detail manned by two sober-faced Lani females came in, loaded Douglas's body on the stretcher, and silently bore it away.

"Douglas was a fool," Arleson said. "He knew we never handle this kind without maximum restraint. I wonder why he did it?"

"I couldn't say. He told me that gas and shackles would hold him."

"He knew better. These Lani know gas capsules. All George had to do was hold his breath. In that cell George would have killed you. You couldn't have stayed away from him."

Kennon shrugged. Maybe that was what Douglas had wanted. Kennon sighed. He didn't have the answer. And it could just be that Douglas had tried to show off. Well, he would pay for it. He'd have a stiff neck for months, and perhaps that was a proper way to end it.

* * *

Commander Mullins, a thin gray-faced man with the hard cold eyes of a professional soldier, came into the corridor followed by another trooper.

His eyes took in the wreckage that had been George, the split lips, the smashed nose, the puffed eyes, the cuts and bruises, and then raked across Kennon.

"Spaceman -- hey?" he asked. "I've seen work like that before."

Kennon nodded. "I was once. I'm station veterinarian now. Douglas called me over -- said it was an emergency."

Mullins nodded.

"Well -- why aren't you tending to it?"

"I have to examine them," Kennon said gesturing at the cells. "And I don't want any more trouble like this."

"Don't worry. You won't have it. Now that you've beaten George, you'll have no trouble at all. You're top dog," Mullins gestured at the cages. "They'll be good for a while. Now you'd better get on with your work. There's been enough disruption of routine for today. The men will help you."

* * *

Kennon checked in at the commandant's office before he left for the main island.

"How is Douglas?" he asked.
"He's alive," Mullins said. "We flew him to Albertsville - and good riddance. How are the Lani?"

"They'll be all right," Kennon said. "It's just food poisoning. I suggest you check your kitchen and your food handlers. There's a break in sanitation that could incapacitate your whole command. I found a few things wrong but there are probably more."

"I'll check on it -- and thanks for the advice," Mullins said. "Sit down, Doctor. Your airboat won't be serviced for another few minutes. Tell me how things are on the main island. How's Blalok?"

"You know him?"

"Of course. I used to be a frequent visitor there. But with that young pup here, I couldn't leave. I didn't dare to. He'd have disrupted routine in a single day. Look what he did in half an hour. Frankly, I owe you a debt for getting him off my hands." Mullins chuckled dryly.

"That's a fine thing to say," Kennon grinned. "But I can sympathize. It took us two months to straighten out Alexandria after the Boss-man sent him here."

"I heard about that."

"Well -- we're under control now. Things are going pretty smoothly."

"They'll be better here," Mullins said. "Now that Douglas is gone." He shrugged. "I hope the Boss doesn't send him back. He's hard to handle and he makes discipline a problem."

"Could you tell me--or would it be violating security?" Kennon said. "Why do you have a Class II installation on full war footing out here?"

Mullins chuckled. "It's no secret," he said. "There was a commercial raid on this place about fifty years ago. Seems as though one of our competitors didn't like us. Alexandria was on a war footing then and managed to hold them off. But it scared the Old Man. You see, our competitive position is based on Lani labor. Our competitors didn't know that. Their intelligence wasn't so good. Up until that time, we'd been keeping the males out here in what was hardly more than a stockade. Those people could have taken a few dozen females and a couple of males and they'd have been in business. But they didn't know. They tried to smash Alexandria instead. Naturally they didn't have a chance. And after it was over the Old Man got smart. He still had the tapes for Alexandria so he built a duplicate out here and spent a few millions on modern armament. The way we're set now it'd take a battle group to hurt us."

"But how about security? Don't the others know about the Lani now?"

"It's a moot question. But it won't do them any good. They can't crack this place, and without males, all the females on Flora wouldn't do them enough long-term good to pay for the force they'd need to be successful."

"So that's why the males are isolated."

"There's another reason -- two of them in fact. One is physical. Even the best male is a dangerous beast. They have a flair for violence that makes them useless as labor and their training doesn't help matters. And the other is mental. The females on the main island believe that we humans are responsible for the continuation of their breed. This tends to keep them in line. We have a great deal more trouble with them out here once they know the truth. We've had a number of cases of females trying to engineer a male's escape. But they're never repeated," Mullins said grimly. "Actually, it would be an interesting life out here, except for the abattoir." He grimaced. "That's an unpleasant chore."

"You mean--." Kennon said.

"Why, certainly. What else could we do with senile animals?"

"But that's murder!"

Mullins shook his head. "No more than killing a cow for beef."

"You know," Kennon said, "I've never thought of what happened to aged Lani. Sure, I've never seen one, but -- Lord Lister! -- I'm a fool."

"You'll get used to the idea," Mullins said. "They aren't human, and except for a few, they aren't as intelligent as a Santosian Varl. I know that they look like us except for those tails, but that's as far as it goes. I've spent two hundred years with them and I know what I'm talking about."

"That's what Alexander says."

"He should know. He's lived with them all his life."

"Well -- perhaps. But I'm not convinced."

"Neither was Old Doc -- not until the day he died."

"Did he change then?"

"I don't know. I wasn't there. But Old Doc was a stubborn cuss."

Kennon stood up. "I've given instructions for treatment to your corpsman," he said. "Now I think I'd better be getting back. I have some reports to finish."

Mullins smiled grimly. "You know," he said, "I get the feeling that you don't approve of this operation."
"Frankly, I don't," Kennon said, "but I signed a contract." He turned toward the door and gestured to the two Lani who waited outside with his bags. "I can find my way to the roof," he said.

"Well -- good luck," Mullins said. "We'll call you again if we need you."

"Do that," Kennon replied. He wanted to leave, to get away from this place and back to the main island. He wanted to see Copper. He'd be damned if anyone was going to butcher her. If he had to stay here until she died of old age, he'd do it. But nobody was going to hurt her.

CHAPTER XII

Kennon wondered if his colleagues in human medicine felt toward their patients as he did toward the Lani, or if they ultimately lost their individuality and became mere hosts for diseases, parasites, and tumors -- vehicles for the practice of surgical and medical skills -- economic units whose well-being meant a certain amount of credits. Probably not, he decided. They were human and their very humanity made them persons rather than things.

But the possession of individuality was not an asset in the practice of animal medicine where economics was the main factor and the satisfaction of the owner the principal personality problem. The normal farm animals, the shrikes, cattle, sheep, morks, and swine were no problem. They were merely a job. But the Lani were different. They weren't human, but they were intelligent and they did have personality even though they didn't possess that indefinable quality that separated man from the beasts. It was hard to treat them with dispassionate objectivity. In fact, it was impossible.

And this lack of objectivity annoyed him. Should he be this way? Was he right to identify them as individuals and treat them as persons rather than things? The passing months had failed to rob them of their personalities: they had not become the faceless mass of a herd of cattle or a flock of sheep. They were still not essentially different from humans -- and wouldn't men themselves lose many of their human characteristics if they were herded into barracks and treated as property for forty generations? Wouldn't men, too, approach the animal condition if they were bred and treated as beasts, their pedigrees recorded, their types winnowed and selected? The thought was annoying.

It would be better, Kennon reflected, if he didn't have time to think, if he were so busy he could drop to his bed exhausted each night and sleep without dreaming, if he could keep on the run so fast that he wouldn't have time to sit and reflect. But he had done his work too well. He had trained his staff too thoroughly. They could handle the petty routines of minor treatment and laboratory tests as well as he. He had only the intellectual stimulation of atypical cases and these were all too rare. The routine inspections were boring, yet he forced himself to make them because the filled the time. The hospital wards were virtually empty of patients, the work was up to date, the whole island was enjoying a carnival of health, and Kennon was still impaled upon the horns of his dilemma. It wasn't so bad now that the first shock was over, but it was bad enough -- and showed no signs of getting better. Now that Copper realized he wanted her, she did nothing to make his life easier. Instead she did her best to get underfoot, usually in some provocative position. It was enough to try the patience of a marble statue Kennon reflected grimly. But it did have its humorous side and were it not for the fact that Copper wasn't human could have been thoroughly enjoyable. That, however, was the real hell of it. He couldn't relax and enjoy the contest - his feet were on too slippery ground.

And Copper with her unerring female instinct knew just what to do to make the footing slipperier. Sooner or later, she was certain that he would fall. It was only a question of applying sufficient pressure at the right spot and the right time. Now that she knew he desired her, she was content to wait. The only thing that had bothered her was the uncertainty whether he cared or not. For Copper the future was a simple thing and she was lighthearted about it.

But not so Kennon. Even after the initial shock had passed there still remained the moral customs, the conditioning, and the prohibitions. But Copper - was Copper -- and somehow the conditioning lost its force in her presence. Perhaps, he thought wryly, it was a symptom of the gradual erosion of his moral character in this abnormal environment.

"I'm getting stale," he confided to Copper as he sat in his office idly turning the pages of the Kardon Journal of Allied Medical Sciences. "There's nothing to do that's interesting."

"You could help me," Copper said as she looked up from the pile of cards she was sorting. He had given her the thankless task of reorganizing the files, and she was barely half through the project.

"There's nothing to do that's interesting," he repeated. He cocked his head to one side. From this angle Copper looked decidedly intriguing as she bent over the file drawer and replaced a stack of cards.

"I could suggest something," Copper said demurely.

"Yes, I know," he said. "You're full of suggestions."

"I was thinking that we could go on a picnic."

"A what?"

"A picnic. Take a lunch and go somewhere in the jeep. Maybe up into the hills. I think it might be fun."

"Why not?" Kennon agreed. "At least it would break the monotony. Tell you what. You run up to the house and tell Kara to pack a lunch and we'll take the day off."
"Good! I hoped you'd say that. I'm getting tired of these dirty old cards." She stood up and sidled past the desk. Kennon resisted the impulse to slap as she went past, and congratulated himself on his self-control as she looked at him with a half-disappointed expression on her face. She had expected it, he thought gleefully. Score one for morality.

He smiled. Whatever the other Lani might be, Copper was different. Quick, volatile, intelligent, she was a constant delight, a flashing kaleidoscope of unexpected facets. Perhaps the others were the same if he knew them better. But he didn't know them -- and avoided learning. In that direction lay ulcers.

"We'll go to Olympus," he said.
Copper looked dubious. "I'd rather not go there. That's forbidden ground."
"Oh nonsense. You're merely superstitious."
She smiled. "Perhaps you're right. You usually are."
"That's the virtue of being a man. Even if I'm wrong, I'm right." He chuckled at the peculiar expression on her face.

"Now off with you -- and get that lunch basket packed."
She bowed. "Yes, master. Your slave flies on winged feet to execute your commands."
Kennon chuckled. Copper had been reading Old Doc's romances again. He recognized the florid style.

* * *

Kennon landed the jeep in a mountain meadow halfway up the slope of the peacefully slumbering volcano. It was quiet and cool, and the light breeze was blowing Olympus's smoky cap away from them to the west. Copper unpacked the lunch. She moved slowly. After all, there was plenty of time, and she wasn't very hungry. Neither was Kennon.

"Let's go for a walk," Copper said. "The woods look cool -- and maybe we can work up an appetite."
"Good idea. I could use some exercise. That lunch looks big enough to choke a horse and I'd like to do it justice."

They walked through the woods, skirting scant patches of underbrush, slowly moving higher on the mountain slopes. The trees, unlike those of Beta, did not end abruptly at a snow line, but pushed green fingers upward through passages between old lava flows, on whose black wrinkled surfaces nothing grew. The faint hum of insects and the piping calls of the birdlike mammals added to the impression of remoteness. It was hard to believe that scarcely twenty kilometers from this primitive microcosm was the border of the highly organized and productive farmlands of Outworld Enterprises.

"Do you think we can see the hospital if we go high enough?" Copper said. She panted a little, unaccustomed to the altitude.
"Possibly," Kennon said. "It is a long distance away. But we should be able to see Alexandria," he added. "That's high enough and big enough." He looked at her curiously. "How is it that you're so breathless?" he asked.
"We're not that high. You're getting fat with too much soft living."
Copper smiled. "Perhaps I'm getting old."
"Nonsense," Kennon chuckled. "It's just fat. Come to think of it you are plumper. Not that I mind, but if you're going to keep that sylphlike figure you'd better go on a diet."
"You're too good to me," Copper said.
"You're darn right I am. Well - let's get going. Exercise is always good for the waistline, and I'd like to see what's up ahead."

Scarcely a kilometer ahead they came to a wall of lava that barred their path. "Oh, oh," Kennon said. "We can't go over that." He looked at the wrinkled and shattered rock with its knifelike edges.
"I don't think my feet could take it," Copper admitted.
"It looks like the end of the trail."
"No -- not quite," Kennon said. "There seems to be a path here." He pointed to a narrow cleft in the black rock.
"Let's see where it goes."
Kennon hung back. "I don't think I want to," she said doubtfully. "It looks awfully dark and narrow."
"Oh, stop it. Nothing's going to hurt us. Come on," Kennon took her hand.

Unwillingly Copper allowed herself to be led forward. "There's something about this place that frightens me," she said uncomfortably as the high black walls closed in, narrowing until only a slit of yellow sky was visible overhead. The path underfoot was surprisingly smooth and free from rocks, but the narrow corridor, steeped in shadows, was gloomy and depressingly silent. It even bothered Kennon, although he wouldn't admit it. What forces had sliced this razor-thin cleft in the dense rock around them? Earthquake probably. And if it happened once it could happen again. He would hate to be trapped here entombed in shattered rock.
Gradually the passage widened, then abruptly it ended. A bleak vista of volcanic ash dotted with sputter cones opened before them. It was a flat tableland, roughly circular, scarcely half a kilometer across, a desolation of black rock, stunted trees and underbrush, and gray volcanic ash. A crater, somewhat larger than the rest, lay with its nearest edge about two hundred meters away. The rock edges were fire polished, gleaming in the yellow sunshine, and the thin margin of trees and brush surrounding the depression were gnarled and shrunken, twisted into fantastic shapes.

"Hey! what's this?" Kennon asked curiously. "That crater looks peculiar, like a meteor had struck here -- but those stunted plants -- hmm -- there must have been some radioactivity too." He looked at the crater speculatively. "Now I wonder----" he began.

Copper had turned a sickly white. "No!" she said in a half-strangled voice--"oh, no!"

Kennon looked at her. "You know what this is?" he demanded. "No," Copper said. But her voice was unsteady. "You're lying."

"But I don't know." Copper wailed. "I'm only guessing. I've never seen this place before in my life! Please! let's get out of here!"

"Then you know about this," Kennon demanded. "I think it's the Pit," Copper said. "The redes don't say where it is. But the description fits -- the Circle of Death, the Twisted Land -- it's all like the redes say."

"Redes? -- what are redes? And what is this business about circles of death? There's something here that's peculiar and I want to know what it is."

"It's nothing. Truly. Just let's go back. Let's leave this place. It's no good. It's tabu."

"Tabu? You've never used that word before."

"Forbidden."

"Who forbids it?"

"The Gods -- the Old Ones. It is not for Lani. Nor for you." Her voice was harsh. "Come away before it is too late. Before the Silent Death strikes you down."

"I'm going to have a look at this."

"You'll be killed!" Copper said. "And if you die, I die too."

"Don't be foolish. There's nothing here that can hurt me. See those trees and plants growing right up to the crater's edge. If they can take it permanently, I can stand it for a few moments. If there's any radioactivity there, it's not very much."

"But the redes say---"

"Oh, forget those redes. I know what I'm doing. Besides, I'm a Betan and can stand more radiation than most men. A brief exposure isn't going to hurt me."

"You go and I go too," Copper said desperately. "You'll stay here where it's safe," Kennon said flatly.

"I'm going with you," Copper repeated. "I don't want to live without you."

"I tell you I won't be hurt. And one quick look isn't going to bother whatever's down there."

"That's what Roga the Foolish said when he opened Lyssa's tower. But he brought men to Flora. And your little look may bring an even greater calamity."

Kennon shrugged, and started Walking toward the crater's edge.

Copper followed.

He turned to order her back, but the words died on his lips as he saw the terror and determination on her face. Neither commands nor pleas would move her. If he went she would follow. The only way he could stop her would be with violence, and he didn't want to manhandle her. He felt an odd mixture of pride, tenderness, and admiration for her. Were their situations reversed, he doubted whether he would have the courage she was showing. He sighed. Perhaps she was right. Perhaps he did need an antiradiation suit.

"All right," he said. "You win. I'll get some protective clothing and look at it later."

Her knees sagged, but he caught her before she fell, and held her erect until her strength returned. Belatedly he understood the emotional strain that had been gripping her. "If you come back later, sir, you'll take me with you."

The words were a statement, not a question.

He nodded. "Providing you wear a radiation suit," he said.

She grimaced with distaste and he chuckled. Clothing and Copper simply didn't get along together.

"Well?"

"All right," she said unhappily.

"And there's one more condition."
"What's that?" she asked suspiciously.
"That you tell me about this place. You obviously know something about it, and with all your talking, you've never mentioned it to me."
"It is forbidden to talk of these things to men," Copper said -- and then, perversely, "Do you want me to tell you now?"
"No -- it can wait. We have come a long way and I am hungry. I listen poorly on an empty stomach. Let's go back to the jeep and you can tell me later."
Copper smiled. "That's good," she said. "I'd feel better away from this place."
CHAPTER XIII
"I was a poor learner of the redes," Copper confessed. "And I'll have to skip the Mysteries. I never even tried to learn them. Somehow I was sure I'd never be a preceptress." She settled herself more comfortably on the tawny grass and watched him as he lay on his back beside her.
"Eh?" Kennon said. "Preceptress?"
"The guardians of our traditions. They know the redes and mysteries by heart."
"And you have kept your religion alive that way all these years?"
"It isn't exactly religion," Copper said. "It's more like history, we learn it to remember that we were once a great race -- and that we may be again. Someday there will come a male, a leader to bring us out of bondage, and our race will be free of dependence on men. There will be pairings again, and freedom to live as we please." She looked thoughtfully at Kennon. "You might even be the one -- even though you are human. You're different from the others."
"You're prejudiced." Kennon smiled. "I'm no different. Well -- not very different at any rate."
"That is not my thought," Copper said. "You are very different indeed. No man has ever resisted a Lani as long as you have."
Kennon shook his head. "Let's not go into that now. What are these redes?"
"I do not remember them all," Copper apologized. "I was----"
"You've said that before. Tell me what you do know."
"I remember the beginning fairly well," she said. "It goes back to the time before Flora when everything was nothing and the Master Himself was lonely."
Without warning her voice changed to a rhythmic, cadenced chant that was almost a song. Her face became rapt and introspective as she rocked slowly from side to side. The rhythm was familiar and then he recognized it -- the unintelligible music he had often heard coming from the barracks late at night when no men were around -- the voiceless humming that the Lani sang at work.
First there was Darkness -- starless and sunless
Void without form -- darker than night
Then did the Master -- Lord of Creation
Wave His right hand, saying, "Let there be light!"
Verse, Kennon thought. That was logical. People remember poetry better than prose. But the form was not what he'd normally expect. It was advanced, a style that was past primitive blank verse or heroic pentameter. He listened intently as Copper went on.
Light filled the heavens, bright golden glowing,
Brought to the Void by His wondrous hand;
Then did the Master -- Lord of Creation
Nod His great head, saying, "Let there be land!"
Air, land, and water formed into being,
Born in the sight of His all-seeing eyes;
Then did the master -- Lord of Creation --
Smile as He murmured, "Let life arise!"
All of the life conceived by the Master,
Varied in shape as the grasses and birds;
Hunters and hunted, moveless and moving,
Came into form at the sound of His words.
"That's a great deal like Genesis," Kennon said with mild astonishment. "Where could you have picked that up?"
"From the beginning of our race," Copper said. "It came to us with Ulf and Lyssa -- but what is Genesis?"
"A part of an ancient religion -- one that is still followed on some of the Central Worlds. Its followers call themselves Christians. They say it came from Earth, the mother-world of men."
"Our faith has no name. We are children of Lyssa, who was a daughter of the Master."

"It is an odd similarity," Kennon said. "But other races have had stories of the Creation. And possibly there may be another explanation. Your ancestors could have picked this up from Alexander's men. They came from Earth originally and some of them could have been Christians."

"No," Cooper said. "This rede is long before Man Alexander. It is the origin of our world, even before Ulf and Lyssa. It is the first Book -- the Book of the God-spell. Man Alexander came in the sixth Book -- the Book of Roga."

"There's no point in arguing about it," Kennon said. "Go on -- tell me the rest."

"It's going to be a long story," Copper said. "Even though I have forgotten some of it, I can chant the redes for hours."

Kennon braced his back against one of the fat tires of the jeep. "I'm a good listener," he said.

She chuckled. "You asked for this," she said -- and took up the verses where she had left off. And Kennon learned the Lani version of creation, of the first man and woman, cast out of Heaven for loving each other despite the Master's objection, of how they came to Flora and founded the race of the Lani. He learned how the Lani grew in numbers and power, how they split into two warring groups over the theological point of whether Ulf or Lyssa was the principal deity, how Roga the Foolish opened Lyssa's tower to find out whether the Ulfians or Lyssans were right, and brought the Black Years to Flora.

He heard the trial of Roga and the details of his torture by the priests of Ulf and the priests of Lyssa -- united by this greatest sacrilege. And he heard the Lani version of the landing of Alexander's ship and man's conquest of Flora.

It was a story of savagery and superstition, of blood and intolerance, of bravery and cowardice, of love and beauty. Yet through it all, even through the redes that described the Conquest, there was a curious remoteness, a lack of emotion that made the verses more terrible as they flowed in passionless rhythm from Copper's lips.

"That's enough!" Kennon said.

"I told you you wouldn't like it."

"It's horrible. How can you remember such things?"

"We begin to learn them as soon as we can talk. We know the redes almost our entire lives." Copper was silent for a moment. "There's lots more," she said, "but it's all about our lives since the Man Alexander -- the old one -- took possession of us. And most of the newer redes are pretty dull. Our life hasn't changed much since the men came. The Book of Man is boring." Copper sighed. "I have dared a great deal by telling you these things. If the others knew, they would kill both of us."

"Then why tell me?" he asked.

"I love you," she said simply. "You wanted to know -- and I can deny you nothing."

A wave of tenderness swept over him. She would give her life for him -- and what would he give? Nothing. Not even his prejudices. His face twisted. If she was only human, If she wasn't just an animal. If he wasn't a Betan. If, if, if. Resentment gorged his throat. It was unfair -- so damned unfair. He had no business coming here. He should have stayed on Beta or at least on a human world where he would never have met Copper. He loved her, but he couldn't have her. It was Tantalus and Sisyphus rolled into one unsightly package and fastened to his soul. With a muttered curse he rose to his feet, and as he did he stopped -- frozen - staring at Copper as though he had never seen her before.

"How did you say that Roga was judged responsible for Alexander coming here?" he demanded.

"He went into Lyssa's tower -- where Ulf and Lyssa tried to call Heaven -- and with his foolish meddling set the tower alight with a glow that all could see. Less than a week later the Man Alexander came."

"Where was this tower?"

"Where Alexandria now stands. Man Alexander destroyed it and built his house upon its ruins."

"And what was that place of the Pit?"

"The Shrine of Ulf -- where the God-Egg struck Flora. It is buried in the pit, but the Silent Death has protected it from blasphemy -- and besides Man Alexander never learned about it. We feared that he would destroy it as he did Lyssa's tower."

A wild hope stirred in Kennon. "We're going home," he announced.

"Good."

"And we're going to get a pair of radiation suits -- and then we're coming back. We'll have a good look at that Pit, and if what's in there is what I think it is -- his face was a mixture of grimness and eagerness -- 'we'll blow this whole operation off this planet!'"

Copper blanched. "It is death to meddle with the God-Egg," she said.

"Superstition!" Kennon scoffed. "If that Egg is what I think, it was made by men, and you are their descendant."

"Perhaps you're right, but I can't help thinking you are wrong," she said soberly. "Look at the trouble that came
with Roga's meddling. Be careful that you do not bring us a worse fate."
"I'll be very careful. We'll take every precaution."
"We?"
"You're coming, of course. I can't imagine you staying away."
Copper nodded.
"You shouldn't worry so much" Kennon teased. "You know we men live forever."
"That is true."
"And if I'm right you're just as human as I. And you're capable of living as long as I do."
"Yes, sir," Copper said. Her voice was unconvinced, her expression noncommittal.
"You females," Kennon said in quick exasperation. "You drive a man crazy. Get an idea in your head and it
takes triatomate to blast it out. Now let's go."
Two hours brought them back to the volcanic area, and knowing what to look for, Kennon located the
pockmarked mountain valley. From the air it looked completely ordinary. Kennon was amazed at the perfection of
the natural camouflage. The Pit was merely another crater in the pitted ground. He dropped to a lower altitude,
barely a hundred feet above the sputter cones. "Look!" he said.
Below them was the crater of the Pit and in its center a smooth bluish-black hemisphere protruded from the
 crater floor. It would have passed unnoticed by the casual eye -- nearly concealed by two gigantic blocks of pumice.
"The God-Egg!" Copper exclaimed.
"Egg -- ha! that's a spacer! I thought it would be. I'd recognize durilium anywhere. Let's go down and look this
over, but first we want a couple of pictures." He pointed a camera at the crater and snapped the shutter. "There --
now let's have a closer look at our baby."
"Do you expect me to get into that thing?" Copper said distastefully as she prodded the shapeless green
coveralls with a bare toe. She eyed the helmet, gloves and boots with equal distaste. "I'd suffocate."
"If you want to come with me, you'll wear it," Kennon said. "Otherwise you won't come near that pit. Try it and
I'll chain you to the jeep."
"You wouldn't!"
"Just try me."
"Oh -- all fight. I'll wear the thing -- but I won't be comfortable."
"Who cares about that? You'll be protected."
"All right -- show me how to put it on. I'd rather be with you than worry about what you are doing."
The suit was several sizes too large but it covered her adequately. Too adequately, Kennon decided. She looked
like a pile of wrinkles with legs. He chuckled.
She glared. "So I'm funny," she said. "Let me tell you something else that's funny. I'm hot. I'm sweating. I itch.
Now -- laugh!"
"I don't feel like laughing," Kennon said. "I feel the same way."
They approached the edge of the Pit carefully. Kennon kept checking the radiation counter. The needle slowly
rose and steadied at one-half roentgen per hour as he thrust the probe over the rim of the depression. "It's fine, so
far," he said encouragingly. "We could take this much for quite a while even without suits."
He lowered himself
over the edge, sliding down the gentle slope.
"How is it down there?" Copper called. The intercom crackled in his ear.
"Fine -- barely over one roentgen per hour. With these suits we could stay here indefinitely." The sigh of relief
was music in her ears. "This place is barely lukewarm."
"That's what you think," Kennon said. "I mean radiation warm," Kennon said. "Stay up there and watch me. I may need some things."
"All right."
Copper squirmed inside the hot suit. The thing was an oven. She hoped that Kennon didn't plan to
work in the daytime. It would be impossible.
Kennon gingerly approached the ship. It was half buried in the loose debris and ash that had fallen or blown
into the pit during the centuries it had rested there. It was old -- incredibly old. The hull design was ancient -- riveted
sheets of millimeter-thick durilium. Ships hadn't been built like that in over two thousand years. And the ovoid
shape was reminiscent of the even more ancient spindizzy design. A hyperspace converter like that couldn't be less
than four millennia old. It was a museum piece, but the blue-black hull was as smooth and unblemished as the day it
had left fabrication.
Space travel would have gotten nowhere without durilium, Kennon reflected. For five thousand years men had
used the incredibly tough synthetic to build their spacecraft. It had given man his empire. Kennon gave the hull one
quick glance. That part of the ship didn't worry him. It was what he would find inside that bothered him. How much
damage had occurred from two thousand or more years of disuse? How much had the original travelers
cannibalized? How much could be salvaged? What sort of records remained? There were a thousand questions that the interior of that enigmatic hull might answer.

The upper segment of the airlock was visible. It was closed, which was a good sign. A few hours' work with a digger should expose it enough to be opened.

"Copper," he said, "we're going to have to dig this out. There's a small excavator in the cargo bed of the jeep. Do you think you can bring it down here?"

"I think so."

"Good girl!" Kennon turned back to the ship. He was eager to enter it. There might be things inside that would settle the question of the Lani. The original crew had probably recognized the value of the hull as a repository as well as he did. But in the meantime there would be work -- lots of it. And every step must be recorded.

It was the rest of the day's work to expose the emergency airlock. The little excavator toiled over the loose ash for hours before it displaced enough to make the port visible, and the ash was not yet cleared away sufficiently to open the portal when darkness brought a halt to the work.

It would be impossible to unearth the spaceship with their low-capacity digger, Kennon decided. It would be difficult enough to clear the emergency airlock in the nose. But if the tubes and drive were still all right, by careful handling it should be possible to use the drive to blast out the loose ash and cinders which surrounded the hull.

Kennon reluctantly gave up the idea of entering the spaceship. That would have to wait until tomorrow. Now they would have to conceal the work and call it a day. A few branches and the big blocks of pumice would suffice for temporary camouflage. Later they could make something better. Anything in the jeep which might be useful was cached along with the radiation suits in the passageway through the lava wall -- and in a surprisingly short time they were heading homeward.

Kennon was not too displeased. Tomorrow they would be able to enter the ship. Tomorrow they would probably have some of the answers to his questions. He looked ahead into the gathering night. The gray mass of the abandoned Olympus Station slipped below them as he lined the jeep along the path indicated by the luminous arrow atop the main building, set the controls on automatic, and locked the craft on the guide beacon in Alexandria's tower. In a little less than an hour they would be home.

CHAPTER XIV

Kennon was morally certain that the Lani were of human stock. Evolved, of course. Mutated. Genetic strangers to the rest of humanity. But human. The spaceship and the redes proved it as far as he was concerned. But moral certainty and legal certainty were two different things. What he believed might be good enough to hold up in a Brotherhood court, but he doubted it. Ulf and Lyssa might be the founders of the Lani race, but they had come to Kardon nearly four thousand years ago and no records existed to prove that the Lani weren't here before they came. Redes passed by word of mouth through hundreds of generations were not evidence. Even the spaceship wasn't the absolute proof that would be needed to overturn the earlier legal decision. Other and better proof was needed -- something that would stand up in any court in the Brotherhood. He hoped the spaceship would hold that proof.

But Kennon's eagerness to find out what was inside the ancient spacer was tempered by hard practicality. Too much depended on what he might find inside that hull. Every step of the work must be documented beyond any refutation. Some method of establishing date, time, and location had to be prepared. There must be a record of every action. And that would require equipment and planning. There must be no mistake that could be twisted by the skillful counsel that Alexander undoubtedly retained.

He had no doubt that the Family would fight. Too much money and prestige were involved. To prove the Lani human would destroy Outworld Enterprises on Kardon. Yet this thought did not bother him. To his surprise he had no qualms of conscience. He was perfectly willing to violate his contract, break faith with his employers, and plot their ruin. The higher duty came first -- the duty to the human race.

He smiled wryly. It wasn't all higher duty. There were some personal desires that leavened the nobility. To prove Copper human was enough motivation -- actually it was better than his sense of duty. Events, Kennon reflected, cause a great deal of change in one's attitude. Although not by nature a plotter, schemes had been flitting through his mind with machine-like regularity, to be examined and discarded, or to be set aside for future reference.

He rejected the direct approach. It was too dangerous, depended too much on personalities, and had too little chance for success. He considered the possibility of letters to the Brotherhood Council but ultimately rejected it. Not only was the proof legally insufficient to establish humanity in the Lani, but he also remembered Alexander's incredible knowledge of his activities, and there was no reason to suppose that his present didn't receive the same scrutiny as the past. And if he, who hadn't written a letter in over a year, suddenly began to write, the correspondence would undoubtedly be regarded with suspicion and would probably be examined, and Dirac messages would be out for the same reason.

He could take a vacation and while he was away from the island he could inform the Brotherhood. Leaving
Flora wouldn't be particularly difficult, but leaving Kardon would be virtually impossible. His contract called for vacations, but it expressly provided that they would be taken on Kardon. And again, there would be no assurance that his activities would not be watched. In fact, it was probable that they would be.

There was nothing that could be done immediately. But there were certain long-range measures that could be started. He could begin preparing a case that could be presented to the Council. And Beta, when it knew, would help him. The situation of the Lani was so close to Beta's own that its obvious merit as a test case simply could not be ignored. If he could get the evidence to Beta, it would be easy to enlist the aid of the entire Medico-Technological Civilization. It would take time and attention to detail; the case, the evidence, everything would have to be prepared with every safeguard and contingency provided, so that there would not be the slightest chance of a slip-up once it came to court.

And perhaps the best method of bringing the evidence would be to transport it under its own power. The thought intrigued him. Actually it wouldn't be too difficult. Externally the Egg wasn't in bad shape. The virtually indestructible durilium hull was still intact. The controls and the engines, hermetically sealed inside the hull, were probably as good as the day they stopped running. The circuitry would undoubtedly be bad but it could be repaired and restored, and new fuel slugs could be obtained for the engine and the converter. But that was a problem for the future.

The immediate problem was to get into the ship in a properly documented fashion. It took nearly two months, but finally, under the impersonal lenses of cameras and recorders, the entrance port of the God-Egg swung open and revealed the dark interior. Kennon moved carefully, recording every step as he entered the black orifice in the spaceship's side. His handtorch gave plenty of light for the recorders as he moved inside - Copper at his heels, both of them physically unrecognizable in antiradiation suits.

"Why are we moving so slowly?" Copper said. "Let's go ahead and find out what's beyond this passageway."
"From a superstitious coward you've certainly become a reckless explorer," he said.
"The Egg hasn't hurt us, and we've been around it many times," she said. "Either the curse has become too old to hurt us, or there never was any in the first place. So let's see what is ahead. I'm curious."
Kennon shook his head. "In this business we must hurry slowly -- very slowly. You know why."
"But I want to see."
"Patience, girl. Simmer down. You'll see soon enough," Kennon said. "Now help me set up this camera."
"Oh, all right -- but isn't there any excitement in you?"
"I'm bubbling over with it," Kennon admitted, "but I manage to keep it under control."
"You're cold-blooded."
"No -- I'm sensible. We want to nail this down. My future, yours, and that of your people depend upon how carefully we work. You wouldn't want to let us all down by being too eager, would you?"
She shook her head. "No -- you're right of course. But I still would like to see."
They moved cautiously through the airlock and into the control room.
"Ah!" Kennon said with satisfaction. "I hoped for this, but I didn't dare expect it."
"What?"
"Look around. What do you see?"
"Nothing but an empty room. It's shaped like half an orange, and it has a lot of funny instruments and dials on the walls, and a video screen overhead. But that's all. Why -- what's so unusual about it? It looks just like someone had left it."
"That's the point. There's nothing essential that's missing. They didn't cannibalize the instruments -- and they didn't come back."
"Why not?"
"Maybe because that curse you mentioned a few minutes ago was real."
Copper drew back. "But you said it wouldn't hurt us--"
"Not now. The heat's practically gone, but when whoever flew this crate came here, the whole shell could have been as hot as a Samarian summer."
"But couldn't they have come back when it cooled?"
"Not with this kind of heat. The hull was probably too radioactive to approach from the outside. And radioactivity cools off slowly. It might take several lifetimes for its level to become low enough to approach if there was no decontamination equipment available."
"I suppose that's why the early ones thought the Egg was cursed."
Kennon nodded. "Now let's check -- oh! oh! what's this?" He pointed to a metal-backed book lying on the control panel.
"It looks like a book," Copper said.
"I'm hoping it's the book."
"The book?"
"Yes -- the ship's log. It's possible. And if it is, we may have all the evidence we need -- Copper! -- Don't touch it!"
"Why not?"
"Because its position has to be recorded first. Wait until we get the camera and recorders set up."

* * *

Gingerly Kennon opened the ancient book. The sheets inside were brittle -- crumbling with age -- but he could make out the title U.N.S.S. Wanderer with the date of launching and a lower line which read "Ship's Log." Kennon was thankful for his medical training. The four years of Classical English that he had despised so much were essential now. Stumbling over unfamiliar words and phrases, he moved slowly through the log tracing the old ship's history from pleasure craft to short-haul freight tractor to obsolescence in a space dump orbiting around a world called Heaven.

There was a gap of nearly ten years indicated by a blank page before the entries resumed.
"Ah -- this is it!" Kennon said.
"What is it?" Copper said curiously. "I can't read the writing."
"Of course you can't. It's in English -- a language that became obsolete during the Interregnum. I had to learn it, since most medical terminology is based on it."
"What is an Interregnum?" Copper interrupted. I've never heard that word before."
"It's a period of confusion when there is no stable government. The last one came after the Second Galactic War -- but never mind that -- it happened long ago and isn't important now. The important thing that did happen was the Exodus."
"What was that?"
"A religious revival and a tremendous desire to see what was happening beyond the next star. During that century men traveled wider and farther then they ever have before or since. In that outward explosion with its mixed motivations of religion and practicality, colonists and missionaries went starward to find new worlds to tame, and new races to be rescued from the darkness of idolatry and hell. Almost any sort of vehicle capable of mounting a spindizzy converter was pressed into service. The old spindizzies were soundly engineered converters of almost childlike simplicity that could and did carry ships enormous distances if their passengers didn't care about subjective time-lag, and a little radioactivity."
"And that's what happened to this ship. According to this log it was bought by Alfred and Melissa Weygand - a missionary couple with the idea of spreading the Christian faith to the heathen."
"Alfred and Melissa -- Ulf and Lyssa -- they were a part of this ancient explosion that scattered human seed across parsecs of interstellar space. It seems that they were a unit in a missionary fleet that had gone out to the stars with flame in their hearts and Gospel on their lips to bring the Word to the benighted heathen on other worlds." Kennon's lips curled with mild contempt at their stupid foolhardiness even as his pulse quickened to their bravery. They had been fanatics, true enough, but theirs was a selfless fanaticism that would risk torture and death for what they believed -- a fanaticism that was more sublime than the concept of Brotherhood which had evolved from it. They knew nothing of the enmity of race, of the incessant struggle man had since waged with alien intelligences all too willing to destroy intruders who encroached upon their worlds. Mankind's early selflessness had long ago been discarded for frank expansionism and dominance over the lesser races that stood in their way. And in a way it was too bad.

The ship's log, meticulously kept in neat round English script, told a story that was more than the bare bones of flight. There was passion and tenderness and a spiritual quality that was shocking to a modern man steeped in millennia of conquest and self-interest. There was a greatness to it, a depth of faith that had since been lost. And as Kennon slowly deciphered the ancient script he admired the courage even as his mind winced with dismay at the unheeding recklessness.

The Weygands had lost contact with the others, and had searched for them in hyperspace, doubling and twisting upon their course until they had become hopelessly lost, and then, with their fuel nearly exhausted, had broken out into the normal three-space continuum to find Kardon's sun and the world they called Flora.

How little they had known and how lucky they had been.

It was only by the grace of their God that they had found this world before their fuel was exhausted. And it was only by further grace that the planet was habitable and not populated with intelligent life. They had more luck than people were entitled to in a dozen lifetimes. Against odds of a million to one they had survived.

It was fascinating reading.
But it was not proof.
The last entry read: "We have circled this world and have seen no buildings -- no sign of intelligent life. We are lost, marooned on this empty world. Our fuel supplies are too low for us to attempt to find the others. Nor could we. The constellations in the sky are strange. We do not know which way to go. Therefore we shall land upon the great island in the center of the yellow sea. And perhaps someday men will come to us since we cannot return to them. Melissa thinks that this is an example of Divine Providence, that the Lord's mercy has been shown to us that were lost in the vastness of the deep -- that we have been chosen, like Eve and Adam, to spread the seed of man to yet another world. I hope she is right, yet I fear the radiation level of the ship has become inordinately high. We may well be Eve and Adam, yet an Adam that cannot beget and an Eve that is not fruitful. I am trimming the ship for landing, and we shall leave it immediately after we have landed, taking with us only what we absolutely need. There is too much radiation from the spindizzy and the drive to remain here longer -- and God knows how hot the outer hull may be."

And that was all. Presumptive evidence -- yes. Reasonable certainty -- yes. But not proof. Lawyers could argue that since no direct exploration was made there was no valid reason to assume that the Lani did not already inhabit Kardon. But Kennon knew. His body, more perceptive than his mind, had realized a truth that his brain would not accept until he read the log. It was at once joy and frustration. Joy that Copper was human, frustration that he could not obtain for her and her race the rights to which they were entitled. But the immediate problem was solved. His conditioning was broken now he was convinced that Copper was a member of the human race. It was no violation of his code to love her. The greatest barrier was broken, and with it gone the lesser ones would yield. Relief that was almost pain washed through him and left him weak with reaction.

"What is it?" Copper asked as he turned to her. "What is this thing that has turned your face to joy?"
"Can't you guess?"
She shook her head. "I have seen nothing but you reading this ancient book, yet you turn to me with the look in your eyes that the redes say Ulf had for Lyssa."
"You're human!"
Copper shrugged. "You're mad. I'm a Lani. I was born a Lani -- and I shall die one."
"Don't you understand? All Lani are human. You all are the descendants of two humans who came here thousands of years ago."
"Then there is no reason why you cannot love me."
Kennon shook his head. "No," he said. "There is no reason."
Copper laughed. It was a sound so merry and gay that Kennon looked at her in surprise. She looked as happy as she sounded.

Simple and savage, Kennon thought. She cared nothing for the future, and probably very little about the injustice of her present. The thing that mattered was that what had kept them apart was gone. She was probably offering mental sacrifices to the Old Ones who had caused this change in the man she loved. She didn't really care about what had caused the change. To her it was sufficient that it had happened.

For a moment Kennon wished that it could be as simple for him as it apparently was for her. The fact that Copper was human posed a greater problem than the one it solved. The one had been personal. The other was infinitely greater. He could not let it lie. The very morality which had kept him from doing what he wished when he thought she was a humanoid now forced him to do what he did not wish. Every instinct said to leave it alone. The problem was too great for one man to solve, the situation too complicated, the evidence too inconclusive, the opposition too powerful. It would be far better to take his happiness and enjoy it. It was not his problem to solve. He could turn the evidence over to the Brotherhood once his contract was over, and better and more capable people than he could settle the Lani legal status. But the inner voice that had called him bestial now called him shirker, coward, and slacker. And this, too, could not be borne. The case of the Lani would have to be pursued as vigorously as he could do it. They were entitled to human rights -- whether they wanted them or not.

His first idea of making the spacer operational was a good one, Kennon decided as they finished the inspection of the ship. Even if it was never used it would make a good means of retreat. He grinned wryly. In a guerrilla operation such as the one he was considering it would be wise to have a way out if things got too hot. The heavy parts, the engines and the controls, were in workable condition and would merely require cleaning and oiling. Some of the optical equipment would have to be replaced and fuel slugs would have to be obtained for the drive -- but none of these would be too hard to accomplish. The slugs from any of the power reactors on the island would serve nicely. All that would have to be done would be to modify the fuel ports on the ship's engine. The spindizzy would have to be disassembled and checked, and the main leads, embedded in time-resistant plastic, would have to be examined. The most serious problem, however, wouldn't involve these things. The control board wiring and circuitry was where the trouble would lie. Normal insulation and printed circuitry wasn't designed to last for thousands of years. Each wired circuit would have to be removed, duplicated, and replaced. Every printed panel would have to be
cleaned and receive a new coat of insulating varnish. Working full time, a four-man electronics team could do the job in a week. Working part-time the two of them might get it done in three months. And the other jobs would take at least another. Add a month for errors in judgment, lack of materials, and mistakes -- and another for unavoidable delays -- it would be at least six months before the Egg would be spaceworthy.

Six months.

Not too long if everything went well, but far too long if there were any mistakes. He would have to be careful, yet he must not give the impression of being careful. He shook his head. Being a subversive was going to require a greater amount of acting ability than he had ever been called upon to display.

And what of Copper? How would she behave under the double strain of knowledge that she was human and knowledge of the spaceship? Women weren't noted for their tight-lipped reticence. Would she tell the other Lani? Would she crack under the pressure? Did she have the qualities of a good conspirator?

As it turned out, he didn't need to worry. As a partner in crime, Copper was all that could be wished. Everything was normal. She was still obedient, helpful, and gay as ever. To watch her, no one would ever think that her bright head was full of knowledge that could rock Flora to its foundations. Never by look or word did she betray the slightest trace of strain or guilt.

And in her other moments she was ecstatic in her love and helpful with the repair work on the Egg whenever Kennon could get time to visit the old spaceship.

"You amaze me," Kennon said as they eased the cover of the spindizzy in place and spun the bolts on the lugs that held it to the outer shielding. He picked up a heavy wrench and began methodically to seat the bolts as Copper wiped the white extrusion of the cover sealant from the shining case.

"How?"

"The way you hide your knowledge of this ship from the others. I know you better than anyone else on this island, and yet you would fool me."

"We Lani are used to hiding things. You men have been our masters for centuries, yet you do not know our redes. Nor do you know what we think, We obey you, but there are parts of us you do not own. It is easy to hide a little thing like this."

Kennon nodded. It figured. He seated another bolt. Three more and the drive room would be restored and they could start on the control circuits. "I wish you were as clever about adopting human customs as you are about hiding guilty knowledge," he said.

Copper laughed. "You mean those silly things you have been teaching me? Why should I learn them? I'm happy as I am. I love you, you love me, and that is all that matters."

"It's not all that matters. Can't you get it through your head that civilized customs are necessary in a civilized society?" He gave the next-to-last bolt an extra-vicious wrench. "You'll have to know them if you expect to get along on Beta."

"But I will never see Beta."

"I am going there when my duty here is over. And you're going with me."

"When will that be?"

"Three years."

"So long? Well -- we can think of it then, but I don't think Man Alexander will let you take me."

"Then I shall take you without his consent."

She smiled. "It would be easier to stay here. In another fifteen years I will be old and you will not want me."

"I'll never do that. I'll always want you."

"You swear too easily," she said gently. "You men live forever. We Lani are a short-lived race."

"But you needn't be. It's obviously----"

"It's been tried, my love -- and those who were treated died. Man Alexander tried many years ago to make us long-lived like you. But he failed. You see, he loved one of us too."

"But----"

"Let us think no more of it. Let us enjoy what we have and be grateful to the Gods for the love we enjoy -- or do you have any Gods?"

"One."

"Two are better. More, anyway. And besides, Ulf and Lyssa and the God-Egg are responsible for our joy."

"They are indeed," Kennon said.

"Then why should you think of leaving the place where they rule? You should stay here. There will be other Lani when I am gone. You will be happy always."

"Not without you," Kennon said. "Don't you understand that I love you?"

"And I you. But I am a Lani. You are a man."
"You're as human as I am," Kennon said abruptly.
"That is what you say," Copper replied. "I am not so sure. I need more proof than this." She waved her hand at the ship.
"What proof do you need?"
"The same as the proof you men require. If I should have your child, then I would believe that I was human."
"I've told you a thousand times that the radiation on this ship must have affected Ulf and Lyssa's germ plasm. Can't you understand that?"
"I can understand it all right, but it does not change things. Ulf and Lyssa may have been human before they came here, but they were not when they landed. They were Lani, and their children were Lani."
"But they were of human stock."
"The law that lets men become our masters does not agree with you."
"Then the law is wrong. It should be changed."
Copper shrugged. "Two people cannot change a law."
"They can try -- particularly if the law is unjust."
"Copper sighed. "Is it not enough for us to love? Must you try to run through a wall?"
"When the wall stands in the way of right and justice I must."
Copper looked at him with pity in her green eyes. "This I do not understand. I know nothing of right and justice. What are these things? Just words. Yet you will endanger our happiness for them. If it is my happiness you wish - then leave this foolishness alone. I have fifteen years I can live with you before I am old and you tire of me. With those years I can be content."
"But I can't," Kennon said. "Call me selfish if you wish, but I want you with me as long as I live. I don't want to live my life without you."
"You want too much," Copper said softly. "But if it makes you happy to try to get it, I shall help. And if we do not succeed you will at least be happier for trying. And if you are happy" -- she shrugged -- "then the rest makes little difference."

That was the crux of the matter, Kennon reflected bitterly. He was convinced she was human. She was not. And until her mind could be changed on that point she would help him but her heart wouldn't be in it. And the only thing that would convince her that she was human would be a child - a child of his begetting. He could perhaps trick her with an artificial insemination of Lani sperm. There were drugs that could suspend consciousness, hypnotics that would make her believe anything she was told while under their influence.

But in the end it would do no good. All witnesses in Brotherhood court actions were examined under psychoprobe, and a hypnotic was of no value against a lie detector that could extract the deepest buried truth. And he would be examined too. The truth would out--and nothing would be gained. In fact -- everything would be lost. The attempt at trickery would prejudice any court against the honest evidence they had so painfully collected.

He sighed. The only thing to do was to go on as they were -- and hope that the evidence would hold. With Betan legal talent at their back it might. And, of course, they could try to produce a child as nature had intended. They could try -- but Kennon knew it would not succeed. It never had.

CHAPTER XV
Copper had been acting strangely of late, Kennon thought as he rolled over in his bed and watched her standing before the full-length mirror on the bathroom door. She pivoted slowly before the glass, eying herself critically, raising her arms over her head, holding them at her sides, flexing her supple spine and tightening muscles that moved like silken cords beneath her golden skin.
"What are you trying to do--become a muscle dancer?" Kennon asked idly.
She whirled, a crimson blush deepening the tan of her face. "You were supposed to be asleep," she said.
"I'm an unregenerate heel," he replied, "and I don't sleep too well nowadays unless you're beside me."
"Well -- I suppose you might as well know now as later," she said. "You'll know in any event."
"Know what?"
"That you're right. I am human."
"And what brought on this sudden change of--" He stopped abruptly, his eyes widening.
"Yes," Copper said. "I am with child. Your child."
"But that's impossible."
She shook her head. "It's a miracle perhaps, but it's not impossible. It's happened. Can't you see the difference?"
"See what? You look just as you always do."
"I suppose you can't see it yet," she admitted. "But I am with child. I'm two weeks past my time."
Kennon's mind leaped to the obvious conclusion. Pseudo-pregnancy. He had seen it before among Lani at Hillside Farm. It was an odd syndrome which occasionally occurred in humans and animals. The brain, desiring
children, made demands upon the body and the body responded to its desire by tricking the brain. Lani were fairly subject to its probably because they had better imaginations. He would run a few tests when they went down to the hospital, and once she realized the practical joke her body was playing everything would be all right. No wonder she seemed excited.

"We'll find out about that later," he said equably. "We'll settle this when we get back to the hospital."

Copper smiled confidently and patted her stomach. "I know what you are thinking, but you're wrong. We Lani know about these things. In forty generations I am the first to conceive as the Master intended."

"I hope you haven't," Kennon said with such bitter sincerity that Copper looked at him wide-eyed. "Not now. Because if you have, neither your life nor mine is safe."

"Why?"

"The Alexanders. Do you think they'll take it lying down? We're not ready for them yet. They'll fight, and the first thing they'll do is kill you and erase me so we would never be able to talk. You have been declared an animal, and you will not be allowed to change."

"What can we do?" Copper asked. She shivered. "I do not want to die."

"Nor do I want you to," Kennon said.

"I could tell the others."

"And just what would that accomplish?"

"In a week every Lani on the island would know it. There would be revolt. For the Lani would no longer be dependent upon Men to survive. Their greatest hold on us would be gone. And we would be free again on our island world."

"You would not!" Kennon said. "That sort of thinking is foolishness. Alexander would have men here within a week, and a week after that you would be smashed. Don't you realize that there are thousands of millions of men in the galaxy -- and to every one of them you would be animals. You know nothing about what you would face. Your puny hundreds couldn't even stand against a fraction of the power Alexander could mount against you. Have you seen a Burkholtz blaster work? Have you seen remote-control antipersonnel missiles? Have you push-pull projectors, atomic warheads? All of these weapons Alexander can command. Don't you realize he's an entrepreneur -- one of the most powerful men in this sector?"

Copper shook her head. "You put that in a different way. You talk as if it were my belief rather than the truth."

"What is truth?" Kennon said heavily. "Who would believe you? There are hundreds of others with child."

"Sure you're human. You know it. I know it. I've been trying to convince you for the past two months. You're just as human as I am. But pray that you're not pregnant. We can't get out of here in less than four months and by then everybody will know about you. Someone will certainly check the records. And after that will come the psychoprobes. Everything will come to light. The Egg will be destroyed. I will be erased. You will be dead. And that will be the end of it." He looked down at her with an odd expression of pity on his face. "You see?" he demanded harshly.

Copper nodded. "I didn't understand," she said. "Don't be angry with me. I shouldn't have told you. I thought you'd be happy."

"I was never angry with you, but I am with myself. I was stupid. I didn't figure on the remote possibility that we might be genetically compatible. I should have my head examined for putting you in such danger. However there's the possibility -- the probability -- that your body is playing a trick upon you."

She shook her head. "You are wrong. I am not mistaken. I am with child and the child is yours. But the fault is no more yours than mine. I wanted you before you looked on me. I still do and I do not feel at fault. That is I am yours, that my child is yours is a thing of wonder and joy. Never could I have expected so much."

Kennon looked down at her smudged face, streaked with the sudden rivulets of tears, and bitterness galled his throat. Dear God -- let her be wrong, he prayed silently. Let it be pseudopregnancy this time. Let the tests be negative.

But they weren't. Unequivocally they confirmed Copper's diagnosis. Here was the proof he needed. The final test that would prove the Lani human. And he had no way of getting it where it would do any good. It would take at least four months of steady labor before the ship was ready, and he didn't have that sort of time. He was needed here and his prolonged absence would cause suspicion and investigation. Something would have to be done -- but what? He couldn't take Copper off the island in an airboat. They were checked with microscopic care by Otpen One's IFF. A jeep didn't have enough range to take them to the mainland. And even if they got there they couldn't get off the planet. Alexander knew everything that happened on Kardon's two spaceports. The Egg was the only way, but the
Egg was unfinished and unspaceworthy.

Frantically Kennon considered concealing Copper. He shook his head. It wouldn't work. It would be impossible, to hide a baby on a place where every birth was recorded. Nor could one hide evidence of pregnancy in a Lani. Childbearing leaves telltale marks upon the body, and Copper, even if she could be concealed for the duration of her pregnancy, could never survive the sharp-eyed scrutiny of her fellows or the other humans. Questions would inevitably be asked.

There had to be a solution. He rubbed his forehead wearily. It was strange how so little a thing as the union of a spermatozoon and an ovum could produce so much trouble. He looked across the office at Copper placidly filing case cards. She wasn't worrying. With sublime faith, she was sure that he would find the answer, the one that would solve everything. He shuddered. The only logical solution was abortion -- and that was unthinkable! He would not murder his child -- nor would Copper permit it if he was capable of doing so.

It was almost a relief when his phone rang and Blalok's voice came cheerfully across the wire.

"Tried to get you about an hour ago," the superintendent said, "but your girl said you were busy."

"I was."

"You through now?"

"Yes."

"Well, get up to the fortress. Alexander just flew in and he's calling a meeting. Something important has come up."

Something important! A wave of ice rattled down Kennon's spine, and then he grinned feebly. Alexander didn't know. He couldn't know. It had to be something else.

"I'll be right up," he said, marveling at the calmness in his voice.

Kennon couldn't help comparing this meeting with the one a year ago. The location was different -- the conference room in Alexandria was more formal than Blalok's parlor but the same people were present: Alexander, Blalok, Jordan, and himself. Somehow Alexander seemed to have shrunk. He was no longer as impressive as he had been. But the man still radiated force, even though it didn't seem quite so overpowering. The year, Kennon thought, had done much to build his self-confidence. He felt assured rather than nervous.

"Good to see you, Kennon," Alexander said. "Reports say you're doing a good job."

"I can't claim the credit," Kennon said. "Eighty-five per cent of our success is due to co-operation from the operating staff. And that's Blalok's doing -- he knocked the heads of the division managers together and they took care of their staffs. Otherwise we could have had a bad time."

"But you didn't," Alexander said. "And you were the motive force."

"I've darn near motivated myself out of a job," Kennon said. "They co-operate all too well nowadays."

"Which goes to prove that my theories on preventive medicine are right," Alexander said, turning to Blalok.

"It looks that way," Blalok admitted, "but that could be because you picked a good man."

"He's good in more ways than one," Alexander said. "Or did he tell you he saved Douglas's life out on Otpen One?"

"He's never said a word."

Alexander smiled. "Another point in his favor. He knows how to keep his mouth shut."

"Not when he's telling someone what to do about disease," Jordan interjected.

"Or telling someone off when they haven't followed directions," Blalok added.

"Better and better. I was sure that he was the one we needed when we first met."

Kennon felt his ears turn flaming red.

"But that's not the reason I brought you here. This isn't a Jac Kennon admiration society. I called you because I want to expand the Lani breeding program."

"Why?" Jordan asked.

Blalok stiffened. "You know my feeling about that, sir. I've never liked the idea of selling them. If that's what's in your mind--"

Alexander shook his head. "Simmer down," he said, as he seated himself at the head of the table. "There's going to be no selling. The Lani are too valuable for that. We'll need them more than the money they'd bring on the market. You see -- I've acquired a planet out on the periphery. A place called Phoebe. One of our ships found it, and I staked a discovery claim on the major land mass, and the crew made lesser claims that covered all the available land. Last month the Brotherhood allowed the claims. Last week the crews sold me their land. Phoebe's a lovely place -- quite a bit like Flora -- and the ecological tests show it's capable of supporting mammalian life. Just before I came here I sent three shiploads of exterminators to clean it up and make it ready for us. It should be ready in two years."

"What sort of an ecology are you exterminating?" Jordan asked.
"Not that it makes any difference," Alexander said, "but it's mainly reptilian. Nothing over Group I. We'll restock with Floran animals."

Jordan sighed. "Since that's the way it is, it doesn't make any difference," he said. "But it could have. The Lani are sensitive to things like that. If they thought that they were walking in over a pile of bodies they'd do badly. It'd be like Olympus all over again. And we couldn't keep them from knowing. We talk and we forget, but they'd tell each other - and they'd remember."

"I know," Alexander said, "somehow they've never forgotten that Grandfather trapped the last of the Lani males on Olympus."

Jordan nodded. "They can't stand the place. That's why we had to abandon the station."

"Does this new world have a moon?" Kennon asked abruptly.

"Yes -- in fact it has two."

"Habitable?"

"No -- they're too small to hold air. But men could live there in domes -- but why do you? -- oh! I see! I hadn't considered that point." Alexander's hand darted to the phone beside him. "Get me Albertsville," he snapped. "Yes, my offices -- I want Mr. Oliver in purchasing and contracting. Hello -- Ward? Alexander here. Yes -- everythin's fine. I have a job for you -- use your scrambler - pattern two." Alexander dialed the scrambler code on the second dial at the base of the phone, effectively preventing eavesdropping by beam tappers. "Yes," he went on. "It's Project Phoebe. Have you secured title to the moons? You haven't? Well -- you'd better do it before some of our competitors get bright ideas. Sure they know about the project -- do you think they're stupid? Warren over at Consolidated practically told me that he was onto our scheme. So get title to those moons. Since they're uninhabitable and within the planet's primary field they come under the Spatial Debris Act and you should be able to get Kardonian title without any great amount of trouble. Naturally we want them. -- For defense -- what else? We'll have most of our eggs in that basket. No -- I don't know how we overlooked that point. But if it wasn't for a bright young man out here we'd have left ourselves wide open. Now get cracking -- get that leak plugged!" Alexander dropped the phone back in its cradle and sighed. "Well -- that's buttoned up," he said. "Thanks, Kennon."

Kennon looked at Alexander's grinning face, his own impassive, but a shattering certainty exploded in his mind - Alexander was a telepath! That was his difference! That was the thing that made him feared and respected by his business associates. It wouldn't have been enough on the Central Worlds, where men knew of sensitives and took precautions against them. But out here on the periphery it was a deadly advantage.

"So I gave it away," Alexander said. "I suppose I was careless, but your thoughts about the moons shocked me."

"You practically told me once before, when you hired me," Kennon said, "but I never realized it."

"You were too excited then."

"I wouldn't know," Kennon said. "At any rate I didn't add the facts correctly." From somewhere deep in his memory an old quip came floating to the surface: "An executive is a man who picks brains -- others' brains." By that definition Alexander was an executive of the first class. Alexander chuckled.

Suddenly Kennon wanted to run. Panic flooded him! What had he been thinking about? Had he thought of -- two times two are four, four times four are sixteen, sixteen times sixteen are -- let's see, six times sixteen is ninety-six, one times sixteen is -- six, five, carry one -- two hundred fifty-six. Two hundred fifty-six times--

"What's eating you?" Alexander demanded.

"I'm angry," Kennon said. "I told you the conditions I'd sign that contract, and you wrote a Peep Clause into it. And then you peep in the worst way possible. There's no defense against a Telep unless you know about him; you've had my whole mind bare! You've violated my personal privacy like no man has done before. Sure I'm mad. I expected honesty from you -- and you peep!" The anger was stronger now -- a wave of raw emotion based on a lifetime of training in mutual respect of a man's privacy -- a feeling intensified by his childhood environment of a crowded planetary ecology and the cramped crew quarters on a spaceship. To Kennon, Alexander had committed the ultimate sin.

"I can see I made a mistake by not telling you," Alexander said. His voice was cold. "But you have no right to insult me."

"I'm not saying it, am I?" Kennon snapped. The moonflower on the bookcase behind Alexander was a thing of beauty. Alexander liked beauty. He had said so, and the Great Hall below them bore it out. It was a lovely room. Those four bronze Lani in the fountain were works of art. One of them looked remarkably like Copper. Copper in bronze. The little witch had probably posed for the casting. Maybe it had even been made from her body.

"They're all of Susy," Alexander said. "I can see why you are angry, and I don't blame you. But remember I warned you about Lani."

Copper -- Kennon wrenched his thoughts back to the moonflower. It had twelve petals, limpid white on the
borders shading to deep blue in the center-from which the cream-colored stamen surrounded by transparent pistils sprang to burst into a golden glory of pollen that dripped in tiny yellow flecks to the broad petals below. It was a magnificent flower. There was nothing like it on Beta. That was a marvelous thing about flowers -- wherever one went in the universe, plants used the same methods to fertilize their seed and spread their germ plasm. It was too bad that -- Kennon jerked his attention to Alexander's face. He detested the thought that his mind was common property. A man should have something he can call his own. There had been a clinics instructor in Year Six who was a sensitive. The classes had protected themselves against his prying with a circlet -- a thought screen -- he had done it too. Maybe he had brought the circlet with him. If he did, no one was going to catch him without it. It was a dirty business, this reading of others' thought. Now where had he put that circlet? Was it among his old books -- or was it with his instruments?

"Why don't you go back to your house and find it?" Alexander snapped. "As you are, you're nothing but a disruption. I want you in on this meeting, but not the way you're acting."

"I'm not going to act any other way until I get some protection from peeping," Kennon said grimly. "And if you think this is bad wait till I start going through comparative anatomy."

"What's the matter with you two?" Blalok asked.

"Be quiet," Alexander snapped. "This isn't your problem. Kennon is behaving like a spoiled child!"

"He's a telepath!" Kennon said. "And he didn't tell me."

"So what? I've known that for years."

"And you stand for it?"

"I'm a Mystic, not a Betan," Blalok said. "I don't have your insane desire for privacy."

"Go find that thought screen if you still have it!" Alexander said. "I don't want any more of this. You're making me ill!"

Kennon grinned thinly as he rose to his feet. It was a good thing he remembered Alexander was squeamish and didn't like anatomy. The door was to his left, an iris door with eight leaves -- terribly old-fashioned. About ten steps away. Count them -- one -- two -- three--

Alexander sighed as Kennon left the room. "I certainly pushed the panic button on that young man," he said. "He has a pathological attitude toward telepathy. Wonder what he has to hide that he wants privacy so badly? Even for a Betan this reaction was violent."

"Oh, I don't know. He's a pretty emotional sort. Maybe he hates to look like a fool. He's gotten himself mixed up with one of the Lani. Cute little thing by the name of Copper," Blalok said.

"Oh -- that's it. I thought that was what he was hiding. A picture of a girl kept popping up." Alexander chuckled. "I suppose that's the trouble. A man hardly likes to look a fool, particularly to someone who has warned him. At that, I don't blame him. They are beautiful and affectionate. And even with their superstitions and tabus they're better than most humans."

"For pets," Blalok said heavily.

"They're not better at anything," Jordan demurred. "They can't be -- man is the best and always will be."

"The eternal racial chauvinist," Alexander murmured. He turned his attention to Blalok. "But for awhile, Evald, I'd suggest you keep an eye on our young man. I still don't like his reaction. It was too violent -- too defensive. I don't feel right about it. Perhaps Betans are more sensitive than most people but it seems to me that he's trying to conceal something. There was an undertone of fear -- and something else -- beneath his defenses."

"Couldn't you get any more than that?" Blalok asked. "You're pretty good at this mind-reading business."

"His defenses were remarkably good," Alexander said dryly.

* * *

Well he'd done it now, Kennon thought. He found the thought-screen circlet sandwiched between two books on comparative neuroanatomy which he hadn't bothered to unpack. He slipped it on and connected the lead wires to a portable battery pack. There was a half-forgotten tingling as the weak field heterodyned his thought waves. Kennon sighed. If Alexander wasn't suspicious of him now the man was a fool. He'd done as well as he could with confusion and outrage, but it was hardly possible to hide behind superficialities. Even the most disciplined mind couldn't do that without some preparation. Undoubtedly his concern about Copper had leaked through. He could only hope that other and more important things had not.

Well -- he could go back to the conference now, but he would have to be doubly careful from now on. He couldn't make daily trips to Olympus. His reaction had killed that plan. Alexander would be suspicious now -- and unusual actions would crystallize suspicion to certainty. Now he needed a reason to be in that area. And then he grinned. He had a reason -- a good one -- one that would fit in with Alexander's plans and his own. The only problem would be to make Alexander buy it -- and that might be difficult. He'd have to work carefully -- but with normal luck he could put the idea across. He crossed his fingers as he trudged back up the path to Alexandria.
The conference dragged on. Unlike most meetings, this one accomplished things -- which was a tribute to Alexander's ability to keep the subject in hand. Details of the expansion program presented by Alexander were rapidly reduced to workable plans. They involved some rearrangement of existing facilities, and the construction of others. But the obvious snags were rapidly disposed of, and the whole revamped operation was outlined on paper in surprisingly few hours. A deadline date was set, construction was authorized, and in the morning the first steps in the practical implementation of the new program would be taken.

"Well, that's that," Alexander said with a sigh. "I think this calls for a drink."

"There's one more thing," Kennon said. "I know it isn't much, but Jordan's remark started me thinking."

"What remark?" Jordan asked.

"The one you made at the beginning about Phoebe possibly being like the Olympus Station. I've often wondered why that particular location has been so difficult to operate. Sure, I know the accepted explanation, but I think we should learn why it works and how to break a tabu. If we don't, we might be in for trouble."

"That's a good thought," Alexander said. "I tried to find out once, but all I could discover was that it was tabu. The Lani simply didn't like it. And despite the fact that I can read minds, I didn't learn any more than that. There's a certain sex-linkage to telepathy, as you probably know."

Kennon nodded.

"All I could discover was that their dislike of Olympus was a basic emotion rather than reasoned thought. They were nervous, irritable, disobedient, and uncooperative while they were there -- and even they didn't know why. It was merely tabu. We even tried youngsters -- but the attitude was the same. I'd like to know more about that basic emotion."

"We should understand it," Kennon agreed. "If we transship a large number of Lani to a strange world, we should know their deepest motivations. We cannot take the chance that the transplant won't take, with all the money you're sinking into this project."

"You have a point there. Have you any suggestions about how to accomplish this?" Alexander's voice was interested.

"I have. Hire a psychologist. And reopen Olympus."

"I'll be the same story," Jordan said.

"Not if you apply experimental procedure," Kennon said. "Divide the place into a number of separate units in which groups of -- say ten -- Lani of various ages are kept. Let every group know where they are, but don't let them come in contact with one another. Observe them constantly. Put spy cells in the units. Couple them to recorders. Prepare a set of test situations and observe how each group performs. Question individuals under narcosynthesis. Observe and record any changes in physical condition -- give them the works. Maybe we can collect some basic data that will indicate the answer."

"Not a bad idea," Alexander said.

"I don't like it," Jordan said. "It sounds cumbersome."

"It is," Kennon agreed. "But it may save a great deal of trouble later."

"I think you're right, Kennon," Blalok said. "We should know everything we can."

"What would you do first if you were heading this program?" Alexander asked. He eyed Kennon critically.

"Nothing," Kennon said promptly. "I'm not qualified to run an investigation like this. You need a specialist. I am a practitioner."

"Hmm -- but you know experimental procedure."

"Naturally -- but I do not have the training to prepare a program or evaluate its results. The only thing I could do would be to check the physical condition of the experimental groups."

"Could you set up the physical facilities?" Alexander asked.

"Possibly -- I'd need a set of plans of the station, and I couldn't guarantee that the specialist wouldn't want to make changes. But the physical arrangements should be simple enough to construct."

"How long would it take you to prepare a plan?"

"I could have it by tomorrow, or perhaps a day later."

"If you can do it by then I'll stay over. I'd like to examine this proposal more closely. It has merit. That's the second constructive suggestion you've made tonight. Despite your peculiar desire for privacy, I'm glad you came back."

Alexander smiled.

Kennon smiled back. Apparently the entrepreneur had taken the bait. But it was too early to tell whether he had swallowed it without reservation. It all depended upon how much had been given away before he had discovered that Alexander was a telepath. Perhaps Alexander was merely leading him on. There were too many intangibles, and there was no way of predicting how it would turn out. But he felt mildly optimistic.

Alexander closed the meeting, and Kennon left promptly. He had a good excuse. There was plenty of work to
do if he was going to prepare an adequate plan for utilizing Olympus Station. Jordan went with him, but Blalok stayed behind. It was natural enough. Blalok was the administrator, but Kennon felt uneasy. Nor would he have felt any better if he could have heard what went on after he left.

Alexander looked quizzically at Blalok after the door closed behind the two men.

"Well, Evald, what do you think? Does it strike you that Kennon's sincere -- or does it sound as though he has something up his sleeve?"

"If he does," Blalok said, "I don't know what it could be. I wouldn't take a job on Olympus if you gave it to me."

"If he doesn't know about the place," Alexander said thoughtfully, "it's probable that his suggestion was honest. I think it is but I'm not sure. He worries me now that I can't read him. I think I'll send Douglas back here to watch him."

"Why? In my book that'd be a poor choice. After all, you said Kennon saved his life. He should be grateful."

"You don't know Douglas," Alexander said. "He hates Kennon's guts for what he did."

"What did he do?"

"He made Douglas feel inferior. And there's no surer way to gain my cousin's undying enmity." Alexander laughed. "I know," he said. "He'd like to kill me, too."

Blalok shrugged.

"But in the meantime I want you to keep an eye on Kennon. If his outline is all right, I'm going to authorize him to set up this experiment. I want to give him every possible chance. I like him -- and he's done good work. I wouldn't want him to feel that I distrust him."

"Which you do, of course," Blalok said dryly.

Alexander smiled. "Actually," he said with equal dryness, "I distrust everyone."

CHAPTER XVI

"If you think this job is easy, you have another think coming," Kennon said bitterly. "I hired out as a veterinarian, not as a nursemaid for a bunch of psychoneurotic humans and superstitious Lani. The place is jinxed, they tell me. -- Ha! Jinxed! Sure it's jinxed! What job wouldn't be with a bunch of goofballs like these I've got working on it.

"I can't keep a Lani here for two weeks without having her throw a catfit, and the superstitious idiots are affecting the men -- who ought to know better! I wish I'd never have opened my big mouth to Alexander! As far as I'm concerned he can take this job and--"

"Hey -- take it easy, man!" Blalok said. "You're heading straight for a nervous breakdown."

"And why shouldn't I?" Kennon asked. "Nothing goes right. There's always trouble. I order materials -- they don't arrive. There's worker trouble, equipment trouble, installation trouble. Everybody's cutting corners, trying to get done faster and away sooner -- and all they do is mess up work that should have been done right the first time. We should have been finished last week, but we have another week to go, at least unless some bumble-fingered beanbrain gets another bright idea that sets us back again. I'm sick to death of it!"

"I know, I know," Blalok said soothingly, "and I'm sorry."

"Sorry? What good is that? You and Jordan come up here in relays. Just what do you think you'll find? Or has Alexander dragged you into keeping an eye on me because I don't like someone snooping inside my skull?"

"It's not that," Blalok said. "It's just--"

"Oh, don't make excuses. You know and I know the Boss-man is suspicious." Kennon shrugged. "Normally I wouldn't blame him but it's a damned nuisance with things the way they are. All we have is one more bay and a hall to finish - but if----"

"Now wait a minute," Blalok said. "Get the kink out of your neck and simmer down. Sure -- the Boss-man told us to keep an eye on you -- but that's not why I'm here this time."

"Well?"

"Douglas came back this morning."

"What for?"

"I don't know." Blalok's face wore the noncommittal look it always wore when he was taking liberties with the truth.

"You're probably the worst liar in the galaxy," Kennon chuckled. "He's here to breathe down my neck, isn't he?"

Blalok nodded.

"Keep him off my back for another week and he can breathe all he wants to. I'll be done then."

"I can't promise a thing."

Kennon shrugged. "It's too much to ask, I guess."
"But I can try," Blalok added.
"That's enough for me," Kennon grinned. "Has he turned Alexandria into a shambles yet?"
"Not yet, but everyone's uneasy."
"I can't blame them. That young fellow's undiluted poison. By the way, how does he look?"
"About the same."
"The medics must have done a good job," Kennon said.
"The Boss-man shipped him to Beta for treatment," Blalok said. "He didn't trust the docs out here."
"That figures. At any rate Douglas couldn't have gone to a better place."
"What happened to him?"
"He stuck his nose where he shouldn't," Kennon said pointedly.
Blalok stiffened.
"I'm sorry, Evald. Even if you knew, I couldn't talk about it. What I know about Douglas is classified!"
"Well -- Douglas is doing plenty of talking. Claims his stay in the hospital was all your fault."
Kennon shrugged. "That's his opinion. And as long as he stays out of my way he's welcome to it."  
Blalok looked at Kennon's haggard face with mild concern, "Doc," he said, "you'd better take it easy. You're going to pieces."
"I'll be through here in another week, I'll have this all wrapped up."
"Providing you're not wrapped up first."
"Eh?"
"In a shroud. You look like a walking corpse."
Kennon chuckled wearily. "Sometimes I feel like one. But I'd like to get this job finished."
"Well, I'll do what I can," Blalok said. "I'll try to keep him down at Alexandria for a few days."
"It'll be enough," Kennon said. More than enough -- he added mentally. The coils of fuel wire were ready to load, and the power slugs for the ship's reactor were already stored in the power plant building here at Olympus. Three more days and the old spacer would be as ready to fly as she would ever be. And after that, it was in the lap of fate.

He ushered Blalok to his jeep and watched until he disappeared.
"I'm getting to be a first-class liar," he remarked wryly to himself as he turned back to the temporary quarters he was occupying at the station. "And the bad thing about it is that I'm actually enjoying it."

A few weeks ago an admission like that would have been inconceivable. It was odd, he thought, how one thing led to another and produced an end that could not be foreseen. Now he could lie and dissemble with the best. He had no compunction about falsifying a requisition, or stealing what he could not obtain with apparent honesty. His character had sunk to an all-time low, he reflected with grim humor as he walked into the shadow of the main building. Neither Blalok's nor Jordan's frequent visits bothered him. Both men were creatures of habit and both were married. They stayed home at night -- and it was nighttime that he worked on the spacer. The project afforded him a perfect cover and it was only minutes by jeep away from the crater.

Even so, the double duty was an appalling task. And it would have been impossible if it wasn't for Copper. Her quick fingers, keen eyesight, and uncanny memory made the work seem simple, and neither the tediousness of repairing miles of circuitry nor the depressing environment of Olympus Station seemed to bother her. While he worked with the men on the project she restored and reassembled circuits in his quarters and at night they replaced them in the old ship. And the God-Egg was rapidly becoming operational.

Kennon wondered what it was about Copper that made her so different from the rest. Olympus didn't bother her at all. In fact she seemed to thrive on the depressing atmosphere that filled the Station. Perhaps it was because she had violated the tabu about the God-Egg so often that ordinary superstition had no effect upon her. He shrugged. He had troubles enough without worrying about Copper's motivations, and not the least of these was taking the God-Egg into space.

Kennon looked forward to blast-off with distinct misgivings. There was too much about the ancient spacer that was strange -- and too much that was terrifying.

Basically the ship was an ion-jet job with atomic primaries and a spindizzy converter that might possibly take her up as high as middle yellow Cth -- far enough to give her a good turn of speed, but not enough to compensate for timelag. Her screens were monstrosities, double polyphase lattices that looked about as spacetight as so many sieves. There were no acceleration dampers, no temporal compensators, no autopilot, no four-space computer, and the primaries operated on nuclear rather than binding energy. The control chairs weren't equipped with forcefields, but instead had incredibly primitive safety webs that held one in place by sheer tensile strength. Taking a ship like that into space was an open invitation to suicide. A man needed a combination of foolhardy bravery and incredible fatalism to blast off in a can like this. He had the stimulus, but the knowledge of what he would face troubled him.
more than he cared to admit. More and more, as he understood the ship, he was amazed at the courage of the ancients who had blithely leaped into hyperspace in these flying coffins with no more motivation than to see what was beyond the nearest star. And in ships more primitive than this men had swept through the star systems nearest Earth in the outward expansion of the First Millennium.

He sighed. The breed of man must have been tough in the old days -- and he'd soon be finding out if any of that ancient toughness remained.

He opened the door to his quarters.

Copper was sitting in his favorite chair, a pile of completed assemblies neatly stacked beside her, and a disorderly file of crumpled cloth at her feet. Her face was sullen as she looked up at him. "I've had about all of this I'm going to take," she said mutiniously as she stirred the heap of cloth with a bare foot. "Not even you are going to make me wear those -- things!"

Kennon sighed. It was the same old story. For months he had been trying patiently to indoctrinate Copper with a minimum of civilized habits, but she was quite literally a savage. In her entire lifetime she had never worn clothing, and to encase her body in hose, kilts, blouse, and sandals was a form of torture. She scratched, wiggled, and twisted at the garments until she looked as bad as she felt, and would usually finish a session by tearing off the offending clothes and sulking. She was doing it now.

"You must act like a civilized human being," Kennon said mildly. "You're simply going to have to learn to wear these clothes properly."

"Why? I'm more comfortable as I am."

"That's not the point. You are going to be living in human society and you must act human. The only planet where you could get away with nudity is Santos, and we're not going there."

"Why not?"

"I've explained it time and again. We'll have to go to Beta. That's the only place I know where you'll have a fair hearing. And on Beta people wear clothes. They have to. It's cold, even in summer, and in the wintertime, there's snow."

"What's snow?"

"Ice crystals that fall like rain, but I've told you this before."

"And I still don't believe it."

"Believe it or not you're going to wear those things. Now put them on!"

She looked at him with mutiny on her face. "All right, slave driver," she muttered as she picked up the clothing, "but I hope you'll itch someday and be unable to scratch."

"And try to wear those garments more gracefully. You make them look like a sack."

"They feel like one. I keep thinking that all I need is a tag around my neck."

"You haven't much time to get used to them," Kennon said. "We're leaving this week."

"So soon?"

"Yes -- and you'll wear those things to the ship, into the ship, and all the time we're on the ship. You'll keep wearing clothing until it looks right."

"Slave driver!" Copper hissed.

"Slave," Kennon answered equably.

Copper giggled. The sound was utterly unexpected, and completely incongruous. That was the wonder of her, Kennon reflected. Her mercurial temperament made life something that was continually exciting. She was a never-ending delight.

CHAPTER XVII

It was the last trip. Kennon loaded the jeep with the last-minute items he would need. The four reactor cores in their lead cases went aboard last and were packed inside a pile of lead-block shielding.

He helped Copper in and looked back without regret as the bulk of Olympus Station vanished below him in the dusk. The last of the work crew had left that afternoon. The station was ready for occupancy. His assignment had been completed. He felt an odd pleasure at having finished the job. Alexander might not be happy about his subsequent actions, but he could have no complaint about what he did while he was here.

"Well -- say good-bye to Flora," he said to Copper.

"I don't want to," she said. "I don't want to leave."

"You can't stay. You know that."

She nodded. "But that doesn't make me any less regretful."

"Regretful?"

"All right -- scared. We're going to try to make the God-Egg fly again. Not only is it sacrilege, but as you've often said, it's dangerous. I have no desire to die."
"You have two courses---"

"I know -- you've pointed them out often enough," Copper said. "And since you decided to go I'd go with you even though I knew the Egg would blow up."

"You're quite a girl," Kennon said admiringly. "Did I ever tell you that I love you?"

"Not nearly often enough," Copper said. "You could do it every day and I'd never get tired of hearing it."

The jeep settled over the lava wall. "We'll leave it in the passageway when we're through," Kennon said. "Maybe it will survive blast-off."

"Why worry about it?" Copper asked.

"I hate destroying anything needlessly," Kennon said.

"And since we have plenty of time, we might as well be neat about our departure."

He was wrong, of course, but he didn't know that.

* * *

Douglas Alexander checked the radarscope and whistled in surprise at the picture it revealed. "So that's where he's going," he said softly to himself. "Cousin Alex was right as usual." He grimaced unpleasantly. "He's up to something -- that's for sure." His face twisted into an expression that was half sneer, half triumph. "This is going to be fun." He moved the control, and his airboat, hovering silently at five thousand meters, dropped toward the ground in free fall as Douglas loosened the Burkholzt in the holster at his waist. "But what is he doing?" he muttered. The question hung unanswered in the still air of the cabin as the airboat dropped downward.

Douglas hadn't been impressed with Blalok's attempt at a delaying action. Normally he might have been, but his fear of his cousin was greater than his respect for Blalok. The superintendent had only succeeded in accomplishing something he had not intended when he had tried to dissuade Douglas from visiting Kennon. He had made Douglas cautious. The airboat and long-range surveillance had been the result. For the past two nights Douglas had hung over Olympus Station, checking the place -- to leave at dawn when the new day's work began. For two nights Kennon had been lucky. He had departed for the Egg shortly before Douglas took up his station, and had returned after the watcher had called it a night and had returned home. But this last night, Kennon left late -- and his departure was noted.

"Wonder who's the girl with him?" Douglas said as the boat plunged down. "Well, I'll be finding out in a minute."

Kennon's head jerked upward at the sound of air whistling past the airboat's hull, and a wave of icy coldness swept through his chest. There was no question that he was discovered. His shoulders sagged.

"Well -- it was a good try," he said bitterly as Copper looked at him with sudden terror on her face.

"I don't want to die," she wailed.

"You won't -- not if I can help it," Kennon said. "Move away from me -- quickly!"

"But--"

"Do as I say!" Kennon's voice was sharp. "And keep that hood over your face."

The airboat settled softly on the ash in front of him, the door snapped open and Douglas dropped to the ground, Burkholzt jutting from his pudgy fist.

"My, my," Douglas said, "what have we here? Dr. Kennon and a woman! I thought better of you than that, Doctor. And all dressed up in antiradiation suits. This is interesting. Just what are you doing up here on the mountain so late at night -- prospecting?"

"You might call it that," Kennon said. His body sagged with relief. Douglas thank Ochsner it was Douglas! He was running true to form -- talking when he should have been shooting.

Douglas jerked his head toward Copper, standing a few feet to his left. "Who is she?"

"None of your business," Kennon snapped, hoping that his outburst covered Copper's gasp of surprise and fear, and knowing that it didn't.

"I'm making it my business. There's something funny going on around here."

Kennon blinked. Could it be that Douglas didn't know? Had he been watching them on radar? Durilium was radar-transparent. It absorbed and dissipated electromagnetic waves rather than reflecting them. For a second he felt a tiny surge of hope.

"Stand where you are," Douglas said as he stepped over to the half-paralyzed Copper and jerked the hood back from her face. For a moment he looked puzzled. "Just who are you?" he demanded. "I don't recall seeing you before." And then recognition dawned. "Old Doc's Lani!" he gasped.

"She works for me now," Kennon said.

Douglas laughed. It wasn't a nice sound. "All dressed up?" he asked. "Nice work."

"That's my fault," Kennon said.

"You know the rules," Douglas said. "I could blast you both."
"Go ahead," Kennon said, "but if you do, you'll never find out what we're doing up here."
Douglas hesitated. Kennon's voice was flat and filled with utter conviction.
"There's a reason why Copper's wearing that suit," Kennon continued, "and you won't know that either."
The Burkholz swiveled around to point at Kennon's belly. "I've had about enough of this. Let's have it. Tell me what you're doing here!"
"I'll do better than that," Kennon said promptly. "I'll show you. You'll be surprised at what we've uncovered."
He made his muscles relax, and forced himself to speak naturally. Copper, he noted, was still rigid with terror. The Alexanders -- any of them -- were everything he had said they were. They were the masters here. And despite Copper's boast, she was as susceptible to their influence as any other Lani.
"All right," Douglas said, "show me this thing I'd never be able to find without your help." He half turned to Copper. "Stay where you are, Lani," he said. "Don't move until I come back."
"Yes, Man Douglas," Copper replied. Her voice was flat, colorless, and submissive.
Kennon shuddered. He had never heard precisely that tone from her before. One word from Douglas and she had become a zombie -- a mindless muscle preparation that existed only to obey. Anger filled him -- anger that one he loved could be ordered by someone who wasn't worth a third of her -- anger that she obeyed -- anger at his own impotence and frustration. It wasn't a clean anger. It was a dark, red-splashed thing that struggled and writhed inside him, a fierce unreasoning rage that seethed and bubbled yet could not break free. For an instant, with blinding clarity, Kennon understood the feelings of the caged male Lani on Otpen One. And he sympathized.
"Follow me," he said and started around the ship.
"Stay -- no -- go ahead," Douglas said, "but remember, I'm right behind you."
Kennon walked straight up to the pit and pointed down at the dark bulk of the Egg, concealed in the shadows of the bottom.
"That's it!" he said.
"What? I don't see anything," Douglas said suspiciously.
"Here -- I'll shine a light." Kennon reached for his belt.
"No you don't! I know that trick. You're not going to blind me. Take that torch loose carefully -- that's it -- now hand it to me." Douglas' hand closed over the smooth plastic. Cautiously he turned on the beam and directed it downward.
"A spacer!" he gasped. "How did that get here?" He leaned forward to look into the pit as a dark shadow materialized behind him.
Kennon choked back the involuntary cry of warning that rose in his throat. Copper! His muscles tensed as her arm came up and down -- a shadow almost invisible in the starlight. The leaning figure of Douglas collapsed like a puppet whose strings had been suddenly released. The torch dropped from his hand and went bouncing and winking down the wall of the pit, followed by Douglas -- a limp bundle of arms and legs that rotated grotesquely as he disappeared down the slope. Starlight gleamed on the Burkholz lying on the lip of the crater, where it had fallen from his hand.
"I told you that not even Man Alexander could order me since I gave my love to you," Copper said smugly as she peered over the edge of the pit, a chunk of lava gripped in one small capable hand. "Maybe this proves it."
"Douglas isn't Alexander," Kennon said slowly as he picked up the blaster, "but I believe you."
"Didn't I act convincingly?" she said brightly.
"Very," he said. "You fooled me completely."
"The important thing was that I fooled Douglas."
"You did that all right. Now let's get him out of that pit."
"Why?"
"The jet blast will fry him when we take off."
"What difference would that make?"
"I told you," Kennon said, "that I never destroy things unnecessarily -- not even things like Douglas."
"But he would have destroyed you."
"That's no excuse for murder. Now go back to the jeep and fetch a rope. I'll go down and get him out."
"Do we have to bother with him?" Copper asked, and then shrugged. It was an eloquent gesture expressing disgust, resignation, and unwilling compliance in one lift of smoothly muscled shoulders.
"There's no question about it," Kennon said. "You're becoming more human every day."
He chuckled as he slid over the edge of the pit following the path Douglas had taken a moment before. He found him sitting on a pile of ashes, shaking his head.
"What happened?" Douglas asked querulously. There was fear in his voice.
"Copper hit you on the head with a rock," Kennon said as he bent over and retrieved the torch, still burning
near Douglas' feet.

"The Lani?" Douglas' voice was incredulous.

"Not a Lani," Kennon corrected. "She's as human as you or I."

"That's a lie," Douglas said.

"Maybe this spacer's a lie too. Her ancestors came in it -- a pair of humans named Alfred and Melissa Weygand. They were Christian missionaries from a planet called Heaven out in Ophiuchus Sector. Went out to convert aliens and landed here when their fuel ran out." Kennon paused. "That was about four millennia ago. Their descendants, naturally, reverted to barbarism in a few generations, but there's enough evidence in the ship to prove that the Lani were their children."

"But the tails -- the differences -- the failure of the test," Douglas said.

"Mutation," Kennon replied. "Those old spindizzy converters weren't too choosy about how they scattered radiation. And they had come a long way." He paused, looking down at Douglas, feeling a twinge of pity for the man. His world was crumbling. "And there was no other human blood available to filter out their peculiarities. It might have been done during the first couple of generations, but constant inbreeding fixed the genetic pattern."

"How did you discover this?" Douglas asked.

"Accident," Kennon said briefly.

"You'll never be able to prove they're human!" Douglas said.

"The ship's log will do that."

"Not without a humanity test -- they can't pass that."

"Sorry to disappoint you. Your grandfather used the wrong sort of sperm. Now if there had been a Betan in the crew--"

"You mean she's pregnant!"

Kennon nodded. "There's been mutation on Beta," he said. "And it's apparently a similar one to hers. Betan-Lani matings are fertile."

Douglas's shoulders sagged, and then straightened. "I don't believe it," he said. "You're just a damned sneaking spy. Somehow or other you got a spacer in here after you wormed your way into Cousin Alex's confidence -- and now you're going to space out with the nucleus of a new farm. Just wait. When Alex learns of this the galaxy'll be too small to hold you."

"Don't babble like a fool!" Kennon said with disgust. "How could I land a spacer here without being spotted? You sound like a two-credit novel. And even if I did -- would it be a can like this?" Kennon played the torch over the blue-black durilium protruding from the ashes.

Douglas' eyes widened as he took in the details of construction. "What an antique!" he blurted. "Where did you get this can?"

"I found it here."

"Tell me another one."

"You won't believe," Kennon said flatly, "because you don't dare believe. You have a mental block. You've killed, maimed, tortured -- treated them like animals -- and now your mind shrinks from admitting they're human. You know what will happen if the old court decision is reversed. It will wreck your little empire, dry up your money, break you -- and you can't stand the thought of that. You don't dare let us leave, yet you can't stop us because I have your blaster and I'd just as soon shoot you as look at your rotten face. Now get on your feet and start climbing if you want to stay alive. We're getting out of here, and you'll fry inside this pit."

"Where are you taking me?"

"Back to your airboat. I'm going to tie you up and set you off on autopilot. You'll be able to get loose quickly enough but it'll be too late to stop us. We'll be gone, and you can think of how you'll manage to face the human race."

"I hope you blow yourself and that antique clear out of space."

"We might. But you'll never know for sure. But mark this -- if I live I'll be back with the Brotherhood. You can count on it."

They struggled up the side of the pit and halted, panting, on the rim. "How much radiation was down there?" Douglas asked worriedly.

"Not enough to hurt you."

"That's good." Douglas accepted the statement at face value, a fact which failed to surprise Kennon. "You know," he said, "I've been around Lani all my life. And I know that they're not human. No self-respecting human would take a tenth of what they put up with."

"Their ancestors didn't," Kennon said. "They fought to the end. But your Grandfather was a smart man even though he was a Degrader."
"He wasn't!" Douglas exploded. "No Alexander is a Degrader."

"He realized," Kennon went on, "that he'd never succeed in enslaving the Lani unless he separated the sexes. And since women are more subjective in their outlook -- more pliable -- he picked them for his slaves. The males he retired to stud. Probably the fact that there were more women than men helped him make up his mind.

"In every society," Kennon went on inexorably, "there are potential freeman and potential slaves. The latter invariably outnumber the former. They're cowards: the timid, the unsacrificing -- the ones that want peace at any price -- the ones who will trade freedom for security. Those were the ones who hid rather than risk their lives fighting the aggressor. Those were the ones who survived. Old Alexander had a ready-made slave cadre when he finished off the last of the warriors. For four centuries the survivors have been bred and selected to perpetuate slave traits. And the system works. The men don't want freedom -- they want liberty to kill each other. The women don't want freedom -- they want males. And they'd serve them precisely as the Sarkian women serve their menfolk. You've killed any chance they had to become a civilization. It's going to take generations perhaps before they're reoriented. There's plenty you Alexanders should answer for."

"If there's any fault, it's yours," Douglas snarled. "We were doing all right until you came here. We'd still be doing all right if I had shot you both." His shoulders sagged. "I should have killed you when I had the chance," he said bitterly.

"But you didn't," Kennon said, "and to show my gratitude I'm letting you get away with a whole skin. I don't expect you to be grateful, but at least you'll not be on my conscience. I don't enjoy killing, not even things like you."

Douglas sneered. "You're soft -- a soft sentimental fool."

"Admitted," Kennon said, "but that's my nature."

"Yet you'd destroy the family, wreck Outworld Enterprises, and throw a whole world into chaos over a few thousand animals. I don't understand you."

"They're human," Kennon said flatly.

"Admitting they might once have been, they're not now."

"And whose fault is that?"

"Not ours," Douglas said promptly. "If there is any fault it's that of the court who decided they were humanoid."

"You didn't help any."

"Why should we? Does one treat a shrike like a brother? ---or a varl? ---or a dog? We treat them like the animals they are. And we've done no worse with the Lani. Our consciences are clear."

Kennon laughed humorlessly. "Yet this clear conscience makes you want to kill me, so you can keep on treating them as animals -- even though you know they're human."

"I know nothing of the sort. But you're right about the killing, I'd kill you cheerfully if I had the chance. It's our necks if you get away with this. Of course, you probably won't, but why take the chance. I like my neck more than I like yours."

"You're honest at any rate," Kennon admitted. "And in a way I don't blame you. To you it's probably better to be a rich slaver living off the legacy of a Degrader than a penniless humanitarian. But you've lost your chance.

Douglas screamed with rage. He whirled on Kennon, his face a distorted mask of hate.

"Hold it!" Kennon barked. "I don't want to kill you, but I'll burn a hole clear through your rotten carcass if you make another move. I have no love for your kind."

Douglas spat contemptuously. "You haven't got the guts," he snarled. But he didn't move.

"Just stand still -- very still," Kennon said softly. The iron in his voice was not hidden by the quiet tone.

Douglas shivered. "I'll get you yet," he said, but there was no force in the threat.

"Here's the rope you wanted," Copper said as she emerged abruptly from the darkness. "I had a hard time finding it."

"You haven't been too long," Kennon said. "Now tie Douglas' hands behind him while I keep him covered."

"It's a pleasure," Copper murmured.

CHAPTER XVIII

"I'm frightened," Copper said, twisting uncomfortably in the shock chair beside Kennon's.

"After you have been so brave?" Kennon asked. "That's nonsense. It's just nervous reaction. Now web in like I showed you. It's time for blast-off. We don't dare wait much longer."

"All right -- but I have a feeling that this isn't right. Something is going to go wrong."

"I hope you don't have precognition," Kennon smiled. "I've checked everything. The ship is as good as she'll ever be. There's nothing more that we can do."

"There's one consolation," Copper said wanly. "At we'll die together."

"There's a better chance that we'll live together."

"I hope so."
"Ready?" Kennon asked.
She nodded.

He flipped the switches that would send the fuel rods into the reactor. Below them a soft, barely audible whine ascended the sonic scale to a point of irritating inaudibility. Kennon smiled. The spindizzy was functioning properly. He flipped a second bank of switches and a dull roar came from the buried stem. Ashes and pumice heated to incandescence were blown through the air. Molten drops of radioactive lava skittered across the durilium hull as Kennon advanced the power. The whole stem of the ship was immersed in a seething lake of boiling rock as the Egg lifted slowly with ponderous dignity into the night sky.

"Hang on!" Kennon said. "I'm going to hyper." His hand moved a red lever and the Egg shimmered and vanished with a peculiar wrenching motion into an impossible direction that the mind could not grasp. And the interceptor missile from Otpen One nosed through the space the Egg had occupied.

* * *

"We made it!" Kennon said, looking across the writhing semifluid control board, shifting oddly in the harsh yellow monochromatic light that pervaded the cabin. The screens were leaking like sieves, but they were holding well enough to keep Cth yellow from being anything more than an annoyance. He glanced over at Copper, a fantastically elongated Copper who looked like a madman's dream of chaos.

And Copper screamed! The sound echoed and re-echoed, dying away with a lingering discordant reverberation that made his skin tingle.

"Copper! It's all right! It's all fight! Stop it!"

Copper screamed again and her elongated figure suddenly foreshortened and collapsed into a small writhing ball from which two small pink hands emerged clutching at a gelid mass of air that flowed sluggishly around them.

And Kennon knew what he had forgotten! Hyperspace with leaky screens was nothing to inflict upon an unprepared mind. It is one thing to endure partial exposure after months of training, with experienced medics standing by to help you through the shock phase, but quite another to be thrust from a safe and sheltered existence into the mind shattering distortions of the Cth continuum.

The Egg was old. Her screens, never good at best, were hardly more than filters. Through the hull, through the drive lattice, the viciously distorted Cth environment seeped into the ship turning prosaic shapes of controls and instruments into writhing masses of obscene horror that sent extensions wiggling off into nothingness at eye-aching angles. A spaceman could take this -- knowing it wasn't real -- but a tyro could not.

Copper collapsed. Her mind, assaulted by sensations no untrained person should experience, went into shock. But she wasn't granted the mercy of unconsciousness. Terrified by a pseudo reality that surpassed her wildest nightmares, she stared wide-eyed at the control room and the thing that had been Kennon. She screamed until her throat was raw, until the monster beside her touched her with Kennon's hands. Then, mercifully, she felt a stinging in her arm and all sensation ceased.

Kennon stared glumly at the controls. Fleming alone knew how many objective years were passing outside as they hurtled through four-space. Subjectively it would only be hours aboard the Egg, but a decade -- or maybe a century -- might pass outside this mad universe where neither time nor speed had meaning. The old ships didn't have temporal compensators, nor could they travel through upper bands of Cth where subjective and objective time were more nearly equal. They were trapped in a semi-stasis of time as the ship fled on through the distorted monochromatic regions that bypassed normal space.

The Egg slipped smoothly out of the hyper jump, back into the normal universe. Beta floated above them, the blue shield of her atmosphere shining softly in the light of Beta's sun.

"Couldn't hit it that good again in a hundred tries," Kennon gloated. "Halfway across the galaxy -- and right on the nose." He looked at the shock chair beside him. Copper was curled into a tight ball inside the confining safety web, knees drawn up, back bent, head down -- arms wrapped protectingly around her legs -- the fetal position of catatonic shock.

He shook her shoulder -- no response. Her pulse was thready and irregular. Her breathing was shallow. Her lips were blue. Her condition was obvious -- space shock -- extreme grade. She'd need medical attention if she was going to live. And she'd need it fast!

"Just why, you educated nitwit," he snarled at himself, "didn't you have sense enough to give her that injection of Sonmol before we hypered! You haven't the sense of a decerebrate Capellan grackle!"

"Identify yourself -- give your license. Over."

"What port are you?"

"Hunterstown -- will you please identify? Over."

"Your co-ordinates," Kennon snapped. "Over."
"280.45--67.29 plus. Repeat -- request your identification."
"Pilot Kennon, Jac, Beta 47M 26429. I have no I.D. for the ship -- and you'll see why when I land. Over."
"Hunterstown Port to Kennon. You are not -- repeat not - cleared to land. Go into orbit and report your position. Over."
"Sorry, Hunterstown. You wouldn't have checked in if you didn't have room, and a hospital. This is an emergency. I'm setting down. Out."
"But--" The words got no farther. Kennon was already spinning the ship.
"All right -- we have you on the scope. But this is a class one violation. You may come in on Landing Beam One."
"Sorry. I have no GCA."
"What? -- what sort of ship are you flying?" The voice was curious.
"I'm matching intrinsics over your port. Talk me in when I break through the overcast."
"Talk you in?"
"That's right. My instruments are obsolete."
"Great Halstead! What else?"
"I have an Ion drive. Plus two radioactive."
"Oh no! -- And you still want to come in?"
"I have to. My passenger's in shock. She's going to have a baby."
"All right -- I'll try to get you down in one piece."
"Have an ambulance ready," Kennon said.
Kennon lowered the Egg through the overcast. Ground control picked him up smoothly and took him down as though it had been rehearsed. The Egg touched down in the radioactive area of the port. Decontamination jets hissed, sluicing the ship to remove surface contamination.
"Ochsnerr! what sort of a ship is that?" Ground Control's startled voice came over the annunciator.
"It's an old one," Kennon said.
"That's a gross understatement. Stand by for boarders. Ambulance coming up."
Kennon opened the airlock and two radiation-suited men entered. "At least you had sense enough to wear protective clothing in this hotbox," one said as they carefully unwebbed Copper and carried her out of the lock. "You wait here. The Port Captain wants to see you."
"Where are you taking her? What Center?" Kennon asked.
"What should you care? You've nearly killed her. The idea of taking a pregnant woman up in this death trap! What in Fleming's name's the matter with your brain?"
"I had to," Kennon said. "I had to. It was a matter of life and death." For once, he thought wryly, the cliche was true.
The Betan's face behind the transparent helmet was disgusted and unbelieving. "I hear that sort of thing every day," he said. "Am I supposed to believe it?"
"You'd believe it if you'd have been where I was," Kennon muttered. "Now -- whe're are you taking her?" he demanded.
The man arched blond eyebrows. "To the local Medical Center -- where else? There's only one in this area."
"Thanks," Kennon said.
He watched the ambulance flit off as he waited for the Spaceport Patrol. There was no further need for the protection suit, so he peeled it off and hung it in the control-room locker. Copper was right, he mused. It did itch.
The Port Captain's men were late as usual - moving gingerly through the radiation area. A noncom gestured for him to enter their carryall. "Port Captain wants to see you," he said.
"I know," Kennon replied.
"You should have waited upstairs."
"I couldn't. It was a matter of medicine," Kennon said.
The noncom's face sobered. "Why didn't you say so? All you said was that it was an emergency."
"I've been away. I forgot."
"You shouldn't have done that. You're a Betan, aren't you?"
Kennon nodded.
They drove to the Port Office, where Kennon expected - and got -- a bad time from the port officials. He filled out numerous forms, signed affidavits, explained his unauthorized landing, showed his spaceman's ticket, defended his act of piloting without an up-to-date license, signed more forms, entered a claim for salvage rights to the Egg, and finally when the Legal Division, the Traffic Control Division, the Spaceport Safety Office, Customs, Immigration, and Travelers Aid had finished with him, he was ushered into the presence of the Port Captain.
The red-faced chunky officer eyed him with a cold stare. "You'll be lucky, young man, if you get out of this with a year in Correction. Your story doesn't hang together."

It didn't, Kennon thought. But there was no sense telling all of it to a Port Captain. Under no circumstances could the man be any help to him. He had neither the power nor the prestige to request a Brotherhood Board of Inquiry. In rank, he was hardly more than a glorified Traffic Control officer. It would do no good to tell him an improbable tale of slavery on a distant planet. The only thing to do was wait out the storm and hope it would pass. If worst came to worst he'd use his rank, but he'd made enough stir already. He doubted if the Captain had authority to order him into Detention -- but he was certain to get a lecture. These minor officials loved to tell someone off. He gritted his teeth. He'd endure it for Copper's sake -- and to get out of here quietly. Alexander would undoubtedly have agents posted by now, and his only chance for temporary freedom of action was to get out of here with as little fuss as possible.

He sat quietly, his flushed face and tight jaw muscles betraying his impatience as the Captain paced up and down and talked on and on. The man sounded like he could go for hours. With increasing impatience Kennon listened to the cadenced flow of complaint and condemnation, occasionally inserting a "Yes, sir" or "Sorry, sir" or "No, sir" as the words flowed around him.

However, there had to be a breaking point somewhere, and the monotony was beginning to wear his temper thin. Another five minutes, he reflected, was about all he could take.

The door chime rang softly.

"Come in," the Port Captain said, breaking off in mid-tirade. The change in his manner was so abrupt that Kennon couldn't help smiling.

A young blond man in an interne's gray uniform entered the room.

"Yes, Doctor," the Port Captain said. "What can I do for you?"

"Do you have a Jac Kennon here? Dr. Jac Kennon?"

"Did you say doctor?" the Port Captain said in a half-strangled voice.

"You never let me tell you," Kennon said mildly, "that my landing here was a matter of medicine. Technically you have contributed to a delay in treatment."

The Port Captain's face paled. "Why didn't you say something?" he said.

"Against your gale of wind I would be but a faint breeze," Kennon said coldly. He turned to the interne. 'Tm Dr. Kennon." They bowed formally to each other.

"I'm Smalley, sir, from the medical center. Dr. Brainard sends his compliments and requests that you join him for consultation."

"The Port Captain--" Kennon began.

"Don't worry about it, Doctor. I'll relinquish responsibility to Dr. Brainard," the Captain said.

"I have placed a formal written request with your office," Smalley said stiffly. "You are relieved of further charge. Dr. Kennon is urgently needed. It is a matter of medicine."

The Captain looked relieved. On Beta it was poor policy to interfere with the doings of doctors and engineers -- or even doctors of philosophy.

"Very well. He's yours -- and I'm glad to be rid of him." The Port Captain bowed to Kennon and Smalley and stalked out of the office.

"Pompous little man," Kennon observed, "but he certainly can talk."

"Oh -- you know these Administrative people," the interne said depreciatingly. "One mustn't mind them. They're necessary nuisances." He eyed Kennon curiously. "How is it that you didn't stand on your professional rights?"

"I have my reasons -- but they have nothing to do with medicine."

"Oh -- I see. Ethical." The interne's voice was faintly sarcastic.

"Manners, Doctor -- manners." Kennon's voice was gentle but the interne flushed a dull red.

"Sorry, sir."

"Don't mention it. It's normal for a graduate to confuse liberty with license." Kennon smiled. "Don't worry. I shan't report you."

"That's good of you, sir." Smalley's face registered relief. Demerits were difficult to erase -- particularly ones of courtesy.

Kennon wondered if the young man would report himself. He doubted it. The interne didn't look the type -- probably he was dated for some obscure job, like a general practitioner. He shrugged. It took all kinds to make a profession. Even the Smalleys had their place.

"That girl you brought in," Smalley said as they entered a white car emblazoned with the three crosses, red, blue, and green, that represented the three fields of medicine. "She's an interesting case. I've never seen space shock
before. And the patient herself -- one would hardly believe she was a Betan."
"She isn't," Kennon said.
"So?" Blond eyebrows rose in inverted U's of surprise. "But that's hardly possible. Our tests indicate." "Don't you think that this is a matter for Dr. Brainard?" Kennon said icily. "Protocol--"
"Of course. Stupid of me -- but the case is so interesting. Half the center staff have seen her already. I wasn't proposing to discuss the case. It wouldn't be proper. Even though you are only a veterinarian."
"Only?" Kennon's voice was hard. "I shouldn't have to remind you of this, Mr. Smalley -- but I have been for the past two years on a world of bad manners. I expected better here at home."
Smalley flushed to the roots of his straw-colored hair. "Sorry, Doctor," he muttered. "I don't know what's the matter with me."
"I can tell you," Kennon said. "You've just graduated."
"How did you know?" Smalley said.
"I was a graduate once, myself -- not too long ago."
"How long, sir?"
"Class of Eighty-seven."
"That's twelve years ago," Smalley said.
Kennon nodded. Ten years lost. Not bad -- not bad at all. But Alexander could have done a lot in ten years.
"I meant no disrespect," Smalley said worriedly.
"I know it. But if you intend to practice on Beta, you'd better polish your professional manner. Now where I was, it didn't make much difference. Laymen often called me 'Doc.'"
Smalley was properly shocked. "I hope you didn't encourage them, sir."
"It was impossible to discourage them," Kennon said. "After all, when the man who hires you----"
"Oh -- entrepreneurs," Smalley said in a tone that explained everything.
* * *
The car stopped in front of the Medical Center's staff entrance. "This way, sir," Smalley said. He led the way down a green-tiled corridor to an elevator -- then down another corridor past a pair of soft-footed nurses who eyed them curiously -- looking at Kennon's tunic and sandals with mild disapproval in their eyes. Smalley stopped and knocked softly on a closed door.
"Enter," said a pleasant baritone voice from the annunciator.
"Dr. Brainard -- Dr. Kennon," Smalley said.
Kennon liked the man instantly. A plump, pink-cheeked man of middle age, with prematurely white hair, Dr. Will Brainard combined a fatherly appearance with an impression of quick intelligence. The fat that sheathed his stocky body had obviously not touched his mind. Brainard rose from the deep chair near the window where he had been sitting, knocked the ashes from his pipe, and bowed stiffly. His eyes -- sharp points of blue in the smooth pinkness of his face - surveyed Kennon curiously.
"So you're the young man who takes untrained pregnant women for rides in old-fashioned spacers," he said. " Didn't you know what would happen?"
"I was in a hurry, Doctor," Kennon said.
"Obviously. Now tell me about it." Brainard looked at the eager-faced interne standing behind Kennon. "That will be all, Smalley," he said.
Kennon waited until the door closed. "Ordinarily," he said, "I'd never have done a thing like that, but there were some very pressing reasons. However, I should have given her an injection of Somnol before we started. I'm criminally liable. If anything happens to her----" His voice was tight with worry.
"You'd give her an injection?" Brainard said. "I hope you didn't mean that."
"But I did, sir. I've given thousands of Lani injections."
"What's a Lani?"
"She is, sir. The impression has been that her race isn't human."
"Nonsense -- it's obvious she is." "A Brotherhood Court of Inquiry didn't think so."
"Hmm. Is that so?"
"Yes, sir. -- But before I go on, tell me, how is she?"
"Oh, she'll be fine. A little mental therapy and plenty of rest are all she needs. She's a remarkably healthy young woman. But this is beside the point. There are a number of unusual features about this case that need investigation."
Brainard took a standard hospital form from his desk. "Mind if I ask you some questions, Doctor?"
"Not at all but you are due for some unpleasant shocks as you go through that form."
"I believe I can survive them," Brainard said dryly.
"This is professional confidence---" Kennon began.
"Of course, of course," Brainard said impatiently. "Now let's get on with it."

* * *

"This is the most amazing tale I've ever heard," Brainard said slowly. "Are you certain you are telling the truth?"

Kennon grinned. "I don't blame you for not believing me -- but the evidence is conclusive, and there is enough documentary evidence in the space ship -- and in the fact of the ship itself to prove what I am saying. Laboratory tests here will establish the fact that Copper's child is also mine. And as for Flora, a Brotherhood Investigation Team can prove that part."

"That will be attended to," Brainard said grimly.

"But how did you deduce she wasn't from a Betan colony?" Kennon asked.

Brainard smiled. "That wasn't hard. Her sun tan and the condition of her feet proved she was a practicing nudist. No Betan girl ever practices nudism to my knowledge. Besides, the I.D. tattoo under her left arm and the V on her hip are no marks of our culture. Then there was another thing -- the serological analysis revealed no gerontal antibodies. She had never received an injection of longevity compound in her life. This might occur, but it's highly improbable. The evidence indicates that she's extra-Betan."

Kennon nodded.

"But this business of her being fifteen years old! That's impossible. She has the development of a woman of twenty-five."

"Remember the Alpha V colony?" Kennon said.

"Of course -- oh -- I see! It could be something like that. Certainly -- strong yellow G-type sun -- an isolated colony serviced at twenty-year intervals -- there was a marked physical precocity."

"And if this had been continued for several millennia?" Kennon asked.

"Hmm -- I see. Yes, it's possible. On Alpha V the colonists grew from infancy to maturity in fifteen years."

"And wasn't Heaven one of our early colonies?"

"Yes -- it was established after the Great Schism near the end of the First Millennium -- when science and religion split irrevocably on this world. We packed the whole lot of them off to a world of their own where they could develop as they pleased. They called it Heaven -- odd name for a fogworld - but there's no accounting for tastes." Brainard chuckled.

"I thought that was the case, but I couldn't remember. My ancient history is pretty weak."

"You should read more," Brainard said. "But as I see it -- this girl is of Betan ancestry providing your theory and the facts coincide."

"Which could also explain why an outworld species of agerone would be toxic. They tried to prolong Lani life and met with failure. Our plants are mutant forms."

"Just as we are a mutant race," Brainard said, "or partly mutant." He sighed. "You have brought us a great deal of trouble, Kennon. You are bringing matters to a head. If our investigations prove your statements, we are morally bound to open the Lani question. And if those people are of Betan origin -- that fellow Alexander will have plenty to answer for."

"I don't believe it is really his fault," Kennon said slowly. "I don't think he has ever known the truth."

"Why didn't you tell him?"

"The answer to that should be obvious. Even though I trusted him completely, I could never be sure. He has a Free Trader background and those people can't be trusted where money's concerned. The whole Kardonian culture is an outgrowth of Free Traderism: small business, independent corporation, linear trusts, and all the cutthroat competition such a culture would naturally have. It's a regular jungle of Free Enterprise. I couldn't predict how he would react. He could either act in a moral manner and make restitution, or he could quietly cut our throats and go on with his business."

"I see. The temptation to cut a throat might be overwhelming."

"They fight commercial wars," Kennon said.

"Disgusting -- utterly uncivilized! Under the circumstances you had no other course. Still, they have no moral right to enslave human beings."

"There is always the element of doubt. Maybe they didn't know. After all, an impartial court declared the Lani alien - and the Betan mutation isn't known throughout the Brotherhood."

"One doesn't go around broadcasting data on the variations of one's germ plasm," Brainard said. "That's a private affair - a matter of personal privacy."

"And public safety?"

Brainard nodded. "We're no more courageous than any other civilization. We have no desire to borrow trouble.
"We are content to leave things alone."

"That's the trouble," Kennon said. "We're all content to leave things alone. If I hadn't found the spaceship I'd not have been able to lay aside my moral conditioning. And if I had not, Copper would not have become pregnant and forced me into these drastic actions. It's even possible that I would have done nothing." He grimaced. "And when I left Alexander's employment mnemonic erasure would have removed all memory of the Lani's human origin." He shrugged. "I still am not certain that it wouldn't have been the wiser course. Naturally, once I knew, I couldn't do anything else than what I did."

"Naturally," Brainard said. "Humanity reaches the heights when it faces questions of moral responsibility."

"To mankind," Kennon added heavily. "We have a convenient blind spot regarding our moral responsibility to other intelligent races."

"A harsh fact, but true -- and who is to judge whether it is right or wrong? We achieved dominance of Earth by our moral responsibility to family, tribe, and nation -- and we nearly exterminated ourselves when we forgot that this responsibility went beyond nations and embraced all mankind. We learned that after the Exodus. As for the other races - perhaps someday we will learn moral responsibility for all intelligence -- but we are not ready for that yet. That's too big a mental hurdle." Brainard sighed. "We are what we are, and we change slowly. But we change."

"True enough," Kennon said. "But it's hard to be philosophical about it."

"You're young. Live a couple of centuries and you will understand patience."

Kennon smiled.

"You know," Brainard said thoughtfully, "you still have plenty of things to do."

"I know. I'll have to make a transcript of this discussion, have it witnessed, and make a sealed record. I have to arrange for the reposition of the evidence inside the Egg, and a complete recording of the Egg itself."

"And to be safe you'll need several facsimiles, properly attested. The arms of these outworld entrepreneurs are long, and unfortunately not all Betans are models of honesty."

"I'd better get started then."

"Let me help you," Brainard said. "I have a little influence in this area - and your cause interests me." He picked up the phone on his desk.

Kennon sighed. He had found an ally.

CHAPTER XIX

"What are you going to do with that girl?" Brainard asked.

"Formalize our mating as soon as she is able to get out of bed," Kennon replied.

"She is an ignorant, untrained savage!" Brainard protested. "You should hear the stories the nurses tell about her!"

Kennon chuckled. "You don't have to tell me about those. I've lived with Lani for two years. But she's not stupid."

"What are your plans?"

"After we establish her humanity legally," Kennon said, "I'm going to send her to school."

"For twenty years?"

"If necessary. But I don't think it will take that long. She has some schooling."

"But no training -- and what of the Lani in the meantime?"

"I have plans for that. I'm going back to Kardon and give Alexander a chance to make restitution. I think he is an honorable man. Slavery may be as revolting to him as it is to any civilized human. He deserves a chance to rectify his grandfather's error."

"That is reasonable -- and in the best traditions of the Brotherhood."

"Furthermore, it's practical," Kennon said. "Alexander is the only one fully qualified to handle the problems of enfranchisement. He's known the Lani all his life, and he is an executive type. A Brotherhood committee would probably botch the whole affair. What with colonial jurisdiction, territorial rights, and all the legal quibbling that committees love, the Lani would get a poor deal. And there's no reason to wreck the lives of a couple of hundred million Kardonians because the rightful owners of Kardon were illegally enslaved. That happened too long ago to have any practical meaning. There are other and better solutions."

"What?"

"How should I know?" Kennon asked. "But I'm sure Alexander will. That's his field."

"All you have to worry about is whether he'll co-operate," Brainard said.

"He'll co-operate once he knows the score," Kennon said confidently. "And he'll have to make some form of restitution. But it shouldn't involve Kardon. Actually the Lani were never in a position to develop that world. They'd probably have remained on Flora indefinitely. The old court records showed no tendency for their culture to expand. They were an inbred group, a static, balanced society in harmony with their environment. In nearly thirty-five
hundred years their numbers increased only to a few thousand. Actually there is a good possibility that the race would ultimately have died out if Old Alexander hadn't enslaved them and instituted a controlled breeding program. There are more Lani alive today than there were at the height of their power. So in a way Old Alexander did them a favor. He kept their race alive. All we can expect is a fair and just settlement."

"But if Alexander doesn't co-operate?"

"That's where you come in. You'll be a watchdog. If you don't receive annual progress reports from me -- and see or talk to me personally every second year, you are released from our bond and can do what you wish with the evidence I've accumulated."

"We'd better get this into Private Record," Brainard said. "We can transcribe an agreement and place it in the Public Repository."

"A good idea and we'd better waste no time. Alexander might still be looking for me -- and if he is, it's merely a question of time before he catches up."

"Ten years have passed. It's doubtful. But we could keep you here at the Center."

Kennon shook his head. "Too dangerous. And besides it would compromise you. No -- we'll get everything possible done to make the Lani's case airtight, and then I'll return to Kardon. It will put our case in a better light if it ever comes to trial, if I go back voluntarily. Anyway -- I'm morally bound to return. Now let's make this record."

"It's your decision," Brainard said. "And it's your neck - but I must admit that I agree with you."

"I'll feel safer when we get the legal details clarified," Kennon said.

"And what of the girl?"

"Can you take care of her if I have to leave quickly?"

"Of course. I'll give her personal attention, and after she has her child I'll see that she is sent to you."

"That's decent of you, Doctor."

"It's my moral responsibility," Brainard said as he slipped a new tape into the recorder.

* * *

Copper responded quickly to rest and therapy. The space shock cleared up quickly. The gerontological treatments put her to bed again, but within a month she was completely normal, and her lifespan was now that of a normal human. She could look forward to some four hundred years with Kennon -- and the prospect was not unpleasant. The Center fascinated her. Never before had she seen a hospital devoted to the care and treatment of humans. It was a far cry, in its polished steel and stone magnificence, from the tiny primitive structure over which Kennon had presided. Yet both places served the same purpose. Perhaps Kennon was right -- that there was no difference between man and Lani. The idea was not nearly as unbelievable as it was at first.

"I never realized what it meant to be human," Copper said as she held Kennon's hand. "It is nice to feel important and to know that our child is a member of the race that rules the galaxy."

"So you're convinced?" Kennon chuckled.

"The serological identity--" she began.

"Hmm. You've been getting some education, I see."

"Well," Copper smiled, "I didn't think you wanted a stupid woman. I can read -- and since you are around so seldom nowadays, there is little else to do. I've been reading history, medicine, and novels," she finished proudly.

"A fine catholic selection," Kennon said, "Now if you add mathematics, sociology, and philosophy you'll have a well-rounded basic education."

"Dr. Brainard has been trying something he calls 'hypno.' He says it will help me learn faster. But I can't see that it's done much good."

"You won't until you need the information," Kennon said.

"That technique is only good for implanting basic knowledge, and much of that will merely suppleent or complete that which you already have. You won't be conscious of it."

"Oh -- I think I see what you mean."

"Of course, you'll have to continue your formal education. There's a great deal for you to learn. It should keep you busy while I'm away."

"Away? Where are you going?"

"Back to Kardon."

"But you can't! Alexander will destroy you."

"I think not. After all, ten years have elapsed since we left there and he's had plenty of time to think. Douglas must have told him about us. I wouldn't be surprised if he has already done something about your people."

She shivered. "He might -- but the question is what would he do? He could have killed them all!"

Kennon shook his head. "I don't think so. He never struck me as a mass murderer."

She shook her head. "You don't know the Alexanders like I do. I was raised by them. They're capable of
anything. But what is this business of ten years? That's silly. I haven't had my child yet -- and it doesn't take ten years of pregnancy to produce a baby."

"It's the difference between subjective and objective time," Kennon said. "We traveled here through hyperspace -- low Cth -- in an uncompensated ship, and there is little temporal flow in the levels below the blue."

"Oh -- of course."
Kennon chuckled. "That would have been Greek to you a couple of weeks ago. See where that basic data fits?"
"But I've always known that."
"You just think you have. Search your memory and see if I'm not right."
Copper shook her head. "It's very strange," she said. "But that's not important. This idea of going back to Kardon, though -- that's a different thing -- that is important."

"I have to do it. Not only because it's a personal moral obligation but also because of the Lani. They must have their freedom."

"Providing there are any still alive."
"Stop being a calamity howler. Whatever Alexander may be, he's not a butcher. He even loved a Lani once. You told me so yourself. And he couldn't kill where he loved."

She nodded. "I suppose you're right, but I've never lost my fear of the Man Alexander. He held the power of life and death over me. But if you must go then I should go too. My obligation is greater than yours."

"Later," Kennon said. "You're not ready to return. It will be time enough after you have learned some civilized habits."
Copper's face lengthened. "You mean like wrapping myself in cloth like these people do?"

"That's part of it."
"Why can't they be sensible -- or are they so ashamed of what the gods gave them that they must hide themselves?"

"No, it's not that. At least not exactly. It's custom. And you must learn to conform to customs -- outwardly at least -- no matter what you may really think."
"Isn't that a form of lying?" Copper asked.
"I suppose so."
"Isn't that strange. Your society exalts truth, honor, morality, and intelligence -- yet you lie about your attitude."
"It's called diplomacy," Kennon said. "It's part of respect for others' attitudes and beliefs, a necessary part of human relationships."

"Then you'd be a nudist on Santos?"
"Of course -- even though I think it isn't proper, I couldn't inflict my ideas and attitudes on the customs of an independent world."

"Oh -- you think I'm doing that?"
"Yes -- and it is a mark of barbarism."
"Sometimes you're not very nice," Copper said.
Kennon smiled wryly. "I suppose I'm not," he agreed.
"I'll try to be civilized," Copper said. "But if you go to Kardon -- I'm going with you."
"Perhaps," Kennon said. "We'll see how things turn out."
"You don't want me to go with you?"
"To be honest -- no," Kennon said. "You're safe here, and until your status is cleared by a Brotherhood court, I wouldn't care to place you in Alexander's hands. And clearing your status is going to take time."

"You mean that I am still his property?"

"Yes. But there is a legal doubt that will prevent him from exercising his claim as long as you stay on Beta. In the area where he has power, that doubt might not hold. So until your status is definitely proven to be human, you should not leave."

"And what happens if this court denies my claim?"

"Then we appeal to the Council. However, with the evidence we have, your claim cannot reasonably be denied. The only question is one of time. It may take years. Still, I don't think there is anything to worry about. I don't think Alexander will give us any trouble, but there's no sense in taking chances."

"You still think I'm a Lani," she said accusingly.
"I do not."
"Then you think that I'd obey Alexander, after what I did to Douglas."
"I can only repeat that Douglas isn't the Boss-man."
"I wish I knew what you really thought."
"That isn't hard. I think you should stay here until I get this business straightened out."
"That's all?" she asked suspiciously. "After all, I know I'm not very pretty now. And there's lots of Lani on Flora----"

Oh, for Ochsner's sake! Do you think that I'm---" He paused, speechless. "Just what do you think I am?"

"You're a man. And that's the trouble."
Kennon chuckled. "So that's it! You don't trust me."
"I love you," Copper said.

"Sometimes I wonder why men ever finalize their status with women," Kennon murmured. "It does no good. It doesn't convince the woman. She's still fearful, jealous, and suspicious--always belittling her ability to hold what she has, always alert for competition, clinging, holding, absorbing--when she should be working as part of a team."

"That's not true!"
"Then prove it."
"How--by staying here while you go to the end of the galaxy and play noble?"
"I'm only doing what I have to do."
"And so am I--and if you go I'm going with you."
Kennon shrugged. There was no sense arguing. The only thing to do was make his plans and leave quietly. If she was faced with an established fact, she might be more reasonable. He doubted it, but alone, she could do nothing--and Brainard would see that she was comfortable. The salvage money from the Egg would keep her from being a public charge. And he had more banked in Albertsville which he could send her once he got there. He'd start making plans to leave as soon as possible.

Copper looked up at him as he stood above her bed. Slowly she reached out and placed one slim hand in his. "I know what you are thinking," she said, "and--" her face twisted in a grimace of pain, and the hand in his clutched with convulsive strength at his fingers.

"What's the matter?" he said.

"Nothing--it's perfectly normal," she said. "I'm just going to give you a son. Now if you'd call for the doctor, perhaps we can get this over. That pain was only twenty minutes from the last. I think it's about time."

Kennon--who had attended several hundred Lani births and had developed a certain callousness about them--was suddenly frightened and helpless as he pushed the call button. He could feel the cold sweat form on his forehead. He had started this. It was his fault if anything went wrong. He wished that it was someone else rather than Copper who was going through this trial. He was nervous, unsure, and guilty. In a word, he felt like a man whose mate was giving birth to their first child.

* * *

"It's a boy," Dr. Brainard said. He smiled down at Kennon's haggard face.

"How is Copper?" Kennon asked.

"Fine--she's healthy as a horse."

Kennon winced at the cliche. It was so ancient that it had lost all meaning. Most Betans didn't know what a horse was, let alone whether it was healthy or not. From what Kennon could remember of veterinary history, the horse wasn't too healthy an animal. It was rather delicate, in fact.

"How is the child?" Kennon asked. It took a little courage to ask this question. The baby could be anything from normal to a monstrosity.

"Perfectly normal," Brainard said. "A true Betan type even down to the vestigial tail. We amputated that, of course."

"Thank Ochsner!" Kennon breathed. "I was afraid."

"Of course you were," Brainard said. "Do you want to see them now? When I left, Copper was asking for you."

Kennon sighed. Leaving, he realized, wasn't going to be as easy as he had thought.

"We'll have to keep them here for a couple of months," Brainard said. "We must take exhaustive tests if we expect the court to reverse its prior decision."

"I expected that," Kennon said. He shrugged, "It's probably best," he said. "Now show me where Copper is."

"She's back in the same room. You don't need a guide."

Kennon didn't. In fact, he behaved quite admirably.

CHAPTER XX

Longliners, Kennon reflected, didn't make Beta a port of call, and the Shortliner connections with other worlds were infrequent. Beta had done a good job separating from the rest of the Brotherhood. Too good. The spaceline schedules showed only one departure in the next month, a Shortliner for Earth, and from Earth the road to Kardon was long and tortuous, involving a series of short jumps from world to world and a final medium-range hop from Halsey to Kardon. If everything went right and he made every connection he would be in Kardon four months after he left Beta. Kennon sighed as he left Travelers Aid. Morality was a heavy load to carry.
He walked slowly down the road from the spaceport toward the Co-operative where he had been staying. He had left Huntersville and Copper a week ago, after he had seen his child. His child! The thought of being a father was oddly dismaying. It distorted his sense of values. But one thing was certain. He was returning to Kardon, and Copper was not coming with him. She had a duty to their son - and he had a duty to his contract with Alexander, to the Lani on Flora, and to Copper -- and none of these could be satisfied by further running. He had to return and settle the account.

A tall man in a conservative yellow-and-black suit was waiting patiently in front of his room. "My name is Richter," he said. " -- Art Richter. Are you Dr. Jac Kennon?"

"I could deny it, but I won't," Kennon said.

"Thank you, Doctor. It was just a formality anyway. You see, I know you by sight." He sighed. "One has to observe the formalities in this business." He drew a long white envelope from his tunic and handed it to Kennon.

"Most of my subjects try to deny their identity," he said.

"It's a refreshing change to find an honest man." He bowed formally. "I really thought this would be harder, considering the charges against you." He bowed again and walked away.

"Now -- what was that?" Kennon muttered as he opened the envelope. The man Richter was undoubtedly a process server -- but who had hired him? He unfolded the sheet and scanned the charges -- coercion, larceny, livestock theft, and breach of contract. He shrugged. This was Alexander's work. What was the man thinking of? It was insanity to bring the Lani matter into open court. Hadn't Douglas told him what had happened? Couldn't Alexander guess that he had fled with Copper for a good reason -- one that would stand up in court? Didn't he know about the spacer? Or had Douglas turned on his cousin? The pup had so many hates that it was possible. He was a natural troublemaker. Maybe Alexander didn't know. Maybe he was working in the dark. Kennon scanned the sheet quickly. Ah! here it was. Complaint - Mr. Alexander X. M. Alexander, Skyline Tower 1024, Beta City!

Alexander! Here on Beta! Kennon opened the door of his room, went straight to the phone beside the bed. He lifted the handset from its cradle and dialed the operator. "Get me Huntersville THU 2-1408. I want to speak to Dr. Brainard, Dr. Will Brainard. This is a priority call -- my name is Kennon. Dr. Jac Kennon D.V.M. I'm in the registry -- 47M 26429 -- yes -- of course, and thank you." He waited a moment. "Hello -- Dr. Brainard? -- Kennon here. I've just had some news. Alexander's on Beta! Yes -- he served me with a summons. Can you get a restraining order to prevent him from leaving? You can? Good! Here's his address." Kennon rattled off the location. "Yes -- I'm taking the next airboat to Beta City. This should simplify things considerably. -- Of course it should. He was a fool to have come here. Yes -- I suppose you should tell Copper. Oh! She is? I'm sorry to hear that, but there's no reason for her to be angry. She should realize that I did this for her -- not to make her miserable. Hmm.-- She -- she has? You think she should come with me? -- Yes, I realize she can be a problem when she wants to be. All right then -- tell her to pack a toothbrush and a few spare diapers. And see if you can get me a couple of tickets on the next flight to Beta City. I'll be over in a couple of hours and pick her up." He cradled the phone and dialed the operator again.

"I want the phone number of Skyline Tower 1024, Beta City, Mr. Alexander. Yes. I'll wait. This number is HUV 2-1278 and my name is Kennon, Dr. Jac Kennon 47M 26429. I called you before. No, I'm a transient. I can refer you to Dr. James Brainard, Huntersville Medical Center. Yes, I'll accept charges. Now will you give me that number? BCA 7-8941--thank you."

Kennon hung up, dialed the number, and waited.

"Hello," he said. "Mr. Alexander? This is Dr. Kennon. - Yes -- I suppose you do, but I've been trying to get back to Kardon for the past month. You are? Well, that's your privilege, but I'd advise you to go easy until I see you. Naturally -- I'm coming as soon as I can get there. We'll be seeing you tomorrow morning at the latest. We? -- I'm bringing Copper, of course. I just wanted you to know."

Kennon wiped his forehead. Alexander sounded angry and dangerous. Ten years hadn't served to cool him off. What had happened on Kardon after he had left? Kennon shook his head. There was something here he didn't understand. The entrepreneur should have been covering his tracks, not threatening jail and disaccreditation. It was obvious that a personal visit was more necessary than he had thought.

Alexander was waiting. His eyebrows rose at the sight of Copper in formal Betan dress -- and lifted a trifle more at the sight of the baby.

"What is this, Kennon?" he asked.

"Trouble," Kennon said. He took off his hat. "I came here to settle things before you took this case to court. You obviously do not understand what has happened. I suppose Douglas has double-crossed you. It would be characteristic of him. But before we go any further I think we should clear the air and let each other know where we stand. I don't want to make trouble if it's not necessary. You'll notice I'm not wearing a thought screen, so you'll be able to check everything I say, and know I'm telling the truth."

"It had better be good," Alexander said grimly. "I've been looking for you for ten years. I intend to throw the
book at you."

"I don't know whether my reason is good or not. Technically I'm guilty of breach of contract and larceny of corporation property, but there are extenuating circumstances."

Alexander chuckled mirthlessly. "There are a few other charges. And quite probably I can think of more if you beat these. I'm going to make an example of you, Kennon. I'm going to drag you down and stamp on you. You're going to be a horrible example to all smart operators who think they can break contracts. It's taken a million credits and ten years' time to hunt you down, but it's going to be worth it."

"Copper's child is a boy," Kennon said mildly. "My son."

Alexander froze. "You can prove that?" he asked in a half-strangled voice.

Kennon nodded. "You see the extenuating circumstance?" he asked. "Suppression of human slavery!"

Alexander sat down. It was as though some unseen hand had pulled his legs from under him. "You believe it," he said. "-- No -- you've proved it! Why -- why didn't you tell me? What sort of a man do you think I am?"

"I didn't know. I couldn't take the chance until Copper was protected. You see, sir, I love her."

"That isn't hard to do with Lani," Alexander said. He sank back in his chair, his face clouded, his expression troubled. It was obvious that the realization shocked him.

Kennon felt an odd sympathy for the entrepreneur. It wasn't a nice feeling, he suspected, to have the beliefs of a lifetime ripped apart and sent to the disposal chute.

"So the Lani are a human variant," Alexander said dully.

"The proof is here," Kennon said, "and the supporting evidence is conclusive."

"An innocent victim of circumstances," Kennon said. "You didn't know. None of us knew. And we still wouldn't know if the Lani weren't of Betan extraction." He grimaced painfully. "I've done some soul-searching myself, and it hasn't been a pleasant task."

"But it's nothing like mine," Alexander said in a low voice. "I suspected they were human when I was younger, but I denied my suspicions and accepted false facts instead of investigating."

"You would have found nothing."

"Unfortunately, that's not true. We discovered quite a bit from the experimental station you left us when you disappeared ten years ago. But we stopped when we found the age that was being indoctrinated with Lani tabus. We could have gone farther, but I didn't think it was necessary."

"Didn't Douglas tell you?" Kennon asked curiously. "I told him when I turned him loose."

"Douglas didn't tell anything except that you had somehow gotten a spaceship. I assumed it was one of those that were involved in that commercial raid a few decades ago, but I see it wasn't. No -- I knew nothing about this development. And Douglas, I guess, wanted to keep it hidden. He gave your co-ordinates and ordered Mullins to launch a missile. But he apparently forgot to turn on his IFF. At any rate the missile lost you -- but found Douglas. Douglas was still talking to Alexandria when it struck."

"He might have informed you," Kennon said. "If he had more time."

"I doubt it. He ordered the missile first. He was trying to destroy you before you could destroy Outworld Enterprises."

"His motives were selfish as usual." Alexander looked at Kennon with a haggard eye. "I owe you an apology," he said. "I've considered you responsible for Douglas's death for ten years. I've searched for you on a hundred worlds. My agents in every branch office have had standing orders to report any unusual arrivals. I have hunted you personally. I wanted to break you -- I wanted to kill you."

"I couldn't help the delay," Kennon said. "The ship was old."

"I know. You've told me more than you think. I'm a telepath, you know."

"I've never forgotten it," Kennon said. "That was one of the principal reasons I came here. I wanted to see how you'd react when you learned the whole truth."

"And I suppose you gloat -- no -- you're not doing that. But you are right. I could have checked it further. But I didn't. Outworld Enterprises is far bigger than Flora -- and I was busy. Galactic trade is a snake-pit. And, after all, there was Douglas's death -- and the Family with their never-ending clamor for money and their threats when it didn't come promptly. I like being an entrepreneur, but until I made Outworld independent of Family control, I couldn't do anything except run the business to their wishes. Actually the island was only a small part of the corporation. I tried to run it as humanely as possible under the circumstances." He shuddered. "I don't think I was ever needlessly cruel."

"No," Kennon said, "you were indifferent."

"Which is just as bad," Alexander said.
"Well -- what are you going to do about it?" Copper interjected. "You can beat yourself until you're blue, but that won't accomplish anything."

"What are you going to do?" Alexander countered. "You have the upper hand."

"Me?" Copper asked. "I have nothing. This is between you men." She lapsed into silence.

Alexander turned back to Kennon. "You have undoubtedly made some arrangements. You wouldn't come here -- oh! I see. Congratulations. Handling the evidence that way was a wise course. You have my admiration. But then I should have known that I was not dealing with a fool." He smiled wryly. "Subconsciously I think I did know -- but --"

"That's one consolation," Kennon grinned. "To be thought a rascal is bad enough, but to be considered a fool is intolerable."

"But your decision not to use the evidence unless you were forced to -- that's poor business."

"But good morals," Kennon said. "Neither the Brotherhood nor I could settle this affair. It is a matter only you can handle. There is no sense in killing Outworld or throwing Kardon into centuries of litigation. The Lani never were numerous enough to lay claim to an entire world. I'll admit the club is there, but I'll never use it unless it's necessary."

"Why not? -- it's sound business practice."

"I'm a professional -- not a businessman. And besides, I haven't the moral right to return evil for good. You have not been a bad boss."

"Thanks," Alexander said glumly. "I've always considered myself civilized."

"I wouldn't go so far as to say that," Kennon said. "Honorable, yes -- civilized, no. But none of us are really civilized."

"So?"

"We haven't changed much, despite our development. Perhaps we've varied a little physically -- and we've learned to use new tools, but our minds are still the minds of barbarians -- blood brothers against the enemy, and everything not of us is enemy. Savages -- hiding under a thin veneer of superficial culture. Savages with spaceships and the atom." Kennon looked down at Copper. Apparently her thoughts were miles away in an introspective world that was all her own. She had said her piece and having done that was content to let the two men develop it. Kennon looked at her with odd respect. Alexander eyed her with a mildly startled expression on his lean face. And both men smiled, but the smiles were not amused.

"Judging from Copper," Alexander said, "I don't think we'll have to worry about how the Lani will turn out."

He looked at Kennon with mild sympathy. "You are going to have quite a time with her," he said.

"I suppose so. I'll probably never know whether I'm guided or whether I'm doing the guiding. I've changed a lot of my opinions about Copper since the day I met her."

Copper looked up and smiled at them. It was an odd smile, hinting at secrets neither of them would ever know. Alexander chuckled. "It serves you right." He crossed his legs and looked up at Kennon standing before him. By some uncanny legerdemain he had gotten control of himself and the situation at the same time. Being telepathic was an unfair advantage, Kennon thought.

"You were equally unfair with your accusation," Alexander said. "Sure -- humanity makes mistakes, and like this one they're sometimes brutal mistakes. But we are capable of atonement. Morally we have come a long way from the brutality of the Interregnum. I shouldn't have to use examples, but look at that" -- he waved at the view wall at the panorama of gleaming fairy towers and greenery that made Beta City one of the most beautiful in the Brotherhood. "Don't tell me that five thousand years of peace and development haven't produced civilization. That's a concrete example out there."

"It isn't," Kennon said flatly. "Sure, it's pretty -- clean -- and beautifully designed for art and utility -- but it isn't civilization. You're confusing technology with culture. You look at this and say, 'What a great civilization man has built,' when you really mean, 'What a great technology mankind has developed.' There's all the difference in the world. Technology is of the mind and hands. Civilization is of the spirit -- and spiritually we are still in the Dark Ages.

"We conquer, kill, loot, and enslave. We establish standards to keep humanity a closed corporation, a special club in which men can live but aliens can't. We've made the standards for admission so rigid that we even enslave our own kind and call them animals. That's not civilization -- that's savagery!

"For nearly five hundred years your family has run a slave pen. Your fortune is based upon it. And you have perpetuated this traffic in flesh on the specious reasoning that a court judgment of half a millennium ago is as good today as when it was handed down. Never once did anyone have the moral courage to re-examine that old decision. Never once did any human question the rightness of that decision. None of us are immune. We all based our conduct upon an antiquated law and searched no further. Everyone was happy with the status quo -- or at least not so
unhappy that they wanted to change it. Even I would have been content had it not been for Copper."

"Yet I do not feel that it was bad that I hired you," Alexander said. "Even though you have shown me that I am a slaver, and made me see faults I never knew I had." His face was drawn -- harsh lines reached from nose to lips, from eyes to chin. Suddenly he looked old. "I can accept censure if censure is just. And this is just. No -- I'm not sorry I hired you even though the thought of what I have helped do to the Lani makes me sick to my stomach."

"Well--" Kennon said. "What are you going to do about it?"

"I don't know," Alexander said. "At the first smell of trouble, the Family will turn tail and run. You can break the company, and I won't stand in your way. It's only just. You're the one who's carrying the ball. Now run with it."

"That damned blind spot," Kennon said. "You realize, of course, that you're not legally liable. It was a mistake. All you have to do is admit the error and start from there. Naturally -- no reasonable intelligence would expect that you change the older Lani. They're too old for either agerone or change. It would be both cruel and inhuman to turn them loose. It's with the youngsters that you can work -- those who are physically and physiologically young enough to derive benefit from agerone and education.

"As I remember, you bought a planet called Phoebe. Now why don't you----"

"Phase out! Of course! But that means that you can't press charges."

"Why should I? I'm not one of these starry-eyed reformers who expect to change things overnight. It's the future of the Lani race that's important, And Brainard agrees with me. A phase-out is the proper solution. Change the education, let males be born -- teach the young to think instead of to obey. Give them Phoebe for a home -- they never owned all of Kardon anyway. And within a century or two we will have a new group of the human race -- and then we can tell the Brotherhood."

Kennon looked inquiringly at Copper. She smiled and nodded. "It would cause less trouble that way," she said.

"It would be more sure -- and there are never too many old ones."

Kennon shuddered, thinking of the euthanasia chambers on Otpen One. "There will be more from now on," he said.

"Outworld can afford it. It'll bend us a little but we won't break -- and besides, the Lani will need our help for some time to come." Alexander looked at Kennon. "Can we make an agreement that all parties will respect?" he asked.

"I think so -- providing there are no sleeper clauses in it," Kennon said.

"There won't be," Alexander said.

And there weren't.

* * *

It was a private ceremony. The Family, sulky and unwilling, faced with a choice of drastically reduced income or outright confiscation and preferring a portion of a loaf to none. Alexander -- grim but oddly peaceful of expression. Brainard -- pink-cheeked and emotionless. Kennon and Copper -- happily conscious that it was at last finished. It was an oddly assorted group of conspirators who planned to restore a segment of humanity to the human race.

Kennon signed last, and as he did, Alexander looked at him with a sly grin distorting the smooth pallor of his face.

"You forgot something," he said.

"What?" Kennon said -- aware suddenly that something was wrong.

"What do you plan to do, now that this is over?"

"Join the Medical Center here and practice veterinary medicine."

"You wouldn't care to work for me -- to help rebuild the wreckage you've helped create? I'll need a manager on Kardon to phase out the island while we phase in Phoebe."

"No, thank you. I've had enough of that."

"You just think you have," Alexander said gleefully. "That's what you have forgotten. You've gotten your agreement -- now you will satisfy me. As I see it you have breached your contract by leaving Flora without authorization."

"That is right," Kennon said. A small lump of lead began to grow rapidly larger in his stomach. Brainard was grinning and Copper's eyes were shining. "You've been jobbed!" his mind told him. He sighed. He knew what was coming next.

"The punitive clause for breach of contract," Alexander went on inexorably, "is very broad. Discretion is vested in the entrepreneur. I can obtain judgment against you in any court on any planet."

"I know," Kennon said glumly.

"But I am going to be civilized," Alexander said. "I am going to be merciful. I am going to extend your contract until phase-out has been completed. You are going to have control of the entire Kardon phase of the operation. It's
poetic justice -- you made the mess -- now you can clean it up."

"That's inhuman!"

"Humanity has nothing to do with it. It's justice," Alexander said. He smiled at Copper's radiant face. The thought of going home was good to her. "Good luck on your new job, Dr. Kennon," he said. "And welcome to the brotherhood of the ulcer."

MIZORA: A PROPHECY
A Mss. Found Among The Private Papers Of The Princess Vera Zarovitch;
Being a true and faithful account of her Journey to the Interior of the Earth, with a careful description of the
Country and its Inhabitants, their Customs, Manners and Government.
WRITTEN BY HERSELF
By Mary E. Bradley

PREFACE

The narrative of Vera Zarovitch, published in the Cincinnati Commercial in 1880 and 1881, attracted a great
deal of attention. It commanded a wide circle of readers, and there was much more said about it than is usual when
works of fiction run through a newspaper in weekly installments. Quite a number of persons who are unaccustomed
to bestowing consideration upon works of fiction spoke of it, and grew greatly interested in it.

I received many messages about it, and letters of inquiry, and some ladies and gentlemen desired to know the
particulars about the production of the story in book form; and were inquisitive about it and the author who kept
herself in concealment so closely that even her husband did not know that she was the writer who was making this
stir in our limited literary world.

I was myself so much interested in it that it occurred to me to make the suggestion that the story ought to have
an extensive sale in book form, and to write to a publisher; but the lady who wrote the work seemed herself a shade
indifferent on the subject, and it passed out of my hands and out of my mind.

It is safe to say that it made an impression that was remarkable, and with a larger audience I do not doubt that it
would make its mark as an original production wrought out with thoughtful care and literary skill, and take high
rank.

Yours very truly,
Murat Halstead.
Nov. 14th, 1889.
PART FIRST
CHAPTER I.

Having little knowledge of rhetorical art, and possessing but a limited imagination, it is only a strong sense of
the duty I owe to Science and the progressive minds of the age, that induces me to come before the public in the
character of an author. True, I have only a simple narration of facts to deal with, and am, therefore, not expected
to present artistic effects, and poetical imagery, nor any of those flights of imagination that are the trial and test of
genius.

Yet my task is not a light one. I may fail to satisfy my own mind that the true merits of the wonderful and
mysterious people I discovered, have been justly described. I may fail to interest the public; which is the one
difficulty most likely to occur, and most to be regretted—not for my own sake, but theirs. It is so hard to get human
nature out of the ruts it has moved in for ages. To tear away their present faith, is like undermining their existence.
Yet others who come after me will be more aggressive than I. I have this consolation: whatever reception may be
given my narrative by the public, I know that it has been written solely for its good. That wonderful civilization I
met with in Mizora, I may not be able to more than faintly shadow forth here, yet from it, the present age may form
some idea of that grand, that ideal life that is possible for our remote posterity. Again and again has religious
enthusiasm pictured a life to be eliminated from the grossness and imperfections of our material existence. The
Spirit—the Mind—that mental gift, by or through which we think, reason, and suffer, is by one tragic and awful
struggle to free itself from temporal blemishes and difficulties, and become spiritual and perfect. Yet, who, sweeping
the limitless fields of space with a telescope, glancing at myriads of worlds that a lifetime could not count, or gazing
through a microscope at a tiny world in a drop of water, has dreamed that patient Science and practice could evolve
for the living human race, the ideal life of exalted knowledge: the life that I found in Mizora; that Science had made
real and practicable. The duty that I owe to truth compels me to acknowledge that I have not been solicited to write
this narrative by my friends; nor has it been the pastime of my leisure hours; nor written to amuse an invalid; nor, in
fact, for any of those reasons which have prompted so many men and women to write a book. It is, on the contrary,
the result of hours of laborious work, undertaken for the sole purpose of benefiting Science and giving
encouragement to those progressive minds who have already added their mite of knowledge to the coming future of
the race. "We owe a duty to posterity," says Junius in his famous letter to the king. A declaration that ought to be a
motto for every schoolroom, and graven above every legislative hall in the world. It should be taught to the child as soon as reason has begun to dawn, and be its guide until age has become its master.

It is my desire not to make this story a personal matter; and for that unavoidable prominence which is given one's own identity in relating personal experiences, an indulgence is craved from whomsoever may peruse these pages.

In order to explain how and why I came to venture upon a journey no other of my sex has ever attempted, I am compelled to make a slight mention of my family and nationality.

I am a Russian: born to a family of nobility, wealth, and political power. Had the natural expectations for my birth and condition been fulfilled, I should have lived, loved, married and died a Russian aristocrat, and been unknown to the next generation—and this narrative would not have been written.

There are some people who seem to have been born for the sole purpose of becoming the playthings of Fate—who are tossed from one condition of life to another without wish or will of their own. Of this class I am an illustration. Had I started out with a resolve to discover the North Pole, I should never have succeeded. But all my hopes, affections, thoughts, and desires were centered in another direction, hence—but my narrative will explain the rest.

The tongue of woman has long been celebrated as an unruly member, and perhaps, in some of the domestic affairs of life, it has been unnecessarily active; yet no one who gives this narrative a perusal, can justly deny that it was the primal cause of the grandest discovery of the age.

I was educated in Paris, where my vacations were frequently spent with an American family who resided there, and with whom my father had formed an intimate friendship. Their house, being in a fashionable quarter of the city and patriotically hospitable, was the frequent resort of many of their countrymen. I unconsciously acquired a knowledge and admiration for their form of government, and some revolutionary opinions in regard to my own. Had I been guided by policy, I should have kept the latter a secret, but on returning home, at the expiration of my school days, I imprudently gave expression to them in connection with some of the political movements of the Russian Government—and secured its suspicion at once, which, like the virus of some fatal disease, once in the system, would lose its vitality only with my destruction.

While at school, I had become attached to a young and lovely Polish orphan, whose father had been killed at the battle of Grochow when she was an infant in her mother's arms. My love for my friend, and sympathy for her oppressed people, finally drew me into serious trouble and caused my exile from my native land.

I married at the age of twenty the son of my father's dearest friend. Alexis and I were truly attached to each other, and when I gave to my infant the name of my father and witnessed his pride and delight, I thought to my cup of earthly happiness, not one more drop could be added.

A desire to feel the cheering air of a milder climate induced me to pay my Polish friend a visit. During my sojourn with her occurred the anniversary of the tragedy of Grochow, when, according to custom, all who had lost friends in the two dreadful battles that had been fought there, met to offer prayers for their souls. At her request, I accompanied my friend to witness the ceremonies. To me, a silent and sympathizing spectator, they were impressive and solemn in the extreme. Not less than thirty thousand people were there, weeping and praying on ground hallowed by patriot blood. After the prayers were said, the voice of the multitude rose in a mournful and pathetic chant. It was rudely broken by the appearance of the Russian soldiers.

A scene ensued which memory refuses to forget, and justice forbids me to deny. I saw my friend, with the song of sorrow still trembling on her innocent lips, fall bleeding, dying from the bayonet thrust of a Russian soldier. I clasped the lifeless body in my arms, and in my grief and excitement, poured forth upbraidings against the government of my country which it would never forgive nor condone. I was arrested, tried, and condemned to the mines of Siberia for life.

My father's ancient and princely lineage, my husband's rank, the wealth of both families, all were unavailing in procuring a commutation of my sentence to some less severe punishment. Through bribery, however, the cooperation of one of my jailors was secured, and I escaped in disguise to the frontier.

It was my husband's desire that I proceed immediately to France, where he would soon join me. But we were compelled to accept whatever means chance offered for my escape, and a whaling vessel bound for the Northern Seas was the only thing I could secure passage upon with safety. The captain promised to transfer me to the first southward bound vessel we should meet.

But none came. The slow, monotonous days found me gliding farther and farther from home and love. In the seclusion of my little cabin, my fate was more endurable than the horrors of Siberia could have been, but it was inexpressibly lonesome. On shipboard I sustained the character of a youth, exiled for a political offense, and of a delicate constitution.

It is not necessary to the interest of this narrative to enter into the details of shipwreck and disaster, which befel
us in the Northern Seas. Our vessel was caught between ice floes, and we were compelled to abandon her. The small boats were converted into sleds, but in such shape as would make it easy to re-convert them into boats again, should it ever become necessary. We took our march for the nearest Esquimaux settlement, where we were kindly received and tendered the hospitality of their miserable huts. The captain, who had been ill for some time, grew rapidly worse, and in a few days expired. As soon as the approach of death became apparent, he called the crew about him, and requested them to make their way south as soon as possible, and to do all in their power for my health and comfort. He had, he said, been guaranteed a sum of money for my safe conduct to France, sufficient to place his family in independent circumstances, and he desired that his crew should do all in their power to secure it for them.

The next morning I awoke to find myself deserted, the crew having decamped with nearly everything brought from the ship.

Being blessed with strong nerves, I stared my situation bravely in the face, and resolved to make the best of it. I believed it could be only a matter of time when some European or American whaling vessel should rescue me; and I had the resolution to endure, while hope fed the flame.

I at once proceeded to inure myself to the life of the Esquimaux. I habited myself in a suit of reindeer fur, and ate, with compulsory appetite, the raw flesh and fat that form their principal food. Acclimated by birth to the coldest region of the temperate zone, and naturally of a hardy constitution, I found it not so difficult to endure the rigors of the Arctic temperature as I had supposed.

I soon discovered the necessity of being an assistance to my new friends in procuring food, as their hospitality depends largely upon the state of their larder. A compass and a small trunk of instruments belonging to the Captain had been either over-looked or rejected by the crew in their flight. I secured the esteem of the Esquimaux by using the compass to conduct a hunting party in the right direction when a sudden snow-storm had obscured the landmarks by which they guide their course. I cheerfully assumed a share of their hardships, for with these poor children of the North life is a continual struggle with cold and starvation. The long, rough journeys which we frequently took over ice and ridges of snow in quest of animal food, I found monotonously destitute of everything I had experienced in former traveling, except fatigue. The wail of the winds, and the desolate landscape of ice and snow, never varied. The coruscations of the Aurora Borealis sometimes lighted up the dreary waste around us, and the myriad eyes of the firmament shone out with a brighter lustre, as twilight shrank before the gloom of the long Arctic night.

A description of the winter I spent with the Esquimaux can be of little interest to the readers of this narrative. Language cannot convey to those who have dwelt always in comfort the feeling of isolation, the struggle with despair, that was constantly mine. We were often confined to our ice huts for days while the blinding fury of the wind driven snow without made the earth look like chaos. Sometimes I crept to the narrow entrance and looked toward the South with a feeling of homesickness too intense to describe. Away, over leagues of perilous travel, lay everything that was dear or congenial; and how many dreary months, perhaps years, must pass before I could obtain release from associations more dreadful than solitude. It required all the courage I could command to endure it.

The whale-fishing opens about the first week in August, and continues throughout September. As it drew near, the settlement prepared to move farther north, to a locality where they claimed whales could be found in abundance. I cheerfully assisted in the preparations, for to meet some whaling vessel was my only hope of rescue from surroundings that made existence a living death.

The dogs were harnessed to sleds heavily laden with the equipments of an Esquimaux hut. The woman, as well as the men, were burdened with immense packs; and our journey begun. We halted only to rest and sleep. A few hours work furnished us a new house out of the ever present ice. We feasted on raw meat--sometimes a freshly killed deer; after which our journey was resumed.

As near as I could determine, it was close to the 85° north latitude, where we halted on the shore of an open sea. Wild ducks and game were abundant, also fish of an excellent quality. Here, for the first time in many months, I felt the kindly greeting of a mild breeze as it hailed me from the bosom of the water. Vegetation was not profuse nor brilliant, but to my long famished eyes, its dingy hue was delightfully refreshing.

Across this sea I instantly felt a strong desire to sail. I believed it must contain an island of richer vegetation than the shore we occupied. But no one encouraged me or would agree to be my companion. On the contrary, they intimated that I should never return. I believed that they were trying to frighten me into remaining with them, and declared my intention to go alone. Perhaps I might meet in that milder climate some of my own race. My friend smiled, and pointing to the South, said, as he designated an imaginary boundary:

"Across that no white man's foot has ever stepped."

So I was alone. My resolution, however, was not shaken. A boat was constructed, and bidding adieu to my humble companions, I launched into an unknown sea.

CHAPTER II.

On and on, and on I rowed until the shore and my late companions were lost in the gloomy distance. On and on,
and still on, until fatigued almost to exhaustion; and still, no land. A feeling of uncontrollable lonesomeness took possession of me. Silence reigned supreme. No sound greeted me save the swirl of the gently undulating waters against the boat, and the melancholy dip of the oars. Overhead, the familiar eyes of night were all that pierced the gloom that seemed to hedge me in. My feeling of distress increased when I discovered that my boat had struck a current and was beyond my control. Visions of a cataract and inevitable death instantly shot across my mind. Made passive by intense despair, I laid down in the bottom of the boat, to let myself drift into whatever fate was awaiting me.

I must have lain there many hours before I realized that I was traveling in a circle. The velocity of the current had increased, but not sufficiently to insure immediately destruction. Hope began to revive, and I sat up and looked about me with renewed courage. Directly before me rose a column of mist, so thin that I could see through it, and of the most delicate tint of green. As I gazed, it spread into a curtain that appeared to be suspended in mid-air, and began to sway gently back and forth, as if impelled by a slight breeze, while sparks of fire, like countless swarms of fire-flies, darted through it and blazed out into a thousand brilliant hues and flakes of color that chased one another across and danced merrily up and down with bewildering swiftness. Suddenly it drew together in a single fold, a rope of yellow mist, then instantly shook itself out again as a curtain of rainbows fringed with flame. Myriads of tassels, composed of threads of fire, began to dart hither and thither through it, while the rainbow stripes deepened in hue until they looked like gorgeous ribbons glowing with intensest radiance, yet softened by that delicate misty appearance which is a special quality of all atmospheric color, and which no pencil can paint, nor the most eloquent tongue adequately describe.

The swaying motion continued. Sometimes the curtain approached near enough, apparently, to flaunt its fiery fringe almost within my grasp. It hung one instant in all its marvelous splendor of colors, then suddenly rushed into a compact mass, and shot across the zenith, an arc of crimson fire that lit up the gloomy waters with a weird, unearthly glare. It faded quickly, and appeared to settle upon the water again in a circular wall of amber mist, round which the current was hurrying me with rapidly increasing speed. I saw, with alarm, that the circles were narrowing. A whirlpool was my instant conjecture, and I laid myself down in the boat, again expecting every moment to be swept into a seething abyss of waters. The spray dashed into my face as the boat plunged forward with frightful swiftness. A semi-stupor, born of exhaustion and terror, seized me in its merciful embrace.

It must have been many hours that I lay thus. I have a dim recollection of my boat going on and on, its speed gradually decreasing, until I was amazed to perceive that it had ceased its onward motion and was gently rocking on quiet waters. I opened my eyes. A rosy light, like the first blush of a new day, permeated the atmosphere. I sat up and looked about me. A circular wall of pale amber mist rose behind me; the shores of a new and beautiful country stretched before. Toward them, I guided my boat with reviving hope and strength.

I entered a broad river, whose current was from the sea, and let myself drift along its banks in bewildered delight. The sky appeared bluer, and the air balmier than even that of Italy's favored clime. The turf that covered the banks was smooth and fine, like a carpet of rich green velvet. The fragrance of tempting fruit was wafted by the zephyrs from numerous orchards. Birds of bright plumage flitted among the branches, anon breaking forth into wild and exultant melody, as if they rejoiced to be in so favored a clime.

And truly it seemed a land of enchantment. The atmosphere had a peculiar transparency, seemingly to bring out clearly objects at a great distance, yet veiling the far horizon in a haze of gold and purple. Overhead, clouds of the most gorgeous hues, like precious gems converted into vapor, floated in a sky of the serenest azure. The languorous atmosphere, the beauty of the heavens, the inviting shores, produced in me a feeling of contentment not easily described. To add to my senses another enjoyment, my ears were greeted with sounds of sweet music, in which I detected the mingling of human voices.

I wondered if I had really drifted into an enchanted country, such as I had read about in the fairy books of my childhood.

The music grew louder, yet wondrously sweet, and a large pleasure boat, shaped like a fish, glided into view. Its scales glittered like gems as it moved gracefully and noiselessly through the water. Its occupants were all young girls of the highest type of blonde beauty. It was their soft voices, accompanied by some peculiar stringed instruments they carried, that had produced the music I had heard. They appeared to regard me with curiosity, not unmixed with distrust, for their boat swept aside to give me a wide berth.

I uncovered my head, shook down my long black hair, and falling upon my knees, lifted my hands in supplication. My plea was apparently understood, for turning their boat around, they motioned me to follow them. This I did with difficulty, for I was weak, and their boat moved with a swiftness and ease that astonished me. What surprised me most was its lack of noise.

As I watched its beautiful occupants dressed in rich garments, adorned with rare and costly gems, and noted the noiseless, gliding swiftness of their boat, an uncomfortable feeling of mystery began to invade my mind, as though I...
really had chanced upon enchanted territory.

As we glided along, I began to be impressed by the weird stillness. No sound greeted me from the ripening orchards, save the carol of birds; from the fields came no note of harvest labor. No animals were visible, nor sound of any. No hum of life. All nature lay asleep in voluptuous beauty, veiled in a glorious atmosphere. Everything wore a dreamy look. The breeze had a loving, lingering touch, not unlike to the Indian Summer of North America. But no Indian Summer ever knew that dark green verdure, like the first robe of spring. Wherever the eye turned it met something charming in cloud, or sky, or water, or vegetation. Everything had felt the magical touch of beauty.

On the right, the horizon was bounded by a chain of mountains, that plainly showed their bases above the glowing orchards and verdant landscapes. It impressed me as peculiar, that everything appeared to rise as it gained in distance. At last the pleasure boat halted at a flight of marble steps that touched the water. Ascending these, I gained an eminence where a scene of surpassing beauty and grandeur lay spread before me. Far, far as the eye could follow it, stretched the stately splendor of a mighty city. But all the buildings were detached and surrounded by lawns and shade trees, their white marble and gray granite walls gleaming through the green foliage.

Upon the lawn, directly before us, a number of most beautiful girls had disposed themselves at various occupations. Some were reading, some sketching, and some at various kinds of needlework. I noticed that they were all blondes. I could not determine whether their language possessed a peculiarly soft accent, or whether it was an unusual melody of voice that made their conversation as musical to the ear as the love notes of some amorous wood bird to its mate.

A large building of white marble crowned a slight eminence behind them. Its porticos were supported upon the hands of colossal statues of women, carved out of white marble with exquisite art and beauty. Shade trees of a feathery foliage, like plumes of finest moss, guarded the entrance and afforded homes for brilliant-plumed birds that flew about the porticos and alighted on the hands and shoulders of the ladies without fear. Some of the trees had a smooth, straight trunk and flat top, bearing a striking resemblance to a Chinese umbrella. On either side of the marble-paved entrance were huge fountains that threw upward a column of water a hundred feet in height, which, dissolving into spray, fell into immense basins of clearest crystal. Below the rim of these basins, but covered with the crystal, as with a delicate film of ice, was a wreath of blood red roses, that looked as though they had just been plucked from the stems and placed there for a temporary ornament. I afterward learned that it was the work of an artist, and durable as granite.

I supposed I had arrived at a female seminary, as not a man, or the suggestion of one, was to be seen. If it were a seminary, it was for the wealth of the land, as house, grounds, adornments, and the ladies' attire were rich and elegant.

I stood apart from the groups of beautiful creatures like the genus of another race, enveloped in garments of fur that had seen much service. I presented a marked contrast. The evident culture, refinement, and gentleness of the ladies, banished any fear I might have entertained as to the treatment I should receive. But a singular silence that pervaded everything impressed me painfully. I stood upon the uplifted verge of an immense city, but from its broad streets came no sound of traffic, no rattle of wheels, no hum of life. Its marble homes of opulence shone white and grand through mossy foliage; from innumerable parks the fountains sparkled and statues gleamed like rare gems upon a costly robe; but over all a silence, as of death, reigned unbroken. The awe and the mystery of it pressed heavily upon my spirit, but I could not refuse to obey when a lady stepped out of the group, that had doubtless been discussing me, and motioned me to follow her.

She led me through the main entrance into a lofty hall that extended through the entire building, and consisted of a number of grand arches representing scenes in high relief of the finest sculpture. We entered a magnificent salon, where a large assembly of ladies regarded me with unmistakable astonishment. Every one of them was a blonde. I was presented to one, whom I instantly took to be the Lady Superior of the College, for I had now settled it in my mind that I was in a female seminary, albeit one of unheard of luxury in its appointments.

The lady had a remarkable majesty of demeanor, and a noble countenance. Her hair was white with age, but over her features, the rosy bloom of youth still lingered, as if loth to depart. She looked at me kindly and critically, as if to determine whether I was a brunette. My guide, having apparently received some instruction in regard to me, led me upstairs into a private apartment. She placed before me a complete outfit of female wearing apparel, and informed me by signs that I was to put it on. She then retired. The apartment was sumptuously furnished in two colors—amber and lazulite. A bath-room adjoining had a beautiful porcelain tank with scented water, that produced a delightful feeling of exhilaration.

Having donned my new attire, I descended the stairs and met my guide, who conducted me into a spacious dining-room. The walls were adorned with paintings, principally of fruit and flowers. A large and superb picture of a sylvan dell in the side of a rock, was one exception. Its deep, cool shadows, and the pellucid water, which a wandering sunbeam accidentally revealed, were strikingly realistic. Nearly all of the pictures were upon panels of
crystal that were set in the wall. The light shining through them gave them an exceedingly natural effect. One picture that I especially admired, was of a grape vine twining around the body and trunk of an old tree. It was inside of the crystal, and looked so natural that I imagined I could see its leaves and tendrils sway in the wind. The occupants of the dining-room were all ladies, and again I noted the fact that they were all blondes: beautiful, graceful, courteous, and with voices softer and sweeter than the strains of an eolian harp.

The table, in its arrangement and decoration, was the most beautiful one I had ever seen. The white linen cloth resembled brocaded satin. The knives and forks were gold, with handles of solid amber. The dishes were of the finest porcelain. Some of them, particularly the fruit stands, looked as though composed of hoar frost. Many of the fruit stands were of gold filigree work. They attracted my notice at once, not so much on account of the exquisite workmanship and unique design of the dishes, as the wonderful fruit they contained. One stand, that resembled a huge African lily in design, contained several varieties of plums, as large as hen's eggs, and transparent. They were yellow, blue and red. The centre of the table was occupied by a fruit stand of larger size than the others. It looked like a boat of sea foam fringed with gold moss. Over its outer edge hung clusters of grapes of a rich wine color, and clear as amethysts. The second row looked like globes of honey, the next were of a pale, rose color, and the top of the pyramid was composed of white ones, the color and transparency of dew.

The fruit looked so beautiful. I thought it would be a sacrilege to destroy the charm it had for the eye; but when I saw it removed by pink tipped fingers, whose beauty no art could represent, and saw it disappear within such tempting lips. I thought the feaster worthy of the feast. Fruit appeared to be the principal part of their diet, and was served in its natural state. I was, however, supplied with something that resembled beefsteak of a very fine quality. I afterward learned that it was chemically prepared meat. At the close of the meal, a cup was handed me that looked like the half of a soap bubble with all its iridescent beauty sparkling and glancing in the light. It contained a beverage that resembled chocolate, but whose flavor could not have been surpassed by the fabled nectar of the gods.

CHAPTER III.

I have been thus explicit in detailing the circumstances of my entrance into the land of Mizora, or, in other words, the interior of the earth, lest some incredulous person might doubt the veracity of this narrative.

It does seem a little astonishing that a woman should have fallen by accident, and without intention or desire, upon a discovery that explorers and scientists had for years searched for in vain. But such was the fact, and, in generosity, I have endeavored to make my accident as serviceable to the world in general, and Science in particular, as I could, by taking observations of the country, its climate and products, and especially its people.

I met with the greatest difficulty in acquiring their language. Accustomed to the harsh dialect of the North, my voice was almost intractable in obtaining their melodious accentuation. It was, therefore, many months before I mastered the difficulty sufficiently to converse without embarrassment, or to make myself clearly understood. The construction of their language was simple and easily understood, and in a short time I was able to read it with ease, and to listen to it with enjoyment. Yet, before this was accomplished, I had mingled among them for months, listening to a musical jargon of conversation, that I could neither participate in, nor understand. All that I could therefore discover about them during this time, was by observation. This soon taught me that I was not in a seminary—in our acceptance of the term—but in a College of Experimental Science. The ladies—girls I had supposed them to be—were, in fact, women and mothers, and had reached an age that with us would be associated with decrepitude, wrinkles and imbecility. They were all practical chemists, and their work was the preparation of food from the elements. No wonder that they possessed the suppleness and bloom of eternal youth, when the earthy matter and impurities that are ever present in our food, were unknown to theirs.

I also discovered that they obtained rain artificially when needed, by discharging vast quantities of electricity in the air. I discovered that they kept no cattle, nor animals of any kind for food or labor. I observed a universal practice of outdoor exercising; the aim seeming to be to develop the greatest capacity of lung or muscle. It was astonishing the amount of air a Mizora lady could draw into her lungs. They called it their brain stimulant, and said that their faculties were more active after such exercise. In my country, a cup of strong coffee, or some other agreeable beverage, is usually taken into the stomach to invigorate or excite the mind.

One thing I remarked as unusual among a people of such cultured taste, and that was the size of the ladies' waists. Of all that I measured not one was less than thirty inches in circumference, and it was rare to meet with one that small. At first I thought a waist that tapered from the arm pits would be an added beauty, if only these ladies would be taught how to acquire it. But I lived long enough among them to look upon a tapering waist as a disgusting deformity. They considered a large waist a mark of beauty, as it gave a greater capacity of lung power; and they laid the greatest stress upon the size and health of the lungs. One little lady, not above five feet in height, I saw draw into her lungs two hundred and twenty-five cubic inches of air, and smile proudly when she accomplished it. I measured five feet and five inches in height, and with the greatest effort I could not make my lungs receive more than two hundred cubic inches of air. In my own country I had been called an unusually robust girl, and knew, by
comparison, that I had a much larger and fuller chest than the average among women.

I noticed with greater surprise than anything else had excited in me, the marked absence of men. I wandered about the magnificent building without hindrance or surveillance. There was not a lock or bolt on any door in it. I frequented a vast gallery filled with paintings and statues of women, noble looking, beautiful women, but still—nothing but women. The fact that they were all blondes, singular as it might appear, did not so much impress me. Strangers came and went, but among the multitude of faces I met, I never saw a man's.

In my own country I had been accustomed to regard man as a vital necessity. He occupied all governmental offices, and was the arbitrator of domestic life. It seemed, therefore, impossible to me for a country or government to survive without his assistance and advice. Besides, it was a country over which the heart of any man must yearn, however insensible he might be to beauty or female loveliness. Wealth was everywhere and abundant. The climate as delightful as the most fastidious could desire. The products of the orchards and gardens surpassed description. Bread came from the laboratory, and not from the soil by the sweat of the brow. Toil was unknown; the toil that we know, menial, degrading and harassing. Science had been the magician that had done away all that. Science, so formidable and austere to our untutored minds, had been gracious to these fair beings and opened the door to nature's most occult secrets. The beauty of those women it is not in my power to describe. The Greeks, in their highest art, never rivalled it, for here was a beauty of mind that no art can represent. They enhanced their physical charms with attractive costumes, often of extreme elegance. They wore gems that flashed a fortune as they passed. The rarest was of a pale rose color, translucent as the clearest water, and of a brilliancy exceeding the finest diamond. Their voices, in song, could only be equalled by a celestial choir. No dryad queen ever floated through the leafy aisles of her forest with more grace than they displayed in every movement. And all this was for feminine eyes alone—and they of the most enchanting loveliness.

Among all the women that I met during my stay in Mizora—comprising a period of fifteen years—I saw not one homely face or ungraceful form. In my own land the voice of flattery had whispered in my ear praises of face and figure, but I felt ill-formed and uncouth beside the perfect symmetry and grace of these lovely beings. Their chief beauty appeared in a mobility of expression. It was the divine fire of Thought that illumined every feature, which, while gazing upon the Aphrodite of Praxitiles, we must think was all that the matchless marble lacked. Emotion passed over their features like ripples over a stream. Their eyes were limpid wells of loveliness, where every impulse of their natures were betrayed without reserve.

"It would be a paradise for man."

I made this observation to myself, and as secretly would I propound the question:

"Why is he not here in lordly possession?"

In my world man was regarded, or he had made himself regarded, as a superior being. He had constituted himself the Government, the Law, Judge, Jury and Executioner. He doled out reward or punishment as his conscience or judgment dictated. He was active and belligerent always in obtaining and keeping every good thing for himself. He was indispensable. Yet here was a nation of fair, exceedingly fair women doing without him, and practising the arts and sciences far beyond the imagined pale of human knowledge and skill.

Of their progress in science I will give some accounts hereafter. It is impossible to describe the feeling that took possession of me as months rolled by, and I saw the active employments of a prosperous people move smoothly and quietly along in the absence of masculine intelligence and wisdom. Cut off from all inquiry by my ignorance of their language, the singular absence of the male sex began to prey upon my imagination as a mystery. The more so after visiting a town at some distance, composed exclusively of schools and colleges for the youth of the country. Here I saw hundreds of children—and all of them were girls. Is it to be wondered at that the first inquiry I made, was:

"Where are the men?"

CHAPTER IV.

To facilitate my progress in the language of Mizora I was sent to their National College. It was the greatest favor they could have conferred upon me, as it opened to me a wide field of knowledge. Their educational system was a peculiar one, and, as it was the chief interest of the country. Here I saw hundreds of children—and all of them were girls. Is it to be wondered at that the first inquiry I made, was:

"Where are the men?"

All institutions for instruction were public, as were, also, the books and other accessories. The State was the beneficent mother who furnished everything, and required of her children only their time and application. Each pupil was compelled to attain a certain degree of excellence that I thought unreasonably high, after which she selected the science or vocation she felt most competent to master, and to that she then devoted herself.

The salaries of teachers were larger than those of any other public position. The Principal of the National College had an income that exceeded any royal one I had ever heard of; but, as education was the paramount interest of Mizora, I was not surprised at it. Their desire was to secure the finest talent for educational purposes, and as the
highest honors and emoluments belonged to such a position, it could not be otherwise. To be a teacher in Mizora was to be a person of consequence. They were its aristocracy.

Every State had a free college provided for out of the State funds. In these colleges every department of Science, Art, or Mechanics was furnished with all the facilities for thorough instruction. All the expenses of a pupil, including board, clothing, and the necessary traveling fares, were defrayed by the State. I may here remark that all railroads are owned and controlled by the General Government. The rates of transportation were fixed by law, and were uniform throughout the country.

The National College which I entered belonged to the General Government. Here was taught the highest attainments in the arts and sciences, and all industries practised in Mizora. It contained the very cream of learning. There the scientist, the philosopher and inventor found the means and appliances for study and investigation. There the artist and sculptor had their finest work, and often their studios. The principals and subordinate teachers and assistants were elected by popular vote. The State Colleges were free to those of another State who might desire to enter them, for Mizora was like one vast family. It was regarded as the duty of every citizen to lend all the aid and encouragement in her power to further the enlightenment of others, wisely knowing the benefits of such would accrue to her own and the general good. The National College was open to all applicants, irrespective of age, the only requirements being a previous training to enter upon so high a plane of mental culture. Every allurement was held out to the people to come and drink at the public fountain where the cup was inviting and the waters sweet.

"For," said one of the leading instructors to me, "education is the foundation of our moral elevation, our government, our happiness. Let us relax our efforts, or curtail the means and inducements to become educated, and we relax into ignorance, and end in demoralization. We know the value of free education. It is frequently the case that the greatest minds are of slow development, and manifest in the primary schools no marked ability. They often leave the schools unnoticed; and when time has awakened them to their mental needs, all they have to do is to apply to the college, pass an examination, and be admitted. If not prepared to enter the college, they could again attend the common schools. We realize in its broadest sense the ennobling influence of universal education. The higher the culture of a people, the more secure is their government and happiness. A prosperous people is always an educated one; and the freer the education, the wealthier they become." The Preceptress of the National College was the leading scientist of the country. Her position was more exalted than any that wealth could have given her. In fact, while wealth had acknowledged advantages, it held a subordinate place in the estimation of the people. I never heard the expression "very wealthy," used as a recommendation of a person. It was always: "She is a fine scholar, or mechanic, or artist, or musician. She excels in landscape gardening, or domestic work. She is a first-class chemist." But never "She is rich."

The idea of a Government assuming the responsibility of education, like a parent securing the interest of its children, was all so new to me; and yet, I confessed to myself, the system might prove beneficial to other countries than Mizora. In that world, from whence I had so mysteriously emigrated, education was the privilege only of the rich. And in no country, however enlightened, was there a system of education that would reach all. Charitable institutions were restricted, and benefited only a few. My heart beat with enthusiasm when I thought of the mission before me. And then I reflected that the philosophers of my world were but as children in progress compared to these. Still traveling in grooves that had been worn and fixed for posterity by bygone ages of ignorance and narrow-mindedness, it would require courage and resolution, and more eloquence than I possessed, to persuade them out of these trodden paths. To be considered the privileged class was an active characteristic of human nature. Wealth, and the powerful grip upon the people which the organizations of society and governments gave, made it hereditary. Yet in this country, nothing was hereditary but the prosperity and happiness of the whole people.

It was not a surprise to me that astronomy was an unknown science in Mizora, as neither sun, moon, nor stars were visible there. "The moon's pale beams" never afford material for a blank line in poetry; neither do scientific discussions rage on the formation of Saturn's rings, or the spots on the sun. They knew they occupied a hollow sphere, bounded North and South by impassible oceans. Light was a property of the atmosphere. A circle of burning mist shot forth long streamers of light from the North, and a similar phenomena occurred in the South.

The recitation of my geography lesson would have astonished a pupil from the outer world. They taught that a powerful current of electricity existed in the upper regions of the atmosphere. It was the origin of their atmospheric heat and light, and their change of seasons. The latter appeared to me to coincide with those of the Arctic zone, in one particular. The light of the sun during the Arctic summer is reflected by the atmosphere, and produces that mellow, golden, rapturous light that hangs like a veil of enchantment over the land of Mizora for six months in the year. It was followed by six months of the shifting iridescence of the Aurora Borealis.

As the display of the Aurora Borealis originated, and was most brilliant at what appeared to me to be the terminus of the pole, I believed it was caused by the meeting at that point of the two great electric currents of the earth, the one on its surface, and the one known to the inhabitants of Mizora. The heat produced by the meeting of
of food. But there was one other consideration that bore vitally upon it. The dignity and necessity of labor was early
poverty such as I knew existed in all civilized nations upon the face of the earth, was largely owing to the cheapness
no distinction of birth or position among themselves. Ignominy rested on any kind of labor, the whole community of Mizora was one immense family of sisters who knew custom of selecting whatever vocation they felt themselves competent to most worthily fill, and as no social favor or social rank, refined in manner and frequently of notable intellectual acquirements. It grew, or was the result of the accustomed to see accepted by the people of inferior birth and breeding, were there filled by women of the highest citizen, no matter how wealthy, had some regular trade, business or profession. I found those occupations we are accepted no pay.

I wrote out a careful description of the processes by which they converted food out of the valueless elements--valueless because of their abundance--and put it carefully away for use in my own country. There drouth, or excessive rainfalls, produced scarcity, and sometimes famine. The struggle of the poor was for food, to the exclusion of all other interests. Many of them knew not what proper and health-giving nourishment was. But here in Mizora, the daintiest morsels came from the chemists laboratory, cheap as the earth under her feet.

I now began to enjoy the advantages of conversation, which added greatly to my happiness and acquirements. I formed an intimate companionship with the daughter of the Preceptress of the National College, and to her was addressed the questions I asked about things that impressed me. She was one of the most beautiful beings that it had been my lot to behold. Her eyes were dark, almost the purplish blue of a pansy, and her hair had a darker tinge than is common in Mizora, as if it had stolen the golden edge of a ripe chestnut. Her beauty was a constant charm to me.

The National College contained a large and well filled gallery. Its pictures and statuary were varied, not confined to historical portraits and busts as was the one at the College of Experimental Science. Yet it possessed a number of portraits of women exclusively of the blonde type. Many of them were ideal in loveliness. This gallery also contained the masterpieces of their most celebrated sculptors. They were all studies of the female form. I am a connoisseur in art, and nothing that I had ever seen before could compare with these matchless marbles, bewitching in every delicate contour, alluring in softness, but grand and majestic in pose and expression.

But I haunted this gallery for other reasons than its artistic attractions. I was searching for the portrait of a man, or something suggesting his presence. I searched in vain. Many of the paintings were on a peculiar transparent substance that gave to the subject a startlingly vivid effect. I afterward learned that they were imperishable, the material being a translucent adamant of their own manufacture. After a picture was painted upon it, another piece of adamant was cemented over it.

Each day, as my acquaintance with the peculiar institutions and character of the inhabitants of Mizora increased, my perplexity and a certain air of mystery about them increased with it. It was impossible for me not to feel for them a high degree of respect, admiration, and affection. They were ever gentle, tender, and kind to solicitude. To accuse them of mystery were a paradox; and yet they were a mystery. In conversation, manners and habits, they were frank to singularity. It was just as common an occurrence for a poem to be read and commented on by its author, as to hear it done by another. I have heard a poetess call attention to the beauties of her own habits, they were frank to singularity. It was just as common an occurrence for a poem to be read and commented on

Ambition of the most intense earnestness was a natural characteristic, but was guided by a stern and inflexible justice. Envy and malice were unknown to them. It was, doubtless, owing to their elevated moral character that courts and legal proceedings had become unnecessary. If a discussion arose between parties involving a question of law, they repaired to the Public Library, where the statute books were kept, and looked up the matter themselves, and settled it as the law directed. Should they fail to interpret the law alike, a third party was selected as referee, but accepted no pay.

Indolence was as much a disgrace to them as is the lack of virtue to the women of my country, hence every citizen, no matter how wealthy, had some regular trade, business or profession. I found those occupations we are accustomed to see accepted by the people of inferior birth and breeding, were there filled by women of the highest social rank, refined in manner and frequently of notable intellectual acquirements. It grew, or was the result of the custom of selecting whatever vocation they felt themselves competent to most worthily fill, and as no social favor or ignominy rested on any kind of labor, the whole community of Mizora was one immense family of sisters who knew no distinction of birth or position among themselves.

There were no paupers and no charities, either public or private, to be found in the country. The absence of poverty such as I knew existed in all civilized nations upon the face of the earth, was largely owing to the cheapness of food. But there was one other consideration that bore vitally upon it. The dignity and necessity of labor was early
and diligently impressed upon the mind. The Preceptress said to me:

"Mizora is a land of industry. Nature has taught us the duty of work. Had some of us been born with minds fully matured, or did knowledge come to some as old age comes to all, we might think that a portion was intended to live without effort. But we are all born equal, and labor is assigned to all; and the one who seeks labor is wiser than the one who lets labor seek her."

Citizens, I learned, were not restrained from accumulating vast wealth had they the desire and ability to do so, but custom imposed upon them the most honorable processes. If a citizen should be found guilty of questionable business transactions, she suffered banishment to a lonely island and the confiscation of her entire estate, both hereditary and acquired. The property confiscated went to the public schools in the town or city where she resided; but never was permitted to augment salaries. I discovered this in the statute books, but not in the memory of any one living had it been found necessary to inflict such a punishment.

"Our laws," said Wauna, "are simply established legal advice. No law can be so constructed as to fit every case so exactly that a criminal mind could not warp it into a dishonest use. But in a country like ours, where civilization has reached that state of enlightenment that needs no laws, we are simply guided by custom."

The love of splendor and ornament was a pronounced characteristic of these strange people. But where gorgeous colors were used, they were always of rich quality. The humblest homes were exquisitely ornamented, and often displayed a luxury that, with us, would have been considered an evidence of wealth.

They took the greatest delight in their beauty, and were exceedingly careful of it. A lovely face and delicate complexion, they averred, added to one's refinement. The art of applying an artificial bloom and fairness to the skin, which I had often seen practiced in my own country, appeared to be unknown to them. But everything savoring of deception was universally condemned. They made no concealment of the practice they resorted to for preserving their complexions, and so universal and effectual were they, that women who, I was informed, had passed the age allotted to the grandmothers in my country, had the smooth brow and pink bloom of cheek that belongs to a more youthful period of life. There was, however, a distinction between youth and old age. The hair was permitted to whiten, but the delicate complexion of old age, with its exquisite coloring, excited in my mind as much admiration as astonishment.

I cannot explain why I hesitated to press my first inquiry as to where the men were. I had put the question to Wauna one day, but she professed never to have heard of such beings. It silenced me--for a time.

"Perhaps it is some extinct animal," she added, naively. "We have so many new things to study and investigate, that we pay but little attention to ancient history."

I bided my time and put the query in another form.

"Where is your other parent?"

"Where is your other parent?"

She regarded me with innocent surprise. "You talk strangely. I have but one parent. How could I have any more?"

"You ought to have two."

She laughed merrily. "You have a queer way of jesting. I have but one mother, one adorable mother. How could I have two?" and she laughed again.

I saw that there was some mystery I could not unravel at present, and fearing to involve myself in some trouble, refrained from further questioning on the subject. I nevertheless kept a close observance of all that passed, and seized every opportunity to investigate a mystery that began to harass me with its strangeness.

Soon after my conversation with Wauna, I attended an entertainment at which a great number of guests were present. It was a literary festival and, after the intellectual delicacies were disposed of, a banquet followed of more than royal munificence. Toasts were drank, succeeded by music and dancing and all the gayeties of a festive occasion, yet none but the fairest of fair women graced the scene. Is it strange, therefore, that I should have regarded with increasing astonishment and uneasiness a country in all respects alluring to the desires of man--yet found him not there in lordly possession?

Beauty and intellect, wealth and industry, splendor and careful economy, natures lofty and generous, gentle and loving--why has not Man claimed this for himself?

CHAPTER V.

The Preceptress of the National College appointed her daughter Wanna as a guide and instructor to me. I formed a deep and strong attachment for her, which, it pains me to remember, was the cause of her unhappy fate. In stature she was above the medium height, with a form of the fairest earthly loveliness and exquisite grace. Her eyes were so deep a blue, that at first I mistook them for brown. Her hair was the color of a ripe chestnut frosted with gold, and in length and abundance would cover her like a garment. She was vivacious and fond of athletic sports. Her strength amazed me. Those beautiful hands, with their tapering fingers, had a grip like a vise. They had discovered, in this wonderful land, that a body possessing perfectly developed muscles must, by the laws of nature,
shrubs. vines of ivy, grape and rose winding about them, carved and colored into perfect representations of the natural
porch floors were of clouded marble. The pillars supporting its roof were round shafts of the same material, with
residences in the country. She was the mother of eight children, and possessed one of the largest fortunes and most magnificent
resembl ing Man, never ceased to prey upon my curiosity. and perhaps penetrate its greatest mystery, for I must confess that the singular dearth of anything and everything
gratification, as it would afford me the opportunity I coveted to become acquainted with the domestic life of Mizora,
 punished by banishment. Corporal punishment was unknown. I would never give it expression, as any dereliction of duty would be severely rebuked by the whole community, if not
as so many afflictions is unknown to Mizora. If a mother should ever feel her children as burdens upon her, she
scholarly attainments and noble character is a credit to her mother. That selfish mother who looks upon her children
strong and deep. They consider the care of them a sacred duty, fraught with the noblest results of life. A daughter of
the curtain fell, I could scarcely believe it had only been a play. The love of Mizora women for their children is
thrilling beyond my power to describe. I lost control of my feelings. The audience wept and applauded; and when
watching the vessel break to pieces upon the rock and her child sink into the boiling water to rise no more, was
shore, the frightful carnival of wind and waves that no human power could still, and the agony of the mother
distracted mother. The scenery was managed with wonderful realism. The thunder of the surf as it beat upon the
district of its atmosphere, as we do to the material neatness of ours.
Mizora, I never saw a tear of sorrow fall from children's eyes. Admirable sanitary regulations exist in all the cities
physical. The result was plump limbs, healthy, happy faces and joyous spirits. In all the fifteen years that I spent in
manner of rearing children. The most scrupulous attention was paid to their diet and exercise, both mental and
be symmetrical and graceful. They rode a great deal on small, two-wheeled vehicles, which they propelled
themselves. They gave me one on which I accompanied Wauna to all of the places of interest in the Capital city and vicinity.
I must mention that Wauna's voice was exceedingly musical, even in that land of sweet voices, but she did not
excel as a singer.
The infant schools interested me more than all the magnificence and grandeur of the college buildings. The
quaint courtesy, gentle manners and affectionate demeanor of the little ones toward one another, was a surprise to me. I had visited infant schools of my own and other countries, where I had witnessed the display of human nature, un
restrained by mature discretion and policy. Fights, quarrels, kicks, screams, the unlawful seizure of toys and trinkets, and other misdemeanors, were generally the principal exhibits. But here it was all different. I thought, as I looked at them, that should a philanthropist from the outside world have chanced unknowingly upon the playground of a Mizora infant school, he would have believed himself in a company of little angels.
At first, a kindness so universal impressed me as studied; a species of refined courtesy in which the children were drilled. But time and observation proved to me that it was the natural impulse of the heart, an inherited trait of moral culture. In my world, kindness and affection were family possessions, extended occasionally to acquaintances. Beyond this was courtesy only for the great busy bustling mass of humanity called--"the world."
It must not be understood that there was no variety of character in Mizora. Just as marked a difference was to be found there as elsewhere; but it was elevated and ennobled. Its evil tendencies had been eliminated. There were many causes that had made this possible. The first, and probably the most influential, was the extreme cheapness of living. Food and fuel were items of so small consequence, that poverty had become unknown. Added to this, and to me by far the most vital reason, was their system of free education. In contemplating the state of enlightenment to which Mizora had attained, I became an enthusiast upon the subject of education, and resolved, should I ever again reach the upper world, to devote all my energies and ability to convincing the governments of its importance. I believe it is the duty of every government to make its schools and colleges, and everything appertaining to education--FREE. To be always starved for knowledge is a more pitiful craving than to hunger for bread. One dwarfs the body; the other the mind.
The utmost care was bestowed upon the training and education of the children. There was nothing that I met with in that beautiful and happy country I longed more to bring with me to the inhabitants of my world, than their manner of rearing children. The most scrupulous attention was paid to their diet and exercise, both mental and physical. The result was plump limbs, healthy, happy faces and joyous spirits. In all the fifteen years that I spent in Mizora, I never saw a tear of sorrow fall from children's eyes. Admirable sanitary regulations exist in all the cities and villages of the land, which insures them pure air. I may state here that every private-house looks as carefully to the condition of its atmosphere, as we do to the material neatness of ours.
The infant schools interested me more than all the magnificence and grandeur of the college buildings. The
infant schools interested me more than all the magnificence and grandeur of the college buildings. The
infant schools interested me more than all the magnificence and grandeur of the college buildings. The
infant schools interested me more than all the magnificence and grandeur of the college buildings. The
infant schools interested me more than all the magnificence and grandeur of the college buildings. The
infant schools interested me more than all the magnificence and grandeur of the college buildings.

The only intense feeling that I could discover among these people was the love between parent and child. I visited the theater where the tragedy of the play was the destruction of a daughter by shipwreck in view of the distracted mother. The scenery was managed with wonderful realism. The thunder of the surf as it beat upon the shore, the frightful carnival of wind and waves that no human power could still, and the agony of the mother watching the vessel break to pieces upon the rock and her child sink into the boiling water to rise no more, was thrilling beyond my power to describe. I lost control of my feelings. The audience wept and applauded; and when the curtain fell, I could scarcely believe it had only been a play. The love of Mizora women for their children is strong and deep. They consider the care of them a sacred duty, fraught with the noblest results of life. A daughter of scholarly attainments and noble character is a credit to her mother. That selfish mother who looks upon her children as so many afflictions is unknown to Mizora. If a mother should ever feel her children as burdens upon her, she would never give it expression, as any dereliction of duty would be severely rebuked by the whole community, if not punished by banishment. Corporal punishment was unknown.
I received an invitation from a lady prominent in literature and science to make her a visit. I accepted with gratification, as it would afford me the opportunity I coveted to become acquainted with the domestic life of Mizora, and perhaps penetrate its greatest mystery, for I must confess that the singular dearth of anything and everything resembling Man, never ceased to prey upon my curiosity.
The lady was the editor and proprietor of the largest and most widely known scientific and literary magazine in the country. She was the mother of eight children, and possessed one of the largest fortunes and most magnificent residences in the country.
The house stood on an elevation, and was a magnificent structure of grey granite, with polished cornices. The porch floors were of clouded marble. The pillars supporting its roof were round shafts of the same material, with vines of ivy, grape and rose winding about them, carved and colored into perfect representations of the natural shrubs.
The drawing-room, which was vast and imposing in size and appearance, had a floor of pure white marble. The mantels and window-sills were of white onyx, with delicate vinings of pink and green. The floor was strewn with richly colored mats and rugs. Luxurious sofas and chairs comprised the only furniture. Each corner contained a piece of fine statuary. From the centre of the ceiling depended a large gold basin of beautiful design and workmanship, in which played a miniature fountain of perfumed water that filled the air with a delicate fragrance. The walls were divided into panels of polished and unpolished granite. On the unpolished panels hung paintings of scenery. The dull, gray color of the walls brought out in sharp and tasteful relief the few costly and elegant adornments of the room: a placid landscape with mountains dimly outlining the distance. A water scene with a boat idly drifting, occupied by a solitary figure watching the play of variegated lights upon the tranquil waters. Then came a wild and rugged mountain scene with precipices and a foaming torrent. Then a concert of birds amusingly treated.

The onyx marble mantel-piece contained but a single ornament—an orchestra. A coral vase contained a large and perfect tiger lily, made of gold. Each stamen supported a tiny figure carved out of ivory, holding a musical instrument. When they played, each figure appeared instinct with life, like the mythical fairies of my childhood; and the music was so sweet, yet faint, that I readily imagined the charmed ring and tiny dancers keeping time to its rhythm.

The drawing-room presented a vista of arches draped in curtains of a rare texture, though I afterward learned they were spun glass. The one that draped the entrance to the conservatory looked like sea foam with the faint blush of day shining through it. The conservatory was in the shape of a half sphere, and entirely of glass. From its dome, more than a hundred feet above our heads, hung a globe of white fire that gave forth a soft clear light. Terminating, as it did, the long vista of arches with their transparent hangings of cobweb texture, it presented a picture of magnificence and beauty indescribably.

The other apartments displayed the same taste and luxury. The sitting-room contained an instrument resembling a grand piano.

The grounds surrounding this elegant home were adorned with natural and artificial beauties, Grottoes, fountains, lakes, cascades, terraces of flowers, statuary, arbors and foliage in endless variety, that rendered it a miniature paradise. In these grounds, darting in and out among the avenues, playing hide-and-seek behind the statuary, or otherwise amusing themselves, I met eight lovely children, ranging from infancy to young maidenhood. The glowing cheeks and eyes, and supple limbs spoke of perfect health and happiness. When they saw their mother coming, they ran to meet her, the oldest carrying the two-year old baby. The stately woman greeted each with a loving kiss. She showed in loving glance and action how dear they all were to her. For the time being she unbent, and became a child herself in the interest she took in their prattle and mirth. A true mother and happy children.

I discovered that each department of this handsome home was under the care of a professional artist. I remarked to my hostess that I had supposed her home was the expression of her own taste.

"So it is," she replied; "but it requires an equally well educated taste to carry out my designs. The arrangement and ornamentation of my grounds were suggested by me, and planned and executed by my landscape artist."

After supper we repaired to the general sitting-room. The eldest daughter had been deeply absorbed in a book before we came in. She closed and left it upon a table. I watched for an opportunity to carelessly pick it up and examine it. It was a novel I felt sure, for she appeared to resign it reluctantly out of courtesy to her guest. I might, from it, gather some clue to the mystery of the male sex. I took up the book and opened it. It was The Conservation of Force and The Phenomena of Nature. I laid it down with a sigh of discomfiture.

The next evening, my hostess gave a small entertainment, and what was my amazement, not to say offense, to her presume that the cook, the chamber-maid, and in fact all the servants in the establishment, enter and join in the conversation and amusement. The cook was asked to sing, for, with the exception of myself—and I tried to conceal it—no one appeared to take umbrage at her presence. She sat down to the piano and sang a pretty ballad in a charming manner. Her voice was cultivated and musical, as are all the voices in Mizora, but it was lacking in the qualities that make a great singer, yet it had a plaintive sweetness that was very attractive.

I was dumbfounded at her presumption. In my country such a thing is unknown as a servant entertaining guests in such a capacity, and especially among people of my rank and position in the world.

I repelled some advances she made me with a hauteur and coldness that it mortified me afterward to remember. Instead of being my inferior, I was her's, and she knew it; but neither by look, tone nor action did she betray her consciousness of it. I had to acknowledge that her hands were more delicately modeled than mine, and her bearing had a dignity and elegance that might have been envied by the most aristocratic dame of my own land. Knowing that the Mizora people were peculiar in their social ideas, I essayed to repress my indignation at the time, but later I unburdened myself to Wauna who, with her usual sweetness and gentleness, explained to me that her occupation was a mere matter of choice with her.

"She is one of the most distinguished chemists of this nation. She solved the problem of making bread out of the..."
limestone of a much finer quality than had been in use before."

"Don't tell me that you gave me a stone when I asked for bread!" I exclaimed.

"We have not done that," replied Wauna; "but we have given you what you took for bread, but which is manufactured out of limestone and the refuse of the marble quarries."

I looked at her in such inane astonishment that she hastened to add:

"I will take you to one of the large factories some day. They are always in the mountains where the stone is abundant. You can there see loaves by the thousands packed in great glass tanks for shipment to the different markets. And they do not cost the manufacturer above one centime per hundred."

"And what royalty does the discoverer get for this wonder of chemistry?"

"None. Whenever anything of that kind is discovered in our country, it is purchased outright by the government, and then made public for the benefit of all. The competition among manufacturers consists in the care and exactness with which they combine the necessary elements. There is quite a difference in the taste and quality of our bread as it comes from different factories."

"Why doesn't such a talented person quit working in another woman's kitchen and keep herself like a lady?" I inquired, all the prejudice of indolent wealth against labor coming up in my thoughts.

"She has a taste for that kind of work," replied Wauna, "instead of for making dresses, or carving gems, or painting. She often says she could not make a straight line if she tried, yet she can put together with such nicety and chemical skill the elements that form an omelette or a custard, that she has become famous. She teaches all who desire to learn, but none seem to equal her. She was born with a genius for cooking and nothing else. Haven't you seen her with a long glass tube testing the vessels of vegetables and fruit that were cooking?"

"Yes," I answered. "It was from that that I supposed her occupation menial."

"Visitors from other cities," continued Wauna, "nearly always inquire for her first."

Perceiving the mistake that I had made, I ventured an apology for my behavior toward her, and Wauna replied, with a frankness that nearly crushed me:

"We all noticed it, but do not fear a retaliation," she added sweetly. "We know that you are from a civilization that we look back upon as one of barbarism."

I acknowledged that if any superciliousness existed in Mizora while I was there, I must have had it.

The guests departed without refreshments having been served. I explained the custom of entertainment in my country, which elicited expressions of astonishment. It would be insulting to offer refreshments of any kind to a guest between the regular hours for dining, as it would imply a desire on your part to impair their health. Such was the explanation of what in my country would be deemed a gross neglect of duty. Their custom was probably the result of two causes: an enlightened knowledge of the laws of health, and the extreme cheapness of all luxuries of the table which the skill of the chemist had made available to every class of people in the land.

The word "servant" did not exist in the language of Mizora; neither had they an equivalent for it in the sense in which we understand and use the word. I could not tell a servant—for I must use the word to be understood—from a professor in the National College. They were all highly-educated, refined, lady-like and lovely. Their occupations were always matters of choice, for, as there was nothing in them to detract from their social position, they selected the one they knew they had the ability to fill. Hence those positions we are accustomed to regard as menial, were there filled by ladies of the highest culture and refinement; consequently the domestic duties of a Mizora household moved to their accomplishment with the ease and regularity of fine machinery.

It was long before I could comprehend the dignity they attached to the humblest vocations. They had one proverb that embraced it all: "Labor is the necessity of life." I studied this peculiar phase of Mizora life, and at last comprehended that in this very law of social equality lay the foundation of their superiority. Their admirable system of adapting the mind to the vocation in which it was most capable of excelling, and endowing that with dignity and respect, and, at the same time, compelling the highest mental culture possible, had produced a nation in the enjoyment of universal refinement, and a higher order of intelligence than any yet known to the outside world.

The standard of an ordinary education was to me astonishingly high. The reason for it was easily understood when informed that the only aristocracy of the country was that of intellect. Scholars, artists, scientists, literateurs, all those excelling in intellectual gifts or attainments, were alone regarded as superiors by the masses.

In all the houses that I had visited I had never seen a portrait hung in a room thrown open to visitors. On inquiry, I was informed that it was a lack of taste to make a portrait conspicuous.

"You meet faces at all times," said my informant, "but you cannot at all times have a variety of scenery before you. How monotonous it would be with a drawing-room full of women, and the walls filled with their painted representatives. We never do it."

"Then where do you keep your family portraits?"

"Ours is in a gallery upstairs."
I requested to be shown this, and was conducted to a very long apartment on the third floor, devoted exclusively to relics and portraits of family ancestry. There were over three thousand portraits of blond women, which my hostess' daughter informed me represented her grandmothers for ages back. Not one word did she say about her grandfathers.

I may mention here that no word existed in their dictionaries that was equivalent to the word "man." I had made myself acquainted with this fact as soon as I had acquired sufficient knowledge of their language. My astonishment at it cannot be described. It was a mystery that became more and more perplexing. Never in the closest intimacy that I could secure could I obtain the slightest clue, the least suggestion relating to the presence of man. My friend's infant, scarcely two years old, prattled of everything but a father.

I cannot explain a certain impressive dignity about the women of Mizora that, in spite of their amiability and winning gentleness, forbade a close questioning into private affairs. My hostess never spoke of her business. It would have been a breach of etiquette to have questioned her about it. I could not bring myself to intrude the question of the marked absence of men, when not the slightest allusion was ever made to them by any citizen.

So time passed on, confirming my high opinion of them, and yet I knew and felt and believed that some strange and incomprehensible mystery surrounded them, and when I had abandoned all hope of a solution to it, it solved itself in the most unexpected and yet natural manner, and I was more astonished at the solution than I was at the mystery.

CHAPTER VI.

Their domestic life was so harmonious and perfect that it was a perpetual pleasure to contemplate.

Human nature finds its sweetest pleasure, its happiest content, within its own home circle; and in Mizora I found no exception to the rule. The arrangement and adornment of every house in Mizora were evidently for the comfort and happiness of its inmates. To purchase anything for merely outside show, or to excite the envy or jealousy of a neighbor, was never thought of by an inhabitant of Mizora.

The houses that were built to rent excited my admiration quite as much as did the private residences. They all seemed to have been designed with two special objects in view—beauty and comfort. Houses built to rent in large cities were always in the form of a hollow square, inclosing a commodious and handsomely decorated park. The back was adorned with an upper and lower piazza opening upon the park. The suites of rooms were so arranged as to exclusively separate their occupants from all others. The park was undivided. The center was occupied by a fountain large enough to shoot its spray as high as the uppermost piazza. The park was furnished with rustic seats and shade trees, frequently of immense size, branched above its smooth walks and promenades, where baby wagons, velocipedes and hobby horses on wheels could have uninterrupted sport.

Suburban residences, designed for rent, were on a similar but more amplified plan. The houses were detached, but the grounds were in common. Many private residences were also constructed on the same plan. Five or six acres would be purchased by a dozen families who were not rich enough to own large places separately. A separate residence would be built for each family, but the ground would be laid off and ornamented like a private park. Each of the dozen families would thus have a beautiful view and the privilege of the whole ground. In this way, cascades, fountains, rustic arbors, rockeries, aquariums, tiny lakes, and every variety of landscape ornamenting, could be supplied at a comparatively small cost to each family.

Should any one wish to sell, they disposed of their house and one-twelfth of the undivided ground, and a certain per cent. of the value of its ornaments. The established custom was never to remove or alter property thus purchased without the consent of the other shareholders. Where a people had been educated to regard justice and conscience as their law, such an arrangement could be beneficial to an entire city.

Financial ability does not belong to every one, and this plan of uniting small capitals gave opportunity to the less wealthy classes to enjoy all the luxuries that belong to the rich. In fact some of the handsomest parks I saw in Mizora were owned and kept up in this manner. Sometimes as many as twenty families united in the purchase of an estate, and constructed artificial lakes large enough to sail upon. Artificial cascades and fountains of wonderful size and beauty were common ornaments in all the private and public parks of the city. I noticed in all the cities that I visited the beauty and charm of the public parks, which were found in all sections.

The walks were smoothly paved and shaded by trees of enormous size. They were always frequented by children, who could romp and play in these sylvan retreats of beauty in perfect security.

The high state of culture arrived at by the Mizora people rendered a luxurious style of living a necessity to all. Many things that I had been brought up to regard as the exclusive privileges of the rich, were here the common pleasure of every one. There was no distinction of classes; no genteel-poverty people, who denied themselves necessities that they might appear to have luxuries. There was not a home in Mizora that I entered—and I had access to many—that did not give the impression of wealth in all its appointments.

I asked the Preceptress to explain to me how I might carry back to the people of my country this social
happiness, this equality of physical comfort and luxury; and she answered me with emphasis:

"Educate them. Convince the rich that by educating the poor, they are providing for their own safety. They will have fewer prisons to build, fewer courts to sustain. Educated Labor will work out its own salvation against Capital. Let the children of toil start in life with exactly the same educational advantages that are enjoyed by the rich. Give them the same physical and moral training, and let the rich pay for it by taxes."

I shook my head "They will never submit to it," was my reluctant admission.

"Appeal to their selfishness," urged the Preceptress "Get them to open their college doors and ask all to come and be taught without money and without price. The power of capital is great, but stinted and ignorant toil will rise against its oppression, and innocence and guilt will alike suffer from its fury. Have you never known such an occurrence?"

"Not in my day or country," I answered "But the city in which I was educated has such a history. Its gutters flowed with human blood, the blood of its nobles."

She inclined her head significantly. "It will be repeated," she said sadly, "unless you educate them. Give their bright and active minds the power of knowledge. They will use it wisely, for their own and their country's welfare."

I doubted my ability to do this, to contend against rooted and inherited prejudice, but I resolved to try. I did not need to be told that the rich and powerful had a monopoly of intellect: Nature was not partial to them, for the children of the poor, I well knew, were often handsomer and more intellectual than the offspring of wealth and aristocratic birth.

I have before spoken of the positions occupied by those who performed what I had been bred to regard as menial work. At first, the mere fact of the person who presided over the kitchen being presented to me as an equal, was outraging to all my hereditary dignity and pride of birth. No one could be more pronounced in a consciousness of inherited nobility than I. I had been taught from infancy to regard myself as a superior being, merely because the accident of birth had made me so, and the arrogance with which I had treated some of my less favored schoolmates reverted to me with mortifying regret, when, having asked Wauna to point out to me the nobly born, she looked at me with her sweet expression of candor and innocence and said:

"We have no nobility of birth. As I once before told you, intellect is our only standard of excellence. It alone occupies an exalted place and receives the homage of our people."

In a subsequent conversation with her mother, the Preceptress, she said:

"In remote ages, great honor and deference was paid to all who were born of rulers, and the designation 'noble blood,' was applied to them. At one time in the history of our country they could commit any outrage upon society or morals without fear of punishment, simply because they belonged to the aristocracy. Even a heinous murder would be unnoticed if perpetrated by one of them. Nature alone did not favor them Imbecile and immoral minds fell to the lot of the aristocrat as often as to the lowly born. Nature's laws are inflexible and swerve not for any human wish. They outraged them by the admixture of kindred blood, and degeneracy was often the result. A people should always have for their chief ruler the highest and noblest intellect among them, but in those dark ages they were too often compelled to submit to the lowest, simply because it had been born to the position. But," she added, with a sweet smile, "that time lies many centuries behind us, and I sometimes think we had better forget it entirely."

My first meeting with the domestics of my friend's house impressed me with their high mental culture, refinement and elegance. Certainly no "grande dame" of my own country but would have been proud of their beauty and graceful dignity.

Prejudice, however deeply ingrained, could not resist the custom of a whole country, and especially such a one as Mizora, so I soon found myself on a familiar footing with my friend's "artist"--for the name by which they were designated as a class had very nearly the same meaning.

Cooking was an art, and one which the people of Mizora had cultivated to the highest excellence. It is not strange, when their enlightenment is understood, that they should attach as much honor to it as the people of my country do to sculpture, painting and literature. The Preceptress told me that such would be the case with my people when education became universal and the poor could start in life with the same intellectual culture as the rich. The chemistry of food and its importance in preserving a youthful vigor and preventing disease, would then be understood and appreciated by all classes, and would receive the deference it deserved.

"You will never realize," said the Preceptress earnestly, "the incalculable benefit that will accrue to your people from educating your poor. Urge that Government to try it for just twenty years, long enough for a generation to be born and mature. The bright and eager intellects of poverty will turn to Chemistry to solve the problems of cheap Light, cheap Fuel and cheap Food. When you can clothe yourselves from the fibre of the trees, and warm and light your dwellings from the water of your rivers, and eat of the stones of the earth, Poverty and Disease will be as unknown to your people as it is to mine."

"If I should preach that to them, they would call me a maniac."
"None but the ignorant will do so. From your description of the great thinkers of your country, I am inclined to believe there are minds among you advanced enough to believe in it."

I remembered how steamboats and railroads and telegraphy had been opposed and ridiculed until proven practicable, and I took courage and resolved to follow the advice of my wise counselor.

I had long felt a curiosity to behold the inner workings of a domestic's life, and one day ventured to ask my friend's permission to enter her kitchen. Surprise was manifested at such a request, when I began to apologize and explain. But my hostess smiled and said:

"My kitchen is at all times as free to my guests as my drawing room."

Every kitchen in Mizora is on the same plan and conducted the same way. To describe one, therefore, is to describe all. I undertook to explain that in my country, good breeding forbade a guest entering the host's kitchen, and frequently its appearance, and that of the cook's, would not conduce to gastric enjoyment of the edibles prepared in it.

My first visit happened to be on scrubbing day, and I was greatly amused to see a little machine, with brushes and sponges attached, going over the floor at a swift rate, scouring and sponging dry as it went. Two vessels, one containing soap suds and the other clear water, were connected by small feed pipes with the brushes. As soon as the drying sponge became saturated, it was lifted by an ingenious yet simple contrivance into a vessel and pressed dry, and was again dropped to the floor.

I inquired how it was turned to reverse its progress so as to clean the whole floor, and was told to watch when it struck the wall. I did so, and saw that the jar not only reversed the machine, but caused it to spring to the right about two feet, which was its width, and again begin work on a new line, to be again reversed in the same manner when it struck the opposite wall. Carpeted floors were swept by a similar contrivance.

No wonder the "artists" of the kitchen had such a dainty appearance. They dipped their pretty hands in perfumed water and dried them on the finest and whitest damask, while machinery did the coarse work.

Mizora, I discovered, was a land of brain workers. In every vocation of life machinery was called upon to perform the arduous physical labor. The whole domestic department was a marvel of ingenious mechanical contrivances. Dishwashing, scouring and cleaning of every description were done by machinery.

The Preceptress told me that it was the result of enlightenment, and it would become the custom in my country to make machinery perform the laborious work when they learned the value of universal and advanced knowledge.

I observed that the most exact care was given to the preparation of food. Every cook was required to be a chemist of the highest excellence; another thing that struck me as radically different from the custom in vogue in my country.

Everything was cooked by hot air and under cover, so that no odor was perceptible in the room. Ventilating pipes conveyed the steam from cooking food out of doors. Vegetables and fruits appeared to acquire a richer flavor when thus cooked. The seasoning was done by exact weight and measure, and there was no stirring or tasting. A glass tube, on the principle of a thermometer, determined when each article was done. The perfection which they had attained as culinary chemists was a source of much gratification to me, both in the taste of food so delicious and palatable, and in its wholesome effect on my constitution. As to its deliciousness, a meal prepared by a Mizora cook could rival the fabled feasts of the gods. Its beneficial effects upon me were manifested in a healthier tone of body and an increase of animal spirits, a pleasurable feeling of content and amiability.

The Preceptress told me that the first step toward the eradication of disease was in the scientific preparation of food, and the establishment of schools where cooking was taught as an art to all who applied, and without charge. Placed upon a scientific basis it became respectable.

"To eliminate from our food the deleterious earthy matter is our constant aim. To that alone do we owe immunity from old age far in advance of that period of life when your people become decrepit and senile. The human body is like a lamp-wick, which filters the oil while it furnishes light. In time the wick becomes clogged and useless and is thrown away. If the oil could be made perfectly pure, the wick would not fill up."

She gave this homely explanation with a smile and the air of a grown person trying to convey to the immature mind of a child an explanation of some of Nature's phenomena.

I reflected upon their social condition and arrived at the conviction that there is no occupation in life but what has its usefulness and necessity, and, when united to culture and refinement, its dignity. A tree has a million leaves, yet each individual leaf, insignificant as it may appear, has its special share of work to perform in helping the tree to live and perfect its fruit. So should every citizen of a government contribute to its vitality and receive a share of its benefits.

"Will the time ever come," I asked myself, "when my own country will see this and rise to a social, if not intellectual equality." And the admonition of the Preceptress would recur to my mind:

"Educate them. Educate them, and enlightenment will solve for them every problem in Sociology."
My observations in Mizora led me to believe that while Nature will permit and encourage the outgrowth of equality in refinement, she gives birth to a more decided prominence in the leadership of intellect.

The lady who conducted me through the culinary department, and pointed out the machinery and explained its use and convenience, had the same grace and dignity of manner as the hostess displayed when exhibiting to me the rare plants in her conservatory.

The laundry was a separate business. No one unconnected with it as a profession had anything to do with its duties. I visited several of the large city laundries and was informed that all were conducted alike. Steam was employed in the cleaning process, and the drying was done by hot air impregnated with ozone. This removed from white fabrics every vestige of discoloration or stain. I saw twelve dozen fine damask table-cloths cleaned, dried and ironed in thirty minutes. All done by machinery. They emerged from the rollers that ironed them looking like new pieces of goods, so pure was their color, and so glossy their finish.

I inquired the price for doing them up, and was told a cent a piece. Twelve cents per dozen was the established price for doing up clothes. Table-cloths and similar articles were ironed between rollers constructed to admit their full width. Other articles of more complicated make, were ironed by machines constructed to suit them. Some articles were dressed by another, by having hot air forced rapidly through them. Lace curtains, shawls, veils, spreads, tidies and all similar articles, were by this process made to look like new, and at a cost that I thought ought certainly to reduce the establishment to beggary or insolvency. But here chemistry again was the magician that had made such cheap labor profitable. And such advanced knowledge of chemistry was the result of universal education.

Ladies sent their finest laces to be renewed without fear of having them reduced to shreds. In doing up the frailest laces, nothing but hot air impregnated with ozone was employed. These were consecutively forced through the fabric after it was carefully stretched. Nothing was ever lost or torn, so methodical was the management of the work.

I asked why cooking was not established as the laundry was, as a distinct public business, and was told that it had been tried a number of times, but had always been found impracticable. One kind of work in a laundry would suit everyone, but one course of cooking could not. Tastes and appetites differed greatly. What was palatable to one would be disliked by another, and to prepare food for a large number of customers, without knowing or being able to know exactly what the demand would be, had always resulted in large waste, and as the people of Mizora were the most rigid and exacting economists, it was not to be wondered at that they had selected the most economical plan. Every private cook could determine accurately the amount of food required for the household she prepared it for, and knowing their tastes she could cater to all without waste.

"We, as yet," said my distinguished instructor, "derive all our fruit and vegetables from the soil. We have orchards and vineyards and gardens which we carefully tend, and which our knowledge of chemistry enables us to keep in health and productiveness. But there is always more or less earthy matter in all food derived from cultivating the soil, and the laboratories are now striving to produce artificial fruit and vegetables that will satisfy the palate and be free from deleterious matter."

CHAPTER VII.

One of the most curious and pleasing sights in Mizora was the flower gardens and conservatories. Roses of all sizes and colors and shades of color were there. Some two feet across were placed by the side of others not exceeding the fourth of an inch in order to display the disparity in size.

To enter into a minute description of all the discoveries made by the Mizora people in fruit and floriculture, would be too tedious; suffice to say they had laid their hands upon the beautiful and compelled nature to reveal to them the secret of its formation. The number of petals, their color, shape and size, were produced as desired. The only thing they could neither create nor destroy was its perfume. I questioned the Preceptress as to the possibility of its ever being discovered? She replied:

"It is the one secret of the rose that Nature refuses to reveal. I do not believe we shall ever possess the power to increase or diminish the odor of a flower. I believe that Nature will always reserve to herself the secret of its creation. The success that we enjoy in the wonderful cultivation of our fruits and flowers was one of our earliest scientific conquests."

I learned that their orchards never failed to yield a bounteous harvest. They had many fruits that were new to me, and some that were new and greatly improved species of kinds that I had already seen and eaten in my own or other countries. Nothing that they cultivated was ever without its own peculiar beauty as well as usefulness. Their orchards, when the fruit was ripe, presented a picture of unique charm. Their trees were always trained into graceful shapes, and when the ripe fruit gleamed through the dark green foliage, every tree looked like a huge bouquet. A cherry tree that I much admired, and the fruit of which I found surpassingly delicious, I must allow myself to describe. The cherries were not surprisingly large, but were of the colors and transparency of honey. They were seedless, the tree having to be propagated from slips. When the fruit was ripe the tree looked like a huge ball of pale
Their grape arbors were delightful pictures in their season of maturity. Some vines had clusters of fruit three feet long; but these I was told were only to show what they could do in grape culture. The usual and marketable size of a bunch was from one to two pounds weight. The fruit was always perfect that was offered for sale.

Science had provided the fruit growers of Mizora with permanent protections from all kinds of blight or decay. When I considered the wholesomeness of all kinds of food prepared for the inhabitants of this favored land. I began to think they might owe a goodly portion of their exceptional health to it, and a large share of their national amiability to their physical comfort. I made some such observation to the Preceptress, and she admitted its correctness.

"The first step that my people made toward the eradication of disease was in the preparation of healthy food; not for the rich, who could obtain it themselves, but for the whole nation."

I asked for further information and she added:

"Science discovered that mysterious and complicated diseases often had their origin in adulterated food. People suffered and died, ignorant of what produced their disease. The law, in the first place, rigidly enforced the marketing of clean and perfect fruit, and a wholesome quality of all other provisions. This was at first difficult to do, as in those ancient days, (I refer to a very remote period of our history) in order to make usurious profit, dealers adulterated all kinds of food; often with poisonous substances. When every state took charge of its markets and provided free schools for cooking, progress took a rapid advance. Do you wonder at it? Reflect then. How could I force my mind into complete absorption of some new combination of chemicals, while the gastric juice in my stomach was battling with sour or adulterated food? Nature would compel me to pay some attention to the discomfort of my digestive organs, and it might happen at a time when I was on the verge of a revelation in science, which might be lost. You may think it an insignificant matter to speak of in connection with the grand enlightenment that we possess; but Nature herself is a mass of little things. Our bodies, strong and supple as they are, are nothing but a union of tiny cells. It is by the investigation of little things that we have reached the great ones."

I felt a keen desire to know more about their progress toward universal health, feeling assured that the history of the extirpation of disease must be curious and instructive. I had been previously made acquainted with the fact that disease was really unknown to them, save in its historical existence. To cull this isolated history from their vast libraries of past events, would require a great deal of patient and laborious research, and the necessary reading of a great deal of matter that I could not be interested in, and that could not beside be of any real value to me, so I requested the Preceptress to give me an epitomized history of it in her own language, merely relating such facts as might be useful to me, and that I could comprehend, for I may as well bring forward the fact that, in comparison to their libraries of past events, would require a great deal of patient and laborious research, and the necessary reading of a great deal of matter that I could not be interested in, and that could not beside be of any real value to me, so I requested the Preceptress to give me an epitomized history of it in her own language, merely relating such facts as might be useful to me, and that I could comprehend, for I may as well bring forward the fact that, in comparison to theirs, my mind was as a savages would be to our civilization.

Their brain was of a finer intellectual fiber. It possessed a wider, grander, more majestic receptivity. They absorbed ideas that passed over me like a cloud. Their imaginations were etherealized. They reached into what appeared to be materialless space, and brought from it substances I had never heard of before, and by processes I could not comprehend. They divided matter into new elements and utilized them. They disintegrated matter, added to it new properties and produced a different material. I saw the effects and uses of their chemistry, but that was all.

There are minds belonging to my own age, as there have been to all ages, that are intellectually in advance of it. They live in a mental and prophetic world of their own, and leave behind them discoveries, inventions and teachings that benefit and ennoble the generations to come. Could such a mind have chanced upon Mizora, as I chanced upon it, it might have consorted with its intellect, and brought from the companionship ideas that I could not receive, and sciences that I can find no words in my language to represent. The impression that my own country might make upon a savage, may describe my relation to Mizora. What could an uncivilized mind say of our railroads, or magnificent cathedrals, our palaces, our splendor, our wealth, our works of art. They would be as difficult of representation as were the lofty aims, the unselfishness in living, the perfect love, honor and intellectual grandeur, and the universal comfort and luxury found in Mizora, were to me. To them the cultivation of the mind was an imperative duty, that neither age nor condition retarded. To do good, to be approved by their own conscience, was their constant pleasure.

CHAPTER VIII.

It was during my visit at my friend’s house that I first witnessed the peculiar manner in which the markets in Mizora are conducted. Everything, as usual, was fastidiously neat and clean. The fruit and vegetables were fresh and perfect. I examined quantities of them to satisfy myself, and not a blemish or imperfection could be found on any. None but buyers were attending market. Baskets of fruit, bunches of vegetables and, in fact, everything exhibited for sale, had the quality and the price labeled upon it. Small wicker baskets were near to receive the change. When a buyer had selected what suited her, she dropped the label and the change in the basket. I saw one basket filled with gold and silver coin, yet not one would be missing when the owner came to count up the sales. Sometimes a
purchaser was obliged to change a large piece of money, but it was always done accurately.

There was one singular trait these people possessed that, in conjunction with their other characteristics, may seem unnatural: they would give and exact the last centime (a quarter of a cent) in a trade. I noticed this peculiarity so frequently that I inquired the reason for it, and when I had studied it over I decided that, like all the other rules that these admirable people had established, it was wise. Said my friend:

"We set a just value on everything we prepare for sale. Anything above or below that, would be unjust to buyer or seller."

The varieties of apples, pears, peaches and other fruits had their names attached, with the quality, sweet, sour, or slightly acid. In no instance was it found to be incorrectly stated. I came to one stall that contained nothing but glass jars of butter and cream. The butter was a rich buff color, like very fine qualities I had seen in my own country. The cream, an article I am fond of drinking, looked so tempting I longed to purchase a glass for that purpose. The lady whom I accompanied (my hostess' cook) informed me that it was artificially prepared. The butter and cheese were chemical productions. Different laboratories produced articles of varying flavor, according to the chemist's skill. Although their construction was no secret, yet some laboratories enjoyed special reputation for their butter and cheese owing to the accuracy with which their elements were combined.

She gave me quite a history about artificial food, also how they kept fruits and vegetables in their natural state for years without decaying or losing their flavor, so that when eaten they were nearly as fine as when freshly gathered. After hearing that the cream was manufactured, I resolved to taste it. Dropping my coin into the basket, I took up a glass and drank it. A look of disgust crossed the countenance of my companion.

"Do you not drink this?" I asked in surprise, as I set down the empty vessel. "It is truly delicious."

"At regular meal times we all use it, and sometimes drink it in preference to other beverages--but never in public. You will never see a citizen of Mizora eating in public. Look all over this market and you will not discover one person, either adult or child, eating or drinking, unless it be water."

I could not; and I felt keenly mortified at my mistake. Yet in my own country and others that, according to our standard, are highly civilized, a beverage is made from the juice of the corn that is not only drank in public places, but its effects, which are always unbecoming, are exhibited also, and frequently without reproof. However, I said nothing to my companion about this beverage. It bears no comparison in color or taste to that made in Mizora. I could not have distinguished the latter from the finest dairy cream.

The next place of interest that I visited were their mercantile bazars or stores. Here I found things looking quite familiar. The goods were piled upon shelves behind counters, and numerous clerks were in attendance. It was the regular day for shopping among the Mizora ladies, and the merchants had made a display of their prettiest and richest goods. I noticed the ladies were as elegantly dressed as if for a reception, and learned that it was the custom. They would meet a great many friends and acquaintances, and dressed to honor the occasion.

It was my first shopping experience in Mizora, and I quite mortified myself by removing my glove and rubbing and examining closely the goods I thought of purchasing. I entirely ignored the sweet voice of the clerk that was gently informing me that it was "pure linen" or "pure wool," so habituated had I become in my own country to being my own judge of the quality of the goods I was purchasing, regardless always of the seller's recommendation of it. I found it difficult, especially in such circumstances, to always remember their strict adherence to honesty and fair dealing. I felt rebuked when I looked around and saw the actions of the other ladies in buying.

In manufactured goods, as in all other things, not the slightest cheaterly is to be found. Woolen and cotton mixtures were never sold for pure wool. Nobody seemed to have heard of the art of glossing muslin cuffs and collars and selling them for pure linen.

Fearing that I had wounded the feelings of the lady in attendance upon me, I hastened to apologize by explaining the peculiar methods of trade that were practiced in my own country. They were immediately pronounced barbarous.

I noticed that ladies in shopping examined colors and effects of trimmings or combinations, but never examined the quality. Whatever the attendant said about that was received as a fact.

The reason for the absence of attendants in the markets and the presence of them in mercantile houses was apparent at once. The market articles were brought fresh every day, while goods were stored.

Their business houses and their manner of shopping were unlike anything I had ever met with before. The houses were all built in a hollow square, enclosing a garden with a fountain in the center. These were invariably roofed over with glass, as was the entire building. In winter the garden was as warm as the interior of the store. It was adorned with flowers and shrubs. I often saw ladies and children promenading in these pretty inclosures, or sitting on their rustic sofas conversing, while their friends were shopping in the store. The arrangement gave perfect light and comfort to both clerks and customers, and the display of rich and handsome fabrics was enhanced by the bit of scenery beyond. In summer the water for the fountain was artificially cooled.
Every clerk was provided with a chair suspended by pulleys from strong iron rods fastened above. They could be raised or lowered at will; and when not occupied, could be drawn up out of the way. After the goods were purchased, they were placed in a machine that wrapped and tied them ready for delivery.

A dining-room was always a part of every store. I desired to be shown this, and found it as tasteful and elegant in its appointments as a private one would be. Silver and china and fine damask made it inviting to the eye, and I had no doubt the cooking corresponded as well with the taste.

The streets of Mizora were all paved, even the roads through the villages were furnished an artificial cover, durable, smooth and elastic. For this purpose a variety of materials were used. Some had artificial stone, in the manufacture of which Mizora could surpass nature's production. Artificial wood they also made and used for pavements, as well as cement made of fine sand. The latter was the least durable, but possessed considerable elasticity and made a very fine driving park. They were experimenting when I came away on sanded glass for road beds. The difficulty was to overcome its susceptibility to attrition. After business hours every street was swept by a machine. The streets and sidewalks, in dry weather, were as free from soil as the floor of a private-house would be.

Animals and domestic fowls had long been extinct in Mizora. This was one cause of the weird silence that so impressed me on my first view of their capital city. Invention had superseded the usefulness of animals in all departments: in the field and the chemistry of food. Artificial power was utilized for all vehicles.

The vehicle most popular with the Mizora ladies for shopping and culling purposes, was a very low carriage, sometimes with two seats, sometimes with one. They were upholstered with the richest fabrics, were exceedingly light and graceful in shape, and not above three feet from the ground. They were strong and durable, though frequently not exceeding fifty pounds in weight. The wheel was the curious and ingenious part of the structure, for in its peculiar construction lay the delight of its motion. The spokes were flat bands of steel, curved outward to the tire. The carriage had no spring other than these spokes, yet it moved like a boat gliding down stream with the current. I was fortunate enough to preserve a drawing of this wheel, which I hope some day to introduce in my own land. The carriages were propelled by compressed air or electricity; and sometimes with a mechanism that was simply pressed with the foot. I liked the compressed air best. It was most easily managed by me. The Mizora ladies preferred electricity, of which I was always afraid. They were experimenting with a new propelling power during my stay that was to be acted upon by light, but it had not come into general use, although I saw some vehicles that were propelled by it. They moved with incredible speed, so rapid indeed, that the upper part of the carriage had to be constructed of glass, and securely closed while in motion, to protect the occupant. It was destined, I heard some of their scientists say, to become universal, as it was the most economical power yet discovered. They patiently tried to explain it to me, but my faculties were not receptive to such advanced philosophy, and I had to abandon the hope of ever introducing it into my own country.

There was another article manufactured in Mizora that excited my wonder and admiration. It was elastic glass. I have frequently mentioned the unique uses that they made of it, and I must now explain why. They had discovered a process to render it as pliable as rubber. It was more useful than rubber could be, for it was almost indestructible. It had surpassed iron in many ways. All cooking utensils were made of it. It entered largely into the construction and decoration of houses. All cisterns and cellars had an inner lining of it. All underground pipes were made of it, and many things that are the necessities and luxuries of life.

They spun it into threads as fine and delicate as a spider's gossamer, and wove it into a network of clear or variegated colors that dazzled the eye to behold. Innumerable were the lovely fabrics made of it. The frailest lace, in the most intricate and aerial patterns, that had the advantage of never soiling, never tearing, and never wearing out. Curtains for drawing-room arches were frequently made of it. Some of them looked like woven dew drops.

One set of curtains that I greatly admired, and was a long time ignorant of what they were made of, were so unique, I must do myself the pleasure to describe them. They hung across the arch that led to the glass conservatory attached to my friend's handsome dwelling. Three very thin sheets of glass were woven separately and then joined at the edges so ingeniously as to defy detection. The inside curtain was one solid color: crimson. Over this was a

The wonderful water scene that I beheld at the theatre was produced by waves made of glass and edged with foam, a milky glass spun into tiny bubbles. They were agitated by machinery that caused them to roll with a terribly
natural look. The blinding flashes of lightning had been the display of genuine electricity.

Nothing in the way of artistic effect could call forth admiration or favorable comment unless it was so exact an imitation of nature as to not be distinguished from the real without the closest scrutiny. In private life no one assumed a part. All the acting I ever saw in Mizora was done upon the stage.

I could not appreciate their mental pleasures, any more than a savage could delight in a nocturne of Chopin. Yet one was the intellectual ecstasy of a sublime intelligence, and the other the harmonious rapture of a divinely melodious soul. I must here mention that the processes of chemical experiment in Mizora differed materially from those I had known. I had once seen and tasted a preparation called artificial cream that had been prepared by a friend of my fathers, an eminent English chemist. It was simply a combination of the known properties of cream united in the presence of gentle heat. But in Mizora they took certain chemicals and converted them into milk, and cream, and cheese, and butter, and every variety of meat, in a vessel that admitted neither air nor light. They claimed that the elements of air and light exercised a material influence upon the chemical production of foods, that they could not be made successfully by artificial processes when exposed to those two agents. Their earliest efforts had been unsuccessful of exact imitation, and a perfect result had only been obtained by closely counterfeiting the processes of nature.

The cream prepared artificially that I had tasted in London, was the same color and consistency as natural cream, but it lacked its relish. The cream manufactured in Mizora was a perfect imitation of the finest dairy product.

It was the same with meats; they combined the elements, and the article produced possessed no detrimental flavor. It was a more economical way of obtaining meat than by fattening animals.

They were equally fortunate in the manufacture of clothing. Every mountain was a cultivated forest, from which they obtained every variety of fabric; silks, satins, velvets, laces, woolen goods, and the richest articles of beauty and luxury, in which to array themselves, were put upon the market at a trifling cost, compared to what they were manufactured at in my own country. Pallid and haggard women and children, working incessantly for a pittance that barely sustained existence, was the ultimatum that the search after the cause of cheap prices arrived at in my world, but here it traveled from one bevy of beautiful workwoman to another until it ended at the Laboratory where Science sat throned, the grand, majestic, humane Queen of this thrice happy land.

CHAPTER IX.

Whenever I inquired: "From whence comes the heat that is so evenly distributed throughout the dwellings and public buildings of Mizora?" they invariably pointed to the river. I asked in astonishment:

"From water comes fire?"

And they answered: "Yes."

I had long before this time discovered that Mizora was a nation of very wonderful people, individually and collectively; and as every revelation of their genius occurred, I would feel as though I could not be surprised at any marvellous thing that they should claim to do, but I was really not prepared to believe that they could set the river on fire. Yet I found that such was, scientifically, the fact. It was one of their most curious and, at the same time, useful appliances of a philosophical discovery.

They separated water into its two gases, and then, with their ingenious chemical skill, converted it into an economical fuel.

Their coal mines had long been exhausted, as had many other of nature's resources for producing artificial heat. The dense population made it impracticable to cultivate forests for fuel. Its rapid increase demanded of Science the discovery of a fuel that could be consumed without loss to them, both in the matter consumed and in the expense of procuring it. Nothing seemed to answer their purpose so admirably as water. Water, when decomposed, becomes gas. Convert the gas into heat and it becomes water again. A very great heat produces only a small quantity of water: hence the extreme utility of water as a heat producing agent.

The heating factories were all detached buildings, and generally, if at all practicable, situated near a river, or other body of water. Every precaution against accident was stringently observed.

There were several processes for decomposing the water explained to me, but the one preferred, and almost universally used by the people of Mizora, was electricity. The gases formed at the opposite poles of the electrical current, were received in large glass reservoirs, especially constructed for them.

In preparing the heat that gave such a delightful temperature to the dwellings and public buildings of their vast cities, glass was always the material used in the construction of vessels and pipes. Glass pipes conveyed the separate gases of hydrogen and oxygen into an apartment especially prepared for the purpose, and united them upon ignited carbon. The heat produced was intense beyond description, and in the hands of less experienced and capable chemists, would have proved destructive to life and property. The hardest rock would melt in its embrace; yet, in the hands of these wonderful students of Nature, it was under perfect control and had been converted into one of the
most healthful and agreeable agents of comfort and usefulness known. It was regulated with the same ease and convenience with which we increase or diminish the flames of a gas jet. It was conducted, by means of glass pipes, to every dwelling in the city. One factory supplied sufficient heat for over half a million inhabitants.

I thought I was not so far behind Mizora in a knowledge of heating with hot air; yet, when I saw the practical application of their method, I could see no resemblance to that in use in my own world. In winter, every house in Mizora had an atmosphere throughout as balmy as the breath of the young summer. Country-houses and farm dwellings were all supplied with the same kind of heat.

In point of economy it could not be surpassed. A city residence, containing twenty rooms of liberal size and an immense conservatory, was heated entire, at a cost of four hundred centimes a year. One dollar per annum for fuel.

There was neither smoke, nor soot, nor dust. Instead of entering a room through a register, as I had always seen heated air supplied, it came through numerous small apertures in the walls of a room quite close to the floor, thus rendering its supply imperceptible, and making a draft of cold air impossible.

The extreme cheapness of artificial heat made a conservatory a necessary luxury of every dwelling. The same pipes that supplied the dwelling rooms with warmth, supplied the hot-house also, but it was conveyed to the plants by a very different process.

They used electricity in their hot-houses to perfect their fruit, but in what way I could not comprehend; neither could I understand their method of supplying plants and fruits with carbonic acid gas. They manufactured it and turned it into their hot-houses during sleeping hours. No one was permitted to enter until the carbon had been absorbed. They had an instrument resembling a thermometer which gave the exact condition of the atmosphere. They were used in every house, as well as in the conservatories. The people of Mizora were constantly experimenting with those two chemical agents, electricity and carbonic acid gas, in their conservatories. They confidently believed that with their service, they could yet produce fruit from their hot-houses, that would equal in all respects the season grown article.

They produced very fine hot-house fruit. It was more luscious than any artificially ripened fruit that I had ever tasted in my own country, yet it by no means compared with their season grown fruit. Their preserved fruit I thought much more natural in flavor than their hot-house fruit.

Many of their private greenhouses were on a grand scale and contained fruit as well as flowers. A family that could not have a hot-house for fresh vegetables, with a few fruit trees in it, would be poor indeed. Where a number of families had united in purchasing extensive grounds, very fine conservatories were erected, their expense being divided among the property holders, and their luxuries enjoyed in common.

So methodical were all the business plans of the Mizora people, and so strictly just were they in the observance of all business and social duties that no ill-feeling or jealousy could arise from a combination of capital in private luxuries. Such combinations were formed and carried out upon strictly business principles.

If the admirable economy with which every species of work was carried on in Mizora could be thoroughly comprehended, the universality of luxuries need not be wondered at. They were drilled in economy from a very early period. It was taught them as a virtue.

Machinery, with them, had become the slave of invention. I lived long enough in Mizora to comprehend that the absence of pauperism, genteel and otherwise, was largely due to the ingenious application of machinery to all kinds of physical labor. When the cost of producing luxuries decreases, the value of the luxuries produced must decrease with it. The result is they are within reach of the narrowest incomes. A life surrounded by refinement must absorb some of it.

I had a conversation with the Preceptress upon this subject, and she said:

"Some natures are so undecided in character that they become only what their surroundings make them. Others only partially absorb tastes and sentiments that form the influence about them. They maintain a decided individuality; yet they are most always noticeably marked with the general character of their surroundings. It is very, very seldom that a nature is fixed from infancy in one channel."

I told her that I knew of a people whose minds from infancy to mature age, never left the grooves they were born in. They belonged to every nationality, and had palaces built for them, and attendants with cultivated intelligences employed to wait upon them.

"Are their minds of such vast importance to their nation? You have never before alluded to intellect so elevated as to command such royal homage." My friend spoke with awakened interest.

"They are of no importance at all," I answered, humiliated at having alluded to them. "Some of them have not sufficient intelligence to even feed themselves."

"And what are they?" she inquired anxiously.

"They are idiots; human vegetables."

"And you build palaces for them, and hire servants to feed and tend them, while the bright, ambitious children
of the poor among you, struggle and suffer for mental advancement. How deplorably short-sighted are the wise ones of your world. Truly it were better in your country to be born an idiot than a poor genius." She sighed and looked grave.

"What should we do with them?" I inquired.

"What do you do with the useless weeds in your garden," she asked significantly. "Do you carefully tend them, while drouth and frost and lack of nourishment cause your choice plants to wither and die?"

"We are far behind you," I answered humbly. "But barbarous as you think we are, no epithet could be too scathing, too comprehensive of all that was vicious and inhuman, to apply to a person who should dare to assail the expense of those institutions, or suggest that they be converted to the cultivation of intellect that could be improved."

My friend looked thoughtful for a long time, then she resumed her discourse at the point where I had so unfortunately interrupted it.

"No people," she said, "can rise to universal culture as long as they depend upon hand labor to produce any of the necessities of life. The absence of a demand for hand labor gives rise to an increasing demand for brain labor, and the natural and inevitable result is an increased mental activity. The discovery of a fuel that is furnished at so small a cost and with really no labor but what machinery performs, marks one grand era in our mental progress."

In mentioning the numerous uses made of glass in Mizora, I must not forget to give some notice to their water supply in large cities. Owing to their cleanly advantages, the filtering and storing of rain-water in glass-lined cisterns supplied many family uses. But drinking water was brought to their large cities in a form that did not greatly differ from those I was already familiar with, excepting in cleanliness. Their reservoirs were dug in the ground and lined with glass, and a perfectly fitting cover placed on the top. They were constructed so that the water that passed through the glass feed pipes to the city should have a uniform temperature, that of ordinary spring water. The water in the covered reservoirs was always filtered and tested before passing into the distributing pipes.

No citizen of Mizora ever hied to the country for pure water and fresh air. Science supplied both in a densely populated city.

CHAPTER X.

When a question as to the existence of social distinctions would be asked the citizens of Mizora, the invariable answer would be—there were none; yet a long and intimate acquaintance with them assured me that there were. They had an aristocracy; but of so peculiar and amiable a kind that it deserves a special mention. It took a long time for me to comprehend the exact condition of their society in this respect. That there were really no dividing lines between the person who superintended the kitchen and the one who paid her for it, in a social point of view, I could plainly see; yet there were distinctions; and rather sharply defined ones too.

In order to explain more lucidly the peculiar social life of Mizora, I will ask you to remember some Charity Fair you have attended, perhaps participated in, and which had been gotten up and managed by women of the highest social rank. If in a country where titles and social positions were hereditary, it then represented the highest aristocracy of blood. Grand dames there departed from the routine of their daily lives and assumed the lowlier occupations of others. They stood behind counters, in booths, and sold fancy articles, or dispensed ices and lemonade, or waited upon customers at the refreshment tables; bringing in trays of eatables, gathering up and removing empty dishes; performing labor that, under the ordinary circumstances of life, they would not perform in their own homes, and for their own kindred. It was all done with the same conscious dignity and ease that characterized the statelier duties of their every day life. One fact was apparent to all: they were gentlewomen still. The refinement of their home education, and the charm of nourished beauty were, perhaps, more prominent in contrast with their assumed avocation.

The Charity Fair, with its clerks and waiter girls and flower sellers called from the highest society, was a miniature picture of the actual every-day social life of Mizora. The one who ordered a dinner at their finest hotel, had it served to her by one who occupied the same social standing. Yet there was a difference; but it was the difference of mind.

The student in Sociology discovers that in all grades of society, congenial natures gravitate to a center. A differentiation of the highest mental quality was the result of this law in Mizora, and its co-ordinate part, their aristocracy.

The social organism did not need legislation to increase its benefits; it turned to Science, and, through Science, to Nature. The Laboratory of the Chemist was the focus that drew the attention of all minds. Mizora might be called a great school of Nature, whose pupils studied her every phase, and pried into her secrets with persistent activity, and obeyed her instructions as an imperative duty. They observed Nature to be an economist, and practiced economy with scrupulous exactness.

They had observed that in all grades of animal life, from the lowest form to the highest, wherever sociality had produced unity a leader was evolved, a superiority that differed in power according to the grade of development. In
the earlier histories, the leaders were chosen for their prowess in arms. Great warriors became rulers, and soldiers were the aristocracy of the land. As civilization progressed and learning became more widely disseminated, the military retired before the more intellectual aristocracy of statemanship. Politics was the grand entrance to social eminence.

"But," said my friend, "we have arrived at a higher, nobler, grander age. The military and political supremacies lived out their usefulness and decayed. A new era arrived. The differentia of mind evolved an aristocracy."

Science has long been recognized as the greatest benefactor of our race. Its investigators and teachers are our only acknowledged superiors and leaders.

Generally the grandest intellects and those which retain their creative power the longest, are of exceptionally slow development. Preccocity is short lived, and brilliant rather than strong. This I knew to be true of my own race.

In Mizora, a mind that developed late lost none of the opportunities that belong exclusively to the young of my own and other countries of the outer world. Their free schools and colleges were always open: always free. For this reason, it was no unusual thing for a person in Mizora to begin life at the very lowest grade and rise to its supreme height. Whenever the desire awakened, there was a helping hand extended on every side.

The distinction between the aristocracy and the lower class, or the great intellects and the less, was similar to the relative positions of teacher and pupil. I recognized in this social condition the great media of their marvelous approach to perfection. This aristocracy was never arrogant, never supercilious, never aggressive. It was what the philosophers of our world are: tolerant, humane, sublime.

In all communities of civilized nations marked musical talent will form social relations distinct from, but not superior to, other social relations. The leader of a musical club might also be the leader of another club devoted to exclusive literary pursuits; and both clubs possess equal social respect. Those who possess musical predilections, seek musical associations; those who are purely literary, seek their congenials. This is true of all other mental endowments or tastes; that which predominates will seek its affinity; be it in science, literature, politics, music, painting, or sculpture. Social organizations naturally grow out of other business pursuits and vocations of all grades and kinds. The society of Mizora was divided only by such distinctions. The scientific mind had precedence of all others. In the social world, they found more congenial pleasure in one another, and they mingled more frequently among themselves. Other professions and vocations followed their example for the same reason. Yet neither was barred by social caste from seeking society where she would. If the artisan sought social intercourse with a philosopher, she was expected to have prepared herself by mental training to be congenial. When a citizen of Mizora became ambitious to rise, she did not have to struggle with every species of opposition, and contend against rebuff and repulse. Correct language, refined tastes, dignified and graceful manners were the common acquirements of all. Mental culture of so high an order--I marveled that a lifetime should be long enough to acquire it in--was universal.

Under such conditions social barriers could not be impregnable. In a world divided by poverty and opulence into all their intermediate grades, wealth must inevitably be pre-eminent. It represents refined and luxurious environments, and, if mind be there, intellectual pre-eminence also. Where wealth alone governs society it has its prerogatives.

The wealth that affords the most luxurious entertainments must be the wealth that rules. Its privilege--its duty rather--is to ignore all applicants to fraternization that cannot return what it receives. Where mind is the sole aristocracy it makes demands as rigid, though different, and mind was the aristocracy of Mizora. With them education is never at an end. I spoke of having graduated at a renowned school for young ladies, and when I explained that to graduate meant to finish one's education, it elicited a peal of silvery mirth.

"We never graduate," said Wauna. "There is my mamma's mother, two centuries old, and still studying. I paid her a visit the other day and she took me into her laboratory. She is a manufacturer of lenses, and has been experimenting on microscopes. She has one now that possesses a truly wonderful power. The leaf of a pear tree, that she had allowed to become mouldy, was under the lens, and she told me to look.

"A panorama of life and activity spread out before me in such magnitude that I can only compare it to the feeling one must possess who could be suspended in air and look down upon our world for a cycle of time.

"Immense plains were visible with animals grazing upon them, that fought with and devoured one another. They perished and sank away and immense forests sprang up like magic. They were inhabited by insects and tiny creatures resembling birds. A sigh of air moved the leaf and a tiny drop of water, scarcely discernible to the naked eye rolled over the forests and plains, and before it passed to the other side of the leaf a great lake covered the spot. My great-great-grandmother has an acute conductor of sound that she has invented, so exquisite in mechanism as to reveal the voice of the tiniest insect. She put it to my ear, and the bellowing of the animals in battle, the chirp of the insects and the voices of the feathered mites could be clearly heard, but attenuated like the delicate note of two threads of spun glass clashed together."

"And what good," I asked, "can all this knowledge do you? Your great-great-grandmother has condensed the
learning of two centuries to evolve this one discovery. Is it not so?"

"Yes," replied Wauna, and her look and tone were both solemn. "You ask me what good it can do? Reflect! If the history of a single leaf is so vast and yet ephemeral, what may not be the history of a single world? What, after all, are we when such an infinitesimal space can contain such wonderful transactions in a second of time."

I shuddered at the thought she raised in my mind. But inherited beliefs are not easily dissipated, so I only sought to change the subject.

"But what is the use of studying all the time. There should be some period in your lives when you should be permitted to rest from your labors. It is truly irksome to me to see everybody still eager to learn more. The artist of the kitchen was up to the National College yesterday attending a lecture on chemistry. The artist who arranges my rooms is up there to-day listening to one on air. I can not understand why, having learned to make beds and cook to perfection, they should not be content with their knowledge and their work."

"If you were one of us you would know," said Wauna. "It is a duty with us to constantly seek improvement. The culinary artist at the house where you are visiting, is a very fine chemist. She has a predilection for analyzing the construction of food. She may some day discover how to produce vegetables from the elements.

"The artist who arranges your room is attending a lecture on air because her vocation calls for an accurate knowledge of it. She attends to the atmosphere in the whole house, and sees that it is in perfect health sustaining condition. Your hostess has a particular fondness for flowers and decorates all her rooms with them. All plants are not harmless occupants of livingrooms. Some give forth exhalations that are really noxious. That artist has so accurate a knowledge of air that she can keep the atmosphere of your home in a condition of perfect purity; yet she knows that her education is not finished. She is constantly studying and advancing. The time may come when she, too, will add a grand discovery to science."

"Had my ancestors thought as you do, and rested on an inferior education, I should not represent the advanced stage of development that I do. As it is, when my mind reaches the age of my mother's, it will have a larger comprehensiveness than hers. She already discerns it. My children will have intellects of a finer grade than mine. This is our system of mind culture. The intellect is of slower development than the body, and takes longer to decay. The gradations of advancement from one intellectual basis to another, in a social body, requires centuries to mark a distinct change in the earlier ages of civilization, but we have now arrived at a stage when advancement is clearly perceptible between one generation and the next."

Wauna's mother added:

"Universal education is the great destroyer of castes. It is the conqueror of poverty and the foundation of patriotism. It purifies and strengthens national, as well as individual character. In the earlier history of our race, there were social conditions that rendered many lives wretched, and that the law would not and, in the then state of civilization, could not reach. They were termed "domestic miseries," and disappeared only under the influence of our higher intellectual development. The nation that is wise will educate its children."

"Alas! alas!" was my own silent thought. "When will my country rise to so grand an idea. When will wealth open the doors of colleges, academies, and schools, and make the Fountain of Knowledge as free as the God-given water we drink."

And there rose a vision in my mind--one of those day dreams when fancy upon the wing takes some definite course--and I saw in my own land a Temple of Learning rise, grand in proportion, complete in detail, with a broad gateway, over whose wide-open majestic portal was the significant inscription: "ENTER WHO WILL: NO WARDER STANDS WATCH AT THE GATE."

CHAPTER XI.

The Government of Mizora not being of primary importance in the estimation of the people, I have not made more than a mere mention of it heretofore. In this respect I have conformed to the generally expressed taste of the Mizora people. In my own country the government and the aristocracy were identical. The government offices and emoluments were the highest pinnacles of ambition.

I mentioned the disparity of opinion between Mizora and all other countries I had known in regard to this. I could not understand why politics in Mizora should be of so small importance. The answer was, that among an educated and highly enlightened people, the government will take care of itself. Having been perfected by wise experience, the people allow it to glide along in the grooves that time has made for it.

In form, the government of Mizora was a Federal Republic. The term of office in no department exceeded the limit of five years. The Presidential term of office was for five years.

They had one peculiar--exceedingly peculiar--law in regard to politics. No candidate could come before the public seeking office before having a certificate from the State College to which she belonged, stating her examination and qualifications to fill such an office.

Just like examining for school-teachers, I thought. And why not? Making laws for a State is of far more
importance than making them for a few dozen scholars. I remembered to have heard some of my American acquaintances say that in their country it was not always qualifications that get a candidate into office. Some of the ways were devious and not suitable for publicity. Offices were frequently filled by incompetent men. There had been congressmen and other offices of higher and more responsible duties, filled by persons who could not correctly frame a sentence in their native language, who could not spell the simplest words as they were spelled in the dictionary, unless it were an accident.

To seek the office of President, or any other position under the General Government, required an examination and certificate from the National College. The examinations were always public, and conducted in such a manner that imposture was impossible. Constituents could attend if they chose, and decide upon the qualifications of a favorite candidate. In all the public schools, politics—to a certain extent—formed part of the general education of every child. Beyond that, any one having a predilection for politics could find in the State Colleges and National Colleges the most liberal advantages for acquiring a knowledge of political economy, political arithmetic, and the science of government.

Political campaigns, (if such a term could be applicable to the politics of Mizora) were of the mildest possible character. The papers published the names of the candidates and their examinations in full. The people read and decided upon their choice, and, when the time came, voted. And that was the extent of the campaign enthusiasm.

I must mention that the examinations on the science of government were not conducted as are ordinary examinations in any given study that consists of questions and answers. That was the preliminary part. There followed a thorough, practical test of their ability to discharge the duties of office with wisdom. No matter which side the sympathies or affections might be enlisted upon, the stern decree of justice was what the Mizorean abided by. From earliest infancy their minds were trained in that doctrine. In the discharge of all public duties especially, it seemed to be the paramount consideration. Certainly no government machinery ever could move with more ease, or give greater satisfaction to the people, than that of Mizora.

They never appeared to be excited or uneasy about the result of the elections. I never heard an animated political argument, such as I used to read about in America. I asked a politician one day what she thought of the probable success of the opposite party. She replied that it would not make any difference to the country as both candidates were perfectly competent to fill the office.

"Do you never make disparaging statements about the opposing candidate?" was my inquiry.
"How could we?" she asked in surprise, "when there are none to make."
"You might assume a few for the time being; just to make her lose votes."
"That would be a crime worthy of barbarians."
"Do you never have any party issues?"
"No. There is never anything to make an issue of. We all work for the good of the people, and the whole people. There is no greed of glory or gain; no personal ambition to gratify. Were I to use any artifice to secure office or popularity, I should be instantly deprived of public esteem and notice. I do my duty conscientiously; that is the aim of public life. I work for the public good and my popularity comes as it is earned and deserved. I have no fear of being slighted or underrated. Every politician feels and acts the same way."

"Have politicians ever bought votes with money, or offered bribes by promising positions that it would be in their official power to grant when elected?"

"Never! There is not a citizen of Mizora who would not scorn an office obtained in such a way. The profession of politics, while not to be compared in importance with the sciences, is yet not devoid of dignity. It is not necessary to make new laws. They were perfected long ago, and what has been proven good we have no desire to change. We manage the government according to a conscientious interpretation of the law. We have repealed laws that were in force when our Republic was young, and dropped them from the statute books. They were laws unworthy of our civilization. We have laws for the protection of property and to regulate public morals, and while our civilization is in a state of advancement that does not require them, yet we think it wisdom to let them remain. The people know that we have such laws and live up to them without surveillance. They would abide by the principles of justice set forth in them just as scrupulously if we should repeal them.

"You spoke of bribes. In remote ages, when our country was emerging from a state of semi-barbarism, such things were in common practice. Political chicanery was a name given to various underhand and dishonest maneuvers to gain office and public power. It was frequently the case that the most responsible positions in the Government would be occupied by the basest characters, who used their power only for fraud to enrich themselves and their friends by robbing the people. They deceived the masses by preaching purity. They were never punished. If they were accused and brought to trial, the wealth they had stolen from the government purchased their acquittal, and then they posed as martyrs. The form of government was then, as now, a Federal Republic, but the people had very little to do with it. They were merely the tools of unscrupulous politicians. In those days a sensitively honest
By this means the occupant of a Government office was freed from every care but those of state. so, at last, the Government assumed all the expenses contingent upon every office, from the highest to the lowest. to it were often but niggardly requited. Sometimes business embarrassments and real necessity demanded economy; those early days, when a penurious character became an incumbent of public office, the social obligations belonging treasury, the salaries might be considered as net profit. This custom had originated many centuries in the past. In all the personal expenses, excepting clothing, were paid by the Government. The salaries of Government positions been able to discover.

Capitol building had its home-like appointments, was a Nation of women exclusively—at least as far as I had as yet goes, she endeavors to surround herself with its comforts and pleasures. That was the reason that the splendid Capitols were similarly accommodated. In Mizora the home is the heart of all joy, and wherever a Mizora woman dining and sleeping accommodations for the stateswoman were all in the Capitol building. I observed that the State compare it to, especially when lighted up by great globes of white fire suspended from every ceiling. crystal glass, with facing and cornices of marble onyx. It looked more like a gigantic gem than anything I could compare it to, especially when lighted up by great globes of white fire suspended from every ceiling.

In Mizora the home is the heart of all joy, and wherever a Mizora woman dining and sleeping accommodations for the stateswoman were all in the Capitol building. I observed that the State compare it to, especially when lighted up by great globes of white fire suspended from every ceiling. crystal glass, with facing and cornices of marble onyx. It looked more like a gigantic gem than anything I could compare it to, especially when lighted up by great globes of white fire suspended from every ceiling.

Taste. Their public buildings might all be called works of art. Their government buildings, especially, were on a scale of magnificent splendor. The hollow square seemed to be a favorite form. One very beautiful capitol building was of magnificent splendor. The hollow square seemed to be a favorite form. One very beautiful capitol building was of crystal glass, with facing and cornices of marble onyx. It looked more like a gigantic gem than anything I could compare it to, especially when lighted up by great globes of white fire suspended from every ceiling.

I visited with Wauna a number of the States’ Capitals. In architecture the Mizora people display an excellent taste. Their public buildings might all be called works of art. Their government buildings, especially, were on a scale of magnificent splendor. The hollow square seemed to be a favorite form. One very beautiful capitol building was of crystal glass, with facing and cornices of marble onyx. It looked more like a gigantic gem than anything I could compare it to, especially when lighted up by great globes of white fire suspended from every ceiling.

Upon my entrance into Mizora, I was led into the belief that I had arrived at a female seminary, because the dining and sleeping accommodations for the stateswoman were all in the Capitol building. I observed that the State Capitol buildings were similarly accommodated. In Mizora the home is the heart of all joy, and wherever a Mizora woman goes, she endeavors to surround herself with its comforts and pleasures. That was the reason that the splendid Capitol building had its home-like appointments, was a Nation of women exclusively—at least as far as I had as yet been able to discover.

Another reason for the homes of all officials of the Government being within the public buildings, was because all the personal expenses, excepting clothing, were paid by the Government. The salaries of Government positions were not large, compared with those of the sciences; but as their social and political dues were paid out of the public treasury, the salaries might be considered as net profit. This custom had originated many centuries in the past. In those early days, when a penurious character became an incumbent of public office, the social obligations belonging to it were often but niggardly required. Sometimes business embarrassments and real necessity demanded economy; so, at last, the Government assumed all the expenses contingent upon every office, from the highest to the lowest. By this means the occupant of a Government office was freed from every care but those of state.

The number and style of all social entertainments that were obligatory of the occupant of a public office, were
regulated by law. As the people of Mizora believed in enjoyment, the entertainments provided by the Government as
the necessary social dues of its officers, were not few, nor scantily furnished.

CHAPTER XII.

The artificial light in Mizora puzzled me longest to understand. When I first noticed it, it appeared to me to
have no apparent source. At the touch of a delicate hand, it blazed forth like a star in the center of the ceiling. It
diffused a soft and pleasing brilliancy that lent a charm to everything it revealed. It was a dreamy daylight, and was
produced by electricity.

In large halls, like a theatre or opera house, the light fell in a soft and penetrating radiance from the center of
the dome. Its source was not visible to either audience or actresses, and, in consequence, occasioned no discomfort
to the eyes. The light that illuminated the stage was similarly arranged. The footlights were not visible. They were in
the rear of the stage. The light came upward like the rays of the setting sun, revealing the setting of the stage with
vivid distinctness. I can best describe the effect of this singular arrangement by calling attention to the appearance of
the sun when declining behind a small elevation. How sharply every object is outlined before it? How soft and
delicate is the light in which everything is bathed? Every cloud that floats has all of its fleecy loveliness limned with
a radiant clearness.

I was very desirous to know how this singular effect was produced, and at my request was taken to the stage.
An opening in the back part of it was covered with pink colored glass. Powerful electric lights from below the stage
were reflected through this glass upon it. The glass was highly refractive and so perfectly translucent, I at first
thought there was none there, and when I stood upon its edge, and looked down into a fiery gulf below, I
instinctively thought of the "Lost People," who are said to wander amid torturing yet unconsumable flames. But,
happily, the ones I gazed upon were harmless ones.

The street lights of Mizora were at a considerable elevation from the ground. They were in, or over, the center
of the street, and of such diffuse brilliancy as to render the city almost as light as day. They were in the form of
immense globes of soft, white fire, and during the six months that answered to the Mizora night, were kept
constantly burning. It was during this period that the Aurora Borealis shone with such marvelous brilliancy.

Generally, its display was heralded by an arc of delicate green-tinted light, that spanned the heavens. The green
tint deepened into emerald, assuming a delicate rose hue as it faded upward into rays that diverged from the top until
the whole resembled a gigantic crown. Every ray became a panorama of gorgeous colors, resembling tiny sparks,
moving hither and thither with inconceivable swiftness. Sometimes a veil of mist of delicate green hue depended
from the base of the crown, and swayed gently back and forth. As soon as the swaying motion commenced, the most
gorgeous colors were revealed. Myriads of sparks, no larger than snow-flakes, swarmed across the delicate green
curtain in every conceivable color and shade, but always of that vapory, vivid softness that is indescribable. The
dancing colors resembled gems encased in a film of mist.

One display that I witnessed I shall attempt to describe. The arc of delicate green appeared first, and shot
upward diverging rays of all the warm, rich hues of red. They formed a vast crown, outlined with a delicate halo of
fire. A veil of misty green fluttered down from its base, and, instantly, tiny crowns, composed of every brilliant
color, with a tracery of fire defining every separate one, began to chase one another back and forth with bewildering
rapidity. As the veil swayed to and fro, it seemed to shake the crowns into skeins of fire, each thread strung with
countless minute globes of every conceivable color and hue. Those fiery threads, aerial as thistle down, wove
themselves in and out in a tangled mass of gorgeous beauty. Suddenly the beads of color fell in a shower of gems,
topaz and emerald, ruby and sapphire, amethyst and pearly crystals of dew. I looked upward, where the rays of
variegated colors were sweeping the zenith, and high above the first crown was a second more vivid still. Myriads of
rainbows, the colors broad and intense, fluttered from its base, the whole outlined by a halo of fire. It rolled together
in a huge scroll, and, in an instant, fell apart a shower of flakes, minute as snow, but of all the gorgeous, dazzling
hues of earth and sky combined. They disappeared in the mystery of space to instantly form into a fluttering, waving
banner of delicate green mist and--vanish! only to repeat itself.

The display of the Aurora Borealis was always an exhibition of astonishing rapidity of motion of intense colors.
The most glorious sunset--where the vapory billows of the sky have caught the bloom of the dying Autumn--cannot
rival it. All the precious gems of earth appear to have dissolved into mist, to join in a wild and aerial dance. The
people of Mizora attributed it entirely to electricity.

Although the sun never rose or set in Mizora, yet for six months in a year, that country had the heart of a
voluptuous summer. It beat with a strong, warm pulse of life through all nature. The orchards budded and bloomed,
and mellowed into perfect fruition their luscious globes. The fields laughed in the warm, rich light, and smiled on
the harvest. I could feel my own blood bound as with a new lease of life at the first breath of spring.

The winters of Mizora had clouds and rain and sleet and snow, and sometimes, especially near the circular sea,
the fury of an Arctic snow storm; but so well prepared were they that it became an amusement. Looking into the
chaos of snow flakes, driven hither and thither by fierce winds, the pedestrians in the street presented no painful contrast to the luxury of your own room, with its balmy breath and cheerful flowers. You saw none but what were thoroughly clad, and you knew that they were hurrying to homes that were bright and attractive, if not as elegant as yours; where loving welcomes were sure to greet them and happiness would sit with them at the feast; for the heart that is pure has always a kingly guest for its company.

A wonderful discovery that the people of Mizora had made was the power to annihilate space as an impediment to conversation. They claimed that the atmosphere had regular currents of electricity that were accurately known to them. They talked to them by means of simply constructed instruments, and the voice would be as audible and as easily recognized at three thousand miles distant as at only three feet. Stations were built similar to our telegraph offices, but on high elevations. I understood that they could not be used upon the surface. Every private and public house, however, had communication with the general office, and could converse with friends at a distance whenever desirable. Public speakers made constant use of it, but in connection with another extraordinary apparatus which I regret my inability to perfectly describe.

I saw it first from the dress circle of a theater. It occupied the whole rear of the stage, and from where I sat, looked like a solid wall of polished metal. But it had a wonderful function, for immediately in front of it, moving, speaking and gesturing, was the figure of a popular public lecturer, so life-like in appearance that I could scarcely be convinced that it was only a reflection. Yet such it was, and the original was addressing an audience in person more than a thousand miles distant.

It was no common thing for a lecturer to address a dozen or more audiences at the same time, scattered over an area of thousands of miles, and every one listening to and observing what appeared to be the real speaker. In fact, public speakers in Mizora never traveled on pure professional business. It was not necessary. They prepared a room in their own dwelling with the needful apparatus, and at the time specified delivered a lecture in twenty different cities.

I was so interested in this very remarkable invention that I made vigorous mental exertions to comprehend it sufficiently to explain its mechanism and philosophical principles intelligently; but I can only say that it was one of the wonders those people produced with electricity. The mechanism was simple, but the science of its construction and workings I could not comprehend. The grasp of my mind was not broad enough. The instrument that transmitted the voice was entirely separate.

I must not neglect to mention that all kinds of public entertainments, such as operas, concerts and dramas, could be and were repeated to audiences at a distance from where the real transaction was taking place. I attended a number of operas that were only the reflection of others that were being presented to audiences far distant.

These repetitions were always marvels of accuracy of vividness.

Small reflecting apparatus were to be found in every dwelling and business house. It is hardly necessary to state that letter-writing was an unknown accomplishment in Mizora. The person who desired to converse with another, no matter how far distant, placed herself in communication with her two instruments and signaled. Her friend appeared upon the polished metal surface like the figure in a mirror, and spoke to her audibly, and looked at her with all the naturalness of reality.

I have frequently witnessed such interviews between Wauna and her mother, when we were visiting distant cities. It was certainly a more satisfactory way of communicating than by letter. The small apparatus used by private families and business houses were not like those used in public halls and theaters. In the former, the reflection was exactly similar to the image of a mirror; in the latter, the figure was projected upon the stage. It required more complicated machinery to produce, and was not practicable for small families or business houses. I now learned that on my arrival in Mizora I had been taken to one of the largest apparatus and put in communication with it. I was informed by Wauna that I had been exhibited to every college and school in the country by reflex representation. She said that she and her mother had seen me distinctly and heard my voice. The latter had been so uncongenial in accent and tone that she had hesitated about becoming my instructor on that account. It was my evident appreciation of my deficiencies as compared to them that had enlisted her sympathy.

Now, in my own country, my voice had attracted attention by its smoothness and modulation, and I was greatly surprised to hear Wauna speak of its unmusical tone as really annoying. But then in Mizora there are no voices but what are sweet enough to charm the birds.

In the journeys that Wauna and I took during the college vacation, we were constantly meeting strangers, but they never appeared the least surprised at my dark hair and eyes, which were such a contrast to all the other hair and eyes to be met with in Mizora, that I greatly wondered at it until I learned of the power of the reflector. I requested permission to examine one of the large ones used in a theater, and it was granted me. Wauna accompanied me and signaled to a friend of hers. As if by magic a form appeared and moved across the stage. It bowed to me, smiled and motioned with its hand, to all appearances a material body. I asked Wauna to approach it, which she did, and passed
her hand through it. There was nothing that resisted her touch, yet I plainly saw the figure, and recognized it as the perfect representation of a friend of Wauna's, an actress residing in a distant city. When I ascended the stage, the figure vanished, and I understood that it could be visible only at a certain distance from the reflector.

In traveling great distances, or even short ones where great speed was desired, the Mizoraens used air ships; but only for the transportation of passengers and the very lightest of freight. Heavy articles could not be as conveniently carried by them as by railroads. Their railroads were constructed and conducted on a system so perfect that accidents were never known. Every engineer had an electric signal attached to the engine, that could signal a train three miles distant.

The motive power for nearly all engines was compressed air. Electricity, which was recognized by Mizora scientists as a force of great intensity, was rarely used as a propelling power on railroads. Its use was attended by possible danger, but compressed air was not. Electricity produced the heat that supplied the air ships and railroads with that very necessary comfort. In case there should be an accident, as a collision, or thrown from the track, heat could not be a source of danger when furnished by electricity. But I never heard of a railroad accident during the whole fifteen years that I spent in Mizora.

Air-ships, however, were not exempt from danger, although the precautions against it were ingenious and carefully observed. The Mizora people could tell the approach of a storm, and the exact time it would arrive. They had signal stations established for the purpose, all over the country.

But, though they were skilled mechanics, and far in advance of my own world, and the limits of my comprehension in their scientific discoveries and appliances, they had not yet discovered the means of subduing the elements, or driving unharmed through their fury. When nature became convulsed with passion, they guarded themselves against it, but did not endeavor to thwart it.

Their air-ships were covered, and furnished with luxurious seats. The whole upper part of the car was composed of very thin glass. They traveled with, to me, astonishing rapidity. Towns and cities flew away beneath us like birds upon the wing. I grew frightened and apprehensive, but Wauna chatted away with her friends with the most charming unconcern.

I was looking down, when I perceived, by the increasing size of objects below, that we were descending. The conductor entered almost immediately, and announced that we were going down to escape an approaching storm. A signal had been received and the ship was at once lowered.

I felt intensely relieved to step again on solid earth, and hoped I might escape another trial of the upper regions. But after waiting until the storm was over we again entered the ship. I was ashamed to refuse when everyone else showed no fear.

In waiting for the storm to pass we were delayed so long that our journey could have been performed almost as speedily by rail. I wondered why they had not invented some means by which they could drive through a tempest in perfect safety. As usual, I addressed my inquiries to Wauna. She answered:

"So frail a thing as an air-ship must necessarily be, when compared with the strength of a storm, is like a leaf in the wind. We have not yet discovered, and we have but little expectation of discovering, any means by which we can defy the storms that rage in the upper deeps.

"The electricity that we use for heat is also a source of danger during a storm. Our policy is to evade a peril we cannot control or destroy. Hence, when we receive a signal that a storm is approaching we get out of its way. Our railroad carriages, having no danger to fear from them, ride right through the storm."

The people of Mizora, I perceived, possessed a remarkable acuteness of vision. They could see the odor emanating from flowers and fruit. They described it to me as resembling attenuated mist. They also named other colors in the solar spectrum than those known to me. When I first heard them speak of them, I thought it a freak of the imagination; but I afterward noticed artists, and persons who had a special taste for colors, always detected them with greater readiness. The presence of these new colors were apparent to all with whom I spoke upon the subject. When I mentioned my own inability to discern them, Wauna said that it was owing to my inferior mental development.

"A child," she said, "if you will observe, is first attracted by red, the most glaring color known. The untutored mind will invariably select the gaudiest colors for personal adornment. It is the gentle, refined taste of civilization that chooses the softened hues and colors."

"But you, as a nation, are remarkable for rich warm colors in your houses and often in your dress," I said.

"But they are never glaring," she replied. "If you will notice, the most intense colors are always so arranged as to present a halo, instead of sharply defined brilliancy. If a gorgeous color is worn as a dress, it will be covered with filmy lace. You have spoken of the splendor of the Aurora Borealis. It is nature's most gorgeous robe, and intense as the primal colors are, they are never glaring. They glow in a film of vapor. We have made them our study. Art, with us, has never attempted to supercede nature."
The sense of smell was also exceedingly sensitive with the Mizora people. They detected odors so refined that I was not aware of them. I have often seen a chemist take a bottle of perfumery and name its ingredients from the sense of smell only. No one appeared surprised at the bluntness of my senses. When I spoke of this Wauna tried to explain it.

"We are a more delicately organized race of beings than you are. Our intellects, and even sense that we possess, is of a higher and finer development. We have some senses that you do not possess, and are unable to comprehend their exquisite delicacy. One of them I shall endeavor to explain to you by describing it as impression. We possess it in a highly refined state, both mentally and physically. Our sensitiveness to changes of temperature, I have noticed, is more marked than yours. It is acute with all of my people. For this reason, although we are free from disease, our bodies could not sustain, as readily as yours could, a sudden and severe shock to their normal temperature, such as a marked change in the atmosphere would occasion. We are, therefore, extremely careful to be always appropriately clothed. That is a physical impression. It is possessed by you also, but more obtusely.

"Our sensitiveness to mental pleasure and pain you would pronounce morbid on account of its intensity. The happiness we enjoy in the society of those who are congenial, or near and dear to us through family ties, is inconceivable to you. The touch of my mother's hand carries a thrill of rapture with it.

"We feel, intuitively, the happiness or disappointment of those we are with. Our own hopes impress us with their fulfillment or frustration, before we know what will actually occur. This feeling is entirely mental, but it is evidence of a highly refined mentality. We could not be happy unless surrounded, as we are, by cultivated and elegant pleasures. They are real necessities to us.

"Our appreciation of music, I notice, has a more exquisite delicacy than yours. You desire music, but it is the simpler operas that delight you most. Those fine and delicate harmonies that we so intensely enjoy, you appear incapable of appreciating."

I have previously spoken of their elegance in dress, and their fondness for luxury and magnificence. On occasions of great ceremony their dresses were furnished with very long trains. The only prominent difference that I saw in their state dresses, and the rare and costly ones I had seen in my own and other countries, was in the waist. As the women of Mizora admired a large waist, their dresses were generally loose and flowing. Ingenuity, however, had fashioned them into graceful and becoming outlines. On occasions of great state and publicity, comfortably fitting girdles confined the dress at the waist.

I attended the Inaugural of a Professor of Natural History in the National College. The one who had succeeded to this honor was widely celebrated for her erudition. It was known that the ceremony would be a grand affair, and thousands attended it.

I there witnessed another of these marvelous achievements in science that were constantly surprising me in Mizora. The inauguration took place in a large hall, the largest I had ever seen. It would accommodate two hundred thousand people, and was filled to repletion. I was seated far back in the audience, and being a little short-sighted anyway, I expected to be disappointed both in seeing and hearing the ceremonies. What was my astonishment then, when they began, to discover that I could see distinctly every object upon the stage, and hear with perfect accuracy every word that was uttered.

Upon expressing myself to Wauna as being greatly pleased that my eyesight and hearing had improved so wonderfully and unexpectedly, she laughed merrily, and asked me if I had noticed a curious looking band of polished steel that curved outward from the proscenium, and encircled its entire front? I had noticed it, but supposed it to be connected with some different arrangement they might have made concerning the footlights. Wauna informed me that I owed my improved hearing to that.

"But my eyesight," I asked, "how do you account for its unusual penetrativeness?"

"Have you ever noticed some seasons of the year display a noticeably marked transparency of the atmosphere that revealed objects at great distances with unusual clearness? Well, we possess a knowledge of air that enables us to qualify it with that peculiar magnifying condition. On occasions like this we make use of it. This hall was built after the discovery, and was specially prepared for its use. It is seldom employed in smaller halls."

Just then a little flutter of interest upon the stage attracted my attention, and I saw the candidate for the professorship entering, accompanied by the Faculty of the National College.

She wore a sea-green velvet robe with a voluminous train. The bottom of the dress was adorned with a wreath or band of water lilies, embroidered in seed pearls. A white lace overdress of filmiest texture fell over the velvet, almost touching the wreath of lilies, and looked as though it was made of sea foam. A girdle of large pink pearls confined the robe at the waist. Natural flowers were on her bosom and in her hair.

The stage was superbly decorated with flowers and shells. A large chair, constructed of beautiful shells and cushioned with green velvet, rested upon a dais of coral. It was the chair of honor. Behind it was a curtain of seaweed. I afterward learned that the moss was attached to a film of glass too delicate to detect without handling.
In the midst of these charming surroundings stood the applicant for honor. Her deep blue eyes glowed with the joy of triumph. On the delicate cheek and lip burned the carmine hue of perfect health. The golden hair even seemed to have caught a brighter lustre in its coiled masses. The uplifted hand and arm no marble goddess could have matched, for this had the color and charm of life. As she stood revealed by the strong light that fell around her, every feature ennobled with the glory of intellect, she appeared to me a creature of unearthly loveliness, as something divine.

I spoke to Wauna of the rare beauty and elegance of her dress.
"She looks like a fabled Naiad just risen from the deep," was my criticism on her.
"Her dress," answered Wauna, "is intended to be emblematical of Nature. The sea-green robe, the water lilies of pearls, the foamy lace are all from Nature's Cradle of Life."
"How poetical!" I exclaimed.
But then Mizora is full of that charming skill that blends into perfect harmony the beautiful and useful in life.

CHAPTER XIII.

On my return to college, after the close of vacation, I devoted myself exclusively to history. It began with their first President; and from the evidence of history itself, I knew that the Nation was enjoying a high state of culture when its history began.

No record of a more primitive race was to be found in all the Library, assiduously as I searched for it. I read with absorbing interest their progress toward perfect enlightenment, their laborious searchings into science that had resulted in such marvelous achievements. But earnestly as I sought for it, and anxiously as I longed for it, I found and heard no mention of a race of men. From the most intimate intercourse with the people of Mizora, I could discover no attempt at concealment in anything, yet the inquiry would crowd itself upon me. "Where are the men?" And as constantly would I be forced to the conclusion that Mizora was either a land of mystery beyond the scope of the wildest and weirdest fancy, or else they were utterly oblivious of such a race. And the last conclusion was most improbable of all.

Man, in my country, was a necessity of government, law, and protection. His importance, (as I viewed it from inherited ideas) was incalculable. It could not be possible that he had no existence in a country so eminently adapted to his desires and ability.

The expression, "domestic misery," that the Preceptress made use of one day in conversation with me, haunted my imagination with a persistent suspicion of mystery. It had a familiar sound to me. It intimated knowledge of a world I knew so well; where ill-nature, malice, spite, envy, deceit, falsehood and dishonesty, made life a continual anxiety.

Locks, bolts and bars shut out the thief who coveted your jewels; but no bolts nor bars, however ingeniously constructed or strongly made, could keep out the thief who coveted your character. One little word from a pretended friend might consummate the sorrow of your whole life, and be witnessed by the perpetrator without a pang--nay, even with exultation.
There were other miseries I thought of that were common in my country. There were those we love. Some who are woven into our lives and affections by the kinship of blood; who grow up weak and vacillating, and are won away, sometimes through vice, to estrangement. Our hearts ache not the less painfully that they have ceased to be worthy of a throb; or that they have been weak enough to become estranged, to benefit some selfish alien.

There were other sorrows in that world that I had come from, that brought anguish alike to the innocent and the guilty. It was the sorrow of premature death. Diseases of all kinds made lives wretched; or tore them asunder with death. How many hearts have ached with cankering pain to see those who are vitally dear, wasting away slowly, but surely, with unrelievable suffering; and to know that life but prolongs their misery, and death relieves it only with inconsolable grief for the living.

Who has looked into a pair of youthful eyes, so lovely that imagination could not invent for them another charm, and saw the misty film of death gather over them, while your heart ached with regret as bitter as it was unavailing. The soft snows of winter have fallen--a veil of purity--over the new made graves of innocence and youth, and its wild winds have been the saddest requiem. The dews of summer have wept with your tears, and its zephyrs have sighed over the mouldering loveliness of youth.

I had known no skill in my world that could snatch from death its unlawful prey of youth. But here, in this land so eminently blessed, no one regarded death as a dreaded invader of their household.

"We cannot die until we get old," said Wauna, naively.

And looking upon their bounding animal spirits, their strong supple frames, and the rich, red blood of perfect health, mantling their cheeks with its unsurpassable bloom, one would think that disease must have strong grasp indeed that could destroy them.

But these were not all the sorrows that my own country knew. Crimes, with which we had no personal connection, shocked us with their horrible details. They crept, like noxious vapors, into the moral atmosphere of the pure and good; tainting the weak, and annoying the strong.

There were other sorrows in my country that were more deplorable still. It was the fate of those who sought to relieve the sufferings of the many by an enforced government reform. Misguided, imprudent and fanatical they might be, but their aim at least was noble. The wrongs and sufferings of the helpless and oppressed had goaded them to action for their relief.

But, alas! The pale and haggard faces of thousands of those patriot souls faded and wasted in torturing slowness in dungeons of rayless gloom. Or their emaciated and rheumatic frames toiled in speechless agony amid the horrors of Siberia's mines.

In this land they would have been recognized as aspiring natures, spreading their wings for a nobler flight, seeking a higher and grander life. The smile of beauty would have urged them on. Hands innumerable would have given them a cordial and encouraging grasp. But in the land they had sought to benefit and failed, they suffered in silence and darkness, and died forgotten or cursed.

My heart and my brain ached with memory, and the thought again occurred: "Could the Preceptress ever have known such a race of people?"

I looked at her fair, calm brow, where not a wrinkle marred the serene expression of intellect, although I had been told that more than a hundred years had touched with increasing wisdom its broad surface. The smile that dwelt in her eyes, like the mystic sprite in the fountain, had not a suspicion of sadness in them. A nature so lofty as hers, where every feeling had a generous and noble existence and aim, could not have known without anguish the race of people I knew so well. Their sorrows would have tinged her life with a continual sadness.

The words of Wauna had awakened a new thought. I knew that their mental life was far above mine, and that in all the relations of life, both business and social, they exhibited a refinement never attained by my people. I had supposed these qualities to be an endowment of nature, and not a development sought and labored for by themselves. But my conversation with Wauna had given me a different impression, and the thought of a future for my own country took possession of me.

"Could it ever emerge from its horrors, and rise through gradual but earnest endeavor to such perfection? Could a higher civilization crowd its sufferings out of existence and, in time, memory?"

I had never thought of my country having a claim upon me other than what I owed to my relatives and society. But in Mizora, where the very atmosphere seemed to feed one's brain with grander and nobler ideas of life and humanity, my nature had drank the inspiration of good deeds and impulses, and had given the desire to work for something beside myself and my own kindred. I resolved that if I should ever again behold my native country, I would seek the good of all its people along with that of my nearest and dearest of kin. But how to do it was a matter I could not arrange. I felt reluctant to ask either Wauna or her mother. The guileless frankness of Wauna's nature was an impassable barrier to the confidence of crimes and wretchedness. One glance of horror from her dark, sweet eyes, would have chilled me into painful silence and sorrowful regret.
The mystery that had ever surrounded these lovely and noble blonde women had driven me into an unnatural reserve in regard to my own people and country. I had always perceived the utter absence of my allusion to the masculine gender, and conceiving that it must be occasioned by some more than ordinary circumstances, I refrained from intruding my curiosity.

That the singular absence of men was connected with nothing criminal or ignoble on their part I felt certain; but that it was associated with something weird and mysterious I had now become convinced. My efforts to discover their whereabouts had been earnest and untiring. I had visited a number of their large cities, and had enjoyed the hospitality of many private homes. I had examined every nook and corner of private and public buildings, (for in Mizora nothing ever has locks) and in no place had I ever discovered a trace or suggestion of man.

Women and girls were everywhere. Their fair faces and golden heads greeted me in every town and city. Sometimes a pair of unusually dark blue eyes, like the color of a velvet-leaved pansy, looked out from an exquisitely tinted face framed in flossy golden hair, startling me with its unnatural loveliness, and then I would wonder anew:

"Why is such a paradise for man so entirely devoid of him?"

I even endeavored to discover from the conversation of young girls some allusion to the male sex. But listen as attentively and discreetly as I could, not one allusion did I hear made to the mysteriously absent beings. I was astonished that young girls, with cheeks like the downy bloom of a ripe peach, should chatter and laugh merrily over every conversational topic but that of the lords of society. The older and the wiser among women might acquire a depreciating idea of their worth, but innocent and inexperienced girlhood was apt to surround that name with a halo of romance and fancied nobility that the reality did not always possess. What, then, was my amazement to find them indifferent and wholly neglectful of that (to me) very important class of beings.

Conjecture at last exhausted itself, and curiosity became indifferent. Mizora, as a nation, or an individual representative, was incapable of dishonor. Whatever their secret I should make no farther effort to discover it. Their hospitality had been generous and unreserved. Their influence upon my character--morally--had been an incalculable benefit. I had enjoyed being among them. The rhythm of happiness that swept like a strain of sweet music through all their daily life, touched a chord in my own nature that responded.

And when I contrasted the prosperity of Mizora--a prosperity that reached every citizen in its vast territory--with the varied phases of life that are found in my own land, it urged me to inquire if there could be hope for such happiness within its borders.

To the Preceptress, whose sympathies I knew were broad as the lap of nature, I at last went with my desire and perplexities. A sketch of my country's condition was the inevitable prelude. I gave it without once alluding to the presence of Man. She listened quietly and attentively. Her own land lay like a charming picture before her. I spoke of its peaceful happiness, its perfected refinement, its universal wealth, and paramount to all its other blessings, its complete ignorance of social ills. With them, love did not confine itself to families, but encircled the Nation in one embrace. How dismal, in contrast, was the land that had given me birth.

"But one eminent distinction exists among us as a people," I added in conclusion. "We are not all of one race."

I paused and looked at the Preceptress. She appeared lost in reverie. Her expression was one of solicitude and approached nearer to actual pain than anything I had ever noticed upon it before. She looked up and caught my eye regarding her. Then she quietly asked:

"Are there men in your country?"

PART SECOND.

CHAPTER I.

I answered in the affirmative, and further added that I had a husband and a son.

The effect of a confession so simple, and so natural, wounded and amazed me.

The Preceptress started back with a look of loathing and abhorrence; but it was almost instantly succeeded by one of compassion.

"You have much to learn," she said gently, "and I desire not to judge you harshly. You are the product of a people far back in the darkness of civilization. We are a people who have passed beyond the boundary of what was once called Natural Law. But, more correctly, we have become mistresses of Nature's peculiar processes. We influence or control them at will. But before giving you any further explanation I will show you the gallery containing the portraits of our very ancient ancestors."

She then conducted me into a remote part of the National College, and sliding back a panel containing a magnificent painting, she disclosed a long gallery, the existence of which I had never suspected, although I knew their custom of using ornamented sliding panels instead of doors. Into this I followed her with wonder and increasing surprise. Paintings on canvas, old and dim with age; paintings on porcelain, and a peculiar transparent material, of which I have previously spoken, hung so thick upon the wall you could not have placed a hand between them. They were all portraits of men. Some were represented in the ancient or mediaeval costumes of my own
ancestry, and some in garbs resembling our modern styles.

Some had noble countenances, and some bore on their painted visages the unmistakable stamp of passion and vice. It is not complimentary to myself to confess it, but I began to feel an odd kind of companionship in this assembly of good and evil looking men, such as I had not felt since entering this land of pre-eminently noble and lovely women.

As I gazed upon them, arrayed in the armor of some stern warrior, or the velvet doublet of some gay cavalier, the dark eyes of a debonair knight looked down upon me with familiar fellowship. There was pride of birth, and the passion of conquest in every line of his haughty, sensuous face. I seemed to breathe the same moral atmosphere that had surrounded me in the outer world.

They had lived among noble and ignoble deeds I felt sure. They had been swayed by conflicting desires. They had known temptation and resistance, and reluctant compliance. They had experienced the treachery and ingratitude of humanity, and had dealt in it themselves. They had known joy as I had known it, and their sorrow had been as my sorrows. They had loved as I had loved, and sinned as I had sinned, and suffered as I had suffered.

I wept for the first time since my entrance into Mizora, the bitter tears of actual experience, and endeavored to convey to the Preceptress some idea of the painful emotion that possessed me.

"I have noticed," she said, "in your own person and the descriptions you have given of your native country, a close resemblance to the people and history of our nation in ages far remote. These portraits are very old. The majority of them were painted many thousands of years ago. It is only by our perfect knowledge of color that we are enabled to preserve them. Some have been copied by expert artists upon a material manufactured by us for that purpose. It is a transparent adamant that possesses no refractive power, consequently the picture has all the advantage of a painting on canvas, with the addition of perpetuity. They can never fade nor decay."

"I am astonished at the existence of this gallery," I exclaimed. "I have observed a preference for sliding panels instead of doors, and that they were often decorated with paintings of rare excellence, but I had never suspected the existence of this gallery behind one of them."

"Any student," said the Preceptress, "who desires to become conversant with our earliest history, can use this gallery. It is not a secret, for nothing in Mizora is concealed; but we do not parade its existence, nor urge upon students an investigation of its history. They are so far removed from the moral imbecility that dwarfed the nature of these people, that no lesson can be learned from their lives; and their time can be so much more profitably spent in scientific research and study."

"You have not, then, reached the limits of scientific knowledge?" I wonderingly inquired, for, to me, they had already overstepped its imaginary pale.

"When we do we shall be able to create intellect at will. We govern to a certain extent the development of physical life; but the formation of the brain--its intellectual force, or capacity I should say--is beyond our immediate skill. Genius is yet the product of long cultivation."

I had observed that dark hair and eyes were as indiscriminately mingled in these portraits as I had been accustomed to find them in the living people of my own and other countries. I drew the Preceptress' attention to it.

"We believe that the highest excellence of moral and mental character is alone attainable by a fair race. The elements of evil belong to the dark race."

"And were the people of this country once of mixed complexions?"
"As you see in the portraits? Yes," was the reply.
"And what became of the dark complexions?"
"We eliminated them."

I was too astonished to speak and stood gazing upon the handsome face of a young man in a plumed hat and lace-frilled doublet. The dark eyes had a haughty look, like a man proud of his lineage and his sex.

"Let us leave this place," said the Preceptress presently. "It always has a depressing effect upon me."
"In what way?" I asked.
"By the degradation of the human race that they force me to recall."

I followed her out to a seat on one of the small porticoes.

In candidly expressing herself about the dark complexions, my companion had no intention or thought of wounding my feelings. So rigidly do they adhere to the truth in Mizora that it is of all other things pre-eminent, and is never supposed to give offense. The Preceptress but gave expression to the belief inculcated by centuries of the teachings and practices of her ancestors. I was not offended. It was her conviction. Besides, I had the consolation of secretly disagreeing with her. I am still of the opinion that their admirable system of government, social and political, and their encouragement and provision for universal culture of so high an order, had more to do with the formation of superlative character than the elimination of the dark complexion.

The Preceptress remained silent a long time, apparently absorbed in the beauty of the landscape that stretched
before us. The falling waters of a fountain was all the sound we heard. The hour was auspicious. I was so eager to
develop a revelation of the mystery about these people that I became nervous over my companion's protracted
silence. I felt a delicacy in pressing inquiries concerning information that I thought ought to be voluntarily given.
Inquisitiveness was regarded as a gross rudeness by them, and I could frame no question that I did not fear would
sound impertinent. But at last patience gave way and, at the risk of increasing her commiseration for my barbarous
mental condition, I asked:
"Are you conversant with the history of the times occupied by the originals of the portraits we have just seen?"
"I am," she replied.
"And would you object to giving me a condensed recital of it?"
"Not if it can do you any good?"
"What has become of their descendants--of those portraits?"
"They became extinct thousands of years ago."

She became silent again, lost in reverie. The agitation of my mind was not longer endurable. I was too near the
acme of curiosity to longer delay. I threw reserve aside and not without fear and trembling faltered out:
"Where are the men of this country? Where do they stay?"
"There are none," was the startling reply. "The race became extinct three thousand years ago."

CHAPTER II.

I trembled at the suggestion of my own thoughts. Was this an enchanted country? Where the lovely blonde
women fairies--or some weird beings of different specie, human only in form? Or was I dreaming?
"I do not believe I understand you," I said. "I never heard of a country where there were no men. In my land
they are so very, very important."
"Possibly," was the placid answer.
"And you are really a nation of women?"
"Yes," she said. "And have been for the last three thousand years."
"Will you tell me how this wonderful change came about?"
"Certainly. But in order to do it, I must go back to our very remote ancestry. The civilization that I shall begin
with must have resembled the present condition of your own country as you describe it. Prisons and punishments
were prevalent throughout the land."

I inquired how long prisons and places of punishment had been abolished in Mizora.
"For more than two thousand years," she replied. "I have no personal knowledge of crime. When I speak of it, it
is wholly from an historical standpoint. A theft has not been committed in this country for many many centuries.
And those minor crimes, such as envy, jealousy, malice and falsehood, disappeared a long time ago. You will not
find a citizen in Mizora who possesses the slightest trace of any of them.
"Did they exist in earlier times?"
"Yes. Our oldest histories are but records of a succession of dramas in which the actors were continually
striving for power and exercising all of those ancient qualities of mind to obtain it. Plots, intrigues, murders and
wars, were the active employments of the very ancient rulers of our land. As soon as death laid its inactivity upon
one actor, another took his place. It might have continued so; and we might still be repeating the old tragedy but for
one singular event. In the history of your own people you have no doubt observed that the very thing plotted,
intrigued and labored for, has in accomplishment proved the ruin of its projectors. You will remark this in the
history I am about to relate.

"Main ages ago this country was peopled by two races--male and female. The male race were rulers in public
and domestic life. Their supremacy had come down from pre-historic time, when strength of muscle was the only
master. Woman was a beast of burden. She was regarded as inferior to man, mentally as well as physically. This
idea prevailed through centuries of the earlier civilization, even after enlightenment had brought to her a chivalrous
regard from men. But this regard was bestowed only upon the women of their own household, by the rich and
powerful. Those women who had not been fortunate enough to have been born in such a sphere of life toiled early
and late, in sorrow and privation, for a mere pittance that was barely sufficient to keep the flame of life from going
out. Their labor was more arduous than men's, and their wages lighter.

"The government consisted of an aristocracy, a fortunate few, who were continually at strife with one another
to gain supremacy of power, or an acquisition of territory. Wars, famine and pestilence were of frequent occurrence.
Of the subjects, male and female, some had everything to render life a pleasure, while others had nothing. Poverty,
oppression and wretchedness was the lot of the many. Power, wealth and luxury the dower of the few.
Children came into the world undesired even by those who were able to rear them, and often after an attempt
had been made to prevent their coming alive. Consequently numbers of them were deformed, not only physically,
but mentally. Under these conditions life was a misery to the larger part of the human race, and to end it by self-
destruction was taught by their religion to be a crime punishable with eternal torment by quenchless fire.

"But a revolution was at hand. Stinted toil rose up, armed and wrathful, against opulent oppression. The struggle was long and tragical, and was waged with such rancor and desperate persistence by the insurrectionists, that their women and children began to supply the places vacated by fallen fathers, husbands and brothers. It ended in victory for them. They demanded a form of government that should be the property of all. It was granted, limiting its privileges to adult male citizens.

"The first representative government lasted a century. In that time civilization had taken an advance far exceeding the progress made in three centuries previous. So surely does the mind crave freedom for its perfect development. The consciousness of liberty is an ennobling element in human nature. No nation can become universally moral until it is absolutely FREE.

"But this first Republic had been diseased from its birth. Slavery had existed in certain districts of the nation. It was really the remains of a former and more degraded state of society which the new government, in the exultation of its own triumphant inauguration, neglected or lacked the wisdom to remedy. A portion of the country refused to admit slavery within its territory, but pledged itself not to interfere with that which had. Enmities, however, arose between the two sections, which, after years of repression and useless conciliation, culminated in another civil war. Slavery had resolved to absorb more territory, and the free territory had resolved that it should not. The war that followed in consequence severed forever the fetters of the slave and was the primary cause of the extinction of the male race.

"The inevitable effect of slavery is enervating and demoralizing. It is a canker that eats into the vitals of any nation that harbors it, no matter what form it assumes. The free territory had all the vigor, wealth and capacity for long endurance that self-dependence gives. It was in every respect prepared for a long and severe struggle. Its forces were collected in the name of the united government.

"Considering the marked inequality of the combatants the war would necessarily have been of short duration. But political corruption had crept into the trust places of the government, and unscrupulous politicians and office-seekers saw too many opportunities to harvest wealth from a continuation of the war. It was to their interest to prolong it, and they did. They placed in the most responsible positions of the army, military men whose incapacity was well known to them, and sustained them there while the country wept its maimed and dying sons.

"The slave territory brought to the front its most capable talent. It would have conquered had not the resources against which it contended been almost unlimited. Utterly worn out, every available means of supply being exhausted, it collapsed from internal weakness.

"The general government, in order to satisfy the clamors of the distressed and impatient people whose sons were being sacrificed, and whose taxes were increasing, to prolong the war had kept removing and reinstating military commanders, but always of reliable incapacity.

"A man of mediocre intellect and boundless self-conceit happened to be the commander-in-chief of the government army when the insurrection collapsed. The politicians, whose nefarious scheming had prolonged the war, saw their opportunity for furthering their own interests by securing his popularity. They assumed him to be the greatest military genius that the world had ever produced; as evidenced by his success where so many others had failed. It was known that he had never risked a battle until he was assured that his own soldiers were better equipped and outnumbered the enemy. But the politicians asserted that such a precaution alone should mark him as an extraordinary military genius. The deluded people accepted him as a hero.

"The politicians exhausted their ingenuity in inventing honors for him. A new office of special military eminence, with a large salary attached, was created for him. He was burdened with distinctions and emoluments, always worked by the politicians, for their benefit. The nation, following the lead of the political leaders, joined in their adulation. It failed to perceive the dangerous path that leads to anarchy and despotism--the worship of one man. It had unfortunately selected one who was cautious and undemonstrative, and who had become convinced that he really was the greatest prodigy that the world had ever produced.

"He was made President, and then the egotism and narrow selfishness of the man began to exhibit itself. He assumed all the prerogatives of royalty that his position would permit. He elevated his obscure and numerous relatives to responsible offices. Large salaries were paid them and intelligent clerks hired by the Government to perform their official duties.

"Corruption spread into every department, but the nation was blind to its danger. The few who did perceive the weakness and presumption of the hero were silenced by popular opinion.

"A second term of office was given him, and then the real character of the man began to display itself before the people. The whole nature of the man was selfish and stubborn. The strongest mental trait possessed by him was cunning.

"His long lease of power and the adulation of his political beneficiaries, acting upon a superlative self-conceit,
been rigorously closed against them. The professional pursuits of life were denied them. But a few, with sublime

his inaugural address he declared that nothing but the will of the people governed him. He had not desired the office;

public life was distasteful to him, yet he was willing to sacrifice himself for the good of his country.

"Had the people been less enlightened, they might have yielded without a murmur; but they had enjoyed too

long the privileges of a free Government to see it usurped without a struggle. Tumult and disorder prevailed over the

country. Soldiers were called out to protect the new Government, but numbers of them refused to obey. The

consequence was they fought among themselves. A dissolution of the Government was the result. The General they

had lauded so greatly failed to bring order out of chaos; and the schemers who had foisted him into power, now

turned upon him with the fury of treacherous natures when foiled of their prey. Innumerable factions sprung up all

over the land, each with a leader ambitious and hopeful of subduing the whole to his rule. They fought until the

extermination of the race became imminent, when a new and unsuspected power arose and mastered.

"The female portion of the nation had never had a share in the Government. Their privileges were only what the

chivalry or kindness of the men permitted. In law, their rights were greatly inferior. The evils of anarchy fell with

direct effect upon them. At first, they organized for mutual protection from the lawlessness that prevailed. The

organizations grew, united and developed into military power. They used their power wisely, discreetly, and

effectively. With consummate skill and energy they gathered the reins of Government in their own hands.

"Their first aim had been only to force the country into peace. The anarchy that reigned had demoralized

society, and they had suffered most. They had long pleaded for an equality of citizenship with men, but had pleaded

in vain. They now remembered it, and resolved to keep the Government that their wisdom and power had restored.

They had been hampered in educational progress. Colleges and all avenues to higher intellectual development had

been rigorously closed against them. The professional pursuits of life were denied them. But a few, with sublime
courage and energy, had forced their way into them amid the revilings of some of their own sex and opposition of the men. It was these brave spirits who had earned their liberal cultivation with so much difficulty, that had organized and directed the new power. They generously offered to form a Government that should be the property of all intelligent adult citizens, not criminal.

"But these wise women were a small minority. The majority were ruled by the remembrance of past injustice. They were now the power, and declared their intention to hold the Government for a century.

"They formed a Republic, in which they remedied many of the defects that had marred the Republic of men. They constituted the Nation an integer which could never be disintegrated by States' Rights ideas or the assumption of State sovereignty.

"They proposed a code of laws for the home government of the States, which every State in the Union ratified as their State Constitution, thus making a uniformity and strength that the Republic of men had never known or suspected attainable.

"They made a law of every State that criminals could be arrested in any State they might flee to, without legal authority, other than that obtained in the vicinity of the crime. They made a law that criminals, tried and convicted of crime, could not be pardoned without the sanction of seventy-five out of one hundred educated and disinterested people, who should weigh the testimony and render their decision under oath. It is scarcely necessary to add that few criminals ever were pardoned. It removed from the office of Governor the responsibility of pardoning, or rejecting pardons as a purely personal privilege. It abolished the power of rich criminals to bribe their escape from justice; a practice that had secretly existed in the former Republic.

"In forming their Government, the women, who were its founders, profited largely by the mistakes or wisdom displayed in the Government of men. Neither the General Government, nor the State Government, could be independent of the other. A law of the Union could not become such until ratified by every State Legislature. A State law could not become constitutional until ratified by Congress.

"In forming the State Constitutions, laws were selected from the different State Constitutions that had proven wise for State Government during the former Republic. In the Republic of men, each State had made and ratified its own laws, independent of the General Government. The consequence was, no two States possessed similar laws.

"To secure strength and avoid confusion was the aim of the founders of the new Government. The Constitution of the National Government provided for the exclusion of the male sex from all affairs and privileges for a period of one hundred years.

"At the end of that time not a representative of the sex was in existence."

CHAPTER III.

I expressed my astonishment at her revelation. Their social life existed under conditions that were incredible to me. Would it be an impertinence to ask for an explanation that I might comprehend? Or was it really the one secret they possessed and guarded from discovery, a mystery that must forever surround them with a halo of doubt, the suggestion of uncanny power? I spoke as deprecatingly as I could. The Preceptress turned upon me a calm but penetrating gaze.

"Have we impressed you as a mysterious people?" she asked.

"Very, very much!" I exclaimed. "I have at times been oppressed by it."

"You never mentioned it," she said, kindly.

"I could not find an opportunity to," I said.

"It is the custom in Mizora, as you have no doubt observed, never to make domestic affairs a topic of conversation outside of the family, the only ones who would be interested in them; and this refinement has kept you from the solution of our social system. I have no hesitancy in gratifying your wish to comprehend it. The best way to do it is to let history lead up to it, if you have the patience to listen."

I assured her that I was anxious to hear all she chose to tell. She then resumed:

"The prosperity of the country rapidly increased under the rule of the female Presidents. The majority of them were in favor of a high state of morality, and they enforced it by law and practice. The arts and sciences were liberally encouraged and made rapid advancement. Colleges and schools flourished vigorously, and every branch of education was now open to women.

"During the Republic of men, the government had founded and sustained a military and naval academy, where a limited number of the youth of the country were educated at government expense. The female government re-organized the institutions, substituting the youth of their own sex. They also founded an academy of science, which was supplied with every facility for investigation and progress. None but those having a marked predilection for scientific research could obtain admission, and then it was accorded to demonstrated ability only. This drew to the college the best female talent in the country. The number of applicants was not limited.

"Science had hitherto been, save by a very few, an untrodden field to women, but the encouragement and rare
facilities offered soon revealed latent talent that developed rapidly. Scarcely half a century had elapsed before the pupils of the college had effected by their discoveries some remarkable changes in living, especially in the prevention and cure of diseases.

"However prosperous they might become, they could not dwell in political security with a portion of the citizens disfranchised. The men were resolved to secure their former power. Intrigues and plots against the government were constantly in force among them. In order to avert another civil war, it was finally decided to amend the constitution, and give them an equal share in the ballot. They had no sooner obtained that than the old practices of the former Republic were resorted to to secure their supremacy in government affairs. The women looked forward to their former subjugation as only a matter of time, and bitterly regretted their inability to prevent it. But at the crisis, a prominent scientist proposed to let the race die out. Science had revealed the Secret of Life."

She ceased speaking, as though I fully understood her.

"I am more bewildered than ever," I exclaimed. "I cannot comprehend you."

"Come with me," she said.

I followed her into the Chemist’s Laboratory. She bade me look into a microscope that she designated, and tell her what I saw.

"An exquisitely minute cell in violent motion," I answered.

"Daughter," she said, solemnly, "you are now looking upon the germ of all Life, be it animal or vegetable, a flower or a human being, it has that one common beginning. We have advanced far enough in Science to control its development. Know that the MOTHER is the only important part of all life. In the lowest organisms no other sex is apparent."

I sat down and looked at my companion in a frame of mind not easily described. There was an intellectual grandeur in her look and mien that was impressive. Truth sat, like a coronet, upon her brow. The revelation I had so longed for, I now almost regretted. It separated me so far from these beautiful, companionable beings.

"Science has instructed you how to supercede Nature," I said, finally.

"By no means. It has only taught us how to make her obey us. We cannot create Life. We cannot develop it. But we can control Nature's processes of development as we will. Can you deprecate such a power? Would not your own land be happier without idiots, without lunatics, without deformity and disease?"

"You will give me little hope of any radical change in my own lifetime when I inform you that deformity, if extraordinary, becomes a source of revenue to its possessor."

"All reforms are of slow growth," she said. "The moral life is the highest development of Nature. It is evolved by the same slow processes, and like the lower life, its succeeding forms are always higher ones. Its ultimate perfection will be mind, where all happiness shall dwell, where pleasure shall find fruition, and desire its ecstasy."

"It is the duty of every generation to prepare the way for a higher development of the next, as we see demonstrated by Nature in the fossilized remains of long extinct animal life, a preparatory condition for a higher form in the next evolution. If you do not enjoy the fruit of your labor in your own lifetime, the generation that follows you will be the happier for it. Be not so selfish as to think only of your own narrow span of life."

"By what means have you reached so grand a development?" I asked.

"By the careful study of, and adherence to, Nature's laws. It was long years--I should say centuries--before the influence of the coarser nature of men was eliminated from the present race.

"We devote the most careful attention to the Mothers of our race. No retarding mental or moral influences are ever permitted to reach her. On the contrary, the most agreeable contacts with nature, all that can cheer and ennoble in art or music surround her. She is an object of interest and tenderness to all who meet her. Guarded from unwholesome agitation, furnished with nourishing and proper diet--both mental and physical--the child of a Mizora mother is always an improvement upon herself. With us, childhood has no sorrows. We believe, and the present condition of our race proves, that a being environed from its birth with none but elevating influences, will grow up amiable and intelligent though inheriting unfavorable tendencies.

"On this principle we have ennobled our race and discovered the means of prolonging life and youthful loveliness far beyond the limits known by our ancestors.

"Temptation and necessity will often degrade a nature naturally inclined and desirous to be noble. We early recognized this fact, and that a nature once debased by crime would transmit it to posterity. For this reason we never permitted a convict to have posterity."

"But how have you become so beautiful?" I asked. "For, in all my journeys, I have not met an uncomely face or form. On the contrary, all the Mizora women have perfect bodies and lovely features."

"We follow the gentle guidance of our mother, Nature. Good air and judicious exercise for generations and generations before us have helped. Our ancestors knew the influence of art, sculpture, painting and music, which they were trained to appreciate."
"But has not nature been a little generous to you?" I inquired.
"Not more so than she will be to any people who follow her laws. When you first came here you had an idea that you could improve nature by crowding your lungs and digestive organs into a smaller space than she, the maker of them, intended them to occupy.

"If you construct an engine, and then cram it into a box so narrow and tight that it cannot move, and then crowd on the motive power, what would you expect?

"Beautiful as you think my people, and as they really are, yet, by disregarding nature's laws, or trying to thwart her intentions, in a few generations to come, perhaps even in the next, we could have coarse features and complexion, stoop shoulders and deformity.

"It has required patience, observation and care on the part of our ancestors to secure to us the priceless heritage of health and perfect bodies. Your people can acquire them by the same means."

CHAPTER IV.

As to Physical causes, I am inclined to doubt altogether of their operation in this particular; nor do I think that men owe anything of their temper or genius to the air, food, or climate.--Bacon.

I listened with the keenest interest to this curious and instructive history; and when the Preceptress had ceased speaking. I expressed my gratitude for her kindness. There were many things about which I desired information, but particularly their method of eradicating disease and crime. These two evils were the prominent afflictions of all the civilized nations I knew. I believed that I could comprehend enough of their method of extirpation to benefit my own country. Would she kindly give it?

"I shall take Disease first," she said, "as it is a near relative of Crime. You look surprised. You have known life-long and incurable invalids who were not criminals. But go to the squalid portion of any of your large cities, where Poverty and Disease go hand in hand, where the child receives its life and its first nourishment from a haggard and discontented mother. Starvation is her daily dread. The little tenderness that make home the haven of the heart, are never known to her. Ill-fed, ill-clothed, ill-cherished, all that might be refined and elevated in her nature, if properly cultivated, is choked into starveling shapes by her enemy--Want.

"If you have any knowledge of nature, ask yourself if such a condition of birth and infancy is likely to produce a noble, healthy human being? Do your agriculturists expect a stunted, neglected tree to produce rare and luscious fruit?"

I was surprised at the Preceptress' graphic description of wretchedness, so familiar to all the civilized nations that I knew, and asked:

"Did such a state of society ever exist in this country?"

"Ages ago it was as marked a social condition of this land as it is of your own to-day. The first great move toward eradicating disease was in providing clean and wholesome food for the masses. It required the utmost rigor of the law to destroy the pernicious practice of adulteration. The next endeavor was to crowd poverty out of the land. In order to do this the Labor question came first under discussion, and resulted in the establishment in every state of a Board of Arbitration that fixed the price of labor on a per cent, of the profits of the business. Public and private charities were forbidden by law as having an immoral influence upon society. Charitable institutions had long been numerous and fashionable, and many persons engaged in them as much for their own benefit as that of the poor. It was not always the honest and benevolent ones who became treasurers, nor were the funds always distributed among the needy and destitute, or those whom they were collected for. The law put a stop to the possibility of such frauds, and of professional impostors seeking alms. Those who needed assistance were supplied with work--respectable, independent work--furnished by the city or town in which they resided. A love of industry, its dignity and independence, was carefully instilled into every young mind. There is no country but what ought to provide for everyone of its citizens a comfortable, if not luxurious, home by humane legislation on the labor question.

"The penitentiaries were reconstructed by the female government. One half the time formerly allotted to labor was employed in compulsory education. Industrial schools were established in every State, where all the mechanical employments were taught free. Objects of charity were sent there and compelled to become self supporting. These industrial schools finally became State Colleges, where are taught, free, all the known branches of knowledge, intellectual and mechanical.

"Pauperism disappeared before the wide reaching influence of these industrial schools, but universal affluence had not come. It could not exist until education had become universal.

"With this object in view, the Government forbade the employment of any citizen under the age of twenty-one, and compelled their attendance at school up to that time. At the same time a law was passed that authorized the furnishing of all school-room necessaries out of the public funds. If a higher education were desired the State Colleges furnished it free of all expenses contingent.

"All of these measures had a marked influence in improving the condition of society, but not all that was
required. The necessity for strict sanitary laws became obvious. Cities and towns and even farms were visited, and
everything that could breed malaria, or produce impure air, was compelled to be removed. Personal and household
cleanliness at last became an object of public interest, and inspectors were appointed who visited families and
reported the condition of their homes. All kinds of out-door sports and athletic exercises were encouraged and
became fashionable.

"All of these things combined, made a great improvement in the health and vigor of our race, but still hereditary
diseases lingered.

"There were many so enfeebled by hereditary disease they had not enough energy to seek recuperation, and
died, leaving offspring as wretched, who in turn followed their parents' example.

"Statistics were compiled, and physician's reports circulated, until a law was passed prohibiting the perpetuity
of diseased offspring. But, although disease became less prevalent, it did not entirely disappear. The law could only
reach the most deplorable afflictions, and was eventually repealed.

"As the science of therapeutics advanced, all diseases--whether hereditary or acquired--were found to be
associated with abnormal conditions of the blood. A microscopic examination of a drop of blood enabled the
scientist to determine the character and intensity of any disease, and at last to effect its elimination from the system.

"The blood is the primal element of the body. It feeds the flesh, the nerves, the muscles, the brain. Disease
cannot exist when it is in a natural condition. Countless experiments have determined the exact properties of healthy
blood and how to produce it. By the use of this knowledge we have eliminated hereditary diseases, and developed
into a healthy and moral people. For people universally healthy is sure of being moral. Necessity begets crime. It is the
wants of the ignorant and debased that suggests theft. It is a diseased fancy, or a mind ignorant of the laws that
govern the development of human nature, that could attribute to offspring hated before birth: infancy and childhood
neglected; starved, ill-used in every way, a disposition and character, amiable and humane and likely to become
worthy members of society. The reverse is almost inevitable. Human nature relapses into the lower and baser
instincts of its earlier existence, when neglected, ill-used and ignorant. All of those lovely traits of character which
excite the enthusiast, such as gratitude, honor, charity are the results of education only. They are not the natural
instincts of the human mind, but the cultivated ones.

"The most rigid laws were passed in regard to the practice of medicine. No physician could become a
practitioner until examined and authorized to do so by the State Medical College. In order to prevent favoritism, or
the furnishing of diplomas to incompetent applicants, enormous penalties were incurred by any who would sign
such. The profession long ago became extinct. Every mother is a family physician. That is, she obeys the laws of
nature in regard to herself and her children, and they never need a doctor.

"Having become healthy and independent of charity, crime began to decrease naturally. The conditions that had
bred and fostered petty crimes having ceased to exist, the natures that had inherited them rose above their influence
in a few generations, and left honorable posterity.

"But crime in its grossest form is an ineradicable hereditary taint. Generation after generation may rise and
disappear in a family once tainted with it, without displaying it, and then in a most unexpected manner it will spring
up in some descendant, violent and unconquerable.

"We tried to eliminate it as we had disease, but failed. It was an inherited molecular structure of the brain.
Science could not reconstruct it. The only remedy was annihilation. Criminals had no posterity."

"I am surprised," I interrupted, "that possessing the power to control the development of the body, you should
not do so with the mind."

"If we could we would produce genius that could discover the source of all life. We can control Cause and
Effect, but we cannot create Cause. We do not even know its origin. What the perfume is to the flower, the intellect
is to the body; a secret that Nature keeps to herself. For a thousand years our greatest minds have sought to discover
its source, and we are as far from it to-day as we were a thousand years ago."

"How then have you obtained your mental superiority?" I inquired.

"By securing to our offspring perfect, physical and mental health. Science has taught us how to evolve intellect
by following demonstrated laws. I put a seed into the ground and it comes up a little green slip, that eventually
becomes a tree. When I planted the seed in congenial soil, and watered and tended the slip, I assisted Nature. But I
did not create the seed nor supply the force that made it develop into a tree, nor can I define that force."

"What has produced the exquisite refinement of your people?"

"Like everything else, it is the result of gradual development aiming at higher improvement. By following
strictly the laws that govern the evolution of life, we control the formation of the body and brain. Strong mental
traits become intensified by cultivation from generation to generation and finally culminate in one glorious outburst
of power, called Genius. But there is one peculiarity about mind. It resembles that wonderful century plant which,
after decades of developing, flowers and dies. Genius is the long unfolding bloom of mind, and leaves no posterity.
We carefully prepare for the future development of Genius. We know that our children will be neither deformed nor imbecile, but we watch the unfolding of their intellects with the interest of a new revelation. We guide them with the greatest care.

"I could take a child of your people with inherited weakness of body and mind. I should rear it on proper food and exercise--both mental and physical--and it would have, when matured, a marked superiority to its parents. It is not what Nature has done for us, it is what we have done for her, that makes us a race of superior people."

"The qualities of mind that are the general feature of your people," I remarked, "are so very high, higher than our estimate of Genius. How was it arrived at?"

"By the processes I have just explained. Genius is always a leader. A genius with us has a subtlety of thought and perception beyond your power of appreciation. All organized social bodies move intellectually in a mass, with their leader just ahead of them."

"I have visited, as a guest, a number of your families, and found their homes adorned with paintings and sculpture that would excite wondering admiration in my own land as rare works of art, but here they are only the expression of family taste and culture. Is that a quality of intellect that has been evolved, or is it a natural endowment of your race?"

"It is not an endowment, but has been arrived at by the same process of careful cultivation. Do you see in those ancient portraits a variety of striking colors? There is not a suggestion of harmony in any of them. On the contrary, they all display violent contrasts of color. The originals of them trod this land thousands of years ago. Many of the colors, we know, were unknown to them. Color is a faculty of the mind that is wholly the result of culture. In the early ages of society, it was known only in the coarsest and most brilliant hues. A conception and appreciation of delicate harmonies in color is evidence of a superior and refined mentality. If you will notice it, the illiterate of your own land have no taste for or idea of the harmony of color. It is the same with sound. The higher we rise in culture, the more difficult we are to please in music. Our taste becomes critical."

I had been revolving some things in my mind while the Preceptress was speaking, and I now ventured to express them. I said:

"You tell me that generations will come and go before a marked change can occur in a people. What good then would it do me or mine to study and labor and investigate in or to teach my people how to improve? They can not comprehend progress. They have not learned by contact, as I have in Mizora, how to appreciate it. I should only waste life and happiness in trying to persuade them to get out of the ruts they have traveled so long; they think there are no other roads. I should be reviled, and perhaps persecuted. My doctrines would be called visionary and impracticable. I think I had better use my knowledge for my own kindred, and let the rest of the world find out the best way it can."

The Preceptress looked at me with mild severity. I never before had seen so near an approach to rebuke in her grand eyes.

"What a barbarous, barbarous idea!" she exclaimed. "Your country will never rise above its ignorance and degradation, until out of its mental agony shall be evolved a nature kindled with an ambition that burns for Humanity instead of self. It will be the nucleus round which will gather the timid but anxious, and then will be lighted that fire which no waters can quench. It burns for the liberty of thought. Let human nature once feel the warmth of its beacon fires, and it will march onward, defying all obstacles, braving all perils till it be won. Human nature is ever reaching for the unattained. It is that little spark within us that has an undying life. When we can no longer use it, it flies elsewhere."

CHAPTER V.

I had long contemplated a trip to the extreme southern boundary of Mizora. I had often inquired about it, and had always been answered that it was defined by an impassable ocean. I had asked them to describe it to me, for the Mizora people have a happy faculty of employing tersely expressive language when necessary; but I was always met with the surprising answer that no tongue in Mizora was eloquent enough to portray the wonders that bounded Mizora on the south. So I requested the Preceptress to permit Wauna to accompany me as a guide and companion; a request she readily complied with.

"Will you be afraid or uneasy about trusting her on so long a journey with no companion or protector but me?" I asked.

The Preceptress smiled at my question.

"Why should I be afraid, when in all the length and breadth of our land there is no evil to befall her, or you either. Strangers are friends in Mizora, in one sense of the word, when they meet. You will both travel as though among time endeared associates. You will receive every attention, courtesy and kindness that would be bestowed upon near and intimate acquaintances. No, in this land, mothers do not fear to send their daughters alone and unrecommended among strangers."
When speed was required, the people of Mizora traveled altogether by air ships. But when the pleasure of landscape viewing, and the delight and exhilaration of easy progress is desired, they use either railroad cars or carriages.

Wauna and I selected an easy and commodious carriage. It was propelled by compressed air, which Wauna said could be obtained whenever we needed a new supply at any village or country seat.

Throughout the length and breadth of Mizora the roads were artificially made. Cities, towns, and villages were provided with paved streets, which the public authorities kept in a condition of perfect cleanliness. The absence of all kinds of animals rendered this comparatively easy. In alluding to this once in the presence of the Preceptress, she startled me by the request that I should suggest to my people the advantage to be derived from substituting machinery for animal labor.

"The association of animals is degrading," she asserted. "And you, who still live by tilling the soil, will find a marked change economically in dispensing with your beasts of burden. Fully four-fifths that you raise on your farms is required to feed your domestic animals. If your agriculture was devoted entirely to human food, it would make it more plentiful for the poor."

I did not like to tell her that I knew many wealthy people who housed and fed their domestic animals better than they did their tenants. She would have been disgusted with such a state of barbarism.

Country roads in Mizora were usually covered with a cement that was prepared from pulverized granite. They were very durable and very hard. Owing to their solidity, they were not as agreeable for driving as another kind of cement they manufactured. I have previously spoken of the peculiar style of wheel that was used on all kinds of light conveyances in Mizora, and rendered their progress over any road the very luxury of motion.

In our journey, Wauna took me to a number of factories, where the wonderful progress they had made in science continually surprised and delighted me. The spider and the silkworm had yielded their secret to these indefatigable searchers into nature's mysteries. They could spin a thread of gossamer, or of silk from their chemicals, of any width and length, and with a rapidity that was magical. Like everything else of that nature in Mizora, these discoveries had been purchased by the Government, and then made known to all.

They also manufactured ivory that I could not tell from the real article. I have previously spoken of their success in producing various kinds of marble and stone. A beautiful table that I saw made out of artificial ivory, had a painting upon the top of it. A deep border, composed of delicate, convoluted shells, extended round the top of the table and formed the shores of a mimic ocean, with coral reefs and tiny islands, and tangled sea-weeds and shining fishes sporting about in the pellucid water. The surface was of highly polished smoothness, and I was informed that the picture was not a painting but was formed of colored particles of ivory that had been worked in before the drying or solidifying process had been applied. In the same way they formed main beautiful combinations of marbles. The magnificent marble columns that supported the portico of my friend's house were all of artificial make. The delicate green leaves and creeping vines of ivy, rose, and eglantine, with their spray-like blossoms, were colored in the manufacturing process and chiseled out of the solid marble by the skillful hand of the artist.

It would be difficult for me to even enumerate all the beautiful arts and productions of arts that I saw in Mizora. Our journey was full of incidents of this kind.

Every city and town that we visited was like the introduction of a new picture. There was no sameness between any of them. Each had aimed at picturesqueness or stately magnificence, and neither had failed to obtain it. Looking back as I now do upon Mizora, it presents itself to me as a vast and almost limitless landscape, variegated with grand cities, lovely towns and villages, majestic hills and mountains crowned with glittering snows, or deep, delightful valleys veiled in scented vines.

Kindness, cordiality and courtesy met us on every side. It was at first quite novel for me to mingle among previously unheard-of people with such sociability, but I did as Wauna did, and I found it not only convenient but quite agreeable.

"I am the daughter of the Preceptress of the National College," said Wauna; and that was the way she introduced herself.

I noticed with what honor and high esteem the name of the Preceptress was regarded. As soon as it was known that the daughter of the Preceptress had arrived, the citizens of whatever city we had stopped in hastened to extend to her every courtesy and favor possible for them to bestow. She was the daughter of the woman who held the highest and most enviable position in the Nation. A position that only great intellect could secure in that country.

As we neared the goal of our journey, I noticed an increasing warmth of the atmosphere, and my ears were soon greeted with a deep, reverberating roar like continuous thunder. I have seen and heard Niagara, but a thousand Niagaras could not equal that deafening sound. The heat became oppressive. The light also from a cause of which I shall soon speak.

We ascended a promontory that jutted out from the main land a quarter of a mile, perhaps more. Wauna
conducted me to the edge of the cliff and told me to look down. An ocean of whirlpools was before us. The madened dashing and thundering of the mighty waters, and the awe they inspired no words can paint. Across such an abyss of terrors it was certain no vessel could sail. We took our glasses and scanned the opposite shore, which appeared to be a vast cataract as though the ocean was pouring over a precipice of rock. Wauna informed me that where the shore was visible it was a perpendicular wall of smooth rock.

Over head an arc of fire spanned the zenith from which depended curtains of rainbows waving and fluttering, folding and floating out again with a rapid and incessant motion. I asked Wauna why they had not crossed in air-ships, and she said they had tried it often but had always failed.

"In former times," she said, "when air-ships first came into use it was frequently attempted, but no voyager ever returned. We have long since abandoned the attempt, for now we know it to be impossible."

I looked again at that display of uncontrollable power. As I gazed it seemed to me I would be drawn down by the resistless fascination of terror. I grasped Wauna and she gently turned my face to the smiling landscape behind us. Hills and valleys, and sparkling cities veiled in foliage, with their numberless parks and fountains and statues sleeping in the soft light, gleaming lakes and wandering rivers that glittered and danced in the glorious atmosphere like imprisoned sunbeams, greeted us like the alluring smile of love, and yet, for the first time since entering this lovely land, I felt myself a prisoner. Behind me was an impassable barrier. Before me, far beyond this gleaming vision of enchantment, lay another road whose privations and dangers I dreaded to attempt.

I felt as a bird might feel who has been brought from the free expanse of its wild forest-home, and placed in a golden cage where it drinks from a jeweled cup and eats daintier food than it could obtain in its own rude haunts. It pines for that precarious life; its very dangers and privations fill its breast with desire. I began to long with utterable impatience to see once more the wild, rough scenes of my own nativity. Memory began to recall them with softening touches. My heart yearned for my own; debased as compared with Mizora though they be, there was the congeniality of blood between us. I longed to see my own little one whose dimpled hands I had unclasped from my neck in that agonized parting. Whenever I saw a Mizora mother fondling her babe, my heart leapt with quick desire to once more hold my own in such loving embrace. The mothers of Mizora have a devotional love for their children. Their smiles and prattle and baby wishes are listened to with loving tenderness, and treated as matters of importance.

I was sitting beside a Mizora mother one evening, listening to some singing that I truly thought no earthly melody could surpass. I asked the lady if ever she had heard anything sweeter, and she answered, earnestly:

"Yes, the voices of my own children."

On our homeward journey, Wauna took me to a lake from the center of which we could see, with our glasses, a green island rising high above the water like an emerald in a silver setting.

"That," said Wauna, directing my attention to it, "is the last vestige of a prison left in Mizora. Would you like to visit it?"

I expressed an eager willingness to behold so curious a sight, and getting into a small pleasure boat, we started toward it. Boats are propelled in Mizora either by electricity or compressed air, and glide through the water with soundless swiftness.

As we neared the island I could perceive the mingling of natural and artificial attractions. We moored our boat at the foot of a flight of steps, hewn from the solid rock. On reaching the top, the scene spread out like a beautiful painting. Grottos, fountains, and cascades, winding walks and vine-covered bowers charmed us as we wandered about. In the center stood a medium-sized residence of white marble. We entered through a door opening on a wide piazza. Art and wealth and taste had adorned the interior with a generous hand. A library studded with books closely shut behind glass doors had a wide window that commanded an enchanting view of the lake, with its rippling waters sparkling and dimpling in the light. On one side of the mantel-piece hung a full length portrait of a lady, painted with startling naturalness.

"That," said Wauna, solemnly, "was the last prisoner in Mizora."

I looked with interested curiosity at a relic so curious in this land. It was a blonde woman with lighter colored eyes than is at all common in Mizora. Her long, blonde hair hung straight and unconfined over a dress of thick, white material. Her attitude and expression were dejected and sorrowful. I had visited prisons in my own land where red-handed murder sat smiling with indifference. I had read in newspapers, labored eloquence that described the stoicism of some hardened criminal as a trait of character to be admired. I had read descriptions where mistaken eloquence exerted itself to waken sympathy for a criminal who had never felt sympathy for his helpless and innocent victims, and I had felt nothing but creeping horror for it all. But gazing at this picture of undeniable repentance, tears of sympathy started to my eyes. Had she been guilty of taking a fellow-creature's life?

"Is she still living?" I asked by way of a preface.

"Oh, no, she has been dead for more than a century," answered Wauna.
"Was she confined here very long?"
"For life," was the reply.
"I should not believe," I said, "that a nature capable of so deep a repentance could be capable of so dark a crime as murder."
"Murder!" exclaimed Wauna in horror. "There has not been a murder committed in this land for three thousand years."
It was my turn to be astonished.
"Then tell me what dreadful crime she committed."
"She struck her child," said Wauna, sadly; "her little innocent, helpless child that Nature gave her to love and cherish, and make noble and useful and happy."
"Did she inflict a permanent injury?" I asked, with increased astonishment at this new phase of refinement in the Mizora character.
"No one can tell the amount of injury a blow does to a child. It may immediately show an obvious physical one; it may later develop a mental one. It may never seem to have injured it at all, and yet it may have shocked a sensitive nature and injured it permanently. Crime is evolved from perverted natures, and natures become perverted from ill-usage. It merges into a peculiar structure of the brain that becomes hereditary."
"What became of the prisoner's child?"
"It was adopted by a young lady who had just graduated at the State College of the State in which the mother resided. It was only five years old, and its mother's name was never mentioned to it or to anyone else. Long before that, the press had abolished the practice of giving any prominence to crime. That pernicious eloquence that in uncivilized ages had helped to nourish crime by a maudlin sympathy for the criminal, had ceased to exist. The young lady called the child daughter, and it called her mother."
"Did the real mother never want to see her child?"
"That is said to be a true picture of her," said Wauna; "and who can look at it and not see sorrow and remorse."
"How could you be so stern?" I asked, in wondering astonishment.
"Pity has nothing to do with crime," said Wauna, firmly. "You must look to humanity, and not to the sympathy one person excites when you are aiding enlightenment. That woman wandered about these beautiful grounds, or sat in this elegant home a lonely and unsympathized-with prisoner. She was furnished with books, magazines and papers, and every physical comfort. Sympathy for her lot was never offered her. Childhood is regarded by my people as the only period of life that is capable of knowing perfect happiness, and among us it is a crime greater than the heinousness of murder in your country, to deprive a human being of its childhood--in which cluster the only unalloyed sweets of life."
"A human being who remembers only pain, rebukes treatment in childhood, has lost the very flavor of existence, and the person who destroyed it is a criminal indeed."

CHAPTER VI.
There was one peculiarity about Mizora that I noticed soon after my arrival, but for various reasons have refrained from speaking of before now. It was the absence of houses devoted to religious worship.
In architecture Mizora displayed the highest perfection. Their colleges, art galleries, public libraries, opera houses, and all their public buildings were grand and beautiful. Never in any country, had I beheld such splendor in design and execution. Their superior skill in this respect, led me to believe that their temples of worship must be on a scale of magnificence beyond all my conceiving. I was eager to behold them. I looked often upon my first journeyings about their cities to discover them, but whenever I noticed an unusually imposing building, and asked what it was, it was always something else. I was frequently on the point of asking them to conduct me to some church that resembled my own in worship, (for I was brought up in strict compliance with the creeds, dogmas, and regulations of the Russo Greek Church) but I refrained, hoping that in time, I should be introduced to their religious ceremonies.
When time passed on, and no invitation was extended me, and I saw no house nor preparation for religious worship, nor even heard mention of any, I asked Wauna for an explanation. She appeared not to comprehend me, and I asked the question:
"Where do you perform your religious rites and ceremonies?"
She looked at me with surprise.
"You ask me such strange questions that sometimes I am tempted to believe you a relic of ancient mythology that has drifted down the centuries and landed on our civilized shores, or else have been gifted with a marvelous prolongation of life, and have emerged upon us from some cavern where you have lived, or slept for ages in unchanged possession of your ancient superstition."
"Have you, then," I asked in astonishment, "no religious temples devoted to worship?"
"Oh, yes, we have temples where we worship daily. Do you see that building?" nodding toward the majestic granite walls of the National College. "That is one of our most renowned temples, where the highest and the noblest in the land meet and mingle familiarly with the humblest in daily worship."

"I understand all that you wish to imply by that," I replied. "But have you no building devoted to divine worship; no temple that belongs specially to your Deity; to the Being that created you, and to whom you owe eternal gratitude and homage?"

"We have," she answered grandly, with a majestic wave of her hand, and in that mellow, musical voice that was sweeter than the chanting of birds, she exclaimed:

"This vast cathedral, boundless as our wonder; Whose shining lamps yon brilliant mists[A] supply; Its choir the winds, and waves; its organ thunder; Its dome the sky."

[Footnote A: Aurora Borealis]

"Do you worship Nature?" I asked.

"If we did, we should worship ourselves, for we are a part of Nature."

"But do you not recognize an invisible and incomprehensible Being that created you, and who will give your spirit an abode of eternal bliss, or consign it to eternal torments according as you have glorified and served him?"

"I am an atom of Nature;" said Wauna, gravely. "If you want me to answer your superstitious notions of religion, I will, in one sentence, explain, that the only religious idea in Mizora is: Nature is God, and God is Nature. She is the Great Mother who gathers the centuries in her arms, and rocks their children into eternal sleep upon her bosom."

"But how," I asked in bewildered astonishment, "how can you think of living without creeds, and confessionals? How can you prosper without prayer? How can you be upright, and honest, and true to yourselves and your friends without praying for divine grace and strength to sustain you? How can you be noble, and keep from envying your neighbors, without a prayer for divine grace to assist you to resist such temptation?"

"Oh, daughter of the dark ages," said Wauna, sadly, "turn to the benevolent and ever-willing Science. She is the goddess who has led us out of ignorance and superstition; out of degradation and disease, and every other wretchedness that superstitious, degraded humanity has known. She has lifted us above the low and the little, the narrow and mean in human thought and action, and has placed us in a broad, free, independent, noble, useful and grandly happy life."

"You have been favored by divine grace," I reiterated, "although you refuse to acknowledge it."

She smiled compassionately as she answered:

"She is the divinity who never turned a deaf ear to earnest and persistent effort in a sensible direction. But prayers to her must be work, resolute and conscientious work. She teaches that success in this world can only come to those who work for it. In your superstitious belief you pray for benefits you have never earned, possibly do not deserve, but expect to get simply because you pray for them. Science never betrays such partiality. The favors she bestows are conferred only upon the industrious."

"And you deny absolutely the efficacy of prayer?" I asked.

"If I could obtain anything by prayer alone, I would pray that my inventive faculty should be enlarged so that I might conceive and construct an air-ship that could cleave its way through that chaos of winds that is formed when two storms meet from opposite directions. It would rend to atoms one of our present make. But prayer will never produce an improved air-ship. We must dig into science for it. Our ancestors did not pray for us to become a race of symmetrically-shaped and universally healthy people, and expect that to effect a result. They went to work on scientific principles to root out disease and crime and want and wretchedness, and every degrading and retarding influence."

"Prayer never saved one of my ancestors from premature death," she continued, with a resolution that seemed determined to tear from my mind every fabric of faith in the consolations of divine interposition that had been a special part of my education, and had become rooted into my nature. "Disease, when it fastened upon the vitals of the young and beautiful and dearly-loved was stronger and more powerful than all the agonized prayers that could be poured from breaking hearts. But science, when solicited by careful study and experiment and investigation, offered the remedy. And now, we defy disease and have no fear of death until our natural time comes, and then it will be the welcome rest that the worn-out body meets with gratitude."

"But when you die," I exclaimed, "do you not believe you have an after life?"

"When I die," replied Wauna, "my body will return to the elements from whence it came. Thought will return to the force which gave it. The power of the brain is the one mystery that surrounds life. We know that the brain is a mechanical structure and acted upon by force; but how to analyze that force is still beyond our reach. You see that huge engine? We made it. It is a fine piece of mechanism. We know what it was made to do. We turn on the motive power, and it moves at the rate of a mile a minute if we desire it. Why should it move? Why might it not stand still?
CHAPTER VII.

Not long after my conversation with Wauna, mentioned in the previous chapter, an event happened in Mizora
of so singular and unexpected a character for that country that it requires a particular description. I refer to the death
of a young girl, the daughter of the Professor of Natural History in the National College, whose impressive inaugural
ceremonies I had witnessed with so much gratification. The girl was of a venturesome disposition, and, with a
number of others, had gone out rowing. The boats they used in Mizora for that purpose were mere cockle shells. A
sudden squall arose from which all could have escaped, but the reckless daring of this young girl cost her her life.
Her boat was capsized, and despite the exertions made by her companions, she was drowned.

Their lot was so barren of beauty and happiness, and the desire for it is, now and always has been, a strong trait of
human character. The conditions of society in those earlier ages rendered it impossible to enjoy this life perfectly,
and hope and longing pictured an imaginary one for an imaginary part of the body called the Soul. Progress and
civilization have brought to us the ideal heaven of the ancients, and we receive from Nature no evidence of any
other.

"But I do believe there is another," I declared. "And we ought to be prepared for it."
Wauna smiled. "What better preparation could you desire, then, than good works in this?" she asked.
"You should pray, and do penance for your sins," was my reply.
"Then," said Wauna, "we are doing the wisest penance every day. We are studying, investigating,
experimenting in order that those who come after us may be happier than we. Every day Science is yielding us some
new knowledge that will make living in the future still easier than now."
"I cannot conceive," I said, "how you are to be improved upon."
"When we manufacture fruit and vegetables from the elements, can you not perceive how much is to be gained?
Old age and death will come later, and the labor of cultivation will be done away. Such an advantage will not be
enjoyed during my lifetime. But we will labor to effect it for future generations."
"Your whole aim in life, then, is to work for the future of your race, instead of the eternal welfare of your own
soul?" I questioned, in surprise.

"If Nature," said Wauna, "has provided us a future life, if that mysterious something that we call Thought is to
be clothed in an etherealized body, and live in a world where decay is unknown, I have no fear of my reception
there. Live this life usefully and nobly, and no matter if a prayer has never crossed your lips your happiness will be
assured. A just and kind action will help you farther on the road to heaven than all the prayers that you can utter, and
all the pains and sufferings that you can inflict upon the flesh, for it will be that much added to the happiness of this
world. The grandest epitaph that could be written is engraved upon a tombstone in yonder cemetery. The subject
was one of the pioneers of progress in a long-ago century, when progress fought its way with difficulty through
ignorance and superstition. She suffered through life for the boldness of her opinions, and two centuries after, when
they had become popular, a monument was erected to her memory, and has been preserved through thousands of
years as a motto for humanity. The epitaph is simply this: 'The world is better for her having lived in it.'"
never expect and sincerely hope never to witness again. It made the deeper impression upon me because I knew the expressions of grief were all genuine.

I asked Wauna if any of the dead girl's companions feared that her mother might censure them for not making sufficient effort to save her when her boat capsized. She looked at me with astonishment.

"Such a thought," she said, "will never occur to her nor to any one else in Mizora. I have not asked the particulars, but I know that everything was done that could have been done to save her. There must have been something extraordinarily unusual about the affair for all Mizora girls are expert swimmers, and there is not one but would put forth any exertion to save a companion."

I afterward learned that such had really been the case.

It developed upon the Preceptress to break the news to the afflicted mother. It was done in the seclusion of her own home. There was no manifestation of morbid curiosity among acquaintances, neighbors and friends. The Preceptress and one or two others of her nearest and most intimate friends called at the house during the first shock of her bereavement.

After permission had been given to view the remains, Wauna and I called at the house, but only entered the drawing-room. On a low cot, in an attitude of peaceful repose, lay the breathless sleeper. Her mother and sisters had performed for her the last sad offices of loving duty, and lovely indeed had they made the last view we should have of their dear one.

There was to be no ceremony at the house, and Wauna and I were in the cemetery when the procession entered. As we passed through the city, I noticed that every business house was closed. The whole city was sympathizing with sorrow. I never before saw so vast a concourse of people. The procession was very long and headed by the mother, dressed and veiled in black. Behind her were the sisters carrying the body. It rested upon a litter composed entirely of white rosebuds. The sisters wore white, their faces concealed by white veils. Each wore a white rosebud pinned upon her bosom. They were followed by a long procession of young girls, schoolmates and friends of the dead. They were all dressed in white, but were not veiled. Each one carried a white rosebud.

The sisters placed the litter upon rests at the side of the grave, and clasping hands with their mother, formed a semicircle about it. They were all so closely veiled that their features could not be seen, and no emotion was visible. The procession of young girls formed a circle inclosing the grave and the mourners, and began chanting a slow and sorrowful dirge. No words can paint the pathos and beauty of such a scene. My eye took in every detail that displayed that taste for the beautiful that compels the Mizora mind to mingle it with every incident of life. The melody sounded like a chorus of birds chanting, in perfect unison, a weird requiem over some dead companion.

**DIRGE**

She came like the Spring in its gladness We received her with joy--we rejoiced in her promise Sweet was her song as the bird's, Her smile was as dew to the thirsty rose. But the end came ere morning awakened, While Dawn yet blushed in its bridal veil, The leafy music of the woods was hushed in snowy shrouds. Spring withered with the perfume in her hands; A winter sleet has fallen upon the buds of June; The ice-winds blow where yesterday zephyrs disported: Life is not consummated The rose has not blossomed, the fruit has perished in the flower, The bird lies frozen under its mother's breast Youth sleeps in round loveliness when age should lie withered and weary, and full of honor. Then the grave would be welcome, and our tears would fall not. The grave is not for the roses of youth; We mourn the early departed. Youth sleeps without dreams-- Without an awakening.

At the close of the chant, the mother first and then each sister took from her bosom the white rosebud and dropped it into the grave. Then followed her schoolmates and companions who each dropped in the bud she carried. A carpet of white rosebuds was thus formed, on which the body, still reclining upon its pillow of flowers, was gently lowered.

The body was dressed in white, and over all fell a veil of fine white tulle. A more beautiful sight I can never see than that young, lovely girl in her last sleep with the emblems of youth, purity and swift decay forming her pillow, and winding-sheet. Over this was placed a film of glass that rested upon the bottom and sides of the thin lining that covered the bottom and lower sides of the grave. The remainder of the procession of young girls then came forward and dropped their rosebuds upon it, completely hiding from view the young and beautiful dead.

The eldest sister then took a handful of dust and casting it into the grave, said in a voice broken, yet audible: "Mingle ashes with ashes, and dust with its original dust. To the earth whence it was taken, consign we the body of our sister." Each sister then threw in a handful of dust, and then with their mother entered their carriage, which immediately drove them home.

A beautiful silver spade was sticking in the soft earth that had been taken from the grave. The most intimate of the dead girls friends took a spadeful of earth and threw it into the open grave. Her example was followed by each one of the remaining companions until the grave was filled. Then clasping hands, they chanted a farewell to their departed companion and playmate. After which they strewed the grave with flowers until it looked like a bed of
beauty, and departed. I was profoundly impressed by the scene. Its solemnity, its beauty, and the universal expression of sorrow it had called forth. A whole city mourned the premature death of gifted and lovely youth. Alas! In my own unhappy country such an event would have elicited but a passing phrase of regret from all except the immediate family of the victim; for there sorrow is a guest at every heart, and leaves little room for sympathy with strangers.

The next day the mother was at her post in the National College; the daughters were at their studies, all seemingly calm and thoughtful, but showing no outward signs of grief excepting to the close observer. The mother was performing her accustomed duties with seeming cheerfulness, but now and then her mind would drop for a moment in sorrowful abstraction to be recalled with resolute effort and be fastened once more upon the necessary duty of life.

The sisters I often saw in those abstracted moods, and frequently saw them wiping away silent but unobtrusive tears. I asked Wauna for the meaning of such stoical reserve, and the explanation was as curious as all the other things that I met with in Mizora.

"If you notice the custom of different grades of civilization in your own country," said Wauna, "you will observe that the lower the civilization the louder and more ostentatious is the mourning. True refinement is unobtrusive in everything, and while we do not desire to repress a natural and inevitable feeling of sorrow, we do desire to conceal and conquer it, for the reason that death is a law of nature that we cannot evade. And, although the death of a young person has not occurred in Mizora in the memory of any living before this, yet it is not without precedent. We are very prudent, but we cannot guard entirely against accident. It has cast a gloom over the whole city, yet we refrain from speaking of it, and strive to forget it because it cannot be helped."

"And can you see so young, so fair a creature perish without wanting to meet her again?"

"Whatever sorrow we feel," replied Wauna, solemnly, "we deeply realize how useless it is to repine. We place implicit faith in the revelations of Nature, and in no circumstances does she bid us expect a life beyond that of the body. That is a life of individual consciousness."

"How much more consoling is the belief of my people," I replied, triumphantly. "Their belief in a future reunion would sustain them through the sorrow of parting in this. It has been claimed that some have lived pure lives solely in the hope of meeting some one whom they loved, and who had died in youth and innocence."

Wauna smiled.

"You do not all have then the same fate in anticipation for your future life?" she asked.

"Oh, no!" I answered. "The good and the wicked are divided."

"Tell me some incident in your own land that you have witnessed, and which illustrates the religious belief of your country."

"The belief that we have in a future life has often furnished a theme for the poets of my own and other countries. And sometimes a quaint and pretty sentiment is introduced into poetry to express it."

"I should like to hear some such poetry. Can you recite any?"

"I remember an incident that gave birth to a poem that was much admired at the time, although I can recall but the two last stanzas of it. A rowing party, of which I was a member, once went out upon a lake to view the sunset. After we had returned to shore, and night had fallen upon the water in impenetrable darkness, it was discovered that one of the young men who had rowed out in a boat by himself was not with us. A storm was approaching, and we all knew that his safety lay in getting ashore before it broke. We lighted a fire, but the blaze could not be seen far in such inky darkness. We hallooed, but received no answer, and finally ceased our efforts. Then one of the young ladies who possessed a very high and clear soprano voice, began singing at the very top of her power. It reached the wanderer in the darkness, and he rowed straight toward it. From that time on he became infatuated with the singer, declaring that her voice had come to him in his despair like an angel's straight from heaven.

"She died in less than a year, and her last words to him were: 'Meet me in heaven.' He had always been recklessly inclined, but after that he became a model of rectitude and goodness. He wrote a poem that was dedicated to her memory. In it he described himself as a lone wanderer on a strange sea in the darkness of a gathering storm and no beacon to guide him, when suddenly he hears a voice singing which guides him safe to shore. He speaks of the beauty of the singer and how dear she became to him, but he still hears the song calling him across the ocean of death."

"Repeat what you remember of it," urged Wauna.

"That face and form, have long since gone Beyond where the day was lifted: But the beckoning song still lingers on, An angels earthward drifted.

And when death's waters, around me roar And cares, like the birds, are winging: If I steer my bark to Heaven's shore 'Twill be by an angel's singing."

"Poor child of superstition," said Wauna, sadly. "Your belief has something pretty in it, but for your own
welfare, and that of your people, you must get rid of it as we have got rid of the offspring of Lust. Our children come to us as welcome guests through portals of the holiest and purest affection. That love which you speak of, I know nothing about. I would not know. It is a degradation which mars your young life and embitters the memories of age. We have advanced beyond it. There is a cruelty in life," she added, compassionately, "which we must accept with stoicism as the inevitable. Justice to your posterity demands of you the highest and noblest effort of which your intellect is capable."

CHAPTER VIII.

The conversation that I had with Wauna gave me so much uneasiness that I sought her mother. I cannot express the shock I felt at hearing such youthful and innocent lips speak of the absurdity of religious forms, ceremonies, and creeds. She regarded my belief in them as a species of barbarism. But she had not convinced me. I was resolved not to be convinced. I believed she was in error.

Surely, I thought, a country so far advanced in civilization, and practicing such unexampled rectitude, must, according to my religious teaching, have been primarily actuated by religious principles which they had since abandoned. My only surprise was that they had not relapsed into immorality, after destroying church and creed, and I began to feel anxious to convince them of the danger I felt they were incurring in neglecting prayer and supplication at the throne to continue them in their progress toward perfection of mental and moral culture.

I explained my feelings to the Preceptress with great earnestness and anxiety for their future, intimating that I believed their immunity from disaster had been owing to Divine sufferance. "For no nation," I added, quoting from my memory of religious precepts, "can prosper without acknowledging the Christian religion."

She listened to me with great attention, and when I had finished, asked:

"How do you account for our long continuance in prosperity and progress, for it is more than a thousand years since we rooted out the last vestige of what you term religion, from the mind. We have had a long immunity from punishment. To what do you attribute it?"

I hesitated to explain what had been in my mind, but finally faltered out something about the absence of the male sex. I then had to explain that the prisons and penitentiaries of my own land, and of all other civilized lands that I knew of, were almost exclusively occupied by the male sex. Out of eight hundred penitentiary prisoners, not more than twenty or thirty would be women; and the majority of them could trace their crimes to man's infidelity.

"And what do you do to reform them?" inquired the Preceptress.

"We offer them the teachings of Christianity. All countries, however, differ widely in this respect. The government of my country is not as generous to prisoners as that of some others. In the United States every penitentiary is supplied with a minister who expounds the Gospel to the prisoners every Sunday; that is once every seven days."

"And what do they do the rest of the time?"

"They work."

"Are they ignorant?"

"Oh, yes, indeed;" I replied, earnestly. "You could not find one scholar in ten thousand of them. Their education is either very limited, or altogether deficient."

"Do the buildings they are confined in cost a great deal?"

"Vast sums of money are represented by them; and it often costs a community a great deal of money to send a criminal to the penitentiary. In some States the power to pardon rests entirely with the governor, and it frequently occurs that a desperate criminal, who has cost a county a great deal of money to get rid of him, will be pardoned by the governor, to please a relative, or, as it is sometimes believed, for a bribe."

"And do the people never think of educating their criminals instead of working them?"

"That would be an expense to the government," I replied.

"If they would divide the time, and compel them to study half a day as rigorously as they make them work, it would soon make a vast change in their morals. Nothing so ennobles the mind as a broad and thorough education."

"They are all compelled to listen to religious instruction once a week," I answered. "That surely ought to make some improvement in them. I remember hearing an American lady relate her attendance at chapel service in a State penitentiary one Sunday. The minister's education was quite limited, as she could perceive from the ungrammatical language he used, but he preached sound orthodox doctrine. The text selected had a special application to his audience: 'Depart from me ye accursed, into everlasting torment prepared for the Devil and his angels.' There were eight hundred prisoners, and the minister assured them, in plain language, that such would surely be their sentence unless they repented."

"And that is what you call the consolations of religion, is it?" asked the Preceptress with an expression that rather disconcerted me; as though my zeal and earnestness entirely lacked the light of knowledge with which she viewed it.
"That is religious instruction;" I answered. "The minister exhorted the prisoners to pray and be purged of their sins. And it was good advice."

"But they might aver," persisted the Preceptress, "that they had prayed to be restrained from crime, and their prayers had not been answered."

"They didn't pray with enough faith, then;" I assured her in the confidence of my own belief. "That is wherein I think my own church is so superior to the other religions of the world," I added, proudly. "We can get the priest to absolve us from sin, and then we know we are rid of it, when he tells us so."

"But what assurance have you that the priest can do so?" asked the Preceptress.

"Because it is his duty to do so.

"Education will root out more sin than all your creeds can," gravely answered the Preceptress. "Educate your convict and train them into controlling and subduing their criminal tendencies by their own will, and it will have more effect on their morals than all the prayers ever uttered. Educate them up to that point where they can perceive for themselves the happiness of moral lives, and then you may trust them to temptation without fear. The ideas you have expressed about dogmas, creeds and ceremonies are not new to us, though, as a nation, we do not make a study of them. They are very, very ancient. They go back to the first records of the traditionary history of man. And the farther you go back the deeper you plunge into ignorance and superstition.

"The more ignorant the human mind, the more abject was its slavery to religion. As history progresses toward a more diffuse education of the masses, the forms, ceremonies and beliefs in religion are continually changing to suit the advancement of intelligence; and when intelligence becomes universal, they will be renounced altogether. What is true of the history of one people will be true of the history of another. Religions are not necessary to human progress. They are really clogs. My ancestors had more trouble to extirpate these superstitious ideas from the mind than they had in getting rid of disease and crime. There were several reasons for this difficulty. Disease and crime were self-evident evils, that the narrowest intelligence could perceive; but beliefs in creeds and superstitions were perversions of judgment, resulting from a lack of thorough mental training. As soon, however, as education of a high order became universal, it began to disappear. No mind of philosophical culture can adhere to such superstitions.

"Many ages the people made idols, and, decked them with rich ornaments, placed them in magnificent temples specially built for them and the rites by which they worshipped them. There have existed many variations of this kind of idolatry that are marked by the progressive stages of civilization. Some nations of remote antiquity were highly cultured in art and literature, yet worshipped gods of their own manufacture, or imaginary gods, for everything. Light and darkness, the seasons, earth, air, water, all had a separate deity to preside over and control their special services. They offered sacrifices to these deities as they desired their co-operation or favor in some enterprise to be undertaken.

"In remote antiquity, we read of a great General about to set out upon the sea to attack the army of another nation. In order to propitiate the god of the ocean, he had a fine chariot built to which were harnessed two beautiful white horses. In the presence of a vast concourse of people collected to witness the ceremony, he drove them into the sea. When they sank out of sight it was supposed that the god had accepted the present, and would show his gratitude for it by favoring winds and peaceful weather.

"A thousand years afterward history speaks of the occurrence derisively, as an absurd superstition, and at the same time they believed in and lauded a more absurd and cruel religion. They worshipped an imaginary being who had created and possessed absolute control of everything. Some of the human family it had pleased him to make eminently good, while others he made eminently bad. For those whom he had created with evil desires, he prepared a lake of molten fire into which they were to be cast after death to suffer endless torture for doing what they had been expressly created to do. Those who had been created good were to be rewarded for following out their natural inclinations, by occupying a place near the Deity, where they were to spend eternity in singing praises to him.

"He could, however, be persuaded by prayer from following his original intentions. Very earnest prayer had caused him to change his mind, and send rain when he had previously concluded to visit the country with drouth.

"Two nations at war with each other, and believing in the same Deity, would pray for a pestilence to visit their enemy. Death was universally regarded as a visitation of Providence for some offense committed against him instead of against the laws of nature.

"Some believed that prayer and donations to the church or priest, could induce the Deity to take their relatives from the lake of torment and place them in his own presence. The Deity was prayed to on every occasion, and for every trivial object. The poor and indolent prayed for him to send them food and clothes. The sick prayed for health, the foolish for wisdom, and the revengeful besought the Deity to consign all their enemies to the burning lake.

"The intelligent and humane began to doubt the necessity of such dreadful and needless torment for every conceivable misdemeanor, and it was modified, and eventually dropped altogether. Education finally rooted out every phase of superstition from the minds of the people, and now we look back and smile at the massive and
magnificent structures erected to the worship of a Deity who could be coaxed to change his mind by prayer."

I did not tell the Preceptress that she had been giving me a history of my own ancestry; but I remarked the resemblance with the joyous hope that in the future of my own unhappy country lay the possibility of a civilization so glorious, the ideal heaven of which every sorrowing heart had dreamed. But always with the desire to believe it had a spiritual eternity.

CHAPTER IX.

I have described the peculiar ceremony attending the burial of youth in Mizora. Old age, in some respects, had a similar ceremony, but the funeral of an aged person differed greatly from what I had witnessed at the grave of youth. Wauna and I attended the funeral of a very aged lady. Death in Mizora was the gradual failing of mental and physical vigor. It came slowly, and unaccompanied with pain. It was received without regret, and witnessed without tears.

The daughters performed the last labor that the mother required. They arrayed her body for burial and bore it to the grave. If in that season of the year, autumn leaves hid the bier, and formed the covering and pillow of her narrow bed. If not in the fall, full-blown roses and matured flowers were substituted.

The ceremony was conducted by the eldest daughter, assisted by the others. No tears were shed; no mourning worn; no sorrowful chanting. A solemn dirge was sung indicative of decay. A dignified solemnity befitting the farewell to a useful life was manifest in all the proceedings; but no demonstrations of sorrow were visible. The mourners were unveiled, and performed the last services for their mother with calmness. I was so astonished at the absence of mourning that I asked an explanation of Wauna.

"Why should we mourn," was the surprising answer, "for what is inevitable? Death must come, and, in this instance, it came in its natural way. There is nothing to be regretted or mourned over, as there was in the drowning of my young friend. Her life was suddenly arrested while yet in the promise of its fruitfulness. There was cause for grief, and the expressions and emblems of mourning were proper and appropriate. But here, mourning would be out of place, for life has fulfilled its promises. Its work is done, and nature has given the worn-out body rest. That is all."

That sympathy and regret which the city had expressed for the young dead was manifested only in decorum and respectful attendance at the funeral. No one appeared to feel that it was an occasion for mourning. How strange it all seemed to me, and yet there was a philosophy about it that I could not help but admire. Only I wished that they believed as I did, that all of those tender associations would be resumed beyond the grave. If only they could be convinced. I again broached the subject to Wauna. I could not relinquish the hope of converting her to my belief. She was so beautiful, so pure, and I loved her so dearly. I could not give up my hope of an eternal reunion. I appealed to her sympathy.

"What hope," I asked, "can you offer those whose lives have been only successive phases of unhappiness? Why should beings be created only to live a life of suffering, and then die, as many, very many, of my people do? If they had no hope of a spiritual life, where pain and sorrow are to be unknown, the burdens of this life could not be borne."

"You have the same consolation," replied Wauna, "as the Preceptress had in losing her daughter. That daring spirit that cost her her life, was the pride of her mother. She possessed a promising intellect, yet her mother accepts her death as one of the sorrowful phases of life, and bravely tries to subdue its pain. Long ages behind us, as my mother has told you, the history of all human life was but a succession of woes. Our own happy state has been evolved by slow degrees out of that sorrowful past. Human progress is marked by blood and tears, and the heart's bitterest anguish. We, as a people, have progressed almost beyond the reach of sorrow, but you are in the midst of it. You must work for the future, though you cannot be of it."

"I cannot," I declared, "reconcile myself to your belief. I am separated from my child. To think I am never to see it in this world, nor through endless ages, would drive me insane with despair. What consolation can your belief offer me?"

"In this life, you may yearn for your child, but after this life you sleep," answered Wauna, sententiously. "And how sweet that sleep! No dreams; no waking to work and trial; no striving after perfection; no planning for the morrow. It is oblivion than which there can be no happier heaven."

"Would not meeting with those you have loved be happier?" I asked, in amazement.

"There would be happiness; and there would be work, too."

"But my religion does not believe in work in heaven," I answered.

"Then it has not taken the immutable laws of Nature into consideration," said Wauna. "If Nature has prepared a conscious existence for us after this body decays, she has prepared work for us, you may rest assured. It might be a grander, nobler work; but it would be work, nevertheless. Then, how restful, in contrast, is our religion. It is eternal, undisturbable rest for both body and brain. Besides, as you say yourself, you cannot be sure of meeting those whom you desire to meet in that other country. They may be the ones condemned to eternal suffering for their sins. Think
you I could enjoy myself in any surroundings, when I knew that those who were dear to me in this life, were enduring torment that could have no end. Give me oblivion rather than such a heaven.

"Our punishment comes in this world; but it is not so much through sin as ignorance. The savages lived lives of misery, occasioned by their lack of intelligence. Humanity must always suffer for the mistakes it makes. Misery belongs to the ignorant; happiness to the wise. That is our doctrine of reward and punishment."

"And you believe that my people will one day reject all religions?"

"When they are advanced enough," she answered. "You say you have scholars among you already, who preach their inconsistencies. What do you call them?"

"Philosophers," was my reply.

"They are your prophets," said Wauna. "When they break the shackles that bind you to creeds and dogmas, they will have done much to advance you. To rely on one's own will power to do right is the only safe road to morality, and your only heaven."

I left Wauna and sought a secluded spot by the river. I was shocked beyond measure at her confession. It had the earnestness, and, to me, the cruelty of conviction. To live without a spiritual future in anticipation was akin to depravity, to crime and its penalty of prison life forever. Yet here was a people, noble, exalted beyond my conceiving, living in the present, and obeying only a duty to posterity. I recalled a painting I had once seen that always possessed for me a horrible fascination. In a cave, with his foot upon the corpse of a youth, sat the crowned and sceptered majesty of Death. The waters of oblivion encompassed the throne and corpse, which lay with its head and feet bathed in its waters—for out of the Unknown had life come, and to the Unknown had it departed. Before me, in vision, swept the mighty stream of human life from which I had been swept to these strange shores. All its sufferings, its delusions; its baffled struggles; its wrongs, came upon me with a sense of spiritual agony in them that religion—my religion, which was their only consolation—must vanish in the crucible of Science. And that Science was the magician that was to purify and exalt the world. To live in the Present; to die in it and become as the dust; a mere speck, a flash of activity in the far, limitless expanse of Nature, of Force, of Matter in which a spiritual ideal had no part. It was horrible to think of. The prejudices of inherited religious faith, the contracted forces of thought in which I had been born and reared could not be uprooted or expanded without pain.

CHAPTER X.

I had begun to feel an intense longing to return to my own country, but it was accompanied by a desire, equally as strong, to carry back to that woe-burdened land some of the noble lessons and doctrines I had learned in this. I saw no means of doing it that seemed so available as a companion,—a being, born and bred in an atmosphere of honor and grandly humane ideas and actions.

My heart and my judgment turned to Wauna. She was endeared to me by long and gentle association. She was self-reliant and courageous, and possessed a strong will. Who, of all my Mizora acquaintances, was so well adapted to the service I required.

When I broached the subject to her, Wauna expressed herself as really pleased with the idea; but when we went to the Preceptress, she acknowledged a strong reluctance to the proposition. She said:

"Wauna can form no conception of the conditions of society in your country. They are far, very far, behind our own. They will, I fear, chafe her own nature more than she can improve theirs. Still, if I thought she could lead your people into a broader intelligence, and start them on the way upward to enlightenment and real happiness, I would let her go. The moment, however, that she desires to return she must be aided to do so."

I pledged myself to abide by any request the Preceptress might make of me. Wauna's own inclinations greatly influenced her mother, and finally we obtained her consent. Our preparations were carefully made. The advanced knowledge of chemistry in Mizora placed many advantages in our way. Our boat was an ingenious contrivance with a thin glass top that could be removed and folded away until needed to protect us from the rigors of the Arctic climate.

I had given an accurate description of the rapids that would oppose us, and our boat was furnished with a motive power sufficient to drive us through them at a higher rate of speed than what they moved at. It was built so as to be easily converted into a sled, and runners were made that could be readily adjusted. We were provided with food and clothing prepared expressly for the severe change to and rigors of the Arctic climate through which we must pass.

I was constantly dreading the terrors of that long ice-bound journey, but the Preceptress appeared to be little concerned about it. When I spoke of its severities, she said for us to observe her directions, and we should not suffer. She asked me if I had ever felt uncomfortable in any of the air-ship voyages I had taken, and said that the cold of the upper regions through which I had passed in their country was quite as intense as any I could meet within a lower atmosphere of my own.

The newspapers had a great deal to say about the departure of the Preceptress' daughter on so uncertain a
mission, and to that strange land of barbarians which I represented. When the day arrived for our departure, immense throngs of people from all parts of the country lined the shore, or looked down upon us from their anchored air-ships.

The last words of farewell had been spoken to my many friends and benefactors. Wauna had bidden a multitude of associates good-by, and clasped her mother's hand, which she held until the boat parted from the shore. Years have passed since that memorable parting, but the look of yearning love in that Mizora mother's eyes haunts me still. Long and vainly has she watched for a boat's prow to cleave that amber mist and bear to her arms that vision of beauty and tender love I took away from her. My heart saddens at the thought of her grief and long, long waiting that only death will end.

We pointed the boat's prow toward the wide mysterious circle of amber mists, and then turned our eyes for a last look at Mizora. Wauna stood silent and calm, earnestly gazing into the eyes of her mother, until the shore and the multitude of fair faces faded like a vision of heaven from our views.

"O beautiful Mizora!" cried the voice of my heart. "Shall I ever again see a land so fair, where natures so noble and aims so lofty have their abiding place? Memory will return to you though my feet may never again tread your delightful shores. Farewell, sweet ideal land of my Soul, of Humanity, farewell!"

My thoughts turned to that other world from which I had journeyed so long. Would the time ever come when it, too, would be a land of universal intelligence and happiness? When the difference of nations would be settled by argument instead of battle? When disease, deformity and premature death would be unknown? When locks, and bolts and bars would be useless?

I hoped so much from the personal influence of Wauna. So noble, so utterly unconscious of wrong, she must surely revolutionize human nature whenever it came in contact with her own.

I pictured to myself my own dear land--dear, despite its many phases of wretchedness--smiling in universal comfort and health. I imagined its political prisons yawning with emptiness, while their haggard and decrepit and sorrowful occupants hobbled out into the sunshine of liberty, and the new life we were bringing to them. Fancy flew abroad on the wings of hope, dropping the seeds of progress wherever it passed.

The poor should be given work, and justly paid for it, instead of being supported by charity. The charity that had fostered insolence in its mistaken efforts to do good, should be employed to train poverty to skillful labor and economy in living. And what a world of good that one measure would produce! The poor should possess exactly the same educational advantages that were supplied to the rich. In this one measure, if I could only make it popular, I would see the golden promise of the future of my country. "Educate your poor and they will work out their own salvation. Educated Labor can dictate its rights to Capital."

How easy of accomplishment it all seemed to me, who had seen the practical benefits arising to a commonwealth that had adopted these mottoes. I doubted not that the wiser and better of my own people would aid and encourage me. Free education would lead to other results.

Riches should be accumulated only by vast and generous industries that reached a helping hand to thousands of industrious poor, instead of grinding them out of a few hundred of poorly-paid and over-worked artisans. Education in the hands of the poor would be a powerful agent with which they would alleviate their own condition, and defend themselves against oppression and knavery.

The prisons should be supplied with schools as well as work-rooms, where the intellect should be trained and cultivated, and where moral idiocy, by the stern and rigorous law of Justice to Innocence, should be forced to deny itself posterity.

No philanthropical mind ever spread the wings of its fancy for a broader flight.

CHAPTER XI.

Our journey was a perilous one with all our precautions. The passage through the swiftest part of the current almost swamped our boat. The current that opposed us was so strong, that when we increased our speed our boat appeared to be cleaving its way through a wall of waters. Wauna was perfectly calm, and managed the motor with the steadiest nerves. Her courage inspired me, though many a time I despaired of ever getting out of the rapids. When we did, and looked up at the star-gemmed canopy that stretches above my own world, and abroad over the dark and desolate waste of waters around us, it gave me an impression of solemn and weird magnificence. It was such a contrast to the vivid nights of Mizora, to which my eyes had so long been accustomed, that it came upon me like a new scene.

The stars were a source of wonder and ceaseless delight to Wauna. "It looks," she said, "as though a prodigal hand had strewn the top of the atmosphere with diamonds."

The journey over fields of ice and snow was monotonous, but, owing to the skill and knowledge of Mizora displayed in our accoutrements, it was deprived of its severities. The wind whistled past us without any other greeting than its melancholy sound. We looked out from our snug quarters on the dismal hills of snow and ice
without a sensation of distress. The Aurora Borealis hung out its streamers of beauty, but they were pale compared
to what Wauna had seen in her own country. The Esquimaux she presumed were animals.

We traveled far enough south to secure passage upon a trading-vessel bound for civilized shores. The sun came
up with his glance of fire and his banners of light, laying his glorious touch on cloud and water, and kissing the
cheek with his warmth. He beamed upon us from the zenith, and sank behind the western clouds with a lingering
glance of beauty. The moon came up like the ghost of the sun, casting a weird yet tender beauty on every object. To
Wauna it was a revelation of magnificence in nature beyond her contriving.

"How grand," she exclaimed, "are the revelations of nature in your world! To look upon them, it seems to me,
would broaden and deepen the mind with the very vastness of their splendor. Nature has been more bountiful to you
than to Mizora. The day with its heart of fire, and the night with its pale beauty are grander than ours. They speak of
vast and incomprehensible power."

When I took Wauna to the observatory, and she looked upon the countless multitudes of worlds and suns
revolving in space so far away that a sun and its satellites looked like a ball of mist, she said that words could not
describe her sensations.

"To us," she said, "the leaves of Nature's book are the winds and waves, the bud and bloom and decay of
seasons. But here every leaf is a world. A mighty hand has sprinkled the suns like fruitful seeds across the limitless
fields of space. Can human nature contemplate a scene so grand that reaches so far beyond the grasp of mind, and
not feel its own insignificance, and the littleness of selfish actions? And yet you can behold these myriads of worlds
and systems of worlds wheeling in the dim infinity of space—a spectacle awful in its vastness—and turn to the
practice of narrow superstitions?"

At last the shores of my native land greeted my longing eyes, and the familiar scenes of my childhood drew
near. But when, after nearly twenty years absence, I stood on the once familiar spot, the graves of my heart's dear
ones were all that was mine. My little one had died soon after my exile. My father had soon followed. Suspected,
and finally persecuted by the government, my husband had fled the country, and, nearly as I could discover, had
sought that universal asylum for the oppressed of all nations—the United States. And thither I turned my steps.

In my own country and in France, the friends who had known me in girlhood were surprised at my youthful
appearance. I did not explain the cause of it to them, nor did I mention the people or country from whence I had
come. Wauna was my friend and a foreigner—that was all.

The impression she made was all that I had anticipated. Her unusual beauty and her evident purity attracted
attention wherever she went. The wonderful melody of her singing was much commented upon, but in Mizora she
had been considered but an indifferent singer. But I had made a mistake in my anticipation of her personal influence.
The gentleness and delicacy of her character received the tenderest respect. None who looked upon that face or met
the glance of the dark soft eyes ever doubted that the nature that animated them was pure and beautiful. Yet it was
the respect felt for a character so exceptionably superior that imitation and emulation would be impossible.

"She is too far above the common run of human nature," said one observer. "I should not be surprised if her
spirit were already pluming its wings for a heavenly flight. Such natures never stay long among us."

The remark struck my heart with a chill of depression. I looked at Wauna and wondered why I had noticed
sooner the shrinking outlines of the once round cheek. Too gentle to show disgust, too noble to ill-treat, the spirit of
Wauna was chafing under the trying associations. Men and women alike regarded her as an impossible character,
and I began to realize with a sickening regret that I had made a mistake. In my own country, in France and England,
her beauty was her sole attraction to men. The lofty ideal of humanity that she represented was smiled at or gently
ignored.

"The world would be a paradise," said one philosopher, "if such characters were common. But one is like a
seed in the ocean; it cannot do much good."

When we arrived in the United States, its activity and evident progress impressed Wauna with a feeling more
nearly akin to companionship. Her own character received a juster appreciation.

"The time is near," she said, "when the New World will be the teacher of the Old in the great lesson of
Humanity. You will live to see it demonstrate to the world the justice and policy of giving to every child born under
its flag the highest mental, moral and physical training known to the present age. You can hardly realize what
twenty-five years of free education will bring to it. They are already on the right path, but they are still many
centuries behind my own country in civilization, in their government and modes of dispensing justice. Yet their free
schools, as yet imperfect, are, nevertheless, fruitful seeds of progress."

Yet here the nature of Wauna grew restless and homesick, and she at last gave expression to her longing for
home.

"I am not suited to your world," she said, with a look of deep sorrow in her lovely eyes. "None of my people
are. We are too finely organized. I cannot look with any degree of calmness upon the practices of your civilization.
It is a common thing to see mothers ill-treat their own helpless little ones. The pitiful cries of the children keep ringing in my ears. Cannot mothers realize that they are whipping a mean spirit into their offspring instead of out. I have heard the most enlightened deny their own statements when selfishness demanded it. I cannot mention the half of the things I witness daily that grates upon my feelings. I cannot reform them. It is not for such as I to be a reformer. Those who need reform are the ones to work for it.

Sorrowfully I bade adieu to my hopes and my search for Alexis, and prepared to accompany Wauna's return. We embarked on a whaling vessel, and having reached its farthest limit, we started on our perilous journey north; perilous for the lack of our boat, of which we could hear nothing. It had been left in charge of a party of Esquimaux, and had either been destroyed, or was hidden. Our progress, therefore, depended entirely upon the Esquimaux. The tribe I had journeyed so far north with had departed, and those whom I solicited to accompany us professed to be ignorant of the sea I mentioned. Like all low natures, the Esquimaux are intensely selfish. Nothing could induce them to assist us but the most apparent benefit to themselves; and this I could not assure them. The homesickness, and coarse diet and savage surroundings told rapidly on the sensitive nature of Wauna. In a miserable Esquimaux hut, on a pile of furs, I saw the flame of a beautiful and grandly noble life die out. My efforts were hopeless; my anguish keen. O Humanity, what have I sacrificed for you!

"Oh, Wauna," I pleaded, as I saw the signs of dissolution approaching, "shall I not pray for you?"

"Prayers cannot avail me," she replied, as her thin hands reached and closed over one of mine. "I had hoped once more to see the majestic hills and smiling valleys of my own sweet land, but I shall not. If I could only go to sleep in the arms of my mother. But the Great Mother of us all will soon receive me in her bosom. And oh! my friend, promise me that her dust shall cover me from the sight of men. When my mother rocked me to slumber on her bosom, and soothed me with her gentle lullaby, she little dreamed that I should suffer and die first. If you ever reach Mizora, tell her only that I sleep the sleep of oblivion. She will know. Let the memory of my suffering die with me."

"Oh, Wauna," I exclaimed, in anguish, "you surely have a soul. How can anything so young, so pure, so beautiful, be doomed to annihilation?"

"We are not annihilated," was the calm reply. "And as to beauty, are the roses not beautiful? Yet they die and you say it is the end of the year's roses. The birds are harmless, and their songs make the woods melodious with the joy of life, yet they die, and you say they have no after life. We are like the roses, but our lives are for a century and more. And when our lives are ended, the Great Mother gathers us in. We are the harvest of the centuries."

When the dull, gray light of the Arctic morning broke, it fell gently upon the presence of Death.

With the assistance of the Esquimaux, a grave was dug, and a rude wooden cross erected on which I wrote the one word "Wauna," which, in the language of Mizora, means "Happiness."

The world to which I have returned is many ages behind the civilization of Mizora.

Though we cannot hope to attain their perfection in our generation, yet many, very many, evils could be obliterated were we to follow their laws. Crime is as hereditary as disease.

No savant now denies the transmittable taint of insanity and consumption. There are some people in the world now, who, knowing the possibility of afflicting offspring with hereditary disease, have lived in ascetic celibacy. But where do we find a criminal who denies himself offspring, lest he endow posterity with the horrible capacity for murder that lies in his blood?

The good, the just, the noble, close heart and eyes to the sweet allurements of domestic life, lest posterity suffer physically or mentally by them. But the criminal has no restraints but what the law enforces. Ignorance, poverty and disease, huddled in dens of wretchedness, where they multiply with reckless improvidence, sometimes fostered by mistaken charity.

The future of the world, if it be grand and noble, will be the result of UNIVERSAL EDUCATION, FREE AS THE GOD-GIVEN WATER WE DRINK.

In the United States I await the issue of universal liberty. In this refuge for oppression, my husband found a grave. Childless, homeless and friendless, in poverty and obscurity, I have written the story of my wanderings. The world's fame can never warm a heart already dead to happiness; but out of the agony of one human life, may come a lesson for many. Life is a tragedy even under the most favorable conditions.

THE END
THE DOOR THROUGH SPACE
By Marion Zimmer Bradley

...across half a Galaxy, the Terran Empire maintains its sovereignty with the consent of the governed. It is a peaceful reign, held by compact and not by conquest. Again and again, when rebellion threatens the Terran Peace, the natives of the rebellious world have turned against their own people and sided with the men of Terra; not from fear, but from a sense of dedication.

There has never been open war. The battle for these worlds is fought in the minds of a few men who stand between worlds; bound to one world by interest, loyalties and allegiance; bound to the other by love.

Such a world is Wolf. Such a man was Race Cargill of the Terran Secret Service.

Author's Note:
I've always wanted to write. But not until I discovered the old pulp science-fantasy magazines, at the age of sixteen, did this general desire become a specific urge to write science-fantasy adventures.

I took a lot of detours on the way. I discovered s-f in its golden age: the age of Kuttner, C.L. Moore, Leigh Brackett, Ed Hamilton and Jack Vance. But while I was still collecting rejection slips for my early efforts, the fashion changed. Adventures on faraway worlds and strange dimensions went out of fashion, and the new look in science-fiction--emphasis on the science--came in.

So my first stories were straight science-fiction, and I'm not trying to put down that kind of story. It has its place. By and large, the kind of science-fiction which makes tomorrow's headlines as near as this morning's coffee, has enlarged popular awareness of the modern, miraculous world of science we live in. It has helped generations of young people feel at ease with a rapidly changing world.

But fashions change, old loves return, and now that Sputniks clutter up the sky with new and unfamiliar moons, the readers of science-fiction are willing to wait for tomorrow to read tomorrow's headlines. Once again, I think, there is a place, a wish, a need and hunger for the wonder and color of the world way out. The world beyond the stars. The world we won't live to see. That is why I wrote THE DOOR THROUGH SPACE.

--MARION ZIMMER BRADLEY

CHAPTER ONE

Beyond the spaceport gates, the men of the Kharsa were hunting down a thief. I heard the shrill cries, the pad-padding of feet in strides just a little too long and loping to be human, raising echoes all down the dark and dusty streets leading up to the main square.

But the square itself lay empty in the crimson noon of Wolf. Overhead the dim red ember of Phi Coronis, Wolf's old and dying sun, gave out a pale and heatless light. The pair of Spaceforce guards at the gates, wearing the black leathers of the Terran Empire, shockers holstered at their belts, were drowsing under the arched gateway where the star-and-rocket emblem proclaimed the domain of Terra. One of them, a snub-nosed youngster only a few weeks out from Earth, cocked an inquisitive ear at the cries and scuffling feet, then jerked his head at me.

"Hey, Cargill, you can talk their lingo. What's going on out there?"

I stepped out past the gateway to listen. There was still no one to be seen in the square. It lay white and windswept, a barricade of emptiness; to one side the spaceport and the white skyscraper of the Terran Headquarters, and at the other side, the clutter of low buildings, the street-shrine, the little spaceport cafe smelling of coffee and jaco, and the dark opening mouths of streets that rambled down into the Kharsa--the old town, the native quarter. But I was alone in the square with the shrill cries--closer now, raising echoes from the enclosing walls--and the loping of many feet down one of the dirty streets.

Then I saw him running, dodging, a hail of stones flying round his head; someone or something small and cloaked and agile. Behind him the still-faceless mob howled and threw stones. I could not yet understand the cries; but they were out for blood, and I knew it.

I said briefly, "Trouble coming," just before the mob spilled out into the square. The fleeing dwarf stared about wildly for an instant, his head jerking from side to side so rapidly that it was impossible to get even a fleeting impression of his face--human or nonhuman, familiar or bizarre. Then, like a pellet loosed from its sling, he made straight for the gateway and safety.

And behind him the loping mob yelled and howled and came pouring over half the square. Just half. Then by
that sudden intuition which permeates even the most crazed mob with some semblance of reason, they came to a ragged halt, heads turning from side to side.

I stepped up on the lower step of the Headquarters building, and looked them over.

Most of them were chaks, the furred man-tall nonhumans of the Kharsa, and not the better class. Their fur was unkempt, their tails naked with filth and disease. Their leather aprons hung in tatters. One or two in the crowd were humans, the dregs of the Kharsa. But the star-and-rocket emblem blazoned across the spaceport gates sobered even the wildest blood-lust somewhat; they milled and shifted uneasily in their half of the square.

For a moment I did not see where their quarry had gone. Then I saw him crouched, not four feet from me, in a patch of shadow. Simultaneously the mob saw him, huddled just beyond the gateway, and a howl of frustration and rage went ringing round the square. Someone threw a stone. It zipped over my head, narrowly missing me, and landed at the feet of the black-leathered guard. He jerked his head up and gestured with the shocker which had suddenly come unholstered.

The gesture should have been enough. On Wolf, Terran law has been written in blood and fire and exploding atoms; and the line is drawn firm and clear. The men of Spaceforce do not interfere in the old town, or in any of the native cities. But when violence steps over the threshold, passing the blazon of the star and rocket, punishment is swift and terrible. The threat should have been enough.

Instead a howl of abuse went up from the crowd.

"Terranan!"
"Son of the Ape!"

The Spaceforce guards were shoulder to shoulder behind me now. The snub-nosed kid, looking slightly pale, called out. "Get inside the gates, Cargill! If I have to shoot--"

I nodded to show that I heard.

"You talk their lingo. Tell them to haul off! Damned if I want to shoot!"

I stepped down and walked into the open square, across the crumbled white stones, toward the ragged mob. Even with two armed Spaceforce men at my back, it made my skin crawl, but I flung up my empty hand in token of peace:

"Take your mob out of the square," I shouted in the jargon of the Kharsa. "This territory is held in compact of peace! Settle your quarrels elsewhere!"

There was a little stirring in the crowd. The shock of being addressed in their own tongue, instead of the Terran Standard which the Empire has forced on Wolf, held them silent for a minute. I had learned that long ago: that speaking in any of the languages of Wolf would give me a minute's advantage.

But only a minute. Then one of the mob yelled, "We'll go if you give'em to us! He's no right to Terran sanctuary!"

I walked over to the huddled dwarf, miserably trying to make himself smaller against the wall. I nudged him with my foot.

"Get up. Who are you?"

The hood fell away from his face as he twitched to his feet. He was trembling violently. In the shadow of the hood I saw a furred face, a quivering velvety muzzle, and great soft golden eyes which held intelligence and terror.

"What have you done? Can't you talk?"

He held out the tray which he had shielded under his cloak, an ordinary peddler's tray. "Toys. Sell toys. Children. You got'm?"

I shook my head and pushed the creature away, with only a glance at the array of delicately crafted manikins, tiny animals, prisms and crystal whirligigs. "You'd better get out of here. Scram. Down that street." I pointed.

A voice from the crowd shouted again, and it had a very ugly sound. "He is a spy of Nebran!"

"Nebran--" The dwarfish nonhuman gabbled something then doubled behind me. I saw him dodge, feint in the direction of the gates, then, as the crowd surged that way, run for the street-shrine across the square, slipping from recess to recess of the wall. A hail of stones went flying in that direction. The little toy-seller dodged into the street-shrine.

Then there was a hoarse "Ah, aah!" of terror, and the crowd edged away, surged backward. The next minute it had begun to melt away, its entity dissolving into separate creatures, slipping into the side alleys and the dark streets that disgorged into the square. Within three minutes the square lay empty again in the pale-crimson noon.

The kid in black leather let his breath go and swore, slipping his shocker into its holster. He stared and demanded profanely, "Where'd the little fellow go?"

"Who knows?" the other shrugged. " Probably sneaked into one of the alleys. Did you see where he went, Cargill?"
I came slowly back to the gateway. To me, it had seemed that he ducked into the street-shrine and vanished into thin air, but I've lived on Wolf long enough to know you can't trust your eyes here. I said so, and the kid swore again, gulping, more upset than he wanted to admit. "Does this kind of thing happen often?"

"All the time," his companion assured him soberly, with a sidewise wink at me. I didn't return the wink.

The kid wouldn't let it drop. "Where did you learn their lingo, Mr. Cargill?"

"I've been on Wolf a long time," I said, spun on my heel and walked toward Headquarters. I tried not to hear, but their voices followed me anyhow, discreetly lowered, but not lowered enough.

"Kid, don't you know who he is? That's Cargill of the Secret Service! Six years ago he was the best man in Intelligence, before--" The voice lowered another decibel, and then there was the kid's voice asking, shaken, "But what the hell happened to his face?"

I should have been used to it by now. I'd been hearing it, more or less behind my back, for six years. Well, if my luck held, I'd never hear it again. I strode up the white steps of the skyscraper, to finish the arrangements that would take me away from Wolf forever. To the other end of the Empire, to the other end of the galaxy--anywhere, so long as I need not wear my past like a medallion around my neck, or blazoned and branded on what was left of my ruined face.

CHAPTER TWO

The Terran Empire has set its blazon on four hundred planets circling more than three hundred suns. But no matter what the color of the sun, the number of moons overhead, or the geography of the planet, once you step inside a Headquarters building, you are on Earth. And Earth would be alien to many who called themselves Earthmen, judging by the strangeness I always felt when I stepped into that marble-and-glass world inside the skyscraper. I heard the sound of my steps ringing into thin resonance along the marble corridor, and squinted my eyes, readjusting them painfully to the cold yellowness of the lights.

The Traffic Division was efficiency made insolent, in glass and chrome and polished steel, mirrors and windows and looming electronic clerical machines. Most of one wall was taken up by a TV monitor which gave a view of the spaceport; a vast open space lighted with blue-white mercury vapor lamps, and a chained-down skyscraper of a starship, littered over with swarming ants. The process crew was getting the big ship ready for skylift tomorrow morning. I gave it a second and then a third look. I'd be on it when it lifted.

Turning away from the monitored spaceport, I watched myself stride forward in the mirrored surfaces that were everywhere; a tall man, a lean man, bleached out by years under a red sun, and deeply scarred on both cheeks and around the mouth. Even after six years behind a desk, my neat business clothes--suitable for an Earthman with a desk job--didn't fit quite right, and I still rose unconsciously on the balls of my feet, approximating the lean stooping walk of a Dry-towner from the Coronis plains.

The clerk behind the sign marked TRANSPORTATION was a little rabbit of a man with a sunlamp tan, barricaded by a small-sized spaceport of desk, and looking as if he liked being shut up there. He looked up in civil inquiry.

"Can I do something for you?"

"My name's Cargill. Have you a pass for me?"

He stared. A free pass aboard a starship is rare except for professional spacemen, which I obviously wasn't. "Let me check my records," he hedged, and punched scanning buttons on the glassy surface. Shadows came and went, and I saw myself half-reflected, a tipsy shadow in a flurry of racing colors. The pattern finally stabilized and the clerk read off names.

"Brill, Cameron ... ah, yes. Cargill, Race Andrew, Department 38, transfer transportation. Is that you?"

I admitted it and he started punching more buttons when the sound of the name made connection in whatever desk-clerks use for a brain. He stopped with his hand halfway to the button.

"Are you Race Cargill of the Secret Service, sir? The Race Cargill?"

"It's right there," I said, gesturing warily at the projected pattern under the glassy surface. "Why, I thought--I mean, everybody took it for granted--that is, I heard--"

"You thought Cargill had been killed a long time ago because his name never turned up in news dispatches any more?" I grinned sourly, seeing my image dissolve in blurring shadows, and feeling the long-healed scar on my mouth draw up to make the grin hideous. "I'm Cargill, all right. I've been up on Floor 38 for six years, holding down a desk any clerk could handle. You for instance."

He gaped. He was a rabbit of a man who had never stepped out of the safe familiar boundaries of the Terran Trade City. "You mean you're the man who went to Charin in disguise, and routed out The Lisse? The man who scouted the Black Ridge and Shainsa? And you've been working at a desk upstairs all these years? It's--hard to
believe, sir."

My mouth twitched. It had been hard for me to believe while I was doing it. "The pass?"

"Right away, sir." He punched buttons and a printed chip of plastic extruded from a slot on the desk top. "Your fingerprint, please?" He pressed my finger into the still-soft surface of the plastic, indelibly recording the print; waited a moment for it to harden, then laid the chip in the slot of a pneumatic tube. I heard it whoosh away.

"They'll check your fingerprint against that when you board the ship. Skylift isn't till dawn, but you can go aboard as soon as the process crew finishes with her." He glanced at the monitor screen, where the swarming crew were still doing inexplicable things to the immobile spacecraft. "It will be another hour or two. Where are you going, Mr. Cargill?"

"Some planet in the Hyades Cluster. Vainwal, I think, something like that."

"What's it like there?"

"How should I know?" I'd never been there either. I only knew that Vainwal had a red sun, and that the Terran Legate could use a trained Intelligence officer. And not pin him down to a desk.

There was respect, and even envy in the little man's voice. "Could I--buy you a drink before you go aboard, Mr. Cargill?"

"Thanks, but I have a few loose ends to tie up." I didn't, but I was damned if I'd spend my last hour on Wolf under the eyes of a deskbound rabbit who preferred his adventure safely secondhand.

But after I'd left the office and the building, I almost wished I'd taken him up on it. It would be at least an hour before I could board the starship, with nothing to do but hash over old memories, better forgotten.

The sun was lower now. Phi Coronis is a dim star, a dying star, and once past the crimson zenith of noon, its light slants into a long pale-reddish twilight. Four of Wolf's five moons were clustered in a pale bouquet overhead, mingling thin violet moonlight into the crimson dusk.

The shadows were blue and purple in the empty square as I walked across the stones and stood looking down one of the side streets.

A few steps, and I was in an untidy slum which might have been on another world from the neat bright Trade City which lay west of the spaceport. The Kharsa was alive and reeking with the sounds and smells of human and half-human life. A naked child, diminutive and golden-furred, darted between two of the chinked pebble-houses, and disappeared, spilling fragile laughter like breaking glass.

A little beast, half snake and half cat, crawled across a roof, spread leathery wings, and flapped to the ground.

The sour pungent reek of incense from the open street-shrine made my nostrils twitch, and a hulked form inside, not human, cast me a surly green glare as I passed.

I turned, retracing my steps. There was no danger, of course, so close to the Trade City. Even on such planets as Wolf, Terra's laws are respected within earshot of their gates. But there had been rioting here and in Charin during the last month. After the display of mob violence this afternoon, a lone Terran, unarmed, might turn up as a solitary corpse flung on the steps of the HQ building.

There had been a time when I had walked alone from Shainsa to the Polar Colony. I had known how to melt into this kind of night, shabby and inconspicuous, a worn shirtcloak hunched round my shoulders, weaponless except for the razor-sharp skean in the clasp of the cloak; walking on the balls of my feet like a Dry-towner, not looking or sounding or smelling like an Earthman.

That rabbit in the Traffic office had stirred up things I'd be wiser to forget. It had been six years; six years of slow death behind a desk, since the day when Rakhal Sensar had left me a marked man; death-warrant written on my scared face anywhere outside the narrow confines of the Terran law on Wolf.

Rakhal Sensar--my fists clenched with the old impotent hate. If I could get my hands on him!

It had been Rakhal who first led me through the byways of the Kharsa, teaching me the jargon of a dozen tribes, the chirping call of the Ya-men, the way of the catmen of the rain-forests, the argot of thieves markets, the walk and step of the Dry-towners from Shainsa and Daillon and Ardcaran--the parched cities of dusty, salt stone which spread out in the bottoms of Wolf's vanished oceans. Rakhal was from Shainsa, human, tall as an Earthman, weathered by salt and sun, and he had worked for Terran Intelligence since we were boys. We had traveled all over our world together, and found it good.

And then, for some reason I had never known, it had come to an end. Even now I was not wholly sure why he had erupted, that day, into violence and a final explosion. Then he had disappeared, leaving me a marked man. And a lonely one: Juli had gone with him.

I strode the streets of the slum unseeing, my thoughts running a familiar channel. Juli, my kid sister, clinging around Rakhal's neck, her gray eyes hating me. I had never seen her again.

That had been six years ago. One more adventure had shown me that my usefulness to the Secret Service was over. Rakhal had vanished, but he had left me a legacy: my name, written on the sure scrolls of death anywhere
outside the safe boundaries of Terran law. A marked man, I had gone back to slow stagnation behind a desk. I’d stood it as long as I could.

When it finally got too bad, Magnusson had been sympathetic. He was the Chief of Terran Intelligence on Wolf, and I was next in line for his job, but he understood when I quit. He’d arranged the transfer and the pass, and I was leaving tonight.

I was nearly back to the spaceport by now, across from the street-shrine at the edge of the square. It was here that the little toy-seller had vanished. But it was exactly like a thousand, a hundred thousand other such street-shrines on Wolf, a smudge of incense reeking and stinking before the squatting image of Nebran, the Toad God whose face and symbol are everywhere on Wolf. I stared for a moment at the ugly idol, then slowly moved away.

The lighted curtains of the spaceport cafe attracted my attention and I went inside. A few spaceport personnel in storm gear were drinking coffee at the counter, a pair of furred chaks, lounging beneath the mirrors at the far end, and a trio of Dry-towners, rangy, weathered men in crimson and blue shirt cloaks, were standing at a wall shelf, eating Terran food with aloof dignity.

In my business clothes I felt more conspicuous than the chaks. What place had a civilian here, between the uniforms of the spacemen and the colorful brilliance of the Dry-towners?

A snub-nosed girl with alabaster hair came to take my order. I asked for jaco and bunlets, and carried the food to a wall shelf near the Dry-towners. Their dialect fell soft and familiar on my ears. One of them, without altering the expression on his face or the easy tone of his voice, began to make elaborate comments on my entrance, my appearance, my ancestry and probably personal habits, all defined in the colorfully obscene dialect of Shainsa.

That had happened before. The Wolfan sense of humor is only half-human. The finest joke is to criticize and insult a stranger, preferably an Earthman, to his very face, in an unknown language, perfectly deadpan. In my civilian clothes I was obviously fair game.

A look or gesture of resentment would have lost face and dignity—what the Dry-towners call their kihar—permanently. I leaned over and remarked in their own dialect that I would, at some future and unspecified time, appreciate the opportunity to return their compliments.

By rights they should have laughed, made some barbed remark about my command of language and crossed their hands in symbol of a jest decently reversed on themselves. Then we would have bought each other a drink, and that would be that.

But it didn't happen that way. Not this time. The tallest of the three whirled, upsetting his drink in the process. I heard its thin shatter through the squeal of the alabaster-haired girl, as a chair crashed over. They faced me three abreast, and one of them fumbled in the clasp of his shirtcloak.

I edged backward, my own hand racing up for a skean I hadn't carried in six years, and fronted them squarely, hoping I could face down the prospect of a roughhouse. They wouldn't kill me, this close to the HQ, but at least I was in for an unpleasant mauling. I couldn't handle three men; and if nerves were this taut in the Kharsa, I might get knifed. Quite by accident, of course.

The chaks moaned and gibbered. The Dry-towners glared at me and I tensed for the moment when their steady stare would explode into violence.

Then I became aware that they were gazing, not at me, but at something or someone behind me. The skeans snicked back into the clasps of their cloaks.

Then they broke rank, turned and ran. They ran, blundering into stools, leaving havoc of upset benches and broken crockery in their wake. One man barged into the counter, swore and ran on, limping. I let my breath go. Something had put the fear of God into those brutes, and it wasn't my own ugly mug. I turned and saw the girl.

She was slight, with waving hair like spun black glass, circled with faint tracery of stars. A black glass belt bound her narrow waist like clasped hands, and her robe, stark white, bore an ugly embroidery across the breasts, the flat sprawl of a conventionalized Toad God, Nebran. Her features were delicate, chiseled, pale; a Dry-town face, all human, all woman, but set in an alien and unearthly repose. The great eyes gleamed red. They were fixed, almost unseeing, but the crimson lips were curved with inhuman malice.

She stood motionless, looking at me as if wondering why I had not run with the others. In half a second, the smile flickered off and was replaced by a startled look of—recognition?

Whoever and whatever she was, she had saved me a mauling. I started to phrase formal thanks, then broke off in astonishment. The cafe had emptied and we were entirely alone. Even the chaks had leaped through an open window—I saw the whisk of a disappearing tail.

We stood frozen, looking at one another while the Toad God sprawled across her breasts rose and fell for half a dozen breaths.

Then I took one step forward, and she took one step backward, at the same instant. In one swift movement she was outside in the dark street. It took me only an instant to get into the street after her, but as I stepped across the
door there was a little stirring in the air, like the rising of heat waves across the salt flats at noon. Then the street-shrine was empty, and nowhere was there any sign of the girl. She had vanished. She simply was not there.

I gaped at the empty shrine. She had stepped inside and vanished, like a wraith of smoke, like--

--Like the little toy-seller they had hunted out of the Kharsa.

There were eyes in the street again and, becoming aware of where I was, I moved away. The shrines of Nebran are on every corner of Wolf, but this is one instance when familiarity does not breed contempt. The street was dark and seemed empty, but it was packed with all the little noises of living. I was not unobserved. And meddling with a street-shrine would be just as dangerous as the skeans of my three loud-mouthed Dry-town roughnecks.

I turned and crossed the square for the last time, turning toward the loom of the spaceship, filing the girl away as just another riddle of Wolf I'd never solve.

How wrong I was!

---

CHAPTER THREE

From the spaceport gates, exchanging brief greetings with the guards, I took a last look at the Kharsa. For a minute I toyed with the notion of just disappearing down one of those streets. It's not hard to disappear on Wolf, if you know how. And I knew, or had known once. Loyalty to Terra? What had Terra given me except a taste of color and adventure, out there in the Dry-towns, and then taken it away again?

If an Earthman is very lucky and very careful, he lasts about ten years in Intelligence. I had had two years more than my share. I still knew enough to leave my Terran identity behind like a worn-out jacket. I could seek out Rakhal, settle our blood-feud, see Juli again....

How could I see Juli again? As her husband's murderer? No other way. Blood-feud on Wolf is a terrible and elaborate ritual of the code duello. And once I stepped outside the borders of Terran law, sooner or later Rakhal and I would meet. And one of us would die.

I looked back, just once, at the dark rambling streets away from the square. Then I turned toward the blue-white lights that hurt my eyes, and the starship that loomed, huge and hateful, before me.

A steward in white took my fingerprint and led me to a coffin-sized chamber. He brought me coffee and sandwiches--I hadn't, after all, eaten in the spaceport cafe--then got me into the skyhook and strapped me, deftly and firmly, into the acceleration cushions, tugging at the Garensen belts until I ached all over. A long needle went into my arm--the narcotic that would keep me safely drowsy all through the terrible tug of interstellar acceleration.

Doors clanged, buzzers vibrated lower down in the ship, men tramped the corridors calling to one another in the language of the spaceports. I understood one word in four. I shut my eyes, not caring. At the end of the trip there would be another star, another world, another language. Another life.

I had spent all my adult life on Wolf. Juli had been a child under the red star. But it was a pair of wide crimson eyes and black hair combed into ringlets like spun black glass that went down with me into the bottomless pit of sleep....

* * * * *

Someone was shaking me.

"Ah, come on, Cargill. Wake up, man. Shake your boots!"

My mouth, foul-tasting and stiff, fumbled at the shapes of words. "Wha' happened? Wha' y' want?" My eyes throbbed. When I got them open I saw two men in black leathers bending over me. We were still inside gravity.

"Get out of the skyhook. You're coming with us."

"Wha'--" Even through the layers of the sedative, that got to me. Only a criminal, under interstellar law, can be removed from a passage-paid starship once he has formally checked in on board. I was legally, at this moment, on my "planet of destination."

"I haven't been charged--"

"Did I say you had?" snapped one man.

"Shut up, he's doped," the other said hurriedly. "Look," he continued, pronouncing every word loudly and distinctly, "get up now, and come with us. The co-ordinator will hold up blastoff if we don't get off in three minutes, and Operations will scream. Come on, please."

Then I was stumbling along the lighted, empty corridor, swaying between the two men, foggily realizing the crew must think me a fugitive caught trying to leave the planet.

The locks dilated. A uniformed spaceman watched us, fussily regarding a chronometer. He fretted. "The dispatcher's office--"

"We're doing the best we can," the Spaceforce man said. "Can you walk, Cargill?"

I could, though my feet were a little shaky on the ladders. The violet moonlight had deepened to mauve, and...
gusty winds spun tendrils of grit across my face. The Spaceforce men shepherded me, one on either side, to the gateway.

"What the hell is all this? Is something wrong with my pass?"

The guard shook his head. "How would I know? Magnusson put out the order, take it up with him."

"Believe me," I muttered, "I will."

They looked at each other. "Hell," said one, "he's not under arrest, we don't have to haul him around like a convict. Can you walk all right now, Cargill? You know where the Secret Service office is, don't you? Floor 38. The Chief wants you, and make it fast."

I knew it made no sense to ask questions, they obviously knew no more than I did. I asked anyhow.

"Are they holding the ship for me? I'm supposed to be leaving on it."

"Not that one," the guard answered, jerking his head toward the spaceport. I looked back just in time to see the dust-dimmed ship leap upward, briefly whitened in the field searchlights, and vanish into the surging clouds above.

My head was clearing fast, and anger speeded up the process. The HQ building was empty in the chill silence of just before dawn. I had to rout out a dozing elevator operator, and as the lift swooped upward my anger rose with it. I wasn't working for Magnusson any more. What right had he, or anybody, to grab me off an outbound starship like a criminal? By the time I barged into his office, I was spoiling for a fight.

The Secret Service office was full of grayish-pink morning and yellow lights left on from the night before. Magnusson, at his desk, looked as if he'd slept in his rumpled uniform. He was a big bull of a man, and his littered desk looked, as always, like the track of a typhoon in the salt flats.

The clutter was weighted down, here and there, with solidopic cubes of the five Magnusson youngsters, and as usual, Magnusson was fiddling with one of the cubes. He said, not looking up, "Sorry to pull this at the last minute, Race. There was just time to put out a pull order and get you off the ship, but no time to explain."

I glared at him. "Seems I can't even get off the planet without trouble! You raised hell all the time I was here, but when I try to leave--what is this, anyhow? I'm sick of being shoved around!"

Magnusson made a conciliating gesture. "Wait until you hear--" he began, and broke off, looking at someone who was sitting in the chair in front of his desk, somebody whose back was turned to me. Then the person twisted and I stopped cold, blinking and wondering if this were a hallucination and I'd wake up in the starship's skyhook, far out in space.

Then the woman cried, "Race, Race! Don't you know me?"

I took one dazed step and another. Then she flew across the space between us, her thin arms tangling around my neck, and I caught her up, still disbelieving.

"Juli!"

"Oh, Race, I thought I'd die when Mack told me you were leaving tonight. It's been the only thing that's kept me alive, knowing--knowing I'd see you." She sobbed and laughed, her face buried in my shoulder.

I let her cry for a minute, then held my sister at arm's length. For a moment I had forgotten the six years that lay between us. Now I saw them, all of them, printed plain on her face. Juli had been a pretty girl. Six years had fined her face into beauty, but there was tension in the set of her shoulders, and her gray eyes had looked on horrors.

She looked tiny and thin and unbearably frail under the scanty folds of her fur robe, a Dry-town woman's robe. Her wrists were manacled, the jeweled tight bracelets fastened together by the links of a long fine chain of silvered gilt that clashed a little, thinly, as her hands fell to her sides.

"What's wrong, Juli? Where's Rakhal?"

She shivered and now I could see that she was in a state of shock.

"Gone. He's gone, that's all I know. And--oh, Race, Race, he took Rindy with him!"

From the tone of her voice I had thought she was sobbing. Now I realized that her eyes were dry; she was long past tears. Gently I unclasped her clenched fingers and put her back in the chair. She sat like a doll, her hands falling to her sides with a thin clash of chains. When I picked them up and laid them in her lap she let them lie there motionless. I stood over her and demanded, "Who's Rindy?" She didn't move.

"My daughter, Race. Our little girl."

Magnusson broke in, his voice harsh. "Well, Cargill, should I have let you leave?"

"Don't be a damn fool!"

"I was afraid you'd tell the poor kid she had to live with her own mistakes," growled Magnusson. "You're capable of it."

For the first time Juli showed a sign of animation. "I was afraid to come to you, Mack. You never wanted me to marry Rakhal, either."

"Water under the bridge," Magnusson grunted. "And I've got lads of my own, Miss Cargill--Mrs.--" he stopped in distress, vaguely remembering that in the Dry-towns an improper form of address can be a deadly insult.
But she guessed his predicament.
"You used to call me Juli, Mack. It will do now."
"You've changed," he said quietly. "Juli, then. Tell Race what you told me. All of it."
She turned to me. "I shouldn't have come for myself--"

I knew that. Juli was proud, and she had always had the courage to live with her own mistakes. When I first saw her, I knew this wouldn't be anything so simple as the complaint of an abused wife or even an abandoned or deserted mother. I took a chair, watching her and listening.

She began, "You made a mistake when you turned Rakhal out of the Service, Mack. In his way he was the most loyal man you had on Wolf."

Magnusson had evidently not expected her to take this tack. He scowled and looked disconcerted, shifting uneasily in his big chair, but when Juli did not continue, obviously awaiting his answer, he said, "Juli, he left me no choice. I never knew how his mind worked. That final deal he engineered--have you any idea how much that cost the Service? And have you taken a good look at your brother's face, Juli girl?"

Juli raised her eyes slowly, and I saw her flinch. I knew how she felt. For three years I had kept my mirror covered, growing an untidy straggle of beard because it hid the scars and saved me the ordeal of facing myself to shave.

Juli whispered, "Rakhal's is just as bad. Worse."
"That's some satisfaction," I said, and Mack stared at us, baffled. "Even now I don't know what it was all about."

"And you never will," I said for the hundredth time. "We've been over this before. Nobody could understand it unless he'd lived in the Dry-towns. Let's not talk about it. You talk, Juli. What brought you here like this? What about the kid?"

"There's no way I can tell you the end without telling you the beginning," she said reasonably. "At first Rakhal worked as a trader in Shainsa."

I wasn't surprised. The Dry-towns were the core of Terran trade on Wolf, and it was through their cooperation that Terra existed here peaceably, on a world only half human, or less.

The men of the Dry-towns existed strangely poised between two worlds. They had made dealings with the first Terran ships, and thus gave entrance to the wedge of the Terran Empire. And yet they stood proud and apart. They alone had never yielded to the Terranizing which overtakes all Empire planets sooner or later.

There were no Trade Cities in the Dry-towns; an Earthman who went there unprotected faced a thousand deaths, each one worse than the last. There were those who said that the men of Shainsa and Daillon and Ardcarran had sold the rest of Wolf to the Terrans, to keep the Terrans from their own door.

Even Rakhal, who had worked with Terra since boyhood, had finally come to a point of decision and gone his own way. And it was not Terra's way.

That was what Juli was saying now.

"He didn't like what Terra was doing on Wolf. I'm not so sure I like it myself--"

Magnusson interrupted her again. "Do you know what Wolf was like when we came here? Have you seen the Slave Colony, the Idiot's Village? Your own brother went to Shainsa and routed out The Lisse."

"And Rakhal helped him!" Juli reminded him. "Even after he left you, he tried to keep out of things. He could have told them a good deal that would hurt you, after ten years in Intelligence, you know."

I knew. It was, although I wasn't going to tell Juli this, one reason why, at the end--during that terrible explosion of violence which no normal Terran mind could comprehend--I had done my best to kill him. We had both known that after this, the planet would not hold the two of us. We could both go on living only by dividing it unevenly. I had been given the slow death of the Terran Zone. And he had all the rest.

"But he never told them anything! I tell you, he was one of the most loyal--"

Mack grunted, "Yeah, he's an angel. Go ahead."

She didn't, not immediately. Instead she asked what sounded like an irrelevant question. "Is it true what he told me? That the Empire has a standing offer of a reward for a working model of a matter transmitter?"

"That offer's been standing for three hundred years, Terran reckoning. One million credits cash. Don't tell me he was figuring to invent one?"

"I don't think so. But I think he heard rumors about one. He said with that kind of money he could bargain the Terrans right out of Shainsa. That was where it started. He began coming and going at odd times, but he never said any more about it. He wouldn't talk to me at all."

"When was all this?"

"About four months ago."

"In other words, just about the time of the riots in Charin."
She nodded. "Yes. He was away in Charin when the Ghost Wind blew, and he came back with knife cuts in his thigh. I asked if he had been mixed-up in the anti-Terran rioting, but he wouldn't tell me. Race, I don't know anything about politics. I don't really care. But just about that time, the Great House in Shainsa changed hands. I'm sure Rakhal had something to do with that.

"And then--" Juli twisted her chained hands together in her lap--"he tried to mix Rindy up in it. It was crazy, awful! He'd brought her some sort of nonhuman toy from one of the lowland towns, Charin I think. It was a weird thing, scared me. But he'd sit Rindy down in the sunlight and have her look into it, and Rindy would gabble all sorts of nonsense about little men and birds and a toymaker."

The chains about Juli's wrists clashed as she twisted her hands together. I stared somberly at the fetters. The chain, which was long, did not really hamper her movements much. Such chains were symbolic ornaments, and most Dry-town women went all their lives with fettered hands. But even after the years I'd spent in the Dry-towns, the sight still brought an uneasiness to my throat, a vague discomfort.

"We had a terrible fight over that," Juli went on. "I was afraid, afraid of what it was doing to Rindy. I threw it out, and Rindy woke up and screamed--" Juli checked herself and caught at vanishing self-control.

"But you don't want to hear about that. It was then I threatened to leave him and take Rindy. The next day--" Suddenly the hysteria Juli had been forcing back broke free, and she rocked back and forth in her chair, shaken and strangled with sobs. "He took Rindy! Oh, Race, he's crazy, crazy. I think he hates Rindy, he--he, Race, he smashed her toys. He took every toy the child had and broke them one by one, smashed them into powder, every toy the child had--"

"Juli, please, please," Magnusson pleaded, shaken. "If we're dealing with a maniac--"

"I don't dare think he'd harm her! He warned me not to come here, or I'd never see her again, but if it meant war against Terra I had to come. But Mack, don't do anything against him, please, please. He's got my baby, he's got my little girl...." Her voice failed and she buried her face in her hands.

Mack picked up the solidopic cube of his five-year-old son, and turned it between his pudgy fingers, saying unhappily, "Juli, we'll take every precaution. But can't you see, we've got to get him? If there's a question of a matter transmitter, or anything like that, in the hands of Terra's enemies--"

I could see that, too, but Juli's agonized face came between me and the picture of disaster. I clenched my fist around the chair arm, not surprised to see the fragile plastic buckle, crack and split under my grip. If it had been Rakhal's neck....

"Mack, let me handle this. Juli, shall I find Rindy for you?"

A hope was born in her ravaged face, and died, while I looked. "Race, he'd kill you. Or have you killed."

"He'd try," I admitted. The moment Rakhal knew I was outside the Terran zone, I'd walk with death. I had accepted the code during my years in Shainsa. But now I was an Earthman and felt only contempt.

"Can't you see? Once he knows I'm at large, that very code of his will force him to abandon any intrigue, whatever you call it, conspiracy, and come after me first. That way we do two things: we get him out of hiding, and we get him out of the conspiracy, if there is one."

I looked at the shaking Juli and something snapped. I stooped and lifted her, not gently, my hands biting her shoulders. "And I won't kill him, do you hear? He may wish I had; by the time I get through with him--I'll beat the living hell out of him; I'll cram my fists down his throat. But I'll settle it with him--catch him and let him live afterward!"

Magnusson stepped toward me and pried my crushing hands off her arms. Juli rubbed the bruises mechanically, not knowing she was doing it. Mack said, "You can't do it, Cargill. You wouldn't get as far as Daillon. You haven't been out of the zone in six years. Besides--"

"His eyes rested full on my face. "I hate to say this, Race, but damn it, man, go and take a good look at yourself in a mirror. Do you think I'd ever have pulled you off the Secret Service otherwise? How in hell can you disguise yourself now?"

"There are plenty of scarred men in the Dry-towns," I said. "Rakhal will remember my scars, but I don't think anyone else would look twice."

Magnusson walked to the window. His huge form bulked against the light, perceptibly darkening the office. He looked over the faraway panorama, the neat bright Trade City below and the vast wilderness lying outside. I could almost hear the wheels grinding in his head. Finally he swung around.

"Race, I've heard these rumors before. But you're the only man I could have sent to track them down, and I wouldn't send you out in cold blood to be killed. I won't now. Spaceforce will pick him up."

I heard the harsh inward gasp of Juli's breath and said, "Damn it, no. The first move you make--" I couldn't finish. Rindy was in his hands, and when I knew Rakhal, he hadn't been given to making idle threats. We all three knew what Rakhal might do at the first hint of the long arm of Terran law reaching out for him.
I said, "For God's sake let's keep Spaceforce out of it. Let it look like a personal matter between Rakhal and me, and let us settle it on those terms. Remember he's got the kid."

Magnusson sighed. Again he picked up one of the cubes and stared into the clear plastic, where the three-dimensional image of a nine-year-old girl looked out at him, smiling and innocent. His face was transparent as the plastic cube. Mack acts tough, but he has five kids and he is as soft as a dish of pudding where a kid is concerned.

"I know. Another thing, too. If we send out Spaceforce, after all the riots--how many Terrans are on this planet? A few thousand, no more. What chance would we have, if it turned into a full-scale rebellion? None at all, unless we wanted to order a massacre. Sure, we have bombs and dis-guns and all that.

"But would we dare to use them? And where would we be after that? We're here to keep the pot from boiling over, to keep out of planetary incidents, not push them along to a point where bluff won't work. That's why we've got to pick up Rakhal before this gets out of hand."

I said, "Give me a month. Then you can move in, if you have to. Rakhal can't do much against Terra in that time. And I might be able to keep Rindy out of it."

Magnusson stared at me, hard-eyed. "If you do this against my advice, I won't be able to step in and pull you out of a jam later on, you know. And God help you if you start up the machines and can't stop them."

I knew that. A month wasn't much. Wolf is forty thousand miles of diameter, at least half unexplored; mountain and forest swarming with nonhuman and semi-human cities where Terrans had never been.

Finding Rakhal, or any one man, would be like picking out one star in the Andromeda nebula. Not impossible. Not quite impossible.

Mack's eyes wandered again to his child's face, deep in the transparent cube. He turned it in his hands. "Okay, Cargill," he said slowly, "so we're all crazy. I'll be crazy too. Try it your way."

CHAPTER FOUR
By sunset I was ready to leave. I hadn't had any loose ends to tie up in the Trade City, since I'd already disposed of most of my gear before boarding the starship. I'd never been in better circumstances to take off for parts unknown.

Mack, still disapproving, had opened the files to me, and I'd spent most of the day in the back rooms of Floor 38, searching Intelligence files to refresh my memory, scanning the pages of my own old reports sent years ago from Shainsa and Daillon. He had sent out one of the nonhumans who worked for us, to buy or acquire somewhere in the Old Town a Dry-towner's outfit and the other things I would wear and carry.

I would have liked to go myself. I felt that I needed the practice. I was only now beginning to realize how much I might have forgotten in the years behind a desk. But until I was ready to make my presence known, no one must know that Race Cargill had not left Wolf on the starship.

Above all, I must not be seen in the Kharsa until I went there in the Dry-town disguise which had become, years ago, a deep second nature, almost an alternate personality.

About sunset I walked through the clean little streets of the Terran Trade City toward the Magnusson home where Juli was waiting for me.

Most of the men who go into Civil Service of the Empire come from Earth, or from the close-in planets of Proxima and Alpha Centaurus. They go out unmarried, and they stay that way, or marry women native to the planets where they are sent.

But Joanna Magnusson was one of the rare Earth women who had come out with her husband, twenty years ago. There are two kinds of Earthwomen like that. They make their quarterings a little bit of home, or a little bit of hell. Joanna had made their house look like a transported corner of Earth.

I never knew quite what to think of the Magnusson household. It seemed to me almost madness to live under a red sun, yet come inside to yellow light, to live on a world with the wild beauty of Wolf and yet live as they might have lived on their home planet. Or maybe I was the one who was out of step. I had done the reprehensible thing they called "going native." Possibly I had done just that, and in absorbing myself into the new world, had lost the ability to fit into the old.

Joanna, a chubby comfortable woman in her forties, opened the door and gave me her hand. "Come in, Race. Juli's expecting you."

"It's good of you." I broke off, unable to express my gratitude. Juli and I had come from Earth--our father had been an officer on the old starship Landfall when Juli was only a child. He had died in a wreck off Procyon, and Mack Magnusson had found me a place in Intelligence because I spoke four of the Wolf languages and haunted the Kharsa with Rakhal whenever I could get away.

They had also taken Juli into their own home, like a younger sister. They hadn't said much--because they had
liked Rakhal—when the breakup came. But that terrible night when Rakhal and I nearly killed each other, and Rakhal came with his face bleeding and took Juli away with him, had hurt them hard. Yet it had made them all the kinder to me.

Joanna said forthrightly, "Nonsense, Race! What else could we do?" She drew me along the hall. "You can talk in here."

I delayed a minute before going through the door she indicated. "How is Juli?"

"Better, I think. I put her to bed in Meta's room, and she slept most of the day. She'll be all right. I'll leave you to talk." Joanna opened the door, and went away.

Juli was awake and dressed, and already some of the terrible frozen horror was gone from her face. She was still tense and devil-ridden, but not hysterical now.

The room, one of the children's bedrooms, wasn't a big one. Even at the top of the Secret Service, a cop doesn't live too well. Not on Terra's Civil Service pay scale. Not, with five youngsters. It looked as if all five of the kids had taken it to pieces, one at a time.

I sat down on a too-low chair and said, "Juli, we haven't much time, I've got to be out of the city before dark. I want to know about Rakhal, what he does, what he's like now. Remember, I haven't seen him for years. Tell me everything—his friends, his amusements, everything you know."

"I always thought you knew him better than I did." Juli had a fidgety little way of coiling the links of the chain around her wrists and it made me nervous.

"It's routine, Juli. Police work. Mostly I play by ear, but I try to start out by being methodical."

She answered everything I asked her, but the sum total wasn't much and it wouldn't help much. As I said, it's easy to disappear on Wolf. Juli knew he had been friendly with the new holders of the Great House on Shainsa, but she didn't even know their name.

I heard one of the Magnusson children fly to the street door and return, shouting for her mother. Joanna knocked at the door of the room and came in.

"There's a chak outside who wants to see you, Race."

I nodded. "Probably my fancy dress. Can I change in the back room, Joanna? Will you keep my clothes here till I get back?"

I went to the door and spoke to the furred nonhuman in the sibilant jargon of the Kharsa and he handed me what looked like a bundle of rags. There were hard lumps inside. The chak said softly, "I hear a rumor in the Kharsa, Raiss. Perhaps it will help you. Three men from Shainsa are in the city. They came here to seek a woman who has vanished, and a toymaker. They are returning at sunrise. Perhaps you can arrange to travel in their caravan."

I thanked him and carried the bundle inside. In the empty back room I stripped to the skin and unrolled the bundle. There was a pair of baggy striped breeches, a worn and shabby shirtcloak with capacious pockets, a looped belt with half the gilt rubbed away and the base metal showing through, and a scuffed pair of ankle-boots tied with frayed thongs of different colors. There was a little cluster of amulets and seals. I chose two or three of the commonest kind, and strung them around my neck.

One of the lumps in the bundle was a small jar, holding nothing but the ordinary spices sold in the market, with which the average Dry-towner flavors food. I rubbed some of the powder on my body, put a pinch in the pocket of my shirtcloak, and chewed a few of the buds, wrinkling my nose at the long-unfamiliar pungency.

The second lump was a skean, and unlike the worn and shabby garments, this was brand-new and sharp and bright, and its edge held a razor glint. I tucked it into the clasp of my shirtcloak, a reassuring weight. It was the only weapon I could dare to carry.

The last of the solid objects in the bundle was a flat wooden case, about nine by ten inches. I slid it open. It was divided carefully into sections cushioned with sponge-absorbent plastic, and in them lay tiny slips of glass, on Wolf as precious as jewels. They were lenses—camera lenses, microscope lenses, even eyeglass lenses. Packed close, there were nearly a hundred of them nestled by the shock-absorbent stuff.

They were my excuse for travel to Shainsa. Over and above the necessities of trade, a few items of Terran manufacture—vacuum tubes, transistors, lenses for cameras and binoculars, liquors and finely forged small tools—are literally worth their weight in platinum.

Even in cities where Terrans have never gone, these things bring exorbitant prices, and trading in them is a Dry-town privilege. Rakhal had been a trader, so Juli told me, in fine wire and surgical instruments. Wolf is not a mechanized planet, and has never developed any indigenous industrial system; the psychology of the nonhuman seldom runs to technological advances.

I went down the hallway again to the room where Juli was waiting. Catching a glimpse in a full-length mirror, I was startled. All traces of the Terran civil servant, clumsy and uncomfortable in his ill-fitting clothes, had dropped away. A Dry-towner, rangy and scarred, looked out at me, and it seemed that the expression on his face was one of
Joanna whirled as I came into the room and visibly paled before, recovering her self-control, she gave a nervous little giggle. "Goodness, Race, I didn't know you!"

Juli whispered, "Yes, I--I remember you better like that. You're--you look so much like--"

The door flew open and Mickey Magnusson scurried into the room, a chubby little boy browned by a Terra-type sunlamp and glowing with health. In his hand he held some sparkling thing that gave off tiny flashes and glints of color.

I gave the kid a grin before I realized that I was disguised anyhow and probably a hideous sight. The little boy backed off, but Joanna put her plump hand on his shoulder, murmuring soothing things.

Mickey toddled toward Juli, holding up the shining thing in his hands as if to display something very precious and beloved. Juli bent and held out her arms, then her face contracted and she snatched at the plaything.

"Mickey, what's that?"

He thrust it protectively behind his back. "Mine!"

"Mickey, don't be naughty," Joanna chided.

"Please let me see," Juli coaxed, and he brought it out, slowly, still suspicious. It was an angled prism of crystal, star-shaped, set in a frame which could get the star spinning like a solidopic. But it displayed a new and comical face every time it was turned.

Mickey turned it round and round, charmed at being the center of attention. There seemed to be dozens of faces, shifting with each spin of the prism, human and nonhuman, all dim and slightly distorted. My own face, Juli's, Joanna's came out of the crystal surface, not a reflection but a caricature.

A choked sound from Juli made me turn in dismay. She had let herself drop to the floor and was sitting there, white as death, supporting herself with her two hands.

"Race! Find out where he got that--that thing!"

I bent and shook her. "What's the matter with you?" I demanded. She had lapsed into the dazed, sleepwalking horror of this morning. She whispered, "It's not a toy. Rindy had one. Joanna, where did he get it?" She pointed at the shining thing with an expression of horror which would have been laughable had it been less real, less filled with terror.

Joanna cocked her head to one side and wrinkled her forehead, reflectively. "Why, I don't know, now you come to ask me. I thought maybe one of the chaks had given it to Mickey. Bought it in the bazaar, maybe. He loves it. Do get up off the floor, Juli!"

Juli scrambled to her feet. She said, "Rindy had one. It--it terrified me. She would sit and look at it by the hour, and--I told you about it, Race. I threw it out once, and she woke up and screamed. She shrieked for hours and hours and she ran out in the dark and dug for it in the trash pile, where I'd buried it. She went out in the dark, broke all her fingernails, but she dug it out again." She checked herself, staring at Joanna, her eyes wide in appeal.

"Well, dear," said Joanna with mild, rebuking kindness, "you needn't be so upset. I don't think Mickey's so attached to it as all that, and anyhow I'm not going to throw it away." She patted Juli reassuringly on the shoulder, then gave Mickey a little shove toward the door and turned to follow him. "You'll want to talk alone before Race leaves. Good luck, wherever you're going, Race." She held out her hand forthrightly.

"And don't worry about Juli," she added in an undertone. "We'll take good care of her."

When I came back to Juli she was standing by the window, looking through the oddly filtered glass that dimmed the red sun to orange. "Joanna thinks I'm crazy, Race."

"She thinks you're upset."

"Rindy's an odd child, a real Dry-towner. But it's not my imagination, Race, it's not. There's something--"

Suddenly she sobbed aloud again.

"Homesick, Juli?"

"I was, a little, the first years. But I was happy, believe me." She turned her face to me, shining with tears. "You've got to believe I never regretted it for a minute."

"I'm glad," I said dully. That made it just fine.

"Only that toy--"

"Who knows? It might be a clue to something." The toy had reminded me of something, too, and I tried to remember what it was. I'd seen nonhuman toys in the Kharsa, even bought them for Mack's kids. When a single man is invited frequently to a home with five youngsters, it's about the only way he can repay that hospitality, by bringing the children odd trifles and knickknacks. But I had never seen anything quite like this one, until--

--Until yesterday. The toy-seller they had hunted out of the Kharsa, the one who had fled into the shrine of Nebran and vanished. He had had half a dozen of those prism-and-star sparklers.

I tried to call up a mental picture of the little toy-seller. I didn't have much luck. I'd seen him only in that one
swift glance from beneath his hood. "Juli, have you ever seen a little man, like a chak only smaller, twisted, hunchbacked? He sells toys--"

She looked blank. "I don't think so, although there are dwarf chaks in the Polar Cities. But I'm sure I've never seen one."

"It was just an idea." But it was something to think about. A toy-seller had vanished. Rakhal, before disappearing, had smashed all Rindy's toys. And the sight of a plaything of cunningly-cut crystal had sent Juli into hysterics.

"I'd better go before it's too dark," I said. I buckled the final clasp of my shirtcloak, fitted my skean another notch into it, and counted the money Mack had advanced me for expenses. "I want to get into the Kharsa and hunt up the caravan to Shainsa."

"You're going there first?"

"Where else?"

Juli turned, leaning one hand against the wall. She looked frail and ill, years older than she was. Suddenly she flung her thin arms around me, and a link of the chain on her fettered hands struck me hard, as she cried out, "Race, Race, he'll kill you! How can I live with that on my conscience too?"

"You can live with a hell of a lot on your conscience." I disengaged her arms firmly from my neck. A link of the chain caught on the clasp of my shirtcloak, and again something snapped inside me. I grasped the chain in my two hands and gave a mighty heave, bracing my foot against the wall. The links snapped asunder. A flying end struck Juli under the eye. I ripped at the seals of the jeweled cuffs, tore them from her arms, and threw the whole assembly into a corner, where it fell with a clash.

"Damn it," I roared, "that's over! You're never going to wear those things again!" Maybe after six years in the Dry-towns, Juli was beginning to guess what those six years behind a desk had meant to me.

"Juli, I'll find your Rindy for you, and I'll bring Rakhal in alive. But don't ask more than that. Just alive. And don't ask me how."

He'd be alive when I got through with him. Sure, he'd be alive.

CHAPTER FIVE

It was getting dark when I slipped through a side gate, shabby and inconspicuous, into the spaceport square. Beyond the yellow lamps, I knew that the old city was beginning to take on life with the falling night. Out of the chinked pebble-houses, men and woman, human and nonhuman, came forth into the moonlit streets.

If anyone noticed me cross the square, which I doubted, they took me for just another Dry-town vagabond, curious about the world of the strangers from beyond the stars, and who, curiosity satisfied, was drifting back where he belonged. I turned down one of the dark alleys that led away, and soon was walking in the dark.

The Kharsa was not unfamiliar to me as a Terran, but for the last six years I had seen only its daytime face. I doubted if there were a dozen Earthmen in the Old Town tonight, though I saw one in the bazaar, dirty and lurching drunk; one of those who run renegade and homeless between worlds, belonging to neither. This was what I had nearly become.

I went further up the hill with the rising streets. Once I turned, and saw below me the bright-lighted spaceport, the black many-windowed loom of the skyscraper like a patch of alien shadow in the red-violet moonlight. I turned my back on them and walked on.

At the fringe of the thieves market I paused outside a wineshop where Dry-towners were made welcome. A golden nonhuman child murmured something as she pattered by me in the street, and I stopped, gripped by a spasm of stagefright. Had the dialect of Shainsa grown rusty on my tongue? Spies were given short shrift on Wolf, and a mile from the spaceport, I might as well have been on one of those moons. There were no spaceport shockers at my back now. And someone might remember the tale of an Earthman with a scarred face who had gone to Shainsa in disguise....

I shrugged the shirtcloak around my shoulders, pushed the door and went in. I had remembered that Rakhal was waiting for me. Not beyond this door, but at the end of the trail, behind some other door, somewhere. And we have a byword in Shainsa: A trail without beginning has no end.

Right there I stopped thinking about Juli, Rindy, the Terran Empire, or what Rakhal, who knew too many of Terra's secrets, might do if he had turned renegade. My fingers went up and stroked, musingly, the ridge of scar tissue along my mouth. At that moment I was thinking only of Rakhal, of an unsettled blood-feud, and of my revenge.

Red lamps were burning inside the wineshop, where men reclined on frowsy couches. I stumbled over one of
them, found an empty place and let myself sink down on it, arranging myself automatically in the sprawl of Dry-towners indoors. In public they stood, rigid and formal, even to eat and drink. Among themselves, anything less than a loose-limbed sprawl betrayed insulting watchfulness; only a man who fears secret murder keeps himself on guard.

A girl with a tangled rope of hair down her back came toward me. Her hands were unchained, meaning she was a woman of the lowest class, not worth safeguarding. Her fur smock was shabby and matted with filth. I sent her for wine. When it came it was surprisingly good, the sweet and treacherous wine of Ardcarran. I sipped it slowly, looking round.

If a caravan for Shainsa were leaving tomorrow, it would be known here. A word dropped that I was returning there would bring me, by ironbound custom, an invitation to travel in their company.

When I sent the woman for wine a second time, a man on a nearby couch got up, and walked over to me. He was tall even for a Dry-towner, and there was something vaguely familiar about him. He was no riffraff of the Kharsa, either, for his shirtcloak was of rich silk interwoven with metallic threads, and crusted with heavy embroideries. The hilt of his skean was carved from a single green gem. He stood looking down at me for some time before he spoke.

"I never forget a voice, although I cannot bring your face to mind. Have I a duty toward you?"

I had spoken a jargon to the girl, but he addressed me in the lilting, sing-song speech of Shainsa. I made no answer, gesturing him to be seated. On Wolf, formal courtesy requires a series of polite non sequiturs, and while a direct question merely borders on rudeness, a direct answer is the mark of a simpleton.

"A drink?"

"I joined you unasked," he retorted, and summoned the tangle-headed girl. "Bring us better wine than this swill!"

With that word and gesture I recognized him and my teeth clamped hard on my lip. This was the loudmouth who had shown fight in the spaceport cafe, and run away before the dark girl with the sign of Nebran sprawled on her breast.

But in this poor light he had not recognized me. I moved deliberately into the full red glow. If he did not know me for the Terran he had challenged last night in the spaceport cafe, it was unlikely that anyone else would. He stared at me for some minutes, but in the end he only shrugged and poured wine from the bottle he had ordered.

Three drinks later I knew that his name was Kyral and that he was a trader in wire and fine steel tools through the nonhuman towns. And I had given him the name I had chosen, Rascar.

He asked, "Are you thinking of returning to Shainsa?"

Wary of a trap, I hesitated, but the question seemed harmless, so I only countered, "Have you been long in the Kharsa?"

"Several weeks."

"Trading?"

"No," he applied himself to the wine again. "I was searching for a member of my family."

"Did you find him?"

"Her," said Kyral, and ceremoniously spat. "No, I didn't find her. What is your business in Shainsa?"

I chuckled briefly. "As a matter of fact, I am searching for a member of my family."

He narrowed his eyelids as if he suspected me of mocking him, but personal privacy is the most rigid convention of the Dry-towns and such mockery showed a sensible disregard for prying questions if I did not choose to answer them. He questioned no further.

"I can use an extra man to handle the loads. Are you good with pack animals? If so, you are welcome to travel under the protection of my caravan."

I agreed. Then, reflecting that Juli and Rakhal must, after all, be known in Shainsa, I asked, "Do you know a trader who calls himself Sensar?"

He started slightly; I saw his eyes move along my scars. Then reserve, like a lowered curtain, shut itself over his face, concealing a brief satisfied glimmer. "No," he lied, and stood up.

"We leave at first daylight. Have your gear ready." He flipped something at me, and I caught it in midair. It was a stone incised with Kyral's name in the ideographs of Shainsa. "You can sleep with the caravan if you care to. Show that token to Cuinn."

*Kyral's caravan was encamped in a barred field past the furthest gates of the Kharsa. About a dozen men were busy loading the pack animals—horses shipped in from Darkover, mostly. I asked the first man I met for Cuinn. He pointed out a burly fellow in a shiny red shirtcloak, who was busy at chewing out one of the young men for the way he'd put a packsaddle on his beast.*

Shainsa is a good language for cursing, but Cuinn had a special talent at it. I blinked in admiration while I
waited for him to get his breath so I could hand him Kyral's token.

In the light of the fire I saw what I'd half expected: he was the second of the Dry-towners who'd tried to rough me up in the spaceport cafe. Cuinn barely glanced at the cut stone and tossed it back, pointing out one of the packhorses. "Load your personal gear on that one, then get busy and show this mush-headed wearer of sandals"—an insult carrying particularly filthy implications in Shainsa—"how to fasten a packstrap."

He drew breath and began to swear at the luckless youngster again, and I relaxed. He evidently hadn't recognized me, either. I took the strap in my hand, guiding it through the saddle loop. "Like that," I told the kid, and Cuinn stopped swearing long enough to give me a curt nod of acknowledgment and point out a heap of boxed and crated objects.

"Help him load up. We want to get clear of the city by daybreak," he ordered, and went off to swear at someone else.

Kyral turned up at dawn, and a few minutes later the camp had vanished into a small scattering of litter and we were on our way.

Kyral's caravan, in spite of Cuinn's cursing, was well-managed and well-handled. The men were Dry-towners, eleven of them, silent and capable and most of them very young. They were cheerful on the trail, handled the pack animals competently, during the day, and spent most of the nights grouped around the fire, gambling silently on the fall of the cut-crystal prisms they used for dice.

Three days out of the Kharsa I began to worry about Cuinn.

It was of course a spectacular piece of bad luck to find all three of the men from the spaceport cafe in Kyral's caravan. Kyral had obviously not known me, and even by daylight he paid no attention to me except to give an occasional order. The second of the three was a gangling kid who probably never gave me a second look, let alone a third.

But Cuinn was another matter. He was a man my own age, and his fierce eyes had a shrewdness in them that I did not trust. More than once I caught him watching me, and on the two or three occasions when he drew me into conversation, I found his questions more direct than Dry-town good manners allowed. I weighed the possibility that I might have to kill him before we reached Shainsa.

We crossed the foothills and began to climb upward toward the mountains. The first few days I found myself short of breath as we worked upward into thinner air, then my acclimatization returned and I began to fall into the pattern of the days and nights on the trail. The Trade City was still a beacon in the night, but its glow on the horizon grew dimmer with each day's march.

Higher we climbed, along dangerous trails where men had to dismount and let the pack animals pick their way, foot by foot. Here in these altitudes the sun at noonday blazed redder and brighter, and the Dry-towners, who come from the parched lands in the sea-bottoms, were burned and blistered by the fierce light. I had grown up under the blazing sun of Terra, and a red sun like Wolf, even at its hottest, caused me no discomfort. This alone would have made me suspect. Once again I found Cuinn's fierce eyes watching me.

As we crossed the passes and began to descend the long trail through the thick forests, we got into nonhuman country. Racing against the Ghost Wind, we skirted the country around Charin, and the woods inhabited by the terrible Ya-men, birdlike creatures who turn cannibal when the Ghost Wind blows.

Later the trail wound through thicker forests of indigo trees and grayish-purple brushwood, and at night we heard the howls of the catmen of these latitudes. At night we set guards about the caravan, and the dark spaces and shadows were filled with noises and queer smells and rustlings.

Nevertheless, the day's marches and the night watches passed without event until the night I shared guard with Cuinn. I had posted myself at the edge of the camp, the fire behind me. The men were sleeping rolls of snores, huddled close around the fire. The animals, hobbled with double ropes, front feet to hind feet, shifted uneasily and let out long uncanny whines.

I heard Cuinn pacing behind me. I heard a rustle at the edge of the forest, a stir and whisper beyond the trees, and turned to speak to him, then saw him slipping away toward the outskirts of the clearing.

For a moment I thought nothing of it, thinking that he was taking a few steps toward the gap in the trees where he had disappeared. I suppose I had the idea that he had slipped away to investigate some noise or shadow, and that I should be at hand.

Then I saw the flicker of lights beyond the trees--light from the lantern Cuinn had been carrying in his hand! He was signaling!

I slipped the safety clasp from the hilt of my skean and went after him. In the dimming glow of the fire I fancied I saw luminous eyes watching me, and the skin on my back crawled. I crept up behind him and leaped. We went down in a tangle of flailing legs and arms, and in less than a second he had his skean out and I was gripping his wrist, trying desperately to force the blade away from my throat.
I gasped, "Don't be a fool! One yell and the whole camp will be awake! Who were you signaling?"

In the light of the fallen lantern, lips drawn back in a snarl, he looked almost inhuman. He strained at the knife for a moment, then dropped it. "Let me up," he said.

I got up and kicked the fallen skean toward him. "Put that away. What in hell were you doing, trying to bring the catmen down on us?"

For a moment he looked taken aback, then his fierce face closed down again and he said wrathfully, "Can't a man walk away from the camp without being half strangled?"

I glared at him, but realized I really had nothing to go by. He might have been answering a call of nature, and the movement of the lantern accidental. And if someone had jumped me from behind, I might have pulled a knife on him myself. So I only said, "Don't do it again. We're all too jumpy."

There were no other incidents that night, or the next. The night after, while I lay huddled in my shirtcloak and blanket by the fire, I saw Cuinn slip out of his bedroll and steal away. A moment later there was a gleam in the darkness, but before I could summon the resolve to get up and face it out with him, he returned, looked cautiously at the snoring men, and crawled back into his blankets.

While we were unpacking at the next camp, Kyral halted beside me. "Heard anything queer lately? I've got the notion we're being trailed. We'll be out of these forests tomorrow, and after that it's clear road all the way to Shainsa. If anything's going to happen, it will happen tonight."

I debated speaking to him about Cuinn's signals. No, I had my own business waiting for me in Shainsa. Why mix myself up in some other, private intrigue?

He said, "I'm putting you and Cuinn on watch again. The old men doze off, and the young fellows get to daydreaming or fooling around. That's all right most of the time, but I want someone who'll keep his eyes open tonight. Did you ever know Cuinn before this?"

"Never set eyes on him."

"Funny, I had the notion--" He shrugged, turned away, then stopped.

"Don't think twice about rousing the camp if there's any disturbance. Better a false alarm than an ambush that catches us all in our blankets. If it came to a fight, we might be in a bad way. We all carry skeans, but I don't think there's a shocker in the whole camp, let alone a gun. You don't have one by any chance?"

After the men had turned in, Cuinn patrolling the camp, halted a minute beside me and cocked his head toward the rustling forest.

"What's going on in there?"

"Who knows? Catmen on the prowl, probably, thinking the horses would make a good meal, or maybe that we would."

"Think it will come to a fight?"

"I wouldn't know."

He surveyed me for a moment without speaking. "And if it did?"

"We'd fight." Then I sucked in my breath, for Cuinn had spoken Terran Standard, and I, without thinking had answered in the same language. He grinned, showing white teeth filed to a point.

"I thought so!"

I seized his shoulder and demanded roughly, "And what are you going to do about it?"

"That depends on you," he answered, "and what you want in Shainsa. Tell me the truth. What were you doing in the Terran Zone?" He gave me no chance to answer. "You know who Kyral is, don't you?"

"A trader," I said, "who pays my wages and minds his own affairs." I moved backward, hand on my skean, braced for a sudden rush. He made no aggressive motion, however.

"Kyral told me you'd been asking questions about Rakhal Sensar," he said. "Clever. Now I, for one, could have told you he'd never set eyes on Rakhal. I--"

He broke off, hearing a noise in the forest, a long eerie howl. I muttered, "If you've brought them down on us--"

He shook his head urgently. "I had to take that chance, to get word to the others. It won't work. Where's the girl?"

I hardly heard him. I was hearing twigs snap, and silent sneaking feet. I turned for a yell that would rouse the camp and Cuinn grabbed me hard, saying insistently, "Quick! Where's the girl! Go back and tell her it won't work! If Kyral suspected--"

He never finished the sentence. Just behind us came another of the long eerie howls. I knocked Cuinn away, and suddenly the night was filled with crouching forms that came down on us like a whirlwind.

I shouted madly as the camp came alive with men struggling out of blankets, fighting for life itself. I ran hard, still shouting, for the enclosure where we had tied the horses. A catman, slim and black-furred, was crouched and cutting the hobble-strings of the nearest animal. I hurled myself on him. He exploded, clawing, raking my shoulder
with talons that ripped the rough cloth like paper. I whipped out my skean and slashed upward. The talons
contracted in my shoulder and I gasped with pain. Then the thing howled and fell away, clawing at the air. It
twitched and lay still.

Four shots in rapid succession cracked in the clearing. Kyral to the contrary, someone must have had a pistol. I
heard one of the cat-things wail, a hoarse dying rattle. Something dark clawed my arm and I slashed with the knife,
going down as another set of talons fastened in my back, rolling and clutching.

I managed to get the thing’s forelimbs wedged under my elbow, my knee in its spine. I heaved, bent it
backward, backward till it screamed, a high wail.

Then I felt the spine snap and the dead thing mewed once, just air escaping from collapsing lungs, and slid
limp from my thigh. Erect it had not been over four feet tall and in the light of the dying fire it might have been a
dead lynx.

"Rascar...." I heard a gasp, a groan. I whirled and saw Kyral go down, struggling, drowning in half a dozen or
more of the fierce half-humans. I leaped at the smother of bodies, ripped one away with a stranglehold, slashed at its
throat.

They were easy to kill.

I heard a high, urgent scream in their meowing tongue. Then the furred black things seemed to melt into the
forest as silently as they had come. Kyral, dazed, his forehead running blood, his arm slashed to the bone, was sitting
on the ground, still stunned.

Somebody had to take charge. I bellowed, "Lights! Get lights. They won't come back if we have enough light,
you can only see well in the dark."

Someone stirred the fire. It blazed up as they piled on dead branches, and I roughly commanded one of the kids
to fill every lantern he could find, and get them burning. Four of the dead things were lying in the clearing. The
youngster I’d helped loading horses, the first day, gazed down at one of the catmen, half-disemboweled by
somebody’s skean, and suddenly bolted for the bushes, where I heard him retching.

I set the others with stronger stomachs to dragging the bodies away from the clearing, and went back to see
how badly Kyral was hurt. He had the rip in his arm and his face was covered with blood from a shallow scalp
wound, but he insisted on getting up to inspect the hurts of the others.

There was no one without a claw-wound in leg or back or shoulder, but none were serious, and we were all
feeling fairly cheerful when someone demanded, "Where’s Cuinn?"

He didn't seem to be anywhere. Kyral, staggering slightly, insisted on searching, but I felt we wouldn't find

"You should have told me," he began, but shouts from the far end of the clearing sent us racing there. We
nearly stumbled over a single, solitary, motionless form, outstretched and lifeless, blind eyes staring upward at the
moons.

It was Cuinn. And his throat had been torn completely out.

CHAPTER SIX

Once we were free of the forest, the road to the Dry-towns lay straight before us, with no hidden dangers. Some
of us limped for a day or two, or favored an arm or leg clawed by the catmen, but I knew that what Kyral said was
true; it was a lucky caravan which had to fight off only one attack.

Cuinn haunted me. A night or two of turning over his cryptic words in my mind had convinced me that
whoever, or whatever he'd been signaling, it wasn't the catmen. And his urgent question "Where's the girl?" swam
endlessly in my brain, making no more sense than when I had first heard it. Who had he mistaken me for? What did
he think I was mixed up in? And who, above all, were the "others" who had to be signaled, at the risk of an attack by
catmen which had meant his own death?

With Cuinn dead, and Kyral thinking I'd saved his life, a large part of the responsibility for the caravan now fell
on me. And strangely I enjoyed it, making the most of this interval when I was separated from the thought of blood-
feud or revenge, the need of spying or the threat of exposure. During those days and nights on the trail I grew back
slowly into the Dry-towner I once had been. I knew I would be sorry when the walls of Shainsa rose on the horizon,
bringing me back inescapably to my own quest.

We swung wide, leaving the straight trail to Shainsa, and Kyral announced his intention of stopping for half a
day at Canarsa, one of the walled nonhuman cities which lay well off the traveled road. To my inadvertent show of
surprise, he returned that he had trading connections there.

"We all need a day's rest, and the Silent Ones will buy from me, though they have few dealings with men. Look
here, I owe you something. You have lenses? You can get a better price in Canarsa than you’d get in Ard carran or
Shainsa. Come along with me, and I'll vouch for you."

Kyral had been most friendly since the night I had dug him out from under the catmen, and I knew no way to refuse without exposing myself for the sham trader I was. But I was deathly apprehensive. Even with Rakhal I had never entered any of the nonhuman towns.

On Wolf, human and nonhuman have lived side by side for centuries. And the human is not always the superior being. I might pass, among the Dry-towners and the relatively stupid humanoid chaks, for another Dry-towner. But Rakhal had cautioned me I could not pass among nonhumans for native Wolfan, and warned me against trying.

Nevertheless, I accompanied Kyral, carrying the box which had cost about a week's pay in the Terran Zone and was worth a small fortune in the Dry-towns.

Canarsa seemed, inside the gates, like any other town. The houses were round, beehive fashion, and the streets totally empty. Just inside the gates a hooded figure greeted us, and gestured us by signs to follow him. He was covered from head to foot with some coarse and shiny fiber woven into stuff that looked like sacking.

But under the thick hooling was horror. It slithered and it had nothing like a recognizable human shape or walk, and I felt the primeval ape in me cowering and gibbering in a corner of my brain. Kyral muttered, close to my ear, "No outsider is ever allowed to look on the Silent Ones in their real form. I think they're deaf and dumb, but be damn careful."

"You bet," I whispered, and was glad the streets were empty. I walked along, trying not to look at the gliding motion of that shrouded thing up ahead.

The trading was done in an open hut of reeds which looked as if it had been built in a hurry, and was not square, round, hexagonal or any other recognizable geometrical shape. It formed a pattern of its own, presumably, but my human eyes couldn't see it. Kyral said in a breath of a whisper, "They'll tear it down and burn it after we leave. We're supposed to have contaminated it too greatly for any of the Silent Ones ever to enter again. My family has traded with them for centuries, and we're almost the only ones who have ever entered the city."

Then two of the Silent Ones of Canarsa, also covered with that coarse shiny stuff, slithered into the hut, and Kyral choked off his words as if he had swallowed them.

It was the strangest trading I had ever done. Kyral laid out the small forged-steel tools and the coils of thin fine wire, and I unpacked my lenses and laid them out in neat rows. The Silent Ones neither spoke nor moved, but through a thin place in the gray veiling I saw a speck which might have been a phosphorescent eye, moving back and forth as if scanning the things laid out for their inspection.

Then I smothered a gasp, for suddenly blank spaces appeared in the rows of merchandise. Certain small tools--wirecutters, calipers, surgical scissors--had vanished, and all the coils of wire had disappeared. Blanks equally had appeared in the rows of lenses; all of my tiny, powerful microscope lenses had vanished. I cast a quick glance at Kyral, but he seemed unsurprised. I recalled vague rumors of the Silent Ones, and concluded that, eerie though it seemed, this was merely their way of doing business.

Kyral pointed at one of the tools, at an exceptionally fine pair of binocular lenses, at the last of the coils of wire. The shrouded ones did not move, but the lenses and the wire vanished. The small tool remained, and after a moment Kyral dropped his hand.

I took my cue from Kyral and remained motionless, awaiting whatever surprise was coming. I had halfway expected what happened next. In the blank spaces, little points of light began to glimmer, and after a moment, blue and red and green gem-stones appeared there. To me the substitution appeared roughly equitable and fair, though I am no judge of the fine points of gems.

Kyral pointed at one of the tools, at an exceptionally fine pair of binocular lenses, at the last of the coils of wire. The shrouded ones did not move, but the lenses and the wire vanished. The small tool remained, and after a moment Kyral dropped his hand.

I took my cue from Kyral and remained motionless, awaiting whatever surprise was coming. I had halfway expected what happened next. In the blank spaces, little points of light began to glimmer, and after a moment, blue and red and green gem-stones appeared there. To me the substitution appeared roughly equitable and fair, though I am no judge of the fine points of gems.

Kyral scowled slightly and pointed to one of the green gems, and after a moment it whisked away and a blue one took its place. In another spot where a fine set of surgical instruments had lain, Kyral pointed at the blue gem which now lay there, shook his head and held out three fingers. After a moment, a second blue stone lay winking beside the first.

Kyral did not move, but inexorably held out the three fingers. There was a little swirling in the air, and then both gems vanished, and the case of surgical instruments lay in their place.

Still Kyral did not move, but held the three fingers out for a full minute. Finally he dropped them and bent to pick up the case instruments. Again the little swirl in the air, and the instruments vanished. In their place lay three of the blue gems. My mouth twitched in the first amusement I had felt since we entered this uncanny place. Evidently bargaining with the Silent Ones was not a great deal different than bargaining with anyone anywhere. Nevertheless, under the eyes of those shrouded but horrible forms--if they had eyes, which I doubted--I had no impulse to protest their offered prices.

I gathered up the rejected lenses, repacked them neatly, and helped Kyral recreate the tools and instruments the Silent Ones had not wanted. I noticed that in addition to the microscope lenses and surgical instruments, they had taken all the fine wire. I couldn't imagine, and didn't particularly want to imagine, what they intended to do with it.
On our way back through the streets, unshepherded this time, Kyral's tongue was loosened as if with a great release from tension. "They're psychokinetics," he told me. "Quite a few of the nonhuman races are. I guess they have to be, having no eyes and no hands. But sometimes I wonder if we of the Dry-towns ought to deal with them at all."

"What do you mean?" I asked, not really listening. I was thinking mostly about the way the small objects had melted away and reappeared. The sight had stirred some uncomfortable memory, a vague sense of danger. It was not tangible enough for me to know why I feared it, but just a subliminal uneasiness that kept prodding at me, like a tooth that isn't quite aching yet.

Kyral said, "We of Shainsa live between fire and flood. Terra on the one hand, and on the other maybe something worse, who knows? We know so little about the Silent Ones, and those like them. Who knows, maybe we're giving them the weapons to destroy us--" He broke off, with a gasp, and stood staring down one of the streets.

It lay open and bare between two rows of round houses, and Kyral was staring fixedly at a doorway which had opened there. I followed his paralyzed gaze, and saw the girl.

Hair like spun black glass fell in hard waves around her shoulders, and the red eyes smiled with alien malice, alien mischief, beneath the dark crown of little stars. And the Toad God sprawled in hideous embroideries across the white folds of her breast.

Kyral gulped hoarsely. His hand flew up as he clutched the charms strung about his neck. I imitated the gesture mechanically, watching Kyral, wondering if he would turn and run again. But he stood frozen for a minute. Then the spell broke and he took one step toward the girl, arms outstretched.

"Miellyn!" he cried, and there was heartbreak in his voice. And again, the cry making ringing echoes in the strange street:

"Miellyn! Miellyn!"

This time it was the girl who whirled and fled. Her white robes fluttered and I saw the twinkle of her flying feet as she vanished into a space between the houses and was gone.

Kyral took one blind step down the street, then another. But before he could burst into a run I had him by the arm, dragging him back to sanity.

"Man, you've gone mad! Chase, in a nonhuman town?"

He struggled for a minute, then, with a harsh sigh, he said, "It's all right, I won't--" and shook loose from my arm.

He did not speak again until we reached the gates of Canarsa and they closed, silently and untouched, behind us. I had forgotten the place already. I had space only to think of the girl, whose face I had not forgotten since the moment when she saved me and disappeared. Now she had appeared again to Kyral. What did it all mean?

I asked, as we walked toward the camp, "Do you know that girl?" But I knew the question was futile. Kyral's face was closed, conceding nothing, and his friendliness had vanished completely.

He said, "Now I know you. You saved me from the catmen, and again in Canarsa, so my hands are bound from harming you. But it is evil to have dealings with those who have been touched by the Toad God." He spat noisily on the ground, looked at me with loathing, and said, "We will reach Shainsa in three days. Stay away from me."

CHAPTER SEVEN

Shainsa, first in the chain of Dry-towns that lie in the bed of a long-dried ocean, is set at the center of a great alkali plain; a dusty, parched city bleached by a million years of sun. The houses are high, spreading buildings with many rooms and wide windows. The poorer sort were made of sun-dried brick, the more imposing being cut from the bleached salt stone of the cliffs that rise behind the city.

News travels fast in the Dry-towns. If Rakhal were in the city, he'd soon know that I was here, and guess who I was or why I'd come. I might disguise myself so that my own sister, or the mother who bore me, would not know me. But I had no illusions about my ability to disguise myself from Rakhal. He had created the disguise that was me.

When the second sun set, red and burning, behind the salt cliffs, I knew he was not in Shainsa, but I stayed on, waiting for something to happen. At night I slept in a cubbyhole behind a wineshop, paying an inordinate price for that very dubious privilege. And every day in the sleepy silence of the blood-red noon I paced the public square of Shainsa.

This went on for four days. No one took the slightest notice of another nameless man in a shabby shirtcloak, without name or identity or known business. No one appeared to see me except the dusty children, with pale fleecy hair, who played their patient games on the windswept curbing of the square. They surveyed my scarred face with neither curiosity or fear, and it occurred to me that Rindy might be such another as these.

If I had still been thinking like an Earthman, I might have tried to question one of the children, or win their
confidence. But I had a deeper game in hand.

On the fifth day I was so much a fixture that my pacing went unnoticed even by the children. On the gray moss of the square, a few dried-looking old men, their faces as faded as their shirtcloaks and bearing the knife scars of a hundred forgotten fights, drowsed on the stone benches. And along the flagged walk at the edge of the square, as suddenly as an autumn storm in the salt flats, a woman came walking.

She was tall, with a proud swinging walk, and a metallic clashing kept rhythm to her swift steps. Her arms were fettered, each wrist bound with a jeweled bracelet and the bracelets linked together by a long, silver-gilt chain passed through a silken loop at her waist. From the loop swung a tiny golden padlock, but in the lock stood an even tinier key, signifying that she was a higher caste than her husband or consort, that her fettering was by choice and not command.

She stopped directly before me and raised her arm in formal greeting like a man. The chain made a tinkling sound in the hushed square as her other hand was pulled up tight against the silken loop at her waist. She stood surveying me for some moments, and finally I raised my head and returned her gaze. I don't know why I had expected her to have hair like spun black glass and eyes that burned with a red reflection of the burning star.

This woman's eyes were darker than the poison-berries of the salt cliffs, and her mouth was a cut berry that looked just as dangerous. She was young, the slimness of her shoulders and the narrow steel-chained wrists told me how very young she was, but her face had seen weather and storms, and her dark eyes had weathered worse psychic storms than that. She did not flinch at the sight of my scars, and met my gaze without dropping her eyes.

"You are a stranger. What is your business in Shainsa?"

I met the direct question with the insolence it demanded, hardly moving my lips. "I have come to buy women for the brothels of Ardcarran. Perhaps when washed you might be suitable. Who could arrange for your sale?"

She took the rebuke impassively, though the bitter crimson of her mouth twitched a little in mischief or rage. But she made no sign. The battle was joined between us, and I knew already that it would be fought to the end.

From somewhere in her draperies, something fell to the ground with a little tinkle. But I knew that trick too and I did not move. Finally she went away without bending to retrieve it and when I looked around I saw that all the fleece-haired children had stolen away, leaving their playthings lying on the curbing. But one or two of the gaffers on the stone benches, who were old enough to show curiosity without losing face, were watching me with impassive eyes.

I could have asked the woman's name then, but I held back, knowing it could only lessen the prestige I had gained from the encounter. I glanced down, without seeming to do so, at the tiny mirror which had fallen from the recesses of the fur robe. Her name might have been inscribed on the reverse.

But I left it lying there to be picked up by the children when they returned, and went back to the wineshop. I had accomplished my first objective; if you can't be inconspicuous, be so damned conspicuous that nobody can miss you. And that in itself is a fair concealment. How many people can accurately describe a street riot?

I was finishing off a bad meal with a stone bottle of worse wine when the chak came in, disregarding the proprietor, and made straight for me. He was furred immaculately white. His velvet muzzle wascontracted as if the very smells might soil it, and he kept a dainty paw outstretched to ward off accidental contact with greasy counters or tables or tapestries. His fur was scented, and his throat circled with a collar of embroidered silk. This pampered minion surveyed me with the innocent malice of an uninvolved nonhuman for merely human intrigues.

"You are wanted in the Great House of Shanitha, thcarred man." He spoke the Shainsa dialect with an affected lisp. "Will it pleathe you, come wis' me?"

I came, with no more than polite protest, but was startled. I had not expected the encounter to reach the Great House so soon. Shainsa's Great House had changed hands four times since I had last been in Shainsa. I wasn't overly anxious to appear there.

The white chak, as out of place in the rough Dry-town as a jewel in the streets or a raindrop in the desert, led me along a winding boulevard to an outlying district. He made no attempt to engage me in conversation, and indeed I got the distinct impression that this cockscomb of a nonhuman considered me well beneath his notice. He seemed much more aware of the blowing dust in the street, which ruffled and smudged his carefully combed fur.

The Great House was carved from blocks of rough pink basalt, the entry guarded by two great caryatids enwrapped in chains of carved metal, set somehow into the surface of the basalt. The gilt had long ago worn away from the chains so that it alternately gleamed gold or smudged base metal. The caryatids were patient and blind, their jewel-eyes long vanished under a hotter sun than today's.

The entrance hall was enormous. A Terran starship could have stood upright inside it, was my first impression, but I dismissed that thought quickly; any Terran thought was apt to betray me. But the main hall was built on a scale even more huge, and it was even colder than the legendary hell of the chaks. It was far too big for the people in it.
that didn't help much either. The chak melted into the shadows, and I went down the steps into the hall by myself, feeling carefully for each step with my feet and trying not to seem to be doing so. My comparative night-blindness is the only significant way in which I really differ from a native Wolfan.

There were three men, two women and a child in the room. They were all Dry-towners and had an obscure family likeness, and they all wore rich garments of fur dyed in many colors. One of the men, old and stooped and withered, was doing something to the brazier. A slim boy of fourteen was sitting cross-legged on a pile of cushions in the corner. There was something wrong with his legs.

A girl of ten in a too-short smock that showed long spider-thin legs above her low leather boots was playing with some sort of shimmery crystals, spilling them out into patterns and scooping them up again from the uneven stones of the floor. One of the women was a fat, creased slattern, whose jewels and dyed furs did not disguise her greasy slovenliness.

Her hands were unchained, and she was biting into a fruit which dripped red juice down the rich blue fur of her robe. The old man gave her a look like murder as I came in, and she straightened slightly but did not discard the fruit. The whole room had a curious look of austere, dignified poverty, to which the fat woman was the only discordant note.

But it was the remaining man and woman who drew my attention, so that I noticed the others only peripherally, in their outermost orbit. One was Kyral, standing at the foot of the dais and glowering at me.

The other was the dark-eyed woman I had rebuked today in the public square. Kyral said, "So it's you." And his voice held nothing. Not rebuke, not friendliness or a lack of it, not even hatred.

Nothing.

There was only one way to meet it. I faced the girl--she was sitting on a thronelike chair next to the fat woman, and looked like a doe next to a pig--and said boldly, "I assume this summons to mean that you informed your kinsmen of my offer."

She flushed, and that was triumph enough. I held back the triumph, however, wary of overconfidence. The gaffer laughed the high cackle of age, and Kyral broke in with a sharp, angry monosyllable by which I knew that my remark had indeed been repeated, and had lost nothing in the telling. But only the line of his jaw betrayed the anger as he said calmly, "Be quiet, Dallisa. Where did you pick this up?"

I said boldly, "The Great House has changed rulers since last I smelled the salt cliffs. Newcomers do not know my name and theirs is unknown to me."

The old gaffer said thinly to Kyral, "Our name has lost khar. One daughter is lured away by the Toymaker and another babbles with strangers in the square, and a homeless no-good of the streets does not know our name."

My eyes, growing accustomed to the dark blaze of the brazier, saw that Kyral was biting his lip and scowling. Then he gestured to a table where an array of glassware was set, and at the gesture, the white chak came on noiseless feet and poured wine.

"If you have no blood-feud with my family, will you drink with me?"

"I will," I said, relaxing. Even if he had associated the trader with the scarred Earthman of the spaceport, he seemed to have decided to drop the matter. He seemed startled, but he waited until I had lifted the glass and taken a sip. Then, with a movement like lightning, he leaped from the dais and struck the glass from my lips.

I staggered back, wiping my cut mouth, in a split-second juggling possibilities. The insult was terrible and deadly. I could do nothing now but fight. Men had been murdered in Shainsa for far less. I had come to settle one feud, not involve myself in another, but even while these lightning thoughts flickered in my mind, I had whipped out my skean and I was surprised at the shrillness of my own voice.

"You contrive offense beneath your own roof--""

"Spy and renegade!" Kyral thundered. He did not touch his skean. From the table he caught a long four-thonged whip, making it whistle through the air. The long-legged child scuttled backward. I stepped back one pace, trying to conceal my desperate puzzlement. I could not guess what had prompted Kyral's attack, but whatever it was, I must have made some bad mistake and could count myself lucky to get out of there alive.

Kyral's voice perceptibly trembled with rage. "You dare to come into my own home after I have tracked you to the Kharsa and back, blind fool that I was! But now you shall pay."

The whip sang through the air, hissing past my shoulders. I dodged to one side, retreating step by step as Kyral swung the powerful thongs. It cracked again, and a pain like the burning of red-hot irons seared my upper arm. My skean rattled down from numb fingers.

The whip whacked the floor.

"Pick up your skean," said Kyral. "Pick it up if you dare." He poised the lash again.

The fat woman screamed.
I stood rigid, gauging my chances of disarming him with a sudden leap. Suddenly the girl Dallisa leaped from her seat with a harsh musical chiming of chains.

"Kyral, no! No, Kyral!"

He moved slightly, but did not take his eyes from me. "Get back, Dallisa."

"No! Wait!" She ran to him and caught his whip-arm, dragging it down, and spoke to him hurriedly and urgently. Kyral's face changed as she spoke; he drew a long breath and threw the whip down beside my skean on the floor.

"Answer straight, on your life. What are you doing in Shainsa?"

I could hardly take it in that for the moment I was reprieved from sudden death, from being beaten into bloody death there at Kyral's feet. The girl went back to her thronelike chair. Now I must either tell the truth or a convincing lie, and I was lost in a game where I didn't know the rules. The explanation I thought might get me out alive might be the very one which would bring down instant and painful death. Suddenly, with a poignancy that was almost pain, I wished Rakhal were standing here at my side.

But I had to bluff it out alone.

If they had recognized me for Race Cargill, the Terran spy who had often been in Shainsa, they might release me—it was possible, I supposed, that they were Terran sympathizers. On the other hand, Kyral's shouts of "Spy, renegade!" seemed to suggest the opposite.

I stood trying to ignore the searing pain in my lashed arm, but I knew that blood was running hot down my shoulder. Finally I said, "I came to settle blood-feud." I told you he wasn't," said Dallisa, high and hysterically. "I told you he wasn't."

"A scarred man, tall—what was I to think?" Kyral sounded and looked badly shaken. He filled a glass himself and handed it to me, saying hoarsely, "I did not believe even the renegade Rakhal would break the code so far as to drink with me."

"He would not." I could be positive about this. The codes of Terra had made some superficial impress on Rakhal, but down deep his own world held sway. If these men were at blood-feud with Rakhal and he stood here where I stood, he would have let himself be beaten into bloody rags before tasting their wine.

I took the glass, raised it and drained it. Then, holding it out before me, I said, "Rakhal's life is mine. But I swear by the red star and by the unmoving mountains, by the black snow and by the Ghost Wind, I have no quarrel with any beneath this roof." I cast the glass to the floor, where it shattered on the stones.

Kyral hesitated, but under the blazing eyes of the girl he quickly poured himself a glass of the wine and drank a few sips, then flung down the glass. He stepped forward and laid his hands on my shoulders. I winced as he touched the welt of the lash and could not raise my own arm to complete the ceremonial toast.

Kyral stepped away and shrugged. "Shall I have one of the women see to your hurt?" He looked at Dallisa, but she twisted her mouth. "Do it yourself!"

"It is nothing," I said, not truthfully. "But I demand in requital that since we are bound by spilled blood under your roof, that you give me what news you have of Rakhal, the spy and renegade."

Kyral said fiercely, "If I knew, would I be under my own roof?"

The old gaffer on the dais broke into shrill whining laughter. "You have drunk wi' him, Kyral, now he's bound you not to do him harm! I know the story of Rakhal! He was spy for Terra twelve years. Twelve years, and then he fought and flung their filthy money in their faces and left 'em. But his partner was some Dry-town halfbreed or Terran spy and they fought wi' clawed gloves, and near killed one another except the Terrans, who have no honor, stopped 'em. See the marks of the kifirgh on his face!"

"By Sharra the golden-chained," said Kyral, gazing at me with something like a grin. "You are, if nothing else, a very clever man. What are you, spy, or half-caste of some Ardcarran slut?"

"What I am doesn't matter to you," I said. "You have blood-feud with Rakhal, but mine is older than yours and his life is mine. As you are bound in honor to kill"—the formal phrases came easily now to my tongue; the Earthman had slipped away—"so you are bound in honor to help me kill. If anyone beneath your roof knows anything of Rakhal—"
Kyral's smile bared his teeth.

"Rakhal works against the Son of the Ape," he said, using the insulting Wolf term for the Terrans. "If we help you to kill him, we remove a goad from their flanks. I prefer to let the filthy Terranan spend their strength trying to remove it themselves. Moreover, I believe you are yourself an Earthman.

"You have no right to the courtesy I extend to we, the People of the Sky. Yet you have drunk wine with me and I have no quarrel with you." He raised his hand in dismissal, outfencing me. "Leave my roof in safety and my city with honor."

I could not protest or plead. A man's kihar, his personal dignity, is a precious thing in Shainsa, and he had placed me so I could not compromise mine further in words. Yet I lost kihar equally if I left at his bidding, like an inferior dismissed.

One desperate gamble remained.

"A word," I said, raising my hand, and while he half turned, startled, believing I was indeed about to compromise my dignity by a further plea, I flung it at him:

"I will bet shegri with you."

His iron composure looked shaken. I had delivered a blow to his belief that I was an Earthman, for it is doubtful if there are six Earthmen on Wolf who know about shegri, the dangerous game of the Dry-towns.

It is no ordinary gamble, for what the better stakes is his life, possibly his reason. Rarely indeed will a man beg shegri unless he has nothing further to lose.

It is a cruel, possibly decadent game, which has no parallel anywhere in the known universe.

But I had no choice. I had struck a cold trail in Shainsa. Rakhal might be anywhere on the planet and half of Magnusson's month was already up. Unless I could force Kyral to tell what he knew, I might as well quit.

So I repeated: "I will bet shegri with you."

And Kyral stood unmoving.

For what the shegrin wagers is his courage and endurance in the face of torture and an unknown fate. On his side, the stakes are clearly determined beforehand. But if he loses, his punishment or penalty is at the whim of the one who has accepted him, and he may be put to whatever doom the winner determines.

And this is the contest:

The shegrin permits himself to be tortured from sunrise to sunset. If he endures he wins. It is as simple as that. He can stop the torture at any moment by a word, but to do so is a concession of defeat.

This is not as dangerous as it might, at first, seem. The other party to the bet is bound by the ironclad codes of Wolf to inflict no permanent physical damage (no injury that will not heal with three suncourses). But from sunrise to sunset, any torment or painful ingenuity which the half-human mentality of Wolf can devise must be endured.

The man who can outthink the torture of the moment, the man who can hold in his mind the single thought of his goal—that man can claim the stakes he has set, as well as other concessions made traditional.

The silence grew in the hall. Dallisa had straightened and was watching me intently, her lips parted and the tip of a little red tongue visible between her teeth. The only sound was the tiny crunching as the fat woman nibbled at nuts and cast their shells into the brazier. Even the child on the steps had abandoned her game with the crystal dice, and sat looking up at me with her mouth open. Finally Kyral demanded, "Your stakes?"

"Tell me all you know of Rakhal Sensar and keep silence about me in Shainsa."

"By the red shadow," Kyral burst out, "you have courage, Rascar!"

"Say only yes or no!" I retorted.

Rebuked, he fell silent. Dallisa leaned forward and again, for some unknown reason, I thought of a girl with hair like spun black glass.

Kyral raised his hand. "I say no. I have blood-feud with Rakhal and I will not sell his death to another. Further, I believe you are Terran and I will not deal with you. And finally, you have twice saved my life and I would find small pleasure in torturing you. I say no. Drink again with me and we part without a quarrel."

Beaten, I turned to go.

"Wait," said Dallisa.

She stood up and came down from the dais, slowly this time, walking with dignity to the rhythm of her musically clashing chains. "I have a quarrel with this man."

I started to say that I did not quarrel with women, and stopped myself. The Terran concept of chivalry has no equivalent on Wolf.

She looked at me with her dark poison-berry eyes, icy and level and amused, and said, "I will bet shegri with you, unless you fear me, Rascar."

And I knew suddenly that if I lost, I might better have trusted myself to Kyral and his whip, or to the wild beast-things of the mountains.
CHAPTER EIGHT

I slept little that night.

There is a tale told in Daillon of a shegri where the challenger was left in a room alone, where he was blindfolded and told to await the beginning of the torment.

Somewhere in those dark hours of waiting, between the unknown and the unexpected, the hours of telling over to himself the horrors of past shegri, the torture of anticipation alone became the unbearable. A little past noon he collapsed in screams of horror and died raving, unmarred, untouched.

Daybreak came slowly, and with the first streamers of light came Dallisa and the white chak, maliciously uninvolved, sniffing his way through the shabby poverty of the great hall. They took me to a lower dungeon where the slant of the sunlight was less visible. Dallisa said, "The sun has risen."

I said nothing. Any word may be interpreted as a confession of defeat. I resolved to give them no excuse. But my skin crawled and I had that peculiar prickling sensation where the hair on my forearms was bristling erect with tension and fear.

Dallisa said to the chak, "His gear was not searched. See that he has swallowed no anesthetic drugs."

Briefly I gave her credit for thoroughness, even while I wondered in a split second why I had not thought of this. Drugs could blur consciousness, at least, or suspend reality. The white nonhuman sprang forward and pinioned my arms with one strong, spring-steel forearm. With his other hand he forced my jaws open. I felt the furred fingers at the back of my throat, gagged, struggled briefly and doubled up in uncontrollable retching.
Dallisa's poison-berry-eyes regarded me levelly as I struggled upright, fighting off the dizzy sickness of disgust. Something about her impassive face stopped me cold. I had been, momentarily, raging with fury and humiliation. Now I realized that this had been a calculated, careful gesture to make me lose my temper and thus sap my resistance.

If she could set me to fighting, if she could make me spend my strength in rage, my own imagination would fight on her side to make me lose control before the end. Swimming in the glare of her eyes, I realized she had never thought for a moment that I had taken any drug. Acting on Kyral's hint that I was a Terran, she was taking advantage of the well-known Terran revulsion for the nonhuman.

"Blindfold him," Dallisa commanded, then instantly countermanded that: "No, strip him first."

The chak ripped off shirtcloak, shirt, shoes, breeches, and I had my first triumph when the wealed clawmarks on my shoulders--worse, if possible, than those which disfigured my face--were laid bare. The chak screwed up his muzzle in fastidious horror, and Dallisa looked shaken. I could almost read her thoughts:

If he endured this, what hope have I to make him cry mercy?

Briefly I remembered the months I lay feverish and half dead, waiting for the wounds Rakhal had inflicted to heal, those months when I had believed that nothing would ever hurt me again, that I had known the worst of all suffering. But I had been younger then.

Dallisa had picked up two small sharp knives. She weighed them, briefly, gesturing to the chak. Without resisting, I let myself be manhandled backward, spreadeagled against the wall.

Dallisa commanded, "Drive the knives through his palms to the wall!"

My hands twitched convulsively, anticipating the slash of steel, and my throat closed in spasmodic dread. This was breaking the compact, bound as they were not to inflict physical damage. I opened my lips to protest this breaking of the bond of honor and met her dark blazing stare, and suddenly the sweat broke out on my forehead. I had placed myself wholly in their hands, and as Kyral had said, they were in no way bound by honor to respect a pledge to a Terran!

Then, as my hands clenched into fists, I forced myself to relax. This was a bluff, a mental trick to needle me into breaking the pact and pleading for mercy. I set my lips, spread my palms wide against the wall and waited impassively.

She said in her lilting voice, "Take care not to sever the tendons, or his hands would be paralyzed and he may claim we have broken our compact."

The points of the steel, razor-sharp, touched my palms, and I felt blood run down my hand before the pain. With an effort that turned my face white, I did not pull away from the point. The knives drove deeper.

Dallisa gestured to the chak. The knives dropped. Two pinpricks, a quarter of an inch deep, stung in my palm. I had outbluffed her. Had I?

If I had expected her to betray disappointment--and I had--I was disappointed. Abruptly, as if the game had wearied her already, she gestured, and I could not hold back a gasp as my arms were hauled up over my head, twisted violently around one another and trussed with thin cords that bit deep into the flesh. Then the rough upward pull almost jerked my shoulders from their sockets and I heard the giant chak grunt with effort as I was hauled upward until my feet barely, on tiptoe, touched the floor.

"Blindfold him," said Dallisa languidly, "so that he cannot watch the ascent of the sun or its descent or know what is to come."

A dark softness muffled my eyes. After a little I heard her steps retreating. My arms, wrenched overhead and numbed with the bite of the cords, were beginning to hurt badly now. But it wasn't too bad. Surely she did not mean that this should be all....

Sternly I controlled my imagination, taking a tight rein on my thoughts. There was only one way to meet this--hanging blind and racked in space, my toes barely scrubbling at the floor--and that was to take each thing as it came and not look ahead for an instant. First of all I tried to get my feet under me, and discovered that by arching upwards to my fullest height I could bear my weight on tiptoe and ease, a little, the dislocating ache in my armpits by slackening the overhead rope.

But after a little, a cramping pain began to flare through the arches of my feet, and it became impossible to support my weight on tiptoe. I jarred down with violent strain on my wrists and wrenched shoulders again, and for a moment the shooting agony was so intense that I nearly screamed. I thought I heard a soft breath near me.

After a little it subsided to a sharp ache, then to a dull ache, and then to the violent cramping pain again, and once more I struggled to get my toes under me. I realized that by allowing my toes barely to touch the floor they had doubled and tripled the pain by the tantalizing hope of, if not momentary relief, at least the alteration of one pain for another.

I haven't the faintest idea, even now, how long I repeated that agonizing cycle: struggle for a toehold on rough
stone, scraping my bare feet raw; arch upward with all my strength to release for a few moments the strain on my wrenched shoulders; the momentary illusion of relief as I found my balance and the pressure lightened on my wrists.

Then the slow creeping, first of an ache, then of a pain, then of a violent agony in the arches of feet and calves. And, delayed to the last endurable moment, that final terrible anguish when the drop of my full weight pulled shoulder and wrist and elbow joints with that bone-shattering jerk.

I started once to estimate how much time had passed, how many hours had crawled by, then checked myself, for that was imminent madness. But once the process had begun my brain would not abandon and I found myself, with compulsive precision, counting off the seconds and the minutes in each cycle: stretch upward, release the pressure on the arms; the beginning of pain in calves and arches and toes; the creeping of pain up ribs and loins and shoulders; the sudden jarring drop on the arms again.

My throat was intolerably dry. Under other circumstances I might have estimated the time by the growth of hunger and thirst, but the rough treatment I had received made this impossible. There were other, unmentionable, humiliating pains.

After a time, to bolster my flagging courage, I found myself thinking of all the ways it might have been worse. I had heard of a shegrin exposed to the bite of poisonous—not fatal, but painfully poisonous— insects, and to the worrying of the small gnawing rodents which can be trained to bite and tear. Or I might have been branded....

I banished the memory with the powerful exorcism; the man in Daillon whose anticipation, alone, of a torture which never came, had broken his mind. There was only one way to conquer this, and that was to act as if the present moment was the only one, and never for a moment to forget that the strongest of compacts bound them not to harm me, that the end of this was fixed by sunset.

Gradually, however, all such rational thoughts blurred in a semidelirium of thirst and pain, narrowing to a red blaze of agony across my shoulder blades. I eased up on my toes again.

White-hot pain blazed through my feet. The rough stone on which my toes sank had been covered with metal and I smelled scorching flesh, jerking up my feet with a wordless snarl of rage and fury, hanging in agony by my shoulders alone.

And then I lost consciousness, at least for several moments, for when I became aware again, through the nightmare of pain, my toes were resting lightly and securely on cold stone. The smell of burned flesh remained, and the painful stinging in my toes. Mingled with that smell was a drift of perfume close by.

Dallisa murmured, "I do not wish to break our bargain by damaging your feet. It's only a little touch of fire to keep you from too much security in resting them."

I felt the taste of blood mingle in my mouth with the sour taste of vomit. I felt delirious, lightheaded. After another eternity I wondered if I had really heard Dallisa's lilting croon or whether it was a nightmare born of feverish pain:

Plead with me. A word, only a word and I will release you, strong man, scarred man. Perhaps I shall demand only a little space in your arms. Would not such doom be light upon you? Perhaps I shall set you free to seek Rakhal if only to plague Kyral. A word, only a word from you. A word, only a word from you....

It died into an endlessly echoing whisper. Swaying, blinded, I wondered why I endured. I drew a dry tongue over lips, salty and bloody, and nightmarishly considered yielding, winning my way somehow around Dallisa. Or knocking her suddenly senseless and escaping—I, who need not be bound by Wolf's codes either. I fumbled with a stiff shape of words.

And a breath saved me, a soft, released breath of anticipation. It was another trick. I swayed, limp and racked. I was not Race Cargill now. I was a dead man hanging in chains, swinging, filthy vultures pecking at my dangling feet. I was....

The sound of boots rang on the stone and Kyral's voice, low and bitter, demanded somewhere behind me, "What have you done with him?"

She did not answer, but I heard her chains clash lightly and imagined her gesture. Kyral muttered, "Women have no genius at any torture except...." His voice faded out into great distances. Their words came to me over a sort of windy ringing, like the howling of lost men, dying in the snowfast passes of the mountains.

"Speak up, you fool, he can't hear you now."

"If you have let him faint, you are clumsy!"

"You talk of clumsiness?" Dallisa's voice, even thinned by the nightmare ringing in my head, held concentrated scorn. "Perhaps I shall release him, to find Rakhal when you failed! The Terrans have a price on Rakhal's head, too. And at least this man will not confuse himself with his prey!"

"If you think I would let you bargain with a Terranan--"

Dallisa cried passionately, "You trade with the Terrans! How would you stop me, then?"

"I trade with them because I must. But for a matter involving the honor of the Great House--"
"The Great House whose steps you would never have climbed, except for Rakhal!" Dallisa sounded as if she were chewing her words in little pieces and spitting them at Kyral. "Oh, you were clever to take us both as your consorts! You did not know it was Rakhal's doing, did you? Hate the Terrans, then!" She spat an obscenity at him. "Enjoy your hate, wallow in hating, and in the end all Shainsa will fall prey to the Toymaker, like Miellyn."

"If you speak that name again," said Kyral very low, "I will kill you."

"Like Miellyn, Miellyn, Miellyn," Dallisa repeated deliberately. "You fool, Rakhal knew nothing of Miellyn!"

"He was seen--"

"With me, you fool! With me! You cannot yet tell twin from twin? Rakhal came to me to ask news of her!"

Kyral cried out hoarsely, like a man in anguish, "Why didn't you tell me?"

"You don't really have to ask, do you, Kyral?"

"You bitch!" said Kyral. "You filthy bitch!" I heard the sound of a blow. The next moment Kyral ripped the blindfold from my eyes and I blinked in the blaze of light. My arms were wholly numb now, twisted above my head, but the jar of his touch sent fresh pain racing through me. Kyral's face swam out of the blaze of hell. "If that is true, then this is a damnable farce, Dallisa. You have lost our chance of learning what he knows of Miellyn."

"What he knows?" Dallisa lowered her hand from her face, where a bruise was already darkening.

"Miellyn has twice appeared when I was with him. Loose him, Dallisa, and bargain with him. What we know of Rakhal for what he knows of Miellyn."

"If you think I would let you bargain with Terranan," she mocked. "Weakling, this quarrel is mine! You fool, the others in the caravan will give me news, if you will not! Where is Cuinn?"

From a million miles away Kyral laughed. "You've slipped the wrong hawk, Dallisa. The catmen killed him."

His skean flicked loose. He climbed to a perch near the rope at my wrists. "Bargain with me, Rascar!"

I coughed, unable to speak, and Kyral insisted, "Will you bargain? End this damned woman's farce which makes a mock of shegri?"

The slant of sun told me there was light left. I found a shred of voice, not knowing what I was going to say until I had said it, irrevocably. "This is between Dallisa and me."

Kyral glared at me in mounting rage. With four strides he was out of the room, flinging back a harsh, furious "I hope you kill each other!" and the door slammed.

Dallisa's face swam red, and again as before, I knew the battle which was joined between us would be fought to a dreadful end. She touched my chest lightly, but the touch jolted excruciating pain through my shoulders.

"Did you kill Cuinn?"

I wondered, wearily, what this presaged.

"Did you?" In a passion, she cried, "Answer! Did you kill him?" She struck me hard, and where the touch had been pain, the blow was a blaze of white agony. I fainted.

"Answer!" She struck me again and the white blaze jolted me back to consciousness. "Answer me! Answer!"

Each cry bought a blow until I gasped finally, "He signaled ... set catmen on us...."

"No!" She stood staring at me and her white face was a death mask in which the eyes lived. She screamed wildly and the huge chak came running.

"Cut him down! Cut him down! Cut him down!"

A knife slashed the rope and I slumped, falling in a bone-breaking huddle to the floor. My arms were still twisted over my head. The chak cut the ropes apart, pulled my arms roughly back into place, and I gagged with the pain as the blood began flowing painfully through the chafed and swollen hands.

And then I lost consciousness. More or less permanently, this time.

CHAPTER NINE

When I came to again I was lying with my head in Dallisa's lap, and the reddish color of sunset was in the room. Her thighs were soft under my head, and for an instant I wondered if, in delirium, I had conceded to her. I muttered, "Sun ... not down...."

She bent her face to mine, whispering, "Hush. Hush."

It was heaven, and I drifted off again. After a moment I felt a cup against my lips.

"Can you swallow this?"

I could and did. I couldn't taste it yet, but it was cold and wet and felt heavenly trickling down my throat. She bent and looked into my eyes, and I felt as if I were falling into those reddish and stormy depths. She touched my scarred mouth with a light finger. Suddenly my head cleared and I sat upright.

"Is this a trick to force me into calling my bet?"

She recoiled as if I had struck her, then the trace of a smile flitted around her red mouth. Yes, between us it was
battle. "You are right to be suspicious, I suppose. But if I tell you what I know of Rakhal, will you trust me then?"
I looked straight at her and said, "No."
Surprisingly, she threw back her head and laughed. I flexed my freed wrists cautiously. The skin was torn away
and chafed, and my arms ached to the bone. When I moved harsh lances of pain drove through my chest.
"Well, until sunset I have no right to ask you to trust me," said Dallisa when she had done laughing. "And since
you are bound by my command until the last ray has fallen, I command that you lay your head upon my knees."
I blazed, "You are making a game of me!"
"Is that my privilege? Do you refuse?"
"Refuse?" It was not yet sunset. This might be a torture more complex than any which had yet greeted me.
From the scarlet glint in her eyes I felt she was playing with me, as the cat-things of the forest play with their
helpless victims. My mouth twitched in a grimace of humiliation as I lowered myself obediently until my head
rested on her fur-clad knees.
She murmured, smiling, "Is this so unbearable, then?"
I said nothing. Never, never for an instant could I forget that--all human, all woman as she seemed--Dallisa's
race was worn and old when the Terran Empire had not left their home star. The mind of Wolf, which has mingled
with the nonhuman since before the beginnings of recorded time, is unfathomable to an outsider. I was better
equipped than most Earthmen to keep pace with its surface acts, but I could never pretend to understand its deeper
motivations.
It works on complex and irrational logic. Mischief is an integral part of it. Even the deadly blood-feud with
Rakhal had begun with an overelaborate practical joke--which had lost the Service, incidentally, several thousand
credits worth of spaceship.
And so I could not trust Dallisa for an instant. Yet it was wonderful to lie here with my head resting against the
perfumed softness of her body.
Then suddenly her arms were gripping me, frantic and hungry; the subdued thing in her voice, her eyes, flamed
out hot and wild. She was pressing the whole length of her body to mine, breasts and thighs and long legs, and her
voice was hoarse.
"Is this torture too?"
Beneath the fur robe she was soft and white, and the subtle scent of her hair seemed a deeper entrapment than
any. Frail as she seemed, her arms had the strength of steel, and pain blazed down my wrenched shoulders, seared
through the twisted wrists. Then I forgot the pain.
Over her shoulder the last dropping redness of the sun vanished and plunged the room into orchid twilight.
I caught her wrists in my hands, prizing them backward, twisting them upward over her head. I said thickly,
"The sun's down." And then I stopped her wild mouth with mine.
And I knew that the battle between us had reached climax and victory simultaneously, and any question about
who had won it was purely academic.
* * * * *
During the night sometime, while her dark head lay motionless on my shoulder, I found myself staring into the
darkness, wakeful. The throbbing of my bruises had little to do with my sleeplessness; I was remembering other
chained girls from the old days in the Dry-towns, and the honey and poison of them distilled into Dallisa's kisses.
Her head was very light on my shoulders, and she felt curiously insubstantial, like a woman of feathers.
One of the tiny moons was visible through the slitted windows. I thought of my rooms in the Terran Trade City,
clean and bright and warm, and all the nights when I had paced the floor, hating, filled to the teeth with bitterness,
longing for the windswept stars of the Dry-towns, the salt smell of the winds and the musical clashing of the walk of
the chained women.
With a sting of guilt, I realized that I had half forgotten Juli and my pledge to her and her misfortune which had
freed me again, for this.
Yet I had won, and what they knew had narrowed my planet-wide search to a pinpoint. Rakhal was in Charin.
I wasn't altogether surprised. Charin is the only city on Wolf, except the Kharsa, where the Terran Empire has
put down deep roots into the planet, built a Trade City, a smaller spaceport. Like the Kharsa, it lies within the circle
of Terran law--and a million miles outside it.
A nonhuman town, inhabited largely by chaks, it is the core and center of the resistance movement, a noisy
town in a perpetual ferment. It was the logical place for a renegade. I settled myself so that the ache in my racked
shoulders was less violent, and muttered, "Why Charin?"
Slight as the movement was, it roused Dallisa. She rolled over and propped herself on her elbows, quoting
drowsily, "The prey walks safest at the hunter's door."
I stared at the square of violet moonlight, trying to fit together all the pieces of the puzzle, and asked half aloud,
"What prey and what hunters?"

Dallisa didn't answer. I hadn't expected her to answer. I asked the real question in my mind: "Why does Kyral hate Rakhal Sensar, when he doesn't even know him by sight?"

"There are reasons," she said somberly. "One of them is Miellyn, my twin sister. Kyral climbed the steps of the Great House by claiming us both as his consorts. He is our father's son by another wife."

That explained much. Brother-and-sister marriages, not uncommon in the Dry-towns, are based on expediency and suspicion, and are frequently, though not always loveless. It explained Dallisa's taunts, and it partly explained, only partly, why I found her in my arms. It did not explain Rakhal's part in this mysterious intrigue, nor why Kyral had taken me for Rakhal, (but only after he remembered seeing me in Terran clothing).

I wondered why it had never occurred to me before that I might be mistaken for Rakhal. There was no close resemblance between us, but a casual description would apply equally well to me or to Rakhal. My height is unusual for a Terran--within an inch of Rakhal's own--and we had roughly the same build, the same coloring. I had copied his walk, imitated his mannerisms, since we were boys together.

And, blurring minor facial characteristics, there were the scars of the kifirgh on my mouth, cheeks, and shoulders. Anyone who did not know us by sight, anyone who had known us by reputation from the days when we had worked together in the Dry-towns, might easily take one of us for the other. Even Juli had blurted, "You're so much like--" before thinking better of it.

Other odd bits of the puzzle floated in my mind, stubbornly refusing to take on recognizable patterns, the disappearance of a toy-seller; Juli's hysterical babbling; the way the girl--Miellyn?--had vanished into a shrine of Nebran; and the taunts of Dallisa and the old man about a mysterious "Toymaker." And something, some random joggling of a memory, in that eerie trading in the city of the Silent Ones. I knew all these things fitted together somehow, but I had no real hope that Dallisa could complete their pattern for me.

She said, with a vehemence that startled me, "Miellyn is only the excuse! Kyral hates Rakhal because Rakhal will compromise and because he'll fight!"

She rolled over and pressed herself against me in the darkness. Her voice trembled. "Race, our world is dying. We can't stand against Terra. And there are other things, worse things."

I sat up, surprised to find myself defending Terra to this girl. After all these years I was back in my own world. And yet I heard myself say quietly, "The Terrans aren't exploiting Wolf. We haven't abolished the rule of Shainsa. We've changed nothing."

It was true. Terra held Wolf by compact, not conquest. They paid, and paid generously, for the lease of the lands where their Trade Cities would rise, and stepped beyond them only when invited to do so.

"We let any city or state that wants to keep its independence govern itself until it collapses, Dallisa. And they do collapse after a generation or so. Very few primitive planets can hold out against us. The people themselves get tired of living under feudal or theocratic systems, and they beg to be taken into the Empire. That's all."

"But that's just it," Dallisa argued. "You give the people all those things we used to give them, and you do it better. Just by being here, you are killing the Dry-towns. They're turning to you and leaving us, and you let them do it."

I shook my head. "We've kept the Terran Peace for centuries. What do you expect? Should we give you arms, planes, bombs, weapons to hold your slaves down?"

"Yes!" she flared at me. "The Dry-towns have ruled Wolf since--since--you, you can't even imagine how long! And we made compact with you to trade here--"

"And we have rewarded you by leaving you untouched," I said quietly. "But we have not forbidden the Dry-towns to come into the Empire and work with Terra."

She said bitterly, "Men like Kyral will die first," and pressed her face helplessly against me. "And I will die with them. Miellyn broke away, but I cannot! Courage is what I lack. Our world is rotten, Race, rotten all through, and I'm as rotten as the core of it. I could have killed you today, and I'm here in your arms. Our world is rotten, but I've no confidence that the new world will be better!"

I put my hand under her chin, and looked down gravely into her face, only a pale oval in the darkness. There was nothing I could say; she had said it all, and truthfully. I had hated and yearned and starved for this, and when I found it, it turned salty and bloody on my lips, like Dallisa's despairing kisses. She ran her fingers over the scars on my face, then gripped her small thin hands around my wrists so fiercely that I grunted protest.

"You will not forget me," she said in her strangely lilting voice. "You will not forget me, although you were victorious." She twisted and lay looking up at me, her eyes glowing faintly luminous in darkness. I knew that she could see me as clearly as if it were day. "I think it was my victory, not yours, Race Cargill."

Gently, on an impulse I could not explain, I picked up one delicate wrist, then the other, unclasping the heavy jeweled bracelets. She let out a stifled cry of dismay. And then I tossed the chains into a corner before I drew her
savagely into my arms again and forced her head back under my mouth.

* * * *

I said good-bye to her alone, in the reddish, windswept space before the Great House. She pressed her head against my shoulder and whispered, "Race, take me with you!"

For answer I only picked up her narrow wrists and turned them over on my palm. The jeweled bracelets were clasped again around the thinly boned joints, and on some self-punishing impulse she had shortened the chains so that she could not even put her arms around me. I lifted the punished wrists to my mouth and kissed them gently.

"You don't want to leave, Dallisa."

I was desperately sorry for her. She would go down with her dying world, proud and cold and with no place in the new one. She kissed me and I tasted blood, her thin fettered body straining wildly against me, shaken with tearing, convulsive sobs. Then she turned and fled back into the shadow of the great dark house.

I never saw her again.

CHAPTER TEN

A few days later I found myself nearing the end of the trail.

It was twilight in Charin, hot and reeking with the gypsy glare of fires which burned, smoking, at the far end of the Street of the Six Shepherds. I crouched in the shadow of a wall, waiting.

My skin itched from the dirty shirtcloak I hadn't changed in days. Shabbiness is wise in nonhuman parts, and Dry-towners think too much of water to waste much of it in superfluous washing anyhow. I scratched unobtrusively and glanced cautiously down the street.

It seemed empty, except for a few sodden derelicts sprawled in doorways—the Street of the Six Shepherds is a filthy slum—but I made sure my skean was loose. Charin is not a particularly safe town, even for Dry-towners, and especially not for Earthmen, at any time.

Even with what Dallisa had told me, the search had been difficult. Charin is not Shainsa. In Charin, where human and nonhuman live closer together than anywhere else on the planet, information about such men as Rakhal can be bought, but the policy is to let the buyer beware. That's fair enough, because the life of the seller has a way of not being worth much afterward, either.

A dirty, dust-laden wind was blowing up along the street, heavy with strange smells. The pungent reek of incense from a street-shrine was in the smells. The heavy, acrid odor that made my skin crawl. In the hills behind Charin, the Ghost Wind was rising.

Borne on this wind, the Ya-men would sweep down from the mountains, and everything human or nearly human would scatter in their path. They would range through the quarter all night, and in the morning they would melt away, until the Ghost Wind blew again. At any other time, I would already have taken cover. I fancied that I could hear, borne on the wind, the faraway yelping, and envision the plumed, taloned figures which would come leaping down the street.

In that moment, the quiet of the street split asunder.

From somewhere a girl's voice screamed in shrill pain or panic. Then I saw her, dodging between two of the chinked pebble-houses. She was a child, thin and barefoot, a long tangle of black hair flying loose as she darted and twisted to elude the lumbering fellow at her heels. His outstretched paw jerked cruelly at her slim wrist.

The little girl screamed and wrenched herself free and threw herself straight on me, wrapping herself around my neck with the violence of a storm wind. Her hair got in my mouth and her small hands gripped at my back like a cat's flexed claws.

"Oh, help me," she gasped between sobs. "Don't let him get me, don't." And even in that broken plea I took it in that the little ragamuffin did not speak the jargon of that slum, but the pure speech of Shainsa.

What I did then was as automatic as if it had been Juli. I pulled the kid loose, shoved her behind me, and scowled at the brute who lurched toward us.

"Make yourself scarce," I advised. "We don't chase little girls where I come from. Haul off, now."

The man reeled. I smelled the rankness of his rags as he thrust one grimy paw at the girl. I never was the hero type, but I'd started something which I had to carry through. I thrust myself between them and put my hand on the skean again.

"You--you Dry-towner." The man set up a tipsy howl, and I sucked in my breath. Now I was in for it. Unless I got out of there damned fast, I'd lose what I'd come all the way to Charin to find.

I felt like handing the girl over. For all I knew, the bully could be her father and she was properly in line for a spanking. This wasn't any of my business. My business lay at the end of the street, where Rakhal was waiting at the fires. He wouldn't be there long. Already the smell of the Ghost Wind was heavy and harsh, and little flurries of sand
went racing along the street, lifting the flaps of the doorways.

But I did nothing so sensible. The big lunk made a grab at the girl, and I whipped out my skean and pantomimed.

"Get going!"
"Dry-towner!" He spat out the word like filth, his pig-eyes narrowing to slits. "Son of the Ape! Earthman!"
"Terranan!" Someone took up the howl. There was a stir, a rustle, all along the street that had seemed empty, and from nowhere, it seemed, the space in front of me was crowded with shadowy forms, human and otherwise.

"Earthman!"

I felt the muscles across my belly knotting into a band of ice. I didn't believe I'd given myself away as an Earthman. The bully was using the time-dishonored tactic of stirring up a riot in a hurry, but just the same I looked quickly round, hunting a path of escape.

"Put your skean in his guts, Spilkar! Grab him!"
"Hai-ai! Earthman! Hai-ai!"

It was the last cry that made me panic. Through the sultry glare at the end of the street, I could see the plumed, taloned figures of the Ya-men, gliding through the banners of smoke. The crowd melted open.

I didn't stop to reflect on the fact--suddenly very obvious--that Rakhal couldn't have been at the fires at all, and that my informant had led me into an open trap, a nest of Ya-men already inside Charin. The crowd edged back and muttered, and suddenly I made my choice. I whirled, snatched up the girl in my arms and ran straight toward the advancing figures of the Ya-men.

Nobody followed me. I even heard a choked shout that sounded like a warning. I heard the yelping shrieks of the Ya-men grow to a wild howl, and at the last minute, when their stiff rustling plumes loomed only a few yards away, I dived sidewise into an alley, stumbled on some rubbish and spilled the girl down.

"Run, kid!"

She shook herself like a puppy climbing out of water. Her small fingers closed like a steel trap on my wrist. "This way," she urged in a hasty whisper, and I found myself plunging out the far end of the alley and into the shelter of a street-shrine. The sour stink of incense smarted in my nostrils, and I could hear the yelping of the Ya-men as they leaped and rustled down the alley, their cold and poisonous eyes searching out the recess where I crouched with the girl.

"Here," she panted, "stand close to me on the stone--" I drew back, startled.
"Oh, don't stop to argue," she whimpered. "Come here!"
"Hai-ai! Earthman! There he is!"

The girl's arms flung round me again. I felt her slight, hard body pressing on mine and she literally hauled me toward the pattern of stones at the center of the shrine. I wouldn't have been human if I hadn't caught her closer yet.

The world reeled. The street disappeared in a cone of spinning lights, stars danced crazily, and I plunged down through a widening gulf of empty space, locked in the girl's arms. I fell, spun, plunged head over heels through tilting lights and shadows that flung us through eternities of freefall. The yelping of the Ya-men whirled away in unimaginable distances, and for a second I felt the unmerciful blackout of a power dive, with blood breaking from my nostrils and filling my mouth.

CHAPTER ELEVEN

Lights flared in my eyes.

I was standing solidly on my feet in the street-shrine, but the street was gone. Coils of incense still smudged the air. The God squatted toadlike in his recess. The girl was hanging limp, locked in my clenched arms. As the floor straightened under my feet I staggered, thrown off balance by the sudden return of the girl's weight, and grabbed blindly for support.

"Give her to me," said a voice, and the girl's sagging body was lifted from my arms. A strong hand grasped my elbow. I found a chair beneath my knees and sank gratefully into it.

"The transmission isn't smooth yet between such distant terminals," the voice remarked. "I see Miellyn has fainted again. A weakling, the girl, but useful."

I spat blood, trying to get the room in focus. For I was inside a room, a room of some translucent substance, windowless, a skylight high above me, through which pink daylight streamed. Daylight--and it had been midnight in Charin! I'd come halfway around the planet in a few seconds!

From somewhere I heard the sound of hammering, tiny, bell-like hammering, the chiming of a fairy anvil. I looked up and saw a man--a man?--watching me.

On Wolf you see all kinds of human, half-human and nonhuman life, and I consider myself something of an
expert on all three. But I had never seen anyone, or anything, who so closely resembled the human and so obviously
wasn't. He, or it, was tall and lean, man-shaped but oddly muscled, a vague suggestion of something less than human
in the lean hunch of his posture.

Manlike, he wore green tight-fitting trunks and a shirt of green fur that revealed bulging biceps where they
shouldn't be, and angular planes where there should have been swelling muscles. The shoulders were high, the neck
unpleasantly sinuous, and the face, a little narrower than human, was handsomely arrogant, with a kind of wary alert
mischief that was the least human thing about him.

He bent, tilted the girl's inert body on to a divan of some sort, and turned his back on her, lifting his hand in an
impatient, and unpleasantly reminiscent, gesture.

The tinkling of the little hammers stopped as if a switch had been disconnected.

"Now," said the nonhuman, "we can talk."

Like the waif, he spoke Shainsan, and spoke it with a better accent than any nonhuman I had ever known--so
well that I looked again to be certain. I wasn't too dazed to answer in the same tongue, but I couldn't keep back a
spate of questions:

"What happened? Who are you? What is this place?"

The nonhuman waited, crossing his hands--quite passable hands, if you didn't look too closely at what should
have been nails--and bent forward in a sketchy gesture.

"Do not blame Miellyn. She acted under orders. It was imperative you be brought here tonight, and we had
reason to believe you might ignore an ordinary summons. You were clever at evading our surveillance, for a time.
But there would not be two Dry-towners in Charin tonight who would dare the Ghost Wind. Your reputation does
you justice, Rakhal Sensar."

Rakhal Sensar! Once again Rakhal!

Shaken, I pulled a rag from my pocket and wiped blood from my mouth. I'd figured out, in Shainsa, why the
mistake was logical. And here in Charin I'd been hanging around in Rakhal's old haunts, covering his old trails.
Once again, mistaken identity was natural.

Natural or not, I wasn't going to deny it. If these were Rakhal's enemies, my real identity should be kept as an
ace in reserve which might--just might--get me out alive again. If they were his friends ... well, I could only hope
that no one who knew him well by sight would walk in on me.

"We knew," the nonhuman continued, "that if you remained where you were, the Terranan Cargill would have
made his arrest. We know about your quarrel with Cargill, among other things, but we did not consider it necessary
that you should fall into his hands at present."

I was puzzled. "I still don't understand. Exactly where am I?"

"This is the mastershrine of Nebran."

Nebran!

The stray pieces of the puzzle suddenly jolted into place. Kyral had warned me, not knowing he was doing it. I
hastily imitated the gesture Kyral had made, gabbling a few words of an archaic charm.

Like every Earthman who's lived on Wolf more than a tourist season, I'd seen faces go blank and impassive at
mention of the Toad God. Rumor made his spies omnipresent, his priests omniscient, his anger all-powerful. I had
believed about a tenth of what I had heard, or less.

The Terran Empire has little to say to planetary religions, and Nebran's cult is a remarkably obscure one,
despite the street-shrines on every corner. Now I was in his mastershrine, and the device which had brought me here
was beyond doubt a working model of a matter transmitter.

A matter transmitter, a working model--the words triggered memory. Rakhal was after it.

"And who," I asked slowly, "are you, Lord?"

The green-clad creature hunched thin shoulders again in a ceremonious gesture. "I am called Evarin. Humble
servant of Nebran and yourself," he added, but there was no humility in his manner. "I am called the Toymaker."

Evarin. That was another name given weight by rumor. A breath of gossip in a thieves market. A scrawled
word on smudged paper. A blank folder in Terran Intelligence. Another puzzle-piece snapped into place--Toymaker!

Miellyn pouted and looked ruefully at her bare bruised feet, patted the wrinkles in her ragged frock with
fastidious fingers. "My poor feet," she mourned, "they are black and blue with the cobbles and my hair is filled with
sand and tangles! Toymaker, what way was this to send me to entice a man? Any man would have come quickly,
quickly, if he had seen me looking lovely, but you—you send me in rags!

She stamped a small bare foot. She was not merely as young as she had looked in the street. Though immature and underdeveloped by Terran standards, she had a fair figure for a Dry-town woman. Her rags fell now in graceful folds. Her hair was spun black glass, and I—I saw what the rags and the confusion in the filthy street had kept me from seeing before.

It was the girl of the spaceport cafe, the girl who had appeared and vanished in the eerie streets of Canarsa.

Evarin was regarding her with what, in a human, might have been rueful impatience. He said, "You know you enjoyed yourself, as always, Miellyn. Run along and make yourself beautiful again, little nuisance."

The girl danced out of the room, and I was just as glad to see her go. The Toymaker motioned to me.

"This way," he directed, and led me through a different door. The offstage hammering I had heard, tiny bell tones like a fairy xylophone, began again as the door opened, and we passed into a workroom which made me remember nursery tales from a half-forgotten childhood on Terra. For the workers were tiny, gnarled trolls!

They were chaks. Chaks from the polar mountains, dwarfed and furred and half-human, with witchlike faces and great golden eyes, and I had the curious feeling that if I looked hard enough I would see the little toy-seller they had hunted out of the Kharsa. I didn't look. I figured I was in enough trouble already.

Tiny hammers pattered on miniature anvils in a tinkling, jingling chorus of musical clinks and taps. Golden eyes focused like lenses over winking jewels and gimcracks. Busy elves. Makers of toys!

Evarin jerked his shoulders with an imperative gesture. I followed him through a fairy workroom, but could not refrain from casting a lingering look at the worktables. A withered leprechaun set eyes into the head of a minikin hound. Furred fingers worked precious metals into invisible filigree for the collarpiece of a dancing doll. Metallic feathers were thrust with clockwork precision into the wings of a skeleton bird no longer than my fingernail. The nose of the hound wabbled and sniffed, the bird's wings quivered, the eyes of the little dancer followed my footsteps.

Toys?

"This way," Evarin rapped, and a door slid shut behind us. The clinks and taps grew faint, fainter, but never ceased.

My face must have betrayed more than conventional impassivity, for Evarin smiled. "Now you know, Rakhal, why I am called Toymaker. Is it not strange—the masterpriest of Nebran, a maker of Toys, and the shrine of the Toad God a workshop for children's playthings?"

Evarin paused suggestively. They were obviously not children's playthings and this was my cue to say so, but I avoided the trap. Evarin opened a sliding panel and took out a doll.

She was perhaps the length of my longest finger, molded to the precise proportions of a woman, and costumed after the bizarre fashion of the Ardcarran dancing girls. Evarin touched no button or key that I could see, but when he set the figure on its feet, it executed a whirling, armtossing dance in a fast, tricky tempo.

"I am, in a sense, benevolent," Evarin murmured. He snapped his fingers and the doll sank to her knees and poised there, silent. "Moreover, I have the means and, let us say, the ability to indulge my small fantasies.

"The little daughter of the President of the Federation of Trade Cities on Samarra was sent such a doll recently. What a pity that Paolo Arimengo was so suddenly impeached and banished!" The Toymaker clucked his teeth commiseratingly. "Perhaps this small companion will compensate the little Carmela for her adjustment to her new ... position."

He replaced the dancer and pulled down something like a whirligig. "This might interest you," he mused, and set it spinning. I stared at the pattern of lights that flowed and disappeared, melting in and out of visible shadows. Suddenly I realized what the thing was doing. I wrested my eyes away with an effort. Had there been a lapse of seconds or minutes? Had Evarin spoken?

Evarin arrested the compelling motion with one finger. "Several of these pretty playthings are available to the children of important men," he said absently. "An import of value for our exploited and impoverished world. Unfortunately they are, perhaps, a little ... ah, obvious. The incidence of nervous breakdowns is, ah, interfering with their sale. The children, of course, are unaffected, and love them." Evarin set the hypnotic wheel moving again, glanced sidewise at me, then set it carefully back.

"Now"—Evarin's voice, hard with the silkiness of a cat's snarl, clawed the silence—"we'll talk business."

I turned, composing my face. Evarin had something concealed in one hand, but I didn't think it was a weapon. And if I'd known, I'd have had to ignore it anyway.

"Perhaps you wonder how we recognized and found you?" A panel cleared in the wall and became translucent. Confused flickers moved, dropped into focus and I realized that the panel was an ordinary television screen and I was looking into the well-known interior of the Cafe of Three Rainbows in the Trade City of Charin.

By this time I was running low on curiosity and didn't wonder till much, much later how televised pictures were transmitted around the curve of a planet. Evarin sharpened the focus down on the long Earth-type bar where a tall
man in Terran clothes was talking to a pale-haired girl. Evarin said, "By now, Race Cargill has decided, no doubt, that you fell into his trap and into the hands of the Ya-men. He is off-guard now."

And suddenly the whole thing seemed so unbearably, illogically funny that my shoulders shook with the effort to keep back dangerous laughter. Since I'd landed in Charin, I'd taken great pains to avoid the Trade City, or anyone who might have associated me with it. And Rakhal, somehow aware of this, had conveniently filled up the gap. By posing as me.

It wasn't nearly as difficult as it sounded. I had found that out in Shainsa. Charin is a long, long way from the major Trade City near the Kharsa. I hadn't a single intimate friend there, or within hundreds of miles, to see through the imposture. At most, there were half a dozen of the staff that I'd once met, or had a drink with, eight or ten years ago.

Rakhal could speak perfect Standard when he chose; if he lapsed into Dry-town idiom, that too was in my known character. I had no doubt he was making a great success of it all, probably doing much better with my identity than I could ever have done with his.

Evarin rasped, "Cargill meant to leave the planet. What stopped him? You could be of use to us, Rakhal. But not with this blood-feud unsettled."

That needed no elucidation. No Wolfan in his right mind will bargain with a Dry-towner carrying an unresolved blood-feud. By law and custom, declared blood-feud takes precedence over any other business, public or private, and is sufficient excuse for broken promises, neglected duties, theft, even murder.

"We want it settled once and for all." Evarin's voice was low and unhurried. "And we aren't above weighting the scales. This Cargill can, and has, posed as a Dry-towner, undetected. We don't like Earthmen who can do that. In settling your feud, you will be aiding us, and removing a danger. We would be ... grateful."

He opened his closed hand, displaying something small, curled, inert.

"Every living thing emits a characteristic pattern of electrical nerve impulses. We have ways of recording those impulses, and we have had you and Cargill under observation for a long time. We've had plenty of opportunity to key this Toy to Cargill's pattern."

On his palm the curled thing stirred, spread wings. A fledgling bird lay there, small soft body throbbing slightly. Half-hidden in a ruff of metallic feathers I glimpsed a grimly elongated beak. The pinions were feathered with delicate down less than a quarter of an inch long. They beat with delicate insistence against the Toymaker's prisoning fingers.

"This is not dangerous to you. Press here"--he showed me--"and if Race Cargill is within a certain distance--and it is up to you to be within that distance--it will find him, and kill him. Unerringly, inescapably, untraceably. We will not tell you the critical distance. And we will give you three days."

He checked my startled exclamation with a gesture. "Of course this is a test. Within the hour Cargill will receive a warning. We want no incompetents who must be helped too much! Nor do we want cowards! If you fail, or release the bird at a distance too great, or evade the test"--the green inhuman malice in his eyes made me sweat--"we have made another bird."

By now my brain was swimming, but I thought I understood the complex inhuman logic involved. "The other bird is keyed to me?"

With slow contempt Evarin shook his head. "You? You are used to danger and fond of a gamble. Nothing so simple! We have given you three days. If, within that time, the bird you carry has not killed, the other bird will fly. And it will kill. Rakhal, you have a wife."

Yes, Rakhal had a wife. They could threaten Rakhal's wife. And his wife was my sister Juli.

Everything after that was anticlimax. Of course I had to drink with Evarin, the elaborate formal ritual without which no bargain on Wolf is concluded. He entertained me with gory and technical descriptions of the way in which the birds, and other of his hellish Toys, did their killing, and worse tasks.

Miellyn danced into the room and upset the exquisite solemnity of the wine-ritual by perching on my knee, stealing a sip from my cup, and pouting prettily when I paid her less attention than she thought she merited. I didn't dare pay much attention, even when she whispered, with the deliberate and thorough wantonness of a Dry-town woman of high-caste who has flung aside her fetters, something about a rendezvous at the Three Rainbows.

But eventually it was over and I stepped through a door that twisted with a giddy blankness, and found myself outside a bare windowless wall in Charin again, the night sky starred and cold. The acrid smell of the Ghost Wind was thinning in the streets, but I had to crouch in a cranny of the wall when a final rustling horde of Ya-men, the last of their receding tide, rustled down the street. I found my way to my lodging in a filthy chak hostel, and threw myself down on the verminous bed.

Believe it or not, I slept.
CHAPTER TWELVE

An hour before dawn there was a noise in my room. I roused, my hand on my skean. Someone or something was fumbling under the mattress where I had thrust Evarin's bird. I struck out, encountered something warm and breathing, and grappled with it in the darkness. A foul-smelling something gripped over my mouth. I tore it away and struck hard with the skean. There was a high shrilling. The gripping filth loosened and fell away and something died on the floor.

I struck a light, retching in revulsion. It hadn't been human. There wouldn't have been that much blood from a human. Not that color, either.

The chak who ran the place came and gibbered at me. Chaks have a horror of blood and this one gave me to understand that my lease was up then and there, no arguments, no refunds. He wouldn't even let me go into his stone outbuilding to wash the foul stuff from my shirtcloak. I gave up and fished under the mattress for Evarin's Toy.

The chak got a glimpse of the embroideries on the silk in which it was wrapped, and stood back, his loose furry lips hanging open, while I gathered my few belongings together and strode out of the room. He would not touch the coins I offered; I laid them on a chest and he let them lie there, and as I went into the reddening morning they came flying after me into the street.

I pulled the silk from the Toy and tried to make some sense from my predicament. The little thing lay innocent and silent in my palm. It wouldn't tell me whether it had been keyed to me, the real Cargill, some time in the past, or to Rakhal, using my name and reputation in the Terran Colony here at Charin.

If I pressed the stud it might play out this comedy of errors by hunting down Rakhal, and all my troubles would be over. For a while, at least, until Evarin found out what had happened. I didn't deceive myself that I could carry the impersonation through another meeting.

On the other hand, if I pressed the stud, the bird might turn on me. And then all my troubles would be over for good.

If I delayed past Evarin's deadline, and did nothing, the other bird in his keeping would hunt down Juli and give her a swift and not too painless death.

I spent most of the day in a chak dive, juggling plans. Toys, innocent and sinister. Spies, messengers. Toys which killed horribly. Toys which could be controlled, perhaps, by the pliant mind of a child, and every child hates its parents now and again!

Even in the Terran colony, who was safe? In Mack's very home, one of the Magnusson youngsters had a shiny thing which might, or might not, be one of Evarin's hellish Toys. Or was I beginning to think like a superstitious Dry-towner?

Damn it, Evarin couldn't be infallible; he hadn't even recognized me as Race Cargill! Or--suddenly the sweat broke out, again, on my forehead--or had he? Had the whole thing been one of those sinister, deadly and incomprehensible nonhuman jokes?

I kept coming to the same conclusion. Juli was in danger, but she was half a world away. Rakhal was here in Charin. There was a child involved--Juli's child. The first step was to get inside the Terran colony and see how the land lay.

Charin is a city shaped like a crescent moon, encircling the small Trade City: a miniature spaceport, a miniature skyscraper HQ, the clustered dwellings of the Terrans who worked there, and those who lived with them and supplied them with necessities, services and luxuries.

Entry from one to the other is through a guarded gateway, since this is hostile territory, and Charin lies far beyond the impress of ordinary Terran law. But the gate stood wide-open, and the guards looked lax and bored. They had shockers, but they didn't look as if they'd used them lately.

One raised an eyebrow at his companion as I shambled up. I could pretty well guess the impression I made, dirty, unkempt and stained with nonhuman blood. I asked permission to go into the Terran Zone.

They asked my name and business, and I toyed with the notion of giving the name of the man I was inadvertently impersonating. Then I decided that if Rakhal had passed himself off as Race Cargill, he'd expect exactly that. And he was also capable of the masterstroke of impudence--putting out a pickup order, through Spaceforce, for his own name!

So I gave the name we'd used from Shainsa to Charin, and tacked one of the Secret Service passwords on the end of it. They looked at each other again and one said, "Rascar, eh? This is the guy, all right." He took me into the little booth by the gate while the other used an intercom device. Presently they took me along into the HQ building, and into an office that said "Legate."

I tried not to panic, but it wasn't easy! Evidently I'd walked square into another trap. One guard asked me, "All right, now, what exactly is your business in the Trade City?"
I'd hoped to locate Rakhal first. Now I knew I'd have no chance and at all costs I must straighten out this matter of identity before it went any further.

"Put me straight through to Magnusson's office, Level 38 at Central HQ, by visi," I demanded. I was trying to remember if Mack had ever even heard the name we used in Shainsa. I decided I couldn't risk it. "Name of Race Cargill."

The guard grinned without moving. He said to his partner, "That's the one, all right." He put a hand on my shoulder, spinning me around.

"Haul off, man. Shake your boots."

There were two of them, and Spaceforce guards aren't picked for their good looks. Just the same, I gave a pretty good account of myself until the inner door opened and a man came storming out.

"What the devil is all this racket?"

One guard got a hammerlock on me. "This Dry-towner bum tried to talk us into making a priority call to Magnusson, the Chief at Central. He knew a couple of the S.S. passwords. That's what got him through the gate. Remember, Cargill passed the word that somebody would turn up trying to impersonate him."

"I remember." The strange man's eyes were wary and cold.

"You damned fools," I snarled. "Magnusson will identify me! Can't you realize you're dealing with an impostor?"" One of the guards said to the legate in an undertone, "Maybe we ought to hold him as a suspicious character."

But the legate shook his head. "Not worth the trouble. Cargill said it was a private affair. You might search him, make sure he's not concealing contraband weapons," he added, and talked softly to the wide-eyed clerk in the background while the guards went through my shirtcloak and pockets.

When they started to unwrap the silk-shrouded Toy I yelled--if the thing got set off accidentally, there'd be trouble. The legate turned and rebuked, "Can't you see it's embroidered with the Toad God? It's a religious amulet of some sort, let it alone."

They grumbled, but gave it back to me, and the legate commanded, "Don't mess him up any more. Give him back his knife and take him to the gates. But make sure he doesn't come back."

I found myself seized and frog-marched to the gate. One guard pushed my skean back into its clasp. The other shoved me hard, and I stumbled, fell sprawling in the dust of the cobbled street, to the accompaniment of a profane statement about what I could expect if I came back. A chorus of jeers from a cluster of chak children and veiled women broke across me.

I picked myself up, glowered so fiercely at the giggling spectators that the laughter drained away into silence, and clenched my fists, half inclined to turn back and bull my way through. Then I subsided. First round to Rakhal. He had sprung the trap on me, very neatly.

The street was narrow and crooked, winding between doubled rows of pebble-houses, and full of dark shadows even in the crimson noon. I walked aimlessly, favoring the arm the guard had crushed. I was no closer to settling things with Rakhal, and I had slammed at least one gate behind me.

Why hadn't I had sense enough to walk up and demand to see Race Cargill? Why hadn't I insisted on a fingerprint check? I could prove my identity, and Rakhal, using my name in my absence, to those who didn't know me by sight, couldn't. I could at least have made him try. But he had maneuvered it very cleverly, so I never had a chance to insist on proofs.

I turned into a wineshop and ordered a dram of greenish mountainberry liquor, sipping it slowly and fingering the few bills and coins in my pockets. I'd better forget about warning Juli. I couldn't vise her from Charin, except in the Terran zone. I had neither the money nor the time to make the trip in person, even if I could get passage on a Terran-dominated airline after today.

Miellyn. She had flirted with me, and like Dallisa, she might prove vulnerable. It might be another trap, but I'd take the chance. At least I could get hints about Evarin. And I needed information. I wasn't used to this kind of intrigue any more. The smell of danger was foreign to me now, and I found it unpleasant.

The small lump of the bird in my pocket tantalized me. I took it out again. It was a temptation to press the stud and let it settle things, or at least start them going, then and there.

After a while I noticed the proprietors of the shop staring at the silk of the wrappings. They backed off, apprehensive. I held out a coin and they shook their heads. "You are welcome to the drink," one of them said. "All we have is at your service. Only please go. Go quickly."

They would not touch the coins I offered. I thrust the bird in my pocket, swore and went. It was my second experience with being somehow tabu, and I didn't like it. It was dusk when I realized I was being followed.

At first it was a glimpse out of the corner of my eye, a head seen too frequently for coincidence. It developed
into a too-persistent footstep in uneven rhythm.
  
  Tap-tap-tap. Tap-tap-tap.
  
  I had my skean handy, but I had a hunch this wasn't anything I could settle with a skean. I ducked into a side street and waited.
  
  Nothing.
  
  I went on, laughing at my imagined fears.
  
  Then, after a time, the soft, persistent footfall thudded behind me again.
  
  I cut across a thieves market, dodging from stall to stall, cursed by old women selling hot fried goldfish, women in striped veils railing at me in their chiming talk when I brushed their rolled rugs with hasty feet. Far behind I heard the familiar uneven hurry: tap-tap-tap, tap-tap-tap.
  
  I fled down a street where women sat on flower-decked balconies, their open lanterns flowing with fountains and rivulets of gold and orange fire. I raced through quiet streets where furred children crept to doors and watched me pass with great golden eyes that shone in the dark.
  
  I dodged into an alley and lay there, breathing hard. Someone not two inches away said, "Are you one of us, brother?"
  
  I muttered something surly, in his dialect, and a hand, reassuringly human, closed on my elbow. "This way."
  
  Out of breath with long running, I let him lead me, meaning to break away after a few steps, apologize for mistaken identity and vanish, when a sound at the end of the street made me jerk stiff and listen.
  
  Tap-tap-tap. Tap-tap-tap.
  
  I let my arm relax in the hand that guided me, flung a fold of my shirtcloak over my face, and went along with my unknown guide.

CHAPTER THIRTEEN

I stumbled over steps, took a jolting stride downward, and found myself in a dim room jammed with dark figures, human and nonhuman.
  
  The figures swayed in the darkness, chanting in a dialect not altogether familiar to me, a monotonous wailing chant, with a single recurrent phrase: "Kamaina! Kama-aina!" It began on a high note, descending in weird chromatics to the lowest tone the human ear could resolve.
  
  The sound made me draw back. Even the Dry-towners shunned the orgiastic rituals of Kamaina. Earthmen have a reputation for getting rid of the more objectionable customs--by human standards--on any planet where they live. But they don't touch religions, and Kamaina, on the surface anyhow, was a religion.
  
  I started to turn round and leave, as if I had inadvertently walked through the wrong door, but my conductor hauled on my arm, and I was wedged in too tight by now to risk a roughhouse. Trying to force my way out would only have called attention to me, and the first of the Secret Service maxims is; when in doubt, go along, keep quiet, and watch the other guy.
  
  As my eyes adapted to the dim light, I saw that most of the crowd were Charin plainsmen or chaks. One or two wore Dry-town shirtcloaks, and I even thought I saw an Earthman in the crowd, though I was never sure and I fervently hope not. They were squatting around small crescent-shaped tables, and all intently gazing at a flickery spot of light at the front of the cellar. I saw an empty place at one table and dropped there, finding the floor soft, as if cushioned.
  
  On each table, small smudging pastilles were burning, and from these cones of ash-tipped fire came the steamy, swimmy smoke that filled the darkness with strange colors. Beside me an immature chak girl was kneeling, her fettered hands strained tightly back at her sides, her naked breasts pierced for jeweled rings.
  
  Beneath the pallid fur around her pointed ears, the exquisite animal face was quite mad. She whispered to me, but her dialect was so thick that I could follow only a few words, and would just as soon not have heard those few. An older chak grunted for silence and she subsided, swaying and crooning.
  
  There were cups and decanters on all the tables, and a woman tilted pale, phosphorescent fluid into a cup and offered it to me. I took one sip, then another. It was cold and pleasantly tart, and not until the second swallow turned sweet on my tongue did I know what I tasted. I pretended to swallow while the woman's eyes were fixed on me, then somehow contrived to spill the filthy stuff down my shirt.
  
  I was wary even of the fumes, but there was nothing else I could do. The stuff was shallavan, outlawed on every planet in the Terran Empire and every halfway decent planet outside it.
  
  More and more figures, men and creatures, kept crowding into the cellar, which was not very large. The place looked like the worst nightmare of a drug-dreamer, ablaze with the colors of the smoking incense, the swaying crowd, and their monotonous cries. Quite suddenly there was a blaze of purple light and someone screamed in
raving ecstasy: "Na ki na Nebran n'hai Kamaina!"

"Kamayeeeeeenezzaa!

An old man jumped up and started haranguing the crowd. I could just follow his dialect. He was talking about Terra. He was talking about riots. He was jabbering mystical gibberish which I couldn't understand and didn't want to understand, and rabble-rousing anti-Terran propaganda which I understood much too well.

Another blaze of lights and another long scream in chorus: "Kamayeeeeeenezzaa!

Evarin stood in the blaze of the many-colored light.

The Toymaker, as I had seen him last, cat-smooth, gracefully alien, shrouded in a ripple of giddy crimsons. Behind him was a blackness. I waited till the painful blaze of lights abated, then, straining my eyes to see past him, I got my worst shock.

A woman stood there, naked to the waist, her hands ritually fettered with little chains that stirred and clashed musically as she moved stiff-legged in a frozen dream. Hair like black grass banded her brow and naked shoulders, and her eyes were crimson.

And the eyes lived in the dead dreaming face. They lived, and they were mad with terror although the lips curved in a gently tranced smile.

Miellyn.

Evarin was speaking in that dialect I barely understood. His arms were flung high and his cloak went spilling away from them, rippling like something alive. The jammed humans and nonhumans swayed and chanted and he swayed above them like an iridescent bug, weaving arms rippling back and forth, back and forth. I strained to catch his words.

"Our world ... an old world."

"Kamayeeenezzaa," whimpered the shrill chorus.

"... humans, humans, all humans would make slaves of us all, all save the Children of the Ape....."

I lost the thread for a moment. True. The Terran Empire has one small blind spot in otherwise sane policy, ignoring that nonhuman and human have lived placidly here for millennia: they placidly assumed that humans were everywhere the dominant race, as on Earth itself.

The Toymaker's weaving arms went on spinning, spinning. I rubbed my eyes to clear them of shallavan and incense. I hoped that what I saw was an illusion of the drug--something, something huge and dark, was hovering over the girl. She stood placidly, hands clasped on her chains, but her eyes writhed in the frozen calm of her face.

Then something--I can only call it a sixth sense--bore it on me that there was someone outside the door. I was perhaps the only creature there, except for Evarin, not drugged with shallavan, and perhaps that's all it was. But during the days in the Secret Service I'd had to develop some extra senses. Five just weren't enough for survival.

I knew somebody was fixing to break down that door, and I had a good idea why. I'd been followed, by the legate's orders, and, tracking me here, they'd gone away and brought back reinforcements.

Someone struck a blow on the door and a stentorian voice bawled, "Open up there, in the name of the Empire!"

The chanting broke in ragged quavers. Evarin stopped. Somewhere a woman screamed. The lights abruptly went out and a stampede started in the room. Women struck me with chains, men kicked, there were shrieks and howls. I thrust my way forward, butting with elbows and knees and shoulders.

A dusky emptiness yawned and I got a glimpse of sunlight and open sky and knew that Evarin had stepped through into somewhere and was gone. The banging on the door sounded like a whole regiment of Spaceforce out there. I dived toward the shimmer of little stars which marked Miellyn's tiara in the darkness, braving the black horror hovering over her, and touched rigid girl-flesh, cold as death.

I grabbed her and ducked sideways. This time it wasn't intuition--nine times out of ten, anyway, intuition is just a mental shortcut which adds up all the things which your subconscious has noticed while you were busy thinking about something else. Every native building on Wolf had concealed entrances and exits and I know where to look for them. This one was exactly where I expected. I pushed at it and found myself in a long, dim corridor.

The head of a woman peered from an opening door. She saw Miellyn's limp body hanging on my arm and her mouth widened in a silent scream. Then the head popped back out of sight and a door slammed. I heard the bolt slide. I ran for the end of the hall, the girl in my arms, thinking that this was where I came in, as far as Miellyn was concerned, and wondering why I bothered.

The door opened on a dark, peaceful street. One lonely moon was setting beyond the rooftops. I set Miellyn on her feet, but she moaned and crumpled against me. I put my shirtcloak around her bare shoulders. Judging by the noises and yells, we'd gotten out just in time. No one came out the exit behind us. Either the Spaceforce had plugged it or, more likely, everyone else in the cellar had been too muddled by drugs to know what was going on.

But it was only a few minutes, I knew, before Spaceforce would check the whole building for concealed escape holes. Suddenly, and irre relevantly, I found myself thinking of a day not too long ago, when I'd stood up in front of a
unit-in-training of Spaceforce, introduced to them as an Intelligence expert on native towns, and solemnly warned
them about concealed exits and entrances. I wondered, for half a minute, if it might not be simpler just to wait here
and let them pick me up.

Then I hoisted Miellyn across my shoulders. She was heavier than she looked, and after a minute, half
conscious, she began to struggle and moan. There was a chak-run cookshop down the street, a place I’d once known
well, with an evil reputation and worse food, but it was quiet and stayed open all night. I turned in at the door,
bending at the low lintel.

The place was smoke-filled and foul-smelling. I dumped Miellyn on a couch and sent the frowsy waiter for two
bowls of noodles and coffee, handed him a few extra coins, and told him to leave us alone. He probably drew the
worst possible inference—I saw his muzzle twitch at the smell of shallavan—but it was that kind of place anyhow. He
drew down the shutters and went.

I stared at the unconscious girl, then shrugged and started on the noodles. My own head was still swimmy with
the fumes, incense and drug, and I wanted it clear. I wasn't quite sure what I was going to do, but I had Evarin's
right-hand girl, and I was going to use her.

The noodles were greasy and had a curious taste, but they were hot, and I ate all of one bowl before Miellyn
stirred and whimpered and put up one hand, with a little clinking of chains, to her hair. The gesture was indefinably
reminiscent of Dallisa, and for the first time I saw the likeness between them. It made me wary and yet curiously
softened.

Finding she could not move freely, she rolled over, sat up and stared around in growing bewilderment and
dismay.

"There was a sort of riot," I said. "I got you out. Evarin ditched you. And you can quit thinking what you're
thinking, I put my shirtcloak on you because you were bare to the waist and it didn't look so good." I stopped to
think that over, and amended: "I mean I couldn't haul you around the streets that way. It looked good enough."

To my surprise, she gave a shaky little giggle, and held out her fettered hands. "Will you?"

I broke her links and freed her. She rubbed her wrists as if they hurt her, then drew up her draperies, pinned
them so that she was decently covered, and tossed back my shirtcloak. Her eyes were wide and soft in the light of
the flickering stub of candle.

"O, Rakhal," she sighed. "When I saw you there--" She sat up, clasping her hands hard together, and when she
continued her voice was curiously cold and controlled for anyone so childish. It was almost as cold as Dallisa's.

"If you've come from Kyral, I'm not going back. I'll never go back, and you may as well know it."

"I don't come from Kyral, and I don't care where you go. I don't care what you do." I suddenly realized that the
last statement was wholly untrue, and to cover my confusion I shoved the remaining bowl of noodles at her.

"Eat."

She wrinkled her nose in fastidious disgust. "I'm not hungry."

"Eat it anyway. You're still half doped, and the food will clear your head." I picked up one mug of the coffee
and drained it at a single swallow. "What were you doing in that disgusting den?"

Without warning she flung herself across the table at me, throwing her arms round my neck. Startled, I let her
cling a moment, then reached up and firmly unfastened her hands.

"None of that now. I fell for it once, and it landed me in the middle of the mudpie."

But her fingers bit my shoulder.

"Rakhal, Rakhal, I tried to get away and find you. Have you still got the bird? You haven't set it off yet? Oh,
don't, don't, Rakhal, you don't know what Evarin is, you don't know what he's doing." The words spilled out of
her like floodwaters. "He's won so many of you, don't let him have you too, Rakhal. They call you an honest man,
you worked once for Terra, the Terrans would believe you if you went to them and told them what he--Rakhal, take
me to the Terran Zone, take me there, take me there where they'll protect me from Evarin."

At first I tried to stop her, question her, then waited and let the torrent of entreaty run on and on. At last,
exhausted and breathless, she lay quietly against my shoulder, her head fallen forward. The musty reek of shallavan
mingled with the flower scent of her hair.

"Kid," I said heavily at last, "you and your Toymaker have both got me wrong. I'm not Rakhal Sensar."

"You're not?" She drew back, regarding me in dismay. Her eyes searched every inch of me, from the gray
streak across my forehead to the scar running down into my collar. "Then who--"

"Race Cargill. Terran Intelligence."

She stared, her mouth wide like a child's.

Then she laughed. She laughed! At first I thought she was hysterical. I stared at her in consternation. Then, as
her wide eyes met mine, with all the mischief of the nonhuman which has mingled into the human here, all the
circular complexities of Wolf illogic behind the woman in them, I started to laugh too.
I threw back my head and roared, until we were clinging together and gasping with mirth like a pair of raving fools. The chak waiter came to the door and stared at us, and I roared "Get the hell out," between spasms of crazy laughter.

Then she was wiping her face, tears of mirth still dripping down her cheeks, and I was frowning bleakly into the empty bowls.

"Cargill," she said hesitantly, "you can take me to the Terrans where Rakhal--"

"Hell's bells," I exploded. "I can't take you anywhere, girl. I've got to find Rakhal--" I stopped in midsentence and looked at her clearly for the first time.

"Child, I'll see that you're protected, if I can. But I'm afraid you've walked from the trap to the cookpot. There isn't a house in Charin that will hold me. I've been thrown out twice today."

She nodded. "I don't know how the word spreads, but it happens, in nonhuman parts. I think they can see trouble written in a human face, or smell it on the wind." She fell silent, her face propped sleepily between her hands, her hair falling in tangles. I took one of her hands in mine and turned it over.

It was a fine hand, with birdlike bones and soft rose-tinted nails; but the lines and hardened places around the knuckles reminded me that she, too, came from the cold austerity of the salt Dry-towns. After a moment she flushed and drew her hand from mine.

"What are you thinking, Cargill?" she asked, and for the first time I heard her voice sobered, without the coquetry, which must after all have been a very thin veneer.

I answered her simply and literally. "I am thinking of Dallisa. I thought you were very different, and yet, I see that you are very like her."

I thought she would question what I knew of her sister, but she let it pass in silence. After a time she said, "Yes, we were twins." Then, after a long silence, she added, "But she was always much the older."

And that was all I ever knew of whatever obscure pressures had shaped Dallisa into an austere and tragic Clytemnestra, and Miellyn into a pixie runaway.

Outside the drawn shutters, dawn was brightening. Miellyn shivered, drawing her thin draperies around her bare throat. I glanced at the little rim of jewels that starred her hair and said, "You'd better take those off and hide them. They alone would be enough to have you hauled into an alley and strangled, in this part of Charin." I hauled the bird Toy from my pocket and slapped it on the greasy table, still wrapped in its silk. "I don't suppose you know which of us this thing is set to kill?"

"I know nothing about the Toys."

"You seem to know plenty about the Toymaker."

"I thought so. Until last night." I looked at the rigid, clamped mouth and thought that if she were really as soft and delicate as she looked, she would have wept. Then she struck her small hand on the tabletop and burst out, "It's not a religion. It isn't even an honest movement for freedom! Its a--a front for smuggling, and drugs, and--and every other filthy thing!"

"Believe it or not, when I left Shainsa, I thought Nebran was the answer to the way the Terrans were strangling us! Now I know there are worse things on Wolf than the Terran Empire! I've heard of Rakhal Sensar, and whatever you may think of Rakhal, he's too decent to be mixed up in anything like this!"

"Suppose you tell me what's really going on," I suggested. She couldn't add much to what I knew already, but the last fragments of the pattern were beginning to settle into place. Rakhal, seeking the matter transmitter and some key to the nonhuman sciences of Wolf--I knew now what the city of Silent Ones had reminded me of!--had somehow crossed the path of the Toymaker.

Evarin's words now made sense: "You were clever at evading our surveillance--for a while." Possibly, though I'd never know, Cuinn had been keeping one foot in each camp, working for Kyral and for Evarin. The Toymaker, knowing of Rakhal's anti-Terran activities, had believed he would make a valuable ally and had taken steps to secure his help.

Juli herself had given me the clue: "He smashed Rindy's Toys." Out of the context it sounded like the work of a madman. Now, having encountered Evarin's workshop, it made plain good sense.

And I think I had known all along that Rakhal could not have been playing Evarin's game. He might have turned against Terra--though now I was beginning even to doubt that--and certainly he'd have killed me if he found me. But he would have done it himself, and without malice. Killed without malice--that doesn't make sense in any of the languages of Terra. But it made sense to me.

Miellyn had finished her brief recitation and was drowsing, her head pillowed on the table. The reddish light was growing, and I realized that I was waiting for dawn as, days ago, I had waited for sunset in Shainsa, with every nerve stretched to the breaking point. It was dawn of the third morning, and this bird lying on the table before me must fly or, far away in the Kharsa, another would fly at Juli.
I said, "There's some distance limitation on this one, I understand, since I have to be fairly near its object. If I lock it in a steel box and drop it in the desert, I'll guarantee it won't bother anybody. I don't suppose you'd have a shot at stealing the other one for me?"

She raised her head, eyes flashing. "Why should you worry about Rakhal's wife?" she flared, and for no good reason it occurred to me that she was jealous. "I might have known Evarin wouldn't shoot in the dark! Rakhal's wife, that Earthwoman, what do you care for her?"

It seemed important to set her straight. I explained that Juli was my sister, and saw a little of the tension fade from her face, but not all. Remembering the custom of the Dry-towns, I was not wholly surprised when she added, jealously, "When I heard of your feud, I guessed it was over that woman!"

"But not in the way you think," I said. Juli had been part of it, certainly. Even then I had not wanted her to turn her back on her world, but if Rakhal had remained with Terra, I would have accepted his marriage to Juli. Accepted it. I'd have rejoiced. God knows we had been closer than brothers, those years in the Dry-towns. And then, before Miellyn's flashing eyes, I suddenly faced my secret hate, my secret fear. No, the quarrel had not been all Rakhal's doing.

He had not turned his back, unexplained on Terra. In some unrecognized fashion, I had done my best to drive him away. And when he had gone, I had banished a part of myself as well, and thought I could end the struggle by saying it didn't exist. And now, facing what I had done to all of us, I knew that my revenge--so long sought, so dearly cherished--must be abandoned.

"We still have to deal with the bird," I said. "It's a gamble, with all the cards wild." I could dismantle it, and trust to luck that Wolf illogic didn't include a tamper mechanism. But that didn't seem worth the risk.

"First I've got to find Rakhal. If I set the bird free and it killed him, it wouldn't settle anything." For I could not kill Rakhal. Not, now, because I knew life would be a worse punishment than death. But because--I knew it, now--if Rakhal died, Juli would die, too. And if I killed him I'd be killing the best part of myself. Somehow Rakhal and I must strike a balance between our two worlds, and try to build a new one from them.

"And I can't sit here and talk any longer. I haven't time to take you--" I stopped, remembering the spaceport cafe at the edge of the Kharsa. There was a street-shrine, or matter transmitter, right there, across the street from the Terran HQ. All these years....

"You know your way in the transmitters. You can go there in a second or two." She could warn Juli, tell Magnusson. But when I suggested this, giving her a password that would take her straight to the top, she turned white. "All jumps have to be made through the Mastershrine."

I stopped and thought about that.

"Where is Evarin likely to be, right now?"

She gave a nervous shudder. "He's everywhere!"

"Rubbish! He's not omniscient! Why, you little fool, he didn't even recognize me. He thought I was Rakhal!" I wasn't too sure, myself, but Miellyn needed reassurance. "Or take me to the Mastershrine. I can find Rakhal in that scanning device of Evarin's." I saw refusal in her face and pushed on, "If Evarin's there, I'll prove he's fallible enough with a skean in his throat! And here"--I thrust the Toy into her hand--"hang on to this, will you?"

She put it matter-of-factly into her draperies. "I don't mind that. But to the shrine--" Her voice quivered, and I stood up and pushed at the table.

"Let's get going. Where's the nearest street-shrine?"

"No, no! Oh, I don't dare!"

"You've got to." I saw the chak who owned the place edging round the door again and said, "There's no use arguing, Miellyn." When she had readjusted her robes a little while ago, she had pinned them so that the flat sprawl of the Nebran embroideries was over her breasts. I put a finger against them, not in a sensuous gesture, and said, "The minute they see these, they'll throw us out of here, too."

"If you knew what I know of Nebran, you wouldn't want me to go near the Mastershrine again!" There was that faint coquettishness in her sidewise smile.

And suddenly I realized that she didn't want her to. But she was not Dallisa and she could not sit in cold dignity while her world fell into ruin. Miellyn must fight for the one she wanted.

And then some of that primitive male hostility which lives in every man came to the surface, and I gripped her arm until she whimpered. Then I said, in the Shainsan which still comes to my tongue when moved or angry, "Damn it, you're going. Have you forgotten that if it weren't for me you'd have been torn to pieces by that raving mob, or something worse?"

That did it. She pulled away and I saw again, beneath the veneer of petulant coquetry, that fierce and untamable insolence of the Dry-towner. The more fierce and arrogant, in this girl, because she had burst her fettered hands free and shaken off the ruin of the past.
I was seized with a wildly inappropriate desire to seize her, crush her in my arms, taste the red honey of that teasing mouth. The effort of mastering the impulse made me rough.

I shoved at her and said, "Come on. Let's get there before Evarin does."

CHAPTER FOURTEEN

Outside in the streets it was full day, and the color and life of Charin had subsided into listlessness again, a dim morning dullness and silence. Only a few men lounged wearily in the streets, as if the sun had sapped their energy. And always the pale fleecy-haired children, human and furred nonhuman, played their mysterious games on the curbs and gutters and staring at us with neither curiosity nor malice.

Miellyn was shaking when she set her feet into the patterned stones of the street-shrine.

"Scared, Miellyn?"

"I know Evarin. You don't. But" -- her mouth twitched in a pitiful attempt at the old mischief -- "when I am with a great and valorous Earthman...."

"Cut it out," I growled, and she giggled. "You'll have to stand closer to me. The transmitters are meant only for one person."

I stooped and put my arms round her. "Like this?"

"Like this," she whispered, pressing herself against me. A staggering whirl of dizzy darkness swung round my head. The street vanished. After an instant the floor steadied and we stepped into the terminal room in the Mastershrine, under a skylight dim with the last red slant of sunset. Distant hammering noises rang in my ears.

Miellyn whispered, "Evarin's not here, but he might jump through at any second." I wasn't listening.

"Where is this place, Miellyn? Where on the planet?"

"No one knows but Evarin, I think. There are no doors. Anyone who goes in or out, jumps through the transmitter." She pointed. "The scanning device is in there, we'll have to go through the workroom."

She was patting her crushed robes into place, smoothing her hair with fastidious fingers. "I don't suppose you have a comb? I've no time to go to my own--"

I'd known she was a vain and pampered brat, but this passed all reason, and I said so, exploding at her. She looked at me as if I wasn't quite intelligent. "The Little Ones, my friend, notice things. You are quite enough of a roughneck, but if I, Nebran's priestess, walk through their workroom all blown about and looking like the tag end of an orgy in Ardcarran...."

Abashed, I fished in a pocket and offered her a somewhat battered pocket comb. She looked at it distastefully but used it to good purpose, smoothing her hair swiftly, rearranging her loose-pinned robe so that the worst of the tears and stains were covered, and giving me, meanwhile, an artless and rather tempting view of some delicious curvature. She replaced the starred tiara on her ringlets and finally opened the door of the workroom and we walked through.

Not for years had I known that particular sensation--thousands of eyes, boring holes in the center of my back somewhere. There were eyes; the round inhuman orbs of the dwarf chaks, the faceted stare of the prism eyes of the Toys. The workroom wasn't a hundred feet long, but it felt longer than a good many miles I've walked. Here and there the dwarfs murmured an obsequious greeting to Miellyn, and she made some lighthearted answer.

She had warned me to walk as if I had every right to be there, and I strode after her as if we were simply going to an agreed-on meeting in the next room. But I was drenched with cold sweat before the farther door finally closed, safe and blessedly opaque, behind us. Miellyn, too, was shaking with fright, and I put a hand on her arm.

"Steady, kid. Where's the scanner?"

She touched the panel I'd seen. "I'm not sure I can focus it accurately. Evarin never let me touch it."

This was a fine time to tell me that. "How does it work?"

"It's an adaptation of the transmitter principle. It lets you see anywhere, but without jumping. It uses a tracer mechanism like the one in the Toys. If Rakhal's electrical-impulse pattern were on file--just a minute." She fished out the bird Toy and unwrapped it. "Here's how we find out which of you this is keyed to."

I looked at the fledgling bird, lying innocently in her palm, as she pushed aside the feathers, exposing a tiny crystal. "If it's keyed to you, you'll see yourself in this, as if the screen were a mirror. If it's keyed to Rakhal...."

She touched the crystal to the surface of the screen. Little flickers of snow wavered and danced. Then, abruptly, we were looking down from a height at the lean back of a man in a leather jacket. Slowly he turned. I saw the familiar set of his shoulders, saw the back of his head come into an aquiline profile, and the profile turn slowly into a scarred, seared mask more hideously claw-marked and disfigured than my own.

"Rakhal," I muttered. "Shift the focus if you can, Miellyn, get a look out the window or something. Charin's a big city. If we could get a look at a landmark--"
Rakhal was talking soundlessly, his lips moving as he spoke to someone out of sight range of the scanning device. Abruptly Miellyn said, "There." She had caught a window in the sight field of the pane. I could see a high pylon and two of three uprights that looked like a bridge, just outside. I said, "It's the Bridge of Summer Snows. I know where he is now. Turn it off, Miellyn, we can find him--" I was turning away when Miellyn screamed.

"Look!"

Rakhal had turned his back on the scanner and for the first time I could see who he was talking to. A hunched, catlike shoulder twisted; a sinuous neck, a high-held head that was not quite human.

"Evarin!" I swore. "That does it. He knows now that I'm not Rakhal, if he didn't know it all along! Come on, girl, we're getting out of here!"

This time there was no pretense of normality as we dashed through the workroom. Fingers dropped from half-completed Toys as they stared after us. Toys! I wanted to stop and smash them all. But if we hurried, we might find Rakhal. And, with luck, we would find Evarin with him.

And then I was going to bang their heads together. I'd reached a saturation point on adventure. I'd had all I wanted. I realized that I'd been up all night, that I was exhausted. I wanted to murder and smash, and wanted to fall down somewhere and go to sleep, all at once. We banged the workroom door shut and I took time to shove a heavy divan against it, blockading it.

Miellyn stared. "The Little Ones would not harm me," she began. "I am sacrosanct."

I wasn't sure. I had a notion her status had changed plenty, beginning when I saw her chained and drugged, and standing under the hovering horror. But I didn't say so.

"Maybe. But there's nothing sacred about me!"

She was already inside the recess where the Toad God squatted. "There is a street-shrine just beyond the Bridge of Summer Snows. We can jump directly there." Abruptly she froze in my arms, with a convulsive shudder.

"Evarin! Hold me, tight--he's jumping in! Quick!"

Space reeled round us, and then....

Can you split instantaneousness into fragments? It didn't make sense, but so help me, that's what happened. And everything that happened, occurred within less than a second. We landed in the street-shrine. I could see the pylon and the bridge and the rising sun of Charin. Then there was the giddy internal wrenching, a blast of icy air whistled round us, and we were gazing out at the Polar mountains, ringed in their eternal snow.

Miellyn clutched at me. "Pray! Pray to the Gods of Terra, if there are any!"

She clung so violently that it felt as if her small body was trying to push through me and come out the other side. I hung on tight. Miellyn knew what she was doing in the transmitter; I was just along for the ride and I didn't relish the thought of being dropped off somewhere in that black limbo we traversed.

We jumped again, the sickness of disorientation forcing a moan from the girl, and darkness shivered round us. I looked on an unfamiliar street of black night and dust-bleared stars. She whimpered, "Evarin knows what I'm doing. He's jumping us all over the planet. He can work the controls with his mind. Psychokinetics--I can do it a little, but I never dared--oh, hang on tight!"

Then began one of the most amazing duels ever fought. Miellyn would make some tiny movement, and we would be falling, blind and dizzy, through blackness. Halfway through the giddiness, a new direction would wrench us and we would be thrust elsewhere, and look out into a new street.

One instant I smelled hot coffee from the spaceport cafe near the Kharsa. An instant later it was blinding noon, with crimson fronds waving above us and a dazzle of water. We flicked in and out of the salty air of Shainsa, glimpsed flowers on a Daillon street, moonlight, noon, red twilight flickered and went, shot through with the terrible giddiness of hyperspace.

Then suddenly I caught a second glimpse of the bridge and the pylon; a moment's oversight had landed us for an instant in Charin. The blackness started to reel down, but my reflexes are fast and I made one swift, scrabbling step forward. We lurched, sprawled, locked together, on the stones of the Bridge of Summer Snows. Battered, and bruised, and bloody, we were still alive, and where we wanted to be.

I lifted Miellyn to her feet. Her eyes were dazed with pain. The ground swayed and rocked under our feet as we fled along the bridge. At the far end, I looked up at the pylon. Judging from its angle, we couldn't be more than a hundred feet from the window through which I'd seen that landmark in the scanner. In this street there was a wineshop, a silk market, and a small private house. I walked up and banged on the door.

Silence. I knocked again and had time to wonder if we'd find ourselves explaining things to some uninvolved stranger. Then I heard a child's high voice, and a deep familiar voice hushing it. The door opened, just a crack, to reveal part of a scarred face.

It drew into a hideous grin, then relaxed.

"I thought it might be you, Cargill. You've taken at least three days longer than I figured, getting here. Come on
CHAPTER FIFTEEN

He hadn't changed much in six years. His face was worse than mine; he hadn't had the plastic surgeons of Terran Intelligence doing their best for him. His mouth, I thought fleetingly, must hurt like hell when he drew it up into the kind of grin he was grinning now. His eyebrows, thick and fierce with gray in them, went up as he saw Miellyn; but he backed away to let us enter, and shut the door behind us.

The room was bare and didn't look as if it had been lived in much. The floor was stone, rough-laid, a single fur rug laid before a brazier. A little girl was sitting on the rug, drinking from a big double-handled mug, but she scrambled to her feet as we came in, and backed against the wall, looking at us with wide eyes.

She had pale-red hair like Juli's, cut straight in a fringe across her forehead, and she was dressed in a smock of dyed red fur that almost matched her hair. A little smear of milk like a white moustache clung to her upper lip where she had forgotten to wipe her mouth. She was about five years old, with deep-set dark eyes like Juli's, that watched me gravely without surprise or fear; she evidently knew who I was.

"Rindy," Rakhal said quietly, not taking his eyes from me. "Go into the other room."

Rindy didn't move, still staring at me. Then she moved toward Miellyn, looking up intently not at the woman, but at the pattern of embroideries across her dress. It was very quiet, until Rakhal added, in a gentle and curiously moderate voice, "Do you still carry a skean, Race?"

I shook my head. "There's an ancient proverb on Terra, about blood being thicker than water, Rakhal. That's Juli's daughter. I'm not going to kill her father right before her eyes." My rage spilled over then, and I bellowed, "To hell with your damned Dry-town feuds and your filthy Toad God and all the rest of it!"

Rakhal said harshly, "Rindy. I told you to get out."

"She needn't go." I took a step toward the little girl, a wary eye on Rakhal. "I don't know quite what you're up to, but it's nothing for a child to be mixed up in. Do what you damn please. I can settle with you any time."

"The first thing is to get Rindy out of here. She belongs with Juli and, damn it, that's where she's going."

"You're as stupid as ever, Race. Why, you fool, I knew Juli would run straight to you, if she was scared enough. I knew it would bring you out of hiding. Why, you damned fool!" He stood mocking me, but there was a strained fury, almost a frenzy of contempt behind the laughter.

"You filthy coward, Race! Six years hiding in the Terran zone. Six years, and I gave you six months! If you'd had the guts to walk out after me, after I rigged that final deal to give you the chance, we could have gone after the biggest thing on Wolf. And we could have brought it off together, instead of spending years spying and dodging and hunting! And now, when I finally get you out of hiding, all you want to do is run back where you'll be safe! I thought you had more guts!"

"Not for Evarin's dirty work!"

Rakhal swore hideously. "Evarin! Do you really believe--I might have known he'd get to you too! That girl--and you've managed to wreck all I did there, too!" Suddenly, so swiftly my eyes could hardly follow, he whipped out his skean and came at me. "Get away from that door!"

I stood my ground. "You'll have to kill me first. And I won't fight you, Rakhal. We'll settle this, but we'll do it my way for once, like Earthmen."

"Son of the Ape! Get your skean out, you stinking coward!"

"I won't do it, Rakhal." I stood and defied him. I had outmaneuvered Dry-towners in a shegri bet. I knew Rakhal, and I knew he would not knife an unarmed man. "We fought once with the kifirgh and it didn't settle
anything. This time we'll do it my way. I threw my skean away before I came here. I won't fight."

He thrust at me. Even I could see that the blow was a feint, and I had a flashing, instantaneous memory of Dallisa's threat to drive the knife through my palms. But even while I commanded myself to stand steady, sheer reflex threw me forward, grabbing at his wrist and the knife.

Between my grappling hand he twisted and I felt the skean drive home, rip through my jacket with a tearing sound; felt the thin fine line of touch, not pain yet, as it sliced flesh. Then pain burned through my ribs and I felt hot blood, and I wanted to kill Rakhal, wanted to get my hands around his throat and kill him with them. And at the same time I was raging because I didn't want to fight the crazy fool, I wasn't even mad at him.

Miellyn flung the door open, shrieking, and suddenly the Toy, released, was darting a small whirring droning horror, straight at Rakhal's eyes. I yelled. But there was no time even to warn him. I bent and butted him in the stomach. He grunted, doubled up in agony and fell out of the path of the diving Toy. It whirred in frustration, hovered.

He writhed in agony, drawing up his knees, clawing at his shirt, while I turned on Miellyn in immense fury--and stopped. Hers had been a move of desperation, an instinctive act to restore the balance between a weaponless man and one who had a knife. Rakhal gasped, in a hoarse voice with all the breath gone from it:

"Didn't want to use. Rather fight clean--" Then he opened his closed fist and suddenly there were two of the little whirring droning horrors in the room and this one was diving at me, and as I threw myself headlong to the floor the last puzzle-piece fell into place: Evarin had made the same bargain with Rakhal as with me!

I rolled over, dodging. Behind me in the room there was a child's shrill scream: "Daddy! Daddy!" And abruptly the birds collapsed in midair and went limp. They fell to the floor like dropping stones and lay there quivering. Rindy dashed across the room, her small skirts flying, and grabbed up one of the terrible vicious things in either hand.

"Rindy!" I bellowed. "No!"

She stood shaking, tears pouring down her round cheeks, a Toy squeezed tight in either hand. Dark veins stood out almost black on her fair temples. "Break them, Daddy," she implored in a little thread of a voice. "Break them, quick. I can't hang on...."

Rakhal staggered to his feet like a drunken man and snatched one of the Toys, grinding it under his heel. He made a grab at the second, reeled and drew an anguished breath. He crumpled up, clutching at his belly where I'd butted him. The bird screamed like a living thing.

Breaking my paralysis of horror I leaped up, ran across the room, heedless of the searing pain along my side. I snatched the bird from Rindy and it screamed and shriiled and died as my foot crunched the tiny feathers. I stamped the still-moving thing into an amorphous mess and kept on stamping and smashing until it was only a heap of powder.

Rakhal finally managed to haul himself upright again. His face was so pale that the scars stood out like fresh burns.

"That was a foul blow, Race, but I--I know why you did it." He stopped and breathed for a minute. Then he muttered, "You ... saved my life, you know. Did you know you were doing it, when you did it?"

Still breathing hard, I nodded. Done knowingly, it meant an end of blood-feud. However we had wronged each other, whatever the pledges. I spoke the words that confirmed it and ended it, finally and forever:

"There is a life between us. Let it stand for a death."

Miellyn was standing in the doorway, her hands pressed to her mouth, her eyes wide. She said shakily, "You're walking around with a knife in your ribs, you fool!"

Rakhal whirled and with a quick jerk he pulled the skean loose. It had simply been caught in my shirtcloak, in a fold of the rough cloth. He pulled it away, glanced at the red tip, then relaxed. "Not more than an inch deep," he said. Then, angrily, defending himself: "You did it yourself, you ape. I was trying to get rid of the knife when you jumped me."

But I knew that and he knew I knew it. He turned and scooped up Rindy, who was sobbing noisily. She dug her head into his shoulder and I made out her strangled words. "The other Toys hurt you when I was mad at you.... she sobbed, rubbing her fists against smeared cheeks. "I--I wasn't that mad at you. I wasn't that mad at anybody, not even... him."

Rakhal pressed his hand against his daughter's fleecy hair and said, looking at me over her head, "The Toys activate a child's subconscious resentments against his parents--I found out that much. That also means a child can control them for a few seconds. No adult can." A stranger would have seen no change in his expression, but I knew him, and saw.

"Juli said you threatened Rindy."

He chuckled and set the child on her feet. "What else could I say that would have scared Juli enough to send her
"Come on, sit down and let's decide what to do, now we've finished up the old business." He looked remotely at Miellyn and said, "You must be Dallisa's sister? I don't suppose your talents include knowing how to make coffee?"

They didn't, but with Rindy's help Miellyn managed, and while they were out of the room Rakhal explained briefly. "Rindy has rudimentary ESP. I've never had it myself, but I could teach her something--not much--about how to use it. I've been on Evarin's track ever since that business of The Lisse.

"I'd have got it sooner, if you were still working with me, but I couldn't do anything as a Terran agent, and I had to be kicked out so thoroughly that the others wouldn't be afraid I was still working secretly for Terra. For a long time I was just chasing rumors, but when Rindy got big enough to look in the crystals of Nebran, I started making some progress.

"I was afraid to tell Juli; her best safety was the fact that she didn't know anything. She's always been a stranger in the Dry-towns." He paused, then said with honest self-evaluation, "Since I left the Secret Service I've been a stranger there myself."

I asked, "What about Dallisa?"

"Twins have some ESP to each other. I knew Miellyn had gone to the Toymaker. I tried to get Dallisa to find out where Miellyn had gone, learn more about it. Dallisa wouldn't risk it, but Kyral saw me with Dallisa and thought it was Miellyn. That put him on my tail, too, and I had to leave Shainsa. I was afraid of Kyral," he added soberly. "Afraid of what he'd do. I couldn't do anything without Rindy and I knew if I told Juli what I was doing, she'd take Rindy away into the Terran Zone, and I'd be as good as dead."

As he talked, I began to realize how vast a web Evarin and the underground organization of Nebran had spread for us. "Evarin was here today. What for?"

Rakhal laughed mirthlessly. "He's been trying to get us to kill each other off. That would get rid of us both. He wants to turn over Wolf to the nonhumans entirely, I think he's sincere enough, but"--he spread his hands helplessly--"I can't sit by and see it."

"What about Dallisa?"

"Twins have some ESP to each other. I knew Miellyn had gone to the Toymaker. I tried to get Dallisa to find out where Miellyn had gone, learn more about it. Dallisa wouldn't risk it, but Kyral saw me with Dallisa and thought it was Miellyn. That put him on my tail, too, and I had to leave Shainsa. I was afraid of Kyral," he added soberly. "Afraid of what he'd do. I couldn't do anything without Rindy and I knew if I told Juli what I was doing, she'd take Rindy away into the Terran Zone, and I'd be as good as dead."

As he talked, I began to realize how vast a web Evarin and the underground organization of Nebran had spread for us. "Evarin was here today. What for?"

Rakhal laughed mirthlessly. "He's been trying to get us to kill each other off. That would get rid of us both. He wants to turn over Wolf to the nonhumans entirely, I think he's sincere enough, but"--he spread his hands helplessly--"I can't sit by and see it."

I asked point-blank, "Are you working for Terra? Or for the Dry-towns? Or any of the anti-Terran movements?"

"I'm working for me," he said with a shrug. "I don't think much of the Terran Empire, but one planet can't fight a galaxy. Race, I want just one thing. I want the Dry-towns and the rest of Wolf, to have a voice in their own government. Any planet which makes a substantial contribution to galactic science, by the laws of the Terran Empire, is automatically given the status of an independent commonwealth.

"If a man from the Dry-towns discovers something like a matter transmitter, Wolf gets dominion status. But Evarin and his gang want to keep it secret, keep it away from Terra, keep it locked up in places like Canarsa! Somebody has to get it away from them. And if I do it, I get a nice fat bonus, and an official position."

I believed that, where I would have suspected too much protestation of altruism. Rakhal tossed it aside.

"You've got Miellyn to take you through the transmitters. Go back to the Mastershrine, and tell Evarin that Race Cargill is dead. In the Trade City they think I'm Cargill, and I can get in and out as I choose--sorry if it caused you trouble, but it was the safest thing I could think of--and I'll vise Magnusson and have him send soldiers to guard the street-shrines. Evarin might try to escape through one of them."

"I shook my head. "Terra hasn't enough men on all Wolf to cover the street-shrines in Charin alone. And I can't go back with Miellyn." I explained. Rakhal pursed his lips and whistled when I described the fight in the transmitter.

"You have all the luck, Cargill! I've never been near enough even to be sure how they work--and I'll bet you didn't begin to understand! We'll have to do it the hard way, then. It won't be the first time we've bullied our way through a tight place! We'll face Evarin in his own hideout! If Rindy's with us, we needn't worry."

"I was willing to let him assume command, but I protested, "You'd take a child into that--that--"

"What else can we do? Rindy can control the Toys, and neither you nor I can do that, if Evarin should decide to throw his whole arsenal at us." He called Rindy and spoke softly to her. She looked from her father to me, and back again to her father, then smiled and stretched out her hand to me.

Before we ventured into the street, Rakhal scowled at the sprawled embroideries of Miellyn's robe. He said, "In those things you show up like a snowfall in Shainsa. If you go out in them, you could be mobbed. Hadn't you better get rid of them now?"

"I can't," she protested. "They're the keys to the transmitter!"

Rakhal looked at the conventionalized idols with curiosity, but said only, "Cover them up in the street, then. Rindy, find her something to put over her dress."

When we reached the street-shrine, Miellyn admonished: "Stand close together on the stones. I'm not sure we can all make the jump at once, but we'll have to try."
Rakhal picked up Rindy and hoisted her to his shoulder. Miellyn dropped the cloak she had draped over the pattern of the Nebran embroideries, and we crowded close together. The street swayed and vanished and I felt the now-familiar dip and swirl of blackness before the world straightened out again. Rindy was whimpering, dabbing smeary fists at her face. "Daddy, my nose is bleeding...."

Miellyn hastily bent and wiped the blood from the snubby nose. Rakhal gestured impatiently.

"The workroom. Wreck everything you see. Rindy, if anything starts to come at us, you stop it. Stop it quick. And--he bent and took the little face between his hands--"chiya, remember they're not toys, no matter how pretty they are."

Her grave gray eyes blinked, and she nodded.

Rakhal flung open the door of the elves' workshop with a shout. The ringing of the anvils shattered into a thousand dissonances as I kicked over a workbench and half-finished Toys crashed in confusion to the floor.

The dwarfs scattered like rabbits before our assault of destruction. I smashed tools, filigree, jewels, stamping everything with my heavy boots. I shattered glass, caught up a hammer and smashed crystals. There was a wild exhilaration to it.

A tiny doll, proportioned like a woman, dashed toward me, shrilling in a supersonic shriek. I put my foot on her and ground the life out of her, and she screamed like a living woman as she came apart. Her blue eyes rolled from her head and lay on the floor watching me. I crushed the blue jewels under my heel.

Rakhal swung a tiny hound by the tail. Its head shattered into debris of almost-invisible gears and wheels. I caught up a chair and wrecked a glass cabinet of parts with it, swinging furiously. A berserk madness of smashing and breaking had laid hold on me.

I was drunk with crushing and shattering and ruining, when I heard Miellyn scream a warning and turned to see Evarin standing in the doorway. His green cat-eyes blazed with rage. Then he raised both hands in a sudden, sardonic gesture, and with a loping, inhuman glide, raced for the transmitter.

"Rindy," Rakhal panted, "can you block the transmitter?"

Instead Rindy shrieked. "We've got to get out! The roof is falling down! The house is going to fall down on us! The roof, look at the roof!"

I looked up, transfixed by horror. I saw a wide rift open, saw the skylight shatter and break, and daylight pouring through the cracking walls, Rakhal snatched Rindy up, protecting her from the falling debris with his head and shoulders. I grabbed Miellyn round the waist and we ran for the rift in the buckling wall.

We shoved through just before the roof caved in and the walls collapsed, and we found ourselves standing on a bare grassy hillside, looking down in shock and horror as below us, section after section of what had been apparently bare hill and rock caved in and collapsed into dusty rubble.

Miellyn screamed hoarsely. "Run. Run, hurry!"

I didn't understand, but I ran. I ran, my sides aching, blood streaming from the forgotten flesh-wound in my side. Miellyn raced beside me and Rakhal stumbled along, carrying Rindy.

Then the shock of a great explosion rocked the ground, hurling me down full length, Miellyn falling on top of me. Rakhal went down on his knees. Rindy was crying loudly. When I could see straight again, I looked down at the hillside.

There was nothing left of Evarin's hideaway or the Mastershrine of Nebran except a great, gaping hole, still oozing smoke and thick black dust. Miellyn said aloud, dazed, "So that's what he was going to do!"

It fitted the peculiar nonhuman logic of the Toymaker. He'd covered the traces.

"Destroyed!" Rakhal raged. "All destroyed! The workrooms, the science of the Toys, the matter transmitter--the minute we find it, it's destroyed!" He beat his fists furiously. "Our one chance to learn--"

"We were lucky to get out alive," said Miellyn quietly. "Where on the planet are we, I wonder?"

I looked down the hillside, and stared in amazement. Spread out on the hillside below us lay the Kharsa, topped by the white skyscraper of the HQ.

"I'll be damned," I said, "right here. We're home. Rakhal, you can go down and make your peace with the Terrans, and Juli. And you, Miellyn--" Before the others, I could not say what I was thinking, but I put my hand on her shoulder and kept it there. She smiled, shakily, with a hint of her old mischief. "I can't go into the Terran Zone looking like this, can I? Give me that comb again. Rakhal, give me your shirtcloak, my robes are torn."

"You vain, stupid female, worrying about a thing like that at a time like this!" Rakhal's look was like murder. I put my comb in her hand, then suddenly saw something in the symbols across her breasts. Before this I had seen only the conventionalized and intricate glyph of the Toad God. But now--

I reached out and ripped the cloth away.

"Cargill!" she protested angrily, crimsoning, covering her bare breasts with both hands. "Is this the place? And before a child, too!"
I hardly heard. "Look!" I exclaimed. "Rakhal, look at the symbols embroidered into the glyph of the God! You can read the old nonhuman glyphs. You did it in the city of The Lisse. Miellyn said they were the key to the transmitters! I'll bet the formula is written out there for anyone to read!

"Anyone, that is, who can read it! I can't, but I'll bet the formula equations for the transmitters are carved on every Toad God glyph on Wolf. Rakhal, it makes sense. There are two ways of hiding something. Either keep it locked away, or hide it right out in plain sight. Whoever bothers even to look at a conventionalized Toad God? There are so many billions of them...."

He bent his head over the embroideries, and when he looked up his face was flushed. "I believe--by the chains of Sharra, I believe you have it, Race! It may take years to work out the glyphs, but I'll do it, or die trying!" His scarred and hideous face looked almost handsome in exultation, and I grinned at him.

"If Juli leaves enough of you, once she finds out how you maneuvered her. Look, Rindy's fallen asleep on the grass there. Poor kid, we'd better get her down to her mother."

"Right." Rakhal thrust the precious embroidery into his shirtcloak, then cradled his sleeping daughter in his arms. I watched him with a curious emotion I could not identify. It seemed to pinpoint some great change, either in Rakhal or myself. It's not difficult to visualize one's sister with children, but there was something, some strange incongruity in the sight of Rakhal carrying the little girl, carefully tucking her up in a fold of his cloak to keep the sharp breeze off her face.

Miellyn was limping in her thin sandals, and she shivered. I asked, "Cold?"

"No, but--I don't believe Evarin is dead, I'm afraid he got away."

For a minute the thought dimmed the luster of the morning. Then I shrugged. "He's probably buried in that big hole up there." But I knew I would never be sure.

We walked abreast, my arm around the weary, stumbling woman, and Rakhal said softly at last, "Like old times."

It wasn't old times, I knew. He would know it too, once his exultation sobered. I had outgrown my love for intrigue, and I had the feeling this was Rakhal's last adventure. It was going to take him, as he said, years to work out the equations for the transmitter. And I had a feeling my own solid, ordinary desk was going to look good to me in the morning.

But I knew now that I'd never run away from Wolf again. It was my own beloved sun that was rising. My sister was waiting for me down below, and I was bringing back her child. My best friend was walking at my side. What more could a man want?

If the memory of dark, poison-berry eyes was to haunt me in nightmares, they did not come into the waking world. I looked at Miellyn, took her slender unmanacled hand in mine, and smiled as we walked through the gates of the city. Now, after all my years on Wolf, I understood the desire to keep their women under lock and key that was its ancient custom. I vowed to myself as we went that I should waste no time finding a fetter shop and having forged therein the perfect steel chains that should bind my love's wrists to my key forever.
When he was nine, Vogel almost killed another boy who inadvertently scattered his half-completed jigsaw puzzle.

At sixteen, he discovered the mysteries of the Danish Gambit, and cried.

At twenty-two, he crouched in a foxhole on Okinawa, oblivious to the death bursting about him, squinting in a painful ecstasy at the tattered fragment of newspaper on his knee. His sergeant screamed in agony, then died at his elbow. Vogel's face lit up. "Slay," he said happily, scribbling. As crossword puzzles go, it had been a toughie.

At thirty, he was Production Manager of Sachs Fixtures. His men hated him. The General Manager loved him. Tall, gaunt and ruthless, he could glance at any detail print and instantly pinpoint the pattern of final assembly, total man-hour budget and fabrication lead time.

Once, he made a mistake.

On a forty-thousand-dollar job lot he estimated too high on production scrap. When the final assemblies were completed, they had two feet of bulb extension left over. It disturbed him. He spent that evening in his den brooding over chessmen. His wife let him alone.

Next day, he hired Amenth.

Personnel called that morning and apologized. "No experience, but amazing shop aptitude. He's coming down to you for an interview."

"I want," Vogel said into the phone, "three bench men. By noon. With shop experience."

Personnel was sorry. Vogel snarled and hung up.

"Hello, please, sir," said a voice.

Vogel stared, icily.

Meekness cowered in front of his desk. Meekness in the form of a small birdlike person with beseeching amber eyes.

"I am Amenth," he said, cringing.

Vogel eyed the olive skin, the cheekbones, the blue-black hair. "A wetback," he said. "Three men short and they send me wetbacks. You know sheet metal, buster?"

Fighting apoplexy, Vogel took him out into the shop. Amenth cringed at the howl of air tools and punch presses. Vogel contemptuously took him by the arm and led him to a workbench where a wizened persimmon of a man performed deft lightnings with rivets and air wrench.

"Benny, this is Amenth. He's new." Vogel pronounced it like a curse. "Get him some goggles from the crib, a rivet gun."

Vogel returned to his office scowling. The phone rang almost instantly.

"Boss," said Benny, "he's from nothing--all thumbs with an air wrench and he don't know alclad from stainless."

"Be right out," Vogel said, hanging up.

Before he had a chance to fire Amenth, the Fabrication Super came in with a production problem. Vogel solved it, but it was almost an hour before he returned to Benny's bench--and stared.

Amenth was a blur of motion. His Keller chattered like a live thing.

A furious sweaty Benny snapped at Vogel, "You playing practical jokes? Look, this guy's gone crazy, he's fifty per cent under standard! Tell him to slow down before I file a grievance."

Amenth beamed. "I am of the aptitude," he said.

A queer deep tingle went through Vogel. The crystal delight of challenge he felt when confronted by an apparently impregnable fianchetto.

That was the first day.

* * * * *

A week later, Vogel was compiling a progress report from completed shop travelers. Abruptly he scowled at one traveler, then said, "Charlie!"
"Yes, sir," one of the planners said.
"Why didn't these galleys go out for drop hammer?"
Charlie peered at the form and whistled. "Somebody must have changed the planning sheet."
"Get me the story!"
Charlie went hurriedly out into the shop.
Some time later he returned with a pale, dazed look. "It's this guy in assembly," he said. "Name is Amenth. He didn't even read the traveler. Just looked at the attached detail print and decided to miter the edges, then reverse the flange with a weld." He threw the completed part on Vogel's desk. "Go ahead, check those tolerances," he said whitely. "Right on the money."

Vogel walked over to a calculator and figured. There was a dreamy expression in his eyes. He said softly, "All fabrication in our own shop. A net saving of 93 cents per unit, or eight hundred dollars total. I believe you planned this item, Charlie."
Vogel fired him.
That same afternoon Amenth came into the office on Vogel's order. "Sir?"
"Don't you know how to read a traveler?" Vogel asked sternly.
"It was a lucky accident," Amenth looked terrified. "I just read the print--"
"And did what seemed logical." Statement, then a very quiet question. "What happened to your accent?"
The little man looked blank.
Vogel took a slow deep breath. "I've got a material planning job open," he said tightly. "Three-fifty to start. Interested?"
For a moment he thought Amenth would lick his hand.
The little man took to planning sheets like a duck to water. He pored feverishly over blueprints, turning out travelers in a steady flood.
Vogel watched him. He went over to Personnel, requested Amenth's employment application, read it and scowled. It was a masterpiece of anonymity. Birthplace: New York. Former Occupation: Laborer. Hobbies: None. He memorized Amenth's address and returned the application.
Vogel always ate lunch in the office with his expediters. That noon two of them got into an argument about the planets.
"I say there is life on Mars," Pete Stone insisted stubbornly. "When the polar ice cap melts, the water runs along the canals and traces of green from growing vegetation can be spotted."
"Which proves nothing," Harvey Lamb yawned. Lamb was chief expediter. "Man couldn't live there, anyway. There's not enough oxygen."
"You would be amazed," Amenth said quietly, "at the adaptability of Man."
Vogel set down his thermos and leaned forward. "You mean Martians, for instance, could live here, assuming they existed and had spaceships?"
Amenth's smile was infinitely bitter. "Until they'd go mad."
The talk turned to baseball. Vogel lit his pipe and gave Amenth a surreptitious glance. The little man slumped in the corner, bleak and withdrawn.
This was delicious.

* * * * *
Vogel left the shop and drove across town to Amenth's address. It turned out to be an ancient rooming house on the West Side. Mrs. Reardon, the landlady, was an apathetic woman who brightened when he asked her about Amenth.
"He moved in just three weeks ago." Her face softened in recollection. "He was like a lost dog coming in out of the rain. Couldn't hardly speak English and he wanted me to trust him for the rent. I must have been crazy." Her nostrils flared. "Not that he hasn't paid up. Are you a cop?"
Vogel nodded as he took out his wallet. In it was his honorary sheriff's badge, but he doubted if the woman would know the difference. She didn't. She led the way upstairs to Amenth's room, worrying, and Vogel assured her they were only looking for a hit-and-run witness, that it was strictly routine.
Amenth's room was incredibly aseptic, barren of pictures, ash trays, dirty laundry, any of the normal masculine debris. Vogel got the stark impression of a convict's cell. In the bleak dresser were two pair of socks, underwear, one tie. In the closet hung one white shirt ... period. Everything wore an indefinable patina of newness. Two books graced the top of the dresser. Vogel recognized one of them, a text on fabrication and design which Amenth had borrowed from his office. The other was a child's primer of English.
"He stays in his room almost every night--reads mostly, and he speaks English much better now," said Mrs. Reardon. "A good tenant--I can't complain--and he's quiet and clean." She described Amenth and Vogel shook his
"Our man is about sixty, with a beard," he said. "Funny coincidence. It's a strange name."
Mrs. Reardon agreed.
Vogel drove back to the shop, whistling.
He did not go to his chess club that night, but went to the library instead. He read about Flying Saucers, about space travel, about the possibility of life on other planets. Sometimes he chuckled. Once he frowned deeply and bit his lip.
That night in bed, listening to his wife's shallow breathing, he said, "Alice."
"Yes?"
"Supposing you were lost on a desert island. What would you do?"
"I'd build a raft," she said sleepily.
Vogel smiled into the darkness.
Next day he made a systematic tour of the stockroom, scanning the racks of completed sub-assemblies, the gleaming fixture components, the rows of panels, brackets, extrusions, all waiting like soldiers to march from the stockroom into final assembly.
Vogel suddenly grunted.
There, half hidden behind a row of stainless-steel basin assemblies, was a nine-inch bowl. He examined it. The bowl was heavy and shiny. There was no part number stamp, and the metal was not alclad, not stainless, not cad nor zinc. Five small copper discs had been welded to the lower flange.
Vogel carefully scraped off a sample with a file. Then he replaced the part in the stock rack and went into his office where he placed the sample in an envelope.
That afternoon he ranged the shop like a hound.
In the shipping crib, he found a half-completed detail that struck a chord of strangeness. Two twisted copper vanes with a crumpled shop traveler signed by Amenth. The next operation specified furnace braze. Vogel squinted at the attached detail print. It was a current job number.
He spent the next two hours in the ozalid room, leafing through the print files. The job number called for a deep-freeze showcase, and there were exactly two hundred and seven detail drawings involved.
Not one of them matched the print in shipping.
After an almost silent dinner at home, he sat smoking his pipe, waiting for the phone to ring. It rang at eight.
"It's platinum," Carstairs said. Tim Carstairs was a night-shift chemist. "Anything wrong, Mr. Vogel?"
"No." Vogel paused. "Thanks, Tim." He hung up, glanced at his fingers. They were shaking.
"You," Alice said, "look ready to call mate in three."
"I'm going over to the shop," he said, kissing her. "Don't wait up."
* * * * *
He was not surprised to see the light on in the parts control section. Amenth was writing planning sheets.
"I don't believe we authorized overtime," Vogel told him mildly, hanging up his coat.
"Just loose ends." Amenth's smile was nervous. "Tying up these burden charts. I'm on my own time."
"Thought I'd set up next month's budget." Vogel sat at his desk. "By the way, what did you do before you came here?"
"Odd jobs." Amenth's lips twitched.
"Your family live on the coast?"
Sweat glistened on the little man's forehead. "Ah--no. My folks passed on years ago."
Cat and mouse.
"You've done good work lately." Vogel yawned, studying the progress chart on the wall. Behind him he heard a soft exhalation of relief, the furtive rustle of papers as Amenth cleaned off his desk.
When Amenth finally left, Vogel went over to his desk and methodically ransacked the work in process file. It took him two hours to find what he was looking for.
One: A schematic detail on graph paper which resembled no type of circuit Vogel had ever seen.
Two: Fourteen completed shop travelers on which were typed clearly, Call Amenth upon completion. That was not unusual; most expediters wanted to be notified when a hot part hit Inspection. The unusual part was that no inspection stamp had been placed opposite the final operation of Inspect, Identify, Return to Stock. Ergo, Amenth had inspected and stocked the parts himself.
Three: A progress chart with dates, indicating four detail parts still remaining in fabrication. Final assembly date--tomorrow!
The following afternoon, Vogel sat alone in the conference room. The door opened and Amenth came in. "You sent for me, sir?"
"Sit down, Amenth. Let's talk a while."

Amenth sat down uneasily.

"We're considering you for promotion," Vogel said, silencing the little man's protests with a deprecating wave. "But we've got to know if you're ready. Let's talk about your job."

Amenth relaxed.

They talked shop for a few moments, then Vogel opened a folder, took out his watch. "Very good," he said. "Now let's check your initiative potential." As Amenth stiffened, Vogel reassured him, "Relax. It's a routine association test."

For the next ten minutes he timed Amenth's responses with a stop watch. Most of the words were familiar shop words and most of the responses were standard.

"Job."
"Escape," Amenth said instantly.
"Blueprint."
"Create."
"Noise."
"Hate."
"Want."
"Home!"

It was all so childish, so obvious, and Amenth's eyes were frightened amber pools when Vogel dismissed him.

No matter. Let him suspect. Vogel studied the reaction results with grim amusement.

Outside, the shop roared.

And Amenth's travelers sped the rounds: Issue material; Shear to size; Form on brake; Weld per print; Miter, drill, inspect, stock. One by one, the strange details were being formed, finished, to lie inert in the stockroom, to await final assembly.

Assembly.
Of what?
Tonight was project completion.

* * * * *

Midnight.

Vogel stood in darkness, leaning against the wall. He was tired. He had maintained this vigil for three hours. His right leg was numb and he started to shift position, then froze as he heard footsteps. Three aisles over, a light exploded, blindingly. He held his breath.

From outside in fabrication came the muffled clang of drill press and power brake, the sounds of the night shift. He waited. Three aisles over, something moved. Someone fumbled in the stock bins, collecting shaped pieces of metal, grunting with the effort of piling them on the salvage bench, now panting with impatience while assembling the parts. There was a hammering, a fitting together, a flash of light, a humming of power and finally a sob of relief.

Vogel's hand slipped into his coat pocket and grasped the gun. He moved silently.

Amenth stood at the salvage bench, adjusting studs and connecting terminals. Vogel stared at the final assembly.

It was a helmet. A large silvery helmet, connected to a nightmarish maze of wiring, mounted on a rectangular plastic base. It hummed, although there was no visible source of power. Vogel put on the helmet with a feverish haste. Vogel chuckled. Amenth stood motionless. Then as his hand darted toward a stand, Vogel said sharply, "Don't!"

Amenth stared at the gun.
"Take it off!" Vogel's voice was iron.
Amenth slowly took off the helmet. His eyes were golden with tears. "Please," he said.
"Mars or Venus?" Vogel said. "Which?"
"N- neither. You could not grasp the concept. Let me go. Please!"
"Where?" Vogel prodded. "Another dimension?"
"You would call it that," the alien whispered. Hope brightened his face. "You want something? Wealth? Power?"

It was the way he said the words, like a white trader offering his aborigine captors glass beads to set him free.
Vogel nodded toward the circuit. "That hook up—you tap the gravitational field direct? Cosmic rays?"
"Your planet's magnet force lines. Look, I'll leave you the schematic diagram. It's simple, really. You can use it to transmute—" He babble on with a heartbreaking eagerness, and Vogel listened.

"In my own world," said Amenth brokenly, "I am a moron. A criminal moron. Once, out of a childish malice, I
destroyed beauty. One of the singing crystals." He shuddered. "I was punished. They sent me here--to the snake pit. Sentence for felony. This--" he indicated the helmet--"would have fused three seconds after I used it. So, incidentally, would this entire shop. I had no time to construct a feedback dispersion."

"Tell me about your world," Vogel said.

Amenth told him.

Vogel's breath hissed softly between his teeth. All his life an unformed vision had tormented him, driven him toward perfection. Abruptly the vision was reality. He smiled, moved forward. "You shouldn't have told me."

Amenth saw the intent in his eyes and started to beg. Vogel clipped him behind the ear.

He put the helmet on, gingerly. The electrodes tingled against his temple and his grin was wry as he thought of Alice. Then he depressed the stud.

Vogel sobbed.

* * * * *

Color blinded him, rainbows blared in sweet, sparkling thunder. He whimpered, covering his eyes. The music drowned him in a fugue of weeping delight. Slowly he raised his head.

He stood ankle-deep in gold crystals that stretched out forever in a splendid sea of flame. The crystals sang softly, achingly, to a silver sun in an emerald sky. A grove of blue needle trees tinkled in ecstasy on his left. And beyond those trees....

The city sang.

White spires foamed skyward in impossible cataracts of glory. A glissando of joy burned his eardrums, and he could not face that living splendor. It was the city beyond dreams, beyond legend, the city where all dreams end. He strode toward it, raptly.

The crystals screamed. The blue needle forest lashed wildly, and terror shivered through the air in shrieking dissonance.

From the blue forest, people ran. Beautiful people, with great golden eyes and scarlet tunics. They could have been Amenth's brothers and sisters. They stared, horror and revulsion twisting their faces. They started toward him.

Vogel understood.

If destroying beauty on this world was a crime, then killing ugliness must be a duty.

On this world, he was ugly--
Dave stared around the office. He went to the window and stared upwards at the crazy patchwork of the sky. For all he knew, in such a sky there might be cracks. In fact, as he looked, he could make out a rift, and beyond that a hole... a small patch where there was no color, and yet the sky there was not black. There were no stars there, though points of light were clustered around the edges, apparently retreating.

"Dave Hanson! By the power of the true name be summoned cells and humors, ka and id, self and--"

Dave Hanson! The name came swimming through utter blackness, sucking at him, pulling him together out of nothingness. Then, abruptly, he was aware of being alive, and surprised. He sucked in on the air around him, and the breath burned in his lungs. He was one of the dead--there should be no quickening of breath within him!

He caught a grip on himself, fighting the fantasies of his mind, and took another breath of air. This time it burned less, and he could force an awareness of the smells around him. But there was none of the pungent odor of the hospital he had expected. Instead, his nostrils were scorched with a noxious odor of sulfur, burned hair and cloying incense.

He gagged on it. His diaphragm tautened with the sharp pain of long-unused muscles, and he sneezed.

"A good sign," a man's voice said. "The followers have accepted and are leaving. Only a true being can sneeze. But unless the salamander works, his chances are only slight."

There was a mutter of agreement from others, before an older voice broke in. "It takes a deeper fire than most salamanders can stir, Ser Perth. We might aid it with high-frequency radiation, but I distrust the effects on the prepsyche. If we tried a tamed succubus--"

"The things are untrustworthy," the first voice answered. "And with the sky falling, we dare not trust one."

The words blurred off in a fog of semiconsciousness and half-thoughts. The sky was falling? Who killed Foxy Loxy? I, said the spider, who sat down insider, I went boomp in the night and the bull jumped over the moon....

"Bull," he croaked. "The bull sleeper!"

"Delirious," the first voice muttered.

"I mean--bull pusher!" That was wrong, too, and he tried again, forcing his reluctant tongue around the syllables. "Bull dosser!"

Damn it, couldn't he even pronounce simple Engaliss?

The language wasn't English, however. Nor was it Canadian French, the only other speech he could make any sense of. Yet he understood it--had even spoken it, he realized. There was nothing wrong with his command of whatever language it was, but there seemed to be no word for bulldozer. He struggled to get his eyes open.

The room seemed normal enough, in spite of the odd smells. He lay on a high bed, surrounded by prim white walls, and there was even a chart of some kind at the bottom of the bedframe. He focused his eyes slowly on what must be the doctors and nurses there, and their faces looked back with the proper professional worry. But the varicolored gowns they wore in place of proper clothing were covered with odd designs, stars, crescents and things that might have been symbols for astronomy or chemistry.

He tried to reach for his glasses to adjust them. There were no glasses! That hit him harder than any other discovery. He must be delirious and imagining the room. Dave Hanson was so nearsighted that he couldn't have seen the men, much less the clothing, without corrective lenses.

The middle-aged man with the small mustache bent over the chart near his feet. "Hmm," the man said in the voice of the first speaker. "Mars trines Neptune. And with Scorpio so altered... hmm. Better add two cc. of cortisone to the transfusion."

Hanson tried to sit up, but his arms refused to bear his weight. He opened his mouth. A slim hand came to his lips, and he looked up into soothing blue eyes. The nurse's face was framed in copper-red hair. She had the transparent skin and classic features that occur once in a million times but which still keep the legend of redheaded enchantresses alive. "Shh," she said.

He began to struggle against her hand, but she shook her head gently. Her other hand began a series of complicated motions that had a ritualistic look about them.

"Shh," she repeated. "Rest. Relax and sleep, Dave Hanson, and remember when you were alive."

There was a sharp sound from the doctor, but it began to blur out before Hanson could understand it. He fought to remember what he'd heard the nurse say--something about when he was alive--as if he'd been dead a long time....
He couldn't hold the thought. At a final rapid motion of the girl's hand his eyes closed, the smell faded from his nose and all sounds vanished. Once there was a stinging sensation, as if he were receiving the transfusion. Then he was alone in his mind with his memories—mostly of the last day when he'd still been alive. He seemed to be reliving the events, rethinking the thoughts he'd had then.

It began with the sight of his uncle's face leering at him. Uncle David Arnold Hanson looked like every man's dream of himself and every woman's dreams of manliness. But at the moment, to Dave, he looked more like a personal demon. His head was tilted back and nasty laughter was booming through the air of the little office.

"So your little farewell activity didn't fare so well, eh?" he chortled. "And you come crawling here to tell me you want to do the honorable thing, is that it? All right, my beloved nephew, you'll do the honorable thing! You'll stick to your contract with me."

"But--" Dave began.

"But if you don't, you'd better read it again. You don't get one cent except on completion of your year with me. That's what it says, and that's what happens." He paused, letting the fact that he meant it sink in. He was enjoying the whole business, and in no hurry to end it. "And I happen to know, Dave, that you don't even have fare to Saskatchewan left. You quit and I'll see you never get another job. I promised my sister I'd make a man of you and, by jumping Jupiter, I intend to do just that. And in my book, that doesn't mean you run back with your tail between your legs just because some silly young girl pulls that old chestnut on you. Why, when I was your age, I already had...."

Dave wasn't listening any longer. In futile anger, he'd swung out of the office and gone stumbling back toward the computer building. Then, in a further burst of anger, he swung off the trail. To hell with his work and blast his uncle! He'd go on into town, and he'd—he'd do whatever he pleased.

The worst part of it was that Uncle David could make good on his threat of seeing that Dave got no more work anywhere. David Arnold Hanson was a power to reckon with. No other man on Earth could have persuaded anyone to let him try his scheme of building a great deflection wall across northern Canada to change the weather patterns. And no other man could have accomplished the impossible task, even after twelve countries pooled their resources to give him the job. But he was doing it, and it was already beginning to work. Dave had noticed that the last winter in Chicago had definitely shown that Uncle David's predictions were coming true.

Like most of the world, Dave had regarded the big man who was his uncle with something close to worship. He'd jumped at the chance to work under Uncle David. And he'd been a fool. He'd been doing all right in Chicago. Repairing computers didn't pay a fortune, but it was a good living, and he was good at it. And there was Bertha—maybe not a movie doll, but a sort of pretty girl who was also a damned good cook. For a man of thirty who'd always been a scrawny, shy runt like the one in the "before" pictures, he'd been doing all right.

Then came the letter from his uncle, offering him triple salary as a maintenance man on the computers used for the construction job. There was nothing said about romance and beauteous Indian maids, but Dave filled that in himself. He would need the money when he and Bertha got married, too, and all that healthy outdoor living was just what the doctor would have ordered.

The Indian maids, of course, turned out to be a few fat old squaws who knew all about white men. The outdoor living developed into five months of rain, hail, sleet, blizzard, fog and constant freezing in tractors while breathing the healthy fumes of diesels. Uncle David turned out to be a construction genius, all right, but his interest in Dave seemed to lie in the fact that he was tired of being Simon Legree to strangers and wanted to take it out on one of his own family. And the easy job turned into hell when the regular computer-man couldn't take any more and quit, leaving Dave to do everything, including making the field tests to gain the needed data.

Now Bertha was writing frantic letters, telling him how much he'd better come back and marry her immediately. And Uncle David thought it was a joke!

Dave paid no attention to where his feet were leading him, only vaguely aware that he was heading down a gully below the current construction job. He heard the tractors and bulldozers moving along the narrow cliff above him, but he was used to the sound. He heard frantic yelling from above, too, but paid no attention to it; in any Hanson construction program, somebody was always yelling about something that had to be done day before yesterday. It wasn't until he finally became aware of his own name being shouted that he looked up. Then he froze in horror.

The bulldozer was teetering at the edge of the cliff as he saw it, right above him. And the cliff was crumbling from under it, while the tread spun idiotically out of control. As Dave's eyes took in the whole situation, the cliff crumbled completely, and the dozer came lunging over the edge, plunging straight for him. His shout was drowned in the roar of the motor. He tried to force his legs to jump, but they were frozen in terror. The heavy mass came straight for him, its treads churning like great teeth reaching for him.

Then it hit, squarely on top of him. Something ripped and splattered and blacked out in an unbearable welter of
agony.

Dave Hanson came awake trying to scream and thrusting at the bed with arms too weak to raise him. The dream of the past was already fading. The horror he had thought was death lay somewhere in the past.

Now he was here--wherever here was.

The obvious answer was that he was in a normal hospital, somehow still alive, being patched up. The things he seemed to remember from his other waking must be a mixture of fact and delirium. Besides, how was he to judge what was normal in extreme cases of surgery?

He managed to struggle up to a sitting position in the bed, trying to make out more of his surroundings. But the room was dark now. As his eyes adjusted, he made out a small brazier there, with a cadaverous old man in a dark robe spotted with looped crosses. On his head was something like a miter, carrying a coiled brass snake in front of it. The old man's white goatee bobbed as he mouthed something silently and made passes over the flame, which shot up prismatically. Clouds of white fire belched up.

Dave reached to adjust his glasses, and found again that he wasn't wearing them. But he'd never seen so clearly before.

At that moment, a chanting voice broke into his puzzled thoughts. It sounded like Ser Perth. Dave turned his head weakly. The motion set sick waves of nausea running through him, but he could see the doctor kneeling on the floor in some sort of pantomime. The words of the chant were meaningless.

A hand closed over Dave's eyes, and the voice of the nurse whispered in his ear. "Shh, Dave Hanson. It's the Sather Karf, so don't interrupt. There may be a conjunction."

He fell back, panting, his heart fluttering. Whatever was going on, he was in no shape to interrupt anything. But he knew that this was no delirium. He didn't have that kind of imagination.

The chant changed, after a long moment of silence. Dave's heart had picked up speed, but now it missed again, and he felt cold. He shivered. Hell or heaven weren't like this, either. It was like something out of some picture--something about Cagliostro, the ancient mystic. But he was sure the language he somehow spoke wasn't an ancient one. It had words for electron, penicillin and calculus, for he found them in his own mind.

The chant picked up again, and now the brazier flamed a dull red, showing the Sather Karf's face changing from some kind of disappointment to a businesslike steadiness. The red glow grew white in the center, and a fat, worm-like shape of flame came into being. The old man picked it up in his hand, petted it and carried it toward Dave. It flowed toward his chest.

He pulled himself back, but Ser Perth and the nurse leaped forward to hold him. The thing started to grow brighter. It shone now like a tiny bit of white-hot metal; but the older man touched it, and it snuggled down into Dave's chest, dimming its glow and somehow purring. Warmth seemed to flow from it into Dave. The two men watched for a moment, then picked up their apparatus and turned to go. The Sather Karf lifted the fire from the brazier in his bare hand, moved it into the air and said a soft word. It vanished, and the two men were also gone.

"Magic!" Dave said. He'd seen such illusions created on the stage, but there was something different here. And there was no fakery about the warmth from the thing over his chest. Abruptly he remembered that he'd come across something like it, called a salamander, in fiction once; the thing was supposed to be a spirit of fire, and dangerously destructive.

The girl nodded in the soft glow coming from Dave's chest. "Naturally," she told him. "How else does one produce and control a salamander, except by magic? Without, magic, how can we thaw a frozen soul? Or didn't your world have any sciences, Dave Hanson?"

Either the five months under his uncle had toughened him, or the sight of the bulldozer falling had knocked him beyond any strong reaction. The girl had practically told him he wasn't in his own world. He waited for some emotion, felt none, and shrugged. The action sent pain running through him, but he stood it somehow. The salamander ceased its purring, then resumed.

"Where in hell am I?" he asked. "Or when?"

She shook her head. "Hell? No, I don't think so. Some say it's Earth and some call it Terah, but nobody calls it Hell. It's--well, it's a long--time, I guess--from when you were. I don't know. In such matters, only the Satheri know. The Dual is closed even to the Seri. Anyhow, it's not your space-time, though some say it's your world."

"You mean dimensional travel?" Dave asked. He'd seen something about that on a science-fiction television program. It made even time travel seem simple. At any event, however, this wasn't a hospital in any sane and normal section of Canada during his time, on Earth.

"Something like that," she agreed doubtfully. "But go to sleep now. Shh." Her hands came up in complicated gestures. "Sleep and grow well."

"None of that hypnotism again!" he protested.

She went on making passes, but smiled on him kindly. "Don't be superstitious--hypnotism is silly. Now go to
sleep. For me, Dave Hanson. I want you well and true when you awake."

Against his will, his eyes closed, and his lips refused to obey his desire to protest. Fatigue dulled his thoughts. But for a moment, he went on pondering. Somebody from the future--this could never be the past--had somehow pulled him out just ahead of the accident, apparently; or else he'd been deep frozen somehow to wait for medical knowledge beyond that of his own time. He'd heard it might be possible to do that.

It was a cockeyed future, if this were the future. Still, if scientists had to set up some, sort of a religious mumbo-jumbo....

Sickness thickened in him, until he could feel his face wet with perspiration. But with it had come a paralysis that left him unable to move or groan. He screamed inside himself.

"Poor mandrake-man," the girl said softly. "Go back to Lethe. But don't cross over. We need you sorely."

Then he passed out again.

II

Whatever they had done to patch him up hadn't been very successful, apparently. He spent most of the time in a delirium; sometimes he was dead, and there was an ultimate coldness like the universe long after the entropy death. At other times, he was wandering into fantasies that were all horrible. And at all times, even in unconsciousness, he seemed to be fighting desperately to keep from falling apart painfully within himself.

When he was awake, the girl was always beside him. He learned that her name was Nema. Usually there was also the stout figure of Ser Perth. Sometimes he saw Sather Karf or some other older man working with strange equipment, or with things that looked like familiar hypodermics and medical equipment. Once they had an iron lung around him and there was a thin wisp over his face.

He started to brush it aside, but Nema's hand restrained him. "Don't disturb the sylph," she ordered.

Another semirational period occurred during some excitement or danger that centered around him. He was still half delirious, but he could see men working frantically to build a net of something around his bed, while a wet, thick thing flopped and drooled beyond the door, apparently immune to the attacks of the hospital staff. There were shouting orders involving the undine. The salamander in Dave's chest crept deeper and seemed to bleat at each cry of the monstrous thing beyond the door.

Sather Karf sat hunched over what seemed to be a bowl of water, paying no attention to the struggle. Something that he seemed to see there held his attention. Then he screamed suddenly.

"The Sons of the Egg. It's their sending!"

He reached for a brazier beside him, caught up the fire and plunged it deep into the bowl of water, screaming something. There was the sound of an explosion from far away as he drew his hands out, unwet by the water. Abruptly the undine began a slow retreat. In Dave's chest, the salamander began purring again, and he drifted back into his coma.

He tried to ask Nema about it later when she was feeding him, but she brushed it aside.

"An orderly let out the news that you are here," she said. "But don't worry. We've sent out a doppelganger to fool the Sons, and the orderly has been sentenced to slavery under the pyramid builder for twenty lifetimes. I hate my brother! How dare he fight us with the sky falling?"

Later, the delirium seemed to pass completely, but Dave took no comfort from that. In its place came a feeling of gloom and apathy. He slept most of the time, as if not daring to use his little strength even to think.

Ser Perth stayed near him most of the time now. The man was obviously worried, but tried not to show it.

"We've managed to get some testosterone from a blond homunculus," he reported. "That should put you on your feet in no time. Don't worry, young man we'll keep you vivified somehow until the Sign changes." But he didn't sound convincing.

"Everyone is chanting for you," Nema told him. "All over the world, the chants go up."

It meant nothing to him, but it sounded friendly. A whole world hoping for him to get well! He cheered up a bit at that until he found out that the chants were compulsory, and had nothing to do with goodwill.

The iron lung was back the next time he came to, and he was being tugged toward it. He noticed this time that there was no sylph, and his breathing seemed to be no worse than usual. But the sight of the two orderlies and the man in medical uniform beside the lung reassured him. Whatever their methods, he was convinced that they were doing their best for him here.

He tried to help them get him into the lung, and one of the men nodded encouragingly. But Dave was too weak to give much assistance. He glanced about for Nema, but she was out on one of her infrequent other duties. He sighed, wishing desperately that she were with him. She was a lot more proficient than the orderlies.

The man in medical robe turned toward him sharply. "Stop that!" he ordered.

Before Dave could ask what he was to stop, Nema came rushing into the room. Her face paled as she saw the three men, and she gasped, throwing up her hand in a protective gesture.
The two orderlies jumped for her, one grabbing her and the other closing his hands over her mouth. She struggled violently, but the men were too strong for her.

The man in doctor's robes shoved the iron lung aside violently and reached into his clothing. From it, he drew a strange, double-bladed knife. He swung toward Dave, raising the knife into striking position and aiming it at Dave's heart.

"The Egg breaks," he intoned hollowly. It was a cultured voice, and there was a refinement to his face that registered on Dave's mind even over the horror of the weapon. "The fools cannot hold the shell. But neither shall they delay its breaking. Dead you were, mandrake son, and dead you shall be again. But since the fault is only theirs, may no ill dreams follow you beyond Lethe!"

The knife started down, just as Nema managed to break free. She shrieked out a phrase of keening command. The salamander suddenly broke from Dave's chest, glowing brighter as it rose toward the face of the attacker. It was like a bit from the center of a star. The man jumped back, beginning a frantic ritual. He was too late. The salamander hit him, sank into him and shone through him. Then he slumped, steamed ... and was nothing but dust falling toward the carpet. The salamander turned, heading toward the others. But it was to Nema it went, rather than the two men. She was trying something desperately, but fear was thick on her face, and her hands were unsure.

Abruptly, Sather Karf was in the doorway. His hand lifted, his fingers dancing. Words hissed from his lips in a stream of sibilants too quick for Dave to catch. The salamander paused and began to shrink doubtfully. Sather Karf turned, and again his hands writhed in the air. One hand darted back and forward, as if he were throwing something. Again he made the gesture. With each throw, one of the false orderlies dropped to the floor, clutching at a neck where the skin showed marks of constriction as if a steel cord were tightening. They died slowly, their eyes bulging and faces turning blue. Now the salamander moved toward them, directed apparently by slight motions from Sather Karf. In a few moments, there was no sign of them.

The old man sighed, his face slumping into lines of fatigue and age. He caught his breath. He held out a hand to the salamander, petted it to a gentle glow and put it back over Dave's chest.

"Good work, Nema," he said wearily. "You're too weak to control the salamander, but this was done well in the emergency. I saw them in the pool, but I was almost too late. The damned fanatics. Superstition in this day and age!"

He swung to face Dave, whose vocal cords were still taut with the shock of the sight of the knife. "Don't worry, Dave Hanson. From now on, every Ser and Sather will protect you with the lower and the upper magic. The House changes tomorrow, if the sky permits, and we shall shield you until then. We didn't bring you back from the dead, piecing your scattered atoms together with your scattered revenant particle by particle, to have you killed again. Somehow, we'll incarnate you fully! You have my word for that."

"Dead?" Dave had grown numbed to his past during the long illness, but that brought it back afresh. "Then I was killed? I wasn't just frozen and brought here by some time machine?"

Sather Karf stared at him blankly. "Time machine? Impossible. Of course not. After the tractor killed you, and you were buried, what good would such fantasies be, even if they existed? No, we simply reincarnated you by pooling our magic. Though it was a hazardous and parlous thing, with the sky falling...."

He sighed and went out, while Dave went back to his delirium.

III

There was no delirium when he awoke in the morning. Instead, there was only a feeling of buoyant health. In fact, Dave Hanson had never felt that good in his life—or his former life. He reconsidered his belief that there was no delirium, wondering if the feeling were not itself a form of hallucination. But it was too genuine. He knew without question that he was well.

It shouldn't have been true. During the night, he'd partially awakened in agony to find Nema chanting and gesturing desperately beside him, and he'd been sure he was on the verge of his second death. He could remember one moment, just before midnight, when she had stopped and seemed to give up hope. Then she'd braced herself and begun some ritual as if she were afraid to try it. Beyond that, he had no memory of pain.

Nema came into the room now, touching his shoulder gently. She smiled and nodded at him. "Good morning, Sagittarian. Get out of bed."

Expecting the worst, he swung his feet over the side and sat up. After so much time in bed, even a well man should be rendered weak and shaky. But there was no dizziness, no sign of weakness. He had made a most remarkable recovery, and Nema didn't even seem surprised. He tentatively touched foot to floor and half stood, propping himself against the high bed.

"Come on," Nema said impatiently. "You're all right now. We entered your sign during the night." She turned her back on him and took something from a chest beside the bed. "Ser Perth will be here in a moment. He'll want to find you on your feet and dressed."

Hanson was beginning to feel annoyance at the suddenly cocksure and unsympathetic girl, but he stood fully
erect and flexed his muscles. There wasn't even a trace of bedsoreness, though he had been flat on his back long enough to grow callouses. And as he examined himself, he could find no scars or signs of injuries from the impact of the bulldozer—if there had ever really been a bulldozer.

He grimaced at his own doubts. "Where am I, anyhow, Nema?"

The girl dumped an armload of clothing on his bed and looked at him with controlled exasperation. "Dave Hanson," she told him, "don't you know any other words? That's the millionth time you've asked me that, at least. And for the hundredth time, I'll tell you that you're here. Look around you; see for yourself. I'm tired of playing nursemaid to you." She picked up a shirt of heavy-duty khaki from the pile on the bed and handed it to him. "Get into this," she ordered. "Dress first, talk later."

She stalked out of the room.

Dave did as she had ordered, busy with his own thoughts as he discovered what he was to wear. He was still wearing something with a vague resemblance to a short hospital gown, with green pentacles and some plant symbol woven into it, and with a clasp to hold it together shaped into a silver crux ansata. He took it off and hurled it into a corner disgustedly.

He picked up the khaki shirt and put it on; then, with growing curiosity, the rest of the garments, until he came to the shoes. Khaki shirt, khaki breeches, a wide, webbed belt, a flat-brimmed hat. And the shoes—they weren't shoes, but knee-length leather boots, like a dressy version of lumberman's boots or a rougher version of riding boots. He hadn't seen even pictures of such things since the few silent movies run in some of the little art theaters. He struggled to get them on. They were an excellent fit, and comfortable enough, but he felt as if his legs were encased in hardened concrete when he was through. He looked down at himself in disgust. He was in all respects costumed as the epitome of the Hollywood dream of a heroic engineer-builder, ready to drive a canal through an isthmus or throw a dam across a raging river—the kind who'd build the dam while the river raged, instead of waiting until it was quiet, a few days later. He was about as far from the appearance of the actual blue-denim, leather-jacket engineers he had worked with as Maori in ancient battle array.

He shook his head and went looking for the bathroom, where there might be a mirror. He found a door, but it led into a closet, filled with alembics and other equipment. There was a mirror hung on the back of it, however, with a big sign over it that said "Keep Out." He threw the door wide and stared at himself. At first, in spite of the costume, he was pleased. Then the truth began to hit him, and he felt abruptly sure he was still raging with fever and delirium.

He was still staring when Nema came back into the room. She pursed her lips and shut the door quickly. But he'd already seen enough.

"Never mind where I am," he said. "Tell me, who am I?"

She stared at him. "You're Dave Hanson."

"The hell I am," he told her. "Oh, that's what I remember my father having me christened as. He hated long names. But take a good look at me. I've been shaving my face for years now, and I should know it. That face in the mirror wasn't it! There's a resemblance. But a damned faint one. Change the chin, lengthen my nose, make the eyes brown instead of blue, and it might be me. But Dave Hanson's at least five inches shorter and fifty pounds lighter, too. Maybe the face is plastic surgery after the accident—but this isn't even my body."

The girl's expression softened. "I'm sorry, Dave Hanson," she said gently. "We should have thought to warn you. You were a difficult conjuration—and even the easier ones often go wrong these days. We did our best, though it may be that the auspices were too strong on the soma. I'm sorry if you don't like the way you look. But there's nothing we can do about it now."

Hanson opened the door again, in spite of Nema's quick frown, and looked at himself. "Well," he admitted, "I guess it could be worse. In fact, I guess it was worse—once I get used to looking like this, I think I'll get to like it. But seeing it was a heck of a thing to take for a sick man."

"Are you sick?"

"Well—I guess not."

"Then why say you are? You shouldn't be; I told you we've entered the House of Sagittarius now. You can't be sick in your own sign. Don't you understand even that much elementary science?"

Hanson didn't get a chance to answer. Ser Perth was suddenly in the doorway, dressed in a different type of robe. This was short and somehow conservative—it had a sincere, executive look about it. The man seemed changed in other ways, too. But Dave wasn't concerned about that. He was growing tired of the way people suddenly appeared out of nowhere. Maybe they all wore rubber-soled shoes or practiced sneaking about; it was a silly way for grown people to act.

"Come with me, Dave Hanson," Ser Perth ordered, without wasting words. He spoke in a clipped manner now.

Dave followed, grumbling in his mind. It was even sillier than their sneaking about for them to expect him to
start running around before they bothered to check the condition of a man fresh out of his death bed. In any of the hospitals he had known, there would have been hours or days of X-rays and blood tests and temperature taking before he would be released. These people simply decided a man was well and ordered him out.

To do them justice, however, he had to admit that they seemed to be right. He had never felt better. The twaddle about Sagittarius would have to be cleared up sometime, but meanwhile he was in pretty good shape. Sagittarius, as he remembered it, was supposed to be one of the signs of the Zodiac. Bertha had been something of a sucker for astrology and had found he was born under that sign before she agreed to their little good-by party. He snorted to himself. It had done her a heck of a lot of good, which was to be expected of such nonsense.

They passed down a dim corridor and Ser Perth turned in at a door. Inside there was a single-chair barber shop, with a barber who might also have come from some movie-casting office. He had the proper wavy black hair and rat-tailed comb stuck into a slightly dirty off-white jacket. He also had the half-obsequious, half-insulting manner Dave had found most people expected from their barbers. While he shaved and trimmed Dave, he made insultingly solicitous comments about Dave's skin needing a massage, suggested a tonic for thinning hair and practically insisted on a singe. Ser Perth watched with a mixture of intentness and amusement. The barber trimmed the tufts from over Dave's ears and clipped the hair in his nose, while a tray was pushed up and a slatternly blonde began giving him a manicure.

He began noticing that she carefully dumped his fingernail parings into a small jar. A few moments later, he found the barber also using a jar to collect the hair and shaving stubble. Ser Perth was also interested in that, it seemed, since his eyes followed that part of the operation. Dave frowned, and then relaxed. After all, this was a hospital barber shop, and they probably had some rigid rules about sanitation, though he hadn't seen much other evidence of such care.

The barber finally removed the cloth with a snap and bowed. "Come again, sir," he said.

Ser Perth stood up and motioned for Dave to follow. He turned to look in a mirror, and caught sight of the barber handing the bottles and jars of waste hair and nail clippings to a girl. He saw only her back, but it looked like Nema.

Something stirred in his mind then. He'd read something somewhere about hair clippings and nail parings being used for some strange purpose. And there'd been something about spittle. But they hadn't collected that. Or had they? He'd been unconscious long enough for them to have gathered any amount they wanted. It all had something to do with some kind of mumbo-jumbo, and....

Ser Perth had led him through the same door by which they'd entered--but not into the same hallway. Dave's mind dropped the other thoughts as he tried to cope with the realization that this was another corridor. It was brightly lit, and there was a scarlet carpet on the floor. Also, it was a short hall, requiring only a few steps before they came to a bigger door, elaborately enscrolled. Ser Perth bent before it, and the door opened silently while he and Dave entered.

The room was large and sparsely furnished. Sitting cross-legged on a cushion near the door was Nema, juggling something in her hands. It looked like a cluster of colored threads, partly woven into a rather garish pattern. On a raised bench between two windows sat the old figure of Sather Karf, resting his chin on hands that held a staff and staring at Dave intently.

Dave stopped as the door closed behind him. Sather Karf nodded, as if satisfied, and Nema tied a complex knot in the threads, then paused silently.

Sather Karf looked far less well than when Dave had last seen him. He seemed older and more shriveled, and there was a querulous, pinched expression in place of the firmness and almost nobility Dave had come to expect. His old eyes bored into the younger man, and he nodded. His voice had a faint quaver now. "All right. You're not much to look at, but you're the best we could find in the Ways we can reach. Come here, Dave Hanson."

The command was still there, however petty the man seemed now. Dave started to phrase some protest, when he found his legs taking him forward to stop in front of Sather Karf, like some clockwork man whose lever has been pushed. He stood in front of the raised bench, noticing that the spot had been chosen to highlight him in the sunset light from the windows. He listened while the old man talked.

Sather Karf began without preamble, stating things in a dry voice as if reading off a list of obvious facts.

"You were dead, Dave Hanson. Dead, buried, and scattered by time and chance until even the place where you lay was forgotten. In your own world, you were nothing. Now you are alive, through the effort of men here whose work you could not even dream of. We have created you, Dave Hanson. Remember that, and forget the ties to any other world, since that world no longer holds you."

The command was still there, however petty the man seemed now. Dave started to phrase some protest, when he found his legs taking him forward to stop in front of Sather Karf, like some clockwork man whose lever has been pushed. He stood in front of the raised bench, noticing that the spot had been chosen to highlight him in the sunset light from the windows. He listened while the old man talked.

Sather Karf began without preamble, stating things in a dry voice as if reading off a list of obvious facts.

"You were dead, Dave Hanson. Dead, buried, and scattered by time and chance until even the place where you lay was forgotten. In your own world, you were nothing. Now you are alive, through the effort of men here whose work you could not even dream of. We have created you, Dave Hanson. Remember that, and forget the ties to any other world, since that world no longer holds you."

Dave nodded slowly. It was hard to swallow, but there were too many things here that couldn't be in any world he had known. And his memory of dying was the clearest memory he had. "All right," he admitted. "You saved my life--or something. And I'll try to remember it. But if this isn't my world, what world is it?"
"The only world, perhaps. It doesn't matter." The old man sighed, and for a moment the eyes were shrouded in speculation, as if he were following some strange by-ways of his own thoughts. Then he shrugged. "It's a world and culture linked to the one you knew only by theories that disagree with each other. And by vision--the vision of those who are adept enough to see through the Ways to the branches of Duality. Before me, there was nothing. But I've learned to open a path--a difficult path for one in this world--and to draw from it, as you have been drawn. Don't try to understand what is a mystery even to the Satheri, Dave Hanson."

"A reasonably intelligent man should be able--" Dave began.

Ser Perth cut his words off with a sharp laugh. "Maybe a man. But who said you were a man, Dave Hanson? Can't you even understand that? You're only half human. The other half is mandrake--a plant that is related to humanity through shapes and signs by magic. We make simulacra out of mandrakes--like the manicurist in the barber shop. And sometimes we use a mandrake root to capture the essence of a real man, in which case he's a mandrake-man, like you. Human? No. But a very good imitation, I must admit."

Dave turned from Ser Perth toward Nema, but her head was bent over the cords she was weaving, and she avoided his eyes. He remembered now that she'd called him a mandrake-man before, in a tone of pity. He looked down at his body, sick in his mind. Vague bits of fairy tales came back to him, suggesting horrible things about mandrake creatures--zombie-like things, only outwardly human.

Sather Karf seemed amused as he looked at Ser Perth. Then the old man dropped his eyes toward Dave, and there was a brief look of pity in them. "No matter, Dave Hanson," he said. "You were human, and by the power of your true name, you are still the same Dave Hanson. We have given you life as precious as your other life. Pay us for that with your service, and that new life will be truly precious. We need your services."

"What do you want?" Dave asked. He couldn't fully believe what he'd heard, but there had been too many strange things to let him disbelieve, either. If they had made him a mandrake-man, then by what little he could remember and guess, they could make him obey them.

"Look out the window--at the sky," Sather Karf ordered.

Dave looked. The sunset colors were still vivid. He stepped forward and peered through the crystalline glass. Before him was a city, bathed in orange and red, towering like the skyline of a dozen cities he had seen--and yet; not like any. The buildings were huge and many-windowed. But some were straight and tall, some were squat and fairy-colored and others blossomed from thin stalks into impossibly bulbous, minaretted domes, like long-stemmed tulips reproduced in stone. Haroun-al-Rashid might have accepted the city, but Mayor Wagner could never have believed in it.

"Look at the sky," the old man suggested again, and there was no mockery in his voice now. Dave looked up obediently.

The sunset colors were not sunset. The sun was bright and blinding overhead, surrounded by reddish clouds, glaring down on the fairy city. The sky was--blotchy. It was daylight, but through the clouds bright stars were shining. A corner of the horizon was winter blue; a whole sweep of it was dead, featureless black. It was a nightmare sky, an impossible sky. Dave's eyes bulged as he looked at it.

He turned back to Sather Karf. "What--what's the matter with it?"

"What indeed?" There was bitterness and fear in the old man's voice. In the corner of the room, Nema looked up for a moment, and there was fear and worry in her eyes before she looked back to her weaving of endless knots. Sather Karf sighed in weariness. "If I knew what was happening to the sky, would I be dredging the muck of Duality for the likes of you, Dave Hanson?"

He stood up, wary but with a certain ease and grace that belied his age, looking down at Dave. There was stern command in his words, but a hint of pleading in his expression.

"The sky's falling, Dave Hanson. Your task is to put it together again. See that you do not fail us!"

He waved dismissal and Ser Perth led Dave and Nema out.

IV

The corridor down which they moved this time was one that might have been familiar even in Dave's Chicago. There was the sound of typewriters from behind the doors, and the floor was covered with composition tile, instead of the too-lush carpets. He began to relax a little until he came to two attendants busily waxing the floor. One held the other by the ankles and pushed the creature's hairy face back and forth, while its hands spread the wax ahead of it. The results were excellent, but Dave found it hard to appreciate.

Ser Perth shrugged slightly. "They're only mandrakes," he explained. He threw open the door of one of the offices and led them through an outer room toward an inner chamber, equipped with comfortable chairs and a desk. "Sit down, Dave Hanson. I'll fill you in on anything you need to know before you're assigned. Now--the Sather Karf told you what you were to do, of course, but--"

"Wait a minute," Dave suggested. "I don't remember being told any such thing."
Ser Perth looked at Nema, who nodded. "He distinctly said you were to repair the sky. I've got it down in my notes if you want to see them." She extended the woven cords.

"Never mind," Ser Perth said. He twiddled with his mustache. "I'll recap a little. Dave Hanson, as you have seen, the sky is falling and must be repaired. You are our best hope. We know that from a prophecy, and it is confirmed by the fact that the fanatics of the Egg have tried several times to kill you. They failed, though one effort was close enough, but their attempts would not have been made at all if they had not been convinced through their arts that you can succeed with the sky."

Dave shook his head. "It's nice to know you trust me!"

"Knowing that you can succeed," the other went on smoothly, "we know that you will. It is my unpleasant duty to point out to you the things that will happen if you fail. I say nothing of the fact that you owe us your life; that may be a small enough gift, and one quickly withdrawn. I say only that you have no escape from us. We have your name, and the true symbol is the thing, as you should know. We also have cuttings from your hair and your beard; we have the parings of your nails, five cubic centimeters of your spinal fluid and a scraping from your liver. We have your body through those, nor can you take it out of our reach. Your name gives us your soul." He looked at Hanson piercingly. "Shall I tell you what it would be like for your soul to live in the muck of a swamp in a mandrake root?"

Dave shook his head. "I guess not. I--look, Ser Perth. I don't know what you're talking about. How can I go along with you when I'm in the dark? Start at the beginning, will you? I was killed; all right, if you say I was, I was. You brought me to life again with a mandrake root and spells; you can do anything you want with me. I admit it; right now, I'll admit anything you want me to, because you know what's going on and I don't. But what's all this business of the sky falling? If it is and can be falling, what's the difference? If there is a difference, why should I be able to do anything about it?"

"Ignorance!" Ser Perth murmured to himself. He sighed heavily. "Always ignorance. Well, then, listen." He sat down on the corner of the desk and took out a cigarette. At least it looked like a cigarette. He snapped his fingers and lighted it from a little flame that sprang up, blowing clouds of bright green smoke from his mouth. The smoke hung lazily, drifting into vague patterns and then began to coalesce into a green houri without costume. He swatted at it negligently.

"Dratted sylphs. There's no controlling the elementals properly any more." He didn't seem too displeased, however, as he watched the thing dance off. Then he sobered.

"In your world, Dave Hanson, you were versed in the engineering arts--you more than most. That you should be so ignorant, though you were considered brilliant is a sad commentary on your world. But no matter. Perhaps you can at least learn quickly still. Even you must have had some idea of the composition of the sky?"

Dave frowned as he tried to answer. "Well, I suppose the atmosphere is oxygen and nitrogen, mostly; then there's the ionosphere and the ozone layer. As I remember, the color of the sky is due to the scattering of light--light rays being diffracted in the air."

"Beyond the air," Ser Perth said impatiently. "The sky itself!"

"Oh--space. We were just getting out there with manned ships. Mostly vacuum, of course. Of course, we're still in the solar atmosphere, even there, with the Van Allen belts and such things. Then there are the stars, like our sun, but much more distant. The planets and the moon--"

"Ignorance was bad enough," Ser Perth interrupted in amazement. He stared at Dave, shaking his head in disgust. "You obviously come from a culture of even more superstition than ignorance. Dave Hanson, the sky is no such thing. Put aside the myths you heard as a child. The sky is a solid sphere that surrounds Earth. The stars are no more like the sun than the glow of my cigarette is like a forest fire. They are lights on the inside of the sphere, moving in patterns of the Star Art, nearer to us than the hot lands to the south."

"Fort," Dave said. "Charles Fort said that in a book."

Ser Perth shrugged. "Then why make me say it again? This Fort was right. At least one intelligent man lived in your world, I'm pleased to know. The sky is a dome holding the sun, the stars and the wandering planets. The problem is that the dome is cracking like a great, smashed eggshell."

"What's beyond the dome?"

Ser Perth shuddered slightly. "My greatest wish is that I die before I learn. In your world, had you discovered that there were such things as elements? That is, basic substances which in combination produce--"

"Of course," Dave interrupted.

"Good. Then of the four elements--" Dave gulped, but kept silent, "--of the four elements the universe is built. Some things are composed of a single element; some of two, some of three. The proportions vary and the humors and spirits change but all things are composed of the elements. And only the sky is composed of all four elements--of earth, of water, of fire and of air--in equal proportions. One part each, lending each its own essential quality to the mixture, so that the sky is solid as earth, radiant as fire, formless as water, insubstantial as air. And the sky is
cracking and falling, as you have seen for yourself. The effects are already being felt. Gamma radiation is flooding through the gaps; the quick-breeding viruses are mutating through half the world, faster than the Medical Art can control them, so that millions of us are sneezing and choking—and dying, too, for lack of antibiotics and proper care. Air travel is a perilous thing; just today, a stratosphere roc crashed head-on into a fragment of the sky and was killed with all its passengers. Worst of all, the Science of Magic suffers. Because the stars are fixed on the dome of the sky. With the crumbling of that dome, the course of the stars has been corrupted. It's pitiful magic that can be worked without regard to the conjunctions of the planets; but it is all the magic that is left to us. When Mars trines Neptune, the Medical Art is weak; even while we were conjuring you, the trine occurred. It almost cost your life. And it should not have occurred for another seven days."

There was silence, while Ser Perth let Dave consider it. But it was too much to accept at once, and Dave's mind was a treadmill. He'd agreed to admit anything, but some of this was such complete nonsense that his mind rejected it automatically. Yet he was sure Ser Perth was serious; there was no humor on the face of the prissy thin-mustached man before him. Nor had the Sather Karf considered it a joke, he was sure. He had a sudden vision of the latter strangling two men from a distance of thirty feet without touching them. That couldn't happen in a sane world, either.

Dave asked weakly, "Could I have a drink?"

"With a sylph around?" Ser Perth grimaced. "You wouldn't have a chance. Now, is all clear to you, Dave Hanson?"

"Sure. Except for one thing. What am I supposed to do?"

"Repair our sky. It should not be too difficult for a man of your reputation. You built a wall across a continent high and strong enough to change the air currents and affect all your weather—and that in the coldest, meanest country in your world. You come down to us as one of the greatest engineers of history. Dave Hanson, so great that your fame has penetrated even to our world, through the viewing pools of our wisest historians. There is a shrine and monument in your world. 'Dave Hanson, to whom nothing was impossible.' Well, we have a nearly impossible task: a task of engineering and building. If our Science of Magic could be relied upon—but it cannot; it never can be, until the sky is fixed. We have the word of history: no task is impossible to Dave Hanson."

Dave looked at the smug face and a slow grin crept over his own, in spite of himself. "Ser Perth, I'm afraid you've made a slight mistake."

"We don't make mistakes in such matters. You're Dave Hanson," Ser Perth said flatly. "Of all the powers of the Science, the greatest lies in the true name. We evoked you by the name of Dave Hanson. You are Dave Hanson, therefore."

"Don't try to deceive us," Nema suggested. Her voice was troubled. "Pray rather that we never have reason to doubt you. Otherwise the wisest of the Satheri would spend their remaining time in planning something unthinkable for you."

Ser Perth nodded vigorous assent. Then he motioned to the office. "Nema will show you to your quarters later. Use this until you leave. I have to report back."

Dave stared after him until he was gone, and then around at the office. He went to the window and stared upwards at the crazy patchwork of the sky. For all he knew, in such a sky there might be cracks. In fact, as he looked, he could make out a rift, and beyond that a ... hole ... a small patch where there was no color, and yet the sky there was not black. There were no stars there, though points of light were clustered around the edges, apparently retreating.

All he had to do was to repair the sky. Shades of Chicken Little!

Maybe to David Arnold Hanson, the famed engineer, no task was impossible. But quite a few things were impossible to that engineer's obscure and unimportant nephew, the computer technician and generally undistinguished man who had been christened Dave. They'd gotten the right man for the name, all right. But the wrong man for the job.

Dave Hanson could repair anything that contained electrical circuits or ran on tiny jeweled bearings, but he could handle almost nothing else. It wasn't stupidity or incapacity to learn, but simply that he had never been subjected to the discipline of construction engineering. Even on the project, while working with his uncle, he had seen little of what went on, and hadn't really understood that, except when it produced data that he could feed into his computer. He couldn't drive a nail in the wall to hang a picture or patch a hole in the plaster.

But it seemed that he'd better put on a good show of trying if he wanted to continue enjoying good health. "I suppose you've got a sample of the sky that's fallen?" he asked Nema. "And what the heck are you doing here, anyhow? I thought you were a nurse."

She frowned at him, but went to a corner where a small ball of some clear crystalline substance stood. She muttered into it, while a surly face stared out. Then she turned back to him, nodding. "They are sending some of the
sky to you. As to my being a nurse, of course I am. All student magicians take up the Medical Art for a time. Surely one so skilled can also be a secretary, even to the great Dave Hanson? As to why I'm here--" She dropped her eyes, frowning, while a touch of added color reached her cheeks. "In the sleep spell I used, I invoked that you should be well and true. But I'm only a bachelor in magic, not even a master, and I slipped. I phrased it that I wanted you well and true. Hence, well and truly do I want you."

"Huh?" He stared at her, watching the blush deepen. "You mean--?"

"Take care! First you should know that I am proscribed as a duly registered virgin. And in this time of need, the magic of my blood must not be profaned." She twisted sidewise, and then turned toward the door, avoiding him. Before she reached it, the door opened to show a dull clod, entirely naked, holding up a heavy weight of nothing.

"Your sample of sky," she said as the clod labored over to the desk and dropped nothing with a dull clank. The desk top dented slightly.

Dave could clearly see that nothing was on the desk. But if nothing was a vacuum, this was an extremely hard and heavy one. It seemed to be about twelve inches on a side, in its rough shape, and must have weighed two hundred pounds. He tapped it, and it rang. Inside it, a tiny point of light danced frantically back and forth.

"A star," she said sadly.

"I'm going to need some place to experiment with this," he suggested. He expected to be sent to the deepest, dankest cave of all the world as a laboratory, and to find it equipped with pedigreed bats, dried unicorn horns and whole rows of alembics that he couldn't use.

Nema smiled brightly. "Of course. We've already prepared a construction camp for you. You'll find most of the tools you used in your world waiting there and all the engineers we could get or make for you."

He'd been considering stalling while he demanded exactly such things. He was reasonably sure by now that they had no transistors, signal generators, frequency meters or whatever else he could demand. He could make quite an issue out of the need to determine the characteristic impedance of their sky. That might even be interesting, at that; would it be anywhere near 300 ohms here? But it seemed that stalling wasn't going to work. They'd given him what they expected him to need, and he'd have to be careful to need only what they expected, or they might just decide he wasn't Dave Hanson.

"I can't work on this stuff here," he said.

"Then why didn't you say so?" she asked sharply. She let out a cry and a raven came flying in. She whispered something to it, frowned, and then ordered it off. "There's no surface transportation available, and all the local rocs are in use. Well, we'll have to make do with what we have."

She darted for the outer office, rummaged in a cabinet, and came back with a medium-sized rug of worn but gaudy design. Bad imitation Sarouk, Dave guessed. She tossed it onto the largest cleared space, gobbled some outlandish noises, and dropped onto it, squatting near one end. Behind her, the dull clod picked up the sample of sky and fell to his face on the rug. At her vehement signal, Dave squatted down beside her, not daring to believe what he was beginning to guess.

The carpet lifted uncertainly. It seemed to protest at the unbalanced weight of the sky piece. She made the sounds again, and it rose reluctantly, curling up at the front, like a crazy toboggan. It moved slowly, but with increasing speed, sailed out of the office through the window and began gaining altitude. They went soaring over the city at about thirty miles an hour, heading toward what seemed to be barren land beyond. "Sometimes they fail now," she told him. "But so far, only if the words are improperly pronounced."

He gulped and looked gingerly over at the city below. As he did, she gasped. He heard a great tearing sound of thunder. In the sky, a small hole appeared. There was a scream of displaced air, and something went zipping downwards in front of them, setting up a wind that bounced the carpet about crazily. Dave glanced over the edge again to see one of the tall buildings crumble under the impact. The three top stories were ripped to shreds. Then the whole building began to change. It slowly blossomed into a huge cloud of pink gas that rifted away, to show people and objects dropping like stones to the ground below. Nema sighed and turned her eyes away.

"But--it's ridiculous!" Dave protested. "We heard the rip and less than five seconds later, that piece fell. If your sky is even twenty miles above us, it would take longer than that to fall."

"It's a thousand miles up," she told him. "And sky has no inertia until it is contaminated by contact with the ground. It took longer than usual for that piece to fall." She sighed. "It gets worse. Look at the signs. That break has disturbed the planets. We're moving retrograde, back to our previous position, out of Sagittarius! Now we'll go back to the character we had before--and just when I was getting used to the change."

He jerked his eyes off the raw patch of emptiness in the sky, where a few stars seemed to be vanishing. "Your character? Isn't anything stable here?"

"Of course not. Naturally, in each House we have a differing of character, as does the world itself. Why else should astrology be the greatest of the sciences?"
It was a nice world, he decided. And yet the new factor explained some things. He'd been vaguely worried about the apparent change in Ser Perth, who'd turned from a serious and helpful doctor into a supercilious, high-handed fop. But—what about his recovery, if that was supposed to be determined by the signs of the zodiac?

He had no time to ask. The carpet bucked, and the girl began speaking to it urgently. It righted itself, to begin sliding downwards.

"There is a ring of protection around your camp," Nema explained. "It is set to make entry impossible to one who does not have the words or who is unfriendly. The carpet could not go through that, anyway. The ring negates all other magic trying to pass it. And of course we have basilisks mounted on posts around the grounds. They're trained to hood their eyes, except when they sense anyone trying to enter who should not. You can't be turned to stone looking at one, you know—only by having one look at you."

"You're cheering me up no end," he assured her.

She smiled pleasantly and began setting the carpet down. Below, he could see a camp that looked much like the camps he had seen in the same movies from which all his clothes had been copied. There were well laid-out rows of sheds, beautiful lines of construction equipment and everything in order, as it could never be in a real camp. As he began walking with the girl toward a huge tent that should have belonged to a circus, he could see other discrepancies. The tractors were designed for work in mud flats and the haulers had the narrow wheels used on rocky ground. Nothing seemed quite as it should be. He spotted a big generator working busily—and then saw a gang of about fifty men, or mandrakes, turning a big capstan that kept it going. Here and there were neat racks of miscellaneous tools. Some were museum pieces. There was even a gandy cart, though no rails for it to run on.

They were almost at the main tent when a crow flew down and yelled something in Nema's ear. She scowled, and nodded. "I'm needed back," she said. "Most of the men here—" She pointed to the gangs that moved about busily doing nothing, all in costumes similar to his, except for the boots and hat. "They're mandrakes, conjured into existence, but without souls. The engineers we have are snatched from Duality just after dying and revived here while their brains still retain their knowledge. They have no true souls either, of course, but they don't know it. Ah. The short man there—he's Garm. Sersa Garm, an apprentice to Ser Perth. He's to be your foreman, and he's real."

She headed back to the outskirts, then turned to shout back. "Sather Karf says you may have ten days to fix the sky," she called. Her hand waved toward him in friendly good-bye. "Don't worry, Dave Hanson. I have faith in you."

Then she was running toward her reluctant carpet.

Dave stared up at the mottled dome above him and at the dull clod—certainly a mandrake—who was still carrying the sample. With all this preparation and a time limit, he couldn't even afford to stall. He'd never fully understood why some plastics melted and others turned hard when heated, but he had to find what was wrong with the dome above and how to fix it. And maybe the time limit could be stretched a little, once he came up with the answer. Maybe. He'd worry about that after he worried about the first steps.

Sersa Garm proved to be a glum, fat young man, overly aware of his importance in training for serhood. He led Dave through the big tent, taking pride in the large drafting section—under the obvious belief that it was used for designing spells. Maybe it could have been useful for that if there had been a single man who knew anything about draftsman ship. There were four engineers, supposedly. One, who had died falling off a bridge while drunk, was curing himself of the shock by remaining dead drunk. One had been a chemical engineer specializing in making yeast and dried soya meal into breakfast cereals. Another knew all about dredging canals and the last one was an electronics engineer—a field in which Dave was far more competent.

He dismissed them. Whatever had been done to them—or perhaps the absence of a true soul, whatever that was—left them rigidly bound to their past ideas and totally incapable of doing more than following orders by routine now. Even Sersa Garm was more useful.

That young man could offer little information, however. The sky, he explained pompously, was a great mystery that only an adept might communicate to another. He meant that he didn't know about it, Dave gathered. Everything, it turned out, was either a mystery or a rumor. He also had a habit of sucking his thumb when pressed too hard for details.

"But you must have heard some guesses about what started the cracks in the sky?" Dave suggested.

"Oh, indeed, that is common knowledge," Sersa Garm admitted. He changed thumbs while he considered. "'Twas an experiment most noble, but through mischance going sadly awry. A great Sather made the sun remain in one place too long, and the heat became too great. It was like the Classic experiment—"

"How hot is your sun?"

There was a long pause. Then Sather Germ shrugged. "'Tis a great mystery. Suffice to say it has no true heat, but does send forth an activating principle against the phlogiston layer, which being excited grows vengeful against the air ... but you have not the training to understand."

"Okay, so they didn't tell you, if they knew." Dave stared up at the sun, trying to guess. The light looked about
like what he was used to, where the sky was still whole. North light still was like what a color photographer would consider 5500° Kelvin, so the sun must be pretty hot. Hot enough to melt anything he knew about. "What's the melting point of this sky material?"

He never did manage to make Sather Garm understand what a melting point was. But he found that one of the solutions tried had been the bleeding of eleven certified virgins for seven days. When the blood was mixed with dragonfeathers and frogspaw and melded with a genuine philosopher's stone, they had used it to ink in the right path of the planets of a diagram. It had failed. The sky had cracked and a piece had fallen into the vessel of blood, killing a Sather who was less than two thousand years old.

"Two thousand?" Dave asked. "How old is Sather Karf?"

"None remembers truly. He has always been the Sather Karf—at least ten thousand years or more. To attain the art of a Sather is the work of a score of centuries, usually."

That Sather had been in sad shape, it seemed. No one had been able to revive him, though bringing the dead back to life when the body was reasonably intact was routine magic that even a sersa could perform. It was after that they'd begun conjuring back to Dave's world for all the other experts.

"All whose true names they could find, that is," Garm amended. "The Egyptian pyramid builder, the man who discovered your greatest science, dianetics, the great Cagliostro—and what a time we had finding his true name! I was assigned to the helping of one who had discovered the secrets of gravity and some strange magic which he termed relativity—though indeed it had little to do with kinship, but was a private mystery. But when he was persuaded by divers means to help us, he gave up after one week, declaring it beyond his powers. They were even planning what might best be done to chastise him when he discovered in some manner a book of elementary conjuration and did then devise some strange new formula from the elements with which magic he disappeared."

'It is obviously not a thing of reason," Garm told him severely. "If the current in such a form moves first in one direction and then in the other, then it cancels out and is useless. No, you must be wrong."

As Dave remembered it, Tesla had been plagued by similar doubts from such men as Edison. He gave up and settled finally for one of the native welding torches, filled with a dozen angry salamanders. The flame or whatever it was had enough heat, but it was hard to control. By the time he learned to use it, night had fallen, and he was too tired to try anything more. He ate a solitary supper and went to sleep.

During the next three days he learned a few things the hard way, however. In spite of Garm's assurance that nothing could melt the sky, he found that his sample would melt slowly under the heat of the torch. In the liquid state, it was jet black, though it cooled back to complete transparency. It was also without weight when in liquid form—a fact he discovered when it began rising through the air and spattering over everything, including his bare skin. The burns were nasty, but somehow seemed to heal with remarkable speed. Sersa Garm was impressed by the discoveries, and went off to suck his thumbs and brood over the new knowledge, much to Dave's relief.

More work established the fact that welding bits of the sky together was not particularly difficult. The liquid sky was perfectly willing to bond onto anything, including other bits of itself.

Now, if he could get a gang up the thousand miles to the sky with enough torches to melt the cracks, it might recongeal as a perfect sphere. The stuff was strong, but somewhat brittle. He still had no idea of how to get the stars and planets back in the right places.

"The mathematician thought of such an idea," Sersa Garm said sourly. "But 'twould never work. Even with much heat, it could not be done. For see you, the upper air is filled with phlogiston, which no man can breathe. Also, the phlogiston has negative weight, as every school child must know. Your liquid sky would sink through it, since negative weight must in truth be lighter than no weight, while nothing else would rise through the layer. And phlogiston will quench the flame of a rocket, as your expert von Braun discovered."

The man was a gold mine of information, all bad. The only remaining solution, apparently, was to raise a scaffolding over the whole planet to the sky, and send up mandrakes to weld back the broken pieces. They wouldn't need to breathe, anyhow. With material of infinite strength—and an infinite supply of it—and with infinite time and patience, it might have been worth considering.

Nema came out the next day with more cheering information. Her multi-times great grandfather, Sather Karf, regretted it, but he must have good news to release at once; the populace was starving because the food multipliers couldn't produce reliable supplies. Otherwise, Dave would find venom being transported into his blood in increasing amounts until the pain drove him mad. And, just incidentally, the Sons of the Egg who'd attacked him in the hospital
had tried to reach the camp twice already, once by interpenetrating into a shipment of mandrakes, which indicated to what measures they would resort. They meant to kill him somehow, and the defense of him was growing too costly unless there were positive results.

Dave hinted at having nearly reached the solution, giving her only a bit of his wild idea of welding the sky. She took off with that, but he was sure it wouldn't satisfy the Sather. In that, he was right. By nightfall, when she came back from the city, he was groaning in pain. The venom had arrived ahead of her, and his blood seemed to be on fire.

She laid a cool hand on his forehead. "Poor Dave," she said. "If I were not registered and certified, sometimes I feel that I might ... but no more of that. Ser Perth sends you this unguent which will hold back the venom for a time, cautioning you not to reveal his softness." Ser Perth, it seemed, had reverted to his pre-Sagittarian character as expected. "And Sather Karf wants the full plans at once. He is losing patience."

He began rubbing on the ointment, which helped slightly. She peeled back his shirt and began helping, apparently delighted with the hair which he'd sprouted on his chest since his reincarnation. The unguent helped, but it wasn't enough.

"He never had any patience to lose. What the hell does he expect me to do?" Dave asked hotly. "Snap my fingers thus, yell abracadabra and give him egg in his beer?"

He stopped to stare at his hand, where a can of beer had suddenly materialized!

Nema squealed in delight. "What a novel way to conjure, Dave. Let me try it." She began snapping her fingers and saying the word eagerly, but nothing happened. Finally she turned back to him. "Show me again."

He was sure it wouldn't work twice, and he hesitated, not too willing to have his stock go down with her. Then he gave in.

"Abracadabra!" he said, and snapped his fingers.

There were results at once. This time an egg appeared in his hand, to the delighted cry of Nema. He bent to look at it uncertainly. It was a strange looking egg--more like one of the china eggs used to make hens think they were nesting when their eggs were still being taken from them.

Abruptly Nema sprang back. But she was too late. The egg was growing. It swelled to the size of a football, then was man-sized, and growing to the size of a huge tank that filled most of the tent. Suddenly it split open along one side and a group of men in dull robes and masks came spilling out of it.

"Die!" the one in front yelled. He lifted a double-bladed knife, charged for Dave, and brought the knife down. The blades went through clothing, skin, flesh and bones, straight for Dave's heart.

There was no easing of the pain that threatened to make him black out at any second.

He heard shouting, quarreling voices, but nothing made sense through the haze of his agony. He felt someone grab at him--more than one person--and they were dragging him willy-nilly across the ground. Something was clutched around his throat, almost choking him. He opened his eyes just as something clicked behind him.

The huge, translucent walls of the monstrous egg were all around him and the opened side was closing. The pain began to abate. The bleeding had already stopped entirely and his lungs seemed to have cleared themselves of the blood and froth in them. Now with the ache of the wound ceasing, Dave could still feel the venom burning in his blood, and the constriction around his throat was still there, making it hard to breathe. He sat up, trying to free himself. The constriction came from an arm around his neck, but he couldn't see to whom it belonged, and there was no place to move aside in the corner of the egg.

From inside, the walls of the egg were transparent enough for him to see cloudy outlines of what lay beyond. He could see the ground sweeping away beneath them from all points. A man had run up and was standing beside the egg, beating at it. The man suddenly shot up like a fountain, growing huge; he towered over them, until he seemed miles high and the giant structures Dave could see were only the turned-up toes of the man's shoes. One of those shoes was lifting, as if the man meant to step on the egg.

They must be growing smaller again.

A voice said tightly: "We're small enough, Bork. Can you raise the wind for us now?"

"Hold on." Bork's voice seemed sure of itself.
The egg tilted and soared. Dave was thrown sidewise and had to fight for balance. He stared unbelievingly through the crystal shell. They rose like a Banshee jet. There was a shaggy, monstrous colossus in the distance, taller than the Himalayas--the man who had been beside them. Bork grunted. "Got it! We're all right now." He chanted something in a rapid undertone "All right, relax. That will teach them not to work resonance magic inside a protective ring; the egg knows how we could have got through otherwise. Lucky we were trying at the right time, though. The Satheri must be going crazy. Wait a minute, this tires the fingers."

The man called Bork halted the series of rapid passes he had been making, flexing his fingers with a grimace. The spinning egg began to drop at once, but he let out a long, keening cry, adding a slight flip of his other arm. Outside, something like a mist drew near and swirled around them. It looked huge to Dave, but must have been a small thing in fact. Now they began speeding along smoothly again. The thing was probably another sylph, strong enough to move them in their present reduced size.

Bork pointed his finger. "There's the roc!" He leaned closer to the wall of the tiny egg and shouted. The sylph changed direction, and began to bob about.

It drifted gently, while Bork pulled a few sticks with runes written on them toward him and made a hasty assembly of them. At once, there was a feeling of growing, and the sylph began to shrink away from them. Now they were falling swiftly, growing as they dropped. Dave felt his stomach twist, until he saw they were heading toward a huge bird that was cruising along under them, drawing closer. It looked like a cross between a condor and a hawk, but its wing span must have been over three hundred feet. It slipped under the egg, catching the falling object deftly on a cushion-like attachment between its wings, and then struck off briskly toward the east.

Bork snapped the side of the egg open and stepped out while the others followed. Dave tried to crawl out, but something held him back. It wasn't until Bork's big hand reached in to help him that he made it. When all were out, Bork tapped the egg-shaped object and caught it as it shrank. When it was small enough, he pocketed it.

Dave sat up again, examining himself, now that he had more room. His clothing was a mess, spattered with drying blood, but he seemed unharmed now. Even the burning of the venom was gone. He reached for the arm around his neck and began breaking it free from its stranglehold.

From behind an incredulous cry broke out. Nema sprawled across him, staring at his face and burying her head against his shoulder. "Dave! You're not dead! You're alive!"

Dave was still amazed at that himself. But Bork snorted. "Of course he is. Why'd we take him along with you hanging on in a faint if he were dead? When the snetha-knife kills, it kills completely. They stay dead, or they don't die. Sagittarian?"

She nodded, and the big man seemed to be doing some calculations in his head.

"Yeah," he decided. "It would be. There was one second there around midnight when all the signs were at their absolute maximum favorableness. Someone must have said some pretty dangerous health spells over him then." He turned to Dave, as if aware that the other was comparatively ignorant of such matters. "Happened once before, without this mess-up of the signs. They revived a corpse and found he was unkillable from then on. He lasted eight thousand years, or something like that, before he got burned trying to control a giant salamander. They cut off his head once, but it healed before the axe was all the way through. Woops!"

The bird had dipped downward, rushing toward the ground. It landed at a hundred miles an hour and managed to stop against a small entrance to a cave in the hillside. Except for the one patch where the bird had lighted, they were in the middle of a dense forest.

Dave and Nema were hustled into the cave, while the others melted into the woods, studying the skies. She clung to Dave, crying something about how the Sons of the Egg would torture them.

"All right," he said finally. "Who are these sons of eggs? And what have they got against me?"

"They're monsters," she told him. "They used to be the antimagic individualists. They wanted magic used only when other means wouldn't work. They fought against the Satheri. While magic produced their food and made a better world for them, they hated it because they couldn't do it for themselves. And a few renegade priests like my brother joined them."

"Your brother?"

"She means me," Bork said. He came in to drop on his haunches and grin at Dave. There was no sign of personal hatred in his look. "I used to be a stooge for Sather Karf, before I got sick of it. How do you feel, Dave Hanson?"

Dave considered it, still in wonder at the truth. "I feel good. Even the venom they were putting in my blood doesn't seem to hurt any more."

"Fine. Means the Sather Karf must believe we killed you--he must have the report by now. If he thinks you're dead, there's no point in his giving chase; he knows I wouldn't let them kill Nema, even if she is a little fool. Anyhow, he's not really such a bad old guy, Dave--not, like some of those Satheri. Well, you figure how you'd like it..."
if you were just a simple man and some priest magicked her away from you--and then sent her back with enough
magic of her own to be a witch and make life hell for you because she'd been kicked out by the priest, but he hadn't
pulled the wanting spell off her. Or anything else you wanted and couldn't keep against magic. Sure, they fed us.
They had to, after they took away our fields and the kine, and got everyone into the habit of taking their dole instead
of earning our living in the old way. They made slaves of us. Any man who lets another be responsible for him is a
slave. It's a fine world for the Satheri, if they can keep the egg from breaking."

"What's all this egg nonsense?"

Bork shrugged. "Plain good sense. Why should there be a sky shell around the planet? Look, there's a legend
here. You should know it, since for all I know it has some meaning for you. Long ago--or away, or whatever--there
was a world called Tharé and another called Erath. Two worlds, separate and distinct, on their own branching time
paths. They must have been that way since the moment of creation. One was a world of rule and law. One plus one
might not always equal two, but it had to equal something. There seems to be some similarity to your world in that,
doesn't there? The other was--well, you'd call it chaos, though it had some laws, if they could be predicted. One plus
one there depended--or maybe there was no such thing as unity. Mass-energy wasn't conserved. It was deserved. It
was a world of anarchy, from your point of view. It must have been a terrible place to live, I guess."

He hesitated somberly. "As terrible as this one is getting to be," he said at last. "Anyway, there were people
who lived there. There were the two inhabited worlds in their own time lines, or probability orbits, or whatever. You
know, I suppose, how worlds of probability would separate and diverge as time goes on? Of course. Well, these two
worlds coalesced."

He looked searchingly at Dave. "Do you see it? The two time lines came together. Two opposites fused into
one. Don't ask me to explain it; it was long ago, and all I know for sure is that it happened. The two worlds met and
fused, and out of the two came this world, in what the books call the Dawnstruggle. When it was over, our world
was as it has been for thousands of centuries. In fact, one result was that in theory, neither original world could have
a real past, and the fusion was something that had been--no period of change. It's pretty complicated."

"It sounds worse than that," Dave grumbled. "But while that might explain the mystery of magic working here,
it doesn't explain your sky."

Bork scratched his head. "No, not too well," he admitted. "I've always had some doubts about whether or not all
the worlds have a shell around them. I don't know. But our world does, and the shell is cracking. The Satheri don't
like it; they want to stop it. We want it to happen. For the two lines that met and fused into one have an analogue.
Doesn't the story of that fusion suggest something to you, Dave Hanson? Don't you see it, the male principle of rule
and the female principle of whim; they join, and the egg is fertile! Two universes join, and the result is a nucleus
world surrounded by a shell, like an egg. We're a universe egg. And when an egg hatches, you don't try to put it back
together!"

He didn't look like a fanatic, Dave told himself. Crazy or not, he took this business of the hatching egg
seriously. But you could never be sure about anyone who joined a cult. "What is your egg going to hatch into?" he
asked.

The big man shrugged. "Does an egg know it is going to become a hen--or maybe a fish? We can't possibly tell,
of course."

Dave considered it. "Don't you even have a guess?"

Bork answered shortly, "No." He looked worried, Dave thought, and guessed that even the fanatics were not
quite sure they wanted to be hatched. Bork shrugged again.

"An egg has got to hatch," he said. "That's all there is to it. We prophesied this, oh, two hundred years ago. The
Satheri laughed. Now they've stopped laughing, but they want to stop it. What happens to a chick when it is stopped
from hatching? Does it go on being a chick, or does it die? It dies, of course. And we don't want to die. No, Dave
Hanson, we don't know what happens next--but we do know that we must go through with it. I have nothing against
you personally--but I can't let you stop us. That's why we tried to kill you. If I could, I'd kill you now, with the
sneha-knife so they couldn't revive you."

Dave said reasonably, "You can't expect me to like it, you know. The Satheri, at least, saved my life--" He
stopped in confusion. Bork was staring at him in hilarious incredulosity that broke into roars of laughter.

"You mean ... Dave Hanson, do you believe everything they tell you? Don't you know that the Satheri arranged
to kill you first? They needed a favorable death conjunction to bring you back to life; they got it--by arranging an
accident!"

Nema cried out in protest. "That's a lie!"

"Of course," Bork said mildly. "You always were on their side, little sister. You were also usually a damned
nuisance, fond as I was of you. Come here."

He caught her and yanked a single hair out of her head. She screamed and tried to claw him, then fought for the
hair. Bork was immovable. He held her off easily with one hand while the fingers of the other danced in the air. He spoke what seemed to be a name, though it bore no resemblance to Nema. She quieted, trembling.

"You'll find a broom near the entrance, little sister. Take it and go back, to forget that Dave Hanson lives. You saw him die and were dragged off with us and his body. You escaped before we reached our hideaway. By the knot I tie in your true hair and by your secret name, this I command."

She blinked slowly and looked around as Bork burned the knotted hair. Her eyes swept past Bork and Dave without seeing them and centered on the broom one man held out to her, without appearing to see him, either. She seized the broom. A sob came to her throat. "The devil! The renegade devil! He didn't have to kill Dave! He didn't--"

Her voice died away as she ran toward the clearing. Dave made no protest. He suspected Bork was putting the spell on her for her own good, and he agreed that she was better out of all this.

"Now where were we?" Bork asked. "Oh, yes, I was trying to convert you and knowing I'd failed already. Of course, I don't know that they killed you first--but those are their methods. Take it from me, I know. I was the youngest Ser ever to be accepted for training as a Sather. They wanted you, so they got you."

Dave considered it. It seemed as likely as anything else. "Why me?" he asked.

"Because you can put back the sky. At least, the Satheri think so, and I must admit that in some ways they are smarter than we."

Dave started to protest, but Bork cut him off.

"I know all about your big secret. You're not the engineer, whose true name was longer. We know all that. Our pools are closer to perfection than theirs, not being contaminated by city air, and we see more. But there is a cycle of confirmation; if prophecy indicates a thing will happen, it will happen--though not always as expected. The prophecy fulfills itself, rather than being fulfilled. Then there are the words on the monument--a monument meant for your uncle, but carrying your true name, because his friends felt the short form sounded better. It was something of a coincidence that they had the wrong true name. But prophecy is always strongest when based on coincidence--that is a prime rule. And those words coupled with our revelations prophesy that you--not your uncle--can do the impossible. So what are we going to do with you?"

Bork's attitude was reassuring, somehow. It was nearer his own than any Dave had heard on this world. And the kidnapping was beginning to look like a relief. The Sons of the Egg had gotten him off the hook with Sather Karf. He grinned and stretched back. "If I'm unkillable, Bork, what can you do?"

The big man grinned back. "Flow rock around you up to your nose and toss you into a lake. You'd live there--but you'd always be drowning and you'd find it slightly unpleasant for the next few thousand years! It's not as bad as being turned into a mangrove with your soul intact, but it would last longer. And don't think the Satheri can't pull a lot worse than that. They have your name--everyone has your secret name here--and parts of you."

The conversation was suddenly less pleasant. Dave thought it over. "I could stay here and join your group. I might as well, since I can't really help the Satheri anyhow."

"They'd spot your aura eventually. They'll be checking around here for us for a while. Of course, we might do something about it, if you really converted. But I don't think you would, if you knew more." Bork got up and headed for the entrance. "I wasn't going to let you see the risings, but now maybe I will. If you still want to join, it might be worked. Otherwise, I'll think of something else."

Dave followed the man out into the clearing. A few men were just planning to leave, and they looked at Dave suspiciously, but made no protest. One, whom Dave recognized as the leader with the snetha-knife, scowled. "The risings are almost due, Bork," he said.

Bork nodded. "I know, Malok. I've decided to let Dave Hanson watch. Dave, this is our leader here, Res Malok."

Dave felt no strong love for his would-be murderer, and it seemed to be mutual. But no protest was lodged. Apparently Bork was their top conjurer, and privileged. They crossed the clearing and went through the woods toward another, smaller one. Here a group of some fifty men were watching the sky, obviously waiting. Others stood around, watching them and avoiding looking up. Almost directly overhead, there was a rent place where the strange absence of color or feature indicated a hole in the dome over them. As it drew nearer true vertical, a chanting began among the men with up-turned faces. Their hands went upwards, fingers spread and curled into an unnatural position. Then they stood waiting.

"I don't like it," Bork whispered to Dave. "This is one of the reasons we're growing too weak to fight the Satheri."

"What's wrong with a ceremony of worship, if you must worship your eggshell?" Dave asked.

"You'll see. That was all it was once--just worship. But now for weeks, things are changing. They think it's a sign of favor, but I don't know. There, watch!"

The hole in the sky was directly overhead now, and the moaning had risen in pitch. Across the little clearing,
Malok began backing quietly away, carefully not looking upwards. Nobody but Dave seemed to notice his absence. There was a louder moan.

One of the men in the clearing began to rise upwards slowly. His body was rigid as it lifted a foot, ten feet, then a hundred above the ground. Now it picked up speed, and rushed upwards. Another began to rise, and another. In seconds, more than half of those who had waited were screaming upwards toward the hole in the sky. They disappeared in the distance.

Those who had merely stood by and those who had worshipped waited a few seconds more, but no more rose. The men sighed and began moving out of the clearing. Dave arose to follow, but Bork gestured for him to wait.

"Sometimes--" he said.

They were alone now. Still Bork waited, staring upwards. Then Dave saw something in the sky. A speck appeared and came hurtling down. In seconds, it was the body of one of the men who had risen. Dave felt his stomach tighten and braced himself. There was no slowing as the body fell. It landed in the center of the clearing, without losing speed, but with less noise than he had expected.

When they reached the shattered body, there could be no question of its being dead.

Bork's face was solemn. "If you're thinking of joining, you'd better know the worst. You're too easily shocked to make a good convert unless you're prepared. The risings have been going on for some time. Malok swears it proves we are right. But I've seen five other bodies come down like this. What does it mean? Are they stillborn? We don't know. Shall I revive him for you?"

Dave felt sick as he stared at the ghastly terror on the face of the corpse. The last thing he wanted to see was its revival, but his curiosity about the secret in the sky could not be denied. He nodded.

"We call," Bork answered. "Tell us what you saw at the hole in the sky."

A scream tore from the throat of the thing, and its hands came up to its eyes, tearing at them. Its mouth worked soundlessly, and breath sucked in. Then a single word came out.

"Faces!"

It fell onto the grass, distorted in death again. Bork shuddered.

"The others were the same," he said. "And he can't be revived again. Even the strongest spell can't bring back his soul. That is gone, somehow."

Dave shivered. "And knowing that, you'd still fight against repairing the sky?"

"Hatching is probably always horrible from inside the shell," Bork answered. "Do you still want to join us? No, I thought not. Well, then, let's go back. We might as well try to eat something while I think about what to do with you."

Malok and most of the others were gone when they reached the cave again. Bork fell to work with some scraps of food, cursing the configurations of the planets as his spell refused to work. Then suddenly the scraps became a mass of sour-smelling stuff. Bork made a face as he tasted it, but he ate it in silence. Dave couldn't force himself to put it in his mouth, though he was hungry by then.

He considered, and then snapped his fingers. "Abracadabra," he cried. He swore as something wet and slimy that looked like seaweed plopped into his hand. The next time he got a limp fish that had been dead far too long. But the third try worked better. This time, a whole bunch of bananas appeared. They were a little riper than he liked, but some of them were edible enough. He handed some to the other man, who quickly abandoned his own creation.

Bork was thoughtful as he ate. Finally he grimaced. "New magic!" he said. "Maybe that's the secret of the prophecy. I thought you knew no magic."

"I didn't," Dave admitted. He was still tingling inside himself at this confirmation of his earlier discovery. It was unpredictable magic, but apparently bore some vague relationship to what he was wishing for.

"So the lake's out," Bork decided. "With unknown powers at your command, you might escape in time. Well, that settles it. There's one place where nobody will look for you or listen to you. You'll be nothing but another among millions, and that's probably the best hiding place for you. With the overseers they have, you couldn't even turn yourself back to the Satheri, though I'll admit I'm hoping you don't want them to find you."

"And I was beginning to think you liked me," Dave commented bitterly.

Bork grinned. "I do, Dave Hanson. That's why I'm picking the easiest place to hide you I can think of. It will be hell, but anything else would be worse. Better strip and put this cloth on."
The thing he held out was little more than a rag, apparently torn from one of the robes. "Come on, strip, or I'll burn off your clothes with a salamander. There, that's better. Now wrap the cloth around your waist and let it hang down in front. It'll be easier on you if you don't attract much attention. The sky seems to indicate the planets favor teleportation now. Be quick before I change my mind and think of something worse!"

Dave didn't see what he did this time, but there was a puff of flame in front of his eyes.

The next second, he stood manacled in a long line of men loaded with heavy stones. Over their backs fell the cutting lashes of a whip. Far ahead was a partially finished pyramid. Dave was obviously one of the building slaves.

VI

Sunrise glared harshly over the desert. It was already hot enough to send heat waves dancing over the sand as Hanson wakened under the bite of a lash. The overseers were shouting and kicking the slaves awake. Overhead the marred sky shone in crazy quilt patterns.

Hanson stood up, taking the final bite of the whip without flinching. He glanced down at his body, noticing that it had somehow developed a healthy deep tan during the few hours of murderous labor the day before. He wasn't particularly surprised. Something in his mind seemed also to have developed a "tan" that let him face the bite of chance without flinching. He'd stopped wondering and now accepted; he meant to get away from here at the first chance and he was somehow sure he could.

It was made easier by the boundless strength of his new body. He showed no signs of buckling under physical work that would have killed him on his own world.

Not all the slaves got up. Two beside him didn't move at all. Sleeping through that brutal awakening seemed impossible. When Hanson looked closer, he saw that they weren't asleep; they were dead.

The overseer raged back along the line and saw them. He must be one of those conjured into existence here from the real Egypt of the past. He might have no soul, but a lifetime of being an overseer had given him habits that replaced the need for what had been a pretty slim soul to begin with.

"Quitters!" he yelled. "Lazy, worthless, work-dodging goldbrick artists!" He knelt in fury, thumbing back the eyelids of the corpses. There was little need for the test. They were too limp, too waxen to be pretending.

The overseer cut them out of the chain and kicked at Hanson. "Move along!" he bellowed. "Menes himself is here, and he's not as gentle as I am."

Hanson joined the long line, wondering what they were going to do about breakfast. How the devil did they expect the slaves to put in sixteen hours of work without some kind of food? There had been nothing the night before but a skin of water. There was not even that much this morning. No wonder the two beside him had died from overwork, beatings and plain starvation.

Menes was there, all right. Hanson saw him from the distance, a skinny giant of a man in breechclout, cape and golden headdress. He bore a whip like everyone else who seemed to have any authority at all, but he wasn't using it. He was standing hawklike on a slight rise in the sandy earth, motionless and silent. Beside him was a shorter figure: a pudgy man with a thin mustache, on whom the Egyptian headdress looked strangely out of place. It could only be Ser Perth!

Hanson's staring came to an end as the lash cut down across his shoulders, biting through to the shoulder-bone. He stumbled forward, heedless of the overseers' shouting voices. Someday, if he had the chance, he'd flay his own overseer, but that could wait. Even the agony of the cut couldn't take his mind from Ser Perth's presence. Had Bork slipped up--did the Satheri know that Hanson was still alive, and had they sent Ser Perth here to locate him? It seemed unlikely, however. The man was paying no attention to the lines of slaves. It would be hard to spot one among three million, anyhow. More likely, Hanson decided, Ser Perth was supervising the supervisors, making an inspection tour of all this.

Of all what? Apparently then this must be another of their frenzied efforts to find a way to put back the sky. He'd heard that they had called up the pyramid builder, but hadn't fully realized it would lead to this type of activity.

He looked around him appraisingly. The long lines of slaves that had been carrying rock and rubble the day before now were being formed into hauling teams. Long ropes were looped around enormous slabs of quarried rock. Rollers underneath them and slaves tugging and pushing at them were the only means of moving them. The huge stones slid remorselessly forward onto the prepared beds of rubble. Casting back in his memory, Hanson could not recall seeing the rock slabs the night before. They had appeared as if by magic--

Obviously, they had really been conjured up by magic. But if the rocks could be conjured, what was the need of all the slaves and the sadistic overseers? Why not simply magic the entire construction, whatever it was to be?

The whip hit him again, and the raging voice of the overseer ranted in his ears. "Get on, you blundering slacker. Menes himself is looking at you. Ho there--what the devil?"

The overseer's hand spun Hanson around. The man's eyes, large and opale, stared at Hanson. He frowned cruelly. "Yeah, you're the same one! Didn't I take the hide off your back twice already? And now you stand there
only an idle fancy, but—
came into his consciousness—some inkling of what should have been done, or how they had failed. It was probably
should logically be found in magic, not in the methods of other worlds. His mind groped for something that almost

had the guts to try the impossible themselves. A pyramid seemed like a ridiculous solution, but for an incredible
likely few and giving full cooperation. Magic must have made solutions to most things so easy that they no longer
screening the probability of finding an answer. The size of the ancient pyramid must have been enough to sway

through other worlds and ages for anyone with a reputation as a builder, engineer or construction genius, without
suffering millions of slaves in their labor gangs.

The idiots must be trying to reach the sky with their pyramid. There could be no other answer to the immense
bulk planned for this structure. Like the pride-maddened men of Babel, they were building a sky-high thing of stone.
It was obviously impossible, and even Menes must be aware of that. Yet perhaps it was no more impossible than all
the rest of the things in this impossible world.

When the warlocks of this world had discovered that they could not solve the problem of the sky, they must
have gone into a state of pure hysteria, like a chicken dashing back and forth in front of a car. They had sought
through other worlds and ages for anyone with a reputation as a builder, engineer or construction genius, without
screening the probability of finding an answer. The size of the ancient pyramid must have been enough to sway
them. They had used Hanson, Menes, Einstein, Cagliostro—for some reason of their own, since he'd never been a
builder—and probably a thousand more. And then they had half-supplied all of them, rather than picking the most
likely few and giving full cooperation. Magic must have made solutions to most things so easy that they no longer
had the guts to try the impossible themselves. A pyramid seemed like a ridiculous solution, but for an incredible
task, an impossible solution had to be tried.

And maybe, he thought, they'd overlooked the obvious in their own system. The solution to a problem in magic
should logically be found in magic, not in the methods of other worlds. His mind groped for something that almost
came into his consciousness—some inkling of what should have been done, or how they had failed. It was probably
only an idle fancy, but—
"Hey!" One of the slaves below was waving at him. While Hanson looked down, the slave called to another, got a shoulder to lean on, and walked his way up the side of the block, pushed from below and helped by Hanson's hands above. He was panting when he reached the top, but he could still talk. "Look, it's your skin, but you're going to be in trouble if you don't get busy. Look out for that overseer up there. Don't just stand around when he's in sight."

Hanson stared up at the overseer who was staring back at him. "Why is he any worse than the rest of this crowd?"

The slave shuddered as the dour, slow-moving overseer began walking stiffly toward them. "Don't let the fact that he's an overseer fool you. He's smarter than most of his kind, but just as ugly. He's a mandrake, and you can't afford to mess with him."

Hanson looked at the ancient, wrinkled face of the mandrake and shuddered. There was the complete incarnation of inhumanity in the thing's expression. He passed ropes around the corners until the mandrake turned and rigidly marched away, the blows of his whip falling metronome-like on the slaves he passed. "Thanks," Hanson said. "I wonder what it's like, being a true mandrake?"

"Depends," the slave said easily. He was obviously more intelligent than most, and better at conserving himself. "Some mandrake-men are real. I mean, the magicians want somebody whom they can't just call back--direct translation of the body usually messes up the brain patterns enough to make the thinkers hard to use, especially with the sky falling. So they get his name and some hold on his soul and then rebuild his body around a mandrake root. They bind his soul into that, and in some ways he's almost human. Sometimes they even improve on what he was. But the true mandrake--like that one--never was human. Just an ugly, filthy simulacrum. It's bad business. I never liked it, even though I was in training for sersa rating."

"You're from this world?" Hanson asked in surprise. He'd been assuming that the man was one of the things called back.

"A lot of us are. They conscripted a lot of the people they didn't need for these jobs. But I was a little special. All right, maybe you don't believe me--you think they wouldn't send a student sersa here now. Look, I can prove it. I managed to sneak one of the books I was studying back with me. See?"

He drew a thin volume from his breechclout cautiously, then slipped it back again. "You don't get such books unless you're at least of student rating." He sighed, then shrugged. "My trouble is that I could never keep my mouth shut. I was attendant at one of the revivatoria, and I got drunk enough to let out some information about one of the important revival cases. So here I am."

"Umm." Hanson worked silently for a minute, wondering how far coincidence could go. It could go a long ways here, he decided. "You wouldn't have been sentenced to twenty lifetimes here by the Sather Karf, would you?"

The slave stared at him in surprise. "You guessed it. I've died only fourteen times so far, so I've got six more lives to go. But--hey, you can't be! They were counting on you to be the one who really fixed things. Don't tell me my talking out of turn did this to you."

Hanson reassured him on that. He recognized the man now for another reason. "Aren't you the one I saw dead on his back right next to me this morning?"

"Probably. Name's Barg." He stood up to take a careful look at the net of cording around the stone. "Looks sound enough. Yeah, I died this morning, which is why I'm fairly fresh now. Those overseers won't feed us because it takes time and wastes food; they let us die and then have us dragged back for more work. It's a lot easier on the ones they dragged back already dead; dying doesn't matter so much without a soul."

"Some of them seem to be Indians," Hanson noted. He hadn't paid too much attention, but the slaves seemed to be from every possible background.

Barg nodded. "Aztecs from a place called Tenochtitlan. Twenty thousand of them got sacrificed in a bunch for some reason or other. Poor devils. They think this is some kind of heaven. They tell me this is easy work compared to the type they had to undergo. The Satheri like to get big bunches through in one conjuration, like the haul they made from the victims of somebody named Tamerlane." He tested a rope, then dropped to a sitting position on the edge of the block. "I'll let you stay up to call signals from here. Only watch it. That overseer has his eyes on you. Make sure the ropes stay tight while we see if the thing can be moved."

He started to slip over the side, hanging by his fingertips. Something caught, and he swore. With one hand, he managed to free his breechclout and drag out the thin volume that was lodged between his groin and the block. "Here, hold this for me until we meet tonight. You've got more room to hide it in your cloth than I have." He tossed it over quickly, then dropped from sight to land on the ground below.

Hanson shoved the book out of sight and tried to act busy again. The mandrake overseer had started ponderously toward him. But in a moment the thing's attention was directed to some other object of torture.

Hanson braced himself as the lines of slaves beneath him settled themselves to the ropes. There was a loud
cracking of whips and a chorus of groans. A small drum took up a beat, and the slaves strained and tugged in unison. Ever so slowly, the enormous block of stone began to move, while the ropes drew tighter.

Hanson checked the rigging with half his mind, while the other half raced in a crazy circle of speculation. Mandrakes and mandrake-men, zombie-men, from the past and multiple revivals! A sky that fell in great chunks. What came next in this ridiculous world in which he seemed to be trapped?

As if in answer to his question, there was a sudden, coruscating flare from above.

Hanson's body reacted instinctively. His arm came up over his eyes, cutting off the glare. But he managed to squint across it, upwards toward what was happening in the cracked dome. For a split second, he thought that the sun had gone nova.

He was wrong, but not by too much. Something had happened to the sun. Now it was flickering and flaming, shooting enormous jets of fire from its rim. It hovered at the edge of a great new hole and seemed to be wobbling, careening and losing its balance.

There was a massive shriek of fear and panic from the horde of slaves. They began bellowing like the collective death-agony of a world. Most of them dropped their ropes and ran in blind panic, trampling over each other in their random flight for safety. The human overseers were part of the same panic-stricken riot. Only the mandrakes stood stolidly in place, flicking each running man who passed them.

Hanson flung himself face down on the stone. There was a roar of tortured air from overhead and a thundering sound that was unlike anything except the tearing of an infinity of cloth combined with a sustained explosion of atomic bombs. Then it seemed as if the thunderbolt of Thor himself had blasted in Hanson's ears.

The sky had ripped again, and this time the entire dome shook with the shock. But that wasn't the worst of it.

VII

The fall of the sun was seemingly endless. It teetered out of the hole and seemed to hover, spitting great gouts of flame as it encountered the phlogiston layer. Slowly, agonizingly, it picked up speed and began its downward rush. Unlike the sky, it seemed to obey the normal laws of inertia Hanson had known. It swelled bit by bit, raging as it drew nearer. And it seemed to be heading straight for the pyramid.

The heat was already rising. It began to sear the skin long before the sun struck the normal atmosphere. Hanson could feel that he was being baked alive. The blood in his arteries seemed to bubble and boil, though that must have been an illusion. But he could see his skin rise in giant blisters and heal almost at once to blister again. He screamed in agony, and heard a million screams around him. Then the other screams began to decrease in numbers and weaken in volume, and he knew that the slaves were dying.

Through a slit between two fingers, he watched the ponderous descent. The light was enough to sear his retinas, but even they healed faster than the damage. He estimated the course of the sun, amazed to find that there was no panic in him, and doubly amazed that he could think at all over the torture that wracked his body.

Finally, convinced that the sun would strike miles to the south, he rolled across the scorching surface of the stone block and dropped to the north side of it. The shock of landing must have broken bones, but a moment later he could begin to breathe again. The heat was still intense, even behind the stone block, but it was bearable—at least for him.

Pieces were breaking off the sun as it fell, and already striking the ground. One fell near, and its heat seared at him, giving him no place of shelter. Then the sun struck, sending up earth tremors that knocked him from his feet. He groped up and stared around the block.

The sun had struck near the horizon, throwing up huge masses of material. Its hissing against the ground was a tumult in his ears, and superheated ash and debris began to fall.

So far as he could see, there were no other survivors in the camp. Three million slaves had died. Those who had found some shelter behind the stonework had lived longer than the others, but that had only increased their suffering. And even his body must have been close to its limits, if it could be killed at all.

He was still in danger. If a salamander could destroy even such a body as his, then the fragments of sun that were still roiling across the landscape would be fatal. The only hope he had was to get as far away from the place where the sun had struck as he could.

He braced himself to leave even the partial shelter. There was a pile of water skins near the base of the block, held in the charred remains of an attendant's body. The water was boiling, but there was still some left. He poured several skins together and drank the stuff, forcing himself to endure the agony of its passage down his throat. Without it, he'd be dehydrated before he could get a safe distance away.

Then he ran. The desert was like molten iron under his bare feet, and the savage radiation on his back was worse than any overseer's whip. His mind threatened to blank out with each step, but he forced himself on. And slowly, as the distance increased, the sun's pyre sank further and further over the horizon. The heat should still have
been enough to kill any normal body in fifteen minutes, but he could endure it. He stumbled on in a trot, guiding himself by the stars that shone in the broken sky toward a section of this world where there had been life and some measure of civilization before. After a few hours, the tongues of flame no longer flared above the horizon, though the brilliant radiance continued. And Hanson found that his strong and nearly indestructible body still had limits. It could not go on without rest forever. He was sobbing with fatigue at every step.

He managed to dig a small hollow in the sand before dropping off to sleep. It was a sleep of total exhaustion, lacking even a sense of time. It might have been minutes or hours that he slept, and he had no way of knowing which. With the sun gone and the stars rocking into dizzy new configurations, there was no night or day, nor any way to guess the passage of time.

He woke to a roaring wind that sent cutting blasts of sand driving against him. He staggered up and forced himself against it, away from the place where the sun had fallen. Even through the lashing sandstorm, he could see the glow near the horizon. Now a pillar of something that looked like steam but was probably vapor from molten and evaporated rocks was rising upwards, like the mushroom clouds of his own days. It was spreading, apparently just under the phlogiston layer, reflecting back the glare. And the wind was caused by the great rising column of superheated gases over the sun.

He staggered on, while the sand gave way slowly to patches of green. With the sun gone and the sky falling into complete shards, this world was certainly doomed. He'd assumed that the sun of this world must be above the sky, but he'd been wrong; like the other heavenly bodies, it had been embedded inside the shell. He had discovered that the sky material resisted any sudden stroke, but that other matter could be interpenetrated into it, as the stars were. He had even been able to pass his hand and arm completely through the sample. Apparently the sun had passed through the sky in a similar manner.

Then why hadn't the shell melted? He had no real answer. The sun must have been moving fast enough so that no single spot became too hot, or else the phlogiston layer somehow dissipated the heat.

The cloud of glowing stuff from the rising air column was spreading out now, reflecting the light and heat back to the earth. There was a chance that most of one hemisphere might retain some measure of warmth, then. At least there was still light enough for him to travel safely.

By the time he was too tired to go on again, he had come to the beginnings of fertile land. He passed a village, but it had been looted, and he skirted around it rather than stare at the ghastly ghoul-work of the looters. The world was ending, but civilization seemed to have ended already. Beyond it, he came to a rude house, now abandoned. He staggered in gratefully.

For a change, he had one piece of good luck. His first attempt at magic produced food. At the sound of the snapping fingers and his hoarse-voiced "abracadabra," a dirty pot of hot and greasy stew came into existence. He had no cutlery, but his hands served well enough. When it was gone, he felt better. He wiped his hands on the breechclout. Whatever the material in the cloth, it had stood the sun's heat almost as well as he had.

Then he paused as his hand found a lump under the cloth. He drew out the apprentice magician's book. The poor devil had never achieved his twenty lifetimes, and this was probably all that was left of him. Hanson stared at it, reading the title in some surprise.

Applied Semantics.

He propped himself up and began to scan it, wondering what it had to do with magic. He'd had a course of semantics in college and could see no relationship. But he soon found that there were differences.

This book began with the axiomatic statement that the symbol is the thing. From that it developed in great detail the fact that any part of a whole bearing similarity to the whole was also the whole; that each seven was the class of all sevens; and other details of the science of magical similarity followed quite logically from the single axiom. Hanson was surprised to find that there was a highly developed logic to it. Once he accepted the axiom—and he was no longer prepared to doubt it here—he could follow the book far better than he'd been able to follow his own course in semantics. Apparently this was supposed to be a difficult subject, from the constant efforts of the writer to make his point clear. But after learning to deal with electron holes in transistors, this was elementary study for Hanson.

The second half of the book dealt with the use of the true name. That, of course, was the perfect symbol, and hence the true whole. There was the simple ritual of giving a secret name. Apparently any man who discovered a principle or device could use a name for it, just as parents could give one to their children. And there were the laws for using the name. Unfortunately, just when Hanson was beginning to make some sense of it, the book ended. Obviously, there was a lot more to be covered in later courses.

He tossed the book aside, shivering as he realized that his secret name was common knowledge. The wonder was that he could exist at all. And while there was supposed to be a ritual for relinquishing one name and taking another, that was one of the higher mysteries not given.
In the morning, he stopped to magic up some more food and the clothing he would need if he ever found the trace of civilized people again. The food was edible, though he'd never particularly liked cereal. He seemed to be getting the hang of abracadabraing up what was in his mind. But the clothing was a problem. Everything he got turned out to be the right size, but he couldn't see himself in hauberk and greaves, nor in a filmy nightgown. Finally, he managed something that was adequate, if the brilliant floral sportshirt could be said to go with levi pants and a morning frock. But he felt somewhat better in it. He finally left the frock behind, however. It was still too hot for that.

He walked on briskly, watching for signs of life and speculating on the principles of applied semantics, name magic and similarity. He could begin to understand how an Einstein might read through one of the advanced books here and make leaps in theory beyond what the Satheri had developed. They'd had it too easy. Magic that worked tended to overcome the drive for the discipline needed to get the most out of it. Any good theoretician from Hanson's world could probably make fools of these people. Maybe that was why the Satheri had gone scrounging back through other worlds to find men who had the necessary drive to get things done when the going was tough.

Twice he passed abandoned villages, but there was nothing there for him. He was coming toward forested ground now, something like the country in which the Sons of the Egg had found refuge. The thought of that made him go slower. But for a long time, there was no further sign of life. The woods thinned out to grasslands, and he went on for hours more before he spotted a cluster of lights ahead.

As he drew nearer, he saw that the lights seemed to be fluorescents. They were coming from corrugated iron sheds that looked like aircraft hangars strung together. There was a woven-wire fence around the structures, and a sign that said simply: Project Eighty-Five. In the half-light from the sky, he could see a well-kept lawn, and there were a few groups of men standing about idly. Most wore white coveralls, though two were dressed in simple business suits.

Hanson moved forward purposefully, acting as if he had urgent business. If he stopped, there would be questions, he suspected; he wanted to find answers, not to answer idle questions.

There was no one at the desk in the little reception alcove, but he heard the sound of voices through a side door leading out. He went through it, to find a larger yard with more men idling. There should be someone here who knew more of what was going on in this world than he did now.

His choice, in the long run, seemed to lie between Bork and the Satheri, unless he could find some way of hiding himself from both sides. At the moment, he was relatively free for the first time since they had brought him here, and he wanted to make sure that he could make the most use of the fact.

Nobody asked anything. He slowed, drifting along the perimeter of the group of men, and still nobody paid him any attention. Finally, he dropped onto the ground near a group of half a dozen men who looked more alert than the rest. They seemed to be reminiscing over old times.

"--two thirty-eight an hour with overtime--and double time for the swing shift. We really had it made then! And every Saturday, never fail, the general would come out from Muroc and tell us we were the heros of the home front--with overtime pay while we listened to him!"

"Yeah, but what if you wanted to quit? Suppose you didn't like your shift boss or somebody? You go down and get your time, and they hand you your draft notice. Me, I liked it better in '46. Not so much pay, but--"

Hanson pricked up his ears. The conversation told him more than he needed to know. He stood up and peered through the windows of the shed. There, unattended under banks of lights, stood half-finished aircraft shapes.

He wouldn't get much information here, it seemed. These were obviously reanimates, men who'd been pulled from his own world and set to work. They could do their duties and their memories were complete, but they were lacking some essential thing that had gone out of them before they were brought here. Unless he could find one among them who was either a mandrake-man housing a soul or one of the few reanimates who seemed almost fully human, he'd get little information. But he was curious as to what the Satheri had expected to do with aircraft. The rocs had better range and altitude than any planes of equal hauling power.

He located one man who seemed a little brighter than the others. The fellow was lying on the ground, staring at the sky with his hands clasped behind his head. From time to time, he frowned, as if the sight of the sky was making him wonder. The man nodded as Hanson dropped down beside him. "Hi. Just get here, Mac?"

"Yeah," Hanson assented. "What's the score?"

The man sat up and made a disgusted noise. "Who knows?" he answered. There was more emotion in his voice than might be expected from a reanimate; in real life on his own world, he must have had an amazing potential for even that much to carry over. "We're dead. We're dead, and we're here, and they tell us to make helicopters. So we make them, working like dogs to make a deadline. Then, just as the first one comes off the line, the power fails. No more juice. The head engineer took off in the one we finished. He was going to find out what gives, but he never came back. So we sit." He spat on the ground. "I wish they'd left me dead after the plant blew up. I'm not myself
since then."

"What in hell would they need with helicopters?" Hanson asked.

The man shrugged. "Beats me. But I'm beginning to figure some things out. They've got some kind of trouble with the sky. I figure they got confused in bringing us here. This shop is one that made those big cargo copters they call 'Sky Hooks' and maybe they thought the things were just what they're called. All I know is they kept us working five solid weeks for nothing. I knew the power was going to fail; they had the craziest damn generating plant you ever saw, and it couldn't last. The boilers kept sizzling and popping their safety valves with no fire in the box! Just some little old man sitting in a corner, practicing the Masonic grip or something over a smudgepot."

Hanson gestured back to the sheds. "If there's no power, what are those lights?"

"Witch lights, they told us," the man explained. "Saved a lot of wiring, or something. They--hey, what's that?"

He was looking up, and Hanson followed his gaze. There was something whizzing overhead at jet-plane speed.

"A piece of the sky falling?" he said.

The man snorted. "Falling sidewise? Not likely, even here. I tell you, pal, I don't like this place. Nothing works right. There was no fuel for the 'copter we finished--the one we called Betsy Ann. But the little geezer who worked the smudgepot just walked up to it and wiggled his finger. 'Start your motor going, Betsy Ann,' he ordered with some other mumbo-jumbo. Then the motor roared and he and the engineer, took off at double the speed she could make on high-test gas. Hey, there it is again! Doesn't look like the Betsy Ann coming back, either."

The something whizzed by again, in the other direction, but lower and slower. It made a gigantic but erratic circle beyond the sheds and swooped back. It looked nothing like a helicopter. It looked like a Hallowe'en decoration of a woman on a broomstick. As it came nearer, Hanson saw that it was a woman on a broomstick, flying erratically. She straightened out in a flat glide.

She came in for a one-point landing a couple of yards away. The tip of the broom handle hit the ground, and she went sailing over it, to land on her hands and knees. She got up, facing the shed.

The woman was Nema. Her face was masklike, her eyes tortured. She was staring searchingly around her, looking at every man.

"Nema!" Hanson cried.

She spun to face him, and gasped. Her skin seemed to turn gray, and her eyes opened to double their normal size. She took one tottering step toward him and halted. "Illusion!" she whispered hoarsely, and slumped to the ground in a faint.

She was reviving before he could raise her from the ground. She swayed a moment, staring at him. "You're not dead!"

"What's so wonderful about that around here?" he asked, but not with much interest. With the world going to pot and only a few days left, the girl's face and the slim young body under it were about all the reality left worth thinking about. He grabbed for her, pulling her to him. Bertha had never made him feel like that.

She managed to avoid his lips and slid away from him. "But they used the snetha-knife! Dave Hanson, you never died! It was only induced illusion by that--that Bork! And to think that I nearly died of grief while you were enjoying yourself here! You ... you mandrake-man!"

He grunted. He'd almost managed to forget what he was, and he didn't enjoy having the aircraft worker find out. He turned to see what the reaction was, and then stared open-mouthed at his surroundings.

There were no lights from the plane factory. In fact, there was no plane factory. In the half-light of the sky, he saw that the plant was gone. No men were left. There was only barren earth, with a tiny, limp sapling in the middle of empty acres.

"What happened?"

Nema glanced around briefly and sighed. "It's happening all over. They created the plane plant by the law of identities from that little plane tree sapling, I suppose; it is a plane plant, after all. But with the conjunctions and signs failing, all such creations are returning to their original form, unless a spell is used continually over them. Even then, sometimes, we fail. Most of the projects vanished after the sun fell."

Hanson remembered the man with whom he'd been talking before Nema appeared. He'd have liked to know such a man before death and revivification had ruined him. It wasn't fair that anyone with character enough to be that human even as a zombie should be wiped out without even a moment's consideration. Then he remembered the man's own estimate of his current situation. Maybe he was better off returned to the death that had claimed him.

Reluctantly, he returned to his own problems. "All right, then, if you thought I was dead, what are you doing here, Nema?"

"I felt the compulsion begin even before I returned to the city. I thought I was going mad. I tried to forget you, but the compulsion grew until I could fight it no longer." She shuddered. "It was a terrible flight. The carpets will not work at all now, and I could hardly control the broom. Sometimes it wouldn't lift. Twice it sailed so high I could
hardly breathe. And I had no hope of finding you, yet I went on. I've been flying when I could for three days now."

Bork, of course, hadn't known of her spell with which she'd forced herself to want him "well and truly." Apparently it had gone on operating even when she thought he was dead, and with a built-in sense of his direction. Well, she was here--and he wasn't sorry.

Hanson took another look across the plains toward the glowing hell of the horizon. He reached for her and pulled her to him. She was firm and sweet against him, and she was trembling in response to his urging.

At the last moment she pulled back. "You forget yourself, Dave Hanson! I'm a registered and certified virgin. My blood is needed for--"

"For spells that won't work anyhow," he told her harshly. "The sky isn't falling now, kid. It's down--or most of it."

"But--" She hesitated and then let herself come a trifle closer. Her voice was doubtful. "It's true that our spells are failing. Not even the surest magic is reliable. The world has gone mad, and even magic is no longer trustworthy. But--"

He was just pulling her close enough again and feeling her arms lift to his neck when the ground shook behind them and there was a sound of great, jarring, thudding steps.

Hanson jerked around to see a great roc making its landing run, heading straight for them. The huge bird braked savagely, barely stopping before they were under its feet. From its back, a ladder of some flexible material snaked down and men began descending. The first were mandrakes in the uniform of the Satheri, all carrying weapons with evil-looking blades or sharp stickers.

The last man off was Bork. He came toward Hanson and Nema with a broad grin on his face. "Greetings, Dave Hanson. You do manage to survive, don't you? And my little virgin sister, without whose flight I might not have found you. Well, come along. The roc's growing impatient!"

VIII

The great roc's hard-drumming wings set up a constant sound of rushing air and the distance flowed behind them. There was the rush of wind all around them, but on the bird's back they were in an area where everything seemed calm. Only when Hanson looked over toward the ground was he fully conscious of the speed they were making. From the height, he could see where the sun had landed. It was sinking slowly into the earth, lying in a great fused hole. For miles around, smaller drops of the three-mile-diameter sun had spattered and were etching deeper holes in the pitted landscape.

Then they began passing over desolate country, scoured by winds, gloomy from the angry, glaring clouds above. Once, two bodies went hurtling upwards toward the great gaps in the sky.

"Those risings were from men who were no worshippers of the egg's hatching," Bork commented. "It's spreading. Something is drawing them up from all over the planet."

Later, half a square mile of the shell cracked off. The roc squawked harshly, but it had learned and had been watching above. By a frantic effort of the great wings, it missed the hurtling chunk. They dropped a few thousand feet in the winds that followed the piece of sky, but their altitude was still safe.

Then they passed over a town, flying low. The sights below were out of a ghoul's bacchanalia. As the roc swept over, the people stopped their frenzied pursuit of sensation and ran for weapons. A cloud of arrows hissed upwards, all fortunately too late.

"They blame all their troubles on the magicians," Bork explained. "They've been shooting at everything that flies. Not a happy time to associate with the Satheri, is it?"

Nema drew further back from him. "We're not all cowards like you! Only rats desert a sinking ship."

"Nobody thought it was sinking when I deserted," Bork reminded her. "Anyway, if you'd been using your eyes and seen the way we are traveling, you'd know I've rejoined the crew. I've made up with the Sather Karf--and at a time like this, our great grandfather was glad to have me back!"

Nema rushed toward him in delight, but Hanson wasn't convinced. "Why?" he asked.

Bork sobered. "One of the corpses that fell back from the risings added a word to what the others had said. No, I'll bear the weight of it myself, and not burden you with it. But I'm convinced now that his egg should not hatch. I had doubts before, unlike our friend Malok, who also heard the words but is doubly the fanatic now. Perhaps the hatching cannot be stopped--but I've decided that I am a man and must fight like one against the fates. So, though I still oppose much that the Satheri have done, I've gone back to them. We'll be at the camp of the Sather Karf shortly."

"That sewed everything up neatly, Hanson thought. Before, he had been torn between two alternatives. Now there was only one and he had no choice; he could never trust the Sons of the Egg with Bork turned against them. He stared up at the sky, realizing that more than half of it had already fallen. The rest seemed too weak to last much longer. It probably didn't make much difference what he did now or who had him; time was running out for this
The light was dimmer by the time they reached the great capital city—or what was left of it. They had left the sun pyre far to the south. The air was growing cold already.

The roc flew low over the city. The few people on the streets looked up and made threatening gestures, but there was no flight of arrows from the ground. Probably the men below had lost even the strength to hate. It was hard to see, since there was no electric lighting system now. But it seemed to Hanson that only the oldest and ugliest buildings were still standing. Honest stone and metal could survive, but the work of magic was no longer safe.

One of the remaining buildings seemed to be a hospital, and the empty space in front of it was crammed with people. Most of them seemed to be dead or unconscious. Squat mandrakes were carrying off bodies toward a great fire that was burning in another square. Plague and pestilence had apparently gotten out of hand.

They flew on, beyond the city toward the construction camp that had been Hanson's headquarters. The roc was beginning to drop into a long landing glide, and details below were easier to see. Along the beach beyond the city, a crowd had collected. They had a fire going and were preparing to cook one of the mermaids. A fight was already going on over the prey. Food must have been exhausted days before.

The camp was a mess when they reached it. One section had been ripped down by the lash of wind from a huge piece of the sky, which now lay among the ruins with a few stars glowing inside it. There was a brighter glow beyond. Apparently one blob of material from the sun had been tossed all the way here and had landed against a huge rock to spatter into fragments. The heat from those fragments cut through the chill in the air, and the glow furnished light for most of the camp.

The tents had been burned, but there was a new building where the main tent had been. This was obviously a hasty construction job, thrown together of rocks and tree trunks, without the use of magic. It was more of an enormous lean-to than a true building, but it was the best protection now available. Hanson could see Sather Karf and Sersa Garm waiting outside, together with less than a hundred other warlocks.

The mandrakes prodded Hanson down from the roc and toward the new building, then left at a wave of the Sather Karf's hand. The old man stared at Hanson intently, but his expression was unreadable. He seemed to have aged a thousand years. Finally he lifted his hand in faint greeting, sighed and dropped slowly to a seat. His face seemed to collapse, with the iron running out of it. He looked like a beaten, sick old man. His voice was toneless.

"Fix the sky, Dave Hanson!"

There were angry murmurs from other warlocks in the background, but Sather Karf shook his head slowly, still facing Hanson. "No--what good to threaten dire punishments or to torture you when another day or week will see the end of everything? What good to demand your reasons for desertion when time is so short? Fix the sky and claim what reward you will afterwards. We have few powers now that the basis of astrology is ruined. But repair our sky and we can reward you beyond your dreams. We can find ways to return you to your own world intact. You have near immortality now. We can fill that entire lifetime with pleasures. We'll give you jewels to buy an empire. Or if it is vengeance against whatever you feel we are, you shall know my secret name and the name of everyone here. Do with us then what you like. But fix the sky!"

It shook Hanson. He had been prepared to face fury, or to try lying his way out if there was a chance with some story of having needed to study Menes's methods. Or of being lost. But he had no defense prepared against such an appeal.

It was utterly mad. He could do nothing, and their demands were impossible. But before the picture of the world dying and the decay of the old Sather's pride, even Hanson's own probable death with the dying world seemed unimportant. He might at least give them something to hope for while the end came.

"Maybe," he said slowly. "Maybe, if all of the men you brought here to work on the problem were to pool their knowledge, we might still find the answer. How long will it take to get them here for a council?"

Ser Perth appeared from the group. Hanson had thought the man dead in the ruins of the pyramid, but somehow he had survived. The fat was going from his face, and his mustache was untrimmed, but he was uninjured. He shook his head sadly. "Most have disappeared with their projects. Two escaped us. Menes is dead. Cagliostro tricked us successfully. You are all we have left. And we can't even supply labor beyond those you see here. The people no longer obey us, since we have no food to give them."

"You're the only hope," Bork agreed. "They've saved what they could of the tools from the camp and what magical instruments are still useful. They've held on only for your return."

Hanson stared at them and around at the collection of bric-a-brac and machinery they had assembled for him. He opened his mouth, and his laughter was a mockery of their hopes and of himself.

"Dave Hanson, world saver! You got the right name but the wrong man, Sather Karf," he said bitterly. He'd been a pretender long enough, and what punitive action they took now didn't seem to matter. "You wanted my uncle, David Arnold Hanson. But because his friends called him Dave and cut that name on his monument, and because I
was christened by the name you called, you got me instead. He'd have been helpless here, probably, but with me you have no chance. I couldn't even build a doghouse. I wasn't even a construction engineer. Just a computer operator and repairman."

He regretted ruining their hopes, almost as he said it. But he could see no change on the old Sather's face. It seemed to stiffen slightly and become more thoughtful, but there was no disappointment.

"My grandson Bork told me all that," he said. "Yet your name was on the monument, and we drew you back by its use. Our ancient prophecy declared that we should find omnipotence carved on stone in a pool of water, as we found your name. Therefore, by the laws of rational magic, it is you to whom nothing is impossible. We may have mistaken the direction of your talent, but nonetheless it is you who must fix the sky. What form of wonder is a computer?"

Dave shook his head at the old man's monomania. "Just a tool. It's a little hard to explain, and it couldn't help."

"Humor my curiosity, then. What is a computer, Dave Hanson?"

Nema's hand rested on Hanson's arm pleadingly, and he shrugged. He groped about for some answer that could be phrased in their language, letting his mind flicker from the modern electronic gadgets back to the old-time tide predictor.

"An analogue computer is a machine that ... that sets up conditions mathematically similar to the conditions in some problem and then lets all the operations proceed while it draws a graph--a prediction--of how the real conditions would turn out. If the tides change with the position of some heavenly body, then we can build cams that have shapes like the effect of the moon's orbit, and gear them together in the right order. If there are many factors, we have a cam for each factor, shaped like the periodic rise and fall of that factor. They're all geared to let the various factors operate at the proper relative rate. With such a machine, we can run off a graph of the tides for years ahead. Oh, hell--it's a lot more complicated than that, but it takes the basic facts and draws a picture of the results. We use electronic ones now, but the results are the same."

"I understand," Sather Karf said. Dave doubted it, but he was happy to be saved from struggling with a more detailed explanation. And maybe the old man did understand some of it. He was no fool in his own subject, certainly. Sather Karf pondered for a moment, and then nodded with apparent satisfaction. "Your world was more advanced in understanding than I had thought. This computer is a fine scientific instrument, obeying natural law well. We have applied the same methods, though less elaborately. But the basic magical principle of similarity is the foundation of true science."

Dave started to protest, and then stopped, frowning. In a way, what the other had said was true. Maybe there was some relation between science and magic, after all; there might even be a meeting ground between the laws of the two worlds he knew. Computers set up similar conditions, with the idea that the results would apply to the original. Magic used some symbolic part of a thing in manipulations that were to be effective for the real thing. The essential difference was that science was predictive and magic was effective--though the end results were often the same. On Dave's world, the cardinal rule of logic was that the symbol was not the thing--and work done on symbols had to be translated by hard work into reality. Maybe things were really more logical here where the symbol was the thing, and all the steps in between thought and result were saved.

"So we are all at fault," Sather Karf said finally. "We should have studied you more deeply and you should have been more honest with us. Then we could have obtained a computer for you and you could have simulated our sky as it should be within your computer and forced it to be repaired long ago. But there's no time for regrets now. We cannot help you, so you must help yourself. Build a computer, Dave Hanson!"

"It's impossible."

Suddenly rage burned on the old man's face, and he came to his feet. His arm jerked back and snapped forward. Nothing happened. He grimaced at the ruined sky. "Dave Hanson," he cried sharply, "by the unfailing power of your name which is all of you, I hold you in my mind and your throat is in my hand--"

The old hands squeezed suddenly, and Hanson felt a vise clamp down around his throat. He tried to break free, but there was no escape. The old man mumbled, and the vise was gone, but something clawed at Hanson's liver. Something else rasped across his sciatic nerve. His kidneys seemed to be wrenched out of him.

"You will build a computer," Sather Karf ordered. "And you will save our world!"

Hanson staggered from the shock of the pain, but he was no longer unused to agony. He had spent too many hours under the baking of the sun, the agony of the snetha-knife and the lash of an overseer's whip. The agony could not be stopped, but he'd learned it could be endured. His fantastic body could heal itself against whatever they did to him, and his mind refused to accept the torture supinely. He took a step toward Sather Karf, and another. His hands came up as he moved forward.

Bork laughed suddenly. "Let up, Sather Karf, or you'll regret it. By the laws, you're dealing with a man this time. Let up, or I'll free him to meet you fairly."
The old man’s eyes blazed hotly. Then he sighed and relaxed. The clutching hands and the pain were gone from Hanson as the Sather Karf slumped back wearily to his seat.

"Fix our sky," the old man said woodenly.

Hanson staggered back, panting from his efforts. But he nodded. "All right," he agreed. "Like Bork, I think a man has to fight against his fate, no matter how little chance he has. I'll do what I can. I'll build the damned computer. But when I'm finished, I'll wait for your true name!"

Suddenly Sather Karf laughed. "Well said, Dave Hanson. You'll have my name when the time comes. And whatever else you desire. Also what poor help we can give you now. Ser Perth, bring food for Dave Hanson!"

Ser Perth shook his head sadly. "There is none. None at all. We hoped that the remaining planets would find a favorable conjunction, but--"

Dave Hanson studied his helpers with more bitterness. "Oh, hell!" he said at last. He snapped his fingers. "Abracadabra!"

His skill must be improving, since he got exactly what he had wished for. A full side of beef materialized against his palm, almost breaking his arm before he could snap it out of the way. The others swarmed hungrily toward it. At their expressions of wonder, Hanson felt more confidence returning to him. He concentrated and went through the little ritual again. This time loaves of bread rained down--fresh bread, and even of the brand he had wished for. Maybe he was becoming a magician himself, with a new magic that might still accomplish something.

Sather Karf smiled approvingly. "The theory of resonance, I see. Unreliable generally. More of an art than a science. But you show promise of remarkable natural ability to apply it."

"You know about it?" Dave had assumed that it was completely outside their experience and procedures.

"We knew it. But when more advanced techniques took over, most of us forgot it. The syllables resonate in a sound pattern with your world, to which you also still resonate. It won't work for you with anything from this world, nor will anything work thus for us from yours. We had different syllables, of course, for use here." Sather Karf considered it. "But if you can control it and bring in one of your computers or the parts for one--"

Sixteen tries later, Dave was cursing as he stared at a pile of useless items. He'd gotten transistors at first. Then he lost control with too much tension or fatigue and began getting a bunch of assorted junk, such as old 201-A tubes, a transit, a crystal vase and resistors. But the chief trouble was that he couldn't secure working batteries. He had managed a few, but all were dead.

"Like the soul, electrical charges will not transfer," Sather Karf agreed sadly. "I should have told you that."

There was no electricity here with which to power anything, and their spells could not be made to work now. Even if he could build a computer out of what was obtainable, there would be no way to power it.

Overhead, the sky shattered with a roar, and another piece fell, tearing downwards toward the city. Sersa Garm stared upwards in horror.

"Mars!" he croaked. "Mars has fallen. Now can there be no conjunction ever!"

He tautened and his body rose slowly from the ground. A scream ripped from his lips and faded away as he began rushing upwards with increasing speed. He passed but of their sight, straight toward the new hole in the sky.

IX

In the hours that followed, Dave’s vague plans changed a dozen times as he found each idea unworkable. His emotional balance was also erratic--though that was natural, since the stars were completely berserk in what was left of the sky. He seemed to fluctuate between bitter sureness of doom and a stupidly optimistic belief that something could be done to avert that doom. But whatever his mood, he went on working and scheming furiously. Maybe it was the desperate need to keep himself occupied that drove him, or perhaps it was the pleading he saw in the eyes around him. In the end, determination conquered his pessimism.

Somewhere in the combination of the science he had learned in his own world and the technique of magic that applied here there had to be an answer--or a means to hold back the end of the world until an answer could be found.

The biggest problem was the number of factors with which he had to deal. There were seven planets and the sun, and three thousand fixed stars. All had to be ordered in their courses, and the sky had to be complete in his calculations.

He had learned his trade where the answer was always to add one more circuit in increasing complexity. Now he had to think of the simplest possible similarity computer. Electronics was out, obviously. He tried to design a set of cams, like the tide machine, to make multiple tracings on paper similar to a continuous horoscope, but finally gave it up. They couldn't build the parts, even if there had been time.

He had to depend on what was available, since magic couldn't produce any needed device and since the people here had depended on magic too long to develop the other necessary skills. When only the broadest powers of magic remained, they were hopeless. Names were still potent, resonance worked within its limits, and the general principles of similarity still applied; but those were not enough for them. They depended too heavily on the second
great principle of contagion, and that seemed to be wrapped up with some kind of association through the signs and houses and the courses of the planets.

He found himself thinking in circles of worry and pulled himself back to his problem. Normally, a computer was designed for flexibility and to handle varying conditions. This one could be designed to handle only one set of factors. It had to duplicate the courses of the objects in their sky and simulate the general behavior of the dome. It was not necessary to allow for all theoretical courses, but only for the normal orbits.

And finally he realized that he was thinking of a model—the one thing which is functionally the perfect analogue.

It brought him back to magic again. Make a doll like a man and stick pins in it—and the man dies. Make a model of the universe within the sky, and any changes in that should change reality. The symbol was the thing, and a model was obviously a symbol.

He began trying to plan a model with three thousand stars in their orbits, trying to find some simple way of moving them. The others watched in fascination. They apparently felt that the diagrams he was drawing were some kind of scientific spell. Ser Perth was closer than the others, studying the marks he made. The man suddenly pointed to his computations.

"Over and over I find the figure seven and the figure three thousand. I assume that the seven represents the planets. But what is the other figure?"

"The stars," Hanson told him impatiently.

Ser Perth shook his head. "That is wrong. There were only two thousand seven hundred and eighty-one before the beginnings of our trouble."

"And I suppose you've got the exact orbits of every one?" Hanson asked. He couldn't see that the difference was going to help much.

"Naturally. They are fixed stars, which means they move with the sky. Otherwise, why call them fixed stars? Only the sun and the planets move through the sky. The stars move with the sky over the world as a unity."

Dave grunted at his own stupidity. That really simplified things, since it meant only one control for all of them and the sky itself. But designing a machine to handle the planets and the sun, while a lot simpler, was still a complex problem. With time, it would have been easy enough, but there was no time for trial and error.

He ripped up his plans and began a new set. He'd need a glass sphere with dots on it for the stars, and some kind of levers to move the planets and sun. It would be something like the orreries he'd seen used for demonstrations of planetary movement.

Ser Perth came over again, staring down at the sketch. He drowned in doubt. "Why waste time drawing such engines? If you want a model to determine how the orbits should be, we have the finest orrery ever built here in the camp. We brought it with us when we moved, since it would be needed to determine how the sky should be repaired and to bring the time and the positions into congruence. Wait!"

He dashed off, calling two of the mandrakes after him. In a few minutes, they staggered back under a bulky affair in a protective plastic case. Ser Perth stripped off the case to reveal the orrery to Hanson.

It was a beautiful piece of workmanship. There was an enormous sphere of thin crystal to represent the sky. Precious gems showed the stars, affixed to the dome. The whole was nearly eight feet in diameter. Inside the crystal, Hanson could see a model of the world on jeweled-bearing supports. The planets and the sun were set on tracks around the outside, with a clockwork drive mechanism that moved them by means of stranded spiderweb cords. Power came from weights, like those used on an old-fashioned clock. It was obviously all hand work, which must make it a thing of tremendous value here.

"Sather Fareth spent his life designing this," Ser Perth said proudly. "It is so well designed that it can show the position of all things for a thousand centuries in the past or future by turning these cranks on the control, or it will hold the proper present positions for years from its own engine."

"It's beautiful workmanship," Hanson told him. "As good as the best done on my world."

Ser Perth went away, temporarily pleased with himself, and Hanson stood staring at the model. It was as good as he'd said it was—and completely damning to all of his theories and hopes. No model he could make would equal it. But in spite of it and all its precise analogy to the universe around him, the sky was still falling in shattered bits!

Sather Karf and Bork had come over to join Hanson. They waited expectantly, but Hanson could think of nothing to do. It had already been done—and had failed. The old man dropped a hand on his shoulder. There was the weight of all his centuries on the Sather, yet a curious toughness showed through his weariness. "What is wrong with the orrery?" he asked.

"Nothing—nothing at all, damn it!" Hanson told him. "You wanted a computer—and you've got it. You can feed in data as to the hour, day, month and year, turn the cranks, and the planets there will turn to their proper position exactly as the real planets should run. You don't need to read the results off graph paper. What more could any
analogue computer do? But it doesn't influence the sky."

"It was never meant to," the old man said, surprise in his voice. "Such power--"

Then he stopped, staring at Hanson while something almost like awe spread over his face. "Yet... the prophecy and the monument were right! You have unlocked the impossible! Yet you seem to know nothing of the laws of similarity or of magic, Dave Hanson. Is that crystal similar to the sky, by association, by contagion, or by true symbolism? A part may be a symbol for the whole--or so may any designated symbol, which may influence the thing it is. If I have a hair from your head, I can model you with power over you. But not with the hair of a pig! That is no true symbol!"

"Suppose we substituted bits of the real thing for these representations?" Hanson asked.

Bork nodded. "It might work. I've heard you found the sky material could be melted, and we've got enough of that where it struck the camp. Any one of us who has studied elementary alchemy could blow a globe of it to the right size for the sky dome. And there are a few stars from which we can chip pieces enough. We can polish them and put them into the sphere where they belong. And it will be risky, but we may even be able to shape a bit of the sun stuff to represent the great orb in the sky."

"What about the planets?" Hanson was beginning to feel the depression lift. "You might get a little of Mars, since it fell near here, but that still leaves the other six."

"That long associated with a thing achieves the nature of the thing," Sather Karf intoned, as if giving a lesson to a kindergarten student. "With the right colors, metals and bits of jewels--as well as more secret symbols--we can simulate the planets. Yet they cannot be suspended above the dome, as in this orrery--they must be within the sky, as in nature."

"How about putting some iron in each and using a magnet on the control tracks to move the planets?" Hanson suggested. "Or does cold iron ruin your conjuring here?"

Sather Karf snorted in obvious disgust, but Bork only grinned. "Why should it? You must have heard peasant superstitions. Still, you'd have a problem if two tracks met, as they do. The magnets would then affect both planets alike. Better make two identical planets for each--and two suns--and put one on your track controls. Then one must follow the other, though the one remain within the sky."

Hanson nodded. He'd have to shield the cord from the sun stuff, but that could be done. He wondered idly whether the real universe was going to wind up with tracks beyond the sky on which little duplicate planets ran--just how much similarity would there be between model and reality when this was done, if it worked at all? It probably didn't matter, and it could hardly be worse than whatever the risers had run into beyond the hole in the present sky. Metaphysics was a subject with which he wasn't yet fully prepared to cope.

The model of the world inside the orrery must have been made from earthly materials already, and it was colored to depict land and sea areas. It could probably be used. At their agreement, he nodded with some satisfaction. That should save some time, at least. He stared doubtfully at the rods and bearings that supported the model world in the center of the orrery.

"What about those things? How do we hold the globe in the center of everything?"

Bork shrugged. "It seems simple enough. We'll fashion supports of more of the sky material."

"And have real rods sticking up from the poles in the real universe?" Hanson asked sarcastically.

"Why not?" Bork seemed surprised at Hanson's tone. "There have always been such columns connecting the world and the sky. What else would keep us from falling?"

Hanson swore. He might have guessed it! The only wonder was that simple rods were used instead of elephants and turtles. And the doubly-damned fools had let Menes drive millions of slaves to death to build a pyramid to the sky when there were already natural columns that could have been used!

"There remains only one step," Sather Karf decided after a moment more. "To make symbol and thing congruent, all must be invoked with the true and secret name of the universe."

Hanson suddenly remembered legends of the tetragrammaton and the tales of magic he'd read in which there was always one element lacking. "And I suppose nobody knows that or dares to use it?"

There was hurt pride of the aged face and the ring of vast authority in his voice. "Then you suppose wrong, Dave Hanson! Since this world first came out of Duality, a Sather Karf has known that mystery! Make your device and I shall not fail in the invocation!"

For the first time, Hanson discovered that the warlocks could work when they had to, however much they disliked it. And at their own specialties, they were superb technicians. Under the orders of Sather Karf, the camp sprang into frenzied but orderly activity.

They lost a few mandrakes in prying loose some of the sun material, and more in getting a small sphere of it shaped. But the remainder gave them the heat to melt the sky stuff. When it came to glass blowing, Hanson had to admit they were experts; it should have come as no surprise, after the elaborate alchemical apparatus he'd seen. Once
the crystal shell was cracked out of the orrery, a fat-faced Ser came in with a long tube and began working the molten sky material, getting the feel of it. He did things Hanson knew were nearly impossible, and he did them with the calm assurance of an expert. Even when another rift in the sky appeared with a crackling of thunder, there was no faltering on his part. The sky shell and world supports were blown into shape around the world model inside the outer tracks in one continuous operation. The Ser then clipped the stuff from his tube and sealed the tiny opening smoothly with a bit of sun material on the end of a long metal wand.

"Interesting material," he commented, as if only the technical nature of the stuff had offered any problem to him.

Tiny, carefully polished chips from the stars were ready, and men began placing them delicately on the shell. They sank into it at once and began twinkling. The planets had also been prepared, and they also went into the shell, while a mate to each was attached to the tracking mechanism. The tiny sun came last. Hanson fretted as he saw it sink into the shell, sure it would begin to melt the sky material. It seemed to have no effect, however; apparently the sun was not supposed to melt the sky when it was in place--so the little sun didn't melt the shell. Once he was sure of that, he used a scrap of the sky to insulate the second little sun that would control the first sympathetically from the track. He moved the control delicately by hand, and the little sun followed dutifully.

The weights on the control mechanism were in place, Hanson noted. Someone would probably have to keep them wound from now on, unless they could devise a foolproof motor. But that was for the future. He bent to the hand cranks. Sather Karf was being called to give the exact settings for this moment, but Hanson had a rough idea of where the planets should be. He began turning the crank, just as the Sather came up.

There was a slight movement. Then the crank stuck, and there was a whirring of slipping gears! The fools who had moved the orrery must have been so careless that they'd sprung the mechanism. He bent down to study the tiny little jeweled gears. A whole gear train was out of place!

Sather Karf was also inspecting it, and the words he cried didn't sound like an invocation, though they were strange enough. He straightened, still cursing. "Fix it!"

"I'll try," Hanson agreed doubtfully. "But you'd better get the man who made this. He'll know better than I--"

"He was killed in the first cracking of the sky when a piece hit him. Fix it, Dave Hanson. You claimed to be a repairman for such devices."

Hanson bent to study it again, using a diamond lens one of the warlocks handed him. It was a useful device, having about a hundred times magnification without the need for exact focusing. He stared at the jumble of fine gears, then glanced out through the open front of the building toward the sky. There was even less of it showing than he had remembered. Most of the great dome was empty. And now there were suggestions of ... shadows ... in the empty spots. He looked away hastily, shaken.

"I'll need some fine tools," he said.

"They were lost in moving this," Ser Perth told him. "This is the best we can do."

The jumble of tools had obviously been salvaged from the kits on the tractors in the camp. There was one fairly small pair of pliers, a small pick and assorted useless junk. He shook his head hopelessly.

"Fix it!" Sather Karf ordered again. The old man's eyes were also on the sky. "You have ten minutes, perhaps--no more."

Hanson's fingers steadied as he found bits of wire and began improvising tools to manipulate the tiny gears. The mechanism was a piece of superb craftsmanship that should have lasted for a million years, but it had never been meant to withstand the heavy shock of being dropped, as it must have been. And there was very little space inside. It should have been disassembled and put back piece by piece, but there was no time for that.

Another thunder of falling sky sounded, and the ground heaved. "Earthquakes!" Sather Karf whispered. "The end is near!"

Then a shout went up, and Hanson jerked his eyes from the gears to focus on a group of rocs that were landing at the far end of the camp. Men were springing from their backs before they stopped running--men in dull robes with elaborate masks over their faces. At the front was Malok, leader of the Sons of the Egg, brandishing his knife.

His voice carried clearly. "The egg hatches! To the orrery and smash it! That was the shadow in the pool. Destroy it before Dave Hanson can complete his magic!"

The men behind him yelled. Around Hanson, the magicians cried out in shocked fear. Then old Sather Karf was dashing out from under the cover of the building, brandishing a pole on which a drop of the sun-stuff was glowing. His voice rose into a command that rang out over the cries of the others.

Dave reached for a heavy hammer, meaning to follow. The old Sather seemed to sense it without looking back.
"Fix the engine, Dave Hanson," he called.

It made sense. The others could do the fighting, but only he had training with such mechanisms. He turned back to his work, just as the warlocks began rallying behind Sather Karf, grabbing up what weapons they could find.
There was no magic in this fight. Sticks, stones, hammers and knives were all that remained workable.

Dave Hanson bent over the gears, cursing. Now there was another rumble of thunder from the falling sky. The half-light from the reflected sunlight dimmed, and the ground shook violently. Another set of gears broke from the housing. Hanson caught up a bit of sun-stuff on the sharp point of the awl and brought it closer, until it burned his hands. But he had seen enough. The mechanism was ruined beyond his chance to repair it in time.

He slapped the cover shut and stuck the sun-tipped awl where it would light as much of the orrery as possible. As always, the skills of his own world had failed. To the blazes with it, then--when in magic land, magic had to do.

He thought of calling Ser Perth or Sather Karf, but there was no time for that, and they could hardly have heard him over the sounds of the desperate fight going on.

He bent to the floor, searching until he found a ball of the sky material that had been pinched off when the little opening was sealed. Further hunting gave him a few bits of dust from the star bits and some of the junk that had gone into shaping the planets. He brushed in some dirt from the ground that had been touched by the sun stuff and was still glowing faintly. He wasn't at all sure of how much he could extrapolate from what he'd read in the book on Applied Semantics, but he knew he needed a control--a symbol of the symbol, in this case. It was crude, but it might serve to represent the orrery.

He clutched it in his hand and touched it against the orrery, trying to remember the formula for the giving of a true name. He had to improvise, but he got through a rough version of it, until he came to the end: "I who created you name you--" What the deuce did he name it? "I name you Rumpelstiltsken and order you to obey me when I call you by your name."

He clutched the blob of material tighter in his hand, mentally trying to shape an order that wouldn't backfire, as such orders seemed to in the childhood stories of magic he had learned. Finally his lips whispered the simplest order he could find. "Rumpelstiltsken, repair yourself!"

There was a whirring and scraping inside the mechanism, and Hanson let out a yell. He got only a hasty glimpse of gears that seemed to be back on their tracks before Sather Karf was beside him, driving the cranks with desperate speed.

"We have less than a minute!" the old voice gasped.

The Sather's fingers spun on the controls. Then he straightened, moving his hands toward the orrery in passes too rapid to be seen. There was a string of obvious ritual commands in their sacred language. Then a single word rang out, a string of sounds that should have come from no human vocal chords.

There was a wrench and twist through every atom of Hanson's body. The universe seemed to cry out. Over the horizon, a great burning disc rose and leaped toward the heavens as the sun went back to its place in the sky. The big bits of sky-stuff around also jerked upwards, revealing themselves by the wind they whipped up and by the holes they ripped through the roof of the building. Hanson clutched at the scrap he had pocketed, but it showed no sign of leaving, and the tiny blob of sun-stuff remained fixed to the awl.

Through the diamond lens, Hanson could see the model of the world in the orrery changing. There were clouds apparently painted on it where no clouds had been. And there was an indication of movement in the green of the forests and the blue of the oceans, as if trees were whipping in the wind and waves lapping the shores.

When he jerked his eyes upward, all seemed serene in the sky. Sunlight shone normally on the world, and from under the roof he could see the gaudy blue of sky, complete, with the cracks in it smoothing out as he watched.

The battle outside had stopped with the rising of the sun. Half the warlocks were lying motionless, and the other half had clustered together, close to the building where Hanson and Sather Karf stood. The Sons of the Egg seemed to have suffered less, since they greatly out-numbered the others, but they were obviously more shocked by the rising of the sun and the healing of the sky.

Then Malok's voice rang out sharply. "It isn't stable yet! Destroy the machine! The egg must hatch!"

He leaped forward, brandishing his knife, while the Sons of the Egg fell in behind him. The warlocks began to close ranks, falling back to make a stand under the jutting edge of the roof, where they could protect the orrery. Bork and Ser Perth were among them, bloody but hopelessly determined.

One look at Sather Karf's expression was enough to convince Hanson that Malok had cried the truth and that their work could still be undone. And it was obvious that the warlocks could never stand the charge of the Sons. Too many of them had already been killed, and there was no time for reviving them.

Sather Karf was starting forward into the battle, but Hanson made no move to follow. He snapped the diamond lens to his eye and his fingers caught at the drop of sun-stuff on the awl. He had to hold it near the glowing bit for steadiness, and it began searing his fingers. He forced control on his muscles and plunged his hand slowly through the sky sphere, easing the glowing blob downward toward the spot on the globe he had already located with the lens. His thumb and finger moved downward delicately, with all the skill of practice at working with nearly invisibly fine wires on delicate instruments.
Then he jerked his eyes away from the model and looked out. Something glaring and hot was suspended in the air five miles away. He moved his hand carefully, steadying it on one of the planet tracks. The glowing fire in the air outside moved another mile closer--then another. And now, around it, he could see a monstrous fingertip and something that might have been miles of thumbnail.

The warlocks leaped back under the roof. The Sons of the Egg screamed and panicked. Jerking horribly, the monstrous thing moved again. For part of a second, it hovered over the empty camp. Then it was gone.

Hanson began pulling his hand out through the shell of the model, whimpering as his other hand clenched against the blob in his pocket. He had suddenly realized what horrors were possible to anyone who could use the orrery now. "Rumpelstiltsken, I command you to let no hand other than mine enter and to respond to no other controls." He hoped it would offer enough protection.

His hand came free and he threw the sun-bit away with a flick of his wrist. His hand ached with the impossible task of steadiness he had set it, and his finger and thumb burned and smoked. But the wound was already healing.

In the exposed section of the camp, the Sons of the Egg were charred corpses. There was a fire starting on the roof of the building, but others had already run out to quench that. It sounded like the snuffling progress of an undine across the roof! Maybe magic was working again.

Bork turned back from the sight of his former companions. His face was sick, but he managed to grin at Hanson. "Dave Hanson, to whom nothing is impossible," he said.

Hanson had located Nema finally as she approached. He caught her hand and grabbed Bork's arm. Like his own, it was trembling with fatigue and reaction.

"Come on," he said. "Let's find some place where we can see whether it's impossible now for you to magic up a decent meal. And a drink strong enough to scare away the sylphs."

The sylph that found them wasn't scared by the Scotch, but there was enough for all of them.

X

Three days can work magic--in a world where magic works. The planets swung along their paths again and the sun was in the most favorable house for conjuration. The universe was stable again.

There was food for all, and houses had been conjured hastily to shelter the people. The plagues were gone. Now the strange commerce and industry of this world were humming again. Those who had survived and those who could be revived were busily rebuilding. Some were missing, of course. Those who had risen and--hatched--were beyond recall, but no one spoke of them. If any Sons of the Egg survived, they were quiet in their defeat.

Hanson had been busy during most of the time. It had been taken for granted that he would tend to the orrery, setting it for the most favorable conditions when some special major work of magic required it, and he had taken the orders and moved the controls as they wanted them. The orrery was housed temporarily in the reconstituted hall of the Satheri in the capital city. They were building a new hall for it, to be constructed only of natural materials and hand labor, but that was a project that would take long months still.

Now the immediate pressure was gone, and Hanson was relaxing with Bork and Nema.

"Another week," Bork was saying. "Maybe less. And then gangs of the warlocks can spread out to fix up all the rest of the world--and to take over control of their slaves again. Are you happy with your victory, Dave Hanson?"

Hanson shrugged. He wasn't entirely sure, now. There was something in the looks of the Sather who gave him orders for new settings that bothered him. And some of the developments he watched were hardly what he would have preferred. The warlocks had good memories, it seemed, and there had been manifold offenses against them while the world was falling apart.

He tried to put it out of his mind as he drew Nema to him. She snuggled against him, admiring him with her eyes. But old habits were hard to break. "Don't, Dave. I'm a registered and certified--"

She stopped then, blushing, and Bork chuckled.

Ser Perth appeared at the doorway with two of the mandrakes. He motioned to Hanson. "The council of Satheri want you," he said. His eyes avoided the other, and he seemed uncomfortable.

"Why?" Bork asked.

"It's time for Dave Hanson's reward," Ser Perth said. The words were smooth enough, but the eyes turned away again.

Hanson got up and moved forward. He had been wondering when they would get around to this. Beside him, Bork and Nema also rose. "Never trust a Sather," Bork said softly.

Nema started to protest, then changed her mind. She frowned, torn between old and new loyalties.

"The summons was only for Dave Hanson," Ser Perth said sternly as the three drew up to him. But as Hanson took the arms of the other two, the Ser shrugged and fell in behind. Very softly, too low for the hearing of the mandrakes, his words sounded in Hanson's ear. "Guard yourself, Dave Hanson!"

So there was to be treachery, Hanson thought. He wasn't surprised. He was probably lucky to have even three
friends. The Satheri would hardly feel very grateful to a mandrake-man who had accomplished something beyond their power, now that the crisis was over. They had always been a high-handed bunch, apparently, and he had served his purpose. But he covered his thoughts in a neutral expression and went forward quietly toward the huge council room.

The seventy leading Satheri were all present, with Sather Karf presiding, when Hanson was ushered into their presence. He moved down the aisle, not glancing at the seated Satheri, until he was facing the old man, drawing Nema and Bork with him. There were murmurs of protest, but nobody stopped him. Above him, the eyes of Sather Karf were uncertain. For a moment, there seemed to be a touch of friendliness and respect in them, but there was something else that Hanson liked far less. Any warmth that was there vanished at his first words.

"It's about time," Hanson said flatly. "When you wanted your world saved, you were free enough with offers of reward. But three days have passed without mention of it. Sather Karf, I demand your secret name!"

He heard Nema gasp, but felt Bork's fingers press against his arm reassuringly. There was a rising mutter of shock and anger from the others, but he lifted his voice over it. "And the secret names of all those present. That was also part of the promised reward."

"And do you think you could use the names, Dave Hanson?" Sather Karf asked. "Against the weight of all our knowledge, do you think you could become our master that easily?"

Hanson had his own doubts. There were counter-magical methods against nearly all magic, and the book he had read had been only an elementary one. But he nodded. "I think with your name I could get my hands on your hearts, even if you did your worst. It doesn't matter. I claim my reward."

"And you shall have it. The word of Sather Karf is good," the old man told him. "But there was no mention of when you would be given those names. You said that when the computer was finished you would wait for my true name, and I promised that you should have it when the time came, but not what the time would be. So you will wait, or the agreement shall be broken by you, not by me. When you are dying or otherwise beyond power over us, you shall have the names, Dave Hanson. No, hear me!"

He lifted his hand in a brief gesture and Hanson felt a thickness over his lips that made speech impossible. "We have discussed your reward, and you shall indeed have it," Sather Karf went on. "Exactly as I promised it to you. I agreed to find ways to return you to your own world intact, and you shall be returned."

For a moment, the thickness seemed to relax, and Hanson choked a few words out through it. "What's the world of a mandrake-man, Sather Karf? A mandrake swamp?"

"For a mandrake-man, yes. But not for you." There was something like amusement in the old man's voice. "I never said you were a mandrake-man. That was told you by Ser Perth who knew no better. No, Dave Hanson, you were too important to us for that. Mandrake-men are always less than true men, and we needed your best. You were conjured atom by atom, id and ka and soul, from your world. Even the soul may be brought over when enough masters of magic work together and you were our greatest conjuration. Even then, we almost failed. But you're no mandrake-man."

A load of sickness seemed to leave Hanson's mind. He had never fully realized how much the shame of what he thought himself to be had weighed on him. Then his mind adjusted to the new facts, dismissing his past worries. "I promised you that we would fill your entire lifetime with pleasures," Sather Karf went on. "And you were assured of jewels to buy an empire. All this the council is prepared to give you. Are you ready for your reward?"

"No!" Bork's cry broke out before Hanson could answer. The big man was writhing before he could finish the word, but his own fingers were working in conjurations that seemed to hold back enough of the spells against him to let him speak. "Dave Hanson, your world was a world of rigid laws. You died there. And there would be no magic to avoid the fact that there you must always be dead."

Hanson's eyes riveted on the face of Sather Karf. The old man looked back and finally nodded his head. "That is true," he admitted. "It would have been kinder for your own world intact, but it is the truth."

"And jewels enough to buy an empire on a corpse," Hanson accused. "A lifetime of pleasures--simple enough when that lifetime would be over before it began. What were the pleasures, Sather Karf? Having you reveal your name just before I was sent back and feeling I'd won?" He grimaced. "I reject the empty rewards of your empty promises!"

"I also rejected the interpretation, but I was out-voted," Sather Karf said, and there was a curious reluctance as he raised his hand. "But it is too late. Dave Hanson prepare to receive your reward. By the power of your name--"

Hanson's hand went to his pocket and squeezed down on the blob of sky material there. He opened his mouth, and found that the thickness was back. For a split second, his mind screamed in panic as he realized he could not even pronounce the needed words.

Then coldness settled over his thoughts as he drove them to shape the unvoiced words in his mind. Nobody had told him that magic incantations had to be pronounced aloud. It seemed to be the general law, but for all he knew,
ignorance of the law here might change the law. At least he meant to die trying, if he failed.

"Rumpelstiltsken, I command the sun to set!"

He seemed to sense a hesitation in his mind, and then the impression of jeweled gears turning. Outside the window, the light reddened, dimmed, and was gone, leaving the big room illuminated by only a few witch lights.

The words Sather Karf had been intoning came to a sudden stop, even before they could be drowned in the shouts of shock and panic from the others. His eyes centered questioningly on Hanson and the flicker of a smile crossed his face. "To the orrery!" he ordered. "Use the manual controls."

Hanson waited until he estimated the men who left would be at the controls. The he clutched the sky-blob again. The thoughts in his mind were clearer this time.

"Rumpelstiltsken, let the sun rise from the west and set in the east!"

Some of the Satheri were at the windows to watch what happened this time. Their shouts were more frightened than before. A minute later, the others were back, screaming out the news that the manual controls could not be moved--could not even be touched.

The orrery named Rumpelstiltsken was obeying its orders fully, and the universe was obeying its symbol.

Somehow, old Sather Karf brought order out of the frightened mob that had been the greatest Satheri in the world. "All right, Dave Hanson," he said calmly. "Return the sun to its course. We agree to your conditions."

"You haven't heard them yet!"

"Nevertheless," Sather Karf answered firmly, "we agree. What else can we do? If you decided to wreck the sky again, even you might not be able to repair it a second time." He tapped his hands lightly together and the sound of a huge gong reverberated in the room. "Let the hall be cleared. I will accept the conditions in private."

There were no objections. A minute later Hanson, Bork and Nema were alone with the old man. Sunlight streamed in through the window, and there were fleecy clouds showing in the blue sky.

"Well?" Sather Karf asked. There was a trace of a smile on his face and a glow of what seemed to be amusement in his eyes as he listened, though Hanson could see nothing amusing in the suggestions he was making.

First, of course, he meant to stay here. There was no other place for him, but he would have chosen to stay in any event. Here he had developed into what he had never even thought of being, and there were still things to be learned. He'd gone a long way on what he'd found in one elementary book. Now, with a chance to study all their magical lore and apply it with the methods he had learned in his own world, there were amazing possibilities opening up to him. For the world, a few changes would be needed. Magic should be limited to what magic did best; the people needed to grow their own food and care for themselves. And they needed protection from the magicians. There would have to be a code of ethics to be worked out later.

"You've got all the time you need to work things out, Sathator Hanson," Sather Karf told him. "It's your world, literally, so take your time. What do you want first?"

Hanson considered it, while Nema's hand crept into his. Then he grinned. "I guess I want to get your great granddaughter turned into a registered and certified wife and take her on a long honeymoon," he decided. "After what you've put me through, I need a rest."

He took her arm and started down the aisle of the council room. Behind him, he heard Bork's chuckle and the soft laughter of Sather Karf. But their faces were sobering by the time he reached the doorway and looked back.

"I like him, too, grandfather," Bork was saying. "Well, it seems your group was right, after all. Your prophecy is fulfilled. He may have a little trouble with so many knowing his name, but he's Dave Hanson, to whom nothing is impossible. You should have considered all the implications of omnipotence."

Sather Karf nodded. "Perhaps. And perhaps your group was also right, Bork. It seems that the world-egg has hatched."

Hanson puzzled over their words briefly as he closed the door and went out with Nema. He'd probably have to do something about his name, but the rest of the conversation was a mystery to him. Then he dismissed it. He could always remember it when he had more time to think about it.

* * * * *

It was many millennia and several universes later when Dave Hanson finally remembered. By then it was no mystery, of course. And there was no one who dared pronounce his true name.

THE END.
It's a funny thing, but most monsters seem to be of the opinion that it's men who are the monsters. You know, they have a point.

Ten minutes after the crashup, somebody phoned for the Army. That meant us. The black smoke of the fire, and the oily residues, which were later analyzed, proved the presence of a probable petroleum derivative. The oil was heavily tainted with radioactivity. Most likely it was fuel from the odd, conchlike reaction-motors, the exact principles of which died, as far as we were concerned, with the crash.

The craft was mainly of aluminum, magnesium and a kind of stainless steel, proving that, confronted with problems similar to ones we had encountered, aliens might solve them in similar ways. From the crumpled-up wreckage which we dug out of that Missouri hillside, Klein even noticed a familiar method of making girders and braces lighter. Circular holes were punched out of them at spaced intervals.

I kept hunting conviction by telling myself that, for the first time in all remembered history, we were peeking behind the veil of another planet. This should be the beginning of a new era, one of immensely widened horizons, and of high romance—but with a dark side, too. The sky was no longer a limit. There were things beyond it that would have to be reckoned with. And how does unknown meet unknown? Suppose one has no hand to shake?

The mass of that wreck reeked like a hot cinder-pile and a burning garbage dump combined. It oozed blackened goo. There were crushed pieces of calcined material that looked like cuttlebone. The thin plates of charred stuff might almost have been pressed cardboard. Foot-long tubes of thin, tin-coated iron contained combined chemicals identifiable as proteins, carbohydrates and fats. Food, we decided.

Naturally, we figured that here was a wonderful clue to the plant and animal life of another world. Take a can of ordinary beef goulash; you can see the fibrous muscle and fat structure of the meat, and the cellular components of the vegetables. And here it was true, too, to a lesser degree. There were thin flakes and small, segmented cylinders which must have been parts of plants. But most was a homogeneous mush like gelatin.

Evidently there had been three occupants of the craft. But the crash and the fire had almost destroyed their forms. Craig, our biologist, made careful slides of the remains, tagging this as horny epidermis, this as nerve or brain tissue, this as skeletal substance, and this as muscle from a tactile member—the original had been as thin as spaghetti, and dark-blooded.

Under the microscope, muscle cells proved to be very long and thin. Nerve cells were large and extremely complex. Yet you could say that Nature, starting from scratch in another place, and working through other and perhaps more numerous millions of years, had arrived at somewhat the same results as it had achieved on Earth.

I wonder how an other-world entity, ignorant of humans, would explain a shaving-kit or a lipstick. Probably for like reasons, much of the stuff mashed into that wreck had to remain incomprehensible to us. Wrenches and screwdrivers, however, we could make sense of, even though the grips of those tools were not hand-grips. We saw screws and bolts, too. One device we found had been a simple crystal diaphragm with metal details—a radio. There were also queer rifles. Lord knows how many people have wondered what the extraterrestrial equivalents of common human devices would look like. Well, here were some answers.

A few of the instruments even had dials with pointers. And the numeral 1 used on them was a vertical bar, almost like our own. But zero was a plus sign. And they counted by twelves, not tens.

But all these parallels with our own culture seemed canceled by the fact that, even when this ship was in its original undamaged state, no man could have gotten inside it. The difficulty was less a matter of human size than of shape and physical behavior. The craft seemed to have been circular, with compartmentation in spiral form, like a chambered nautilus.

This complete divergence from things we knew sent frost imps racing up and down my spine.

And it prompted Blaine to say: "I suppose that emotions, drives, and purposes among off-Earth intelligences must be utterly inconceivable to us."

We were assembled in the big trailer that had been brought out for us to live in, while we made a preliminary survey of the wreck.

"Only about halfway, Blaine," Miller answered. "Granting that the life-chemistry of those intelligences is the
same as ours—the need for food creates the drive of hunger. Awareness of death is balanced by the urge to avoid it. There you have fear and combativeness. And is it so hard to tack on the drives of curiosity, invention, and ambition, especially when you know that these beings made a spaceship? Cast an intelligence in any outward form, anywhere, it ought to come out much the same. Still, there are bound to be wide differences of detail—with wide variations of viewpoint. They could be horrible to us. And most likely it's mutual."

I felt that Miller was right. The duplication of a human race on other worlds by another chain of evolution was highly improbable. And to suppose that we might get along with other entities on a human basis seemed pitifully naive.

With all our scientific thoroughness, when it came to examining, photographing and recording everything in the wreck, there was no better evidence of the clumsy way we were investigating unknown things than the fact that at first we neglected our supreme find almost entirely.

It was a round lump of dried red mud, the size of a soft baseball. When Craig finally did get around to X-raying it, indications of a less dense interior and feathery markings suggesting a soft bone structure showed up on the plate. Not entirely sure that it was the right thing to do, he opened the shell carefully.

Think of an artichoke ... but not a vegetable. Dusky pink, with thin, translucent mouth-flaps moving feebly. The blood in the tiny arteries was very red—rich in hemoglobin, for a rare atmosphere.

As a youngster, I had once opened a chicken egg, when it was ten days short of hatching. The memory came back now.

"It looks like a growing embryo of some kind," Klein stated.
"Close the lump again, Craig," Miller ordered softly.
The biologist obeyed.
"A highly intelligent race of beings wouldn't encase their developing young in mud, would they?" Klein almost whispered.
"You're judging by a human esthetic standard," Craig offered. "Actually, mud can be as sterile as the cleanest surgical gauze."

* * * * *

The discussion was developing unspoken and shadowy ramifications. The thing in the dusty red lump—whether the young of a dominant species, or merely a lower animal—had been born, hatched, started in life probably during the weeks or months of a vast space journey. Nobody would know anything about its true nature until, and if, it manifested itself. And we had no idea of what that manifestation might be. The creature might emerge an infant or an adult. Friendly or malevolent. Or even deadly.

Blaine shrugged. Something scared and half-savage showed in his face. "What'll we do with the thing?" he asked. "Keep it safe and see what happens. Yet it might be best to get rid of it fast—with chloroform, cyanide or the back of a shovel."

Miller's smile was very gentle. "Could be you're right, Blaine."
I'd never known Miller to pull rank on any of the bunch. Only deliberate thought would remind us that he was a colonel. But he wasn't really a military man; he was a scientist whom the Army had called in to keep a finger on a possibility that they had long known might be realized. Yes—space travel. And Miller was the right guy for the job. He had the dream even in the wrinkles around his deep-set gray eyes.

Blaine wasn't the right guy. He was a fine technician, good at machinery, radar—anything of the sort. And a nice fellow. Maybe he'd just blown off steam—uncertainty, tension. I knew that no paper relating to him would be marked, "Psychologically unsuited for task in hand." But I knew just as surely that he would be quietly transferred. In a big thing like this, Miller would surround himself only with men who saw things his way.

That night we moved everything to our labs on the outskirts of St. Louis. Every particle of that extraterrestrial wreck had been packed and crated with utmost care. Klein and Craig went to work to build a special refuge for that mud lump and what was in it. They were top men. But I had got tied up with Miller more or less by chance, and I figured I'd be replaced by an expert. I can say that I was a college man, but that's nothing.

I guess you can't give up participation in high romance without some regret. Yet I wasn't too sorry. I liked things the way they'd always been. My beer. My Saturday night dates with Alice. On the job, the atmosphere was getting a bit too rich and futuristic.

* * * * *

Later that evening, Miller drew me aside. "You've handled carrier pigeons and you've trained dogs, Nolan," he said. "You were good at both."
"Here I go, back to the farm-yard."
"In a way. But you expand your operations, Nolan. You specialize as nurse for a piece of off-the-Earth animal life."
"Look, Miller," I pointed out. "Ten thousand professors are a million times better qualified, and rarin' to go."
"They're liable to think they're well qualified, when no man could be--yet. That's bad, Nolan. The one who does it has to be humble enough to be wary--ready for whatever might happen. I think a knack with animals might help. That's the best I can do, Nolan."
"Thanks, Miller." I felt proud--and a little like a damn fool.
"I haven't finished talking yet," Miller said. "We know that real contact between our kind and the inhabitants of another world can't be far off. Either they'll send another ship or we'll build one on Earth. I like the idea, Nolan, but it also scares the hell out of me. Men have had plenty of trouble with other ethnic groups of their own species, through prejudice, misunderstanding, honest suspicion. How will it be at the first critical meeting of two kinds of things that will look like hallucinations to each other? I suspect an awful and inevitable feeling of separateness that nothing can bridge--except maybe an impulse to do murder.
"It could be a real menace. But it doesn't have to be. So we've got to find out what we're up against, if we can. We've got to prepare and scheme. Otherwise, even if intentions on that other world are okay, there's liable to be an incident at that first meeting that can spoil a contact across space for all time, and make interplanetary travel not the success it ought to be, but a constant danger. So do you see our main objective, Nolan?"
I told Miller that I understood.

That same night, Klein and Craig put the lump of mud in a small glass case from which two-thirds of the air had been exhausted. The remainder was kept dehydrated and chilled. It was guess work, backed up by evidence: The rusty red of that mud; the high hemoglobin content of the alien blood we had seen; the dead-air cells--resistant to cold--in the shreds of rough skin that we had examined. And then there was the fair proximity of Mars and Earth in their orbits at the time.

My job didn't really begin till the following evening, when Craig and Klein had completed a much larger glass cage, to which my outlandish--or, rather, outworldish--ward was transferred. Miller provided me with a wire-braced, airtight costume and oxygen helmet, the kind fliers use at extreme altitudes. Okay, call it a spacesuit. He also gave me a small tear-gas pistol, an automatic, and a knife.
All there was to pit such armament against was a seemingly helpless lump of protoplasm, two inches in diameter. Still, here was an illustration of how cautiously you are prompted to treat so unknown a quantity. You are unable to gauge its powers, or lack of them, for you have nothing on which to base a judgment.
I became like a monk--my pressure armor was my robe; the chilly semi-vacuum inside that glass cage, my cell. Nights out with Alice were going to be far between.

* * * * *
On the third evening, that lump of mud, resting in dried-out soil similar to itself, split along the line where Craig had originally cut it. Out onto the cage floor crept what the records designated as E.T.L.--Extra-Terrestrial-Life. It was finished with the mud shell that had encased it to survive a crash and fire.
Craig, Klein, Miller and a lot of news reporters stared into the glass cage from outside. There was nothing for me to do just then except watch that tiny monster, and try to read, in its every clumsy, dragging movement, some fragmentary unveiling of many riddles.

Although it might have shrunk a bit since I had last seen it, it looked more complete. The dusky pink of its wrinkled integument was darker. It had dozens of short tendrils, hardly thicker than horsehair, with which it pulled itself along. It had lost some leaflike pieces of skin. Laterally, two eyes gleamed, clear and slit-pupiled. Its jaws, hinged on a horizontal plane, opened and closed between fleshy flaps. Through the thin plastic of my oxygen helmet, I heard a querulous "chip-chip-chip," which reminded me of the squeaking of an infant bat.

The E.T.L. crept in a small looping course on the cage floor, back to one half of the mud shell that had encased it. It tried to mount this, perhaps to gain a vantage point for better observation. But it fell and turned over. Its ventral surface was ceiling-ward; its tendrils writhed furiously as it tried to right itself. I thought of a horseshoe crab, stranded on its back and kicking helplessly. But this thing's form and movement were even more alien.

After a moment, I followed an impulse which was part duty to my job and part pity. I tipped the little horror back on its bottom, glad that there was a glove between me and it. Then I did the same thing I would do with a pet puppy or kitten. I set a dish of food--chemically prepared to duplicate the contents of the tubes we had found in the wreck--right down in front of the E.T.L.
It fumbled at the stuff and, possibly because of a gravity two-and-a-half times as great as it was made for, it almost got itself stuck in the mess. But it freed itself. Its mouth-flaps began to make lapping movements as it sucked the nourishment.
I felt prematurely relieved. This was no potentially dominant wizard in a strange body, I told myself. This was pure animal.
Over my helmet radiophone--there was a mike outside the cage, so they could communicate with me when I
was inside--I heard Miller say to the reporters:
"The feeding instinct. They've got it, too. Now we know for sure...."

I think that the E.T.L. had colic from that first meal, though, like any half-smart puppy trainer, I tried not to let it eat too much. It writhed for a while, as if in pain. And I was on pins. How was I supposed to know just what was best to feed the thing, so it would survive? Everything was guesswork, varying formulas cautiously, groping. And it wasn't only the food. There was the searching for the temperature, the air-pressure and the degree of dryness at which the E.T.L. seemed most comfortable. And there was also the fiddling around with light-composition and intensities, variable in the sun lamps, to find what seemed best.

We seemed to have figured things out right--or else the monster was just rugged. It shed several skins, thrived and grew active. Its size increased steadily. And other things began to grow in that cage. Odd, hard-shelled, bluish-green weeds; lichenous patches, dry as dust; invisible, un-Earthly bacteria--all were harmless, possibly even beneficial, to my charge.

We seemed to have figured things out right--or else the monster was just rugged. It shed several skins, thrived and grew active. Its size increased steadily. And other things began to grow in that cage. Odd, hard-shelled, bluish-green weeds; lichenous patches, dry as dust; invisible, un-Earthly bacteria--all were harmless, possibly even beneficial, to my charge.

How did all this stuff come into being? Miller and Craig had examined the dried clay of the E.T.L.'s discarded casing with microscopes. They scraped dust from every fragment of the wreck that hadn't been blasted too much with fire, and made cultures. They were looking for spores and seeds and microbes. And it wasn't long before they had classified quite a list of other-world biological forms. The most common of these they transplanted into the cage.

Often I even slept inside the cage, clad in my armor. That's devotion to a purpose for you. In a way, it was like living on a little piece of Mars. Often enough I was bored stiff.

But plenty did happen. From the start Etl--we began calling the thing that--showed an almost electrically intense curiosity for everything. Some of the habits of its kind were written in its instincts. It basked in strong light, but it liked dark corners, too. At night--when we turned the sun lamps off, that is--it would bury itself in the dusty soil. Protection against nocturnal cold might have been the reason for that.

When he was a month and two days out of his clay shell, Etl tried to rear up vertically on his tendrils. He kept toppling over. Maybe he was trying to "walk." But there were no bones in those tendrils and, of course, the strong Earth gravity defeated him.

Lots of times I tried to see what he could do. A real scientist would call this "making tests." I just called it fooling around. I made him climb a stool for his food. He seemed to make a careful survey first, eying each rung; then he drew himself up in one motion.

During one of my rare nights in town--to get a refresher from outlandish stuff in Alice's company--I bought some toys. When I came back to relieve Craig, who had taken care of Etl during my absence, I said: "Etl, here's a rubber ball. Let's play."

He caught it on the second try, in those swift, dextrous tendrils. There was a savagery in the way he did it. I thought of a dog snapping a bumblebee out of the air. Yet my idea that Etl was just an animal had almost vanished by then.

I got into the habit of talking to him the way you do to a pup. Sort of crooning. "Good fella, Etl. Smart. You learn fast, don't you?"

Stuff like that. And I'd coax him to climb up the front of my spacesuit. There were fine, barb-like prongs along the length of his many tentacles; I could feel them pulling in the tough, rubberized fabric, like the claws of a climbing kitten. And he would make a kind of contented chirping that might have had affection in it.

But then there was the time when he bit me. I don't know the reason, unless it was that I had held onto his ball too long. He got my finger, through the glove, with his snaggy, chalk-hued mandibles, while he made a thin hissing noise.

Pretty soon my hand swelled up to twice its size, and I felt sick. Klein had to relieve me in the cage for a while. The bite turned out to be mildly venomous. Before that, I'd had a rash on my arms. An allergy, probably; maybe some substance from those Martian plants had gotten inside my spacesuit and rubbed onto my skin. Who knows? Perhaps Earthly flesh can sense alien life, and reddens to fight it off. And there you have one of the potential disadvantages of contact with unknown worlds.

That poisoned bite was one thing. But Etl's show of rage was another--a sign of the mixed nature of all his kind, emerging a bit from the shadows of enigma. Here revealed was the emotion on which things like murder are based. These creatures had it, just as we did. Maybe it's necessary for any kind of thing that can progress upward from nothing. Still, people did not find it reassuring when they heard about it on the news cast.

After that, popular opinion insisted that the cage be constantly surrounded by four manned machine-guns
pointing inward. And tanks of cyanogen were so arranged that the poison gas could be sent gushing into the cage at any time.

Part of my mind felt these precautions were completely exaggerated. There is a certain, ever-present segment of any public, whose jittery imagination is a constant fuse-cap for panic. Such cowardice angered me.

But the rest of me went along with Miller when he said: "We're in the dark, Nolan. For all we know, we might be up against very swift maturity and inherited memory. And we've got to go on testing Etl ... with toys, psychological apparatus and tools and devices made by his own people. Suppose he 'remembers' skills from his ancestors, and can build dangerous new devices, or make old ones work again? If his kind are bent on being enemies, we'd better find it out as soon as possible, too, hadn't we? No, I don't truly expect any serious developments, Nolan. Still--just for insurance--eh?"

A year passed without great mishap--unless I should mention that Alice and I got married. But it didn't spoil anything, and it raised my morale. We got a bungalow right on the lab grounds.

A lot had been accomplished, otherwise. Once I let Etl play with my gun, minus cartridges. He was avidly interested; but he paid no attention to the Hopalong cap pistol that I left in its place when I took the gun back. He figured out how to grip simple Martian tools, threading his tactile members through the holes in their handles; but complicated devices of the same origin seemed more of a puzzle to him than to the rest of us. So our inherited-memory idea faded out.

Etl liked to work with those slender tendrils of his. The dexterity and speed with which he soon learned to build many things with a construction set seemed to prove a race background of perhaps ages of such activities. I made a tower or a bridge, while he watched. Then he was ready to try it on his own, using screwdrivers that Klein had made with special grips.

Of course we tried dozens of intelligence tests on Etl, mostly of the puzzle variety, like fitting odd-shaped pieces of plastic together to form a sphere or a cube. He was hard to rate on any common human I.Q. scale. Even for an Earthian, an I.Q. rating is pretty much of a makeshift proposition. There are too many scattered factors that can't be touched.

With Etl, it was even tougher. But at the end of that first year Miller had him pegged at about 120, judging him on the same basis as a five-year-old child. This score scared people a lot, because it seemed to hint at a race of super-beings.

But Miller wasn't jumping to conclusions. He pointed out to the reporters that Etl's kind seemed to grow up very rapidly; 120 was only twenty points above the norm--not uncommon among Earth youngsters, especially those from more gifted families. Etl seemed to have sprung from corresponding parentage, he said, for it seemed clear that they had been of the kind that does big things. They'd made a pioneering voyage across space, hadn't they?

Etl could make chirps and squeaks and weird animal cries. Human speech, however, was beyond his vocal powers, though I knew that he could understand simple orders. He had a large tympanic membrane or "ear" on his ventral surface. Of course we wondered how his kind communicated with one another. The way he groped at my fingers with certain of his tentacles gave us a clue. There were tiny, nerve-like threads at their extremities. Seeing them prompted Miller to do something as brave as it was foolhardy.

He called in a surgeon and had a nerve in his arm bared. It must have hurt like the devil, but he let Etl clutch it with those thread-like members.

I was cockeyed enough to follow Miller's example and found out how much it really hurt. The idea was to establish a nerve channel, brain to brain, along which thoughts might pass. But nothing came through except a vague and restless questioning, mixed with the pain of our experiment.

"It doesn't work with us, Nolan," Miller said regretfully. "Our nervous systems aren't hooked up right for this sort of stunt, or Etl's nerve cells are too different from ours."

So we had to fall back on simpler methods of communication with Etl. We tried teaching him sign language, but it didn't work too well, because tentacles aren't hands. Klein's inventive ability, plus some pointers from me about how Etl used his tendrils, finally solved the problem.

Klein made a cylindrical apparatus with a tonal buzzer, operated by electricity, at one end. It had dozens of stops and controls, their grips in the shape of tiny metal rings, along the sides of the cylinder.

First I had to learn a little about how to work that instrument with my big fingers. The trick was to mold the sounds of the buzzer, as human lips and tongue mold and shape tones of the vocal cords, so that they became syllables and words.

"Hell-oh-g-g-Et-t-I-I-I.... Chee-s-s-ee-whad-d I-ee got-t?"

It was tougher for me than learning to play a saxophone is for a boy of ten. And the noises were almost as bad.
I turned the apparatus over to Etl as soon as I could. Let him figure out how to use it. I’d just give him the words, the ideas. Of course he had to get educated, learn his cat, dog and rat, and his arithmetic, the same as a human kid, even if he was from another world. In a way, it was the law. You can’t let a youngster, capable of learning, stay home from school.

And I was Etl’s tutor. I thought what a crazy situation we had here; an entity from one planet being brought up on another, without any real knowledge of his own folks, and unable to be very close to those entities by whom he was being reared. It was strange and sad and a little comic.

For a while I thought I had a stammering parrot on my hands: “Hel-l-l-l-l-o ... Hell-oh-g-o ... N-n-ol-l-an-n-n ... Hell-lo-oh.”

Etl never lost that habit of repetition. But he made progress in his studies.

“One, two, t’ree, fo’, fibe, siss ... One time one ee one, toot time one ee two....”

Picture it the way it was--I, clad in a spacesuit, crouching beside Etl in the cold, thin air inside that cage, tracing numbers and words in the dusty soil on the floor, while he read aloud with his voice tube or copied my words and figures with a sharp stick. Outside the transparent cage, the television cameras would be watching. And I would think that maybe in a way Etl was like Tarzan, being raised by apes.

* * * * *

Four more years went by. I had offspring of my own. Patty and Ron. Good-looking, lovable brats. But Etl was my job--and maybe a little more than that.

At the end of two years, he stopped growing. He weighed fifty-two pounds and he was the ugliest-looking, elongated, gray-pink, leathery ovoid that you could imagine. But with his voice tube clutched in his tendrils, he could talk like a man.

He could take the finest watch, apart, repair and clean it in jig-time--and this was just one skill among scores. Toward the end of the four years, a Professor Jonas was coming in regularly and getting into a spacesuit to give him lessons in physics, chemistry, college math, astronomy and biology. Etl was having his troubles with calculus.

And Etl could at least ape the outward aspects of the thoughts and feelings of men. There were things he said to me that were characteristic, though they came out of apparent sullenness that, for all I knew, had seeds of murder in it: “You're my pal, Nolan. Sort of my uncle. I won't say my father; you wouldn't like that.”

Nice, embarrassing sentiment, on the surface. Maybe it was just cool mimicry--a keen mind adding up human ways from observation of me and my kids, and making up something that sounded the same, without being the same at all. Yet somehow I hoped that Etl was sincere.

Almost from the building of the cage, of course, we'd kept photographs and drawings of Mars inside for Etl to see.

Hundreds of times I had said to him things like: "It's a ninety-nine and ninety-nine hundredths per cent probability that your race lives on that world, Etl. Before the ship that brought you crashed on Earth, we weren't at all sure that it was inhabited, and it's still an awful mystery. I guess maybe you'll want to go there. Maybe you'll help us make contact and establish amicable relations with the inhabitants--if there's any way we can do that.”

During those five years, no more ships came to Earth from space, as far as we knew. I guessed that the Martians understood how supremely hard it would be to make friendly contact between the peoples of two worlds that had always been separate. There was difference of form, and certainly difference of esthetic concepts. Of custom, nothing could be the same. We didn't have even an inkling of what the Martian civilization would be like.

* * * * *

One thing happened during the third year of Etl's existence. And his presence on Earth was responsible. Enough serious interest in space travel was built up to overcome the human inertia that had counteracted the long-standing knowledge that such things were possible. A hydrogen-fusion reaction motor was built into a rocket, which was then hurled to the moon.

Miller went along, ostensibly to help establish the first Army experimental station there, but mostly to acquire the practical experience for a far longer leap.

In a way, I wished I could have gone, too; but, after all, the shadows in Etl's background were far more intriguing than the dead and airless craters and plains of the lunar surface.

Before Miller and the other moon-voyagers even returned, Detroit was busy forging, casting and machining the parts for a better, larger and much longer-range rocket, to be assembled in White Sands, New Mexico.

When Miller got back, he was too eager and busy to say much about the moon. For the next two and a half years, he was mostly out in White Sands.

But during the first of our now infrequent meetings, he said to Craig and Klein and me: "When I go out to Mars, I'd like to keep my old bunch as crew. I need men I'm used to working with, those who understand the problems we're up against. I have a plan that makes sense. The trouble is, to join this expedition, a man has to be
part damn-fool."
Klein chuckled. "I'll sell you some of mine."
I just nodded my way in. I'd never thought of backing out.
Craig grabbed Miller's hand and shook it.
Miller gave Etl a chance to say no. "You can stay on Earth if you want to, Etl."
But the creature said: "I have lived all my life with the idea of going, Miller. Thank you."

* * * * *
Miller briefed us about his plan. Then he, Klein, Craig and I all took a lot of psych tests--trick questioning and so forth to reveal defects of conviction and control. But we were all pretty well indoctrinated and steady. Etl had taken so many tests already that, if there were any flaws still hidden in him, they would probably never be found.

Mars and Earth were approaching closer to each other again in their orbital positions. A month before takeoff time, Craig, Klein and I took Etl, in a small air-conditioned cage, to White Sands. The ship towered there, silvery, already completed. We knew its structure and the function of its machinery intimately from study of its blueprints. But our acquaintance with it had to be actual, too. So we went over it again and again, under Miller's tutelage.

Miller wrote a last message, to be handed to the newscast boys after our departure:
"If by Martian action, we fail to return, don't blame the Martians too quickly, because there is a difference and a doubt. Contact between worlds is worth more than the poison of a grudge...."

I said good-by to Alice and the kids, who had come out to see me off. I felt pretty punk. Maybe I was a stinker, going off like that. But, on the other hand, that wasn't entirely the right way to look at things, because Patty's and Ron's faces fairly glowed with pride for their pa. The tough part, then, was for Alice, who knew what it was all about. Yet she looked proud, too. And she didn't go damp.

"If it weren't for the kids, I'd be trying to go along, Louie," she told me. "Take care of yourself."
She knew that a guy has to do what's in his heart. I think that the basic and initial motive of exploration is that richest of human commodities--high romance. The metallic ores and other commercial stuff that get involved later are only cheap by-products. To make the dream of space travel a reality was one of our purposes. But to try to forestall the danger behind it was at least as important.

* * * * *
We blasted off in a rush of fire that must have knocked down some self-operating television cameras. We endured the strangling thrust of acceleration, and then the weightlessness of just coasting on our built-up velocity. We saw the stars and the black sky of space. We saw the Earth dwindle away behind us.

But the journey itself, though it lasted ninety days, was no real adventure--comparatively speaking. There was nothing unpredictable in it. Space conditions were known. We even knew about the tension of nostalgia. But we understood, too, the mental attitudes that could lessen the strain. Crossing space to another world under the tremendous power of atomic fusion, and under the precise guidance of mathematics and piloting devices, reduces the process almost to a formula. If things go right, you get where you're going; if not, there isn't much you can do. Anyway, we had the feeling that the technical side of interplanetary travel was the simplest part.

There is a marking near the Martian equator shaped like the funnel of a gigantic tornado. It is the red planet's most conspicuous feature and it includes probably the least arid territory of a cold, arid world. Syrtis Major, it is called. Astronomers had always supposed it to be an ancient sea-bottom. That was where our piloting devices were set to take us.

Over it, our retarding fore-jets blazed for the last time. Our retractable wings slid from their sockets and took hold of the thin atmosphere with a thump and a soft rustle. On great rubber-tired wheels, our ship--horizontal now, like a plane--landed in a broad valley that must have been cleared of boulders by Martian engineers countless ages before.

Our craft stopped rumbling. We peered from the windows of our cabin, saw the deep blue of the sky and the smaller but brilliant Sun. We saw little dusty whirlwinds, carven monoliths that were weathering away, strange blue-green vegetation, some of which we could recognize. To the east, a metal tower glinted. And a mile beyond it there was a tremendous flat structure. An expanse of glassy roof shone. What might have been a highway curved like a white ribbon into the distance.

The scene was quiet, beautiful and sad. You could feel that here maybe a hundred civilizations had risen, and had sunk back into the dust. Mars was no older than the Earth; but it was smaller, had cooled faster and must have borne life sooner. Perhaps some of those earlier cultures had achieved space travel. But, if so, it had been forgotten until recent years. Very soon now its result would be tested. The meeting of alien entity with alien entity was at hand.

I looked at Etl, still in his air-conditioned cage. His stalked eyes had a glow and they swayed nervously. Here was the home-planet that he had never seen. Was he eager or frightened, or both?
His education and experience were Earthly. He knew no more of Mars than we did. Yet, now that he was here and probably at home, did difference of physical structure and emotion make him feel that the rest of us were enemies, forever too different for friendly contact? My hide began to pucker.

* * * * *

High in the sky, some kind of aircraft glistened. On the distant turnpike there were the shining specks of vehicles that vanished from sight behind a ridge shaggy with vegetation.

Miller had a tight, nervous smile. "Remember, men," he said. "Passivity. Three men can't afford to get into a fight with a whole planet."

We put on spacesuits, which we'd need if someone damaged our rocket. It had been known for years that Martian air was too thin and far too poor in oxygen for human lungs. Even Etl, in his cage, had an oxygen mask that Klein had made for him. We had provided him with this because the Martian atmosphere, drifting away through the ages, might be even leaner than the mixture we'd given Etl on Earth. That had been based on spectroscopic analyses at 40 to 60 million miles' distance, which isn't close enough for any certainty.

Now all we could do was wait and see what would happen. I know that some jerks, trying to make contact with the inhabitants of an unknown world, would just barge in and take over. Maybe they'd wave a few times and grin. If instead of being met like brothers, they were shot at, they'd be inclined to start shooting. If they got out alive, their hatred would be everlasting. We had more sense.

Yet passivity was a word that I didn't entirely like. It sounded spineless. The art of balancing naive trust exactly against hard cynicism, to try to produce something that makes a little sense, isn't always easy. Though we knew something of Martians, we didn't know nearly enough. Our plan might be wrong; we might turn out to be dead idiots in a short time. Still, it was the best thing that we could think of.

The afternoon wore on. With the dropping temperature, a cold pearly haze began to form around the horizon. The landscape around us was too quiet. And there was plenty of vegetation at hand to provide cover. Maybe it had been a mistake to land here. But we couldn't see that an arid place would be any good either. We had needed to come to a region that was probably inhabited.

We saw a Martian only once--scampering across an open glade, holding himself high on his stiffened tentacles. Here, where the gravity was only thirty-eight percent of the terrestrial, that was possible. It lessened the eeriness a lot to know beforehand what a Martian looked like. He looked like Etl.

* * * * *

Later, something pinged savagely against the flank of our rocket. So there were trigger-happy individuals here, too. But I remembered how, on Earth, Etl's cage had been surrounded by machine-guns and cyanogen tanks, rigged to kill him quickly if it became necessary. That hadn't been malice, only sensible precaution against the unpredictable. And wasn't our being surrounded by weapons here only the same thing, from another viewpoint? Yet it didn't feel pleasant, sensible or not.

There were no more shots for half an hour. But our tension mounted with the waiting.

Finally Klein said through his helmet phone: "Maybe Etl ought to go out and scout around now."

"Go only if you really want to, Etl," Miller said. "It could be dangerous even for you."

But Etl had already put on his oxygen mask. Air hissed into his cage from the greater pressure outside as he turned a valve. Then he unlatched the cage-door. He wouldn't be harmed by the brief exposure to atmosphere of Earth-density while he moved to our rocket's airlock. Now he was getting around high on his tendrils. Like a true Martian.

He left his specially built pistol behind, according to plan. We had weapons, but we didn't mean to use them unless everything went dead wrong.

Etl's tendrils touched the dusty surface of Mars. A minute later, he disappeared behind some scrub growths. Then, for ten minutes, the pendant silence was heavy. It was broken by the sound of a shot, coming back to us thinly through the rarefied air.

"Maybe they got him," Craig said anxiously.

Nobody answered. I thought of an old story I'd read about a boy being brought up by wolves. His ways were so like an animal's that hunters had shot him. He had come back to civilization dead. Perhaps there was no other way.

By sundown, Etl had not returned. So three things seemed possible: He had been murdered. He had been captured. Or else he had deserted to his own kind. I began to wonder. What if we were complete fools? What if there were more than differences of body and background, plus the dread of newness, between Earthmen and Martians, preventing their friendship?

What if Martians were basically malevolent?

But speculation was useless now. We were committed to a line of action. We had to follow it through.
We ate a meager supper. The brief dusk changed to a night blazing with frigid stars. But the darkness on the ground remained until the jagged lump of light that was Phobos, the nearer moon, arose out of the west. Then we saw two shapes rushing toward our ship to find cover closer to it. As they hid themselves behind a clump of cactiform shrubs, I had only the memory of how I had seen them for a moment, their odd masks and accoutrements glinting, their supporting tendrils looking like tattered rags come alive in the dim moonlight.

* * * * *

We'd turned the light out in our cabin, so we couldn't be seen through the windows. But now we heard soft, scraping sounds against the outer skin of our rocket. Probably they meant that the Martians were trying to get in. I began to sweat all over, because I knew what Miller meant to do. Here was a situation that we had visualized beforehand.

"We could shut them out till dawn, Miller," I whispered hoarsely. "We'd all feel better if the meeting took place in day-light. And there'd be less chance of things going wrong.”

But Miller said, "We can't tell what they'd be doing in the dark meanwhile, Nolan. Maybe fixing to blow us up. So we'd better get this thing over with now.”

I knew he was right. Active resistance to the Martians could never save us, if they intended to destroy us. We might have taken the rocket off the ground like a plane, seeking safety in the upper air for a while, if we could get it launched that way from the rough terrain. But using our jets might kill some of the Martians just outside. They could interpret it as a hostile act.

We didn't matter much, except to ourselves. And our primary objective was to make friendly contact with the beings of this planet, without friction, if it could be done. If we failed, space travel might become a genuine menace to Earth.

At Miller's order, Craig turned on our cabin lights. Miller pressed the controls of our ship's airlock. While its outer valve remained wide, the inner valve unsealed itself and swung slowly toward us. Our air whooshed out.

The opening of that inner valve meant we were letting horror in. We kept out of line of possible fire through the open door.

Our idea was to control our instinctive reactions to strangeness, to remain passive, giving the Martians a chance to get over their own probable terror of us by finding out that we meant no harm. Otherwise we might be murdering each other.

The long wait was agony. In spite of the dehumidifying unit of my spacesuit, I could feel the sweat from my body collecting in puddles in the bottoms of my boots. A dozen times there were soft rustles and scrapes at the airlock; then sounds of hurried retreat.

But at last a mass of gray-pink tendrils intruded over the threshold. And we saw the stalked eyes, faintly luminous in the shadowy interior of the lock. Grotesquely up-ended on its tentacles, the monster seemed to flow into the cabin. Over its mouth-palps was the cup of what must have been its oxygen mask.

What was clearly the muzzle of some kind of pistol, smoothly machined, was held ready by a mass of tendrils that suggested Gorgon hair. Behind the first monster was a second, similarly armed. Behind him was a third. After that I lost count, as the horde, impelled by fear to grab control in one savage rush, spilled into the cabin with a dry-leaf rustle.

* * * * *

All my instincts urged me to yank my automatic out of my belt and let go at that flood of horror. Yes, that was in me, although I'd been in intimate association with Etl for four years. Psychologists say that no will power could keep a man's reflexes from withdrawing his hand from a hot stove for very long. And going for my gun seemed almost a reflex action.

There was plenty of sound logic to back up the urge to shoot. In the presence of the unfathomable, how could you replace the tried defenses of instinct with intellectual ideas of good will?

On the other hand, to shoot now would be suicide and ruin our hopes, besides. So maybe there'd have to be human sacrifices to faith between the planets. If we succeeded in following the plan, our faith would be proven either right or wrong. If we didn't act passively, the failure would be partly our fault. In any case, if we didn't get back to Earth, hatred and fear of the Martians would inevitably arise there, whether it had been the Martians' fault or ours. The message that Miller had left for newscast might only give people the self-righteous attitude that Earthly intentions had been good. If another expedition ever came to Mars, it might shoot any inhabitants on sight, and maybe get wiped out itself.

Still, how could we know that the Martians weren't preparing the kind of invasion of Earth that has been imagined so often? It was a corny notion, but the basis for it remained sound. Mars was a dying world. Couldn't the Martians still want a new planet to move to?

All these old thoughts popped back into my head during that very bad moment. And if I was almost going for
my pistol, how much worse was it for Craig, Klein and Miller, who hadn't been as friendly with Etl as I had been? Maybe we should have put our weapons out of our own reach, in preparation for this incident. Then there would have been no danger of our using them.

But any freedom of action was swiftly wrested from us. The Martians rolled over us in a wave. Thousands of dark tendrils with fine, sawlike spines latched onto our bodies. I was glad that I wore a spacesuit, as much from the revulsion I felt at a direct contact as for the small protection it gave against injury.

* * * * *

I am sure that there was panic behind that wild Martian rush. To get us pinned down and helpless quickly, they drove themselves in spite of their own fear of the horrid human forms. For did I feel a tremor in those tendrils, a tendency to recoil from me? I was trembling and sweating. Still, my impressions were vivid. Those monsters held us down as if they were Malay beaters holding down trapped pythons. Maybe they had known beforehand what men looked like—from previous, secret expeditions to Earth. Just as we had known about Martians from Etl. But it wouldn't have made any difference.

Or perhaps they weren't even aware that we were from the neighboring planet. But it would be obvious that we were from another world; nothing from their own planet could be so strange.

Our own reactions to the situation differed a little. Craig gasped curses through his helmet phones. Miller said, "Easy, men! Easy!" It was as if he were trying to build up his own morale, too. I couldn't utter a sound.

It wasn't hard for our captors to recognize our weapons. We were disarmed. They carried us out into the night and around a hill. We were piled onto a flat metallic surface. A vehicle under us began to throb and move; you could have called it a truck. The nature of its mechanism was hinted at only by a small, frosty wisp of steam or vapor up front. Perhaps it came from a leak. The Martians continued to hold us down as savagely as ever. Now and then a pair of them would join the nerve-ends of tendrils, perhaps to converse. Others would chirp or hoot for no reason that I could understand.

The highway rolled away behind us, under the light of Phobos. Buildings passed, vague as buildings along a road usually are at night. It was the same with the clumps of vegetation. Lights, which might have been electrical, flashed into my eyes and passed by. In a deep valley through which we moved in part of our short trip, a dense, stratified fog arose between the lights and me. I noticed with an odd detachment that the fog was composed of minute ice crystals, which glinted in the glow of the strange lamps. I tried to remember our course. I knew that it was generally east. Off in the night there were clangings and hisses that might have been factory noises.

Once Miller asked, "Is everybody okay?"

Klein's and Craig's responses were gruff and unsteady in the phones.

"Sure...."

"More or less—if heart-failure doesn't get me."

"I guess our skins are still intact," I said.

We didn't talk after that.

* * * * *

At last we entered a long, downward-slanting tunnel, full of soft luminescence that seemed to come out of the white-tiled walls themselves. My attention grew a little vague. It could be that my mind turned in on itself, like a turtle drawing in its head for protection. In that state of semiconsciousness, I experienced a phantasm. I imagined I was a helpless grub being dragged down into the depths of an ant-hill.

But such a grub belongs in an ant-hill a lot more than a man belonged where I was going. This became plainer when the large tunnel ended, and we were dragged and carried along winding burrows, never more than three feet in diameter. Mostly they were tiled, but often their walls were of bare rock or soil. Twice we passed through air-locks.

I couldn't describe too much of what I saw or the noises I heard in those warrens. In one place, incandescence glowed and wheels turned. In a great low-ceilinged chamber full of artificial sun-rays there was a garden with strange blooms. The architecture of the city was not altogether utilitarian and it was not unpleasing. I saw a lot more. But my mind was somewhat fuzzy, probably from shock and fatigue.

I know we traversed another chamber, where trays full of round lumps of soil were set in frames. A Martian nursery, no doubt.

Some minutes later, my companions and I were left in a small room, high enough so that we could stand erect in it. Here the Martians let go of us. We sprawled on the floor, faces down. We'd had a busy day. Our nerve-energy was burned out.

Hopelessness warped all of my thoughts. I must have slipped into the coma of exhaustion. I had jangled dreams about Alice and the kids and home, and almost imagined I was there.

Half awake again, I had a cursing spree, calling myself fifty kinds of a numbskull. Be passive before the people of other worlds! Reassure them! How did we ever think up that one? We'd been crazy. Why didn't we at least use
our guns when we’d had the chance? It wouldn’t have made any difference to be killed right away.

Now we were sacrificial lambs on the altar of a featherbrained idea that the inhabitants of worlds that had always been separate from the beginning should become friends, learn to swap and to benefit from the diverse phases of each other’s cultures. How could Martians who hatched out of lumps of mud be like humans at all?

Klein, Craig, Miller and I were alone in that room. There were crystal-glazed spy-windows in the walls. Perhaps we were still being observed.

* * * * *

While I was sleeping, the exit had been sealed with a circular piece of glassy stuff. Near the floor there were vents through which air was being forced into the room. Hidden pumps, which must have been hastily rigged for our reception, throbbed steadily.

Miller, beside me, had removed his oxygen helmet. His grin was slightly warped as he said to me: "Well, Nolan, here's another parallel with what we've known before. We had to keep Etl alive in a cage. Now the same thing is being done to us."

This could be regarded as a service, a favor. Yet I was more inclined to feel that I was like something locked up in a zoo. Maybe Etl's case was a little different. For the first thing he had known in life was his cage.

I removed my oxygen helmet, too, mainly to conserve its air-purifier unit, which I hoped I might need sometime--in an escape.

"Don't look so glum, Nolan," Miller told me. "Here we have just what we need, a chance to observe and learn and know the Martians better. And it's the same for them in relation to us. It's the best situation possible for both worlds."

I was thinking mostly--belatedly--of my wife and kids. Right then, Miller was a crackpot to me, a monomaniac, a guy whose philosophical viewpoint went way beyond the healthy norm. And I soon found that Craig and Klein agreed with me now. Something in our attitude had shifted.

I don't know how long we were in that sealed room. A week, perhaps. We couldn't see the day-light. Our watches had vanished along with our weapons. Sometimes there were sounds of much movement in the tunnels around us; sometimes little. But the variation was too irregular to indicate a change based on night and day.

Lots of things happened to us. The air we breathed had a chemical smell. And the Martians kept changing its composition and density constantly--experimenting, no doubt. Now it would be oppressively heavy and humid; now it would be so dry and thin that we began to feel faint. They also varied the temperature, from below freezing to Earthly desert heat. And I suspected that at times there was a drug in the air.

Food was lowered to us in metal containers from a circular airlock in the ceiling. It was the same kind of gelatinous stuff that we had found in the wreck of the ship that had brought the infant Etl to Earth. We knew that it was nourishing. Its bland sweetishness was not to our taste, but we had to eat.

Various apparatus was also lowered to us. There were odd mechanical puzzles that made me think how grotesquely Earthly Martian scientific attitudes were. And there was s little globe on a wire, the purpose of which we never figured out, though Miller got an electric shock from it.

* * * * *

I kept looking for Etl among the Martians at the spy-windows, hoping that he'd turn up again. I had noticed that Martians showed variations of appearance, like humans--longer or shorter eye-stalks, lighter or darker tendrils.... I figured I'd recognize Etl. But I didn't see him.

We were none of us quite ourselves. Not even Miller, whose scientific interest in the things around him sustained him even in captivity. Mine had worn out. And Klein and Craig were no better off. I was desperately homesick, and I felt a little ill, besides.

I managed to loosen the metal heel-plate from one of my boots, and with this, when I thought that no Martian was watching, I started to dig the gummy cement from around the circular glassy disc with which the main exit of our quarters had been sealed. Craig, Klein and I worked at it in brief and sporadic shifts. We didn't really hope that we could escape. It was just something to do.

"We're going to try to get to the ship, Miller, if it's still there," I whispered once. "Probably it won't work. Want to join up with the rest of us?"

I just didn't think of him as being in command now. And he seemed to agree, because he didn't protest against my high-handed way of talking. Also, he didn't argue against a projected rashness that could easily get us killed. Apparently he understood that our lives weren't worth much to us as things were.

He smiled a little. "I'll stick around, Nolan. If you do manage to get back to Earth, don't make the Martians sound too bad."

"I won't," I answered, troubled by an odd sense of regret.

Loosening that exit disc proved in the end to be no special trick. Then we just waited for a lull in the activity in
the tunnels around us. We all put on our oxygen helmets, Miller included, for the air-pressure here in our "cage"
would drop as soon as the loosened disc was dislodged. We put our shoulders against it and pushed. It popped
outward. Then the three of us, with Miller staying behind, scrambled on hands and knees through the tunnel that lay
before us.
*A* * * *
A crazy kind of luck seemed to be with us. For one thing, we didn't have to retrace our way along the
complicated route by which we had been brought down to our prison. In a minute we reached a wide tunnel that
slanted upward. A glassy rotary airlock worked by a simple lever--for, of course, most of the city's air would be
pressurized to some extent for the Martians--led into it.
The main passage wasn't exactly deserted, but we traversed it in leaps and bounds, taking advantage of the
weak Martian gravity. Shapes scattered before us, chirping and squeaking.
We reached the surface quickly. It was frigid night. We stumbled away into it, taking cover under some
lichenous bushes, while we looked for the highway. It was there, plain to see, in the light of Phobos. We dashed on
toward it, across what seemed to be a planted field. A white layer of ice-crystal mist flowed between and over those
tough cold-endured growths. For a minute, just as two shots rang out behind us, we were concealed by it completely.
I thought to myself that, to the Martians, we were like escaped tigers or leopards--only worse. For a moment I
felt that we had jumped from the frying pan into the fire. But, as we reached the highway, my spirits began to soar.
Perhaps--only perhaps--I'd see my family again before too long. There was traffic on the road, trains of great soft-
tired wagons, pulled by powered vehicles ahead. I wondered if, like on Earth, much freight was moved at night to
avoid congestion.
"When I was a college kid, I used to hitchhike sometimes," Craig remarked.
"I don't guess we had better try that here," Klein said. "What we can do is more of a hobo stunt."
We found the westerly direction we needed easily enough from the stars. The constellations naturally looked
the same as they did at home. We hid behind some rustling leaves, dry as paper, and waited for the next truck train
to pass. When one came, we used the agility which Martian gravity gave us and rushed for the tail-end wagon and
scrambled aboard. There we hid ourselves under a kind of coarse-fibered tarpaulin.
Peering past boxes and bales, we kept cautious watch of the road. We saw strange placques, which might have
served as highway signs. Again we saw buildings and passing lights.
We were dopes, of course, ever to think that we were going to get away with this. Our overwrought nerves had
urged us to unreasoning rebellion, and we had yielded to them.
*A* * * *
Our last hope was punctured when at last we saw the flood-lights that bathed our ship. The taste on my tongue
was suddenly bitter. There were roughly three things we could do now, and none of the choices was especially
attractive.
We could go back where we had come from. We could try to keep concealed in the countryside, until we were
finally hunted down, or until our helmet air-purifiers wore out and we smothered. Or we could proceed to our
rocket, which was now surrounded by a horde of Martians. Whichever one we chose, it looked as if the end would
be the same--death.
"I'm for going on to the ship," Klein said in a harsh whisper.
"The same with me," Craig agreed. "It's where we want to go. If they're going to kill or capture us, it might as
well be there."
Suddenly, for no good reason, I thought of something. No special safeguards had been set up around that sealed
room in the city.
Escape had been easy. What did that mean?
"Okay," I said. "Maybe you've both got the same hunch I just got. We walk very slowly toward our rocket. We
get into the light as soon as possible. Does that sound right to you? We'd be going back to the plan. And, it could be,
to common sense."
"All right," Klein answered.
"We'll give it a whirl," Craig agreed.
We jumped off that freight wagon at the proper moment and moved toward the rocket. Nothing that we'd done
on Mars—not even making our first acquaintance with the inhabitants—was as ticklish an act.
*A* * * *
Step after slow step, we approached the floodlighted area, keeping close together before that horde which still
looked horrible to us. One thing in our favor was that the Martians here had probably been warned of our escape by
whatever means of communication they used. And they could certainly guess that our first objective would be our
ship. Hence they would not be startled into violence by our sudden appearance.
One of them fired a shot which passed over our heads. But we kept on going, making our movements as
unfrightening as we could to counteract the dread of us that they must have still felt.

Panic and the instinctive fear of the strange were balanced in our minds against reason. We got to the nose of
our ship, then to the open doors of its airlock. The horde kept moving back before us and we clambered inside.
Martian eyes remained wary, but no more action was taken against us.

Our cabin had been ransacked. Most of the loose stuff had been removed ... even my picture of Alice, and our
two kids.

"Who cares about trifles?" I muttered. "Rap on wood, guys--I think we've won. So have the local people."

"You're right," Klein breathed. "What other reason can there be for their not jumping us? Miller's passive
strategy must've worked the first time. The story that we meant no harm must have gotten around. They don't want
to make trouble, either. And who, with any sense does?"

I felt good--maybe too good. I wondered if the Martians felt the same eager fascination for the enigmas of
space that we felt, in spite of the same fear of the nameless that we too could feel. My guess was that they did.
Undoubtedly they also wanted interplanetary relations to be smooth. They could control their instinctive doubts to
help attain this objective. If they coveted Earth's resources, it was still far away, and could defend itself. Besides,
they were not built to live in comfort under the raw conditions of its strange environment. Commerce was the only
answer.

Suddenly Mars was no longer a hostile region to me, out in the reaches of space. Again it was full of endless,
intriguing mysteries. It was beautiful. And knowledge of that beauty and mystery had been won, in spite of some
blundering. The scheme that we had practiced, and that Miller had stuck to, had paid off. It had broken down that
first inevitable barrier of alieness between Earthmen and Martians enough so that they now had a chance to start
looking for the countless similarities between us.

A fraction of our food stores aboard the rocket had been taken, probably for analysis. But there was plenty
more. We closed the airlock, repressurized the cabin from air-tanks, and cooked ourselves a meal. Then we slept in
shifts, one of us always awake as guard.

At dawn, Miller hammered at a window. He'd been brought out from the city. We weren't too surprised by then.

* * * * *

Etl turned up at noon. He came in a kind of plane, which landed right beside our rocket, making quite a noise. I
recognized him easily enough; I'd know those eye-stalks anywhere. Besides, as he came out of the plane, he was
carrying the speech-tube that Klein had made for him.

We let him into the cabin. "Hello, gang," he said, manipulating the tube with his tendrils. "I see you passed
your tests almost as well as I did on those weird things you were always making me take on Earth."

"So they were tests," I said.

"Sure. Otherwise, why do you think I didn't come to you before? They said you had to solve your own
problems."

"How did they treat you?" Miller wanted to know.

"Mostly my people were nice to me. They took me to a great desert city, far away. Sort of the capital of Mars.
It's in an 'oasis' where a network of 'canals' join. The canals fit an old theory of your astronomers. They're ribbons of
irrigated vegetation. But the water is piped underground. I spoke to my people in the way that you once thought I
would, trying to convince them that you were okay. But I guess that you did most of the job yourselves."

"In spite of a lot of blunders, maybe we did, Etl," I replied dryly. "What are your plans? Going to stay here
now? Or will you come back with us?"

I sensed that he would stay. It was natural. Maybe I even sensed a remoteness in him, a kind of withdrawal. Not
unfriendly, but ... we both knew it was the parting of the ways.

"It's best for what we're trying to accomplish, Nolan," he said. "I can tell my people about Earth; you can tell
yours about Mars. Besides, I like it here. But I'll be back on Earth some time. Just so you'll come here again. Thanks
to you guys for everything."

"I'd like to stay too, Nolan," Miller said, smiling. "If they'll have me. Under Etl's instructions, they might
improve my quarters."

* * * * *

So that much was settled. I felt a certain longing myself now. But I'm a family man, with home still in my
blood. Klein and Craig weren't tied as I was, but they had a lot to hold them to Earth. Besides, somebody had to
report back.

We were on Mars two days longer, though we didn't go any farther than back to the neighboring city. We took
thousands of photographs. We were given samples of common Martian apparatus, pieces of jade that were covered
with queer, beautiful carvings made millions of years before, bars of radioactive metal.
Earth was still near enough in its orbit to be reached without too much trouble. We jacked our rocket into a vertical position, from which an interplanetary takeoff could best be made. The cabin, swinging on its universal joints, stayed level. Martians watched, interested, but still obviously not quite ready to cast aside their deeper suspicions. Yet, when we blasted clear, we knew that a ship of theirs, halfway around the planet, was doing the same and would follow us back to Earth. Ambassadors, of course, and commercial attachés.

I'd lost my picture of Alice, Patty and Ron to some local souvenir hunter. But I knew that I was going to see them....

The friendly contact between Earth and Mars can still be queered by somebody's silly blunder, of course. Human or Martian. You have to be careful. But a beginning has been made.
The game was stud. There were seven at the table, which makes for good poker. Outside of Nick, who banked the game, nobody looked familiar. They all had the beat look of compulsive gamblers, fogged over by their individual attempts at a poker face. They were a cagey-looking lot. Only one of them was within ten years of my age.

"Just in case, gamblers," the young one said. I looked up from stacking the chips I had just bought from Nick. The speaker was a skinny little guy with a sharp chin and more freckles than I'd like to have.

"If any one of you guys has any psi powers," the sharp-chinned gambler said sourly, "you better beat it. All gamblers here will recoup double their losses from any snake we catch using psi powers to beat the odds."

He shot a hard eyed look around a room not yet dimmed by cigar smoke. I got the most baleful glare, I thought. He didn't need to worry. I'd been certified Normal by an expert that very evening.

The expert was Dr. Shari King, whom I had taken to dinner before joining the game at Nick's. It had gotten to be a sort of weekly date--although this night had given signs of being the last one. For a while that spring, desoxyribonucleic acid had begun to take second place in my heart. This is a pitiful admission for a biochemist to make--DNA should be the cornerstone of his life. But Shari was something rare--a gorgeous woman, if somewhat distant, who was thoroughly intelligent. She had already earned her doctorate, while I was still struggling with the tag ends of my thesis.

"Poker, Tex?" Shari had asked, when the waitress was bringing dessert. "Is this becoming a problem? You've played every night this week."

"No problem, Shari," I said. "I'm winning, and I see no point in not pocketing all that found money."

"Compulsive gambling is a sickness," she said, looking at me thoughtfully. She was wearing a shirtwaist and skirt that had the bright colors and fullness you associate with peasant dress.

"The only sick thing about me is my bank account," I grinned, relishing her dark, romantic quality. "I need the dough, Shari. I've got a thesis to finish if I ever want to get a job teaching."

She threw her spoon to the table. "I'll remind you of how silly these remarks sound, after you've hit a losing streak," she told me.

I laughed at that one. "I don't lose, Shari," I said. "And I don't intend to."

Her lashes veiled her violet eyes as she smiled and said more quietly, "Then you are in even worse trouble than I thought. I hear a lot about what happens to these strange people who never lose at cards or at dice or at roulette. Aren't you afraid of winding up in the gutter with your throat slit? Isn't that what happens to people with psi powers who gamble?"

"What's your trick, Tex? Do you stack the deck with telekinesis, or does precognition tell you what's about to be dealt?"

"That crack isn't considered very funny in Texas," I growled.

"Is it any more silly for me to think you might be a psi personality than for you to think you never lose at cards?" she nailed me.

I could feel my face getting red. "Damn it!" I started. "Nobody talks to a friend like that!"

"Pretty convincing proof," Shari said tartly.

"Of what?"

"Of the fact that you aren't making any sense about this gambling kick you're on, Tex. You should have laughed my teasing off. Who would seriously suggest that you were a psi personality?" she demanded. "And most of all, with my background in psi, do you think I could be misled about it?"

I shrugged, trying to cool down. Shari's doctorate had been earned with a startling thesis on psi phenomena and psi personalities, and she had stayed on at Columbia as a research fellow in the field. In egghead circles, she rated as a psi expert, all right.

"Guess not," I said, trying to kill the subject.
She wasn't going to let it die. "I don't think you're a psi, Tex. You're a Normal!" The way she said it, it didn't sound like a compliment. "Worse than that," she insisted. "You're beginning to act like a compulsive gambler." She took a deep breath, and let me have the clincher: "I could never marry a gambler, Tex!"

"You've never been asked," I reminded her.
She had the last word. "Let's go!" she snapped.

* * * * *

Angry as I was about her acting as though I were a snake, I wished I could have thrown her certification that I was a Normal in the freckled face of the sharp-chinned gambler at Nick's later that night. After Shari's needling, I didn't take very kindly to his popping off with the Law of the Pack. It's understood wherever people gamble that psis aren't welcome.

Nick didn't like it any better than I did. "All right, Lefty," he said to the sharp-chinned gambler. "Calm down, huh, kid? What kinda game you think I run, huh?"

I didn't let the sour start spoil my game. I was lucky right from the start and hit big in several hands.

Lefty, the gambler who had yelped about psi powers at the game, dealt the tenth hand. He gave me the eight of spades in the hole. By the fourth card I had three other spades showing, which gave me four-fifths of a rare flush in stud poker. But by the fourth card Lefty had given himself a pair of jacks. That drove all the other gamblers to cover.

Lefty raised, of course, and it cost me five hundred bucks to see my fifth card. It was a classic kind of stand-off in stud, and the waiter stopped with his tray of drinks to press in among the other kibitzers and watch the pay-off.

Lefty shucked out the last two cards carelessly, as if they didn't really matter. His own fifth card made no difference—he already had a busted flush beaten. His smile was just a little too sharp as he tossed me my last card face up and reached for the pot with the same left-handed gesture.

I took the poker panetella out of my teeth. "All blue," I said, turning up my hole card with the other hand.

Lefty threw the unused part of the deck to the center of the table. "That does it, you snake!" he swore at me.

It took a second for his accusation to sink in. I started across the table after him. If they hadn't stopped me, I would have torn his lying throat out. Funny, but there were kibitzers on my shoulders before I could rise an inch out of my chair.

"Down in Texas you could get shot for a crack like that, Lefty!" I said. I guess I really yelled it.

"And in New York you can, and probably will, get your rotten throat slit for a trick like the one you just pulled," he replied. He turned to the other gamblers, most of whom had their hands on the edge of the table, ready to jump to their feet if it got any rougher.

"I stacked the deck this last deal," he said coolly. He held a palm up at their surprised mutter. "Tex's fifth card was stacked to be a heart, gamblers. You saw him get a spade and take the pot. I won't sit at the same table with a guy that can do that. Telekinesis has no place in poker."

"Pretty near as bad as stacked decks," one of the gamblers rasped. But the others weren't with him. I only had to take one look at Nick's face.

I stood up slowly, and the hands on my shoulders didn't hold me down any longer. "Lefty says he stacked the deck," I told them. "I say he lies. You know there's nothing to choose between our statements. Lefty is a cheap grandstander, and I'll settle with him myself. Nick, I won't embarrass you tonight. This isn't your fault. But I'll be here tomorrow night, and you had better be glad to see me!"

"Sure, Tex," he said uncomfortably, rising with me. "Take my seat, Shorty," he directed one of the kibitzers. He walked around to grab me by the elbow and steer me as far away from Lefty's truculent face as he could. At least the sharp-chinned little rat had quit the game, too. Both of us had left our chips on the table.

Nick wanted me to leave. "Pay me off," I insisted. He said yes a lot quicker than I thought he would. The other gamblers could have squawked that my chips should go into the next pot, but apparently none of them did.

Lefty sidled out as Nick was paying me off. "Wait outside for me," I said to him.

"Why not?" he said, sticking his chin out at me and walking out.

Nick grabbed me again. "Don't get hot, Tex," he warned me. "I don't want a killing on my own sidewalk. Take it some place else, huh, kid?"

"Sure," I said.

There wasn't any danger Lefty would hang around. I was big enough to break him in two, which is exactly what I planned if I caught up with him.

* * * * *

It had been dark for some hours by the time I hit the street and waved for a skim-copter. Nick's games start late.

"You asked me to wait," somebody said. I spun around and saw Lefty standing in the alleyway beside the building. I went for him, charging hard. He scuttled back into the alley, out of what little light there was that far downtown. Just as I reached for him, somebody slugged me in the gut. I went down on a knee, gasping. I hadn't seen
his sidekick—the alley was pretty dark. I heard Lefty's breath suck in sharply as I came up out of my crouch, diving for him. After all, it was only pain, something inside my head. It wasn't as though I had been really crippled. My fingers clawed at his jacket, and would have held him. But the other guy grabbed at my ankle and threw me down on the slippery cobbles again.

I came up slower that time. I'd bunged up my kneecap more than I wanted to think about. Lefty was still out of reach. I called him a name that was always good for a fight in Texas, and started after him, but slower than before. I wasn't fast enough to avoid the hard thing that rammed against my spine. Even down in Texas, a gun in the back freezes you up.

Lefty was all guts now that I was hung up on the gun barrel. It might as well have been a meat hook.

"I warned you not to use psi in the game!" he snapped. "Now you'll have to talk to Pete."

"One of us isn't going to live through this," I promised him, starting to reach for his throat. The gun jabbed a reminder to watch my manners.

"Do you come quietly?" Lefty asked shrilly. "Or do we--?"

The sudden shrillness of his voice scared me more than anything else. He was worked up worse than I was.

"Quietly," I conceded, trying to get some saliva to flow again. The pressure against my spine eased off.

Lefty stepped out of the alley to the curb and flagged down a cruising ‘copter. He made me get in first, which gave me a chance to turn, when I sat down, and see who had been holding the gun on me from behind. The gunman had sure drifted in one awful hurry. There wasn't a soul except Lefty around.

He hopped in after me. The turbine howled as the driver gunned us up on the air cushion and sent us skimming away. The trip lasted only four or five minutes through the thinning traffic of late evening. We pulled up in front of a brownstone house in the upper Eighties that reared up four stories among a string of three-story neighbors.

I limped to the top of the steps after Lefty. He let us in with a key. We were in a dimly-lit hall that had a staircase against its left wall and an open door at its right, leading into a darkened room.

A tall skinny girl was sitting about a third of the way up the carpeted flight of steps. Her face was drawn out to a point by a long, thin nose. "Here they are," she called up the stairway, showing braces on her teeth. She stood up and came down the hall. She was clad in a shortie wrapper that showed off her race-horse legs.

"Billy Joe," she said to Lefty. "I told them you were coming."

"Hi, Pheola," he said. "Good for you." He sounded pleased.

There were steps above, and two others joined us. First came a short square man with gray hair and bushy gray eyebrows. He was wrapped up in a flannel robe that had once been maroon and was now rusty with age and wear. It only served to confirm that he had just been yanked out of bed. He hadn't bothered to put anything on his bare feet or to comb his hair. A pretty wild looking old man.

Behind him stumped a chunky woman, crowding fifty. She was in a worse state of dishabille. She hadn't quite made it to bed and was still in her slip. Her stockings had been unhitched from her garters and hung in slack transparency around her fat calves, like the sloughed-off skin of a snake.

"I told you," Pheola said to the gray-haired man.  
"It's nice that you're right once in a while," he said in a scratchy, sleepy voice, walking past her to switch on the ceiling of the room on the right side of the hall.

She didn't like that. Lefty stopped her reply. "Will it be PC?" he asked her.

"No," she said.

"You missed that one," Lefty said.

"Didn't neither!"

"Well, sit in with us and see," he suggested.

"What for?" she asked. "I know what's going to happen in there. You'll be along to bed right soon, darlin' Billy!"

He looked over at me. "Go on in, Tex," he said.

"Darlin' Billy!" I sneered.

"Don't pay any attention to her," he said. "She's in another space-time continuum." I pointedly ogled the girl's pretty legs going up the stairs and whistled softly. "My wife," he said, blushing. "A powerful PC, or one day will be."

"You're kidding," I said. His arm on my elbow pushed me into the lighted room.

* * * * *

It had been the front parlor of the old brownstone in its prime, and was now fixed up as an office. The place held an executive desk with several buttons and enough other controls to put it in orbit. There were a number of cushioned straight-backed chairs and a comfortable leather couch under the window. Only the fact that it was getting on toward midnight made me willing to believe that the couple who had walked down the stairs expected to be taken
seriously.

"This is George Robertson, the poker whiz," Lefty said briefly to the two sleepy heads. "They call him Tex. Tex, this is Peter Maragon, Grand Master of the Lodge."

The gray-haired man gave me a tired nod. "I imagine you're a pretty angry young man, Mr. Robertson," he said in his scratchy voice. I started to tell him quite a little about how I felt, but he held up his hand. "I've had a hard day," he complained. "And I got out of bed solely to adjudicate your case. Now, this will go a lot more quickly if you listen." He smacked his lips a couple times as if he wondered where he had left his partial plate. I hoped he had swallowed it. "Sit down, sit down," he said irritably, pointing at the chair across the desk from him.

I debated it, but took the chair, grinding my teeth.

"You aren't stupid, or you wouldn't be a scientist," he said, revealing that he knew a lot more about me than I did about him. "Let's start out with a couple facts."

He pointed a gnarled finger at Lefty. "Wally Bupp stacked a deck of cards on you tonight," he said gruffly. "What you don't know is that he stacked them with telekinesis. He's a TK."

"A snake!" I gasped.

"Watch your lip!" Maragon croaked. "Everybody in this room is a psi. 'Snake' is a dirty word around here, Mr. Robertson. Mr. Bupp has a special aversion to it."

"What's the purpose...?" I began hotly.

"Hah!" Maragon barked. "A good word!" He cackled a laugh at me. "Purpose. Exactly, Mr. Robertson. Well, the Lodge has a purpose, and you'll act a lot more sensibly if you know it."

"You," he said to me. "Are a TK."

"You," I yelled right back. "Are a liar!"

He ignored me completely. "We can't afford to have you gambling and cheating Normals," he went on. "One of the Lodge's fundamental rules is that no psi may use his powers to the detriment of Normals. Lefty's big scene at Nick's fixed it so you won't be welcome in a big-time poker game anywhere in town. We did that deliberately. And we're telling you to quit gambling, as of this minute."

"You say you are a TK," I interrupted.

"Somewhat," he said. "I have psi powers, but I'm not mainly a TK."

"Whatever your powers are," I said. "They don't make you supermen immune from the laws of libel. If you or anybody I can catch breathes one false word about my being a snake, you'll be on the receiving end of the roughest lawsuit you ever heard of!"

"The silliness of that statement will occur to you in a while," he said dryly. "And truth is a defense against a claim of libel. But to get back to purpose. Our second purpose tonight is to get it through your thick head, Mr. Robertson, that the Lodge insists on its right to control your actions insofar as they involve the use of your psi powers. We mean business, Mr. Robertson, and before you are through with our heartless Mr. Bupp tonight, you'll know it. That's all that's behind our little charade."

He came to a stop and took a deep breath.

"I'm going to make one statement and rest on it," I said, trying to keep my voice calm and level.

He shrugged. "Your turn," he said.

"I'm a Normal," I said. "I flatly deny that I have the slightest shred of psi power. I accuse that freckled snake over there of lying deliberately. I'll make him pay for it, and he'll be lucky if it isn't with his blood."

"That's all?"

"Isn't it enough?"

He laughed harshly and grinned over at Lefty. "Some of you maverick psis scream like a gelded porker," he said. "I figgered you'd tell me we'd cost you a fortune in prospective poker winnings, to say the least."

"My stomach dropped. I hadn't thought of that, not as much as I should have. It was my only income!"

"Something a darn sight more important than money is involved," I said.

"Maybe you aren't such a bad guy," he decided. He looked over at the woman standing silently in her slip beside his desk, her bare arms folded over her ample bosom.

"How about it, Milly?" he asked her.

She shrugged. "He believes what he says," she told him. "He honestly doesn't think he has any psi powers."

"That mitigates the affair," Maragon said. "Still, our purpose demands an object lesson. I have to fine you, Mr. Robertson. You've broken one of our rules by using TK to stack a poker deck. Because you weren't aware of it, though, half of your fine will be remitted if you join the Lodge within a week. Accordingly I assess you ... uh, how much, Milly?"

"He's got eight thousand and some in his breast pocket," she said with fiendish accuracy. "Every penny he has in the world."
"Assess you eight thousand dollars," Maragon concluded. He got wearily to his feet, and started to pad past me
toward the door. "Mr. Bupp will collect," he said. The woman followed him, her hose hanging down around her
ankles, and climbed the stairs stolidly behind him.

* * * * *

Lefty, whom Maragon had called Wally Bupp, walked around behind the desk and took the swivel chair that
the older man had just vacated. "I'll take the eight thousand now, Tex," he said, poking his chin at me belligerently.
"You'll take four," I said, getting my feet under me.

He frowned. "Four?" he repeated.
"Four knuckles," I gritted and started for him. The gun barrel rammed me in the kidney, harder than it had in
the alley. They'd smuggled in some protection. I really slammed on the brakes, halfway across the desk. Lefty hadn't
bothered to flinch, but sat there with his legs crossed, looking idly at his fingernails.

"Look behind you," he said.

I did. The gun eased off my kidney as I turned. There wasn't anybody there.

"TK," Lefty said. "I also used it to trip you up when you went for me in the alley, after I'd TK'd a left right in
your gut. You're a hard guy to stop, Tex. But don't overdo it."

"Mere pain never stopped a guy who really meant it!" I went for him again.

Then it hit me. A deep and sickening pain throbbed from my breastbone down my left arm. The lights started to
dim, and I sagged down on the desk.

"How'd that feel?" Lefty asked, apparently not expecting an answer. "I clamped your coronary artery shut for a
few seconds. A post-mortem would never be able to tell it from the real thing if I held down tight."

His grin had a viciousness in it I hadn't seen before. He held out his hand. I struggled erect and handed my
wallet to him. He only took out the big bills, and tossed it back across the desk to me. "Thanks," he said. "You'll get
half of this back if you decide to join the Lodge within a week."

"What's all this about a Lodge?" I tried weakly. "What Lodge?"

"Why, this Lodge," Lefty said, waving a hand around loosely. "It's an organization of folks with psi powers.
Guys like you and me, Tex."

"I'm no TK!" I growled. "I didn't manipulate those cards in any way."

"Funny you say that," he said, looking interested and leaning his elbows on the desk. "You're right. I hadn't
actually bothered to stack the deck, Tex. Just kept a light TK touch on it to see if you were moving cards. You
weren't, but you were hitting them right all the time. I haven't had time to tell Maragon the boys on the Crap Patrol
were wrong. It wasn't telekinesis, Tex. It was precognition. You're a PC, Tex." He stood up and pointed toward the
door. I was shaking so badly from the heart attack the snake had induced that I got up helplessly and allowed him to
steer me out by the elbow.

"Remember," he said at the head of the steps that led down to the street. "You've got a week to make up your
mind about joining the Lodge. In the meantime, don't gamble."

"Great," I said bitterly. "You sapped me down and rolled me for my poke, or the next thing to it. And now you
tell me not to get in a game and try to get whole again. Why should you care?"

"You don't listen," he said sourly. "Look, psis are supermen, in spite of your sneers. And whether you like it or
not, Tex, you've got some psi powers. Normals resent, fear and hate us. We can't afford to have you make a killing
at a poker table and then get exposed as a 'snake.' We psis are a tiny minority. We all get blamed for things any one
of us does."

"I'm a Normal," I said, a little hollowly.

"You're more fortunate than that," he assured me. "Just so you understand the origin and purpose of the Lodge.
We find strength in union, strength to resist the pressure of the majority. And membership in the Lodge gives us
control--control over psis like you who might bring the wrath of the Normal majority down on us by their
shortsightedness."

I shook my head. "You don't have to dress it up like this," I protested. "This is blackmail or extortion, I'm not
sure which. I'm not joining anything you bunch of creeps are a part of."

"You won't find that practical," he said, turning to go back inside. "And remember: stay away from cards."

* * * * *

You're supposed to have nightmares at night. I had mine the whole next day. No, I wasn't a TK, Lefty had said.
I was a PC. You don't have anemia, Tex. It's leukemia!

I made a farce of trying to get some work done in the lab. After letting the third test tube slip through my
fingers and shatter on the lab bench, I gave it up. How would you have acted if you had gotten that kind of news?
That first gut-twisting admission that you really may be a snake! Then sharp awareness of what it means. A
guillotine couldn't cut you off more sharply from Normal humanity. But the spirit struggles and refuses to accept it.
You can't be a snake!

"Take action!" I said aloud, getting a worried look from my lab assistant, busy mopping up my last shattered culture. "Don't spin around like this. Do something!"

I did the only thing I could think of, and dialed Shari at her laboratory. She refused to accept the call at first. Finally she tore herself away from a "delicate experiment" long enough to look at me angrily in the screen.

"We don't have anything to say to each other," she said coldly. "There are delicate experiments--"

"Can you test me for psi powers?" I interrupted.

"Whatever for?"

"To settle whether I have any," I snarled. "It's important to me."

"Not necessary," she said. "Do you think I'd be successful in the psi field if I weren't sensitive to this sort of thing? Don't worry, Tex. You're a Normal."

"Thanks," I said. "So you've told me. Now prove it to my satisfaction."

"We shut up shop at five o'clock," she said. "I'll be here for about an hour after that. My dinner date isn't until seven."

"Bet he doesn't gamble," I said, trying to win a little sympathy.

"You bet he doesn't!" she sniffed.

Shari's laboratory was nothing more than a large windowless office that could be cut into two sound-proof parts with a movable partition. She had a whopper desk with full controls and other evidences of academic pelf. On a table against the short wall was her apparatus--if that's what you call decks of cards, a roulette wheel, a set of Rhine ESP cards, several dice and, so help me, a crystal ball.

* * * * *

Shari stood up behind her desk when I came in. It was something of a shock to find that her colorful peasant getup was antiseptically sheathed in a white laboratory coat. She was sure dressed for dirtier work than she would ever have to do in that lab.

Her first look at me was one of surprise, but it softened to one of concern, which might have been cheering on some other occasion. "What has happened, Tex?" she asked.

"Nothing," I said, keeping calm. "Not a thing."

"Outside of seeing a ghost, eh?" she said. "Stop grinding your teeth like that. You'll give me the creeps. Sit down. Sit down! Do you hear me? Relax!"

I guess I found the chair across from her at the desk. "Do I have psi powers?" I asked her. "Either TK or PC? Test me, Shari."

"What happened?" she insisted.

I shook my head. "I'd rather not talk about it--not until I know the result of your test," I said.

Shari thought about it for a while, tapping her desk with an irritated finger, and finally got a set of cards from the lab table against the wall. She shuffled them slowly on her desk blotter. "Cards are your strong point," she observed. "If you have any psi powers, they're most likely to show up with cards. I take it you will do your utmost to be right?"

"Who would double-cross himself?" I said tightly.

"Most people," Shari said. "When it comes to psi. But we'll assume, for a starter, that you are on the level." She stacked the cards in her hand. "We'll keep it simple," Shari suggested. "I'll deal the cards one at a time. All you have to do is tell me whether the next card will be red or black. Fair?"

"Sure," I said. "Deal!"

She was a lousy dealer. Or maybe it was because it was a one-handed operation. She was scoring my hits and misses with the little counter in her other hand.

She ran the deck ten times for me. I got thirty-eight right on my best attempt and thirty-seven wrong on my worst. In total, of five hundred and twenty chances, I was right on two hundred and seventy-three, or fifty-two point two per cent of the time, according to Shari's slide rule.

"Oh, no," I said dismally. "I do have a little edge on the cards!"

"As a statistician, you'll make a great biochemist," Shari said, putting the deck away. "That would only be true if I hadn't let you see your hits and misses as each deal proceeded. You made succeeding guesses in the knowledge of what had already been dealt. Actually, your score was below average for trained observers without psi powers." She heaved a sigh, which somehow seemed to be of relief. "And now, you crazy cowpoke," she said, "tell me what this is all about."

"I'm not a psi?" I demanded.

"Not if you were really trying," she said. "Were you?"

"You think I want to be a psi?" I demanded. I told her all that had happened the night before from the time
Lefty had accused me of being a snake until he had let me out of the brownstone house and warned me against gambling.

Guess how Shari reacted. A big nothing!

* * * * *

"Well?" I asked, as she sat silent with her elbows on the edge of her desk and her chin propped up on her knuckles.

"You're really quite naive, aren't you, Tex?" she asked me. "Let me give you an objective statement of what happened to you last night."

She counted these things off on her fingers: "You won some money at poker. A gambler said you used TK to win. He took your winnings, and then some, away from you as the price of silence. He warned you not to gamble any more. He claimed he was part of an organization of psi personalities. Is that a fair statement?"

"Except for one thing," I said. "He used his psi powers on me in a pretty dramatic fashion."

"Try Occam's razor," she suggested.

She was getting insulting. "All right," I growled, feeling my face get red. "Prefer the simpler explanation, if you can find one. I was prodded in the back, both in the alley and in the office at the brownstone house. Something hit me in the gut and tripped me up. I had a heart seizure. What's simpler than TK in accounting for the fact this was done without a soul around?"

"I suppose I shouldn't be critical of you," she said. "It's not your field and you haven't been exposed to the lengths to which charlatans go, just to prove they are supermen. The simpler explanation is that there was someone else in the alley, carefully dressed in dull black to stay invisible in the darkness. The second prodding of a gun in your spine was pure suggestion--you'd been so well-sold by that time you were ready to believe anything."

"And my heart attack?"

"I can think of ten poisons that would give you the symptoms," Shari said. "And don't tell me you let nothing pass your lips!" she burst out hotly as I started to speak. "I suppose you've never had a spray hypodermic? You'd never have felt it. Don't you see why they went to all this trouble?"

"Honestly," I said. "I can't. I'm simply not that important to anyone in the world."

"You're not," she said dryly. "But your eight thousand dollars was. I'd say if people can steal that much money and convince the victim he shouldn't go to the police, it was worth their while. You're not very likely to advertise the claim that you're a psi, are you?"

"No," I admitted.

"And," she said wearily, standing up. "There's always the angle that they'll con you by letting you into their imaginary 'Lodge' and extract some kind of dues out of you in return for keeping quiet about your so-called psi powers when you gamble. That would serve you right," she concluded.

"For what?" I demanded, beginning to feel pretty icy.

"Being such an easy mark, for one thing," Shari said. "And for seriously thinking that you might be a PC! That, I must confess, I find the most comical of all. You, Tex, a PC!"

"Why is that funnier than being a TK?" I demanded, getting up.

She waved her hand impatiently. "We see a little TK here in the lab right along," she said. "At least, there are those who seem to have a small genuine edge on the cards that we can explain no other way. It's small, but apparently exists. But precognition? That's not simply mechanical or kinetic, like TK. PC is something terrifyingly different." Her voice hushed as she said it. "It's a kind of sensitivity that has nothing to do with mere kinetics. It defies time!" She looked back at me. "I simply find it comical that you thought of yourself as sensitive to that degree."

"So I've been a fool," I mused.

"In a word, yes. You're a Normal. They suckered you, if you want the jargon."

"Wait till tonight!" I seethed, beginning to feel my anger grow as my fear dwindled. "Let them try to pin the psi label on me! I'll call their bluff!"

The TV-phone on Shari's desk rang, and she pressed the Accept key.

"Let me speak with Tex," a familiar aggressive voice said. It didn't sound as if it would stand for much nonsense.

Shari still had another look of surprise in her. "For you," she said, arching her romantic eyebrows, and turning the instrument around so I was facing the 'scope and screen.

Sure enough, it was Wally Bupp. "Don't do it, Tex," he warned me. "Don't do what?"

"Don't play tonight. It won't be practical. We mean business."

"So do the laws of libel," I said. "One crack about my having psi powers--"
"Yeah, yeah," he interrupted. "You told us about the lawsuit," he said. "You've got six more days." I could see his hand come up to cut the image.

"Hey!" I said. "How'd you know where to reach me?"

His sharp face split in that vicious grin. "I forgot to tell you," he said. "Maragon is a clairvoyant, too." The image faded.

"See what I mean?" I said shakily to Shari. "They sure talk a good game. I didn't tell a soul I was coming here. How'd they catch me?"

"Occam's razor," she said. "How many wrong numbers did they try first? Come back to earth!"

"That snake Lefty still worries me," I admitted, going to the door. "Shari, I know I've acted nuts, but they nearly got me to flip! Thanks for helping me. I couldn't have stood it to know I was a snake. You got my mind back on the track again."

"Not enough to keep from going right back to the poker table," she observed.

There didn't seem any point to telling her how badly I needed the dough. Anyway, I had to prove a point. I was a Normal. I left.

* * * * *

There were already seven at the table when I got to Nick's after dinner. He didn't want to deal me in.

"Seven's a full table, huh, Tex?" he said.

"Not for stud, it isn't," I told him. "You can deal to ten gamblers."

"Dealer's choice tonight," he protested, while some of the gamblers eyed me curiously. "Can't deal to more than seven for three-card draw."

"I told you where I stood on this thing last night," I snapped.

"All right," Nick said warmly. "So maybe I'd like the whole stink to cool down a little, huh?"

"Not with my dough in it, Nick!" I told him, being pretty free with something I didn't have much of any more.

"You'll deal me in tonight or I'll find another banker!"

A gink with a long, scrawny neck put down his highball and rose from the table. "Gosh, fellows," he said. "I'm sort of a fifth wheel around here, I guess. Here, neighbor," he insisted. "Take my place." He was all grins and teeth and bobbed his head around with a rural awkwardness.

"You don't have to do that, Snead," Nick started to say.

"Just as soon kibitz," he insisted, drawing up a chair behind me as I took his seat. "You don't mind, neighbor?" he asked anxiously. I shook my head and yanked out my much-depleted wallet to pay for chips. It took all that the Lodge hadn't.

Four hands were enough. On the first, at stud, I had aces back to back and picked up a pair of sevens on the next two cards. Two pair, aces high, will win about ninety-nine out of a hundred stud hands. I chewed down on the panetella in my teeth and bet them like I had them. The tilt of my cigar showed just a little too much confidence as a way to convince some of the gamblers that I was bluffing. It must have been a good act, for three of them stayed with me all the way. None of them had much showing, and regardless of what their hole cards were, by the time we had our fifth cards, I had them all beaten.

It was raise against raise, but somebody finally called, and I turned over my ace in the hole. "Aces and sevens, gamblers," I grinned, reaching for the pot.

"I see the sevens," a fat-faced man across the table said around his cigar. "But what's this jazz about aces?"

So help me Hannah, my hole card was a two! I tried to cover it up. "You'll have to admit I bet them like aces," I said.

Somebody laughed, but not very hard. I paid mighty close attention to what I was dealt the next hand, and turned down a drink to make sure I was cold sober. Unfortunately, I got all screwed up over what one of the other gamblers had. It had been a bunch of spinach when I'd been betting my pair against it, but it was one good-looking straight when he flipped the card in the hole.

The third hand I dropped out before the fourth card. After a gambler raked in that pot, my kibitzer asked me: "How much do you have to have on the first three cards to stay in the pot?"

"Any pair would convince me," I said. "Why?"

"What was the matter with the kings you had showing?" he asked. They were still on the table in front of me, king of hearts and king of clubs.

I scarcely dared bet the fourth hand. We had switched to three-card draw. I discarded two small diamonds, keeping a pair of nines and an ace for a kicker. On the draw I got one card that claimed to be the fourteen of eagles and one on which there was a message reading: "These hallucinations are sent to you with the courtesy of the Manhattan Chapter of the Lodge. Are you finding it practical?"
I threw the hand in and stood up, shaking. "Since when don't you bet a full house?" my kibitzer demanded, after
the hand was won. He picked up what I had thrown in. The fourteen of eagles turned out to be a nine, and the card
with the hallucination message the other ace.
"Got to confuse the other bettors," I said. "One of the fundamentals of poker."
There really weren't enough chips left in front of me to bother cashing in. I just left them lying there and
wandered down to the street, flat broke.

* * * * *

Wally Bupp was right. I hadn't found it practical. All of a sudden I saw that it really didn't matter whether I
were a psi or not. The important question had always been whether Lefty and the others were psis. If so, they might
be on the level about my psi powers—which meant I was right back being a snake again. And if they weren't, it was a
simple case of blackmail, which at least let me rejoin the human race. On that basis, I was in tough shape. Occam's
razor has no answer for hallucinations. Either you've had them or you hadn't. I had. Nobody would change my mind
on that score. That made Snead, and presumably Lefty, a psi. And me, too.

But—what if they were mistaken? Shari's tests looked conclusive to me. I saw that as the only way out. I had to
insist on a test in their presence. And that meant I had to get in touch with Wally Bupp.

My kibitzer came stalking out of the building, gangling and gawky. "Didn't mean to spoil your luck, neighbor," he
said.
"Don't give it a second thought, Snead," I said.
"Call me Mortimer," he said. "You mind a word of advice, neighbor?" he asked, bobbing his head around and
grinning in a self-conscious way. "Next time, bet that fourteen. Highest card in the deck. Beats all the others!"
"You lousy snake!" I gasped. I'd learned better than to take a poke at him. Lefty had taught me my lesson on
that one. Snead might turn out to be a TK as well as a hallucinator, and I wanted no more heart attacks.

He handed me a card. "There'll be somebody at this number all night, neighbor. Gamblers Anonymous."
He faded off down the dark street. The card merely said:
"Manhattan Chapter NO 5-5600"

* * * * *

Shari must have had a swell time at dinner with some guy who didn't gamble, because she didn't come home
until nearly midnight. I know because I dialed her apartment every ten minutes until I got her face on the screen.
She was still dressed for dinner and had a sort of tiara over her thick tresses. "What is it?" she said.
"I'm not a psi?" I demanded.
"No!" she said. "Hasn't this gone--?"
"Well, then, am I crazy?" I cut in on her.
Her lips compressed. "It's a lot more likely," she decided. "Why?"
"Either I'm nuts," I told her. "Or those characters really are psis." She was reaching up to cut the image when I
cought her interest. "Is there such a thing as a psi who can induce hallucinations?" I demanded.
"No." Flatly.
"They've got me sold that they can do it," I said. "What does Occam's razor say about that?"
"You idiot!" she exploded. "They don't believe you are a PC any more than I do!" She was sure sensitive about
my having any precognition!
"O.K.," I said. "Then you make them eat it. Aren't you the one who knows all about exposing charlatans?"
That was the right button. "Certainly," Shari said.
"I'll pick you up in ten minutes," I said.
"Now? Midnight?"
"This is the pay-off," I said, and cut the image. I dialed the number Snead had given me.
"Manhattan Chapter," the Operator cartoon said.
"This is George Robertson," I said. "Mortimer Snead told me there'd be somebody there to talk to me. Maybe
Lefty."
"Snead?" the cartoon said, frowning. "No one here by that--Oh! Wait a moment. Dr. Walter Bupp will talk to
you," the cartoon said, and Wally's face appeared on the screen.
"It wasn't practical," I admitted.
"Six days early," he observed.
"Nuts," I said. "Look, you've got me convinced you are a psi. That Snead puts on a terrific show."
"Snead?" he frowned. "Oh!" He laughed. "Yeah," he agreed condescendingly. "He's red hot, every now and
then."
"But you haven't sold me that I'm a PC," I growled. "I've been tested. I'm not. Now I want you to get off my
back. You and the rest of them! Lay off!"
He shook his head. "The Lodge acts unilaterally on this," he said soberly. "You've got psi powers. You'll accept our direction in their use. Or else, Tex."

"All I ask is a fair test," I said desperately. "Under laboratory conditions."

He gave me an address. "Come any time," he said.

"That's me walking in," I told him.

Shari had to pay off the 'copter when we got there. It wasn't the brownstone I had seen the night before. This place was a medium-sized office building, say a hundred stories or so, quite new. There was no identification on its front other than the street number. The Directory in the silent and unpopulated lobby was names, all names. But Dr. Walter Bupp was one of them, in 7704. Shari and I rode the elevator to seventy-seven in chilly silence.

The corridor was dim, with its lights on night-time setting. Stronger light came from an open door quite a way down the hall. It had to be Bupp's office, and it was.

Wally certainly wasn't surprised to see Shari. He shook hands with her briefly, pushing his sharp chin out at her in his gamecock fashion. "Your mate?" he asked me.

"Certainly not," she told him. "We're ... uh ... colleagues at the University."

"That's not what Pheola says," he told her sourly, pointing to chairs we could take.

"Pheola?" Shari questioned.

"A powerful PC," Wally said. "She predicted you would accompany Tex tonight."

"Oh, really," Shari said scathingly.

"I was there," I told her. "She really did."

"Let's not be diverted by sideshows," Shari said. "We're here to measure the psi powers of Tex Robertson, not to talk over the reputed clairvoyance of some dim and misty character."

"Precognition," Wally corrected her. "Stick around, Dr. King. Pheola will be down a little later. She thinks Tex is something special."

That was not going to make a good interchange, so I cut in. "Dr. King is a professional in this field--" I started.

Wally waved a disgusted hand. "We know all about Dr. King and her field," he said. "Proving that psi powers don't exist, right, Dr. King?"

Shari bristled. It was hard to stay friendly in any talk with Bupp. "You know my field," she said, about twenty degrees below zero. "I accept any and all evidence, regardless what it proves! There's a lot of talk about psi powers, but precious little that can ever be detected under laboratory conditions!"

"Oh, well," Wally Bupp grinned. "That's not so strange. All members of the Lodge are cautioned to stay away from laboratories. You've been testing Normals. What do you expect for results?"

"Then you show me!" she stormed.

"Go on with you," he grinned. "I thought it was Tex's powers you wanted tested. Mine are irrelevant."

"I thought so," she said triumphantly. "Charlatan!"

For a moment the grin flickered off his face and I tensed to catch Shari if she should start to drop. But I guess he thought better of it.

"Some other time," he said. "Let's get this over with. Make it simple. You may have some statistical objections to my technique tonight, but I'm not looking for fringe effects. If this hot-eyed swain of yours is any good at all, he'll bat a thousand." He got a deck of cards out of his desk drawer and fanned it out so that he could pluck the two of spades and the two of hearts from the deck. The rest he put back in his desk.

He put his hands under the desk, with the two cards in them, produced the cards again, face down, and laid them in a thin stack on the desk before all of us.

"What's on top?" he said. "Red or black?"

"How will you score?" Shari insisted. He scowled at her and tossed a squeeze counter across the desk.

"You score," he said. "It really isn't necessary. Tex will either be right all the time or it won't matter."

But before I could call the top card, the office door opened behind us. I looked around, expecting Pheola. Instead it was Milly with the down, down hose. Only this time she was decently dressed in a dark two-piece suit and wore make-up. She certainly was no more talkative than before, nor did Wally introduce her. Shari was perfectly equal to the occasion and looked through Milly with composure. This takes about three generations of overbreeding.

"Try it," Wally insisted. "What's on top?"

I hit it. Then I missed it. Then I hit three in a row. It wasn't fast work, because Wally hid the cards under his desk after each guess, shuffled the two cards around and then laid them before me again. This went on for about twenty minutes. At that point Shari spoke.

"That makes exactly three hundred tries," she said, looking at the counter in her hand. "Have you been keeping score, Mr. Bupp?"
"I thought you were."

"So I was," she snapped, throwing up her tiaraed head. He sure brought out the worst in people. "Tex has been right exactly one hundred and fifty times. He's never been more than five tries to the good in the whole series."

"Interesting," Wally said.

I took my first decent breath in the day. "This ought to let me off the hook," I said to him. "Are you convinced?"

He shrugged. "How about it, Milly?" he asked.

"A random sample," she said. "He doesn't want to score. He didn't try."

Shari was ready for that one. She turned and spoke to Milly: "You have ways of knowing what Tex was thinking?" she asked sweetly.

"Yes."

"Name any three!" Shari lashed at her furiously. The solid woman wasn't the least bit bowled over.

"Read his mind," she said matter-of-factly. "Just like I can tell that you're getting ready to screech 'Charlatan!' at me, and like you think I got a cast-iron girdle and homely shoes. Well, they're comfortable, dearie, which is more than you can say for those high-heeled slippers of yours. That left little toe of yours is killing you, dearie!"

Shari's lips moved, but her mouth was as empty of sound as her face was of blood. Milly had hit the bull's-eye.

"Everybody relax a moment," Wally said. "Tell me, Dr. King, what's your attitude toward PC?"

"I don't have any!" she snapped. "It's a phenomenon. I have as much attitude toward it as I do toward osmosis or toward peristalsis. None."

"Would you consider a person fortunate to possess the power of precognition?" Wally asked her.

Shari's head came up. "If there were such a thing," she said, much more quietly. "Yes. I should imagine that precognition would be a powerful talent."

"If you have no emotional bias against psi as such," he went on smoothly, "you'd be happy for Tex if he were a PC."

Her eyebrows drew together. She looked at me, veiling her violet eyes as if to hide her thoughts from us. "I would consider Tex quite fortunate. But only if you could show that such a thing really existed," she said more loudly.

"How about you, Tex?" Wally asked me.

"Nuts," I said. "You can't make me like the idea of being a snake, no matter how you dress it up." I shook my head. "Psi powers are the mark of a diseased mind, for my dough. They're pure poison. What have they ever done for you?" I insisted rudely.

"Made me a surgeon," he said.

"Never!" Shari said hotly.

"Ask Tex," Wally suggested. "He felt me put a lift on his coronary artery. I'm a TK surgeon--I've got enough TK to put clamps on inaccessible arteries and feel out mechanical disorders of the body. Check it. I'm on the staff at Universal Hospital."

"And what are you doing here?" she argued.

"Meeting my obligation to the Lodge," he said. "This is where I got my training, right in this building."

"I thought that brownstone house was the Lodge," I said.

"No," he said. "That's just the Grand Master's residence. The Lodge provides quarters for its brass. This building is the real chapter house."

He heaved a long sigh and dug into his drawer again. "You can beat it, Milly," he said. "Thanks."

"I know," she told him from the door. She had started out long before he spoke. Impressive stuff, but it got a sniff from Shari.

What Wally got out of his desk had a refreshing shape and color. It was oblong. It was green. It was money. It was, for a fact, a stack of one thousand dollar bills.

Wally shuffled the two cards under his desk again and piled them two-deep in front of Shari and me.

"You heard what Dr. King said," Wally reminded me. "She'll love you no less for being a PC. Now we'll play the game a little more realistically. Every time you guess the top card right, Tex, I'm going to give you a thousand dollars. No strings attached. When you miss, you give one back. But if you have none to give, you don't have to pay. You can't lose. Maybe you can win. All set?"

"One minute," I demanded. "Shari, is this a fair test?"

She shrugged. "Why not?"

"Is it gambling?"

She smiled faintly, her first sign of relaxation. "Hardly," she said.

"Then you don't mind if I win?"
She found a laugh this time. "You can try," she corrected me.
"This could be our nest egg," I said.
She blushed. "If that's a proposal," she said tartly. "The answer is 'no.'"
"I'll talk to you later," I growled. "When I'm richer!"
I looked at the back of the card on the desk. Wally was leaning back in his swivel chair and wasn't within four feet of the pasteboards. If there was any hanky-panky, I couldn't see how he planned to work it.
"Heart," I said.
"Why don't you turn it over, Dr. King?" Wally suggested. "Remove any possible chance of manipulation." It was the two of hearts that Shari turned over. I was a thousand dollars richer.
I won the next. And the next. Every thousand dollars drove another nail into my coffin--went that much farther to prove I was a snake. Well, I wasn't!
I missed the fourth one.
"Cut that out!" Wally snapped at me. I jumped a foot. I had tried to miss it.
With a sickening realization of doom, I called the next four right.
"Stop it!" Shari screeched, grabbing at the cards. "I'll shuffle!" she announced. She hid the pasteboards from me with her body, and took care, in putting them before me on the desk, that I didn't see the face of the bottom card.
Her eyes were violet pools of hate and rage and she spoke to me: "Now try it!"
"Spade!" That made eight straight.
Even Shari succumbed to the ghastly fascination of it. There had been fifty thousand dollars in the stack of bills Wally had taken from his desk. Soon all fifty of the bills were stacked in front of me. Except for the one time I had tried to, I had never missed.
Lefty stuck his sharp chin at Shari. "I'd call that a fairly convincing string," he said. "Will you concede, Dr. King?"
She gave him an awful mouthful of silence. A pitiless blackness descended over my spirit. I looked at the money in front of me. It had been like selling my soul to the Devil. There it was, all that money. All I'd had to give up was any claim to being a human--I wasn't a Normal any more. I was a psi!
Then Shari was talking, in short gasping bursts, half choking, half sobbing. "No wonder Tex is in a whirl," she said. "I've seen some good illusions, worked by the best light-fingered operators in the country, but nothing to compare with this! Just let me see you match this charade in my laboratory! With my apparatus!" She meant her playing cards.
Wally was sweet and reasonable. "You dealt and shuffled most of the hands yourself," he reminded her. "I never touched the cards. How could I control them?" He grinned a little more sharply. "And you can't call it TK," he went on. "Did you feel the cards move or twitch or resist you as you shuffled them? It has to be PC."
She blew her top on that one. It's sickening to see someone you love goaded past all endurance and break down into screams and wild gestures.
"Aah!" she cried, shaking her head blindly. "Before I believe that Tex Robertson can feel things that I can't feel, I'll accept any other explanation. What are those cards of yours? Small TV screens? Is this more electronic hokum?"
Wally quietly tore one of the cards in two. "Now I understand," he said. "That's the real reason."
I looked my surprise at him, and Shari quieted down just a little. "Relax, Dr. King," he advised her. "The possession of psi powers isn't a mark of moral superiority. Part of the problem in the Lodge is that psi powers are possessed as often by evil and stupid people as by the good and intelligent. Yes, I know that you think you deserve precognition, Dr. King. But that ain't the way the ball bounces. You're a Normal, Dr. King, and that's all you'll ever be."
He got a face full of fingers for his trouble. Shari leaped to her feet and really slapped him in the kisser. She stormed out of there. I started to follow, but a tug at my earlobe signaled me to stop.

* * * * *
"Hold on a minute, Tex," Wally said sympathetically. "You're one of us now."
I had to go after her. "I love her," I said hopelessly. "I can't see her hurt and upset like that. I've got to--"
But he was shaking his head. "You haven't got a chance," Wally said. "She'll never forgive you for having precognition! That's why she made the study of psi her life-work. She's wanted PC for herself, and was sure she was pure enough of heart to deserve to have the power. Well, she doesn't have it, and she'll hate you for having what she thinks she deserves. Forget her."
Talk about your cup brimming over! Well, if I had to get used to being cut off from the human race, perhaps Shari was the place to start. That's what happens to superHumans!
There was one desperate hope. "This wasn't hallucination?" I tried.
"No, Tex," he said calmly. "This was on the level. Just for fun," he went on. "Can you do it when there isn't any
money riding on it?"
Reluctantly I came back to his desk and looked down at the back of the top card. "Heart," I said dully. I hit ten in a row for him. The spade was on top four times, the heart six times.
"And was that on the level?" I asked.
He scowled at me and chewed his thin lips. "Yeah," he said.
"That settles it," I said, sagging back into my seat. "I'm a snake. A rotten PC!"
"Don't you believe it!" Wally growled, lunging out of his chair. He started to pace back and forth across the office, his chin stuck way out ahead of him as he prowled. "I don't know what you are, Tex," he declared. "But you're no PC!"
"I'm a Normal after all!" I gasped, feeling a surge of blessed relief.
He swiped at the air with a hand. "Don't be silly!" he snapped. "You've got a psi power so incredible that--" He whirled on me while I died for good.
"You explain it," he insisted. "After your lovely Dr. King flew out of here, I shuffled the cards ten times under the desk, and you hit ten in a row, right?"
"Right." Dismally.
"I cheated on the shuffle," he told me. "I used TK to make sure that I put the two of spades on top all ten times."
"No," I insisted. "Six times the heart was on top. You turned them over yourself."
"That's just it," he whispered, leaning toward me. "I put that spade on top every time! I did! But when I turned it over, more than half the time it was a heart. What did you do?"
"You mean I'm a hallucinator?" I asked. "Look, this is getting ridiculous! I was kidding myself, too?"
"Nonsense. It was real." His face jerked in surprise. "You couldn't!" he gasped, as the idea hit him. "But you did!" he reminded himself. "Wait till Maragon hears this!"
And then he told me. It couldn't be, I knew. But it was. He proved it to me—or I proved it to us.
At some stage you have to get excited about it, if it's no more than a grisly fascination. At that, it was dawn before we could stop our intoxicated talk. Maragon had been yanked out of bed again, and when he heard the news, woke up a darned sight faster than the night before. Pheola of the race-horse legs joined us, and several other psis as well. Before it was over the Grand Master had put on a ridiculous piece of regalia and mumbled me into probationary membership in the Lodge. There was nothing creepy about the ritual--only about the way I felt.
I guess, if we hadn't gotten hungry, we'd be there yet. Wally had one last little wrinkle for me as I started down the corridor for the elevator.
"Pheola," he called.
"Yes, darlin' Billy," she said, coming to his side.
"How's Tex going to make out with that overeducated iceberg he's hot after?" he asked her. I flinched at the thought of Shari--I was getting used to considering her a memory.
Pheola looked into the corner for a moment. "Oh, yum!" she said, smiling and showing the braces on her teeth. She kissed me. I think I was about as startled as Wally was. "Just so you let her be the only Cassandra," she said. "And you call that an iceberg?" She looked at me curiously. "You'd better start eating red meat, Tex," she told me, and would say no more.

* * * * *
I had a heck of a time getting Shari on the 'phone. An hour before lunch she caved in and accepted my call. She looked pale and shaken, even in the black and white of the screen. "Please," she said. "I've had all I can stand. You stayed there all night, didn't you?"
"I'm not a PC, Shari," I said.
Nothing else would have caught her ear.
"Not?"
"Proved it before I left," I said. "I can prove it to you, too."
"Ridiculous. You can't prove a negative."
"Well, in a manner of speaking. What I can do is show you how the card trick was worked."
I had her hooked. "You mean it? It really was a trick after all?" she said, slumping.
"It sure wasn't PC," I said. "Let me show you."
"At the lab," Shari said. "I'll be there in ten minutes."
A couple graduate students were there, fooling around with Rhine cards when we arrived, and Shari chased them out without ceremony. She locked the door behind them. We were to have privacy. She didn't bother with her lab coat this time.
"Show me," she insisted.
"The apparatus, Shari," I grinned. She gave me a deck of cards, and pulled out the two of hearts and two of spades.

"We'll do it face-up," I said. "So you can see how it's done!"

I laid the two cards side by side on her blotter, face up. "Now put a finger on each one," I directed. "And watch them like a hawk. What card is under your right forefinger?"

"Heart," Shari said.

"Wrong," I told her. "Spade."

They could have heard that shriek clear to Keokuk. Good thing we were in a sound-proof laboratory. I got her calmed down after a while. "It didn't happen!" she insisted, clutching at her temples.

"If you won't holler," I said. "I'll do it again. Remember, it's just a phenomenon, like osmosis."

"It is not!" she gasped.

But I did it for her. Ten times in a row. The cards changed under her fingers without moving.

"So it's not PC," I said.

"Oh, Tex, but what is it?"

"You agree it's real?"

Shari nodded. "It's real. You can do it, whatever it is. What is it?"

"TK," I told her. "Telekinesis."

"Nonsense," she said. "Are you trying to make me believe I wouldn't have felt the cards move if you'd snapped them out from under my fingers? I was pressing hard on them every time."

"I didn't move the cards," I explained.

"But you said it was telekinesis!"

"Sure. I just moved the molecules of pigment in the printing ink and reassembled them in the opposite cards. You didn't expect to feel molecular movement, did you?"

"No. Then it really happened?" I nodded. "What an incredible power!" she said. A glow of satisfaction spread over me. "Can you really test this molecular hypothesis?" she asked.

I told her of the hours of demonstrations I had made during the night. "The perception on scanning part of it goes on at some subconscious level, Shari," I said. "But we had evidence that it can be made completely conscious."

She shuddered and hugged her arms to herself. "I hate to say this to you," she said. "But you're a freak."

I took a deep breath and smiled. "Unique is the way the Grand Master puts it," I said, pleased with myself. "He says it has terrific possibilities. And then it hit me, that delicious thought that I was among the elect, that I always had been."

"What possibilities?" Shari demanded, recoiling from me. "Doing card tricks?"

"To name a few," I said. "They feel sure I can operate directly on the molecular chain in genes. This means we can alter heredity to suit ourselves. Next, why not rearrange the DNA molecule in a cancer? If you can change the genes in one cell, you can change them in another. Knock out the ability of cancerous cells to reproduce their own kind and the cancer disappears. A silly one: Maragon says I can be a one-man catalytic cracking station. Pipe a liquid through a tube within my TK range and I can make an equilibrium reaction run uphill as the stuff flows past me. How about a one-step operation to produce those rare drugs that now take forty-nine separate reactions?"

"This does have a significance for science," she admitted. "The genetic part is right down your alley. And it's not PC, is it?"

"Strictly TK," I told her. "You're the only PC in the family."

"Family?" She turned pink as I went around the desk after her. "I told you the answer was 'no.'"

"I have inside information," I said, pulling her to me. "One of the PC's up at the chapter house said this was what would happen."

She didn't fight my kiss more than a couple seconds. Then it was a pure case of self-preservation for me. This girl was a tiger. Looks can be awfully deceiving. But she broke away from me.

"Tex!" she gasped. "Stop, honey! Suppose somebody walks in."

"A PC like you never gets that kind of surprise," I lied valiantly.

"Am I?" she whispered. "Am I really a PC?"

"That's why you locked the door," I said. "Remember?"

THE END
We've all heard of the wonderful invention that the Big Corporation or the Utilities suppressed...? Usually, that Wonderful Invention won't work, actually. But there's another possibility, too....

The workshop-laboratory was a mess.

Sam Bending looked it over silently; his jaw muscles were hard and tense, and his eyes were the same.

To repeat what Sam Bending thought when he saw the junk that had been made of thousands of dollars worth of equipment would not be inadmissible in a family magazine, because Bending was not particularly addicted to four-letter vulgarities. But he was a religious man--in a lax sort of way--so repeating what ran through his mind that gray Monday in February of 1981 would be unfair to the memory of Samson Francis Bending.

Sam Bending folded his hands over his chest. It was not an attitude of prayer; it was an attempt to keep those big, gorillalike hands from smashing something. The fingers intertwined, and the hands tried to crush each other, which was a good way to keep them from actually crushing anything else.

He stood there at the door for a full minute--just looking.

The lab--as has been said--was a mess. It would have looked better if someone had simply tossed a grenade in it and had done with it. At least the results would have been random and more evenly dispersed.

But whoever had gone about the wrecking of the lab had gone about it in a workmanlike way. Whoever had done the job was no amateur. The vandal had known his way about in a laboratory, that was obvious. Leads had been cut carefully; equipment had been shoved aside without care as to what happened to it, but with great care that the shover should not be damaged by the shoving; the invader had known exactly what he was after, and exactly how to get to it.

And he--whoever he was--had gotten his hands on what he wanted.

The Converter was gone.

Sam Bending took his time in regaining his temper. He had to. A man who stands six feet three, weighs three hundred pounds, and wears a forty-eight size jacket can't afford to lose his temper very often or he'll end up on the wrong end of a homicide charge. That three hundred pounds was composed of too much muscle and too little fat for Sam Bending to allow it to run amok.

At last, he took a deep breath, closed his eyes, and let his tense nerves, muscles, and tendons sag--he pretended someone had struck him with a dose of curare. He let his breath out slowly and opened his eyes again.

The lab still looked the same, but it no longer irritated him. It was something to be accepted as done. It was something to investigate, and--if possible--avenge. But it was no longer something to worry about or lose his temper over.

I should have expected it, he thought wryly. They'd have to do something about it, wouldn't they?

But the funny thing was that he hadn't expected it--not in modern, law-abiding America.

He reached over to the wall switch to turn on the lights, but before his hand touched it, he stopped the motion and grinned to himself. No point in turning on the switch when he knew perfectly well that there was no power behind it. Still--

His fingers touched the switch anyway. And nothing happened.

He shrugged and went over to the phone.

He let his eyes wander over the wreckage as his right index finger spun the dial. Actually, the room wasn't as much of a shambles as it had looked on first sight. The--burglar?--hadn't tried to get at anything but the Converter. He hadn't known exactly where it was, but he'd been able to follow the leads to its hiding place. That meant that he knew his beans about power lines, anyway.

It also meant that he hadn't been an ordinary burglar. There were plenty of other things around for a burglar to make money out of. Unless he knew what it was, he wouldn't have gone to the trouble of stealing the Converter.

On the other hand, if he had--
"Police Department," said a laconic voice from the speaker. At the same time, the blue-clad image of a police officer appeared on the screen. He looked polite, but he also looked as though he expected nothing more than a routine call.

Bending gave the cop's sleeve a quick glance and said: "Sergeant, my name is Samson Bending. Bending Consultants, 3991 Marden--you'll find it in the phone book. Someone broke into my place over the weekend, and I'd appreciate it if you'd send someone around."

The sergeant's face showed that he still thought it was routine. "Anything missing, sir?"

"I'm not sure," said Bending carefully. "I'll have to make a check. I haven't touched anything. I thought I'd leave that for the detectives. But you can see for yourself what's happened."

He stepped back from the screen and the Leinster cameras automatically adjusted for the greater distance to the background.

"Looks like you had a visitor, all right," said the police officer. "What is that? A lab of some kind you've got there?"

"That's right," Bending said. "You can check it with the Register."

"Will do, Mr. Bending," agreed the sergeant. "We'll send the Technical Squad around in any case." He paused, and Sam could see that he'd pressed an alarm button. There was more interest in his manner, too. "Any signs that it might be kids?" he asked.

Sam shrugged. "Hard to tell. Might be. Might not." He knew good and well that it wasn't a JD gang that had invaded his lab. He grinned ingratiatingly. "I figure you guys can tell me more about that than I could tell you."

The sergeant nodded. "Sure. O.K., Mr. Bending; you just hold on. Don't touch anything; we'll have a copter out there as soon as we can. O.K.?"

"O.K.," Sam agreed. He cut off as the cop's image began to collapse.

Sam Bending didn't obey the cop's order to touch nothing. He couldn't afford to--not at this stage of the game. He looked over everything--the smashed oscilloscopes, the overturned computer, the ripped-out meters--everything. He lifted a couple of instruments that had been toppled to the floor, raising them carefully with a big screwdriver, used as a lever. When he was through, he was convinced that he knew exactly who the culprit was.

Oh, he didn't know the name of the man, or men, who had actually committed the crime. Those things were, for the moment, relatively unimportant. The police might find them, but that could wait. The thing that was important was that Bending was certain within his own mind who had paid to have the lab robbed.

Not that he could make any accusations to the police, of course. That wouldn't do at all. But he knew. He was quite certain.

He left the lab itself and went into the outer rooms, the three rooms that constituted the clients' waiting room, his own office, and the smaller office of Nita Walder, the girl who took care of his files and correspondence.

A quick look told him that nothing in the offices had been disturbed. He shrugged his huge shoulders and sat down on the long couch in the waiting room.

Much good it may do them, he thought pleasantly. The Converter won't be worth the stuff it's made of if they try to open it.

He looked at the clock on the wall and frowned. It was off by five hours. Then he grinned and looked at his wrist watch. Of course the wall clock was Off. It had stopped when the power had been cut off. When the burglars had cut the leads to the Converter, everything in the lab had stopped.

It was eight seventeen. Sam Bending lit a cigarette and leaned back to wait for the cops. United States Power Utilities, Monopolated, had overstepped themselves this time.

Bending Consultants, as a title for a business, was a little misleading because of the plural ending of the last word. There was only one consultant, and that was Samson Francis Bending. His speciality was the engineering design of atomic power plants--both the old fashioned heavy-metal kind and the newer, more elegant, stellarators, which produced power by hydrogen-to-helium conversion.

Bending made good money at it. He wasn't a millionaire by any means, but he had enough money to live comfortably on and enough extra to experiment around on his own. And, primarily, it had always been the experimentation that had been the purpose of Bending Consultants; the consulting end of the business had always been a monetary prop for the lab itself. His employees--mostly junior engineers and engineering draftsmen--worked in the two-story building next door to the lab. Their job was to make money for the company under Bending's direction while Bending himself spent as much time as he could fussing around with things that interested him.

The word "genius" has several connotations, depending on how one defines a genius. Leaving aside the Greek, Roman and Arabic definitions, a careful observer will find that there are two general classes of genius: the "partial"
genius, and the "general" genius. Actually, such a narrow definition doesn't do either kind justice, but defining a human being is an almost impossible job, anyway, so we'll have to do the best we can with the tools we have to work with.

The "partial" genius follows the classic definition. "A genius is a man with a one-track mind; an idiot has one track less." He's a real wowser at one class of knowledge, and doesn't know spit about the others.

The "general" genius doesn't specialize. He's capable of original thought in any field he works in.

The trouble is that, because of the greater concentration involved, the partial genius usually gets more recognition than the general--that is, if he gets any recognition at all. Thus, the mathematical and optical work of Sir Isaac Newton show true genius; his theological and political ideas weren't worth the paper he wrote them on. Similar accusations might be leveled against Albert Einstein--and many others.

The general genius isn't so well known because he spreads his abilities over a broad area. Some--like Leonardo da Vinci--have made a name for themselves, but, in general, they have remained in the background.

Someone once defined a specialist as "a man who learns more and more about less and less until he finally knows everything about nothing." And there is the converse, the general practitioner, who knows "less and less about more and more until he finally knows nothing about everything."

Both types can produce geniuses, and there is, of course, a broad spectrum in between. Da Vinci, for instance, became famous for his paintings; he concentrated on that field because he knew perfectly well that his designs for such things as airplanes were impracticable at the time, whereas the Church would pay for art.

Samson Bending was a genius, granted; but he was more toward the "special" than the "general" side of the spectrum. His grasp of nuclear physics was far and away beyond that of any other scientist of his day; his ability to handle political and economic relationships was rather feeble.

As he sat in his waiting room on that chill day of February, 1981, his mind was centered on nuclear physics, not general economics. Not that Bending was oblivious to the power of the Great God Ammon; Bending was very fond of money and appreciated the things it could achieve. He simply didn't appreciate the over-all power of Ammon. At the moment, he was brooding darkly over the very fact of existence of Power Utilities, and trying to figure out a suitable rejoinder to their coup de démon.

And then he heard the whir of helicopter blades over the building. The police had come.

He opened the door of the lab building as they came up the steps. There were two plainclothes men--the Technical Squad, Bending knew--and four uniformed officers.

* * * * *

The plainclothesman in the lead, a tall, rather thin man, with dark straight hair and a small mustache, said: "Mr. Bending? I'm Sergeant Ketzel. Mind if the boys take a look at the scene? And I'd like to ask a few questions?"

"Fine," said Sam Bending. "Come on in."

He showed the officers to the lab, and telling them nothing, left them to their work. Then he went into his office, followed by Sergeant Ketzel. The detective took down all the pertinent data that Bending chose to give him, and then asked Bending to go with him to the lab.

The other plainclothesman came up to Sergeant Ketzel and Bending as they entered. "Pretty easy to see what happened," he said. "Come on over and take a look." He led them over to the wall where the Converter had been hidden.

"See," he said, "here's your main power line coming in here. It's been burned off. They shut off the power to cut off the burglar alarm to that safe over there."

Ketzel shook his head slowly, but said nothing for the moment. He looked at Bending. "Has the safe been robbed?"

"I don't know," Bending admitted. "I didn't touch it after I saw all this wreckage."

Ketzel told a couple of the uniformed men to go over the safe for evidence. While they waited, Bending looked again at the hole in the wall where the Converter had been. And it suddenly struck him that, even if he had reported the loss of the Converter to the police, it would be hard to prove. The thief had taken care to burn off the ends of the old leads that had originally come into the building. Bending himself had cut them a week before to install the Converter. Had they been left as they were, Bending could have proved by the oxidation of the surface that they had been cut a long time before the leads on this side of the Converter. But both had been carefully fused by a torch.

"Nothing on the safe," said one of the officers. "No prints, at any rate. Micros might show glove or cloth traces, but--" He shrugged.

"Would you mind opening the safe, Mr. Bending?" Sergeant Ketzel asked.

"Certainly," Bending said. He wondered if the safe had been robbed. In the certainty that it was only the Converter that the burglars had been after, he hadn't even thought about the safe.

Bending touched the handle, turned it a trifle, and the door swung open easily in his hand. "It wasn't even
locked," Bending said, almost to himself.

He looked inside. The safe had been thoroughly gone through, but as far as Bending could see, there were no papers missing.

"Don't touch anything in there, Mr. Bending," said Ketzel, "Just tell us as much as you can by looking at it."

"The papers have been disturbed," Bending said carefully, "but I don't think anything is missing, except the petty cash box."

"Uh-huh," Ketzel grunted significantly. "Petty cash box. About how much was in it, Mr. Bending?"

"Three or four thousand, I imagine: you'll have to ask Jim Luckman, my business manager. He keeps track of things like that."

"Three or four thousand in petty cash?" Ketzel asked, as though he'd prefer Bending to correct the figure to "two or three hundred."

"About that. Sometimes we have to order equipment of one kind or another in a hurry, and we can usually expedite matters if we can promise cash. You know how it is."

Sergeant Ketzel nodded sourly. He evidently knew only too well how it was. Even the most respectable businessmen were doing occasional business with the black market in technological devices. But he didn't say anything to Bending.

"What did the cash box look like?" he asked.

Bending held out his hands to measure off a distance. "About so long--ten inches, I guess; maybe six inches wide and four deep. Thin sheet steel, with a gray crackle finish. There was a lock on it, but it wasn't much of one; since it was kept in the safe, there was no need for a strong lock."

Sergeant Ketzel nodded. "In other words, an ordinary office cash box. No distinguishing marks at all?"

"It had 'Bending Consultants' on the top. And underneath that, the word 'Lab'. In black paint. That 'Lab' was to distinguish it from the petty cash box in the main office."

"I see. Do you know anything about the denominations of the bills? Were they marked in any way?"

Bending frowned. "I don't know. You'd have to ask Luckman about that, too."

"Where is he now?"

"Home, I imagine. He isn't due to report for work until ten."

"O.K. Will you leave word that we want to talk to him when he comes in? It'll take us a while to get all the information we can from the lab, here."

"It still doesn't make sense. Why should they go to all that trouble just to shut off a burglar alarm?" He shook his head and went over to where the others were working.

It was hours before the police left, and long before they were gone Sam Bending had begun to wish fervently that he had never called them. He felt that he should have kept his mouth shut and fought Power Utilities on the ground they had chosen. They had known about the Converter only two weeks, and they had already struck. He tried to remember exactly how the Utilities representative had worded what he'd said, and couldn't.

"Thank you for your time, Mr. Bending," the man whose card had announced him as Richard Olcott. He was a rather average-sized man, with a fiftyish face, graying hair that was beginning to thin, and an expression like that of a friendly poker player--pleasant, but inscrutable.

"I always have time to see a representative of Power Utilities, Mr. Olcott," Bending said. "Though I must admit that I'm more used to dealing with various engineers who work for your subsidiaries."

"Not subsidiaries, please," Olcott admonished in a friendly tone. "Like the Bell Telephone Company, Power Utilities is actually a group of independent but mutually co-operative companies organized under a parent company."

Bending grinned. "I stand corrected. What did you have on your mind, Mr. Olcott?"

Olcott's hesitation was of half-second duration, but it was perceptible.

"Mr. Bending," he began, "I understand that you have been ... ah ... working on a new and ... ah ... radically different method of power generation. Er ... is that substantially correct?"

Bending looked at the man, his blocky, big-jawed face expressionless. "I've been doing experimenting with power generators, yes," he said after a moment. "That's my business."

"Oh, quite, quite. I understand that," Olcott said hurriedly. "I ... ah ... took the trouble to look up your record before I came. I'm well aware of the invaluable work you've done in the power field."

"Thank you," Bending said agreeably. He waited to see what the other would say next. It was his move.
"However," Olcott said, "that's not the sort of thing I was referring to." He leaned forward in his chair, and his bright gray eyes seemed to take on a new life; his manner seemed to alter subtly.

"Let me put my ... our cards on the table, Mr. Bending. We understand that you have designed, and are experimenting with, an amazingly compact power source. We understand that little remains but to get the bugs out of your pilot model.

"Naturally, we are interested. Our business is supplying the nation with power. Anything from a new type solar battery on up is of interest to us." He stopped, waiting for Bending to speak.

Bending obliged. "I see Petternek let the cat out of the bag prematurely," he said with a smile. "I hadn't intended to spring it until it was a polished work of engineering art. It's been more of a hobby than anything else, you see."

Olcott smiled disarmingly. "I'm not acquainted with Mr. Petternek; to be quite honest, I have no idea where our engineers picked up the information."

"He's an engineer," Bending said. "Friends of mine. He probably got a little enthusiastic in a conversation with one of your boys. He seemed quite impressed by my Converter."

"Possibly that is the explanation." Olcott paused. "Converter, you say? That's what you call it?"

"That's right. I couldn't think up any fancier name for it. Oh, I suppose I could have, but I didn't want anything too descriptive."

"And the word 'converter' isn't descriptive?"

"Hardly," said Bending with a short laugh. "Every power supply is a converter of some kind. A nickel-cadmium battery converts chemical energy into electrical energy. A solar battery converts radiation into electrical current. The old-fashioned, oil- or coal-burning power plants converted chemical energy into heat energy, converted that into kinetic energy, and that, in turn was converted into electrical energy. The heavy-metal atomic plant does almost the same thing, except that it uses nuclear reactions instead of chemical reactions to produce the heat. The stellarator is a converter, too."

"About the only exception I can think of is the electrostatic condenser, and you could say that it converts static electricity into a current flow if you wanted to stretch a point. On the other hand, a condenser isn't usually considered as a power supply."

Olcott chuckled. "I see your point. Could you give me a rough idea of the principle on which your Converter operates?"

Bending allowed himself a thoughtful frown. "I'd rather not, just now, Mr. Olcott. As I said, I want to sort of spring this full-blown on the world." He grinned. He looked like a small boy who had just discovered that people liked him; but it was a calculated expression, not an automatic one.

Olcott looked into Bending's eyes without seeing them. He ran his tongue carefully over the inside of his teeth before he spoke. "Mr. Bending." Pause. "Mr. Bending, we—and by 'we', I mean, of course, Power Utilities,—have heard a great deal about this ... this Converter." His chocolate-brown eyes bored deep into the gray eyes of Samson Bending. "Frankly," he continued, "we are inclined to discount ninety per cent of the rumors that come to us. Most of them are based on purely crackpot ideas. None the less, we investigate them. If someone does discover a new process of producing power, we can't afford to be blind to new ideas just because they happen to come from ... ah ... unorthodox sources."

"You, Mr. Bending, are an unusual case. Any rumor concerning your work, no matter how fantastic, is worth looking into on your reputation alone, even though the claims may be utterly absurd."

"I have made no claims," Bending interposed.

Olcott raised a lean hand. "I understand that, Mr. Bending. None the less, others—who may or may not know what they are talking about—have made this claim for you." Olcott settled back in his chair and folded his hands across his slight paunch. "You've worked with us before, Mr. Bending; you know that we can—and do—pay well for advances in the power field which are contributed by our engineers. As you know, our contract is the standard one—any discovery made by an engineer while in our employ is automatically ours. None the less, we give such men a handsome royalty." He paused, opened his brief case, and pulled out a notebook. After referring to it, he looked up at Bending and said:

"You, yourself have benefitted by this policy. According to our records, you are drawing royalties from three patented improvements in the stellarator which were discovered at times when you were employed by us—or, rather, by one of our associative corporations—in an advisory capacity. Those discoveries were, by contract, ours. By law, we could use them as we saw fit without recompense to you, other than our regular fee. None the less, we chose to pay you a royalty because that is our normal policy with all our engineers and scientific research men. We find it more expedient to operate thus."

Bending was getting a little tired of Olcott's "none the less," but he didn't show it. "Are you trying to say that
my Converter was invented during my employ with your company, Mr. Olcott?"

Olcott cleared his throat and shook his head. "No. Not necessarily. It is true that we might have a case on those
grounds, but, under the circumstances, we feel it inexpedient to pursue such a course."

Which means, Bending thought, that you don't have a case at all. "Then just what are you driving at, Mr.
Olcott?" he asked aloud.

"I'll put my cards on the table, Mr. Bending," Olcott said.

You've already said that, Bending thought, and I've seen no evidence of it. "Go ahead," he said.

"Thank you." He cleared his throat again. "If your invention is ... ah ... worth while, we are prepared to
negotiate with you for use and/or purchase of it."

Bending had always disliked people who said or wrote "and/or," but he had no desire to antagonize the Power
Utilities representative by showing personal pique. "Let me understand you clearly," he said. "Power Utilities wants
to buy my rights to the Converter. Right?"

Olcott cleared his throat a third time. "In a word, yes. Provided, of course, that it is actually worth our while.
Remember, we know almost nothing about it; the claims made for it by our ... ah ... anonymous informer are ... well,
ah ... rather fantastic. But your reputation--" He let the sentence hang.

Bending was not at all immune to flattery. He grinned. "Do you mean that you came to me to talk about buying
an invention you weren't even sure existed--just because of my reputation?"

"Frankly, yes," said Olcott. "Your reputation is ... ah ... shall we say, a good one in power engineering circles."

"Are you an engineer?" Bending asked suddenly.

Olcott blinked. "Why, no. No, I am not. I'm a lawyer. I thought you understood that."

"Sorry," Bending said. "I didn't. Most of the financial work around here is done through my Mr. Luckman. I'm
not acquainted with the monetary end of the business."

Olcott smiled. "Quite all right. Evidently I am not as well known to you as you are to me. Not that it matters.
Why did you ask?"

Bending stood up. "I'm going to show you something, Mr. Olcott," he said. "Would you care to come with me
to the lab?"

Olcott was on his feet in a second. "I'd be glad to, Mr. Bending."

* * * * *

Bending led the man into the lab. "Over here," he said. At the far end of the laboratory was a thick-legged table
cluttered with lengths of wire, vacuum tubes, transistors, a soldering gun, a couple of meters, and the other various
paraphernalia of an electronics workshop. In the center of the table, surrounded by the clutter, sat an oblong box. It
didn't look like much; it was just an eighteen by twelve by ten box, made of black plastic, featureless, except for a
couple of dials and knobs on the top of it, and a pair of copper studs sticking out of the end.

Still, Olcott didn't look skeptical. Nor surprised. Evidently, his informant had had plenty of information. Or else
his poker face was better than Bending had thought.

"This is your pilot model?" Olcott asked.

"One of them, yes. Want to watch it go through its paces?"

"Very much."

"O.K. First, though, just how good is your technical education? I mean, how basic do I have to get?" Sam
Bending was not exactly a diplomat.

Olcott, however, didn't look offended. "Let's say that if you keep it on the level of college freshman physics I'll
get the general drift. All right?"

"Sure. I don't intend to get any more technical than that, anyway. I'm going to tell you what the Converter does-
not how."

"Fair enough--for the moment. Go ahead."

"Right." Sam flipped a switch on the top of the box. "Takes a minute or so to warm up," he said.

When the "minute or so" had passed, Bending, who had been watching the meters on the top of the machine,
said: "See this?" He pointed at a dial face. "That's the voltage. It's controlled by this vernier knob here." He turned
the knob, and the needle on the voltmeter moved obligingly upwards. "Anything from ten to a thousand volts," he
said. "Easily adjusted to suit your taste."

"I don't think I'd like the taste of a thousand volts," Olcott said solemnly. "Might affect the tongue adversely."

Olcott didn't look particularly impressed. Why should he? Anyone can build a machine that can generate high
voltage.

"Is that AC or DC?" he asked.

"DC," said Bending. "But it can easily be converted to AC. Depends on what you want to use it for."

Olcott nodded. "How much power does that thing deliver?"
Sam Bending had been waiting for that question. He delivered his answer with all the nonchalance of a man dropping a burnt match in an ash tray.

"Five hundred horsepower."

Olcott’s face simply couldn’t hold its expressionless expression against something like that. His lips twitched, and his eyes blinked. "Five hundred what?"

"I will not make the obvious pun," said Bending. "I said ‘five hundred horsepower’--unquote. About three hundred and seventy-five kilowatts, maximum."

Olcott appeared to be unable to say anything. He simply stared at the small, innocuous-looking Converter. Bending was unable to decide whether Olcott was overawed by the truth or simply stricken dumb by what must sound like a monstrous lie.

Olcott licked his lips with the tip of his small, pink tongue. "Five hundred horsepower. Hm-m-m." He took a deep breath. "No wonder those copper studs are so thick."

"Yeah," said Bending. "If I short ‘em across at low voltage, they get hot."

"Short them across?" Olcott’s voice sounded harsh.

Bending was in his seventh heaven, and he showed it. His grin was running as high an energy output as that he claimed for the Converter. "Sure. The amperage is self-limiting. You can only draw about four hundred amps off the thing, no matter how low you put the voltage. When I said five hundred HP, I meant at a thousand volts. As a matter of fact, the available power in horsepower is roughly half the voltage. But that only applies to this small model. A bigger one could supply more, of course."

"What does it weigh?" asked Olcott, in a hushed voice.

"Little over a hundred pounds," Bending said.

Olcott tore his eyes away from the fantastic little box and looked into Sam Bending’s eyes. "May I ask where you’re getting power like that?"

"Sure. Hydrogen fusion, same as the stellarator."

"It’s powered by deuterium?"

Bending delivered his bombshell. "Nope. Water. Plain, ordinary aitch-two-oh. See those little vents at the side? They exhaust oxygen and helium. It burns about four hundred milligrams of water per hour at maximum capacity."

Olcott had either regained control of himself or had passed the saturation point; Sam couldn’t tell which. Olcott said: "Where do you put the water?"

"Why put water in it?" Sam asked coolly. "That small whirring sound you hear isn’t the hydrogen-helium conversion; it’s a fan blowing air through a cooling coil. Even in the Sahara Desert there’s enough moisture in the air to run this baby."

"And the fan is powered--"

"... By the machine itself, naturally," said Bending. "It’s a self-contained unit. Of course, with a really big unit, you might have to hire someone to hang out their laundry somewhere in the neighborhood, but only in case of emergencies."

"May I sit down?" asked Olcott. And, without waiting for Sam Bending’s permission, he grabbed a nearby chair and sat. "Mr. Bending," he said, "what is the cost of one of those units?"

"Well, that one cost several hundred thousand dollars. But the thing could be mass produced for ... oh, around fifteen hundred dollars. Maybe less."

Olcott absorbed that, blinked, and said: "Is it dangerous? I mean, could it explode, or does it give out radiation?"

"Well, you have to treat it with respect, of course," Bending said. He rubbed his big hands together in an unconscious gesture of triumph. "Just like any power source. But it won’t explode; that I can guarantee. And there’s no danger from radiation. All the power comes out as electric current."

* * * * *

Sam Bending remained silent while Olcott stared at the little black box. Finally, Olcott put his hands to his face and rubbed his eyes, as though he’d been too long without sleep. When he removed his hands, his eyes were focused on Bending.

"You realize," he said, "that we can’t give you any sort of contract until this has been thoroughly checked by our own engineers and research men?"

"Obviously," said Sam Bending. "But--"

"Do you have a patent?" Olcott interrupted.

"It’s pending," said Bending. "My lawyer thinks it will go through pretty quickly."

Olcott stood up abruptly. "Mr. Bending, if this machine is actually what you claim it to be--which, of course, we will have to determine for ourselves--I think that we can make you a handsome--a very handsome settlement."
"How much?" Bending asked flatly.
"For full rights--millions," said Olcott without hesitation. "That would be a ... shall we say, an advance ... an advance on the royalties."
"What, no bargaining?" Bending said, in a rather startled tone.

* * * * *

Olcott shook his head. "Mr. Bending, you know the value of such a device as well as I do. You're an intelligent man, and so am I. Haggling will get us nothing but wasted time. We want that machine--we must have that machine. And you know it. And I know you know it. Why should we quibble?
"I can't say: 'Name your price'; this thing is obviously worth a great deal more than even Power Utilities would be able to pay. Not even a corporation like ours can whip up a billion dollars without going bankrupt. What we pay you will have to be amortized over a period of years. But we--"

"Just a minute, Mr. Olcott," Bending interrupted. "Exactly what do you intend to do with the Converter if I sell it to you?"

Olcott hesitated. "Why ... ah--" He paused. "Actually, I couldn't say," he said at last. "A decision like that would have to be made by the Board. Why?"

"How long do you think it would take you to get into production?"

"I ... ah ... frankly couldn't say," Olcott said cautiously. "Several years, I imagine..."

" Longer than that, I dare say," Bending said, with more than a touch of sarcasm. "As a matter of fact, you'd pretty much have to suppress the Converter, wouldn't you?"

Olcott looked at Bending, his face expressionless. "Of course. For a while. You know very well that this could ruin us."

"The automobile ruined the buggy-whip makers and threw thousands of blacksmiths out of work," Bending pointed out. "Such things are inevitable. Every new invention is likely to have an effect like that if it replaces something older. What do you think atomic energy would have done to coal mining if it weren't for the fact that coal is needed in the manufacture of steel? You can't let considerations like that stand in the way of technological progress, Mr. Olcott."

"Is it a question of money?" Olcott asked quietly.

Bending shook his head. "Not at all. We've already agreed that I could make as much as I want by selling it to you. No; it's just that I'm an idealist of sorts. I intend to manufacture the Converter myself, in order to make sure it gets into the hands of the people."

"I assure you, Mr. Bending, that Power Utilities would do just that--as soon as it became economically feasible for us to do so."

"I doubt it," Sam Bending said flatly. "If any group has control over the very thing that's going to put them out of business, they don't release it; they sit on it. Dictators, for instance, have throughout history, promised freedom to their people 'as soon as it was feasible'. Cincinnatus may have done it, but no one else has in the last twenty-five centuries."

"What do you suppose would have happened in the 1940s if the movie moguls of Hollywood had had the patent rights for television? How many other inventions actually have been held down simply because the interested parties did happen to get their hands on them first?"

"No, Mr. Olcott; I don't think I can allow Power Utilities to have a finger in this pie or the public would never get a slice of it."

Olcott stood up slowly from the chair. "I see, Mr. Bending; you're quite frank about your views, anyway." He paused. "I shall have to talk this over with the Board. There must be some way of averting total disaster. If we find one, we'll let you know, Mr. Bending."

* * * * *

And that was it. That was the line that had stuck in the back of Bending's mind for two weeks. If we find a way of averting total disaster, we'll let you know, Mr. Bending.

And they evidently thought they'd found a way. For two weeks, there had been phone calls from officers of greater or lesser importance in Power Utilities, but they all seemed to think that if they could offer enough money, Sam Bending would capitulate. Finally, they had taken the decisive step of stealing the Converter. Bending wondered how they had known where it was; he had taken the precaution of concealing it, just in case there might be an attempt at robbery, and using it as power supply for the lab had seemed the best hiding place. But evidently someone at Power Utilities had read Poe's "Purloined Letter," too.

He smiled grimly. Even if the police didn't find any clues leading them to the thieves who'd broken into his lab, the boys at Power Utilities would find themselves in trouble. The second they started to open the Converter, it would begin to fuse. If they were quick, whoever opened it should be able to get away from it before it melted down into an
unrecognizable mass.

Sam Bending took the tape from the playback and returned it to his files. He wondered how the Power Utilities boys had managed to find where the Converter was. Checking the power that had been used by Bending Consultants? Possibly. It would show that less had been used in the past two weeks than was normally the case. Only the big building next door was still using current from the power lines. Still, that would have meant that they had read the meter in the last two weeks, which, in turn, meant that they had been suspicious in the first place or they wouldn't have ordered an extra reading.

On the other hand, if--

The visiphone rang.

It was the phone with the unregistered number, a direct line that didn't go through his secretary's switchboard. He flipped it on. "Yes?" He never bothered to identify himself on that phone; anyone who had the number knew who they were calling. The mild-looking, plumpish, blond-haired man whose face came onto the screen was immediately recognizable.

"How's everything, Mr. Bending?" he asked with cordial geniality. "Fine, Mr. Trask," Bending answered automatically. "And you?"

"Reasonable, reasonable. I hear you had the police out your way this morning." There was a questioning look in his round blue eyes. "No trouble, I hope."

Sam understood the question behind the statement. Vernon Trask was the go-between for some of the biggest black market operators in the country. Bending didn't like to have to deal with him, but one had very little choice these days.

"No. No trouble. Burglary in the night. Someone opened my safe and picked up a few thousand dollars, is all."

"I see." Trask was obviously wondering whether some black market operator would be approached by a couple of burglars in the next few days--a couple of burglars trying to peddle apparatus and equipment that had been stolen from Bending. There still were crooks who thought that the black market dealt in stolen goods of that sort.

"Some of my instruments were smashed," Bending said, "but none of them are missing."

"I'm glad to hear that," Trask said. "And Bending knew he meant it. The black market boys didn't like to have their customers robbed of scientific equipment; it might reflect back on them. "I just thought I'd explain about missing our appointment this morning," Trask went on. "It was unavoidable; something unexpected came up."

Trask was being cagey, as always. He didn't talk directly, even over a phone that wasn't supposed to be tapped. Bending understood, though. Some of the robotics equipment he'd contracted to get from Trask was supposed to have been delivered that morning, but when the delivery agent had seen the police car out front, he'd kept right on going naturally enough.

"That's all right, Mr. Trask," Bending said. "What with all this trouble this morning, it actually slipped my mind. Another time, perhaps."

Trask nodded. "I'll try to make arrangements for a later date. Thanks a lot, Mr. Bending. Good-by."

Bending said good-by and cut the connection.

Samson Bending didn't like being forced to buy from the black market operators, but there was nothing else to do if one wanted certain pieces of equipment. During the "Tense War" of the late Sixties, the Federal and State governments had gone into a state of near-panic. The war that had begun in the Near East had flashed northwards to ignite the eternal Powder Keg of Europe. But there were no alliances, no general war; there were only periodic armed outbreaks, each one in turn threatening to turn into World War III. Each country found itself agreeing to an armistice with one country while trying to form an alliance with a second and defending itself from or attacking a third.

And yet, during it all, no one quite dared to use the Ultimate Weapons. There was plenty of strafing by fighter planes and sorties by small bomber squadrons, but there was none of the "massive retaliation" of World War II. There could be heard the rattle of small-arms fire and the rumble of tanks and the roar of field cannon, but not once was there the terrifying, all-enveloping blast of nuclear bombs.

But, at the time, no one knew that it wouldn't happen. The United States and the Soviet Union hovered on the edges of the war, two colossi who hesitated to interfere directly for fear they would have to come to grips with each other.

The situation made the "Brinksmanship" of former Secretary Dulles look as safe as loafing in an easy-chair. And the bureaucratic and legislative forces of the United States Government had reacted in a fairly predictable manner. The "security" guards around scientific research, which had been gradually diminishing towards the vanishing point, had suddenly been re-imposed--this time, even more stringently and rigidly than ever before.

Coupled with this was another force--apparently unrelated--which acted to tie in with the Federal security regulations. The juvenile delinquent gangs had begun to realize the value of science. Teen-age hoodlums armed with
homemade pistols were dangerous enough in the Fifties; add aimed rockets and remote-control bombs to their armories, and you have an almost uncontrollable situation. Something had to be done, and various laws controlling the sale of scientific apparatus had been passed by the fifty states. And--as with their liquor and divorce laws--no two of the states had the same set of laws, and no one of them was without gaping flaws.

By the time the off-again-on-again wars in Europe had been stilled by the combined pressure of the United Nations--in which the United States and the Soviet Union co-operated wholeheartedly, working together in a way they had not done for over twenty years—the "scientific control laws" in the United States had combined to make scientific research almost impossible for the layman, and a matter of endless red tape, forms-in-octuplicate, licenses, permits, investigations, delays, and confusion for the professional.

The answer, of course, was the black market. What bootlegging had done for the average citizen in the Twenties, the black market was doing for scientists fifty years later.

The trouble was that, unlike the Volstead Act, the scientific prohibitions aroused no opposition from the man in the street. Indeed, he rather approved of them. He needed and wanted the products of scientific research, but he had a vague fear of the scientist--the "egghead." To his way of thinking, the laws were cleverly-designed restrictions promulgated by that marvelous epitome of humanity, the common man, to keep the mysterious scientists from meddling with things they oughtn't to.

The result was that the Latin American countries went into full swing, producing just those items which North American scientists couldn't get their hands on, because the laws stayed on the books. During the next ten years, they were modified slightly, but only very slightly; but the efforts to enforce them became more and more lax. By the time the late Seventies and early Eighties rolled around, the black marketers were doing very nicely, thank you, and any suggestion from scientists that the laws should be modified was met with an intensive counterpropaganda effort by the operators of the black market.

Actually, the word "operators" is a misnomer. It was known by the authorities at the time that there was only one ring operating; the market was too limited to allow for the big-time operations carried on by the liquor smugglers and distillers of half a century before.

Sam Bending naturally was forced to deal with the black market, just as everyone else engaged in research was; it was, for instance, the only source for a good many technical publications which had been put on the Restricted List. Sam wasn't as dependent on them as college and university research men were, simply because he was engaged in industrial work, which carried much higher priorities than educational work did.

Sam, however, was fed up with the whole mess, and would have given his eyeteeth to clear up the whole stupid farce.

* * * * *

Irritated by every petty distraction at his office, Sam Bending finally gave up trying to cope with anything for the rest of the day. At three in the afternoon, he told his secretary that he was going home, jammed his hat on his head, and went out to his car.

He got in, turned the switch, and listened to the deep hum of the electric motors inside. Somehow, it made him feel so good that the irritations of the day lessened a great deal. He grinned.

Power Utilities hadn't even thought of this hiding place. The Converter in the rear of the car gave the vehicle far more power than it needed, but the extra juice came in handy sometimes. The driving motors wouldn't take the full output of the generators, of course; the Converter hardly had to strain itself to drive the automobile at top speed, and, as long as there was traction, no grade could stall the car. Theoretically, it could climb straight up a wall.

Not that Sam Bending had any intention of climbing a wall with it.

He even had power left over for the sound-effects gadget and the air-heater that made the thing appear to be powered by an ordinary turbo-electric engine. He listened and smiled as the motors made satisfying sounds while he pulled out of the parking lot and into the street. He kept that pleased, self-satisfied grin on his face for six blocks.

At Humber Avenue, he turned left and drove southwards. The steel-blue Ford was just a common Ford Cruiser of the nondescript steel blue color that was so popular. But Bending had been conscious of its presence for several blocks. He looked carefully in the mirror.

Maybe he was wrong. Maybe it had been several cars of that same color that had moved in and out of the traffic behind him. Well, he'd soon see.

He kept on going toward the North-South Expressway, and kept watching the steel-blue Ford, glancing at his rear view mirror every time he could afford to take his eyes off the traffic.

It moved back and forth, but it was never more than three cars behind him, and usually only one. Coincidence? Possibly.

At Humber Avenue, he turned left and drove southwards. The steel-blue Ford turned, too. Coincidence? Still
He kept on going down Humber Avenue for ten blocks, until he came to the next cross street that would take him to a lower entrance to the North-South Expressway. He turned right, and the Ford followed.

At the ramp leading to the northbound side of the Expressway, the Ford was two cars behind.

Coincidence? No. That's pushing coincidence too far. If the men in the car had actually intended to go north on the Expressway, they would have gone on in the direction they had been taking when Bending first noticed them; they wouldn't have gone ten blocks south out of their way.

Bending's smile became grim. He had never liked the idea of being followed around, and, since the loss of one of his Converters, he was even touchier about the notion. Trouble was, his fancy, souped-up Lincoln was of no use to him at all. He could outrun them on a clear highway—but not on the crowded Expressway. Or, conversely, he could just keep on driving until they were forced to stop for fuel—but that could be a long and tedious trip if they had a full tank. And besides, they might make other arrangements before they went dry.

Well, there was another way.

He stayed on the Expressway for the next twenty miles, going far north of where he had intended to turn off. At the Marysville Exit, he went down the ramp. He had been waiting for a moment when the Ford would be a little farther behind than normal, but it hadn't come; at each exit, the driver of the trailing car would edge up, although he allowed himself to drop behind between exits. Whoever was driving the car knew what he was doing.

At the bottom of the ramp, Bending made a left turn and took the road into Marysville. It was a small town, not more than five or six thousand population, but it was big enough.

There weren't many cars on the streets that led off the main highway. Bending made a right turn and went down one of the quiet boulevards in the residential section. The steel-blue Ford dropped behind as they turned; they didn't want to make Bending suspicious, evidently.

He came to a quiet street parallel to the highway and made a left turn. As soon as he was out of sight of his pursuers, he shoved down on the accelerator. The car jumped ahead, slamming Bending back in his seat. At the next corner, he turned left again. A glance in the mirror showed him that the Ford was just turning the previous corner.

Bending's heavy Lincoln swung around the corner at high speed and shot back toward the highway. At the next corner, he cut left once more, and the mirror showed that the Ford hadn't made it in time to see him turn.

They'd probably guess he'd gone left, so he made a right turn as soon as he hit the next street, and then made another left, then another right. Then he kept on going until he got to the highway.

A left turn put him back on the highway, headed toward the Expressway. The steel-blue car was nowhere in sight.

Bending sighed and headed back south towards home.

* * * * *

Sam Bending knew there was something wrong when he pulled up in front of his garage and pressed the button on the dashboard that was supposed to open the garage door. Nothing happened.

He climbed out of the car, went over to the door of the garage, and pushed the emergency button. The door remained obstinately shut.

Without stopping to wonder what had happened, he sprinted around to the front door of the house, unlocked it, and pressed the wall switch. The lights didn't come on, and he knew what had happened.

Trailing a stream of blue invective, he ran to the rear of the house and went down the basement stairs. Sure enough. Somebody had taken his house Converter, too.

And they hadn't even had the courtesy to shunt him back onto the power lines.

At his home, he had built more carefully than he had at the lab. He had rigged in a switch which would allow him to use either the Converter or the regular power sources, so that he could work on the Converter if he wanted to. His basement was almost a duplicate of his lab in the city, except that at home he built gadgets just for the fun of watching them work, while at the lab he was doing more serious research.

He went over to the cabinet where the switch was, opened it, and punched the relay button. The lights came on.

He stalked back up the stairs and headed for the visiphone. First, he dialed his patent attorney's office; he needed some advice. If Power Utilities had their hands on two out of three of his Converters, there might be some trouble over getting the patents through.

The attorney's secretary said he wasn't in, and she didn't know if he expected to be back that day. It was, she informed Bending rather archly, nearly five in the afternoon. Bending thanked her and hung up.

He dialed the man's home, but he wasn't there, either.

Sam Bending stuck a cigarette in his mouth, fired it up, walked over to his easy-chair and sat down to think.

According to the police, the first Converter had been stolen on Friday night. The second one had obviously been taken sometime this morning, while he was in the lab with the police.
That made sense. The first one they'd tried to open had fused, so they decided to try to get a second one. Only how had they known he had had more than one? He hadn't told anyone that he had three—or even two.

Well, no matter. They had found out. The question was, what did he do next? Inform the police of the two thefts or--

There was a car pulling up outside the house.

Sam stood up and glanced out the window. It was a steel-blue Ford.

By Heaven! Did they intend to steal the third Converter, too? And right in front of his eyes, before it even got decently dark?

Sam was so furious that he couldn't even think straight. When the two men climbed out of the car and started walking toward the house, Sam ran back into his study, pulled open his desk drawer, and took out the .38 Special he kept there. It was the work of seconds to thumb six cartridges into the chambers and swing the cylinder shut.

The door chime sounded.

Sam went back into the front room with the revolver in his jacket pocket and his hand ready to fire it.

"Who is it?" he called, in what he hoped was a steady voice.

"We're Special Agents of the FBI," said a voice. "May we see you for a few moments, Mr. Bending?"

"Certainly. Come on in; the door's unlocked." Just walk in, you phonies! Just trot right on in, he thought.

And they did. The two men walked in, removing their hats as they did so.

"We--" one of them began. He stopped when he saw that he was addressing a round, black hole that was only a fraction more than a third of an inch in diameter but looked much, much larger from his viewpoint.

"Get your hands in the air and turn around very slowly," said Bending. "Lean forward and brace your hands against the wall."

They did as they were told. Bending frisked them carefully and thoroughly, thankful that the two years he had spent in the Army hadn't been completely wasted. Neither one of them was carrying a gun.

Bending stepped back and pocketed his own weapon. "All right. You two can turn around now. If you want to try anything, come ahead—but I don't advise it."

The two men turned around. Neither of them was exactly a small man, but the two of them together didn't outweigh Samson Bending by more than fifty pounds.

"What's the idea of the gun, Mr. Bending?" the taller of the two asked. He seemed to be the spokesman for the team.

"I'll ask the questions," Bending said. "But first, I want to tell you that, in the first place, you can get in trouble for impersonating a Federal officer, and, in the second, I don't like being followed. So you just trot right back to the boys at Power Utilities and tell them that if they want to play rough, I am perfectly willing to do likewise. That if they come after me again, I'm going to do some very unpleasant things. Understand?"

"I think we understand," said the spokesman, still relatively unruffled. "But I don't think you do. Would you care to look at our credentials, Mr. Bending?"

"Credentials?" Sam looked startled. Had he made a mistake?

"That's right. May I take my billfold out?"

Bending took his gun out again. "Go ahead. But slowly."

The billfold came out slowly. Bending took it. The identification card and the small gold badge said very plainly that the man was a Special Agent of the Federal Bureau of Investigation.

"I ... I'm sorry," Bending said weakly. "I thought you were someone else. Some men were following me this afternoon, and--"

"That was us, Mr. Bending. Sorry."

"May I verify this?" Bending asked.

"Certainly. Go right ahead."

Bending phoned the local office of the FBI and verified the identities of the two men. When he cut off, he asked dazedly: "What was it you wanted?"

"Would you mind coming with us--downtown? We'd like to have you see some people."

"Am I under arrest?"

"No." The agent smiled a little. "I suppose, if we had to, we could get you for speeding and reckless driving; that was pretty fancy dodging you did. But we're not supposed to be traffic cops."

Sam smiled feebly. "What's this all about?"

"I haven't the faintest notion, Mr. Bending. Honestly. We were told to stick with you until we got word to pick you up. We got that word just shortly after you ... hm-m-m ... after you left us. Fortunately, we found you at home. It might have been difficult ..."
"Can we go in my car?" Bending asked. "I'd rather not leave it unguarded just now."
"Certainly. I'll go with you, and Steve can follow." He paused. "But I'm afraid you'll have to take that revolver out of your pocket and put it away."
"Sure," Bending said. "Sure."
* * * * *

Bending's mind simply refused to function during the drive back to the city. The FBI agent beside him just sat silently while Sam drove the car.

Once, Sam asked: "Who is it that wants to see me?"
And the FBI man said: "Sorry, Mr. Bending; I can't answer any questions. My job is over as soon as I deliver you."

A little later, Sam had another question. "Can you tell me where we're going, at least?"
"Oh--" the agent laughed, "sure. I thought I had. The General Post Office Building, on Kenmore Drive."

After that, Sam didn't say anything. That this whole affair had something to do with the Converter, Sam had no doubt whatsoever. But he couldn't see exactly what, and none of his wild speculations made sense.

He pulled up at last into the parking lot behind the Post Office Building. The second FBI man came up in the steel-blue Ford, and the three of them got out of the cars and went towards the building. It was quite dark by now, and the street lights were glowing against a faint falling of February mist. Bending, in spite of his topcoat, felt chilly.

They went in the back way, past the uniformed Postal Service guard, and took an elevator to the sixth floor. None of the three had anything to say. They walked down the hall, toward the only office that showed any light behind the frosted glass. The lettering on the glass simply said: Conference Room A-6.

The FBI man who had driven with Sam rapped on the door with gentle knuckles.
"Yes?" said a questioning voice from the other side.
"This is Hodsen, sir. Mr. Bending is with us."

The door opened, and Sam Bending felt mild shock as he saw who it was. He recognized the man from his news photos and TV appearances. It was the Honorable Bertram Condley, Secretary of Economics for the President of the United States.

"Come in, Mr. Bending," the Secretary said pleasantly. Unnecessarily, he added, "I'm Bertram Condley."
He held out his hand, and Sam took it. "It's a pleasure, Mr. Secretary."

Condley gave out with his best friendly-politico smile. "I'm sorry to have to drag you up here like this, Mr. Bending, but we felt it best this way."

Sam smiled back, with a trace of irony in the smile. "It's a pleasure, Mr. Secretary," he repeated.

Condley nodded, still smiling—but there was a spark in his eyes now. "I see we understand each other. Come on in; I want you to meet the others." He looked at the FBI men. "That's all. For now."

The Federal agents nodded and moved away into the dimness of the corridor.
"Come in, man, come in," the Secretary urged, opening the door wider.
Sam hesitated. The light within the room was none too bright. Then he stepped forward, following the Secretary.
* * * * *

The outer room was dark. Not too dark, but illuminated only by the dim light from the corridor and from the inner room. From that inner room, there was only a glow of light from the frosted glass panel of the door that separated the two rooms.

Condley closed the hall door, and, as Sam stepped forward toward the lighted door, held out a hand to stop him.
"Just a moment," he whispered softly. "I think you ought to know what you're walking in to, Mr. Bending."

Bending stood stock-still. "Yes, sir?" he asked, questioningly.
"I suppose you know what this is all about?" Secretary Condley asked softly.

"The Converter, I imagine," Sam Bending said.

Condley nodded, his gray hair gleaming silver in the dim light. "Exactly. I'm sorry we had to drag you up here this way, Mr. Bending, but, in the circumstances, we felt it to be the best way." He took a breath. "Do you know why we called you here?"

"No," Sam said honestly.

Condley's head nodded again. "You're in for an argument, Mr. Bending. A very powerful one, I hope. We want to convince you of something."
Again he paused. "Are you an open-minded man, Mr. Bending?"

Sam Bending followed the Secretary's lead, and kept his voice low. "I like to think so, Mr. Secretary." He recognized that Condley was preparing him for something, and he recognized that the preliminary statements were calculated to soften him. And he recognized the fact that they did soften him. All right—what was the argument?

"You're an engineer, Mr. Bending," Condley said, in the same low voice. "You have been trained to evaluate
facts. All I ask is that you use that training. Now, let's get in there before Tovarishch Artomonov begins to think we might be stalling him."

Condley strode toward the door and grasped the knob with a firm hand. Sam Bending followed, wondering. Artomonov? Who was Artomonov? The Secretary of Economics had indicated, by his precise enunciation of tovarishch, that the man was a Russian--or at least a citizen of one of the Soviet satellites. Sam Bending took a deep breath and decided that he was prepared for almost anything.

There were four men seated around the conference table in the back room, and the most surprising thing, as far as Sam was concerned, was that he recognized only one of them. From the big buildup, he had had half a notion that the President himself might be there.

"Mr. Samson Bending, gentlemen," said Secretary Condley to the group. They all rose and made half-hearted attempts to smile, but Sam could see that they were watching him as though he had a live grenade in his pocket.

"Mr. Bending, I believe you know Mr. Richard Olcott," the Secretary said.

Bending gave the Power Utilities executive a sardonic smile, which was returned by a solemn nod of the head.

"And, around the table," Condley continued, "are Dr. Edward Larchmont, the research departmental head of Power Utilities--Dr. Stefan Vanderlin, of the United States Bureau of Standards--and Dr. Alexis Andreevich Artomonov, of the Soviet Socialist Republics' representative office at the United Nations."

Sam Bending managed not to blink in astonishment as the last man was introduced--a feat which took every milligram of his self-possession. He recognized the name; A. A. Artomonov, head of the United Nation's International Trade Bureau. What was he doing here?

"If you'll sit down, Mr. Bending," Condley was saying, "we can get to business."

Bending sat down, and the others sat with him. "May I say something before we go any further?" Sam Bending asked. "May I say that I think this is a rather irregular method of doing things and that I think I ought to see my lawyer."

Secretary Condley's eyes narrowed just the slightest. He was a heavy, jowl-faced, graying man who was known for his firmness in his official capacity. "At this stage of the game, Mr. Bending, there is no need for a lawyer. We merely want to explain something to you--we want you to get all the data. If, afterwards, you still want your lawyer, you'll be perfectly free to call him. Right now, we want you to listen with an open mind."

Bending thought it over. "All right. Go ahead."

* * * * *

"Very well. First, I'll agree that all this may seem a bit high-handed. But time was--and is--getting short." He glanced at Olcott, and the glance was not all friendliness. "The Government was notified about this almost too late; we have had to act fast. Almost too fast."

"I notified the Government as soon as I was sure of my facts," Olcott said, completely unflustered.

"That's as may be," Condley said. "The point is that we now have the problem on our hands, and we must find an equitable solution." He took a gold fountain pen from his pocket, and his strong, thick fingers began toying with it while his eyes remained on Sam Bending. "The fact that you have applied for a patent makes it imperative that we get the situation under control immediately."

Before Sam could answer, there was a knock on the outer door that came clearly into the rear room. Secretary Condley rose without saying a word and went out.

Dr. Larchmont, the Power Utilities physicist, decided to make small talk to bridge the hiatus. "That's a really beautiful piece of machinery you've built, Mr. Bending. Really remarkable." He was a small, flat-faced man with a fringe of dark hair around his otherwise naked scalp.

Sam looked a little startled. "You mean you opened a Converter up?"

Larchmont nodded. "I presume you are referring to the fusing device. We X-rayed the thing thoroughly before we opened it. These days, many devices are rigged to be self-destroying, but that, in itself is a specialized field. Most of them are traps that are rather easy to get around if one is expecting them and knows how to handle them. But the Converter itself, if I may say so, is one of the most original and elegant devices I have seen in many a day."

"Thanks," said Bending, with a touch of bitterness in his voice. "I--"

The door opened at that moment, and Secretary Condley came in followed by a tall, round-faced man with dark wavy hair and clear brown eyes.

"Jim!" Sam said in surprise.

The man was James Luckman, Sam Bending's business manager. "Hello, Sam. What's this all about? The FBI men who picked me up said I wasn't under arrest, but I had a hunch it was about as close as you can come without actual arrest."

Sam nodded. "Funny--I had that impression, too." He looked at Condley. "What's the idea, Condley? Jim
doesn't know anything about this."

The Secretary managed to look unoffended at Bending's tone. "Possibly not. We can't be sure, of course, but--frankly, I'd be willing to accept your word." He paused. "But--you're not a businessman, Mr. Bending?" He made it only half a question.

"No. I leave that sort of thing up to Jim. Oh, I don't say I'm completely ignorant of the field; it's just that I'm not particularly interested, that's all. Why should I be?" He went on, half belligerently. "I've known and trusted Jim for years. He knows his business; I know my science. I know enough to be able to check the account books, and he knows enough to be able to understand a technical report. Right, Jim?"

Luckman looked bewildered. "Sure, Sam. But what's all this leading up to? I don't get it." He frowned suddenly. "Has someone accused me of cheating you?"

"No, no, no," Condley said rapidly. "Of course not. Nothing like that." He looked sharply at Luckman. "Do you know anything about the Converter?"

Jim Luckman glanced at Bending before replying. Bending's face remained expressionless. "Go ahead, Jim," he said, "square with him."

Luckman spread his hands. "I know that Sam was working on something he called a Converter. I don't know anything more about it than that. Sam keeps his ideas secret until he gets them to a marketable stage, which is all right with me. I have enough work to do, handling the stuff he's already patented, without worrying about anything that isn't salable yet. So?"

Condley nodded, then gestured toward a chair. "Sit down, Mr. Luckman. Do you know these other gentlemen?" he asked rhetorically. He proceeded to introduce the others. Sam Bending noted with satisfaction that Luckman looked rather puzzled when the Russian was introduced.

Condley himself sat down again, and said: "Well, we're all here. We're not going to make this formal, gentlemen, but I hope it won't develop into a heated argument, either. Let's try to keep our tempers."

* * * * *

"First, as to the Converter itself. We all know, with the possible exception of Mr. Luckman, what it does, but for his benefit, we'll go over that. The Converter, by means of what Dr. Larchmont has been wont to call 'a very elegant method', produces electrical power directly from the fusion of hydrogen into helium. A pilot model, with a total volume of a little more than one and one-quarter cubic feet, is capable of turning out up to five hundred horsepower, either DC or AC in a wide range of frequencies. The voltage can be regulated from zero to one thousand volts by simply setting a dial.

"The device is powered by using ordinary water as fuel. At full capacity, the Converter consumes approximately four hundred milligrams of water per hour, which can easily be drawn from the moisture of the air. The machine is thus self-fueling.

"Since the nuclear energy released is converted almost one hundred per cent into electrical current, there is no danger from radiation; since the process is, by its very nature, self-limiting, there is no danger of explosion. The worst that can happen is for the machine to burn out, and, I understand, it won't do that unless it is purposely tampered with to make it do so."

"Finally, the device is so inexpensive to produce that it could be sold for about one-quarter of the price of an ordinary automobile." He stopped, cleared his throat, and glanced at Larchmont and Vanderlin. "Am I essentially correct, gentlemen?"

Larchmont nodded, and Vanderlin said, "That's about it."

Jim Luckman looked at Sam Bending in open admiration. "Wow," he said softly. "You're quite a genius, Sam."

"Very well, gentlemen," Condley continued, "we know what this device will do on a physical level. Now we must consider what it will do on an economic level. Have you considered what would happen, Mr. Bending?"

"Certainly," Bending said, with an angry glance at Olcott. "The Power Utilities would lose their pants. So what? I figure that any company which tries to steal and suppress inventions deserves a licking."

Secretary Condley glanced at Olcott as though he were trying to hold back a smile, then returned his gaze to Bending. "We won't quibble over the ethics of the situation, Mr. Bending. You are correct in saying that Power Utilities would be bankrupt. They couldn't stand the competition of what amounts to almost unlimited free power. And then what would happen, with every power company in the United States suddenly put out of business?"

Sam looked puzzled. "What difference would it make? People would just be getting their power from another source, that's all."

Richard Olcott leaned forward earnestly. "May I interject something here? I know you are angry with me, Mr. Bending--perhaps with good reason. But I'd like to point out something that you might not have recognized. Public Utilities and its co-operative independent companies are not owned by individuals. Much of the stock is owned by
small share-holders who have only a few shares each. The several billion dollars that these companies are worth is spread out over the nation, not just centered with a few wealthy men. In addition, a great many shares are held by insurance companies and banks. Literally millions of people would lose money--just as surely as if it had been stolen from them--if this device went on the market.

Bending frowned. He hadn't thought of it in exactly that way. "Still," he said tentatively, "didn't blacksmiths and buggy-whip manufacturers and horse-breeders lose money after World War I?"

"Not to this extent," Olcott said, shaking his head. "This is not 1918, Mr. Bending. Sixty years ago, our economy was based on gold, not, as it is today on production and manpower, centered in the vast interlocking web of American industry."

Condley said: "Mr. Olcott said a moment ago that millions of people would lose money just as surely as if it had been stolen from them. I think it would be more proper to say that the money will be destroyed, not stolen. A thief, after all, does put money back into circulation after he steals it. But when vast amounts of wealth are suddenly removed from circulation completely, the economic balance is disastrously upset."

* * * * *

Sam Bending was still frowning. His grandfather had been a small businessman in 1929--not fabulously wealthy, but certainly well off by the social standards of the day. Two years later, in 1931, he was broke, wiped out completely, happy and eager to accept any odd job he could get to support his family.

Sam's father had had to leave school during the Thirties and go to work in order to bring in enough money to keep the family going. Grandfather Bending, weakened by long hours of labor that he was physically unfit for, had become an invalid, and the entire support of the family had devolved upon Sam's father.

He could remember his dad talking about the breadlines and the free-soup kitchens. He could remember his grandmother, her hands crippled by arthritis, aggravated by long hours at a commercial sewing machine in a clothing center sweat-shop, just so she could bring in that little extra money that meant so much to her children and her invalid husband.

Could one invention bring all that back again? Could his own harmless-looking Converter plunge millions back into that kind of misery? It seemed hardly possible, but Sam couldn't banish the specter of the Great Depression from his mind.

"Just how far-reaching would this economic upset be?" he asked Condley.

Condley had taken out his gold fountain pen again and was rolling it between his palms. "Well, that's a question with a long answer, Mr. Bending. Let's begin small and watch it spread.

"Banks are pretty safe today, aren't they? The Federal Deposit Insurance Corporation insures all depositors for deposits up to twenty thousand dollars now. A bank is hedged in by so many legal fences that it is almost impossible for one to fail in the same way that they failed all over the country in the early Thirties. Even if one does fail, through the gross mismanagement or illegal activities of its governing board, the depositors don't get excited; they know they're covered. There hasn't been a really disastrous run on a bank for more than thirty years.

"But banks don't just keep their money in vaults; they invest it. And a significantly large percentage of that money is invested in power companies all over the nation. In an attempt to keep their heads above water, those banks would be forced to make up tremendous losses if Power Utilities failed overnight. It would force them to draw in outstanding loans for ready cash. It would mean turning in United States Savings Bonds, which would put a tremendous strain on the Government."

"In spite of that, most banks won't be able to stay solvent because their other capital investments will be dropping rapidly in value. As Mr. Olcott said, our monetary system isn't based on gold, but on production and goods. If Power Utilities and its members fail, you and your machine will have destroyed--made worthless--several billion dollars worth of machinery and equipment. You will have thrown tens of thousands of people out of work. You will have cut the underpinnings from beneath the American dollar.

"And it won't stop there. What will happen to the companies that build the dynamos and the boilers and the atomic plants for the power companies? What will happen to the copper industry when the need for millions of miles of copper wire vanishes? They will all suffer tremendous setbacks, throwing tens of thousands more out of work and lowering the value of their stock drastically.

"The banks, then, will find their investments suddenly worth only a fraction of their former value. They'll fail wholesale. And you can see what that will do to the Federal Deposit Insurance Corporation and other insurance companies."

Sam Bending nodded slowly. He could see that. Insurance companies base their business on the prediction that a certain event--death, accident, or the failure of a bank--will happen to a certain percentage of their covered clients, and they adjust their rates accordingly. But something that would change a five-percent-failure rate to a fifty-percent-failure rate would break the company.
And the unemployment rate would go up even higher. And Sam thought of something the Secretary hadn't even mentioned. State and Federal Unemployment Insurance. What would that drain do to the treasuries of the various governments involved?

Sam Bending felt as if the thing were snowballing on him. Where would the State and Federal Governments get that money? Taxes? Don't be silly. How can you collect sales taxes when sales are dropping off because of unemployment? How can you get income taxes from depleted incomes? How can you charge luxury taxes when no one is buying luxuries?

Certainly essentials like food, rent, and clothing couldn't be taxed. People would buy as cheaply as possible, which would force down prices. Which would--

* * * * *

"Where would it go from there?" Sam asked Condley in a shaken voice.

Condley glanced over at the Russian. "I believe Dr. Artomonov can answer that one for you."

Artomonov was a red-faced, fleshy man with almost no hair and a huge, bristling, gray mustache. His eyes were a startling blue. "Mr. Bending," he said in excellent English, "you may recall that your depression of the Thirties was not confined to America. All of Europe became involved. The same will happen again, to a greater degree, if your machine is released to the world at this time." He brushed at his mustache with a fingertip.

"You may wonder what I am doing here, Mr. Bending. You might think that the traditional rivalry which has existed between our countries for so many decades would preclude my being admitted to such a secret session as this one. I might have thought so, too, fifteen years ago. But when something threatens both our countries, the picture changes. We fought together during the Motherland War--what you call World War II--because of the common threat of German Nazi terrorism. We co-operated to suppress the brush-fires that threatened us in Europe and the Middle East during the so-called Tense War. In big things we must co-operate.

"Again we are both threatened by a common source, Mr. Bending, and again we must co-operate."

Sam Bending felt a chill. The thought that he and his machine were a threat as great as that, a threat to the two greatest nations of Earth, was appalling.

"I am not a scientist, Mr. Bending," the Russian went on. "My title comes from a degree in economics and political science, not in physical science. As soon as this machine was demonstrated to me, however, I could appreciate its power--not only physically, but economically. I immediately contacted my superiors in Moscow to discuss the problem.

"Naturally, we would like to know the ... ah ... 'elegant' principle behind its operation. Equally naturally"--he smiled politely at Secretary Condley--"you will not tell us. However, my superiors in Moscow assure me that we need not worry on that score; a machine identically similar to yours was invented by one of our brilliant young scientists at the University of Moscow over four years ago. As a patriot, of course, he was willing to have the machine suppressed, and no news of it has leaked out."

Sam Bending found it difficult to keep from smiling. Sure, he thought, and a man named Popov invented radio, and Yablochkov invented the electric light.

"You see, Mr. Bending," Dr Artomonov continued, "while we do not have the unstable setup of money-based capitalism, and while we do not need to worry about such antiquated and dangerous things as fluctuating stock markets, we would still find your machine a threat. Communism is based on the work of the people; our economy is based on the labor of the working man. It is thus stable, because every man must work.

"But we, too, have a vast, power network, the destruction of which would cause the unemployment of millions of our citizens. The unemployment alone would cause repercussions all over the Soviet Republics which would be difficult to deal with. We would eventually recover, of course, because of the inherent stability of our system, but the shock would not be good for us.

"The same thing would happen in every industrialized nation on Earth," Artomonov went on. "In my work with the United Nations, I have studied just such problems. European governments would fall overnight. In Germany, in the 1920s, it was cheaper to burn bundles of one-mark notes than it was to buy firewood with them. Such things will be repeated, not only in the Germanies, but all over Europe.

"Some countries, of course, will not be so drastically effected. China, and other parts of Asia which have not built up a vast industrial system, will be affected only slightly. The South American countries still have a more or less agricultural economy and will not be bothered greatly.

"But the great industrial civilizations of East and West will collapse."

With one breath, Artomonov was saying that the Soviet Union could weather the storm, and with another he was hinting that it probably wouldn't. But Sam Bending could see the point in spite of the Russian's tortuous logic.

"I think that is all I have to say for the moment," Artomonov said, "except to emphasize one point. The Great Depression hit the world some fifty years ago. It was a terrible thing for everyone concerned. But it was as nothing
at all--a mere zephyr of ill wind--compared to what the Depression of the Eighties will be if your machine goes on the market."

* * * * *

There was silence for a minute. Sam Bending was thinking hard, and the others could see it--and they knew there was no point in interrupting at that moment.

"Just a second," Sam said. "There's one thing that I don't really quite see. I can see that the situation you outline would develop if every power plant in America--or in the Soviet Union or Europe--were to be suddenly replaced by Converters. I can see that chaos would result." He paused, marshaling his thoughts, then went on, with a tinge of anger in his voice.

"But that's not the way it will work! You can't do a thing like that overnight. To mass produce the Converter will take time--factories will have to be tooled up for it, and all that. And distribution will take time. It seems to me that there would be plenty of time to adjust."

Condley started to say something, but Dr. Artomonov burst in explosively.

"Don't you see, Mr. Bending? The threat of the machine is enough! Even here in your own country, just the knowledge that such machines were to be made at some time in the immediate future would have a disastrous effect! Who would invest in Power Utilities if they knew that within a short time it would be bankrupt? No one would want to buy such stock, and those who had it would be frantically trying to sell what they had. The effect on the banking system would be the same as if the machine were already being used. Your Mr. Roosevelt pointed out that fear was the problem."

Bending frowned puzzledly. "I don't see--"

He was interrupted by Dr. Larchmont. "Let me see if I can't give you an analogy, Mr. Bending. Do you know anything about the so-called 'nerve gases'?"

"Some," admitted Sam. "Most of them aren't gases; they're finely dispersed aerosols."

Larchmont nodded. "Have you any idea how much it takes to kill a man?"

"A drop or so of the aerosol on the skin is enough, I understand."

"That's right. Now, how can such a minute amount of poison damage a human being?"

Bending began to get a glimmer of what the man was driving at. "Well, I know that some of them suppress the enzymic action with acetylcholine, which means that the nerves simply act as though their synapses had been shorted through. It only takes a small percentage of that kind of damage to the nerve fibers to ruin the whole nervous system. The signals get jammed up and confused, and the whole mechanism ceases to function. The victim dies."

Larchmont nodded. "Now, as I understand it, our banking system is the vital nerve network of our economy. And our system is built on credit--faith, if you will. Destroy that faith--even a small percentage of it--and you destroy the system.

"If your machine were to go on the market, there would be no more faith in the present utilities system. Their stocks would be worthless long before your machine actually put them out of business. And that would hit our banking system the same way a nerve gas hits the nervous system. And the victim--the American economy--would die. And the nation, as a nation, would die with it."

"I see," said Bending slowly. He didn't like the picture at all; it was more frightening than he cared to admit, even to himself. He looked at his business manager. "What do you think, Jim?" he asked softly. He knew he could depend on Luckman.

Jim Luckman looked worried. "They're right, Sam. Clean, dead right. I know the investment pattern in this country, and I have an idea of what it must be abroad. This country would be in the middle of the worst depression in its history. At least we had Federal help during the Thirties--but there won't even be a United States Government if this hits. Nor, I think, will there be a Soviet government, in spite of what Dr. Artomonov's personal beliefs may be."

Significantly, the Russian economist said nothing.

Sam Bending closed his eyes. "I've worked on this thing for years," he said tensely. "It was ... it means something to me. I invented it. I perfected it." His voice began to quaver just a little. "But if it's going to do ... to do all that--" He paused and took a deep breath. "All right. I'll smash my apparatus and destroy my plans and forget about it."

Jim Luckman looked at Secretary Condley. "I don't think that would be fair. Sam's worked hard on this thing. He deserves recognition. And the people of Earth deserve to get this machine somehow. Can't something be worked out?"

"Certainly," said Condley. "In some countries, and in some eras, dangerous inventions were suppressed by the simplest method. If it was discovered in time, the inventor was executed summarily, along with anyone else who knew the secret, and the invention was destroyed. The United States isn't that kind of country." He looked down at
his hands and the gold pen again before he went on.

"Please don't misunderstand, Mr. Bending; we are not trying to keep the Converter under wraps forever. In the
first place, I don't think it would be possible. What do you think, Dr. Vanderlin?"

The Bureau of Standards man said: "I doubt it. Granted, the Converter is not something one would accidentally
stumble across, nor automatically deduce from the 'previous state of the art'. I'll admit frankly that I doubt if I would
ever have thought of it. But I doubt gravely that it is so unique that it will never be rediscovered independently."

"So," said Condley, "we have no intent to hold it back on that score. And, in the second place, such an
invention is too valuable to allow it to be lost.

"So here is our proposition. You will sell your rights to the Converter to Power Utilities. It won't even be
patented in the usual sense; we can't allow the Converter to become public property at this time. We can't make it
possible for just anyone to send in a quarter to the Patent Office to find out how it works. That's why we stopped the
patent application.

"But the Government will see that a contract is written up which admits that you are the inventor of the
Converter, and which will give you royalties on every unit built. High royalties.

"Under strict Government supervision, Power Utilities will proceed to liquidate their holdings--slowly, so that
there will be no repercussions on an economic level. The danger lies, not in the Converter's replacing existing power
equipment, but in the danger of its replacing them too quickly. But with care and control, the adjustment can be
made slowly. The process will take about ten years, but you will receive a lump sum, plus a monthly payment, as an
advance against future royalties."

"I see," said Bending slowly. "That sounds all right to me. What about you, Jim? What do you think?"

Jim Luckman was smiling again. "Sounds fine to me, Sam. We'll have to work out the terms of the contract, of
course, but I think Mr. Olcott and I can see eye to eye."

Olcott seemed to wince a little. He knew he was over a barrel.

"I suppose I'll have to be sworn to secrecy, eh?" Bending asked. He was beginning to recover his poise.

Condley nodded. 'You will.' He made his characteristic pause, looking down at the gold pen and back up. "Mr.
Bending, don't think that this is the first time this has happened. Yours is not the first dangerous invention that has
come up. It just so happens that it's the most dangerous so far. We don't like to have to work this way, but we must.
There was simply nothing else to do."

Sam Bending leaned back in his chair. "That's all right. To be perfectly honest, there are a lot of details that I
still don't understand. But I recognize the fact that I'm simply not an economist; I can see the broad outlines plainly
enough."

Dr. Artomonov smiled widely. "I do not understand the details of your machine, either, Mr. Bending, but I
understand the broad outlines of its operations well enough to be frightened when I think of what it could do to
world economy if it were to be dumped on the market at this time. I am happy to see that America, as well as
Mother Russia, can produce patriots of a high order."

Sam gave him a smile. "Thanks." He didn't know quite what else to say to a statement like that. "But Jim, here,
is going to spend the next several days trotting out facts and figures for me. I want to see just what would take place,
if I can wrestle with that kind of data."

"Oh, brother!" said Jim Luckman softly. "Well, I'll try."

"I'll have the reports from the computers sent to you," Condley offered. "They show the whole collapse, step by
step."

Artomonov cast a speculative glance in Condley's direction, but he said nothing.

"There's one other thing," Sam said flatly. "The Converter is my baby, and I want to go on working on it. I
think Power Utilities might put me on as a permanent consultant, so that I could earn some of the money that's
coming in over the next ten years. That way, my royalties won't suffer so much from the advance payments."

Jim Luckman grinned, and Richard Olcott said: "I thought you said you were no businessman, Mr. Bending."

"I may be ignorant," said Sam, "but I'm not stupid. What about it?"

Olcott glanced at Dr. Larchmont. The little scientist was beaming.

"Definitely," he said. "I want Mr. Bending to show me how he managed to dope that thing out. And, to be
perfectly frank, there are a couple of things in there that I don't get at all."

"That's understandable," said Dr. Vanderlin. "We only had a few hours to look at the thing. Still, I must admit
it's a lulu."

"That's not what I meant," Larchmont said. "There are some things in there that would take a long time to
figure out without an explanation. I'll admit that--"

"Wait a minute," Bending interrupted. "You said 'a few hours', Dr. Vanderlin. You mean only since this
morning?" He grinned. "What happened to the one you got Friday night? Did my fusing device work the first time?"
Vanderlin looked puzzledly at Larchmont. Larchmont said wonderingly: "Friday? You mean you had two pilot models?"

Olcott said: "Where was the other? We checked your power drain and saw you weren't using any at your house, so—"

"I had three models," Bending said. "I've got one left in my car; you took one from my house, and the third was taken from my lab sometime Friday night. Somebody has it..."

Condley said: "Dr. Artomonov, do you know anything about this?"

The Russian shook his head. "Nothing." He looked plainly frightened. "I assure you, my government knew nothing of this."

Condley leaped to his feet, said: "Where are those FBI men?" and ran out the door.

"The black market," said Bending softly. "They found out somehow."

"And they've had three days to study it," Larchmont said. "It's too late now. That thing is probably somewhere in South America by this time."

Artomonov stood up, his face oddly pale. "You must excuse me, gentlemen. I must get in touch with Moscow immediately." He strode out of the room.

The four men remaining in the room just stared at each other for a long moment. There wasn't much else they could do.

THE END
MECCANIA: THE SUPER-STATE
By Owen Gregory

INTRODUCTION
A FEW WORDS ABOUT MR. MING AND HIS JOURNAL

As this book is little more than a transcript of a document originally written in the form of a journal by a man who, until about a year ago, was an entire stranger to me, and as the document itself contains not a few statements which make large demands upon the credulity of the average reader, it seems necessary to offer some explanation regarding both the journal and its author, Mr. Ming—or, to give him his full name, Ming Yuen-hwuy.

If I were able to go bail for Mr. Ming and assure the British Public that he was an entirely credible and impartial witness, the book might have stood on the same foundation as other volumes of 'revelations' concerning a country with which Englishmen are still insufficiently acquainted. But I cannot go bail for Mr. Ming. The chief source of my knowledge of him is the journal itself. It has even been suggested to me that Mr. Ming did not write the journal, but must have stolen it from some European, probably an Englishman. On this point I shall have something to say presently. Perhaps the best solution of these difficulties will be to say what I know of the origin of the book.

Mr. Ming was introduced to me, by a friend whose name it is unnecessary to give, in November or December 1917. My friend said he remembered meeting him in London as far back as 1909. Since then, however, Mr. Ming had not only lived in London and travelled throughout England, but had also spent about two years in France and Italy, and had visited America. What his previous career had been I do not know, nor did my friend know. He appeared always to have plenty of money, and we surmised that he might have been attached in some way to the Chinese Legation; but he never gave the least hint about any such connection. What I do know is that he had a remarkable knowledge of our language, and a remarkable familiarity with our laws, customs and political institutions. He professed a great admiration for our British Constitutions, a circumstance which may account for some of the political views to which he gives expression in his journal.

A day or two after he had been introduced to me I invited him to dinner and on this occasion we found much to talk about—chiefly European politics. At length, after we had finished a bottle of wine and a liqueur or two, he remarked that of all the countries he had visited in Western Europe he had been most impressed by Meccania. (He pronounced the word 'Mek-kah'-nia.)

My knowledge of Geography is not complete, I admit, but I thought I knew all the countries of Western Europe (the war has helped wonderfully to fill up certain gaps). I replied that I had never heard of such a country.

"Probably not," he answered. "But it exists. And the proof of it is that I spent some five months there in 1970, and kept a journal of my experiences."

"You mean 1870," I said.

"No, 1970," he replied.

I hardly knew whether he were experimenting upon my sense of humour, or had got confused between Chinese and European chronology; or whether the liqueur had gone to his head. Possibly and here I became a little nervous—he was a little abnormal. "Anyhow," he said, "one of my chief objects in seeking an interview with you was to consult you about publishing this journal."

We were dining in my chambers and he begged permission to fetch his hand-bag from the anteroom. He returned with a bulky manuscript. I wondered if he were hard up and wanted to draw me into some sort of bargain, but I reflected that he seemed to be a much wealthier man than I. He said he was convinced that his journal was an important contribution to political literature, and would be found of interest not only in Great Britain but in France and America as well. It would be a good thing also if the Meccanians themselves could read it. Unfortunately there was no chance of that, he said, because nothing was read in Meccania except by permission of the Government. He went on to explain that the journal had been kept partly in English, partly in Chinese and partly in Meccanian; but that he had since written a rough translation of the whole in English. His knowledge of English, though sufficient for most practical purposes, was not such as to satisfy the literary critics; and that was one of the reasons why he sought my assistance. The upshot was that I promised to read the manuscript, which I did in a few hours next day.

I found that it purported to be the journal of a visit or tour, made in 1970, to a country he called Meccania. I had little difficulty in penetrating the fiction. (It was obvious what country was meant.) As to the date, 1970, I soon came to the conclusion that this was another literary device, to enable him to describe with greater freedom what he considered to be the probable, or as he would be inclined to say, the inevitable development of the tendencies he had
observed in that country. Whilst some parts of the description were clear, and even vivid, many things were left in obscurity. For instance, the extent and the limits of the country were quite vague. Only two cities were described in any detail. Little was said about domestic life, little about religion, little about women and children.

When I questioned him subsequently on these points, he said that the obstacles to obtaining full information had proved insuperable: he had not been at liberty to travel about when and where he pleased, nor to get into close contact with the common people. The journal itself if carefully read, he said, gave a sufficient answer on these points, and he had preferred to give a faithful account of what had actually happened to him, and of the conversations he had had with representative Meccanians, leaving the evidence to speak for itself. If he had said little about Education the little that he had said would be found most illuminating, by the aid of insight and imagination. If he had said little about military matters, that was because it would have been positively dangerous to be suspected of spying.

I then questioned him about his references to Luniland, which occur on the very first page of the journal and are scattered throughout the book. Did he mean to indicate England by this term? If so, it was not exactly flattering.

Mr. Ming said he intended no offence. The references were perhaps a little obscure. The simple fact was that some years ago he had, for his own amusement, written a harmless satire upon some of our national characteristics. He had then hit upon the phrase Luniland and Lunilanders, and he could not get it out of his head. It was just an instance of his whimsicality.

"But why Luniland?" I asked.
"Why not?" he said. "You do such funny things without seeing that they are funny."
"Such as what?" I asked.
"Well, to take a few things that have happened recently in connection with your great war. You are intensely proud of all your soldiers, and rightly. Yet you seem to pay the citizens who stay at home about three times as much as the soldiers who go out to fight; and I have been told, although this seems more difficult to believe, that you pay the men who volunteered from the very first less than those whom you subsequently had to compel to serve in your armies."
"I am afraid these things you allege are true," I replied, "but they do not seem funny to us."
"No, probably not," he said. "Each nation has its own sense of humour!"
"Have you noticed anything else of the same kind?" I asked.
"Oh, a great many things," he said, "but I just gave you a sample of what first occurred to me. I did hear of some men being excused from serving in the army because they were engaged in carving gravestones."
"For the soldiers, I suppose?"
"Oh no," he replied, "there is no time to carve gravestones for the soldiers; for people who die in their beds at home. Yet you do not profess to be worshippers of the dead."
"Do not misunderstand me," he added. "You are a wonderful people, and it is perhaps because you are Lunilanders that I cannot help liking you. We are Lunilanders ourselves if only we knew it. If you were to come to my country you would find many things just as funny as those I have observed here. Perhaps when you have more time and the opportunity is favourable you may like to read my book of observations on Luniland, but Meccania is a more important subject."

After a careful reading of Mr. Ming's account of Meccania I was inclined to agree with him. Indeed, I would go so far as to say that the dangers to be apprehended from Meccania, or Meccanianism, are far more real and imminent than the dangers from what he would call our Lunilandishness, and for that reason I have done my best to bring before the British Public his account of Meccania, although I hope at some future time to produce, perhaps for a smaller circle of readers, his notes on Luniland and the Lunilanders.

Lastly, a word about the suggestion that the journal cannot be the work of a Chinaman. It is implied that the sentiments professed by Mr. Ming, his interests and his way of looking at things, are those of an Englishman. What does this really amount to? Mr. Ming does not like the Meccanians. Certainly we should not like the Meccanians. Therefore Mr. Ming is an Englishman. Mr. Ming does not like interferences with his personal habits: he has some belief in the political value of individual liberty. An Englishman resents interference and is also credited with a passion for Liberty. Therefore Mr. Ming must be an Englishman. Now I would suggest that, so far from Mr. Ming's sentiments being evidence against him, they really substantiate his character as a Chinaman and remove all suspicion of his having stolen the document from some Englishman, or some other European. In the first place, he submits calmly to indignities that a typical Englishman would fiercely resent. In the second place, he records things with a detachment that few Englishmen would be capable of, and resigns himself to the customs of the country in the manner of a mere spectator. In the third place, he betrays a philosophical interest, which is again very different from the behaviour of most of our countrymen. He records at great length conversations which we perhaps find tedious, because he thinks the ideas of the Meccanians even more significant than their customs. An Englishman's journal, in
the same circumstances, would be certain to contain angry diatribes against the Meccanians, whereas Mr. Ming writes with singular restraint, even when he is describing features of Meccanian life which we should consider revolting.

Possibly the style in which the book is presented, the turns of expression and the colloquialisms, give the journal an English appearance; but for these features the editor is responsible, as it was Mr. Ming's wish that the book should not suffer from the most common defects of a mere translation.

NOTE ON PERSONAL NAMES

The names which occur in the narrative are exactly as given by Mr. Ming in his journal, but it would appear that he has taken some liberties with the language in attempting to give an approximate English equivalent for the original meaning. The translation of personal names and place-names is notoriously difficult as many names are either corrupt or obscure.

MECCANIA
THE SUPER-STATE
CHAPTER I
I BECOME A FOREIGN OBSERVER

I had already spent several years in various parts of Western Europe, staying for long periods in Francaria, Romania and Luniland, before I made up my mind to pay a visit to Meccania. Before coming to Europe I had read a great deal about Western civilisation generally and had conceived a great admiration for many of its features. My experiences during my travels had, on the whole, strengthened my feelings of admiration; although even an Oriental may be allowed to criticise some of the characteristics of Western nations. In Romania I had been delighted with the never-ending spectacle of history displayed in every part of the country. The whole land was like an infinite museum; but it was not in Romania that the living forces of the present were to be found. In Francaria, on the other hand, the people were more interesting than the country, charming as that country was in many ways. One perceived that the people were highly civilised; they displayed a combination of intellectual and moral refinement, an appreciation of the material and sensuous enjoyment of life as well as a traditional standard of conduct and manners, while at the same time they were keenly alive to the most modern political ideas, and were perpetually discussing new phases of all those problems which must constantly emerge wherever political liberty is held as an article of popular faith.

But it was in Luniland that I felt most at home. Just what it was that kept me constantly pleased and interested it would take long to tell, and I must reserve my observations on Luniland for another occasion. It will be sufficient to say here that I was not so much impressed with the wealth of ideas current in society in Luniland--Francaria was more prolific in ideas, and in Francaria intellectual discussion was more brilliant--as with the stability of certain political principles which, as it seems to me at any rate, are destined to prevail ultimately throughout the world.

For many reasons I thoroughly enjoyed the three or four years which, with short intervals of absence, I had spent there. I had made many acquaintances and even a considerable number of friends. In fact, I had stayed so long, contrary to my original intention, that there was little time left for carrying out the project of visiting Meccania, and I was in some doubt whether I should not have to return home without seeing that remarkable country. For I had already received one or two pressing reminders from my family that they were expecting my return. Before leaving home, however, I had promised some of my political friends, who were interested in the subject of Meccanian culture, that I would not return without investigating the social and political life of Meccania. They had, in fact, written several times to remind me of my promise, and I had put them off by explaining that, whilst travelling in the rest of Europe was a simple and easy matter, I could not enter Meccania without elaborate preparation.

When I began to talk to some of my friends in Luniland of my idea of investigating Meccanian culture on the spot, I received the most conflicting advice. Some said, "Don't go on any account. You will be arrested as a spy, and probably shot!" Others said Meccania was ahead of Luniland in every respect, and that I should certainly see something worth remembering if I went there. Others, again, said that if I did go, I should be looked upon with suspicion on my return. In fact, I gathered that most of my friends would never open their doors to me again. Finally, I took counsel with Mr. Yorke, a gentleman occupying an important position in Lunopolis, a man of wide culture and sober views, whom it was a great privilege to count among my friends.

He discussed the matter very frankly with me. I remember it was a cold evening early in March, and we sat by the fire in his study after an excellent dinner. "We Lunilanders," he said, "do not like the Meccanians, and few of us ever visit Meccania. We prefer to have nothing to do with that country, and if you followed the advice which nine out of ten of my countrymen would give you, you would not go near Meccania. But you have come to Europe partly, at all events, to study our civilisation, and not simply to amuse yourself; and although there is little intercourse between the Meccanians and the rest of us, if you want to know Europe you cannot afford to neglect Meccania. If I may advise you, I should say, Go there by all means. See as much as you can with your own eyes. But
try to see the country as a whole. Don't be content to see just what interests you, or amuses you, or what excites your admiration. If you do that, you will be like certain cranks from this country who come back and tell us there is no poverty in Meccania, there are no strikes, there is no disorder, no ignorance, no preventible disease. You at any rate are not a simpleton to be taken in by any sort of hocus-pocus. But the Meccanians are very clever, and they manage to impose on many people who are not so wideawake as you are. How much you will be allowed to see I don't know. It is a good many years since I was there, but, if things are managed as I am told they are now, you will not see all you want by any means. In fact, in one sense, you would learn far more from books—you read Meccanian easily already, I know—than from an actual visit. But unless you go there you will not feel satisfied that what you read is true, and you will not have the same sense of reality.

"The great thing is to look at the country as a whole—I don't mean geographically, but spiritually. There is always a tendency for foolish people to take this idea from one country and that institution from another. Enthusiastic reformers are ready to shut their eyes to everything else if only they can get support for their particular fads. If you find after a real study of Meccanian life that you would like to turn your own country into a second edition of Meccania, I shall say, like old Dogberry, that you are not the man I took you for."

He impressed upon me the importance of a thorough knowledge of the language, but I was able to satisfy him on that score; for I had learnt to read easily before coming to Europe, and had already undertaken a long course of colloquial Meccanian under a good teacher during a visit to Francaria. Besides, I rather prided myself on my aptitude for languages, and considered myself well equipped. So I packed up all the miscellaneous goods I had collected, and stored them in Lunopolis, reserving only a couple of trunks filled with the usual necessaries for a mere tourist.

I procured my passport from our own Government.

I procured another from the Luniland Foreign Office. I obtained, further, the necessary permission from the Meccanian Government, and, choosing the shortest route, arrived at the outer frontier on March 28th. As most people know, Meccania has a double frontier on the Western side. A belt of country twenty miles wide is preserved as neutral territory, a veritable No Man's Land. This is a relic from the Great War. It is entirely uninhabited and uncultivated. Not a single line of railway crosses it, and only five roads, which are merely rough tracks, lead across it from various points to the five frontier towns on the inner side. These are the only gates into Meccania on the West. The small town on the outer frontier in Francaria, through which I was to pass, is called Graves. Here my first delay occurred. Intercourse with Meccania is so limited that although the official conveyance goes only once a week, I found no more than a dozen persons collected there in readiness for the journey across No Man's Land. I was about to take my place in the conveyance provided to carry us to Bridgetown on the inner frontier, when it was discovered that I had no ticket authorising me to make this journey. I produced my passports and the letter giving me permission to travel in Meccania, but the official who took charge of foreigners pointed to a printed instruction on the back of the letter informing me that a ticket would be forwarded by a later post.

No explanations or expostulations were of any use. Until I had that ticket I could not enter Meccania. The conveyance went only once a week. There was nothing for it therefore but to stay at some hotel in Graves, or return to Lunopolis in search of my missing ticket. I put up at a small hotel in Graves and telegraphed to my last address for my letters. These arrived two days later, and among them was my precious ticket.

The week I spent in Graves forms no part of my Meccanian tour, so I will say nothing about it except that it gave me an opportunity of seeing the extraordinary sight of No Man's Land. It stretched like a belt of desert as far as one could see. Rough grass grew here and there, but no other vegetation. Every year, in the warm weather, the grass was fired, and other means were taken also to ensure that the weeds should not injure the vegetation on the cultivated side, which by contrast looked like a garden. At intervals of every twenty yards or so an iron pole was erected with wire between. Otherwise there was no obstacle; but no unauthorised person, so I was told, ever crossed the line.

At the end of the week a few more travellers arrived and were met by the conveyance from Bridgetown. It was something like a large prison van, but quite comfortable inside except for the fact that the passengers could not see outside. My fellow-passengers were evidently strangers to one another. One or two, I thought, were Meccanians returning home, but as there was little conversation and the journey lasted not more than an hour, I was able to learn nothing about any of them. When the car stopped—it was a sort of large motor-omnibus—the door was opened by a porter in a dark blue uniform, and I found myself in the large courtyard of the Bridgetown Police Office. What became of my fellow-passengers I have no idea, but I was conducted to a waiting-room, where another subordinate official in a grey uniform took my papers, and about ten minutes after led me into a small office adjoining, where a man in a green uniform sat at a desk surrounded by neat little bundles of papers of various colours. He was a rather stout man of middle age, with bushy iron-grey hair and whiskers, yet rather bald in front. With his light grey eyes slightly protruding, he looked at me for a few seconds and said, 'Mr. Ming?"
I said, "I am Mr. Ming."
"I am Inspector of Foreigners Stiff," he said very distinctly, "and whilst you are in Bridgetown you will be responsible to me for your good conduct. By what title are you authorised to be addressed?"
"I am plain Mr. Ming, or Citizen Ming," I replied.
"But you have some other title, doubtless," he said. "What office do you hold in your own country?"
"Well," I replied, "I am what we call a National Councillor. I am also the President of the Literary Society of my own province, and I have been once the Mayor of my native town."
"Then you had better be addressed as National Councillor Ming, or as Literary President Ming, or Mayor Ming," he answered promptly. "Choose which you prefer, and write down the title on the third line of this form."
I wrote down, with a smile, "National Councillor Ming."
"National Councillor Ming," he said, as I handed the form back to him, "before we have any further conversation, you will please pass into the next room and undergo your medical examination."
I passed into the next room, where I found a man, also in a green uniform, but with different facings from those worn by Inspector of Foreigners Stiff. "National Councillor Ming," he said, "allow me to make my necessary medical examination." I wondered how he had got my name so pat. Then I remembered that immediately before passing me into the next room, Inspector Stiff had put a card into a pneumatic tube by the side of his desk. The doctor led me out of his office into a small bedroom, next to which stood a bathroom fitted with various apparatus. After undressing in the bedroom, I was ordered to step into the bathroom, where first of all I was carefully measured in at least a score of places: head, ears, arms, hands, legs, feet, chest, etc. etc. Thumb-prints and footprints were taken; I was weighed; my chest was sounded; my organs were investigated with various curious instruments; a record of my speaking voice was taken, for which purpose I had to pronounce several long sentences in Meccanian and in my own language. A lock of my hair was cut off, and finally I was photographed in several different positions. I was then ordered to bathe, at first in water, afterwards in a fluid which was evidently some sort of disinfectant. At the end of about an hour and a half the doctor pronounced me to be "disease -free," and asked me to dress myself in some garments specially used on these occasions. The garments were made either of paper, or of some substance like paper, and were intended to be destroyed after use. I was now in the bedroom. The doctor had disappeared, but a sort of orderly in a grey uniform knocked at the door and brought in a tray with some food and coffee. He announced that Inspector of Foreigners Stiff would be ready to see me again in fifteen minutes. I was very glad of the food, the first I had eaten since my arrival, and at the end of the fifteen minutes I was again led into Mr. Stiff's room, still wearing my paper suit.
"Now," said he, "you will remain in your room until morning, when your own clothes will be restored to you after having been thoroughly disinfected. You can have supper supplied to you in your room, and as you will have a few hours to spare I should advise you to make yourself acquainted with the contents of these documents. You will find they contain all the instructions you require for the first few days."
I retired to my room feeling rather fatigued by the various experiences I had already gone through, but for want of something more interesting I began to study my' Instructions.' The first document was a closely printed circular of eight foolscap pages containing numerous extracts from the Law relating to the Conduct of Foreign Observers. By the time I had waded through this I thought I had done enough for one day, and as the orderly came in with preparations for some supper I asked him if I might see the daily paper. He did not seem to understand what I meant.
"Oh," I said, "just to see the current news."
"News what about?" he asked.
"About anything," I replied. "One likes to see the newspaper to see what is going on."
"But no one wants anything except for some purpose," he replied, "and you have not explained the purpose for which you require a newspaper. Also, there are no general newspapers. There are the various gazettes issued by the different departments of Government, and there are a few local gazettes dealing with purely municipal matters. But until you have entered upon your authorised tour of observation, I should have no authority to supply you with any
of these."

What a fuss about such a trifle, I thought, and wished I had never troubled him. I apologised for making the request, whereupon he said, "If you wish for something to read after supper there is a case of books in the office, from which, no doubt, I can supply your needs."

I thanked him, and presently went to see the books. There was a work on the Law in Relation to Foreign Observers, in three volumes; a History of the Development of Town Planning, in five volumes; a treatise on Sewage, in two volumes; a series of Reports on the various Municipal Departments of Bridgetown; an Encyclopedia of Building; and a few other works equally interesting. I took away a volume, hardly noticing what it was, intending to use it only as a means of inducing sleep, which it did most effectively.

I was awakened about half-past six next morning by the orderly in the grey uniform entering the bedroom to announce that my bath would be ready in five minutes, and that it was against the rules to be late. I promptly went into the bathroom and found the bath half filled with a thin, greeny-yellowish fluid which smelt like a strong disinfectant. The orderly explained that all foreigners were obliged to be disinfected in this way. "But," I said, "I was disinfected only yesterday." "The bath yesterday," he explained, "was to ensure that you brought no disease into the country."

"And what is this for?" I asked. "This is to prevent you from contracting any new disease through the change in climate," he answered.

I remarked that the authorities were very solicitous of the welfare of foreigners, to which he replied:

"Ah, we must look after ourselves; a sick man is a source of infection."

I was told to remain in the bath forty-five minutes. I found I had no choice, for, once in, I had no power to get out.

At the end of the forty-five minutes the orderly came and lifted me out, turned on a shower bath, and said, "Breakfast in ten minutes." My own clothes had been returned to me. I dressed quickly, ate my breakfast, which was the usual light continental early breakfast of rolls and coffee, and was preparing to leave the Police Office when the orderly informed me that Inspector of Foreigners Stiff was ready to see me.

"National Councillor Ming," he began, as soon as I entered his room, "I find you have with you letters of introduction to several persons in Meccania." (So my private papers had been closely scrutinised during the process of disinfection.) "You will, of course, not present these until you have received permission from the proper authority. In no case can this be given until a period of three months has elapsed. Now after completing these forms, in accordance with the Instructions I handed you yesterday, you will be authorised to begin your tour of observation in Bridgetown." Here he handed me four forms. "You must first decide whether you mean to stay a week, or a month, or longer; for that will naturally determine the programme of your tour of observation. You cannot in any case leave without giving three clear days' notice and completing your arrangements as to the place you are proceeding to."

"Oh," I said in some surprise, "I had no idea that would be necessary. I thought I would just look round, perhaps for a day or two, then go on to one of your other important cities and make my way by degrees to Mecco."

"Then you cannot have read the Instruction Form No. 4, or you would know that is quite impossible. If you intend to stay a month, please fill up this blue form."

"I think, perhaps, it would be better to say a week," I replied; "then if I want to stay longer I suppose I could do so?"

"If you had read the Instructions you would have seen that the plan of a tour of a week is on quite a different scale from that of a tour of a fortnight or a month. You must decide now which you will take."

I stuck to the week, and we filled up the necessary forms for Tour No. 1.

"Your conductor will be Sub-Conductor of Foreign Observers Sheep," he said next.

"My conductor?" I exclaimed. "Is it necessary to have a conductor?"

"You are not still in Luniland," he replied testily, "and I must again remind you that if you had read the extracts from the Law with reference to Foreign Observers you would not have asked the question. Sub-Conductor Sheep will be here in five minutes," he said, evidently anxious to get rid of me, "and as soon as you have discharged this bill of expenses he will take you to the Hotel for Foreign Observers, and you will begin your tour." Here he handed me a sort of invoice containing the following items:--

To food, 5s.; to bed, one night, 4s.; to medical examination, 10s.; to temporary garments, 2s.; to service, 2s.--total, 23s.

There was certainly nothing exorbitant about the charges; all the same, I grudged the 10s. for the medical examination.

CHAPTER II
BRIDGETOWN, TOUR No. 1
SUB-CONDUCTOR of Foreign Observers Sheep came in as I was paying the bill. He was a well-set-up man about fifty, and had the appearance of an old Non-Com. He looked quiet and rather stolid. I never saw him smile during the whole week I was with him, but he was not offensive in his manner. Like Inspector Stiff he wore a green uniform, but one with fewer facings and with chocolate-coloured buttons. Before we started to walk across to the hotel he asked if I had got my pocket-diary. I fished out a small notebook, such as I had used in Luniland for marking engagements.

"That is of no use for the purpose," he informed me. "You must have one like this--;" and he showed me a book about six inches by four inches, with four pages for each day.

"Oh!" I said, "I shall never need all that; besides, it is spaced for a month only."

In a perfectly matter-of-fact voice he said calmly, "Every person in Meccania uses a pocket-diary like this. You will find it indispensable in order that you may make your entries correctly in your weekly diary for the Time Department."

"The what department?" I asked, rather puzzled.

"The Time Department: but never mind; I will explain all that in its proper place. We will get a pocket-diary as we go along."

We walked to the hotel, and on the way Sheep slipped into an office of some kind and handed me a pocket-diary of the regulation type. As we entered the hotel, which was a very small affair,-- evidently the number of foreigners in Bridgetown at any one time could not be more than a dozen if they were all lodged here,--he popped his head into a sort of box-office near the door and said in a loud voice, "Nine o'clock. National Councillor Ming." A girl in the box-office echoed the words whilst making an entry on a large sheet, and handed him a buff-coloured sheet of cardboard, divided or ruled into small squares. This he presented to me, telling me to note down on it the exact time when I entered and left the hotel, and to get it initialed every other day by the girl clerk in the box-office. If the times did not tally with her record I was to consult the manager of the hotel.

"The first thing to do is to report yourself to the manager of the hotel," said Sheep when he had taken me to my room, where I found my baggage, which I had not seen since I left Graves.

The manager was a rather fussy little man, also in a green uniform like Sheep's but with different facings. He did not seem specially pleased to see me. All he said was, "I hope you will not give so much trouble as the last of your fellow-countrymen we had here. If you will study the regulations you will save yourself and me much inconvenience. Meals are at eight, one, and six, and at no other times. And remember that conversation with other Foreign Observers is prohibited until you have received the Certificate of Approval."

Conductor Sheep had rung up for a motor-car, and as we waited a few minutes for its arrival he said, "As you will have seen from the printed programme of Tour No. i, we shall first make a geographical survey of the town, then we shall visit the public buildings, taking note of their architectural features, and beginning first with those under local control, following on with those under the joint control of the Central and Local Government, and concluding with those solely under the control of the Central Government. And of the first category we shall see those first which have to do with the bodily needs, and of these we shall take first those connected with food, then with clothing, then with housing; for that is the only logical order. Everything has been carefully prescribed by the Department of Culture and the Department of Sociology, and the same plan is followed by all Foreign Observers, whatever city they may be visiting."

We went first to a look-out tower which stood on a hill about a mile outside the town. Here we had a view of the surrounding country. The town lay in a bend of the river. It was not exactly picturesque, but the large number of new public buildings near the centre, the broad streets lined with villas, each surrounded by a garden in the large residential quarter on the western side, and even the orderly streets of houses and flats on the more thickly populated eastern side, produced altogether a fine effect. The country round was magnificent. Low wooded hills rose on three sides, backed by higher hills in the distance. Sheep talked almost learnedly about the geology of the district and the historical reasons for the situation of Bridgetown. Then he pointed out that the plan of the town was like a wheel. In the centre were the public buildings and squares. The main streets radiated like spokes, and between these came the residential quarters of the seven social classes; those of the first three on the west side, those of the fourth to the north and south, those of the fifth, sixth and seventh, to the east. On the east side also lay the factories, workshops and warehouses. The shops were arranged in a sort of ring running through the middle of each of the residential quarters.

"The seven social classes?" I asked. I had heard in a vague way of the existence of this arrangement, but had little idea what it meant.

"Yes," answered Sheep, as if he were reading from a guide-book, "the first consists of the highest aristocracy, military and civil; the second, of the military and naval officers, all of noble birth; the third, of the highest mercantile class with an income of £5000 a year and the officials of the first grade in the Imperial civil service; the fourth,
the officials of the civil service of lower grades and the bulk of the professional classes; the fifth, of the skilled artisan class; the sixth, of the semi-skilled; and the seventh, of the menial industrial groups."

I asked him to go over it again whilst I took a note for future reference.

The rest of the morning passed in listening to Sheep's elaborate descriptions of the drainage and sewage systems, the water supply, the power and light and heat supply, the tramway system, the parcels system, the postal delivery system, the milk delivery system, all from the geographical point of view. After lunch we spent some time in going all over the town on the tramways. This completed the geographical survey.

At six o'clock I was deposited in the hotel just in time for dinner. Presently I prepared to go out to some place of amusement; but on attempting to leave the hotel I was stopped by the porter, who told me I could not leave the hotel unless accompanied by my conductor.

So I spent the evening in writing up my journal.

During the day I had noticed that everywhere all the men were dressed in a sort of uniform, and that the colours of these uniforms corresponded to the rank or class of the wearers. Perhaps I ought to have mentioned this circumstance earlier, for certainly it was one of the first things I noticed when I began to go into the streets. The colours of the uniforms are very striking and even crude. They supply the only touch of the picturesque in Bridgetown, for, judging by my first day's impressions of the town, I should imagine that the authorities responsible for rebuilding it have swept away every vestige of the tiny mediaeval city which once existed on this spot and have replaced it by a perfectly uniform piece of Meccanian town-planning. In such a setting these uniforms strike one at first as out of place, but perhaps I have not yet grasped their purpose or significance. The colour of the uniforms of the members of the First Class is white; that of the Second Class, red or scarlet; of the Third, yellow; of the Fourth, green; of the Fifth, chocolate; of the Sixth, grey; of the Seventh, dark blue. But so far I have seen no white uniforms, and only a few scarlet. I saw several yellow uniforms to-day, but the most common were the green uniforms of the Fourth Class and the chocolate uniforms of the Fifth Class, to which the skilled artisans belong. Greys and dark blues were also fairly numerous; but what surprised me most of all was the small number of people to be seen in the streets. I must ask Sheep for the explanation of this.

Promptly at nine o'clock next morning Sub-Conductor of Foreign Observers Sheep made his appearance at the hotel, and we began our tour of the public buildings. He took me first to the 'Import-Food-Hall,' which stood alongside the railway on the outskirts of the town near the industrial quarter. It was a great warehouse through which all the food brought into the town has to pass before it is allowed to be sold in the markets and shops. (The sole exception is milk, which is distributed by municipal servants.) The building was very extensive and several stories high. The two ends were open for the passage of railway wagons. The architecture was not without a certain coarse dignity. The arches were decorated in Romanesque style, and the whole front facing the street was covered with rude sculptures in high relief of scenes connected with the production of food. The interior walls were covered with frescoes depicting similar scenes. Conductor Sheep grew almost enthusiastic over this exhibition of Meccanian Art. All these decorations, he said, had been executed by the students of the Bridgetown Art School. I was not altogether surprised to hear this; there was something so very naive and obvious about the whole idea.

We next saw the municipal slaughter-houses, which were almost adjoining. Inspector Sheep informed me how many minutes it took to kill and prepare for the meat market a given number of cattle, sheep or pigs. He dilated on the perfection of the machinery for every process, and assured me that not a single drop of blood was wasted. The amount of every particular kind of animal food required for each week in the year was ascertained by the Sociological Department, and consequently there was no difficulty in regulating the supply. The perfection of the methods of preserving meat also effected some economy. Conductor Sheep assured me that the Meccanian slaughter-houses had become the models for all the civilised world, and that a former Director of the Bridgetown slaughter-houses had been lent to a foreign Government to organise the system of technical instruction for butchers.

The five markets were in five different parts of the city. They served to distribute perishable foods only which were not allowed to be sold in the ordinary shops. All women in the Fifth, Sixth and Seventh Classes were obliged to do their marketing in person. Each person was obliged to deal solely with one dealer for a year at a time, and to attend at the market at a particular hour, so that there should be no congestion and no waste of time on the part of the dealers. This, I suppose, explains the wonderful orderliness of these markets. There was no gossiping or chaffering. Whether the people enjoy this arrangement is a matter upon which Sheep did not enlighten me. He said it had been calculated by the Time Department that an economy of 50 per cent had been effected in the time spent upon the daily purchase of food since the introduction of the modern market system.

Foods that are not perishable are sold in the shops, and as regards certain articles there is the same system of choosing each year the shop at which one buys a particular article, whilst as regards others trade is free. The housewife must buy her bread always from the same baker; but things like mustard, spices, coffee or preserved food may be bought at any shop.
The sale of drink is regulated in a different way. The three lowest classes are not allowed to keep drink in their houses; but as the favourite national drink is a mild kind of beer which can be got in any restaurant, there is no apparent hardship in this regulation. The way in which excess is checked is very curious. The weekly budgets of every family, in all classes below the fourth, are checked by the authorities--by which department I do not know--and if the amount spent on drink exceeds a certain sum per head, a fine is inflicted and the offender warned. If the offence is persisted in, the offender is forbidden to buy any drink for a specified period. One might suppose that such regulations could easily be evaded; so they could in most countries, but not in Meccania. Everything is so perfectly scrutinised that no evasion seems possible--at any rate as far as the three lowest classes are concerned.

"This scrutiny of family budgets," I remarked, "is it not resented and even evaded?"

"I do not think it is resented," answered Sheep, "but it certainly cannot be evaded. Why should it be resented? The facts are only known to the officials, and in any case they would be required by the Sociological Department. How else could it obtain the necessary data for its researches? Every woman is taught how to keep her household accounts in the proper manner, and she sends in her account book at the end of each quarter. That is necessary for many reasons. No," he concluded, as if the idea had not occurred to him before, "I have never heard of any complaints. Only those would wish to complain who desired to evade some salutary regulation; consequently there is no reason why, out of regard for them, we should interfere with a practice that has so many advantages."

"What are the advantages?" I asked, for so far I had seen no advantage except the possibility of checking expenditure upon drink.

"The use of these accurate family budgets and household accounts to the Sociological Department is simply indispensable. To the Department of Trade and Industry also they are very valuable. In fact, you may take it that all our Meccanian institutions are so arranged that they serve several purposes and fit in with the whole Meccanian scheme of life."

Incidentally, in connection with the family expenditure on food, he mentioned model dietaries. I was curious to know what these were. He explained that there were three recognised kinds of dietaries. First, the Food Department prescribed model dietaries for families of the three lowest classes in normal health. Secondly, when each person was medically examined--and this happened at least once a year--the medical officer might prescribe a dietary for the individual; and lastly, if a person were positively ill, it would be the duty of the medical officer in charge of the case to prescribe a dietary. I was going to ask some further questions about the Medical Department, when Sheep reminded me that we had still several other municipal departments to visit before we came to the Medical Department, and that we must not depart from the programme of our tour.

The Department for the Inspection and Regulation of Clothing came next. I was rather surprised that this should be a municipal institution, seeing that the regulations were uniform for the whole country.

Sheep explained that it was just because the regulations were so perfectly uniform that the function of administering them could be entrusted to the municipality. The department was quite a small affair. Only about ten inspectors were required for Bridgetown. Their duties were to see that no person wore any uniform to which he was not entitled, and that on ceremonial occasions full-dress uniform was worn. It was quite easy to ensure that a uniform of the right colour was worn, but in addition to that the various grades of each class were indicated by the various facings, stripes, buttons and badges, as were also the different occupations within each class and grade. The penalties for wearing unauthorised decorations were very heavy, and infringements were very rare, as detection was almost certain.

"I should have thought that the whole clothing trade would be in the hands of the Government," I remarked.

"That is not part of our system," replied Sheep. "The production of all the kinds of cloth for all the uniforms is so standardised that there would be no advantage in the State taking over the mere manufacture. Each person chooses his tailor from a small panel. Naturally the members of the higher classes have the best tailors. In fact, a tailor of the first grade would not be allowed to make suits for the three lowest classes; it would be a waste of talent."

"And what about the women's clothing?" I inquired. "They do not wear uniforms. Is their dress regulated in any way?"

"Only in two ways," answered Sheep. "Every woman must wear, on the front upper part of each of her outdoor dresses, a piece of cloth of the regulation pattern and colour, to indicate the class to which she belongs. Also the expenditure on dress is limited according to the social class."

When we came to the offices of the Department of Health, Sheep said I had made a grave error of judgment in choosing Tour No. i--the tour for a single week only--as there was enough to occupy us for a week in the Department of Health alone. It included the Sanitation Section, the Medical Inspection Section, the Medical Dispensing Section, the Medical Attendance Section, the Hospital Section, the section of the Special Medical Board, the Marriages and Births Section, the Post-Mortem Section, and the Buildings Section.
After this I was not surprised to hear that over a thousand persons were employed in the Health Department, in addition to the workmen—chiefly of the Sixth and Seventh Classes—who did the actual menial work of keeping the sewage system in order and keeping the streets clean. I might write a whole chapter on the Health Department, but it will perhaps suffice if I mention the most singular features.

Inspectors visit every house twice a year to see that each house and flat is kept in a sanitary condition. Each person is medically examined once a year--this is in addition to the system of medical inspection in schools—and whatever treatment is prescribed he must submit to.

"What happens," I asked, "if a person declines to submit to treatment?"

"He would be taken before the Special Medical Board," answered Sheep.

"And what is that?" I asked.

"We shall come to that presently," said Sheep reprovingly. He went on to explain that the Dispensing Section treated all persons of the three lowest classes who did not require to go into a hospital. The doctors were municipal officials and there was no choice of doctor.

"Why do you not allow choice of doctor?" I asked.

"That would interfere with the proper classification of the diseases," he answered. "As soon as a complaint is diagnosed, it is handed over to the appropriate doctor for treatment. The same applies to the Medical Attendance Section; but persons in the three lowest classes are not generally attended in their homes, they are brought into the hospitals. The chief work of the Medical Attendance Section is in connection with births; consequently we employ a number of women doctornurses in this Section. Now we come to the Special Medical Board. It is a sort of Higher General Staff. It collates the results of the work of all the other medical sections, and is responsible for the annual report. It receives the instructions of the Central Medical Department of Meccania, and sees that these are carried out. It directs special investigations in all abnormal cases. In the case of so-called incurable diseases it pronounces its decree as to whether the case is incurable, and in that event it authorises the death of the patient."

"Authorises the death of the patient?" I said. "Without the patient’s consent?"

"The patient can hardly be the best judge," said Sheep.

"What about the relatives then?" I asked.

"The relatives have no voice in the matter," said Sheep.

"That sounds very drastic," I remarked; "and what about the sort of case you mentioned a little while ago?"

"The case you mentioned?" said Sheep. "I do not remember any such cases, but if one occurred it would be dealt with under Section 143 of the Medical Regulations, which prescribes that in case of persistent disregard of the instructions of the authorised medical officer, with the consent of the Special Medical Board, the person guilty of such refusal is to be removed to an asylum for mental abnormality."

"A lunatic asylum!"

"We do not call them lunatic asylums. The term is obsolete; it does not accord with our system of classification."

Sheep next dealt with the Marriages and Births Section. This is in some ways the most remarkable of all. It appears that a licence to marry is issued to all persons in normal health, the Department prescribing the number of children to be born within each period of five years. Persons classified as abnormal are specially dealt with, and on this subject Sheep referred me to the Report of the Central Medical Department, which I could obtain in the Great Meccanian Library at Mecco. The Post-Mortem Section carried out an examination in all cases of interest to the Health Department before cremation.

I asked what the Buildings Section was. It seems to be a sort of link between the Architectural Department and the Health Department, and supervises the building regulations from the hygienic point of view.

The next day Conductor Sheep called punctually at nine o’clock to continue the tour of observation. We had come to the end of one section, as marked out in the mind of the Authority, and were now to begin another, namely, the institutions controlled partly by the City and partly by the State. I suspect that the control by the City is a good deal of a fiction, for the State has power to take over any of the functions that are not performed to its satisfaction.

We began with the Police. The office of the Central Police Station was in the building where I had first been inspected, examined and instructed, on my arrival. It was a large building for a town of the size of Bridgetown, and seemed full of officials, police officers and clerks. Yet I had noticed very few police officers in the streets. I remarked upon this to my guide. I said, "In the country I have just come from they have a great many police officers in the streets of the large towns, but very few other officials connected with the police service. Here, apparently, you have few police officers in the streets, but a great many other officials connected with the police service. Can you explain that?"

"Yes," he said; "I have heard something of the kind before, and although I have never been abroad to other countries, the books in our libraries describe the police systems so fully that I think I can answer your question. The
police in Luniland—so I am informed—do little else besides keeping order in the streets and following up criminals."

"Exactly," I remarked. "What else should they do?"

"Here," said Sheep, "these are the least of their functions. We employ fewer police in keeping order in the streets, and in detecting criminals, than any country in the world. Crime and disorder are almost unknown in Meccania. Our people are so well brought up that they have little desire to commit crime. Those who do show any propensity in that direction are deported to criminal colonies and give very little trouble afterwards. Besides, there is, after all, very little opportunity to commit crime, as you would soon discover if you attempted to do so."

"I can well believe that," I said. "But what, then, do your police find to do?"

"Speaking generally, their function is to see that the regulations devised for the good of the State are properly carried out."

"And those regulations are rather numerous, I suppose?"

"Undoubtedly. As they affect every department of life, there are many occasions upon which the assistance of the police is necessary in order that people shall not make mistakes," said Sheep.

"But," I said, "I thought that the officials of each department of State attended to so many things that there would be little left for the police. For instance," I added, "the inspectors of food and clothing, of buildings, of public health, of education, and so forth."

"Yes, yes," answered Conductor Sheep; "but suppose some matter arises which may belong to several departments; the citizen needs guidance. Quite apart from that, the police watch over the life of the people from the point of view of the general public interest. They collect information from all the other departments. Suppose a man neglects his attendance at the theatre: the amusement authority must report the case to the police. Similarly with all the other departments. Suppose, for instance, a man were to try to make an unauthorised journey, or to remain absent from work without a medical certificate, or to exceed his proper expenditure and get into debt, or try to pass himself off as a member of a higher class: in such cases it is the police who take cognisance of the offence. Then there is the annual report and certificate of conduct with respect to every citizen. How could this be filled up without exact information? All this involves a great deal of work."

"Indeed it must," I replied.

"You see, then, that our police are not idle," said Sheep triumphantly.

"Indeed I do," I replied.

After this enlightening explanation the offices of the Police Department no longer presented a mystery to me. I looked with awe at the hundreds of volumes of police reports in the official library of the Bridgetown police office, and wondered what the Central Police Office Library would be like; for I was told it contained a copy of every police report of every district in the country, as well as those for the great capital Mecco.

When we came to the Department of Education, which was one of the institutions managed by the State and the Municipality, Conductor Sheep regretted once more that I had chosen Tour No. 1. We could only spare half a day at most for this important department. Here, again, I can only note a few of the unusual features of the system as explained to me by my encyclopaedic conductor. We saw no schools except on the outside, but I noticed the children going to and from school. They all marched in step, in twos or fours, like little soldiers. They did not race about the streets or play games. Wherever they started from they fell into step with their comrades and carried their satchels like knapsacks. The State Inspectors, it seems, decide what is to be taught, and how it is to be taught: the local officers carry out their instructions and classify the children. In the office of the Department there is a sort of museum of school apparatus in connection with the stores section. The books are all prescribed by the Central Department, and no others may be used. The children of the Sixth and Seventh Classes attend common schools in order to get the benefit of better classification. There are no schools in Bridgetown for the members of the First and Second Classes. They go elsewhere, but the other classes have separate schools. The children of the Sixth and Seventh Classes stay at school until they are twelve; but their instruction is largely of a practical and manual kind. Those of the Fifth Class remain until fifteen, and are trained to be skilled workmen. After fifteen they receive instruction in science in connection with their several occupations.

Closely connected with the system of education, for the three lowest classes, is the Juvenile Bureau of Industry. This is controlled by the Department of Industry and Commerce. No young person in Meccania can take up any employment without a certificate granted by this Department. The officials of the Juvenile Bureau, after consultation with the officials of the Education Department, decide what occupation boys and girls may enter, and no employer is allowed to engage a boy or girl except through the medium of the Bureau.

"What about the inclinations of the boys and girls, and the desires of their parents?" I remarked to Sheep.

"The inclinations of the boys?" said Sheep, more puzzled than surprised. "In what way does that affect the question?"

"A boy might like to be a cabinet-maker rather than a metal worker, or a mason rather than a clerk," I said.
"But such a question as that will have been determined while the boy is at school."
"Then when does he get the chance of choosing an occupation?"
"It will depend upon his abilities for different kinds of work. And he can hardly be the judge of that himself," added Sheep.
"Where do the parents come in, then?" I asked.
"The parents will naturally encourage the boy to do his best at school. And after all, does it matter much whether a boy is a mason or a carpenter? In any case, the number of carpenters will be decided each year, and even each quarter, by the Department of Industry. It is not as if it would alter his class, either; he will be in the same class unless he is very exceptional and passes the State Examination for promotion."

I saw it would be useless to suggest any other ideas to Sub-Conductor Sheep, who seemed constitutionally unable to understand any objections to the official point of view. I could hardly hope to learn much about education in a single afternoon. All we saw was the mere machinery from the outside, and not even a great deal of that. I gathered that there was a most minute classification, with all sorts of subdivisions, of the children according to their capacities and future occupations. There were sufficient local inspectors to provide one for each large school, and their chief business was to conduct psychological experiments and apply all sorts of tests of intelligence in order to introduce improved methods of instruction. The inspectors themselves were all specialists. One was an expert on mental fatigue, another devoted himself to classifying the teachers according to their aptitude for teaching particular subjects, another specialised in organising profitable recreative employments for different grades of children; another superintended all juvenile amusements. Sheep showed me the exterior of a large psychological laboratory attached to the Technical College. Bridgetown was too small to have a University of its own, but it had two large Secondary Schools for pupils in the Third and Fourth Classes, and an enormous technical school for the boys of the Fifth Class. It was fitted up like a series of workshops for all sorts of trades, with class-rooms and laboratories attached. Sheep asserted that it was through these schools that the Meccanian artisans had become by far the most efficient workmen in the whole world. I had not time to ask many questions about the provision for games or physical training, but from something Sheep said I inferred that whilst games had been reduced to a minimum the experts had devised a system of physical training which satisfied all Meccanian requirements.

Sheep strongly advised me to study Meccanian education in Mecco if I ever got there. All true Meccanians recognised, he said, that the whole national greatness of Meccania rested on their system of education. No doubt statesmen had done much, but the ground had been prepared by the schoolmasters, and the statesmen themselves had been brought up in the Meccanian system of education. He himself, he confided, was the son of a Meccanian village schoolmaster.

Why then, I asked, begging his pardon if the question were indiscreet, did he wear the chocolate button which indicated that he had once been a member of the Fifth Class?
"When the sevenfold classification was introduced," he answered, "village schoolmasters who were not graduates were in the Fifth Class, and I was in the Fifth Class until I was thirty and gained my promotion in the Police Department."

Tour No. i made no provision for studying the lighter side of life in Bridgetown. Sheep said that practically all forms of amusement were controlled by a section of the Department of Culture, but t at the Organising Inspectors of Private Leisure were appointed locally, subject to the approval of the Central Department.

"Organising Inspectors of Private Leisure I "T exclaimed. "What an extraordinary institution!"
"In what way extraordinary?" said Sheep.
"I am sure they do not exist in any other country," I replied.
"Perhaps not," replied Sheep; "but, then, our culture is not modelled on that of any other country. Possibly other countries will discover the use of such officials when they have developed a better system of education."
"But what is their function?" I asked.
"Any person who has more than an hour a day unaccounted for, after doing his day's work, and fulfilling all his other duties, is required to submit a scheme every half-year, showing what cultural pursuit he proposes to follow. The inspectors will assist him with expert advice and will see that he carries out his programme."
"Is there nothing left unregulated in this country?" I asked in as innocent a tone as I could command.
"That is a very interesting question," replied Sheep. "If you will consult the Forty-eighth Annual Report of the Ministry of Culture you will find an interesting diagram, or map, showing the whole field of Meccanian life and the stages in its organisation. One by one all the spheres of life have been gradually organised. If you examine the diagram showing the present state of Meccania, and compare it with similar maps for other countries, you will perceive how very much more advanced our culture is than that of any other country."
"And what regions still remain for the Department of Culture to conquer?"
"An investigation is going on at the present time into the interesting question of individual taste," he answered.
"It is being conducted by the "Esthetic Section of the Department, but they have not yet reported."

Where everything is so completely regulated it is not surprising to find that poverty, as understood in many countries, no longer exists; but I was not quite clear how it was provided against. Once more Sheep was ready with a complete explanation.

"Our laws," he said, "do not permit anyone to remain idle, and the regulation of the expenditure of the lower classes secures them against improvidence. Besides, as they contribute to insurance funds, they receive a pension in old age, and allowances during sickness or disablement. Poverty is therefore impossible."

"Apparently, then," I remarked, "if the labouring classes will surrender their liberty to the State they can be relieved of all danger of poverty."

"I do not understand what you mean by surrendering their liberty," replied Sheep.

"In many other countries," I said, "people desire to please themselves what they will work at, and indeed whether they will work at all. They have the liberty of striking, for instance, against wages or other conditions that do not satisfy them, and I have heard people in such countries declare that they would rather preserve their freedom in such things than be secured even against poverty."

"It is no part of my business to discuss such questions," replied Sheep, "but I have never heard such a question even discussed in Meccania. The foundation of Meccanian law is that the private individual has no rights against the State."

It was towards the end of the week that I mentioned to Conductor Sheep that I had had great difficulty in procuring a copy of the local newspaper published in Bridgetown; in fact, I had not managed to get a sight of it. Sheep explained that Tour No. i did not allow time for the study of local social life in such detail as to provide a place for such a thing, but he was good enough to procure me a sight of the Bridgetown Weekly Gazette. It was well printed on good paper, but it was more like an official municipal record than a newspaper. It contained brief reports of municipal committee meetings, announcements as to forthcoming examinations, lists of persons who had passed various examinations; and statistics of births, death sand marriages. The figures for the births were given in an unusual form. There were fifty first-born boys, forty-five first-born girls; forty-seven second-born boys, forty-eight second-born girls; and so on down to three fourteenth-born boys and seven fourteenth-born girls. There were statistics of accidents, with brief details. There was a list of small fines inflicted for various infringements of regulations, and announcements of forthcoming legal cases. The only advertisements were a few concerning sales of property and household goods. It was altogether the driest document calling itself a newspaper I had ever seen. I tried to draw Sheep on the subject of newspapers in general, but he seemed rather annoyed.

"I procured this Gazette," he said, "as a concession to your curiosity, although it forms no part of our programme, and now you wish to go into a subject which is totally unconnected with our tour. The question is of historical interest only, and if you stay in Meccania long enough to study the historical development of our Culture, you will study the history of the Press in its proper place and connection. I will, however, add for your present information that the Central Government issues a complete series of Gazettes, which serve the same purpose for the country as a whole as the Bridgetown Weekly Gazette for his locality." With that the subject was closed for the present.

Although I had now been here nearly a whole week, I had not yet had an opportunity of strolling round to see anything that might catch my fancy. Everything had been done according to the programme. Nevertheless, I had noticed a few things in the course of my daily tours which Conductor Sheep did not think worthy of comment. I got very tired of his guide-book style of explanation. Bridgetown was hardly worth the painful and systematic study which he compelled me to give to it, and I decided to go straight on to the capital in a few days.

I saw no drunken people--the regulations do not permit drunkenness. I saw no loose women in the streets. On this subject I can get no information from Sheep, but I suspect there is something to learn. There were no advertisement hoardings. I must confess I rather missed them; they may be ugly, but they are often interesting. The shops were very dull. Nothing was displayed in the windows to tempt people to buy, and there were no people about the streets shopping in a casual way. People must know what they want, and go to the shops which specialise in the particular article. There were large stores; but even these were so divided into departments that there was little fun in shopping. Indiscriminate and casual shopping is distinctly discouraged by the State. Advertising is restricted to trade journals, except for a little in the miserable local gazettes. Only those forms of production which the State considers necessary are allowed to expand indefinitely; all the others are regulated. Consequently there are none of the incitements to expenditure which exist in most modern countries. I have never been a great shopper, but I could not have believed how much duller life was without the attractions of the shop windows and the stores, if I had not been here. For instance, I found that I had very foolishly come without a pair of bedroom slippers, so I wanted to buy a pair. I looked round naturally for a shop where I should see such things displayed in the window, but I had to go to the slipper section of the boot department of a store, choose from an illustrated catalogue the quality I wanted, and
I thought I should have seen book-shops displaying all the most recent books and publications. In other countries I found it possible to pick up a great deal of information by noticing the kind of literature exposed for sale. Booksellers' shops have always an attraction for me. To my amazement the booksellers' shops have disappeared from Meccania, yet I know from my own reading they used to be quite a feature in the life of the old Meccania. The censorship of the printing trade has apparently revolutionised the book-selling business. At any rate, the only place in which I could get to see books in Bridgetown was at a sort of office in the Technical College. It seems that the Publications Department of the Ministry of Culture--I think that is the right name--has in every town a public room, fitted up like a small library, in which all the current books published are exhibited for six months at a time. This is really a very useful institution in itself, but the books exhibited were not on sale, so all the pleasurable excitement of a book-shop was wanting. To buy books one must order them through an authorised book-agent, who has a sort of monopoly. I wondered why such an extraordinary arrangement should have been made, but when I got the explanation from Sheep it was quite consistent with the general scheme of things here.

I asked him whether the Government discouraged the public from reading. He said, "Not at all. Our people are great readers; they do not need any incitements to read. They consult the lists of new books and come to the book-room to see any book in which they are interested. Then they decide whether to buy it or to borrow it from the public library."

"But why do you not permit people to open book-shops?"

"It would be a sheer waste," replied Sheep. "One book-agent can supply all the books required in Bridgetown without keeping a stock of thousands of books that would never be wanted or not wanted for years. Apply the same principle to other towns and you will see that by keeping only one central stock we effect a great economy."

I pointed out that in other countries the publishers kept the stock and supplied booksellers with what they wanted, allowing them to keep a few copies for the immediate sales; and that consequently this was almost as economical an arrangement.

"But," said Sheep, "we have no publishers in your sense of the word. When a book is written it cannot be printed without the sanction of the Government censors, who decide how many copies in the first instance are to be issued. The publishers are really printers who arrange the form and style of the book, but undertake no responsibility such as publishers in other countries undertake."

"Then the Government are really the publishers?" I suggested.

"Well," answered Sheep, "the Government are the publishers of most books. That is to say, the number of Government publications exceeds the number of private publications, but as regards the latter the publishers or printers assume the financial responsibility for the sales but are insured by the Government against loss, so long as they comply with the conditions imposed by the Publishing Department."

But I have digressed too far. My interest in book-shops must be my excuse. Not only were there no casual shoppers, but I saw no one sauntering about the streets. Everybody seemed to have an object in view. There were no children playing. The children were either marching in step to or from school, or they were performing some kind of organised game--if it could be called a game--under the supervision of a teacher or guardian. The workmen going to their work, or returning, also marched in step like soldiers. The women going to market went at the appointed time and took their place in a little queue if there were more than three or four in front of them. At the theatre there was no crowd outside; every one had his numbered seat and went to it at the minute. Each man's ticket has printed on it the day of his attendance, the number of the seat and the exact time at which he must be present.

There are no such things here as football matches or other sports witnessed by crowds. The men attend military drill once a week, some on Sundays and some on Saturdays. This is in addition to their annual periods of drill. The only custom which survives from old times, resembling the customs of other countries, is that of sitting in the evening in gardens attached to restaurants. Here the people listen to bands of music whilst they drink a thin kind of liquor and smoke cigars.

The sense of orderliness is almost oppressive. Every hour of the day has been mapped out for me, except when I have been writing my journal in the evening. The day before yesterday we began to visit the State institutions. The chief of these is the Post Office, but the most remarkable is the Time Department. The Post Office is very much like any other post office, except that it has a Censor's Department. All letters are actually read by the clerks in the Censor's Department. Sheep gave me a curious explanation in justification of this extraordinary institution. Put briefly, his case was this. The State could not, with due regard to the interests of the community, allow all letters to go uncensored. All sorts of mischief might be hatched. If the State censors any letters it cannot logically stop short of censoring all. As to the labour involved, this pays for itself. For the public, knowing that its letters are liable to be read, does not indulge in unnecessary letter-writing. Thus time is saved, which can be devoted to more useful purposes. The statistics compiled by the Time Department have completely proved that the labour of the fifty clerks
employed in censoring the letters effects a saving of more than four times the amount of time which would otherwise be spent by the public in useless letter-writing.

This Time Department is the most extraordinary institution of all I have seen so far. Every person over ten years of age is required to fill in a diary form each week showing the time spent daily on every separate operation. The diary form is a stout double sheet of foolscap providing four page altogether. The first page is stamped with the name, address, and other particulars of the diarist. The two open pages are ruled into 336 small oblong spaces, one for each half-hour of the week. In these spaces brief entries are made, such as ‘breakfast,’ ‘tram-journey,’ ‘conversation,’ ‘sleeping,’ etc. This part of the diary thus gives a chronological account of each day in successive half-hours. On the back page is printed a long list of about 150 categories in three columns. I noticed such headings as these:—Sleep, dressing, meals (subdivided), travelling (conveyance specified), employment (specified under many heads), study (specified), reading, letter-writing, interviews with officials, attendance at theatre, concert, church, museum, etc., conversation (subdivided into family, friends, others), other amusements (specified), public ceremonies, drill, etc. Against each of these headings the total number of minutes spent during the week is recorded.

The information derived from these diaries is scrutinised and worked up into elaborate reports and statistics for the benefit of the Sociological Department, the Police Department, the Department of Trade and Industry, and so forth. I hope to learn more of this most remarkable feature of Meccanian life when I reach the capital, where the Central Time Department carries on its work.

I have good reason to remember the Time Department, for on Sunday morning after breakfast I was sent for by the official who manages the Hotel for Foreign Observers. He told me rather curtly that he had just received a telephone message from the local office of the Time Department inquiring whether I had sent in my diary, as it had not been received. I told him I knew nothing about such a thing. He said, "Nonsense. You have had the usual instructions given to all foreigners. Look among your papers." I did look, and there, sure enough, was a sheet of instructions and three blank forms. He said, "You had better fill it up at once." So I went to the writing-room and began. But I could not remember what had happened at all clearly enough to fill the half of it in. At the end of an hour the hotel manager came to ask what I was doing all this time. I explained my difficulty. He asked if I had not kept a pocket-diary: it was indispensable. I suddenly remembered the pocketdiary Sheep had procured for me; but I had forgotten to make use of it. What a fool I was! We spent the next hour doctoring up the diary and then sent it in. He told me I should have to pay a fine of ten shillings for the delay. I did not mind that, but the next day I received a visit from an official from the Time Department, who came with Conductor Sheep to point out that there were many errors in the diary. The times for a number of items did not tally with those in Conductor Sheep’s diary, although we had been together the whole week from 9 a.m. to 6 p.m. each day. I should have to make out a fresh diary with the assistance of Conductor Sheep, and pay a fine of £1. The charge of falsifying my diary would not be made, in view of my colossal ignorance; the charge would be reduced to that of negligence to verify particulars. Conductor Sheep was rather disagreeable about the affair, as it might be considered to reflect on him. I certainly thought he might have taken the trouble to instruct me more fully upon such a momentous business. However, as I was on the point of leaving Bridgetown for Mecco, I was not much disturbed by his ill-humour.

CHAPTER III
INTRODUCTION TO MECCO

IT is a week since I arrived in Mecco, and for the first time I have leisure to write up my journal. The life of a Foreign Observer is very strenuous, for the Meccanian method of seeing everything according to programme and timetable is very fatiguing. Already I feel that a holiday will be welcome at the end of my tour. In the whole of this vast city of Mecco there is nothing casual, nothing incidental, nothing unprovided for. Although I am only a spectator, I feel like a little cog in the huge complicated machine. The machine seems to absorb everything; the individual counts for nothing. That is perhaps the reason why it seems impossible to get into contact with any human being other than the officials who instruct me and conduct me every moment of my time. I begin to wonder whether the individual Meccanian really exists, or whether his personality is merged in the official personality which is all that is visible to me.

To resume the record of my experiences. Before I left Bridgetown, Sub-Conductor Sheep repeated his opinion that in choosing Tour No. I, which allowed only a week for the study of an important town, I had revealed my incapacity as a Foreign Observer. He evidently put me down in one of the pigeon-holes of his mind as a mere tourist—-a creature almost extinct in Meccania. The day before my departure I paid the bill for his services, which were reckoned at the modest rate of 16s. a day. My hotel bill was also discharged, and I proceeded to my final interview with the Police Authorities. I had to submit to another disinfecting bath, but apart from this the medical examination was a formality.

At the Police Office, Inspector of Foreigners Stiff was very sarcastic at my expense. "So you think there is nothing more to be learnt in Bridgetown," he remarked. "It is not more than ten days since you left Luniland, and
you think yourself qualified to proceed to the very centre of our national Culture. Evidently your stay in Luniland has not improved whatever powers of appreciation you may have possessed; but that is what one would expect from that country of amateurs, charlatans and cranks. You have seen nothing of our Museum, our Art Collections, our Libraries: you are not interested in such things. How, then, do you suppose you will be able to appreciate what you will find in Mecco? Do we not assist all Foreign Observers, but it is rather a waste of time to provide an experienced and qualified Conductor for persons who are so clever that they only require a week to learn all there is to know in a whole city. However," he added, "the law with respect to Foreign Observers does not forbid you to proceed to Mecco. You have your medical certificate, I suppose, to show that you are still disease-free?" I produced it. "Have you notified the Railway Authority of your intention to travel to Mecco?" I had not done so.

"Turn to paragraph 44 of your Instructions and you will see that a day's notice must be given," he said brusquely. "You will have to stay another night in the hotel and travel to-morrow. Good morning."

Sheep accompanied me to the booking-office at the station, where I filled up a form of application. When this was presented to the clerk in charge, a fussy little old man in a chocolate-coloured uniform, he turned to Sheep in great excitement and whispered something which I did not hear. Then he turned indignantly to me and said, "But you are not an Ambassador, nor even a Government Agent."

"No," I said; "I am merely National Councillor Ming."

"So I see," he answered testily, "but why do you wish to travel First Class?" (I had filled in the word "First " in the space for "Class.") "Are you not aware," he said, "that only foreigners who are Ambassadors are ever permitted to travel First Class? You will travel Third Class in the compartment for Foreign Observers."

Next morning I went to the station in good time. An attendant from the hotel brought my bags over and handed them to one of the porters. I did not see them again until I found them in the hotel at Mecco. I was handed over to an official at the station. This person looked at my travel-permit and informed me curtly that I had arrived too early. I said, "Oh, that does not matter. I can look about the station until the train starts."

"That is not permitted," he said. "You will go to the waiting-room—that is what a waiting-room is for. Your train will come in a quarter of an hour before it is due to leave, and you will then take your seat, Coach Third Class, Compartment IV., Seat No. 12."

So I was taken to the waiting-room. Apparently I did not miss much of interest, for the station was one of the quietest and dullest I have ever seen. There is very little traffic across the frontier, so that Bridgetown station is a sort of dead-end. Only three passenger trains a day go direct to Mecco, and these are by no means crowded. I have since learnt that the restrictions on travelling in all parts of Meccania are part of the general policy designed to keep down unnecessary forms of expenditure to a minimum.

The train was due to leave at ten o'clock. At a quarter before ten exactly, as I looked through the window screen I saw it gliding along the platform into the bay. A bell rang, and my porter came to take me to my place. As I stepped across the platform I saw about a hundred people preparing to get into the train. Where they had been up to this moment I do not know. There was no bustle. Each person took his place as if he had been taking his seat in a concert-room. There was no examination of tickets. Every one had booked his seat the day before, and every seat was numbered. The train was made up of five passenger coaches, a post-office van, a baggage wagon, two wagons for perishable goods and a special coach for soldiers (privates). One of the passenger coaches painted red bore a large Roman II., indicating that it was a Second Class coach, another painted yellow was marked III., two others painted green were marked IV., and another painted chocolate was marked V. There was no First Class coach on this train, as there were no persons of the First Class travelling by it. Neither, apparently, were there any Sixth or Seventh Class passengers. Every one travelling wore a sort of uniform overcoat of the same colour as that of the coach in which he travelled. It was only later that I was able to recognise readily and without confusion the colours appropriate to the seven social classes, but I did notice that the Fifth Class wore chocolate, the Fourth green, the Third yellow and the Second red or scarlet.

I was taken to a compartment temporarily set apart for foreigners in the Third Class coach.

There was still ten minutes before the train started, so I looked out of the window and saw the porters and minor officials storing the luggage, putting in the mails, and so forth. The perishable goods had already been loaded, in a siding I suppose. No one was permitted on the platform except the railway servants, so that the station looked almost deserted. Presently the stationmaster, dressed in a green uniform with chocolate facings and a bit of gold braid on his cap, came on the platform and looked at his watch. Then, exactly as the big bell of the station clock began to strike ten, he waved a signal and the train glided out.

In a few minutes we were going at 100 miles an hour, and in less than a quarter of an hour the speed increased to 150. The track was smooth, but I began to feel dizzy when I looked out of the window. There was little to be seen, for every now and then we passed between embankments that shut out the view. I pulled down the blinds, turned on the light and tried to read. In a short time I had almost forgotten the immense speed at which we were travelling.
I had previously learnt that if I went to Mecco by the express I should see nothing of the country, and had consequently proposed to travel by a stopping train, perhaps breaking my journey a few times. But when I mentioned this to Sheep he said it would be impossible. I could not stop at any place to make a stay of less than three days, and each of the places I stopped at would have to be notified. I must either go direct to Mecco, or to some other city. So here I was, almost flying to Mecco. After about an hour, one of the guards came in to see that everything was in order. He wore a chocolate uniform, with a number of stripes and other symbols to indicate his particular, grade, occupation and years of service. After stamping my ticket he grinned good-humouredly for a Meccanian, and said, "So you are going to see the wonders of our wonderful Mecco. Lucky man! There is nothing like it anywhere in the world."

"Indeed," I said, "you have travelled abroad a good deal, then?"

"Oh no. I have never been out of Meccania, thank God!"

"What makes you think there is nothing like it, then, in any other country?" I asked.

"Oh, the wide streets, the buildings, the gardens, the monuments, the uniforms, the music, everything—it is c-o-l-o-s-s-a-I! When you have seen the great monument, the statue of Prince Mechow! There is nothing like it anywhere. You will see! And you must not miss the Memorial Museum of Prince Mechow! I tell you it is a privilege to live in Mecco. But I must not gossip," he said, as if half ashamed; "I have many duties," and off he went. Towards the end of the journey, which lasted a little over two hours, he looked in again and said, "You must not leave Mecco until you have seen the great festival on Prince Mechow's birthday." I promised to remember it.

As we drew near to Mecco the train slackened speed, and I could see, but only for a minute or two, a great city spread over a wide plain. There were domes and towers, steeples and pinnacles, huge masses of masonry suggesting great public buildings, then miles of houses and gardens and in the far distance warehouses and factories, but no smoke. We plunged into a tunnel and then emerged suddenly into a blaze of light. The train glided along the platform, and as I stepped out I could not help looking round in admiration at the truly magnificent arches and lofty dome of the great Central Station of Mecco. The roof seemed to be made of some wonderful prismatic glass that radiated light everywhere. The ground was covered with immense tiles in coloured patterns, all as clean as if they had been washed and scrubbed that very hour. Not a speck of dirt or smoke was to be seen. Although hundreds of people were in the station, there was no bustle. No one sauntered about; every one seemed to go just where he had business. There was no scrambling for luggage or for cabs. No one was allowed to take luggage with him unless it could be carried in one hand; the rest was all registered and sent to its destination by the railway servants. Only persons of the third or a higher class were allowed to use motorcabs, and these were all ordered beforehand. The impression of orderliness was almost uncanny. As I reached the end of the platform I was touched on the shoulder by a man in the green uniform of the Fourth Class, decorated with several stripes and badges. "You are National Councillor Ming," he said, "and I am Conductor of Foreign Observers Prigge."

He seemed to be in very good spirits, but this made him rather offensive than amiable. He treated me as if I were a sort of prisoner, or at any rate as if I were a very juvenile pupil. He said that as my bags had gone to the Hotel for Foreign Observers we need not go there first, but could proceed straight to the Police Office. This was not far from the station and was a large building, almost like a fortress in front. Viewed from the other side, as I afterwards saw, it was more like a set of offices with large windows.

First of all I was taken to the police doctor, who spent nearly two hours upon a minute medical examination of me. The object of this could not have been to make sure that I was "disease-free," for I had been seen the day before by the police doctor at Bridgetown. It could not have been for the purpose of identification, seeing that the authorities had obtained all the finger-prints and everything else they required, on my first arrival. I could only conclude that it was for the purpose of scientific research. I judged from the remarks made by Doctor Pincher in the course of his investigations that he was an expert anthropologist. He took samples of my hair, not only from my head, but from various parts of my body. He took a sample of my blood, and of the perspiration from several different glands. He even removed a small particle of skin, without any pain. He tested my eyesight, hearing and smell, my muscular powers, and all sorts of reactions to various stimuli. He informed me that I should require a pair of spectacles. I said I did not think it was worth while, as I had never yet experienced any discomfort. He replied that that made no difference, and proceeded to write out a prescription which he told me to take to a certain office, where, in a few days, I should be supplied with the necessary glasses. He then took a cast of my mouth and of my ears, and measured me in twenty different places. Finally he gave me a drink of what appeared to be water, but which made me unconscious for several minutes. What he did during those few minutes I do not know, and he did not deign to inform me. As I left him he smiled—I suppose he thought he was being amiable—"We do not have the pleasure of seeing a Chinaman here every day."
and after noting the time and my name on a sort of tablet, took out a yellow form, foolscap size, upon which he proceeded to make notes of my answers to his questions. He put me through a catechism as to what I had seen in Bridgetown. Which of the local institutions had I visited, which of the national, which of the local and national? What had I learnt of the industrial and social economy of Bridgetown? What had I learnt of the cultural institutions? Had I made notes of my daily tours, and could I produce them? (Luckily all my notes were in a language that Inspector Bulley could not read.)

He then proceeded to discuss plans for my tours of observation in Mecco. In the first place, how long did I propose to stay? I did not know. What did the length of my stay depend upon? I said it would largely depend upon my ability to stand the strain of it.

I thought this would perhaps annoy him, but on the contrary it pleased him immensely. "Good!" he said. "You are here to study the institutions of Mecco, and you will stay as long as you have the strength to carry out your task."

That was not what I meant, but I let it pass.

"I think you had better select the preliminary six months' tour of observation," he said. "After that, you can begin the study of any special branch for which you are qualified, and for which you have an inclination; possibly industry, possibly art, possibly sociology, possibly education. We can decide that at the end of your preliminary period.

You will have for your guide, for the first few weeks, Lower Conductor Prigge. As, however, he has just been promoted to a higher rank in the police service, he will not be available after the first few weeks, but I will arrange for a suitable successor."

He then presented me with several documents. "This," he said, handing me a thick notebook of some two hundred pages, "is the preliminary diary in which you make your notes in whatever form you like. There are four pages for each day. This is the formal diary for the Time Department, to be carefully entered up each week and posted before Sunday morning. These are the sheets of Instructions specially drawn up for Foreign Observers in Mecco; you will notice they are all marked' Tour No. 4,' and numbered consecutively. And this," handing me a thin metal plate about half the size of a postcard, "is your identification ticket."

It was now the middle of the afternoon. I had had no luncheon, so when Prigge came to take me off to the hotel, I proposed that we should have some tea. He demurred a little, as he did not drink tea, but he consented to have some coffee and a cigar in the smoke-room if I would drink my tea there. So we went on talking over our tea and coffee, and this is a specimen of the conversation:--

"You will understand," said Prigge, "that everything depends upon your own energy and intelligence. If you apply yourself thoroughly to the work before you, you will learn more in a fortnight under my guidance than in a whole year in Luniland. I have had a long experience in conducting foreigners. Most of them have no idea how to observe, especially those who come from Luniland. They want to roam about without any system or method at all. They want to see an Art Gallery one day, and a manufactory the next; or even on the same day. Then they want to see a natural history museum on the same day as an archaeological museum; they will fly from pottery to pictures, and from geology to botany. Why, I was taking one of them through our great museum illustrative of the stages of culture, which is arranged in twenty successive centuries, and when we had reached the sixteenth he actually wanted to turn back to look at something in the twelfth!"

"I think it will be a good thing," I said, "if I ask you questions as we go along, about matters that strike me. With all your knowledge you will be able to tell me many things outside the regular routine."

"Your proposal implies," he replied, "that I shall not give you the appropriate information in proper order. If you will follow my directions you will learn more than by any amount of aimless and desultory questioning. I have studied the principles of Pedagogy as applied to conducting Foreign Observers, and I shall accommodate the presentation of new matter to the existing content of your mind, in so far as your mind has any definite content. You will not be precluded from "asking questions, but whether I shall answer them will depend upon their relevance to the subject in hand."

Before we parted he gave me some general instructions. "For the first week," he said, "you will not be permitted to converse with other foreigners staying in the hotel. To-night you will be free to attend to your private affairs and prepare for to-morrow. We shall begin by a survey of the general geography of the city, and in the evening you will have permission to attend one of the lectures specially given to Foreign Observers by Professor Proser-Toady on Prince Mechow, the re-Founder of the Meccanian State. Professor Proser-Toady is the Professor of Historical Culture in Mecco, and this course of lectures is given periodically, so that foreigners may have no excuse for being ignorant of the true history of the rise and development of Meccanian culture."

So I spent the evening in writing letters, looking up my' Instructions,' and filling up my diary. For this day, interviews with officials accounted for at least five hours. Next morning at nine o'clock Conductor Prigge turned up, looking more perky than ever. He had all the airs of a professor, a police officer, and a drill sergeant rolled into one.
"Our first business will be to study the map," he said. "To that we will give one and a half hours. After that we will ascend the look-out tower in the Meteorological Department and take a view of the city in the concrete. In the afternoon we will go by tram-car in three concentric circles, and in the evening you will attend Professor Proser-Toady's lecture."

We began with the maps. I remembered something of the maps of the old city from my geographical studies at home, and I remarked on the great changes, for hardly a vestige of the old city seemed to remain.

Prigge appeared rather pleased. "That is an instance of the superiority of our culture," he remarked. "All the other capitals of Europe," he said, "still preserve the plan of the mediaeval city, in the central parts at least. And the central parts are the most important. The authorities profess to have preserved them because of their historical interest. In reality it is because they do not know how to remodel them. Against human stupidity the very gods fight in vain, but to intelligence all things are possible. Any dolt can plan a new city, but we are the only people in Europe who know how to remodel our old cities. Now you will notice," he went on, "that we have preserved the old royal palace and several other important buildings. They do not interfere with the general plan. The large central ring, over a square mile in extent, is occupied by Government buildings; and although there is a larger number than in all the European capitals put together, they are not crowded. The square of Prince Mechow, where the great statue stands, is the largest in Europe. The ring outside that is occupied by Cultural Institutions, Museums, Art Galleries, Libraries, the University, the Zoological Gardens, the Botanical Gardens, and so forth. Next comes a very much larger ring, occupied almost entirely by the residential quarters of the six social classes. (In Mecco itself there are no members of the Seventh Class.) The whole presents a superficial resemblance to a great wheel."

"Where, then, is the manufacturing quarter and the business quarter?"

"Now where would you expect?" he asked, as if to show off his own cunning.

"I saw a number of factories in the distance," I said.

"Yes," he answered, "the manufacturing quarter lies outside the ring and forms a sort of town by itself."

"And the business quarter? That must be centrally placed," I said.

"Not necessarily. If you draw a line from the centre of Mecco to the industrial quarter you will find the commercial quarter occupying a long rectangle between the second ring and the outer edge of the exterior circle. The commercial quarter thus cuts the residential ring on one side. The residential quarters of the Sixth and Fifth Classes lie on each side of the commercial quarter and are therefore nearest to the industrial quarter.

"You will observe," he continued, "that we have no Seventh Class in Mecco itself. We are an Imperial city, and even the servants of the well-to-do belong to the Sixth Class. It is the greatest privilege of a Meccanian citizen to live in Mecco, and all the citizens of Mecco are, so to speak, selected. None but loyal upholders of the national and imperial ideal are allowed the privilege of living here. It would not be right. There again, it is our superior national culture that has enabled us to realise such a plan. What Government in Europe could drive out of its capital all citizens who did not actively support the State?"

"It is indeed a wonderful thing," I said. "But what becomes of such disloyal citizens when they are, shall I say, expelled or exiled?"

"Ah! You must not believe that we have had to indulge in any policy of expulsion. You will not find any disloyal element anywhere in Meccania. A few individuals you might find, but most of them are in lunatic asylums."

"But surely," I said, "I have read in the histories of Meccania, that formerly there were large numbers of people, among the working classes chiefly, who were, well, rather revolutionary in their ideas, and whom I should not have expected to see becoming loyal to such a State as the Meccania of to-day."

He smiled a very superior smile. "Really," he said, "the ignorance of our country which foreigners betray is extraordinary. Disloyalty to the State is found in every country except Meccania. We have got rid of it long ago by the simple process of Education. If we find an odd individual who displays disloyal sentiments we regard him as a lunatic and treat him accordingly."

"How?" I asked.

"We put him in a lunatic asylum."

"And your lunatic asylums? Have you enough for the purpose?" I ventured to ask.

Conductor Prigge luckily did not see the point. "In most cases," he said, "the threat is sufficient. We require very few lunatic asylums, just as we require few prisons. But we are wandering from the subject," he remarked; and he drew out a map of the residential quarters, coloured in white, red, yellow, green, chocolate and grey, the colours of the classes, omitting the Seventh.

I noticed that the parts coloured white, red and yellow covered about half the circle. I was going to put some questions to Prigge as to the relative numbers of the classes, when he said, "I do not think you have yet grasped our sevenfold classification of the citizenship of Meccania."

"Somewhat imperfectly, I am afraid," I replied.
"Then you have not grasped it," he said. "You cannot be said to grasp it if you are not perfectly clear about it. I will explain. Attend! Begin with the lowest. That is the logical order. The Seventh Class consists of persons of the lowest order of intelligence who cannot profit by the ordinary instruction in the schools beyond a very moderate degree. They are not very numerous. From the age of ten they are taught to do simple work of a purely mechanical kind, and when strong enough are set to do the most menial work which requires little intelligence. A few other persons, who have failed in life through their own fault, are relegated to this class as a punishment.

"The Sixth Class corresponds to the unskilled labouring class of most foreign countries. They are recruited from the children who at twelve years of age show only average ability. They are then trained to do either simple manual work, or to act as servants in families below the Second Class.

"The Fifth is the largest class; it is larger than the Sixth and Seventh together. We require a very large number of skilled artisans and clerks in a subordinate capacity. Consequently, we train all who are capable of profiting by a combination of theoretical and practical instruction until the age of fifteen, and even for some years after that, in industrial schools, where they study the practical aspects of mathematics and science. Consequently, they are by far the most skilled artisan class in the world. We have no trouble in inducing them to apply themselves to study, for any member of the Fifth Class who failed to profit by the system of instruction provided for him would soon find himself in the Sixth Class, which enjoys much less in the shape of privileges and material well-being than the Fifth.

"The Fourth Class includes most of the bourgeoisie, the bulk of the officials and clergy, as well as the small group of professional people who are not officials. In detail it comprises tradesmen, managers of businesses and foremen in responsible positions. All these are in the Industrial and Commercial world. Then come all Civil servants below the first grade, all non-commissioned officers in the Army and Navy, all the Clergy below the rank of Bishops. The professional people I referred to are a few who have not been absorbed in the official class. We have no journalists in Meccania, no doctors who are not in the State service, and no lawyers who are not officials."

"Then who are these professional people?" I interrupted.

"They are merely a handful of people, mostly possessed of small private means, who write books that are never published, or cultivate art, or music, or science. They are not good enough to be taken into the State service, and they are gradually disappearing altogether.

"The Third Class," he resumed, "corresponds partly to the Higher Bourgeoisie of other countries, but it also includes several more important elements. It comprises the richer merchants and manufacturers, who must possess an income of at least Â£5000 a year; the first class of Civil servants, the Higher Clergy, those University Professors who have held their posts for ten years and are approved by the Ministry of Culture, landed proprietors who are District Councillors and Magistrates, and all Fundholders with an income of Â£10,000 a year.

"The Second Class is the military class. It includes all officers, who must be of noble birth. A few of the highest Civil servants are in this class, but they must have previously served as officers in the Army or Navy.

"The First Class is partly military and partly civil; but, except members of royal or ducal families, all in the First Class have previously passed through the Second. Ambassadors are in the First Class, but they have all served for a period as officers in the Army. Even the head of a department of State is not admitted to the First Class unless he has previously been in the Second Class.

"Lastly, the relative numbers of the various classes are as follows: out of a total population of 100,000,000 only about 10,000 are in the First Class; 4,000,000 are in the Second; 6,000,000 are in the Third; 20,000,000 are in the Fourth; 40,000,000 are in the Fifth; 20,000,000 are in the Sixth; and the rest, nearly 10,000,000, in the Seventh Class.

"All women take the rank of their fathers or their husbands, whichever is the higher; children take the rank of their parents until their sixteenth year. Is that clear?"

"Quite clear," I replied, "except in one particular."

"What is that?"

"I take it that some, at any rate, pass from one class to another. By what means, for example, does a person who starts life, let us say in the Fourth Class, obtain admission to the Third?"

"We must take some particular category."

"A business man, a small manufacturer who is highly successful, perhaps makes some valuable discovery which enriches him. How does he obtain admission to the Third Class?"

"He must have an income of at least Â£5000 a year, and he must have performed some service to the State," answered Prigge promptly.

"And a Civil servant?"

"If he is promoted to the first grade he also is admitted to the Third Class, but this does not frequently happen."

"Then, on the whole, the children of those in each class respectively remain in the class in which they are born?"
of the civilisation of the modern world. Here are three million thoroughly efficient Meccanians, every one in his
whole capital. We ascended the look-out tower. The sight was magnificent. From where we stood the details of the
architecture could not be seen, nor even the style of the buildings. But the general impression produced by such a
vast assemblage of massive edifices was one of grandeur and power, while the bright sunlight and the absence of
smoke and dirt gave the whole city the appearance of having suddenly sprung up in a night, like Aladdin's palace.

The colossal statue of Prince Mechow, a gigantic portrait-figure of a man in the uniform of the First Class, his breast
covered with decorations, a sword in one hand and a mace or some symbolical weapon in the other. The impression
of brute force which it conveyed was terrific. Every person in the square, as he came within sight of it, took off his
hat; those in military dress saluted it, and pronounced the words, "Long live Meccania and God bless Prince
^Mechow!"

My first feeling on seeing it was one of intense disgust at the barbarity of the thing, and I was just going to
make some satirical remark when I caught sight of Prigge's face. It wore an expression of absolute ecstasy, and the
look of fierce disdain with which he said "Uncover!" was startling. He added something which sounded like
"Mongolian monkey," but in the excitement of the moment I was not quite sure what he said.

I tried to pacify him by saying, in as innocent a tone as I could assume, "It is indeed the most remarkable statue
I have ever seen."

"It is the most perfect embodiment of Meccanian Culture: no other country could produce such a work," he
replied solemnly.

"I am inclined to agree," I said. "Who was the artist who conceived and executed a monument of such
wonderful proportions?"

"The artist? What other nation could produce a man who united such gifts with such a true Meccanian spirit?
He desired that his name should never be spoken. When the work was completed after ten years, he gave up his life,
and begged to be allowed to be buried underneath the rock with all the tools that had been used in the execution of
the statue. His dying request was respected. His name is never uttered, but every child in Meccania knows it, and
every citizen in Meccania comes once every ten years to salute the statue of Prince Mechow and do honour to the
hero-artist who lies buried beneath."

"I shall never forget the story," I said, and we walked on to the look-out tower. On the way, I noticed that every
person in the street saluted every other person of higher rank than himself. I have since learnt that there are six
different forms of salute, one for each class above the Seventh, and that it is a point of strict etiquette to give the
right salute. A salute appropriate to the Fourth Class given to a member of the Third is an insult, and the wrong
salute given to a member of the Second (military) Class may cost the offender his life.

"That is so as a rule. The percentage has been worked out carefully by the statistical branch of the Sociological
Department. About 4 per cent of the Seventh Class enter the Sixth, about 5 per cent of the Sixth enter the Fifth,
about 3 per cent of the Fifth enter the Fourth, about 8 per cent of the Fourth enter the Third. No one, strictly
speaking, enters the Second from the Third, but as many of the men of the Second Class marry women in the Third
Class, which is the rich class, the sons may enter the Second Class, if they are suitable as officers in the Army. Also,
a number of the women of the Second Class marry men in the Third Class, and their sons also may enter the Army."

"It is a wonderful system," I ventured to observe.

"It is simplicity itself," said Prigge, "yet no other nation has had the intelligence to discover it, nor even to copy
it. As a matter of fact, it is the only logical and scientific classification of society; it puts everybody in his proper
place."

After this conversation, or rather this discourse, we walked out to ascend the look-out tower; but on the way we
had to cross the great square of Prince Mechow, and there, for the first time, I saw the great monument about which
I had heard so much. I had expected something extraordinary, but I was not prepared for the actual thing. It was as
high as a church steeple. At the base was a huge shapeless mass of basalt. Above this rose a square granite block,
twenty feet high, covered with high-relief sculptures representing in allegorical form the reconstruction of the
Meccanian Super-State. At the four corners were four figures representing Arms, Intellect, Culture and Power.
Above this again towered a great pedestal a hundred feet high and forty feet in diameter. On the top stood the
colossal statue of Prince Mechow, a gigantic portrait-figure of a man in the uniform of the First Class, his breast
covered with decorations, a sword in one hand and a mace or some symbolical weapon in the other. The impression
of brute force which it conveyed was terrific. Every person in the square, as he came within sight of it, took off his
hat; those in military dress saluted it, and pronounced the words, "Long live Meccania and God bless Prince
^Mechow!"

Conductor Prigge seemed duly satisfied with the impression made on me. "Here," he said, "you are at the centre
of the civilisation of the modern world. Here are three million thoroughly efficient Meccanians, every one in his
proper place, every one fulfilling his appointed duty. Think of the disorder, the squalor, the conflict of aims, the absence of ideals, represented by a city like Lunopolis, or Prisa, and look on this picture!"

We descended and returned to the hotel.

After luncheon we proceeded with our tour of the tramway system. By this means I got a good view of the exterior appearance of the houses of the various classes. It confirmed the impression I had gained from the look-out tower, except in one respect. The houses of the well-to-do looked as if they had all been designed by the same school of architects, and except that they differed in size they might have been turned out by machinery. The houses of the rest of the population were 'standardised' to an even greater degree. The dwellings of the Sixth Class are really blocks of small flats of a standard size; those of the Fifth Class are similar, except that the rooms are a little larger and there are more of them. One curious fact came to light in the course of Conductor Prigge's explanation of the housing system. It seems that the Births Department determines the number of children each family is expected to have within a given period of years, and the houses are distributed accordingly. Thus a family in the Fifth Class which is due to have, let us say, four children within the next seven years, is assigned a flat of five rooms. Then, if the same family is due to have two more children within the next five years, they move into a house with seven rooms. Persons in the first grade of the Fifth Class are allowed to take a flat with more rooms on payment of a special rate or tax.

Apparently there is very little choice of houses. As all the houses of a certain grade are practically alike, if a tenant wishes to move to another street he has to furnish valid reasons; and it is not easy to furnish reasons satisfactory to the authorities. Besides, the number of houses or flats is very closely proportioned to the number of tenants, and there are never many vacant houses. The members of the Third and higher classes own their own houses, and can therefore change their residences by purchasing or exchanging. By special privilege members of the Fourth Class can obtain permission to buy their houses, but as these are mostly flats they are usually rented from the municipality.

CHAPTER IV
PROFESSOR PROSER-TOADY'S LECTURE

FOLLOWING Conductor Prigge's instructions, I presented myself at six o'clock in the evening at the entrance to the Great University of Mecco. It was the first time I had been out without my 'keeper,' but as everybody else was dressed in the Meccanian costume, whilst I was wearing the clothes I had been accustomed to wear in Luniland and Francaria, there was little risk of my going astray. A porter darted out of a box in the entrance hall and directed me to Room 415, where the Professor of Historical Culture was to deliver his monthly four-hour lecture to Foreign Observers. I found about a dozen Foreign Observers of various nationalities waiting in the small lecture-room, and presently a few more arrived. Some were Scandinavians, some South Americans; a few, I thought, were Turks; several were from some part of India. At 6.10 precisely the Professor came in. He wore a brilliant yellow uniform of the Third Class, with green facings and buttons and a number of little ribbons indicating,

I suppose, various services rendered to the cause of Meccanian Culture. Apart from his dress he resembled the caricatures of Meccanian professors in our comic prints. His head was bald on the top and at the front, but at the sides great tufts of white hair protruded. His grey beard was of ample proportions. His coarse wizened face and staring eyes, covered by a pair of huge spectacles, gave him the appearance of a Jack-in-the-box as he sat behind a high reading-desk. His voice was tough and leathery. At the end of three hours it sounded as fresh and as harsh as in the opening sentences. I cannot reproduce the whole lecture; if I did it would almost fill a book by itself. I can only hope to give a rough idea of it by paraphrasing some of the most salient passages.

He began by saying that to accommodate himself to the culture of his foreign auditors he would endeavour to present his subject in the simplest possible form, which was the narrative, and would sketch the biography of the great re-founder of the Meccanian State, the true architect of the First Super-State in the world, the greatest political creative genius that had ever stepped upon the World Stage, Prince Mechow. We had all seen his memorial statue, which is due to have, let us say, four children within the next seven years, is assigned a flat of five rooms. Then, if the same family is due to have two more children within the next five years, they move into a house with seven rooms. Persons in the first grade of the Fifth Class are allowed to take a flat with more rooms on payment of a special rate or tax.

He began by saying that to accommodate himself to the culture of his foreign auditors he would endeavour to present his subject in the simplest possible form, which was the narrative, and would sketch the biography of the great re-founder of the Meccanian State, the true architect of the First Super-State in the world, the greatest political creative genius that had ever stepped upon the World Stage, Prince Mechow. We had all seen his memorial statue, , a unique monument to a unique individual, and no doubt it had made an impression upon our imagination; but it was impossible for any work of art however great--and here he paid a tribute to the hero-artist who built the monument--to convey more than a symbolic suggestion of the all-embracing magnificence of Prince Mechow's truly Meccanian personality. For that we must look around at the Super-State itself.

Prince Mechow, he said, was historically the culminating figure of the national development of Meccania. Compared with many countries in Europe, Meccania could not boast a long history. Some historians sought a false glory for Meccania by tracing its greatness back to the so-called Roman Empire of the Middle Ages, but true Meccanian history went back only a few hundred years. In fact, it was not until the eighteenth century that the Meccanian State was in the proper sense of the word began, and only in the nineteenth century did it take its place among the powers of the modern world. In the nineteenth century the Meccanian State was saved by the genius and will of one great man, the worthy predecessor of Prince Mechow, his great-uncle Prince Bludiron. From a scientific
or philosophical point of view it was difficult to say whether Prince Bludiron had not contributed as much to the
greatness of Meccania as Prince Mechow; for it was he, undoubtedly, who laid the foundations upon which the final
structure rested. The work of Prince Bludiron was very different from, but also similar in spirit to, the work of
Prince Mechow. His task had been to rescue the young and inexperienced State from the perils and distractions of
the false ideals of Liberty and Democracy, to secure the power of the State over all sections and classes, to create the
proud and confident Meccanian spirit and to set the nation on the right path.

The task of Prince Mechow was to erect the Super-State on the foundations laid by Prince Bludiron; in other
words, to organise the energies of the whole nation to one supreme end, to train and direct the powers of every
individual so as to produce one mind and one will.

Turning to the work of Prince Bludiron, the Professor said that when he began his work Meccania was
distracted by false and conflicting ideals, of foreign origin. Revolution was in the air. People were ready to drive out
their lawful rulers. Popular government was demanded. Parliaments were being set up. It was the saddest page in
Meccanian history. Had these anarchic forces triumphed, Meccania would have sunk to the level of other nations,
and the Super-State would never have arisen. It was the greatest testimony to the intellectual genius and moral
power of Prince Bludiron that, after forty years of strenuous work, the whole outlook for Meccania was completely
changed. The false ideal of individual liberty was dead and buried. Popular government was a discredited
superstition. The military aristocracy were secure in their rightful position. The efficiency of the Government was
demonstrated in every direction, and not least on the field of battle. Wars had been won with a rapidity
unprecedented in any age.

Prince Bludiron's success was so complete that it was almost impossible for us now to realise how great his
difficulties had been. So strong were the forces of Democracy that even he had to temporise and set up a Parliament.
He even granted manhood suffrage.

Dr. Proser-Toady then explained how Prince Bludiron outwitted the disloyal elements among the people by
securing the reality of power to the organised centralised State, whilst leaving the semblance of control to the
representative bodies. He quoted a Foreign Observer, at the end of Prince Bludiron's career, who declared that the
institutions set up by him enabled the State to wield the maximum of power with the minimum of opposition.
Strangely enough, said the Professor, the very movement that threatened to undo all his work was in reality of the
greatest service. He referred to the movement of Meccanian Socialism or Social Democracy which owed its peculiar
caracter to a certain demagogue named Spotts. The career and influence of Spotts was for a time almost as
remarkable as Prince Bludiron's. Spotts persuaded his followers that the economic tendencies of modern life must
inevitably create the Socialist State. The people need only wait until these tendencies had worked themselves out
and then seize the power of the State, which would drop into their hands like ripe fruit. He saw in the existing State
nothing but organised Capitalism. Consequently he encouraged his followers to take no part in the actual
Government, but to maintain themselves in permanent opposition until the inevitable revolution came about, when
they were to assume the whole control. Spottsian Socialism became the universal doctrine of the Meccanian
proletariat of those days. They talked about the economic interpretation of history, about economic forces, about
economic revolutions, mixed with vague notions of Liberty and Equality. But in reality they cared not a straw for
Liberty; what they sought was Power. Yet by standing in permanent opposition to every other element in the State
they played into Prince Bludiron's hands. Whilst they waited for the inevitable revolution, he had accustomed the
people to prosperity; and had raised the prestige of the State at home and abroad. He had gained the support of all
the strongest elements in society, had trained an efficient bureaucracy and an efficient military aristocracy. And yet
at his death the followers of Spotts went on waiting for the economic revolution!

The Professor then dealt briefly with what he said was the most difficult period for a Meccanian historian, the
period between the death of Prince Bludiron and the rise of the still greater statesman, Prince Mechow. In that
interval no great leader arose, but a number of foolish statesmen who fancied they were cast in the mould of the
great Bludiron. At that time Meccania had commercial relations with the whole world, and was rapidly penetrating
every country with its peculiar culture. Its army and navy were growing in strength, and the temper of the people
was becoming restless and aggressive. They lacked the controlling hand of Prince Bludiron. They were carried away
by dreams of sudden world-conquest. Foolish statesmen allowed the country to be plunged into war with half the
world at once. The Meccanians performed wonders, but they could not perform miracles, and in the end the country
was reduced to great straits. Provinces were torn away. Its accumulations of wealth were exhausted; its manhood
was decimated. The situation was terrible, yet it was this tremendous ordeal that indirectly created the most
favourable conditions for the work of Prince Mechow.

During the war the Government had been compelled to take over, more and more, the control of every
department of life. Under the pressure of war the last vestiges of the obsolete doctrines of Individualism had
disappeared. Now that the war was over, the necessity for increasing all the means of wealth-production placed a
new power in the hands of the State. It was in these years of what was called 'Reconstruction' that Prince Mechow came to the front. Every one was depressed. The most conflicting views were expressed. Some people lamented that the whole work of Prince Bludiron had been destroyed. Others said it had been all a mistake, and that the nation ought to have followed the example of the rest of Europe. Some advocated hare-brained schemes of Internationalism,' as they called it.

Prince Mechow was one of the few who kept a clear head. He saw exactly where the blunder had been made. Meccania had ventured upon projects of world-conquest before completing the internal work of perfecting the Super-State on the foundations laid down by Prince Bludiron. He saw that we must go back exactly to the point where Prince Bludiron left off. But the first step was the most difficult. Prince Mechow was quite a young man, not more than thirty, and was only an Under-Secretary. He had one advantage in that he was a grand-nephew of Prince Bludiron and had the ear of the Emperor, who very soon made him Minister of the Interior, a post created to relieve the Chief Minister.

Professor Proser-Toady said we should obtain the clearest conception of Prince Mechow's views and the best key to his policy in a volume of correspondence with his cousin General Count Block. Count Block, like many of his military colleagues, was alarmed at the general confusion. He declared there was nothing for it but to sweep away all popular representative institutions, restrict education to the upper classes and fall back upon the direct rule of the military. Prince Mechow pointed out that such a policy would fail utterly: it would bring about the very revolution it sought to avoid. Efficiency could never be created by the military alone. Industrial efficiency was absolutely necessary to military power. He agreed in the main with Count Block's objects, but declared that his means were clumsy and inadequate. The work of Prince Bludiron must be continued by the creation of a Super-State. The term had already been coined, but the thing did not yet exist.

It is in Prince Mechow's clear conception of the Super-State that we see his intellectual genius, but it is in the steps he took to bring it into being that we realise his kinship with his famous predecessor, Prince Bludiron. Prince Bludiron had had to live from hand to mouth relying upon his statesman's instinct. Prince Mechow, even before he became Chief Minister, foresaw every detail of the structure he was determined to erect.

The State, he said, has hitherto done only what is forced upon it by necessity. It has never attempted to utilise the whole energies of the Nation. The Super-State will only come into being by uniting in itself the will, the knowledge, the wisdom, and the multifarious energies, of the whole people. The State has been merely the strongest organ of society: the Super-State must be the only organ, uniting all others in itself.

How was such a conception to be realised concretely? In explaining his plans he found ample illustration in the circumstances of the recent Great War. The State had not only controlled everything essential to the conduct of the war; it had not only regulated the manufacture of all supplies, including food and clothing for the whole nation, but had undertaken a thousand activities never previously dreamt of, except by the Socialists.

He proposed to capture the whole armoury of the Socialists by gradually seizing everything for the State itself. The motto of the Super-State must be Efficiency. But to be efficient the State must absorb all the persons who represented efficiency. The whole conception of Bureaucracy must be revolutionised by being carried to its logical conclusion. The efficiency of a business firm depends upon the efficiency of the persons composing it. The efficiency of the Super-State will depend upon the efficiency of the new Bureaucracy and the Military Class. There was no instance in history of an efficient Government being overthrown by any popular forces.

A century of industrial development had transformed the material world, whilst in the meantime the organisation of the State had almost stood still. The Super-State must borrow from the Socialists the conception of an all-embracing power and activity, and from the Industrial world the machinery for the execution of its will. The most efficient and successful business firms were those which got every ounce of work out of every member of the firm. The Super-State must not be less resourceful.

Now as to the methods, said the Professor. How was the State to absorb into its service all the energies of the nation, without at the same time becoming a Social Democracy? Already the Social Democrats, as in Prince Bludiron's time, were proclaiming that the Capitalist State was working out for them the Social Revolution predicted by Spotts; and as in Prince Bludiron's days so under Prince Mechow they went on waiting for the Social Revolution. They are waiting still. In the meantime Prince Mechow got into the saddle and began his practical reforms. He was a man of the most extraordinary energy and versatility. He was not content to begin with Education and wait for a generation. He attacked a dozen different problems at the same time: Education, Industry, Commerce, Railways, Finance, the Press, the Stage, the Professions, the Church--every side of national life received his attention; but the prime instrument through which he worked was the Bureaucracy. He laid it down as an axiom that the machinery of the State must work so smoothly that the people should be unaware of its operations.

There have been instances in history, he wrote in one of his letters, in which a Government has been overturned in a single day. How? By a perfectly planned coup d'etat. What can be accomplished on a single occasion can be
done as a part of the regular working of the State Machinery. Our Super-State must be capable of a coup d'état every day. Those of his friends who did not see the necessity for his reforms he silenced by showing them that if they did not capture the State the Social Democracy would do so.

During the first ten years of his regime he worked wonders. He renewed the State control of all the large industries. He took into the service of the State all the most capable business men and manufacturers, all the best scientists and engineers as well as the best administrators. The Censorship of the Press was continued and extended to every form of literature. He bought up all the big newspapers and drove all the little ones into bankruptcy. When every clever journalist was engaged on the State newspapers and all advertisements were controlled, there was not much room for an 'opposition' Press. The Schools and Universities were already well under control, but he revised the whole system. He made every teacher and every professor a direct servant of the State. Every textbook was revised. He paid particular attention to history, philosophy and literature. The new generation were thus educated in an atmosphere calculated to cultivate the true Meccanian spirit. Inspectors, organisers and directors of Education infused new energy into the system and trained the whole population to co-operate with the Super-State.

As to the proletariat, he saw to it that there was no unemployment. Production went up by leaps and bounds, wages were increased, but there was no waste. Goods that could not be disposed of immediately were stored, but methods of control and regulation were introduced to direct industry into the right channels. Whilst he controlled the wage-earners he at the same time controlled the employers. All surplus wages and profits were invested in the State funds.

Of course there was opposition to these reforms. The Military Class were slow to understand his methods, so he established periodical military councils, took them into his confidence and eventually won them over completely. As for the Social Democrats, he did not scruple to employ against them the same methods they would have employed against him. He made use of secret agents to preach the doctrine that by his methods the way would be prepared for the social revolution. When at length he inaugurated the system of the seven social classes the Social Democrats professed to see in this a means of stimulating class consciousness; but after a few years they discovered that no class was willing to surrender its privileges. The Fifth Class, which includes the most skilled artisans in Europe, began to see that no revolution would improve their position, whilst it might lower them to the level of the Sixth or Seventh Class. The boasted solidarity of the proletariat proved to be an illusion, like most of Spotts's ideas.

When he reformed the railway system he made travelling free. But of course if travelling were to be free, restrictions must be imposed. Similarly in regard to housing. He applied all the technical knowledge in the country to the problem. Standardised houses and other devices made it possible to rebuild any portions of our cities and to transfer population from one region to another with the greatest ease. On the other hand, restrictions were necessary. You cannot have free trade in houses and at the same time guarantee a house to every family.

I have condensed Dr. Proser-Toady's lecture, which lasted several hours, into such short compass that it gives very little idea, I am afraid, of the complete revolution worked out by Prince Mechow's reforms. For instance, he showed how the whole character of politics had been transformed, how the questions that agitated Meccania sixty years ago had entirely disappeared; how the Press no longer existed, because its functions had been absorbed by other agencies; how the Parliament, which I was surprised to hear still existed, was now organised to correspond with the seven social classes; how the State was so wealthy that control over taxation was no longer necessary.

He ended with a remarkable passage about the seven social classes and the national Meccanian uniforms. "Many Foreign Observers," he said, "in times past, have made merry over our sevenfold classification and our national costumes. What have other nations to put in their place? They too have these classes, for they are natural and inevitable. They have their nobles, their soldiers, their officials and professional men, their bourgeoisie, their artisans, their labourers and their degraded submerged tenth. But they are afraid to call them by their proper names, afraid to recognise them. They have no uniforms, no dignified and pleasing costumes; but you never mistake one class for another. You never mistake the labourer for the wealthy bourgeois or the popinjay aristocrat. Nowhere else, they say, would people consent to wear the servile badge of their caste. We Meccanians are proud of our seven national colours. So far from being a degradation, the historical origin of the costumes proves that it is a privilege to wear them. The seven uniforms were once the ceremonial dress of the seven guilds established by Prince Mechow. When permission was granted for all the members of the classes to wear the ceremonial dress it was the occasion of national rejoicings everywhere. The national costumes are part of the Ritual of the Super-State."

Long-winded as some parts of the lecture were, I must confess it was most illuminating, and to me, as a student of politics and sociology, exceedingly interesting. I begin to understand now what the Meccanian Super-State really is.

CHAPTER V
CULTURE IN MECCO
DURING the first few weeks of my tour in Mecco--Tour No. 4--Conductor Prigge kept my nose well to the
grindstone. At times he made me feel like a small schoolboy, at times like a prisoner in charge of a warder. It would be tedious to detail all the incidents of my daily rounds, or to describe everything in the exact order in which it was presented to my view. So I propose to set down, as they remain in my mind, the most interesting or remarkable features of this truly remarkable city. One circumstance, however, annoys and almost distresses me. I cannot get into contact with any individual living people. I see everything as a spectacle from the outside.

As I go about, the impression of orderliness, cleanliness, and even magnificence of a kind, is such as I have seldom felt in any part of the world. At times the whole city gives one the same sort of feeling that one experiences in going through a gigantic hospital, where everything is spotless and nothing is out of its place. I am even getting used to the coloured uniforms of the seven classes. In the central parts of the city green and yellow predominate; for the number of people belonging to the official class is enormous. Even apart from their actual number they are the most conspicuous, because the lower classes are at work in their factories and business houses, and are consequently seldom seen except when returning home in the evening. Occasionally I notice a few white uniforms (of the very select First Class) and occasionally, too, a crowd of officers in their brilliant scarlet uniforms. At the other end of the scale, the most common colour visible is the grey, worn by the numerous servants in the well-to-do quarters. The few servants who wear chocolate are mostly the lackeys of the very rich, and the upper servants in the large hotels.

On the day after Dr. Proser-Toady’s lecture, Conductor Prigge was more than usually "pedagogic." I wanted to look about the streets and ask questions about many things that occurred to me at the moment, but he insisted upon pouring out detailed information about the drainage system, the postal areas, the parcels' delivery areas, the telephone system, the market system, and so forth. What did interest me, however, was the organisation known as the Time Department, of which I had already seen something at Bridgetown.

There is, as I have said, an enormous number of public buildings in Mecco, but nobody can miss the gigantic office of the Time Department. It towers up, about seven stories high, over the surrounding buildings, and above it rises a great clock that can be seen for miles. In this central department alone, ten thousand people are employed—that is, of course, in addition to all those employed in the local offices of the Time Department in various parts of the country.

Conductor Prigge was tremendously proud of the Time Department. "Other nations," he said, "have never thought of establishing such an institution for themselves. They have not even had the intelligence to imitate ours. We Meccanians were the first to discover both time and space: our philosophers were the first to understand time and space: we have been the first Government to organise time and space. We can tell you," he went on, "the exact amount of time occupied by any person, or any group of persons, in doing anything. We know exactly how much time is devoted to eating and drinking, as well as the time required to produce a picture, or a piece of sculpture, or a poem, or a musical composition; or how long it takes to learn any language, or any subject of study."

"But," I said, "what about the time spent by all the clerks and officials employed all over the country, as well as here, in the Time Department itself; isn't it rather extravagant? What is the object of it all?"

"Do you think," he replied, "that we should keep up such an institution if it had not proved to be useful in the highest degree? Foreigners have such childish ideas of organisation," he continued. "This was one of the most brilliant inventions of Prince Mechow, but it has taken thirty years to bring it to its present state of perfection. It pays for itself over and over again, in the mere economy it effects; and it has other far-reaching effects on the whole social and economic life of the nation. In the first place, in the matter of material production, in every trade and occupation it enables us to speed-up scientifically. An increase of 1 per cent in the productiveness of the four main industries alone would more than pay all the expenses of the Time Department. We have increased productiveness all round by at least 20 per cent since the introduction of the Time Department; and although not all of this increase is due to the Time Department, we may safely reckon 5 per cent. We have done away with all the dawdlers in art, all the incompetent painters and novelists and poets. In connection with the Post Office we have been able to diminish the amount of time spent in writing useless letters by 50 per cent. Why, without the Time Department the Department for the Direction of Leisure would be helpless. In Education, how should we know the right proportion of time to be devoted to the various subjects, the right amount to recreation or amusement? And apart from economy, the aid given to the researches of the Sociological Department is simply invaluable. The efficiency of the Police Department is due in great measure to the Time Department."

"But," I inquired innocently, "is there no feeling of resentment on the part of the public at the somewhat inquisitorial methods of the Time Department?"

"Resentment!" he said, almost angrily. "Why should there be resentment?"

"At having to give an account of all that one does even in one’s leisure time?"

"But when everybody knows that we save millions a year by it, and when the State has decided that it is for the public benefit, and the obligation is imposed upon everybody; why should anyone raise objections?"

"Still," I said, remembering my unfortunate experience, "you find it necessary to inflict fines in order to ensure..."
compliance with the regulations about filling up the weekly diaries."

"Naturally. But perhaps you overlook the educative effect of having to keep the diary. The proper keeping of the diary is almost an education in itself." My conductor said this with such an air of finality that I thought it was not worth while to pursue the question further.

I was much amused by a conversation I had a few days ago on another subject. It was about five o'clock and I was feeling rather tired, so I proposed that we should have a meal in a restaurant, and then go to some place of amusement in the evening.

"You may return to the hotel if you are indisposed," said Prigge, "and rest there during the evening; or you may have a meal in a restaurant and resume your tour. But until we have completed at least the first week's tour of observation, you cannot possibly be permitted to visit any place of amusement, as you call it. Besides, such places as you probably have in mind, do not exist in Mecco. I have seen, in other countries, what are termed music halls, where a lot of so-called actors were making fools of themselves."

"Perhaps," I ventured to say, "you did not look at the performance from the right point of view."

"I see! You mean that I should have regarded these childish performances as illustrating the stage of mental culture of the people. From that point of view your music halls may be of some interest, just as the drama of foreign countries is of interest; but it is so very primitive."

"Primitive? In what way primitive?" I asked.

"Primitive by comparison with our highly developed drama. For example, all the foreign dramas I have seen are written in the narrative form, or rather, I should say, the drama is still in the chronological stage. We have left that behind."

"Indeed," I said, "I am afraid I can hardly conceive of drama in any other form."

"Exactly. You cannot understand. But our Meccanian culture is not exactly designed for the intelligence of foreigners. If you are specially interested in the subject of the drama--it is not one of my specialities, although of course I am not ignorant of the drama, no Meccanian is--I will introduce you to my friend in the Department of Public Amusement, which is a branch of the Ministry of Education and Culture. He will probably enable you in the shortest period of time--and that is always a consideration, although most foreigners are often quite oblivious of the time aspect of such matters--to understand the Meccanian drama, in so far as it is possible for a foreigner to understand it."

I thanked him, and he made a note in his pocketbook to remind him of his promise. "Perhaps you can tell me," I said, "how your people do amuse themselves, apart from going to the theatre; for they cannot go to the theatre every evening."

"I notice that, like all foreigners, you are more interested in amusement than in the serious aspects of life. You will receive full information at the proper time if you will avail yourself of my offer to take you to my friend Dr. Dodderer, the Sub-Controller of Public Amusements (Section B); but I do not mind giving you a few facts such as are common knowledge among all Meccanians."

"Well," I said, "take your commercial travellers, who must spend a good deal of time in towns away from home. What do they do in the evenings?"

"If you were to go to the Great Meccanian Library," he replied, "and consult the Reports of the Sociological Department for the last twenty years, you would be able to see exactly how all these persons have spent their time. But you would perhaps be surprised to find that the number of persons travelling about and staying away from home is very small. When you have studied our industrial and commercial system you will see that we require comparatively few commercial travellers. As to the way they spend their time, you must understand that in every town there are guilds of all the professions. Consequently, as every commercial traveller naturally wishes to improve his knowledge, he frequents the guild house, where he meets with other members of his profession and discusses matters of interest. If he comes from Mecco he will be welcomed, as the provincial members will be only too glad to learn anything from one who comes from the very centre of Meccanian culture. Also, he may wish to visit the local museums, or other cultural institutions. If not, he will attend either an outdoor or an indoor concert."

"The commercial travellers of Meccania must be quite unlike the commercial travellers of all other countries if they spend their leisure in the way you have described," I remarked. "You spoke of concerts," I continued. "I suppose music is still the most popular form of amusement in Meccania?"

"Neither the drama nor music are, strictly speaking, mere amusements," answered Conductor Prigge. "They may be so regarded in other countries, but not in Meccania."

"Then what are they?" I asked.

"They form part of our general scheme of culture," replied Prigge. "As you probably know, attendance at the theatre once a week is compulsory for all persons over eighteen. Those below eighteen attend the juvenile theatre as part of their school course in literature."
"Attendance compulsory?" I said. "But if Meccanians are so advanced in the cultivation of the drama, why should it be necessary to enforce attendance?"

"Perhaps it is not really necessary, but I doubt whether our scheme of dramatic culture could be carried out without strict regulation. For instance, there are some plays more popular than others. People would want to see these plays in great numbers and there would not be room for them; whilst the less popular plays would not be well attended."

"Just so," I said, "that is what one would naturally expect; and where is the harm?"

"Our scheme provides a succession of plays throughout the year, all designed as part of our culture, and if people were at liberty to pick and choose what they would see, and what they would not see, we should have no guarantee that they would have gone through the course."

"Would that matter," I asked, "so long as they were amused?"

"May I repeat that the Meccanian drama is something more than amusement," he replied testily. "You will learn more of this subject from Dr. Dodderer. We need not pursue it further."

"Then may I ask whether attendance at concerts is compulsory also?"

"It is not compulsory, but it is strictly regulated as regards the different grades of music," he answered. "I should like to know how you regulate attendance at concerts," I said; "I have never heard of it elsewhere."

"I daresay not," said Prigge. "Other countries are still in a very backward state as regards musical culture. In the first place, all persons below eighteen have to pass an examination in some branch of practical or theoretical music, unless they are defective in the musical sense. Then, before any adult is admitted to the first, second or third grades of concerts, he has to pass an examination in musical appreciation. That is to say, only those are admitted to concerts of the first class who hold a first-class certificate in musical appreciation, and so on with the other grades. Otherwise we should have people whose musical knowledge is very moderate listening to the best music by the best performers. By means of our system we can provide exactly the right standard of music at all public concerts. At the beginning of each season the programmes of all the concerts of the first three grades are issued. Each person enters his name for a course of concerts according to the grade of musical culture attained by him. He is informed how many concerts he may attend in the season; he then chooses which concerts he will attend, and after that there is no difficulty."

"No," said I, "I should think there would be no difficulty after such careful preparation. Then the open-air concerts in the beer gardens," I said; "where do they come in?"

"Those are not regulated in the same way. We can tell from the Time Department whether any person is spending too much time at these performances, and any person who neglects to pass his examination in musical appreciation before the age of thirty is forbidden to attend such concerts--if they can be called concerts--more than once a week."

"And is it possible to carry out such a regulation?" I asked.

"You have not studied our Time Department to much purpose if you ask such a question," answered Prigge. "I suppose, then," I said; "as I have no certificate I shall not be permitted to hear any of your best music?"

"Foreigners who are Doctors of Music of any University," replied Prigge, "are admitted by special leave of the Ministry of Culture to attend a specified number of concerts even of the first grade, and others can attend a few concerts of the third grade, likewise by special permission of the Ministry of Culture."

I think it was on the same day that Prigge said to me, "I notice you are not wearing your spectacles."

"I have never worn spectacles," I said.

"But you were ordered to wear spectacles by Dr. Pincher."

"He did prescribe them," I said; "but I have not troubled to get them, as I do not really require them."

Conductor Prigge looked positively aghast. "You must go at once," he said; "you have the address. You had better pretend that there has been some delay--but no, your diary will show that you have not been to the optician. You will certainly be fined in accordance with Regulation 127 of the Instructions to Foreign Observers."

I went accordingly, and in a few days I had the spectacles. I suppose this incident caused me to notice that nearly all Meccanians wear spectacles or eyeglasses. Some wear two pairs at once, and I have seen even three pairs worn. I felt thankful nothing wrong with my teeth had been discovered.

A day or two later I was taken by Prigge to see Dr. Dodderer. What I learnt from him was even more remarkable than what my conductor had told me, so I will not apologise for giving a fairly full account of my interview.

We were due at ten o'clock, and a whole hour had been reserved for me. As we entered his room he noted the exact time on his tablet and said, "The object of your visit is to learn something of the Meccanian drama, as part of the system of culture, and the relation of amusement to our system of culture. Very good; if you will be seated I will do my best to enlighten you."
He was a dried-up little man, with bright black eyes and a narrow but lofty forehead. I thanked him and prepared to listen. I knew he would think me disrespectful if I did not make use of my notebook, so I prepared to make copious notes.

When he saw I was ready, he sat with his eyes shut and his hands clasped together in front of him, and proceeded to pour forth a long discourse. He began by saying that all the higher animals showed some disposition towards play; and that, in particular, the human animal was pre-eminently distinguished in this respect. Some anthropologists had argued that the persistence of the play-instinct was a proof of the essential usefulness of play, in developing both muscular and intellectual power. He himself did not adopt this view, or, at any rate, only in a modified form. He held that play was one of the most wasteful methods of nature, and that if the competition between the various races and subdivisions of the human species had been perfect, the race that could reduce play to an absolute minimum, confined perhaps to the first three years of life, would--ceteris paribus--succeed in winning the foremost place. Play was certainly the least profitable form of mental activity, and one of the problems of education was the gradual elimination of play from the scheme of national culture. It was unfortunately true that even the best system of education had to make concessions to this instinct of play, and it would take many generations before it could be reduced to a minimum. But the experiments of the Meccanian psychologists had demonstrated that the amount necessary, both in the case of children and in the case of adults, had been grossly exaggerated in the past, and was still grossly exaggerated by other nations. These experiments would have been impossible without the assistance of the Time Department, and the absence of a Time Department in other countries probably accounted for the little progress they had made in this direction.

"For example," he continued, "other nations have almost entirely neglected the value of cultural toys. They have been content, even where they have given any thought at all to the subject, to devise toys which gave a little more opportunity for ingenuity, but their object has been mainly to amuse; they have had no clear conception of the ultimate purpose of toys in a complete cultural scheme. Now we have a carefully thought-out scheme, and although it does not come under my department, but under Section Ai, it affords a good illustration of the basis of our system. All our toys are classified in fifteen stages. We began with only five stages, but the number has gradually increased, for the system necessarily becomes more complex as it becomes more perfect. Stage I. is represented by simple objects which a baby can grasp and recognise before the age of eighteen months. Stage II. is represented by balls and cubes and objects of that order. Stage III. by dolls and images. Stage IV. by objects which can be grouped so as to afford a basis for the teaching of number. Stage V. by simple mechanical toys and simple tools. Stage VI. by constructive blocks of various kinds...."

Here, I am afraid, I became confused, but I remember that Stage XIII. was represented by toys which formed an introduction to chemistry, and that the toys of Stage XIV. could only be worked by boys whose mathematical knowledge was far in advance of what I should have thought possible. He explained that visits were paid by the domestic Inspectors of Child-Life to see that the parents made proper use of the system of cultural toys. There had been great difficulty at first, but the parents were now properly instructed; and in a short time there would be no need to instruct them, as they would have grown up in familiarity with the system.

"Other experiments equally valuable have been conducted in order to discover what forms of amusement are most profitable from the cultural point of view; these include experiments designed to improve production.

"For example," he continued, "other nations have almost entirely neglected the value of cultural toys. "I have been trying to show you the basis of our system of public amusement. With us, amusement is never an end in itself. We find a certain crude kind of interest in the drama, or shall I say in the theatre, in almost all peoples, and some of the greatest poets have utilised that interest in order to reach the minds of their hearers. The greatest poets are those who have conceded least to the mere instinct for amusement. We have followed the same principle. But we could not carry out this scheme of dramatic culture without first getting control over the theatre. Prince Mechow, with his usual insight, saw that it was useless to control and direct the Press, if he did not at the same time control and direct the Theatre. First of all he made the censorship a reality. Then he took all the most popular playwrights into the State service. Then he was able to weed out those who were incapable of entering into his purpose. Gradually all the theatres became cultural institutions of the State. All this took time, of course. Even now there are a few popular theatres where only the lower kinds of dramatic varieties are performed. Attendance at these is not compulsory."

"I do not yet understand," I said, "why it should be necessary to make attendance compulsory when the drama is so popular."

"For the majority of the people," replied Dr. Dodderer, "compulsion is quite unnecessary; but it is just those who are most in need of the culture that can be given through the medium of the drama who would be lax in their attendance. The whole subject has been investigated," he continued, "by the aid of the Time Department, and we are satisfied that we get the best results through our present system."

"Since your playwrights became Civil servants has there been no decline in the quality of your dramatic productions?" I asked.

"On the contrary," replied Dr. Dodderer. "Our modern plays are on a much higher level. There are several reasons for this. In the first place, in the old days the uninstructed public were hardly fit judges of dramatic or literary excellence. They often preferred plays of little cultural value. Consequently, the men who could write really good plays often found it impossible to get them produced. Our Board of Dramatic Criticism is now able to decide the merits of all plays, and the dramatists are quite independent of the caprice of the public. Also, we can carry specialisation to a point undreamt of in former times."

"Specialisation?" I said; "that is quite a new idea to me."

"Naturally, there are writers who have plenty of ingenuity in devising plots, but who are lacking in literary style; others who write excellent Meccanian, both prose and verse, but who are weak in the dramatic instinct. It is, in fact, very seldom that a modern Meccanian drama is the sole work of any single author. Moreover, the drama as developed by us lends itself particularly to specialisation. For example, most of our classical plays are presented in four phases. The simplest phase comes first. The subject is presented in chronological-dramatic form, somewhat resembling the dramas of other days and other countries. Next comes the analytical phase, and after that the synthetic. The last phase or act is a complete philosophical symposium in which the whole subject is presented in its highest and most abstract form."

"When you speak of the subject of a play, what do you mean exactly?" I asked.

"The old plays had often no real subject; they had titles, it is true, but these titles were mere names of persons, or mere names of places or incidents. What, for instance, can you make of a title such as Julius Ccesar? or The Emperor of the East? or Catherine? or The Tyrant of Genoa? or The Crime of Boniface? If you are acquainted with the development of the drama, you will know that about ninety years ago a great advance was made by means of what was then called 'The Problem Play.' Some of these plays had a real subject. We have gone much further, of course. Take the subjects of some of our best-known plays: Efficiency, Inefficiency, National Self-Consciousness. What was then called 'The Problem Play.' Some of these plays had a real subject. We have gone much further, of course. Take the subjects of some of our best-known plays: Efficiency, Inefficiency, National Self-Consciousness."

"Uric Acid!" I exclaimed; "what an extraordinary subject!"

"It is one of a series of medical plays," explained Dr. Dodderer, quite undisturbed. "The subject lends itself splendidly to the methods of Meccanian Art. The part played by uric acid in the life of the individual, the family, the State, treated physiologically, pathologically, sociologically, ethically and philosophically, is almost infinite in its possibilities, and Grubber has made the most of them."

"And do the public enjoy these medical plays?"

"You appear to be obsessed, if I may say so," replied Dr. Dodderer, "with the idea of enjoyment. You must bear in mind our standpoint, which I have already explained. But certainly the public take great interest in the medical plays. Sub-Dramatist Smellie wrote a series, Phthisis, Nephritis and Meningitis, which are almost equal to Grubber's Uric Acid, but he fails a little in the higher aspects of the subject, and consequently his fourth acts fall short of the highest philosophical perfection. I remember reading the proofs of his first play, Gall Stones. It was excellent until he came to the philosophical phase. It reminded me of an older play produced in the transition period, some fifty years ago, called The Blind and the Deaf. It had a considerable vogue for several years, but you see from its title that
the conception was not fully developed."

"These medical plays," I said, "are not the most typical productions of the dramatic genius of modern
Meccania, I suppose?"

"In some ways they are," replied Dr. Dodderer. "That is to say, they are almost peculiar to our country. But one
of our younger playwrights has developed the subject of economics in a way almost equally unique. His
Significance of Food, and his Insurance, and Distribution, are a mere introduction to his masterpiece, Value. A very
slight work on Inaccuracy, which was almost a farce, first attracted the attention of the Board of Criticism. They
refused to produce Inaccuracy in its original form, and he embodied it in a more mature work, Production, which
was the first of his genuine economic plays."

"I suppose, then, you have historical or at least political plays?"

"Historical plays are mostly performed in the juvenile theatres," he said. "I have very little to do with them.
They fall under Section A, and, as you know, I am the Sub-Controller of Section B," replied Dodderer. "But," he
continued, "we have a certain number of more advanced historical plays for adults. For instance, The Evolution of
Society, with its sequel, The Triumph of Meccania, are excellent historical plays. Political plays have become almost
obsolete, but there are still a few produced occasionally. The Principle of Monarchy is still quite a classic in its way,
and The Futility of Democracy is one of the most brilliant pieces of Meccanian satire. Obedience is another classic."

"It seems to me a very remarkable fact that your Sixth and Seventh Classes should be able to appreciate such
plays as those you have been describing," I said, "especially in parts of the country which cannot be so far advanced
as the capital."

"I do not say that they appreciate the drama in the same degree as the more educated classes; but you must
remember they have gone through a long course of training. You perhaps now appreciate our wisdom in making
attendance compulsory. Without regularity in attendance we could not arrange for a proper sequence of plays.
Also, I must admit that on the days when the Sixth and Seventh Classes are due to attend, we put on the less
advanced plays as a rule."

"What happens," I asked, "to the old plays which were written, say, a hundred years ago; are they never
performed?"

"Oh dear, yes," replied Dr. Dodderer; "the performance of such plays forms a regular part of the literature
course at all our Universities and Colleges. We also utilise quite a number of them in the courses of plays for the
Fifth, Sixth and Seventh Classes; but the form in which they are written is so simple and childish, such a contrast to
the ripe perfection of the fully developed Meccanian drama."

"It must be a difficult matter," I remarked, "to arrange for progressive courses of plays for so many people as
you have in Meceo."

"On the contrary, the larger the city the easier it is. Members of the Third Class and, of course, of higher
classes, are considered capable of appreciating all kinds of plays. Class Four consists of four grades, and the two
higher grades, all the members of which are over thirty, are likewise eligible to attend any plays. We have a very
simple plan of classifying all the others. At the age of eighteen they are all at liberty to attend plays which are
classed as Stage I.; then after six months any one is at liberty to apply for a certificate entitling him to attend plays in
Stage II. After another year they can obtain a certificate for Stage III.; and so on. We seldom refuse an application,
and in fact we rather encourage our people to advance, otherwise many people would be content to remain in Stage
II., or Stage III., all their lives. Then, at the beginning of each season, we know how many to provide for in each
class, and at each stage; and the greater the number of theatres the easier it is to arrange the plays accordingly."

"What about the actors?" I asked. "In most countries the leading actors are very much sought after, and can
make large fortunes. I should imagine your system does not allow of that kind of career for a successful actor."

"All our actors," replied Dr. Dodderer, "are trained in the Imperial Meccanian Dramatic College. The lower
grades belong to the Fifth Class, the higher grades to the Fourth. The technique of acting has been brought to such
perfection that the 'star' as he used to be called, has entirely disappeared. There is no room for him in our system.
The 'star' was a mere product of popular enthusiasm."

"How do you judge, then, of the popularity of any particular actor?"

"We take no account of it at all," replied Dr. Dodderer. "Our expert Board of Dramatic Criticism determines the
standing of each actor. We have, of course, expert psychologists, who are able to test the particular psychological
effect both of each phase of the play and of the impression made by individual actors. Their experiments are of great
value both to our dramatic managers and to the writers of plays."

At this point Dr. Dodderer announced that the hour he had reserved for me was at an end.

CHAPTER VI
MORE CULTURE IN MECCO
I RETURNED to Conductor Prigge and my daily grind. But as most of this first period was spent in visiting
systematically a number of institutions similar to those I had seen in Bridgetown, but on a larger scale, it is hardly necessary to describe them here. For instance, the arrangements for receiving and distributing food are on the same principle: the markets are managed in the same way. The general system of shopping is the same, except that, as the city is much larger, there is very much more’ shopping by post.’ As the shops are not permitted to display anything in shop windows, nor to advertise except in the trade gazettes and catalogues, there is not much incentive to spend time in desultory shopping. The great Stores are more like warehouses than shops. I had gathered from my conversations with Sheep that the State seemed to place obstacles in the way of personal expenditure, and yet at the same time production was encouraged. Sheep’s explanations had not seemed to me entirely satisfactory, so I decided to question Prigge on this interesting point. As his services were charged for at double the rate of Sheep’s, I thought I ought to get more complete information from him. So one day I said to him >"How is it that in Meccania, as far as I can judge, you have brought production to such a pitch of perfection—I mean as regards the enormous quantities manufactured—whilst at the same time you seem to restrict expenditure or consumption in so many ways?"

Prigge tilted back his head and put on his professorial air.

"Such a question would be better dealt with when you come to make a definite study of our National Economy, but as it is really quite an elementary question—a commonplace of all our textbooks— I do not mind explaining it briefly now. Your first error is in supposing that the State encourages production indiscriminately. We produce what we require and no more, but we are able to measure our requirements better than other nations. In other countries people are allowed to buy a lot of things they do not require; this causes unnecessary production, of course. Unregulated consumption gives rise to unregulated production."

I still felt puzzled as to what became of the wealth produced by the wonderfully efficient system of wholesale production, for, as far as I could tell, the people seemed less luxurious in their habits than those of countries far less advanced in machine production. But I felt I should be getting on dangerous ground, and forbore.

The commercial quarter, in which we spent a whole day, was remarkably small for so large a city, especially considering that the city is not commercially self-contained. But I learnt that Mecco is not really the commercial centre of Meccania. The merchants are little more than the agents for the distribution of goods. The quantities are largely fixed by the Department of Industry and Commerce, consequently there is not much room for enterprise, except in effecting economies in distribution, in bargaining with the Government as to the kinds of goods to be produced, and in discussing with manufacturers matters of detail as to patterns and styles. For example, the Schools of Art produce every year designs for cloth for women’s dress. The merchants select from these the patterns to be manufactured. There is little excitement in a merchant’s career. Most of the clerks seem to be occupied in the preparation and revision of catalogues, which are the substitute for advertisements. No new article can be produced until it has been approved by the Improvements Section of the Department of Industry and Commerce.

All this side of the life of Meccania was very tame and stereotyped. Prigge discoursed at length on the merits of the Post Office and all its works, but the only remarkable thing I noticed about it, besides the censorship of letters, and the enormous number of people employed, was the ingenious arrangement whereby a conversation carried on in any part of Meccania could be overheard at the Central Office.

The absence of life and bustle in the streets was as striking as in Bridgetown. Most of the people in the Government offices belonged to the Fourth Class, and as these all lived in the two quarters running north and south of the central ring, they could reach their offices in a very short time. The midday meal was taken in a canteen within the office. The few inferior employees, messengers, porters, cleaners, etc., who belonged to the Fifth or Sixth Class, lived almost as near. The higher Civil servants of the Third Class, who of course were less numerous, did not make a crowd in the street. The green uniforms of the Fourth Class were the most conspicuous object everywhere. The industrial classes, living as they do on the side nearest the industrial town, are transported by an ingenious system of trams and underground and overhead railways, so that in half an hour they can all get from their homes to their work, where they remain all day. All goods arriving from the industrial town for distribution to the Stores are carried by a regular service of motor-vans. The distribution of goods to houses is so systematised as to require comparatively few vehicles. For instance, certain kinds of goods can be delivered only once a month for each household, others only once a week. Consequently one sees a perfectly regular stream of traffic, which is never very dense and never congested. All this might have been very interesting to a student of municipal socialism and mechanical organisation, but my chief interests lay in other directions, and it was not until we came to the cultural institutions that I found things so remarkable, at any rate from my own point of view, that I shall make no apology for describing them with some fullness here, even at the risk of being tedious to those who think more of locomotion than of liberty, or who regard the Post Office as the highest symbol of civilisation.

I had looked forward with some curiosity to my first visit to a Meccanian Art Gallery, for, as I had not been into any private houses, and as there are no shop windows, I had seen hardly any signs of Meccanian Art Culture, except in Architecture. The decorative work in the public buildings did not impress me favourably. It was Patriotic
was placed together as if the gallery were a collection of butterflies. "Madonnas" together in another, all the "Adam and Eves," all the "Deluges," all the "Susannas," all the pictures. They were arranged strictly according to subject. All the "Nativities" were together in one room, all the pictures which are soundly Meccanian in spirit but which do not come up to the standard of the Great Gallery."

On four days in the year. For them we have a few local galleries, as we have for the Sixth Class also, containing pictures which are soundly Meccanian in spirit but which do not come up to the standard of the Great Gallery."

The Great Meccanian Gallery, he said, was the temple of all that was sacred in the aesthetic world. I must be properly prepared for it, so that I could concentrate my attention upon what I saw and not be distracted by having to ask questions about extraneous matters. If I would pay careful attention he would describe the general arrangements.

"The Great Meccanian Gallery," he said, "is one of the four galleries in Mecco; the other three are subsidiary. The first gallery is devoted to the old historical collections that existed before the time of Prince Mechow, and contains only foreign pictures. The second gallery contains Meccanian pictures of a date previous to the foundation of the Great Meccanian Gallery by Prince Mechow. The fourth gallery contains foreign pictures contemporary with those in the Great Meccanian Gallery. And now we come to the Great Meccanian Gallery itself.

"Every picture in that gallery is an expression of the Meccanian spirit; otherwise it is not admitted. Its technique must also satisfy the Board of Art of the Department of Culture. Consequently, as soon as you enter you are in the atmosphere of pure Meccanian Art. Previous to the creation of this gallery, the influence of Art was rather de-nationalising. The aesthetic sense was cultivated in total ignorance of the possibility of marrying it to the Meccanian spirit. The Meccanian spirit is the active, creative male; the aesthetic sense is receptive, conceptive, essentially female. Of the two, Meccanian Art is born."

He went on in this style for several minutes until I thought I had better get something more definite from him for my guidance. So I said, "How does one tell whether a picture is an expression of the Meccanian spirit?"

"To the true Meccanian, all things truly Meccanian are sacred, and by the inward cultivation of the sense of reverence for what is most characteristically Meccanian he arrives at a certainty which is incommunicable to others."

"But suppose opinion is divided. Suppose, for example, one man says, here is a picture which is full of the Meccanian spirit, and another man says the contrary."

Musch smiled in a sad, superior way, by which I saw that after all, in spite of his 'decadence,' he was a true Meccanian. "You are evidently not well acquainted with either Meccanian history or philosophy," he said. "Even our early philosophers taught that the Meccanian spirit must embody itself in institutions or it would evaporate. The Imperial Meccanian Academy is the visible embodiment of the highest manifestation of the Meccanian aesthetic spirit. All Meccanian artists are trained under the influence of the Academy. Its judgment, as expressed by the Central Board, is infallible. None of its decisions has ever been reversed. I do not think you realise how completely the influence of the Academy has moulded the Meccanian appreciation of Art during the last generation," he went on in his slow, soft speech. "You have heard something from my friend Dr. Dodderer of the care taken by our all-benevolent Super-State in the cultivation of the appreciation of the Drama, and you have probably heard something too of our musical culture. Other forms of Art are equally sacred, since they are all Meccanian. Every person in the Fourth and higher classes goes through a course of art appreciation, which extends over several years. No person is admitted beyond the fifth stage of the Great Meccanian Gallery unless he has passed the advanced test. Attendance at the gallery is compulsory, once a fortnight, for all persons of the Fourth and Third Classes between the ages of fourteen and twenty-five. The Fifth Class are not admitted to rooms beyond Stage III, except by special permission on four days in the year. For them we have a few local galleries, as we have for the Sixth Class also, containing pictures which are soundly Meccanian in spirit but which do not come up to the standard of the Great Gallery."

Presently we proceeded to the gallery containing the old historical collection. Musch said that we should see what we wanted of this in an hour, in fact it was rather a formality to visit it, but the Regulations for Foreign Observers made it necessary that I should see this first. It turned out to be really a fine collection, such as I had seen in many others parts of Europe; but I almost gasped at the strange freak which had inspired the curators in arranging the pictures. They were arranged strictly according to subject. All the "Nativities" were together in one room, all the "Madonnas" together in another, all the "Adam and Eves," all the "Deluges," all the "Susannas," all the "Prodigal Sons," all the "Venuses," all the "Bacchuses;" whatever the subject, every picture relating to that subject was placed together as if the gallery were a collection of butterflies.

Musch took no interest in this collection. It was all dead, he said, obsolete, pre-Meccanian, untouched by the
spirit. When we came to the second gallery containing the older Meccanian pictures he showed more interest. Some
painted three centuries ago I thought very fine, but Musch said they were lacking in self-consciousness. The
Meccanian spirit was overlaid by false foreign culture. Only when we came to some weird and powerful but almost
revolting pictures, dating from the beginning of the century, did he grow enthusiastic. These, he said, were the
genuine precursors and pioneers of Meccanian Art.

It was afternoon when we entered the first section or stage of the Great Meccanian Gallery. This was the first
stage for young persons, and was divided into a section containing elementary general pictures, and another
containing historical pictures. The general pictures were mostly scenes of places of interest in various parts of
Meccania, or national customs and public ceremonies. The technique was distinctly good. The historical pictures
mostly represented wars against foreign enemies. I noticed that the Meccanians were represented as heroes, and their
enemies as brutalised hordes of semi-lunatics. Others represented Meccanians discovering all the arts of peace and
war. I spent a dreary day and more, working painfully through Stages I., II. and III., up to XIX., until, on the third
day, we came to the most advanced specimens. These reminded me of Dr. Dodderer's account of the Meccanian
drama. There was a number of allegorical subjects--"The Birth of the Meccanian Spirit," "The Victory of Time over
Space," "The Festival of Chemistry," "The Nuptials of Science and Force," "The Conquests of Culture." Others were
more mystical--"War the Servant of Culture," "The Deity instructing Monarchy," "The Eternal Principle of

Some of these were immense canvases forty feet long, full of life-size figures drawn with microscopic
exactness. The artists had certainly managed to catch and even accentuate the Meccanian features of every face. I
felt the Meccanian atmosphere, but I still could not understand why such careful cultivation should have been
required to produce this extraordinary collection. I would gladly have given the whole gallery for a few masterpieces
from the old collection.

I could not imagine that any effect produced on the mind even of patriotic Meccanians could be worth all the
trouble spent upon either the creation of the gallery itself or the organisation of artistic culture that centred round it. I
was therefore curious to see what sort of effect the sight of the pictures had upon other visitors. In one of the lower
rooms I had seen some groups of schoolgirls accompanied by a teacher. They all had their notebooks, and were
taking down notes in shorthand. Musch explained enthusiastically that these girls would spend a whole afternoon on
half a dozen pictures, and that by the time they were twenty years of age they would have studied every picture up to
Stage XIX. in the gallery. What I overheard from the teacher's lecture was something like this: "Now let us analyse
the colour scheme. By the aid of the colour divider you perceive at once the proportions in which the colours are
distributed. Now notice that red, which occupies only 7 per cent of the canvas, is more conspicuous than green,
which occupies more than 25 per cent." I did not catch the next passage, but presently I heard: "All the pictures by
the same artist have the same distribution of colour. Consequently it would be possible to determine by an analysis
of the colour scheme the authenticity of any picture by this artist. Next notice the method of the brush strokes. Under
the microscope "(here the microscope came into play) "you will see the characteristic quality of the brush stroke. It
has been already ascertained that in this picture there are 5232 down-strokes of an average length of 3 millimetres,
1079 strokes from right to left of an average length of 1 1 millimetre, only 490 from left to right, and 72 upward
strokes. The same proportion of strokes has been discovered in several other pictures by the same artist, according to
the size of the picture. This picture was painted in exactly 125 hours. The quantity of paint used must have been
almost exactly three-quarters of a litre, so you can make a calculation to ascertain the number of brush strokes to the
litre."

In another gallery I noticed some superior young men of the Fourth Class in their green uniforms, discussing
the merits of a popular artist. One of them was saying, "And I maintain that his morality is pre-Meccanian; he lacks
super-masculinity." In another room a few stolid citizens of middle age were slowly making a pilgrimage. I
wondered why they did not move faster and get it over, until I discovered there was a rule that, at each visit, non-
students were not allowed to spend less than half an hour in one room, or more than three-quarters of an hour. This
regulation did not apply to me so long as I was under the charge of Musch, who had access to the whole gallery.

I found Musch a less desirable acquaintance than Prigge. I suspected him of being addicted to drugs, and
wondered how far his enthusiasm for the Meccanian spirit was an official pose; for, after completing my visit to the
Great Gallery, I was asking him whether all artists were employed by the State, and whether there were not other
types of pictures produced, besides those represented in the Great Gallery, when he began to tell me of another
phase of art.

"All artists," he said, "who in the seventh year of their training are accepted by the Academy are employed
permanently by the State; the others are found other employment according to their capacity, but are not permitted to
produce pictures."

"I suppose," I said, "the artists who are taken into the service of the State are controlled in some way. What
happens, for instance, if they turn out to be idlers?"

"They are certainly controlled. The Board selects the subjects for the year, for each artist, according to his capacity. Of course he may suggest subjects too, but until they are approved he is not allowed to proceed. He must also submit a plan or sketch of his proposed treatment."

"And is a painter not allowed even in his own leisure to paint subjects of his own choice?"

"Ah, there you touch upon an interesting subject," replied Musch, with something like a leer. "The Board are naturally desirous of preserving the Meccanian spirit in all its purity, but the effort to rise to the sublime heights of emotion which that demands, produces a reaction, and many of our artists find an outlet for this, so that beside the pure stream of Meccanian Art there flows, as it were, another stream."

"In other words," I suggested, "they carry on an illicit production of works of a lower ethical quality, which can only be disposed of by being sold to the rich."

"Your intuition is remarkable," he replied.

"Not in the least," I said. "One only requires a little knowledge of human nature to see what must happen. But how does this practice escape the attention of the Super-State?"

"There are many patrons of Art among the higher official class," replied Musch significantly.

"Perhaps you can tell me," I said, "something which has puzzled me ever since I came here, and that is--Why your Super-State occupies itself so meticulously with such things as Music, and the Drama, and Art. Such interests seem rather foreign to the main purpose for which, as I understand it, the great statesmen who have made Meccania what it is, designed it."

"I have often wondered the same thing myself," replied Musch. "I can only say that if all this side of life were left unregulated, the life of the State would be incomplete. Sooner or later the consciousness of the State must embrace all things."

I said no more, and this was the last I saw of poor Musch, for next day he was ill, and I was taken by another Sub-Conductor, whose name was Grovel, to see the Mechow Memorial Museum. Almost everything in Mecco is a sort of memorial or reminder of Prince Mechow. Mechow Street, Mechow Square, the Mechow Monument, Mechow Park, the Mechow Palace, Mechow Hotels meet one at every turn. There are even Mechow whiskers, of a pattern seldom seen outside Meccania, but immensely popular among middle-aged officials of the Third and Fourth Classes. Curiously enough, I learnt that the higher officials rather resent the wearing of this style of whisker by subordinate officials, but as it is a sort of symbol of loyalty it is not considered proper to repress it.

The Museum is near the square and is the largest biographical museum in existence. It contains a model of the house Prince Mechow was born in, with all his clothes and toys, all the schoolbooks he used, and models of all the rooms he lived in, including his bedrooms. One room contains all the letters he wrote, all the letters written to him, all the minutes he wrote as a Civil servant, the very pens he used, the office furniture, etc. etc. The library contains not only the books he read, and the few he wrote, but an enormous number of books and pamphlets written about him personally and about all his work.

Besides his printed speeches, which run into many volumes, there are phonographic records of them, which are 'performed' daily in a special hall, to youths and girls from the High Schools.

One large room contains models of all the towns in Meccania, as they were before his reforms and as they are now. Another room is devoted to the great Monument. It contains the original plans and models, as well as a model of all the copies erected in various towns. Adjoining this room is a large collection of photographs of Prince Mechow, casts of his face and waxwork models of him as he appeared on several great historical occasions. One case in the library struck me as very characteristic. It was a series of volumes in folio, sumptuously bound. The first was entitled Prince Mechow as Statesman; and there were at least thirty others with such titles as Prince Mechow as Subject, Prince Mechow as Conservative, Prince Mechow as Reformer, Prince Mechow as Student, Prince Mechow as Author, Prince Mechow as Orator, Prince Mechow as Philosopher, Prince Mechow as Husband and Father, Prince Mechow as Agriculturist, Prince Mechow's Taste in Art, Prince Mechow's Taste in Music, Prince Mechow's Taste in Literature, Prince Mechow's Taste in Nature, Prince Mechow's Loyalty, Prince Mechow's Generosity, Prince Mechow's Pets, Prince Mechow's Religion.

CHAPTER VII
A MECCANIAN APOSTLE

It was a week or two after my visit to the Mechow Museum that I made the acquaintance of one of the Foreign Observers who was staying at the hotel. A day or two before, I had been sent for by the Hotel Manager, and had been presented with a small certificate authorising me to take my meals in the common dining-room, and to converse with other foreigners whose names I was instructed to enter in my diary. I had previously noticed a certain gentleman from Luniland whose face seemed familiar to me. On this particular evening he came across to my table
and introduced himself as Mr. Johnson, a friend of Mr. Yorke, in whose house I had stayed and where he had met me. We soon fell into conversation, and when dinner was over we retired for a long chat to a corner of the smoke-
room. It appeared that he had been in Mecco over a year, and had travelled also in various parts of the country. In
fact, this was his second visit, he said, his first having been made a few years before. He was a man of about forty-
five, tall and slim, with a rather large bony nose and a grave but kindly expression. His manner was quiet and
dignified, and at first he spoke with a certain obvious restraint; but afterwards he became more genial and was rather
humorous, after the manner of many of his countrymen.

"I should rather like to ask what you think of this country, but it would hardly be fair, because the chances are
that every word we say here is overheard. I always suspect they have one of those beastly contrivances fixed in the
walls, to enable the manager or somebody representing the Authorities to listen to everything that goes on. I don't
much mind if they turn me out of their precious country, but I wouldn't like to get you into trouble. Anyhow, I
believe if we were to begin talking in my language, which I remember you speak very well, we should presently
have somebody round reminding us that it is against the rules."

"Yet you have spent quite a long time in the country apparently," I remarked. "I have really been wondering
whether to stay here much longer, and perhaps you could give me some tips if I decide to stay."

"Well," he replied, "it's just a matter of taste whether you like the country. I shouldn't be able to stand it but for
one thing."

"And what is that?" I asked.

"It enables me to thank God every hour that I am not a Meccanian."

"Yes," I said, "there's something in that. I myself object to some of the inconveniences that these numerous
regulations about everything entail, but they are nothing, I suppose, compared with what it would feel like if one
expected to spend one's life here."

"It's just possible they really like it. But what sort of tips were you thinking of? Perhaps I know the ropes a
little better than you, if you have been here only a month or two."

"Well, there are two things I would like to know," I replied. "I am rather tired of being 'conducted' about
everywhere. That's the first. And I want to get to know individual people as I did in Luniland. Here, so far, I have
met only officials, always on duty. It seems impossible to get into contact with real live people. Until lately, as you
know, I was forbidden to talk to the people staying in the hotel; but now that I have got over that difficulty,
although, no doubt, I can pick up a certain amount of information from my fellow Foreign Observers and enjoy their
conversation, I am no nearer getting to know the Meccanian private citizens themselves."

"And do you particularly want to know them?" asked Mr. Johnson.

"One naturally wants to know what the people of any country are like, and unless one has some fairly intimate
intercourse of a social kind with people of different ranks and types, one might almost as well stay at home and read
the matter up in books," I replied.

"I see. You are a genuine Foreign Observer. Well, to tell the truth, so am I," he said more confidentially. "I am
not here because I like it. I detest the whole lot of them. I came here for the first time five or six years ago. I had
heard a lot about the country and its wonderful organisation. Organisation! Blessed word! I had also heard some
rather tall stories, and thought the accounts had been exaggerated. I came with an open mind. I rather prided myself
on being an impartial observer. I was prepared to allow a lot for the natural differences of taste between one nation
and another. At first I was so keenly interested that I didn't mind the little restrictions, but when the novelty had
worn off, and I began to realise what it all meant, I determined to make a more thorough study of the country than I
had at first thought would be worth while. So I am here now studying Meccanian education. Now the only way, so
far as I know, of getting rid of your everlasting' conductors' is to get permission to study some special subject. I went
through just the same experience. I was what they call merely a' general' observer. The Authorities don't exactly like
the 'general' observer. They can't find it in their hearts to let him alone. As they regulate their own people they must
keep as close a watch on the foreigner. As he doesn't fit into their system, they have to invent a system for him. It is
troublesome to them, and not very pleasant for the foreigner; but Meccanian principles make it necessary. However,
if you can satisfy them that you are a bona fide student of some special subject â€” it doesn't matter what it is, you
may choose anything from the parasites in the intestines of a beetle to the philosophy of the Absolute--they will treat
you quite decently, according to their lights."

"How do you account for this difference?" I asked.

"They are immensely flattered by the notion that if you come here to study anything, it must be because their
knowledge is so superior to what can be found elsewhere. However, if you want to get rid of the daily worry of a'
conductor,' that is what you must do. But you must be a specialist of some sort, or they won't admit you to the
privilege."

"But there is no special subject I want to study," I said. "I am just a 'general' observer, and if I undertake to
study a special subject I shall miss seeing what I most want to see."

"That is a difficulty. Perhaps you had better go on as you have been doing, and when you have had enough of
that, go in for some political institutions; they have got you registered as a National Councillor, so you can pretend
to study the working of the Constitution or some such thing."

"That's rather a good idea," I said; "but, judging from what I have seen, I should doubt whether they will let me
see what I want to see."

"Why, what do you want to see?"

"Just what I cannot get from an inspection of the machinery of the State--the effect of the laws and customs on
the actual life of the people."

"Ah, that you will have to get by the aid of your imagination."

"But," I suggested, "is it not possible to get permission to live in some family, or with several different families
in different classes in succession?"

"Oh yes," replied Johnson, "quite possible, if you are prepared to go through all the necessary formalities; but I
doubt whether you will get much by it. You see, each family is a sort of replica, in miniature, of the State. They will
have to report to the Police once a week upon all your doings. Every word you say will be listened to. They will be
studying you, just as you will be studying them. I have tried it. There is no natural intercourse in this country. Try it
if you like, but I am sure you will come to my opinion in the end.

"Don't forget to enter the time of this conversation in your diary," Mr. Johnson said as we parted. "If you make
a mistake, or if I make a mistake, we shall have an interview with an inspector from the Time Department, and the
hotel manager will worry us to death about it."

The next day I resumed my tour of observation with a new' conductor' whose name was Lickrod. He was
almost affectionate in his greeting when we met at the Police Office, and we had not been long together before I
recognised that he was a different type from Prigge, or Sheep, or any of the others I had met. He was to take me to
see the Industrial town, and he was full of enthusiasm for everything we were to see. As we went along in the tram
he explained rather effusively that it was a great pleasure to him to meet foreigners. He had a mission in life, just as
Meccania had a mission among all the nations. He was a loyal Meccanian â€” in fact, he yielded to no man in his
loyalty to the State; but for that very reason he ventured to criticise one defect in the policy of the Government. I
began to wonder what that could be.

"I have travelled abroad," he said, "and I have seen with my own eyes the benighted condition of so many
millions of my fellow-creatures. I come home, and I see everywhere around me order, knowledge, prosperity,
cleanliness--no dirt, no poverty, no disorder, no strikes, no disturbance, no ignorance, no disease that can be
prevented--Culture everywhere. It makes me almost weep to think of the state of the world outside. We have not
done all that we might have done to carry our Culture abroad. We have kept it too much to ourselves. In my humble
way, as a Conductor of Foreigners, I take every opportunity I can of spreading a knowledge of our Culture. But
instead of a few score, or at most a few hundred, foreigners every year, we ought to have thousands here. Then they
would become missionaries in their own countries. I always impress upon them that they must begin with the reform
of education in their countries; and I would advise you, before you return, to make a thorough study of our system of
education. Without that you cannot hope to succeed."

"But," I suggested, "if other countries followed your example would they not become as strong as you? Perhaps
your Government looks at it from that point of view."

"There are, on this question," he observed sagely, "two opposite opinions. One is that it is better to keep our
Culture to ourselves; the other is that we ought to teach other nations, so that ultimately all the earth can become one
great and glorious Meccania."

By this time we had arrived at the entrance to the Industrial town. Conductor Lickrod broke off to note the time
of our arrival, and to lead me into the office of the Governor or Controller of what, for convenience, I may call
Worktown. Indeed the Industrial quarter is known by a similar term in Mecco. This Controller is responsible for the
preservation of order; but as there is no difficulty about discipline in the ordinary sense of the word, his functions are
rather to promote a high standard of Meccanian conduct among the workers of all ages and grades. In this work he is
assisted by scores of Sub-Controls of Industrial Training, as they are called.

The organisation of the Controller's Department was explained before we proceeded to any of the works. There
was a large room filled with thousands of little dossiers in shelves, and card-index cases to correspond. The
particulars of the character and career of every worker in the town could be ascertained at a moment's notice. All the
workers were either in the Fifth or Sixth Class, but they were divided into more than a dozen subgrades, and the
card-index showed by the colour which of the many grades any particular person had attained.

I asked how the workmen were engaged.

"The industrial career of a workman," said Lickrod enthusiastically, "begins, if I may so express myself, with
the dawn of his industrial intelligence. In our schools—and here you perceive one of the perfections of our educational system—our teachers are trained to detect the signs of the innate capacity of each child, and to classify it appropriately. In 70% per cent of cases, as you will see from the last report of the Industrial Training Section of the Department of Industry and Commerce, the careers of boys are determined before the age of thirteen. The rest is merely a question of training. By a proper classification we are able to adjust the supply of each different kind of capacity to the requirements of our industry.

We avoid all the waste and uncertainty which one sees in countries where even the least competent workmen are allowed to choose their employment. We guarantee employment to everybody, and on the other hand we preserve the right to say what the employment shall be."

"Does that mean," I asked, "that a workman can never change his employment?"

"In some of the more backward parts of the country it is sometimes necessary for workmen to change their employment; but here, in Mecco, we should think we had managed our business very badly if that were necessary."

"But without its being necessary, a man might wish to change. I have heard of many cases, in Luniland and Transatlantica, of a clever and enterprising man having risen to eminence, after an experience in half a dozen different occupations. Here, I understand, that is impossible."

"Ah," replied Lickrod, "I see you have not grasped the scientific basis of our system. You say such and such a person rose to eminence, shall we say as a lawyer, after having been, let us say, a printer or even a house-painter. If there had been a sufficient supply of good lawyers it is probable that he would not have succeeded in becoming an eminent lawyer. Now, we know our requirements as regards lawyers, just as we know our requirements as to engineers. We have also the means of judging the capacity of our young people, and we place them in the sphere in which they can be of most service."

I thought I could see holes in this theory, but all I said was, "So you think of the problem from the point of view of the good of the State, regardless of the wishes of the individual."

"Certainly of the good of the State; but you mistake the true meaning of the wishes of the individual. The apparent wish of the individual may be to follow some other course than that which the State, with its fuller knowledge and deeper wisdom, directs; but the real inward wish of all Meccanians is to serve the interests of Meccania. That is the outcome of our system of education. We must talk about that some other time, but just now I want you to see that our system produces such wonderful fruits that it never enters the head of any Meccanian workman to question its wisdom."

We entered a gigantic engineering works, full of thousands of machine tools. Everything appeared as clean and orderly as in the experimental room of an engineering college. Some of the workmen wore grey-coloured overalls, showing that they belonged to the Sixth Class, but most of them wore the chocolate uniform of the men of the Fifth Class. These were evidently performing highly skilled work. Even the moulding shops were clean and tidy, and the employment of machinery for doing work that elsewhere I had been accustomed to see done by hand astonished me. The workmen looked like soldiers and behaved like automatons. Conversation went on, but I was informed by Lickrod, again in a tone of pride, that only conversation relative to the work in hand was permitted. Here and there I saw a man in a green uniform, applying some mysterious instrument to one of the workmen. I asked Lickrod what this meant.

"That is one of our industrial psychologists, testing the psycho-physiological effects of certain operations. By this means we can tell not only when a workman is over-fatigued, but also if he is under-fatigued. It is all part of our science of production."

"What happens if a man is under-fatigued persistently?" I asked.

"He will have to perform fatigue duty after the usual hours, just as he would in the army," he answered.

"And do they not object to this?"

"Who?"

"The workmen."

"Why should they? The man who is guilty of under-fatigue knows that he is justly punished. The others regard the offence as one against themselves. It is part of our industrial training. But we have indeed very few cases of under-fatigue in Mecco. You know, perhaps, that all our citizens are, so to speak, selected. Anyone who does not appreciate his privileges can be removed to other cities or towns, and there are thousands of loyal Meccanians only too eager to come to live in Mecco."

One of the most remarkable industries I saw carried on was the House-building Industry. The plans for houses of every kind, except those for the Third and higher classes, are stereotyped. That is to say, there are some forty or fifty different plans, all worked out to the minutest detail. Suppose ten houses are wanted in any particular quarter, the Building Department decides the type of house, the order is given for ten houses, Type No. 27 let us say. This goes to the firm which specialises in Type No. 27. There are no architect's fees, and the expenses of superintending
I asked Conductor Lickrod why it was that, when the whole industry of house-building had been reduced to a matter of routine, the State did not itself carry on the work, but employed private firms. "That question," he said, "touched one of the fundamental principles of our Meccanian policy. If you study our National Economy you will learn all you require about it, but for the moment I may say that the control of the State over Industry is complete, yet we have not extinguished the capitalist. We do not desire to do so, for many reasons. The Third Class, which includes all the large capitalists, and the Fourth Class, which includes the smaller capitalists, furnish a most important element in the National Economy. Their enterprise in business and manufacture is truly astonishing."

"But what motive have they for displaying enterprise?" I asked.

"What motive? Why, every motive. Their livelihood depends upon the profits made; then promotion to a higher grade in their own class, and in the case of those in the Fourth Class their promotion to the ranks of the Third Class, also depends upon their skill and enterprise. But most of all, the Meccanian spirit, which has been inculcated by our system of education, inspires them with the desire to excel the business men of all other nations for the sake of Meccanian Culture."

Certainly the organisation of industry was marvellous, and the production of everything must be enormous. We spent three days going through factory after factory. There was the same marvellous order and cleanliness and perfect discipline, wherever one turned. On leaving the works the men all marched in step, as if on parade. Inside, they saluted their officers, but the salute was of a special kind—the hand was raised to the shoulder only, so as to avoid a sweeping motion which might have brought it in contact with some object. One of the triumphs of organisation, to which Lickrod called my attention, was the arrangement whereby the workmen reached their work at the proper time, got their midday meal, and reached home in the evening without any congestion. Each separate workshop had its appointed time for beginning work; some began as early as 6, others at 6.15, the last to begin were a few that had a comparatively short day, starting at 7.30. The midday meal began at 11.30, and was taken by relays until about 1.30. All the women employed in the canteens were the wives and daughters of workmen, who spent the rest of their time in household work at home.

At the end of the third day, as I was taking coffee with Conductor Lickrod, I took advantage of his communicativeness, which was rather a contrast to the brusqueness of Prigge, to get some light on several matters that had so far puzzled me.

"Your industrial system," I remarked, "as a productive machine, appears to me to be quite marvellous."

Lickrod beamed. "I knew you would think so," he said. "We have a word in our language which, so far as I am aware, has no exact equivalent in other languages, because their culture does not include the thing. It means the adaptation of the means to the end. Our industrial system exemplifies the virtue connoted by that expression; but our whole industrial system itself is only a means perfectly adapted to its end. We have no 'Industrial Problem' in the old sense of that word. Of course we are always effecting improvements in detail."

"But I have been wondering how it is," I said, "that with all this marvellous efficiency in production, your workmen in the Fifth and Sixth, and I suppose in the Seventh Class also, appear to work as long as those in other countries; they do not appear to be richer and they seem to have fewer opportunities of rising in the social scale."

"I have heard the same question put by other Foreign Observers," replied Lickrod, "and I am glad you have come to me for information on the subject. A complete answer involves a correct understanding of our whole Culture. To begin with, the supreme good of the State can only be determined by the State itself. The wishes or opinions of the private individual are of no account. Now, the State knows what its requirements are, and determines the amounts and kinds of work necessary to meet these requirements. By means of our Sociological Department, our Industrial Department, our Time Department, and the various sections of our Department of Culture, we know perfectly how to adjust our industries to the end determined by the State. Every class and grade therefore is required to contribute towards the supreme good of the State according to its ability."

"I quite understand," I interrupted, "the point of view you are expounding; but what I am wondering is why, with all this efficient machinery of production, everybody in the country is not in the enjoyment either of wealth or of leisure."

"I am afraid it is not easy for a foreigner, without longer experience, to appreciate the different value we attach to things such as wealth and leisure, and other things too. Suppose, purely for the sake of argument, that our working class worked only five hours a day instead of nine or ten: what would they do with their leisure?"

"I suppose they would enjoy themselves," I replied; "and seeing that they have had the benefit of a good education, I take it that they would know how to enjoy themselves in a decent manner. Besides, your regulations would be able to prevent any excesses or disorders."

"And you think they would be better employed in enjoying themselves than in serving the State as they do now?" asked Lickrod.
"Who is to judge whether they would be better employed?" I answered.
"That is just the question," said Lickrod, "and it is there that our Culture is so much in advance of other nations. Private enjoyment is not the supreme end of the State."
"But surely," I said, "you do not go on producing wealth simply for the sake of keeping your working classes employed ten hours instead of five? What becomes of the wealth?"
"As I said before, we produce just the wealth we require."
"Then I confess I am baffled," I said. "Possibly a great deal is required for your army and navy and other public services. You have, you must acknowledge, a very large number of people employed as officials of all kinds. As these are not producing material goods, perhaps the surplus wealth is drained away into these channels?"
"All that is included in my statement, that we produce what we require," answered Lickrod.
"Can you give me any idea," I asked, with some hesitation, fearing I was getting on delicate ground, "how much of the industrial product is required for military and naval purposes? I don't suppose you can, because I am aware that your Government does not publish its military estimates; and even if it did, it would not be possible to tell how much of the labour of the working classes is absorbed in that way. But whilst I do not ask for any information that it is not usual to give, I suggest to you that when I see the extraordinary productivity of your economic machine, coupled with the comparative simplicity of the mode of life pursued by the bulk of your population, I am bound to infer one of two things: either a vast amount must be absorbed by some rich class, or it must be in some way absorbed by the State itself."
"I think your reasoning is perfectly sound," replied Lickrod. "I could not tell you what proportion of the wealth product is absorbed by the army if I wished; for I do not know, and nobody in Meccania knows, except the Supreme Authority. The Finance Department knows only in terms of money what is spent upon the various services. But without knowing either exact amounts or proportions, I have no hesitation in saying that a very great deal of the wealth product does go in these directions. But that is part of our Meccanian ideal. The army is the nation, is it not? Every workman you have seen is a soldier; and he is a soldier just as much when he is in the factory as when he is in the camp or the barracks. He spends five years of his life between twenty and thirty in the camp, and he spends from one to two months of every year afterwards in keeping up his training. Then of course there is the equipment of both army and navy, which of course is always developing. Your idea is, I suppose, that if we devoted less to such objects as these, the people of the working classes, or even the whole body of people, would have more to spend upon pleasure, or could enjoy more leisure."
"Yes," I said, "in most other countries every penny spent upon either military purposes or upon State officials, beyond what is strictly necessary, is grudged. The people scrutinise very keenly all public expenditure. They prefer to spend what they regard as their own money in their own way. It seems to me therefore, that either your people do not look at the matter in the same way, or if they do, that the State has discovered a very effective way of overcoming their objections."
"What you say," replied Lickrod, "only brings out more and more the difference between our Culture and that of other nations. This sense of antagonism between the interests of the individual and the interests of the State, which has hindered and apparently still hinders the development of other countries, has been almost entirely eradicated among the Meccanians."
"What!" I said, "do you mean that a Meccanian pays his taxes cheerfully?"
"What taxes?" asked Lickrod blandly.
"I do not know in what form your taxes are paid," I said, "but they must be paid in some way, and I suspect that even in Meccania, if they were left to voluntary subscription, the Exchequer would not be quite so full."
"Now that is a very curious instance of what I am tempted to call the political stupidity of other nations. Instead of removing all circumstances that provoke a consciousness of difference between the individual and the State, they seem to call the attention of the private citizen, as they call him, to these differences. They first allow a man to regard property as entirely his own, and then discuss with him how much he shall contribute, and finally make him pay in hard cash."
"And how do you manage to get over the difficulty?" I said.
"All Meccanians are taught from their youth-- even from early childhood--that all they have they owe to the beneficent protection of the State. The State is their Father and their Mother. No one questions its benevolence or its wisdom or its power. Consequently all this haggling about how much shall be paid this year or that year is avoided. The State is the direct paymaster of nearly half the nation. Hence it can deduct what is due without any sense of loss. Through our Banking system the collection of the rest is quite easy. The private employers deduct from the wages of their employees, and are charged the exact amount through the Banks. No one feels it."
"But does your Parliament exercise no control over taxation?" I asked in some surprise.
"Our Parliament is in such complete accord with the Government that it would not dream of disturbing the system of taxation, which has worked so well for over thirty years," replied Lickrod.

"Have they the power to do so?" I asked.

"They have the power to ask questions, certainly," he replied; "but the taxes are fixed for periods of seven years. That is to say, the direct taxes falling upon each separate class are fixed every seven years in each case; so that the taxes for the First Class come up for revision one year, those for the Second Class the next year, and so on. The Constitution does not allow Parliament to increase the amount asked for by the Government, and as the vote is taken not individually but by classes, it is hardly to the interest of any of the classes to try to reduce the amount assessed upon any one class. Besides, the Government derives a considerable proportion of its income from its own property in the shape of mines, railways, forests, farms, and so forth. When we hear foreigners speak of Parliamentary Opposition we hardly know what the term means. It is entirely foreign to the Meccanian spirit."

"You speak of the Government," I remarked, "but I have not yet discovered what the Government is."

"I am afraid I must refer you to our manuals of Constitutional Law," replied Lickrod.

"Oh, I know in a general way the outline of your Constitution," I said, "but in every country there is a real working Constitution, which differs from the formal Constitution. For instance, Constitutions usually contain nothing about political parties, yet the policy and traditions of these parties are the most important factors. The merely legal powers of a monarch, for instance, may in practice lapse, or may be so rarely exercised as not to matter. Now in Meccania one sees a powerful Government at work everywhere—that is, one sees the machinery of Government, but the driving force and the controlling force seem hidden."

"You may find the answer to your question if you make a study of our political institutions. At present I am afraid your curiosity seems directed towards matters that to us have only a sort of historical interest. It would never occur to any Meccanian to ask who controls the Government.

His conception of the State is so entirely different that the question seems almost unmeaning."

"I have recently spent a long time in Luniland," I remarked at this point, "and I am afraid a Lunilander would say that if such a question has become unmeaning to a Meccanian the Meccanians must have lost the political sense."

"And we should say that we have solved the problem of politics. We should say," he went on, "that the Lunilanders have no Government. A Government that can be changed every few years, a Government that has to ask the consent of what they call the taxpayers for every penny it is to spend, a Government that must expose all its business to an ignorant mob, a Government that must pass and carry out any law demanded by a mere majority— we do not call that a Government."

"They regard liberty as more important than Government," I replied, with a smile.

"They are still enslaved by the superstitions of the eighteenth and nineteenth centuries," he replied solemnly.

"No nation will make real progress until it learns how to embody its physical, intellectual and spiritual forces in an all-embracing State. Our State may be imperfect—I know it is—but we are in the right way; and developed as it may be in another century it will completely answer all human requirements."

"Developed?" I said, almost betraying my amusement for I wondered what further developments the Super-State was capable of. "In what directions do you anticipate development?"

"There is still an immense fund of religious sentiment that is squandered upon unworthy objects: this may be— I feel sure it will be—directed into a nobler channel. Our ritual, too, in no way corresponds to the sublimity of the Idea of the Super-State. The ritual of the Catholic Church—which is after all a section of the whole State—is still superior, from the sensuous and the artistic point of view, to our State ritual. Our reverence for the State is too cold, too inarticulate. I have sometimes thought that the Emperor might found an order of priests or monks who would cultivate an inward devotion that would inevitably give birth to a real religion of the State."

"You are a true missionary," I said; "in fact, I think you are entitled to be considered a Meccanian Apostle. I have learnt a great deal from our intercourse, and just as you have suggested that the Government might bring more foreigners to see the wonders of your Meccanian Culture, I would suggest that they should send you and others like yourself into other countries to enlighten them as to the real mission of Meccania."

He was pleased to accept this testimony from an innocent and well-disposed Foreign Observer, and said that I could best show my appreciation by inducing more of my fellow-countrymen to come and study the wonders of Meccanian Culture.

CHAPTER VIII
THE MECHOW FESTIVAL

I TOLD Mr. Johnson of this conversation when next we met, and he seemed immensely amused by it. "You will have a chance of seeing a bit of Meccanian ritual to-morrow," he said.

"You mean this Prince Mechow Festival," I replied. "What is it like? I suppose you have seen it before?"
"Haven't you noticed the whole town is crowded with visitors?" he said. "But I won't take the edge off by telling you anything about it. You shall see it for yourself without prejudice."

I was aroused about five o'clock next morning by a tremendous booming of guns. It lasted for half an hour, and sounded like a bombardment. Then, for the next half-hour, all the bells in Mecco began ringing. By this time I was dressed and out on the veranda of the hotel. I had tried to go outside the hotel, but was reminded by the porter that we were instructed to remain indoors until we were taken to a building in the great square to watch the proceedings. At a few minutes after six we were conveyed in a motor-car to one of the hotels in the square, and provided with seats at the windows. There were only about twenty Foreign Observers in Mecco altogether, and as most of them were not very desirable acquaintances I sought the company of Mr. Johnson.

The streets were rapidly filling with people, the great majority being dressed in grey and chocolate uniforms, with a fair sprinkling of green. There were also quite a number of dark blue uniforms. As there is no Seventh Class in Mecco, I pointed this out to Johnson, who said that all the people in the streets were from the provinces.

"You will see the citizens of Mecco presently," he said.

"Where have they lodged all these people?" I asked, for I knew the hotels would not hold them.

"Oh, every person is billeted upon somebody of his own class as far as possible. Some of them have relatives here."

At seven o'clock, about fifty bands of music struck up, in different parts of the great central circle. They all played the same tunes and kept wonderful time. As soon as they struck up, Johnson said, "That means the processions have started."

"We waited about a quarter of an hour. The square itself was quite clear of people, but a few sentries in brilliant uniforms stood guarding the entrances from the four streets that led into it. The great statue towered above everything. Presently, headed by a band, the first of the processions, composed of members of the Sixth Class, in their best grey uniforms with all their badges and stripes, reached the square. Six men, at the head, carried a great banner, and were followed by another six, carrying an enormous wreath, which they deposited at the foot of the statue. Then, as the procession moved on across the square, six abreast, the two outside files left the procession, and separating, one to the right the other to the left, filled up the back of the whole square four deep. How many men there were altogether of the Sixth Class I have no idea, but they took half an hour to file past. Then followed another still bigger procession of the Fifth Class. These performed a similar ceremony, and proceeded to fill up the square ten deep. After them came the Fourth Class, in their green uniforms. This procession was much more brilliant in appearance than even the Fifth Class in its bright chocolate uniform. There were apparently ten grades of the Fourth Class, including as it does nearly all the professional men, as well as officials and business men. Some of the men in the first two grades had their breasts almost covered with badges and decorations. Last came a much smaller procession of the Third Class. The yellow against the background of green and chocolate and grey, as they filed into the square, filling the inner part about four deep, made a brilliant colour effect. There were no women in the processions, but the buildings in the square were full of the wives and daughters of the men of the upper classes, who watched the proceedings from the open windows and balconies. The bands went on playing all the time the processions were moving in and rilling up the square. It must have been half-past nine when the music suddenly stopped. There was silence for five minutes. Then suddenly the guns burst forth again, and for a quarter of an hour the noise was deafening. Then the bells rang for half an hour, but after the guns they sounded like a mere tinkling. At half-past ten, after a short silence, a subdued kind of murmur went through the crowd, and we saw advancing from the Imperial Church, which stands back from one side of the square, a new procession, this time in military uniforms. They seemed to be arranged in companies of about fifty, and there must have been a hundred companies. They were all on foot, as it would have been very inconvenient to have cavalry in the crowded square. They filled up the central space. Immediately after came a group of about fifty generals, all belonging to the Army Council. They were followed by the members of the Imperial Council, all dressed in Generals' uniforms. Then came the Emperor himself, followed by the Prime Minister and some of the chief officials of the State. I could not see the face of the Emperor from where I stood. He was dressed in the most gorgeous sort of uniform I have ever seen, and as he appeared, at a given signal (which I did not see), a great shout went up from all the people present, "Hail the Emperor! Hail the Emperor! Hail the Emperor!" Then everybody knelt on one knee for about half a minute, whilst he uttered some kind of blessing which I could not hear. The bands then struck up the National Hymn, after which there was complete silence for a minute or two. Suddenly a loud voice was heard. It must have been produced by a kind of megaphone, but it was perfectly clear. We were listening to the Emperor's formal speech on the occasion. I have not the exact words, but as near as I can reproduce it the speech was something like this:

"We meet for the sixteenth time since the death of the illustrious Prince Mechow, to commemorate his never-to-be-forgotten services and to thank God for the blessings which, through the divinely appointed instrumentality of that noble Statesman, he has so abundantly bestowed upon this his most beloved country...."
"Superior to all other nations and races in our God-given endowments, we had not achieved those triumphs of culture of which our noble race and nation was capable, until by God's grace my father's Minister, Prince Mechow, showed my people of all ranks and classes how to direct their efforts, through discipline and knowledge and devotion, to the strengthening and glorifying of our divinely founded State....

"To-day we again show our gratitude to God for having raised up, in the direct succession of great servants of the State, one who knew how to serve his Emperor and his God, and thus to defeat the evil intentions of all the host of envious and malignant enemies--enemies to God as well as to our nation--by whom we are surrounded....

"Let those enemies beware how they set God at defiance by thwarting the divine mission he has entrusted to us. He has set our glorious and invincible State in the midst of all the nations, but in their blindness and ignorance they have scorned our mission.... If, whilst all other nations are striving within themselves, class against class and man against man and rulers against ruled, in our nation and among my people there is but one will, one purpose, one mind, we owe it, under God, more to Prince Mechow than to any other.... This monument, which to-day we decorate with the wreaths of memory, is but a symbol of that monument which exists in the shape of the whole nation, whose forces he organised and whose purposes he directed to one end, the strength and unity of the State. Hail to Prince Mechow! Hail! Hail! Hail!"

The whole crowd burst out in shouts of "Hail to Prince Mechow! Hail!" Then came renewed shouts of "Hail the Emperor! Hail!" After he had bowed a dozen times or so, those near him prepared to form the procession back towards the Imperial Church, and for the next two hours the processions filed out to the sound of music. It grew very tiresome, and I was getting hungry, so we got permission to return to our hotel for a meal. Until now everybody had fasted, but the rest of the day was given up to a sort of carnival. Banquets were arranged to take place in every part of the city, and the whole population prepared to enjoy itself. At these banquets it is the custom to make patriotic speeches, which are faithfully reported. The man who is adjudged to have made the best patriotic speech is awarded a special decoration called the Prince Mechow Prize.

As the streets were liable to be crowded with strangers, it was not thought fit to allow us to wander about; but I learnt from Johnson that as the day goes on, and a large quantity of beer is drunk, the streets become filled with a boisterous crowd, which is a most unusual sight in Mecco.

Two things seemed to me rather odd about this festival: why was it that the Emperor allowed such adulation to be paid to a former subject; and why was the commemoration of Prince Mechow, who had done so much to introduce the strictest discipline, and the one occasion when licence was allowed? I put these questions to Mr. Johnson as we sat talking in the smoke-room, where we could faintly hear the murmur of the crowd in the streets in the distance.

"It is just as well you did not ask these questions of any of your Meccanian conductors," replied Johnson. "The real reason is one which I don't believe any Meccanian would avow. This Mechow Festival is a genuine expression of national character. They used to enthuse about Bludiron in almost the same way, some eighty years ago. I have heard my father tell of some of the scenes he saw here. They have a childish belief in national heroes. Then, the upper classes have a very special reason for encouraging this cult of Mechowism. They realise how completely he did their work for them and made their power secure, and it suits them to cultivate the superstition that there is something sacred about everything he established. Perhaps you know that the Military Class are the real power behind the Throne here. They let the Emperor play his part on the stage in public, but he takes good care not to do anything to offend them; and this worship of Mechow is a sort of symbol of their power. The real effect of Mechow's reforms was not to make the Emperor himself supreme, but to make the Military Caste all-powerful. They take care, therefore, to make this festival popular. I don't suppose the Emperor altogether enjoys the part he has to play on an occasion like to-day."

"What you say about the Military is rather interesting," I replied, "for only a day or two ago I was trying to get Lickrod to tell me what the Government really is. I couldn't make out whether he knew or not, but he certainly didn't enlighten me much."

"Of course it's the Military Class," said Johnson, with a laugh. "I thought everybody knew that. It's a very open secret."

"I have heard that theory put forward," I said, "but I can't quite make it square with the facts."

"Why not?" asked Johnson.

"Well, if the Military are the supreme power, why should they have such an elaborate Bureaucracy and make such a parade of culture in every direction?" I said.

"Ah," replied Johnson, "you must remember we are living in the twentieth century; in fact, you must remember all that this wonderful rascal of a Mechow taught his countrymen. The clumsy methods of the Military Autocracy of a barbarous age would not be of the slightest use in our times. Human society in modern times, even under an Autocracy, is tremendously complex. An elaborate Bureaucracy is a necessary part of the machine. Suppose, for
instance, that you were an autocrat, and you wanted to be able to wield the whole force of the nation over which you ruled, how could you give effect to your will unless the whole nation were organised with that end in view? Suppose you had absolute power, as far as the law could give it you, and suppose you wanted a powerful army; you would want also the best equipment. How would you get it unless your industries were already organised and under control? There is no doubt at all that the nation that can control and mobilise all its resources for whatever purposes it happens to require them, has a great advantage, from the military standpoint, over other nations not so organised."

"But," I said, "they organise all sorts of things that have nothing to do with military efficiency. Look at the theatres, and at Art, and Music: their organisation of these is carried to an absurd point."

"That is quite true, but did you ever know any big organisation that did just exactly what it ought to do, and stopped short of the things it ought not to do? Once set up a Bureaucracy and it will inevitably extend its functions. People are dirty, so the bureaucrat says, let us make them wash. Then, he says, let us make them keep their houses clean. Then, he says, let us make them keep their clothes tidy. He doesn't like the way they walk, so he makes them march in step. You can see that there was a tremendous advantage in having a well-instructed middle class and a well-instructed working class. To secure this, a powerful department to organise and enforce education was necessary. Once the Bureaucracy was created there was hardly any limit to its functions. Besides, and this seems to me rather important, the more widely extended are the functions of the Bureaucracy, the more effectually is its main purpose disguised. The people are accustomed to being directed and 'organised.' They imagine, in a vague sort of way, that it is all for their good. Another little turn of the screw is not felt. If the State tells me what to eat, why shouldn't it tell me what to wear, and what to read, and what to think?"

"There is another reason why it 'organises' all this culture. In every nation some kind of intellectual life goes on. It must be either free or controlled. If it is let alone, the force of ideas is such that, in the long run, they will shape the political structure. The State, if it means to preserve itself as an Autocracy, must get control over the intellectual life of the nation. In ancient times it succeeded for a time. In the Middle Ages the Church tried the same thing. In modern times most States have not made the attempt, but this State has made the attempt. It has done no more than Plato would have done. It has done it rather differently perhaps, but it has followed the same idea."

"They would feel rather flattered, don't you think," I said, "if you told them they were carrying out Plato's principles?"

"Perhaps they would, but that only means they have learnt nothing from twenty centuries of political experience."

"On the contrary, it looks as if they have learnt a good deal," I said.

"They have learnt how to make a nation of slaves and tyrants."

"And yet they don't seem to mind being slaves, if they are slaves."

"I wonder," replied Johnson. "A hundred years in the life of a nation is not a long time. Human nature is a strange thing. They kiss the rod so affectionately that I don't mind how long they remain in bondage: all I care about is that they should not make slaves of the rest of us."

"Do you think there is any danger?" I asked.

"Why, how could it be brought about?" I said.

"In all sorts of ways. Liberty is the most precarious possession of the human race. Very few nations have possessed it for long together."

"But surely," I said, "Meccania is so unpopular, to put it mildly, with almost all other nations, that her influence can hardly be dangerous."

"Oh, but it is," insisted Johnson. "The danger takes several forms. Meccania is tremendously strong as a military power. She knows it, and other nations know it. Suppose a great war took place, and she were successful; she would bring other nations under her power, as she has done in the past. These would soon be compelled to adopt her institutions. Then, in self-defence, other nations would feel themselves compelled to resort to the same means as have proved successful in her case, to make themselves strong too. To a certain degree that has already taken place. Lots of our military people now are always agitating to introduce what they call reforms, to place us on a level with Meccania. Then all sorts of cranks come over here: Sanitary Reformers, Eugenists, Town Planners, Educationists, Physical Culturists, Temperance Reformers, Scientific Industrialists, and so forth. Each of them finds some idea he wants to push. There are people who think that if they could only cure unemployment they would bring in the millennium, and they are willing to reconstruct society for the sole purpose of doing away with unemployment. And so we get disconnected bits of Bureaucracy set up, first for this and then for that. By and by some one will come along who will try to co-ordinate the whole thing."

I had evidently set Mr. Johnson on to a train of thought that excited him, for he usually took things very calmly. After a short pause he went on: "And yet I don't think the greatest danger comes from these would-be bureaucrats of
ours. With us the bureaucrat only gets his chance when we have played the fool so badly that somebody has got to step in and set things right. For instance, we had what we called magistrates at one time. They were supposed to be the prominent citizens with common sense and initiative; but they became so incompetent, and the authorities chose them so foolishly, that they lost the public confidence; so we had to replace them partly by officials and partly by paid judges. Then look at our manufacturers; they hadn't the sense to apply a reasonable proportion of their profits to developing their business on scientific lines, so the State had to step in and compel them to. They hadn't the sense, either, to encourage their workpeople to become educated, nor even to pay them any more than they could help. Consequently the State had to step in again. No, what I am most afraid of is our disinclination to set things right ourselves. We can't let mothers go on murdering their babies, we can't let food dealers poison the public, we can't let seducers of children traffic in obscenity; and as the public is apathetic about all these things the bureaucrat steps in and adds another Department to the fabric. What I am afraid of chiefly is that we shall get into a bad mess that will place us at the mercy either of the Meccanians over here or of our own Meccanians at home."

CHAPTER IX
MECCANISATION
WHEN I came to reflect that night upon the experience of the last few days, I was much impressed by three things which somehow seemed to hang together. There was first my conversation with Lickrod. If all Meccanians, or even a majority, took the same view of the State that he did, there could be no limit to the functions of the State. He seemed to claim for it all the moral authority of the Mediaeval Church, and although in other countries theories are put forward for academic discussion without having much influence upon practical politics, in Meccania the powers that be are able to carry out their ideas without the obstruction which necessarily arises in countries where public opinion is more spontaneous. He had evaded the question as to the control of the Government, and had maintained that such a question had no meaning in a country where the people were not conscious of any difference between the State and themselves. Then there was this Mechow Festival. Now, it was either a sincere manifestation of a national admiration of Prince Mechow, and an approval of his work in creating a Super-State with unlimited powers, or it was a proof that the ruling class, whatever that was, could manipulate the whole life of the nation as it pleased. Lastly, there was the idea that Johnson had thrown out. He was quite confident of the accuracy of his own view that the Military Class was the power behind everything, and that the whole elaborate bureaucratic organisation of society had for its motive and driving force the desire and the will to make Meccania a perfect instrument of militarism.

Up to this time I had been partly amused and partly annoyed by what I had seen and heard and experienced. I was amused by the meticulous regulation and organisation of all the petty details of life, by the pedantic precision of all the officials I had met, and by the utter absence of a sense of humour in the mentality of the Meccanian people. I had been annoyed by the meddlesome interference with my private habits, but I tried to disregard this, because, as an experienced traveller, I had sufficient experience to tell me that in every country one has to accommodate oneself to the customs and prejudices of the community. But most of all, I felt baffled by my failure to find out anything about the real life and thought and feeling of the people.

I determined that I would make a more serious attempt to get behind the screen which all this officialism set up between the people and a well intentioned Foreign Observer like myself or Mr. Johnson. I would find out whether the screen was erected only between the foreigner and the people, or whether the people themselves were so organisers that, even for them, intercourse was made difficult. I promised myself that Lickrod, with his genuine enthusiasm for every feature of Meccanian culture, would be much more likely to enlighten me than any person I had come in contact with before. We had still some days to spend in completing our general survey of industry in Mecco. As President of an important Literary Society, I expressed a desire to see how the whole business of literary production was conducted in Meccania, for I understood that several features in the system were quite unlike what could be found anywhere else in the world. Conductor Lickrod was almost eager to gratify my curiosity—at any rate up to a certain point.

"The printing industry," said he in answer to my questions, "is a perfect example of the effect of Prince Mechow's reforms. It would be impossible in any other country to do what we do, even if they employed three times the number of men. In other countries the waste of labour, not only manual labour but brain labour and business enterprise, is ridiculous. Look at the amount of advertising, the number of rival newspapers and magazines, the number of rival publishers of all sorts. It is a perfect chaos. Now we have no advertising, as advertising is understood abroad. Every commodity can be classified, whether it be a hair restorer or a mansion for sale. Our system of commerce gets rid of advertising miscellaneous commodities. The wholesale merchants have their regular catalogues issued to the trade, and the same system is extended to retail trade. For example, if you want to buy an article of clothing, apart from your regular uniform, you consult a directory of the retail dealers. Then you consult a catalogue of any particular firm at the bureau for retail trade, where you will find a catalogue of every shop in the
town you happen to be in. There are no hoardings covered with posters tempting people, out of mere curiosity, to buy things they don't want. Now look at a typical newspaper in any foreign country. Half of it is covered with advertisements of concerts, theatrical performances, other amusements, sales, situations vacant and wanted, clothing, patent medicines, books—every imaginable thing. With us that is all unnecessary. The bureaux of employment do away with all advertisements for employment—but in any case we should require few of these, because our system of employment is so much better organised. As to concerts and theatres, everybody knows, through the official gazettes, what amusements are available for months in advance."

"You have not only got rid of the advertisements," I remarked, "but even of the newspapers themselves, I understand. I have certainly seen none except the local gazettes."

"Exactly; I was coming to that," he continued. "Look at the enormous waste of effort that goes to the production of forty or fifty big newspapers. What is the use of them? Every item of information can be classified. It may be a crime, an accident, an event in foreign politics, a new law, a trial, a new discovery in some branch of science or industry, and so on. Now look at all the ingenuity displayed in getting hold of some sort of account of these things at the earliest moment, in order to gratify the mere curiosity of crowds of ignorant people. Then look at the special articles, all or nearly all produced in haste, and the so-called leading articles, all designed to influence the mind of the public by giving some particular colour or interpretation to the alleged facts. Our official gazettes give the public all they require to know. The Law Gazette, issued each week, gives information about all the breaches of the law committed, all the important processes before the Law Courts, all the changes in the Law. All the articles which are necessary to throw light upon legal matters are written by real experts. As you know, the journalist is extinct in Meccania. The Industrial Gazettes—one for each of the main branches of industry, with a general Industrial Gazette for matters affecting industry generally, contain everything required in a much more complete form than can be given in a daily newspaper. So you see that, applying the same principle to the various aspects of our public life, we are able to substitute one well-organised publication, dealing completely with all matters and issued with all the authority of the State, for the miscellaneous jumble of scraps which are called newspapers in other countries."

"Then look at the number of magazines; they represent a stage of culture which we have left entirely behind. We have our Literary Gazettes to keep the public informed about all the recent publications. We have our Quarterly Records for every department of knowledge. If you want the latest contributions to history or archaeology, philology, ethnology, or anthropology, you know where to go for them. Everything is done by experts, and we do not go to the trouble of printing anything by anyone else on such subjects."

"Then you have no popular magazines such as would interest people who are not strictly students, but who take an interest in things?" I asked.

"No. As I said a moment ago, we have left that stage of culture behind. We provide a good education for all those who, we think, are able to utilise it for the good of the State. After that, every one is encouraged to pursue that branch of knowledge which will be most useful to him in his calling. In a certain sense every man is a specialist. We do not encourage people to dabble in things they only half understand."

"But is there not also a need," I said, "for what I may call general knowledge on the part of the public? For instance, suppose a new law is to be introduced which is to affect people's lives, everybody is concerned, whether he is a specialist or not. Or suppose some question of public morals, or some question of political interest arises, you surely want the public to discuss such things. How, indeed, can your authorities keep in touch with the public mind unless there is some medium by which the general public can express itself?"

"What you say," answered Lickrod, "only serves to demonstrate the truth of what I am trying to convey to you, namely, that our Culture is so differently conceived that you foreigners cannot understand our attitude. You use the expression 'public opinion.' Our psychologists will tell you exactly how that public opinion is formed. They made a careful study of it before we decided to replace it by something better. It was one of the superstitions of the nineteenth century, which has not only lingered on but has become a serious hinderance to the development of scientific government in all countries except Meccania. They actually allow their fiscal policy to be determined by 'public opinion.' Fiscal policy is entirely a matter for the State, and the only persons qualified to advise the State are the experts. You speak of public morals, but the business of guiding the morals of the nation is the highest function of the State itself. Now the organs through which every nation or State functions are determined and developed by the national consciousness: this consciousness expresses itself just as legitimately through experts as through an uninstructed public opinion."

"So you would be prepared to say, then," I said, "that your people fully acquiesce in the suppression or abolition of one of the institutions which most foreigners consider almost the last safeguard of liberty? I mean, of course, the daily press."

"The present generation of Meccanians, that is, the young people, say between twenty and thirty, have never known the Press. The older men were, I confess, bitterly opposed for some years, or at least a section of them were;
but if anyone proposed to revive the Press nowadays he would be regarded as one would be who wished to revive steam-trams, or wigs, or general elections."

"But suppose some people were mad enough to want to publish a newspaper, could they not do so?" I asked.

"Well, there is no positive law against it, but it would be impossible, all the same."

"Why?"

"The expense would be very great, for one thing. There would be no advertisements, remember. They would not be allowed to publish news before it had been submitted to the censor, or before it was given to the public through the official gazettes...."

"You need say no more," I said. "I quite see it would be impossible. The censorship extends to all printed matter, I gather?"

"Certainly," he replied. "The State would be guilty of a grave neglect of its function as guardian of the Meccanian spirit if it permitted any scribbler who wished to seduce the minds of the people to mislead them."

"But," I could not help replying, "I thought that your people were on the whole so well educated that there would be less danger of their being misled in Meccania than in any country. Also I have been informed that all the best writers are already in the employ of the State; and, further, that the people generally are so completely at one in sentiment with the spirit and policy of the State that there could be no real danger from the free expression of opinion."

Conductor Lickrod smiled. It was a benevolent, almost a pitying smile.

"I perceive," he said, "that some of the most commonplace axioms of our policy seem like abstruse doctrines to people whose culture is less advanced. But I think I can make all this clear. Your argument is that our people are well instructed, our writers--the best of them--are employed by the State, and our common loyalty to the Meccanian ideal is so firmly established that even a free Press, or at least the free expression of opinion in books, would give rise to no danger. Now do you not see that it is only by means of our system--so wisely conceived by the greatest statesman who ever lived--that we have this instructed public, that we have all the best writers in the service of the State, that we possess this common allegiance to the Meccanian spirit? When we have achieved what no other nation has achieved, should we not be fools to introduce an entirely contrary principle, and for the sake of what? In order to provide an opportunity for the few people who are not loyal to Meccania to attack the very State whose children they are. For, examine what it is you propose. No one who is a loyal Meccanian finds the least fault with our present system. It has the enormous advantage over all the systems of other countries that, without any waste, it provides the most authentic information about every conceivable subject, it gives the public the benefit of the services of such a body of experts as no other country possesses. And the people who would write such books as you are thinking of; who would support them? They are already fully employed in some manner, and in the manner considered by the State to be the most useful. I assure you this is a purely academic discussion, for no one would dream of putting into practice such a proposal."

"There must be something in the mentality of the Meccanians very different from that of other nations, and that is all the more surprising because, at least according to the ethnologists, they are not racially different from several of the surrounding nations."

"That is quite true, with some slight reservations. We are not a pure race by any means. We have racial elements within our nation which are indeed distinct from those of the surrounding nations, and they have perhaps contributed to the final result much more than in proportion to their actual numbers. What you call Latin culture has never done more than furnish us with the material for such elements of our culture as we wished to utilise. You see it has hardly affected our language. No, the Meccanian culture of to-day is the result of education and scientific statesmanship."

"Excuse my putting the question so bluntly," I said, "but it seems to me that the principles you have put forward would justify even a revival of an institution known in mediaeval times, and even later, as the Inquisition. I suppose there is no institution corresponding to that in Meccania?"

"It is quite unnecessary. And that is one powerful argument in favour of our system of controlling the Press. That control, together with our other institutions of which it forms part--our whole polity is a perfect harmony--makes an Inquisition, as you call it, an anachronism."

"But," I said, "I was told by one of your own people of something that seems to a mere outsider to resemble an incipient Inquisition."

"Indeed," he said, "and what is that?"

"Well, I gathered that in certain cases the Special Medical Board uses its discretionary power to incarcerate persons whose opinions or convictions make it impossible for them to embrace what I may call the Meccanian ideals of life."

I felt I was treading on delicate ground, but as Prigge on a previous occasion had openly approved of putting
people into lunatic asylums if they did not accept the Authority of the Super-State I felt justified in sounding Lickrod on the point. To my surprise he betrayed no embarrassment.

"You are probably not aware," he said, "of the remarkable strides that have been made by our medical scientists in Meccania during the last fifty years. The pathological side of psychology has received great attention, with the consequence that our specialists are able to detect mental disease in cases where it would not be suspected by less skilled doctors. I believe I am right in saying that our experts detected the disease now widely recognised as Znednetlapseiwick (Chronic tendency to Dissent) long before it was known in other countries that such a characteristic was in any way connected with brain disease. The microbe has been fully described in the twenty-seventh volume of the Report of the Special Medical Board. The first clue to the existence of this disease was discovered during the great war, or perhaps a little later. A number of people persisted in putting forward views concerning the origin of the war, which were totally at variance with the official, and even the Imperial, explanatory statements made for the enlightenment of the public. At the time, it was regarded as just mental perversity. But what led to the discovery was that, after ten, and even fifteen years in some cases, notwithstanding every natural inducement to desist from such perversity, these people deliberately and persistently maintained the objectivity of their hallucinations. Experiments were made; they were under close observation for some years, and at length Doctor Sikofantis-Sangwin produced his theory and confidently predicted that the bacillus would be found in a few years. From that time the path was clear. The disease was most rife some forty years ago, soon after the beginning of Prince Mechow's premiership; but since then it has almost disappeared. You see it is not hereditary, and the normal conditions of Meccanian life are very unfavourable to its development. But coming back to your point, although no doubt this is what has given rise to the calumny that the Special Medical Board uses its powers as an Inquisition, there is not a vestige of truth in the charge. Each case—and the cases are becoming very rare indeed—is investigated on strictly psycho-physiological lines. The patients in all cases are isolated, and placed under observation for some months before any pronouncement is made."

"Your explanation is as usual most illuminating,"

I replied, "and the patience with which you deal with my questions emboldens me to put to you some further difficulties that have been puzzling me."

"Proceed," replied Lickrod encouragingly.

"Well now," I said, "your whole national culture is so elaborately perfect, from the standpoint of its basic principles, that it is certainly well worth studying by any student of sociology or politics or economics; yet we foreigners find ourselves hampered at many points whenever we wish to get into contact with certain kinds of facts. For instance, we may wish to find out what are the ideas, the current thoughts and feelings, of the various groups, and even individuals, who make up society. We cannot go and live with people and converse freely with them. I have not been able to understand why your Government takes such precautions to keep secret, as it were, facts which in any other country are as open as the day."

"That is not at all difficult to answer by anyone who really understands the principles of our Culture, and I am surprised that none of the conductors who have instructed you have explained it—-that is, if you have asked them," he answered, "You have been hampered, you say. Yes, but you have been assisted too. You have been shown things in a way that would be impossible in most other countries within such a short time. Our Government has paid great attention to the instruction of foreigners. Instead of leaving them to gather all sorts of erroneous impressions, it provides them with authentic information. If, on the other hand, there are things which it does not wish foreigners to know, it takes care, and quite rightly, that they shall not obtain the information by any illicit means. For instance, if you were foolish enough to attempt to obtain information about our military affairs, you would find yourself against a blank wall; and, if I may say so, you might hurt your head against the wall. But then there are matters which, without being secret, cannot well be investigated by the individual inquirer. Take such a thing as the current thought of any particular class or group. Only a trained and well-equipped social-psychologist is capable of making such an inquiry. The liability to error is tremendous. All the books written by travellers reveal this. We do not wish to be exploited by casual and irresponsible travellers. We provide opportunities, under proper conditions, for expert investigators; but very few are willing to comply with the conditions. Besides, our Culture, like all the finest products of the human intellect, is a very delicate thing. When we have carefully educated our people in the Meccanian spirit we are not prepared to expose them to the insidious influences of irresponsible busybodies. Every Meccanian is valuable in our eyes, and just as we protect him from infection in the shape of physical disease, so we protect him from the more insidious but not less injurious influence of foreign ideas. You will find plenty of philosophical justification for that policy in the writings of Plato and Aristotle—two philosophers who are studied in all the foreign universities but whose systems of thought are utterly misunderstood except in Meccania."

CHAPTER X
CONVERSATIONS
IT must have been more than a week after my long talk with Conductor Lickrod that I was sitting one evening in the hotel with Mr. Johnson and a certain Francarian gentleman to whom he had introduced me, when the latter made a suggestion that has since proved very useful to me. Mr. Villele the Francarian is a short and rather stout man of middle age, with a pair of merry black eyes, a swarthy complexion, and dark hair beginning to turn grey. He professes to find Meccania and the Meccanians amusing, but I suspect from the nature of his sarcasms that he entertains a deep hatred of them. We were talking of my journal when he said, "And what is the use of it?"

"Well," I said, "I do not flatter myself that I can produce a great literary work, but the facts I have been able to place on record are so interesting in themselves that I believe my countrymen would welcome a plain straightforward account of my visit to this most extraordinary country."

"I have heard," he said, "that the Chinese have very good verbal memories. Have you committed your record to memory in its entirety?"

"Why should I?" I replied; "it is to save my memory that I am taking the trouble of making such full notes, even of such things as conversations."

"And how do you propose to get your journal out of the country?"

"I propose to take it with me when I return," I said. At this he turned to Johnson and laughed, but immediately apologised for his apparent rudeness.

"And what about the Censor?" he asked.

"Surely," I replied, "these people take such precautions not to let us foreigners see anything they do not want us to see, that they cannot object to a faithful record being made of what they do permit us to see!"

"Then you have not even read Regulation 79 of the Law concerning Foreign Observers."

"What is that?" I asked.

"Simply that foreigners are not allowed to take out of the country anything they have not been permitted to bring in, except with the consent of the Chief Inspector of Foreign Observers."

"And you think they will object?"

"I have not the slightest doubt."

"But it is written partly in Chinese; they would have to translate it."

"All the more reason for detaining it. If you ever get it again, it will be in a few years, after it has been translated for the benefit of the Sociological Section of the Ministry of Culture."

"What do you advise me to do, then?" I asked. "Have you any friends at the Chinese Embassy?" he asked.

"I have no personal friends. At least I have not troubled to inquire. I have had no business at the Embassy; there seemed no reason why I should trouble them."

"There is a fellow-countryman of yours here in Mecco who is persona grata with the Authorities," said Villele, "but he is rather a dark horse." "A dark horse?" I said.

"He is a sort of convert to Meccanianism. He has written books in appreciation of Meccanian principles, Meccanian ideals, Meccanian institutions, and so forth. They are eagerly read by the Meccanians. They even use them in their colleges. I have read them, and they seem to me very clever indeed. I translated them for the benefit of my countrymen, and I am not exactly an admirer of things Meccanian."

I must have looked rather puzzled, for Mr. Johnson came to my rescue.

"Mr. Villele means," he said, "that these books have a double meaning. I have read one of them. Under cover of the most exuberant flattery he gives such an impression of the cold-blooded devilishness of the system, that some of us suspect his real purpose to be that of exposing the whole business."

"He knows more of Meccania than anyone who is not a high official," said Villele; "and if you want to pursue your investigations any further, and incidentally get your manuscript conveyed out of the country, I should advise you to seek an interview with him."

"Will that be possible," I asked, "without arousing suspicion?"

"Oh, quite easily," answered Villele. "He is above suspicion, if you are not," he added, smiling. "He holds a weekly salon for foreigners, and you can easily get permission to attend. After that I leave it to you, and him."

That evening we went on talking a long time. Mr. Villele related some remarkable things, but I was not sure whether he was merely making fun of the Meccanians.

"You have not seen much of the Meccanian women?" he remarked.

"No," I said; "I have had no opportunity."

"They are quite as wonderful as the men," he said. "You never heard, for instance, of the great Emancipation Act, Regulation 19 of the Marital Law?"

"No," I replied; "what is it?"

"No Meccanian woman is obliged to submit to the embraces of her lawful husband."

"But how did the men ever consent to such a law?" I asked; "for in this country it is the men who make the
laws."

"It is rather a queer story," he replied. "It is quite a long time ago, forty years or more, since a movement arose among the women, influenced no doubt by the women's movement in Europe, which had for its object, or one of its objects, greater freedom from the domestic tyranny of the Meccanian husband. Some of them, of course, thought that the way to secure everything they wanted was to get the right to vote for the National Council; but the wiser among them saw that the vote was merely a bad joke. Anybody could have the vote, because it was worth nothing; seeing that the powers of the representatives were being reduced to nothing. All the same, this women's movement, such as it was, was the nearest approach to a revolutionary movement that the Meccanians have ever shown themselves capable of. Once more our dear old Prince Mechow came to the rescue. He was a real genius."

"But I thought you did not admire the Mechow reforms?" I interrupted.

"I do not; but I recognise a genius when I see him. Believe me, Prince Mechow was the first Meccanian to understand his countrymen. He knew exactly what they wanted, what they would stand, what they could do, what they could be made to believe. He was absorbed in his early reforms when this women's movement broke out, and some people were afraid of it. He attacked the problem in his characteristic fashion. He knew the women didn't want political power; he knew also that there was not the slightest danger of them getting it; but he saw immense possibilities in having the women as his allies in certain of his reforms, especially his Eugenic reforms. He hit upon a really brilliant idea. I don't suppose you can guess what it was?"

"How can I?" I said. "All this is quite new to me."

"Well, if you had read Meccanian literature, or even the writings of the old travellers in Meccania—you would know that the Meccanian women are the most primitive in Europe. They have one ideal as regards men. They have a superstitious admiration for physical strength. If a Meccanian woman were really free to choose her mate, in ninety-nine cases out of a hundred she would choose the strongest man. They have always been like that. Probably many primitive peoples have had that characteristic, but the Meccanians have preserved that trait longest. You think I am joking or spinning a theory?"

"I was thinking that they had the same marriage laws as the rest of Europe for many centuries, the fact, if it is a fact, cannot be of much practical importance," I said.

"The fact itself is vouched for by dozens of writers among the Meccanians. They pride themselves on having preserved these primitive characteristics; they glory in never having been influenced by Latin culture. The marriage laws you speak of have been adopted by the men, in self-defence, so to speak. In very early times the Meccanian marriage laws were essentially the same as they have been for two thousand years, and the penalties on the women for infractions of the marriage laws were more severe in practice than in any other country. Notice the facts: breaches of the 'moral code' before marriage are regarded very lightly: illegitimacy in Meccania, as is proved by statistics, was more prevalent than in most countries; but the men took care that breaches after marriage should be severely dealt with. I told you it was a long story, and I have not yet come to the point. For twenty or thirty years before Prince Mechow got into the saddle all the young hot-headed Meccanian patriots got Eugenics on the brain, but none of them knew how to put their ideas into practice. Mechow himself was an Eugenist of the most brutal type. He believed that if he could once utilise this primitive instinct of the Meccanian women, he could do something much more effective than eliminating certain feeble types, which was all that the Eugenist theorists had so far aimed at. He proposed to give every woman the right to choose, within limits, the father of her children. He knew that all the Meccanian women were obsessed with a frantic admiration for the Military Class—in the old days it was the ambition of every woman to marry an officer, and that was why the officers who were not well-to-do never had any difficulty in getting a rich partie. Well, he actually made a law to the effect that any woman could claim a sort of exemption from the marital rights of her husband, upon the recommendation of an authorised medical man."

"But why on earth did the men consent to such a law?" I asked once more.

"That was easily done. You had only to invoke the Meccanian spirit, devotion to the supreme interests of the State, the opinion of the experts and all the rest of it. The opposition was stifled. The three highest classes were all for it; the women supported it, and although they had no political power they made opposition impossible."

"And what effect has this law had? I am afraid I do not see how it would effect the purpose Prince Mechow had in view," I said.

"The consequences have been enormous. I do not mean that the law by itself effected much, but taken as part of a system it solved the whole problem from Mechow's point of view."

"But how?" I asked, somewhat puzzled.

"You understand, I suppose, the system of medical inspection and medical supervision and medical treatment?"

"To a certain extent," I replied.

"Well, you realise perhaps that, in the hands of a patriotic medical staff, the system can be so worked that every woman who is 'approved' can be provided with a 'eugenic' mate from an approved panel, drawn chiefly from the
Military Class, eh?"

"Is this one of Mr. Villele's jokes at the expense of the Meccanians?" I asked Mr. Johnson.

"He is telling the story in his own way," answered Johnson, "but in substance it is quite true."

"But it sounds incredible," I said. "What do the husbands say to it?"

"Oh, the business is done very quietly. A woman is ordered a 'cure' by the medical authority,' and she goes away for a little time. The men on the panel are kept in training, like pugilists used to be. As for the husbands--did you ever attend any lectures in the Universities on Meccanian ethics? Of course you have not been in the country very long. Jealousy is regarded as an obsolete virtue, or vice, whichever you like. Besides, you must not imagine the custom affects large numbers. Probably not more than 10 per cent of the women, chiefly in the Fifth and Sixth, and to some extent in the Fourth, Class, are affected."

"But I should have thought that social caste would be an insuperable obstacle," I said.

"Surely not! When did you hear that women were chosen for such purposes from any particular class? It is not a question of marriage."

"There is one circumstance," interposed Mr. Johnson, "that has some bearing on this subject.

Domestic life in Meccania for generations past has been based on quite a different ideal from that prevalent in other parts of Europe. A Meccanian in the old days used to choose a wife very much as he would choose a horse. She was thought of as the mother of children; in fact, the Meccanian sociologists used to maintain that this was one of the marks of their superiority over other European nations. Conjugal affection was recognised only as a sort of by-product of marriage. Of course they always pretended to cultivate a kind of Romanticism because they wrote a lot of verse about the spring, and moonlight and kisses and lovelonging, but their Romanticism never went beyond that. As the object of Meccanian sentiment, one person would do just as well as another."

"Our friend seems very much surprised at many things he finds in Meccania," remarked Mr. Villele, "and my own countrymen, and more especially my own countrywomen, only half believe the accounts they read about this country, simply because they think human nature is the same everywhere; but then they are ignorant of history. Civilisations just as extraordinary have existed in ancient times, created through the influence of a few dominant ideas. The Meccanians are a primitive people with a mechanical culture. They have never been civilised, because they have no conception of an individual soul. Consequently they find it easy to devote themselves to a common purpose."

The conversation went on for a long time. It was a warm summer evening and we were sitting in the garden at the back of the hotel, otherwise we should have been rather more guarded in our remarks. As we parted, Mr. Villele repeated his advice to seek an interview with Mr. Kwang, as he called him. (His name was Sz-ma-Kwang, but for convenience I shall allude to him as Mr. Kwang.) A day or two later, I contrived to get an interview with him, and although Conductor Lickrod was present I soon discovered that Mr. Kwang and I were members of the same secret society. He promised that I should see him again before long, and that he would be happy to assist me in any way he could. He told Lickrod that he had been doing his best, for the last five years, to induce the Chinese Government to send more 'observers' to Meccania; but his enthusiasm for Meccania had perhaps defeated its own object, as it caused him to be mistrusted. His writings on Meccania were well known, and it was thought that he was trying to proselytise. He spoke most flattering of me to Lickrod, and said that, in view of the influence I should have in my own country, it was well worth while giving me every facility to see all I wished. He would guarantee that, under his tutelage, I should soon learn to appreciate things from the right point of view.

Two days after this, I received a message to call on the Chief Inspector of Foreigners. He received me most politely, and almost apologised for not having had time to see me before. He had only just learnt that I was a friend of the excellent Mr. Kwang. He said I should be permitted to visit Mr. Kwang whenever I chose, and that I was now at liberty to make use of the letters of introduction I had brought with me to several persons in Meccania. It would not be necessary for me to be accompanied by a 'conductor' every day. He would transfer me to Class B, Stage II. Class B meant Foreign Observers staying not less than six months; and Stage II. meant that they were permitted to submit a plan each week showing how they proposed to spend the following week; so that on the days which were occupied to the satisfaction of the Inspector of Foreign Observers for the district, the services of a 'conductor' could be dispensed with.

I did not know whether to avail myself of my new-found liberty or not. For when I came to talk the matter over with the only person at hand, Conductor Lickrod, I found that it was not very easy to prepare a plan that would be accepted by the Authorities, unless I were prepared to pursue some definite line of research. When I talked of taking a few walks in the poorer quarters, calling in for a few lectures in the University, hearing some concerts, and seeing some plays and other amusements, looking round the museums,--a programme innocent enough in all conscience,--Lickrod said no Inspector would sanction such a miscellaneous time-table for an observer in Stage II. I was not qualified to attend concerts; I had not yet received permission to visit the theatre. Unless I were pursuing some
particular study, I could only visit the museums in company with a conductor. As for a stroll through the poorer quarters, he failed to see the object of that. On the whole, I decided to stick to Lickrod for another week at any rate. I asked if I might see something of Education in Mecco. He said certainly, if I desired to make a study of Meccanian Pedagogics for a period of not less than four months. Otherwise it would not be possible to enter any of the educational institutions. I could get permission to read in the Great Library, if I would specify the subject, or subjects, and show that I was qualified to pursue them. In that way I could read up Meccanian Education. If I were not willing to do this, he advised me to talk to Mr. Johnson, who was a keen and capable student of Meccanian Pedagogics.

I suggested investigating Meccanian political institutions, but similar difficulties arose there. I could only study Meccanian politics if I were registered as a specialist, and for that I should have to obtain permission from the Department for Foreign Affairs as well as from the Chief Inspector of Foreign Observers. He remarked, however, that in his opinion there was little to study beyond what could be got from books. The political system of Meccania was really simplicity itself when once the fundamental principles had been grasped. I replied that in most countries it took a foreigner rather a long time to understand the views and policy of the many different groups and sections in the representative assemblies. Each of them usually had their organisations and their special point of view. He replied that in Meccania the State itself was the only political organisation.

"But," I said, "when your members of the National Council meet, do they not fall into groups according to their views upon policy?"

"They are grouped according to classes, of course," he answered. "Each of the seven classes has the same number of representatives, and there is no doubt a tendency for the representatives of each class to consider things somewhat from the point of view of the interests of their class. But the members have no meetings, except in the full assembly and in the committees. Such groupmeetings form no part of the Constitution. We do not do things by halves. When the State decided to have nothing to do with party government, it decided also not to have anything to do with group government. There is no room for such trifling in Meccania. So you see there is nothing for you to investigate in this direction."

"The classes themselves, then? Is there no body of opinion, no collective political tradition or sentiment cultivated by the various classes?"

"You might find something there," said Lickrod, musing a little. "But except in the shape of books I do not know how you would get at it."

"But all books are censored, are they not?" I said.

"Certainly, but how does that affect the question?"

"Books would hardly give me a truthful idea of all the currents of thought."

"But surely you cannot suppose that the State would assist you in trying to discover things which, by its deliberate action, it had already thought it desirable to suppress?" he answered. " Besides," he added, "such things belong rather to the pathology of politics. By the way, you would find some useful matter in Doctor Squelcher's great work on Political Pathology."

"That is a new term to me," I said. "Doctor Squelcher's researches have proved invaluable to the Special Medical Board in connection with the disease Znednettlapeseiwz (Chronic tendency to Dissent) which you also had not heard of."

In view of this conversation my attempt to investigate Meccanian politics did not seem likely to meet with much success.

Before seeing Mr. Kwang again, I received an invitation to dine with a certain Industrial Director Blobber, one of the persons to whom I had a letter of introduction. He lived in a very pleasant villa in the Third Quarter, and as it was the first time I had had an opportunity of seeing the interior of any private menage, I was naturally rather curious to observe everything in the house. The door was opened by a servant in a livery of grey. The hall was spotlessly clean, and decorated in yellow tones, to indicate the class to which my host belonged. I was shown into what I took to be a drawing-room, the prevailing tone of which was also yellow. The first thing that struck me was the peculiar construction of the easy chairs in the room. They were all fitted with mechanical contrivances which enabled them to be adjusted in any position. At first I thought they were invalids' chairs, but they were all alike. The other furniture suggested the latest phases of Meccanian decorative Art, but it would be tedious to describe it in detail. The frieze was decorated with a curious geometrical design executed in the seven colours. There were silk hangings which at first I took to be Chinese, but which I soon saw were imitations. The carpet had the Imperial arms woven in the centre. It seems it is one of the privileges of officials of the Third Class to have the Imperial arms as a decoration on certain articles of furniture; only members of the Second and First Classes may have their own arms. The mantelpiece was large and clumsy. A bust of the reigning Emperor stood on one side and one of Prince Mechow on the other.
Mr. Blobber joined me in a few minutes. He was dressed in a lounge suit of bright yellow with green buttons. (The buttons indicated that he had been promoted from the Fourth Class.) He was polite, in a condescending sort of way, and spoke to me as if I had been a child. He was a foot taller than I am, and decidedly portly in build. He had a red face, a rather lumpy nose and a large bald forehead. He wore spectacles and was decorated with the Mechow beard, which he not only stroked but combed in my presence.

After the first formal greetings, he said, "So you have come all the way from the other side of the world to see our wonderful country. You had all the countries in the world to choose from, and you had the good sense to come to Meccania. You decided well, and I hope you have been profiting by your stay."

"Yes," I said; "I have seen a great many things to admire already."

"For example?" he said.

"The wonderful roof of your Great Central Station," I said.

"Ah, yes, unique, is it not? We have, of course, the finest railway stations in the world, and the finest railway system too. But that is only part of our industrial organisation."

"You have indeed a wonderful industrial system," I said, "and no industrial problem."

"No industrial problem?" he replied. "We have a great many. We do not produce half enough. Of course, compared with other countries, it may seem that we are doing very well, but we are not satisfied."

"I meant rather that you have no disturbances, no strikes, no Trade Unionism or anything of that sort."

"Of course, you cannot help thinking of what you have seen in other countries. No, we have no time for nonsense of that kind. But I take no interest in that sort of thing. I have enough to do with my work. The chief Director of the Imperial Porcelain Factory is a busy man, I assure you."

At this moment Madame Blobber came in and I was introduced to her. She was a great contrast to her husband in many ways. She was tall and rather thin—at any rate for a Meccanian—and would have been graceful but for a certain stiffness and coldness in her manner and bearing. She had a pale face with cold blue eyes. Her mouth was rather large, and her lips thin and flexible. While her husband's voice was leathery, like that of most Meccanians, hers was thin and penetrating, but not loud. We crossed into the dining-room. A butler in a chocolate-coloured livery saw that all was in order, and left the room. Waiting was unnecessary. The first dishes were on the table, where they were kept hot by electricity, and others on the sideboard were afterwards handed by a woman servant in a grey uniform.

It was a rather silent meal. Mr. Blobber was much occupied with his food, which he evidently enjoyed, and at a later stage he relapsed into a sleepy condition. Madame Blobber then took the lead in the conversation. She was evidently a very well-read woman, especially in all matters relating to Art. I suspected she had no children and had made herself a blue-stocking. She talked like a professor, and with all the dogmatism of one. She said the Chinese had never had any true knowledge of colour. They had merely hit upon some colours which were pleasing to a crude taste. The Meccanians in fifty years had absorbed all the knowledge the Chinese had ever possessed, and much more besides."

I ventured to say that there were still some secrets of artistic production in porcelain that foreigners had not discovered. She laughed at the idea. The' secrets,' she said, were the very things the Meccanian experts had rejected as of no value. I might as well say that the Chinese political constitution was a secret because the Meccanians had not adopted it. When I suggested that scientific knowledge was not a complete equipment for Art, and would not necessarily increase the artistic powers of a nation, she said this was a mere superstition. Art was not a mystery. Every work of art admitted of being analysed; the laws of its production were ascertainable; and it could be reproduced or modified in every conceivable way.

I asked if the same were true of music. I had heard, I said, that for nearly a hundred years even the Meccanians had produced no great musician.

"Another superstition," she declared. "The great musicians, as they were called, were merely the pioneers of music. Their works were much overrated in foreign countries. We have proved by analysis," she said, "that they were merely groping for their effects. We know what they wanted to effect, and we have discovered how to get those effects. Musical psychology was an unknown science a hundred years ago. Why, the old composers had simply no means of testing the psychological effects of their works by experiment."

"I am afraid I am very ignorant of musical science," I said. "In fact, I did not even know there was such a thing as a science of music."

"What did you think music was?" she almost snapped.

"Simply one of the Arts," I said.

"There can be no art in the proper sense without a science."

"But I thought you Europeans considered that in Sculpture, for example, the Ancients had never been surpassed; and yet they had no science of sculpture."
"Their science was probably lost: but we have recovered the true science. The basis of all sculpture is accurate measurement. Whatever has bulk, whatever occupies space, can be measured, if your instruments are fine enough. Our instruments are fine enough. We can reproduce any statue ever made by any artist."

"But that is only copying," I said. "How do you create?"

"The process is a little more elaborate, but the principles are exactly the same. Even the classical sculptors had models, had they not? Well, our sculptors also use models; they pose them in thousands of different positions until they have the attitude they want; they have instruments to enable them to fix them in position, and the rest is merely accurate measurement."

"I should never have imagined that sculpture had been carried to such a point," I remarked. "Is there much of it in Meccania?"

"Not a great deal of the finer work. Accurate measurement is a slow and costly business even with our improved instruments."

"Tell me," I said,--"you see I am very ignorant of Art as understood in Meccania,--has Literature been pursued by the same scientific methods?"

"It depends upon what you mean by Literature," replied Madame Blobber.

"Broadly speaking," I said, "I mean the art of expressing ideas in language that satisfies one's sense of beauty."

"All our professional writers go through a period of training in the particular department they cultivate. For example, our writers of history are very carefully trained, writers of scientific treatises also."

"But what of your novelists and poets?" I asked.

"We do not specially encourage the writing of novels. All stories are merely variations of a few themes: all the stories worth writing have been written long ago. We print a certain number of the old novels, and we employ a few specialists to 'vamp' up new stories from the old materials, chiefly for the benefit of the lower classes. We Meccanians never really took to novel-writing, except under foreign influence, and that passed away long ago. The theme of almost all novels is domestic life and individual passion: they treat of phases of thought and feeling that our Culture tends more and more to make obsolete. We have developed the Drama much more; in fact, the drama takes the place of the novel with us."

"I have heard something of your Drama from Dr. Doddeler," I said.

"Indeed! Then you understand the fourfold treatment. That in itself would explain why we have discarded the novel. We still keep up the philosophical parable, which is a sort of link between the novel and our modern drama."

"I am afraid I should find it difficult to appreciate some of your plays," I said; "Uric Acid, for instance."

"That is only because our mental environment is in advance of the rest of Europe. Physical science, including of course medical science, is part of our mental furniture: we have assimilated whole masses of ideas that are still unfamiliar to other peoples. Naturally our drama finds its material in the affairs that interest us."

"And Poetry?" I said. "Is Poetry still cultivated?"

"Naturally! Most of our dramas are in poetry: our language lends itself admirably; it is almost as easy to write poetry as prose in our language."

"But is there no lyrical poetry?"

"Certainly; we utilise it as one of the means of cultivating the Meccanian spirit, especially among the young. No poetry is published unless it contributes to the uplifting of the Meccanian spirit."

At this point Director Blobber woke up and proposed that we should retire to his study for a glass of spirits and a cigar. Madame Blobber left us, and for the next half-hour I did my best to keep Mr. Blobber awake. But it was evident he wanted to go to bed, and by half-past nine I left the house, without any desire to see either of my hosts again.

Two days later I received another invitation, this time to dine with an Under-Secretary of the Ministry for Foreign Affairs. I had not presented any letters of introduction to him. I could therefore only suspect that this invitation was in some way due to Mr. Kwang. I went, of course; but I could hardly help wondering what was in store for me. Under-Secretary Count Kraft belonged to one of the great families and wore the uniform of the Second Class, with a badge to indicate that he was now in the Civil Service, although of course he had served as an officer in the army. His wife was apparently dining elsewhere, for I saw no sign of her, and we dined tete-a-tete in a small apartment in his large mansion in the Second Quarter. He was much more a man of the world than the others I had met, and in his manners resembled the men of good family whom I had met in Luniland. After a short preliminary talk, about nothing in particular, he said he was sorry that he had not learnt of my presence in Mecco when I first arrived, particularly as I was a friend of Mr. Kwang.

"The applications from foreigners for permission to travel in Meccania," he said, by way of apology, "are not very numerous, and they are always referred to me for my signature. Yours reached us from Luniland, and was regarded as that of a mere globe-trotter. It is a pity you did not give the name of your friend, Mr. Kwang, as a
reference. We think very highly of Mr. Kwang, and I should be pleased to give special facilities to any of his friends.

"I don't suppose you have been neglected," he added; "our officials have instructions to pay attention to the comfort of all Foreign Observers, and I am sure we do more for them than any Government I am acquainted with."

We were by this time about half-way through dinner, and under its influence I ventured upon a mild joke.

"You do everything for them," I said, "except leave them alone."

He took this in good part.

"You have been in Luniland," he remarked, "where every one does what he pleases. When you have spent as long a time here you will appreciate the wisdom of our arrangements. No doubt it seems a little irksome at first, and perhaps rather dull, especially as you have seen only the mere routine aspects of the life of the lower and middle classes--I use the old-fashioned terms, you see. But how else would you arrange matters? We cannot invite all foreign visitors, indiscriminately, to take part in our higher social life, and it would not be fair to our own citizens to allow foreigners a greater liberty than we allow to ourselves."

"So you put us in a strait-jacket," I said, laughing, "because you have to put your whole nation in a strait-jacket."

"Our whole nation in a strait-jacket," he replied, with a smile. "So that is how it strikes you, is it?"

"Well, isn't it so?" I said. "Your children are sorted out while they are at school, their play is turned into useful employment, their careers are decided for them; hardly any of them rise out of their original class. Then everybody is under the eye of the Time Department, everybody is inspected and looked after from the cradle to the grave. It is almost impossible to commit a real crime or to set up any independent institution. There is, you must admit, a certain want of freedom in your arrangements."

"But of what people are you speaking?" said Count Krafft. "You seem to have confined your attention to the lower classes. For them, in all countries, something of a strait-jacket is needed surely. Certainly it is for ours. We know our own people. When they are properly drilled and led they do wonders, but left to themselves they have always relapsed into laziness and barbarism, or else have burst out into anarchy and revolutionary fury."

"But what scope does your system allow for their energies?" I asked. "Every aspect of life seems confined by your meticulous regulations."

"That is an illusion," he replied. "You see, we are a highly intellectual people and it is quite natural for us to formulate regulations. Modern life is necessarily complex, and the chief difference between us and other nations is that we recognise the complexity and organise our activities accordingly. We are simply in advance of other nations, that is all. Take a simple thing like Railways. We organised our Railway system to suit our national purposes instead of leaving them to commercial enterprise. Take the Education of the people. The State took charge of it fifty years before other nations recognised its vital importance. Take the question of Public Health; even those States which prate about individual liberty have had to follow in our wake and organise the medical service. Besides, it is only by organising the activities of the lower classes that the State can maintain its supremacy."

"I see," I replied, "the strait-jacket is for the lower classes. I thought it was a garment worn by everybody."

"The expression was yours," he said, with an indulgent smile. "We certainly do not regard it as a strait-jacket."

"That is perhaps because the ruling classes do not wear it," I replied.

"We do not recognise any classes as ruling classes," he said suavely. "It is an obsolete expression."

"But I thought you liked to recognise facts and call things by their proper names," I replied.

"Certainly we do," he answered. "But which are the ruling classes? The Super-State is the supreme and only ruler in Meccania."

"Even in a Super-State," I said, "I should have thought, from what you have said, that some groups of persons really wielded the power of the State."

"Under the crude organisation of most foreign States that is quite possible," answered Count Krafft; "but the essence of the Super-State is that, in it, power cannot be exercised without authority, and only these persons are authorised through whom the Super-State chooses to express its will. It places everybody in such a position as enables him to render the greatest service to the State that he is capable of rendering. Consequently no fault can be found, by any class or section, with the power exercised by any other class or section; because they are merely the instruments of the State itself."

"That sounds a very comfortable doctrine for those who happen to wield the power," I said. "It leaves no room for any opposition."

"The Super-State would not be the Super-State if it contained within it any opposition," he replied. "You ought to read the speech of Prince Mechow on the Super-State as the final expression of the Meccanian spirit," he went on. "Foreigners are apt to confuse the Super-State with an Autocracy. It is essentially different. In an autocracy of the crude, old-fashioned type, an exterior power is visible, and your talk of ruling classes would be appropriate there. In the Super-State all the functions are so organised that the whole body politic acts as one man. We educate the will of
the component units in such a way that all conflicting impulses are eradicated. After all, that was the ideal of the Catholic Church. Prince Mechow applied the same principle when he reformed our Educational system. A good Meccanian would no more seek to violate the obligations laid upon him by the Super-State than a good Catholic would seek to commit deadly sin.

"Then there is no room for a Free Press in the Super-State," I remarked.

He saw my point and replied, "A' Free Press,' as you call it, would be an anachronism. What necessity is there for it? Its function has disappeared. It only existed during a brief historical phase in the earlier development of the modern State. Our great Prince Bludiron was the first to perceive its inconsistency with the line of true development. Prince Mechow absorbed all the functions of the independent professions, and among them those of the journalists, who were always an element of weakness in the State."

"But what, then, is the object of this complete Unity which, as far as I can make out, the Super-State seems always to be aiming at?" I asked.

"The object?" he replied, almost bored by my pertinacity. "Unity is the law of all organic life. We are simply more advanced in our development than other States, that is all."

"Then it is not true that all this super-organisation is for the purpose of fostering national power?" I said.

"That is the argument of the weak against the strong, the poor against the rich, the ignorant against the educated. Every healthy person is a strong person; the rich man is stronger than the poor man; the educated man is stronger than the ignorant. The modern State, even among our neighbours, is infinitely' stronger' than the incoherent political organisms of earlier times. It cannot help itself. Its resources are enormously greater. How can the Super-State help being strong? No State deliberately seeks to weaken itself, or deprive itself of its natural force." Then, as if tired of the discussion into which our conversation had led us, he said, "But these are all matters about which you will learn much more from my friend the Professor of State Science. I am afraid I have been dishing up one of his old lectures. You will find this liqueur quite palatable."

We then drifted on to more trivial topics. He said I had spent too long among the petty officials, grubbing about with my Tour No. 4. I ought to see something of better society. Unfortunately it was the dead season just then, and I might have to wait a little time, but there were still some dinners at the University. Some of the professors never went out of Mecco and would be glad to entertain me.

We parted on very good terms. His manner had been friendly, and if he had done little besides expound Meccanian principles he had had at any rate not been dictatorial. I wondered whether he really believed in his own plausible theories or whether he had been simply instructing the Foreign Observer.

When I saw Mr. Kwang a day or two afterwards â this time alone--he greeted me cordially and said, "So things are improving?"

"They promise to do so," I said, "but so far, all that has happened has been a very tedious visit to Director Blobber and an academic discussion with Count Krafft."

"So you don't appreciate the honour of dining with an Under-Secretary of the Super-State?" he said. "You have stayed too long in Luniland."

"I am promised the privilege of seeing something of the best Meccanian Society, but what I was more anxious to see was the worst Meccanian Society."

"They will take care you don't," he answered, laughing.

"But why? In any other country one can associate with peasants or vagabonds or artisans or tradesmen or business men."

"You ought to know by this time--I am sure it has been explained to you over and over again. You would gather false impressions, and you might contaminate the delicate fruits of Meccanian Culture."

"That is the theory I have heard ad nauseam. But there is nothing in it."

"Why not?"

"Because by keeping us apart they arouse the suspicions of both."

"Oh no, they may arouse your suspicions, but the Meccanian knows that what the State prescribes for him must be for his good. This is the only country where theories are carried into practice. It is a Super-State."

"And you admire it? You have become a proselyte," I said jokingly.

"Have you read my books yet?" he asked. "I saw one for the first time this week," I said.

"Well?"

"I recognise it as a masterpiece." He bowed and smiled. "From the President of the Kiang-su Literary Society that is high praise indeed."

"I am undecided whether to remain here longer," I said, "or to return home, perhaps calling for a rest and a change to see my friends in Lunopolis. I should like your advice."

"Of course that depends upon circumstances. I do not yet understand your difficulty or the circumstances."
"Well," I said, "I came here prepared to stay perhaps a year, if I liked the country, with the intention of obtaining general impressions, and some definite information on matters in which I am interested; but every Meccanian I have met is either a Government agent or a bore."

"What, even Madame Blobber?" he interposed, smiling.

"Even Madame Blobber," I said. "I am getting tired of it. I try all sorts of means to gratify my perfectly innocent curiosity, and am baffled every time. Now I am promised a sight of high Society, but I expect they will show me what they want me to see and nothing they don't want me to see."

"Why should they show you what they don't want you to see?" he laughed.

"I don't know how you stand it," I said.

"I have had the virtue of patience," he said, "and patience has been rewarded. I, too, am going home before long. I have got what I want."

He made the signal that bound me to absolute secrecy, and told me what his plans were. When I said that he ran a risk of being victimised he shook his head. "I am not afraid," he said. "By the time I reach home, every Meccanian agent in China will have been quietly deported. And they will not come back again. We are not a Super-State, but our country is not Idiotica."

"And in the meantime," I said, "suppose I stay here another month or so, what do you advise me to do?"

"Oh, just amuse yourself as well as you can," he said.

"Amuse myself! In Meccania?"

Yes; it is not worth while trying now to do anything else. You will find out nothing new--nothing that I have not already found out. It takes ten years to penetrate beneath the surface here, even with my methods," he said. "But I have got what I want."

"And how am I to amuse myself?" "Accept all the invitations you get, keep your ears open and use your own considerable powers of reflection. By way of relief, come and talk to me whenever you want."

I followed Sz-ma-Kwang's advice: I gave up all thought of investigating either Meccanian Politics, or social problems, or anything of the kind. I thought I should probably get better information at second hand from Mr. Kwang than I could get at first hand for myself, in the short time that I was prepared to stay, and I am satisfied now that I decided rightly.... I saw Lickrod almost daily, and went with him to a number of places, museums, the great library, industrial exhibitions, manufactories and so forth. We spent a day or two looking at examples of Meccanian architecture, which was more interesting from the engineering point of view than from the artistic. I began to receive invitations to several houses, chiefly of high officials in the Civil Service and one or two members of the higher bourgeoisie.

In the meantime I had some interesting conversation with my friends, Mr. Johnson and Mr. Villele, as we sat in the garden after dinner. I had never yet asked Mr. Johnson why he was pursuing what I could not help thinking was the distasteful study of Meccanian Pedagogics, but as Lickrod had recommended me to talk to Mr. Johnson about Meccanian education the question came up naturally. I put it to him quite frankly.

"You are what I should describe as an Anti-Meccanian by temperament," I said, "and it seems very odd that you should be studying Meccanian Pedagogics of all things in the world."

"It is because I am an Anti-Meccanian, as you put it, that I am doing so," he replied. "You see in Luniland we never do things thoroughly--thank God!--and we have no pedagogical system. But every now and then a sort of movement arises in favour of some reform or other. For a long time Meccanian education was out of court; people would hear of nothing that savoured of Meccania, good or bad. Then there was a revival of interest, and societies were started to promote what they called Education on a scientific basis--by which they meant, not the study of science, but Meccanian education. As Professor of Education in one of our smaller Universities I was obliged to take some line or other, and the more I studied Meccanian Education from books, the less I liked it. So I came to equip myself with a better knowledge of the whole thing than the cranks who have taken it up."

"I suppose you find some things worth copying," I suggested, "in a field so wide, especially seeing that they have applied psychological science to methods of study?"

"Oh yes, there are certain pedagogical tricks and dodges that are decidedly clever. In fact, if the human race were a race of clever insects, the Meccanian system of education would be almost perfect. The pupils store up knowledge as bees store honey, and they learn to perform their functions, as members of an organisation, with wonderful accuracy. I cannot help thinking sometimes that Meccania is a society of clever insects."

"Exactly," struck in Mr. Villele. "There are the soldier ants, and the slave ants, and the official ants, and the egg-producing ants. We ought to call Meccania the Super-Insect-State, eh?"

"Yes; the land of the Super-Insects," said Johnson. "No person in Meccania, certainly no child, is ever looked upon as an' end in itself; he is simply one of a community of ants."

"Of course," I said, "to be quite fair, we cannot consider anybody strictly as an end in himself, even in
"Luniland."

"Theoretically that is so," replied Johnson, "but in practice it makes all the difference in the world whether you regard a man as an individual soul, or as a cell in an organism or a wheel in a machine."

"Why do you Lunilanders and Francarians, if I may ask such a large question, allow yourselves to be influenced at all by what is done in Meccania?

There is so little intercourse between the countries that it hardly seems worth while having any at all," I said.

"Because in both countries there are still many people who regard the Meccanians not as Super-Insects, but as human beings," answered Johnson. "And there is always, too, the ultimate possibility of conflict. If they were on another planet it would not matter, providing they could invent no means of communicating with us. In itself Meccanian education is of little interest, except, of course, as education in the insect world might be interesting, or perhaps as a branch of pedagogical pathology or psychological pathology."

"In effect," interrupted Mr. Villele, "it all comes back to what Mr. Johnson was saying a few nights ago, that the key to the whole polity of Meccania is military power. Meccanian education is merely a means to that end, just as the Time Department, and every other institution--and the absence of certain other institutions like the Press, for example -- is. The Super-State is the grand instrument of Militarism."

"Is it not possible," I said, "that the real key to the Super-State is the desire of the ruling classes to keep themselves in power?"

"But the two things go together," answered Villele. "The Meccanian maxim is that 'The State must be strong within in order to be strong without.'"

"And is not that true doctrine?" I said, wondering how they would answer the argument.

"To a certain extent," answered Johnson cautiously. "But where are their enemies? Why should they want all this 'Super-Strength'?"

"They say they are surrounded by unfriendly nations," I replied.

"So they are," answered Villele, "but they have done their best to make them unfriendly. If you knock a man down, and trample on him, and rob him into the bargain, you can hardly expect him to be a friendly neighbour next day."

"We started by talking about education," I remarked, "but we have very soon got into a discussion about Militarism--somehow we seem to get to that no matter what point we start from."

"And with very good reason," said Villele. "There used to be a saying that all roads lead to Rome. In Meccania all roads lead to Militarism. You who are not faced by the problem it presents may regard it as an obsession, but a man who refuses to admit the plainest evidence is also the victim of an obsession."

"And you think the evidence is unmistakable?" I said.

"For what purpose does the Meccanian Parliament--if it can be called a Parliament--surrender its control over taxation? For what purpose does the Government conceal its expenditure upon army and navy? For what purpose does it destroy the freedom of the Press, and freedom of speech? For what purpose does the Government keep every person under supervision? For what purpose does it control all production?"

"I cannot answer these questions," I said; "but what evidence is there that the Meccanian system of education is designed as part of the scheme of Militarism?"

"The evidence is abundant," answered Johnson, "but it is not so plain as to be unmistakable. If you see one of our elaborate pieces of modern machinery, a printing-machine or a spinning-machine, you will find that it contains a thousand separate contrivances, and unless you are an expert you will not be able to perceive that every part is absolutely necessary to the performance of the simple function of printing or spinning. Yet that is the fact. It is just the same with the Meccanian educational machine. Its chief purpose, according to the Meccanian theory, is to enable the citizen-- or, as Villele and I might say, the Super-Insect-- to perform his functions as a member of the Super-Insect community. But the chief end of the Super-Insect State is Power. The Meccanians say so themselves. Anyhow, we can easily see for ourselves that their system of education fits in exactly with Militarism. It makes men efficient for the purposes required of them by the Super-State; it makes them not only docile and obedient, but actively devoted to the interests, not of themselves individually, but of what they are taught to regard as something more important, namely, the Super-State; it fosters the superstition which makes possible such an incredible custom as Villele has told you of; it keeps them ignorant of all other ideals of civilisation."

"All that may be true," I replied. "It may very well be that the system of education does favour Militarism, but it may not have been deliberately designed to that end. It has been put to me," I added, "that all this elaborate organisation, including education, is part of the inevitable tendency of things in the modern world, and that the Meccanians are only doing a little in advance of other people what they will all do sooner or later."

"That won't do at all," interposed Villele. "They cannot have it both ways. What becomes of the genius of Prince Mechow if it is all an inevitable tendency? They tell us other nations are not clever enough, or not far-seeing
enough, or not strong-willed enough, to produce such a system. These reforms had to be introduced in the teeth of opposition. Other nations have not adopted them and will not adopt them except under the pressure of fear. It is Militarism alone that is strong enough to impose such a system."

"But," said I, "I find it difficult to believe that any civilisation, even Meccanian, can be really the result of the domination of a single idea. Not even the communities of the ancient world were so simple in their principles."

"That fact tells in favour of our contention," answered Villele.

"How so?" I said.

"Why, you admit the natural tendency of all civilised peoples towards diversity of aims. The more highly developed, the more diversified. If, therefore, you find a people becoming less diversified, subordinating all individual wills to the will of the State, you must suspect some extraordinary force. You would not deny the fact that individual liberty has been suppressed?"

"No," I said, "I do not deny that."

"But you think the Super-State has such an interest in the tender plant of the individual souls of its children, their moral and spiritual and physical life, that it is merely a meticulous grandmother trying to prepare them all for a better world, eh?"

I laughed.

"No, that won't do. Only two things are strong enough to suppress the spirit of liberty: one is superstition calling itself religion; the other is Militarism."

"If it were less well done," resumed Johnson, "it would be easier to detect. But it is diabolically well done. Who but the Meccanians would think it worth while to control the whole teaching of history for the sake of cultivating Militarism? In most countries anybody may write history, although very few people read it. Here only the official historians may write: only the books prescribed by the State may be read. And all the people while they are at school and college must read it. In this way they create a powerful tradition. One need not laugh at the idea of State historians. They have done their work too well for that. Their falsification of history is not a clumsy affair of inventing fairy tales. It is scientific falsification. They utilise every fact that can tell against, or discredit, other nations, and every fact about their own people which can raise their national self-esteem. The method is not new, for you may say that all historians are biased. But in other countries the bias of one historian is counterbalanced by the bias of others. The method is not new but the system is. As an example, take their treatment of a well-known Luniland statesman of the beginning of the last century—and this is a fairly harmless instance. He was undoubtedly a single-minded, public spirited man, a patriot who was also a good European, for he did as much as any one man to save Europe from a military tyranny. But he shared many of the current ideas of his age and lived according to its customs. In Meccanian history all we are told of him is that he drank heavily, gambled, persecuted ignorant and misguided labourers, bribed the people's representatives, enriched capitalists and landlords by his fiscal system, and displayed his ignorance of finance by inventing a fallacious Sinking Fund that any schoolboy could see through."

"Mr. Johnson is putting the case much too mildly," interposed Villele. 'There are in the 'reports' issued by the Government on all sorts of matters, but particularly with regard to foreign affairs, falsifications of fact of the most barefaced character. Now the writers of the school and college histories quote very extensively from these official reports, implying always that the statements are true. Further than this, you know, but not perhaps as well as we do, that in countries where speech is free and the Press is free there are any number of libellous writers who vilify their opponents in a shameless fashion. In Luniland in particular, if my friend will pardon my saying so, there are enthusiasts for some particular cause who have no sense whatever of proportion. For instance, to hear some of the so-called Temperance advocates you would imagine that the Lunilanders were a nation of drunkards, wifebeaters, seducers, abandoned wretches of every kind. To listen to their Socialist fanatics you would imagine that every working man was a down-trodden slave. To listen to their anti-vivisectionists you would imagine that the whole medical profession spent its leisure in the sport of torturing animals. To listen to some of the priests you would think the whole nation was sunk in vice.

To listen to the anti-priests you would think the priests were a tribe of grasping hypocrites, and so on and so on. Now you will find Meccanian histories, and works on the social and political life of foreign nations, full of quotations from such writers."

"As I said at the outset," remarked Johnson, "this may seem a little thing in itself, but it is symptomatic and characteristic. Look at an entirely different aspect of the system. The whole teaching profession is honeycombed with sycophancy. Every teacher is a spy upon every other. Every one tries to show his zeal, and gain some promotion, by a display of the Meccanian spirit. As you know, there are no private schools. There is not a single independent teacher in the whole country. It is in the Universities even more than in the schools that sycophancy runs riot."

"That may be perfectly true," I said, "but would you not get this disease of sycophancy wherever you have a
bureaucracy, quite apart from Militarism? Suppose there were no army at all, but suppose that the State were the sole employer and controller of every person and thing, you might still have all the petty tyranny and sycophancy that you describe."

"But there is a difference," said Johnson. "Under a mere bureaucracy it is still possible for the large groups of workers to combine, and very effectually, to safeguard their interests; especially if at the same time there is a real parliamentary system. Indeed, many years ago one of the strongest arguments brought forward in Luniland against any large extension of State employment was that the employees, through their trade combinations, would be able to exert political pressure, and rather exploit the State than be exploited by it. No, I maintain that a military autocracy without a bureaucracy may be brutal and tyrannical, in a spasmodic sort of way; but it is loose-jointed and clumsy: a bureaucracy apart from a military control of the State may be meddlesome and irritating; but it is only when you get the two combined that the people are bound hand and foot. Anyhow, I cannot conceive of the whole teaching profession, including the highest as well as the lowest branches, being so completely enslaved as it is here, without there being a driving power at the back of the bureaucratic machine, such as only Militarism can supply in our times--for religion is out of the question."

"Well, now, is there any other sort of evidence," I said, "that the educational system is inspired by Militarism? So far the case is not proven."

"The cultivation of the Meccanian spirit,' which is one of the prime aims of all the teaching, points at any rate in the same direction."

"But the Meccanian spirit is only another name for patriotism, is it not?" I said.

"Your scepticism," remarked Villele, 'would almost make one suppose you were becoming a convert to Meccanianism."

"Not at all," I said. "I have tried to get firsthand information on these matters and I have failed. Here I am, listening to you who are avowedly, if I may say so in your presence, anti-Meccanians."

"Would it not be foolish of me to accept your views without at any rate sifting the evidence as fully as I am able? It has this advantage, I shall be much more likely to become convinced of the correctness of your opinions if I find that you meet the hypothetical objections I raise than if I merely listen to your views."

"The Meccanian spirit is another name for patriotism," said Johnson; "but it is Meccanian patriotism. Patriotism is not a substitute for Ethics in the rest of Europe, nor was it in Meccania two centuries ago. Absolute obedience to the State is definitely inculcated here. No form of resistance is possible. Resistance is never dreamt of; the Meccanian spirit implies active co-operation with the Super-State, not passive obedience only but reverence and devotion. And remember that the Super-State when you probe under the surface is the Second Class, the Military Caste."

"But do not all States inculcate obedience to themselves?" I said.

"No," replied Johnson bluntly. "They may inculcate obedience to the laws for the time being; it is only Churches claiming Divine inspiration that arrogate to themselves infallibility, and demand unconditional obedience. In the rest of Europe the State is one of the organs--a most necessary and important organ--of the community: here, the State or the Super-State is the Divinity in which society lives and moves and has its being. It is omnipresent, omniscient, omnipotent."

"Admitting all you say about the deliberate policy of the Super-State," I answered, "is it not strange that a hundred millions of people submit themselves to it, and that even outside Meccania there are many advocates of Meccanian principles?"

"Tyrannies have flourished in the world in every age," replied Johnson, "because there is something even worse than Tyranny. To escape a plague a man will take refuge in a prison. Anarchy, such as that which broke out in Idiotica some fifty years ago, was a godsend to the rulers of Meccania. They persuaded the public that there was a choice only between the Super-State and Anarchy or Bolshevism as it was then called. We know that is false. Liberty may be attacked by an open enemy or by a secret and loathsome disease; but that is no reason for surrendering either to the one or the other."

CHAPTER XI
AN ACADEMIC DISCUSSION

It was some days after this conversation with my friends at the hotel that I was present at a dinner-party given by the President of Mecco University. There were about thirty guests, so that at table a general conversation was almost impossible; I could hear only what was said by those close to me. I was seated between a member of the diplomatic corps and a general. General Wolf, a benevolent-looking old gentleman with a large, coarse face and a double chin, seemed rather disappointed that I could not discuss with him the Higher Mathematics. He deplored the neglect of Mathematics in Meccania. He admitted that unless a person had a mathematical brain it was useless to attempt to make him a mathematician; but he said the Eugenics section of the Health Department was not
sufficiently alive to the importance of improving the mathematical stock. He railed very bitterly against a member of the Eugenics Board who had tried to get authority to improve the supply of artists. Happily the Board had turned down his proposals. Count Hardflorgg, who wore the Mechow whisker and an eyeglass, and frowned fiercely at everything one said to him, was full of a recent report by the experts in the Industrial Psychology section of the Department of Industry and Commerce. It seems they had recommended a shortening of hours for the members of the Sixth and Fifth Classes in a number of provincial towns, to bring them more on a level with the same class of workers in Mecco itself. He said it was the thin end of the wedge; that they ought not to have reported until experiments had been made with a different diet: he blamed the Eugenics Section, too, for not being able to produce a tougher strain of workers. Reduction of working hours should not be resorted to, he maintained, until every other expedient had been tried: it was so very difficult to increase them afterwards. Besides, in the Strenuous Month, it had been proved over and over again that the men could easily stand a longer working day without physical injury.

"And what is the Strenuous Month?" I asked.

"Oh, of course," he said, "you have not studied our industrial system as a factor of military organisation. There is a very good account of it in Mr. Kwang's Triumphs of Meccanian Culture. Briefly it is this. Every year, but not always in the same month, the signal is given for the Strenuous Month to begin. The workmen then work at top speed, and for as many hours a day as the Industrial Psychologists determine, for thirty days consecutively. It is excellent training, and incidentally has a very good effect on the output for the other months of the year. The men are so glad when it is over, unconsciously, they work better for the rest of the year."

"But I should have thought they would be so fatigued that you would lose as much as you gain, or more perhaps," I said.

"Oh no," he answered; "they are allowed one day's complete rest, which they must spend in bed; their diet is arranged, both during the time and for a month after. They must go to bed for two hours extra every night for the following month. The effect is most beneficial. They like it too, on the whole, for they get paid for all the extra product—that is to say, it is added to their pension fund."

"But I thought the pension fund was so calculated," I said, "that it tallies exactly with what is required for the support of each man from the time he ceases to be able to work."

"Certainly," he replied. "After fifty-five most of our men work an hour a day less every two years, with variations according to their capacity, as tested by the medical examinations."

"Then how do they benefit," I asked, "by the product of the strenuous month, if it is only added to their pension and not paid at the time?"

"If it is added to the pension fund," he replied, "it is obvious that they must benefit."

I did not pursue the matter further. He asked me if I had been to the Annual Medical Exhibition. I said I had not heard of it, and did not suppose I should receive permission to see it, as I was not altogether well qualified to understand it. He said it was most interesting. He was not a medical man himself, of course; but as an officer in the army he had had to get some acquaintance with physiology.

"The medical menagerie gets more interesting every year," he said.

"The medical menagerie!" I exclaimed. "Whatever is that?"

"It is a wonderful collection of animals, not only domestic but wild animals too, upon which experiments have been carried out. There are goats with sheep's legs. There are cows with horses' hearts, and dogs with only hind-legs, and pigs without livers—oh, all sorts of things. The funniest is a pig with a tiger's skin."

"And what is the object of it all?" I said.

"Oh, just a regular part of medical research. The most valuable experiments are those with bacilli, of course; but only the experts can understand these, as a rule."

"But it is not safe to infer that the results of experiments on animals will be applicable to human beings," I said. "Of course not, without further verification; but the Special Medical Board have ample powers to carry out research."

"What, upon human beings?" I exclaimed.

"People do not always know when they are being experimented upon," he remarked significantly. "Besides, if a man is already suffering from an incurable disease, what does it matter? Of course, we use anaesthetics, wherever possible at least; that goes without saying."

After dinner we drank wine for a little time, seated in little groups after the manner of a custom in some of the colleges in Luniland. Here, instead of being placed with the two gentlemen who had been my neighbours at table, I was one of a group of four, the others being two professors and a high official in the Sociological Department. One of the professors was Secret Councillor Sikofantis-Sauer, an Economist; the other was Church Councillor Muhgubb-Slimey, a Theologian. We talked of indifferent matters for some time until the High Official left us, when the idea occurred to me to try whether the Economist would enlighten me upon the subject of the ultimate destination of the
phenomenal production of the Meccanian economic organisation.

I remarked that I had never seen in any country so few signs of discontent as in Meccania, and I asked if this was due to the great wealth that must necessarily be produced by the efficiency of the methods of production. Professor Sikofantis-Sauer, the Economist, said that my question betrayed that I was not acquainted with the Meccanian System of Ethics. I wondered why the Professor of Economics should begin talking of Ethics. He went on, "Social discontent was never really due to lack of wealth. Properly speaking, it has no relation to material wealth at all. This has been proved up to the hilt—if it needed any proof—by our researches in Economic and Social History. In a nutshell the proof is this. What was called poverty in the early nineteenth century would have been considered affluence in, let us say, the fifth or even the tenth century. The whole idea of wealth is subjective. Now anyone knows that, where wealth is allowed to become the main objective of the social activities of the people, the desire for individual wealth is insatiable. The notion that you can ever reach a state of contentment, by increasing the wealth of the people, is one of the greatest fallacies that even the economists of Luniland ever entertained—and that is saying a good deal. Consequently, if we have succeeded in eradicating discontent, it has not been by pursuing the mirage of a popular El Dorado. No, you must replace the insane desire for the gratification of individual indulgence by a conception of a truer kind of wellbeing. If the individual once grasps the fact that in himself, and by himself, he is little better than an arboreal ape, and that all he possesses, all he can possess, is the gift of the State—which gives him nourishment, language, ideas, knowledge; which trains him to use his powers, such as they are—he will assume an entirely different attitude. Our system of education, far more than our system of production, is responsible for the eradication of social and of every other kind of discontent."

"Then I suppose," I said, "the lower classes, as we sometimes call them abroad—your Fifth and Sixth and Seventh Classes, for example—never inquire whether they receive what they consider a fair share of the national product?"

Professor Sauer laughed aloud. "Pardon me," he said, "but you remind me of a story I used to hear when I was a boy, of a man who had slept in some cave or den for fifty years, or was it a century, and woke up to find a different world. Such a question belongs to the buried fossils of economic theory. Who can say what is a fair share? You might as well ask whether one musical composition is more just than another."

"Well, perhaps you can tell me this," I said. "Considering the superiority of your methods of production, I should have expected to find a much higher standard of individual wealth, or comfort, or leisure—yes, you know what I mean—among not only the lower classes, but all classes. I cannot help wondering what becomes of all the surplus."

"We have all enough for our needs," he said, "and the requirements of the State are of far more importance than the gratification of the tastes of individuals."

"May I put in a word?" said Professor Slimey the Theologian. "In the modern world, the productive powers of man have outstripped his other powers. It is one of the mysteries of the ways of Providence. The discipline of labour is necessary for the development of the soul, but the devil has sought to seduce mankind by teaching him how to produce more than is good for him, in the hope that he will become corrupted by luxury. In other countries that corruption has already taken place. The strenuous life is the only life consistent with moral health. Under the Divine guidance our ruling classes—I am old-fashioned enough to use that expression, for in the eyes of God there are no First or Second Classes—have preserved the sense of duty; they are a discipline unto themselves. God's blessings have been multiplied unto them, and they have not forgotten the Divine injunctions. We cannot expect that the masses of mankind can discipline themselves, and for them the only safety lies in well-regulated and well-directed labour. There can be no greater curse for a people than idleness and luxury. Fortunately, we have been able to preserve them from the evil effects of superabundant wealth."

"I have sometimes wondered," I said, "whether the requirements of the State in regard to what is called National Defence were so great as to account for the surplus product."

"Undoubtedly the demands of the army are very considerable," replied Sauer. "You must remember that we have to protect ourselves against the whole world, so to speak."

"But no estimate has been made, I suppose, of what is required for such things?" I said.

"That is a matter of high policy," replied Sauer. "It would be impossible to estimate for it as a separate item in National expenditure. There again you betray your Lunilandish conceptions of National finance. No doubt they keep up this practice still in Luniland, but such a notion belongs to a bygone age. The State must be able to mobilise all its resources; that is the only logical policy, if you mean to conduct the affairs of the nation successfully, not only in time of war but in time of peace. Your asking how much National wealth is devoted to Defence is like asking a man how much of his dinner is devoted to sustaining his religion."

"But is it not important to be able to form some approximate idea, from the economic point of view?" I said. "For, in one sense, it represents so much waste."

"So much waste?" exclaimed Professor Slimey indignantly; "to what nobler purpose could the energies of the
people be directed than to the defence of their Emperor, their God and their Fatherland?"

"I did not mean that it might not be necessary," I replied, "but it is like a man who has to build a dyke against floods. It may be necessary, but if he could be sure that the floods would not come, he could devote his energies to something more profitable."

Professor Slimey shook his head solemnly. "No, no," he said, "that is another of the fallacies current among foreign peoples. We should sink to their level if our people had not ever before them the duty of serving God by upholding the power of Meccania, his chosen nation. Indeed, I often think what a dispensation of Providence it is that it involves so much labour. Imagine the state of the common people if they could maintain themselves by the aid of a few hours' work a day!"

"Would there not be so much more scope for the spread of your Culture?" I said. "In fact, I had been given to understand that your Culture had reached such a high level that you could easily dispense with the discipline of long hours of labour."

"Our Culture," he replied, speaking with authority, "is not an individual culture at all. It must be understood as a unity. It includes this very discipline of which you seem to think so lightly. It includes the discipline of all classes. The monks of the Middle Ages knew that idleness would undermine even their ideal of life, for they knew that life is a discipline. Our National Culture is the nearest approach to the Christian ideal that any nation has ever put into practice."

"I cannot, of course, speak with confidence upon such a question," I replied, "but I thought the Christian ideal was the development of the individual soul, whereas the Meccanian ideal--I speak under correction--implies the elimination of the individual soul: everything must be sacrificed to the realisation of the glory of the Super-State."

"The Super-State," answered Slimey, "is itself the Great Soul of Meccania; it includes all the individual souls. What you call the sacrifice of the individual soul is no real sacrifice; it is merely a losing oneself to find oneself in the larger soul of Meccania. And just as the individual soul may inflict suffering on itself for the sake of higher self-realisation, so the Super-Soul of Meccania may inflict suffering on the individual souls within itself for the sake of the higher self-realisation. The soul of Meccania is as wonderful in the spiritual world as the material manifestation of Meccania is in the material world."

"I am sure you are right," I said, "although it never struck me in that light before. The soul of Meccania is the most wonderful phenomenon in the history of the world."

"No," replied Professor Slimey, with his solemn air, "it is not phenomenon: it is the thing in itself." Here he paused to drink a liqueur. Then he went on, "It is purely spiritual. It has existed from eternity and has become clothed and manifest through the outward and inward development of the Super-State. You foreigners see only the outward forms, which are merely symbols. It is the Super-Soul of Meccania that is destined to absorb the world of spirit, as the Super-State is destined to conquer the material world."

Professor Sikofantis-Sauer gazed with his fishy eyes, as if he had heard all this before. "Some day," I said, "I should like to hear more of the Super-Soul, but while I have the privilege of talking to both of you I should like to learn some things which probably only a Professor of Economics can tell me. You, as Meccanians, will pardon me, I know, for seeking to acquire knowledge." They nodded assent. "I know something of the economic ideas of other nations in Europe," I said, "but your conditions are so different that I am quite at sea with regard to the economic doctrines of Meccania. What Economic Laws are there within the Super-State?"

"A very profound question," answered Sauer, "and yet the answer is simple. What you have studied in other countries is merely the economics of free exchange, as carried on among peoples of a low culture. Our Economics have hardly anything in common. Some of the laws of large-scale production are similar, but beyond that, our science rests upon other principles. Our science is based upon Meccanian Ethics. The laws of demand have quite a different meaning with us. The State determines the whole character and volume of demand, and entirely upon ethical grounds."

"And distribution too, I suppose?"

"Naturally. That is implied in the regulation of demand. The State determines what each class may spend, and in so doing determines both demand and distribution."

"But I was under the impression that the well-to-do--the Third and higher classes generally--had much more latitude than the lower classes in these respects," I said.

"Quite so. That again is part of our national ethical system. Just as our Economics are National Economics, so our Ethics are National Ethics. The higher functions discharged by the higher classes demand a higher degree and quality of consumption. You will find some most interesting researches upon this subject in the reports of the Sociological Department. Dr. Greasey's monograph on the Sociological Function of the Third Class is also a masterpiece in its way."

"And the Second Class?" I said. "They will require still more latitude?"
"The Second Class, like the First," replied Sauer, "stands outside and above the purely Economic aspect of Society. Their function is to determine what the National-Social Structure shall be. Our business as economists is to provide ways and means. No doubt they are unconsciously guided, or shall I say inspired, by the workings of the Meccanian spirit, of which they are the highest depositaries; and all the organs of the State are at their service, to give effect to their interpretation of the will of the Super-State."

"You do not find any tendency on their part, I suppose, to make large demands for themselves in the shape of what we non-Meccanians persist in calling 'wealth'?" I said.

"Such a question," answered Sauer, "does not admit of any answer, because it involves a conception of wealth which we have entirely discarded. The Second Class—and with them, of course, I include the First Class, for they are indivisible in their functions and spirit—exists for the Super-State. Whatever they consume is consumed in the discharge of the highest duties of the State. Whatever is required by them is simply part of the necessary expenditure of the State. But although no limit is set—and who would presume to set any limit?—it is remarkable how little of this expenditure assumes the form of personal consumption. For the sake of the dignity of the State, their life must be conducted—collectively—on a magnificent scale. But, as you know, a dignitary like the Pope may live in the finest palace in Europe and yet be a man of simple tastes and habits; so our noble class—and no nobler class has ever existed—may represent the glory of the Super-State and yet be the embodiment of the purest virtues."

"I would go further," said Professor Slimey at this point. "Our noble Second Class—and of course I associate the First Class with them, for in reality they are all one—are the true Protectors of the State: they are the guardians of us all. Have you not noticed throughout all history that, after a successful war, the people are ready to bestow all manner of honours and benefits upon those who have saved their country? Well, I say those who have given us all the glory and honour, ay, and the spoils of victory too, without going to war, are as deserving of the rewards as if they had come back from a long campaign. We cannot honour them too much. Besides, it is good for the people to feel that there is a class upon whom they can bestow the natural warmth of their affection and their admiration. The desire to bow down in reverent admiration, the desire to do honour to the worthiest of our race, is a God-given impulse, and should be encouraged, not checked. Our people feel this. We do not bargain with them as to what share they shall have: we do not lay aside a tenth, or some such absurd proportion: we say, take our wealth, take whatever we can give, it is all yours, you are the fathers of the State, you are our saviours."

"And you think this spirit prevails throughout Meccania?" I said.

"I am perfectly sure of it," replied Slimey. "All our greatest artists offer their works freely to the members of the Second Class; all the most gifted scientists compete for places in the colleges for the training of the Military; the services of our best writers are at their disposal: we withhold nothing from them."

"Then it is true, I gather, that the custom I have heard of, by which wives and daughters of other classes, if they are thought worthy by the Eugenics Board, are—shall I say—dedicated to the service of the Second Class, arouses no feeling of indignation?"

"Indignation!" exclaimed the Professor of Theology. "It is a duty and a privilege."

"But is it not contrary to the principles of the Christian religion? I confess I speak with some hesitation, as I do not belong to the Christian communion; but I have been told by some of the strictest of the Christian sects in other countries that such a practice is a violation of the Christian code."

Professor Slimey refreshed himself, and I could see another long speech was coming. "That is a sample of the uncharitable criticism which is constantly being aimed at us, by those who cloak their envy and spite under the name of Christian doctrine. Yet they are utterly inconsistent with themselves. They admit the Doctrine of Development, yet they deny its application, except to suit their own purposes. Take Usury, for example. Christian doctrine, as expounded by the Fathers, regarded usury as sinful. Yet usury is practised in all so-called Christian countries without protest. Why? Because their system of Economics cannot work without it. I might give other illustrations, but that will suffice. Now Ethics must undergo development if there is to be progress in morals. The supreme well-being of the State gives the key to all progress in Ethics. If the custom you refer to were due to private concupiscence, we—and I speak for all Meccanian theologians—would be the first to denounce it. The sin of adultery is a spiritual sin, and exists only where carnal desire is the motive. Every theologian knows that the same physical act may be performed in conformity with the behests of the Mosaic law, or in direct disobedience of it. The one is a sacred duty, the other is sin. It is like the alleged obligation to speak the truth upon all occasions. There is no such obligation. We must look to the end in view. Where the supreme needs of the State demand concealment or even deception, the private ethical impulse to speak the truth to an enemy is superseded by the greater obligation to the State. The virtue of Chastity is not violated; it is raised, if I may say so, to its transcendent degree, by an act of sacrifice which implies the surrender of merely private virtue to the interests of the State; for you must remember that the State as developed by the Meccanian spirit is the highest embodiment of the will of God upon earth."

"We seem to have been carried rather a long way from Meccanian Economics," I remarked, turning to
Professor Sauer by way of apology for having carried on the conversation for so long with Professor Slimey.

"Not at all," he answered. "Meccanian Ethics and Meccanian Economics cannot be separated."

"It must make the science of Economics much more difficult in one sense; but, on the other hand, what a relief it must be to have got rid of all those old troublesome theories of value!" I observed.

"We have not got rid of theories of value," answered Sauer; "they too have only been developed. The basis of our theory of value is to be found in Meccanian Ethics."

"In other words," I said, laughing, "the value of a pair of boots in Meccania is determined by the theologians!"

"How do you mean?" asked Sauer.

"I mean that the remuneration of an artisan in the Fifth Class will purchase so many pairs of boots; and the remuneration of the artisan is determined by what the State thinks good for him; and what the State thinks good for him is determined by Meccanian Ethics; and I suppose the theologians determine the system of Meccanian Ethics."

At that point our conversation was interrupted by an announcement that the toast of the evening would be drunk. This was the signal for the party to break up. We drank to the success of the Meccanian Empire and the confounding of all its enemies, and I went home to the hotel to find a message from Kwang asking me to see him the following day. I spent the morning as usual with Lickrod, who was initiating me into the method of using the catalogues in the Great Library of Mecco. It was indeed a marvel of librarianship. There was a bibliography upon every conceivable subject. There was a complete catalogue of every book according to author, and another according to subject. There was a complete catalogue of the books issued in each separate year for the last twenty-five years. There were courses of study with brief notes upon all the books. Lickrod was in his element. As we came away, about lunchtime, I said to him, "Suppose I want to take back with me, when I leave the country, a dozen books to read for pure pleasure, what would you recommend me to take?"

"Upon what subject?" he asked.

"Upon anything, no matter what. What I am thinking of are books which are just works of art in themselves, pieces of pure literature either in poetry or prose."

"A book must be about something," he said; "it must fall into some category or other."

"Is there any imaginative literature?" I asked.

"Oh, certainly, we have scores of treatises on the imagination."

"But I mean books that are the work of the imagination."

"I see. You want them for your children, perhaps: they would be found in the juvenile departments; fables and parables, and that sort of thing."

"No, I mean books without any serious purpose, but for grown-up people. I seem to remember such works in the old Meccanian literature."

"How very odd," answered Lickrod, "that you should express a wish to see works of that kind."

"Why?" I asked, in some surprise.

"Because we find works of that kind in great demand in the asylums for the mentally afflicted. You see, we treat the inmates as humanely as possible, and our pathologists tell us that they cannot read the books by modern authors. We have to let them read for a few hours a day, and they beg, really rather piteously, for the old books. It is always old books they ask for. I suppose in a way they are cases of a kind of arrested development. At any rate, they have not been able to keep pace with the developments of our ideas. Doctor Barm reported only last year that the only books that seem to have a soothing effect on these patients are those written, oh, two hundred years ago, and of the very kind you probably have in mind."

CHAPTER XII

THE LATEST INSTITUTION

I WENT to see Kwang in the afternoon, and found him in a state of suppressed excitement—at least I could not help having that impression. After a little time, when I had given him some brief account of my experience at the dinner-party, he said, "I told you the other day that I had some thoughts of returning home. I shall be off in a fortnight."

"This is rather sudden," I said; "have you received bad news from home?"

"No," he said; "I told you I had practically completed my work. The fact is, that things are beginning to develop rather fast here. I see signs of preparation for a forward move."

"Oh!" I said. "Not another war?"

"Not necessarily," he replied. "Light your cigar and I will tell you all you need know. I did so and waited.

"The next war," he said, "will be a chemical war."

"A chemical war? What on earth is that?" I said.

"They have been experimenting for thirty years and more, and they think they have discovered what they want. It may take them several years to perfect their arrangements; it will certainly take them a year or two, and may take
six or seven. But one never knows. I suppose you never heard of the three days' war, did you?"

"No," I replied; "what was it?"

"The State of Lugrabia, with which the Meccanians are in permanent alliance, refused to ratify a new treaty that seemed unfavourable to them in some respects, and feeling ran so high that there was some talk in Lugrabia of putting an end to the alliance. Without any declaration of war the Meccanian Government dispatched a small fleet of air-vessels, planted about a dozen chemical 'Distributors,' as they are euphemistically called, and warned the Lugrabian State that, unless their terms were complied with, the twelve chief cities would be wiped out. The war was over in three days. And to this day the outside world has never heard of the event."

"How can it have been kept secret?" I said.

"Ask rather how could it leak out," replied Kwang.

"Anyhow," he went on, "they think they have got something that will enable them to defeat any combination. There is no question in dispute with any foreign power. The political horizon is perfectly clear. But it is time for me to go home."

"Do you think this idea of theirs is really dangerous?" I asked.

"Undoubtedly."

"But can it not be counteracted in any way?"

"If it can't it will be a bad look out for the rest of us," he said.

"But do you see any means of meeting it?"

"There is, if I can get the Governments to act. But they are at a tremendous disadvantage."

"Why?" I said.

"Because everything they do will be proclaimed from the housetops. However, what I wanted to do immediately was to arrange with you about leaving the country. Of course you will stay as long as you like, but I should advise you not to stay too long. I shall not announce that I am going away permanently, and I shall leave nearly all my things here to avoid suspicion; but within three months they will know that I am not likely to come back, and then they may want to look you up if you are still here."

"I shall go as soon as you think it is advisable for me to go," I said. "The only thing I wanted to make sure of was the thing you have apparently found out. Once or twice since I came I have felt sceptical about the Machiavellian designs attributed to the Meccanian Government by all these neighbours. Naturally they see a robber in every bush."

"I have sometimes been inclined to think the Meccanians like organising just for the love of it, but you are satisfied that there is more in it than that," said Kwang. "My dear child," he said, "there are some people who can't see a stone wall till they knock their heads against it, and who can't tell that a mad bull is dangerous till he tosses them in the air; and from what I learn you are almost as bad," he said, laughing. "You have been here, how long? Four or five months at any rate. Well, you have a very unsuspicious mind. But I am going to give you an interesting experience. I am going to take you to see a friend of mine who has been a prisoner in an asylum for the mentally afflicted for the last fifteen years. I enjoy the privilege of talking to him alone, and I have permission to take you. I won't stop to explain how I obtained the privilege, but it has been very useful."

In another quarter of an hour we were rolling along in Kwang's motor-car to a place about forty miles outside Mecco. The roads were as smooth as glass and the car made no noise, so we could converse without raising our voices. Kwang observed that if I wished to stay in Meccania there was only one way of getting behind the screen, and that was to become a convert. The role of a convert, however, was becoming more difficult to play. He had lately begun to suspect that he was being watched, or at any rate that one or two people at the Foreign Office were jealous of his privileges. Some years ago, the Head of the Foreign Office had given him practically the free run of the country, and had utilised him as a sort of missionary of Meccania. His books on the Triumphs of Meccanian Culture and on Meccania's World Mission had been given the widest possible publicity, both in Meccania and abroad. He still enjoyed all his privileges, for Count Krafft was a powerful friend at the Foreign Office. Consequently the Police Department had orders not to interfere with him, and he had free passes for almost everything. But another Under-Secretary had lately begun to question the wisdom of his colleague, not openly but secretly, and was trying to get hold of evidence.

"They lie so wonderfully and so systematically themselves," said Kwang, "that they naturally suspect everybody else of lying too. But this suspicion very often defeats its own object. Still, they can't expect to have a monopoly of lying. I have seen official pamphlets for circulation in the departments, on the methods of testing the bona fides of foreigners; and elaborate rules for finding out whether foreign Governments are trying to deceive them."

"And you have satisfied all their tests?" I said.

"Absolutely," replied Kwang, with a smile; "but I am not yet out of the country, and I don't propose to risk it.
tempted to lose patience. And their conceit! To presume that they--a few hundreds of them at most--know better. We cannot shut our eyes to the fact of moral responsibility, and when I think of the obstinacy of these men I am minister who realises his duties to the State as well as to the Church, always to feel charitably towards these patients. Have now fully demonstrated. As I say, it is self-induced, and it is therefore very difficult, even for a Christian.

Disease itself is certainly not inherited, and can be counteracted in its early stages by prophylactic treatment, as we about this disease," he said, "that the patients suffer no pain directly from it; and you must remember that in practically all cases--just as in alcoholism--it is self-induced. There may be some little hereditary tendency, but the younger generation are attacked by the disease, and the authorities hope "he smiled sardonically--"that in a few years the disease will have disappeared entirely." We first went to call upon Hospital-Governor Canting. He was in his office, which was comfortably furnished in very characteristic Meccanian taste. The chairs were all adjustable, and covered with 'Art' tapestry. The large table had huge legs like swollen pillars--they were really made of thin cast-iron. There were the usual large portraits of the Emperor and Empress, and busts of Prince Mechow and Prince Bludiron. There was the usual large bookcase, full of volumes of reports bound in leather-substitute, and stamped with the arms of Meccania. Governor Canting wore the green uniform of the Fourth Class, with various silver facings and buttons, and a collar of the special kind worn by all the clergy of the Meccanian Church. He was writing at his table when we were shown in. He greeted Kwang almost effusively and bowed to me, with the usual Meccanian attitudes, as I was introduced.

"So you have brought your friend to see our system of treatment," he said, smiling. "It is very unusual for us to receive visits at all,"--here he turned to me,â€”but Mr. Kwang is quite a privileged person in Meccania. If only there were more people like Mr. Kwang we should not be so much misunderstood, and the victims of so much envy, malice and uncharitableness. Still, it is a sad experience for you."

"Do many of them 'recant'?' I asked. "Very few. Most of them do not want to return to the ordinary life of Meccania, but occasionally the desire to be with some member of their family proves too strong for them. They are nearly all old people here now. None of the younger generation are attacked by the disease, and the authorities hope "he smiled sardonically--"that in a few years the disease will have disappeared entirely."

We first went to call upon Hospital-Governor Canting. He was in his office, which was comfortably furnished in very characteristic Meccanian taste. The chairs were all adjustable, and covered with 'Art' tapestry. The large table had huge legs like swollen pillars--they were really made of thin cast-iron. There were the usual large portraits of the Emperor and Empress, and busts of Prince Mechow and Prince Bludiron. There was the usual large bookcase, full of volumes of reports bound in leather-substitute, and stamped with the arms of Meccania. Governor Canting wore the green uniform of the Fourth Class, with various silver facings and buttons, and a collar of the special kind worn by all the clergy of the Meccanian Church. He was writing at his table when we were shown in. He greeted Kwang almost effusively and bowed to me, with the usual Meccanian attitudes, as I was introduced.

"So you have brought your friend to see our system of treatment," he said, smiling. "It is very unusual for us to receive visits at all,"--here he turned to me,â€”but Mr. Kwang is quite a privileged person in Meccania. If only there were more people like Mr. Kwang we should not be so much misunderstood, and the victims of so much envy, malice and uncharitableness. Still, it is a sad experience for you."

"Do many of the patients suffer acutely?" I asked, hardly knowing what was the right cue. "Oh, I did not mean that. No, no, they don't suffer much. But it is sad to think that men who might have been worthy citizens, some of them as writers, some as teachers, some even as doctors-- men who might have served the State in a hundred ways--are wasting their talents and hindering the spread of our Culture." "It must be a terrible affliction," I said. "Do they not sometimes feel it themselves in their moments of clearness of mind?"

He looked at me, a little in doubt as to my meaning, but my face must have reassured him. "The strange thing about this disease," he said, "is that the patients suffer no pain directly from it; and you must remember that in practically all cases--just as in alcoholism--it is self-induced. There may be some little hereditary tendency, but the disease itself is certainly not inherited, and can be counteracted in its early stages by prophylactic treatment, as we have now fully demonstrated. As I say, it is self-induced, and it is therefore very difficult, even for a Christian minister who realises his duties to the State as well as to the Church, always to feel charitably towards these patients. We cannot shut our eyes to the fact of moral responsibility, and when I think of the obstinacy of these men I am tempted to lose patience. And their conceit! To presume that they--a few hundreds of them at most--know better
than all the wise and loyal statesmen of Meccania, better than all the experts, better than all the millions of loyal citizens. But it is when I see what a poor miserable handful of men they are after all that I can find in my heart to pity them."

"And how is my special case?" asked Kwang, when he could get a word in.

"Just the same," said Canting--"just the same. You will find him perhaps a little weaker. I will not go with you. You seem to succeed best with him by yourself; and no doubt you have instructed your friend as to the peculiar nature of his malady." "Yes," said Kwang; "my friend has read my little monograph, and he thought the case so remarkable that with the consent and approval of Dr. Narrowman I brought him to see Patient Stillman in the flesh. I shall get him to talk a little."

"Good," replied Canting; "but you will never cure him. You were quite right in what you once said--Prevention is the only cure. If we had developed our prophylactic system earlier it might have saved him, but he is too old now."

After some preliminary formalities we were taken by one of the warders, who was evidently acquainted with Kwang through his many previous visits, to a room at the end of a long corridor, where we found Mr. Stillman, who greeted us cordially but with old-fashioned dignity. His manner struck me as being very different from that of the modern Meccanians. Clearly he belonged to another generation. The room, which was about twenty feet by ten, was a bed-sitting-room, furnished with one of those contrivances which becomes a bed by night and a false cupboard by day. There was an easy chair with the usual mechanical adjustments, a table, two bedroom chairs, a small sideboard and cupboard, a few other articles of necessity and a shelf of books. There were no bolts or bars or chains--the room suggested a hospital rather than a prison. Mr. Stillman was a fine old man, and, although growing feeble in body, was still vigorous in mind. When seated he held his head erect, and looked us frankly in the face, but with a wistful expression. He had evidently been a good-looking man, but his face bore traces of long suffering. Except that he did not pace about his cell, he reminded me of a caged Hon. One of the orderlies brought in a tray of tea for the three of us. Mr. Stillman said what a pleasure it was to see a human being now and then, and, turning to me, explained that, except to Mr. Kwang and the officials and the doctors, he had not spoken to anyone for five years. "Until five years ago," he said, "I was able to do a little work in the gardens, and could converse with my fellow-prisoners--patients, I mean--but only about our work, and in the presence of a warder. Still, that was some relief. Indeed, it was a great relief, for every one of the patients is a kind of brother--otherwise he would not be here. There are only a few hundreds of us left--perhaps a couple of thousands altogether--I don't know. We have about two hundred here, and this is one of the largest hospitals, or prisons, in the country--so at least I was told."

"But why is conversation not permitted?" I said. "To be deprived of conversation must surely aggravate any tendency to mental instability."

"The theory is that communication with our fellow-patients would hinder our recovery," he replied, with a significant smile.

"But what are you supposed to be suffering from?" I said.

"A mental disease known only to the Government of Meccania," he answered. "You must have heard of it. Mr. Kwang knows all about it. The real name for it is' heresy,' but they call it Znednettlapseiizw. I suffer very badly from it and am incurable--at least I hope so," he added bitterly.

At this point Kwang announced that he wished to visit another patient, and that he would leave us together so that I might have a long talk undisturbed. It was evident that he occupied a privileged position, or he would never have been able to have such access to these patients. When he had left the room I did my best to get Mr. Stillman to talk, but I hardly knew how to induce him to tell me his story. I said, "I suppose you are not treated badly, apart from this prohibition about conversing with your fellow-sufferers?"

"We are fed with the exact amount of food we require," he replied; "we are clothed--and thank God we do not wear any of the seven uniforms; and we are decently warm, except sometimes in winter when, I suppose, something goes wrong with the apparatus."

"What?" I said. "Can any apparatus go wrong in Meccania?"

"Well," he said, "perhaps the fact is that I want to be warmer than the experts think is necessary. Yes; that is probably the explanation."

"And for the rest," I said. "Have you no occupation? How do you spend the time?"

"In trying to preserve the last remains of my sanity," he answered.

"And by what means?" I asked gently.

"Chiefly by prayer and meditation," he replied after a short pause. He used the old-fashioned expressions which I had not heard from the lips of any Meccanian before. "But it is difficult," he went on, "to keep one's faith, cut off from one's fellow-believers."

"But they allow you to attend religious services surely?" I said.
"The Meccanian State Church keeps a chaplain here, and holds a service every day which is attended by all the officials and a few of the patients; but you have heard the maxim Cujus regio ejus religio, have you not?" I nodded. "It has acquired a new significance during the last fifty years. I have not attended any of the services since they ceased to be compulsory about ten years ago."

"That sounds very remarkable," I said.

"What does?"

"It is the first time I have heard of anything ceasing to be compulsory in Meccania," I said.

"The fact was that they discovered it had a very bad effect upon the disease. My chief relief now is reading, which is permitted for three hours a day."

"And you are allowed to choose your own books?"

"As a concession to our mental infirmity," he said, "we have been granted the privilege of reading some of the old authors. It came about in this way. Dr. Weakling, who is in charge of this hospital, is the son of one of my oldest friends--a man who spent several years in this place as a patient. He came in about the same time as I did, but his health gave way and he recanted, or, as they say, he recovered. But while he was here he begged to have a few of the old books to save him from going mad. The authorities refused to let him have any books except those specially provided, and I believe it was this that made him give way. Anyhow he used his influence with his son afterwards, for his son had become one of the leading medical specialists, to obtain for the older patients at any rate a number of the books of the old literature which nobody else wanted to read. He only got the concession through on the ground that it was a psychological experiment. He has had to write a report on the experiment every year since its introduction. That is our greatest positive privilege, but we have a few negative privileges."

"What do you mean exactly?" I said.

"We have no compulsory attendances; we have no forms to fill up; we are not required to keep a diary; we are not required to read the Monthly Gazette of Instructions, nor play any part in State ceremonies. Indeed, if I could talk to my friends who are here I should have little to complain of on the score of personal comfort."

"Then why do you speak of the difficulty of preserving your sanity?" I said, rather thoughtlessly, I am afraid.

"Why do you think I am here at all?" he replied, for the first time speaking fiercely. "I could have my liberty to-day if I chose, could I not?" Then he went on, not angrily but more bitterly, "Did I say I could have my liberty? No; that is not true. I could go out of here tomorrow, but I should not be at liberty. I stay here, because here I am only a prisoner--outside I should be a slave. How long have you been in Meccania did you say?"

"About five months," I said.

"And you are free to go back to your own country?"

"Certainly," I said--"at least, I hope so."

"Then go as soon as you can. This is no fit place for human beings. It is a community of slaves, who do not even know they are slaves because they have never tasted liberty, ruled over by a caste of super-criminals who have turned crime into a science."

"I have not heard the ruling classes called criminals before," I said. "I am not sure that I understand what you mean."

"Then you must have been woefully taken in by all this hocus-pocus of law and constitution and patriotism. The whole place is one gigantic prison, and either the people themselves are criminals, or those who put them there must be. There is such a thing as legalised crime. Crime is not merely the breaking of a statute. Murder and rape are crimes, statute or no statute."

"But what are the crimes these rulers of Meccania have committed?" I said.

"In all civilised countries," he replied passionately, "if you steal from a man, if you violate his wife or his daughters, if you kidnap his children, you are a criminal and outlawed from all decent society. These rulers of ours have done worse than that. They have robbed us of everything; we have nothing of our own. They feed us, clothe us, house us--oh no, there is no poverty--every beast of burden in the country is provided with stall and fodder--ay, and harness too; they measure us, weigh us, doctor us, instruct us, drill us, breed from us, experiment on us, protect us, pension us and bury us. Nay, that is not the end; they dissect us and analyse us and use our carcasses for the benefit of Science and the Super-State. I called them a nation. They are not a nation; they are an organism. You have been here five months, you say. You have seen a lot of spectacles, no doubt. You have seen buildings, institutions, organisations, systems, machinery for this and machinery for that, but you have not seen a single human beingâ€”unless you have visited our prisons and asylums. You have not been allowed to talk to anybody except authorised persons. You have been instructed by officials. You have read books selected by the Super-State, and written by the Super-State. You have seen plays selected by the Super-State, and heard music selected by the Super-State, and seen pictures selected by the Super-State, and no doubt heard sermons preached by the Super-State."

"Your friend tells me other nations are still free. What drives me to the verge of madness is to think that we,
who once were free, are enslaved by bonds of our own making. Can you wonder, after what you have seen—a whole nation consenting to be slaves if only they may make other nations slaves too? That I ask myself sometimes whether this is a real lunatic asylum; whether I am here because I have these terrible hallucinations; whether all that I think has happened this last fifty years is just a figment of my brain, and that really, if I could only see it, the world is just as it used to be when I was a boy?"

Presently he became calmer and began to tell me something of his life story.

"Until I was about twelve," he said, "I lived with my parents in one of the old-fashioned parts of Meccania. My father was a well-to-do merchant who had travelled a good deal. He was something of a scholar too, and took interest in art and archaeology, and as I, who was his youngest son, gave signs of similar tastes, he took me abroad with him several times. This made a break in my schooling, and although I probably learnt more from these travels, especially as I had the companionship of my father, it was not easy to fit me into the regular system again. So my father decided to send me to some relatives who had settled in Luniland, and a few years after, when I was ready to go to the University of Bridgeford, he and my mother came to live for a few years in Luniland.

"Up to that time I had taken no interest in politics, but I can distinctly recall now how my father used to lament over the way things were tending. He said it was becoming almost impossible to remain a good citizen. He had always thought himself a sane and sober person, not given to quarrelling, but he found it impossible to attach himself to any of the political parties or cliques in Meccania. He was not a follower of Spotts, who, he said, was a kind of inverted Bludiron, but he disliked still more the politicians and so-called statesmen who were preaching the Meccanian spirit as a new gospel. I think it was his growing uneasiness with politics that caused him to drift gradually into the position of a voluntary exile. But we were very happy. Every year or so I used to go over to Meccania, and in spite of my cosmopolitan education I retained a strong affection for the land of my birth. I was full of its old traditions, and not even the peaceful charms of Bridgeford—an island that seemed like a vision of Utopia—could stifle my passion for the pine forests of Bergerland, our old home in Meccania. When I had finished my course at Bridgeford I had to decide whether I would return to serve my two years in the army. It was a great worry to my mother that I had not, like my brothers, passed the Meccanian examination which reduced the time of service to one year, but I made light of the matter; and although, after my life in Luniland, it was very distasteful to me, I went through my two years as cheerfully as I could. I learnt a great deal from it. I was nicknamed 'the Lunilander,' and was unpopular because I did not share the silly enthusiasm and boasting which at that time was prevalent. I had got out of touch with the youthful life of Meccania, and this two years opened my eyes.

But I will not dwell on that time. At the end of it I joined my father, who had remained in Luniland when he was not travelling. It was time to choose a career. I had little taste for business and I was determined that I would not become an official of any kind, and when I proposed to devote some years to following up the work that my father had planned for himself, but had never been able to carry out, he gave his consent. We had just planned a long archaeological tour in Francaria when the great war broke out.

"I shall never forget the state of agitation into which this catastrophe threw him. I was about to return to Meccania in obedience to the instruction I had received, when he begged me not to go back at any cost. He had spent two sleepless nights, and his agony of mind was terrible. What he had feared for years had come to pass. He had thought it would be somehow avoided. He had been watching events very closely for the few weeks before the crisis. The day that war was declared between Luniland and Meccania, he declared his intention of going back to Meccania; but not to join in the madness of his country. He could not do much; probably he would not be allowed to do anything, but at any rate he would fight for sanity and right. My mother was eager to go back, but for other reasons. She burst out into a frenzy of abuse of Luniland. She repeated all the lies that I had heard in Meccania about the country in which she had been perfectly happy for years. She called me a coward for not being with my brothers. She said she had always been against my having come to Luniland. I knew she was hysterical, but I could hardly believe my ears. My father stood firm. He insisted on my staying. He said he should regard himself as a murderer if he consented to my going to fight for what he knew to be a monstrous crime. What my mother had said, although of course it pained me, did more to convince me that my father was right than anything he could have said. I had seen already the accounts of the Meccanian crowds shouting for war in a frenzy of martial pride. I had seen also the streets of Lunopolis, full of serious faces, awed by the thought of war and yet never wavering a moment. I had heard my own countrymen jeering at the craven spirit of the Lunilanders. It was a cruel position to be in, and in the years that followed I was tempted sometimes to regret that I had not gone back and sought peace of mind in a soldier's grave. But in my heart I was so revolted by the thought that all this horror was the work of my countrymen that I grew ashamed of being a Meccanian. For the first two years my father wrote to me constantly, and if I had had any doubts of the Tightness of my conduct, what he said would have sustained me.

"But that is a long story. All I need say is that it was in those years of suffering and horror that I discovered where my duty lay, and took a vow to follow it. When the war ended I would go back, and if I were the only man
left in Meccania I would fight for truth and liberty. It was a quixotic vow, but I was a young man of thirty.

"Well, I came back. I had to wait three years, even after the war was over, until there was an amnesty for such as I. And when I did set foot here again, the cause I had come to fight for was already lost. But I did not know it.

"My father had already spent two years in prison, and was only released in time to die. But through him I knew that there were still some left who felt as we did. The idea of Liberty had been lost. Although the war had been over three years, everybody was still under martial law. The military professed that the country was in danger of a revolution. The newspapers preached the necessity for everybody to be organised to repair the ravages of the war. The socialists said the economic revolution, so long predicted, was accomplishing itself. For a few years we could make no headway. Then things began to settle down a little. The fever seemed to be spending itself. That was the moment when Prince Mechow became Chief Minister of the Interior. Some semblance of constitutional government was restored, and we began to hope for better things. We started a newspaper, and established societies in all the big towns. What we were out for was, first and foremost, political liberty. We had three or four brilliant writers and speakers. But the only papers that would take our articles were a few of the socialist papers which wrote leaders criticising our ideas as 'unscientific,' and the only people who came to our meetings were socialists who used them to speakify about the economic revolution. Then Mechow's reforms began. All education was completely controlled. The Press was bought up, and gradually suppressed. The right of public meeting was curtailed, till it disappeared altogether. The censorship of printing was made complete. New regulations accumulated year by year, and month by month. The seven classes were established. And all the time the socialists went on prating about the economic revolution. Prince Mechow was doing their work, they said. All they would have to do would be to step into his place when he had completed it. A few hundreds of us, scattered in various parts of the country, tried to keep up the struggle. We got into prison several times, but nobody cared a straw for our 'Luniland' party, as they called it. I fell ill, and then I tried to go abroad for a rest. I was arrested for an alleged plot, and sentenced to a term of imprisonment and degradation to the Fifth Class! After that I was forbidden to communicate with my children, for fear of infecting them. As they grew up in their teens, even they grew to look on me as an eccentric. Need I say more? The time came when I had either to recant from all my convictions, or be treated as a person of unsound mind. I came here determined to hold out to the last. What I fearedâ€”and I think I feared nothing elseâ€”was that some of their diabolical medical experiments would undermine my will. Fortunately I was sent here, where after a time Dr. Weakling--who is at any rate not a scoundrel--has done his best to protect me. He represents a type we have in Meccania--perhaps the most common type of all--a man who conforms to the system because he finds himself in it and part of it, but who is not actively wicked, and who has some good nature left. He regards me and those like me as simple-minded fanatics who are harmless so long as we are only few in number."

"So you think your cause is lost?" I said.

"No," he said quickly, "our cause is not lost. It is Meccania that is lost."

"But is there no hope even for Meccania?"

"There is no hope from within: hope can only come from without."

"That is a hard saying. How can it come from without?"

"Fifty years ago our neighbours--not our enemies, our neighbours--fought for liberty: they set themselves free, but they did not set us free. They said they would make the world safe for democracy."

"Well, did they not do so?" I asked.

He was quiet for a minute. "I wonder if they did," he said. "I wonder if either Liberty or Democracy can be safe so long as there is a Super-State. If a tragedy like this can happen to one nation it can happen to the whole world. Meccania will never become free whilst the Meccanian Spirit remains alive; and Liberty will never be secure until the whole world is free."

He sank back in his chair looking very tired after the excitement of our interview. At this moment a gong sounded. It was the signal for supper, and he got up mechanically to wash his hands in a bowl by the side of his bed-cupboard. Kwang then knocked at the door and came to bid good-bye. We left our 'patient' preparing to cross the quadrangle. It was growing dark, and we could see the lights in the great hall of the hospital. We were just about to walk back to the lodge when Kwang suddenly said, "Come with me." I followed him through a long corridor, and he led the way to a door which opened into the great dining-hall. There we saw, seated at long tables, nearly two hundred old men. They had just begun their evening meal. There was a strange silence, oppressive and almost sinister. There were no servants to wait on them, but some of the more active men handed the dishes, while a couple of warders in green uniforms seemed to be patrolling the room for the purpose of checking all attempts at conversation. But there was not even a whisper. The men did not look sullen or rebellious. Perhaps they had got past that. I could see them interchanging looks of friendly greeting across the room, and no doubt from long practice they had learnt to convey some simple messages by a glance or a smile; but there was an air of quiet courtesy about them, so different from what I had learnt to know as the typical Meccanian manner. I looked at the faces of those nearest
me. Many of them might have sat for the portraits of senators, or have served as models for some of those old-
fashioned paintings of assemblies of statesmen and ambassadors of bygone centuries. The surroundings were not
altogether wanting in dignity. The hall was large and lofty, and although bare-- save for the inevitable Imperial
portraits which greet one everywhere--was not unsightly. Indeed, the absence of ornament was a relief from the
perpetual reminders of the latest phases of Meccanian Art. Governor Canting had apparently been present at the
beginning of the meal and was going off to his own dinner. He joined us for a moment. "Do you notice," he said,
"how ungracious their expression is? One would think they had never come under the influence of the Meccanian
spirit. Their whole bearing is characteristic of their attitude of studied disloyalty. They never even give the salute. It
has not been insisted upon because--you know..." and he tapped his forehead. "They would not meet with such
consideration in many countries, but we have respect for age and infirmity, no matter what provocation we receive."

We left the hall and took our leave of Governor Canting. As we started on our journey it was dark, and
a cool wind was blowing. We could see before us the dull glow of light from the great city in the distance. The road
was perfect, and we passed few vehicles of any kind; but we were stopped three times by the police, to whom
Kwang showed his pass. As we entered the outer ring we slowed down. Although we were passing along the main
roadway only a few persons were to be seen. Here and there near the outer ring in the Business Quarter we passed a
few groups of workmen marching in step on their way home. The trams were running, but there was no bustle and
no excitement. No boisterous groups of young people filled the streets. No sound of laughter or merry-making fell
on our ears. Where were the people? Where were those crowds that make the streets of all cities in the world a
spectacle to move the heart of man? This might have been a plaguestricken town, a city of the dead. We passed the
great station with its lofty dome, and the towering pile of the Time Department with the great clock above it. As we
slowly swung through the great square, the colossal statue of Prince Mechow looked down on us like the grim and
menacing image of this city of Power. Was he some evil Genius that had slain the souls of men, leaving their bodies
only to inhabit the vast prison-house he had built for them with their own labour?

Kwang put me down at the hotel and drove on to his rooms. I found a letter awaiting me. It was from my father,
and contained painful news. My mother was seriously ill and he urged me to return at once. Early next morning I
hastened to visit Kwang--first obtaining permission from the manager of the hotel--and found him busy with his
preparations also. "Don't be alarmed," he said, when I told him my news. "Your mother is not ill. At any rate we do
not know that she is. I thought it was time for you to be getting ready to leave this country and I had that letter sent.
It will be a good reason in the eyes of the 'Authorities.' I go the day after to-morrow. I have a secret mission for the
Government to the Chinese Embassy at Prisa (the capital of Francana). "I may not return. I may fall suddenly ill."

I expressed some surprise that Kwang, the most privileged stranger in Meccania, the persona grata with all the
official world, should think it necessary to slip out of the country by a back door, and provide for my sudden
departure as well.

"You have been here five months," he said. "I have been here fifteen years. It is always best in this country to
take as little risk as possible-- consistent with your objectives. A word to the wise.... If you have anything that you
wish to take out with you, you had better let me have it. You will be examined when you go out as you were when
you came in. I do not propose to be examined when I leave. That is why I am going via Prisa on a special mission."

CHAPTER XIII
NEVER AGAIN

I DID not see Kwang again until we met some weeks after, in Prisa. He had begun to suspect that one or two
persons in the Foreign Department had guessed the nature of the role he had been playing. There was practically no
evidence against him, because all the information he had obtained, and it was a great deal, had been furnished to him
willingly by the Meccanian Government under the impression that he had become a sort of missionary of Meccanian
Culture. All the same, as he observed to me, without arresting him as a spy (a course of procedure which for many
reasons would have been inconvenient to the Government) he might have been made the victim of an 'accident.' He
could no longer play his part in safety. Anyhow, he succeeded in making his exit in a manner that aroused no
suspicion, and he managed to return to his own country a short time afterwards. Consequently I need say no more
about Kwang.

My own departure was also rather a tame affair. I had an interview, on the day I received my letter, with
Inspector of Foreigners Bulley. Although I knew that the letter had been censored, and I was morally certain its
contents had been made known to him, he betrayed no knowledge of the facts. I explained the circumstances and
showed him the letter. I asked if the three days' notice could be dispensed with, as I wished to leave at the earliest
moment. He said I might possibly leave the day after to-morrow, but not before, as it would be necessary to see that
all my affairs were in order before issuing the certificate of absolution as it was called--a certificate which all
foreigners must obtain before the issue of the ticket authorising them to be conveyed across the frontier. There
would be a charge of £1 for the extra trouble involved. One little difficulty had not occurred to me: there might not
be a conveyance to Graves, via Bridgetown, for several days—perhaps not for a week. Inspector Bulley, who had all such matters at his finger-ends, told me there was no conveyance for five days by that route, but that he would arrange for me to travel by another route, via Primburg and Durven, which lay convenient for a journey to Prisa. After that I could either return home direct or go first to Lunopolis.

He was sorry my visit had been cut short almost before my serious study had begun, and hoped I should find it possible to return. He arranged for me to undergo my necessary medical examination on the afternoon of the same day, and this turned out to be almost a formality. Dr. Pincher was much more polite, and much less exacting, than on a former occasion. Clearly the influence of Kwang—for I was now regarded as a sort of protege of his—was evident in all this. Altogether my exit was quite pleasant, and I almost began to regret my precipitancy, but when I reflected on what I had to gain by staying longer I saw that Kwang was right. I turned over in my mind what I had seen and learnt during five months. I had seen a provincial town (or some aspects of it), and the capital, under the close supervision of well-informed warders. I had talked to a score of officials and a few professors, and received a vast amount of instruction from them. I had seen a great public ceremony. I had visited a large number of institutions. But I had only got into contact with a single native Meccanian who was free from the influence of the all-pervading Super-State, and this person was in an asylum only accessible by a dangerous ruse. I knew little more of the people, perhaps less, than I could have got from reading a few books; but I had at any rate got an impression of the Meccanian System which no book could have given me. That impression was the most valuable result of my tour, but it seemed unlikely that a further stay would do anything more than deepen it. For unless I were prepared to play the role that Kwang had played I was not likely to learn anything the Meccanian Government did not wish me to learn, and, however much I might be sustained by my curiosity, the actual experience of living in the atmosphere of the Meccanian Super-State was not pleasant.

I said good-bye to my friends at the hotel, and, after an uneventful journey by express train, reached Primburg. Except that it bore a general resemblance to Bridgetown, I can say nothing of it, for we were not permitted to go out of the station whilst waiting for the motor-van to take us across the frontier. I say 'us,' because there were about half a dozen other travellers. The fact that not more than half a dozen persons a week travelled from Mecco to Prisa—for this was the main route to the capital of Francaria—was in itself astounding. Even of these, three looked like persons on official business. At Primburg I was spared the indignity of a further medical examination, as I had already obtained the necessary certificate from Dr. Pincher, but nothing could exempt me from the examination which all foreigners had to submit to in order to ensure that they carried nothing out of the country except by leave of the chief inspector of Foreign Observers. My journal had been entrusted to Kwang, and I had nothing else of any importance. I was thoroughly searched, and my clothes and my baggage were closely examined by an official called the Registrar of Travellers.

Although I had spent a considerable time in Francaria I had never before seen Durven. There was now no reason for hurrying on to Prisa, so I decided to spend a day there to look round. I had to report myself to the police, owing to the fact that I had arrived from Meccania, but my credentials proving perfectly satisfactory I was at liberty to go where I liked. It was about four o'clock when I stepped out of the police station, and as it was a bright September afternoon there was still time to walk about for some hours before dark. At first, for about an hour, I could hardly help feeling that I was dreaming. Here I was in the old familiar life of Europe again. The streets of the town seemed full of people, some sauntering about and gossiping with their friends, others shop-gazing, others carrying parcels containing their purchases, some making their way home from business, others standing in groups near the theatres. There were tram-cars and omnibuses and all sorts of vehicles jostling in the central part of the town. A little later I saw people streaming out from a popular matinee. There were old men selling the first issues of the evening papers, and crying some sensational news which was not of the slightest importance but which somehow seemed good fun. I was delighted with everything I saw. It was a positive joy not to see any green uniforms, nor any grey uniforms, nor any yellow uniforms. Green and grey and yellow are beautiful colours, but the plain black of the civilian dress of the men in the streets of Durven seemed pleasant, and the costumes of the women seemed positively beautiful. There were children walking with their mothers, and little urchins racing about in the side streets. I could have laughed with joy at the sight of them: I had seen no children for five months, only little future-Meccanians. There were old women selling flowers. I wondered if they were poor; they looked fat and happy at any rate, and they were free to sell flowers or do anything else they liked. I turned into a cafe. A little band was playing some rollicking frivolous music that I recognised. I remembered some of my former friends making sarcastic remarks about this kind of music. It was not good music, yet it made me feel like laughing or dancing. There was such a babel of talk I could hardly hear the band. Not that I wanted to! I was quite content to hear the happy voices round me, to watch the simple comedies of human intercourse, and to feel that I was out of prison. I strolled out again. This time I looked at the streets themselves, at the buildings and houses and shops. I dived down a side street or two and found myself by the river among little wharves and docks, all on the tiniest scale. The streets...
were rather untidy and not too clean; the houses were irregularly built. I was in the old town apparently. As I walked farther I noticed that by far the greater part of the town had been built during the last fifty years or so, yet the place looked as if it were trying to preserve the appearance of age. At another time I should probably have thought the town rather dull and uninteresting, for there was nothing noteworthy about it. If there had once been any genuine mediaeval churches or guild halls or places of architectural interest they must have been destroyed, yet I discovered a strange joy and delight in everything I saw.

After dark, when I had dined at the little hotel where I was to sleep that night, I went off at once to the nearest theatre, which happened to be a music hall. I laughed at the turns until people looked at me to see if I were drunk or demented. When they saw I was only a little excited they made good-humoured remarks. They were rather pleased that I should be so easily amused. "Perhaps he has just come out of prison," said one; "no doubt it is rather dull there." "Perhaps he is a friend of one of the actors," said another, "and wants to encourage him." "Perhaps he has come from the land where jokes are prohibited," said a third. "Perhaps he is a deaf man who has recovered his hearing," said another. "Or a blind man who has recovered his sight." "Anyhow, he knows how to enjoy himself." Such were the remarks they made.

When I came out I strolled about the streets until after midnight. It seemed so jolly to be able to go just where one pleased.

In the morning I looked up the trains to Prisa and found that I could reach it in a few hours. So I decided to spend the morning in Durven and go on to Prisa in the afternoon. I strolled into the open market-place. How strange it seemed! People in all sorts of simple costumes were going round to the various stalls picking up one thing here and another there. The usual little comedies of bargaining were going on. There were all sorts of trifles for sale, including toys for children--real toys, not disguised mathematical problems, or exercises in mechanical ingenuity. There were dolls and rattles and hoops and balls and whistles and fishing-rods and marbles and pegtops and dolls' houses and furniture and bricks and a hundred things besides. Then there were gingerbread stalls, ice-cream stalls, cocoa-nut shies, swings and even a little merry-go-round. I felt I should like to ride on that merry-go-round, but as it was early in the forenoon there were only a few children--good heavens! what were children doing here? They ought to have been at school, or at any rate being instructed in the use of Stage II. B toys. I turned into the street where the best shops were. Even the grocers' shops looked interesting. There were goods from all over the world. There were cheeses packed in dainty little cases, and dates in little boxes covered with pictures; tea in packets and canisters representing absurd Chinen and Hindoo coolies. The clothing shops were full of the latest fashions, although this was a small provincial town; and very dainty and charming they looked. Then there were antique shops and bric-a-brac shops, print shops and jewellers' shops. I could have spent days wandering about like a child at a fair. I had never realised before that the meanest European town--outside Meccania--is a sort of perennial bazaar.

I tore myself away, and after luncheon took train to Prisa. The confusion and bustle at the stations was delightful; the chatter of the passengers was most entertaining. There were people in shabby clothes and people in smart costumes. There were ticketcollectors and guards in rather dirty-looking uniforms, and an occasional gendarme who looked as if he had come off the comic-opera stage. The villages on the route were like the villages I had seen before in Europe--fragments of bygone ages mixed up with the latest devices in farm buildings and model cottages; churches built in the twelfth century and post offices built in the twentieth; mediaeval barns and modern factories. At length we reached Prisa, which needs no description from me.

It looked like an old friend, and I lost no time in resuming the habits I had adopted during my previous stay. I looked up some of my old acquaintances, and we spent days in endless talk about everything under the sun. What a delight it was to read the newspapers, no matter how silly they were! How delightful to hear the latest gossip about the latest political crisis, the latest dramatic success, the latest social scandal, the latest literary quarrel! In a week or two I had almost forgotten the existence of Meccania. I had seen nothing to remind me of it. I began to understand why the people in Francaria and Luniland were so ignorant of that country. Why should they bother their heads about it? It seemed to me now like a bad dream, a nightmare. They were quite right to ignore it, to forget it. And yet, suppose Meccania should startle Europe again? And with a chemical war this time! Would they be able to escape? Or would the Super-Insects finally conquer the human race? I confess I felt some doubt. It seemed not impossible that the nightmare I had escaped from was a doom impending over the whole world. And it is because I could not dismiss this doubt that I have written a faithful account of what I saw and heard in Meccania, the Super-State.
The ship was proof against any test, but the men inside her could be strained and warped, individually and horribly. Unfortunately, while the men knew that, they couldn't really believe it. The Aliens could—and did.

They sent the advance unit out to scout the new planet in the Ambassador, homing down on the secret beeping of a featureless box dropped by an earlier survey party. Then they sat back at GHQ and began the same old pattern of worry that followed every advance unit.

Not about the ship. The Ambassador was a perfect machine, automatic, self-adjusting, self-regulating. It was built to last and do its job without failure under any and all conditions, as long as there was a universe around it. And it could not fail. There was no question about that.

But an advance unit is composed of men. The factors of safety are indeterminable; the duplications of their internal mechanisms are conjectural, variable. The strength of the unit is the sum of the strengths of its members. The weakness of the unit can be a single small failing in a single man.

"Gotcha!" said Ives. Ives was Communications. He had quick eyes, quick hands. He was huge, almost gross, but graceful. "On the nose," he grinned, and turned up the volume.

"What else do you expect?" said Johnny. Johnny was the pilot—young, wide, flat. His movements were as controlled and decisive as those of the ship itself, in which he had an unshakeable faith. He slid into the bucket seat before the great master console.

"We expect the ship to do her job," said Hoskins, the Engineer. He was mild and deft, middle-aged, with a domed head and wide, light-blue eyes behind old fashioned spectacles. He shared Johnny's belief in the machine, but through understanding rather than through admiration. "But it's always good to see her do it."

"Beautiful," said Captain Anderson softly, and he may have been talking about the way the ship was homing in on the tiny, featureless box that Survey had dropped on the unexplored planet, or about the planet itself, or even about the smooth integration of his crew.

Paresi said nothing. He had eyebrows and nostrils as sensitive as a radarscope, and masked eyes of a luminous black. Faces and motives were to him what gauges and log-entries were to the Engineer. Paresi was the Doctor, and he had many a salve and many a splint for invisible ills. He saw everything and understood much. He leaned against the bulkhead, his gaze flicking from one to the other of the crew. Occasionally his small mustache twitched like the antennae of a cat watching a bird.

Barely audible, faint as the blue outline of a distant hill, hungry and lost as the half-heard cry of a banshee, came the thin sound of high atmosphere against the ship's hull.

An hour passed.

"Shut that damned thing off!"

Ives looked up at the pilot, startled. He turned the gain down to a whisper. Paresi left the bulkhead and stood behind Johnny. "What's the matter?" he asked. His voice was feline, too—a sort of purr.

Johnny looked up at him quickly, and grinned. "I can put her down," he said. "I can put her down." He punched the veering-jet controls. It served men perfectly. The ship ignored him, homed on the beam. The ship computed velocity, altitude, gravity, magnetic polarization, windage; used and balanced and adjusted for them all. It adjusted for interference from the manual controls. It served men perfectly. It ignored them utterly.

Johnny turned to look out and downward. Paresi's gaze followed. It was a beautiful planet, perhaps a shade greener than the blue-green of earth. It seemed, indefinably, more park-like than wild. It had an air of controlled lushness and peace.

The braking jets thundered as Johnny depressed a control. Paresi nodded slightly as he saw the pilot's hand move, for he knew that the autopilot had done it, and that Johnny's movement was one of trained reflex. The youngster was intense and alert, hair-trigger schooled, taught to pretend in such detail that the pretense was reality to
him; a precise pretense that would become reality for all of them if the machine failed.

But of course the machine would not fail.

Fields fled beneath them, looking like a crazy-quilt in pastel. On them, nothing moved. Hoskins moved to the
viewport and watched them mildly. "Very pastoral," he said. "Pretty."

"They haven't gotten very far," said Ives.
"Or they've gotten very far indeed," said Captain Anderson.
Johnny snorted. "No factories. No bridges. Cow-tracks and goat paths."

The Captain chuckled. "Some cultures go through an agrarian stage to reach a technological civilization, and
some pass through technology to reach the pastoral."

"I don't see it," said Johnny shortly, eyes ahead.
Paresi's hand touched the Captain's arm, and the Captain then said nothing.
Pwing-g-g-

"Stand by for landing," said the Captain.

Ives and Hoskins went aft to the shock-panels in the after bulkhead. Paresi and the Captain stepped into niches
flanking the console. Johnny touched a control that freed his chair in its hydraulic gimbals. Chair and niches and
shock-panels would not be needed as long as the artificial gravity and inertialess field functioned; it was a ritual.

The ship skimmed treetops, heading phlegmatically for a rocky bluff. A gush of flame from its underjets and it
shouldered heavily upward, just missing the jagged crest. A gout of fire forward, another, and it went into a long flat
glide, following the fall of a foothill to the plain beyond. It held course and reduced speed, letting the ground bellow
up to it rather than descending. There was a moment of almost-flight, almost-sliding, and then a rush of dust and
smoke which over-took and passed them. When it cleared, they were part of the plain, part of the planet.

"A good landing, John," Paresi said. Hoskins caught his eye and frowned. Paresi grinned broadly, and the
exchange between them was clear: Why do you needle the kid? and Quiet, Engine-room. I know what I'm doing.
Hoskins shrugged, and, with Ives, crossed to the communications desk.

Ives ran his fat, skilled hands over the controls and peered at his indicators. "It's more than a good landing," he
grunted. "That squeak-box we homed in on can't be more than a hundred meters from here. First time I've ever seen
a ship bullseye like that."

Johnny locked his gimbals, ran a steady, sensitive hand over the turn of the console as if it were a woman's
flank. "Why--how close do you usually come?"

"Planetfall's close enough to satisfy Survey," said the Captain. "Once in a while the box will materialize
conveniently on a continent. But this--this is too good to be true. We practically landed on it."

Hoskins nodded. "It's usually buried in some jungle, or at the bottom of a sea. But this is really all right. What a
lineup! Point nine-eight earth gravity, Earth-type atmosphere--"

"Argon-rich," said, Ives, from the panel. "Very rich."

"That'll make no real difference," Hoskins went on. "Temperature, about normal for an early summer back
home... looks as if there's a fiendish plot afoot here to make things easy for us."

Paresi said, as if to himself, "I worry about easy things."

"Yeah, I know," snorted Johnny, rising to stretch. "The head-shrinker always does it the hard way. You can't
just dislike rice pudding; it has to be a sister-syndrome. If the shortest distance is from here to there, don't take it--
remember your Uncle Oedipus."

Captain Anderson chuckled. "Cut your jets, Johnny. Maybe Paresi's tortuous reasoning does seem out of order
on such a nice day. But remember--eternal vigilance isn't just the price of liberty, as the old books say. It's the price
of existence. We know we're here--but we don't know where 'here' is, and won't until after we get back. This is really
Terra Incognita. The location of Earth, or even of our part of the galaxy, is something that has to be concealed at all
costs, until we're sure we're not going to turn up a potentially dangerous, possibly superior alien culture. What we
don't know can't hurt Earth. No conceivable method could get that information out of us, any more than it could be
had from the squeak-box that Survey dropped here.

"Base all your thinking on that, Johnny. If that seems like leaning over backwards, it's only a sample of how
careful we've got to be, how many angles we've got to figure."

"Hell," said the pilot. "I know all that. I was just ribbing the bat-snatcher here." He thumbed a cigarette out of
his tunic, touched his lighter to it. He frowned, stared at the lighter, tried it again. "It doesn't work. Damn it!" he
barked explosively, "I don't like things that don't work!"

Paresi was beside him, catlike, watchful. "Here's a light. Take it easy, Johnny! A bum lighter's not that
important."

Johnny looked sullenly at his lighter. "It doesn't work," he muttered. "Guaranteed, too. When we get back I'm
going to feed it to Supply." He made a vivid gesture to describe the feeding technique, and jammed the lighter back
into his pocket.

"Heh!" Ives' heavy voice came from the communications desk. "Maybe the natives are primitives, at that. Not a whisper of any radio on any band. No powerline fields, either. These are plowboys, for sure."

Johnny looked out at the sleeping valley. His irritation over the lighter was still in his voice. "Imagine that. No video or trideo. No jet-races or feelies. What do people do with their time in a place like this?"

"I don't know what chess is, and conversation's great if you want to tell somebody something, like 'bring me a steak,'" said Johnny. "Let's get out of this fire-trap," he said to the Captain.

"In time," said the Captain. "Ives, DX those radio frequencies. If there's so much as a smell of radiation even from the other side of this planet, we want to know about it. Hoskins, check the landing-suits--food, water, oxygen, radio, everything. Earth-type planet or no, we're not fooling with alien viruses. Johnny, I want you to survey this valley in every way you can and plot a minimum of three take-off vectors."

The crew fell to work, Ives and Hoskins intently, Johnny off-handedly, as if he were playing out a ritual with some children. Paresi bent over a stereomicroscope, manipulating controls which brought in samples of air-borne bacteria and fungi and placed them under its objective. Captain Anderson ranged up beside him.

"We could walk out of the ship as if we were on Muroc Port," said Paresi. "These couldn't be more like Earth organisms if they'd been transplanted from home to delude us."

The Captain laughed. "Sometimes I tend to agree with Johnny. I never met a more suspicious character. How'd you ever bring yourself to sign your contract?"

"Turned my back on a couple of clauses," said Paresi. "Here--have a look."

At that moment the usually imperturbable Ives uttered a sharp grunt that echoed and re-echoed through the cabin. Paresi and the Captain turned. Hoskins was just coming out of the after alleyway with an oxygen bottle in his hand, and had frozen in his tracks at the sharp sound Ives had made. Johnny had whipped around as if the grunt had been a lion's roar. His back was to the bulkhead, his lean, long frame tensed for fight or flight. It was indescribable, Ives' grunt, and it was the only sound which could have had such an effect on such a variety of men--the same shocked immobility.

Ives sat over his Communications desk as if hypnotized by it. He moved one great arm forward, almost reluctantly, and turned a knob.

A soft, smooth hum filled the room. "Carrier," said Ives.

Then the words came. They were English words, faultlessly spoken, loud and clear and precise. They were harmless words, pleasant words even.

They were: "Men of Earth! Welcome to our planet."

The voice hung in the air. The words stuck in the silence like insects wriggling upon a pin. Then the voice was gone, and the silence was complete and heavy. The carrier hum ceased. With a spine-tingling brief blaze of high-frequency sound, Hoskins' oxygen-bottle hit the steel deck.

Then they all began to breathe again.

"There's your farmers, Johnny," said Paresi.

"Knight to bishop's third," said Hoskins softly.

"What's that?" demanded Johnny.

"Chess again," said the Captain appreciatively. "An opening gambit."

Johnny put a cigarette to his lips, tried his lighter. "Damn. Gimme a light, Ives."

Ives complied, saying over his big shoulder to the Captain, "In case you wondered, there was no fix on that. My direction-finders indicate that the signal came simultaneously from forty-odd transmitters placed in a circle around the ship which is their way of saying 'I dunno.'"

The Captain walked to the view bubble in front of the console and peered around. He saw the valley, the warm light of mid-afternoon, the too-green slopes and the blue-green distances. Trees, rocks, a balancing bird.

"It doesn't work," muttered Johnny.

The Captain ignored him. "Men of Earth...." he quoted. "Ives, they've gotten into Survey's squeak-box and analyzed its origin. They know all about us!"

"They don't because they can't," said Ives flatly. "Survey traverses those boxes through second-order space. They materialize near a planet and drop in. No computation on earth or off it could trace their normal-space trajectory, let alone what happens in the second-order condition. The elements the box is made of are carefully averaged isotopic forms that could have come from any of nine galaxies we know about and probably more. And all it does is throw out a VUHF signal that says beep on one side, boop on the other, and bup-bup in between. It does not speak English, mention the planet Earth, announce anyone's arrival and purpose, or teach etiquette."

Captain Anderson spread his hands. "They got it from somewhere. They didn't get it from us. This ship and the
box are the only Terran objects on this planet. Therefore they got their information from the box."

"Q.E.D. You reason like Euclid," said Paresi admiringly. "But don't forget that geometry is an artificial school, based on arbitrary axioms. It just doesn't work where the shortest distance is not a straight line. I'd suggest we gather evidence and postpone our conclusions."

"How do you think they got it?" Ives challenged.

"I think we can operate from the fact they got it, and make our analyses when we have more data."

Ives went back to his desk and threw a switch.

"What are you doing?" asked the Captain.

"Don't you think they ought to be answered?"

"Turn it off, Ives."

"But--"

"Turn it off!" Ives did. An expedition is an informal, highly democratic group, and can afford to be, for when the situation calls for it, there is never any question of where authority lies. The Captain said, "There is nothing we can say to them which won't yield them more information. Nothing. For all we know it may be very important to them to learn whether or not we received their message. Our countermove is obviously to make no move at all."

"You mean just sit here and wait until they do something else?" asked Johnny, appalled.

The Captain thumped his shoulder. "Don't worry. We'll do something in some other area than communications. Hoskins--are those landing suits ready?"

"All but," rapped Hoskins. He scooped up the oxygen bottle and disappeared.

Paresi said, "We'll tell them something if we don't answer."

The Captain set his jaw. "We do what we can, Nick. We do the best we can. Got any better ideas?"

Paresi shrugged easily and smiled. "Just knocking, skipper. Knock everything. Then what's hollow, you know about."

"I should know better than to jump salty with you," said the Captain, all but returning the doctor's smile. "Johnny. Hoskins. Prepare for exploratory patrol."

"I'll go," said Paresi.

"Johnny goes," said the Captain bluntly, "because it's his first trip, and because if he isn't given something to do he'll bust his adrenals. Hoskins goes, because of all of us, the Engineer is most expendable. Ives stays because we need hair-trigger communications. Hoskins--are those landing suits ready?"

"All but," rapped Hoskins. He scooped up the oxygen bottle and disappeared.

Paresi said, "We'll tell them something if we don't answer."

The Captain set his jaw. "We do what we can, Nick. We do the best we can. Got any better ideas?"

Paresi shrugged easily and smiled. "Just knocking, skipper. Knock everything. Then what's hollow, you know about."

"I should know better than to jump salty with you," said the Captain, all but returning the doctor's smile. "Johnny. Hoskins. Prepare for exploratory patrol."

"I'll go," said Paresi.

"Johnny goes," said the Captain bluntly, "because it's his first trip, and because if he isn't given something to do he'll bust his adrenals. Hoskins goes, because of all of us, the Engineer is most expendable. Ives stays because we need hair-trigger communications. I stay to correlate what goes on outside with what goes on inside. You stay because if anything goes wrong I'd rather have you fixing the men up than find myself trying to fix you up."

He squinted at Paresi. "Does that knock solid?"

"Solid."

"Testing, Johnny," Ives said into a microphone. Johnny's duplicated voice, from the open face-plate of his helmet and from the intercom speaker, said, "I hear you fine."

"Testing, Hoskins."

"If I'd never seen you," said the speaker softly, "I'd think you were right here in the suit with me."

Hoskins' helmet was obviously buttoned up.

The two men came shuffling into the cabin, looking like gleaming ghosts in their chameleon-suits, which repeated the color of the walls. "Someday," growled Johnny, "there'll be a type suit where you can scratch your--"

"Scratch when you get back," said the Captain. "Now hear this. Johnny, you can move fastest. You go out first. Wait in the airlock for thirty seconds after the outer port opens. When Ives gives you the beep, jump out, run around the bows and plant your back against the hull directly opposite the port. Hold your blaster at the ready, aimed down-you hear me? Down, so that any observer will know you're armed but not attacking. Hoskins, you'll be in the lock with the outer port open by that time. When Johnny gives the all clear, you'll jump out and put your back against the hull by the port. Then you'll both stay where you are until you get further orders. Is that clear?"

"Aye."

"Yup."

"You're covered adequately from the ship. Don't fire without orders. There's nothing you can get with a blaster that we can't get first with a projector-unless it happens to be within ten meters of the hull and we can't depress to it.

Even then, describe it first and await orders to fire except in really extreme emergency. A single shot at the wrong time could set us back a thousand years with this planet. Remember that this ship isn't called Killer or Warrior or even Hero. It's the Earth Ship Ambassador. Go to it, and good luck."

Hoskins stepped back and waved Johnny past him. "After you, Jets."

Johnny's teeth flashed behind the face-plate. He clicked his heels and bowed stiffly from the waist, in a fine burlesque of an ancient courtier. He stalked past Hoskins and punched the button which controlled the airlock.

They waited. Nothing.
Johnny frowned, jabbed the button again. And again. The Captain started to speak, then fell watchfully silent. Johnny reached toward the button, touched it, then struck it savagely. He stepped back then, one foot striking the other like that of a clumsy child. He turned partially to the others. In his voice, as it came from the speaker across the room, was a deep amazement that rang like the opening chords of a prophetic and gloomy symphony.

He said, "The port won't open."

II

The extremes of mysticism and of pragmatism have their own expressions of worship. Each has its form, and the difference between them is the difference between deus ex machina and deus machina est. --E. Hunter Waldo

"Of course it will open," said Hoskins. He strode past the stunned pilot and confidently palmed the control.

The port didn't open.

Hoskins said, "Hm?" as if he had been asked an inaudible question, and tried again. Nothing happened. "Skipper," he said over his shoulder, "Have a quick look at the meters behind you there. Are we getting auxiliary power?"

"All well here," said Anderson after a glance at the board. "And no shorts showing."

There was a silence punctuated by the soft, useless clicking of the control as Hoskins manipulated it. "Well, what do you know."

"It won't work," said Johnny plaintively.

"Sure it'll work," said Paresi swiftly, confidently. "Take it easy, Johnny."

"It won't work," said Johnny. "It won't work." He stumbled across the cabin and leaned against the opposite bulkhead, staring at the closed port with his head a little to one side as if he expected it to shriek at him.

"Let me try," said Ives, going to Hoskins. He put out his hand.

"Don't!" Johnny cried.

"Shut up, Johnny," said Paresi.

"All right, Nick," said Johnny. He opened his face plate, went to the rear bulkhead, keyed open an acceleration couch, and lay face down on it. Paresi watched him, his lips pursed.

"Can't say I blame him," said the Captain softly, catching Paresi's eye. "It's something of a shock. This shouldn't be. The safety factor's too great--a thousand per cent or better."

"I know what you mean," said Hoskins. "I saw it myself, but I don't believe it." He pushed the button again.

"I believe it," said Paresi.

Ives went to his desk, clicked the transmitter and receiver switches on and off, moved a rheostat or two. He reached up to a wall toggle, turned a small air-circulating fan on and off. "Everything else seems to work," he said absently.

"This is ridiculous!" exploded the Captain. "It's like having your keys home, or arriving at the theater without your tickets. It isn't dangerous--it's just stupid!"

"It's dangerous," said Paresi.

"Dangerous how?" Ives demanded.

"For one thing--" Paresi nodded toward Johnny, who lay tensely, his face hidden. "For another, the simple calculation that if nothing inside this ship made that control fail, something outside this ship did it. And that I don't like."

"That couldn't happen," said the Captain reasonably.

Paresi snorted impatiently. "Which of two mutually exclusive facts are you going to reason from? That the ship can't fail? Then this failure isn't a failure; it's an external control. Or are you going to reason that the ship can fail? Then you don't have to worry about an external force--but you can't trust anything about the ship. Do the trick that makes you happy. But do only one. You can't have both."

Johnny began to laugh.

Ives went to him. "Hey, boy--"

Johnny rolled over, swung his feet down, and sat up, brushing the fat man aside. "What you guys need," Johnny chuckled, "is a nice kind policeman to feed you candy and take you home. You're real lost."

Ives said, "Johnny, take it easy and be quiet, huh? We'll figure a way out of this."

"I already have, scrappy," said Johnny offensively. He got up, strode to the port. "What a bunch of deadheads," he growled. He went two steps past the port and grasped the control-wheel which was mounted on the other side of the port from the button.

"Oh my God," breathed Anderson delightedly, "the manual! Anybody else want to be Captain?"

"Factor of safety," said Hoskins, smiting himself on the brow. "There's a manual control for everything on this scow that there can be. And we stand here staring at it--"

"If we don't win the furlined teacup..." Ives laughed.
Johnny hauled on the wheel.
It wouldn't budge.
"Here--" Ives began to approach.
"Get away," said Johnny. He put his hands close together on the rim of the wheel, settled his big shoulders, and
hauled. With a sharp crack the wheel broke off in his hands.
Johnny staggered, then stood. He looked at the wheel and then up at the broken end of its shaft, gleaming deep
below the surface of the bulkhead.
"Oh, fine...." Ives whispered.
Suddenly Johnny threw back his head and loosened a burst of high, hysterical laughter. It echoed back and
forth between the metal walls like a torrent from a burst dam. It went on and on, as if now that the dam was gone,
the flood would run forever.
Anderson called out "Johnny!" three times, but the note of command had no effect. Paresi walked to the pilot
and with the immemorial practice slapped him sharply across the cheeks. "Johnny! Stop it!"
The laughter broke off as suddenly as it had begun. Johnny's chest heaved, drawing in breath with great,
rasping near-sobs. Slowly they died away. He extended the wheel toward the Captain.
"It broke off," he said, finally, dully, without emphasis.
Then he leaned back against the hull, slowly slid down until he was sitting on the deck. "Broke right off," he
said.
Ives twined his fat fingers together and bent them until the knuckles cracked. "Now what?"
"I suggest," said Paresi, in an extremely controlled tone, "that we all sit down and think over the whole thing
very carefully."
Hoskins had been staring hypnotically at the broken shaft deep in the wall. "I wonder," he said at length,
"which way Johnny turned that wheel."
"Counter-clockwise," said Ives. "You saw him."
"I know that," said Hoskins. "I mean, which way: the right way, or the wrong way?"
"Oh." There was a short silence. Then Ives said, "I guess we'll never know, now."
"Not until we get back to Earth," said Paresi quickly.
"You say 'until', or 'unless'?" Ives demanded.
"I said 'until', Ives," said Paresi levelly, "and watch your mouth."
"Sometimes," said the fat man with a dangerous joviality, "you pick the wrong way to say the right thing,
Nick." Then he clapped the slender doctor on the back. "But I'll be good. We sow no panic seed, do we?"
"Much better not to," said the Captain. "It's being done efficiently enough from outside."
"You are convinced it's being done from outside?" asked Hoskins, peering at him owlishly.
"I'm ... convinced of very little," said the Captain heavily. He went to the acceleration couch and sat down. "I
want out," he said. He waved away the professional comment he could see forming on Paresi's lips and went on,
"Not claustrophobia, Nick. Getting out of the ship's more important than just relieving our feelings. If the trouble
with the port is being caused by some fantastic something outside this ship, we'll achieve a powerful victory over it,
purely by ignoring it."
"It broke off," murmured Johnny.
"Ignore that," snorted Ives.
"You keep talking about this thing being caused by something outside," said Paresi. His tone was almost
complaining.
"Got a better hypothesis?" asked Hoskins.
"Hoskins," said the Captain, "isn't there some way we can get out? What about the tubes?"
"Take a shipyard to move those power-plants," said Hoskins, "and even if it could be done, those radioactive
tubes would fry you before you crawled a third of the way."
"We should have a lifeboat," said Ives to no one in particular.
"What in time does a ship like the Ambassador need with a lifeboat?" asked Hoskins in genuine amazement.
The Captain frowned. "What about the ventilators?"
"Take us days to remove all the screens and purifiers," said Hoskins, "and then we'd be up against the intake
ports. You could stroll out through any of them about as far as your forearm. And after that it's hull-metal, skipper.
That you don't cut, not with a piece of the Sun's core."
The Captain got up and began pacing, slowly and steadily, as if the problem could be trodden out like ripe
grapes. He closed his eyes and said, "I've been circling around that idea for thirty minutes now. Look: the hull can't
be cut because it is built so it can't fail. It doesn't fail. The port controls were also built so they wouldn't fail. They do
fail. The thing that keeps us in stays in shape. The thing that lets us out goes bad. Effect: we stay inside. Cause:
something that wants us to stay inside."

"Oh," said Johnny clearly.

They looked at him. He raised his head, stiffened his spine against the bulkhead. Paresi smiled at him. "Sure, Johnny. The machine didn't fail. It was--controlled. It's all right." Then he turned to the Captain and said carefully, "I'm not denying what you say, Skipper. But I don't like to think of what will happen if you take that tack, reason it through, and don't get any answers."

"I'd hate to be a psychologist," said Ives fervently. "Do you extrapolate your mastications, too, and get frightened of the stink you might get?"

Paresi smiled coldly. "I control my projections."

Captain Anderson's lips twitched in passing amusement, and then his expression sobered. "I'll take the challenge, Paresi. We have a cause and an effect. Something is keeping us in the ship. Corollary: We--or perhaps the ship--we're not welcome."

"Men of Earth," quoted Ives, in an excellent imitation of the accentless English they had heard on the radio, "welcome to our planet."

They're kidding," said Johnny heartily, rising to his feet. He dropped the control wheel with a clang and shoved it carelessly aside with his foot. "Who ever says exactly what they mean anyhow? I see that conclusion the head-shrinker's afraid you'll get to, Skipper. If we can't leave the ship, the only other thing we can do is to leave the planet. That it?"

Paresi nodded and watched the Captain closely. Anderson turned abruptly away from them all and stood, feet apart, head down, hands behind his back, and stared out of the forward viewports. In the tense silence they could hear his knuckles crack. At length he said quietly, "That isn't what we came here for, Johnny."

Johnny shrugged. "Okay. Chew it up all you like, fellers. The only other choice is to sit here like bugs in a bottle until we die of old age. When you get tired of thinking that over, just let me know. I'll fly you out."

"We can always depend on Johnny," said Paresi with no detectible emphasis at all.

"Not on me," said Johnny, and swatted the bulkhead. "On the ship. Nothing on any planet can stop this baby once I pour on the coal. She's just got too much muscles."

"Well, Captain?" asked Hoskins softly.

Anderson looked at the basking valley, at the too-blue sky and the near-familiar, mellow-weathered crags. They waited.

"Take her up," said the Captain. "Put her in orbit at two hundred kilos. I'm not giving up this easily."

Ives swatted Johnny's broad shoulder. "That's a take-off and a landing, if I know the Old Man. Go to it, Jets."

Johnny's wide white grin flashed and he strode to the control chair. "Gentlemen, be seated."

"I'll take mine lying down," said Ives, and spread his bulk out on the acceleration couch. The others went to their take-off posts.

"On automatics," said the Captain, "Fire away!"

"Fire away!" said Johnny cheerfully. He reached forward and pressed the central control.

Nothing happened.

Johnny put his hand toward the control again. It moved as if there were a repeller field around the button. The hand moved more and more slowly the closer it got, until it hovered just over the control and began to tremble.

"On manual," barked the Captain. "Fire!"

"Manual, sir," said Johnny reflexively. His trembling hand darted up to an overhead switch, pulled it. He grasped the control bars and dropped the heels of his hands heavily on the firing studs. From somewhere came a muted roar, a whispering; a subjective suggestion of the thunder of reaction motors.

A frown crossed Paresi's face. The rocket noise was gone as the mind reached for it, like an occluded thought. The motors were silent; there wasn't a tremor of vibration. Yet somewhere a ghost engine was warming up, preparing a ghost ship for an intangible take-off into nothingness.

He snapped off the catch of his safety belt and crossed swiftly and silently to the console. Johnny sat raptly. A slow smile of satisfaction began to spread over his face. His gaze flicked to dials and gauges; he nodded very slightly, and brought both hands down like an organist playing a mighty chord. He watched the gauges. The needles were still, lying on their zero pins, and where lights should have flickered and flashed there was nothing. Paresi glanced at Anderson and met a worried look. Hoskins had his head cocked to one side, listening, puzzled. Ives rose from the couch and came forward to stand beside Paresi.

Johnny was manipulating the keys firmly. His fingers began to play a rapid, skillful, silent concerto. His face had a look of intense concentration and of complete self-confidence.

"Well," said Ives heavily. "That's a bust, too."

Paresi spun to him. "Shhh!" It was done with such intensity that Ives recoiled. With a warning look at him,
Paresi walked to the Captain, whispered in his ear.

"My God," said Anderson. "All right, Doctor." He came forward to the pilot's chair. Johnny was still
concentratedly, uselessly at work. Anderson glanced inquiringly at Paresi, who nodded.

"That does it," said the Captain, loudly. "Nice work, Johnny. We're smack in orbit. The automatics couldn't
have done it better. For once it feels good to be out in space again. Cut your jets now. You can check for correction
later."

"Aye, sir," said Johnny. He made two delicate adjustments, threw a master switch and swung around. "Whew!
That's work!"

Facing the four silent men, Johnny thumbed out a cigarette, put it in his mouth, touched his lighter to it, drew a
long slow puff.

"Man, that goes good...."

The cigarette was not lighted. Hoskins turned away, an expression of sick pity on his face. Ives reached
abruptly for his own lighter, and the doctor checked him with a gesture.

"Every time I see a hot pilot work I'm amazed," Paresi said conversationally. "Such concentration ... you must
be tuckered, Johnny."

Johnny puffed at his unlit cigarette. "Tuckered," he said. "Yeah." There were two odd undertones to his voice
suddenly. They were fatigue, and eagerness. Paresi said, "You're off-watch, John. Go stretch out."

"Real tired," mumbled Johnny. He lumbered to his feet and went aft, where he rolled to the couch and was
almost instantly asleep.

The others congregated far forward around the controls, and for a long moment stared silently at the sleeping
pilot.

"I don't get it," murmured Ives.

"He really thought he flew us out, didn't he?" asked Hoskins.

Paresi nodded. "Had to. There isn't any place in his cosmos for machines that don't work. Contrary evidence
can get just so strong. Then, for him, it ceased to exist. A faulty cigarette lighter irritated him, a failing airlock
control made him angry and sullen and then hysterical. When the drive controls wouldn't respond, he reached his
breaking point. Everyone has such a breaking point, and arrives at it just that way if he's pushed far enough."

"Everyone?"

Paresi looked from face to face, and nodded somberly. Anderson asked, "What knocked him out? He's trained
to take far more strain than that."

"Oh, he isn't suffering from any physical or conscious mental fatigue. The one thing he wanted to do was to get
away from a terrifying situation. He convinced himself that he flew out of it. The next best thing he could do to keep
anything else from attacking him was to sleep. He very much appreciated my suggestion that he was worn out and
needed to stretch out."

"I'd very much appreciate some such," said Ives. "Do it to me, Nick."

"Reach your breaking point first," said the doctor flatly, and went to place a pillow between Johnny's head and
a guard-rail.

Hoskins turned away to stare at the peaceful landscape outside. The Captain watched him for a moment, then:

"Hoskins!"

"Aye."

"I've seen that expression before. What are you thinking about?"

The engineer looked at him, shrugged, and said mildly, "Chess."

"What, especially?"

"Oh, a very general thing. The reciprocity of the game. That's what makes it the magnificent thing it is. Most
human enterprises can gang up on a man, slap him with one disaster after another without pause. But not chess. No
matter who your opponent might be, every time he does something to you, it's your move."

"Very comforting. Have you any idea of how we move now?"

Hoskins looked at him, a gentle surprise on his aging face. "You missed my point, Skipper. We don't move."

"Oh," the Captain whispered. His face tautened as it paled, "I ... I see. We pushed the airlock button to get out.
Countermove: It wouldn't work. We tried the manual. Countermove: It broke off. And so on. Now we've tried to fly
the ship out. Oh, but Hoskins--Johnny broke. Isn't that countermove enough?"

"Maybe. Maybe you're right. Maybe the move wasn't trying the drive controls, though. Maybe the move was to
do what was necessary to knock Johnny out." He shrugged again. "We'll very soon see."

The Captain exhaled explosively through his nostrils. "We'll find out if it's our move by moving," he gritted.

"Ives! Paresi! We're going to go over this thing from the beginning. First, try the port. You, Ives."

Ives grunted and went to the ship's side. Then he stopped.
"Where is the port?"

Anderson and Paresi followed Ives' flaccid, shocked gaze to the bulkhead where there had been the outline of the closed port, and beside it the hole which had held the axle of the manual wheel, and which now was a smooth, seamless curtain of impenetrable black. But Hoskins looked at the Captain first of all, and he said "Now it's our move," and only then did he turn with them to look at the darkness.

III

The unfamiliar, you say, is the unseen, the completely new and strange? Not so. The epitome of the unfamiliar is the familiar inverted, the familiar turned on its head. View a familiar place under new conditions--a deserted and darkened theater, an empty night club by day--and you will find yourself more influenced by the emotion of strangeness than by any number of unseen places. Go back to your old neighborhood and find everything changed. Come into your own home when everyone is gone, when the lights are out and the furniture rearranged--there I will show you the strange and frightening ghosts that are the shapes left over when reality superimposes itself upon the images of memory. The goblins lurk in the shadows of your own room. Owen Miller Essays on Night and the Unfamiliar
