"Everyone his part," replied Crockston; "if you put yourself in my place you would be very much embarrassed, which I shall not be; you will have enough to do later on to get out of the harbour under the fire of the Feds and Rebs, which, for my part, I should manage very badly."

"Well, Crockston, go on."

"Once in the citadel — I know it — I shall see what to do, and rest assured I shall do my best; in the meanwhile, you will be getting your cargo on board."

"Oh, business is now a very unimportant detail," said the Captain.

"Not at all! And what would your Uncle Vincent say to that? We must join sentiment with work; it will prevent suspicion; but do it quickly. Can you be ready in six days?"

"Yes."

"Well, let the Dolphin be ready to start on the 22nd."

"She shall be ready."

"On the evening of the 22nd of January, you understand, send a gig with your best men to White Point, at the end of the town; wait there till nine o’clock, and then you will see Mr. Halliburtt and your servant."

"But how will you manage to effect Mr. Halliburtt’s deliverance, and also escape yourself?"

"That’s my look-out."

"Dear Crockston, you are going to risk your life then, to save my father!"

"Don’t be uneasy, Miss Jenny, I shall risk absolutely nothing, you may believe me."

"Well," asked James Playfair, "when must I have you locked up?"
"To-day — you understand — I demoralise your crew; there is no time to be lost."
"Would you like any money? It may be of use to you in the citadel."
"Money to buy the gaoler! Oh, no, it would be a poor bargain; when one goes there the gaoler keeps the money and the prisoner! No, I have surer means than that; however, a few dollars may be useful; one must be able to drink, if needs be."
"And intoxicate the gaoler."
"No, an intoxicated gaoler would spoil everything. No, I tell you I have an idea; let me work it out."
"Here, my good fellow, are ten dollars."
"It is too much, but I will return what is over."
"Well, then, are you ready?"
"Quite ready to be a downright rogue."
"Let us go to work, then."
"Crockston," said the young girl, in a faltering voice, "you are the best man on earth."
"I know it," replied the American, laughing good-humouredly. "By the by, Captain, an important item."
"What is that?"
"If the General proposes to hang your rebel — you know that military men like sharp work — "
"Well, Crockston?"
"Well, you will say that you must think about it."
"I promise you I will." The same day, to the great astonishment of the crew, who were not in the secret, Crockston, with his feet and hands in irons, was taken on shore by a dozen sailors, and half an hour after, by Captain James Playfair's request, he was led through the streets of the town, and, in spite of his resistance, was imprisoned in the citadel.

During this and the following days the unloading of the Dolphin was rapidly accomplished; the steam cranes lifted out the European cargo to make room for the native goods. The people of Charleston, who were present at this interesting work, helped the sailors, whom they held in great respect, but the Captain did not leave the brave fellows much time for receiving compliments; he was constantly behind them, and urged them on with a feverish activity, the reason of which the sailors could not suspect.

Three days later, on the 18th of January, the first bales of cotton began to be packed in the hold: although James Playfair troubled himself no more about it, the firm of Playfair and Co. were making an excellent bargain, having obtained the cotton which encumbered the Charleston wharves at very far less than its value.

In the meantime no news had been heard of Crockston. Jenny, without saying anything about it, was a prey to incessant fears; her pale face spoke for her, and James Playfair endeavoured his utmost to ease her mind.

"I have all confidence in Crockston," said he; "he is a devoted servant, as you must know better than I do, Miss Jenny. You must make yourself quite at ease; believe me, in three days you will be folded in your father's arms."

"Ah! Mr. James," cried the young girl, "how can I ever repay you for such devotion? How shall we ever be able to thank you?"

"I will tell you when we are in English seas," replied the young Captain.

Jenny raised her tearful face to him for a moment, then her eyelids drooped, and she went back to her cabin.

James Playfair hoped that the young girl would know nothing of her father's terrible situation until he was in safety, but she was apprised of the truth by the involuntary indiscretion of a sailor.

The reply from the Richmond cabinet had arrived by a courier who had been able to pass the line of outposts; the news of the approaching execution was not long in spreading through the town, and it was brought on board by one of the sailors of the Dolphin; the man told the Captain, without thinking that Miss Halliburtt was within hearing; the young girl uttered a piercing cry, and fell unconscious on the deck. James Playfair carried her to her cabin, but the most assiduous care was necessary to restore her to life.

When she opened her eyes again, she saw the young Captain, who, with a finger on his lips, enjoined absolute silence. With difficulty she repressed the outbreak of her grief, and James Playfair, leaning towards her, said gently:

"Jenny, in two hours your father will be in safety near you, or I shall have perished in endeavouring to save him!"

Then he left the cabin, saying to himself, "And now he must be carried off at any price, since I must pay for his liberty with my own life and those of my crew."

The hour for action had arrived, the loading of the cotton cargo had been finished since morning; in two hours the ship would be ready to start.

James Playfair had left the North Commercial Wharf and gone into the roadstead, so that he was ready to make use of the tide, which would be high at nine o'clock in the evening.
It was seven o’clock when James left the young girl, and began to make preparations for departure. Until the present time the secret had been strictly kept between himself, Crockston, and Jenny; but now he thought it wise to inform Mr. Mathew of the situation of affairs, and he did so immediately.

"Very well, sir," replied Mr. Mathew, without making the least remark, "and nine o’clock is the time?"

"Nine o’clock, and have the fires lit immediately, and the steam got up."

"It shall be done, Captain."

"The Dolphin may remain at anchor; we will cut our moorings and sheer off, without losing a moment."

"Just so."

"Have a lantern placed at the mainmast-head; the night is dark, and will be foggy; we must not risk losing our way in returning. You had better have the bell for starting rung at nine o’clock."

"Your orders shall be punctually attended to, Captain."

"And now, Mr. Mathew, have a shore-boat manned with six of our best men. I am going to set out directly for White Point. I leave Miss Jenny in your charge, and may God protect us!"

"May God protect us!" repeated the first officer.

Then he immediately gave the necessary orders for the fires to be lighted, and the shore-boat provided with men. In a few minutes the boat was ready, and James Playfair, after bidding Jenny good-bye, stepped into it, whilst at the same time he saw volumes of black smoke issuing from the chimneys of the ship, and losing itself in the fog.

The darkness was profound; the wind had fallen, and in the perfect silence the waters seemed to slumber in the immense harbour, whilst a few uncertain lights glimmered through the mist. James Playfair had taken his place at the rudder, and with a steady hand he guided his boat towards White Point. It was a distance of about two miles; during the day James had taken his bearings perfectly, so that he was able to make direct for Charleston Point.

Eight o’clock struck from the church of St. Philip when the shore-boat ran aground at White Point.

There was an hour to wait before the exact time fixed by Crockston; the quay was deserted, with the exception of the sentinel pacing to and fro on the south and east batteries. James Playfair grew impatient, and the minutes seemed hours to him.

At half-past eight he heard the sound of approaching steps; he left his men with their oars clear and ready to start, and went himself to see who it was; but he had not gone ten feet when he met a band of coastguards, in all about twenty men. James drew his revolver from his waist, deciding to make use of it, if needs be; but what could he do against these soldiers, who were coming on to the quay?

The leader came up to him, and, seeing the boat, asked:

"Whose craft is that?"

"It is a gig belonging to the Dolphin," replied the young man.

"And who are you?"

"Captain James Playfair."

"I thought you had already started, and were now in the Charleston channels."

"I am ready to start. I ought even now to be on my way but — "

"But — " persisted the coastguard.

A bright idea shot through James’s mind, and he answered:

"One of my sailors is locked up in the citadel, and, to tell the truth, I had almost forgotten him; fortunately I thought of him in time, and I have sent my men to bring him."

"Ah! that troublesome fellow; you wish to take him back to England?"

"Yes.

"He might as well be hung here as there," said the coast-guard, laughing at his joke.

"So I think," said James Playfair, "but it is better to have the thing done in the regular way."

"Not much chance of that, Captain, when you have to face the Morris Island batteries."

"Don’t alarm yourself. I got in and I’ll get out again."

"Prosperous voyage to you!"

"Thank you."

With this the men went off, and the shore was left silent.

At this moment nine o’clock struck; it was the appointed moment. James felt his heart beat violently; a whistle was heard; he replied to it, then he waited, listening, with his hand up to enjoin perfect silence on the sailors. A man appeared enveloped in a large cloak, and looking from one side to another. James ran up to him.

"Mr. Halliburtt?"

"I am he," replied the man with the cloak.

"God be praised!" cried James Playfair. "Embark without losing a minute. Where is Crockston?"

"Crockston!" exclaimed Mr. Halliburtt, amazed. "What do you mean?"
"The man who has saved you and brought you here was your servant Crockston."
"The man who came with me was the gaoler from the citadel," replied Mr. Halliburtt.
"The gaoler!" cried James Playfair.
Evidently he knew nothing about it, and a thousand fears crowded in his mind.
"Quite right, the gaoler," cried a well-known voice. "The gaoler is sleeping like a top in my cell."
"Crockston! you! Can it be you?" exclaimed Mr. Halliburtt.
"No time to talk now, master; we will explain everything to you afterwards. It is a question of life or death. Get in quick!"

The three men took their places in the boat.
"Push off!" cried the captain.

Immediately the six oars dipped into the water; the boat darted like a fish through the waters of Charleston Harbour.

Chapter IX
BETWEEN TWO FIRES

The boat, pulled by six robust oarsmen, flew over the water. The fog was growing dense, and it was with difficulty that James Playfair succeeded in keeping to the line of his bearings. Crockston sat at the bows, and Mr. Halliburtt at the stern, next the Captain. The prisoner, only now informed of the presence of his servant, wished to speak to him, but the latter enjoined silence.

However, a few minutes later, when they were in the middle of the harbour, Crockston determined to speak, knowing what thoughts were uppermost in Mr. Halliburtt’s mind.

"Yes, my dear master," said he, "the gaoler is in my place in the cell, where I gave him two smart blows, one on the head and the other on the stomach, to act as a sleeping draught, and this when he was bringing me my supper; there is gratitude for you. I took his clothes and his keys, found you, and let you out of the citadel, under the soldiers’ noses. That is all I have done."

"But my daughter — ?" asked Mr. Halliburtt.
"Is on board the ship which is going to take you to England."
"My daughter there! there!" cried the American, springing from his seat.
"Silence!" replied Crockston, "a few minutes, and we shall be saved."

The boat flew through the darkness, but James Playfair was obliged to steer rather by guess, as the lanterns of the Dolphin were no longer visible through the fog. He was undecided what direction to follow, and the darkness was so great that the rowers could not even see to the end of their oars.

"Well, Mr. James?" said Crockston.
"We must have made more than a mile and a half," replied the Captain. "You don’t see anything, Crockston?"
"Nothing; nevertheless, I have good eyes; but we shall get there all right. They don’t suspect anything out there."

These words were hardly finished when the flash of a gun gleamed for an instant through the darkness, and vanished in the mist.
"A signal!" cried James Playfair.
"Whew!" exclaimed Crockston. "It must have come from the citadel. Let us wait."
A second, then a third shot was fired in the direction of the first, and almost the same signal was repeated a mile in front of the gig.
"That is from Fort Sumter," cried Crockston, "and it is the signal of escape. Urge on the men; everything is discovered."

"Pull for your lives, my men!" cried James Playfair, urging on the sailors, "those gun-shots cleared my route. The Dolphin is eight hundred yards ahead of us. Stop! I hear the bell on board. Hurrah, there it is again! Twenty pounds for you if we are back in five minutes!"

The boat skidded over the waves under the sailors’ powerful oars. A cannon boomed in the direction of the town. Crockston heard a ball whiz past them.

The bell on the Dolphin was ringing loudly. A few more strokes and the boat was alongside. A few more seconds and Jenny fell into her father’s arms.

The gig was immediately raised, and James Playfair sprang on to the poop.
"Is the steam up, Mr. Mathew?"
"Yes, Captain."
"Have the moorings cut at once."

A few minutes later the two screws carried the steamer towards the principal channel, away from Fort Sumter.
"Mr. Mathew," said James, "we must not think of taking the Sullivan Island channel; we should run directly under the Confederate guns. Let us go as near as possible to the right side of the harbour out of range of the Federal
batteries. Have you a safe man at the helm?"

"Yes, Captain."

"Have the lanterns and the fires on deck extinguished; there is a great deal too much light, but we cannot help the reflection from the engine-rooms."

During this conversation the Dolphin was going at a great speed; but in altering her course to keep to the right side of the Charleston Harbour she was obliged to enter a channel which took her for a moment near Fort Sumter; and when scarcely half a mile off all the guns bearing on her were discharged at the same time, and a shower of shot and shell passed in front of the Dolphin with a thundering report.

"Too soon, stupids," cried James Playfair, with a burst of laughter. "Make haste, make haste, Mr. Engineer! We shall get between two fires."

The stokers fed the furnaces, and the Dolphin trembled all over with the effort of the engine as if she was on the point of exploding.

At this moment a second report was heard, and another shower of balls whizzed behind the Dolphin.

"Too late, stupids," cried the young Captain, with a regular roar.

Then Crockston, who was standing on the poop, cried, "That's one passed. A few minutes more, and we shall have done with the Rebs."

"Then do you think we have nothing more to fear from Fort Sumter?" asked James.

"Nothing at all, but everything from Fort Moultrie, at the end of Sullivan Island; but they will only get a chance at us for half a minute, and then they must choose their time well, and shoot straight if they want to reach us. We are getting near."

"Right; the position of Fort Moultrie will allow us to go straight for the principal channel. Fire away then, fire away!"

At the same moment, and as if in obedience to James Playfair, the fort was illuminated by a triple line of lightning. A frightful crash was heard; then a crackling sound on board the steamer.

"Touched this time!" exclaimed Crockston.

"Mr. Mathew!" cried the Captain to his second, who was stationed at the bows, "what has been damaged?"

"The bowsprit broken."

"Any wounded?"

"No, Captain."

"Well, then, the masts may go to Jericho. Straight into the pass! Straight! and steer towards the island."

"We have passed the Rebs!" cried Crockston; "and, if we must have balls in our hull, I would much rather have the Northerners; they are more easily digested."

In fact, the Dolphin could not yet consider herself out of danger; for, if Morris Island was not fortified with the formidable pieces of artillery which were placed there a few months later, nevertheless its guns and mortars could easily have sunk a ship like the Dolphin.

The alarm had been given to the Federals on the island, and to the blockading squadron, by the firing from Forts Sumter and Moultrie. The besiegers could not make out the reason of this night attack; it did not seem to be directed against them. However, they were obliged to consider it so, and were ready to reply.

It occupied James Playfair's thoughts whilst making towards the passes of Morris Island; and he had reason to fear, for in a quarter of an hour's time lights gleamed rapidly through the darkness. A shower of small shell fell round the steamer, scattering the water over her bulwarks; some of them even struck the deck of the Dolphin, but not on their points, which saved the ship from certain ruin. In fact, these shell, as it was afterwards discovered, could break into a hundred fragments, and each cover a superficial area of a hundred and twenty square feet with Greek fire, which would burn for twenty minutes, and nothing could extinguish it. One of these shell alone could set a ship on fire. Fortunately for the Dolphin, they were a new invention, and as yet far from perfect. Once thrown into the air, a false rotary movement kept them inclined, and, when falling, instead of striking on their points, where is the percussion apparatus, they fell flat. This defect in construction alone saved the Dolphin. The falling of these shells did her little harm, and under the pressure of her over-heated boilers she continued to advance into the pass.

At this moment, and in spite of his orders, Mr. Halliburtt and his daughter went to James Playfair on the poop; the latter urged them to return to their cabins, but Jenny declared that she would remain by the Captain. As for Mr. Halliburtt, who had just learnt all the noble conduct of his deliverer, he pressed his hand without being able to utter a word.

The Dolphin was speeding rapidly towards the open sea. There were only three miles more before she would be in the waters of the Atlantic; if the pass was free at its entrance, she was saved. James Playfair was wonderfully well acquainted with all the secrets of Charleston Bay, and he guided his ship through the darkness with an unerring hand. He was beginning to think his daring enterprise successful, when a sailor on the forecastle cried:
"A ship!"
"A ship?" cried James.
"Yes, on the larboard side."

The fog had cleared off, and a large frigate was seen making towards the pass, in order to obstruct the passage of the Dolphin. It was necessary, cost what it might, to distance her, and urge the steam-engine to an increase of speed, or all was lost.

"Port the helm at once!" cried the Captain.

Then he sprang on to the bridge above the engine. By his orders one of the screws was stopped, and under the action of the other the Dolphin, veering with an extraordinary rapidity, avoided running foul of the frigate, and advanced like her to the entrance of the pass. It was now a question of speed.

James Playfair understood that in this lay his own safety, Miss Jenny’s, her father’s, and that of all his crew.

The frigate was considerably in advance of the Dolphin. It was evident from the volumes of black smoke issuing from her chimneys that she was getting up her steam. James Playfair was not the man to be left in the background.

"How are the engines?" cried he to the engineer.

"At the maximum speed," replied the latter; "the steam is escaping by all the valves."

"Fasten them down," ordered the Captain.

And his orders were executed at the risk of blowing up the ship.

The Dolphin again increased her speed; the pistons worked with frightful rapidity; the metal plates on which the engine was placed trembled under the terrific force of their blows. It was a sight to make the boldest shudder.

"More pressure!" cried James Playfair; "put on more pressure!"

"Impossible!" replied the engineer. "The valves are tightly closed; our furnaces are full up to the mouths."

"What difference! Fill them with cotton soaked in spirits; we must pass that frigate at any price."

At these words the most daring of the sailors looked at each other, but did not hesitate. Some bales of cotton were thrown into the engine-room, a barrel of spirits broached over them, and this expensive fuel placed, not without danger, in the red-hot furnaces. The stokers could no longer hear each other speak for the roaring of the flames. Soon the metal plates of the furnaces became red-hot; the pistons worked like the pistons of a locomotive; the steamgauge showed a frightful tension; the steamer flew over the water; her boards creaked, and her chimneys threw out volumes of smoke mingled with flames. She was going at a headlong speed, but, nevertheless, she was gaining on the frigate — passed her, distanced her, and in ten minutes was out of the channel.

"Saved!" cried the Captain.

"Saved!" echoed the crew, clapping their hands.

Already the Charleston beacon was disappearing in the south-west; the sound of firing from the batteries grew fainter, and it might with reason be thought that the danger was all past, when a shell from a gun-boat cruising at large was hurled whizzing through the air. It was easy to trace its course, thanks to the line of fire which followed it.

Then was a moment of anxiety impossible to describe; every one was silent, and each watched fearfully the arch described by the projectile. Nothing could be done to escape it, and in a few seconds it fell with a frightful noise on the fore-deck of the Dolphin.

The terrified sailors crowded to the stern, and no one dared move a step, whilst the shell was burning with a brisk crackle.

But one brave man alone among them ran up to the formidable weapon of destruction. It was Crockston; he took the shell in his strong arms, whilst showers of sparks were falling from it; then, with a superhuman effort, he threw it overboard.

Hardly had the shell reached the surface of the water when it burst with a frightful report.

"Hurrah! hurrah!" cried the whole crew of the Dolphin unanimously, whilst Crockston rubbed his hands.

Some time later the steamer sped rapidly through the waters of the Atlantic; the American coast disappeared in the darkness, and the distant lights which shot across the horizon indicated that the attack was general between the batteries of Morris Island and the forts of Charleston Harbour.

Chapter X

ST. MUNGO

The next day at sunrise the American coast had disappeared; not a ship was visible on the horizon, and the Dolphin, moderating the frightful rapidity of her speed, made quietly towards the Bermudas.

It is useless to recount the passage across the Atlantic, which was marked by no accidents, and ten days after the departure from Queenstown the French coast was hailed.

What passed between the Captain and the young girl may be imagined, even by the least observant individuals. How could Mr. Halliburtt acknowledge the devotion and courage of his deliverer, if it was not by making him the
happiest of men? James Playfair did not wait for English seas to declare to the father and daughter the sentiments which overflowed his heart, and, if Crockston is to be believed, Miss Jenny received his confession with a happiness she did not try to conceal.

Thus it happened that on the 14th of February, 18—, a numerous crowd was collected in the dim aisles of St. Mungo, the old cathedral of Glasgow. There were seamen, merchants, manufacturers, magistrates, and some of every denomination gathered here. There was Miss Jenny in bridal array and beside her the worthy Crockston, resplendent in apple-green clothes, with gold buttons, whilst Uncle Vincent stood proudly by his nephew.

In short, they were celebrating the marriage of James Playfair, of the firm of Vincent Playfair & Co., of Glasgow, with Miss Jenny Halliburtt, of Boston.

The ceremony was accomplished amidst great pomp. Everyone knew the history of the Dolphin, and everyone thought the young Captain well recompensed for his devotion. He alone said that his reward was greater than he deserved.

In the evening there was a grand ball and banquet at Uncle Vincent’s house, with a large distribution of shillings to the crowd collected in Gordon Street. Crockston did ample justice to this memorable feast, while keeping himself perfectly within bounds.

Everyone was happy at this wedding; some at their own happiness, and others at the happiness around them, which is not always the case at ceremonies of this kind.

Late in the evening, when the guests had retired, James Playfair took his uncle’s hand.
"Well, Uncle Vincent," said he to him.
"Well, Nephew James?"
"Are you pleased with the charming cargo I brought you on board the Dolphin?" continued Captain Playfair, showing him his brave young wife.
"I am quite satisfied," replied the worthy merchant; "I have sold my cotton at three hundred and seventy-five per cent. profit."

Seventy Degrees North Latitude

CHAPTER I.
A SOIRÉE AT FORT RELIANCE.

On the evening of the 17th March 1859, Captain Craventy gave a fête at Fort Reliance. Our readers must not at once imagine a grand entertainment, such as a court ball, or a musical soirée with a fine orchestra. Captain Craventy’s reception was a very simple affair, yet he had spared no pains to give it éclat.

In fact, under the auspices of Corporal Joliffe, the large room on the ground-floor was completely transformed. The rough walls, constructed of roughly-hewn trunks of trees piled up horizontally, were still visible, it is true, but their nakedness was disguised by arms and armour, borrowed from the arsenal of the fort, and by an English tent at each corner of the room. Two lamps suspended by chains, like chandeliers, and provided with tin reflectors, relieved the gloomy appearance of the blackened beams of the ceiling, and sufficiently illuminated the misty atmosphere of the room. The narrow windows, some of them mere loop-holes, were so encrusted with hoar-frost, that it was impossible to look through them; but two or three pieces of red bunting, tastily arranged about them, challenged the admiration of all who entered. The floor, of rough joists of wood laid parallel with each other, had been carefully swept by Corporal Joliffe. No sofas, chairs, or other modern furniture, impeded the free circulation of the guests. Wooden benches half fixed against the walls, huge blocks of wood cut with the axe, and two tables with clumsy legs, were all the appliances of luxury the saloon could boast of. But the partition wall, with a narrow door leading into the next room, was decorated in a style alike costly and picturesque. From the beams hung magnificent furs admirably arranged, the equal of which could not be seen in the more favoured regions of Regent Street or the Perspective-Newski. It seemed as if the whole fauna of the ice-bound North were here represented by their finest skins. The eye wandered from the furs of wolves, grey bears, polar bears, otters, wolverenes, beavers, muskrats, water pole-cats, ermines, and silver foxes; and above this display was an inscription in brilliantly-coloured and artistically shaped cardboard—the motto of the world-famous Hudson’s Bay Company—
"PROPELLE CUTUM."
"Really, Corporal Joliffe, you have surpassed yourself!" said Captain Craventy to his subordinate.
"I think I have, I think I have!" replied the Corporal; "but honour to whom honour is due, Mrs Joliffe deserves part of your commendation; she assisted me in everything."
"A wonderful woman, Corporal."
"Her equal is not to be found, Captain."

An immense brick and earthenware stove occupied the centre of the room, with a huge iron pipe passing from it through the ceiling, and conducting the dense black smoke into the outer air. This stove contained a roaring fire constantly fed with fresh shovelfuls of coal by the stoker, an old soldier specially appointed to the service. Now and then a gust of wind drove back a volume of smoke into the room, dimming the brightness of the lamps, and adding fresh blackness to the beams of the ceiling, whilst tongues of flame shot forth from the stove. But the guests of Fort Reliance thought little of this slight inconvenience; the stove warmed them, and they could not pay too dearly for its cheering heat, so terribly cold was it outside in the cutting north wind.

The storm could be heard raging without, the snow fell fast, becoming rapidly solid and coating the already frosted window panes with fresh ice. The whistling wind made its way through the cranks and chinks of the doors and windows, and occasionally the rattling noise drowned every other sound. Presently an awful silence ensued. Nature seemed to be taking breath; but suddenly the squall recommenced with terrific fury. The house was shaken to its foundations, the planks cracked, the beams groaned. A stranger less accustomed than the habitués of the fort to the war of the elements, would have asked if the end of the world were come.

But, with two exceptions, Captain Craventy’s guests troubled themselves little about the weather, and if they had been outside they would have felt no more fear than the stormy petrels disporting themselves in the midst of the tempest. Two only of the assembled company did not belong to the ordinary society of the neighbourhood, two women, whom we shall introduce when we have enumerated Captain Craventy’s other guests: these were, Lieutenant Jaspar Hobson, Sergeant Long, Corporal Joliffe, and his bright active Canadian wife, a certain Mac-Nab and his wife, both Scotch, John Rae, married to an Indian woman of the country, and some sixty soldiers or employés of the Hudson’s Bay Company. The neighbouring forts also furnished their contingent of guests, for in these remote lands people look upon each other as neighbours although their homes may be a hundred miles apart. A good many employés or traders came from Fort Providence or Fort Resolution, of the Great Slave Lake district, and even from Fort Chippeway and Fort Liard further south. A rare break like this in the monotony of their secluded lives, in these hyperborean regions, was joyfully welcomed by all the exiles, and even a few Indian chiefs, about a dozen, had accepted Captain Craventy’s invitation. They were not, however, accompanied by their wives, the luckless squaws being still looked upon as little better than slaves. The presence of these natives is accounted for by the fact that they are in constant intercourse with the traders, and supply the greater number of furs which pass through the hands of the Hudson’s Bay Company, in exchange for other commodities. They are mostly Chippeway Indians, well grown men with hardy constitutions. Their complexions are of the peculiar reddish black colour always ascribed in Europe to the evil spirits of fairyland. They wear very picturesque cloaks of skins and mantles of fur, with a head-dross of eagle’s feathers spread out like a lady’s fan, and quivering with every motion of their thick black hair.

Such was the company to whom the Captain was doing the honours of Fort Reliance. There was no dancing for want of music, but the "buffet" admirably supplied the want of the hired musicians of the European balls. On the table rose a pyramidal pudding made by Mrs Joliffe’s own hands; it was an immense truncated cone, composed of flour, fat, rein-deer venison, and musk beef. The eggs, milk, and citron prescribed in recipe books were, it is true, wanting, but their absence was atoned for by its huge proportions. Mrs Joliffe served out slice after slice with liberal hands, yet there remained enough and to spare. Piles of sandwiches also figured on the table, in which ship biscuits took the place of thin slices of English bread and butter, and dainty morsels of corned beef that of the ham and stuffed veal of the old world. The sharp teeth of the Chippeway Indians made short work of the tough biscuits; and for drink there was plenty of whisky and gin handed round in little pewter pots, not to speak of a great bowl of punch which was to close the entertainment, and of which the Indians talked long afterwards in their wigwams.

Endless were the compliments paid to the Joliffes that evening, but they deserved them; how zealously they waited on the guests, with what easy grace they distributed the refreshments! They did not need prompting, they anticipated the wishes of each one. The sandwiches were succeeded by slices of the inexhaustible pudding, the pudding by glasses of gin or whisky.

"No, thank you, Mr Joliffe."
"You are too good, Corporal; but let me have time to breathe."
"Mrs Joliffe, I assure you, I can eat no more."
"Corporal Joliffe, I am at your mercy."
"No more, Mrs Joliffe, no more, thank you!"
for travelling led her constantly to explore new lands. She was tall, and her face, framed in long braids of hair, Barnett had given proof of the qualities of a great traveller. She had been a widow for fifteen years, and her passion mountains of Thibet, across an unknown corner of New Holland, from Swan Bay to the Gulf of Carpentaria, Paulina mentioned at the meetings of the Royal Geographical Society. In her journeys up the Brahmaputra, as far as the name of Paulina Barnett, the rival of the Pfeiffers, Tinnis, and Haimaires of Hull, has been several times honourably
already touched with white, was full of energy. She was near-sighted, and a double eye-glass rested upon her long
straight nose, with its mobile nostrils. We must confess that her walk was somewhat masculine, and her whole
appearance was suggestive of moral power, rather than of female grace. She was an Englishwoman from Yorkshire,
possessed of some fortune, the greater part of which was expended in adventurous expeditions, and some new
scheme of exploration had now brought her to Fort Reliance. Having crossed the equinoctial regions, she was
doubtless anxious to penetrate to the extreme limits of the hyperborean. Her presence at the fort was an event. The
governor of the Company had given her a special letter of recommendation to Captain Craventy, according to which
the latter was to do all in his power to forward the design of the celebrated traveller to reach the borders of the Arctic
Ocean. A grand enterprise! To follow in the steps of Hearne, Mackenzie, Rae, Franklin, and others. What fatigues,
what trials, what dangers would have to be gone through in the conflict with the terrible elements of the Polar
climate! How could a woman dare to venture where so many explorers have drawn back or perished? But the
stranger now shut up in Fort Reliance was no ordinary woman; she was Paulina Barnett, a laureate of the Royal
Society.

We must add that the celebrated traveller was accompanied by a servant named Madge. This faithful creature
was not merely a servant, but a devoted and courageous friend, who lived only for her mistress. A Scotchwoman of
the old type, whom a Caleb might have married without loss of dignity. Madge was about five years older than Mrs
Barnett, and was tall and strongly built. The two were on the most intimate terms; Paulina looked upon Madge as an
elder sister, and Madge treated Paulina as her daughter.

It was in honour of Paulina Barnett that Captain Craventy was this evening treating his employés and the
Chippeway Indians. In fact, the lady traveller was to join the expedition of Jaspar Hobson for the exploration of the
north. It was for Paulina Barnett that the large saloon of the factory resounded with joyful hurrahs. And it was no
wonder that the stove consumed a hundredweight of coal on this memorable evening, for the cold outside was
twenty-four degrees Fahrenheit below zero, and Fort Reliance is situated in 61° 47’ N. Lat., at least four degrees
from the Polar circle.

CHAPTER II.
THE HUDSON’S BAY FUR COMPANY.
"Captain Craventy?"
"Mrs Barnett?"

What do you think of your Lieutenant, Jaspar Hobson?"
"I think he is an officer who will go far."

"What do you mean by the words, Will go far? Do you mean that he will go beyond the Twenty-fourth parallel?"

Captain Craventy could not help smiling at Mrs Paulina Barnett’s question. They were talking together near the
stove, whilst the guests were passing backwards and forwards between the eating and drinking tables.

"Madam," replied the Captain, "all that a man can do, will be done by Jaspar Hobson. The Company has charged
him to explore the north of their possessions, and to establish a factory as near as possible to the confines of the
American continent, and he will establish it."

"That is a great responsibility for Lieutenant Hobson!" said the traveller.

"It is, madam, but Jaspar Hobson has never yet drawn back from a task imposed upon him, however formidable
it may have appeared."

"I can quite believe it, Captain," replied Mrs Barnett, "and we shall now see the Lieutenant at work. But what
induces the Company to construct a fort on the shores of the Arctic Ocean?"

"They have a powerful motive, madam," replied the Captain.

"I may add a double motive. At no very distant date, Russia will probably cede her American possessions to the
Government of the United States. [*1] When this cession has taken place, the Company will find access to the
Pacific Ocean extremely difficult, unless the North-west passage discovered by Mc’Clure be practicable. [*1
Captain Craventy’s prophecy has since been realised.] Fresh explorations will decide this, for the Admiralty is about
to send a vessel which will coast along the North American continent, from Behring Strait to Coronation Gulf, on
the eastern side of which the new-Art is to be established. If the enterprise succeed, this point will become an
important factory, the centre of the northern fur trade. The transport of furs across the Indian territories involves a
vast expenditure of time and money, whereas, if the new route be available, steamers will take them from the new
fort to the Pacific Ocean in a few days."

"That would indeed be an important result of the enterprise, if this North-west passage can really be used," replied Mrs Paulina Barnett; "but I think you spoke of a double motive."

"I did, madam," said the Captain, "and I alluded to a matter of vital interest to the Company. But I must beg of
you to allow me to explain to you in a few words how the present state of things came about, how it is in fact that
the very source of the trade of this once flourishing Company is in danger of destruction."
The Captain then proceeded to give a brief sketch of the history of the famous Hudson’s Bay Company.

In the earliest times men employed the skins and furs of animals as clothing. The fur trade is therefore of very great antiquity. Luxury in dress increased to such an extent, that sumptuary laws were enacted to control too great extravagance, especially in furs, for which there was a positive passion. Vair and the furs of Siberian squirrels were prohibited at the middle of the 12th century.

In 1553 Russia founded several establishments in the northern steppes, and England lost no time in following her example. The trade in sables, ermines, and beavers, was carried on through the agency of the Samoiedes; but during the reign of Elizabeth, a royal decree restricted the use of costly furs to such an extent, that for several years this branch of industry was completely paralysed.

On the 2nd May, 1670, a licence to trade in furs in the Hudson’s Bay Territory was granted to the Company, which numbered several men of high rank amongst its shareholders : the Duke of York, the Duke of Albemarle, the Earl of Shaftesbury, &c. Its capital was then only £8420. Private companies were formidable rivals to its success; and French agents, making Canada their headquarters, ventured on hazardous but most lucrative expeditions. The active competition of these bold hunters threatened the very existence of the infant Company.

The conquest of Canada, however, somewhat lessened the danger of its position. Three years after the taking of Quebec, 1776, the fur trade received a new impulse. English traders became familiar with the difficulties of trade of this kind; they learned the customs of the country, the ways of the Indians and their system of exchange of goods, but for all this the Company as yet made no profits whatever. Moreover, towards 1784 some merchants of Montreal combined to explore the fur country, and founded that powerful North-west Company, which soon became the centre of the fur trade. In 1798 the new Company shipped furs to the value of no less than £120,000, and the existence of the Hudson’s Bay Company was again threatened.

We must add, that the North-west Company shrank from no act, however iniquitous, if its interests were at stake. Its agents imposed on their own employés, speculated on the misery of the Indians, robbed them when they had themselves made them drunk, setting at defiance the Act of Parliament forbidding the sale of spirituous liquors on Indian territory; and consequently realising immense profits, in spite of the competition of the various Russian and American companies which had sprung up—the American Fur Company amongst others, founded in 1809, with a capital of a million of dollars, which was carrying on operations on the west of the Rocky Mountains.

The Hudson’s Bay Company was probably in greater danger of ruin than any other; but in 1821, after much discussion, a treaty was made, in accordance with which its old rival the North-west Company became amalgamated with it, the two receiving the common title of "The Hudson’s Bay Fur Company."

Now the only rival of this important association is the American St Louis Fur Company. The Hudson’s Bay Company has numerous establishments scattered over a domain extending over 3,700,000 square miles. Its principal factories are situated on James Bay, at the mouth of the Severn, in the south, and towards the frontiers of Upper Canada, on Lakes Athapeskow, Winnipeg, Superior, Methye, Buffalo, and near the Colombia, Mackenzie, Saskatchewan, and Assiniboin rivers, &c. Fort York, commanding the course of the river Nelson, is the headquarters of the Company, and contains its principal fur depot. Moreover, in 1842 it took a lease of all the Russian establishments in North America at an annual rent of £40,000, so that it is now working on its own account the vast tracts of country between the Mississippi and the Pacific Ocean. It has sent out intrepid explorers in every direction: Hearne, towards the Polar Sea, in 1770, to the discovery of the Coppermine River; Franklin, in 1819 to 1822, along 5550 miles of the American coast; Mackenzie, who, after having discovered the river to which he gave his name, reached the shores of the Pacific at 52° 24’ N. Lat. The following is a list of the quantities of skins and furs despatched to Europe by the Hudson’s Bay Company in 1833-34, which will give an exact idea of the extent of its trade:

- Beavers . . . . . . . . . . . 1,074
- Skins and young Beavers,. . 92,288
- Musk Rats,. . . . . . . . . 694,092
- Badgers,. . . . . . . . . . 1,069
- Bears,. . . . . . . . . . 7,451
- Ermines,. . . . . . . . . . 491
- Foes,. . . . . . . . . . 9,937
- Lynxes,. . . . . . . . . . 14,255
- Sables,. . . . . . . . . . 64,490
- Polecats,. . . . . . . . . 25,100
- Otters,. . . . . . . . . 22,303
- Raccoons,. . . . . . . . . 713
- Swans,. . . . . . . . . . 7,918
Wolves, ............ 8,484
Wolverines, ............ 1,571

Such figures ought to bring in a large profit to the Hudson’s Bay Company, but unfortunately they have not been maintained, and for the last twenty years have been decreasing.

The cause of this decline was the subject of Captain Craventy’s explanation to Mrs Paulina Barnett.

"Until 1839, madam," said he, "the Company was in a flourishing condition. In that year the number of furs exported was 2,350,000, but since then the trade has gradually declined, and this number is now reduced by one-half at least."

"But what do you suppose is the cause of this extraordinary decrease in the exportation of furs?" inquired Mrs Barnett.

"The depopulation of the hunting territories, caused by the activity, and, I must add, the want of foresight of the hunters. The game was trapped and killed without mercy. These massacres were conducted in the most reckless and short-sighted fashion. Even females with young and their little ones did not escape. The consequence is, that the animals whose fur is valuable have become extremely rare. The otter has almost entirely disappeared, and is only to be found near the islands of the North Pacific. Small colonies of beavers have taken refuge on the shores of the most distant rivers. It is the same with many other animals, compelled to flee before the invasion of the hunters. The traps, once crowded with game, are now empty. The price of skins is rising just when a great demand exists for furs. Hunters have gone away in disgust, leaving none but the most intrepid and indefatigable, who now penetrate to the very confines of the American continent."

"Yes," said Mrs Paulina Barnett, "the fact of the fur-bearing animals having taken refuge beyond the polar circle, is a sufficient explanation of the Company’s motive in founding a factory on the borders of the Arctic Ocean."

"Not only so, madam," replied the Captain, "the Company is also compelled to seek a more northern centre of operations, for an Act of Parliament has lately greatly reduced its domain."

"And the motive for this reduction?" inquired the traveller.

"A very important question of political economy was involved, madam; one which could not fail greatly to interest the statesmen of Great Britain. In a word, the interests of the Company and those of civilisation are antagonistic. It is to the interest of the Company to keep the territory belonging to it in a wild uncultivated condition. Every attempt at clearing ground was pitilessly put a stop to, as it drove away the wild animals, so that the monopoly enjoyed by the Hudson’s Bay Company was detrimental to all agricultural enterprise. All questions not immediately relating to their own particular trade, were relentlessly put aside by the governors of the association. It was this despotic, and, in a certain sense, immoral system, which provoked the measures taken by Parliament, and, in 1837, a commission appointed by the Colonial Secretary decided that it was necessary to annex to Canada all the territories suitable for cultivation, such as the Red River and Saskatchewan districts, and to leave to the Company only that portion of its land which appeared to be incapable of future civilisation. The next year the Company lost the western slopes of the Rocky Mountains, which it held direct from the Colonial Office, and you will now understand, madam, how the agents of the Company, having lost their power over their old territories, are determined before giving up their trade to try to work the little known countries of the north, and so open a communication with the Pacific by means of the North-west passage."

Mrs Paulina Barnett was now well informed as to the ulterior projects of the celebrated Company. Captain Craventy had given her a graphic sketch of the situation, and it is probable he would have entered into further details, had not an incident cut short his harangue.

Corporal Joliffe announced in a loud voice that, with Mrs Joliffe’s assistance, he was about to mix the punch. This news was received as it deserved. The bowl—or rather, the basin—was filled with the precious liquid. It contained no less than ten pints of coarse rum. Sugar, measured out by Mrs Joliffe, was piled up at the bottom, and on the top floated slices of lemon shrivelled with age. Nothing remained to be done but to light this alcoholic lake, and the Corporal, match in hand, awaited the order of his Captain, as if he were about to spring a mine.

"All right, Joliffe!" at last said Captain Craventy.

The light was applied to the bowl, and in a moment the punch was in flames, whilst the guests applauded and clapped their hands. Ten minutes afterwards, full glasses of the delightful beverage were circulating amongst the guests, fresh bidders for them coming forward in endless succession, like speculators on the Stock Exchange.

"Hurrah! hurrah! hurrah! three cheers for Mrs Barnett! A cheer for the Captain."

In the midst of these joyful shouts cries were heard from outside. Silence immediately fell upon the company assembled.

"Sergeant Long," said the Captain, "go and see what is the matter."

And at his chief’s order, the Sergeant, leaving his glass unfinished, left the room.
CHAPTER III.
A SAVANT THAWED.

Sergeant Long hastened to the narrow passage from which opened the outer door of the fort, and heard the cries redoubled, and combined with violent blows on the postern gate, surrounded by high walls, which gave access to the court. The Sergeant pushed open the door, and plunging into the snow, already a foot deep; he waded through it, although half-blinded by the cutting sleet, and nipped by the terrible cold.

"What the devil does any one want at this time of night?" exclaimed the Sergeant to himself, as he mechanically removed the heavy bars of the gate; "none but Esquimaux would dare to brave such a temperature as this!"

"Open! open! open!" they shouted from without.

"I am opening," replied Sergeant Long, who really seemed to be a long time about it.

At last the door swung open, and the Sergeant was almost upset by a sledge, drawn by six dogs, which dashed past him like a flash of lightning. Worthy Sergeant Long only just escaped being crushed, but he got up without a murmur, closed the gate, and returned to the house at his ordinary pace, that is to say, at the rate of seventy-five strides a minute.

But Captain Craventy, Lieutenant Jaspar Hobson, and Corporal Joliffe were already outside, braving the intense cold, and staring at the sledge, white with snow, which had just drawn up in front of them.

A man completely enveloped in furs now descended from it,

"Fort Reliance?" he inquired.

"The same," replied the Captain.

"Captain Craventy?"

"Behold him! Who are you?"

"A courier of the Company."

"Are you alone?"

"No, I bring a traveller."

"A traveller! And what does he want?"

"He is come to see the moon."

At this reply, Captain Craventy said to himself the man must be a fool. But there was no time to announce this opinion, for the courier had taken an inert mass from the sledge, a kind of bag covered with snow, and was about to carry it into the house, when the Captain inquired

"What is that bag?"

"It is my traveller," replied the courier.

"Who is this traveller?"

"The astronomer, Thomas Black."

"But he is frozen."

"Well, he must be thawed."

Thomas Black, carried by the Sergeant, the Corporal, and the courier, now made his entrance into the house of the fort, and was taken to a room on the first floor, the temperature of which was bearable, thanks to a glowing stove. He was laid upon a bed, and the Captain took his hand.

It was literally frozen. The wrappers and furred mantles, in which Thomas Black was rolled up like a parcel requiring care, were removed, and revealed a man of about fifty. He was short and stout, his hair was already touched with grey, his beard was untrimmed, his eyes were closed, and his lips pressed together as if glued to one another. If he breathed at all, it was so slightly that the frost-work on the windows would not have been affected by it. Joliffe undressed him, and turned him rapidly on to his face and back again, with the words—

"Come, come, sir, when do you mean to return to consciousness?"

But the visitor who had arrived in so strange a manner showed no signs of returning life, and Corporal Joliffe could think of no better means to restore the lost vital heat than to give him a bath in the bowl of hot punch.

Very happily for Thomas Black, however, Lieutenant Jaspar Hobson had another idea.

"Snow, bring snow!" he cried.

There was plenty of it in the court of Fort Reliance; and whilst the Sergeant went to fetch the snow, Joliffe removed all the astronomer’s clothes. The body of the unfortunate man was covered with white frost-bitten patches. It was urgently necessary to restore the circulation of the blood in the affected portions. This result Jaspar Hobson hoped to obtain by vigorous friction with the snow. We know that this is the means generally employed in the polar countries to set going afresh the circulation of the blood arrested by the intense cold, even as the rivers are arrested in their courses by the icy touch of winter. Sergeant Loin soon returned, and he and Joliffe gave the new arrival such a rubbing as he had probably never before received. It was not soft and agreeable friction, but a vigorous shampooing most lustily performed, more like the scratching of a curry-comb than the caresses of a human hand.
And during the operation the loquacious Corporal continued to exhort the unconscious traveller.

"Come, come, sir. What do you mean by getting frozen like this. Now, don’t be so obstinate!"

Probably it was obstinacy which kept Thomas Black from deigning to show a sign of life. At the end of half an hour the rubbers began to despair, and were about to discontinue their exhausting efforts, when the poor man sighed several times.

"He lives; he is coming to!" cried Jaspar Hobson.

After having warmed the outside of his body, Corporal Joliffe hurried to do the same for the inside, and hastily fetched a few glasses of the punch. The traveller really felt much revived by them; the colour returned to his cheeks, expression to his eyes, and words to his lips, so that Captain Craventy began to hope that he should have an explanation from Thomas Black himself of his strange arrival at the fort in such a terrible condition.

At last the traveller, well covered with wraps, rose on his elbow, and said in a voice still faint

"Fort Reliance?"

"The same," replied the Captain.

"Captain Craventy?"

"He is before you, and is happy to bid you welcome. But may I inquire what brings you to Fort Reliance?"

"He is come to see the moon," replied the courier, who evidently thought this a happy answer.

It satisfied Thomas Black too, for he bent his head in assent and resumed—

"Lieutenant Hobson?"

"I am here," replied the Lieutenant.

"You have not yet started?"

"Not. yet, sir."

"Then," replied Thomas Black, "I have only to thank you, and to go to sleep until to-morrow morning."

The Captain and his companions retired, leaving their strange visitor to his repose. Half an hour later the fête was at an end, and the guests had regained their respective homes, either in the different rooms of the fort, or the scattered houses outside the enceinte.

The next day Thomas Black was rather better. His vigorous constitution had thrown off the effects of the terrible chill he had had. Any one else would have died from it; but he was not like other men.

And now who was this astronomer? Where did he come from? Why had he undertaken this journey across the territories of the Company in the depth of winter? What did the courier’s reply signify?— To see the moon! The moon could be seen anywhere; there was no need to come to the hyperborean regions to look at it!

Such were the thoughts which passed through Captain Craventy’s mind. But the next day, after an hour’s talk with his new guest, he had learned all he wished to know.

Thomas Black was an astronomer attached to the Greenwich Observatory, so brilliantly presided over by Professor Airy. Mr Black was no theorist, but a sagacious and intelligent observer; and in the twenty years during which he had devoted himself to astronomy, he had rendered great services to the science of ouranography. In private life he was a simple nonentity; he existed only for astronomy; he lived in the heavens, not upon the earth; and was a true descendant of the witty La Fontaine’s savant who fell into a well. He could talk of nothing but stars and constellations. He ought to have lived in a telescope. As an observer he had not his rival; his patience was inexhaustible; he could watch for months for a cosmical phenomenon. He had a specialty of his own, too; he had studied luminous meteors and shooting stars, and his discoveries in this branch of astronomical science were considerable. When ever minute observations or exact measurements and definitions were required, Thomas Black was chosen for the service; for his clearness of sight was something remarkable. The power of observation is not given to everyone, and it will not therefore be surprising that the Greenwich astronomer should have been chosen for the mission we are about to describe, which involved results so interesting for selenographic science.

We know that during a total eclipse of the sun the moon is surrounded by a luminous corona. But what is the origin of this corona? Is it a real substance? or is it only an effect of the diffraction of the sun’s rays near the moon? This is a question which science has hitherto been unable to answer.

As early as 1706 this luminous halo was scientifically described. The corona was minutely examined during the total eclipse of 1715 by Lonville and Halley, by Maraldi in 1724, by Antonio de’Ulloa in 1778, and by Bonditch and Ferrer in 1806; but their theories were so contradictory that no definite conclusion could be arrived at. During the total eclipse of 1842, learned men of all nations—Airy, Arago, Keytal, Langier, Mauvais, Otto, Struve, Petit, Baily, &c.—endeavoured to solve the mystery of the origin of the phenomenon; but in spite of all their efforts, “the disagreement,” says Arago, “of the observations taken in different places by skilful astronomers of one and the same eclipse, have involved the question in fresh obscurity, so that it is now impossible to come to any certain conclusion as to the cause of the phenomenon.” Since this was written, other total eclipses have been studied with no better results.
Reliance were well supplied with food. Nature provided for all their wants; and clothed in the skins of foxes, legions of tittamegs, the Coregonus of naturalists, disported themselves in the water, so that the inhabitants of Fort often exceeding forty pounds. Pikes, voracious lobes, a sort of charr or grayling called "blue fish," and countless excellent. The waters of the Slave Lake were full of fish; trout in them attained to an immense size, their weight south the hunters from the fort successfully pursued bisons, elks, and Canadian porcupines, the flesh of which is the lake produced very fine willows. Game was abundant in the underwood, even during the bad season. Further winter. Timber was plentiful in these forests, which consisted almost entirely of poplar, pine, and birch. The islets on conformation of its soil, all influence its climate.

is nearly the same as that of the Azores. The nature of a country, its position with regard to the oceans, and even the so much colder than Europe. In April the streets of New York are still white with snow, yet the latitude of New York distributed in equal quantities, do not follow the terrestrial parallels, and that with the same latitude, America is ever such fine vegetation in this remote district. The Great Slave Lake is not really in a higher latitude than Stockholm or Christiania. We have only to remember that the isothermal lines, or belts of equal heat, along which heat is constructed on its shores—Fort Providence on the north, and Fort Resolution on the south. Fort Reliance is situated on the north-east extremity, and is about three hundred miles from the Chesterfield inlet, a long narrow estuary formed by the waters of Hudson’s Bay.

The Great Slave Lake is dotted with little islands, the granite and gneiss of which they are formed jutting up in several places. Its northern banks are clothed with thick woods, shutting out the barren frozen district beyond, not inaptly called the “Cursed Land.” The southern regions, on the other hand, are flat, without a rise of any kind, and the soil is mostly calcareous. The large ruminants of the polar districts—the buffaloes or bisons, the flesh of which forms almost the only food of the Canadian and native hunters—seldom go further north than the Great Slave Lake.

The trees on the northern shores of the lake form magnificent forests. We need not be astonished at meeting with such fine vegetation in this remote district. The Great Slave Lake is not really in a higher latitude than Stockholm or Christiania. We have only to remember that the isothermal lines, or belts of equal heat, along which heat is distributed in equal quantities, do not follow the terrestrial parallels, and that with the same latitude, America is ever so much colder than Europe. In April the streets of New York are still white with snow, yet the latitude of New York is nearly the same as that of the Azores. The nature of a country, its position with regard to the oceans, and even the conformation of its soil, all influence its climate.

In summer Fort Reliance was surrounded with masses of verdure, refreshing to the sight after the long dreary winter. Timber was plentiful in these forests, which consisted almost entirely of poplar, pine, and birch. The islets on the lake produced very fine willows. Game was abundant in the underwood, even during the bad season. Further south the hunters from the fort successfully pursued bisons, elks, and Canadian porcupines, the flesh of which is excellent. The waters of the Slave Lake were full of fish; trout in them attained to an immense size, their weight often exceeding forty pounds. Pikes, voracious lobes, a sort of charr or grayling called "blue fish," and countless legions of tittamegs, the Coregonus of naturalists, disported themselves in the water, so that the inhabitants of Fort Reliance were well supplied with food. Nature provided for all their wants; and clothed in the skins of foxes,
martens, bears, and other Arctic animals, they were able to brave the rigour of the winter.

The fort, properly so called, consisted of a wooden house with a ground-floor and one upper storey. In it lived the commandant and his officers. The barracks for the soldiers, the magazines of the Company, and the offices where exchanges were made, surrounded this house. A little chapel, which wanted nothing but a clergyman, and a powder-magazine, completed the buildings of the settlement. The whole was surrounded by palisades twenty-five feet high, defended by a small bastion with a pointed roof at each of the four corners of the parallelogram formed by the enceinte. The fort was thus protected from surprise, a necessary precaution in the days when the Indians, instead of being the purveyors of the Company, fought for the independence of their native land, and when the agents and soldiers of rival associations disputed the possession of the rich fur country.

At that time the Hudson’s Bay Company employed about a million men on its territories. It held supreme authority over them, an authority which could even inflict death. The governors of the factories could regulate salaries, and arbitrarily fix the price of provisions and furs; and as a result of this irresponsible power, they often realised a profit of no less than three hundred per cent.

We shall see from the following table, taken from the "Voyage of Captain Robert Lade," on what terms exchanges were formerly made with those Indians who have since become the best hunters of the Company. Beavers’ skins were then the currency employed in buying and selling.

<table>

But a few years ago beaver-skins became so scarce that the currency had to be changed. Bison-furs are now the medium of trade. When an Indian presents himself at the fort, the agents of the Company give him as many pieces of wood as he brings skins, and he exchanges these pieces of wood for manufactured articles on the premises; and as the Company fix the price of the articles they buy and sell, they cannot fail to realise large profits.

Such was the mode of proceeding in Fort Reliance and other factories; so that Mrs Paulina Barnett was able to watch the working of the system during her stay, which extended until the 16th April. Many a long talk did she have with Lieutenant Hobson, many were the projects they formed, and firmly were they both determined to allow no obstacle to check their advance. As for Thomas Black, he never opened his lips except when his own special mission was discussed. He was wrapped up in the subject of the luminous corona and red prominences of the moon; he lived but to solve the problem, and in the end made Mrs Paulina Barnett nearly as enthusiastic as himself. How eager the two were to cross the Arctic Circle, and how far off the 18th July 1860 appeared to both, but especially to the impatient Greenwich astronomer, can easily be imagined.

The preparations for departure could not be commenced until the middle of March, and a month passed before they were completed. In fact, it was a formidable undertaking to organise such an expedition for crossing the Polar regions. Everything had to betaken with them—food, clothes, tools, arms, ammunition, and a nondescript collection of
various requisites.

The troops, under the command of Lieutenant Jaspar Hobson, were one chief and two subordinate officers, with ten soldiers, three of whom took their wives with them. They were all picked men, chosen by Captain Craventy on account of their energy and resolution. We append a list of the whole party:—

1. Lieutenant Jaspar Hobson.
11. Sabine, soldier.
2. Sergeant Long.
12. Hope, do.
3. Corporal Joliffe.
4. Petersen, soldier
14. Mrs Rae
5. Belcher, do.
15. Mrs Joliffe.
6. Rae, do
16. Mrs Mac-Nab.
7. Marbre, do
17. Mrs Paulina Barnett.
8. Garry, do
18. Madge.
9. Pond, do
19. Thomas Black
10. Mac-Nab, do.

In all, nineteen persons to be transported several hundreds of miles through a desert and imperfectly-known country.

With this project in view, however, the Company had collected everything necessary for the expedition. A dozen sledges, with their teams of dogs, were in readiness. These primitive vehicles consisted of strong but light planks joined together by transverse bands. A piece of curved wood, turning up at the end like a skate, was fixed beneath the sledge, enabling it to cleave the snow without sinking deeply into it. Six swift and intelligent dogs, yoked two and two, and controlled by the long thong brandished by the driver, drew the sledges, and could go at a rate of fifteen miles an hour.

The wardrobe of the travellers consisted of garments made of reindeer-skins, lined throughout with thick furs. All wore linen next the skin as a protection against the sudden changes of temperature frequent in these latitudes. Each one, officer or soldier, male or female, wore seal-skin boots sewn with twine, in the manufacture of which the natives excel. These boots are absolutely impervious, and are so flexible that they are admirably adapted for walking. Pine-wood snow-shoes, two or three feet long, capable of supporting the weight of a man on the most brittle snow, and enabling him to pass over it with the rapidity of a skater on ice, can be fastened to the soles of the seal-skin boots. Fur caps and deer-skin belts completed the costumes.

For arms, Lieutenant Hobson had the regulation musketoons provided by the Company, pistols, ordnance sabres, and plenty of ammunition; for tools: axes, saws, adzes, and other instruments required in carpentering. Then there was the collection of all that would be needed for setting up a factory in the remote district for which they were bound: a stove; a smelting furnace, two airpumps for ventilation, an India-rubber boat, only inflated when required, &c., &c.

The party might have relied for provisions on the hunters amongst them. Some of the soldiers were skilful trackers of game, and there were plenty of reindeer in the Polar regions. Whole tribes of Indians, or Esquimaux, deprived of bread and all other nourishment, subsist entirely on this venison, which is both abundant and palatable. But as delays and difficulties had to be allowed for, a certain quantity of provisions was taken with them. The flesh of the bison, elk, and deer, amassed in the large battues on the south of the lake; corned beef, which will keep for any length of time; and some Indian preparations, in which the flesh of animals, ground to powder, retains its nutritive properties in a very small bulk, requiring no cooking, and forming a very nourishing diet, were amongst the stores provided in case of need.

Lieutenant Hobson likewise took several casks of rum and whisky; but he was firmly resolved to economise these spirits, so injurious to the health in cold latitudes, as much as possible. The Company had placed at his disposal a little portable medicine-chest, containing formidable quantities of lime-juice, lemons, and other simple remedies necessary to check, or if possible to prevent, the scorbutic affections which take such a terrible form in these regions.
All the men had been chosen with great care; none were too stout or too thin, and all had for years been accustomed to the severity of the climate, and could therefore more easily endure the fatigues of an expedition to the Polar Sea. They were all brave, high-spirited fellows, who had taken service of their own accord. Double pay had been promised them during their stay at the confines of the American continent, should they succeed in making a settlement beyond the seventieth parallel.

The sledge provided for Mrs Barnett and her faithful Madge was rather more comfortable than the others. She did not wish to be treated better than her travelling companions, but yielded to the urgent request of Captain Craventy, who was but carrying out the wishes of the Company.

The vehicle which brought Thomas Black to Fort Reliance also conveyed him and his scientific apparatus from it. A few astronomical instruments, of which there were not many in those days—a telescope for his selenographic observations, a sextant for taking the latitude, a chronometer for determining the longitudes, a few maps, a few books, were all stored away in this sledge, and Thomas Black relied upon his faithful dogs to lose nothing by the way.

Of course the food for the various teams was not forgotten. There were altogether no less than seventy-two dogs, quite a herd to provide for by the way, and it was the business of the hunters to cater for them. These strong intelligent animals were bought of the Chippeway Indians, who know well how to train them for their arduous calling.

The little company was most skilfully organised. The zeal of Lieutenant Jaspar Hobson was beyond all praise. Proud of his mission, and devoted to his task; he neglected nothing which could insure success. Corporal Joliffe, always a busybody, exerted himself without producing any very tangible results; but his wife was most useful and devoted; and Mrs Paulina Barnett had already struck up a great friendship with the brisk little Canadian woman, whose fair hair and large soft eyes were so pleasant to look at.

We need scarcely add that Captain Craventy did all in his power to further the enterprise. The instructions he had received from the Company showed what great importance they attached to the success of the expedition, and the establishment of a new factory beyond the seventieth parallel. We may therefore safely affirm that every human effort likely to insure success which could be made was made; but who could tell what insurmountable difficulties nature might place in the path of the brave Lieutenant I who could tell what awaited him and his devoted little band.

CHAPTER V.
FROM FORT RELIANCE TO FORT ENTERPRISE.

The first fine days came at last. The green carpet of the hills began to appear here and there where the snow had melted. A few migratory birds from the south-such as swans, bald-headed eagles, &c.—passed through the warmer air. The poplars, birches, and willows began to bud, and the redhead ducks, of which there are so many species in North America, to skim the surface of the numerous pools formed by the melted snow. Guillemots, puffins, and eider ducks sought colder latitudes; and little shrews no bigger than a hazel-nut ventured from their holes, tracing strange figures on the ground with their tiny-pointed tails. It was intoxicating once more to breathe the fresh air of spring, and to bask in the sunbeams. Nature awoke once more from her heavy sleep in the long winter night, and smiled as she opened her eyes.

The renovation of creation in spring is perhaps more impressive in the Arctic regions than in any other portion of the globe, on account of the greater contrast with what has gone before.

The thaw was not, however, complete. The thermometer, it is true, marked 41° Fahrenheit above zero; but the mean temperature of the nights kept the surface of the snowy plains solid—a good thing for the passage of sledges, of which Jaspar Hobson meant to avail himself before the thaw became complete.

The ice of the lake was still unbroken. During the last month several successful hunting expeditions had been made across the vast smooth plains, which were already frequented by game. Mrs Barnett was astonished at the skill with which the men used their snow-shoes, scudding along at the pace of a horse in full gallop. Following Captain Craventy’s advice, the lady herself practised walking in these contrivances, and she soon became very expert in sliding over the snow.

During the last few days several bands of Indians had arrived at the fort to exchange the spoils of the winter chase for manufactured goods. The season had been bad. There were a good many polecats and sables; but the furs of beavers, otters, lynxes, ermines, and foxes were scarce. It was therefore a wise step for the Company to endeavour to explore a new country, where the wild animals had hitherto escaped the rapacity of man.

On the morning of the 16th April Lieutenant Jaspar Hobson and his party were ready to start. The route across the known districts, between the Slave Lake and that of the Great Bear beyond the Arctic Circle, was already determined. Jaspar Hobson was to make for Fort Confidence, on the northern extremity of the latter lake; and he was to revictual at Fort Enterprise, a station two hundred miles further to the north-west, on the shores of the Snare Lake, by travelling at the rate of fifteen miles a day the Lieutenant hoped to halt there about the beginning of May.
From this point the expedition was to take the shortest route to Cape Bathurst, on the North American coast. It was agreed that in a year Captain Craventy should send a convoy with provisions to Cape Bathurst, and that a detachment of the Lieutenant’s men was to go to meet this convoy, to guide it to the spot where the new fort was to be erected. This plan was a guarantee against any adverse circumstances, and left a means of communication with their fellow-creatures open to the Lieutenant and his voluntary companions in exile.

On the 16th April dogs and sledges were awaiting the travellers at the postern gate. Captain Craventy called the men of the party together and said a few kind words to them. He urged them above all things to stand by one another in the perils they might be called upon to meet; reminded them that the enterprise upon which they were about to enter required self-denial and devotion, and that submission to their officers was an indispensable condition of success. Cheers greeted the Captain’s speech, the adieux were quickly made, and each one took his place in the sledge assigned to him. Jaspar Hobson and Sergeant Long went first; then Mrs Paulina Barnett and Madge, the latter dexterously wielding the long Esquimaux whip, terminating in a stiff thong. Thomas Black and one of the soldiers, the Canadian, Petersen, occupied the third sledge; and the others followed, Corporal and Mrs Joliffe bringing up the rear. According to the orders of Lieutenant Hobson, each driver kept as nearly as possible at the same distance from the preceding sledge, so as to avoid all confusion—a necessary precaution, as a collision between two sledges going at full speed, might have had disastrous results.

On leaving Fort Reliance, Jaspar Hobson at once directed his course towards the north-west. The first thing to be done was to cross the large river connecting Lakes Slave and Wolmsley, which was, however, still frozen so hard as to be undistinguishable from the vast white plains around. A uniform carpet of snow covered the whole country, and the sledges, drawn by their swift teams, sped rapidly over the firm smooth surface.

The weather was fine, but still very cold. The sun, scarce above the horizon, described a lengthened curve; and its rays, reflected on the snow, gave more light than heat. Fortunately not a breath of air stirred, and this lessened the severity of the cold, although the rapid pace of the sledges through the keen atmosphere must have been trying to any one not inured to the rigour of a Polar climate.

"A good beginning," said Jaspar Hobson to the Sergeant, who sat motionless beside him as if rooted to his seat; "the journey has commenced favourably. The sky is cloudless; the temperature propitious, our equipages shoot along like express trains, and as long as this fine weather lasts we shall get on capitally. What do you think, Sergeant Long?"

"I agree with you, Lieutenant," replied the Sergeant, who never differed from his chief.

"Like myself, Sergeant, you are determined to push on as far north as possible—are you not?" resumed Lieutenant Hobson.

"You have but to command to be obeyed, Lieutenant."

"I know it, Sergeant; I know that with you to bear is to obey. Would that all our men understood as you do the importance of our mission, and would devote themselves body and soul to the interests of the Company! Ah, Sergeant Long, I know if I gave you an impossible order—"

"Lieutenant, there is no such thing as an impossible order."

"What? Suppose now I ordered you to go to the North Pole?"

"Lieutenant, I should go!"

"And to comeback!" added Jaspar Hobson with a smile.

"I should come back," replied Sergeant Long simply.

During this colloquy between Lieutenant Hobson and his Sergeant a slight ascent compelled the sledges to slacken speed, and Mrs Barnett and Madge also exchanged a few sentences. These two intrepid women, in their otter-skin caps and white bear-skin mantles, gazed in astonishment upon the rugged scenery around them, and at the white outlines of the huge glaciers standing out against the horizon. They had already left behind them the hills of the northern banks of the Slave Lake, with their summits crowned with the gaunt skeletons of trees. The vast plains stretched before them in apparently endless succession. The rapid flight and cries of a few birds of passage alone broke the monotony of the scene. Now and then a troop of swans, with plumage so white that the keenest sight could not distinguish them from the snow when they settled on the ground, rose into view in the clear blue atmosphere and pursued their journey to the north.

"What an extraordinary country!" exclaimed Mrs Paulina Barnett. "What a difference between these Polar regions and the green prairies of Australia! You remember, Madge, how we suffered from the heat on the shores of the Gulf of Carpentaria—you remember the cloudless sky and the parching sunbeams?"

"My dear," replied Madge, "I have not the gift of remembering like you. You retain your impressions, I forget mine."

"What, Madge!" cried Mrs Barnett, "you have forgotten the tropical heat of India arid Australia? You have no recollection of our agonies when water failed us in the desert, when the pitiless sun scorched us to the bone, when
even the night brought us no relief from our sufferings!"

"No, Paulina," replied Madge, wrapping her furs more closely round her, "no, I remember nothing. How could I now recollect the sufferings to which you allude—the heat, the agonies of thirst—when we are surrounded on every side by ice, and I have but to stretch my arm out of this sledge to pick up a handful of snow? You talk to me of heat, when we are freezing beneath our bear skins; you recall the broiling rays of the sun when its April beams cannot melt the icicles on our lips! No, child, no, don't try to persuade me it's hot anywhere else; don't tell me I ever complained of being too warm, for I sha’n't believe you!"

Mrs Paulina Barnett could not help smiling.

"So, poor Madge," she said, "you are very cold!"

"Yes, child, I am cold; but I rather like this climate. I've no doubt it's very healthy, and I think North America will agree with me. It's really a very fine country!"

"Yes, Madge; it is a fine country, and we have as yet seen none of the wonders it contains. But wait until we reach the Arctic Ocean; wait until the winter shuts us in with its gigantic icebergs and thick covering of snow; wait till the northern storms break over us, and the glories of the Aurora Borealis and of the splendid constellations of the Polar skies are spread out above our heads; wait till we have lived through the strange long six months' night, and then indeed you will understand the infinite variety, the infinite beauty, of our Creator's handiwork!"

Thus spoke Mrs Paulina Barnett, carried away by her vivid imagination. She could see nothing but beauty in these deserted regions, with their rigorous climate. Her enthusiasm got the better of the time of her judgment. Her sympathy with nature enabled her to read the touching poetry of the ice-bound north—the poetry embodied in the Sagas, and sung by the bards of the time of Ossian. But Madge, more matter of fact than her mistress, disguised from herself neither the dangers of an expedition to the Arctic Ocean, nor the sufferings involved in wintering only thirty degrees at the most from the North Pole.

And indeed the most robust had sometimes succumbed to the fatigues, privations, and mental and bodily agonies endured in this severe climate. Jaspar Hobson had not, it is true, to press on to the very highest latitudes of the globe; he had not to reach the pole itself, or to follow in the steps of Parry, Ross, Mc'Clure, Kean, Morton, and others. But after once crossing the Arctic Circle, there is little variation in the temperature; it does not increase in coldness in proportion to the elevation reached. Granted that Jaspar Hobson did not think of going beyond the seventieth parallel, we must still remember that Franklin and his unfortunate companions died of cold and hunger before they had penetrated beyond 68° N. lat.

Very different was the talk in the sledge occupied by Mr and Mrs Joliffe. Perhaps the gallant Corporal had too often drunk to the success of the expedition on starting; for, strange to say, he was disputing with his little wife. Yes, he was actually contradicting her, which never happened except under extraordinary circumstances!

"No, Mrs Joliffe," he was saying, "no, you have nothing to fear. A sledge is not more difficult to guide than a pony-carriage, and the devil take me if I can't manage a team of dogs!"

"I don't question your skill," replied Mrs Joliffe; "I only ask you not to go so fast. You are in front of the whole caravan now, and I hear Lieutenant Hobson calling out to you to resume your proper place behind."

"Let him call, Mrs Joliffe, let him call."

And the Corporal, urging on his dogs with a fresh cut of the whip, dashed along at still greater speed.

"Take care, Joliffe," repeated his little wife; "not so fast, we are going down hill."

"Down hill, Mrs Joliffe; you call that down hill? why, it's up hill!"

"I tell you we are going down!" repeated poor Mrs Joliffe.

"And I tell you we are going up; look how the dogs pull!"

Whoever was right, the dogs became uneasy. The ascent was, in fact, pretty steep; the sledge dashed along at a reckless pace, and was already considerably in advance of the rest of the party. Mr and Mrs Joliffe bumped up and down every instant, the surface of the snow became more and more uneven, and the pair, flung first to one side and then to the other, knocked against each other and the sledge, and were horribly bruised and shaken. But the Corporal would listen neither to the advice of his wife nor to the shouts of Lieutenant Hobson. The latter, seeing the danger of this reckless course, urged on his own animals, and the rest of the caravan followed at a rapid pace.

But the Corporal became more and more excited—the speed of his equipage delighted him. He shouted, he gesticulated, and flourished his long whip like an accomplished sportsman.

"Wonderful things these whips!" he cried; "the Esquimaux wield them with unrivalled skill!"

"But you are not an Esquimaux!" cried Mrs Joliffe, trying in vain to arrest the arm of her imprudent husband.

"I have heard tell," resumed the Corporal—"I've heard tell that the Esquimaux can touch any dog they like in any part, that they can even cut out a bit of one of their ears with the stiff thong at the end of the whip. I am going to try." "Don't try, don't try, Joliffe!" screamed the poor little woman, frightened out of her wits.
"Don’t be afraid, Mrs Joliffe, don’t be afraid; I know what I can do. The fifth dog on the right is misbehaving himself.; I will correct him a little!"

But Corporal Joliffe was evidently not yet enough of an Esquimaux to be able to manage the whip with its thong four feet longer than the sledge; for it unrolled with an ominous hiss, and rebounding, twisted itself round Corporal Joliffe’s own neck, sending his fur cap into the air, perhaps with one of his ears in it.

At this moment the dogs flung themselves on one side, the sledge was overturned, and the pair were flung into the snow. Fortunately it was thick and soft, so that they escaped unhurt. But what a disgrace for the Corporal! how reproachfully his little wife looked at him, and how stern was the reprimand of Lieutenant Hobson!

The sledge was picked up, but it was decided that henceforth the reins of the dogs, like those of the household, were to be in the hands of Mrs Joliffe. The crest-fallen Corporal was obliged to submit, and the interrupted journey was resumed.

No incident worth mentioning occurred during the next fifteen days. The weather continued favourable, the cold was not too severe, and on the 1st May the expedition arrived at Fort Enterprise.

CHAPTER VI.
A WAPITI DUEL.

Two hundred miles had been traversed since the expedition left Fort Reliance. The travellers, taking advantage of the long twilight, pressed on day and night, and were literally overcome with fatigue when they reached Fort Enterprise, near the shores of Lake Snare.

This fort was no more than a depot of provisions, of little importance, erected a few years before by the Hudson’s Bay Company. It served as a resting-place for the men taking the convoys of furs from the Great Bear Lake, some three hundred miles further to the north-west. About a dozen soldiers formed the garrison. The fort consisted of a wooden house surrounded by palisades. But few as were the comforts it offered, Lieutenant Hobson’s companions gladly took refuge in it and rested there for two days.

The gentle influence of the Arctic spring was beginning to be felt. Here and there the snow had melted, and the temperature of the nights was no longer below freezing point. A few delicate mosses and slender grasses clothed the rugged ground with their soft verdure; and from between the stones peeped the moist calices of tiny, almost colourless, flowers. These faint signs of reawakening vegetation, after the long night of winter, were refreshing to eyes weary of the monotonous whiteness of the snow; and the scattered specimens of the Flora of the Arctic regions were welcomed with delight.

Mrs Paulina Barnett and Jaspar Hobson availed themselves of this leisure time to visit the shores of the little lake. They were both students and enthusiastic lovers of nature. Together they wandered amongst the ice masses, already beginning to break up, and the waterfalls created by the action of the rays of the sun. The surface itself of Lake Snare was still intact, not a crack denoted the approaching thaw; but it was strewn with the ruins of mighty icebergs, which assumed all manner of picturesque forms, and the beauty of which was heightened when the light, diffused by the sharp edges of the ice, touched them with all manner of colours. One might have fancied that a rainbow, crushed in a powerful hand, had been flung upon the ground, its fragments crossing each other as they fell.

“What a beautiful scene!” exclaimed Mrs Paulina Barnett. “These prismatic effects vary at every change of our position. Does it not seem as if we were bending over the opening of an immense kaleidoscope, or are you already weary of a sight so new and interesting to me?”

“No, madam,” replied the Lieutenant; “although I was born and bred on this continent, its beauties never pall upon me. But if your enthusiasm is so great when you see this scenery with the sun shining upon it, what will it be when you are privileged to behold the terrible grandeur of the winter? To own the truth, I think the sun, so much thought of in temperate latitudes, spoils my Arctic home.”

“Indeed!” exclaimed Mrs Barnett, smiling at the Lieutenant’s last remark; “for my part, I think the sun a capital travelling companion, and I shall not be disposed to grumble at the warmth it gives even in the Polar regions!”

“Ah, madam,” replied Jaspar Hobson, “I am one of those who think it best to visit Russia in the winter, and the Sahara Desert in the summer. You then see their peculiar characteristics to advantage. The sun is a star of the torrid and temperate zones, and is out of place thirty degrees from the North Pole. The true sky of this country is the pure frigid sky of winter, bright with constellations, and sometimes flushed with the glory of the Aurora Borealis. This land is the land of the night, not of the day; and you have yet to make acquaintance with the delights and marvels of the long Polar night.”

“Have you ever visited the temperate zones of Europe and America?” inquired Mrs Barnett.

“Yes, madam; and I admired them as they deserved. But I returned home with fresh love and enthusiasm for my native land. Cold is my element, and no merit is due to me for braving it. It has no power over me; and, like the Esquimaux. I can live for months together in a snow hut.”
"Really, Lieutenant Hobson, it is quite cheering to hear our dreaded enemy spoken of in such terms. I hope to prove myself worthy to be your companion, and wherever you venture, we will venture together."

"I agree, madam, I agree; and may all the women and soldiers accompanying me show themselves as resolute as you. If so, God helping us, we shall indeed advance far."

"You have nothing to complain of yet," observed the lady. "Not a single accident has occurred, the weather has been propitious, the cold not too severe-everything has combined to aid us."

"Yes, madam; but the sun which you admire so much will soon create difficulties for us, and strew obstacles in our path."

"What do you mean, Lieutenant Hobson?"

"I mean that the heat will soon have changed the aspect of the country; that the melted ice will impede the sliding of the sledges; that the ground will become rough and uneven; that our panting dogs will no longer carry us along with the speed of an arrow; that the rivers and lakes will resume their liquid state, and that we shall have to ford or go round them. All of these changes, madam, due to the influence of the solar rays, will cause delays, fatigue, and dangers, the very least of which will be the breaking of the brittle snow beneath our feet, or the falling of the avalanches from the summits of the icebergs. For all this we have to thank the gradual rise of the sun higher and higher above the horizon. Bear this in mind, madam: of the four elements of the old creation, only one is necessary to us here, the air; the other three, fire, earth, and water, are de trop in the Arctic regions."

Of course the Lieutenant was exaggerating, and Mrs Barnett could easily have retorted with counter-arguments; but she liked to hear his raptures in praise of his beloved country, and she felt that his enthusiasm was a guarantee that he would shrink from no obstacle.

Yet Jaspar Hobson was right when he said the sun would cause difficulties. This was seen when the party set out again on the 4th May, three days later. The thermometer, even in the coldest part of the night, marked more than 32° Fahrenheit. A complete thaw set in, the vast white sheet of snow resolved itself into water. The irregularities of the rocky soil caused constant jolting of the sledges, and the passengers were roughly shaken. The roads were so heavy that the dogs had to go at a slow trot, and the reins were therefore again entrusted to the hands of the imprudent Corporal Joliffe. Neither shouts nor flourishings of the whip had the slightest effect on the jaded animals.

From time to time the travellers lightened the sledges by walking little way. This mode of locomotion suited the hunters, who were now gradually approaching the best districts for game in the whole of English America. Mrs Paulina Barnett and Madge took a great interest in the chase, whilst Thomas Black professed absolute indifference to all athletic exercise. He had not come all this distance to hunt the polecat or the ermine, but merely to look at the moon at the moment when her disc should cover that of the sun. When the queen of the night rose above the horizon, the impatient astronomer would gaze at her with eager eyes, and one day the Lieutenant said to him

"It would be a bad look-out for you, Mr Black, if by any unlucky chance the moon should fail to keep her appointment on the 16th July 1860."

"Lieutenant Hobson," gravely replied the astronomer, "if the moon were guilty of such a breach of good manners, I should indeed have cause to complain."

The chief hunters of the expedition were the soldiers Marbre and Sabine, both very expert at their business. Their skill was wonderful; and the cleverest Indians would not have surpassed them in keenness of sight, precision of aim, or manual address. They were alike trappers and hunters, and were acquainted with all the nets and snares for taking sables, otters, wolves, foxes, bears, &c. No artifice was unknown to them, and Captain Craventy had shown his wisdom in choosing two such intelligent men to accompany the little troop.

Whilst on the march however, Marbre and Sabine had no time for setting traps. They could not separate from the others for more than an hour or two at a time, and were obliged to be content with the game which passed within range of their rifles. Still they were fortunate enough to kill two of the large American ruminants, seldom met with in such elevated latitudes.

On the morning of the 15th May the hunters asked permission to follow some fresh traces they had found, and the Lieutenant not only granted it, but himself accompanied them with Mrs Paulina Barnett, and they went several miles out of their route towards the east.

The impressions were evidently the result of the passage of about half-a-dozen large deer. There could be no mistake about it; Marbre and Sabine were positive on that point, and could even have named the species to which the animals belonged.

"You seem surprised to have met with traces of these animals here, Lieutenant," said Mrs Barnett.

"Well, madam," replied Hobson, "this species is rarely seen beyond 57° N. lat. We generally hunt them at the south of the Slave Lake, where they feed upon the shoots of willows and poplars, and certain wild roses to which they are very partial."
"I suppose these creatures, like those with valuable furs, have fled from the districts scour ed by the hunters."

"I see no other explanation of their presence at 65° N. lat.," replied the Lieutenant-"that is, if the men are not mistaken as to the origin of the footprints."

"No, no, sir," cried Sabine; "Marbre and I are not mistaken. These traces were left by deer, the deer we hunters call red deer, and the natives wapitis."

"He is quite right," added Marbre; "old trappers like us are not to be taken in; besides, don’t you hear that peculiar whistling sound?"

The party had now reached the foot of a little hill, and as the snow had almost disappeared from its sides they were able to climb it, and hastened to the summit, the peculiar whistling noticed by Marbre becoming louder, mingled with cries resembling the braying of an ass, and proving that the two hunters were not mistaken.

Once at the top of the hill, the adventurers looked eagerly towards the east. The undulating plains were still white with snow, but its dazzling surface was here and there relieved with patches of stunted light green vegetation. A few gaunt shrubs stretched forth their bare and shrivelled branches, and huge icebergs with precipitous sides stood out against the grey background of the sky.

"Wapitis! wapitis!—there they are!" cried Sabine and Marbre at once, pointing to a group of animals distinctly visible about a quarter of a mile to the east.

"What are they doing?" asked Mrs Barnett.

"They are fighting, madam," replied Hobson; "they always do when the heat of the Polar sun inflames their blood—another deplorable result of the action of the radiant orb of day!"

From where they stood the party could easily watch the group of wapitis. They were fine specimens of the family of deer known under the various names of stags with rounded antlers, American stags, roebucks, grey elks and red elks, &c. These graceful creatures have slender legs and brown skins with patches of red hair, the colour of which becomes darker in the warmer season. The fierce males are easily distinguished from the females by their fine white antlers, the latter being entirely without these ornaments. These wapitis were once very numerous all over North America, and the United States imported a great many; but clearings were begun on every side, the forest trees fell beneath the axe of the pioneer of civilisation, and the wapitis took refuge in the more peaceful districts of Canada; but they were soon again disturbed, and wandered to the shores of Hudson’s Bay. So that although the wapiti thrives in a cold country, Lieutenant Hobson was right in saying that it seldom penetrates beyond 57° N. latitude; and the specimens now found had doubtless fled before the Chippeway Indians, who hunt them without mercy.

The wapitis were so engrossed in their desperate struggle that they were unconscious of the approach of the hunters; but they would probably not have ceased fighting, had they been aware of it. Marbre and Sabine, aware of their peculiarity in this respect, might therefore have advanced fearlessly upon them, and have taken aim at leisure.

Lieutenant Hobson suggested that they should do so.

"Beg pardon, sir," replied Marbre; "but let us spare our powder and shot. These beasts are engaged in a war to the death, and we shall arrive in plenty of time to pick up the vanquished."

"Have these wapitis a commercial value?" asked Mrs Paulina Barnett.

"Yes, madam," replied Hobson; "and their skin, which is not quite so thick as that of the elk, properly so called makes very valuable leather. By rubbing this skin with the fat and brains of the animal itself, it is rendered flexible, and neither damp nor dryness injures it. The Indians are therefore always eager to procure the skins of the wapitis."

"Does not the flesh make admirable venison?"

"Pretty good, madam; only pretty good. It is tough, and does not taste very nice; the fat becomes hard directly it is taken from the fire, and sticks to the teeth. It is certainly inferior as an article of food to the flesh of other deer; but when meat is scarce we are glad enough to eat it, and it supports life as well as anything else."

Mrs Barnett and Lieutenant Hobson had been chatting together for some minutes, when, with the exception of two, the wapitis suddenly ceased fighting. Was their rage satiated? or had they perceived the hunters, and felt the approach of danger? Whatever the cause, all but two fine creatures fled towards the east With incredible speed; in a few instants they were out of sight, and the swiftest horse could not have caught them up.

Meanwhile, however, two magnificent specimens remained on the field of battle. Heads down, antlers to antlers, hind legs stretched and quivering, they butted at each other without a moment’s pause. Like two wrestlers struggling for a prize which neither will yield, they would not separate, but whirled round and round together on their front legs as if riveted to one another. What implacable rage! exclaimed Mrs Barnett.

"Yes," replied the Lieutenant; "the wapitis really are most spiteful beasts. I have no doubt they are fighting out an old quarrel."

"Would not this be the time to approach them, when they are blinded with rage?"

"There’s plenty of time, ma’am," said Sabine; "they won’t escape us now. They will not stir from where they are
when we are three steps from them, the rifles at our shoulders, and our fingers on the triggers!"

Indeed? Yes, madam," added Hobson, who had carefully examined the wapitis after the hunter’s remark; "and whether at our hands or from the teeth of wolves, those wapitis will meet death where they now stand."

"I don’t understand what you mean, Lieutenant," said Mrs Barnett.

"Well, go nearer, madam," he replied; "don’t be afraid of startling the animals; for, as our hunter says, they are no longer capable of flight."

The four now descended the hill, and in a few minutes gained the theatre of the struggle. The wapitis had not moved. They were pushing at each other like a couple of rams, and seemed to be inseparably glued together.

In fact, in the heat of the combat the antlers of the two creatures had become entangled together to such an extent that they could no longer separate without breaking them. This often happens in the hunting districts. It is not at all uncommon to find antlers thus connected lying on the ground; the poor encumbered animals soon die of hunger, or they become an easy prey to wild beasts.

Two bullets put an end to the fight between the wapitis; and Marbre and Sabine taking immediate possession, carried off their skins to be subsequently prepared, leaving their bleeding carcasses to be devoured by wolves and bears.

CHAPTER VII.
THE ARCTIC CIRCLE.

The expedition continued to advance towards the north-west; but the great inequalities of the ground made it hard work for the dogs to get along, and the poor creatures, who could hardly be held in when they started, were now quiet enough. Eight or ten miles a day were as much as they could accomplish, although Lieutenant Hobson urged them on to the utmost.

He was anxious to get to Fort Confidence, on the further side of the Great Bear Lake, where he hoped to obtain some useful information. Had the Indians frequenting the northern banks of the lake been able to cross the districts on the shores of the sea? was the Arctic Ocean open at this time of year? These were grave questions, the reply to which would decide the fate of the new factory.

The country through which the little troop was now passing was intersected by numerous streams, mostly tributaries of the two large rivers, the Mackenzie and Coppermine, which flow from the south to the north, and empty themselves into the Arctic Ocean. Lakes, lagoons, and numerous pools are formed between these two principal arteries; and as they were no longer frozen over, the sledges could not venture upon them, and were compelled to go around them, which caused considerable delay. Lieutenant Hobson was certainly right in saying that winter is the time to visit the hyperborean regions, for they are then far easier to traverse. Mrs Paulina Barnett had reason to own the justice of this assertion than once.

This region, included in the “Cursed Land,” was, besides, completely deserted, as are the greater portion of the districts of the extreme north of America. It has been estimated that there is but one inhabitant to every ten square miles. Besides the scattered natives, there are some few thousand agents or soldiers of the different fur-trading companies; but they mostly congregate in the southern districts and about the various factories. No human footprints gladden the eyes of the travellers, the only traces on the sandy soil were those of ruminants and rodents. Now and then a fierce polar bear was seen, and Mrs Paulina Barnett expressed her surprise at not meeting more of these terrible carnivorous beasts, of whose daily attacks on whalers and persons shipwrecked in Baffin’s Bay and on the coasts of Greenland and Spitzbergen she had read in the accounts of those who had wintered in the Arctic regions.

"Wait for the winter, madam," replied the Lieutenant; “wait till the cold makes them hungry, and then you will perhaps see as many as you care about!”

On the 23d May, after a long and fatiguing journey, the expedition at last reached the Arctic Circle. We know that this latitude 23° 27’ 57” from the North Pole, forms the mathematical limit beyond which the rays of the sun do not penetrate in the winter, when the northern districts of the globe are turned away from the orb of day. Here, then, the travellers entered the true Arctic region, the northern Frigid Zone.

The latitude had been very carefully obtained by means of most accurate instruments, which were handled with equal skill by the astronomer and by Lieutenant Hobson. Mrs Barnett was present at the operation, and had the satisfaction of hearing that she was at last about to cross the Arctic Circle. It was with a feeling of just pride that she received the intelligence.

“You have already passed through the two Torrid Zones in your previous journeys," said the Lieutenant, "and now you are on the verge of the Arctic Circle. Few explorers have ventured into such totally different regions. Some, so to speak, have a specialty for hot countries, and choose Africa or Australia as the field for their investigations. Such were Barth, Burton, Livingstone Speke, Douglas, Stuart, &c. Others, on the contrary, have a passion for the Arctic regions, still so little known. Mackenzie, Franklin, Penny, Kane, Parry, Rae, &c., preceded us on our present journey; but we must congratulate you, Mrs Barnett, on being a more cosmopolitan traveller than all
of them."

"I must see everything or at least try to see everything, Lieutenant," replied Mrs Paulina; "and I think the
dangers and difficulties are about equal everywhere. Although we have not to dread the fevers of the unhealthy
torrid regions, or the attacks of the fierce black races, in this Frigid Zone, the cold is a no less formidable enemy;
and I suspect that the white bears we are liable to meet with here will give us quite as warm a reception as would the
tiers of Thibet or the lions of Africa. In Torrid and Frigid Zones alike there are vast unexplored tracts which will
long defy the efforts of the boldest adventurers."

"Yes, madam," replied Jaspar Hobson; "but I think the hyperborean regions will longer resist thorough
exploration. The natives are the chief obstacle in tropical regions, and I am well aware how many travellers have
fallen victims to savages. But civilisation will necessarily subdue the wild races sooner or later; whereas in the
Arctic and Antarctic Zones it is not the inhabitants who arrest the progress of the explorer, but Nature herself who
repels those who approach her, and paralyses their energies with the bitter cold!"

"You think, then, that the secrets of the most remote districts of Africa and Australia will have been fathomed
before the Frigid Zone has been entirely examined?"

"Yes, madam," replied the Lieutenant; "and I think my opinion is founded on facts. The most intrepid
discoverers of the Arctic regions - Parry, Penny, Franklin, M’Clure, Dane, and Morton — did not get beyond 83°
north latitude, seven degrees from the pole — whereas Australia has several times been crossed from south to north
by the bold Stuart; and even Africa, with all its terrors, was traversed by Livingstone from the Bay of Loanga to the
mouth of the Zambesi. We are, therefore, nearer to geographical knowledge of the equatorial countries than of the
Polar districts."

"Do you think that the Pole itself will ever be reached by man?" inquired Mrs Paulina Barnett.

"Certainly," replied Hobson, adding with a smile, "by man or woman. But I think other means must be tried of
reaching this point, where all the meridians of the globe cross each other, than those hitherto adopted by travellers.
We hear of the open sea, of which certain explorers are said to have caught a glimpse. But if such a sea, free from
ice, really exist, it is very difficult to get at, and no one can say positively whether it extends to the North Pole. For
my part, I think an open sea would increase rather than lessen the difficulties of explorers. As for me, I would rather
count upon firm footing, whether on ice or rock, all the way. Then I would organise successive expeditions,
establishing depôts of provisions and fuel nearer and nearer to the Pole; and so, with plenty of time, plenty of
money, and perhaps the sacrifice of a good many lives, I should in the end solve the great scientific problem. I
should, I think, at last reach the hitherto inaccessible goal!"

"I think you are right, Lieutenant," said Mrs Barnett; "and if ever you try the experiment, I should not be afraid
to join you, and would gladly go to set up the Union Jack at the North Pole. But that is not our present object."

"Not our immediate object, madam," replied Hobson; "but when once the projects of the Company are realised,
when the new fort has been erected on the confines of the American continent, it may become the natural starting-
point of all expeditions to the north. Besides, should the fur-yielding animals, too zealously hunted, take refuge at
the Pole, we should have to follow them."

"Unless costly furs should go out of fashion," replied Mrs Barnett.

"Oh, madam," cried the Lieutenant, "there will always be some pretty woman whose wish for a sable muff or an
ermine tippet must be gratified!"

"I am afraid so," said Mrs Barnett, laughing; "and probably the first discoverer of the Pole will have been led
thither in pursuit of a sable or a silver fox."

"That is my conviction," replied Hobson. "Such is human nature, and greed of gain will always carry a man
further than zeal for science."

"What! do you utter such sentiments?" exclaimed Mrs Barnett.

"Well, madam, what am I but an employé of the Hudson’s Bay Company? and does the Company risk its capital
and agents with any other hope than an increase of profits?"

"Lieutenant Hobson," said Mrs Barnett, "I think I know you well enough to assert that on occasion you would be
ready to devote body and soul to science. If a purely geographical question called you to the Pole, I feel sure you
would not hesitate to go. But," she added, with a smile, "the solution of this great problem is still far distant. We
have but just reached the verge of the Arctic Circle, but I hope we may cross it without any very great difficulty."

"That I fear is doubtful," said the Lieutenant, who had been attentively examining the sky during their
conversation. "The weather has looked threatening for the last few days. Look at the uniformly grey hue of the
heavens. That mist will presently resolve itself into snow; and if the wind should rise ever so little, we shall have to
battle with a fearful storm. I wish we were at the Great Bear Lake!"

"Do not let us lose any time, then," said Mrs Barnett, rising; "give the signal to start at once."

The Lieutenant needed no urging. Had he been alone, or accompanied by a few men as energetic as himself, he
would have pressed on day and night; but he was obliged to make allowance for the fatigue of others, although he
never spared himself. He therefore granted a few hours of rest to his little party, and it was not until three in the
afternoon that they again set out.

Jaspar Hobson was not mistaken in prophesying a change in the weather. It came very soon. During the
afternoon of the same day the mist became thicker, and assumed a yellowish and threatening hue. The Lieutenant,
although very uneasy, allowed none of his anxiety to appear, but had a long consultation with Sergeant Long whilst
the dogs of his sledge were laboriously preparing to start.

Unfortunately, the district now to be traversed was very unsuitable for sledges. The ground was very uneven; ravines
were of frequent occurrence; and masses of granite or half-thawed icebergs blocked up the road, causing
constant delay. The poor dogs did their best, but the drivers’ whips no longer produced any effect upon them.

And so the Lieutenant and his men were often obliged to walk to rest the exhausted animals, to push the sledges,
or even sometimes to lift them when the roughness of the ground threatened to upset them. The incessant fatigue
was, however, borne by all without a murmur. Thomas Black alone, absorbed in his one idea, never got out of his
sledge, and indeed he was so corpulent that all exertion was disagreeable to him.

The nature of the soil changed from the moment of entering the Arctic Circle. Some geological convulsion had
evidently upheaved the enormous blocks strewn upon the surface. The vegetation, too, was of a more distinctive
documentivity. Wherever they were sheltered from the keen north winds, the flanks of the hills were clothed not only
with shrubs, but with large trees, all of the same species — pines, willows, and firs — proving by their presence that
a certain amount of vegetative force is retained even in the Frigid Zone. Jaspar Hobson hoped to find such
specimens of the Arctic Flora even on the verge of the Polar Sea; for these trees would supply him with wood to
build his fort, and fuel to warm its inhabitants. The same thought passed through the minds of his companions, and
they could not help wondering at the contrast between this comparatively fertile region, and the long white plains
stretching between the Great Slave Lake and Fort Enterprise.

At night the yellow mist became more opaque; the wind rose, the snow began to fall in large flakes, and the
ground was soon covered with a thick white carpet. In less than an hour the snow was a foot deep, and as it did not
freeze but remained in a liquid state, the sledges could only advance with extreme difficulty; the curved fronts stuck
in the soft substance, and the dogs were obliged to stop again and again.

Towards eight o’clock in the evening the wind became very boisterous. The snow, driven before it, was flung
upon the ground or whirled in the air, forming one huge whirlpool. The dogs, beaten back by the squall and blinded

snow, could advance no further. The party was then in a narrow gorge between huge icebergs, over which the
storm raged with fearful fury. Pieces of ice, broken off by the hurricane, were hurled into the pass; partial
avalanches, any one of which could have crushed the sledges and their inmates, added to its dangers, and to press on
became impossible. The Lieutenant no longer insisted, and after consulting with Sergeant Long, gave the order to
halt. It was now necessary to find a shelter from the snow-drift; but this was no difficult matter to men accustomed
to Polar expeditions. Jaspar Hobson and his men knew well what they had to do under the circumstances. It was not
the first time they had been surprised by a tempest some hundred miles from the forts of the Company, without so
much as an Esquimaux hut or Indian hovel in which to lay their heads.

"To the icebergs! to the icebergs!" cried Jaspar Hobson.

Every one understood what he meant. Snow houses were to be hollowed out of the frozen masses, or rather holes
were to be dug, in which each person could cower until the storm was over. Knives and hatchets were soon at work
on the brittle masses of ice, and in three-quarters of an hour some ten dens had been scooped out large enough to
contain two or three persons each. The dogs were left to themselves, their own instinct leading them to find
sufficient shelter under the snow.

Before ten o’clock all the travellers were crouching in the snow houses, in groups of two or three, each choosing
genial companions. Mrs Barnett, Madge, and Lieutenant Hobson occupied one hut, Thomas Black and Sergeant
Long another, and so on. These retreats were warm, if not comfortable; and the Esquimaux and Indians have no
other refuge even in the bitterest cold. The adventurers could therefore fearlessly await the end of the storm as long
as they took care not to let the openings of their holes become blocked up with the snow, which they had to shovel
away every half hour. So violent was the storm that even the Lieutenant and his soldiers could scarcely set foot
outside. Fortunately, all were provided with sufficient food, and were able to endure their beaver-like existence
without suffering from cold or hunger.

For forty-eight hours the fury of the tempest continued to increase. The wind roared in the narrow pass, and tore
off the tops of the icebergs. Loud reports, repeated twenty times by the echoes, gave notice of the fall of avalanches,
and Jaspar Hobson began to fear that his further progress would be barred by the masses of debris accumulated
between the mountains. Other sounds mingled with these reports, which Lieutenant Hobson knew too well, and he
did not disguise from Mrs Barnett that bears were prowling about the pass. But fortunately these terrible animals
were too much occupied with their own concerns to discover the retreat of the travellers; neither the dogs nor the sledges, buried in the snow, attracted their attention, and they passed on without doing any harm.

The last night, that of the 25th or 26th May, was even more terrible. So great was the fury of the hurricane that a general overthrow of icebergs appeared imminent. A fearful death would then have awaited the unfortunate travellers beneath the ruins of the broken masses. The blocks of ice cracked with an awful noise, and certain oscillations gave warning that breaches had been made threatening their solidity. However, no great crash occurred, the huge mountains remained intact, and towards the end of the night one of those sudden changes so frequent in the Arctic regions took place; the tempest ceased suddenly beneath the influence of intense cold, and with the first dawn of day peace was restored.

CHAPTER VIII.
THE GREAT BEAR LAKE.

This sudden increase of cold was most fortunate. Even in temperate climes there are generally three or four bitter days in May; and they were most serviceable now in consolidating the freshly-fallen snow, and making it practicable for sledges. Lieutenant Hobson, therefore, lost no time in resuming his journey, urging on the dogs to their utmost speed.

The route was, however, slightly changed. Instead of bearing due north, the expedition advanced towards the west, following, so to speak, the curve of the Arctic Circle. The Lieutenant was most anxious to reach Fort Confidence, built on the northern extremity of the Great Bear Lake. These few cold days were of the greatest service to him; he advanced rapidly, no obstacle was encountered, and his little troop arrived at the factory on the 30th May.

At this time Forts Confidence and Good Hope were the most advanced posts of the Company in the north. Fort Confidence was a most important position, built on the northern extremity of the lake, close to its waters, which being frozen over in winter, and navigable in summer, afforded easy access to Fort Franklin, on the southern shores, and promoted the coming and going of the Indian hunters with their daily spoils. Many were the hunting and fishing expeditions which started from Forts Confidence and Good Hope, especially from the former. The Great Bear Lake is quite a Mediterranean Sea, extending over several degrees of latitude and longitude. Its shape is very irregular: two promontories jut into it towards the centre, and the upper portion forms a triangle; its appearance, as a whole, much resembling the extended skin of a ruminant without the head.

Fort Confidence was built at the end of the "right paw," at least two hundred miles from Coronation Gulf, one of the numerous estuaries which irregularly indent the coast of North America. It was therefore situated beyond the Arctic Circle, but three degrees south of the seventieth parallel, north of which the Hudson’s Bay Company proposed forming a new settlement.

Fort Confidence, as a whole, much resembled other factories further south. It consisted of a house for the officers, barracks for the soldiers, and magazines for the furs - all of wood, surrounded by palisades. The captain in command was then absent. He had gone towards the east on a hunting expedition with a few Indians and soldiers. The last season had not been good, costly furs had been scarce; but to make up for this the lake had supplied plenty of otter-skins. The stock of them had, however, just been sent to the central factories in the south, so that the magazines of Fort Confidence were empty on the arrival of our party.

In the absence of the Captain a Sergeant did the honours of the fort to Jaspar Hobson and his companions. This second officer, Felton by name was a brother-in-law of Sergeant Long. He showed the greatest readiness to assist the views of the Lieutenant, who being anxious to rest his party, decided on remaining two or three days at Fort Confidence. In the absence of the little garrison there was plenty of room, and dogs and men were soon comfortably installed. The best room in the largest house was of course given to Mrs Paulina Barnett, who was delighted with the politeness of Sergeant Felton.

Jaspar Hobson’s first care was to ask Felton if any Indians from the north were then beating the shores of the Great Bear Lake.

"Yes, Lieutenant," replied the Sergeant; "we have just received notice of the encampment of a party of Hare Indians on the other northern extremity of the lake."

"How far from here?" inquired Hobson.

"About thirty miles," replied Sergeant Felton. "Do you wish to enter into communication with these Indians?"

"Yes," said Hobson; they may be able to give me some valuable information about the districts bordering on the Arctic Ocean, and bounded by Cape Bathurst. Should the site be favourable, I propose constructing our new fort somewhere about there."

"Well, Lieutenant, nothing is easier than to go to the Hare encampment."

"Along the shores of the lake?"

"No, across it; it is now free from ice, and the wind is favourable. We will place a cutter and a boatman at your service, and in a few hours you will be in the Indian settlement."
"Thank you, Sergeant; to-morrow, then." Whenever you like, Lieutenant."

The start was fixed for the next morning; and when Mrs Paulina Barnett heard of the plan, she begged the Lieutenant to allow her to accompany him, which of course he readily did.

But now to tell how the rest of this first day was passed. Mrs Barnett, Hobson, two or three soldiers, Madge, Mrs Mac-Nab, and Joliffe explored the shores of the lake under the guidance of Felton. The neighbourhood was by no means barren of vegetation; the hills, now free from snow, were crowned by resinous trees of the Scotch pine species. These trees, which attain a height of some forty feet, supply the inhabitants of the forts with plenty of fuel through the long winter. Their thick trunks and dark gloomy branches form a striking feature of the landscape; but the regular clumps of equal height, sloping down to the very edge of the water, are somewhat monotonous. Between the groups of trees the soil was clothed with a sort of whitish weed, which perfumed the air with a sweet thyme odour. Sergeant Felton informed his guests that this plant was called the "herb of incense" on account of the fragrance it emits when burnt.

Some hundred steps from the fort the party came to a little natural harbour shut in by high granite rocks, which formed an admirable protection from the heavy surf. Here was anchored the fleet of Fort Confidence, consisting of a single fishing-boat—the very one which was to take Mrs Barnett and Hobson to the Indian encampment the next day. From this harbour an extensive view was obtained of the lake; its waters slightly agitated by the wind, with its irregular shores broken by jagged capes and intersected by creeks. The wooded heights beyond, with here and there the rugged outline of a floating iceberg standing out against the clear blue air, formed the background on the north; whilst on the south a regular sea horizon, a circular line clearly cutting sky and water, and at this moment glittering in the sunbeams, bounded the sight.

The whole scene was rich in animal and vegetable life. The surface of the water, the shores strewn with flints and blocks of granite, the slopes with their tapestry of herbs, the tree-crowned hill-tops, were all alike frequented by various specimens of the feathered tribe. Several varieties of ducks, uttering their different cries and calls, eider ducks, whistlers spotted redshanks, "old women," those loquacious birds whose beak is never closed, skimmed the surface of the lake. Hundreds of puffins and guillemots with outspread wings darted about in every direction, and beneath the trees strutted ospreys two feet high—a kind of hawk with a grey body, blue beak and claws, and orange-coloured eyes, which build their huge nests of marine plants in the forked branches of trees. The hunter Sabine managed to bring down a couple of these gigantic ospreys, which measured nearly six feet from tip to tip of their wings, and were therefore magnificent specimens of these migratory birds, who feed entirely on fish, and take refuge on the shores of the Gulf of Mexico when winter sets in, only visiting the higher latitudes of North America during the short summer.

But the most interesting event of the day was the capture of an otter, the skin of which was worth several hundred roubles.

The furs of these valuable amphibious creatures were once much sought after in China; and although the demand for them has considerably decreased in the Celestial Empire, they still command very high prices in the Russian market. Russian traders, ready to buy up sea-otter skins, travel all along the coasts of New Cornwall as far as the Arctic Ocean; and of course, thus hunted, the animal is becoming very rare. It has taken refuge further and further north, and the trackers have now to pursue it on the shores of the Kamtchatka Sea, and in the islands of the Behring Archipelago.

"But," added Sergeant Felton, after the preceding explanation, "American inland otters are not to be despised, and those which frequent the Great Bear Lake are worth from £50 to £60 each."

The Sergeant was right; magnificent otters are found in these waters, and he himself skilfully tracked and killed one in the presence of his visitors which was scarcely inferior in value to those from Kamtchatka itself. The creature measured three feet from the muzzle to the end of its tail; it had webbed feet, short legs, and its fur, darker on the upper than on the under part of its body, was long and silky.

"A good shot, Sergeant," said Lieutenant Hobson, who with Mrs Barnett had been attentively examining the magnificent fur of the dead animal.

"Yes, Lieutenant," replied Felton; "and if each day brought us such a skin as that, we should have nothing to complain of. But much time is wasted in watching these animals, who swim and dive with marvellous rapidity. We generally hunt them at night, as they very seldom venture from their homes in the trunks of trees or the holes of rocks in the daytime, and even expert hunters find it very difficult to discover their retreats."

"And are these otters also becoming scarcer and scarcer?" inquired Mrs Barnett.

"Yes, madam," replied the Sergeant; "and when this species becomes extinct, the profits of the Company will sensibly decline. All the hunters try to obtain its fur, and the Americans in particular are formidable rivals to us. Did you not meet any American agents on your journey up, Lieutenant?"

"Not one," replied Hobson. "Do they ever penetrate as far as this?"
"Oh yes!" said the Sergeant; "and when you hear of their approach, I advise you to be on your guard."

"Are these agents, then, highway robbers?" asked Mrs Paulina Barnett.

"No, madam," replied the Sergeant; "but they are formidable rivals, and when game is scarce, hunters often come to blows about it. I daresay that if the Company's attempt to establish a fort on the verge of the Arctic Ocean be successful, its example will at once be followed by these Americans, whom Heaven confound!"

"Bah!" exclaimed the Lieutenant; "the hunting districts are vast, and there's room beneath the sun for everybody. As for us, let's make a start to begin with. Let us press on as long as we have firm ground beneath our feet, and God be with us!"

After a walk of three hours the visitors returned to Fort Confidence, where a good meal of fish and fresh venison awaited them. Sergeant Long did the honours of the table, and after a little pleasant conversation, all retired to forget their fatigues in a healthy and refreshing sleep.

The next day, May 31st, Mrs Barnett and Jaspar Hobson were on foot at five A.M. The Lieutenant intended to devote this day to visiting the Indian encampment, and obtaining as much useful information as possible. He asked Thomas Black to go with him, but the astronomer preferred to remain on terra firma. He wished to make a few astronomical observations, and to determine exactly the latitude and longitude of Fort Confidence; so that Mrs Barnett and Jaspar Hobson had to cross the lake alone, under the guidance of an old boatman named Norman, who had long been in the Company's service.

The two travellers were accompanied by Sergeant Long as far as the little harbour, where they found old Norman ready to embark. Their little vessel was but an open fishing-boat, six feet long, rigged like a cutter, which one man could easily manage. The weather was beautiful, and the slight breeze blowing from the north-east was favourable to the crossing. Sergeant Felton took leave of his guests with many apologies for being unable to accompany them in the absence of his chief. The boat was let loose from its moorings, and tacking to starboard, shot across the clear waters of the lake.

The little trip passed pleasantly enough. The taciturn old sailor sat silent in the stern of the boat with the tiller tucked under his arm. Mrs Barnett and Lieutenant Hobson, seated opposite to each other, examined with interest the scenery spread out before them. The boat skirted the northern shores of the lake at about three miles' distance, following a rectilinear direction, so that the wooded heights sloping gradually to the west were distinctly visible. From this side the district north of the lake appeared perfectly flat, and the horizon receded to a considerable distance. The whole of this coast contrasted strongly with the sharp angle, at the extremity of which rose Fort Confidence, framed in green pines. The flag of the Company was still visible floating from the tower of the fort. The oblique rays of the sun lit up the surface of the water, and striking on the floating icebergs, seemed to convert them into molten silver of dazzling brightness. No trace remained of the solid ice-mountains of the winter but these moving relics, which the solar rays could scarcely dissolve, and which seemed, as it were, to protest against the brilliant but not very powerful Polar sun, now describing a diurnal arc of considerable length.

Mrs Barnett and the Lieutenant, as was their custom, communicated to each other the thoughts suggested by the strange scenes through which they were passing. They laid up a store of pleasant recollections for the future whilst the boat floated rapidly along upon the peaceful waves.

The party started at six in the morning, and at nine they neared the point on the northern bank at which they were to land. The Indian encampment was situated at the north-west angle of the Great Bear Lake. Before ten o'clock old Norman ran the boat aground on a low bank at the foot of a cliff of moderate height. Mrs Barnett and the Lieutenant landed at once. Two or three Indians, with their chief, wearing gorgeous plumes, hastened to meet them, and addressed them in fairly intelligible English.

These Hare Indians, like the Copper and Beaver Indians, all belong to the Chippeway race, and differ but little in customs and costumes from their fellow-tribes. They are in constant communication with the factories, and have become, so to speak, "Britainised" — at least as much so as is possible for savages. They bring the spoils of the chase to the forts, and there exchange them for the necessaries of life, which they no longer provide for themselves. They are in the pay of the Company, they live upon it, and it is not surprising that they have lost all originality. To find a native race as yet uninfluenced by contact with Europeans we must go to still higher latitudes, to the ice-bound regions frequented by the Esquimaux, who, like the Greenlanders, are the true children of Arctic lands.

Mrs Barnett and Jaspar Hobson accompanied the Indians to their camp, about half a mile from the shore, and found some thirty natives there, men, women, and children, who supported themselves by hunting and fishing on the borders of the lake. These Indians had just come from the northernmost districts of the American continent, and were able to give the Lieutenant some valuable, although necessarily incomplete, information on the actual state of the sea-coast near the seventieth parallel. The Lieutenant heard with considerable satisfaction that a party of Americans or Europeans had been seen oil the confines of the Polar Sea, and that it was open at this time of year. About Cape Bathurst, properly so called, the point for which he intended to make, the Hare Indians could tell him
nothing. Their chief said, however, that the district between the Great Bear Lake and Cape Bathurst was very
difficult to cross, being hilly and intersected by streams, at this season of the year free from ice. He advised the
Lieutenant to go down the Coppermine river, from the north-east of the lake, which would take him to the coast by
the shortest route. Once at the Arctic Ocean, it would be easy to skirt along its shores and to choose the best spot at
Which to halt.

Lieutenant Hobson thanked the Indian chief, and took leave after giving him a few presents. Then accompanied
by Mrs Barnett, he explored the neighbourhood of the camp, not returning to the boat until nearly three o’clock in
the afternoon.

CHAPTER IX.

A STORM ON THE LAKE.

The old sailor was impatiently awaiting the return of the travellers; for during the last hour the weather had
changed, and the appearance of the sky was calculated to render any one accustomed to read the signs of the clouds
uneasy. The sun was obscured by a thick mist, the wind had fallen, but - an ominous moaning was heard from the
south of the lake. These symptoms of an approaching change of temperature were developed with all the rapidity
peculiar to these elevated latitudes.

"Let us be off, sir! let us be off!" cried old Norman, looking anxiously at the fog above his head. "Let us start
without losing an instant. There are terrible signs in the air!"

"Indeed," exclaimed the Lieutenant, "the appearance of the sky is quite changed, and we never noticed it, Mrs
Barnett!"

"Are you afraid of a storm?" inquired the lady of old Norman.

"Yes, madam," replied the old sailor; "and the storms on the Great Bear Lake are often terrible. The hurricane
rages as if upon the open Atlantic Ocean. This sudden fog bodes us no good; but the tempest may hold back for
three or four hours, and by that time we shall be at Fort Confidence. Let us then start without a moment’s delay, for
the boat would not be safe near these rocks."

The Lieutenant, feeling that the old man, accustomed as he was to navigate these waters, was better able to judge
than himself, decided to follow his advice, and embarked at once with Mrs Barnett.

But just as they were pushing off, old Norman, as if possessed by some sudden presentiment, murmured —
"Perhaps it would be better to wait."

Lieutenant Hobson overheard these words, and looked inquiringly at the old boatman, already seated at the helm.
Had he been alone he would not have hesitated to start, but as Mrs Barnett was with him caution was necessary. The
lady at once saw and understood his hesitation.

"Never mind about me, Lieutenant," she said; "act as if I were not present. Let us start immediately, as our brave
guide suggests."

"We are off, then," cried Norman, letting go the moorings, "to the fort by the shortest route."

For about an hour the bark made little head. The sail, scarcely filled by the fitful breeze, flapped against the
mast. The fog became thicker. The waves began to rise and the boat to rock considerably; for the approaching
hurricane affected the water sooner than the atmosphere itself. The two travellers sat still and silent, whilst the old
sailor peered into the darkness with bloodshot eyes. Prepared for all contingencies, he awaited the shock of the wind,
ready to pay out rapidly should the attack be very violent. The conflict of the elements had not, however, as yet
commenced; and all would have been well if they had been able to advance, but after an hour’s sail they were still
only about two hours’ distance from the Indian encampment. A few gusts of wind from the shore drove them out of
their course, and the dense fog rendered it impossible for them to make out the coast-line. Should the wind settle in
the north it would probably go hard with the light boat, which, unable to hold its own course, would be drifted out
into the lake no one knew where.

"We are scarcely advancing at all," said the Lieutenant to old Norman.

"No, sir," replied Norman; "the wind is not strong enough to fill the sail, and if it were, I fear it comes from the
wrong quarter. If so," he added, pointing to the south, "we may see Fort Franklin before Fort Confidence."

"Well," said Mrs Barnett cheerfully, "our trip will have been all the more complete. This is a magnificent lake,
well worth exploring from north to south. I suppose, Norman, one might get back even from Fort Franklin?"

"Yes, madam, if we ever reach it," replied the old man. "But tempests lasting fifteen days are by no means rare
on this lake; and if our bad luck should drive us to the south, it may be a month before Lieutenant Hobson again sees
Fort Confidence."

"Let us be careful, then," said the Lieutenant; "for such a delay, would hinder our projects very much. Do the
best you can under the circumstances, and if you think it would be prudent, go back to the north. I don’t suppose
Mrs Barnett would mind a walk of twenty or twenty-five miles."

I should be glad enough to go back to the north, Lieutenant," replied Norman, "if it were still possible. But look,
the wind seems likely to settle against us. All I can attempt is to get to the cape on the north-east, and if it doesn’t blow too hard, I hope to succeed."

But at about half-past four the storm broke. The shrill whistling of the wind was heard far above their heads, but the state of the atmosphere prevented it from as yet descending upon the lake; this was, however, only delayed for a brief space of time. The cries of frightened birds flying through the fog mingled with the noise of the wind. Suddenly the mist was torn open, and revealed low jagged masses of rain-cloud chased towards the south. The fears of the old sailor were realised. The wind blew from the north, and it was not long before the travellers learned the meaning of a squall upon the lake.

"Look out!" cried old Norman, tightening sail so as to get his boat ahead of the wind, whilst keeping her under control of the helm.

The squall came. It caught the boat upon the flank, and it was turned over on its side; but recovering itself, it was flung upon the crest of a wave. The billows surged as if upon an open sea. The waters of the lake not being very deep, struck against the bottom and rebounded to an immense height.

"Help! help!" cried old Norman, hurriedly struggling to haul down his sail.

Mrs Barnett and Hobson endeavoured to come to his assistance, but without success, for they knew nothing of the management of a boat. Norman, unable to leave the helm, and the halliards being entangled at the top of the mast, could not take in the sail. Every moment the boat threatened to capsize, and heavy seas broke over its sides. The sky became blacker and blacker, cold rain mingled with snow fell in torrents, whilst the squall redoubled its fury, lashing the crests of the waves into foam.

"Cut it! cut it!" screamed Norman above the roaring of the storm.

The Lieutenant, his cap blown away and his eyes blinded by the spray, seized Norman’s knife and cut the halliard like a harp-string; but the wet cordage no longer acted in the grooves of the pulleys, and the yard remained attached to the top of the mast.

Norman, totally unable to make head against the wind, now resolved to tack about for the south, dangerous as it would be to have the boat before the wind, pursued by waves advancing at double its speed. Yes, to tack, although this course would probably bring them all to the southern shores of the lake, far away from their destination.

The Lieutenant and his brave companion were well aware of the danger which threatened them. The frail boat could not long resist the blows of the waves, it would either be crushed or capsized; the lives of those within it were in the hands of God.

But neither yielded to despair; clinging to the sides of the boat, wet to the skin, chilled to the bone by the cutting blast, they strove to gaze through the thick mist and fog. All trace of the land had disappeared, and so great was the obscurity that at a cable’s length from the boat clouds and waves could not be distinguished from each other. Now and then the two travellers looked inquiringly into old Norman’s face, who, with teeth set and hands clutching the tiller; tried to keep his boat as much as possible under wind.

But the violence of the squall became such that the boat could not long maintain this course. The waves which struck its bow would soon have inevitably crushed it; the front planks were already beginning to separate, and when its whole weight was flung into the hollows of the waves it seemed as if it could rise no more.

"We must tack, we must tack, whatever happens!" murmured the old sailor.

And pushing the tiller and paying out sail, he turned the head of the boat to the south. The sail, stretched to the utmost, brought the boat round with giddy rapidity, and the immense waves, chased by the wind, threatened to engulf the little bark. This was the great danger of shifting with the wind right aft. The billows hurled themselves in rapid succession upon the boat, which could not evade them. It filled rapidly, and the water bad to be baled out without a moment’s pause, or it must have fpundered. As they got nearer and nearer to the middle of the lake the waves became rougher. Nothing there broke the fury of the wind; no clumps of trees, no hills, checked for a moment the headlong course of the hurricane. Now and then momentary glimpses were obtained through the fog of icebergs dancing like buoys upon the waves, and driven towards the south of the lake.

It was half-past five. Neither Norman nor the Lieutenant had any idea of where they were, or whither they were going. They had lost all control over the boat, and were at the mercy of the winds and waves.

And now at about a hundred feet behind the boat a huge wave upreared its foam-crowned crest, whilst in front a black whirlpool was formed by the sudden sinking of the water. All surface agitation, crushed by the wind, had disappeared around this awful gulch, which, growing deeper and blacker every moment, drew the devoted little vessel towards its fatal embrace. Ever nearer came the mighty wave, all lesser billows sinking into insignificance before it. It gained upon the boat, another moment and it would crush it to atoms. Norman, looking round, saw its approach; and Mrs Barnett and the Lieutenant, with eyes fixed and staring, awaited in fearful suspense the blow from which there was no escape. The wave broke over them with the noise of thunder; it enveloped the stern of the boat in foam, a fearful crash was heard, and a cry burst from the lips of the Lieutenant and his companion, smothered beneath the
They thought that all was over, and that the boat had sunk; but no, it rose once more, although more than half filled with water.

The Lieutenant uttered a cry of despair. Where was Norman? The poor old sailor had disappeared!

Mrs Paulina Barnett looked inquiringly at Hobson.

"Norman!" he repeated, pointing to his empty place.

"Unhappy man!" murmured Mrs Barnett; and at the risk of being flung from the boat rocking on the waves, the two started to their feet and looked around them. But they could see and hear nothing. No cry for help broke upon their ears. No dead body floated in the white foam. The old sailor had met his death in the element he loved so well.

Mrs Barnett and Hobson sank back upon their seats. They were now alone, and must see to their own safety; but neither of them knew anything of the management of a boat, and even an experienced hand could scarcely have controlled it now. They were at the mercy of the waves, and the bark, with distended sail, swept along in mad career.

What could the Lieutenant do to check or direct its course?

What a terrible situation for our travellers, to be thus overtaken by a tempest in a frail bark which they could not manage!

"We are lost!" said the Lieutenant.

"No, Lieutenant," replied Mrs Barnett; "let us make another effort. Heaven helps those who help themselves!"

Lieutenant Hobson now for the first time realised with how intrepid a woman fate had thrown him.

The first thing to be done was to get rid of the water which weighed down the boat. Another wave shipped would have filled it in a moment, and it must have sunk at once. The vessel lightened, it would have a better chance of rising on the waves; and the two set to work to bale out the water. This was no easy task; for fresh waves constantly broke over them, and the scoop could not be laid aside for an instant. Mrs Barnett was indefatigable, and the Lieutenant, leaving the bailing to her, took the helm himself, and did the best he could to guide the boat with the wind right aft.

To add to the danger, night, or rather darkness, for in these latitudes night only lasts a few hours at this time of year, fell upon them. Scarce a ray of light penetrated through the heavy clouds and fog. They could not see two yards before them, and the boat must have been dashed to pieces had it struck a floating iceberg. This danger was indeed imminent, for the loose ice-masses advance with such rapidity that it is impossible to get out of their way.

"You have no control over the helm?" said Mrs Barnett in a slight lull of the storm.

No, madam he replied; "and you must prepare for the worst."

"I am ready!" replied the courageous woman simply.

As she spoke a loud rippling sound was heard. The sail, torn away by the wind, disappeared like a white cloud. The boat sped rapidly along for a few instants, and then stopped suddenly, the waves buffeting it about like an abandoned wreck. Mrs Barnett and Hobson, flung to the bottom of the boat, bruised, shaken, and torn, felt that all was lost. Not a shred of canvas was left to aid in navigating the craft; and what with the spray, the snow, and the rain, they could scarcely see each other, whilst the uproar drowned their voices. Expecting every moment to perish, they remained for an hour in painful suspense, commending themselves to God, who alone could save them.

Neither of them could have said how long they waited when they were aroused by a violent shock.

The boat had just struck an enormous iceberg, a floating block with rugged, slippery sides, to which it would be impossible to cling.

At this sudden blow, which could not have been parried, the bow of the boat was split open, and the water poured into it in torrents.

"We are sinking! we are sinking!" cried Jasper Hobson.

He was right. The boat was settling down; the water had already reached the seats.

"Madam, madam, I am here! I will not leave you!" added the Lieutenant.

"No, no," cried Mrs Barnett: "alone, you may save yourself; together, we should perish. Leave me! leave me!"

"Never!" cried Hobson.

But he had scarcely pronounced this word when the boat, struck by another wave, filled and sank.

Both were drawn under water by the eddy caused by the sudden settling down of the boat, but in a few instants they rose to the surface. Hobson was a strong swimmer, and struck out with one arm, supporting his companion with the other. But it was evident that he could not long sustain a conflict with the furious waves, and that he must perish with her he wished to save.

At this moment a strange sound attracted his attention. It was not the cry of a frightened bird, but the shout of a human voice! By one supreme effort Hobson raised himself above the waves and looked around him.

But he could distinguish nothing in the thick fog. And yet he again heard cries, this time nearer to him. Some bold men were coming to his succour! Alas! if it were so, they would arrive too late. Encumbered by his clothes, the
Lieutenant felt himself sinking with the unfortunate lady, whose head he could scarcely keep above the water. With a last despairing effort he uttered a heartrending cry and disappeared beneath the waves.

It was, however, no mistake—he had heard voices. Three men, wandering about by the lake, had seen the boat in danger, and put off to its rescue. They were Esquimaux, the only men who could have hoped to weather such a storm, for theirs are the only boats constructed to escape destruction in these fearful tempests.

The Esquimaux boat or kayak is a long pirogue raised at each end, made of a light framework of wood, covered with stretched seal-skins strongly stitched with the sinews of the Walrus. In the upper part of the boat; also covered with skins, is an opening in which the Esquimaux takes his place, fastening his waterproof jacket to the back of his seat; so that he is actually joined to his bark, which riot a drop of water can penetrate. This light, easily-managed kayak, floating as it does, on the crests of the waves, can never be submerged; and if it be sometimes capsized, a blow of the paddle rights it again directly; so that it is able to live and make way in seas in which any other boat would certainly be dashed to pieces.

The three Esquimaux, guided by the Lieutenant’s last despairing cry, arrived at the scene of the wreck joints in time. Hobson and Mrs Barnett, already half drowned, felt themselves drawn up by powerful hands; but in the darkness they were unable to discover who were their deliverers. One of the men took the Lieutenant and laid him across his own boat, another did the same for Mrs Barnett, and the three kayaks, skilfully managed with the paddles, six feet long, sped rapidly over the white foam.

Half an hour afterwards, the shipwrecked travellers were lying on the sandy beach three miles above Fort Providence.

The old sailor alone was missing!

CHAPTER X.
A RETROSPECT.

It was about ten o’clock the same night when Mrs Barnett and Lieutenant Hobson knocked at the postern gate of the fort. Great was the joy on seeing them, for they had been given up for lost; but this joy was turned to mourning at the news of the death of Norman. The brave fellow had been beloved by all, and his loss was sincerely mourned.

The intrepid and devoted Esquimaux received phlegmatically the earnest expressions of gratitude of those they had saved, and could riot be persuaded to come to the fort. What they had done seemed to them only natural, and these were not the first persons they had rescued; so they quietly returned to their wild life of adventure on the lake, where they hunted the otters and water-birds day and night.

For the next three nights the party rested. Hobson always intended to set out on June 2d; and on that day, all having recovered from their fatigues and the storm having abated, the order was given to start.

Sergeant Felton had done all in his power to make his guests comfortable and to aid their enterprise; some of the jaded dogs were replaced by fresh animals, and now the Lieutenant found all his sledges drawn up in good order at the door of the enceinte, and awaiting the travellers.

The adieux were soon over. Each one thanked Sergeant Felton for his hospitality, and Mrs Paulina Barnett was most profuse in her expressions of gratitude. A hearty shake of the hand between the Sergeant and his brother-in-law, Long, completed the leave-taking,

Each pair got into the sledge assigned to them; but this time Mrs Barnett and the Lieutenant shared one vehicle, Madge and Sergeant Long following them.

According to the advice of the Indian chief, Hobson determined to get to the coast by the shortest route, and to take a north-easterly direction. After consulting, his map, which merely gave a rough outline of the configuration of the country, it seemed best to him to descend the valley of the Coppermine, a large river which flows into Coronation Gulf.

The distance between Fort Confidence and the mouth of this river is only a degree and a half—that is to say, about eighty-five or ninety miles. The deep hollow formed by the gulf is bounded on the north by Cape Krusenstein, and from it the coast juts out towards the north-west, ending in Cape Bathurst, which is above the seventieth parallel.

The Lieutenant, therefore, now changed the route he had hitherto followed, directing his course to the east, so as to reach the river in a few hours.

In the afternoon of the next day, June 3d, the river was gained. It was now free from ice, and its clear and rapid waters flowed through a vast valley, intersected by numerous but easily fordable streams. The sledges advanced pretty rapidly, and as they went along, Hobson gave his companion some account of the country through which they were passing. A sincere friendship founded on mutual esteem, had sprung up between these two. Mrs Paulina Barnett was an earnest student with a special gift for discovery, and was therefore always glad to converse with travellers and explorers. Hobson, who knew his beloved North America by heart, was able to answer all her inquiries fully.

"About ninety years ago," he said, "the territory through which the Coppermine flows was unknown, and we are
indebted for its discovery to the agents of the Hudson’s Bay Company. But as always happens in scientific matters, in seeking one thing, another was found. Columbus was trying to find Asia, and discovered America."

"And what were the agents of the Hudson’s Bay Company seeking? The famous North-West Passage?"

"No, madam," replied the young Lieutenant. "A century ago the Company had no interest in the opening of a new route, which would have been more valuable to its rivals than to it. It is even said that in 1741 a certain Christopher Middleton, sent to explore these latitudes, was publicly charged with receiving a bribe of £500 from the Company to say that there was not, and could not be, a sea passage between the oceans."

"That was not much to the credit of the celebrated Company," said Mrs Barnett.

"I do not defend it in the matter," replied Hobson; "and its interference was severely censured by Parliament in 1746, when a reward of £20,000 was offered by the Government for the discovery of the passage in question. In that year two intrepid explorers, William Moor and Francis Smith, penetrated as far as Repulse Bay in the hope of discovering the much-longed-for passage. But they were unsuccessful, and returned to England after an absence of a year and a half."

"But did not other captains follow in their steps, resolved to conquer where they had failed?" inquired Mrs Barnett.

"No, madam; and in spite of the large reward offered by Parliament, no attempt was made to resume explorations in English America until thirty years afterwards, when some agents of the Company took up the unfinished task of Captains Moor and Smith."

"The Company had then relinquished the narrow-minded egotistical position it had taken up?"

"No, madam, not yet. Samuel Hearne, the agent, only went to reconnoitre the position of a copper-mine which native miners had reported. On November 6, 1769, this agent left Fort Prince of Wales, on the river Churchill, near the western shores of Hudson’s Bay. He pressed boldly on to the north-west; but the excessive cold and the exhaustion of his provisions compelled him to return without accomplishing anything. Fortunately he was not easily discouraged, and on February 23rd of the next year he set out again, this time taking some Indians with him. Great hardships were endured in this second journey. The fish and game on which Hearne had relied often failed him; and he had once nothing to eat for seven days but wild fruit, bits of old leather, and burnt bones. He was again compelled to return to the fort a disappointed man. But he did not even yet despair, and started a third time, December 7th, 1770; and after a struggle of nineteen months, he discovered the Coppermine river, July 13th, 1772, the course of which he followed to its mouth. According to his own account, he saw the open sea, and in any case he was the first to penetrate to the northern coast of America."

"But the North-West Passage—that is to say, the direct communication by sea between the Atlantic and Pacific Oceans—was not then discovered?"

"Oh no, madam," replied the Lieutenant; "and what countless adventurous sailors have since gone to seek it! Phipps in 1773, James Cook and Clerke in 1776 to 1779, Kotzebue in 1815 to 1818, Ross, Parry, Franklin, and others have attempted this difficult task; but it was reserved to M’Clure in our own day to pass from one ocean to the other across the Polar Sea."

"Well, Lieutenant, that was a geographical discovery of which we English may well be proud. But do tell me if the Hudson’s Bay Company did not adopt more generous views, and send out some other explorer after the return of Hearne."

"It did, madam; and it was thanks to it that Captain Franklin was able to accomplish his voyage of 1819 to 1822 between the river discovered by Hearne and Cape Turnagain. This expedition endured great fatigue and hardships; provisions often completely failed, and two Canadians were assassinated and eaten by their comrades. But in spite of all his sufferings, Captain Franklin explored no less than five thousand five hundred and fifty miles of the hitherto unknown coast of North America!"

"He was indeed a man of energy," added Mrs Barnett; "and he gave proof of his great qualities in starting on a fresh Polar expedition after all he had gone through."

"Yes," replied the Lieutenant; "and he met a terrible death in the land his own intrepidity had discovered. It has now been proved, however, that all his companions did not perish with him. Many are doubtless still wandering about on the vast ice-fields. I cannot think of their awful condition without a shudder. One day," he added earnestly, and with strange emotion—"one day I will search the unknown lands where the dreadful catastrophe took place, and —"

"And," exclaimed Mrs Barnett, pressing his hand, "I will accompany you. Yes, this idea has occurred to me more than once, as it has to you; and my heart beats high when I think that fellow countrymen of my own-Englishmen—are awaiting succour."

"Which will come too late for most of them, madam," said the Lieutenant; "but rest assured some will even yet be saved."
"God grant it, Lieutenant!" replied Mrs Barnett; "and it appears to me that the agents of the Company, living as they do close to the coast, are better fitted than any one else to fulfil this duty of humanity."

"I agree with you, madam; they are, as they have often proved, inured to the rigours of the Arctic climate. Was it not they who aided Captain Back in his voyage in 1834, when he discovered King William’s Land, where Franklin met his fate? Was it not two of us, Dease and Simpson, who were sent by the Governor of Hudson’s Bay to explore the shores of the Polar Sea in 1838, and whose courageous efforts first discovered Victoria Land? It is my opinion that the future reserves for the Hudson’s Bay Company the final conquest of the Arctic regions. Gradually its factories are advancing further and further north, following the retreat of the fur-yielding animals; and one day a fort will be erected on the Pole itself, that mathematical point where meet all the meridians of the globe."

During this and the succeeding journeys Jaspar Hobson related his own adventures since he entered the service of the Company his struggles with the agents of rival associations, and his efforts to explore the unknown districts of the north or west; and Mrs Barnett, on her side, told of her travels in the tropics. She spoke of all she had done, and of all she hoped still to accomplish; so that the long hours, lightened by pleasant conversation, passed rapidly away.

Meanwhile the dogs advanced at full gallop towards the north. The Coppermine valley widened sensibly as they neared the Arctic Ocean. The hills on either side sank lower and lower, and only scattered clumps of resinous trees broke the monotony of the landscape. A few blocks of ice, drifted down by the river, still resisted the action of the sun; but each day their number decreased, and a canoe, or even a good-sized boat, might easily have descended the stream, the course of which was unimpeded by any natural barrier or aggregation of rocks. The bed of the Coppermine was both deep and wide; its waters were very clear, and being fed by the melted snow, flowed on at a considerable pace, never, however, forming dangerous rapids. Its course, at first very sinuous, became gradually less and less winding, and at last stretched along in a straight line for several miles. Its banks, composed of fine firm sand, and clothed in part with short dry herbage, were wide and level, so that the long train of sledges sped rapidly over them.

The expedition travelled day and night— if we can speak of the night, when the sun, describing an almost horizontal circle, scarcely disappeared at all. The true night only lasted two hours, and the dawn succeeded the twilight almost immediately. The weather was fine; the sky clear, although somewhat misty on the horizon; and everything combined to favour the travellers.

For two days they kept along the river-banks without meeting with any difficulties. They saw but few fur-bearing animals; but there were plenty of birds, which might have been counted by thousands. The absence of otters, sables, beavers, ermines, foxes, &c., did not trouble the Lieutenant much, for he supposed that they had been driven further north by over-zealous tracking; and indeed the marks of encampments, extinguished fires, &c., told of the more or less recent passage of native hunters. Hobson knew that he would have to penetrate a good deal further north, and that part only of his journey would be accomplished when he got to the mouth of the Coppermine river. He was therefore most eager to reach the limit of Hearne’s exploration, and pressed on as rapidly as possible.

Every one shared the Lieutenant’s impatience, and resolutely resisted fatigue in order to reach the Arctic Ocean with the least possible delay. They were drawn onwards by an indefinable attraction; the glory of the unknown dazzled their sight. Probably real hardships would commence when they did arrive at the much-desired coast. But no matter, they longed to battle with difficulties, and to press straight onwards to their aim. The district they were now traversing could have no direct interest for them; the real exploration would only commence on the shores of the Arctic Ocean. Each one, then, would gladly hail the arrival in the elevated western districts for which they were bound, cut across though they were by the seventieth parallel of north latitude.

On the 5th June, four days after leaving Fort Confidence the river widened considerably. The western banks, curving slightly, ran almost due north; whilst the eastern rounded off into the coastline, stretching away as far as the eye could reach.

Lieutenant Hobson paused, and waving his hand to his companions, pointed to the boundless ocean.

CHAPTER XI.

ALONG THE COAST.

Coronation Gulf, the large estuary dotted with the islands forming the Duke of York Archipelago, which the party had now reached, was a sheet of water with irregular banks, let in, as it were, into the North American continent. At its western angle opened the mouth of the Coppermine; and on the east a long narrow creek called Bathurst Inlet ran into the mainland, from which stretched the jagged broken coast with its pointed capes and rugged promontories, ending in that confusion of straits, sounds, and channels which gives such a strange appearance to the maps of North America. On the other side the coast turned abruptly to the north beyond the mouth of the Coppermine River, and ended in Cape Krusenstern.

After consulting with Sergeant Long, Lieutenant Hobson decided to give his party a day’s rest here.

The exploration, properly so called, which was to enable the Lieutenant to fix upon a suitable site for the
establishment of a fort, was now really about to begin. The Company had advised him to keep as much as possible above the seventieth parallel, and on the shores of the Arctic Ocean. To obey his orders Hobson was obliged to keep to the west; for on the east—with the exception, perhaps, of the land of Boothia, crossed by the seventieth parallel—the whole country belongs rather to the Arctic Circle, and the geographical conformation of Boothia is as yet but imperfectly known.

After carefully ascertaining the latitude and longitude, and verifying his position by the map, the Lieutenant found that he was a hundred miles below the seventieth degree. But beyond Cape Krusenstern, the coast-line, running in a north-easterly direction, abruptly crosses the seventieth parallel at a sharp angle near the one hundred and thirtieth meridian, and at about the same elevation as Cape Bathurst, the spot named as a rendezvous by Captain Craventy. He must therefore make for that point, and should the site appear suitable the new fort would be erected there.

"There," said the Lieutenant to his subordinate, Long, "we shall be in the position ordered by the Company. There the sea, open for a great part of the year, will allow the vessels from Behring Strait to come right up to the fort, bringing us fresh provisions and taking away our commodities."

"Not to mention," added Sergeant Long, "that our men will be entitled to double pay all the time they are beyond the seventieth parallel."

"Of course that is understood," replied Hobson; "and I daresay they will accept it without a murmur."

"Well then, Lieutenant," said Long simply, "we have now only to start for Cape Bathurst."

But as a day of rest had been promised, the start did not actually take place until the next day, June 6th.

The second part of the journey would naturally be very different from the first. The rules with regard to the sledges keeping their rank need no longer be enforced, and each couple drove as it pleased them. Only short distances were traversed at a time; halts were made at every angle of the coast, and the party often walked. Lieutenant Hobson only urged two things upon his companions not to go further than three miles from the coast, and to rally their forces twice a day, at twelve o’clock and in the evening. At night they all encamped in tents.

The weather continued very fine and the temperature moderate, maintaining a mean height of 59° Fahrenheit above zero. Two or three times sudden snowstorms came on; but they did not last long, and exercised no sensible influence upon the temperature.

The whole of the American coast between Capes Krusenstern and Parry, comprising an extent of more than two hundred and fifty miles, was examined with the greatest care between the 6th and 20th of June. Geographical observations were accurately taken, and Hobson, most effectively aided by Thomas Black, was able to rectify certain errors in previous marine surveys; whilst the primary object of the expedition—the examination into the quality and quantity of the game in the surrounding districts—was not neglected.

Were these lands well stocked with game? Could they count with certainty not only on a good supply of furs, but also of meat? Would the resources of the country provide a fort with provisions in the summer months at least? Such were the grave questions which Lieutenant Hobson had to solve, and which called for immediate attention. We give a summary of the conclusions at which he arrived.

Game, properly so called, of the kind for which Corporal Joliffe amongst others had a special predilection, was not abundant. There were plenty of birds of the duck tribe; but only a few Polar hares, difficult of approach, poorly represented the rodents of the north. There seemed, however, to be a good many bears about. Marbre and Sabine had come upon the fresh traces of several. Some were even seen and tracked; but, as a rule, they kept at a respectful distance. In the winter, however, driven by famine from higher latitudes, there would probably be more than enough of these ravenous beasts prowling about the shores of the Arctic Ocean.

"There is certainly no denying," said Corporal Joliffe, "that bear’s flesh is very good eating when once it’s in the larder; but there is something very problematical about it beforehand, and it’s always just possible that the hunters themselves may meet the fate they intended for the bears!"

This was true enough. It was no use counting upon the bears to provision their fort. Fortunately traces were presently found of herds of a far more useful animal, the flesh of which is the principal food of the Indians and Esquimaux. We allude to the reindeer; and Corporal Joliffe announced with the greatest satisfaction that there were plenty of these ruminants on this coast. The ground was covered with the lichen to which they are so partial, and which they cleverly dig out from under the snow.

There could be no mistake as to the footprints left by the reindeer, as, like the camel, they have a small nail-like hoof with a convex surface. Large herds, sometimes numbering several thousand animals, are seen running wild in certain parts of America. Being easily domesticated, they are employed to draw sledges; and they also supply the factories with excellent milk, more nourishing than that of cows. Their dead bodies are not less useful. Their thick skin provides clothes, their hair makes very good thread, and their flesh is palatable; so that they are really the most valuable animals to be found in these latitudes, and Hobson, being assured of their presence, was relieved from half
his anxiety.

As he advanced he had also reason to be satisfied with regard to the fur-bearing animals. By the little streams rose many beaver lodges and musk-rat tunnels. Badgers, lynxes, ermines, wolverenes, sables, polecats, &c., frequented these districts, hitherto undisturbed by hunters. They had thus far come to no trace of the presence of man, and the animals had chosen their refuge well. Footprints were also found of the fine blue and silver foxes, which are becoming more and more rare, and the fur of which is worth its weight in gold. Sabine and Mac-Nab might many a time have shot a very valuable animal on this excursion, but the Lieutenant had wisely forbidden all hunting of the kind. He did not wish to alarm the animals before the approaching season—that is to say, before the winter months, when their furs become thicker and more beautiful. It was also desirable not to overload the sledges. The hunters saw the force of his reasoning; but for all that, their fingers itched when they came within shot-range of a sable or some valuable fox. Their Lieutenant’s orders were, however, not to be disobeyed.

Polar bears and birds were, therefore, all that the hunters had to practise upon in this second stage of their journey. The former, however, not yet rendered bold by hunger, soon scampered off, and no serious struggle with them ensued.

The poor birds suffered for the enforced immunity of the quadrupeds. White-headed eagles, huge birds with a harsh screeching cry; fishing hawks, which build their nests in dead trees and migrate to the Arctic regions in the summer; snow buntings with pure white plumage, wild geese, which afford the best food of all the Anseres tribe; ducks with red heads and black breasts; ash-coloured crows, a kind of mocking jay of extreme ugliness; eider ducks; scoters or black divers, &c. &c., whose mingled cries awake the echoes of the Arctic regions, fell victims by hundreds to the unerring aim of Marbre and Sabine. These birds haunt the high latitudes by millions, and it would be impossible to form an accurate estimate of their number on the shores of the Arctic Ocean. Their flesh formed a very pleasant addition to the daily rations of biscuit and corned beef, and we can understand that the hunters laid up a good stock of them in the fifteen days during which they were debarred from attacking more valuable game.

There would then be no lack of animal food; the magazines of the Company would be well stocked with game, and its offices filled with furs and traders; but something more was wanted to insure success to the undertaking. Would it be possible to obtain a sufficient supply of fuel to contend with the rigour of an Arctic winter at so elevated a latitude?

Most fortunately the coast, was well wooded; the hills which sloped down towards the sea were crowned with green trees, amongst which the pine predominated. Some of the woods might even be called forests, and would constitute an admirable reserve of timber for the fort. Here and there Hobson noticed isolated groups of willows, poplars, dwarf birch-trees, and numerous thickets of arbutus. At this time of the warm season all these trees were covered with verdure, and were an unexpected and refreshing sight to eyes so long accustomed to the rugged, barren polar landscape. The ground at the foot of the hills was carpeted with a short herbage devoured with avidity by the reindeer, and forming their only sustenance in winter. On the whole, then, the Lieutenant had reason to congratulate himself on having chosen the north-west of the American continent for the foundation of a new settlement.

We have said that these territories, so rich in animals, were apparently deserted by men. The travellers saw neither Esquimaux, who prefer the districts round Hudson’s Bay, nor Indians, who seldom venture so far beyond the Arctic Circle. And indeed in these remote latitudes hunters may be overtaken by storms, or be suddenly surprised by winter, and cut off from all communication with their fellow-creatures. We can easily imagine that Lieutenant Hobson was by no means sorry not to meet any rival explorers. What he wanted was an unoccupied country, a deserted land, suitable as a refuge for the fur-bearing animals; and in this matter he had the full sympathy of Mrs Barnett, who, as the guest of the Company, naturally took a great interest in the success of its schemes.

Fancy, then, the disappointment of the Lieutenant, when on the morning of the 20th June he came to an encampment but recently abandoned.

It was situated at the end of a narrow creek called Darnley Bay, of which Cape Parry is the westernmost point. There at the foot of a little hill were the stakes which had served to mark the limits of the camp, and heaps of cinders, the extinct embers of the fires.

The whole party met at this encampment, and all understood how great a disappointment it involved for Lieutenant Hobson.

"What a pity!" he exclaimed. "I would rather have met a whole family of polar bears!"

"But I daresay the men who encamped here are already far off," said Mrs Barnett; "very likely they have returned to their usual hunting grounds."

"That is as it may be," replied the Lieutenant. "If these be the traces of Esquimaux, they are more likely to have gone on than to have turned back; and if they be those of Indians, they are probably, like ourselves, seeking a new hunting district; and in either case it will be very unfortunate for us."

"But," said Mrs Barnett, "cannot we find out to what race the travellers do belong? Can’t we ascertain if they be
Esquimaux or Indians from the south? I should think tribes of such a different origin, and of such dissimilar customs, would not encamp in the same manner."

Mrs Barnett was right; they might possibly solve the mystery after a thorough examination of the ground.

Jaspar Hobson and others set to work, carefully examining every trace, every object left behind, every mark on the ground; but in vain, there was nothing to guide them to a decided opinion. The bones of some animals scattered about told them nothing, and the Lieutenant, much annoyed, was about to abandon the useless search, when he heard an exclamation from Mrs Joliffe, who had wandered a little way to the left.

All hurried towards the young Canadian, who remained fixed to the spot, looking attentively at the ground before her.

As her companions came up she said—
"You are looking for traces, Lieutenant; well, here are some."

And Mrs Joliffe pointed to a good many footprints clearly visible in the firm clay.

These might reveal something; for the feet of the Indians and Esquimaux, as well as their boots, are totally different from each other.

But what chiefly struck Lieutenant Hobson was the strange arrangement of these impressions. They were evidently made by a human foot, a shod foot; but, strange to say, the ball alone appeared to have touched the ground! The marks were very numerous, close together, often crossing one another, but confined to a very small circle.

Jaspar Hobson called the attention of the rest of the party to this singular circumstance.
"These were not made by a person walking," he said.
"Nor by a person jumping," added Mrs Barnett; "for there is no mark of a heel."
"No," said Mrs Joliffe; "these footprints were left by a dancer."

She was right, as further examination proved. They were the marks left by a dancer, and a dancer engaged in some light and graceful exercise, for they were neither clumsy nor deep.

But who could the light-hearted individual be who had been impelled to dance in this sprightly fashion some degrees above the Arctic Circle?

"It was certainly not an Esquimaux," said the Lieutenant.
"Nor an Indian," cried Corporal Joliffe.
"No, it was a Frenchman," said Sergeant Long quietly.

And all agreed that none but a Frenchman could have been capable of dancing on such a spot.

CHAPTER XII.

THE MIDNIGHT SUN.

Sergeant Long’s assertion must appear to have been founded on insufficient evidence. That there had been dancing no one could deny, but that the dancer was a Frenchman, however probable, could not be considered proved.

However, the Lieutenant shared the opinion of his subordinate, which did not appear too positive to any of the party, who all agreed in feeling sure that some travellers, with at least one compatriot of Vestris amongst them, had recently encamped on this spot.

Of course Lieutenant Hobson was by no means pleased at this he was afraid of having been preceded by rivals in the north-western districts of English America; and secret as the Company had kept its scheme, it had doubtless been divulged in the commercial centres of Canada and the United States.

The Lieutenant resumed his interrupted march; but he was full of care and anxiety, although he would not now have dreamed of retracing his steps.

"Frenchmen are then sometimes met with in these high latitudes?" was Mrs Barnett’s natural question after this incident.

"Yes, madam," replied the Lieutenant; "or if not exactly Frenchmen, the descendants of the masters of Canada when it belonged to France, which comes to much the same thing. These men are in fact our most formidable rivals."

"But I thought," resumed Mrs Barnett, "that after the absorption by the Hudson’s Bay Company of the old North-West Company, that it had no longer any rivals on the American continent."

"Although there is no longer any important association for trading in furs except our own, there are a good many perfectly independent private companies, mostly American, which have retained French agents or their descendants in their employ."

"Are these agents then held in such high esteem?" asked Mrs Barnett.

"Yes, madam, and with good reason. During the ninety-four years of French supremacy in Canada, French agents always proved themselves superior to ours. We must be just even to our rivals."
"Especially to our rivals," added Mrs Barnett.

"Yes, especially... At that time French hunters, starting from Montreal, their headquarters, pressed on to the north with greater hardihood than any others. They lived for years with the Indian tribes, sometimes intermarrying with them. The natives called them the ‘Canadian travellers,’ and were on the most intimate terms with them. They were bold, clever fellows, expert at navigating streams, light-hearted and merry, adapting themselves to circumstances with the easy flexibility of their race, and always ready to sing or dance."

"And do you suppose that hunting is the only object of the party whose traces we have just discovered?"

"I don’t think any other hypotheses at all likely," replied Hobson. "They are sure to be seeking new hunting grounds. But as we cannot possibly stop them, we must make haste to begin our own operations, and compete boldly with all rivals."

Lieutenant Hobson was now prepared for the competition he could not prevent, and he urged on the march of his party as much as possible, hoping that his rivals might not follow him beyond the seventieth parallel.

The expedition now descended towards the south for some twenty miles, in order the more easily to pass round Franklin Bay. The country was still covered with verdure, and the quadrupeds and birds already enumerated were as plentiful as ever; so that they could reasonably hope that the whole of the north-western coasts of the American continent were populated in the same manner.

The ocean which bathed these shores stretched away as far as the eye could reach. Recent atlases give no land beyond the north American coast-line, and it is only the icebergs which impede the free navigation of the open sea from Behring Strait to the Pole itself.

On the 4th July the travellers skirted round another deep bay called Washburn Bay, and reached the furthest point of a little lake, until then imperfectly known, covering but a small extent of territory, scarcely two square miles—in fact it was rather a lagoon, or large pond of sweet water, than a lake.

The sledges went on easily and rapidly, and the appearance of the country was most encouraging to the explorers. It seemed that the extremity of Cape Bathurst would be a most favourable site for the new fort, as with this lagoon behind them, and the sea open for four or five months in the warm season, and giving access to the great highway of Behring Strait, before them, it would be easy for the exiles to lay in fresh provisions and to export their commodities.

On the 5th June, about three o’clock in the afternoon, the party at last halted at the extremity of Cape Bathurst. It remained to ascertain the exact position of this cape, which the maps place above the seventieth parallel. It was, however, impossible to rely upon the marine surveys of the coast, as they had never yet been made with exactitude. Jaspar Hobson decided to wait and ascertain the latitude and longitude.

"What prevents us from settling here?" asked Corporal Joliffe. "You will own, Lieutenant, that it is a very inviting spot."

"It will seem more inviting still if you get double pay here, my worthy Corporal," replied Hobson.

"No doubt," said Joliffe; "and the orders of the Company must be obeyed."

"Then wait patiently till to-morrow," added Hobson; "and if we find that Cape Bathurst is really beyond 70° north latitude, we will pitch our tent here."

The site was indeed admirably suited for the foundation of a new settlement. The wooded heights surrounding the lagoon would supply plenty of pine, birch, and other woods for the construction of the fort, and for stocking, it with fuel. The Lieutenant and some of his companions went to the very edge of the cape, and found that towards the west the coast-line formed a lengthened curve, beyond which icebergs of a considerable height shut out the view. The water of the lagoon, instead of being brackish as they expected from its close vicinity to the sea, was perfectly sweet; but had it not been so, drinkable water would not have failed the little colony, as a fresh and limpid stream ran a few yards to the south-east of Cape Bathurst, and emptied itself into the Arctic Ocean through a narrow inlet, which, protected by a singular accumulation of sand and earth instead of by rocks, would have afforded a refuge to several vessels from the winds of the offing, and might be turned to account for the anchorage of the ships which it was hoped would come to the new settlement from Behring Strait. Out of compliment to the lady of the party, and much to her delight, Lieutenant Hobson named the stream Paulina river, and the little harbour Port Barnett.

By building the fort a little behind the actual cape, the principal house and the magazines would be quite sheltered from the coldest winds. The elevation of the cape would help to protect them from the snow-drifts, which sometimes completely bury large buildings beneath their heavy avalanches in a few hours. There was plenty of room between the foot of the promontory and the bank of the lagoon for all the constructions necessary to a fort. It could even be surrounded by palisades, which would break the shock of the icebergs; and the cape itself might be surrounded with a fortified redoubt, if the vicinity of rivals should render such a purely defensive erection necessary; and the Lieutenant, although with no idea of commencing anything of the kind as yet, naturally rejoiced at having met with an easily defensible position.
The weather remained fine, and it was quite warm enough. There was not a cloud upon the sky; but, of course, the clear blue air of temperate and torrid zones could not be expected here, and the atmosphere was generally charged with a light mist. What would Cape Bathurst be like in the long winter night of four months when the ice-mountains became fixed and rigid, and the hoarse north wind swept down upon the icebergs in all its fury? None of the party gave a thought to that time now; for the weather was beautiful, the verdant landscape smiled, and the waves sparkled in the sunbeams, whilst the temperature remained warm and pleasant.

A provisional camp, the sledges forming its only material, was arranged for the night on the banks of the lagoon; and towards evening Mrs Barnett, the Lieutenant, Sergeant Long, and even Thomas Black, explored the surrounding district in order to ascertain its resources. It appeared to be in every respect suitable; and Hobson was eager for the next day, that he might determine the exact situations, and find out if it fulfilled the conditions imposed by the Company.

"Well, Lieutenant," said the astronomer when the examination was over, "this is really a charming spot, such as I should not have imagined could have existed beyond the Arctic Circle."

"Ah, Mr Black!" cried Hobson, "the finest countries in the world are to be found here, and I am impatient to ascertain our latitude and longitude."

"Especially the latitude," said the astronomer, whose eclipse was never out of his thoughts; "and I expect your brave companions are as eager as yourself. Double pay beyond the seventieth parallel!"

"But, Mr Black," said Mrs Barnett, "do you not yourself take an interest a purely scientific interest, in getting beyond that parallel?"

"Of course, madam, of course I am anxious to get beyond it, but not so terribly eager. According to our calculations, however, made with absolute accuracy, the solar eclipse which I am ordered to watch will only be total to an observer placed beyond the seventieth degree, and on this account I share the Lieutenant’s impatience to determine the position of Cape Bathurst."

"But I understand, Mr Black," said Mrs Barnett, "that this solar eclipse will not take place until the 18th July 1860?"

"Yes, madam, on the 18th July 1860."

"And it is now only the 15th June 1859! So that the phenomenon will not be visible for more than a year!"

"I am quite aware of it, Mrs Barnett," replied the astronomer; "but if I had not started till next year I should have run a risk of being too late."

"You would, Mr Black," said Hobson, "and you did well to start a year beforehand. You are now quite sure not to miss your eclipse. I own that our journey from Fort Reliance has been accomplished under exceptionally favourable circumstances. We have had little fatigue and few delays. To tell you the truth, I did not expect to get to this part of the coast until the middle of August; and if the eclipse had been expected this year, instead of next; you really might have been too late. Moreover, we do not yet know if we are beyond the seventieth parallel."

"I do not in the least regret the journey I have taken in your company, Lieutenant, and I shall patiently wait until next year for my eclipse. The fair Phœbe, I fancy, is a sufficiently grand lady to be waited for."

The next day, July 6th, a little after noon, Hobson and the astronomer made their preparations for taking the exact bearings of Cape Bathurst. The sun shone clearly enough for them to take the outlines exactly. At this season of the year, too, it had reached its maximum height above the horizon; and consequently its culmination, on its transit across the meridian, would facilitate the work of the two observers.

Already the night before, and the same morning, by raking different altitudes, and by means of a calculation of right ascensions, the Lieutenant and the astronomer had ascertained the longitude with great accuracy. But it was about the latitude that Hobson was most anxious; for what would the meridian of Cape Bathurst matter to him should it not be situated beyond the seventieth parallel?

Noon approached. The men of the expedition gathered round the observers with their sextants ready in their hands. The brave fellows awaited the result of the observation with an impatience which will be readily understood. It was now to be decided whether they had come to the end of their journey, or whether they must search still further for a spot fulfilling the conditions imposed by the Company.

Probably no good result would have followed upon further explorations. According to the maps of North America-imperfect, it is true-the western coast beyond Cape Bathurst sloped down below the seventieth parallel, not again rising above it until it entered Russian America, where the English had as yet no right to settle; so that Hobson had shown considerable judgment in directing his course to Cape Bathurst after a thorough examination of the maps of these northern regions. This promontory is, in fact, the only one which juts out beyond the seventieth parallel along the whole of the North American continent, properly so called-that is to say, in English America. It remained to be proved that it really occupied the position assigned to it in maps.

At this moment the sun was approaching the culminating-point of its course, and the two observers pointed the
telescopes of their sextants upon it. By means of inclined mirrors attached to the instruments, the sun ought apparently to go back to the horizon itself; and the moment when it seemed to touch it with the lower side of its disc would be precisely that at which it would occupy the highest point of the diurnal arc, and consequently the exact moment when it would pass the meridian—in other words, it would be noon at the place where the observation was taken.

All watched in anxious silence.

"Noon!" cried Jaspar Hobson and the astronomer at once.

The telescopes were immediately lowered. The Lieutenant and Thomas Black read on the graduated limbs the value of the angles they had just obtained, and at once proceeded to note down their observations.

A few minutes afterwards, Lieutenant Hobson rose and said, addressing his companions

"My friends, from this date, July 6th, I promise you double pay in the name of the Hudson’s Bay Company!"

"Hurrah! hurrah! hurrah for the Company!" shouted the worthy companions of the Lieutenant with one voice.

Cape Bathurst and its immediate neighbourhood were in very truth above the seventieth degree of north latitude.

We give the result of these simultaneous observations, which agreed to a second.

Longitude, 127° 36’ 12” west of the meridian of Greenwich.

Latitude, 70° 44’ 37” north.

And that very evening these hardy pioneers, encamped so far from the inhabited world, watched the mighty luminary of day touch the edges of the western horizon without dipping beneath it.

For the first time they saw the shining of the midnight sun.

CHAPTER XIII.

FORT HOPE.

The site of the new fort was now finally determined on. It would be impossible to find a better situation than on the level ground behind Cape Bathurst, on the eastern bank of the lagoon Hobson determined to commence the construction of the principal house at once. Meanwhile all must accommodate themselves as best they could; and the sledges were ingeniously utilised to form a provisional encampment.

His men being very skilful, the Lieutenant hoped to have the principal house ready in a month. It was to be large enough to accommodate for a time the nineteen persons of the party. Later, and before the excessive cold set in, if there should be time, the barracks for the soldiers and the magazines for the furs and skins were to be built. There was not much chance of getting it all done before the end of September; and after that date, the winter, with its first bitter frosts and long nights, would arrest all further progress.

Of the ten soldiers chosen by Captain Craventy, two-Marbre and Sabine-were skilful hunters; the other eight handled the hatchet with as much address as the musket. Like sailors, they could turn their hands to anything, and were now to be treated more like workmen than soldiers, for they were to build a fort which there was as yet no enemy to attack. Petersen, Belcher, Rae, Garry, Pond, Hope, and Kellet formed a body of clever, zealous carpenters, under the able superintendence of lilac-Nab, a Scotchman from Stirling, who had had considerable experience in the building both of houses and boats. The men were well provided with tools-hatchets, centre-bits, adzes, planes, hand-saws, mallets, hammers, chisels, &c. &c. Rae was most skilful at blacksmith’s work, and with the aid of a little portable forge he was able to make all the pins, tenons, bolts, nails, screws, nuts, &c., required in carpentry. They had no mason in the party; but none was wanted, as all the buildings of the factories in the north are of wood. Fortunately there were plenty of trees about Cape Bathurst, although as Hobson had already remarked to Mrs Barnett, there was not a rock, a stone, not even a flint or a pebble, to be seen. The shore was strewn with innumerable quantities of bivalve shells broken by the surf, and with seaweed or zoophytes, mostly sea-urchins and asteriadin; but the soil consisted entirely of earth and sand, without a morsel of silica or broken granite; and the cape itself was but an accumulation of soft earth, the particles of which were scarcely held together by the vegetation with which it was clothed.

In the afternoon of the same day, July 6th Hobson and Mac-Nab the carpenter went to choose the site of the principal house on the plateau at the foot of Cape Bathurst. From this point the view embraced the lagoon and the western districts to a distance of ten or twelve miles. On the right, about four miles off, towered icebergs of a considerable height, partly draped in mist; whilst on the left stretched apparently boundless plains, vast steppes which it would be impossible to distinguish from the frozen surface of the lagoon or from the sea itself in the winter.

The spot chosen, Hobson and Mac-Nab set out the outer walls of the house with the line. This outline formed a rectangle measuring sixty feet on the larger side, and thirty on the smaller. The façade of the house would therefore have a length of sixty feet it was to have a door and three windows on the side of the promontory, where the inner court was to be situated, and four windows on the side of the lagoon. The door was to open at the left corner, instead of in the middle, of the back of the house, for the sake of warmth. This arrangement would impede the entrance of the outer air to the further rooms, and add considerably to the comfort of the inmates of the fort.
According to the simple plan agreed upon by the Lieutenant and his master-carpenter, there were to be four compartments in the house: the first to be an antechamber with a double door to keep out the wind; the second to serve as a kitchen, that the cooking which would generate damp, might be all done quite away from the living-rooms; the third, a large hall, where the daily meals were to be served in common; and the fourth, to be divided into several cabins, like the state-rooms on board ship.

The soldiers were to occupy the dining-hall provisionally, and a kind of camp-bed was arranged for them at the end of the room. The Lieutenant, Mrs Barnett, Thomas Black, Madge, Mrs Joliffe, Mrs Mac-Nab, and Mrs Rae were to lodge in the cabins of the fourth compartment. They would certainly be packed pretty closely; but it was only a temporary state of things, and when the barracks were constructed, the principal house would be reserved to the officer in command, his sergeant, Thomas Black, Mrs Barnett, and her faithful Madge, who never left her. Then the fourth compartment might perhaps be divided into three cabins, instead of four; for to avoid corners as much as possible is a rule which should never be forgotten by those who winter in high latitudes. Nooks and corners are, in fact, so many receptacles of ice. The partitions impede the ventilation; and the moisture, generated in the air, freezes readily, and makes the atmosphere of the rooms unhealthy causing grave maladies to those who sleep in them.

On this account many navigators who have to winter in the midst of ice have one large room in the centre of their vessel, which is shared by officers and sailors in common. For obvious reasons, however, Hobson could not adopt this plan.

From the preceding description we shall have seen that the future house was to consist merely of a ground-floor. The roof was to be high, and its sides to slope considerably, so that water could easily run off them. The snow would, however, settle upon them; and when once they were covered with it, the house would be, so to speak, hermetically closed, and the inside temperature would be kept at the same mean height. Snow is, in fact, a very bad conductor of heat: it prevents it from entering, it is true; but, what is more important in an Arctic winter, it also keeps it from getting out.

The carpenter was to build two chimneys-one above the kitchen, the other in connection with the stove of the large dining-room, which was to heat it and the compartment containing the cabins. The architectural effect of the whole would certainly be poor; but the house would be as comfortable as possible, and what more could any one desire?

Certainly an artist who had once seen it would not soon forget this winter residence, set down in the gloomy Arctic twilight in the midst of snow-drifts, half hidden by icicles, draped in white from roof to foundation, its walls encrusted with snow, and the smoke from its fires assuming strangely-contorted forms in the wind.

But now to tell of the actual construction of this house, as yet existing only in imagination. This, of course, was the business of Mac-Nab and his men; and while the carpenters were at work, the foraging party to whom the commissariat was entrusted would not be idle. There was plenty for every one to do.

The first step was to choose suitable timber, and a species of Scotch fir was decided on, which grew conveniently upon the neighbouring hills, and seemed altogether well adapted to the multifarious uses to which it would be put. For in the rough and ready style of habitation which they were planning, there could be no variety of material; and every part of the house-outside and inside walls, flooring, ceiling, partitions, rafters, ridges, framework, and tiling—would have to be contrived of planks, beams, and timbers. As may readily be supposed, finished workmanship was not necessary for such a description of building, and Mac-Nab was able to proceed very rapidly without endangering the safety of the building. About a hundred of these firs were chosen and felled-they were neither barked nor squared—and formed so many timbers, averaging some twenty feet in length. The axe and the chisel did not touch them except at the ends, in order to form the tenons and mortises by which they were to be secured to one another. Very few days sufficed to complete this part of the work, and the timbers were brought down by the dogs to the site fixed on for the principal building. To start with, the Bite had been carefully levelled. The soil, a mixture of fine earth and sand, had been beaten and consolidated with heavy blows. The brushwood with which it was originally covered was burnt, and the thick layer of ashes thus produced would prevent the damp from penetrating the floors. A clean and dry foundation having been thus secured on which to lay the first joists, upright posts were fixed at each corner of the site, and at the extremities of the inside walls, to form the skeleton of the building. The posts were sunk to a depth of some feet in the ground, after their ends had been hardened in the fire; and were slightly hollowed at each side to receive the crossbeams of the outer wall, between which the openings for the doors and windows had been arranged for. These posts were held together at the top by horizontal beams well let into the mortises, and consolidating the whole building. On these horizontal beams, which represented the architraves of the two fronts, rested the high trusses of the roof, which overhung the walls like the eaves of a chalet. Above this squared architrave were laid the joists of the ceiling, and those of the floor upon the layer of ashes.

The timbers, both in the inside and outside walls, were only laid side by side. To insure their being properly joined, Rae the blacksmith drove strong iron bolts through them at intervals; and when even this contrivance proved
insufficient to close the interstices as hermetically as was necessary, Mac-Nab had recourse to calking, a process which seamen find invaluable in rendering vessels water-tight; only as a substitute for tow he used a sort of dry moss, with which the eastern side of the cape was covered, driving it into the crevices with calking-irons and a hammer, filling up each hollow with layers of hot tar, obtained without difficulty from the pine-trees, and thus making the walls and boarding impervious to the rain and damp of the winter season.

The door and windows in the two fronts were roughly but strongly built, and the small panes of the latter glazed with isinglass, which, though rough, yellow, and almost opaque, was yet the best substitute for glass which the resources of the country afforded; and its imperfections really mattered little, as the windows were sure to be always open in fine weather; while during, the long night of the Arctic winter they would be useless, and have to be kept closed and defended by heavy shutters with strong bolts against the violence of the gales. Meanwhile the house was being quickly fitted up inside. By means of a double door between the outer and inner halls a too sudden change of temperature was avoided, and the wind was prevented from blowing with unbroken force into the rooms. The air-pumps, brought from Fort Reliance, were so fixed as to let in fresh air whenever excessive cold prevented the opening of doors or windows -one being made to eject the impure air from within, the other to renew the supply; for the Lieutenant had given his whole mind to this important matter.

The principal cooking utensil was a large iron furnace, which had been brought piecemeal from Fort Reliance, and which the carpenter put up without any difficulty. The chimneys for the kitchen and ball, however, seemed likely to tax the ingenuity of the workmen to the utmost, as no material within their reach was strong enough for the purpose, and stone, as we have said before, was nowhere to be found in the country around Cape Bathurst.

The difficulty appeared insurmountable, when the invincible Lieutenant suggested that they should utilise the shells with which the shore was strewn.

"Make chimneys of shells!" cried the carpenter.

"Yes, Mac-Nab," replied Hobson; "we must collect the shells, grind them, burn them, and make them into lime, then mould the lime into bricks, and use them in the same way."

"Let us try the shells, by all means," replied the carpenter; and so the idea was put in practice at once, and many tons collected of calcareous shells identical with those found in the lowest stratum of the Tertiary formations.

A furnace was constructed for the decomposition of the carbonate which is so large an ingredient of these shells, and thus the lime required was obtained in the space of a few hours. It would perhaps be too much to say that the substance thus made was as entirely satisfactory as if it had gone through all the usual processes; but it answered its purpose, and strong conical chimneys soon adorned the roof, to the great satisfaction of Mrs Paulina Barnett, who congratulated the originator of the scheme warmly on its success, only adding laughingly, that she hoped the chimneys would not smoke.

"Of course they will smoke, madam," replied Hobson coolly; "all chimneys do!"

All this was finished within a month, and on the 6th of August they were to take possession of the new house.

While Mac-Nab and his men were working so hard, the foraging party, with the Lieutenant at its head, had been exploring the environs of Cape Bathurst, and satisfied themselves that there would be no difficulty in supplying the Company’s demands for fur and feathers, so soon as they could set about hunting in earnest. In the meantime they prepared the way for future sport, contenting themselves for the present with the capture of a few couples of reindeer, which they intended to domesticate for the sake of their milk and their young. They were kept in a paddock about fifty yards from the house, and entrusted to the care of Mac-Nab’s wife, an Indian woman, well qualified to take charge of them.

The care of the household fell to Mrs Paulina Barnett, and this good woman, with Madge’s help, was invaluable in providing for all the small wants, which would inevitably have escaped the notice of the men.

After scouring the country within a radius of several miles, the Lieutenant notified, as the result of his observations, that the territory on which they had established themselves, and to which he gave the name of Victoria Land, was a large peninsula about one hundred and fifty square miles in extent, with very clearly-defined boundaries, connected with the American continent by an isthmus, extending from the lower end of Washburn Bay on the east, as far as the corresponding slope on the opposite coast. The Lieutenant next proceeded to ascertain what were the resources of the lake and river, and found great reason to be satisfied with the result of his examination. The shallow waters of the lake teemed with trout, pike, and other available fresh-water fish; and the little river was a favourite resort of salmon and shoals of white bait and smelts. The supply of sea-fish was not so good; and though many a grampus and whale passed by in the offing, the latter probably flying from the harpoons of the Behring Strait fishermen there were no means of capturing them unless one by chance happened to get stranded on the coast; nor would Hobson allow any of the seals which abounded on the western shore to be taken until a satisfactory conclusion should be arrived at as to how to use them to the best advantage.

The colonists now considered themselves fairly installed stalled in their new abode, and after due deliberation...
The factory was therefore entirely encircled, and at each extremity of the lagoon Mac-Nab undertook to erect along the coast at no great distance from Fort Hope, and he well knew how essential it was to be safe from a coup de animals or the hostilities of the natives. The Lieutenant had not forgotten an outrage which had been committed.

strong fence of pointed stakes, planted firmly in the ground, was set up as a protection against the inroads of wild this kennel on the left, while the store and powder magazines were to occupy the front of the enclosure.

and about forty yards to the right of the house. Barracks for the accommodation of the men were to be built opposite the doghouse was built at the very foot of the promontory, against the hill,

interval; and as soon as the principal house was finished, Hobson set them to work to build an enormous kennel or when the snow would begin to fall. It was very important that the carpenters-should make all possible use of the expeditions.

"Yes, indeed; I have been thinking of that, and mean to make all possible use of the produce of the country so as to economise our stores. As soon as we can, we will make some foraging expeditions. We need not think about the furs at present, for there will be plenty of time during the winter to stock the Company's depôts. Besides, the furred animals have not got their winter clothing on yet, and the skins would lose fifty per cent. of their value if taken now. Let us content ourselves for the present with provisioning Fort Hope. Reindeer, elk, - and any wapitis that may have ventured so far north are the only game worth our notice just now; it will be no small undertaking to provide food for twenty people and sixty dogs."

The Lieutenant loved order, and determined to do everything in the most methodical manner, feeling confident that if his companions would help him to the utmost of their power, nothing need be wanting to the success of the expedition.

The weather at this season was almost always fine, and might be expected to continue so for five weeks longer, when the snow would begin to fall. It was very important that the carpenters-should make all possible use of the interval; and as soon as the principal house was finished, Hobson set them to work to build an enormous kennel or shed in which to keep the teams of dogs. This doghouse was built at the very foot of the promontory, against the hill, and about forty yards to the right of the house. Barracks for the accommodation of the men were to be built opposite this kennel on the left, while the store and powder magazines were to occupy the front of the enclosure.

Hobson determined with almost excessive prudence to have the Factory enclosed before the winter set in. A strong fence of pointed stakes, planted firmly in the ground, was set up as a protection against the inroads of wild animals or the hostilities of the natives. The Lieutenant had not forgotten an outrage which had been committed along the coast at no great distance from Fort Hope, and he well knew how essential it was to be safe from a coup de main. The factory was therefore entirely encircled, and at each extremity of the lagoon Mac-Nab undertook to erect

unanimously agreed to bestow upon the settlement the name of Fort Good Hope.

Alas! the auspicious title was never to be inscribed upon a map. The undertaking, begun so bravely and with such prospects of success, was destined never to be carried out, and another disaster would have to be added to the long list of failures in Arctic enterprise.

CHAPTER XIV.

SOME EXCURSIONS.

It did not take long to furnish the new abode. A camp-bed was set up in the hall, and the carpenter Mac-Nab constructed a most substantial table, around which were ranged fixed benches. A few movable seats and two enormous presses completed the furniture of this apartment. The inner room, which was also ready, was divided by solid partitions into six dormitories, the two end ones alone being lighted by windows looking to the front and back. The only furniture was a bed and a table. Mrs Paulina Barnett and Madge were installed in one which looked immediately out upon the lake. Hobson offered the other with the window in it to Thomas Black, and the astronomer took immediate possession of it. The Lieutenant’s own room was a dark cell adjoining the hall, with no window but a bull’s eye pierced through the partition. Mrs Joliffe, Mrs Mac-Nab, and Mrs Rae, with their husbands, occupied the other dormitories. These good people agreed so well together that it would have been a pity to separate them. Moreover, an addition was expected shortly to the little colony; and Mac-Nab had already gone so far as to secure the services of Mrs Barnett as godmother, an honour which gave the good woman much satisfaction. The sledge had been entirely unloaded, and the bedding carried into the different rooms. All utensils, stores, and provisions which were not required for immediate use were stowed away in a garret, to which a ladder gave access. The winter clothing-such as boots, overcoats, furs, and skins-were also taken there, and protected from the damp in large chests. As soon as these arrangements were completed, the Lieutenant began to provide for the heating of the house.

Knowing that the most energetic measures were necessary to combat the severity of the Arctic winter, and that during the weeks of intensest cold there would be no possibility of leaving the house to forage for supplies, he ordered a quantity of fuel to be brought from the wooded hills in the neighbourhood, and took care to obtain a plentiful store of oil from the seals which abounded on the shore.

In obedience to his orders, and under his directions, the house was provided with a condensing apparatus which would receive the internal moisture, and was so constructed that the ice which would form in it could easily be removed.

This question of heating was a very serious one to the Lieutenant.

"I am a native of the Polar regions, madam," he often said to Mrs Barnett; "I have some experience in these matters, and I have read over and over again books written by those who have wintered in these latitudes. It is impossible to take too many precautions in preparing to pass a winter in the Arctic regions, and nothing must be left to chance where a single neglect may prove fatal to the enterprise."

"Very true, Mr Hobson," replied Mrs Barnett; "and you have evidently made up your mind to conquer the cold; but there is the food to be thought of too."

"Yes, indeed; I have been thinking of that, and mean to make all possible use of the produce of the country so as to economise our stores. As soon as we can, we will make some foraging expeditions. We need not think about the furs at present, for there will be plenty of time during the winter to stock the Company's depôts. Besides, the furred animals have not got their winter clothing on yet, and the skins would lose fifty per cent. of their value if taken now. Let us content ourselves for the present with provisioning Fort Hope. Reindeer, elk, - and any wapitis that may have ventured so far north are the only game worth our notice just now; it will be no small undertaking to provide food for twenty people and sixty dogs."

The Lieutenant loved order, and determined to do everything in the most methodical manner, feeling confident that if his companions would help him to the utmost of their power, nothing need be wanting to the success of the expedition.

The weather at this season was almost always fine, and might be expected to continue so for five weeks longer, when the snow would begin to fall. It was very important that the carpenters-should make all possible use of the interval; and as soon as the principal house was finished, Hobson set them to work to build an enormous kennel or shed in which to keep the teams of dogs. This doghouse was built at the very foot of the promontory, against the hill, and about forty yards to the right of the house. Barracks for the accommodation of the men were to be built opposite this kennel on the left, while the store and powder magazines were to occupy the front of the enclosure.

Hobson determined with almost excessive prudence to have the Factory enclosed before the winter set in. A strong fence of pointed stakes, planted firmly in the ground, was set up as a protection against the inroads of wild animals or the hostilities of the natives. The Lieutenant had not forgotten an outrage which had been committed along the coast at no great distance from Fort Hope, and he well knew how essential it was to be safe from a coup de main. The factory was therefore entirely encircled, and at each extremity of the lagoon Mac-Nab undertook to erect
a wooden sentry-box commanding the coast-line, from which a watch could be kept without any danger. The men worked indefatigably, and it seemed likely that everything would be finished before the cold season set in.

In the meantime hunting parties were organised. The capture of seals being put off for a more convenient season, the sportsmen prepared to supply the fort with game, which might be dried and preserved for consumption during the bad season.

Accordingly Marbre and Sabine, sometimes accompanied by the Lieutenant and Sergeant Long, whose experience was invaluable, scoured the country daily for miles round; and it was no uncommon sight to see Mrs Paulina Barnett join them and step briskly along shouldering her gun bravely, and never allowing herself to be outstripped by her companions.

Throughout the month of August these expeditions were continued with great success, and the store of provisions increased rapidly. Marbre and Sabine were skilled in all the artifices which sportsmen employ in stalking their prey—particularly the reindeer, which are exceedingly wary. How patiently they would face the wind lest the creature’s keen sense of smell should warn it of their approach! and how cunningly they lured it on to its destruction by displaying the magnificent antlers of some former victim above the birch-bushes!

They found a useful alley (sic) in a certain little traitorous bird to which the Indians have given the name of “monitor.” It is a kind of daylight owl, about the size of a pigeon, and has earned its name by its habit of calling the attention of hunters to their quarry, by uttering a sharp note like the cry of a child.

When about fifty reindeer, or, to give them their Indian name, "caribous," had been brought down by the guns, the flesh was cut into long strips for food, the skins being kept to be tanned and used for shoe-leather.

Besides the caribous, there were also plenty of Polar hares, which formed an agreeable addition to the larder. They were much less timorous than the European species, and allowed themselves to be caught in great numbers. They belong to the rodent family, and have long ears, brown eyes, and a soft fur resembling swan’s down. They weigh from ten to fifteen pounds each, and their flesh is excellent. Hundreds of them were cared for winter use, and the remainder converted into excellent pies by the skilful hands of Mrs Joliffe.

While making provision for future wants, the daily supplies were not neglected. In addition to the Polar bares, which underwent every variety of culinary treatment from Mrs Joliffe, and won for her compliments innumerable from hunters and workmen alike, many waterfowl figured in the bill of fare. Besides the ducks which abounded on the shores of the lagoon, large flocks of grousé congregated round the clumps of stunted willows. They belong, as their zoological name implies, to the partridge family, and might be aptly described as white partridges with long black-spotted feathers in the tail. The Indians call them willow-fowl; but to a European sportsman they are neither more nor less than blackcock (Tetrao tetrix). When roasted slightly before a quick clear fire they proved delicious.

Then there were the supplies furnished by lake and stream. Sergeant Long was a first-rate angler, and nothing could surpass the skill and patience with which he whipped the water and cast his s line. The faithful Madge, another worthy disciple of Isaak Walton was perhaps his only equal. Day after day the two sallied forth together rod in hand, to spend the day in mute companionship by the river-side, whence they were sure to return in triumph laden with some splendid specimens of the salmon tribe.

But to return to our sportsmen; they soon found that their hunting excursions were not to be free from peril. Hobson perceived with some alarm that bears were very numerous in the neighbourhood and that scarcely a day passed without one or more of them being sighted. Sometimes these unwelcome visitors belonged to the family of brown bears, so common throughout the whole “Cursed Land;” but now and then a solitary specimen of the formidable Polar bear warned the hunters what dangers they might have to encounter so soon as the first frost should drive great numbers of these fearful animals to the neighbourhood of Cape Bathurst. Every book of Arctic explorations is full of accounts of the frequent perils to which travellers and whalers are exposed from the ferocity of these animals.

Now and then, too, a distant pack of wolves was seen, which receded like a wave at the approach of the hunters, or the sound of their bark was heard as they followed the trail of a reindeer or wapiti. These creatures were large grey wolves, about three feet high, with long tails, whose fur becomes white in the winter. They abounded in this part of the country, where food was plentiful; and frequented wooded spots, where they lived in holes like foxes. During the temperate season, when they could get as much as they wanted to eat, they were scarcely dangerous, and fled with the characteristic cowardice of their race at the first sign of pursuit; but when impelled by hunger, their numbers rendered them very formidable; and from the fact of their lairs being close at hand, they never left the country even in the depth of winter.

One day the sportsmen returned to Fort Hope, bringing with them an unpleasant-looking animal, which neither Mrs Paulina Barnett nor the astronomer, Thomas Black, had ever before seen. It was a carnivorous creature of the plantigrada family, and greatly resembled the American glutton, being strongly built, with short legs, and, like all animals of the feline tribe, a very supple back; its eyes were small and horny, and it was armed with curved claws.
"What is this horrid creature?" inquired Mrs Paulina Barnett of Sabine, who replied in his usual sententious manner—

"A Scotchman would call it a 'quick-hatch,' an Indian an 'okeelcoo-haw-gew,' and a Canadian a 'carcajou.'"

"And what do you call it?"

"A wolverene, ma'am," returned Sabine, much delighted with the elegant way in which he had rounded his sentence.

The wolverene, as this strange quadruped is called by zoologists, lives in hollow trees or rocky caves, whence it issues at night and creates great havoc amongst beavers, musk-rats, and other rodents, sometimes fighting with a fox or a wolf for its spoils. Its chief characteristics are great cunning, immense muscular power, and an acute sense of smell. It is found in very high latitudes; and the short fur with which it is clothed becomes almost black in the winter months, and forms a large item in the Company’s exports.

During their excursions the settlers paid as much attention to the Flora of the country as to its Fauna; but in those regions vegetation, has necessarily a hard struggle for existence, as it must brave every season of the year, whereas the animals are able to migrate to a warmer climate during the winter.

The hills on the eastern side, of the lake were well covered with pine and fir trees; and Jaspar also noticed the "tacamahac," a species of poplar which grows to a great height and shoots forth yellowish leaves which turn green in the autumn. These trees and larches were, however, few and sickly looking, as if they found the oblique rays of the sun insufficient to make them thrive. The black fir, or Norway spruce fir, throve better, especially when situated in ravines well sheltered from the north wind. The young shoots of this tree are very valuable, yielding a favourite beverage known in North America as "spruce-beer." A good crop of these branchlets was gathered in and stored in the cellar of Fort Hope. There were also the dwarf birch, a shrub about two feet high, native to very cold climates, and whole thickets of cedars, which are so valuable for fuel.

Of vegetables which could be easily grown and used for food, this barren land yielded but few; and Mrs Joliffe, who took a great interest in "economic" botany, only met with two plants which were available in cooking.

One of these, a bulb, very difficult to classify, because its leaves fall off just at the flowering season, turned out to be a wild leek, and yielded a good crop of onions, each about the size of an egg.

The other plant was that known throughout North America as "Labrador tea;" it grew abundantly on the shores of the lagoon between the clumps of willow and arbutus, and formed the principal food of the Polar hares. Steeped in boiling water, and flavoured with a few drops of brandy or gin, it formed an excellent beverage, and served to economise the supply of China tea which the party had brought from Fort Reliance.

Knowing the scarcity of vegetables, Jaspar Hobson had plenty of seeds with him, chiefly sorrel and scurvy-grass (Cochlearia), the antiscorbutic properties of which are invaluable in these latitudes. In choosing the site of the settlement, such care had been taken to find a spot sheltered from the keen blasts, which shrivel vegetation like a fire, that there was every chance of these seeds yielding a good crop in the ensuing season.

The dispensary of the new fort contained other antiscorbutics, in the shape of casks of lemon and lime juice, both of which are absolutely indispensable to an Arctic expedition. Still the greatest economy was necessary with regard to the stores, as a long period of bad weather might cut off the communication between Fort Hope and the southern stations.

CHAPTER XV.

FIFTEEN MILES FROM CAPE BATHURST.

September had now commenced, and as upon the most favourable calculation only three more weeks would intervene before the bad season set in and interrupted the labours of the explorers, the greatest haste was necessary in completing the new buildings, and Mae-Nab and his workmen surpassed themselves in industry. The dog-house was on the eve of being finished, and very little remained to be done to the palisading which was, to encircle the fort. An inner court had been constructed, in the shape of a half-moon, fenced with tall pointed stakes, fifteen feet high, to which a postern gave entrance. Jaspar Hobson favoured the system of an unbroken enclosure with detached forts (a great improvement upon the tactics of Vauban and Cormontaigne), and knew that to make his defence complete the summit of Cape Bathurst, which was the key of the position, must be fortified; until that could be done, however, he thought the palisading would be a sufficient protection, at least against quadrupeds.

The next thing was to lay in a supply of oil and lights, and accordingly an expedition was organised to a spot about fifteen miles distant where seals were plentiful, Mrs Paulina Barnett being invited to accompany the sportsmen, not indeed for the sake of watching the poor creatures slaughtered, but to satisfy her curiosity with regard to the country around Cape Bathurst, and to see some cliff’s on that part of the coast which were worthy of notice. The Lieutenant chose as his other companions, Sergeant Long, and the soldiers Petersen, Hope, and Kellet, and the party set off at eight o’clock in the morning in two sledges, each drawn by six dogs, on which the bodies of the seals
being cut off, and with jagged tremulous outlines standing out against the sky. They had hitherto escaped the notice of the

After a monotonous journey along a flat and sandy shore, the party reached their destination, and, having unharnessed the teams, they were left behind lest they should startle the seals.

At the first glance around them, all were equally struck with the contrast between the appearance of this district and that of Cape Bathurst.

Here the coast line was broken and fretted, showing manifest traces of its igneous origin; whereas the site of the fort was of sedimentary formation and aqueous origin. Stone, so conspicuously absent at the cape, was here plentiful; the black sand and porous lava were strewn with huge boulders deeply imbedded in the soil, and there were large quantities of the aluminium, silica, and felspar pebbles peculiar to the crystalline strata of one class of igneous rocks. Glittering Labrador stones, and many other kinds of felspar, red, green, and blue, were sprinkled on the unfrequented beach, with grey and yellow pumice-stone, and lustrous variegated obsidian. Tall cliffs, rising some two hundred feet above the sea, frowned down upon the bay; and the Lieutenant resolved to climb them, and obtain a good view of the eastern side of the country. For this there was plenty of time, as but few of the creatures they had come to seek were as yet to be seen, and the proper time for the attack would be when they assembled for the afternoon siesta in which the amphibious mammalia always indulge. The Lieutenant, however, quickly discovered that the animals frequenting this coast were not, as he had been led to suppose, true seals, although they belonged to the Phocidæ family, but morses or walruses, sometimes called sea-cows. They resemble the seals in general form, but the canine teeth of the upper jaw curved down-wards are much more largely developed.

Following the coast line, which curved considerably, and to which they gave the name of "Walruses' Bay," the party soon reached the foot of the cliff, and Petersen, Hope, and Kellet, took up their position as sentinels on the little promontory, whilst Mrs Barnett, Hobson, and Long, after promising not to lose sight of their comrades, and to be on the look-out for their signal, proceeded to climb the cliff, the summit of which they reached in about a quarter of an hour. From this position they were able to survey the whole surrounding country; at their feet lay the vast sea, stretching northwards as far as the eye could reach, its expanse so entirely unbroken by islands or icebergs that the travellers came to the conclusion, that this portion of the Arctic waters was navigable as far as Behring Straits, and that during the summer season the North-West Passage to Cape Bathurst would be open to the Company's ships. On the west, the aspect of the country explained the presence of the volcanic débris on the shore; for at a distance of about ten miles was a chain of granitic hills, of conical form, with blunted crests, looking as if their summits had been cut off, and with jagged tremulous outlines standing out against the sky. They had hitherto escaped the notice

been cut off, and with jagged tremulous outlines standing out against the sky. They had hitherto escaped the notice
of our party, as they were concealed by the cliffs on the Cape Bathurst side, and Jaspar Hobson examined them in silence, but with great attention, before he proceeded to study the eastern side, which consisted of a long strip of perfectly level coast-line stretching away to Cape Bathurst. Any one provided with a good field-glass would have been able to distinguish the fort of Good Hope, and perhaps even the cloud of blue smoke, which was no doubt at that very moment issuing from Mrs Joliffe’s kitchen chimney.

The country behind them seemed to possess two entirely distinct characters; to the east and south the cape was bounded by a vast plain, many hundreds of square miles in extent, while behind the cliff, from “Walruses’ Bay” to the mountains mentioned above, the country had undergone terrible convulsions, showing clearly that it owed its origin to volcanic eruptions. The Lieutenant was much struck with this marked contrast, and Sergeant Long asked him whether he thought the mountains on the western horizon were volcanoes.

“Undoubtedly,” said Hobson; “all these pumice-stones and pebbles have been discharged by them to this distance, and if we were to go two or three miles farther, we should find ourselves treading upon nothing but lava and ashes.”

“Do you suppose,” inquired the Sergeant, “that all these volcanoes are still active?”

“That I cannot tell you yet.”

“But there is no smoke issuing from any of them,” added the Sergeant.

“That proves nothing; your pipe is not always in your mouth, and it is just the same with volcanoes, they are not always smoking.”

“I see,” said the Sergeant; “but it is a great puzzle to me how volcanoes can exist at all on Polar continents.”

“Well, there are riot many of them!” said Mrs Barnett.

“No, madam,” replied Jaspar, “but they are not so very rare either; they are to be found in Jan Mayen’s Land, the Aleutian Isles, Kamtchatka, Russian America, and Iceland, as well as in the Antarctic circle, in Tierra del Fuego, and Australasia. They are the chimneys of the great furnace in the centre of the earth, where Nature makes her chemical experiments, and it appears to me that the Creator of all things has taken care to place these safety-valves wherever they were most needed.”

“I suppose so,” replied the Sergeant; “and yet it does seem very strange to find them in this icy climate.”

“Why should they not be here as well as anywhere else, Sergeant? I should say that ventilation holes are likely to be more numerous at the Poles than at the Equator!”

“Why so?” asked the Sergeant in much surprise.

“Because, if these safety-valves are forced open by the pressure of subterranean gases, it will most likely be at the spots where the surface of the earth is thinnest, and as the globe is flattened at the poles, it would appear natural that—but Kellet is making signs to us,” added the Lieutenant, breaking off abruptly; “will you join us, Mrs Barnett?”

“No, thank you. I will stay here until we return to the fort. I don’t care to watch the walrus slaughtered!”

The beach was soon reached, and some hundred walrus had collected, either waddling about on their clumsy webbed feet, or sleeping in family groups. Some few of the larger males-creatures nearly four feet long, clothed with very short reddish fur—kept guard over the herd.

Great caution was required in approaching these formidable looking animals, and the hunters took advantage of every bit of cover afforded by rocks and inequalities of the ground, so as to get within easy range of them and cut off their retreat to the sea.

On land these creatures are clumsy and awkward, moving in jerks or with creeping motions like huge caterpillars, but in water—their native element—they are nimble and even graceful; indeed their strength is so great, that they have been known to overturn the whalers in pursuit of them.

As the hunters drew near the sentinels took alarm, and raising their heads looked searchingly around them; but before they could warn their companions of danger, Hobson and Kellet rushed upon them from one side, the Sergeant, Petersen, and Hope from the other, and after lodging a ball in each of their bodies, despatched them with their spears, whilst the rest of the herd plunged into the sea.

The victory was an easy one; the five victims were very large and their tusks, though slightly rough, of the best quality. They were chiefly valuable, however, on account of the oil; of which—being in excellent condition—they would yield a large quantity. The bodies were packed in the sledges, and proved no light weight for the dogs.

It was now one o’clock, and Mrs Barnett having joined them, the party set out on foot—the sledges being full-to return to the fort. There were but ten miles to be traversed, but ten miles in a straight line is a weary journey, proving the truth of the adage “It’s a long lane that has no turning.” They beguiled the tediousness of the way by chatting pleasantly, and Mrs Barnett was ready to join in the conversation, or to listen with interest to the accounts the worthy soldiers gave of former adventures; but in spite of the brave struggle against ennui they advanced but slowly,
and the poor dogs found it hard work to drag the heavily-laden sledges over the rough ground. Had it been covered with frozen snow the distance would have been accomplished in a couple of hours.

The merciful Lieutenant often ordered a halt to give the teams breathing-time, and the Sergeant remarked that it would be much more convenient for the inhabitants of the fort, if the morses would settle a little nearer Cape Bathurst.

"They could riot find a suitable spot," replied the Lieutenant, with a melancholy shake of the head.

"Why not?" inquired Mrs Barnett with some surprise.

"Because they only congregate where the slope of the beach is gradual enough to allow of their creeping up easily from the sea. Now Cape Bathurst rises abruptly, like a perpendicular wall, from water three hundred fathoms deep. It is probable that ages ago portion of the continent was rent away in some violent volcanic convulsion, and flung into the Arctic Ocean. Hence the absence of morses on the beach of our cape."

CHAPTER XVI.

TWO SHOTS.

The first half of September passed rapidly away. Had Fort Hope been situated at the Pole itself, that is to say, twenty degrees farther north, the polar night would have set in on the 21st of that month. But under the seventieth parallel the sun would be visible above the horizon for another month. Nevertheless, the temperature was already decidedly colder, the thermometer fell during the night to 31° Fahrenheit; and thin coatings of ice appeared here and there, to be dissolved again in the day-time.

But the settlers were able to await the coming of winter without alarm; they had a more than sufficient store of provisions, their supply of dried venison had largely increased, another score of morses had been killed, the tame rein-deer were warmly and comfortably housed, and a huge wooden shed behind the house was filled with fuel. In short, everything was prepared for the Polar night.

And now all the wants of the inhabitants of the fort being provided for, it was time to think of the interests of the Company. The Arctic creatures had now assumed their winter furs, and were therefore of the greatest value, and Hobson organised shooting parties for the remainder of the fine weather, intending to set traps when the snow should prevent further excursions.

They would have plenty to do to satisfy the requirements of the Company, for so far north it was of no use to depend on the Indians, who are the purveyors of the factories.

The first expedition was to the haunt of a family of beavers, long since noted by the watchful Lieutenant, on a tributary of the stream already referred to. It is true, the fur of the beaver is not now as valuable as when it was used for hats, and fetched £16 per kilogramme (rather more than 2 lb.); but it still commands a high price as the animal is becoming very scarce, in consequence of the reckless way in which it has been hunted.

When the party reached their destination, the Lieutenant called Mrs Barnett's attention to the great ingenuity displayed by beavers in the construction of their submarine city. There were some hundred animals in the little colony now to be invaded, and they lived together in pairs in the "holes" or "vaults" they had hollowed out near the stream. They had already commenced their preparations for the winter, and were hard at work constructing their dams and laying up their piles of wood. A dam of admirable structure had already been built across the stream, which was deep and rapid enough not to freeze far below the surface, even in the severest weather. This dam, which was convex towards the current, consisted of a collection of upright stakes interlaced with branches and roots, the whole being cemented together and rendered watertight with the clayey mud of the river, previously pounded by the animals' feet. The beavers use their tails—which are large and flat, with scales instead of hair at the root—for plastering over their buildings and beating the clay into shape.

"The object of this dam," said the Lieutenant to Mrs Barnett, "is to secure to the beavers a sufficient depth of water at all seasons of the year, and to enable the engineers of the tribe to build the round buts called houses or lodges, the tops of which you can just see. They are extremely solid structures, and the walls made of stick, clay, roots, &c., are two feet thick. They can only be entered from below the water, and their owners have therefore to dive when they go home-an admirable arrangement for their protection. Each lodge contains two stories; in the lower the winter stock of branches, bark, and roots, is laid up, and the upper is the residence of the householder and his family."

"There is, however, not a beaver in sight," said Mrs Barnett; "is this a deserted village?"

"Oh no," replied the Lieutenant, "the inhabitants are now all asleep and resting; they only work in the night, and we mean to surprise them in their holes."

This was, in fact, easily done, and in an hour's time about a hundred of the ill-fated rodents had been captured, twenty of which were of very great value, their fur being black, and therefore especially esteemed. That of the others was also long, glossy, and silky, but of a reddish hue mixed with chestnut brown. Beneath the long fur, the beavers have a second coat of close short hair of a greyish-white colour.
The hunters returned to the fort much delighted with the result of their expedition. The beavers’ skins were warehoused and labelled as “parchments” or “young beavers,” according to their value.

Excursions of a similar kind were carried on throughout the month of September, and during the first half of October, with equally happy results.

A few badgers were taken, the skin being used as an ornament for the collars of draught horses, and the hair for making brushes of every variety. These carnivorous creatures belong to the bear family, and the specimens obtained by Hobson were of the genus peculiar to North America, sometimes called the Taxel badger.

Another animal of the rodent family, nearly as industrious as the beaver, largely contributed to the stores of the Company. This was the musk-rat or musquash. Its head and body are about a foot long and its tail ten inches. Its fur is in considerable demand. These creatures, like the rest of their family, multiply with extreme rapidity, and a great number were easily unearthed.

In the pursuit of lynxes and wolverines or gluttons, fire-arms bad to be used. The lynx has all the suppleness and agility of the feline tribe to which it belongs, and is formidable even to the rein-deer; Marbre and Sabine were, however, well up to their work, and succeeded in killing more than sixty of them. A few wolverines or gluttons were also despatched, their fur is reddish-brown, and that of the lynx, light-red with black spots; both are of considerable value.

Very few ermines or stoats were seen, and Jaspar Hobson ordered his men to spare any which happened to cross their path until the winter, when they should have assumed their beautiful snow-white coats with the one black spot at the tip of the tail. At present the upper fur was reddish-brown and the under yellowish white, so that, as Sabine expressed it, it was desirable to let them "ripen," or, in other words,-to wait for the cold to bleach them.

Their cousins, the polecats, however, which emit so disagreeable an odour, fell victims in great numbers to the hunters, who either tracked them to their homes in hollow trees, or shot them as they glided through the branches.

Martens, properly so-called, were hunted with great zeal. Their fur is in considerable demand, although not so valuable as that of the sable, which becomes a dark lustrous brown in the winter. The latter did not, however, come in the way of our hunters, as it only frequents the north of Europe and Asia as far as Kamtchatka, and is chiefly hunted by the inhabitants of Siberia. They had to be cone tent with the polecats and pine-martens, called "Canada-martens," which frequent the shores of the Arctic Ocean.

All the weasels and martens are very difficult to catch; they wriggle their long supple bodies through the smallest apertures with great ease, and thus elude their pursuers. In the winter, however, they are easily taken in traps, and Marbre and Sabine looked forward to make up for lost time then, when, said they, "there shall be plenty of their furs in the Company’s stores."

We have now only to mention the Arctic or blue and silver foxes, to complete the list of animals which swelled the profits of the Hudson’s Bay Company.

The furs of these foxes are esteemed in the Russian and English markets above all others, and that of the blue fox is the most valuable of all. This pretty creature has a black muzzle, and the fur is not as one would suppose blue, but whitish-brown; its great price-six times that of any other kind-arises from its superior softness, thickness, and length. A cloak belonging to the Emperor of Russia, composed entirely of fur from the neck of the blue fox (the fur from the neck is considered better than that from any other part), was shown at the London Exhibition of 1851, and valued at £3400 sterling.

Several of these foxes were sighted at Cape Bathurst, but all escaped the hunters; whilst only about a dozen silver foxes fell into their hands. The fur of the latter-of a lustrous black dotted with white-is much sought after in England and Russia, although it does not command so high a price as that of the foxes mentioned above.

One of the silver foxes captured was a splendid creature, with a coal-black fur tipped with white at the extreme end of the tail, and with a dash of the same on the forehead. The circumstances attending its death deserve relation in detail, as they proved that Hobson was right in the precautions he had taken.

On the morning of the 24th September, two sledges conveyed Mrs Barnett, the Lieutenant, Sergeant Long, Marbre, and Sabine, to Walruses’ Bay. Some traces of foxes had been noticed the evening before, amongst some rocks clothed with scanty herbage and the direction taken by the animals was very clearly indicated. The hunters followed up the trail of a large animal, and were rewarded by bringing down a very fine silver fox.

Several other animals of the same species were sighted, and the hunters divided into two parties-Marbre and Sabine going after one foe, and Mrs Barnett, Hobson, and the Sergeant, trying to cut off the retreat of another fine animal hiding behind some rocks.

Great caution and some artifice was necessary to deal with this crafty animal, which took care not to expose itself to a shot. The pursuit lasted for half-an-hour without success; but at last the poor creature, with the sea on one side and its three enemies on the other, had recourse in its desperation to a flying leap, thinking thus to escape with its life. But Hobson was too quick for it; and as it bounded by like a flash of lightning, it was struck by a shot, and to
every one's surprise, the report of the Lieutenant's gun was succeeded by that of another, and a second ball entered
the body of the fox, which fell to the ground mortally wounded.

"Hurrah! hurrah!" cried Hobson, "it is mine!"

"And mine!" said another voice, and a stranger stepped forward and placed his foot upon the fox just as the
Lieutenant was about to raise it.

Hobson drew back in astonishment. He thought the second ball had been fired by the Sergeant, and found
himself face to face with a stranger whose gun was still smoking.

The rivals gazed at each other in silence.

The rest of the party now approached, and the stranger was quickly joined by twelve comrades, four of whom
were like himself "Canadian travellers," and eight Chippeway Indians.

The leader was a tall man—a fine specimen of his class—those Canadian trappers described in the romances of
Washington Irving, whose competition Hobson had dreaded with such good reason. He wore the traditional costume
ascribed to his fellow-hunters by the great American writer; a blanket loosely arranged about his person, a striped
cotton shirt, wide cloth trousers, leather gaiters, deerskin mocassins, and a sash of checked woollen stuff round the
waist, from which were suspended his knife, tobacco-pouch, pipe, and a few useful tools.

Hobson was right. The man before him was a Frenchman, or at least a descendant of the French Canadians,
perhaps an agent of the American Company come to act as a spy on the settlers in the fort. The other four Canadians
wore a costume resembling that of their leader, but of coarser materials.

The Frenchman bowed politely to Mrs Barnett, and the Lieutenant was the first to break the silence, during
which he had not removed his eyes from his rival's face.

"This fox is mine, sir," he said quietly.

"It is if you killed it!" replied the other in good English, but with a slightly foreign accent.

"Excuse me, sir," replied Hobson rather sharply, "it is mine in any case."

The stranger smiled scornfully at this lofty reply, so exactly what he expected from an agent of the Hudson's
Bay Company, which claims supremacy over all the northern districts, from the Atlantic to the Pacific.

"Do you mean to say," he said at last, gracefully toying with his gun, "that you consider the Hudson’s Bay
Company mistress of the whole of North America?"

"Of course I do," said Hobson; "and if, as I imagine, you belong to an American company—

"To the St Louis Fur Company," replied the stranger with a bow.

"I think," added the Lieutenant, "that you will find it difficult to show the grants entitling you to any privileges
here."

"Grants! privileges!" cried the Canadian scornfully, "old world terms which are out of place in America!"

"You are not now on American but on English ground," replied the Lieutenant proudly.

"This is no time for such a discussion," said the hunter rather warmly. "We all know the old claims made by the
English in general, and the Hudson’s Bay Company in particular, to these hunting grounds; but I expect coming
events will soon alter this state of things, and America will be America from the Straits of Magellan to the North
Pole!"

"I do not agree with you," replied Hobson dryly.

"Well, sir, however that may be," said the Canadian, "let us suffer this international question to remain in
abeyance for the present. Whatever rights the Company may arrogate to itself, it is very clear that in the extreme
north of the continent, and especially on the coast, the territory belongs to whoever occupies it. You have founded a
factory on Cape Bathurst, therefore we will respect your domain, and you on your side will avoid ours, when the St
Louis fur-traders have established their projected fort at another point on the northern shore of America."

The Lieutenant frowned at this speech, for he well knew what complications would arise in the future when the
Hudson’s Bay Company would be compelled to struggle for supremacy with powerful rivals, and that quarrelling
and even bloodshed would ensue; he could not, however, but acknowledge that this was not the time to begin the
discussion, and he was not sorry when the hunter, whose manners, to tell the truth, were very polite, placed the
dispute on another footing.

"As for this present matter," said the Canadian, "it is of minor importance, and we must settle it according to the
rules of the chase. Our guns are of different calibre, and our balls can be easily distinguished; let the fox belong to
whichever of us really killed it."

The proposition was a fair one, and the body of the victim was examined accordingly. One ball had entered at
the side, the other at the heart; and the latter was from the gun of the Canadian.

"The fox is your property, sir," said Jaspar Hobson, vainly endeavouring to conceal his chagrin at seeing this
valuable spoil fall into the enemy's hands.

The Canadian took it, but instead of throwing it over his shoulder and carrying it off, he turned to Mrs Barnett,
and said " Ladies are fond of beautiful furs, and although, perhaps, if they knew better what dangers and difficulties have to be surmounted in order to obtain them, they might not care so much about them, they are not likely to refuse to wear them on that account, and I hope, madam, you will favour me by accepting this one in remembrance of our meeting."

Mrs Barnett hesitated for a moment, but the gift was offered with so much courtesy and kindliness of manner, that it would have seemed churlish to refuse, and she therefore accepted it with many thanks.

This little ceremony over, the stranger again bowed politely, and, followed by his comrades, quickly disappeared behind the rocks, whilst the Lieutenant and his party returned to Fort Good Hope. Hobson was very silent and thoughtful all the way; for he could not but feel that the existence of a rival company would greatly compromise the success of his undertaking, and lead to many future difficulties.

CHAPTER XVII.
THE APPROACH OF WINTER.

It was the 21st of September. The sun was then passing through the autumnal equinox, that is to say, the day and night were of equal length all over the world. These successive alternations of light and darkness were hailed with delight by the inhabitants of the fort. It is easier to sleep in the absence of the sun, and darkness refreshes and strengthens the eyes, weary with the unchanging brightness of several months of daylight.

We know that during the equinox the tides are generally at their greatest height; we have high water or flood, for the sun and moon being in conjunction, their double influence is brought to bear upon the waters. It was, therefore, necessary to note carefully the approaching tide at Cape Bathurst. Jaspar Hobson had made bench marks some days before, so as to estimate exactly the amount of vertical displacement of the waters between high and low tide; he found, however, that in spite of all the reports of previous observers, the combined solar and lunar influence was hardly felt in this part of the Arctic Ocean. There was scarcely any tide at all, and the statements of navigators on the subject were contradicted.

"There is certainly something unnatural here!" said Lieutenant Hobson to himself.

He did not in fact know what to think, but other cares soon occupied his mind, and he did not long endeavour to get to the rights of this singular peculiarity.

On the 29th September the state of the atmosphere changed considerably. The thermometer fell to 41° Fahrenheit, and the sky became covered with clouds which were soon converted into heavy rain. The bad season was approaching.

Before the ground should be covered with snow, Mrs Joliffe was busy sowing the seeds of Cochlearia (scurvy grass) and sorrel, in the hope that as they were very hardy, and would be well protected from the rigour of the winter by the snow itself, they would come up in the spring. Her garden, consisting of several acres hidden behind the cliff of the cape, had been prepared beforehand, and it was sown during the last days of September.

Hobson made his companions assume their winter garments before the great cold set in, and all were soon suitably clothed in the linen under vests, deerskin cloaks, sealskin pantaloons, fur bonnets, and waterproof boots with which they were provided. We may also say that the rooms were suitably dressed; the wooden walls were hung with skins, in order to prevent the formation upon them of coats of ice in sudden falls of temperature. About this time, Rae set up his condensers for collecting the vapour suspended in the air, which were to be emptied twice a week. The heat of the stove was regulated according to the variations of the external temperature, so as to keep the thermometer of the rooms at 50° Fahrenheit. The house would soon be covered with thick snow, which would prevent any waste of the internal warmth, and by this combination of natural and artificial protections they hoped to be able successfully to contend with their two most formidable enemies, cold and damp.

On the 2nd October the thermometer fell still lower, and the first snow storm came on; there was but little wind, and there were therefore none of those violent whirlpools of snow called drifts, but a vast white carpet of uniform thickness soon clothed the cape, the enceinte of fort, and the coast. The waters of the lake and sea, not yet petrified by the icy hand of winter, were of a dull, gloomy, greyish hue, and on the northern horizon the first icebergs stood out against the misty sky. The blockade had not yet commenced, but nature was collecting her materials, soon to be cemented by the cold into an impenetrable barrier.

The " young ice " was rapidly forming on the liquid surfaces of sea and lake. The lagoon was the first to freeze over; large whitish-grey patches appeared here and there, signs of a hard frost setting in, favoured by the calmness of the atmosphere. and after a night during which the thermometer had remained at 15° Fahrenheit, the surface of the lake was smooth and firm enough to satisfy the most fastidious skaters of the Serpentine. On the verge of the horizon, the sky assumed that peculiar appearance which whalers call ice-blink, and which is the result of the glare of light reflected obliquely from the surface of the ice against the opposite atmosphere. Vast tracts of the ocean became gradually solidified, the ice-fields, formed by the accumulation of icicles, became welded to the coast, presenting a surface broken and distorted by the action of the waves, and contrasting strongly with the smooth
mirror of the lake. Here and there floated these long pieces, scarcely cemented together at the edges, known as "drift ice," and the "hummocks," or protuberances caused by the squeezing of one piece against another, were also of frequent occurrence.

In a few days the aspect of Cape Bathurst and the surrounding districts was completely changed. Mrs Barnett's delight and enthusiasm knew no bounds; everything was new to her, and she would have thought no fatigue or suffering too great to be endured for the sake of witnessing such a spectacle. She could imagine nothing more sublime than this invasion of winter with all its mighty forces, this conquest of the northern regions by the cold. All trace of the distinctive features of the country had disappeared; the land was metamorphosed, a new country was springing into being before her admiring eyes, a country gifted with a grand and touching beauty. Details were lost, only the large outlines were given, scarcely marked out against the misty sky. One transformation scene followed another with magic rapidity. The ocean, which but lately lifted up its mighty waves, was hushed and still; the verdant soil of various hues was replaced by a carpet of dazzling whiteness; the woods of trees of different kinds were converted into groups of gaunt skeletons draped in hoar-frost; the radiant orb of day had become a pale disc, languidly running its allotted course in the thick fog, and visible but for a few hours a day, whilst the sea horizon, no longer clearly cut against the sky, was hidden by an endless chain of ice-bergs, broken into countless rugged forms, and building up that impenetrable ice-wall, which Nature has set up between the Pole and the bold explorers who endeavour to reach it.

We can well understand to how many discussions and conversations the altered appearance of the country gave rise. Thomas Black was the only one who remained indifferent to the sublime beauty of the scene. But what could one expect of an astronomer so wrapped up in his one idea, that he might be said to be present in the little colony in the body, but absent in spirit? He lived in the contemplation of the heavenly bodies, passing from the examination of one constellation to that of another, roving in imagination through the vast realms of space, peopled by countless radiant orbs, and fuming with rage when fogs or clouds hid the objects of his devotion from his sight. Hobson consoled him by promising him fine cold nights admirably suited to astronomical observations, when he could watch the beautiful Aurora Borealis, the lunar halos, and other phenomena of Polar countries worthy even of his admiration.

The cold was not at this time too intense; there was no wind, and it is the wind which makes the cold so sharp and biting. Hunting was vigorously carried on for some days. The magazines became stocked with new furs, and fresh stores of provisions were laid up. Partridges and ptarmigans on their way to the south passed over the fort in great numbers, and supplied fresh and wholesome meat. Polar or Arctic hares were plentiful, and had already assumed their white winter robes. About a hundred of these rodents formed a valuable addition to the reserves of the colony.

There were also large flocks of the whistling swan or hooper, one of the finest species of North America. The hunters killed several couples of them, handsome birds, four or five feet in entire length, with white plumage, touched with copper colour on the head and upper part of neck. They were on their way to a more hospitable zone, where they could find the aquatic plants and insects they required for food, and they sped through the air at a rapid pace, for it is as much their native element as water. Trumpeter swans, with a cry like the shrill tone of a clarion, which are about the same size as the hoopers, but have black feet and beaks, also passed in great numbers, but neither Marbre nor Sabine were fortunate enough to bring down any of them. However, they shouted out "au revoir" in significant tones, for they knew that they would return with the first breezes of spring and that they could then be easily caught. Their skin, plumage, and down, are all of great value, and they are therefore eagerly hunted. In some favourable years tens of thousands of them have been exported, fetching half a guinea a piece.

During these excursions, which only lasted for a few hours, and were often interrupted by bad weather, packs of wolves were often met with. There was no need to go far to find them, for, rendered bold by hunger, they already ventured close to the factory. Their scent is very keen, and they were attracted by the smell from the kitchen. During the night they could be heard howling in a threatening manner. Although not dangerous individually, these carnivorous beasts are formidable in packs, and the hunters therefore took care to be well armed when they went beyond the enceinte of the fort.

The bears were still more aggressive. Not a day passed without several of these animals being seen. At night they would come close up to the enclosure, and sane were even wounded with shot, but got off, staining the snow with their blood, so that up to October 10th not one had left its warm and valuable fur in the hands of the hunters. Hobson would not have them molested, rightly judging that with such formidable creatures it was best to remain on the defensive, and it was not improbable that, urged on by hunger, they might attack Fort Hope before very long. Then the little colony could defend itself, and provision its stores at the same time.

For a few days the weather continued dry and cold, the surface of the snow was firm and suitable for walking, so that a few excursions were made without difficulty along the coast on the south of the fort. The Lieutenant was

to the postern, the shed, and the stable of the dogs and rein-deer. Excursions became more and more rare, and it was impossible to walk without snow-shoes.

When the snow has become hardened by frost, it easily sustains the weight of a man; but when it is soft and yielding, and the unfortunate pedestrian sinks into it up to his knees, the snow-shoes used by Indians are invaluable.

Lieutenant Hobson and his companions were quite accustomed to walk in them, and could glide about over the snow as rapidly as skaters on ice; Mrs Barnett had early practised wearing them, and was quite as expert in their use as the rest of the party. The frozen lake as well as the coast was scoured by these indefatigable explorers, who were even able to advance several miles from the shore on the solid surface of the ocean now covered with ice several feet thick. It was, however, very tiring work, for the ice-fields were rugged and uneven, strewn with piled-up ridges of ice and hummocks which had to be turned. Further out a chain of icebergs, some five hundred feet high, barred their progress. These mighty icebergs, broken into fantastic and picturesque forms, were a truly magnificent spectacle. Here they looked like the whitened ruins of a town with curtains battered in, and monuments and columns overthrown; there like some volcanic land torn and convulsed by earthquakes and eruptions; a confusion of glaciers and glittering ice-peaks with snowy ramparts and buttresses, valleys, and crevasses, mountains and hillocks, tossed and distorted like the famous Alps of Switzerland. A few scattered birds, petrels, guillemots, and puffins, lingering behind their fellows, still enlivened the vast solitude with their piercing cries; huge white bears roamed about amongst the hummocks, their dazzling coats scarcely distinguishable from the shining ice-true there was enough to interest and excite our adventurous lady traveller, and even Madge, the faithful Madge, shared the enthusiasm of her mistress. How far, how very far, were both from the tropic zones of India or Australia!

The frozen ocean was firm enough to have allowed of the passage of a park of artillery, or the erection of a monument, and many were the excursions on its surface until the sudden lowering of the temperature rendered all exertion so exhausting that they had to be discontinued. The pedestrians were out of breath after taking a few steps, and the dazzling whiteness of the glittering snow could not be endured by the naked eye; indeed, the reverberation or flickering glare of the undulatory reflection of the light from the surface of the snow, has been known to cause several cases of blindness amongst the Esquimaux.

A singular phenomenon due to the refraction of rays of light was now observed: distances, depths, and heights lost their true proportions, five or six yards of ice looked like two, and many were the falls and ludicrous results of this optical illusion.

On October 14th the thermometer marked 3° Fahrenheit below zero, a severe temperature to endure, especially when the north wind blows strongly. The air seemed to be made of needles, and those who ventured out of the house were in great danger of being frost-bitten, when death or mortification would ensue if the suspended circulation of the blood were not restored by immediate friction with snow. Garry, Belcher, Hope, and other members of the little community were attacked by frost-bite, but the parts affected being rubbed in time they escaped without serious injury.

It will readily be understood that all manual labour had now become impossible. The days were extremely short, the sun was only above the horizon for a few hours and the actual winter, implying entire confinement within doors, was about to commence. The last Arctic birds forsook the gloomy shores of the Polar Sea, only a few pairs of those speckled quails remained which the Indians appropriately call "winter birds," because they wait in the Arctic regions until the commencement of the Polar night, but they too were soon to take their departure.

Lieutenant Hobson, therefore, urged on the setting of the traps and snares which were to remain in different parts of Cape Bathurst throughout the winter.

These traps consisted merely of rough joists supported on a square, formed of three pieces of wood so balanced as to fall on the least touch-in fact, the same sort of trap as that used for snaring birds in fields on a large scale. The end of the horizontal piece of wood was baited with venison, and every animal of a moderate height, a fox or a marten, for instance, which touched it with its paw, could not fail to be crushed. Such were the traps set in the winter over a space of several miles by the famous hunters whose adventurous life has been so poetically described by Cooper. Some thirty of these snares were set round Fort Hope, and were to be visited at pretty frequent intervals.

On the 12th November a new member was born to the little colony. Mrs Mac-Nab was safely confined of a fine healthy boy, of whom the head carpenter was extremely proud. Mrs Barnett stood god-mother to the child, which received the name of Michael Hope. The ceremony of baptism was performed with considerable solemnity, and a
kind of fête was held in honour of the little creature which had just come into the world beyond the 70th degree N. Lat.

A few days afterwards, on November 20th, the sun sunk below the horizon not to appear again for two months. The Polar night had commenced!

CHAPTER XVIII.

THE POLAR NIGHT.

The long night was ushered in by a violent storm. The cold was perhaps a little less severe, but the air was very damp, and, in spite of every precaution, the humidity penetrated into the house, and the condensers, which were emptied every morning, contained several pounds of ice.

Outside drifts whirled past like waterspouts—the snow seemed no longer to fall horizontally but vertically. The Lieutenant was obliged to insist upon the door being kept shut, for had it been opened the passages would immediately have become blocked up. The explorers were literally prisoners.

The window shutters were hermetically closed, and the lamps were kept burning through the long hours of the sleepless night.

But although darkness reigned without, the noise of the tempest replaced the silence usually so complete in these high latitudes. The roaring of the wind between the house and the cliff never ceased for a moment, the house trembled to its foundations, and had it not been for the solidity of its construction, must have succumbed to the violence of the hurricane. Fortunately the accumulation of snow round the walls broke the force of the squall, and Mac-Nabs only fear was for the chimneys, which were liable to be blown over. However, they remained firm, although they had constantly to be freed from the snow which blocked up the openings.

In the midst of the whistling of the wind, loud reports were heard, of which Mrs Barnett could not conjecture the cause. It was the falling of icebergs in the offing. The echoes caught up the sounds, which were rolled along like the reverberations of thunder. The round shook as the ice-fields split open, crushed by the falling of these mighty mountains, and none but those thoroughly inured to the horrors of these wild rugged climates could witness these strange phenomena without a shudder. Lieutenant Hobson and his companions were accustomed to all these things, and Mrs Barnett and Madge were gradually becoming so, and were, besides, not altogether unfamiliar with those terrible winds which move at the rate of forty miles an hour, and overturn twenty-four pounders. Here, however, the darkness and the snow aggravated the dread might of the storm; that which was not crushed was buried and smothered, and, probably twelve hours after the commencement of the tempest, house, kennel, shed, and enceinte would have disappeared beneath a bed of snow of uniform thickness.

The time was not wasted during this long imprisonment. All these good people agreed together perfectly, and neither ill-humour nor ennui marred the contentment of the little party shut up in such a narrow space. They were used to life under similar conditions at Forts Enterprise and Reliance, and there was nothing to excite Mrs Barnett’s surprise in their ready accommodation of themselves to circumstances.

Part of the day was occupied with work, part with reading and games. Garments had to be made and mended, arms to be kept bright and in good repair, boots to be manufactured, and the daily journal to be issued in which Lieutenant Hobson recorded the slightest events of this northern wintering—the weather, the temperature, the direction of the wind, the appearance of meteors so frequent in the Polar regions, &c., &c. Then the house had to be kept in order, the rooms must be swept, and the stores of furs must be visited every day to see if they were free from damp; the fires and stoves, too, required constant superintendence, and perpetual vigilance was necessary to prevent the accumulation of particles of moisture in the corners.

To each one was assigned a task, the duty of each one was laid down in rules fixed up in the large room, so that without being overworked, the occupants of the fort were never without something to do. Thomas Black screwed and unscrewed his instruments, and looked over his astronomical calculations, remaining almost always shut up in his cabin, fretting and fuming at the storm which prevented him from making nocturnal observations. The three married women had also plenty to see to: Mrs Mac-Nab busied herself with her baby who got on wonderfully, whilst Mrs Joliffe, assisted by Mrs Rae, and with the Corporal always at her heels, presided in the kitchen.

When work was done the entire party assembled in the large room, spending the whole of Sunday together. Reading was the chief amusement. The Bible and some books of travels were the whole library of the fort; but they were all the good folks required. Mrs Barnett generally read aloud, and her audience listened with delight. The Bible and accounts of adventures received a fresh charm when read out in her clear earnest voice; her gestures were so expressive that imaginary persons seemed to live when she spoke of them, and all were glad when she took up the book. She was, in fact, the life and soul of the little community, eager alike to give and receive instruction; she combined the charm and grace of a woman with the energy of a man, and she consequently became the idol of the rough soldiers, who would have willingly laid down their lives in her service. Mrs Barnett shared everything with her companions, never holding herself aloof or remaining shut up in her cabin, but working zealously amongst the
The storm, however, showed no signs of abating. The party had now been confined to the house for three days, and the snow-drifts were as wild and furious as ever. Lieutenant Hobson began to get anxious. It was becoming imperatively necessary to renew the air of the rooms, which was too much charged with carbonic acid. The light of the lamps began to pale in the unhealthy atmosphere, and the air-pumps would not act, the pipes being choked up with ice; they were not, in fact, intended to be used when the house was buried in snow. It was necessary to take counsel; the Lieutenant and Sergeant Long put their heads together, and it was decided on November 23d that, as the wind beat with rather less violence on the front of the house, one of the windows at the end of the Passage on that side should be opened.

This was no light matter. It was easy enough to open the window from inside, but the shutter outside was encrusted over with thick lumps of ice, and resisted every effort to move it. It had to be taken off its hinges, and the hard mass of snow was then attacked with pickaxe and shovel; it was at least ten feet thick, and it was not until a kind of channel had been scooped out that the outer air was admitted.

Hobson, the Sergeant, several soldiers, and Mrs Barnett herself ventured to creep through this tunnel or channel, but not without considerable difficulty, for the wind rushed in with fearful fury.

What a scene was presented by Cape Bathurst and the surrounding plain. It was mid-day, and but a few faint twilight rays glimmered upon the southern horizon. The cold was not so intense as one would have supposed, and the thermometer marked only 15° Fahrenheit above zero; but the snow-drifts whirled along with terrific force, and all would inevitably have been thrown to the ground, had not the snow in which they were standing up to their waists helped to sustain them against the gusts of wind. Everything around them was white, the walls of the enceinte, and the whole of the house even to the roof were completely covered over, and nothing but a few blue wreaths of smoke would have betrayed the existence of a human habitation to a stranger.

Under the circumstances the "promenade" was soon over; but Mrs Barnett had made good use of her time, and would never forget the awful beauty of the Polar regions in a snow-storm, a beauty upon which few women had been privileged to look.

A few moments sufficed to renew the atmosphere of the house, and all unhealthy vapours were quickly dispersed by the introduction of a pure and refreshing current of air.

The Lieutenant and his companions hurried in, and the window was again closed; but after that the snow before it was removed every day for the sake of ventilation.

The entire week passed in a similar manner; fortunately the rein-deer and dogs had plenty of food, so that there was no need to visit them. The eight days during which the occupants of the fort were imprisoned so closely, could not fail to be somewhat irksome to strong men, soldiers and hunters, accustomed to plenty of exercise in the open air; and we must own that listening to reading aloud gradually lost its charm, and even cribbage became uninteresting. The last thought at night was a hope that the tempest might have ceased in the morning, a hope disappointed every day. Fresh snow constantly accumulated upon the windows, the wind roared, the icebergs burst with a crash like thunder, the smoke was forced back into the rooms, and there were no signs of a diminution of the fury of the storm.

At last, however, on the 28th November the Aneroid barometer in the large room gave notice of an approaching change in the state of the atmosphere. It rose rapidly, whilst the thermometer outside fell almost suddenly to less than four degrees below zero. These were symptoms which could not be mistaken, and on the 29th November the silence all around the fort told that the tempest had ceased.

Every one was eager to get out, time confinement had lasted long enough. The door could not be opened, and all had to get through the window, and clear away the fresh accumulation of snow; this time, however, it was no soft mass they had to remove, but compact blocks of ice, which required pick-axes to break them up.

It took about half-an-hour to clear a passage, and then every one in the fort, except Mrs Mac-Nab, who was not yet up, hastened into the interior court, glad once more to be able to walk about.

The cold was still intense, but the wind having given down it was possible to endure it, although great care was necessary to escape serious consequences on leaving the heated rooms for the open air, the difference between the temperature inside and outside being some fifty-four degrees.

It was eight o’clock in the morning. Myriads of brilliant constellations studded the sky, and at the zenith shone the Pole star. Although in both hemispheres there are in reality but 5000 fixed stars visible to the naked eye, their number appeared to the observers incalculable. Exclamations of admiration burst involuntarily from the lips of the delighted astronomer as he gazed into the cloudless heavens, once more undimmed by mists or vapours. Never had a more beautiful sky been spread out before the eyes of an astronomer.

Whilst Thomas Black was raving in ecstasy, dead to all terrestrial matters, his companions had wandered as far
as the enceinte. The snow was as bard as a rock, And so slippery that there were a good many tumbles, but no serious injuries.

It is needless to state that the court of the fort was completely filled up. The roof of the house alone appeared above the white mass, the surface of which had been worn smooth by the action of the wind; of the palisade nothing was visible but the top of the stakes, and the least nimble of the wild animals they dreaded could easily have climbed over them. But what was to be done? It was no use to think of clearing away a mass of frozen snow ten feet thick, extending over so large an extent of ground. All they could attempt would be to dig away the ice inside the enceinte, so as to form a kind of moat, the countervall of which would protect the palisade. But alas the winter was only beginning, and a fresh tempest might at any time fill in the ditch a few hours.

Whilst the Lieutenant was examining the works, which could no more protect his fort than a single sunbeam could melt the solid layer of snow,-Mrs Joliffe suddenly exclaimed:

"And our dogs! our reindeer!"

It was indeed time to think about the poor animals. The dog house and stable being lower than the house were probably entirely covered, and the supply of air had perhaps been completely cut off. Some hurried to the dog-house, others to the reindeer stable, and all fears were quickly dispelled. The wall of ice, which connected the northern corner of the house with the cliff, had partly protected the two buildings, and the snow round them was not more than four feet thick, so that the apertures left in the walls had not been closed up. The animals were all well, and when the door was opened, the dogs rushed out barking with delight.

The cold was so intense, that after an hour’s walk every one began to think of the glowing stove in the large room at home. There was nothing left to be done outside, the traps buried beneath ten feet of snow could not be visited, so all returned to the house, the window, was closed, and the party sat down to the dinner awaiting them with sharpened appetites.

We can readily imagine that the conversation turned on the intensity of the cold, which had so rapidly converted the soft snow into a solid mass. It was no light matter, and might to a certain extent compromise the safety of the little colony.

"But, Lieutenant," said Mrs Barnett, "can we not count upon a few days’ thaw-will not all this snow be rapidly converted into water?"

"Oh no, madam," replied Hobson, "a thaw at this time of year is not at all likely. Indeed I expect the thermometer will fall still lower, and it is very much to be regretted that we were unable to remove the snow when it was soft."

What, you think the temperature likely to become much colder?"
"I do most certainly, madam, 4° below zero-what is that at this latitude?"

"What would it be if we were at the Pole itself?"

"The Pole, madam, is probably not the coldest point of the globe, for most navigators agree that the sea is there open. From certain peculiarities of its geographical position it would appear that a certain spot on the shores of North Georgia, 95° longitude and 78° latitude, has the coldest mean temperature in the world: 2° below zero all the year round. It is, therefore, called the ‘pole of cold.’ "

"But," said Mrs Barnett, "we are more than 8° further south than that famous point."

"Well, I don’t suppose we shall suffer as much as at Cape Bathurst as we might have done in North Georgia. I only tell you of the ‘pole of cold,’ that you may not confound it with the Pole properly so-called when the lowness of the temperature is discussed. Great cold has besides been experienced on other points of the globe. The difference is, that the low temperature is not there maintained."

"To what places do you allude?" inquired Mrs Barnett; "I assure you I take the greatest interest in this matter of degrees of cold."

"As far as I can remember, madam," replied the Lieutenant, Arctic explorers state that at Melville Island the temperature fell to 61° below zero, and at Port Felix to 65°."

"But Melville Island and Port Felix are some degrees farther north latitude than Cape Bathurst, are they not?"

"Yes, madam, but in a certain sense we may say that their latitude proves nothing. A combination of different atmospheric conditions is requisite to produce intense cold. Local and other causes largely modify climate. If I remember rightly in 1845… Sergeant Long, you were at Fort Reliance at that date?"

"Yes, sir," replied Long.

"Well, was it not in January of that year that the cold was so excessive?"

"Yes it was, I remember only too well that the thermometer marked 70° below zero."

"What!" exclaimed Mrs Barnett, "at Fort Reliance, on the Great Slave Lake?"

"Yes, madam," replied the Lieutenant, "and that was at 65° north latitude only, which is the same parallel as that of Christiania and St Petersburg."
"Then we must be prepared for everything."
"Yes, indeed, we must when we winter in Arctic countries."

During the 29th and 30th November, the cold did not decrease, and it was necessary to keep up huge fires to prevent the freezing in all the corners of the house of the moisture in the atmosphere. Fortunately there was plenty of fuel, and it was not spared. A mean temperature of 52° Fahrenheit was maintained indoors in spite of the intensity of the cold without.

Thomas Black was so anxious to take stellar observations, now that the sky was so clear, that he braved the rigour of the outside temperature, hoping to be able to examine some of the magnificent constellations twinkling on the zenith. But he was compelled to desist—his instruments "burnt" his hands! "Burnt" is the only word to express the sensation produced by touching a metallic body subjected to the influence of intense cold. Exactly similar results are produced by the sudden introduction of heat into an animate body, and the sudden withdrawal of the same from it, as the astronomer found to his cost when he left the skin of his fingers on his instruments. He had to give up taking observations.

However, the heavens made him the best amends in their power by displaying the most beautiful and indescribable phenomena of a lunar halo and an Aurora Borealis.

The lunar halo was a white corona with a pale red edge encircling the moon. This luminous meteor was about forty-five degrees in diameter, and was the result of the diffraction of the lunar rays through the small prismatic ice-crystals floating in the atmosphere. The queen of the night shone with renewed splendour and heightened beauty from the centre of the luminous ring, the colour and consistency of which resembled the milky transparent lunar rainbows which have been so often described by astronomers.

Fifteen hours later the heavens were lit up by a magnificent Aurora Borealis, the arch of which extended over more than a hundred geographical degrees. The vertex of this arch was situated in the magnetic meridian, and, as is often the case, the rays darted by the luminous meteor were of all the colours of the rainbow, red preponderating. Here and there, the stars seemed to be floating in blood Glowing lines of throbbing colour spread from the dark segment on the horizon, some of them passing the zenith and quenching the light of the moon in their electric waves, which oscillated and trembled as if swept by a current of air.

No description could give an adequate idea of the glory which flushed the northern sky, converting it into a vast dome of fire, but after the magnificent spectacle had been enjoyed for about half an hour, it suddenly disappeared—not fading gradually away after concentration of its rays, or a diminution of its splendour, but dying abruptly, as if an invisible hand had cut off the supply of electricity which gave it life.

It was time it was over, for the sake of Thomas Black, for in another five minutes he would have been frozen where he stood!

CHAPTER XIX.
A NEIGHBOURLY VISIT.

On the 2nd December; the intensity of the cold decreased. The phenomena of the lunar halo and Aurora Borealis were symptoms which a meteorologist would have been at no loss to interpret. They implied the existence of a certain quantity of watery vapour in the atmosphere, and the barometer fell slightly, whilst the thermometer rose to 15° above zero.

Although this temperature would have seemed very cold to the inhabitants of a temperate zone, it was easily endured by the colonists. The absence of wind made a great difference, and Hobson having noticed that the upper layers of snow were becoming softer, ordered his men to clear it away from the outer approaches of the enceinte. Mac-Nab and his subordinates set to work zealously, and completed their task in a few days. The traps were now uncovered and re-set. A good many footprints showed that there were plenty of furred animals about the cape, and as they could not get any other food, it was probable that the bait in the snares would soon attract them. In accordance with the advice of Marbre the hunter, a reindeer trap was constructed in the Esquimaux style. A trench was dug twelve feet deep, and of a uniform width of ten feet. A see-saw plank, which would rebound when lowered, was laid across it. A bait of herbs was placed at one end of the plank, and any animal venturing to take them, was inevitably flung to the bottom of the pit, and the plank immediately returning to its former position, would allow of the trapping of another animal in the same manner. Once in, there was no getting out. The only difficulty Marbre had to contend with in making his trap, was the extreme hardness of the ground to be dug out, but both he and the Lieutenant were not a little surprised at finding beneath some five feet of earth and sand a bed of snow, as hard as a rock, which appeared to be very thick.

After closely examining the geological structure of the ground, Hobson observed:
"This part of the coast must have been subjected to intense cold for a considerable length of time a great many years ago. Probably the ice rests on a bed of granite, and the earth and sand upon it have accumulated gradually."
"Well, sir, our trap won't be any the worse for that, the reindeer will find a slippery wall, which it will be
impossible for them to climb."

Marbre was right, as the event proved.

On the 5th September, he and Sabine were on their way to the trench, when they heard loud growls. They stood still and listened.

"It's no reindeer making that noise," said Marbre, "I know well enough what creature has fallen into our pit."

"A bear?" replied Sabine.

"Yes," said Marbre, whose eyes glistened with delight.

"Well," remarked Sabine, "we won't grumble at that, bears' steaks are as good as reindeers', and we get the fur in! Come along."

The two hunters were armed. They quickly slipped balls into their guns, which were already loaded with lead, and hurried to the trap. The see-saw plank had swung back into its place, but the bait had disappeared, having probably been dragged down, into the trench. The growls became louder and fiercer, and looking down the hunters saw that it was indeed a bear they had taken. A huge mass was huddled together in one corner of the pit, looking in the gloom like a pile of white fur with two glittering eyes. The sides of the trench had been ploughed up by the creature's sharp claws, and had they been made of earth instead of ice, it would certainly have managed to scramble out, but it could get no hold on the slippery surface, and it had only managed to enlarge its prison, not to escape from it.

Under the circumstances the capture was easy. Two balls carefully aimed put an end to the bear's life, and the next thing to do was to get it out of the pit. The two hunters returned to the fort for reinforcements, and ten of the soldiers, provided with ropes, returned with them. It was not without considerable difficulty that the body was hauled up. It was a huge creature, six feet long, weighing six hundred pounds, and must have possessed immense strength. It belonged to the sub-order of white bears, and had the flattened head, long neck, short and slightly curved claws, narrow muzzle, and smooth white fur characteristic of the species. The edible portions of this valuable animal were confided to Mrs Joliffe, and b her carefully prepared for the table.

The next week the traps were in full activity. Some twenty martens were taken, in all the beauty of their winter clothing, but only two or three foxes. These cunning creatures divined the snare laid for them, and scratching up the ground near the trap, they often managed to run off with the bait without being caught. This made Sabine beside himself with rage for," he said, "such a subterfuge was unworthy of a respectable fox."

About the 10th December, the wind having veered round to the south-west, the snow again began to fall, but not in thick flakes, or in large quantities. The wind being high, however, the cold was severely felt, and it was necessary to settle in-doors again, and resume domestic occupations. Hobson distributed lime lozenges and lime juice to every one as a precaution against the scorbutic affections, which damp cold produces. No symptoms of scurvy had fortunately as yet appeared amongst the occupants of the fort, thanks to the sanitary precautions taken.

The winter solstice was now approaching, when the darkness of the Polar night would be most profound, as the sun would be at the lowest maximum point below the horizon of the northern hemisphere. At midnight the southern edges of the long white plains were touched with a faint glimmer of twilight, that was all, and it would be impossible to imagine anything more melancholy than the gloomy stillness and darkness of the vast expanse.

Hobson felt more secure from the attacks of wild beasts, now that the approaches to the enceinte had been cleared of snow, which was a fortunate circumstance, as ominous growlings were heard, the nature of which no one could mistake.

There was no fear of visits from Indian hunters or Canadians at this time of year, but an incident occurred proving that these districts were not altogether depopulated even in the winter, and which was quite an episode in the long dreary dark months. Some human beings still lingered on the coast hunting morses and camping under the snow. They belonged to the race of Esquimaux, °` or eaters of raw flesh," which is scattered over the continent of North America, from Baffin's Bay to Behring Strait, seldom, however, advancing farther south than the Great Slave Lake.

On the morning of the 14th December, or rather nine hours before midday, Sergeant Long, on his return from an excursion along the coast, ended his report to the Lieutenant by saying, that if his eyes had not deceived him, a tribe of nomads were encamped about four miles from the fort, near a little cape jutting out from the coast.

"What do you suppose these nomads are?" inquired Hobson.

"Either men or morses," replied the Sergeant. "There's no medium!"

The brave Sergeant would have been considerably surprised if any one had told him that some naturalists admit the existence of the "medium," the idea of which he scouted; and certain savants have with some humour classed the Esquimaux as an "intermediate species" between roan and the sea-cow.

Lieutenant Hobson, Mrs Barnett, Madge, and a few others at once went to ascertain the truth of the report. Well wrapt up, and on their guard against a sudden chill, their feet cased in furred boots, and guns and hatchets in their
hands, they issued from the postern, and made their way over the frozen snow along the coast, strewn with masses of ice.

The moon, already in the last quarter, shed a few faint rays through the mists which shrouded the ice-fields. After marching for about an hour, the Lieutenant began to think that the Sergeant had been mistaken, and that what he had seen were morses, who had returned to their native element through the holes in the ice which they always keep open.

But Long, pointing to a grey wreath of smoke curling out of a conical protuberance on the ice-field some hundred steps off, contented himself with observing quietly—

"The morses are smoking, then!"

As he spoke some living creatures came out of the but dragging themselves along the snow. They were Esquimaux, but whether male or female none but a native could have said, for their costumes were all exactly alike.

Indeed, without in the least sharing the opinion of the naturalist quoted above, any one might have taken the rough shaggy figures for seals or some other amphibious animals. There were six of them—four full-grown, and two children. Although very short, they were broad-chested and muscular. They had the flat noses, long eye-lashes, large mouths, thick lips, long black coarse hair, and beardless chins of their race. Their costume consisted of a round coat made of the skin of the walrus, a hood, boots, trousers, and mittens of the same material. They gazed at the Europeans in silence.

"Does any one understand Esquimaux?" inquired the Lieutenant.

No one was acquainted with that idiom, and every one started when a voice immediately exclaimed in English, "Welcome! welcome!"

It was an Esquimaux, and, as they learned later, a woman, who, approaching Mrs Barnett, held out her hand.

The lady, much surprised, replied in a few words, which the native girl readily understood, and the whole family was invited to follow the Europeans to the fort.

The Esquimaux looked searchingly at the strangers, and after a few moments’ hesitation they accompanied the Lieutenant, keeping close together, however:

Arrived at the enceinte, the native woman, seeing the house, of the existence of which she had had no idea, exclaimed—

"House! snow-house!"

She asked if it were made of snow, which was a natural question enough, for the house was all but hidden beneath the white mass which covered the ground. She was made to understand that it was built of wood; she then turned and said a few words to her companions, who made signs of acquiescence, and they all passed through the postern, and were taken to the large room in the chief building.

They removed their hoods, and it became possible to distinguish sexes. There were two men, about forty or fifty years old, with yellowish-red complexions, sharp teeth, and projecting cheek-bones, which gave them something of the appearance of carnivorous animals; two women, still young whose matted hair was adorned with the teeth and claws of Polar bears; and two children, about five or six years old, poor little creatures with intelligent faces, who looked about them with wide wondering eyes.

"I believe the Esquimaux are always hungry," said Hobson, "so I don’t suppose our guests would object to a slice of venison."

In obedience to the Lieutenant’s order, Joliffe brought some reindeer-venison, which the poor creatures devoured with greedy avidity; but the young woman who had answered in English behaved with greater refinement, and watched Mrs Barnett and the women of the fort without once removing her eyes from them. Presently noticing the baby in Mrs Mac-Nab’s arms; she rose and ran up to it, speaking to it in a soft voice, and caressing it tenderly.

Indeed if not exactly superior, the young girl was certainly more civilised than her companions, which was especially noticeable when, being attacked by a slight fit of coughing, she put her hand before her mouth in the manner enjoined by the first rules of civilised society.

This significant gesture did not escape any one, and Mrs Barnett, who chatted for some time with the Esquimaux woman, learned from her in a few short sentences that she had been for a year in the service of the Danish governor of Upper Navik, whose wife was English, and that she had left Greenland to follow her family to the hunting grounds. The two men were her brothers; the other woman was her sister-in-law, married to one of the men, and mother of the two children. They were all returning from Melbourne Island, on the eastern coast of English America, and were making for Point Barrow, on the western coast of Russian America, the home of their tribe, and—were considerably astonished to find a factory established on Cape Bathurst. Indeed the two men shook their heads when they spoke of it. Did they disapprove of the construction of a fort at this particular point of the coast? Did they think the situation ill-chosen? In spite of all his endeavours, Hobson could get no satisfactory reply to these questions, or rather he could not understand the answers he received.
The name of the young girl was Kalumah, and she seemed to have taken a great fancy to Mrs Barnett. But sociable as she was, she appeared to feel no regret at having left the governor of Upper Navik, and to be sincerely attached to her relations.

After refreshing themselves with the reindeer-venison, and drinking half-a-pint of rum, in which the children had their share, the Esquimaux took leave of their hosts; but before saying goodbye, the young girl invited Mrs Barnett to visit their snow-hut, and the lady promised to do so the next day, weather permitting.

The next day was fine, and accompanied by Madge, Lieutenant Hobson, and a few soldiers, well armed in case any bears should be prowling about, Mrs Barnett set out for " Cape Esquimaux," as they had named the spot where the little colony had encamped.

Kalumah hastened forward to meet her friend of yesterday, and pointed to the but with an air of pride. It was a large cone of snow, with an opening in the summit, through which the smoke from the fire inside made its way. These snow-houses, called igloos in the language of the Esquimaux, are constructed with great rapidity, and are admirably suited to the climate. In them their owners can endure a temperature 40° below zero, without fires, and without suffering much. In the summer the Esquimaux encamp in tents made of seal and reindeer skins, which are called tupics.

It was no easy matter to get into this hut. The only opening was a hole close to the ground, and it was necessary to creep through a kind of passage three or four feet long, which is about the thickness of the walls of these snow-houses. But a traveller by profession, a laureate of the Royal Society, could not hesitate, and Mrs Paulina Barnett did not hesitate! Followed by Madge, she bravely entered the narrow tunnel in imitation of her guide. Lieutenant Hobson and his men dispensed with paying their respects inside.

And Mrs Barnett soon discovered that the chief difficulty was not getting into the hut, but remaining in it when there. The room was heated by a fire, on which the bones of morses were burning; and the air was full of the smell of the fetid oil of a lamp, of greasy garments, and the flesh of the amphibious animals which form the chief article of an Esquimaux’s diet. It was suffocating and sickening! Madge could not stand it, and hurried out at once, but Mrs Barnett, rather than hurt the feelings of the young native, showed superhuman courage, and extended her visit over five long minutes!-five centuries! The two children and their mother were at home, but the men had gone to hunt morses four or five miles from their camp.

Once out of the hut, Mrs Barnett drew a long sigh of relief, and the colour returned to her blanched cheeks.

"Well, madam," inquired the Lieutenant, "what do you think of Esquimaux houses?"

"The ventilation leaves something to be desired!" she replied simply.

The interesting native family remained encamped near Cape Esquimaux for eight days. The men passed twelve hours out of every twenty-four hunting morses. With a patience which none but sportsmen could understand, they would watch for the amphibious animals near the holes through which they come up to the surface of the ice-field to breathe. When the morse appears, a rope with a running noose is flung round its body a little below the head, and it is dragged on to the ice-field, often with considerable difficulty, and killed with hatchets. It is really more like fishing than bunting. It is considered a great treat to drink the warm blood of the walrus, and the Esquimaux often indulge in it to excess.

Kalumah came to the fort every day in spite of the severity of the weather. She was never tired of going through the different rooms, and watching Mrs Joliffe at her cooking or sewing. She asked the English name of everything, and talked for hours together with Mrs Barnett, if the term “talking” can be applied to an exchange of words after long deliberation on both sides. When Mrs Barnett read aloud, Kalumah listened with great attention, although she probably understood nothing of what she heard.

The young native girl had a sweet voice, and sometimes sang some strange melancholy rhythmical songs with a peculiar metre, and, if we may so express it, a frosty ring about them, peculiarly characteristic of their origin.

Mrs Barnett had the patience to translate one of these Greenland sagas, which was sung to a sad air, interspersed with long pauses, and filled with strange intervals, which produced an indescribable effect. We give an English rendering of Mrs Barnett’s translation, which may give a faint idea of this strange hyperborean poetry.

GREENLAND SONG
Dark Is the sky,
The sun sinks wearily;
My trembling heart, with sorrow filled,
Aches drearily!
My sweet child at my songs is smiling still,
While at his tender heart the icicles lie chill.
Child of my dreams I
Thy love doth cheer me;
The cruel biting frost I brave
But to be near thee!
Ah me, Ah me, could these hot tears of mine
But melt the icicles around that heart of thine!
Could we once more
Meet heart to heart,
Thy little hands close clasped in mine,
No more to part.
Then on thy chill heart rays from heaven above
Should fall, and softly melt it with the warmth of love!

On the 20th December the Esquimaux family came to take leave of the occupants of the fort. Kalumah was sorry to part with Mrs Barnett, who would gladly have retained her in her service, but the young native could not be persuaded to leave her own people; she promised, however, to return to Fort Hope in the summer.

Her farewell was touching. She presented Mrs Barnett with a copper ring, and received in exchange a necklace of black beads, which she immediately put on. Hobson gave the poor people a good stock of provisions, which they packed in their sledge; and after a few words of grateful acknowledgment from Kalumah, the whole party set out towards the west, quickly disappearing in the thick fogs on the shore.

CHAPTER XX.

MERCURY FREEZES.

A few days of dry calm weather favoured the operations of the hunters, but they did not venture far from the fort; the abundance of game rendered it unnecessary to do so, and Lieutenant Hobson could justly congratulate himself on having chosen so favourable a situation for the new settlement. A great number of furred animals of all kinds were taken in the traps, and Sabine and Marbre killed a good many Polar hares. Some twenty starving wolves were shot. Hunger rendered the latter animals aggressive, and bands of them gathered about the fort, filling the air with hoarse howls, and amongst the " hummocks " on the ice-fields sometimes prowled huge bears, whose movements were watched with great interest.

On the 25th December all excursions had again to be given up. The wind veered suddenly to the north, and the cold became exceedingly severe. It was impossible to remain out of doors without being frost-bitten. The Fahrenheit thermometer fell to 18° below zero, and the gale roared like a volley of musketry. Hobson took care to provide the animals with food enough to last several weeks.

Christmas Day, the day of home-gatherings so dear to the heart of all Englishmen, was kept with due solemnity. The colonists returned thanks to God for preserving them through so many perils; and the workmen, who had a holiday in honour of the day, afterwards assembled with their masters and the ladies round a well-filled board, on which figured two huge Christmas puddings.

In the evening a huge bowl of punch flamed in the centre of the table; the lamps were put out, and for a time the room was lighted only by the livid flames of the spirit, the familiar objects assuming strange fantastic forms. The spirits of the soldiers rose as they watched the flickering illumination, and their excitement was not lessened after imbibing some of the burning liquid.

But now the flames began to pale; bluish tongues still fitfully licked the plump sides of the national pudding for a few minutes, and then died away.

Strange to say, although the lamps had not been relit, the room did not become dark on the extinction of the flames. A bright red light was streaming through the window, which had passed unnoticed in the previous illumination.

The revellers started to their feet, and looked at each other in astonishment.
"A fire!" cried several.

But unless the house itself were burning, there could not be a fire anywhere near Cape Bathurst.

The Lieutenant rushed to the window, and at once understood the cause of the phenomenon. It was an eruption.

Indeed, above the western cliffs beyond Walruses’ Bay the horizon was on fire. The summits of the igneous hills, some miles from Cape Bathurst, could not be seen; but the sheaf of flame shot up to a considerable height, lighting up the whole country in a weird, unearthly manner.

"It is more beautiful than the Aurora Borealis!" exclaimed Mrs Barnett.

Thomas Black indignantly protested against this assertion. A terrestrial phenomenon more beautiful than a meteor! But no one was disposed to argue with him about it, for all hurried out, in spite of the bitter gale and biting cold, to watch the glorious spectacle of the flashing sheaf of flames standing out against the black background of the night sky.

Had not the mouths and ears of the party been cased in furs, they would have been able to hear the rumbling
noise of the eruption, and to tell each other of the impressions made upon them by this magnificent sight; but, as it was, they could neither speak nor hear. They might well be content, however, with gazing upon such a glorious scene—a scene which once looked upon could never be forgotten. The glowing sheets of flames contrasted alike with the gloomy darkness of the heavens and the dazzling whiteness of the far-stretching carpet of snow, and produced effects of light and shade which no pen or pencil could adequately portray. The throbbing reverberations spread beyond the zenith, gradually quenching the light of all the stars. The white ground became dashed with golden tints, the hummocks on the ice-field and the huge icebergs in the background reflecting the glimmering colours like so many glowing mirrors. The rays of light, striking on the edges or surfaces of the ice, became bent and diffracted; the angles and varying inclinations on which they fell fretting them into fringes of colour, and reflecting them back with changed and heightened beauty. It was like a fairy scene in which ice and snow combined to add éclat to a mélée of rays in which luminous s waves rushed upon each other, breaking into coloured ripples.

But the excessive cold soon drove the admiring spectators back to their warm dwelling, and many a nose paid dearly for the feast enjoyed by the eyes.

During the following days the cold became doubly severe. The mercurial thermometer was of course no longer of any use for marking degrees, and an alcohol thermometer had to be used. On the night of the 28th to the 29th December the column fell to 32° below zero.

The stoves were piled up with fuel, but the temperature in the house could not be maintained above 20° degrees. The bedrooms were exceedingly cold, and ten feet from the stove, in the large room, its heat could not be felt at all. The little baby had the warmest corner, and its cradle was rocked in turn by those who came to the fire. Opening doors or windows was strictly forbidden, as the vapour in the rooms would immediately have been converted into snow, and in the passage the breathing of the inmates already produced that result. Every now and then dull reports were heard, which startled those unaccustomed to living in such high latitudes. They were caused by the cracking of the trunks of trees, of which the walls were composed under the influence of the intense cold. The stock of rum and gin stowed away in the garret had to be brought down into the sitting-room, as the alcohol was freezing and sinking to the bottom of the bottles. The spruce-beer made from a decoction of young fir-branchlets burst the barrels in which it was kept as it froze, whilst all solid bodies resisted the introduction of heat as if they were petrified.

Wood burnt very slowly, and Hobson was obliged to sacrifice some of the walrus-oil to quicken its combustion. Fortunately the chimneys drew well, so that there was no disagreeable smell inside, although for a long distance outside the air was impregnated with the fetid odour of the smoke from Fort Hope, which a casual observer might therefore have pronounced an unhealthy building.

The bedrooms were exceedingly cold, and ten feet from the stove, in the large room, its heat could not be felt at all. One symptom we must notice was the great thirst from which every one suffered. To relieve it, different liquids had to be melted at the fire, for it would have been dangerous to eat ice. Another effect of the cold was intense drowsiness, which Hobson earnestly entreated his companions to resist. Some appeared unable to do so; but Mrs Barnett was invaluable in setting an example of constant activity; always brave, she kept herself awake, and encouraged others by her kindness, brightness, and sympathy. Sometimes she read aloud accounts of travels, or sang some old familiar English song, in the chorus of which all joined. These joyous strains roused up the sleepers whether they would or no, and their voices soon swelled the chorus. The long days of imprisonment passed wearily by, and the Lieutenant, consulting the outside thermometer through the windows, announced that the cold was still on the increase. On the 31st December, the mercury was all frozen hard, in the cistern of the instrument, so that the temperature was 44° below freezing point.

The next day, 1st January 1860, Lieutenant Hobson wished Mrs Barnett a happy new year, and complimented her on the courage and good temper with which she endured the miseries of this northern winter. The astronomer was not forgotten in the universal interchange of good wishes amongst the members of the little colony; but his only thought on entering another year was, that it was the beginning of that in which the great eclipse was to take place. Fortunately the general health still remained good, and any symptoms of scurvy were promptly checked by the use of lime-juice and lime-lozenges.

It would not do, however, to rejoice too soon. The winter had still to last three months. The sun would doubtless reappear above the horizon in due time; but there was no reason to think that the cold had reached its maximum intensity, especially as in most northern countries February is the month during which the temperature falls lowest. However that might be, there was no decrease in the severity of the weather during the first days of the new year, and on the 8th January the alcohol thermometer placed outside the window of the passage marked 66° below zero. A few degrees more and the minimum temperature at Fort Reliance in 1835 would be reached!

Jaspar Hobson grew more and more uneasy at the continued severity of the cold. He began to fear that the furred animals would have to seek a less rigorous climate further south, which would of course thwart all his plans for hunting in the early spring. Moreover, he sometimes heard subterranean rumblings, which were evidently connected with the volcanic eruption. The western horizon still glowed with the reflection of the burning lava, and it was
evident that some great convulsion was going on in the bowels of the earth. Might not the close vicinity of an active volcano be dangerous to the new fort? Such was the question which the subterranean rumblings forced upon the mind of the Lieutenant, but he kept his vague apprehensions to himself.

Of course under these circumstances no one dreamt of leaving the house. The animals were well provided for, and being accustomed to long fasts in the winter, required no attention from their masters, so that there really was no necessity for any exposure out of doors. It was difficult enough to endure the inside temperature, even with the help of a plentiful combustion of wood and oil; for, in spite of every precaution, damp crept into the ill-ventilated rooms, and layers of ice, increasing in thickness every day, were formed upon the beams. The condensers were choked up, and one of them burst from the pressure of the ice.

Lieutenant Hobson did not spare his fuel; he was, in fact, rather lavish of it in his anxiety to raise the temperature, which, when the fires got low—as of course sometimes happened—fell to 15° Fahrenheit. The men on guard, who relieved each other every hour, had strict orders to keep up the fires, and great was the dismay of the Lieutenant when Sergeant Long said to him one day—

"We shall be out of wood soon!"

"Out of wood!" exclaimed Hobson.

"I mean our stock is getting low, and we must lay in fresh stores soon. Of course I know, though, that it will be at the risk of his life that any one goes out in this cold!"

"Yes," replied Hobson. "It was a mistake not to build the wooden shed close to the house, and to make no direct communication with it. I see that now it is too late. I ought not to have forgotten that we were going to winter beyond the seventieth parallel. But what's done can't be undone. How long will the wood last?"

"There is enough to feed the furnace and stove for another two or three days," replied the Sergeant.

"Let us hope by that time that the severity of the cold may have decreased, and that we may venture across the court of the fort without danger."

"I doubt it, sir," replied Long, shaking his head. "The atmosphere is very clear, the wind is still in the north, and I shall not be surprised if this temperature is maintained for another fifteen days—until the new moon, in fact."

"Well, my brave fellow," said the Lieutenant, "we won't die of cold if we can help it, and the day we have to brave the outside air"

"We will brave it, sir," said Long.

Hobson pressed his subordinate's hand, well knowing the poor fellow's devotion.

We might fancy that Hobson and the Sergeant were exaggerating when they alluded to fatal results from sudden exposure to the open air, but they spoke from experience, gained from long residence in the rigorous Polar regions. They had seen strong men fall fainting on the ice under similar circumstances; their breath failed them, and they were taken up in a state of suffocation. Incredible as such facts may appear, they have been of frequent occurrence amongst those who have wintered in the extreme north. In their journey along the shores of Hudson's Bay in 1746, Moor and Smith saw many incidents of this kind,—some of their companions were killed, struck down by the cold, and there can be no doubt that sudden death may result from braving a temperature in which mercury freezes.

Such was the distressing state of things at Fort Hope, when a new danger arose to aggravate the sufferings of the colonists.

CHAPTER XXI.
THE LARGE POLAR BEARS.

The only one of the four windows through which it was possible to look into the court of the fort was that opening at the end of the entrance passage. The outside shutters had not been closed; but before it could be seen through it had to be washed with boiling water, as the panes were covered with a thick coating of ice. This was done several times a day by the Lieutenant’s orders, when the districts surrounding the fort were carefully examined, and the state of the sky, and of the alcohol thermometer placed outside, were accurately noted.

On the 6th January, towards eleven o'clock in the morning, Kellet, whose turn it was to look out, suddenly called the Sergeant, and pointed to some moving masses indistinctly visible in the gloom. Long, approaching the window, observed quietly—

"They are bears!"

In fact half-a-dozen of these formidable animals had succeeded in getting over the palisades, and, attracted by the smoke from the chimneys, were advancing upon the house.

On hearing of the approach of the bears, Hobson at once ordered the window of the passage to be barricaded inside; it was the only unprotected opening in the house, and when it was secured it appeared impossible for the bears to effect an entrance. The window was, therefore, quickly closed up with bars, which the carpenter Mac-Nab wedged firmly in, leaving a narrow slit through which to watch the movements of the unwelcome visitors.

"Now," observed the head carpenter, "these gentlemen can't get in without our permission, and we have time to
hold a council of war."

"Well, Lieutenant," exclaimed Mrs Barnett, "nothing has been wanting to our northern winter! After the cold come the bears."

"Not after," replied the Lieutenant, "but, which is a serious matter, with the cold, and a cold ago intense that we cannot venture outside! I really don’t know how we shall get rid of these tiresome brutes."

"I suppose they will soon get tired of prowling about," said the lady, "and return as they came."

Hobson shook his head as if he had his doubts.

"You don’t know these animals, madam. They are famished with hunger, and will not go until we make them!"

"Are you anxious, then?"

"Yes and no," replied the Lieutenant. "I don’t think the bears will get in; but neither do I see how we can get out, should it become necessary for us to do so."

With these words Hobson turned to the window, and Mrs Barnett joined the other women, who had gathered round the Sergeant, and were listening to what he had to say about the bears. He spoke like a man well up in his subject, for he had had many an encounter with these formidable carnivorous creatures, which are often met with even towards the south, where, however, they can be safely attacked, whilst here the siege would be a regular blockade, for the cold would quite prevent any attempt at a sortie.

Throughout the whole day the movements of the bears were attentively watched. Every now and then one of them would lay his great head against the window-pane and an ominous growl was heard.

The Lieutenant and the Sergeant took counsel together, and it was agreed that if their enemies showed no sign of beating a retreat, they would drill a few loopholes in the walls of the house, and fire at them. But it was decided to put off this desperate measure for a day or two, as it was desirable to avoid giving access to the outer air; the inside temperature being already far too low. The walrus oil to be burnt was frozen so hard that it had to be broken up with hatchets.

The day passed without any incident. The bears went and came, prowling round the house, but attempting no direct attack. Watch was kept all night, and at four o’clock in the morning they seemed to have left the court—at any rate, they were nowhere to be seen.

But about seven o’clock Marbre went up to the loft to fetch some provisions, and on his return announced that the bears were walking about on the roof.

Hobson, the Sergeant, Mac-Nab, and two or three soldiers seized their arms, and rushed to the ladder in the passage, which communicated with the loft by a trap-door. The cold was, however, so intense in the loft that the men could not hold the barrels of their guns, and their breath froze as it left their lips and floated about them as snow.

Marbre was right; the bears were all on the roof, and the sound of their feet and their growls could be distinctly heard. Their great claws caught in the laths of the roof beneath the ice, and there was some danger that they might have sufficient strength to tear away the woodwork.

The Lieutenant and his men, becoming giddy and faint from the intense cold, were soon obliged to go down, and Hobson announced the state of affairs in as hopeful a tone as he could assume.

"The bears," he said, "are now upon the roof. We ourselves have nothing to fear, as they can’t get into our rooms; but they may force an entrance to the loft, and devour the furs stowed away there. Now these furs belong to the Company, and it is our duty to preserve them from injury I ask you then, my friends, to aid me in removing them to a place of safety."

All eagerly volunteered, and relieving each other in parties of two or three, for none could have supported the intense severity of the cold for long at a time, they managed to carry all the furs into the large room in about an hour.

Whilst the work was proceeding, the bears continued their efforts to get in, and tried to lift up the rafters of the roof. In some places the laths became broken by their weight, and poor Mac-Nab was in despair; he had not reckoned upon such a contingency when he constructed the roof, and expected to see it give way every moment.

The day passed, however, without any change in the situation. The bears did not get in; but a no less formidable enemy, the cold, gradually penetrated into every room. The fires in the stoves burnt low; the fuel in reserve was almost exhausted; and before twelve o’clock, the last piece of wood would be burnt, and the genial warmth of the stove would no longer cheer the unhappy colonists.

Death would then await them-death in its most fearful form, from cold. The poor creatures, huddled together round the stove, felt that their own vital heat must soon become exhausted, but not a word of complaint passed their lips. The women bore their sufferings with the greatest heroism, and Mrs Mac-Nab pressed her baby convulsively to her ice-cold breast. Some of the soldiers slept, or rather were wrapped in a heavy torpor, which could scarcely be called sleep.

At three o’clock in the morning Hobson consulted the thermometer hanging in the large room, about ten feet
from the stove.

It marked 4° Fahrenheit below zero.

The Lieutenant pressed his hand to his forehead, and looked mournfully at his silent companions without a word. His half-condensed breath shrouded his face in a white cloud, and he was standing rooted to the spot when a hand was laid upon his shoulder. He started, and looked round to see Mrs Barnett beside him.

"Something must be done, Lieutenant Hobson!" exclaimed the energetic woman; "we cannot die like this without an effort to save ourselves!"

"Yes," replied the Lieutenant, feeling revived by the moral courage of his companion—"yes, something must be done!" and he called together Long, Mac-Nab, and Rae the blacksmith, as the bravest men in his party. All, together with Mrs Barnett, hastened to the window, and having washed the panes with boiling water, they consulted the thermometer outside.

"Seventy-two degrees!" cried Hobson. "My friends, two courses only are open to us, we can risk our lives to get a fresh supply of fuel, or we can burn the benches, beds, partition walls, and everything in the house to feed our stoves for a few days longer. A desperate alternative, for the cold may last for some time yet; there is no sign of a change in the weather."

"Let us risk our lives to get fuel!" said Sergeant Long.

All agreed that it would be the best course, and without another word each one set to work to prepare for the emergency.

The following were the precautions taken to save the lives of those who were about to risk themselves for the sake of the general good:

The shed in which the wood was stored was about fifty steps on the left, behind, the principal house. It was decided that one of the men should try and run to the shed. He was to take one rope wound round his body, and to carry another in his hand, one end of which was to be held by one of his comrades. Once at the shed, he was to load one of the sledges there with fuel, and tie one rope to the front, and the other to the back of the vehicle, so that it could be dragged backwards and forwards between the house and the shed without much danger. A tug violently shaking one or the other cord would be the signal that the sledge was filled with fuel at the shed, or unloaded at the house.

A very clever plan, certainly; but two things might defeat it. The door of the shed might be so blocked up with ice that it would be very difficult to open it, or the bears might come down from the roof and prowl about the court. Two risks to be run!

Long, Mac-Nab, and Rae, all three volunteered for the perilous service; but the Sergeant reminded the other two that they were married, and insisted upon being the first to venture.

When the Lieutenant expressed a wish to go himself, Mrs Barnett said earnestly, "You are our chief; you have no right to expose yourself. Let Sergeant Long go."

Hobson could not but realise that his office imposed caution, and being called upon to decide which of his companions should go, he chose the Sergeant. Mrs Barnett pressed the brave man's hand with ill-concealed emotion; and the rest of the colonists, asleep or stupefied, knew nothing of the attempt about to be made to save their lives.

Two long ropes were got ready. The Sergeant wound one round his body above the warm furs, worth some thousand pounds sterling, in which he was encased, and tied the other to his belt, on which he hung a tinder-box and a loaded revolver. Just before starting he swallowed down half a glass of rum, as he said, "to insure a good load of wood."

Hobson, Rae, and Mac-Nab accompanied the brave fellow through the kitchen, where the fire had just gone out, and into the passage. Rae climbed up to the trap-door of the loft, and peeping through it, made sure that the bears were still on the roof. The moment for action had arrived.

One door of the passage was open, and in spite of the thick furs in which they were wrapped, all felt chilled to the very marrow of their bones; and when the second door was pushed open, they recoiled for an instant, panting for breath, whilst the moisture held in suspension in the air of the passage covered the walls and the floor with fine snow.

The weather outside was extremely dry, and the stars shone with extraordinary brilliancy. Sergeant Long rushed out without a moment's hesitation, dragging the cord behind him, one end of which was held by his companions; the outer door was pushed to, and Hobson, Mac-Nab, and Rae went back to the passage and closed the second door, behind which they waited. If Long did not return in a few minutes, they might conclude that his enterprise had succeeded, and that, safe in the shed, he was loading the first train with fuel. Ten minutes at the most ought to suffice for this operation, if he had been able to get the door open.

When the Sergeant was fairly off, Hobson and Mac-Nab walked together towards the end of the passage.
Meanwhile Rae had been watching the bears and the loft. It was so dark that all hoped Long’s movements would escape the notice of the hungry animals.

Ten minutes elapsed, and the three watchers went back to the narrow space between the two doors, waiting for the signal to be given to drag in the sledge.

Five minutes more. The cord remained motionless in their hands! Their anxiety can be imagined. It was a quarter of an hour since the Sergeant had started, plenty of time for all he had to do, and he had given no signal.

Hobson waited a few minutes longer, and then tightening his hold of the end of the rope, he made a sign to his companions to pull with him. If the load of wood were not quite ready, the Sergeant could easily stop it from being dragged away.

The rope was pulled vigorously. A heavy object seemed to slide along the snow. In a few moments it reached the outer door.

It was the body of the Sergeant, with the rope round his waist. Poor Long had never reached the shed. He had fallen fainting to the ground, and after twenty minutes’ exposure to such a temperature there was little hope that he would revive.

A cry of grief and despair burst from the lips of Mac-Nab and Rae. They lifted their unhappy comrade from the ground, and carried him into the passage; but as the Lieutenant was closing the outer door, something pushed violently against it, and a horrible growl was heard.

"Help!" cried Hobson.

Mac-Nab and Rae rushed to their officer’s assistance; but Mrs Barnett had been beforehand with them and was struggling with all her strength to help Hobson to close the door. In vain; the monstrous brute, throwing the whole weight of its body against it, would force its way into the passage in another moment.

Mrs Barnett, whose presence of mind did not forsake her now, seized one of the pistols in the Lieutenant’s belt, and waiting quietly until the animal shoved its head between the door and the wall, discharged the contents into its open mouth.

The bear fell backwards, mortally wounded no doubt, and the door was shut and securely fastened.

The body of the Sergeant was then carried into the large room. But, alas! the fire was dying out. How was it possible to restore the vital heat with no means of obtaining warmth?

"I will go—I will go and fetch some wood!" cried the blacksmith Rae.

"Yes, Rae, we will go together!" exclaimed Mrs Barnett, whose courage was unabated.

"No, my friends, no!" cried Hobson; "you would fall victims to the cold, or the bears, or both. Let us burn all there is to burn in the house, and leave the rest to God!"

And the poor half-frozen settlers rose and laid about them with their hatchets like madmen. Benches, tables, and partition walls were thrown down, broken up, crushed to pieces, and piled up in the stove of the large room and kitchen furnace. Very soon good fires were burning, on which a few drops of walrus-oil were poured, so that the temperature of the rooms quickly rose a dozen degrees.

Every effort was made to restore the Sergeant. He was rubbed with warm rum, and gradually the circulation of his blood was restored. The white blotches with which parts of his body were covered began to disappear; but he had suffered dreadfully, and several hours elapsed before he could articulate a word. He was laid in a warm bed, and Mrs Barnett and Madge watched by him until the next morning.

Meanwhile Hobson, Mac-Nab, and Rae consulted bow best to escape from their terrible situation. It was impossible to shut their eyes to the fact that in two days this fresh supply of fuel would be exhausted, and then, if the cold continued, what would become of them all? The new moon had risen forty-eight hours ago, and there was no sign of a change in the weather! The north wind still swept the face of the country with its icy breath; the barometer remained at " fine dry weather; "and there was not a vapour to be seen above the endless succession of ice-fields. There was reason to fear that the intense cold would last a long time yet, but what was to be done? Would it do to try once more to get to the wood-shed, when the bears had been roused by the shot, and rendered doubly dangerous? Would it be possible to attack these dreadful creatures in the open air? No, it would be madness, and certain death for all!

Fortunately the temperature of the rooms had now become more bearable, and in the morning Mrs Joliffe served up a breakfast of hot meat and tea. Hot grog was served out, and the brave Sergeant was able to take his share. The heat from the stoves warmed the bodies and reanimated the drooping courage of the poor colonists, who were now ready to attack the bears at a word from Hobson. But the Lieutenant, thinking the forces unequally matched, would not risk the attempt; and it appeared likely that the day would pass without any incident worthy of note, when at about three o’clock in the afternoon a great noise was heard on the top of the house.

"There they are!" cried two or three soldiers, hastily arming themselves with hatchets and pistols.

It was evident that the bears had torn away one of the rafters of the roof, and got into the loft.
"Let every one remain where he is!" cried the Lieutenant. "Rae, the trap!"

The blacksmith rushed into the passage, scaled the ladder, and shut and securely fastened the trap-door.

A dreadful noise was now heard—growling, stamping of feet, and tearing of claws. It was doubtful whether the danger of the anxious listeners was increased, or the reverse. Some were of opinion that if all the bears were in the loft, it would be easier to attack them. They would be less formidable in a narrow space, and there would not be the same risk of suffocation from cold. Of course a conflict with such fierce creatures must still be very perilous, but it no longer appeared so desperate as before.

It was now debated whether it would be better to go and attack the besiegers, or to remain on the defensive. Only one soldier could get through the narrow trap-door at a time, and this mace Hobson hesitate, and finally resolve to wait. The Sergeant and others, whose bravery none could doubt, agreed that he was in the right, and it might be possible that some new incident would occur to modify the situation. It was almost impossible for the bears to break through the beams of the ceiling, as they had the rafters of the roof, so that there was little fear that they would get on to the ground-floor.

The day passed by in anxious expectation, and at night no one could sleep for the uproar made by the furious beasts.

The next day, about nine o'clock, a fresh complication compelled Hobson to take active steps.

He knew that the pipes of the stove and kitchen furnace ran all along the loft, and being made of lime-bricks but imperfectly cemented together, they could not resist great pressure for any length of time. Now some of the bears scratched at the masonry, whilst others leant against the pipes for the sake of the warmth from the stove; so that the bricks began to give way, and soon the stoves and furnace ceased to draw.

This really was an irreparable misfortune, which would have disheartened less energetic men. But things were not yet at their worst. Whilst the fire became lower and lower, a thick, nauseous, acrid smoke filled the house; the pipes were broken, and the smoke soon became so thick that the lamps went out. Hobson now saw that he must leave the house if he wished to escape suffocation, but to leave the house would be to perish with cold. At this fresh misfortune some of the women screamed; and Hobson, seizing a hatchet, shouted in a loud voice,

"To the bears! to the bears, my friends!"

It was the forlorn-hope. These terrible creatures must be destroyed. All rushed into the passage and made for the ladder, Hobson leading the way. The trap-door was opened, and a few shots were fired into the black whirlpool of smoke. Mingled howls and screams were heard, and blood began to flow on both sides; but the fearful conflict was waged in profound darkness.

In the midst of the mêlée a terrible rumbling sound suddenly drowned the tumult, the ground became violently agitated, and the house rocked as if it were being torn up from its foundations. The beams of the walls separated, and through the openings Hobson and his companions saw the terrified bears rushing away into the darkness, howling with rage and fright.

CHAPTER XXII.

FIVE MONTHS MORE.

A violent earthquake had shaken Cape Bathurst. Such convulsions were probably frequent in this volcanic region, and the connection between them and eruptions was once more demonstrated.

Hobson well understood the significance of what had occurred, and waited in anxious suspense. He knew that the earth might open and swallow up the little colony; but only one shock was felt, and that was rather a rebound than a vertical upheaval, which made the house lean over towards the lake, and burst open its walls. Immediately after this one shock, the ground again became firm and motionless.

The house, although damaged, was still habitable; the breaches in the walls were quickly repaired, and the pipes of the chimneys were patched together again somehow. Fortunately the wounds the soldiers had received in their struggle with the bears were slight, and merely required dressing.

Two miserable days ensued, during which the woodwork of the beds and the planks of the partition walls were burnt, and the most pressing repairs executed by Mac-Nab and his men. The piles, well driven into the earth, had not yielded; but it was evident that the earthquake had caused a sinking of the level of the coast on which the fort was built, which might seriously compromise the safety of the building. Hobson was most anxious to ascertain the extent of the alteration of elevation, but the pitiless cold prevented him from venturing outside.

But at last there were symptoms of an approaching change in the weather. The stars shone with rather less brilliancy, and on the 11th January the barometer fell slightly; hazy vapours floated in the air, the condensation of which would raise the temperature; and on the 12th January the wind veered to the south-west, and snow fell at irregular intervals.

The thermometer outside suddenly rose to 15° above zero, and to the frozen colonists it was like the beginning
At eleven o'clock the same morning all were out of doors. They were like a band of captives unexpectedly set free. They were, however, absolutely forbidden to go beyond the enceinte of the fort, in case of awkward meetings.

The sun had not yet reappeared above the horizon, but it approached it nearly enough to produce a long twilight, during which objects could be distinctly seen to a distance of two miles; and Hobson’s first thought was to ascertain what difference the earthquake had produced in the appearance of the surrounding districts.

Certain changes had been effected. The crest of the promontory of Cape Bathurst had been broken off, and large pieces of the cliff had been flung upon the beach. The whole mass of the cape seemed to have been bent towards the lake, altering the elevation of the plateau on which the fort was built. The soil on the west appeared to have been depressed, whilst that on the east had been elevated. One of the results of this change of level would unfortunately be, that when the thaw set in, the waters of the lake and of Paulina river, in obedience to the law, requiring liquids to maintain their level, would inundate a portion of the western coast. The stream would probably scoop out another bed, and the natural harbour at its mouth would be destroyed. The hills on the eastern bank seemed to be considerably depressed, but the cliffs on the west were too far off for any accurate observations to be made.

The important alteration produced by the earthquake may, in fact, be summed up in a very few words: the horizontal character of the ground was replaced by a slope from east to west.

"Well, Lieutenant," said Mrs Barnett, laughing, "you were good enough to give my name to the port and river, and now there will be neither Paulina nor Port Barnett. I must say I have been hardly used."

"Well, madam," replied Hobson, "although the river is gone, the lake remains, and we will call it Lake Barnett. I hope that it at least will remain true to you."

Mr and Mrs Joliffe, on leaving the house, had hurried, one to the doghouse, the other to the reindeer-stable. The dogs had not suffered much from their lone confinement, and rushed into the court barking with delight. One reindeer had died, but the others, though thin, appeared to be in good health.

"Well, madam," said the Lieutenant, "we have got through our troubles better than we could have expected."

"I never despaired," replied the lady. "The miseries of an Arctic winter would not conquer men like you and your companions."

"To own the truth, madam," replied Hobson, "I never experienced such intense cold before, in all the years I have spent in the north; and if it had lasted many days longer we should all have been lost."

"The earthquake came in the nick of time then, not only to drive away the bears, but also to modify the extremity of the cold?"

"Perhaps so, madam. All natural phenomena influence each other to a certain extent. But the volcanic structure of the soil makes me rather uneasy. I cannot but regret the close vicinity of this active volcano. If the lava from it cannot reach us, the earthquakes connected with it can. Just look at our house now!"

"Oh, all that can be put right when the fine weather comes, and you will make it all the stronger for the painful experience you have gained."

"Of course we shall, but meanwhile I am afraid you won’t find it very comfortable."

"Are you speaking to me, Lieutenant? to an old traveller like me? I shall imagine myself one of the crew of a small vessel, and now that it does not pitch and toss, I shall have no fear of being sea-sick."

"What you say does not surprise me," replied Hobson; "we all know your grandeur of character, your moral courage and imperturbable good temper. You have done much to help us all to bear our troubles, and I thank you in my own name and that of my men."

"You flatter me, Lieutenant; you flatter me."

"No, no; I only say what every one thinks. But may I ask you one question. You know that next June, Captain Craventy is to send us a convoy with provisions, which will take back our furs to Fort Reliance. I suppose our friend Thomas Black, after having seen his eclipse, will return with the Captain’s men. Do you mean to accompany him?"

"Do you mean to send me back?" asked the lady with a smile.

"O madam!"—

"Well, my superior officer," replied Mrs Barnett, extending her hand to the Lieutenant, "I shall ask you to allow me to spend another winter at Fort Hope. Next year one of the Company’s ships will probably anchor off Cape Bathurst, and I shall return in it. Having come overland, I should like to go back by Behring Strait."

The Lieutenant was delighted with his companion’s decision. The two had become sincerely attached to each other, and had many tastes and qualities in common. The hour of separation could not fail to be painful to both; and who could tell what further trials awaited ‘the colonists, in which their combine, influence might sustain the courage of the rest?

On the 20th January the sun at last reappeared, and the Polar night was at an end. It only remained above the horizon for a few minutes, and was greeted with joyous hurrahs by the settlers. From this date the days gradually
increased in length.

Throughout the month of February, and until the 15th March, there were abrupt transitions from fine to bad weather. The fine days were so cold that the hunters could not go out; and in the bad weather snowstorms kept them in. It was only between whiles that any outdoor work could be done; and long excursions were out of the question. There was no necessity for them, however, as the traps were in full activity. In the latter end of the winter, martens, foxes, ermines, wolverines, and other valuable animals were taken in large numbers, and the trappers had plenty to do.

In March an excursion was ventured on as far as Walruses’ Bay and it was noticed that the earthquake had considerably altered the form of the cliffs, which were much depressed; whilst the igneous hills beyond, with their summits wrapped in mist, seemed to look larger and more threatening than ever.

About the 20th March the hunters sighted the first swans migrating from the south, and uttering shrill cries as they flew. A few snow buntings and winter hawks were also seen. But the ground was still covered with thick layers of frozen snow, and the sun was powerless to melt the hard surface of the lake and sea.

The breaking up of the frost did not commence until early in April. The ice burst with a noise like the discharge of artillery.

Sudden changes took place in the appearance of the icebergs broken by collisions, undermined by the action of the water once more set free, huge masses rolled over with an awful crash, in consequence of the displacement of their centre of gravity, causing fractures and fissures in the ice-fields which greatly accelerated their breaking up.

At this time the mean temperature was 32° above zero, so that the upper layer of ice on the beach rapidly dissolved, whilst the chain of icebergs, drifted along by the currents of the Polar Sea, gradually drew back and became lost in the fogs on the horizon. On the 15th April the sea was open, and a vessel from the Pacific Ocean coming through Behring Strait, could certainly have skirted along the American coast, and have anchored off Cape Bathurst.

Whilst the ice was disappearing from the ocean, Lake Barnett was also laying aside its slippery armour, much to the delight of the thousands of ducks and other water-fowl which began to teem upon its banks. As Hobson had foreseen, however, the level of the lake was affected by the slope of the soil. That part of the beach which stretched away from the enceinte of the fort, and was bounded on the east by wooded hills, had increased considerably in extent; and Hobson estimated that the waters of the lake had reeded five hundred paces on the eastern bank. As a natural consequence, the water on the western side had risen, and if not held back by some natural barrier, would inundate the country.

On the whole, it was fortunate that the slope was from east to west; for had it been from west to east, the factory must have been submerged.

The little river dried up as soon as the thaw set free its waters. It might almost be said to have run back to its source, so abrupt was the slope of its bed from north to south.

"We have now to erase a river from the map of the Arctic regions," observed Hobson to his Sergeant. "It would have been embarrassing if we had been dependent on the truant for drinkable water. Fortunately we have still Lake Barnett, and I don’t suppose our thirsty men will drain it quite dry."

"Yes, we’ve got the lake," replied the Sergeant; "but do you think its waters have remained sweet?"

Hobson started and looked at his subordinate with knitted brows. It had not occurred to him that a fissure in the ground might have established a communication between the lake and the sea! Should it be so, ruin must ensue, and the factory would inevitably have to be abandoned after all.

The Lieutenant and Hobson rushed to the lake and found their fears groundless. Its waters were still sweet.

Early in May the snow had disappeared in several places, and a scanty vegetation clothed the soil. Tiny mosses and slender grasses timidly pushed up their stems above the ground, and the sorrel and cochlearia seeds which Mrs Joliffe had planted began to sprout. The carpet of snow had protected them through the bitter winter; but they had still to be saved from the beaks of birds and the teeth of rodents. This arduous and important task was confided to the worthy Corporal, who acquitted himself of it with the zeal and devotion of a scarecrow in a kitchen garden.

The long days had now returned, and hunting was resumed.

Hobson was anxious to have a good stock of furs for the agents from Fort Reliance to take charge of when they arrived, as they would do in a few weeks. Marbre, Sabine, and the others, therefore, commenced the campaign. Their excursions were neither long nor fatiguing: they never went further than two miles from Cape Bathurst, for they had never before been in a district so well stocked with game; and they were both surprised and delighted. Martens, reindeer, hares, caribous, foxes, and ermines passed close to their guns.

One thing, however, excited some regret in the minds of the colonists, not a trace was to be seen of their old enemies the bears; and it seemed as if they had taken all their relations with them. Perhaps the earthquake had frightened them away, for they have a very delicate nervous organisation, if such an expression can be applied to a
mild quadruped. It was a pity they were gone, for vengeance could not be wreaked upon them.

The month of May was very wet. Rain and snow succeeded each other. The mean temperature was only 41\(^\circ\) above zero. Fogs were of frequent occurrence, and so thick that it would often have been imprudent to go any distance from the fort. Petersen and Kellet once caused their companions grave anxiety by disappearing for forty-eight hours. They had lost their way, and turned to the south when they thought they were near to Walruses’ Bay. They came back exhausted and half dead with hunger.

June came at last, and with it really fine warm weather. The colonists were able to leave off their winter clothing. They worked zealously at repairing the house, the foundations of which had to be propped up; and Hobson also ordered the construction of a large magazine at the southern corner of the court. The quantity of game justified the expenditure of time and labour involved: the number of furs collected was already considerable, and it was necessary to have some place set aside in which to keep them.

The Lieutenant now expected every day the arrival of the detachment to be sent by Captain Craventy. A good many things were still required for the new settlement. The stores were getting low; and if the party had left the fort in the beginning of May, they ought to reach Cape Bathurst towards the middle of June. It will be remembered that the Captain and his Lieutenant had fixed upon the cape as the spot of rendezvous, and Hobson having constructed his fort on it, there was no fear of the reinforcements failing to find him.

From the 15th June the districts surrounding the cape were carefully watched. The British flag waved from the summit of the cliff, and could be seen at a considerable distance. It was probable that the convoy would follow the Lieutenant’s example, and skirt along the coast from Coronation Gulf. If not exactly the shortest, it was the surest route, at a time when the sea being free from ice, the coast-line could be easily followed.

When the month of June passed without the arrival of the expected party, Hobson began to feel rather uneasy, especially as the country again became wrapped in fogs. He began to fear that the agents might lose their way, and often talked the matter over with Mrs Barnett, Mac-Nab, and Rae.

Thomas Black made no attempt to conceal his uneasiness, for he was anxious to return with the party from Fort Reliance as soon as he had seen his eclipse; and should anything keep them back from coming, he would have to resign himself to another winter, a prospect which did not please him at all; and in reply to his eager questions, Hobson could say little to reassure him.

The 4th July dawned. No news! Some men sent to the southeast to reconnoitre, returned, bringing no tidings. Either the agents had never started, or they had lost their way. The latter hypothesis was unfortunately the more probable. Hobson knew Captain Craventy, and felt confident that he had sent off the convoy at the time named.

His increasing anxiety will therefore be readily understood. The fine season was rapidly passing away. Another two months and the Arctic winter, with its bitter winds, its whirlpools of snow, and its long nights, would again set in.

Hobson, as we well know, was not a man to yield to misfortune without a struggle. Something must be done, and with the ready concurrence of the astronomer the following plan was decided on.

It was now the 5th July. In another fortnight—July 18th—the solar eclipse was to take place, and after that Thomas Black would be free to leave Fort Hope. It was therefore agreed that if by that time the agents had not arrived, a convoy of a few men and four or five sledges should leave the factory, and make for the Great Slave Lake, taking with them some of the most valuable furs; and if no accident befell them, they might hope to arrive at Fort Reliance in six weeks at the latest—that is to say, towards the end of August.

This matter settled, Thomas Black shrank back into his shell, and became once more the man of one idea, awaiting the moment when the moon, passing between the orb of day and “himself,” should totally eclipse the disc of the sun.

CHAPTER XXIII.
THE ECLIPSE OF THE 18TH JULY 1860.

The mists did not disperse. The sun shone feebly through thick curtains of fog, and the astronomer began to have a great dread lest the eclipse should not be visible after all. Sometimes the fog was so dense that the summit of the cape could not be seen from the court of the fort.

Hobson got more and more uneasy. He had no longer any doubt that the convoy had gone astray in the strange land; moreover, vague apprehensions and sad forebodings increased his depression. He could not look into the future with any confidence—why, he would have found it impossible to explain. Everything apparently combined to reassure him. In spite of the great rigour of the winter, his little colony was in excellent health. No quarrels had arisen amongst the colonists, and their zeal and enthusiasm was still unabated. The surrounding districts were well stocked with game, the harvest of furs had surpassed his expectations, and the Company might well be satisfied with the result of the enterprise. Even if no fresh supply of provisions arrived, the resources of the country were such that the prospect of a second winter need awake no misgivings. Why, then, was Lieutenant Hobson losing hope and
confidence?

He and Mrs Barnett had many a talk on the subject; and the latter did all she could to raise the drooping spirits of
the commanding officer, urging upon him all the considerations enumerated above; and one day walking with him
along the beach, she pleaded the cause of Cape Bathurst and the factory, built at the cost of so much suffering, with
more than usual eloquence.

"Yes, yes, madam, you are right," replied Hobson; "but we can’t help our presentiments. I am no visionary.
Twenty times in my soldier’s life I have been in critical circumstances, and have never lost presence of mind for one
instant; and now for the first time in my life I am uneasy about the future. If I had to face a positive danger, I should
have no fear; but a vague uncertain peril of which I have only a presentiment"

"What danger do you mean?" inquired Mrs Barnett; "a danger from men, from animals, or the elements?"

"Of animals I have no dread whatever, madam; it is for them to tremble before the hunters of Cape Bathurst, nor
do I fear men; these districts are frequented by none but Esquimaux, and the Indians seldom venture so far north."

"Besides, Lieutenant," said Mrs Barnett, "the Canadians, whose arrival you so much feared in the fine season,
have never appeared."

"I am very sorry for it, madam."

"What! you regret the absence of the rivals who are so evidently hostile to your Company?"

"Madam, I am both glad and sorry that they have not come; that will of course puzzle you. But observe that the
expected convoy from Fort Reliance has not arrived. It is the same with the agents of the St Louis Fur Company;
they might have come, and they have not done so. Not a single Esquimaux has visited this part of the coast during
the summer either"—

"And what do you conclude from all this?" inquired Mrs Barnett.

"I conclude that it is not so easy to get to Cape Bathurst or to Fort Hope as we could wish."

The lady looked into the Lieutenant’s anxious face, struck with the melancholy and significant intonation of the
word easy.

"Lieutenant Hobson," she said earnestly, "if you fear neither men nor animals, I must conclude that your anxiety
has reference to the elements."

"Madam," he replied, "I do not know if my spirit be broken, or if my presentiments blind me, but there seems to
me to be something uncanny about this district. If I had known it better I should not have settled down in it. I have
already called your attention to certain peculiarities, which to me appear inexplicable; the total absence of stones
everywhere, and the clear-cut line of the coast. I can’t make out about the primitive formation of this end of the
continent. I know that the vicinity of a volcano may cause some phenomena; but you remember what I said to you
on the subject of the tides?"

"Oh yes, perfectly."

"Where the sea ought according to the observations of explorers in these latitudes, to have risen fifteen or twenty
feet, it has scarcely risen one!"

"Yes; but that you accounted for by the irregular distribution of land and the narrowness of the straits."

"I tried to account for it, that is all," replied Hobson; "but the day before yesterday I noticed a still more
extraordinary phenomenon, which I cannot even try to explain, and I doubt if the greatest savants could do so
either."

Mrs Barnett looked inquiringly at Hobson.

"What has happened?" she exclaimed.

"Well, the day before yesterday, madam, when the moon was full, and according to the almanac the tide ought to
have been very high, the sea did not even rise one foot, as it did before-it did not rise at all."

"Perhaps you may be mistaken observed Mrs Barnett."

"I am not mistaken. I saw it with my own eyes. The day before yesterday, July 4th, there was positively no tide
on the coast of Cape Bathurst."

"And what do you conclude from that?" inquired Mrs Barnett.

"I conclude madam," replied the Lieutenant, "either that the laws of nature are changed, or that this district is
very peculiarly situated . . . or rather . . . I conclude nothing . . . I explain nothing . . . I am puzzled. . . I do not
understand it; and therefore . . . therefore I am anxious."

Mrs Barnett asked no more questions. Evidently the total absence of tides was as unnatural and inexplicable as
would be the absence of the sun from the meridian at noon. Unless the earthquake had so modified the conformation
of the coast of the Arctic regions as to account for it—but no, such an idea could not be entertained by any one
accustomed to note terrestrial phenomena.

As for supposing that the Lieutenant could be mistaken in his observations, that was impossible; and that very
day he and Mrs Barnett, by means of beach-marks made on the beach, ascertained beyond all doubt that whereas a
year before the sea rose a foot, there was now no tide whatever.

The matter was kept a profound secret, as Hobson was unwilling to render his companions anxious. But he might often be seen standing motionless and silent upon the summit of the cape, gazing across the sea, which was now open, and stretched away as far as the eye could reach.

During the month of July hunting the furred animals was discontinued, as the martens, foxes, and others had already lost their winter beauty. No game was brought down but that required for food, such as caribous, Polar hares, &c., which, strange to say, instead of being scared away by the guns, continued to multiply near the fort. Mrs Barnett did not fail to note this peculiar, and, as the event proved, significant fact.

No change had taken place in the situation on the 15th July. No news from Fort Reliance. The expected convoy did not arrive, and Hobson resolved to execute his project of sending to Captain Craventy, as Captain Craventy did not come to him.

Of course none but Sergeant Long could be appointed to the command of the little troop, although the faithful fellow would rather not have been separated from his Lieutenant. A considerable time must necessarily elapse before he could get back to Fort Hope. He would have to pass the winter at Fort Reliance, and return the next summer. Eight months at least! It is true either Mac-Nab or Rae could have taken the Sergeant’s place; but then they were married, and the one being a master carpenter, and the other the only blacksmith, the colonists could not well have dispensed with their services.

Such were the grounds on which the Lieutenant chose Long, and the Sergeant submitted with military obedience. The four soldiers elected to accompany him were Belcher, Pond, Petersen, and Kellet, who declared their readiness to start.

Four sledges and their teams of dogs were told off for the service. They were to take a good stock of provisions, and the most valuable of the furs. Foxes, ermines, martens, swans, lynxes, musk-rats, gluttons, &c., all contributed to the precious convoy. The start was fixed for the morning of the 19th July, the day after the eclipse. Of course Thomas Black was to accompany the Sergeant, and one sledge was to convoy his precious person and instruments.

The worthy savant endured agonies of suspense in the few days preceding the phenomenon which he awaited with so much impatience. He might well be anxious; for one day it was fine and another wet, now mists obscured the sun, or thick fogs hid it all together; and the wind veered to every point of the horizon with provoking fickleness and uncertainty. What if during the few moments of the eclipse the queen of the night and the great orb of day should be wrapped in an opaque cloud at the critical moment, so that he, the astronomer, Thomas Black, come so far to watch the phenomenon, should be unable to see the luminous corona or the red prominences! How terrible would be the disappointment! How many dangers, how much suffering, how much fatigue, would have been gone through in vain!

"To have come so far to see the moon, and not to see it!" he cried in a comically piteous tone.

No, he could not face the thought and early of an evening he would climb to the summit of the cape and gaze into the heavens. The fair Phoebe was nowhere to be seen; for it being three days before new moon, she was accompanying the sun in his daily course, and her light was quenched in his beams.

Many a time did Thomas Black relieve his over-burdened heart by pouring out his troubles to Mrs Barnett. The good lady felt sincerely sorry for him, and one day, anxious to reassure him, she told him that the barometer showed a certain tendency to rise, and reminded him that they were in the fine season.

"The fine season!" cried the poor astronomer" shrugging his shoulders. "Who can speak of a fine season in such a country as this?"

"Well, but, Mr Black," said Mrs Barnett, "suppose, for the sake of argument, that you miss this eclipse by any unlucky chance, I suppose there will be another some day. The eclipse of July 18th will not be the last of this century."

"No, madam, no," returned Black; "there will be five more total eclipses of the sun before 1900. One on the 31st December 1861, which will be total for the Atlantic Ocean, the Mediterranean, and the Sahara Desert; a second on the 22d December 1870, total for the Azores, the south of Spain, Algeria, Sicily, and Turkey; a third on the 19th August 1887, total for the north-east of Germany, the south of Russia, and Central Asia; a fourth on the 9th April 1896, visible in Greenland, Lapland, and Siberia; and lastly, a fifth on the 28th May 1900, which will be total for the United States, Spain, Algeria, and Egypt."

"Well, Mr Black," resumed Mrs Barnett, "if you lose the eclipse of the 18th July 1860, you can console yourself by looking forward to that of the 31st December 1861. It will only be seventeen months!"

"I can console myself, madam," said the astronomer gravely, "by looking forward to that of 1896. I shall have to wait not seventeen months but thirty-six years!"

"May I ask why?"
"Because of all the eclipses, it alone—that of 9th August 1896—will be total for places in high latitudes, such as Lapland, Siberia, or Greenland."

"But what is the special interest of an observation taken in these elevated latitudes?"

"What special interest?" cried Thomas Black; why, a scientific interest of the highest importance. Eclipses have very rarely been watched near the Pole, where the sun, being very little above the horizon, is considerably increased in size. The disc of the moon which is to intervene between us and the sun is subject to a similar apparent extension, and therefore it may be that the red prominences and the luminous corona can be more thoroughly examined. This, madam, is why I have travelled all this distance to watch the eclipse above the seventieth parallel. A similar opportunity will not occur until 1896, and who can tell if I shall be alive then?"

To this burst of enthusiasm there was no reply to be made; and the astronomer's anxiety and depression increased, for the inconstant weather seemed more and more disposed to play him some ill-natured trick.

It was very fine on the 16th July, but the next day it was cloudy and misty and Thomas Black became really ill. The feverish state he had been in for so long seemed likely to result in a serious illness. Mrs Barnett and Hobson tried in vain to soothe him, and Sergeant Long and the others could not understand how it was possible to be so unhappy for love of the moon.

At last the great day—the 18th July—dawned. According to the calculations of astronomers, the total eclipse was to last four minutes thirty-seven seconds—that is to say, from forty-three minutes fifteen seconds past eleven to forty-seven minutes fifty-seven seconds past eleven A.M.

"What do I ask? what do I ask?" moaned the astronomer, tearing his hair. "Only one little corner of the sky free from clouds! only the small space in which the eclipse is to take place! And for how long? For four short minutes! After that, let it snow, let it thunder, let the elements break loose in fury, I should care no more for it all than a snail for a chronometer."

It is not to be denied that Thomas Black had some grounds for his fears. It really seemed likely that observations would be impossible. At daybreak the horizon was shrouded in mists. Heavy clouds were coming up from the south, and covering the very portion of the sky in which the eclipse was to take place. But doubtless the patron saint of astronomers had pity on poor Black, for towards eight o'clock a slight wind arose and swept the mists and clouds from the sky, leaving it bright and clear!

A cry of gratitude burst from the lips of the astronomer, and his heart beat high with newly-awakened hope. The sun shone brightly, and the moon, so soon to darken it, was as yet invisible in its glorious beams.

Thomas Black's instruments were already carefully placed on the promontory, and having pointed them towards the southern horizon, he awaited the event with calmness restored, and the coolness necessary for taking his observation. What was there left to fear?

Nothing, unless it was that the sky might fall upon his head! At nine o'clock there was not a cloud, not a vapour left upon the sky from the zenith to the horizon. Never were circumstances more favourable to an astronomical observation.

The whole party were anxious to take part in the observation, and all gathered round the astronomer on Cape Bathurst. Gradually the sun rose above the horizon, describing an extended arc above the vast plain stretching away to the south. No one spoke, but awaited the eclipse in solemn silence.

Towards half-past nine the eclipse commenced. The disc of the moon seemed to graze that of the sun. But the moon's shadow was not to fall completely on the earth, hiding the sun, until between forty-three minutes past eleven and forty-seven minutes past eleven. That was the time fixed in the almanacs, and every one knows that no error can creep into them, established, verified, and controlled as they are by the scientific men of all the observatories in the world.

The astronomer had brought a good many glasses with him, and he distributed them amongst his companions, that all might watch the progress of the phenomenon without injury to the eyes.

The brown disc of the moon gradually advanced, and terrestrial objects began to assume a peculiar orange hue, whilst the atmosphere on tire zenith completely changed colour. At a quarter-past ten half the disc of the sun was darkened, and a few dogs which happened to be at liberty showed signs of uneasiness and bowed pityously. The wild ducks, thinking night had come, began to utter sleepy calls—and to seek their nests, and the mothers gathered their little ones under their wings. The hush of eventide fell upon all animated nature.

At eleven o'clock two-thirds of the sun were covered, and all terrestrial objects became a kind of vinous red. A gloomy twilight set in, to be succeeded during the four minutes of totality by absolute darkness. A few planets, amongst them Mercury and Venus, began to appear, and some constellations—Caplet, [symbol] and [symbol] of Taurus, and [symbol] of Orion. The darkness deepened every moment.

Thomas Black remained motionless with his eye glued to the glass of his instrument, eagerly watching the progress of the phenomenon. At forty-three minutes past eleven the discs of the two luminaries ought to be exactly
opposite to each other, that of the moon completely hiding that of the sun.

"Forty-three minutes past eleven," announced Hobson, who was attentively watching the minute hand of his chronometer.

Thomas Black remained motionless, stooping over his instrument. Half a minute passed, and then the astronomer [astronomer] drew himself up, with eyes distended and eager. Once more he bent over the telescope, and cried in a choked voice—

"She is going! she is going! The moon, the moon is going! She is disappearing, running away!"

True enough the disc of the moon was gliding away from that of the sun without having completely covered it!

The astronomer had fallen backwards, completely overcome. The four minutes were past. The luminous corona had not appeared!

"What is the matter?" inquired Hobson.

"The matter is," screamed the poor astronomer, "that the eclipse was not total—not total for this portion of the globe! Do you hear? It was not to-t-a-l! I say not to-t-a-l! !"

"Then your almanacs are incorrect."

"Incorrect! Don’t tell that to me, if you please, Lieutenant Hobson!"

"But what then?" said Hobson, suddenly changing countenance.

"Why," said Black, "we are not after all on the seventieth parallel! !"

"Only fancy!" cried Mrs Barnett.

"We can soon prove it," said the astronomer whose eyes flashed with rage and disappointment. "The sun will pass the meridian in a few minutes. . . . My sextant-quick . . . make haste!"

One of the soldiers rushed to the house and fetched the instrument required.

The astronomer pointed it upon the sun; he watched the orb of day pass the meridian, and rapidly noted down a few calculations.

"What was the situation of Cape Bathurst a year ago when we took the latitude?" he inquired.

"Seventy degrees, forty-four minutes, and thirty-seven seconds," replied Hobson.

"Well, sir, it is now seventy-three degrees, seven minutes, and twenty seconds! You see we are not under the seventieth parallel! !"

"Or rather we are no longer there!" muttered Hobson.

A sudden light had broken in upon his mind, all the phenomena hitherto so inexplicable were now explained.

Cape Bathurst had drifted three degrees farther north since the arrival of the Lieutenant and his companions!

CHAPTER I.
A FLOATING FORT.
And so Fort Hope, founded by Lieutenant Hobson on the borders of the Polar Sea, had drifted! Was the
courageous agent of the Company to blame for this? No; any one might have been deceived as he had been. No
human prevision could have foreseen such a calamity. He meant to build upon a rock, and he had not even built
upon sand. The peninsula of Victoria, which the best maps of English America join to the American continent, had
been torn suddenly away from it. This peninsula was in fact nothing but an immense piece of ice, five hundred
square miles in extent, converted by successive deposits of sand and earth into apparently solid ground well clothed
with vegetation. Connected with the mainland for thousands of centuries, the earthquake of the 8th of January had
dragged it away from its moorings, and it was now a floating island, at the mercy of the winds and waves, and had
been carried along the Arctic Ocean by powerful currents for the last three months!

Yes, Fort Hope was built upon ice! Hobson at once understood the mysterious change in their latitude. The
isthmus—that is to say, the neck of land which connected the peninsula of Victoria with the mainland—had been
snapped in two by a subterranean convulsion connected with the eruption of the volcano some months before. As
long as the northern winter continued, the frozen sea maintained things as they were; but when the thaw came, when
the ice fields, melted beneath the rays of the sun, and the huge icebergs, driven out into the offing, drew back to the
farthest limits of the horizon—when the sea at last became open, the whole peninsula drifted away, with its woods,
its cliffs, its promontories, its inland lagoon, and its coast-line, under the influence of a current about which nothing
was known. For months this drifting had been going on unnoticed by the colonists, who even when hunting did not
go far from Fort Hope. Beach-marks, if they had been made, would have been useless; for heavy mists obscured
everything at a short distance, the ground remained apparently firm and motionless, and there was, in short, nothing
to hint to the Lieutenant and his men that they had become islanders. The position of the new island with regard to
the rising and setting of the sun was the same as before. Had the cardinal points changed their position, had the
island turned round, the Lieutenant, the astronomer, or Mrs Barnett, would certainly have noticed and understood
the change; but in its course the island had thus far followed a parallel of latitude, and its motion, though rapid, had
been imperceptible.

Although Hobson had no doubt of the moral and physical courage and determination of his companions, he
determined not to acquaint them with the truth. It would be time enough to tell them of their altered position when it
had been thoroughly studied. Fortunately the good fellows, soldiers or workmen, took little notice of the
astronomical observations, and not being able to see the consequences involved, they did not trouble themselves
about the change of latitude just announced.
The Lieutenant determined to conceal his anxiety, and seeing no remedy for the misfortune, mastered his emotion by a strong effort, and tried to console Thomas Black, who was lamenting his disappointment and tearing his hair.

The astronomer had no doubt about the misfortune of which he was the victim. Not having, like the Lieutenant, noticed the peculiarities of the district, he did not look beyond the one fact in which he was interested: on the day fixed, at the time named, the moon had not completely eclipsed the sun. And what could he conclude but that, to the disgrace of observatories, the almanacs were false, and that the long desired eclipse, his own eclipse, Thomas Black’s, which he had come so far and through so many dangers to see, had not been “total” for this particular district under the seventieth parallel! No, no, it was impossible to believe it; he could not face the terrible certainty, and he was overwhelmed with disappointment. He was soon to learn the truth, however.

Meanwhile Hobson let his men imagine that the failure of the eclipse could only interest himself and the astronomer, and they returned to their ordinary occupations; but as they were leaving, Corporal Joliffe stopped suddenly and said, touching his cap—

"May I ask you one question, sir?"

"Of course, Corporal; say on," replied the Lieutenant, who wondered what was coming.

But Joliffe hesitated, and his little wife nudged his elbow.

"Well, Lieutenant," resumed the Corporal, "it’s just about the seventieth degree of latitude—if we are not where we thought we were."

The Lieutenant frowned.

"Well," he replied evasively, "we made a mistake in our reckoning, ... our first observation was wrong; ... but what does that concern you?"

"Please, sir, it’s because of the pay," replied Joliffe with a scowl. "You know well enough that the Company promised us double pay."

Hobson drew a sigh of relief. It will be remembered that the men had been promised higher pay if they succeeded in settling on or above the seventieth degree north latitude, and Joliffe, who always had an eye to the main chance, had looked upon the whole matter from a monetary point of view, and was afraid the bounty would be withheld.

"You needn’t be afraid," said Hobson with a smile; "and you can tell your brave comrades that our mistake, which is really inexplicable, will not in the least prejudice your interests. We are not below, but above the seventieth parallel, and so you will get your double pay."

"Thank you, sir, thank you," replied Joliffe with a beaming face. "It isn’t that we think much about money, but that the money sticks to us."

And with this sage remark the men drew off, little dreaming what a strange and fearful change had taken place in the position of the country.

Sergeant Long was about to follow the others when Hobson stopped him with the words—

"Remain here, Sergeant Long."

The subordinate officer turned on his heel and waited for the Lieutenant to address him.

All had now left the cape except Mrs Barnett, Madge, Thomas Black, and the two officers.

Since the eclipse Mrs Barnett had not uttered a word. She looked inquiringly at Hobson, who tried to avoid meeting her eyes.

For some time not another word was spoken. All involuntarily turned towards the south, where the broken isthmus was situated; but from their position they could only see the sea horizon on the north. Had Cape Bathurst been situated a few hundred feet more above the level of the ocean, they would have been able at a glance to ascertain the limits of their island home.

All were deeply moved at the sight of Fort Hope and all its occupants borne away from all solid ground, and floating at the mercy of winds and waves.

"Then, Lieutenant," said Mrs Barnett at last, "all the strange phenomena you observed are now explained!"

"Yes, madam," he replied, "everything is explained. The peninsula of Victoria, now an island, which we thought firm ground with an immovable foundation, is nothing more than a vast sheet of ice welded for centuries to the American continent. Gradually the wind has strewn it with earth and sand, and scattered over them the seeds from which have sprung the trees and mosses with which it is clothed. Rain-water filled the lagoon, and produced the little river; vegetation transformed the appearance of the ground; but beneath the lake, beneath the soil of earth and sand—in a word, beneath our feet is a foundation of ice, which floats upon the water by reason of its being specifically lighter than it. Yes, it is a sheet of ice which bears us up, and is carrying us away, and this is why we have not found a single flint or stone upon its surface. This is why its shores are perpendicular, this is why we found ice ten feet below the surface when we dug the reindeer pit—this, in short, is why the tide was not noticeable on the
peninsula, which rose and sank with the ebb and flow of the waves!"

"Everything is indeed explained," said Mrs Barnett, "and your presentiments did not deceive you; but can you explain why the tides, which do not affect us at all now, were to a slight extent perceptible on our arrival?"

"Simply because, madam, on our arrival the peninsula was still connected by means of its flexible isthmus with the American continent. It offered a certain resistance to the current, and on its northern shores the tide rose two feet beyond low-water mark, instead of the twenty we reasonably expected. But from the moment when the earthquake broke the connecting link, from the moment when the peninsula became an island free from all control, it rose and sank with the ebb and flow of the tide; and, as we noticed together at full moon a few days ago, no sensible difference was produced on our shores."

In spite of his despair, Thomas Black listened attentively to Hobson's explanations, and could not but see the reasonableness of his deductions, but he was furious at such a rare, unexpected, and, as he said, "ridiculous" phenomenon occurring just so as to make him miss the eclipse, and he said not a word, but maintained a gloomy, even haughty silence.

"Poor Mr Black," said Mrs Barnett, "it must be owned that an astronomer was never more hardly used than you since the world began!"

"In any case, however," said Hobson, turning to her, "we have neither of us anything to reproach ourselves with. No one can find fault with us. Nature alone is to blame. The earthquake cut off our communication with the mainland, and converted our peninsula into a floating island, and this explains why the furred and other animals imprisoned like ourselves, have become so numerous round the fort!"

"This, too, is why the rivals you so much dreaded have not visited us, Lieutenant!" exclaimed Madge.

"And this," added the Sergeant, "accounts for the non-arrival of the convoy sent to Cape Bathurst by Captain Craventy."

"And this is why," said Mrs. Barnett, looking at the Lieutenant, "I must give up all hope of returning to Europe this year at least!"

The tone of voice in which the lady made this last remark showed that she resigned herself to her fate more readily than could have been expected. She seemed suddenly to have made up her mind to make the best of the situation, which would no doubt give her an opportunity of making a great many interesting observations. And after all, what good would grumbling have done? Recriminations were worse than useless. They could not have altered their position, or have checked the course of the wandering island, and there was no means of reuniting it to a continent. No; God alone could decide the future of Fort Hope. They must bow to His will.

CHAPTER II.
WHERE ARE WE?

It was necessary carefully to study the unexpected and novel situation in which the agents of the Company now found themselves, and Hobson did so with his chart before him.

He could not ascertain the longitude of Victoria Island—the original name being retained—until the next day, and the latitude had already been taken. For the longitude, the altitude of the sun must be ascertained before and after noon, and two hour angles must be measured.

At two o'clock P.M. Hobson and Black took the height of the sun above the horizon with the sextant, and they hoped to recommence the same operation the next morning towards ten o'clock A.M., so as to be able to infer from the two altitudes obtained the exact point of the Arctic Ocean then occupied by their island.

The party did not, however, at once return to the fort, but remained talking together for some little time on the promontory. Madge declared she was quite resigned, and evidently thought only of her mistress, at whom she could not look without emotion; she could not bear to think of the sufferings and trials her "dear girl" might have to go through in the future. She was ready to lay down her life for "Paulina," but what good could that do now. She knew, however, that Mrs Barnett was not a woman to sink under her misfortunes, and indeed at present there was really no need for any one to despair.

There was no immediate danger to be dreaded, and a catastrophe might even yet be avoided. This Hobson carefully explained to his companions.

Two dangers threatened the island floating along the coast of North America, only two.

It would be drawn by the currents of the open sea to the high Polar latitudes, from which there is no return.

Or the current would take it to the south, perhaps through the Behring Strait into the Pacific Ocean.

In the former contingency, the colonists, shut in by ice and surrounded by impassable icebergs, would have no means of communication with their fellow-creatures, and would die of cold and hunger in the solitudes of the north.

In the latter contingency, Victoria Island, driven by the currents to the western waters of the Pacific, would gradually melt and go to pieces beneath the feet of its inhabitants.

In either case death would await the Lieutenant and his companions, and the fort, erected at the cost of so much
labour and suffering, would be destroyed.

But it was scarcely probable that either of these events would happen. The season was already considerably advanced, and in less than three months the sea would again be rendered motionless by the icy hand of the Polar winter. The ocean would again be converted into an ice-field, and by means of sledges they might get to the nearest land—the coast of Russian America if the island remained in the east, or the coast of Asia if it were driven to the west.

"For," added Hobson, "we have absolutely no control over our floating island. Having no sail to hoist, as in a boat, we cannot guide it in the least. Where it takes us we must go."

All that Hobson said was clear, concise, and to the point. There could be no doubt that the bitter cold of winter would solder Victoria Island to the vast ice-field, and it was highly probable that it would drift neither too far north nor too far south. To have to cross a few hundred miles of ice was no such terrible prospect for brave and resolute men accustomed to long excursions in the Arctic regions. It would be necessary, it was true, to abandon Fort Hope—the object of so many hopes, and to lose the benefit of all their exertions, but what of that? The factory, built upon a shifting soil, could be of no further use to the Company. Sooner or later it would be swallowed up by the ocean, and what was the good of useless regrets? It must, therefore, be deserted as soon as circumstances should permit.

The only thing against the safety of the colonists was—and the Lieutenant dwelt long on this point—that during the eight or nine weeks which must elapse before the solidification of the Arctic Ocean, Victoria Island might be dragged too far north or south.

Arctic explorers had often told of pieces of ice being drifted an immense distance without any possibility of stopping them.

Everything then depended on the force and direction of the currents from the opening of Behring Strait; and it would be necessary carefully to ascertain all that a chart of the Arctic Ocean could tell. Hobson had such a chart, and invited all who were with him on the cape to come to his room and look at it; but before going down to the fort he once more urged upon them the necessity of keeping their situation a secret.

"It is not yet desperate," he said, "and it is therefore quite unnecessary to damp the spirits of our comrades, who will perhaps not be able to understand, as we do, all the chances in our favour."

"Would it not be prudent to build a boat large enough to hold us all, and strong enough to carry us a few hundred miles over the sea?" observed Mrs Barnett.

"It would be prudent certainly," said Hobson, "and we will do it. I must think of some pretext for beginning the work at once, and give the necessary orders to the head carpenter. But taking to a boat can only be a forlorn hope when everything else has failed. We must try all we can to avoid being on the island when the ice breaks up, and we must make for the mainland as soon as ever the sea is frozen over."

Hobson was right. It would take about three months to build a thirty or thirty-five ton vessel, and the sea would not be open when it was finished. It would be very dangerous to embark the whole party when the ice was breaking up all round, and he would be well out of his difficulties if he could get across the ice to firm ground before the next thaw set in. This was why Hobson thought a boat a forlorn hope, a desperate makeshift, and every one agreed with him.

Secrecy was once more promised, for it was felt that Hobson was the best judge of the matter, and a few minutes later the five conspirators were seated together in the large room of Fort Hope, which was then deserted, eagerly examining an excellent map of the oceanic and atmospheric currents of the Arctic Ocean, special attention being naturally given to that part of the Polar Sea between Cape Bathurst and Behring Strait.

Two principal currents divide the dangerous latitudes comprehended between the Polar Circle and the imperfectly known zone, called the North-West Passage since McClure’s daring discovery—at least only two have been hitherto noticed by marine surveyors.

One is called the Kamtchatka Current. It takes its rise in the offing outside the peninsula of that name, follows the coast of Asia, and passes through Behring Strait, touching Cape East, a promontory of Siberia. After running due north for about six hundred miles from the strait, it turns suddenly to the east, pretty nearly following the same parallel as McClure’s Passage, and probably doing much to keep that communication open for a few mouths in the warm season.

The other current, called Behring Current, flows just the other way. After running from east to west at about a hundred miles at the most from the coast, it comes into collision, so to speak, with the Kamtchatka Current at the opening of the strait, and turning to the south approaches the shores of Russian America, crosses Behring Sea, and finally breaks on the kind of circular dam formed by the Aleutian Islands.

Hobson’s map gave a very exact summary of the most recent nautical observations, so that it could be relied on.

The Lieutenant examined it carefully before speaking, and then pressing his hand to his head, as if oppressed by some sad presentiment, he observed—
"Let us hope that fate will not take us to remote northern latitudes. Our wandering island would run a risk of never returning."

"Why, Lieutenant?" broke in Mrs Barnett.

"Why, madam?" replied Hobson; "look well at this part of the Arctic Ocean, and you will readily understand why. Two currents, both dangerous for us, run opposite ways. When they meet, the island must necessarily become stationary, and that at a great distance from any land. At that point it will have to remain for the winter, and when the next thaw sets in, it will either follow the Kamtchatka Current to the deserted regions of the north-west, or it will float down with the Behring Current to be swallowed up by the Pacific Ocean."

"That will not happen, Lieutenant," said Madge in a tone of earnest conviction; "God would never permit that."

"I can’t make out," said Mrs Barnett, "whereabouts in the Polar Sea we are at this moment; for I see but one current from the offing of Cape Bathurst which bears directly to the north-west, and that is the dangerous Kamtchatka Current. Are you not afraid that it has us in its fatal embrace, and is carrying us with it to the shores of North Georgia?"

"I think not," replied Hobson, after a moment’s reflection.

"Why not?"

"Because it is a very rapid current, madam; and if we had been following it for three months, we should have had some land in sight by this time, and there is none, absolutely none!"

"Where, then, do you suppose we are?" inquired Mrs Barnett.

"Most likely between the Kamtchatka Current and the coast, perhaps in some vast eddy unmarked upon the map."

"That cannot be, Lieutenant," replied Mrs Barnett, quickly.

"Why not, madam, why not?"

"Because if Victoria Island were in an eddy, it would have veered round to a certain extent, and our position with regard to the cardinal points would have changed in the last three months, which is certainly not the case."

"You are right, madam, you are quite right. The only explanation I can think of is, that there is some other current, not marked on our map. Oh, that to morrow were here that I might find out our longitude; really this uncertainty is terrible!"

"To-morrow will come," observed Madge.

There was nothing to do but to wait. The party therefore separated, all returning to their ordinary occupations. Sergeant Long informed his comrades that the departure for Fort Reliance, fixed for the next day, was put off. He gave as reasons that the season was too far advanced to get to the southern factory before the great cold set in, that the astronomer was anxious to complete his meteorological observations, and would therefore submit to another winter in the north, that game was so plentiful provisions from Fort Reliance were not needed. &c., &c. But about all these matters the brave fellows cared little.

Lieutenant Hobson ordered his men to spare the furred animals in future, and only to kill edible game, so as to lay up fresh stores for the coming winter; he also forbade them to go more than two miles from the fort, not wishing Marbre and Sabine to come suddenly upon a sea-horizon, where the isthmus connecting the peninsula of Victoria with the mainland was visible a few months before. The disappearance of the neck of land would inevitably have betrayed everything.

The day appeared endless to Lieutenant Hobson. Again and again he returned to Cape Bathurst either alone, or accompanied by Mrs Barnett. The latter, inured to danger, showed no fear; she even joked the Lieutenant about his floating island being perhaps, after all, the proper conveyance for going to the North Pole. "With a favourable current might they not reach that hitherto inaccessible point of the globe?"

Lieutenant Hobson shook his head as he listened to his companion’s fancy, and kept his eyes fixed upon the horizon, hoping to catch a glimpse of some land, no matter what, in the distance. But no, sea and sky met in an absolutely unbroken circular line, confirming Hobson’s opinion that Victoria Island was drifting to the west rather than in any other direction.

"Lieutenant," at last said Mrs Barnett, "don’t you mean to make a tour of our island as soon as possible?"

"Yes, madam, of course; as soon as I have taken our bearings, I mean to ascertain the form and extent of our dominions. It seems, however, that the fracture was made at the isthmus itself, so that the whole peninsula has become an island."

"A strange destiny is ours, Lieutenant," said Mrs Barnett. "Others return from their travels to add new districts to geographical maps, but we shall have to efface the supposed peninsula of Victoria!"

The next day, July 18th, the sky was very clear, and at ten o’clock in the morning Hobson obtained a satisfactory altitude of the sun, and, comparing it with that of the observation of the day before, he ascertained exactly the longitude in which they were.
The island was then in 157° 37' longitude west from Greenwich.
The latitude obtained the day before at noon almost immediately after the eclipse was, as we know, 73° 7' 20"
north.
The spot was looked out on the map in the presence of Mrs Barnett and Sergeant Long.
It was indeed a most anxious moment, and the following result was arrived at.
The wandering island was moving in a westerly direction, borne along by a current unmarked on the chart, and
unknown to hydrographers, which was evidently carrying it towards Behring Strait. All the dangers foreseen by
Hobson were then imminent, if Victoria Island did not again touch the mainland before the winter.
"But how far are we from the American continent? that is the most important point just at present," said Mrs
Barnett.

Hobson took his compasses, and carefully measured the narrowest part of the sea between the coast and the
seventieth parallel.
"We are actually more than two hundred and fifty miles from Point Barrow, the northernmost extremity of
Russian America," he replied.
"We ought to know, then, how many miles the island has drifted since it left the mainland," said Sergeant Long.
"Seven hundred miles at least," replied Hobson, after having again consulted the chart.
"And at about what time do you suppose the drifting commenced?"
"Most likely towards the end of April; the ice-field broke up then, and the icebergs which escaped melting drew
back to the north. We may, therefore, conclude that Victoria Island has been moving along with the current parallel
with the coast at an average rate of ten miles a day."
"No very rapid pace after all!" exclaimed Mrs Barnett.
"Too fast, madam, when you think where we may be taken during the two months in which the sea will remain
open in this part of the Arctic Ocean."
The three friends remained silent, and looked fixedly at the chart of the fearful Polar regions, towards which they
were being irresistibly drawn, and which have hitherto successfully resisted all attempts to explore them.
"There is, then, nothing to be done? Nothing to try?" said Mrs Barnett after a pause.
"Nothing, madam," replied Hobson; "nothing whatever. We must wait; we must all pray for the speedy arrival of
the Arctic winter generally so much dreaded by sailors, but which alone can save us now. The winter will bring ice,
our only anchor of salvation, the only power which can arrest the course of this wandering island."
CHAPTER III.
A TOUR OF THE ISLAND.
From that day, July 18th, it was decided that the bearings should be taken as on board a vessel whenever the
state of the atmosphere rendered the operation possible. Was not the island, in fact, a disabled ship, tossed about
without sails or helm.
The next day after taking the bearings, Hobson announced that without change of latitude the island had
advanced several miles farther west. Mac-Nab was ordered to commence the construction of a huge boat, Hobson
telling him, in explanation, that he proposed making a reconnaissance of the coast as far as Russian America next
summer. The carpenter asked no further questions, but proceeded to choose his wood, and fixed upon the beach at
the foot of Cape Bathurst as his dockyard, so that he might easily be able to launch his vessel.
Hobson intended to set out the same day on his excursion round the island in which he and his comrades were
imprisoned. Many changes might take place in the configuration of this sheet of ice, subject as it was to the
influence of the variable temperature of the waves, and it was important to determine its actual form at the present
time, its area, and its thickness in different parts. The point of rupture, which was most likely at the isthmus itself,
ought to be examined with special care; the fracture being still fresh, it might be possible to ascertain the exact
arrangement of the stratified layers of ice and earth of which the soil of the island was composed.
But in the afternoon the sky clouded over suddenly, and a violent squall, accompanied with thick mists, swept
down upon the fort. Presently torrents of rain fell, and large hailstones rattled on the roof, whilst a few distant claps
of thunder were heard, a phenomenon of exceedingly rare occurrence in such elevated latitudes.
Hobson was obliged to put off his trip, and wait until the fury of the elements abated, but during the 20th, 21st,
and 22d July, no change occurred. The storm raged, the floods of heaven were let loose, and the waves broke upon
the beach with a deafening roar. Liquid avalanches were flung with such force upon Cape Bathurst, that there was
reason to dread that it might give way; its stability was, in fact, somewhat problematical, as it consisted merely of an
aggregation of sand and earth, without any firm foundation. Vessels at sea might well be pitied in this fearful gale,
but the floating island was of too vast a bulk to be affected by the agitation of the waves, and remained indifferent to
their fury.
During the night of the 22d July the tempest suddenly ceased. A strong breeze from the north-east dispelled the
last mists upon the horizon. The barometer rose a few degrees, and the weather appeared likely to favour Hobson's expedition.

He was to be accompanied by Mrs Barnett and Sergeant Long, and expected to be absent a day or two. The little party took some salt meat, biscuits, and a few flasks of rum with them, and there was nothing in their excursion to surprise the rest of the colonists. The days were just then very long, the sun only disappearing below the horizon for a few hours.

There were no wild animals to be feared now. The bears seemed to have fled by instinct from the peninsula whilst it was still connected with the mainland, but to neglect no precaution each of the three explorers was provided with a gun. The Lieutenant and his subordinate also carried hatchets and ice-chisels, which a traveller in the Polar regions should never be without.

During the absence of the Lieutenant and the Sergeant, the command of the fort fell to Corporal Joliffe, or rather to his little wife, and Hobson knew that he could trust her. Thomas Black could not be depended on; he would not even join the exploring party; he promised, however, to watch the northern latitudes very carefully, and to note any change which should take place in the sea or the position of the cape during the absence of the Lieutenant.

Mrs Barnett had endeavoured to reason with the unfortunate astronomer, but he would listen to nothing. He felt that Nature had deceived him, and that he could never forgive her.

After many a hearty farewell, the Lieutenant and his two companions left the fort by the postern gate, and, turning to the west, followed the lengthened curve of the coast between Capes Bathurst and Esquimaux.

It was eight o'clock in the morning; the oblique rays of the sun struck upon the beach, and touched it with many a brilliant tint, the angry billows of the sea were sinking to rest, and the birds, ptarmigans, guillemots, puffins, and petrels, driven away by the storm, were returning by thousands. Troops of ducks were hastening back to Lake Barnett, flying close, although they knew it not, to Mrs Joliffe’s saucepan. Polar hares, martens, musk rats, and ermines rose before the travellers and fled at their approach, but not with any great appearance of haste or terror. The animals evidently felt drawn towards their old enemies by a common danger.

"They know well enough that they are hemmed in by the sea and cannot quit the island," observed Hobson.

"They are all in the habit of seeking warmer climates in the south in the winter, are they not?" inquired Mrs Barnett.

"Yes, madam, but unless they are presently able to cross the ice-field, they will have to remain prisoners like ourselves, and I am afraid the greater number will die of cold or hunger.

"I hope they will be good enough to supply us with food for a long time," observed the Sergeant," and I think it is very fortunate that they had not the sense to run away before the rupture of the isthmus."

"The birds will, however, leave us?" added Mrs Barnett.

"Oh yes, madam, everything with wings will go, they can traverse long distances without fatigue, and, more fortunate than ourselves, they will regain terra firma."

"Could we not use them as messengers?" asked Mrs Barnett.

"A good idea, madam, a capital idea," said Hobson. "We might easily catch some hundreds of these birds, and tie a paper round their necks with our exact situation written upon it. John Ross in 1848 tried similar means to acquaint the survivors of the Franklin expedition with the presence of his ships, the Enterprise and the Investigator in the Polar seas. He caught some hundreds of white foxes in traps, rivetted a copper collar round the neck of each with all the necessary information engraved upon it, and then set them free in every direction."

"Perhaps some of the messengers may have fallen into the hands of the shipwrecked wanderers."

"Perhaps so," replied Hobson; "I know that an old fox was taken by Captain Hatteras during his voyage of discovery, wearing a collar half worn away and hidden beneath his thick white fur. What we cannot do with the quadrupeds, we will do with the birds."

Chatting thus and laying plans for the future, the three explorers continued to follow the coast. They noticed no change; the abrupt cliffs covered with earth and sand showed no signs of a recent alteration in the extent of the island. It was, however, to be feared that the vast sheet of ice would be worn away at the base by the action of the warm currents, and on this point Hobson was naturally anxious.

By eleven o'clock in the morning the eight miles between Capes Bathurst and Esquimaux had been traversed. A few traces of the encampment of Kalumah’s party still remained; of course the snow huts had entirely disappeared, but some cinders and walrus bones marked the spot.

The three explorers halted here for a short time, they intended to pass the few short hours of the night at Walruses’ Bay, which they hoped to reach in a few hours. They breakfasted seated on a slightly rising ground covered with a scanty and stunted herbage. Before their eyes lay the ocean bounded by a clearly-defined sea-horizon, without a sail or an iceberg to break the monotony of the vast expanse of water.

"Should you be very much surprised if some vessel came in sight now, Lieutenant?" inquired Mrs Barnett.
"I should be very agreeably surprised, madam," replied Hobson. "It is not at all uncommon for whalers to come as far north as this, especially now that the Arctic Ocean is frequented by whales and chacholots, but you must remember that it is the 23rd July, and the summer is far advanced. The whole fleet of whaling vessels is probably now in Gulf Kotzebue, at the entrance to the strait. Whalers shun the sudden changes in the Arctic Ocean, and with good reason. They dread being shut in the ice; and the icebergs, avalanches, and, ice-fields they avoid, are the very things for which we earnestly pray."

"They will come, Lieutenant," said Long; "have patience, in another two months the waves will no longer break upon the shores of Cape Esquimaux."

"Cape Esquimaux!" observed Mrs Barnett with a smile. "That name, like those we gave to the other parts of the peninsula, may turn out unfortunate too. We have lost Port Barnett and Paulina River; who can tell whether Cape Esquimaux and Walruses' Bay may not also disappear in time?"

"They too will disappear, madam," replied Hobson, "and after them the whole of Victoria Island, for nothing now connects it with a continent, and it is doomed to destruction. This result is inevitable, and our choice of geographical names will be thrown away; but fortunately the Royal Society has not yet adopted them, and Sir Roderick Murchison will have nothing to efface on his maps."

"One name he will," exclaimed the Sergeant.
"Which?" inquired Hobson.
"Cape Bathurst," replied Long.
"Ah, yes, you are right. Cape Bathurst must now be removed from maps of the Polar regions."

Two hours' rest were all the explorers cared for, and at one o'clock they prepared to resume their journey. Before starting Hobson once more looked round him from the summit of Cape Esquimaux; but seeing nothing worthy of notice, he rejoined Mrs Barnett and Sergeant Long.

"Madam," he said, addressing the lady, "you have not forgotten the family of natives we met here last winter?"
"Oh no, I have always held dear little Kalumah in friendly remembrance. She promised to come and see us again at Fort Hope, but she will not be able to do so. But why do you ask me about the natives now?"
"Because I remember something to which, much to my regret, I did not at the time attach sufficient importance."
"What was that?"
"You remember the uneasy surprise the men manifested at finding a big a factory at the foot of Cape Bathurst."
"Oh yes, perfectly."
"You remember that I tried to make out what the natives meant, and that I could not do so?"
"Yes, I remember."
"Well," added Hobson, "I know now why they shook their heads. From tradition, experience, or something, the Esquimaux knew what the peninsula really was, they knew we had not built on firm ground. But as things had probably remained as they were for centuries, they thought there was no immediate danger, and that it was not worth while to explain themselves."
"Very likely you are right," replied Mrs Barnett; "but I feel sure that Kalumah had no suspicion of her companion's fears, or she would have warned us."

Hobson quite agreed with Mrs Barnett, and Sergeant Long observed—

"It really seems to have been by a kind of fatality that we settled ourselves upon this peninsula just before it was torn away from the mainland. I suppose, Lieutenant, that it had been connected for a very long time, perhaps for centuries."

"You might say for thousands and thousands of years, Sergeant," replied Hobson. "Remember that the soil on which we are treading has been brought here by the wind, little by little, that the sand has accumulated grain by grain! Think of the time it must have taken for the seeds of firs, willows, and arbutus to become shrubs and trees! Perhaps the sheet of ice on which we float was welded to the continent before the creation of man!"

"Well," cried Long, "it really might have waited a few centuries longer before it drifted. How much anxiety and how many dangers we might then have been spared!"

Sergeant Long's most sensible remark closed the conversation, and the journey was resumed.

From Cape Esquimaux to Walruses' Bay the coast ran almost due south, following the one hundred and twenty-seventh meridian. Looking behind them they could see one corner of the lagoon, its waters sparkling in the sunbeams, and a little beyond the wooded heights in which it was framed. Large eagles soared above their heads, their cries and the loud flapping of their wings breaking the stillness, and furred animals of many kinds, martens, polecats, ermines, &c., crouching behind some rising ground, or hiding amongst the stunted bushes and willows, gazed inquiringly at the intruders. They seemed to understand that they had nothing to fear. Hobson caught a glimpse of a few beavers wandering about, evidently ill at ease, and puzzled at the disappearance of the little river. With no ledges to shelter them, and no stream by which to build a new home, they were doomed to die of cold when
the severe frost set in. Sergeant Long also saw a troop of wolves crossing the plain.

It was evident that specimens of the whole Arctic Fauna were imprisoned on the island, and there was every reason to fear that, when famished with hunger, all the carnivorous beasts would be formidable enemies to the occupants of Fort Hope.

Fortunately, however, one race of animals appeared to be quite unrepresented. Not a single white bear was seen! Once the Sergeant thought he saw an enormous white mass moving about on the other side of a clump of willows, but on close examination decided that he was mistaken.

The coast near Walruses’ Bay was, on the whole, only slightly elevated above the sea-level, and in the distance the waves broke into running foam as they do upon a sloping beach. It was to be feared that the soil had little stability, but there was no means of judging of the modifications which had taken place since their last visit, and Hobson much regretted that he had not made bench marks about Cape Bathurst before he left, that he might judge of the amount of sinking or depression which took place. He determined, however, to take this precaution on his return.

It will be understood that, under the circumstances, the party did not advance very rapidly. A pause was often made to examine the soil, or to see if there were any sign of an approaching fracture on the coast, and sometimes the explorers wandered inland for half a mile. Here and there the Sergeant planted branches of willow or birch to serve as landmarks for the future, especially wherever undermining seemed to be going on rapidly and the solidity of the ground was doubtful. By this means it would be easy to ascertain the changes which might take place.

They did advance, however, and at three o’clock in the afternoon they were only three miles from Walruses’ Bay, and Hobson called Mrs Barnett’s attention to the important changes which had been effected by the rupture of the isthmus.

Formerly the south-western horizon was shut in by a long slightly curved coast-line, formed by the shores of Liverpool Bay. Now a sea-line bounded the view, the continent having disappeared. Victoria Island ended in an abrupt angle where it had broken off, and all felt sure that on turning round that angle the ocean would be spread out before them, and that its waves would bathe the whole of the southern side of the island, which was once the connecting-link between Walruses’ Bay and Washburn Bay.

Mrs Barnett could not look at the changed aspect of the scene without emotion. She had expected it, and yet her heart beat almost audibly. She gazed across the sea for the missing continent, which was now left several hundred miles behind, and it rushed upon her mind with a fresh shock that she would never set foot on America again. Her agitation was indeed excusable, and it was shared by the Lieutenant and the Sergeant.

All quickened their steps, eager to reach the abrupt angle in the south. The ground rose slightly as they advanced, and the layers of earth and sand became thicker; this of course was explained by the former proximity of this part of the coast to the true continent. The thickness of the crust of ice and of the layer of earth at the point of junction increasing, as it probably did, every century, explained the long resistance of the isthmus, which nothing but some extraordinary convulsion could have overcome. Such a convulsion was the earthquake of the 8th January, which, although it had only affected the continent of North America, had sufficed to break the connecting-link, and to launch Victoria Island upon the wide ocean.

At four o’clock P.M., the angle was reached. Walruses’ Bay, formed by an indentation of the firm ground, had disappeared! It had remained behind with the continent.

"By my faith, madam!” exclaimed the Sergeant, “it’s lucky for you we didn’t call it Paulina Barnett Bay!"

“Yes,” replied the lady, “I begin to think I am an unlucky godmother for newly-discovered places.”

CHAPTER IV.

A NIGHT ENCAMPMENT.

And so Hobson had not been mistaken about the point of rupture. It was the isthmus which had yielded in the shock of the earthquake. Not a trace was to be seen of the American continent, not a single cliff, even the volcano on the west had disappeared. Nothing but the sea everywhere.

The island on this side ended in a cape, coming to an almost sharp point, and it was evident that the substratum of ice, fretted by the warmer waters of the current and exposed to all the fury of the elements, must rapidly dissolve.

The explorers resumed their march, following the course of the fracture, which ran from west to east in an almost straight line. Its edges were not jagged or broken, but clear cut, as if the division had been made with a sharp instrument, and here and there the conformation of the soil could be easily examined. The banks- half ice, half sand and earth-rose some ten feet from the water. They were perfectly perpendicular, without the slightest slope, and in some places there were traces of recent landslips. Sergeant Long pointed to several small blocks of ice floating in the offing, and rapidly melting, which had evidently been broken off from their island. The action of the warm surf would, of course, soon eat away the new coast-line, which time had not yet clothed with a kind of cement of snow and sand, such as covered the rest of the beach, and altogether the state of things was very far from reassuring.

Before taking any rest, Mrs Barnett, Hobson, and Long, were anxious to finish their examination of the southern
edge of the island. There would be plenty of daylight, for the sun would not set until eleven o’clock P.M. The briliant orb of day was slowly advancing along the western horizon, and its oblique rays cast long shadows of themselves before the explorers, who conversed at intervals after long silent pauses, during which they gazed at the sea and thought of the dark future before them.

Hobson intended to encamp for the night at Washburn Bay. When there eighteen miles would have been traversed, and, if he were not mistaken, half his circular journey would be accomplished. After a few hours’ repose he meant to return to Fort Hope along the western coast.

No fresh incident marked the exploration of the short distance between Walruses’ Bay and Washburn Bay, and at seven o’clock in the evening the spot chosen for the encampment was reached. A similar change had taken place here. Of Washburn Bay, nothing remained but the curve formed by the coast-line of the island, and which was once its northern boundary. It stretched away without a break for seven miles to the cape they had named Cape Michael. This side of the island did not appear to have suffered at all in consequence of the rupture. The thickets of pine and birch, massed a little behind the cape, were in their fullest beauty at this time of year, and a good many furred animals were disporting themselves on the plain.

A halt was made at Washburn Bay, and the explorers were able to enjoy an extended view on the south, although they could not see any great distance on the north. The sun was so low on the horizon, that its rays were intercepted by the rising ground on the west, and did not reach the little bay. It was not, however, yet night, nor could it be called twilight, as the sun had not set.

"Lieutenant," said Long, "if by some miracle a bell were now to ring, what do you suppose it would mean?"

"That it was supper-time," replied Hobson. "Don’t you agree with me, Mrs Barnett?"

"Indeed I do," replied the lady addressed, "and as our cloth is spread for us, let us sit down. This moss, although slightly worn, will suit us admirably, and was evidently intended for us by Providence."

The bag of provisions was opened; some salt meat, a hare paté from Mrs Joliffe’s larder, with a few biscuits, formed their frugal supper.

The meal was quickly over, and Hobson returned to the southwest angle of the island, whilst Mrs Barnett rested at the foot of a low fir tree, and Sergeant Long made ready the night quarters.

The Lieutenant was anxious to examine the piece of ice which formed the island, to ascertain, if possible, something of its structure. A little bank, produced by a landslip, enabled him to step down to the level of the sea, and from there he was able to look closely at the steep wall which formed the coast. Where he stood the soil rose scarcely three feet above the water. The upper part consisted of a thin layer of earth and sand mixed with crushed shells; and the lower of hard, compact, and, if we may so express it, "metallic" ice, strong enough to support the upper soil of the island.

This layer of ice was not more than one foot above the sea-level. In consequence of the recent fracture, it was easy to see the regular disposition of the sheets of ice piled up horizontally, and which had evidently been produced by successive frosts in comparatively quieter waters.

We know that freezing commences on the surface of liquids, and as the cold increases, the thickness of the crust becomes greater, the solidification proceeding from the top downwards. That at least is the case in waters that are at rest; it has, however, been observed that the very reverse is the case in running waters—the ice forming at the bottom, and subsequently rising to the surface.

It was evident, then, that the floe which formed the foundation of Victoria Island had been formed in calm waters on the shores of the North American continent. The freezing had evidently commenced on the surface, and the thaw would begin at the bottom, according to a well-known law; so that the ice-field would gradually decrease in weight as it became thawed by the warmer waters through which it was passing, and the general level of the island would sink in proportion.

This was the great danger.

As we have just stated, Hobson noticed that the solid ice, the ice-field properly so called, was only about one foot above the sea-level! We know that four-fifths of a floating mass of ice are always submerged. For one foot of an iceberg or ice-field above the water, there are four below it. It must, however, be remarked that the density, or rather specific weight of floating ice, varies considerably according to its mode of formation or origin. The ice-masses which proceed from sea water, porous, opaque, and tinged with blue or green, according as they are struck by the rays of the sun, are lighter than ice formed from fresh water. All things considered, and making due allowance for the weight of the mineral and vegetable layer above the ice, Hobson concluded it to be about four or five feet thick below the sea-level. The different declivities of the island, the little hills and rising ground, would of course only affect the upper soil, and it might reasonably be supposed that the wandering island was not immersed more than five feet.

This made Hobson very anxious. Only five feet! Setting aside the causes of dissolution to which the ice-field
might be subjected, would not the slightest shock cause a rupture of the surface? Might not a rough sea or a gale of wind cause a dislocation of the ice-field, which would lead to its breaking up into small portions, and to its final decomposition? Oh for the speedy arrival of the winter, with its bitter cold! Would that the column of mercury were frozen in its cistern! Nothing but the rigour of an Arctic winter could consolidate and thicken the foundation of their island, and establish a means of communication between it and the continent.

Hobson returned to the halting-place little cheered by his discoveries, and found Long busy making arrangements for the night; for he had no idea of sleeping beneath the open sky, although Mrs Barnett declared herself quite ready to do so. He told the Lieutenant that he intended to dig a hole in the ice big enough to hold three persons—in fact to make a kind of snow-hut, in which they would be protected from the cold night air.

"In the land of the Esquimaux," he said, "nothing is wiser than to do as the Esquimaux do."

Hobson approved, but advised the Sergeant not to dig too deeply, as the ice was not more than five feet thick.

Long set to work. With the aid of his hatchet and ice-chisel he had soon cleared away the earth, and hollowed out a kind of passage sloping gently down to the crust of ice.

He next attacked the brittle mass, which had been covered over with sand and earth for so many centuries. It would not take more than an hour to hollow out a subterranean retreat, or rather a burrow with walls of ice, which would keep in the heat, and therefore serve well for a resting-place during the short night.

Whilst Long was working away like a white ant, Hobson communicated the result of his observations to Mrs Barnett. He did not disguise from her that the construction of Victoria Island rendered him very uneasy. He felt sure that the thinness of the ice would lead to the opening of ravines on the surface before long; where, it would be impossible to foresee, and of course it would be equally impossible to prevent them. The wandering Island might at any moment settle down in consequence of a change in its specific gravity, or break up into more or less numerous islets, the duration of which must necessarily be ephemeral. He judged, therefore, that it would be best for the members of the colony to keep together as much as possible, and not to leave the fort, that they might all share the same chances.

Hobson was proceeding further to unfold his views when cries for help were heard.

Mrs Barnett started to her feet, and both looked round in every direction, but nothing was to be seen.

The cries were now redoubled, and Hobson exclaimed—

"The Sergeant! the Sergeant!"

And followed by Mrs Barnett, he rushed towards the burrow, and he had scarcely reached the opening of the snow-house before he saw Sergeant Long clutching with both hands at his knife, which he had stuck in the wall of ice, and calling out loudly, although with the most perfect self-possession.

His head and arms alone were visible. Whilst he was digging, the ice had given way suddenly beneath him, and he was plunged into water up to his waist.

Hobson merely said—

"Keep hold!"

And creeping through the passage, he was soon at the edge of the hole. The poor Sergeant seized his hand, and he was soon rescued from his perilous position.

"Good God! Sergeant!" exclaimed Mrs Barnett; "what has happened?"

"Nothing," replied Long, shaking himself like a wet spaniel, "except that the ice gave way under me, and I took a compulsory bath."

"You forgot what I told you about not digging too deeply, then," said Hobson.

"Beg pardon, sir; I hadn't cut through fifteen inches of the ice, and I expect there was a kind of cavern where I was working—the ice did not touch the water. It was just like going through a ceiling. If I hadn't been able to hang on by my knife, I should have slipped under the island like a fool, and that would have been a pity, wouldn't it, madam?"

"A very great pity, my brave fellow," said Mrs Barnett, pressing his hand.

Long's explanation was correct; for some reason or another—most likely from an accumulation of air—the ice had formed a kind of vault above the water, and of course it soon gave way under the weight of the Sergeant and the blows of his chisel.

The same thing might happen in other parts of the island, which was anything but reassuring. Where could they be certain of treading on firm ground? Might not the earth give way beneath their feet at any minute? What heart, however brave, would not have sunk at the thought of the thin partition between them and the awful gulf of the ocean?

Sergeant Long, however, thought but little of his bath, and was ready to begin mining in some other place. This Mrs Barnett would not allow. A night in the open air would do her no harm; the shelter of the coppice near would be protection enough for them all; and Sergeant Long was obliged to submit.
The camp was, therefore, moved back some thirty yards from the beach, to a rising ground on which grew a few clumps of pines and willows which could scarcely be called a wood. Towards ten o’clock the disc of the sun began to dip below the horizon, and before it disappeared for the few hours of the night a crackling fire of dead branches was blazing at the camp.

Long had now a fine opportunity of drying his legs, of which he gladly availed himself. He and Hobson talked together earnestly until twilight set in, and Mrs Barnett occasionally joined in the conversation, doing the best she could to cheer the disheartened Lieutenant. The sky was bright with stars, and the holy influence of the night could not fail to calm his troubled spirit. The wind murmured softly amongst the pines; even the sea appeared to be wrapt in slumber, its bosom slightly heaving with the swell, which died away upon the beach with a faint rippling sound. All creation was hushed, not even the wail of a sea bird broke upon the ear; the crisp crackling of the dead branches was exchanged for a steady flame, and nothing but the voices of the wanderers broke the sublime, the awful silence of the night.

“Who would imagine,” said Mrs Barnett, “that we were floating on the surface of the ocean! It really requires an effort to realise it, for the sea which is carrying us along in its fatal grasp appears to be absolutely motionless!”

“Yes, madam,” replied Hobson; and if the floor of our carriage were solid, if I did not know that sooner or later the keel of our boat will be missing, that some day its hull will burst open, and finally, if I knew where we are going, I should rather enjoy floating on the ocean like this.”

“Well, Lieutenant,” rejoined Mrs Barnett, “could there be a pleasanter mode of travelling than ours? We feel no motion. Our island has exactly the same speed as the current which is bearing it away. Is it not like a balloon voyage in the air? What could be more delightful than advancing with one’s house, garden, park, &c.? A wandering island, with a solid insubmersible foundation, would really be the most comfortable and wonderful conveyance that could possibly be imagined. I have heard of hanging gardens. Perhaps some day floating parks will be invented which will carry us all over the globe! Their size will render them insensible to the action of the waves, they will have nothing to fear from storms, and perhaps with a favourable wind they might be guided by means of immense sails! What marvels of vegetation would be spread before the eyes of the passengers when they passed from temperate to torrid zones! With skilful pilots, well acquainted with the currents, it might be possible to remain in one latitude, and enjoy a perpetual spring.”

Hobson could not help smiling at Mrs Barnett’s fancies. The brave woman ran on with such an easy flow of words, she talked with as little effort as Victoria Island moved. And was she not right? It would have been a very pleasant mode of travelling if there had been no danger of their conveyance melting and being swallowed up by the sea.

The night passed on, and the explorers slept a few hours. At daybreak they breakfasted, and thoroughly enjoyed their meal. The warmth and rest had refreshed them, and they resumed their journey at about six o’clock A.M.

From Cape Michael to the former Port Barnett the coast ran in an almost straight line from south to north for about eleven miles. There was nothing worthy of note about it; the shores were low and pretty even all the way, and seemed to have suffered no alteration since the breaking of the isthmus. Long, in obedience to the Lieutenant, made bench marks along the beach, that any future change might be easily noted.

Hobson was naturally anxious to get back to Fort Hope the same day, and Mrs Barnett was also eager to return to her friends. It was of course desirable under the circumstances that the commanding officer should not be long absent from the fort.

All haste was therefore made, and by taking a short cut they arrived at noon at the little promontory which formerly protected Port Barnett from the east winds.

It was not more than eight miles from this point to Fort Hope, and before four o’clock P.M the shouts of Corporal Joliffe welcomed their return to the factory.

CHAPTER V.

FROM JULY 25TH TO AUGUST 20TH.

Hobson’s first care on his return to the fort, was to make inquiries of Thomas Black as to the situation of the little colony. No change had taken place for the last twenty-four hours, but, as subsequently appeared, the island had floated one degree of latitude further south, whilst still retaining its motion towards the west. It was now at the same distance from the equator as Icy Cape, a little promontory of western Alaska, and two hundred miles from the American coast. The speed of the current seemed to be less here than in the eastern part of the Arctic Ocean, but the island continued to advance, and, much to Hobson’s annoyance, towards the dreaded Behring Strait. It was now only the 24th July, and a current of average speed would carry it in another month through the strait and into the heated waves of the Pacific, where it would melt “like a lump of sugar in a glass of water.”

Mrs Barnett acquainted Madge with the result of the exploration of the island. She explained to her the arrangement of the layers of earth and ice at the part where the isthmus had been broken off; told her that the
thickness of the ice below the sea level was estimated at five feet; related the accident to Sergeant Long—in short, she made her fully understand the reasons there were to fear the breaking up or sinking of the ice field.

The rest of the colony had, however, no suspicion of the truth; a feeling of perfect security prevailed. It never occurred to any of the brave fellows that Fort Hope was floating above an awful abyss, and that the lives of all its inhabitants were in danger. All were in good health, the weather was fine, and the climate pleasant and bracing. The baby Michael got on wonderfully; he was beginning to toddle about between the house and the palisade; and Corporal Joliffe, who was extremely fond of him, was already beginning to teach him to hold a gun, and to understand the first duties of a soldier. Oh, if Mrs Joliffe would but present him with such a son! but, alas! the blessing of children, for which he and his wife prayed every day, was as yet denied to them.

Meanwhile the soldiers had plenty to do.

Mac-Nab and his men—Petersen, Belcher, Garry, Pond, and Hope—worked zealously at the construction of a boat, a difficult task, likely to occupy them for several months. But as their vessel would be of no use until next year after the thaw, they neglected none of their duties at the factory on its account. Hobson let things go on as if the future of the factory were not compromised, and persevered in keeping the men in ignorance. This serious question was often discussed by the officer and his "staff," and Mrs Barnett and Madge differed from their chief on the subject. They thought it would be better to tell the whole truth; the men were brave and energetic, not likely to yield to despair, and the shock would not be great if they heard of it now, instead of only when their situation was so hopeless that it could not be concealed. But in spite of the justice of these remarks, Hobson would not yield, and he was supported by Sergeant Long. Perhaps, after all, they were right; they were both men of long experience, and knew the temper of their men.

And so the work of provisioning and strengthening the fort proceeded. The palisaded enceinte was repaired with new stakes, and made higher in many places, so that it really formed a very strong fortification. Mac-Nab also put into execution, with his chief’s approval, a plan he had long had at heart. At the corners abutting on the lake he built two little pointed sentry-boxes, which completed the defences; and Corporal Joliffe anticipated with delight the time when he should be sent to relieve guard: he felt that they gave a military look to the buildings, and made them really imposing.

The palisade was now completely finished, and Mac-Nab, remembering the sufferings of the last winter, built a new wood shed close up against the house itself, with a door of communication inside, so that there would be no need to go outside at all. By this contrivance the fuel would always be ready to hand. On the left side of the house, opposite the shed, Mac-Nab constructed a large sleeping-room for the soldiers, so that the camp-bed could be removed from the common room. This room was also to be used for meals, and work. The three married couples had private rooms walled off, so that the large house was relieved of them as well as of all the other soldiers. A magazine for furs only was also erected behind the house near the powder-magazine, leaving the loft free for stores; and the rafters and ribs of the latter were bound with iron cramps, that they might be able to resist all attacks. Mac-Nab also intended to build a little wooden chapel, which had been included in Hobson’s original plan of the factory; but its erection was put off until the next summer.

With what eager interest would the Lieutenant have once watched the progress of his establishment! Had he been building on firm ground, with what delight would he have watched the houses, sheds, and magazines rising around him! He remembered the scheme of crowning Cape Bathurst with a redoubt for the protection of Fort Hope with a sigh. The very name of the factory, "Fort Hope," made his heart sink within him; for should it not more truly be called "Fort Despair?"

These various works took up the whole summer, and there was no time for ennui. The construction of the boat proceeded rapidly. Mac-Nab meant it to be of about thirty tons measurement, which would make it large enough to carry some twenty passengers several hundred miles in the fine season. The carpenter had been fortunate enough to find some bent pieces of wood, so that he was able quickly to form the first ribs of the vessel, and soon the stern and stempost, fixed to the keel, were upon the dockyard at the foot of Cape Bathurst.

Whilst the carpenters were busy with hatchets, saws, and adzes, the hunters were eagerly hunting the reindeer and Polar hares, which abounded near the fort. The Lieutenant, however, told Marbre and Sabine not to go far away, stating as a reason, that until the buildings were completed he did not wish to attract the notice of rivals. The truth was, he did not wish the changes which had taken place to be noticed.

One day Marbre inquired if it was not now time to go to Walruses’ Bay, and get a fresh supply of morses-oil for burning, and Hobson replied rather hastily—

"No, Marbre; it would be useless."

The Lieutenant knew only too well that Walruses’ Bay was two hundred miles away, and that there were no morses to be hunted on the island.
It must not be supposed that Hobson considered the situation desperate even now. He often assured Mrs Barnett, Madge, and Long that he was convinced the island would hold together until the bitter cold of winter should thicken its foundation and arrest its course at one and the same time.

After his journey of discovery, Hobson estimated exactly the area of his new dominions. The island measured more than forty miles round, from which its superficial area[r] would appear to be about one hundred and forty miles at the least. By way of comparison, we may say that Victoria Island was rather larger than St Helena, and its area was about the same as that of Paris within the line of fortifications. If then it should break up into fragments, the separate parts might still be of sufficient size to be habitable for some time.

When Mrs Barnett expressed her surprise that a floating ice-field could be so large, Hobson replied by reminding her of the observations of Arctic navigators. Parry, Penny, and Franklin had met with ice-fields in the Polar seas one hundred miles long and fifty broad. Captain Kellet abandoned his boat on an ice-field measuring at least three hundred square miles, and what was Victoria Island compared to it?

Its size was, however, sufficient to justify a hope that it would resist the action of the warm currents until the cold weather set in. Hobson would not allow himself to doubt; his despair arose rather from the knowledge that the fruit of all his cares, anxieties, and dangers must eventually be swallowed up by the deep, and it was no wonder that he could take no interest in the works that were going on.

Mrs Barnett kept up a good heart through it all; she encouraged her comrades in their work, and took her share in it, as if she had still a future to look forward to. Seeing what an interest Mrs Joliffe took in her plants, she joined her every day in the garden. There was now a fine crop of sorrel and scurvy-grass—thanks to the Corporal’s unwearying exertions to keep off the birds of every kind, which congregated by hundreds.

The taming of the reindeer had been quite successful; there were now a good many young, and little Michael had been partly brought up on the milk of the mothers. There were now some thirty head in the herd which grazed near the fort, and a supply of the herbage on which they feed was dried and laid up for the winter. These useful animals, which are easily domesticated, were already quite familiar with all the colonists, and did not go far from the enceinte. Some of them were used in sledges to carry timber backwards and forwards. A good many reindeer, still wild, now fell into the trap half way between the fort and Port Barnett. It will be remembered that a large bear was once taken in it; but nothing of the kind occurred this season—none fell victims but the reindeer, whose flesh was salted and laid by for future use. Twenty at least were taken, which in the ordinary course of things would have gone down to the south in the winter.

One day, however, the reindeer-trap suddenly became useless in consequence of the conformation of the soil. After visiting it as usual, the hunter Marbre approached Hobson, and said to him in a significant tone——

"I have just paid my daily visit to the reindeer-trap, sir."

"Well, Marbre, I hope you have been as successful to-day as yesterday, and have caught a couple of reindeer," replied Hobson.

"No, sir, no," replied Marbre, with some embarrassment.
"Your trap has not yielded its ordinary contingent then?"
"No, sir; and if any animal had fallen in, it would certainly have been drowned!"
"Drowned!" cried the Lieutenant, looking at the hunter with an anxious expression.
"Yes, sir," replied Marbre, looking attentively at his superior, "the pit is full of water."
"Ah!" said Hobson, in the tone of a man who attached no importance to that, "you know your pit was partly hollowed out of ice; its walls have melted with the heat of the sun, and then "——

"Beg pardon for interrupting you, sir," said Marbre; "but the water cannot have been produced by the melting of ice."

"Why not, Marbre?" "Because if it came from ice it would be sweet, as you explained to me once before. Now the water in our pit is salt!"

Master of himself as he was, Hobson could not help changing countenance slightly, and he had not a word to say.

"Besides," added Marbre, "I wanted to sound the trench, to see how deep the water was, and to my great surprise, I can tell you, I could not find the bottom."

"Well, Marbre," replied Hobson hastily, "there is nothing so wonderful in that. Some fracture of the soil has established a communication between the sea and the trap. So don’t be uneasy about it, my brave fellow, but leave the trap alone for the present, and be content with setting snares near the fort."

Marbre touched his cap respectfully, and turned on his heel, but not before he had given his chief a searching glance.

Hobson remained very thoughtful for a few moments. Marbre’s tidings were of grave importance. It was evident that the bottom of the trench, gradually melted by the warm waters of the sea, had given way.
Hobson at once called the Sergeant, and having acquainted him with the incident, they went together, unnoticed by their companions, to the beach at the foot of Cape Bathurst, where they had made the bench-marks.

They examined them carefully, and found that since they last did so, the floating island had sunk six inches.

"We are sinking gradually," murmured Sergeant Long. "The ice is wearing away."

"Oh for the winter! the winter!" cried Hobson, stamping his foot upon the ground.

But as yet, alas! there was no sign of the approach of the cold season. The thermometer maintained a mean height of 59° Fahrenheit, and during the few hours of the night the column of mercury scarcely went down three degrees.

Preparations for the approaching winter went on apace, and there was really nothing wanting to Fort Hope, although it had not been revictualled by Captain Craventy’s detachment. The long hours of the Arctic night might be awaited in perfect security. The stores were of course carefully husbanded. There still remained plenty of spirits, only small quantities having been consumed; and there was a good stock of biscuits, which, once gone, could not be replaced. Fresh venison and salt meat were to be had in abundance, and with some antiscorbutic vegetables, the diet was most healthy; and all the members of the little colony were well.

A good deal of timber was cut in the woods clothing the eastern slopes of Lake Barnett. Many were the birch-trees, pines, and firs which fell beneath the axe of Mac-Nab, and were dragged to the house by the tamed reindeer. The carpenter did not spare the little forest, although he cut his wood judiciously; for he never dreamt that timber might fail him, imagining, as he did, Victoria Island to be a peninsula, and knowing the districts near Cape Michael to be rich in different species of trees.

Many a time did the unconscious carpenter congratulate his Lieutenant on having chosen a spot so favoured by Heaven. Woods, game, furred animals, a lagoon teeming with fish, plenty of herbs for the animals, and, as Corporal Joliffe would have added, double pay for the men. Was not Cape Bathurst a corner of a privileged land, the like of which was not to be found in the whole Arctic regions? Truly Hobson was a favourite of Heaven, and ought to return thanks to Providence every day for the discovery of this unique spot.

Ah, Mac-Nab, you little knew how you wrung the heart of your master when you talked in that strain!

The manufacture of winter garments was not neglected in the factory. Mrs Barnett, Madge, Mrs Mac-Nab, Mrs Rae, and Mrs Joliffe—when she could leave her fires—were alike indefatigable. Mrs Barnett knew that they would all have to leave the fort in the depth of winter, and was determined that every one should be warmly clothed. They would have to face the bitterest cold for a good many days during the Polar night, if Victoria Island should halt far from the continent. Boots and clothes ought indeed to be strong and well made, for crossing some hundreds of miles under such circumstances. Mrs Barnett and Madge devoted all their energies to the matter in hand, and the furs, which they knew it would be impossible to save, were turned to good account. They were used double, so that the soft hair was both inside and outside of the clothes; and when wearing them, the whole party would be as richly attired as the grandest princesses, or the most wealthy ladies. Those not in the secret were rather surprised at the free use made of the Company’s property; but Hobson’s authority was not to be questioned, and really martens, polecats, musk-rats, beavers, and foxes multiplied with such rapidity near the fort, that all the furs used could easily be replaced by a few shots, or the setting of a few traps; and when Mrs Mac-Nab saw the beautiful ermine coat which had been made for her baby, her delight was unbounded, and she no longer wondered at anything.

So passed the days until the middle of the month of August. The weather continued fine, and any mists which gathered on the horizon were quickly dispersed by the sunbeams.

Every day Hobson took the bearings, taking care, however, to go some distance from the fort, that suspicions might not be aroused, and he also visited different parts of the island, and was reassured by finding that no important changes appeared to be taking place.

On the 16th August Victoria Island was situated in 167° 27’ west longitude, and 70° 49’ north latitude. It had, therefore, drifted slightly to the south, but without getting any nearer to the American coast, which curved considerably.

The distance traversed by the island since the fracture of the isthmus, or rather since the last thaw, could not be less than eleven or twelve hundred miles to the west.

But what was this distance compared to the vast extent of the ocean? Had not boats been known to be drifted several thousands of miles by currents? Was not this the case with the English ship Resolute, the American brig Advance, and with the Fox, all of which were carried along upon ice-fields until the winter arrested their advance?

CHAPTER VI.
TEN DAYS OF TEMPEST

From the 17th to the 20th August the weather continued fine, and the temperature moderate. The mists on the horizon were not resolved into clouds, and altogether the weather was exceptionally beautiful for such an elevated position. It will be readily understood, however, that Hobson could take no pleasure in the fineness of the climate.
On the 21st August, however, the barometer gave notice of an approaching change. The column of mercury suddenly fell considerably, the sun was completely hidden at the moment of culmination, and Hobson was unable to take his bearings.

The next day the wind changed and blew strongly from the north-west, torrents of rain falling at intervals. Meanwhile, however, the temperature did not change to any sensible extent, the thermometer remaining at 54° Fahrenheit.

Fortunately the proposed works were now all finished, and MacNab had completed the carcass of his boat, which was planked and ribbed. Hunting might now be neglected a little, as the stores were complete, which was fortunate, for the weather became very bad. The wind was high, the rain incessant, and thick fogs rendered it impossible to go beyond the enceinte of the fort.

"What do you think of this change in the weather, Lieutenant?" inquired Mrs Barnett on the morning of the 27th August; "might it not be in our favour?"

"I should not like to be sure of it, madam," replied Hobson; "but anything is better for us than the magnificent weather we have lately had, during which the sun made the waters warmer and warmer. Then, too, the wind from the north-west is so very strong that it may perhaps drive us nearer to the American continent."

"Unfortunately," observed Long, "we can’t take our bearings every day now. It’s impossible to see either sun, moon, or stars in this fog. Fancy attempting to take an altitude now!"

"We shall see well enough to recognise America, if we get anywhere near it," said Mrs Barnett. "Whatever land we approach will be welcome. It will most likely be some part of Russian America—probably Western Alaska."

"You are right, madam," said Hobson; "for, unfortunately, in the whole Arctic Ocean there is not an island, an islet, or even a rock to which we could fasten our vessel!"

"Well," rejoined Mrs Barnett, "why should not our conveyance take us straight to the coasts of Asia? Might not the currents carry us past the opening of Bearing Strait and land us on the shores of Siberia?"

"No, madam, no," replied Hobson; "our ice-field would soon meet the Kamtchatka current, and be carried by it to the northwest. It is more likely, however, that this wind will drive us towards the shores of Russian America."

"We must keep watch, then," said Mrs Barnett, "and ascertain our position as soon as possible."

"We shall indeed keep watch," replied Hobson, "although this fog is very much against us If we should be driven on to the coast, the shock will be felt even if we cannot see. Let’s hope the island will not fall to pieces in this storm! That is at present our principal danger. Well, when it comes we shall see what there is to be done, and meanwhile we must wait patiently."

Of course this conversation was not held in the public room, where the soldiers and women worked together. It was in her own room, with the window looking out on the court, that Mrs Barnett received visitors. It was almost impossible to see indoors even in the daytime, and the wind could be heard rushing by outside like an avalanche. Fortunately, Cape Bathurst protected the house from the north-east winds, but the sand and earth from its summit were hurled down upon the roof with a noise like the pattering of hail. Mac Nab began to feel fresh uneasiness about his chimneys, which it was absolutely necessary to keep in good order. With the roaring of the wind was mingled that of the sea, as its huge waves broke upon the beach. The storm had become a hurricane.

In spite of the fury of the gale, Hobson determined on the morning of the 28th of August to climb to the summit of Cape Bathurst, in order to examine the state of the horizon, the sea, and the sky. He therefore wrapped himself up, taking care to have nothing about him likely to give hold the wind, and set out.

He got to the foot of the cape without much difficulty. The sand and earth blinded him, it is true, but protected by the cliff he had not as yet actually faced the wind. The fatigue began when he attempted to climb the almost perpendicular sides of the promontory; but by clutching at the tufts of herbs with which they were covered, he managed to get to the top, but there the fury of the gale was such that he could neither remain standing nor seated; he was therefore forced to fling himself upon his face behind the little coppice and cling to some shrubs, only raising his head and shoulders above the ground.

The appearance of sea and sky was indeed terrible. The spray dashed over the Lieutenant’s head, and half-a-mile from the cape water and clouds were confounded together in a thick mist. Low jagged rain-clouds were chased along the heavens with giddy rapidity, and heavy masses of vapour were piled upon the zenith. Every now and then an awful stillness fell upon the land, and the only sounds were the breaking of the surf upon the beach and the roaring of the angry billows; but then the tempest recommenced with redoubled fury, and Hobson felt the cape tremble to its foundations. Sometimes the rain poured down with such violence that it resembled grape-shot.

It was indeed a terrible hurricane from the very worst quarter of the heavens. This north-east wind might blow for a long time and cause all manner of havoc. Yet Hobson, who would generally have grieved over the destruction around him, did not complain,—on the contrary, he rejoiced; for if, as he hoped, the island held together, it must be driven to the south-west by this wind, so much more powerful than the currents. And the south-west meant land—
Island, and above all whether this wind has, as I hope, driven it near to the American continent.

Hobson’s first care was to tell his comrades that the hurricane was not yet at its height, and that it would probably last a long time yet. He announced these tidings with the manner of one bringing good news, and every one looked at him in astonishment. Their chief officer really seemed to take a delight in the fury of the elements.

On the 30th Hobson again braved the tempest, not this time climbing the cape, but going down to the beach. What was his joy at noticing some long weeds floating on the top of the waves, of a kind which did not grow on Victoria Island. Christopher Columbus’ delight was not greater when he saw the sea-weed which told him of the proximity of land.

The Lieutenant hurried back to the fort, and told Mrs Barnett and Sergeant Long of his discovery. He had a good mind to tell every one the whole truth now, but a strange presentiment kept him silent.

The occupants of the fort had plenty to amuse them in the long days of compulsory confinement. They went on improving the inside of the various buildings, and dug trenches in the court to carry away the rain-water. Mac-Nab, a hammer in one hand and a nail in the other, was always busy at a job in some corner or another, and nobody took much note of the tempest outside in the daytime; but at night it was impossible to sleep, the wind beat upon the buildings like a battering-ram; between the house and the cape sometimes whirled a huge waterspout of extraordinary dimensions; the planks cracked, the beams seemed about to separate, and there was danger of the whole structure tumbling down. Mac-Nab and his men lived in a state of perpetual dread, and had to be continually on the watch.

Meanwhile, Hobson was uneasy about the stability of the island itself, rather than that of the house upon it. The tempest became so violent, and the sea so rough, that there was really a danger of the dislocation of the ice-field. It seemed impossible for it to resist much longer, diminished as it was in thickness and subject to the perpetual action of the waves. It is true that its inhabitants did not feel any motion, on account of its vast extent, but it suffered from it none the less. The point at issue was simply:—Would the island last until it was flung upon the coast, or would it fall to pieces before it touched firm ground?

There could be no doubt that thus far it had resisted. As the Lieutenant explained to Mrs Barnett, had it already been broken, had the ice-field already divided into a number of islets, the occupants of the fort must have noticed it, for the different pieces would have been small enough to be affected by the motion of the sea, and the people on any one of them would have been pitched about like passengers on a boat. This was not the case, and in his daily observations Lieutenant Hobson had noticed no movement whatever, not so much as a trembling of the island, which appeared as firm and motionless as when it was still connected by its isthmus with the mainland.

But the breaking up, which had not yet taken place, might happen at any minute.

Hobson was most anxious to ascertain whether Victoria Island, driven by the north-west wind out of the current, had approached the continent. Everything, in fact, depended upon this, which was their last chance of safety. But without sun, moon, or stars, instruments were of course useless, as no observations could be taken, and the exact position of the island could not be determined. If, then, they were approaching the land, they would only know it when the land came in sight, and Hobson’s only means of ascertaining anything in time to be of any service, was to get to the south of his dangerous dominions. The position of Victoria Island with regard to the cardinal points had not sensibly altered all the time. Cape Bathurst still pointed to the north, as it did when it was the advanced post of North America. It was, therefore, evident that if Victoria Island should come alongside of the continent, it would touch it with its southern side,—the communication would, in a word, be re-established by means of the broken isthmus; it was, therefore, imperative to ascertain what was going on in that direction.

Hobson determined to go to Cape Michael, however terrible the storm might be, but he meant to keep the real motive of his reconnaissance a secret from his companions. Sergeant Long was to accompany him.

About four o’clock P.M., on the 31st August, Hobson sent for the Sergeant in his own room, that they might arrange together for all eventualities.

"Sergeant Long," he began, "it is necessary that we should, without delay, ascertain the position of Victoria Island, and above all whether this wind has, as I hope, driven it near to the American continent."

"I quite agree with you, sir," replied Long, "and the sooner we find out the better."

"But it will necessitate our going down to the south of the island."

"I am ready, sir."
"I know, Sergeant, that you are always ready to do your duty, but you will not go alone. Two of us ought to go, that we may be able to let our comrades know if any land is in sight; and besides I must see for myself ... we will go together."

"When you like, Lieutenant, just when you think best."

"We will start this evening at nine o’clock, when everybody else has gone to bed."

"Yes, they would all want to come with us," said Long, "and they must not know why we go so far from the factory."

"No, they must not know," replied Hobson, "and if I can, I will keep the knowledge of our awful situation from them until the end."

"It is agreed then, sir?"

"Yes. You will take a tinder-box and some touchwood [Footnote: A fungus used as tinder (Polyporous ignarius).] with you, so that we can make a signal if necessary—if land is in sight in the south, for instance."

"Yes, sir."

"We shall have a rough journey, Sergeant."

"What does that matter, sir, but by the way—the lady?"

"I don’t think I shall tell her. She would want to go with us."

"And she could not," said the Sergeant, "a woman could not battle with such a gale. Just see how its fury is increasing at this moment!"

Indeed the house was rocking to such an extent that it seemed likely to be torn from its foundations.

"No," said Hobson, "courageous as she is, she could not, she ought not to accompany us. But on second thought, it will be best to tell her of our project. She ought to know in case any accident should befall us."

"Yes," replied Long, "we ought not to keep anything from her, and if we do not come back."

"At nine o’clock then, Sergeant."

"At nine o’clock."

And with a military salute Sergeant Long retired.

A few minutes later Hobson was telling Mrs Barnett of his scheme. As he expected the brave woman insisted on accompanying him, and was quite ready to face the tempest. Hobson did not dissuade her by dwelling on the dangers of the expedition, he merely said that her presence was necessary at the fort during his absence, and that her remaining would set his mind at ease. If any accident happened to him it would be a comfort to know that she would take his place.

Mrs Barnett understood and said no more about going; but only urged Hobson not to risk himself unnecessarily. To remember that he was the chief officer, that his life was not his own, but necessary to the safety of all. The Lieutenant promised to be as prudent as possible; but added that the examination of the south of the island must be made at once, and he would make it. The next day Mrs Barnett merely told her companions that the Lieutenant and the Sergeant had gone to make a final reconnaissance before the winter set in.

CHAPTER VII.

A FIRE AND A CRY.

The Lieutenant and the Sergeant spent the evening in the large room of the fort, where all were assembled except the astronomer, who still remained shut up in his cabin. The men were busy over their various occupations, some cleaning their arms, others mending or sharpening their tools. The women were stitching away industriously, and Mrs Paulina Barnett was reading aloud; but she was often interrupted not only by the noise of the wind, which shook the walls of the house like a battering-ram, but by the cries of the baby. Corporal Joliffe, who had undertaken to amuse him, had enough to do. The young gentleman had ridden upon his playmate’s knees until they were worn out, and the Corporal at last put the indefatigable little cavalier on the large table, where he rolled about to his heart’s content until he fell asleep.

At eight o’clock prayers were read as usual, the lamps were extinguished, and all retired to rest.

When every one was asleep, Hobson and Long crept cautiously across the large room and gained the passage, where they found Mrs Barnett, who wished to press their hands once more.

"Till to-morrow," she said to the Lieutenant.

"Yes," replied Hobson, "to-morrow, madam, without fail."

"But if you are delayed?"

"You must wait patiently for us," replied the Lieutenant, "for if in examining the southern horizon we should see a fire, which is not unlikely this dark night, we should know that we were near the coasts of New Georgia, and then it would be desirable for me to ascertain our position by daylight. In fact, we may be away forty eight hours. If, however, we can get to Cape Michael before midnight, we shall be back at the fort to-morrow evening. So wait patiently, madam, and believe that we shall incur no unnecessary risk."
"But," added the lady, "suppose you don’t get back to morrow, suppose you are away more than two days?"
"Then we shall not return at all," replied Hobson simply.

The door was opened, Mrs Barnett closed it behind the Lieutenant and his companion and went back to her own room, where Madge awaited her, feeling anxious and thoughtful.

Hobson and Long made their way across the inner court through a whirlwind which nearly knocked them down; but clinging to each other, and leaning on their iron-bound staffs, they reached the postern gates, and set out between the hills and the eastern bank of the lagoon.

A faint twilight enabled them to see their way. The moon, which was new the night before, would not appear above the horizon, and there was nothing to lessen the gloom of the darkness, which would, however, last but a few hours longer.

The wind and rain were as violent as ever. The Lieutenant and his companion wore impervious boots and waterproof cloaks well pulled in at the waist, and the hood completely covering their heads. Thus protected they got along at a rapid pace, for the wind was behind them, and sometimes drove them on rather faster than they cared to go. Talking was quite out of the question, and they did not attempt it, for they were deafened by the hurricane, and out of breath with the buffeting they received.

Hobson did not mean to follow the coast, the windings of which would have taken him a long way round, and have brought him face to face with the wind, which swept over the sea with nothing to break its fury. His idea was to cut across in a straight line from Cape Bathurst to Cape Michael, and he was provided with a pocket compass with which to ascertain his bearings. He hoped by this means to cross the ten or eleven miles between him and his goal, just before the twilight faded and gave place to the two hours of real darkness.

Bent almost double, with rounded shoulders and stooping heads, the two pressed on. As long as they kept near the lake they did not meet the gale full face, the little hills crowned with trees afforded them some protection, the wind howled fearfully as it bent and distorted the branches, almost tearing the trunks up by the roots; but it partly exhausted its strength, and even the rain when it reached the explorers was converted into impalpable mist, so that for about four miles they did not suffer half as much as they expected to.

But when they reached the southern skirts of the wood, where the hills disappeared, and there were neither trees nor rising ground, the wind swept along with awful force, and involuntarily they paused for a moment. They were still six miles from Cape Michael.

"We are going to have a bad time of it," shouted Lieutenant Hobson in the Sergeant’s ear.
"Yes, the wind and rain will conspire to give us a good beating," answered Long.
"I am afraid that now and then we shall have hail as well," added Hobson.
"It won’t be as deadly as grape-shot," replied Long coolly, "and we have both been through that, and so forwards!"
"Forwards, my brave comrade!"

It was then ten o’clock. The twilight was fading away, dying as if drowned in the mists or quenched by the wind and the rain. There was still, however, some light, and the Lieutenant struck his flint, and consulted his compass, passing a piece of burning touchwood over it, and then, drawing his cloak more closely around him, he plunged after the Sergeant across the unprotected plain.

At the first step, both were flung violently to the ground, but they managed to scramble up, and clinging to each other with their backs bent like two old crippled peasants, they struck into a kind of ambling trot.

There was a kind of awful grandeur in the storm to which neither was insensible. Jagged masses of mist and ragged rain-clouds swept along the ground. The loose earth and sand were whirled into the air and flung down again like grape-shot, and the lips of Hobson and his companion were wet with salt spray, although the sea was two or three miles distant at least.

During the rare brief pauses in the gale, they stopped and took breath, whilst the Lieutenant ascertained their position as accurately as possible.

The tempest increased as the night advanced, the air and water seemed to be absolutely confounded together, and low down on the horizon was formed one of those fearful waterspouts which can overthrow houses, tear up forests, and which the vessels whose safety they threaten attack with artillery. It really seemed as if the ocean itself was being torn from its bed and flung over the devoted little island.

Hobson could not help wondering how it was that the ice-field which supported it was not broken in a hundred places in this violent convulsion of the sea, the roaring of which could be distinctly heard where he stood. Presently Long, who was a few steps in advance, stopped suddenly, and turning round managed to make the Lieutenant hear the broken words—
"Not that way!"
"Why not?"
"The sea!"
"What, the sea! We cannot possibly have got to the southeast coast!"
"Look, look, Lieutenant!"

It was true, a vast sheet of water was indistinctly visible before them, and large waves were rolling up and breaking at the Lieutenant’s feet.

Hobson again had recourse to his flint, and with the aid of some lighted touchwood consulted the needle of his compass very carefully.

"No," he said, "the sea is farther to the left, we have not yet passed the wood between us and Cape Michael."
"Then it is——"

"It is a fracture of the island!" cried Hobson, as both were compelled to fling themselves to the ground before the wind, "either a large portion of our land has been broken off and drifted away, or a gulf has been made, which we can go round. Forwards!"

They struggled to their feet and turned to the right towards the centre of the island. For about ten minutes they pressed on in silence, fearing, not without reason, that all communication with the south of the island would be found to be cut off. Presently, however, they no longer heard the noise of the breakers.

"It is only a gulf." screamed Hobson in the Sergeant’s ear. "Let us turn round."

And they resumed their original direction towards the south, but both knew only too well that they had a fearful danger to face, for that portion of the island on which they were was evidently cracked for a long distance, and might at any moment separate entirely; should it do so under the influence of the waves, they would inevitably be drifted away, whither they knew not. Yet they did not hesitate, but plunged into the mist, not even pausing to wonder if they should ever get back.

What anxious forebodings must, however, have pressed upon the heart of the Lieutenant. Could he now hope that the island would hold together until the winter? had not the inevitable breaking up already commenced? If the wind should not drive them on to the coast, were they not doomed to perish very soon, to be swallowed up by the deep, leaving no trace behind them? What a fearful prospect for all the unconscious inhabitants of the fort!

But through it all the two men, upheld by the consciousness of a duty to perform, bravely struggled on against the gale, which nearly tore them to pieces, along the new beach, the foam sometimes bathing their feet, and presently gained the large wood which shut in Cape Michael. This they would have to cross to get to the coast by the shortest route, and they entered it in complete darkness, the wind thudding among the branches over their heads. Everything seemed to be breaking to pieces around them, the dislocated branches intercepted their passage, and every moment they ran a risk of being crushed beneath a falling tree, or they stumbled over a stump they had not been able to see in the gloom. The noise of the waves on the other side of the wood was a sufficient guide to their steps, and sometimes the furious breakers shook the weakened ground beneath their feet. Holding each other’s hands lest they should lose each other, supporting each other, and the one helping the other up when he fell over some obstacle, they at last reached the point for which they were bound.

But the instant they quitted the shelter of the wood a perfect whirlwind tore them asunder, and flung them upon the ground.

"Sergeant, Sergeant! Where are you?" cried Hobson with all the strength of his lungs.
"Here, here!" roared Long in reply.

And creeping on the ground they struggled to reach each other; but it seemed as if a powerful hand rivetted them to the spot on which they had fallen, and it was only after many futile efforts that they managed to reach each other. Having done so, they tied their belts together to prevent another separation, and crept along the sand to a little rising ground crowned by a small clump of pines. Once there they were a little more protected, and they proceeded to dig themselves a hole, in which they crouched in a state of absolute exhaustion and prostration.

It was half-past eleven o’clock P.M.

For some minutes neither spoke. With eyes half closed they lay in a kind of torpor, whilst the trees above them bent beneath the wind, and their branches rattled like the bones of a skeleton. But yet again they roused themselves from this fatal lethargy, and a few mouthfuls of rum from the Sergeant’s flask revived them.

"Let us hope these trees will hold," at last observed Hobson.
"And that our hole will not blow away with them," added the Sergeant, crouching in the soft sand.
"Well!" said Hobson, "here we are at last, a few feet from Cape Michael, and as we came to make observations, let us make them. I have a presentiment, Sergeant, only a presentiment, remember, that we are not far from firm ground!"

Had the southern horizon been visible the two adventurers would have been able to see two-thirds of it from their position; but it was too dark to make out anything, and if the hurricane had indeed driven them within sight of land, they would not be able to see it until daylight, unless a fire should be lighted on the continent.
As the Lieutenant had told Mrs Barnett, fishermen often visited that part of North America, which is called New Georgia, and there are a good many small native colonies, the members of which collect the teeth of mammoths, these fossil elephants being very numerous in these latitudes. A few degrees farther south, on the island of Sitka, rises New-Archangel, the principal settlement in Russian America, and the head-quarters of the Russian Fur Company, whose jurisdiction once extended over the whole of the Aleutian Islands. The shores of the Arctic Ocean are, however, the favourite resort of hunters, especially since the Hudson’s Bay Company took a lease of the districts formerly in the hands of the Russians; and Hobson, although he knew nothing of the country, was well acquainted with the habits of those who were likely to visit it at this time of the year, and was justified in thinking that he might meet fellow-countrymen, perhaps even members of his own Company, or, failing them, some native Indians, scouring the coasts.

But could the Lieutenant reasonably hope that Victoria Island had been driven towards the coast?

"Yes, a hundred times yes," he repeated to the Sergeant again and again. "For seven days a hurricane has been blowing from the northeast, and although I know that the island is very flat, and there is not much for the wind to take hold of, still all these little hills and woods spread out like sails must have felt the influence of the wind to a certain extent. Moreover, the sea which bears us along feels its power, and large waves are certainly running in shore. It is impossible for us to have remained in the current which was dragging us to the west, we must have been driven out of it, and towards the south. Last time we took our bearings we were two hundred miles from the coast, and in seven days "——

"Your reasonings are very just, Lieutenant," replied the Sergeant, "and I feel that whether the wind helps us or not, God will not forsake us. It cannot be His will that so many unfortunate creatures should perish, and I put my trust in Him!"

The two talked on in broken sentences, making each other hear above the roaring of the storm, and struggling to pierce the gloom which closed them in on every side; but they could see nothing, not a ray of light broke the thick darkness.

About half past one A.M. the hurricane ceased for a few minutes, whilst the fury of the sea seemed to be redoubled, and the large waves, lashed into foam, broke over each other with a roar like thunder.

Suddenly Hobson seizing his companion’s arm shouted——

"Sergeant, do you hear?"

"What?"

"The noise of the sea?"

"Of course I do, sir," replied Long, listening more attentively, "and the sound of the breakers seems to me not"——

"Not exactly the same... isn’t it Sergeant; listen, listen, it is like the sound of surf!... it seems as if the waves were breaking against rocks!"

Hobson and the Sergeant now listened intently, the monotonous sound of the waves dashing against each other in the offing was certainly exchanged for the regular rolling sound produced by the breaking of water against a hard body; they heard the reverberating echoes which told of the neighbourhood of rocks, and they knew that along the whole of the coast of their island there was not a single stone, and nothing more sonorous than the earth and sand of which it was composed!

Could they have been deceived? The Sergeant tried to rise to listen better, but he was immediately flung down by the hurricane, which recommenced with renewed violence. The lull was over, and again the noise of the waves was drowned in the shrill whistling of the wind, and the peculiar echo could no longer be made out.

The anxiety of the two explorers will readily be imagined. They again crouched down in their hole, doubting whether it would not perhaps be prudent to leave even this shelter, for they felt the sand giving way beneath them, and the pines cracking at their very roots. They persevered, however, in gazing towards the south, every nerve strained to the utmost, in the effort to distinguish objects through the darkness.

The first grey twilight of the dawn might soon be expected to appear, and a little before half-past two A.M. Long suddenly exclaimed:

"I see it!"

"What?"

"A fire!"

"A fire?"

"Yes, there—over there!"

And he pointed to the south-west. Was he mistaken? No, for Hobson also made out a faint glimmer in the direction indicated.

"Yes!" he cried, "yes, Sergeant, a fire; there is land there!"
"Unless it is a fire on board ship," replied Long.

"A ship at sea in this weather!" exclaimed Hobson, "impossible! No, no, there is land there, land I tell you, a few miles from us!"

"Well, let us make a signal!"

"Yes, Sergeant, we will reply to the fire on the mainland by a fire on our island!"

Of course neither Hobson nor Long had a torch, but above their heads rose resinous pines distorted by the hurricane.

"Your flint, Sergeant," said Hobson.

Long at once struck his flint, lighted the touchwood, and creeping along the sand climbed to the foot of the thicket of firs, where he was soon joined by the Lieutenant. There was plenty of deadwood about, and they piled it up at the stems of the trees, set fire to it, and soon, the wind helping them, they had the satisfaction of seeing the whole thicket in a blaze

"Ah!" said Hobson, "as we saw their fire, they will see ours!"

The firs burnt with a lurid glare like a large torch. The dried resin in the old trunks aided the conflagration, and they were rapidly consumed. At last the crackling ceased, the flames died away, and all was darkness.

Hobson and Long looked in vain for an answering fire—nothing was to be seen. For ten minutes they watched, hoping against hope, and were just beginning to despair, when suddenly a cry was heard, a distinct cry for help. It was a human voice, and it came from the sea.

The cry was not, however, repeated.

The daylight was now gradually beginning to appear, and the violence of the tempest seemed to be decreasing. Soon it was light enough for the horizon to be examined.

But there was no land in sight, sea and sky were still blended in one unbroken circle.

CHAPTER VIII.

MRS. PAULINA BARNETT’S EXCURSION.

The whole morning Hobson and Sergeant Long wandered about the coast. The weather was much improved, the rain had ceased, and the wind had veered round to the south-east with extraordinary suddenness, without unfortunately decreasing in violence, causing fresh anxiety to the Lieutenant, who could no longer hope to reach the mainland.

The south-east wind would drive the wandering island farther from the continent, and fling it into the dangerous currents, which must drift it to the north of the Arctic Ocean.

The Lieutenant felt very uneasy, as they were naturally afraid that the island might have separated into two parts in the storm. The gulf observed the night before might have spread farther, and if so they would be cut off from their friends.

The Lieutenant felt very uneasy, as they were naturally afraid that the island might have separated into two parts in the storm. The gulf observed the night before might have spread farther, and if so they would be cut off from their friends.

They soon reached the wood they had crossed the night before. Numbers of trees were lying on the ground, some with broken stems, others torn up by the roots from the soft soil, which had not afforded them sufficient support. The few which remained erect were stripped of their leaves, and their naked branches creaked and moaned as the south-east wind swept over them.

Two miles beyond this desolated forest the wanderers arrived at the edge of the gulf they had seen the night before without being able to judge of its extent. They examined it carefully, and found that it was about fifty feet wide, cutting the coast line straight across near Cape Michael and what was formerly Fort Barnett, forming a kind of estuary running more than a mile and a half inland. If the sea should again become rough in a fresh storm, this gulf would widen more and more.

Just as Hobson approached the beach, he saw a large piece of ice separate from the island and float away!
"Ah!" murmured Long, "that is the danger!"

Both then turned hurriedly to the west, and walked as fast as they could round the huge gulf, making direct for Fort Hope.

They noticed no other changes by the way, and towards four o’clock they crossed the court and found all their comrades at their usual occupations.

Hobson told his men that he had wished once more before the winter to see if there were any signs of the approach of Captain Craventy’s convoy, and that his expedition had been fruitless.

"Then, sir," observed Marbre, "I suppose we must give up all idea of seeing our comrades from Fort Reliance for this year at least?"

"I think you must," replied Hobson simply, re-entering the public room.

Mrs Barnett and Madge were told of the two chief events of the exploration: the fire and the cry. Hobson was quite sure that neither lib nor the Sergeant were mistaken. The fire had really been seen, the cry had really been heard; and after a long consultation every one came to the conclusion that a ship in distress had passed within sight during the night, and that the island had not approached the American coast.

The south-east wind quickly chased away the clouds and mists, so that Hobson hoped to be able to take his bearings the next day. The night was colder and a fine snow fell, which quickly covered the ground. This first sign of winter was hailed with delight by all who knew of the peril of their situation.

On the 2nd September the sky gradually became free from vapours of all kinds, and the sun again appeared. Patiently the Lieutenant awaited its culmination; at noon he took the latitude, and two hours later a calculation of hour-angles gave him the longitude.

The following were the results obtained: Latitude, 70° 57’; longitude, 170° 30’.

So that, in spite of the violence of the hurricane, the island had remained in much the same latitude, although it had been drifted somewhat farther west. They were now abreast of Behring Strait, but four hundred miles at least north of Capes East and Prince of Wales, which jut out on either side at the narrowest part of the passage.

The situation was, therefore, more dangerous than ever, as the island was daily getting nearer to the dangerous Kamtchatka Current, which, if it once seized it in its rapid waters, might carry it far away to the north. Its fate would now soon be decided. It would either stop where the two currents met, and there be shut in by the ice of the approaching winter, or it would be drifted away and lost in the solitudes of the remote hyperborean regions.

Hobson was painfully moved on ascertaining the true state of things, and being anxious to conceal his emotion, he shut himself up in his own room and did not appear again that day. With his chart before him, he racked his brains to find some way out of the difficulties with which he was beset.

The temperature fell some degrees farther the same day, and the mists, which had collected above the south-eastern horizon the day before, resolved themselves into snow during the night, so that the next day the white carpet was two inches thick. Winter was coming at last.

On September 3rd Mrs Barnett resolved to go a few miles along the coast towards Cape Esquimaux. She wished to see for herself the changes lately produced. If she had mentioned her project to the Lieutenant, he would certainly have offered to accompany her; but she did not wish to disturb him, and decided to go without him, taking Madge with her. There was really nothing to fear, the only formidable animals, the bears, seemed to have quite deserted the island after the earthquake; and two women might, without danger, venture on a walk of a few hours without an escort.

Madge agreed at once to Mrs Barnett’s proposal, and without a word to any one they set out at eight o’clock A.M., provided with an ice-chisel, a flask of spirits, and a wallet of provisions.

After leaving Cape Bathurst they turned to the west. The sun was already dragging its slow course along the horizon, for at this time of year it would only be a few degrees above it at its culmination. But its oblique rays were clear and powerful, and the snow was already melting here and there beneath their influence.

The coast was alive with flocks of birds of many kinds; ptarmigans, guillemots, puffins, wild geese, and ducks of every variety fluttered about, uttering their various cries, skimming the surface of the sea or of the lagoon, according as their tastes led them to prefer salt or fresh water.

Mrs Barnett had now a capital opportunity of seeing how many furred animals haunted the neighbourhood of Fort Hope. Martens, ermines, musk-rats, and foxes were numerous, and the magazines of the factory might easily have been filled with their skins, but what good would that be now? The inoffensive creatures, knowing that hunting was suspended, went and came fearlessly, venturing close up to the palisade, and becoming tamer every day. Their instinct doubtless told them that they and their old enemies were alike prisoners on the island, and a common danger bound them together. It struck Mrs Barnett as strange that the two enthusiastic hunters—Marbre and Sabine—should obey the Lieutenant’s orders to spare the furred animals without remonstrance or complaint, and appeared not even to wish to shoot the valuable game around them. It was true the foxes and others had not yet assumed their winter
robes, but this was not enough to explain the strange indifference of the two hunters.

Whilst walking at a good pace and talking over their strange situation, Mrs Barnett and Madge carefully noted the peculiarities of the sandy coast. The ravages recently made by the sea were distinctly visible. Fresh landslips enabled them to see new fractures in the ice distinctly. The strand, fretted away in many places, had sunk to an enormous extent, and the waves washed along a level beach when the perpendicular shores had once checked their advance. It was evident that parts of the island were now only on a level with the ocean.

"O Madge!" exclaimed Mrs Barnett, pointing to the long smooth tracts on which the curling waves broke in rapid succession, "our situation has indeed become aggravated by the awful storm! It is evident that the level of the whole island is gradually becoming lower. It is now only a question of time. Will the winter come soon enough to save us? Everything depends upon that."

"The winter will come, my dear girl," replied Madge with her usual unshaken confidence. "We have already had two falls of snow. Ice is beginning to accumulate, and God will send it us in time, I feel sure."

"You are right, Madge, we must have faith!" said Mrs Barnett. "We women who do not trouble ourselves about the scientific reasons for physical phenomena can hope, when men who are better informed, perhaps, despair. That is one of our blessings, which our Lieutenant unfortunately does not share. He sees the significance of facts, he reflects, he calculates, he reckons up the time still remaining to us, and I see that he is beginning to lose all hope."

"He is a brave, energetic man, for all that," replied Madge.

"Yes," added Mrs Barnett, "and if it be in the power of man to save us, he will do it."

By nine o’clock the two women had walked four miles. They were often obliged to go inland for some little distance, to avoid parts of the coast already invaded by the sea. Here and there the waves had encroached half-a-mile beyond the former high-water line, and the thickness of the ice-field had been considerably reduced. There was danger that it would soon yield in many places, and that new bays would be formed all along the coast.

As they got farther from the fort Mrs Barnett noticed that the number of furred animals decreased considerably. The poor creatures evidently felt more secure near a human habitation. The only formidable animals which had not been led by instinct to escape in time from the dangerous island were a few wolves, savage beasts which even a common danger did not conciliate. Mrs Barnett and Madge saw several wandering about on the plains, but they did not approach, and soon disappeared behind the hills on the south of the lagoon.

"What will become of all these imprisoned animals," said Madge, "when all food fails them, and they are famished with hunger in the winter?"

"They will not be famished in a hurry, Madge," replied Mrs Barnett, "and we shall have nothing to fear from them; all the martens, ermines, and Polar hares, which we spare will fall an easy prey to them. That is not our danger; the brittle ground beneath our feet, which may at any moment give way, is our real peril. Only look how the sea is advancing here. It already covers half the plain, and the waves, still comparatively warm, are eating away our island above and below at the same time! If the cold does not stop it very soon, the sea will shortly join the lake, and we shall lose our lagoon as we lost our river and our port!"

"Well, if that should happen it will indeed be an irreparable misfortune!" exclaimed Madge.

"Why?" asked Mrs Barnett, looking inquiringly at her companion.

"Because we shall have no more fresh water," replied Madge.

"Oh, we shall not want for fresh water, Madge," said Mrs Barnett, "the rain, the snow, the ice, the icebergs of the ocean, the very ice-field on which we float, will supply us with that; no, no, that is not our danger."

About ten o’clock Mrs Barnett and Madge had readied the rising ground above Cape Esquimaux, but at least two miles inland, for they had found it impossible to follow the coast, worn away as it was by the sea. Being rather tired with the many détours they had had to make, they decided to rest a few minutes before setting off on their return to Fort Hope. A little hill crowned by a clump of birch trees and a few shrubs afforded a pleasant shelter, and a bank covered with yellow moss, from which the snow had melted, served them as a seat. The little wallet was opened, and they shared their simple repast like sisters.

Half an hour later, Mrs Barnett proposed that they should climb along the promontory to the sea, and find out the exact state of Cape Esquimaux. She was anxious to know if the point of it had resisted the storm, and Madge declared herself ready to follow "her dear girl" wherever she went, but at the same time reminded her that they were eight or nine miles from Cape Bathurst already, and that they must not make Lieutenant Hobson uneasy by too long an absence.

But some presentiment made Mrs Barnett insist upon doing as she proposed, and she was right, as the event proved. It would only delay them half an hour after all.

They had not gone a quarter of a mile before Mrs Barnett stopped suddenly, and pointed to some clear and regular impressions upon the snow. These marks must have been made within the last nine or ten hours, or the last fall of snow would have covered them over.
"What animal has passed along here, I wonder?" said Madge.

"It was not an animal," said Mrs Barnett, bending down to examine the marks more closely, "not a quadruped certainly, for its four feet would have left impressions very different from these. Look, Madge, they are the footprints of a human person!"

"But who could have been here?" inquired Madge; "none of the soldiers or women have left the fort, and we are on an island, remember. You must be mistaken, my dear; but we will follow the marks, and see where they lead us."

They did so, and fifty paces farther on both again paused.

"Look, Madge, look!" cried Mrs Barnett, seizing her companion's arm, "and then say if I am mistaken."

Near the footprints there were marks of a heavy body having been dragged along the snow, and the impression of a hand.

"It is the hand of a woman or a child!" cried Madge.

"Yes!" replied Mrs Barnett; "a woman or a child has fallen here exhausted, and risen again to stumble farther on; look, the footprints again, and farther on more falls!"

"Who, who could it have been?" exclaimed Mrs Barnett. "Some unfortunate creature imprisoned like ourselves for three or four months perhaps. Or some shipwrecked wretch flung upon the coast in the storm. You remember the fire and the cry of which Sergeant Long and Lieutenant Hobson spoke. Come, come, Madge, there may be some one in danger for us to save!"

And Mrs Barnett, dragging Madge with her, ran along following the traces, and further on found that they were stained with blood.

The brave, tender-hearted woman, had spoken of saving some one in danger; had she then forgotten that there was no safety for any upon the island, doomed sooner or later to be swallowed up by the ocean?

The impressions on the ground led towards Cape Esquimaux. And the two carefully traced them, but the footprints presently disappeared, whilst the blood-stains increased, making an irregular pathway along the snow. It was evident the poor wretch had been unable to walk farther, and had crept along on hands and knees; here and there fragments of torn clothes were scattered about, bits of sealskin and fur.

"Come, come," cried Mrs Barnett, whose heart beat violently.

Madge followed her, they were only a few yards from Cape Esquimaux, which now rose only a few feet upon the sea-level against the background of the sky, and was quite deserted.

The impressions now led them to the right of the cape, and running along they soon climbed to the top, but there was still nothing, absolutely nothing, to be seen. At the foot of the cape, where the slight ascent began, the traces turned to the right, and led straight to the sea.

Mrs Barnett was turning to the right also, but just as she was stepping on to the beach, Madge, who had been following her and looking about uneasily, caught hold of her hand, and exclaimed—

"Stop! stop!" "No, Madge, no!" cried Mrs Barnett, who was drawn along by a kind of instinct in spite of herself.

"Stop, stop, and look!" cried Madge, tightening her hold on her mistress's hand.

On the beach, about fifty paces from Cape Esquimaux, a large white mass was moving about and growling angrily.

It was an immense Polar bear, and the two women watched it with beating hearts. It was pacing round and round a bundle of fur on the ground, which it smelt at every now and then, lifting it up and letting it fall again. The bundle of fur looked like the dead body of a walrus.

Mrs Barnett and Madge did not know what to think, whether to advance or to retreat, but presently as the body was moved about a kind of hood fell back from the head, and some long locks of brown hair were thrown over the snow.

"It is a woman! a woman!" cried Mrs Barnett, eager to rush to her assistance and find out if she were dead or alive!

"Stop!" repeated Madge, holding her back; "the bear won't harm her."

And, indeed, the formidable creature merely turned the body over, and showed no inclination of tearing it with its dreadful claws. It went away and came back apparently uncertain what to do. It had not yet perceived the two women who were so anxiously watching it.

Suddenly a loud crack was heard. The earth shook, and it seemed as if the whole of Cape Esquimaux were about to be plunged into the sea.

A large piece of the island had broken away, and a huge piece of ice, the centre of gravity of which had been displaced by the alteration in its specific weight, drifted away, carrying with it the bear and the body of the woman.

Mrs Barnett screamed, and would have flung herself upon the broken ice before it floated away, if Madge had not clutched her hand firmly, saying quietly——
“Stop! stop!”

At the noise produced by the breaking off of the piece of ice, the bear started back with a fearful growl, and, leaving the body, rushed to the side where the fracture had taken place; but he was already some forty feet from the coast, and in his terror he ran round and round the islet, tearing up the ground with his claws, and stamping the sand and snow about him.

Presently he returned to the motionless body, and, to the horror of the two women, seized it by the clothes with his teeth, and carrying it to the edge of the ice, plunged with it into the sea.

Being a powerful swimmer, like the whole race of Arctic bears, he soon gained the shores of the island. With a great exertion of strength he managed to climb up the ice, and having reached the surface of the island he quietly laid down the body he had brought with him.

Mrs Barnett could no longer be held back, and, shaking off Madge’s hold, she rushed to the beach, never thinking of the danger she ran in facing a formidable carnivorous creature.

The bear, seeing her approach, reared upon his hind legs, and came towards her, but at about ten paces off he paused, shook his great head, and turning round with a low growl, quietly walked away towards the centre of the island, without once looking behind him. He, too, was evidently affected by the mysterious fear which had tamed all the wild animals on the island.

Mrs Barnett was soon bending over the body stretched about the snow.

A cry of astonishment burst from her lips:

"Madge, Madge, come!" she exclaimed.

Madge approached and looked long and fixedly at the inanimate body. It was the young Esquimaux girl Kalumah!

CHAPTER IX.

KALUMAH’S ADVENTURES.

Kalumah on the floating island, two hundred miles from the American coast. It was almost incredible!

The first thing to be ascertained was whether the poor creature still breathed. Was it possible to restore her to life? Mrs Barnett loosed her clothes, and found that her body was not yet quite cold. Her heart beat very feebly, but it did beat. The blood they had seen came from a slight wound in her hand; Madge bound it up with her handkerchief, and the bleeding soon ceased.

At the same time Mrs Barnett raised the poor girl’s head, and managed to pour a few drops of rum between her parted lips. She then bathed her forehead and temples with cold water, and waited.

A few minutes passed by, and neither of the watchers were able to utter a word, so anxious were they lest the faint spark of life remaining to the young Esquimaux should be quenched.

But at last Kalumah’s breast heaved with a faint sigh, her hands moved feebly, and presently she opened her eyes, and recognising her preserver she murmured—

"Mrs Barnett! Mrs Barnett!"

The lady was not a little surprised at hearing her own name. Had Kalumah voluntarily sought the floating island, and did she expect to find her old European friends on it? If so, how had she come to know it, and how had she managed to reach the island, two hundred miles from the mainland? How could she have guessed that the ice-field as bearing Mrs Barnett and all the occupants of Fort Hope away from the American coast? Really it all seemed quite inexplicable.

"She lives—she will recover!" exclaimed Madge, who felt the vital heat and pulsation returning to the poor bruised body.

"Poor child, poor child!" said Mrs Barnett, much affected; "she murmured my name when she was at the point of death."

But now Kalumah again half opened her eyes, and looked about her with a dreamy unsatisfied expression, presently, however, seeing Mrs Barnett, her face brightened, the same name again burst from her lips, and painfully raising her hand she let it fall on that of her friend.

The anxious care of the two women soon revived Kalumah, whose extreme exhaustion arose not only from fatigue but also from hunger. She had eaten nothing for forty-eight hours. Some pieces of cold venison and a little rum refreshed her, and she soon felt able to accompany her newly-found friends to the fort.

Before starting, however, Kalumah, seated on the sand between Mrs Barnett and Madge, overwhelmed them with thanks and expressions of attachment. Then she told her story: she had not forgotten the Europeans of Fort Hope, and the thought of Mrs Paulina Barnett had been ever present with her. It was not by chance, as we shall see, that she had come to Victoria Island.

The following is a brief summary of what Kalumah related to Mrs Barnett:—

Our readers will remember the young Esquimaux’s promise to come and see her friends at Fort Hope again in
the fine season of the next year. The long Polar night being over, and the month of May having come round, Kalumah set out to fulfill her pledge. She left Russian America, where she had wintered, and accompanied by one of her brothers-in-law, started for the peninsula of Victoria.

Six weeks later, towards the middle of June, she got to that part of British America which is near Cape Bathurst. She at once recognized the volcanic mountains shutting in Liverpool Bay, and twenty miles farther east she came to Walruses’ Bay, where her people had so often hunted morses and seals.

But beyond the bay on the north, there was nothing to be seen. The coast suddenly sank to the south-east in an almost straight line. Cape Esquimaux and Cape Bathurst had alike disappeared.

Kalumah understood what had happened. Either the whole of the peninsula had been swallowed up by the waves, or it was floating away as an island, no one knew whither!

Kalumah’s tears flowed fast at the loss of those whom she had come so far to see.

Her brother-in-law, however, had not appeared surprised at the catastrophe. A kind of legend or tradition had been handed down amongst the nomad tribes of North America, that Cape Bathurst did not form part of the mainland, but had been joined on to it thousands of years before, and would sooner or later be torn away in some convulsion of nature. Hence the surprise at finding the factory founded by Hobson at the foot of the cape. But with the unfortunate reserve characteristic of their race, and perhaps also under the influence of that enmity which all natives feel for those who settle in their country, they said nothing to the Lieutenant, whose fort was already finished. Kalumah knew nothing of this tradition, which after all rested on no trustworthy evidence, and probably belonged to the many northern legends relating to the creation. This was how it was that the colonists of Fort Hope were not warned of the danger they ran in settling on such a spot.

Had a word in season been spoken to Hobson he would certainly have gone farther in search of some firmer foundation for his fort than this soil, certain peculiarities of which he had noticed at the first.

When Kalumah had made quite sure that all trace of Cape Bathurst was gone, she explored the coast as far as the further side of Washburn Bay, but without finding any sign of those she sought, and at last there was nothing left for her to do but to return to the fisheries of Russian America.

Kalumah now gave up all hope of again seeing Mrs Barnett and the other colonists of Fort Hope. She concluded that they had all been swallowed up by the ocean long ago.

At this part of her tale the young Esquimaux looked at Mrs Barnett with eyes full of tears, and pressed her hand affectionately, and then she murmured her thanks to God for her own preservation through the means of her friend.

Kalumah on her return home resumed her customary occupations, and worked with the rest of her tribe at the fisheries near Icy Cape, a point a little above the seventieth parallel, and more than six hundred miles from Cape Bathurst.

Nothing worthy of note happened during the first half of the month of April; but towards the end the storm began which had caused Hobson so much uneasiness, and which had apparently extended its ravages over the whole of the Arctic Ocean and beyond Behring Strait. It was equally violent at Icy Cape and on Victoria Island, and, as the Lieutenant ascertained in taking his bearings, the latter was then not more than two hundred miles from the coast.

As Mrs Barnett listened to Kalumah, her previous information enabled her rapidly to find the key to the strange events which had taken place, and to account for the arrival of the young native on the island.

During the first days of the storm the Esquimaux of Icy Cape were confined to their huts. They could neither get out nor fish. But during the night of the 31st August a kind of presentiment led Kalumah to venture down to the beach, and, braving the wind and rain in all their fury, she peered anxiously through the darkness at the waves rising mountains high.

Presently she thought she saw a huge mass driven along by the hurricane parallel with the coast. Gifted with extremely keen sight—as are all these wandering tribes accustomed to the long dark Polar nights—she felt sure that she was not mistaken.

Something of vast bulk was passing two miles from the coast, and that something could be neither a whale, a boat, nor, at this time of the year, even an iceberg.

But Kalumah did not stop to reason. The truth flashed upon her like a revelation. Before her excited imagination rose the images of her friends. She saw them all once more, Mrs Barnett, Madge, Lieutenant Hobson, the baby she had covered with kisses at Fort Hope. Yes, they were passing, borne along in the storm on a floating ice-field!

Kalumah did not doubt or hesitate a moment. She felt that she must tell the poor shipwrecked people, which she was sure they were, of the close vicinity of the land. She ran to her hut, seized a torch of tow and resin, such as the Esquimaux use when fishing at night, lit it and waved it on the beach at the summit of Icy Cape.
This was the fire which Hobson and Long had seen when crouching on Cape Michael on the night of the 31st August.

Imagine the delight and excitement of the young Esquimaux when a signal replied to hers, when she saw the huge fire lit by Lieutenant Hobson, the reflection of which reached the American coast, although he did not dream that he was so near it.

But it quickly went out, the lull in the storm only lasted a few minutes, and the fearful gale, veering round to the south-east, swept along with redoubled violence.

Kalumah feared that her "prey," so she called the floating island, was about to escape her, and that it would not be driven on to the shore. She saw it fading away, and knew that it would soon disappear in the darkness and be lost to her on the boundless ocean.

It was indeed a terrible moment for the young native, and she determined at all hazards to let her friends know of their situation. There might yet be time for them to take some steps for their deliverance, although every hour took them farther from the continent.

She did not hesitate a moment, her kayak was at hand, the frail bark in which she had more than once braved the storms of the Arctic Ocean, she pushed it down to the sea, hastily laced on the sealskin jacket fastened to the canoe, and, the long paddle in her hand, she plunged into the darkness.

Mrs Barnett here pressed the brave child to her heart, and Madge shed tears of sympathy.

When launched upon the roaring ocean, Kalumah found the change of wind in her favour. The waves dashed over her kayak, it is true, but they were powerless to harm the light boat, which floated on their crests like a straw. It was capsized several times, but a stroke of the paddle righted it at once.

After about an hour's hard work, Kalumah could see the wandering island more distinctly, and had no longer any doubt of effecting her purpose, as she was but a quarter of a mile from the beach.

It was then that she uttered the cry which Hobson and Long had heard.

But, alas! Kalumah now felt herself being carried away towards the west by a powerful current, which could takefirmer hold of her kayak than of the floating island!

In vain she struggled to beat back with her paddle, the light boat shot along like an arrow. She uttered scream after scream, but she was unheard, for she was already far away, and when the day broke the coasts of Alaska and the island she had wished to reach, were but two distant masses on the horizon.

Did she despair? Not yet. It was impossible to get back to the American continent in the teeth of the terrible wind which was driving the island before it at a rapid pace, taking it out two hundred miles in thirty-six hours, and assisted by the current from the coast.

There was but one thing left to do. To get to the island by keeping in the same current which was drifting it away.

But, alas! the poor girl's strength was not equal to her courage, she was faint from want of food, and, exhausted as she was, she could no longer wield her paddle.

For some hours she struggled on, and seemed to be approaching the island, although those on it could not see her, as she was but a speck upon the ocean. She struggled on until her stiffened arms and bleeding hands fell powerless, and, losing consciousness, she was floated along in her frail kayak at the mercy of winds and waves.

She did not know how long this lasted, she remembered nothing more, until a sudden shock roused her, her kayak had struck against something, it opened beneath her, and she was plunged into cold water, the freshness of which revived her. A few moments later, she was flung upon the sand in a dying state by a large wave.

This had taken place the night before, just before dawn—that is to say, about two or three o'clock in the morning. Kalumah had then been seventy hours at sea since she embarked!

The young native had no idea where she had been thrown, whether on the continent or on the floating island, which she had so bravely sought, but she hoped the latter. Yes, hoped that she had reached her friends, although she knew that the wind and current had driven them into the open sea, and not towards the coast!

The thought revived her, and, shattered as she was, she struggled to her feet, and tried to follow the coast.

She had, in fact, been providentially thrown on that portion of Victoria Island which was formerly the upper corner of Walruses' Bay. But, worn away as it was by the waves, she did not recognise the land with which she had once been familiar.

She tottered on, stopped, and again struggled to advance; the beach before her appeared endless, she had so often to go round where the sea had encroached upon the sand. And so dragging herself along, stumbling and scrambling up again, she at last approached the little wood where Mrs. Barnett and Madge had halted that very morning. We know that the two women found the footprints left by Kalumah in the snow not far from this very spot, and it was at a short distance farther on that the poor girl fell for the last time. Exhausted by fatigue and hunger, she still managed to creep along on hands and knees for a few minutes longer.
A great hope kept her from despair, for she had at last recognised Cape Esquimaux, at the foot of which she and her people had encamped the year before. She knew now that she was but eight miles from the factory, and that she had only to follow the path she had so often traversed when she went to visit her friends at Fort Hope.

Yes, this hope sustained her, but she had scarcely reached the beach when her forces entirely failed her, and she again lost all consciousness. But for Mrs Barnett she would have died.

"But, dear lady," she added, "I knew that you would come to my rescue, and that God would save me by your means."

We know the rest. We know the providential instinct which led Mrs Barnett and Madge to explore this part of the coast on this very day, and the presentiment which made them visit Cape Esquimaux after they had rested, and before returning to Fort Hope. We know too—as Mrs Barnett related to Kalumah—how the piece of ice had floated away, and how the bear had acted under the circumstances.

"And after all," added Mrs Barnett with a smile, "it was not I who saved you, but the good creature without whose aid you would never have come back to us, and if ever we see him again we will treat him with the respect due to your preserver."

During this long conversation Kalumah was rested and refreshed, and Mrs Barnett proposed that they should return to the fort at once, as she had already been too long away. The young girl immediately rose ready to start.

Mrs Barnett was indeed most anxious to tell the Lieutenant of all that had happened during the night of the storm, when the wandering island had neared the American continent, but she urged Kalumah to keep her adventures secret, and to say nothing about the situation of the island. She would naturally be supposed to have come along the coast, in fulfilment of the promise she had made to visit her friends in the fine season. Her arrival would tend only to strengthen the belief of the colonists that no changes had taken place in the country around Cape Bathurst, and to set at rest the doubts any of them might have entertained.

It was about three o’clock when Madge and Mrs Barnett, with Kalumah hanging on her arm, set out towards the east, and before five o’clock in the afternoon they all arrived at the postern of the fort.

CHAPTER X.
THE KAMTCHATKA CURRENT.

We can readily imagine the reception given to Kalumah by all at the fort. It seemed to them that the communication with the outer world was reopened. Mrs Mac-Nab, Mrs Rae and Mrs Joliffe overwhelmed her with caresses, but Kalumah’s first thought was for the little child, she caught sight of him immediately, and running to him covered him with kisses.

The young native was charmed and touched with the hospitality of her European hosts. A positive fête was held in her honour and every one was delighted that she would have to remain at the fort for the winter, the season being too far advanced for her to get back to the settlements of Russian America before the cold set in.

But if all the settlers were agreeably surprised at the appearance of Kalumah, what must Lieutenant Hobson have thought when he saw her leaning on Mrs Barnett’s arm. A sudden hope flashed across his mind like lightning, and as quickly died away: perhaps in spite of the evidence of his daily observations Victoria Island had run aground somewhere on the continent unnoticed by any of them.

Mrs Barnett read the Lieutenant’s thoughts in his face, and shook her head sadly.

He saw that no change had taken place in their situation, and waited until Mrs Barnett was able to explain Kalumah’s appearance.

A few minutes later he was walking along the beach with the lady, listening with great interest to her account of Kalumah’s adventures.

So he had been right in all his conjectures. The north-east hurricane had driven the island out of the current. The ice-field had approached within a mile at least of the American continent. It had not been a fire on board ship which they had seen, or the cry of a shipwrecked mariner which they had heard. The mainland had been close at hand, and had the north-east wind blown hard for another hour Victoria Island would have struck against the coast of Russian America. And then at this critical moment a fatal, a terrible wind had driven the island away from the mainland back to the open sea, and it was again in the grasp of the irresistible current, and was being carried along with a speed which nothing could check, the mighty south-east wind aiding its headlong course, to that terribly dangerous spot where it would be exposed to contrary attractions, either of which might lead to its destruction and that of all the unfortunate people dragged along with it.

For the hundredth time the Lieutenant and Mrs Barnett discussed all the bearings of the case, and then Hobson inquired if any important changes had taken place in the appearance of the districts between Cape Bathurst and Walruses’ Bay?

Mrs Barnett replied that in some places the level of the coast appeared to be lowered, and that the waves now covered tracts of sand which were formerly out of their reach. She related what had happened at Cape Esquimaux,
and the important fracture which had taken place at that part of the coast.

Nothing could have been less satisfactory. It was evident that the ice-field forming the foundation of the island was breaking up. What had happened at Cape Esquimaux might at any moment be reproduced at Cape Bathurst. At any hour of the day or night the houses of the factory might be swallowed up by the deep, and the only thing which could save them was the winter, the bitter winter which was fortunately rapidly approaching.

The next day, September 4th, when Hobson took his bearings, he found that the position of Victoria Island had not sensibly changed since the day before. It had remained motionless between the two contrary currents, which was on the whole the very best thing that could have happened.

"If only the cold would fix us where we are, if the ice wall would shut us in, and the sea become petrified around us," exclaimed Hobson, "I should feel that our safety was assured. We are but two hundred miles from the coast at this moment, and by venturing across the frozen ice fields we might perhaps reach either Russian America or Kamtchatka. Winter, winter at any price, let the winter set in, no matter how rapidly."

Meanwhile, according to the Lieutenant’s orders, the preparations for the winter were completed. Enough forage to last the dogs the whole of the Polar night was stored up. They were all in good health, but getting rather fat with having nothing to do. They could not be taken too much care of, as they would have to work terribly hard in the journey across the ice after the abandonment of Fort Hope. It was most important to keep up their strength, and they were fed on raw reindeer venison, plenty of which was easily attainable.

The tame reindeer also prospered, their stable was comfortable, and a good supply of moss was laid by for them in the magazines of the fort. The females provided Mrs Joliffe with plenty of milk for her daily culinary needs.

The Corporal and his little wife had also sown fresh seeds, encouraged by the success of the last in the warm season. The ground had been prepared beforehand for the planting of scurvy-grass and Labrador Tea. It was important that there should be no lack of these valuable anti-scorbutics.

The sheds were filled with wood up to the very roof. Winter might come as soon as it liked now, and freeze the mercury in the cistern of the thermometer, there was no fear that they would again be reduced to burn their furniture as they had the year before. Mac-Nab and his men had become wise by experience, and the chips left from the boat-building added considerably to their stock of fuel.

About this time a few animals were taken which had already assumed their winter furs, such as martens, polecats, blue foxes, and ermines. Marbre and Sabine had obtained leave from the Lieutenant to set some traps outside the enceinte. He did not like to refuse them this permission, lest they should become discontented, as he had really no reason to assign for putting a stop to the collecting of furs, although he knew full well that the destination of these harmless creatures could do nobody any good. Their flesh was, however, useful for feeding the dogs, and enabled them to economise the reindeer venison.

All was now prepared for the winter, and the soldiers worked with an energy which they would certainly not have shown if they had been told the secret of their situation.

During the next few days the bearings were taken with the greatest care, but no change was noticeable in the situation of Victoria Island; and Hobson, finding that it was motionless, began to have fresh hope. Although there were as yet no symptoms of winter in inorganic nature, the temperature maintaining a mean height of 49° Fahrenheit, some swans flying to the south in search of a warmer climate was a good omen. Other birds capable of a long-sustained flight over vast tracts of the ocean began to desert the island. They knew full well that the continent of America and of Asia, with their less severe climates and their plentiful resources of every kind, were not far off, and that their wings were strong enough to carry them there. A good many of these birds were caught; and by Mrs Barnett’s advice the Lieutenant tied round their necks a stiff cloth ticket, on which was inscribed the position of the wandering island, and the names of its inhabitants. The birds were then set free, and their captors watched them winging their way to the south with envious eyes.

Of course none were in the secret of the sending forth of these messengers, except Mrs Barnett, Madge, Kalumah, Hobson, and Long.

The poor quadrupeds were unable to seek their usual winter refuges in the south. Under ordinary circumstances the reindeer, Polar hares, and even the wolves would have left early in September for the shores of the Great Bear and Slave Lakes, a good many degrees farther south; but now the sea was an insurmountable barrier, and they, too, would have to wait until the winter should render it passable. Led by instinct they had doubtless tried to leave the island, but, turned back by the water, the instinct of self-preservation had brought them to the neighbourhood of Fort Hope, to be near the men who were once their hunters and most formidable enemies, but were now, like themselves, rendered comparatively inoffensive by their imprisonment.

The observations of the 5th, 6th, 7th, 8th, and 9th September, revealed no alteration in the position of Victoria Island. The large eddy between the two currents kept it stationary. Another fifteen days, another three weeks of this state of things, and Hobson felt that they might be saved.
But they were not yet out of danger, and many terrible, almost supernatural, trials still awaited the inhabitants of Fort Hope.

On the 10th of September observations showed a displacement of Victoria Island. Only a slight displacement, but in a northerly direction.

Hobson was in dismay; the island was finally in the grasp of the Kamtchatka Current, and was drifting towards the unknown latitudes where the large icebergs come into being; it was on its way to the vast solitudes of the Arctic Ocean, interdicted to the human race, from which there is no return.

Hobson did not hide this new danger from those who were in the secret of the situation. Mrs Barnett, Madge, Kalumah, and Sergeant Long received this fresh blow with courage and resignation.

"Perhaps," said Mrs Barnett, "the island may stop even yet. Perhaps it will move slowly. Let us hope on ... and wait! The winter is not far off, and we are going to meet it. In any case God's will be done!" "My friends," said Hobson earnestly, "do you not think I ought now to tell our comrades. You see in what a terrible position we are and all that may await us! Is it not taking too great a responsibility to keep them in ignorance of the peril they are in?"

"I should wait a little longer," replied Mrs Barnett without hesitation; "I would not give them all over to despair until the last chance is gone."

"That is my opinion also," said Long.

Hobson had thought the same, and was glad to find that his companions agreed with him in the matter.

On the 11th and 12th September, the motion towards the north was more noticeable. Victoria Island was drifting at a rate of from twelve to thirteen miles a day, so that each day took them the same distance farther from the land and nearer to the north. They were, in short, following the decided course made by the Kamtchatka Current, and would quickly pass that seventieth degree which once cut across the extremity of Cape Bathurst, and beyond which no land of any kind was to be met with in this part of the Arctic Ocean.

Every day Hobson looked out their position on the map, and saw only too clearly to what awful solitudes the wandering island was drifting.

The only hope left consisted, as Mrs Barnett had said, in the fact that they were going to meet the winter. In thus drifting towards the north they would soon encounter those ice-cold waters, which would consolidate and strengthen the foundations of the island. But if the danger of being swallowed up by the waves was decreased, would not the unfortunate colonists have an immense distance to traverse to get back from these remote northern regions? Had the boat been finished, Lieutenant Hobson would not have hesitated to embark the whole party in it, but in spite of the zealous efforts of the carpenter it was not nearly ready, and indeed it taxed Mac-Nab's powers to the uttermost to construct a vessel on which to trust the lives of twenty persons in such a dangerous sea.

By the 16th September Victoria Island was between seventy-three and eighty miles north of the spot where its course had been arrested for a few days between the Behring and Kamtchatka Cur rents There were now, however, many signs of the approach of winter Snow fell frequently and in large flakes The column of mercury fell gradually The mean temperature was still 44° Fahrenheit during the day, but at night it fell to 32°. The sun described an extremely lengthened curve above the horizon, not rising more than a few degrees even at noon, and disappearing for eleven hours out of every twenty four.

At last, on the night of the 16th September, the first signs of ice appeared upon the sea in the shape of small isolated crystals like snow, which stained the clear surface of the water As was noticed by the famous explorer Scoresby, these crystals immediately calmed the waves, like the oil which sailors pour upon the sea to produce a momentary cessation of its agitation These crystals showed a tendency to weld themselves together, but they were broken and separated by the motion of the water as soon as they had combined to any extent.

Hobson watched the appearance of the "young ice" with extreme attention. He knew that twenty four hours would suffice to make the ice-crust two or three inches thick, strong enough in fact to bear the weight of a man He therefore expected that Victoria Island would shortly be arrested in its course to the north.

But the day ended the work of the night, and if the speed of the island slackened during the darkness in consequence of the obstacles in its path, they were removed in the next twelve hours, and the island was carried rapidly along again by the powerful current.

The distance from the northern regions became daily less, and nothing could be done to lessen the evil.

At the autumnal equinox on the 21st of September, the day and night were of equal length, and from that date the night gradually became longer and longer. The winter was coming at last, but it did not set in rapidly or with any rigour Victoria Island was now nearly a degree farther north than the seventieth parallel, and on this 21st September, a rotating motion was for the first time noticed, a motion estimated by Hobson at about a quarter of the circumference.

Imagine the anxiety of the unfortunate Lieutenant. The secret he had so long carefully kept was now about to be betrayed by nature to the least clear sighted. Of course the rotation altered the cardinal points of the island. Cape
Bathurst no longer pointed to the north, but to the east. The sun, moon, and stars rose and set on a different horizon, and it was impossible that men like Mac-Nab, Rae, Marbre and others, accustomed to note the signs of the heavens, could fail to be struck by the change, and understand its meaning.

To Hobson’s great satisfaction, however, the brave soldiers appeared to notice nothing, the displacement with regard to the cardinal points was not, it was true, very considerable, and it was often too foggy for the rising and setting of the heavenly bodies to be accurately observed.

Unfortunately the rotation appeared to be accompanied by an increase of speed. From that date Victoria Island drifted at the rate of a mile an hour. It advanced farther and farther north, farther and farther away from all land. Hobson did not even yet despair, for it was not in his nature to do so, but he felt confused and astray, and longed for the winter with all his heart.

At last the temperature began to fall still lower. Snow fell plentifully on the 23d and 24th September, and increased the thickness of the coating of ice on the sea. Gradually the vast ice-field was formed on every side, the island in its advance continually broke it up, but each day it became firmer and better able to resist. The sea succumbed to the petrifying hand of winter, and became frozen as far as the eye could reach, and on September 27th, when the bearings were taken, it was found that Victoria Island had not moved since the day before. It was imprisoned in a vast ice-field, it was motionless in longitude 177° 22', and latitude 77° 57'—more than six hundred miles from any continent.

CHAPTER XI

A COMMUNICATION FROM LIEUTENANT HOBSON.

Such was the situation. To use Sergeant Long’s expression, the island had "cast anchor," and was as stationary as when the isthmus connected it with the mainland. But six hundred miles now separated it from inhabited countries, six hundred miles which would have to be traversed in sledges across the solidified surface of the sea, amongst the icebergs which the cold would build up, in the bitterest months of the Arctic winter.

It would be a fearful undertaking, but hesitation was impossible. The winter, for which Lieutenant Hobson had so ardently longed, had come at last, and arrested the fatal march of the island to the north. It would throw a bridge six hundred miles long from their desolate home to the continents on the south, and the new chances of safety must not be neglected, every effort must be made to restore the colonists, so long lost in the hyperborean regions, to their friends.

As Hobson explained to his companions, it would be madness to linger till the spring should again thaw the ice, which would be to abandon themselves once more to the capricious Behring currents. They must wait until the sea was quite firmly frozen over, which at the most would be in another three or four weeks. Meanwhile the Lieutenant proposed making frequent excursions on the ice-field encircling the island, in order to ascertain its thickness, its suitability for the passage of sledges, and the best route to take across it so as to reach the shores of Asia or America.

"Of course," observed Hobson to Mrs Barnett and Sergeant Long, "we would all rather make for Russian America than Asia, if a choice is open to us."

"Kalumah will be very useful to us," said Mrs Barnett, "for as a native she will be thoroughly acquainted with the whole of Alaska."

"Yes, indeed," replied Hobson, "her arrival was most fortunate for us. Thanks to her, we shall be easily able to get to the settlement of Fort Michael on Norton Sound, perhaps even to New Archangel, a good deal farther south, where we can pass the rest of the winter."

"Poor Fort Hope!" exclaimed Mrs Barnett, "it goes to my heart to think of abandoning it on this island. It has been built at the cost of so much trouble and fatigue, everything about it has been so admirably arranged by you, Lieutenant! I feel as if my heart would break when we leave it finally."

"You will not suffer more than I shall, madam," replied Hobson, "and perhaps not so much. It is the chief work of my life; I have devoted all my powers to the foundation of Fort Hope, so unfortunately named, and I shall never cease to regret having to leave it. And what will the Company say which confided this task to me, for after all I am but its humble agent."

"It will say," cried Mrs Barnett with enthusiasm, "it will say that you have done your duty, that you are not responsible for the caprices of nature, which is ever more powerful than man. It will understand that you could not foresee what has happened, for it was beyond the penetration of the most far-sighted man, and it will know that it owes the preservation of the whole party to your prudence and moral courage."

"Thank you, madam," replied the Lieutenant, pressing Mrs Barnett’s hand, "thank you for your warm-hearted words. But I have had some experience of men, and I know that success is always admired and failure condemned. But the will of Heaven be done!"

Sergeant Long, anxious to turn the Lieutenant from his melancholy thoughts, now began to talk about the preparations for the approaching departure, and asked if it was not time to tell his comrades the truth.
"Let us wait a little longer," replied Hobson. "We have saved the poor fellows much anxiety and worry already, let us keep silent until the day is fixed for the start, and then we will reveal the whole truth."

This point being decided, the ordinary occupations of the factory went on for a few weeks longer.

How different was the situation of the colonists a year ago, when they were all looking forward to the future in happy unconsciousness!

A year ago the first symptoms of the cold season were appearing, even as they were now. The "young ice" was gradually forming along the coast. The lagoon, its waters being quieter than those of the sea, was the first to freeze over. The temperature remained about one or two degrees above freezing point in the day, and fell to three or four degrees below in the night. Hobson again made his men assume their winter garments, the linen vests and furs before described. The condensers were again set up inside the house, the air vessel and air-pumps were cleaned, the traps were set round the palisades on different parts of Cape Bathurst, and Marbre and Sabine got plenty of game, and finally the last touches were given to the inner rooms of the principal house.

Although Fort Hope was now about two degrees farther north than at the same time the year before, there was no sensible difference in the state of the temperature. The fact is, the distance between the seventieth and seventy-second parallels is not great enough to affect the mean height of the thermometer, on the contrary, it really seemed to be less cold than at the beginning of the winter before. Perhaps, however, that was because the colonists were now, to a certain extent, acclimatised.

Certainly the winter did not set in so abruptly as last time. The weather was very damp, and the atmosphere was always charged with vapour, which fell now as rain now as snow. In Lieutenant Hobson’s opinion, at least, it was not nearly cold enough.

The sea froze all round the island, it is true, but not in a regular or continuous sheet of ice. Large blackish patches here and there showed that the icicles were not thoroughly cemented together. Loud resonant noises were constantly heard, produced by the breaking of the ice field when the rain melted the imperfectly welded edges of the blocks composing it. There was no rapid accumulation of lump upon lump such as is generally seen in intense cold. Icebergs and hummocks were few and scattered, and no ice-wall as yet shut in the horizon.

"This season would have just been the thing for the explorers of the North West Passage, or the seekers of the North Pole," repeated Sergeant Long again and again, "but it is most unfavourable for us, and very much against our ever getting back to our own land!"

This went on throughout October, and Hobson announced that the mean temperature was no lower than 32° Fahrenheit, and it is well known that several days of cold, 7° or 8° below zero, are required for the sea to freeze hard.

Had proof been needed that the ice-field was impassable, a fact noticed by Mrs Barnett and Hobson would have sufficed.

The animals imprisoned in the island, the furred animals, reindeer, wolves, &c., would have left the island had it been possible to cross the sea, but they continued to gather in large numbers round the factory, and to seek the vicinity of man. The wolves came actually within musket-range of the enceinte to devour the martens and Polar hares, which were their only food. The famished reindeer having neither moss nor herbs on which to browse, roved about Cape Bathurst in herds. A solitary bear, no doubt the one to which Mrs Barnett and Kalumah felt they owed a debt of gratitude, often passed to and fro amongst the trees of the woods, on the banks of the lagoon, and the presence of all these animals, especially of the ruminants, which require an exclusively vegetable diet, proved that flight was impossible.

We have said that the thermometer remained at freezing point, and Hobson found on consulting his journal that at the same time the year before, it had already marked 20° Fahrenheit below zero, proving how unequally cold is distributed in the capricious Polar regions.

The colonists therefore did not suffer much, and were not confined to the house at all. It was, however, very damp indeed, rain mixed with snow fell constantly, and the falling of the barometer proved that the atmosphere was charged with vapour.

Throughout October the Lieutenant and Long made many excursions to ascertain the state of the ice-field in the offing; one day they went to Cape Michael, another to the edge of the former Walruses’ Bay, anxious to see if it would be possible to cross to the continent of America or Asia, or if the start would have to be put off.

But the surface of the ice-field was covered with puddles of water, and in some parts riddled with holes, which would certainly have been impassable for sledges. It seemed as if it would be scarcely safe for a single traveller to venture across the half-liquid, half-solid masses. It was easy to see that the cold had been neither severe nor equally maintained, for the ice consisted of an accumulation of sharp points, crystals, prisms, polyhedrons, and figures of every variety, like an aggregation of stalactites. It was more like a glacier than a "field," and even if it had been practicable, walking on it would have been very tiring.
Hobson and Long managed with great difficulty to scramble over a mile or two towards the south, but at the expense of a vast amount of time, so that they were compelled to admit that they must wait some time yet, and they returned to Fort Hope disappointed and disheartened.

The first days of November came, and the temperature fell a little, but only a very few degrees, which was not nearly enough. Victoria Island was wrapped in damp fogs, and the lamps had to be lit during the day. It was necessary, however, to economise the oil as much as possible, as the supply was running short. No fresh stores had been brought by Captain Craventy’s promised convoy, and there were no more walruses to be hunted. Should the dark winter be prolonged, the colonists would be compelled to have recourse to the fat of animals, perhaps even to the resin of the firs, to get a little light. The days were already very short, and the pale disc of the sun, yielding no warmth, and deprived of all its brightness, only appeared above the horizon for a few hours at a time. Yes, winter had come with its mists, its rain, and its snow, but without the long desired cold.

On the 11th November something of a fête was held at Fort Hope. Mrs Joliffe served up a few extras at dinner, for it was the anniversary of the birth of little Michael Mac-Nab. He was now a year old, and was the delight of everybody. He had large blue eyes and fair curly hair, like his father, the head carpenter, who was very proud of the resemblance. At dessert the baby was solemnly weighed. It was worth something to see him struggling in the scales, and to hear his astonished cries! He actually weighed thirty-four pounds! The announcement of this wonderful weight was greeted with loud cheers, and Mrs Mac-Nab was congratulated by everybody on her fine boy. Why Corporal Joliffe felt that he ought to share the compliments it is difficult to imagine, unless it was as a kind of foster-father or nurse to the baby. He had carried the child about, dandled and rocked him so often, that he felt he had something to do with his specific weight!

The next day, November 12th, the sun did not appear above the horizon. The long Polar night was beginning nine days sooner than it had done the year before, in consequence of the difference in the latitude of Victoria Island then and now.

The disappearance of the sun did not, however, produce any change in the state of the atmosphere. The temperature was as changeable as ever. The thermometer fell one day and rose the next. Rain and snow succeeded each other. The wind was soft, and did not settle in any quarter, but often veered round to every point of the compass in the course of a single day. The constant damp was very unhealthy, and likely to lead to scorbutic affections amongst the colonists, but fortunately, although the lime juice and lime lozenges were running short, and no fresh stock had been obtained, the scurvy-grass and sorrel had yielded a very good crop, and, by the advice of Lieutenant Hobson, a portion of them was eaten daily.

Every effort must, however, be made to get away from Fort Hope. Under the circumstances, three months would scarcely be long enough for them all to get to the nearest continent. It was impossible to risk being overtaken by the thaw on the ice-field, and therefore if they started at all it must be at the end of November.

The journey would have been difficult enough, even if the ice had been rendered solid everywhere by a severe winter, and in this uncertain weather it was a most serious matter.

On the 13th November, Hobson, Mrs Barnett, and the Sergeant met to decide on the day of departure. The Sergeant was of opinion that they ought to leave the island as soon as possible.

"For," he said, "we must make allowance for all the possible delays during a march of six hundred miles. We ought to reach the continent before March, or we may be surprised by the thaw, and then we shall be in a worse predicament than we are on our island."

"But," said Mrs Barnett, "is the sea firm enough for us to cross it?"

"I think it is," said Long, "and the ice gets thicker every day. The barometer, too, is gradually rising, and by the time our preparations are completed, which will be in about another week, I think, I hope that the really cold weather will have set in."

"The winter has begun very badly," said Hobson, "in fact everything seems to combine against us. Strange seasons have often been experienced on these seas, I have heard of whalers being able to navigate in places where, even in the summer at another time they would not have had an inch of water beneath their keels. In my opinion there is not a day to be lost, and I cannot sufficiently regret that the ordinary temperature of these regions does not assist us."

"It will later," said Mrs Barnett, "and we must be ready to take advantage of every chance in our favour. When do you propose starting, Lieutenant?"

"At the end of November at the latest," replied Hobson, "but if in a week hence our preparations are finished, and the route appears practicable, we will start then."

"Very well," said Long, "we will get ready without losing an instant."

"Then," said Mrs Barnett, "you will now tell our companions of the situation in which they are placed?"

"Yes, madam, the moment to speak and the time for action have alike arrived."
"And when do you propose enlightening them?"

"At once. Sergeant Long," he added, turning to his subordinate, who at once drew himself up in a military attitude, "call all your men together in the large room to receive a communication."

Sergeant Long touched his cap, and turning on his heel left the room without a word.

For some minutes Mrs Barnett and Hobson were left alone, but neither of them spoke.

The Sergeant quickly returned, and told Hobson that his orders were executed.

The Lieutenant and the lady at once went into the large room. All the members of the colony, men and women, were assembled in the dimly lighted room.

Hobson came forward, and standing in the centre of the group said very gravely—

"My friends, until to-day I have felt it my duty, in order to spare you useless anxiety, to conceal from you the situation of our fort. An earthquake separated us from the continent. Cape Bathurst has broken away from the mainland. Our peninsula is but an island of ice, a wandering island"——

At this moment Marbre stepped forward, and said quietly.

"We knew it, sir!"

CHAPTER XII.

A CHANCE TO BE TRIED.

The brave fellows knew it then! And that they might not add to the cares of their chief, they had pretended to know nothing, and had worked away at the preparations for the winter with the same zeal as the year before.

Tears of emotion stood in Hobson's eyes, and he made no attempt to conceal them, but seizing Marbre's outstretched hand, he pressed it in his own.

Yes, the soldiers all knew it, for Marbre had guessed it long ago. The filling of the reindeer trap with salt water, the non-arrival of the detachment from Fort Reliance, the observations of latitude and longitude taken every day, which would have been useless on firm ground, the precautions observed by Hobson to prevent any one seeing him take the bearings, the fact of the animals remaining on the island after winter had set in, and the change in the position of the cardinal points during the last few days, which they had noticed at once, had all been tokens easily interpreted by the inhabitants of Fort Hope. The arrival of Kalumah had puzzled them, but they had concluded that she had been thrown upon the island in the storm, and they were right, as we are aware.

Marbre, upon whom the truth had first dawned, confided his suspicions to Mac-Nab the carpenter and Rae the blacksmith. All three faced the situation calmly enough, and agreed that they ought to tell their comrades and wives, but decided to let the Lieutenant think they knew nothing, and to obey him without question as before.

"You are indeed brave fellows, my friends," exclaimed Mrs Barnett, who was much touched by this delicate feeling, "you are true soldiers!"

"Our Lieutenant may depend upon us," said Mac-Nab, "he has done his duty, and we will do ours."

"I know you will, dear comrades," said Hobson, "and if only Heaven will help and not forsake us, we will help ourselves."

The Lieutenant then related all that had happened since the time when the earthquake broke the isthmus, and converted the districts round Cape Bathurst into an island. He told how, when the sea became free from ice in the spring, the new island had been drifted more than two hundred miles away from the coast by an unknown current, how the hurricane had driven it back within sight of land, how it had again been carried away in the night of the 31st August, and, lastly, how Kalumah had bravely risked her life to come to the aid of her European friends. Then he enumerated the changes the island had undergone, explaining how the warmer waters had worn it away, and his fear that it might be carried to the Pacific, or seized by the Kamtchatka Current, concluding his narrative by stating that the wandering island had finally stopped on the 27th of last September.

The chart of the Arctic seas was then brought, and Hobson pointed out the position occupied by the island—six hundred miles from all land.

He ended by saying that the situation was extremely dangerous, that the island would inevitably be crushed when the ice broke up, and that, before having recourse to the boat—which could not be used until the next summer—they must try to get back to the American continent by crossing the ice-field.

"We shall have six hundred miles to go in the cold and darkness of the Polar night. It will be hard work, my friends, but you know as well as I do that there can be no shrinking from the task."

"When you give the signal to start, Lieutenant, we will follow you," said Mac-Nab.

All being of one mind, the preparations for departure were from that date rapidly pushed forward. The men bravely faced the fact that they would have six hundred miles to travel under very trying circumstances. Sergeant Long superintended the works, whilst Hobson, the two hunters, and Mrs Barnett, often went to test the firmness of the ice-field. Kalumah frequently accompanied them, and her remarks, founded on experience, might possibly be of great use to the Lieutenant. Unless they were prevented they were to start on the 20th November, and there was not a
moment to lose.

As Hobson had foreseen, the wind having risen, the temperature fell slightly, and the column of mercury marked 24° Fahrenheit.

Snow, which soon became hardened, replaced the rain of the preceding days. A few more days of such cold and sledges could be used. The little bay hollowed out of the cliffs of Cape Michael was partly filled with ice and snow; but it must not be forgotten that its calmer waters froze more quickly than those of the open sea, which were not yet in a satisfactory condition.

The wind continued to blow almost incessantly, and with considerable violence, but the motion of waves interfered with the regular formation and consolidation of the ice. Large pools of water occurred here and there between the pieces of ice, and it was impossible to attempt to cross it.

"The weather is certainly getting colder," observed Mrs Barnett to Lieutenant Hobson, as they were exploring the south of the island together on the 10th November, "the temperature is becoming lower and lower, and these liquid spaces will soon freeze over."

"I think you are right, madam," replied Hobson, "but the way in which they will freeze over will not be very favourable to our plans. The pieces of ice are small, and their jagged edges will stick up all over the surface, making it very rough, so that if our sledges get over it at all, it will only be with very great difficulty."

"But," resumed Mrs Barnett, "if I am not mistaken, a heavy fall of snow, lasting a few days or even a few hours, would suffice to level the entire surface!"

"Yes, yes," replied Hobson, "but if snow should fall, it will be because the temperature has risen; and if it rises, the ice-field will break up again, so that either contingency will be against us!"

"It really would be a strange freak of fortune if we should experience a temperate instead of an Arctic winter in the midst of the Polar Sea!" observed Mrs Barnett.

"It has happened before, madam, it has happened before. Let me remind you of the great severity of last cold season; now it has been noticed that two long bitter winters seldom succeed each other, and the whalers of the northern seas know it well. A bitter winter when we should have been glad of a mild one, and a mild one when we so sorely need the reverse. It must be owned, we have been strangely unfortunate thus far! And when I think of six hundred miles to cross with women and a child!"

And Hobson pointed to the vast white plain, with strange irregular markings like guipure work, stretching away into the infinite

"I know you will, dear comrades," said Hobson, "and if only Heaven will help and not forsake us, we will help ourselves."

The Lieutenant then related all that had happened since the time when the earthquake broke the isthmus, and converted the districts round Cape Bathurst into an island. He told how, when the sea became free from ice in the spring, the new island had been drifted more than two hundred miles away from the coast by an unknown current, how the hurricane had driven it luck within sight of land, how it had again been carried away in the night of the 31st August, and, lastly, how Kalumah had bravely risked her life to come to the aid of her European friends. Then he enumerated the changes the island had undergone, explaining how the warmer waters had worn it away, and his fear that it might be carried to the Pacific, or seized by the Kamtchatka Current, concluding his narrative by stating that the wandering island had finally stopped on the 27th of last September.

The chart of the Arctic seas was then brought, and Hobson pointed out the position occupied by the island—six hundred miles from all land.

He ended by saying that the situation was extremely dangerous, that the island would inevitably be crushed when the ice broke up, and that, before having recourse to the boat—which could not be used until the next summer—they must try to get back to the American continent by crossing the ice-field.

"We shall have six hundred miles to go in the cold and darkness of the Polar night. It will be hard work, my friends but you know as well as I do that there can be no shirking from the task! "When you give the signal to start, Lieutenant, we will follow you," said Mac-Nab.

All being of one mind, the preparations for departure were from that date rapidly pushed forward. The men bravely faced the fact that they would have six hundred miles to travel under very trying circumstances. Sergeant Long superintended the works, whilst Hobson, the two hunters, and Mrs Barnett, often went to test the firmness of the ice-field Kalumah frequently accompanied them, and her remarks, founded on experience, might possibly be of great use to the Lieutenant. Unless they were prevented they were to start on the 20th November, and there was not a moment to lose.

As Hobson had foreseen, the wind having risen, the temperature fell slightly, and the column of mercury marked 24° Fahrenheit.

Snow, which soon became hardened, replaced the rain of the preceding days. A few more days of such cold and
sledges could be used. The little bay hollowed out of the cliffs of Cape Michael was partly filled with ice and snow, but it must not be forgotten that its calmer waters froze more quickly than those of the open sea, which were not yet in a satisfactory condition.

The wind continued to blow almost incessantly, and with considerable violence, but the motion of waves interfered with the regular formation and consolidation of the ice. Large pools of water occurred here and there between the pieces of ice, and it was impossible to attempt to cross it.

"The weather is certainly getting colder," observed Mrs Barnett to Lieutenant Hobson, as they were exploring the south of the island together on the 10th November, "the temperature is becoming lower and lower, and these liquid spaces will soon freeze over."

"I think you are right, madam," replied Hobson, "but the way in which they will freeze over will not be very favourable to our plans. The pieces of ice are small, and their jagged edges will stick up all over the surface, making it very rough, so that if our sledges get over it at all, it will only be with very great difficulty."

"But," resumed Mrs Barnett, "if I am not mistaken, a heavy fall of snow, lasting a few days or even a few hours, would suffice to level the entire surface!"

"Yes, yes," replied Hobson, "but if snow should fall, it will be because the temperature has risen; and if it rises, the ice-field will break up again, so that either contingency will be against us!"

"It really would be a strange freak of fortune if we should experience a temperate instead of an Arctic winter in the midst of the Polar Sea!" observed Mrs Barnett.

"It has happened before, madam, it has happened before. Let me remind you of the great severity of last cold season; now it has been noticed that two long bitter winters seldom succeed each other, and the whalers of the northern seas know it well. A bitter winter when we should have been glad of a mild one, and a mild one when we so sorely need the reverse. It must be owned, we have been strangely unfortunate thus far! And when I think of six hundred miles to cross with women and a child!"

And Hobson pointed to the vast white plain, with strange irregular markings like guipure work, stretching away into the infinite distance. Sad and desolate enough it looked, the imperfectly frozen surface cracking every now and then with an ominous sound. A pale moon, its light half quenched in the damp mists, rose but a few degrees above the gloomy horizon and shot a few faint beams upon the melancholy scene. The half-darkness and the refraction combined doubled the size of every object. Icebergs of moderate height assumed gigantic proportions, and were in some cases distorted into the forms of fabulous monsters. Birds passed overhead with loud flapping of wings, and in consequence of this optical illusion the smallest of them appeared as large as a condor or a vulture. In the midst of the icebergs yawned apparently huge black tunnels, into which the boldest man would scarcely dare to venture, and now and then sudden convulsions took place, as the icebergs, worn away at the base, heeled over with a crash, the sonorous echoes taking up the sounds and carrying them along. The rapid changes resembled the transformation scenes of fairyland, and terrible indeed must all those phenomena have appeared to the luckless colonists who were about to venture across the ice-field!

In spite of her moral and physical courage Mrs Barnett could not control an involuntary shudder. Soul and body alike shrunk from the awful prospect, and she was tempted to shut her eyes and stop her ears that she might see and hear no more. When the moon was for a moment veiled behind a heavy cloud, the gloom of the Polar landscape became still more awe-inspiring, and before her mind’s eye rose a vision of the caravan of men and women struggling across these vast solitudes in the midst of hurricanes, snow-storms, avalanches, and in the thick darkness of the Arctic night!

Mrs Barnett, however, forced herself to look; she wished to accustom her eyes to these scenes, and to teach herself not to shrink from facing their terrors. But as she gazed a cry suddenly burst from her lips, and seizing Hobson’s hand, she pointed to a huge object, of ill-defined dimensions, moving about in the uncertain light, scarcely a hundred paces from where they stood.

It was a white monster of immense size, more than a hundred feet high. It was pacing slowly along over the broken ice, bounding from one piece to another, and beating the air with its huge feet, between which it could have held ten large dogs at least. It, too, seemed to be seeking a practicable path across the ice—it, too, seemed anxious to fly from the doomed island. The ice gave way beneath its weight, and it had often considerable difficulty in regaining its feet.

The monster made its way thus for about a quarter of a mile across the ice, and then, its farther progress being barred, it turned round and advanced towards the spot where Mrs Barnett and the Lieutenant stood.

Hobson seized the gun which was slung over his shoulder and presented it at the animal, but almost immediately lowering the weapon, he said to Mrs Barnett—

"A bear, madam, only a bear, the size of which has been greatly magnified by refraction."

It was, in fact, a Polar bear, and Mrs Barnett drew a long breath of relief as she understood the optical illusion of
which presently resolved themselves into heavy rain instead of the sadly-needed snow, the column of mercury from this change in the state of the atmosphere. Whilst the cold decreased the sky became covered with clouds, back to Victoria Island across the ever-changing, ever-moving blocks of ice.

underwent the greatest fatigue in these short excursions, and more than once they ran a risk of being unable to get impossible for sledges to cross it, it was dangerous for unencumbered pedestrians. Hobson and his two men compelled to admit that it was broken by rents, crevasses, and fissures in every direction. Not only would it be corner of the old Walruses' Bay. They even ventured out about a mile and a half upon the ice-field, but were intermittent. Hobson, Marbre, and Sabine went along the coast every day from Cape Michael to what was once the severe enough to freeze the surface of the sea, with any uniformity, and the snow which fell was fine and November.

phenomena of the high latitudes, such as the Aurora Borealis, halos, parhelia, &c. &c. Hobson would have been glad to take some fuel with him, as he would not meet with a tree, a shrub, unfortunately getting low—and an ample reserve of sorrel, scurvy-grass, rum, spirits of wine, for making warm drinks, &c. &c. Hobson was right, the imprisoned animal had tried to leave the island and to get to the continent, and having failed it was returning to the coast. Shaking its head and growling, it passed some twenty paces from the two watchers, and, either not seeing them or disdaining to take any notice of them, it walked heavily on towards Cape Michael, and soon disappeared behind the rising ground.

Lieutenant Hobson and Mrs Barnett returned sadly and silently to the fort.

The preparations for departure went on as rapidly, however, as if it were possible to leave the island. Nothing was neglected to promote the success of the undertaking, every possible danger had to be foreseen, and not only had the ordinary difficulties and dangers of a journey across the ice to be allowed for, but also the sudden changes of weather peculiar to the Polar regions, which so obstinately resist every attempt to explore them.

The teams of dogs required special attention. They were allowed to run about near the fort, that they might regain the activity of which too long a rest had, to some extent, deprived them, and they were soon in a condition to make a long march.

The sledges were carefully examined and repaired. The rough surface of the ice-field would give them many violent shocks, and they were therefore thoroughly overhauled by Mac-Nab and his men, the inner framework and the curved fronts being carefully repaired and strengthened.

Two large waggon sledges were built, one for the transport of provisions, the other for the peltries. These were to be drawn by the tamed reindeer, which had been well trained for the service. The peltries or furs were articles of luxury with which it was not perhaps quite prudent to burden the travellers, but Hobson was anxious to consider the interests of the Company as much as possible, although he was resolved to abandon them, en route, if they harassed or impeded his march. No fresh risk was run of injury of the furs, for of course they would have been lost if left at the factory.

It was of course quite another matter with the provisions, of which a good and plentiful supply was absolutely necessary. It was of no use to count on the product of the chase this time. As soon as the passage of the ice-field became practicable, all the edible game would get on ahead and reach the mainland before the caravan. One waggon sledge was therefore packed with salt meat, corned beef, hare pâtés, dried fish, biscuits—the stock of which was unfortunately getting low—and an ample reserve of sorrel, scurvy-grass, rum, spirits of wine, for making warm drinks, &c. &c. Hobson would have been glad to take some fuel with him, as he would not meet with a tree, a shrub, or a bit of moss throughout the march of six hundred miles, nor could he hope for pieces of wreck or timber cast up by the sea, but he did not dare to overload his sledges with wood. Fortunately there was no lack of warm comfortable garments, and in case of need they could draw upon the reserve of peltries in the waggon.

Thomas Black, who since his misfortune had altogether retired from the world, shunning his companions, taking part in none of the consultations, and remaining shut up in his own room, reappeared as soon as the day of departure was definitely fixed. But even then he attended to nothing but the sledge which was to carry his person, his instruments, and his registers. Always very silent, it was now impossible to get a word out of him. He had forgotten everything, even that he was a scientific man, and since he had been deceived about the eclipse, since the solution of the problem of the red prominences of the moon had escaped him, he had taken no notice of any of the peculiar phenomena of the high latitudes, such as the Aurora Borealis, halos, parhelia, &c.

During the last few days every one worked so hard that all was ready for the start on the morning of the 18th November.

But, alas! the ice-field was still impassable. Although the thermometer had fallen slightly, the cold had not been severe enough to freeze the surface of the sea, with any uniformity, and the snow which fell was fine and intermittent. Hobson, Marbre, and Sabine went along the coast every day from Cape Michael to what was once the corner of the old Walruses' Bay. They even ventured out about a mile and a half upon the ice-field, but were compelled to admit that it was broken by rents, crevasses, and fissures in every direction. Not only would it be impossible for sledges to cross it, it was dangerous for unencumbered pedestrians. Hobson and his two men underwent the greatest fatigue in these short excursions, and more than once they ran a risk of being unable to get back to Victoria Island across the ever-changing, ever-moving blocks of ice.

Really all nature seemed to be in league against the luckless colonists.

On the 18th and 19th November, the thermometer rose, whilst the barometer fell. Fatal results were to be feared from this change in the state of the atmosphere. Whilst the cold decreased the sky became covered with clouds, which presently resolved themselves into heavy rain instead of the sadly-needed snow, the column of mercury
standing at 34° Fahrenheit. These showers of comparatively warm water melted the snow and ice in many places, and the result can easily be imagined. It really seemed as if a thaw were setting in, and there were symptoms of a general breaking up of the ice-field. In spite of the dreadful weather, however, Hobson went to the south of the island every day, and every day returned more disheartened than before.

On the 20th, a tempest resembling in violence that of the month before, broke upon the gloomy Arctic solitudes, compelling the colonists to give up going out, and to remain shut up in Fort Hope for two days.

CHAPTER XIII.

ACROSS THE ICE-FIELD.

At last, on the 22d of November, the weather moderated. In a few hours the storm suddenly ceased. The wind veered round to the north, and the thermometer fell several degrees. A few birds capable of a long-sustained flight took wing and disappeared. There really seemed to be a likelihood that the temperature was at last going to become what it ought to be at this time of the year in such an elevated latitude. The colonists might well regret that it was not now what it had been during the last cold season, when the column of mercury fell to 72° Fahrenheit below zero.

Hobson determined no longer to delay leaving Victoria Island, and on the morning of the 22d the whole of the little colony was ready to leave the island, which was now firmly welded to the ice-field, and by its means connected with the American continent, six hundred miles away.

At half-past eleven A.M., Hobson gave the signal of departure. The sky was grey but clear, and lighted up from the horizon to the zenith by a magnificent Aurora Borealis. The dogs were harnessed to the sledges, and three couple of reindeer to the waggon sledges. Silently they wended their way towards Cape Michael, where they would quit the island, properly so called, for the ice-field.

The caravan at first skirted along the wooded hill on the east of Lake Barnett, but as they were rounding the corner all paused to look round for the last time at Cape Bathurst, which they were leaving never to return. A few snow-encrusted rafters stood out in the light of the Aurora Borealis, a few white lines marked the boundaries of the enceinte of the factory, a—white mass here and there, a few blue wreaths of smoke from the expiring fire never to be rekindled; this was all that could be seen of Fort Hope, now useless and deserted, but erected at the cost of so much labour and so much anxiety.

"Farewell, farewell, to our poor Arctic home!" exclaimed Mrs. Barnett, waving her hand for the last time; and all sadly and silently resumed their journey.

At one o’clock the detachment arrived at Cape Michael, after having rounded the gulf which the cold had imperfectly frozen over. Thus far the difficulties of the journey had not been very great, for the ground of the island was smooth compared to the ice-field, which was strewn with icebergs, hummocks, and packs, between which, practicable passes had to be found at the cost of an immense amount of fatigue.

Towards the evening of the same day the party had advanced several miles on the ice-field, and a halt for the night was ordered; the encampment was to be formed by hollowing out snow-houses in the Esquimaux style. The work was quickly accomplished with the ice-chisels, and at eight o’clock, after a salt meat supper, every one had crept into the holes, which are much warmer than anybody would imagine.

Before retiring, however, Mrs. Barnett asked the Lieutenant how far he thought they had come.

"Not more than ten miles, I think," replied Hobson.

"Ten from six hundred!" exclaimed Mrs Barnett. "At this rate, it will take us three months to get to the American continent!"

"Perhaps more, madam," replied Hobson, "for we shall not be able to get on faster than this. We are not travelling as we were last year over the frozen plains between Fort Reliance and Cape Bathurst; but on a distorted ice-field crushed by the pressure of the icebergs across which there is no easy route. I expect to meet with almost insurmountable difficulties on the way; may we be able to conquer them! It is not of so much importance, however, to march quickly as to preserve our health, and I shall indeed think myself fortunate if all my comrades answer to their names in the roll-call on our arrival at Fort Reliance. Heaven grant we may have all landed at some point, no matter where, of the American continent in three months’ time; if so, we shall never be able to return thanks enough."

The night passed without incident; but during the long vigil which he kept, Hobson fancied he noticed certain ill-omened tremblings on the spot he had chosen for his encampment, and could not but fear that the vast ice-field was insufficiently cemented, and that there would be numerous rents in the surface which would greatly impede his progress, and render communication with firm ground very uncertain. Moreover, before he started, he had observed that none of the animals had left the vicinity of the fort, and they would certainly have sought a warmer climate had not their instinct warned them of obstacles in their way. Yet the Lieutenant felt that he had only done his duty in making this attempt to restore his little colony to an inhabited land, before the setting in of the thaw, and whether he succeeded or had to turn back he would have no reason to reproach himself.
The next day, November 23d, the detachment could not even advance ten miles towards the east, so great were the difficulties met with. The ice-field was fearfully distorted, and here and there many layers of ice were piled one upon another, doubtless driven along by the irresistible force of the ice-wall into the vast funnel of the Arctic Ocean. Hence a confusion of masses of ice, which looked as if they had been suddenly dropped by a hand incapable of holding them, and strewn about in every direction.

It was clear that a caravan of sledges, drawn by dogs and reindeer, could not possibly get over these blocks; and it was equally clear that a path could not be cut through them with the hatchet or ice-chisel. Some of the icebergs assumed extraordinary forms, and there were groups which looked like towns falling into ruins. Some towered three or four hundred feet above the level of the ice-field, and were capped with tottering masses of debris, which the slightest shake or shock or gust of wind would bring down in avalanches.

The greatest precautions were, therefore, necessary in rounding these ice-mountains, and orders were given not to speak above a whisper, and not to excite the dogs by cracking the whips in these dangerous passes.

But an immense amount of time was lost in looking for practicable passages, and the travellers were worn out with fatigue, often going ten miles round before they could advance one in the required direction towards the east. The only comfort was that the ground still remained firm beneath their feet.

On the 24th November, however, fresh obstacles arose, which Hobson really feared, with considerable reason, would be insurmountable.

After getting over one wall of ice which rose some twenty miles from Victoria Island, the party found themselves on a much less undulating ice-field, the different portions of which had evidently not been subjected to any great pressure. It was clear that in consequence of the direction of the currents the influence of the masses of permanent ice in the north had not here been felt, and Hobson and his comrades soon found that this ice-field was intersected with wide and deep crevasses not yet frozen over. The temperature here was comparatively warm, and the thermometer maintained a mean height of more than 34° Fahrenheit. Salt water, as is well known, does not freeze so readily as fresh, but requires several degrees of cold below freezing point before it becomes solidified, and the sea was therefore still liquid. All the icebergs and floes here had come from latitudes farther north, and, if we may so express it, lived upon the cold they had brought with them. The whole of the southern portion of the Arctic Ocean was most imperfectly frozen, and a warm rain was falling, which hastened the dissolution of what ice there was.

On the 24th November the advance of the travellers was absolutely arrested by a crevasse full of rough water strewn with small icicles—a crevasse not more than a hundred feet wide, it is true, but probably many miles long.

For two whole hours the party skirted along the western edge of this gap, in the hope of coming to the end of it and getting to the other side, so as to resume their march to the east, but it was all in vain, they were obliged to give it up and encamp on the wrong side.

Hobson and Long, however, proceeded for another quarter of a mile along the interminable crevasse, mentally cursing the mildness of the winter which had brought them into such a strait.

"We must pass somehow," said Long, "for we can’t stay where we are."

"Yes, yes," replied the Lieutenant, "and we shall pass it, either by going up to the north, or down to the south, it must end somewhere. But after we have got round this we shall come to others, and so it will go on perhaps for hundred of miles, as long as this uncertain and most unfortunate weather continues!"

"Well, Lieutenant, we must ascertain the truth once for all before we resume our journey," said the Sergeant.

"We must indeed, Sergeant," replied Hobson firmly, "or we shall run a risk of not having crossed half the distance between us and America after travelling five or six hundred miles out of our way. Yes, before going farther, I must make quite sure of the state of the ice-field, and that is what I am about to do."

And without another word Hobson stripped himself, plunged into the half-frozen water, and being a powerful swimmer a few strokes soon brought him to the other side of the crevasse, when he disappeared amongst the icebergs.

A few hours later the Lieutenant reached the encampment, to which Long had already returned, in an exhausted condition. He took Mrs Barnett and the Sergeant aside, and told them that the ice-field was impracticable, adding—

"Perhaps one man on foot without a sledge or any encumbrances might get across, but for a caravan it is impossible. The crevasses increase towards the east, and a boat would really be of more use than a sledge if we wish to reach the American coast."

"Well," said Long, "if one man could cross, ought not one of us to attempt it, and go and seek assistance for the rest."

"I thought of trying it myself," replied Hobson.

"You, Lieutenant!"

"You, sir!" cried Mrs Barnett and Long in one breath.
These two exclamations showed Hobson how unexpected and inopportune his proposal appeared. How could he, the chief of the expedition, think of deserting those confided to him, even although it was in their interests and at great risk to himself. It was quite impossible, and the Lieutenant did not insist upon it.

"Yes," he said, "I understand how it appears to you, my friends, and I will not abandon you. It would, indeed, be quite useless for any one to attempt the passage; he would not succeed, he would fall by the way, and find a watery grave when the thaw sets in. And even suppose he reached New Archangel, how could he come to our rescue? Would he charter a vessel to seek for us? Suppose he did, it could not start until after the thaw. And who can tell where the currents will then have taken Victoria Island, either yet farther north or to the Behring Sea!

"Yes, Lieutenant, you are right," replied Long; "let us remain together, and if we are to be saved in a boat, there is Mac-Nab’s on Victoria Island, and for it at least we shall not have to wait!"

Mrs Barnett had listened without saying a word, but she understood that the ice-field being impassible, they had now nothing to depend on but the carpenter’s boat, and that they would have to wait bravely for the thaw.

"What are you going to do, then?" she inquired at last.

"Return to Victoria Island."

"Let us return then, and God be with us!"

The rest of the travellers had now gathered round the Lieutenant, and he laid his plans before them.

At first all were disposed to rebel, the poor creatures had been counting on getting back to their homes, and felt absolutely crushed at the disappointment, but they soon recovered their dejection and declared themselves ready to obey.

Hobson then told them the results of the examination he had just made. They learnt that the obstacles in their way on the east were so numerous that it would be absolutely impossible to pass with the sledges and their contents, and as the journey would last several months, the provisions, &c., could not be dispensed with.

"We are now," added the Lieutenant, "cut off from all communication with the mainland, and by going farther towards the east we run a risk, after enduring great fatigues, of finding it impossible to get back to the island, now our only refuge. If the thaw should overtake us on the ice-field, we are lost. I have not disguised nor have I exaggerated the truth, and I know, my friends, that I am speaking to men who have found that I am not a man to turn back from difficulties. But I repeat, the task we have set ourselves is impossible!"

The men trusted their chief implicitly. They knew his courage and energy, and felt as they listened to his words that it was indeed impossible to cross the ice. It was decided to start on the return journey to Fort Hope the next day, and it was accomplished under most distressing circumstances. The weather was dreadful, squalls swept down upon the ice-field, and rain fell in torrents. The difficulty of finding the way in the darkness through the labyrinth of icebergs can well be imagined!

It took no less than four days and four nights to get back to the island. Several teams of dogs with their sledges fell into the crevasses, but thanks to Hobson’s skill, prudence, and devotion, he lost not one of his party. But what terrible dangers and fatigues they had to go through, and how awful was the prospect of another winter on the wandering island to the unfortunate colonists!

CHAPTER XIV.

THE WINTER MONTHS.

The party did not arrive at Fort Hope until the 28th, after a most arduous journey. They had now nothing to depend on but the boat, and that they could not use until the sea was open, which would not be for six months.

Preparations for another winter were therefore made. The sledges were unloaded, the provisions put back in the pantry, and the clothes, arms, furs, &c., in the magazines. The dogs returned to their dog-house, and the reindeer to their stable.

Great was the despair of Thomas Black at this return to seclusion. The poor astronomer carried his instruments, his books, and his MSS. back to his room, and more angry than ever with "the evil fate which pursued him," he held himself aloof from everything which went on in the factory.

All were again settled at their usual winter avocations the day after their arrival, and the monotonous winter life once more commenced. Needlework, mending the clothes, taking care of the furs, some of which might yet be saved, the observation of the weather, the examination of the ice-field, and reading aloud, were the daily occupations. Mrs Barnett was, as before, the leader in everything, and her influence was everywhere felt. If, as sometimes happened, now that all were uneasy about the future, a slight disagreement occurred between any of the soldiers, a few words from Mrs Barnett soon set matters straight, for she had acquired wonderful power over the little world in which she moved, and she always used it for the good of the community.

Kalumah had become a great favourite with everybody, for she was always pleasant and obliging. Mrs Barnett had undertaken her education, and she got on quickly, for she was both intelligent and eager to learn. She improved her English speaking, and also taught her to read and write in that language. There were, however, twelve masters
for Kalumah, all eager to assist in this branch of her education, as the soldiers had all been taught reading, writing, and arithmetic either in England or in English colonies.

The building of the boat proceeded rapidly, and it was to be planked and decked before the end of the month. Mac-Nab and some of his men worked hard in the darkness outside, with no light but the flames of burning resin, whilst others were busy making the rigging in the magazines of the factory. Although the season was now far advanced, the weather still remained very undecided. The cold was sometimes intense, but owing to the prevalence of west winds it never lasted long.

Thus passed the whole of December, rain and intermittent falls of snow succeeded each other, the temperature meanwhile varying from 26° to 34° Fahrenheit. The consumption of fuel was moderate, although there was no need to economise it, the reserves being considerable. It was otherwise with the oil, upon which they depended for light, for the stock was getting so low that the Lieutenant could at last only allow the lamps to be lit for a few hours every day. He tried using reindeer fat for lighting the house, but the smell of it was so unbearable that every one preferred being in the dark. All work had of course to be given up for the time, and very tedious did the long dark hours appear.

Some Auroræ Borealis and two or three lunar halos appeared at full moon, and Thomas Black might now have minutely observed all these phenomenon, and have made precise calculations on their intensity, their coloration, connection with the electric state of the atmosphere, and their influence upon the magnetic needle, &c. But the astronomer did not even leave his room. His spirit was completely crushed.

On the 30th December the light of the moon revealed a long circular line of icebergs shutting in the horizon on the north and east of Victoria Island. This was the ice-wall, the frozen masses of which were piled up to a height of some three or four hundred feet. Two-thirds of the island were hemmed in by this mighty barrier, and it seemed probable that the blockade would become yet more complete.

The sky was clear for the first week of January. The new year, 1861, opened with very cold weather, and the column of mercury fell to 8° Fahrenheit. It was the lowest temperature that had yet been experienced in this singular winter, although it was anything but low for such a high latitude.

The Lieutenant felt it his duty once more to take the latitude and longitude of the island by means of stellar observations, and found that its position had not changed at all.

About this time, in spite of all their economy, the oil seemed likely to fail altogether. The sun would not appear above the horizon before early in February, so that there was a month to wait, during which there was a danger of the colonists having to remain in complete darkness. Thanks to the young Esquimaux, however, a fresh supply of oil for the lamps was obtained.

On the 3rd January Kalumah walked to Cape Bathurst to examine the state of the ice. All along the south of the island the ice-field was very compact, the icicles of which it was composed were more firmly welded together, there were no liquid spaces between them, and the surface of the floe, though rough, was perfectly firm everywhere. This was no doubt caused by the pressure of the chain of icebergs on the horizon, which drove the ice towards the north, and squeezed it against the island.

Although she saw no crevasses or rents, the young native noticed many circular holes neatly cut in the ice, the use of which she knew perfectly well. They were the holes kept open by seals imprisoned beneath the solid crust of ice, and by which they came to the surface to breathe and look for mosses under the snow on the coast.

Kalumah knew that in the winter bears will crouch patiently near these holes, and watching for the moment when the seal comes out of the water, they rush upon it, hug it to death in their paws, and carry it off. She knew, too, that the Esquimaux, not less patient than the bears, also watch for the appearance of these animals, and throwing a running noose over their heads when they push them up, drag them to the surface.

What bears and Esquimaux could do might certainly also be done by skilful hunters, and Kalumah hastened back to the fort to tell the Lieutenant of what she had seen, feeling sure that where these holes were seals were not far off.

Hobson sent for the hunters, and the young native described to them the way in which the Esquimaux capture these animals in the winter, and begged them to try.

She had not finished speaking before Sabine had a strong rope with a running noose ready in his hand and accompanied by Hobson, Mrs Barnett, Kalumah, and two or three soldiers, the hunters hurried to Cape Bathurst, and whilst the women remained on the beach, the men made their way to the holes pointed out by Kalumah. Each one was provided with a rope, and stationed himself at a different hole.

A long time of waiting ensued—no sign of the seals, but at last the water in the hole Marbre had chosen began to bubble, and a head with long tusks appeared. It was that of a walrus. Marbre flung his running noose skillfully over its neck and pulled it tightly. His comrades rushed to his assistance, and with some difficulty the huge beast was dragged upon the ice, and despatched with hatchets.

It was a great success, and the colonists were delighted with this novel fishing. Other walruses were taken in the
same way, and furnished plenty of oil, which, though not strictly of the right sort, did very well for the lamps, and there was no longer any lack of light in any of the rooms of Fort Hope.

The cold was ever now not very severe, and had the colonists been on the American mainland they could only have rejoiced in the mildness of the winter. They were sheltered by the chain of icebergs from the north and west winds, and the month of January passed on with the thermometer never many degrees below freezing point, so that the sea round Victoria Island was never frozen hard. Fissures of more or less extent broke the regularity of the surface in the offing, as was proved by the continued presence of the ruminants and furred animals near the factory, all of which had become strangely tame, forming in fact part of the menagerie of the colony.

According to Hobson’s orders, all these creatures were unmolested. It would have been useless to kill them, and a reindeer was only occasionally slaughtered to obtain a fresh supply of venison. Some of the furred animals even ventured into the enceinte, and they were not driven away. The martens and foxes were in all the splendour of their winter clothing, and under ordinary circumstances would have been of immense value. These rodents found plenty of moss under the snow, thanks to the mildness of the season, and did not therefore live upon the reserves of the factory.

It was with some apprehensions for the future that the end of the winter was awaited, but Mrs Barnett did all in her power to brighten the monotonous existence of her companions in exile.

Only one incident occurred in the month of January, and that one was distressing enough. On the 7th, Michael Mac-Nab was taken ill—severe headache, great thirst and alternations of shivering and fever, soon reduced the poor little fellow to a sad state. His mother and father, and indeed all his friends, were in very great trouble. No one knew what to do, as it was impossible to say what his illness was, but Madge, who retained her senses about her, advised cooling drinks and poultices. Kalumah was indefatigable, remaining day and night by her favourite’s bedside, and refusing to take any rest.

About the third day there was no longer any doubt as to the nature of the malady. A rash came out all over the child’s body, and it was evident that he had malignant scarlatina, which would certainly produce internal inflammation.

Children of a year old are rarely attacked with this terrible disease, but cases do occasionally occur. The medicine-chest of the factory was necessarily insufficiently stocked, but Madge, who had nursed several patients through scarlet fever, remembered that tincture of belladonna was recommended, and administered one or two drops to the little invalid every day. The greatest care was taken lest he should catch cold; he was at once removed to his parents’ room, and the rash soon came out freely. Tiny red points appeared on his tongue, his lips, and even on the globes of his eyes. Two days later his skin assumed a violet hue, then it became white and fell off in scales.

It was now that double care was required to combat the great internal inflammation, which proved the severity of the attack. Nothing was neglected, the boy was, in fact, admirably nursed, and on the 20th January, twelve days after he was taken ill, he was pronounced out of danger.

Great was the joy in the factory. The baby was the child of the fort, of the regiment! He was born in the terrible northern latitudes, in the colony itself, he had been named Michael Hope, and he had come to be regarded as a kind of talisman in the dangers and difficulties around, and all felt sure that God would not take him from them.

Poor Kalumah would certainly not have survived him had he died, but he gradually recovered, and fresh hope seemed to come back when he was restored to the little circle.

The 23d of January was now reached, after all these distressing alternations of hope and fear. The situation of Victoria Island had not changed in the least, and it was still wrapped in the gloom of the apparently interminable Polar night. Snow fell abundantly for some days, and was piled up on the ground to the height of two feet.

On the 27th a somewhat alarming visit was received at the fort. The soldiers Belcher and Pond, when on guard in front of the enceinte in the morning, saw a huge bear quietly advancing towards the fort. They hurried into the large room, and told Mrs Barnett of the approach of the formidable carnivorous beast.

"Perhaps it is only our bear again," observed Mrs Barnett to Hobson, and accompanied by him, and followed by the Sergeant, Sabine, and some soldiers provided with guns,—he fearlessly walked to the postern.

The bear was now about two hundred paces off, and was walking along without hesitation, as if he had some settled plan in view.

"I know him!" cried Mrs Barnett, "it is your bear, Kalumah, your preserver!"

"Oh, don’t kill my bear!" exclaimed the young Esquimaux.

"He shall not be killed," said the Lieutenant, "don’t injure him, my good fellows," he added to the men, "he will probably return as he came."

"But suppose he intends coming into the enceinte?" said Long, who had his doubts as to the friendly propensities of Polar bears.

"Let him come, Sergeant," said Mrs Barnett, "he is a prisoner like ourselves, and you know prisoners"—
"Don’t eat each other," added Hobson. "True, but only when they belong to the same species. For your sake, however, we will spare this fellow-sufferer, and only defend ourselves if he attack us. I think, however, it will be as prudent to go back to the House. We must not put too strong a temptation in the way of our carnivorous friend!"

This was certainly good advice, and all returned to the large room, the windows were closed, but not the shutters. Through the panes the movements of the visitor were watched. The bear, finding the postern unfastened, quietly pushed open the door, looked in, carefully examined the premises, and finally entered the enceinte. Having reached the centre, he examined the buildings around him, went towards the reindeer stable and dog-house, listened for a moment to the howlings of the dogs and the uneasy noises made by the reindeer, then continued his walk round the palisade, and at last came and leant his great head against one of the windows of the large room.

To own the truth everybody started back, several of the soldiers seized their guns, and Sergeant Long began to fear he had let the joke go too far.

But Kalumah came forward, and looked through the thin partition with her sweet eyes. The bear seemed to recognise her, at least so she thought, and doubtless satisfied with his inspection, he gave a hearty growl, and turning away left the enceinte, as Hobson had prophesied, as he entered it.

This was the bear’s first and last visit to the fort, and on his departure everything went on as quietly as before.

The little boy’s recovery progressed favourably, and at the end of the month he was as rosy and as bright as ever.

At noon on the 3rd of February, the northern horizon was touched with a faint glimmer of light which did not fade away for an hour, and the yellow disc of the sun appeared for an instant for the first time since the commencement of the long Polar night.

CHAPTER XV.

THE LAST EXPLORING EXPEDITION.

From this date, February 3rd, the sun rose each day higher above the horizon, the nights were, however, still very long, and, as is often the case in February, the cold increased, the thermometer marking only 1º Fahrenheit, the lowest temperature experienced throughout this extraordinary winter.

"When does the thaw commence in these northern seas?" inquired Mrs Barnett of the Lieutenant.

"In ordinary seasons," replied Hobson, "the ice does not break up until early in May; but the winter has been so mild that unless a very hard frost should now set in, the thaw may commence at the beginning of April. At least that is my opinion." "We shall still have two months to wait then?"

"Yes, two months, for it would not be prudent to launch our boat too soon amongst the floating ice; and I think our best plan will be to wait until our island has leached the narrowest part of Behring Strait, which is not more than two hundred miles wide."

"What do you mean?" exclaimed Mrs Barnett, considerably surprised at the Lieutenant’s reply. "Have you forgotten that it was the Kamtchatka Current which brought us where we now are, and which may seize us again when the thaw sets in and carry us yet farther north?"

"I do not think it will, madam; indeed I feel quite sure that that will not happen. The thaw always takes place in from north to south, and although the Kamtchatka Current runs the other way, the ice always goes down the Behring Current. Other reasons there are for my opinion which I cannot now enumerate. But the icebergs invariably drift towards the Pacific, and are there melted by its warmer waters. Ask Kalumah if I am not right. She knows these latitudes well, and will tell you that the thaw always proceeds from the north to the south."

Kalumah when questioned confirmed all that the Lieutenant had said, so that it appeared probable that the island would be drifted to the south like a huge ice-floe, that is to say, to the narrowest part of Behring Strait, which is much frequented in the summer by the fishermen of New Archangel, who are the most experienced mariners of those waters. Making allowance for all delays they might then hope to set foot on the continent before May, and although the cold had not been very intense there was every reason to believe that the foundations of Victoria Island had been thickened and strengthened by a fresh accumulation of ice at the base, and that it would hold together for several months to come.

There was then nothing for the colonists to do but to wait patiently,—still to wait!

The convalescence of little Michael continued to progress favourably. On the 20th of February he went out for the first time, forty days after he was taken ill. By this we mean that he went from his bedroom into the large room, where he was petted and made much of. His mother, acting by Madge’s advice, put off weaning him for some little time, and he soon got back his strength. The soldiers had made many little toys for him during his illness, and he was now as happy as any child in the wide world.

The last week of February was very wet, rain and snow falling alternately. A strong wind blew from the north-west, and the temperature was low enough for large quantities of snow to fall; the gale, however, increased in violence, and on the side of Cape Bathurst and the chain of icebergs the noise of the tempest was deafening. The huge ice-masses were flung against each other, and fell with a roar like that of thunder. The ice on the north was
compressed and piled up on the shores of the island. There really seemed to be a danger that the cape itself— which was but a kind of iceberg capped with earth and sand— would be flung down.

Some large pieces of ice, in spite of their weight, were driven to the very foot of the palisaded encinte; but fortunately for the factory the cape retained its position; had it given way all the buildings must inevitably have been crushed beneath it.

It will be easily understood that the position of Victoria Island, at the opening of a narrow strait about which the ice accumulated in large quantities, was extremely perilous, for it might at any time be swept by a horizontal avalanche, or crushed beneath the huge blocks of ice driven inland from the offing, and so become engulfed before the thaw. This was a new danger to be added to all the others already threatening the little band. Mrs Barnett, seeing the awful power of the pressure in the offing, and the violence with which the moving masses of ice crushed upon each other, realised the full magnitude of the peril they would all be in when the thaw commenced. She often mentioned her fears to the Lieutenant, and he shook his head like a man who had no reply to make.

Early in March the squall ceased, and the full extent of the transformation of the ice-field was revealed. It seemed as if by a kind of glissade the chain of icebergs had drawn nearer to the island. In some parts it was not two miles distant, and it advanced like a glacier on the move, with the difference that the latter has a descending and the ice-wall a horizontal motion. Between the lofty chain of ice-mountains the ice-field was fearfully distorted: strewn with hummocks, broken obelisks, shattered blocks, overturned pyramids, it resembled a tempest-tossed sea or a ruined town, in which not a building or a monument had remained standing, and above it all the mighty icebergs reared their snowy crests, standing out against the sky with their pointed peaks, their rugged cones, and solid buttresses, forming a fitting frame for the weird fantastic landscape at their feet.

At this date the little vessel was quite finished. This boat was rather heavy in shape, as might have been expected, but she did credit to Mac-Nab, and shapéd as she was like a barge at the bows, she ought the better to withstand the shocks of the floating ice. She might have been taken for one of those Dutch boats which venture upon the northern waters. Her rig, which was completed, consisted, like that of a cutter, of a mainsail and a jib carried on a single mast. The tent canvass of the factory had been made use of for sailcloth.

This boat would carry the whole colony, and if, as the Lieutenant hoped, the island were drifted to Behring Strait, the vessel would easily make her way to land, even from the widest part of the passage. There was then nothing to be done but wait for the thaw.

Hobson now decided to make a long excursion to the south to ascertain the state of the ice-field, to see whether there were any signs of its breaking up, to examine the chain of icebergs by which it was hemmed in, to make sure, in short, whether it would really be useless to attempt to cross to the American continent. Many incidents might occur, many fresh dangers might arise before the thaw, and it would therefore be but prudent to make a reconnaissance on the ice-field.

The expedition was organised and the start fixed for March 7th. Hobson, Mrs Barnett, Kalumah, Marbre, and Sabine were to go, and, if the route should be practicable, they would try and find a passage across the chain of icebergs. In any case, however, they were not to be absent for more than forty-eight hours.

A good stock of provisions was prepared, and, well provided for every contingency, the little party left Fort Hope on the morning of the 7th March and turned towards Cape Michael.

The thermometer then marked 32° Fahrenheit. The atmosphere was misty, but the weather was perfectly calm. The sun was now above the horizon for seven or eight hours a day, and its oblique rays afforded plenty of light.

At nine o’clock, after a short halt, the party descended the slope of Cape Michael and made their way across the ice-fields in a southeasterly direction. On this side the ice wall rose not three miles from the cape.

The march was of course very slow. Every minute a crevasse had to be turned, or a hummock too high to be climbed. It was evident that a sledge could not have got over the rough distorted surface, which consisted of an accumulation of blocks of ice of every shape and size, some of which really seemed to retain their equilibrium by a miracle. Others had been but recently overturned, as could be seen from the clearly cut fractures and sharp corners. Not a sign was to be seen of any living creature, no footprints told of the passage of man or beast, and the very birds that used to haunt these awful solitudes had deserted them.

Mrs Barnett was astonished at the scene before her, and asked the Lieutenant how they could possibly have crossed the ice-fields if they had started in December, and he replied by reminding her that it was then in a very different condition; the enormous pressure of the advancing icebergs had not then commenced, the surface of the sea was comparatively even, and the only danger was from its insufficient solidification. The irregularities which now barred their passage did not exist early in the winter.

They managed, however, to advance towards the mighty ice-wall, Kalumah generally leading the way. Like a chamois on the Alpine rocks, the young girl firmly treads the ice-masses with a swiftness of foot and an absence of hesitation which was really marvellous. She knew by instinct the best way through the labyrinth of icebergs, and
they wound through the narrow passages pointed out by Marbre and Sabine. They expected to get out of the valley walls on either side.

and the orb of day, already high in the heavens, flung some of its rays across the valley and lit up the glittering ice-9th.

render return through the winding valley difficult. It would not do, however, to approach too near to these beetling cliffs, the solidity of which was very doubtful. Internal fractures and rents were already commencing, the work of destruction and decomposition was proceeding rapidly, aided by the imprisoned air-bubbles; and the fragility of the huge structure, built up by the cold, was manifest to every eye. It could not survive the Arctic winter, it was doomed to melt beneath the sunbeams, and it contained material enough to feed large rivers.

Lieutenant Hobson had warned his companions of the danger of the avalanches which constantly fall from the summits of the icebergs, and they did not therefore go far along their base. That this prudence was necessary was proved by the falling of a huge block, at two o’clock, at the entrance to a kind of valley which they were about to cross. It must have weighed more than a hundred tons, and it was dashed upon the ice-field with a fearful crash, bursting like a bomb-shell. Fortunately no one was hurt by the splinters.

Every one was up at eight o’clock the next morning, and Hobson decided to follow the valley for another mile, in the hope of finding out whether it went right through the ice-wall. The direction of the pass, judging from the position of the sun, had now changed from north to south east, and as early as eleven o’clock the party came out on the opposite side of the chain of icebergs. The passage was therefore proved to run completely through the barrier.

From two to five o’clock the explorers followed a narrow winding path leading down amongst the icebergs; they were anxious to know if it led right through them, but could not at once ascertain. In this valley, as it might be called, they were able to examine the internal structure of the icy barrier. The blocks of which it was built up were here arranged with greater symmetry than outside. In some places trunks of trees were seen embedded in the ice, all, however, of Tropical not Polar species, which had evidently been brought to Arctic regions by the Gulf Stream, and would be taken back to the ocean when the thaw should have converted into water the ice which now held them in its chill embrace.

At five o’clock it became too dark to go any further. The travellers had not gone more than about two miles in the valley, but it was so sinuous, that it was impossible to estimate exactly the distance traversed.

The signal to halt was given by the Lieutenant, and Marbre and Sabine quickly dug out a grotto in the ice with their chisels, into which the whole party crept, and after a good supper all were soon asleep.

The aspect of the ice-field on the eastern side was exactly similar to that on the west. The same confusion of ice-masses, the same accumulation of hummocks and icebergs, as far as the eye could reach, with occasional alternations of smooth surfaces of small extent, intersected by numerous crevasses, the edges of which were already melting fast. The same complete solitude, the same desertion, not a bird, not an animal to be seen.

Mrs Barnett climbed to the top of the hummock, and there remained for an hour, gazing upon the sad and desolate Polar landscape before her. Her thoughts involuntarily flew back to the miserable attempt to escape that had been made five months before. Once more she saw the men and women of the hapless caravan encamped in the darkness of these frozen solitudes, or struggling against insurmountable difficulties to reach the mainland.

At last the Lieutenant broke in upon her reverie, and said—

"Madam, it is more than twenty-four hours since we left the fort. We now know the thickness of the ice-wall, and as we promised not to be away longer than forty-eight hours, I think it is time to retrace our steps."

Mrs Barnett saw the justice of the Lieutenant’s remark. They had ascertained that the barrier of ice was of moderate thickness, that it would melt away quickly enough to allow of the passage of Mac-Nab’s boat after the thaw, and it would therefore be well to hasten back lest a snow-storm or change in the weather of any kind should render return through the winding valley difficult.

The party breakfasted and set out on the return journey about one o’clock P.M.

The night was passed as before in an ice-cavern, and the route resumed at eight o’clock the next morning, March 9th.

The travellers now turned their backs upon the sun, as they were making for the west, but the weather was fine, and the orb of day, already high in the heavens, flung some of its rays across the valley and lit up the glittering ice-walls on either side.

Mrs Barnett and Kalumah were a little behind the rest of the party chatting together, and looking about them as they wound through the narrow passages pointed out by Marbre and Sabine. They expected to get out of the valley
quickly, and be back at the fort before sunset, as they had only two or three miles of the island to cross after leaving the ice. This would be a few hours after the time fixed, but not long enough to cause any serious anxiety to their friends at home.

They made their calculation without allowing for an incident which no human perspicacity could possibly have foreseen.

It was about ten o’clock when Marbre and Sabine, who were some twenty paces in advance of the rest, suddenly stopped and appeared to be debating some point. When the others came up, Sabine was holding out his compass to Marbre, who was staring at it with an expression of the utmost astonishment.

“What an extraordinary thing!” he exclaimed, and added, turning to the Lieutenant—

"Will you tell me, sir, the position of the island with regard to the ice-wall, is it on the east or west?"

"On the west," replied Hobson, not a little surprised at the question, "you know that well enough, Marbre"

"I know it well enough! I know it well enough!" repeated Marbre, shaking his head, "and if it is on the west, we are going wrong, and away from the inland!"

"What, away from the island!” exclaimed the Lieutenant, struck with the hunter’s air of conviction.

"We are indeed, sir," said Marbre; "look at the compass; my name is not Marbre if it does not show that we are walking towards the east not the west!"

"Impossible!" exclaimed Mrs Barnett.

"Look, madam," said Sabine.

It was true. The needle pointed in exactly the opposite direction to that expected. Hobson looked thoughtful and said nothing.

"We must have made a mistake when we left the ice cavern this morning," observed Sabine, "we ought to have turned to the left instead of to the right."

"No, no," said Mrs Barnett, "I am sure we did not make a mistake!"

"But"—said Marbre.

"But," interrupted Mrs Barnett, "look at the sun. Does it no longer rise in the east? Now as we turned our backs on it this morning, and it is still behind us, we must be walking towards the west, so that when we get out of the valley on the western side of the chain of icebergs, we must come to the island we left there."

Marbre, struck dumb by this irrefutable argument, crossed his arms and said no more.

"Then if so," said Sabine, "the sun and the compass are in complete contradiction of each other?"

"At this moment they are," said Hobson, "and the reason is simple enough; in these high northern latitudes, and in latitudes in the neighbourhood of the magnetic pole, the compasses are sometimes disturbed, and the deviation of their needles is so great as entirely to mislead travellers."

"All right then," said Marbre, "we have only to go on keeping our backs to the sun."

"Certainly," replied Lieutenant Hobson, "there can be no hesitation which to choose, the sun or our compass, nothing disturbs the sun."

The march was resumed, the sun was still behind them, and there was really no objection to be made to Hobson’s theory, founded, as it was, upon the position then occupied by the radiant orb of day.

The little troop marched on, but they did not get out of the valley as soon as they expected. Hobson had counted on leaving the ice-wall before noon, and it was past two when they reached the opening of the narrow pass.

Strange as was this delay, it had not made any one uneasy, and the astonishment of all can readily be imagined when, on stepping on to the ice field, at the base of the chain of icebergs, no sign was to be seen of Victoria Island, which ought to have been opposite to them.

Yes!—The island, which on this side had been such a conspicuous object, owing to the height of Cape Michael crowned with trees, had disappeared. In its place stretched a vast ice-field lit up by the sunbeams.

All looked around them, and then at each other in amazement.

"The island ought to be there!" cried Sabine.

"But it is not there," said Marbre. "Oh, sir—Lieutenant—where is it? what has become of it?"

But Hobson had not a word to say in reply, and Mrs Barnett was equally dumfounded.

Kalumah now approached Lieutenant Hobson, and touching his arm, she said—

"We went wrong in the valley, we went up it instead of down it, we shall only get back to where we were yesterday by crossing the chain of icebergs. Come, come!"

Hobson and the others mechanically followed Kalumah, and trusting in the young native’s sagacity, retraced their steps. Appearances were, however, certainly against her, for they were now walking towards the sun in an easterly direction.

Kalumah did not explain her motives, but muttered as she went along—

"Let us make haste!"
All were quite exhausted, and could scarcely get along, when they found themselves on the other side of the ice-wall, after a walk of three hours. The night had now fallen, and it was too dark to see if the island was there, but they were not long left in doubt.

At about a hundred paces off, burning torches were moving about, whilst reports of guns and shouts were heard. The explorers replied, and were soon joined by Sergeant Long and others, amongst them Thomas Black, whose anxiety as to the fate of his friends had at last roused him from his torpor. The poor fellows left on the island had been in a terrible state of uneasiness, thinking that Hobson and his party had lost their way. They were right, but what was it that had made them think so?

Twenty-four hours before, the immense ice-field and the island had turned half round, and in consequence of this displacement they were no longer on the west, but on the east of the ice-wall!

CHAPTER XVI
THE BREAK-UP OF THE ICE

Two hours later all had returned to Fort Hope, and the next day the sun for the first time shone upon that part of the coast which was formerly on the west of the island. Kalumah, to whom this phenomenon was familiar, had been right, and if the sun had not been the guilty party neither had the compass!

The position of Victoria Island with regard to the cardinal points was again completely changed. Since it had broken loose from the mainland the island—and not only the island, but the vast ice field in which it was enclosed—had turned half round. This displacement proved that the ice-field was not connected with the continent, and that the thaw would soon set in.

"Well, Lieutenant," said Mrs. Barnett, "this change of front is certainly in our favour. Cape Bathurst and Fort Hope are now turned towards the north-east, in other words towards the point nearest to the continent, and the ice-wall, through which our boat could only have made its way by a difficult and dangerous passage, is no longer between us and America. And so all is for the best, is it not?" added Mrs. Barnett with a smile.

"Indeed it is," replied Hobson, who fully realised all that was involved in this change of the position of Victoria Island.

No incident occurred between the 10th and 21st March, but there were indications of the approaching change of season. The temperature varied from 43° to 50° Fahrenheit, and it appeared likely that the breaking up of the ice would commence suddenly. Fresh crevasses opened, and the unfrozen water flooded the surface of the ice. As the whalers poetically express it, the "wounds of the ice-field bled copiously," and the opening of these "wounds" was accompanied by a sound like the roar of artillery. A warm rain fell for several hours, and accelerated the dissolution of the solid coating of the ocean.

The birds, ptarmigans, puffins, ducks, &c., which had deserted the island in the beginning of the winter, now returned in large numbers. Marbre and Sabine killed a few of them, and on some were found the tickets tied round their necks by the Lieutenant several months before. Flocks of white trumpeter swans also reappeared, and filled the air with their loud clarion tones; whilst the quadrupeds, rodents, and carnivora alike continued to frequent the vicinity of the fort like tame domestic animals.

Whenever the state of the sky permitted, which was almost every day, Hobson took the altitude of the sun. Sometimes Mrs Barnett, who had become quite expert in handling the sextant, assisted him, or took the observation in his stead. It was now most important to note the very slightest changes in the latitude and longitude of the island. It was still doubtful to which current it would be subject after the thaw, and the question whether it would be drifted north or south was the chief subject of the discussions between the Lieutenant and Mrs Barnett.

The brave lady had always given proof of an energy superior to that of most of her sex, and now she was to be seen every day braving fatigue, and venturing on to the half decomposed, or "pancake" ice, in all weathers, through snow or rain, and on her return to the factory ready to cheer and help everybody, and to superintend all that was going on. We must add that her efforts were ably seconded by the faithful Madge.

Mrs Barnett had compelled herself to look the future firmly in the face, and although she could not fail to fear for the safety of all, and sad presentiments haunted her, she never allowed herself to betray any uneasiness. Her courage and confidence never seemed to waver, she was as ever the kind encouraging friend of each and all, and none could have dreamt of the conflict of spirit going on beneath her quiet exterior demeanour. Lieutenant Hobson’s admiration of her character was unbounded, and he had also entire confidence in Kalumah, often trusting to her natural instinct as implicitly as a hunter to that of his dog.

The young Esquimaux was, in fact, very intelligent, and familiar from babyhood with the phenomena of the Polar regions. On board a whaler she might have advantageously replaced many an ice-master or pilot whose business it is to guide a boat amongst the ice.

Every day Kalumah went to examine the state of the ice-field.

The nature of the noise produced by the breaking of the icebergs in the distance was enough to tell her how far
the decomposition had advanced. No foot was surer than hers upon the ice, no one could spring more lightly forwards than she when her instinct told her that the smooth surface was rotten underneath, and she would scud across an ice-field riddled with fissures without a moment’s hesitation.

From the 20th to the 30th March, the thaw made rapid progress. Rain fell abundantly and accelerated the dissolution of the ice. It was to be hoped that the ice-field would soon open right across, and that in about fifteen days Hobson would be able to steer his boat into the open sea. He was determined to lose no time, as he did not know but that the Kamtchatka Current might sweep the island to the north before it could come under the influence of the Behring Current.

"But," Kalumah repeated again and again, "there is no fear of that, the breaking up of the ice does not proceed upwards but downwards. The danger is there!" she added, pointing to the south in the direction of the vast Pacific Ocean.

The young girl’s confidence on this point reassured Hobson, for he had no reason now to dread the falling to pieces of the island in the warm waters of the Pacific. He meant everybody to be on board the boat before that could happen, and they would not have far to go to get to one or the other continent, as the strait is in reality a kind of funnel through which the waters flow between Cape East on the Asiatic side and Cape Prince of Wales on the American.

This will explain the eager attention with which the slightest change in the position of the island was noticed. The bearings were taken every day, and everything was prepared for an approaching and perhaps sudden and hurried embarkation.

Of course all the ordinary avocations of the factory were now discontinued. There was no hunting or setting of traps. The magazines were already piled up with furs, most of which would be lost. The hunters and trappers had literally nothing to do; but Mac-Nab and his men, having finished their boat, employed their leisure time in strengthening the principal house of the fort, which would probably be subjected to considerable pressure from the accumulation of ice on the coast during the further progress of the thaw, unless indeed Cape Bathurst should prove a sufficient protection. Strong struts were fixed against the outside walls, vertical props were placed inside the rooms to afford additional support to the beams of the ceiling, and the roof was strengthened so that it could bear a considerable weight. These various works were completed early in April, and their utility, or rather their vital importance, was very soon manifested.

Each day brought fresh symptoms of returning spring, which seemed likely to set in early after this strangely mild Polar winter. A few tender shoots appeared upon the trees, and the newly-thawed sap swelled the bark of beeches, willows, and arbutus. Tiny mosses tinged with pale green the slopes under the direct influence of the sunbeams; but they were not likely to spread much, as the greedy rodents collected about the fort pounced upon and devoured them almost before they were above the ground.

Great were the sufferings of Corporal Joliffe at this time. We know that he had undertaken to protect the plot of ground cultivated by his wife. Under ordinary circumstances he would merely have had to drive away feathered pilferers, such as guillemots or puffins, from his sorrel and scurvy grass. A scarecrow would have been enough to get rid of them, still more the Corporal in person. But now all the rodents and ruminants of the Arctic fauna combined to lay siege to his territory; reindeer, Polar hares, musk-rats, shrews, martens, &c., braved all the threatening gestures of the Corporal, and the poor man was in despair, for whilst he was defending one end of his field the enemy was preying upon the other.

It would certainly have been wiser to let the poor creatures enjoy unmolested the crops which could be of no use to the colonists, as the fort was to be so soon abandoned, and Mrs Barnett tried to persuade the angry Corporal to do so, when he came to her twenty times a day with the same wearisome tale, but he would not listen to her:

"To lose the fruit of all our trouble!" he repeated; "to leave an establishment which was prospering so well! To give up the plants Mrs Joliffe and I sowed so carefully!... O madam, sometimes I feel disposed to let you all go, and stay here with my wife! I am sure the Company would give up all claim on the island to us"——

Mrs Barnett could not help laughing at this absurd speech, and sent the Corporal to his little wife, who had long ago resigned herself to the loss of her sorrel, scurvy grass, and other medicinal herbs.

We must here remark, that the health of all the colonists remained good, they had at least escaped illness; the baby, too, was now quite well again, and throve admirably in the mild weather of the early spring.

The thaw continued to proceed rapidly from the 2nd to the 5th April. The weather was warm but cloudy, and rain fell frequently in large drops. The wind blew from the south west, and was laden with the heated dust of the continent. Unfortunately the sky was so hazy, that it was quite impossible to take observations, neither sun, moon, nor stars could be seen through the heavy mists, and this was the more provoking, as it was of the greatest importance to note the slightest movements of the island.

It was on the night of the 7th April that the actual breaking up of the ice commenced. In the morning the
Lieutenant, Mrs Barnett, Kalumah, and Sergeant Long, had climbed to the summit of Cape Bathurst, and saw that a
great change had taken place in the chain of icebergs. The huge barrier had parted nearly in the middle, and now
formed two separate masses, the larger of which seemed to be moving northwards.

Was it the Kamtchatka Current which produced this motion? Would the floating island take the same direction?
The intense anxiety of the Lieutenant and his companions can easily be imagined. Their fate might now be decided
in a few hours, and if they should be drifted some hundred miles to the north, it would be very difficult to reach the
continent in a vessel so small as theirs.

Unfortunately it was impossible to ascertain the nature or extent of the displacement which was going on. One
thing was, however, evident, the island was not yet moving, at least not in the same direction as the ice-wall. It
therefore seemed probable that whilst part of the ice field was floating to the north, that portion immediately
surrounding the island still remained stationary.

This displacement of the icebergs did not in the least alter the opinion of the young Esquimaux. Kalumah still
maintained that the thaw would proceed from north to south, and that the ice wall would shortly feel the influence of
the Behring Current. To make herself more easily understood, she traced the direction of the current on the sand
with a little piece of wood, and made signs that in following it the island must approach the American continent. No
argument could shake her conviction on this point, and it was almost impossible not to feel reassured when listening
to the confident expressions of the intelligent native girl.

The events of the 8th, 9th, and 10th April, seemed, however, to prove Kalumah to be in the wrong. The northern
portion of the chain of icebergs drifted farther and farther north. The breaking up of the ice proceeded rapidly and
with a great noise, and the ice field opened all round the island with a deafening crash. Out of doors it was
impossible to hear one’s self speak, a ceaseless roar like that of artillery drowned every other sound.

About half a mile from the coast on that part of the island overlooked by Cape Bathurst, the blocks of ice were
already beginning to crowd together, and to pile themselves upon each other. The ice-wall had broken up into
numerous separate icebergs, which were drifting towards the north. At least it seemed as if they were moving in that
direction. Hobson became more and more uneasy, and nothing that Kalumah could say reassured him. He replied by
counter-arguments, which could not shake her faith in her own belief.

At last, on the morning of the 11th April, Hobson showed Kalumah the last icebergs disappearing in the north,
and again endeavoured to prove to her that facts were against her.

"No, no!" replied Kalumah, with an air of greater conviction than ever, "no, the icebergs are not going to the
north, but our island is going to the south!"

She might perhaps be right after all, and Hobson was much struck by this last reply. It was really possible that
the motion of the icebergs towards the north was only apparent, and that Victoria Island, dragged along with the ice-
field, was drifting towards the strait. But it was impossible to ascertain whether this were really the case, as neither
the latitude nor longitude could be taken.

The situation was aggravated by a phenomenon peculiar to the Polar regions, which rendered it still darker and
more impossible to take observations of any kind.

At the very time of the breaking up of the ice, the temperature fell several degrees. A dense mist presently
enveloped the Arctic latitudes, but not an ordinary mist. The soil was covered with a white crust, totally distinct
from hoar-frost—it was, in fact, a watery vapour which congeals on its precipitation. The minute particles of which
this mist was composed formed a thick layer on trees, shrubs, the walls of the fort, and any projecting surface which
bristled with pyramidal or prismatic crystals, the apexes of which pointed to the wind.

Hobson at once understood the nature of this atmospheric phenomenon, which whalers and explorers have often
noticed in the spring in the Polar regions.

"It is not a mist or fog," he said to his companions, "it is a ‘frost-rime’, a dense vapour which remains in a state
of complete congelation."

But whether a fog or a frozen mist this phenomenon was none the less to be regretted, for it rose a hundred feet
at least above the level of the sea, and it was so opaque that the colonists could not see each other when only two or
three paces apart.

Every one’s disappointment was very great. Nature really seemed determined to try them to the uttermost. When
the break up of the ice had come at last, when the wandering island was to leave the spot in which it had so long
been imprisoned, and its movements ought to be watched with the greatest care, this fog prevented all observations.

This state of things continued for four days. The frost-rime did not disappear until the 15th April, but on the
morning of that date a strong wind from the south rent it open and dispersed it.

The sun shone brightly once more, and Hobson eagerly seized his instruments. He took the altitude, and found
that the exact position of Victoria Island was then: Latitude, 69° 57'; longitude, 179° 33'.

Kalumah was right, Victoria Island, in the grasp of the Behring Current, was drifting towards the south.
CHAPTER XVII.
THE AVALANCHE.

The colonists were then at last approaching the more frequented latitudes of Behring Sea. There was no longer any danger that they would be drifted to the north, and all they had to do was to watch the displacement of the island, and to estimate the speed of its motion, which would probably be very unequal, on account of the obstacles in its path. Hobson most carefully noted every incident, taking alternately solar and stellar altitudes, and the next day, April 16th, after ascertaining the bearings, he calculated that if its present speed were maintained, Victoria Island would reach the Arctic Circle, from which it was now separated at the most by four degrees of latitude, towards the beginning of May.

It was probable that, when the island reached the narrowest portion of the strait, it would remain stationary until the thaw broke it up, the boat would then be launched, and the colonists would set sail for the American continent.

Everything was ready for an immediate embarkation, and the inhabitants of the island waited with greater patience and confidence than ever. They felt, poor things, that the end of their trials was surely near at last, and that nothing could prevent their landing on one side or the other of the strait in a few days.

This prospect cheered them up wonderfully, and the gaiety natural to them all, which they had lost in the terrible anxiety they had so long endured, was restored. The common meals were quite festal, as there was no need for economising the stores under present circumstances. The influence of the spring became more and more sensibly felt, and every one enjoyed the balmy air, and breathed more freely than before.

During the next few days, several excursions were made to the interior of the island and along the coast. Everywhere the furred animals, &c., still abounded, for even now they could not cross to the continent, the connection between it and the ice-field being broken, and their continued presence was a fresh proof that the island was no longer stationary.

No change had taken place on the island at Cape Esquimaux, Cape Michael, along the coast, or on the wooded heights of the interior, and the banks of the lagoon. The large gulf which had opened near Cape Michael during the storm had closed in the winter, and there was no other fissure on the surface of the soil.

During these excursions, bands of wolves were seen scudding across parts of the island. Of all the animals these fierce carnivorous beasts were the only ones which the feeling of a common danger had not tamed.

Kalumah’s preserver was seen several times. This worthy bear paced to and fro on the deserted plains in melancholy mood, pausing in his walk as the explorers passed, and sometimes following them to the fort, knowing well that he had nothing to fear from them.

On the 20th April Lieutenant Hobson ascertained that the wandering island was still drifting to the south. All that remained of the ice-wall, that is to say, the southern portion of the icebergs, followed it, but as there were no bench marks, the changes of position could only be estimated by astronomical observations.

Hobson took several soundings in different parts of the ground, especially at the foot of Cape Bathurst, and on the shores of the lagoon. He was anxious to ascertain the thickness of the layer of ice supporting the earth and sand, and found that it had not increased during the winter, and that the general level of the island did not appear to have risen higher above that of the sea. The conclusion he drew from these facts was, that no time should be lost in getting away from the fragile island, which would rapidly break up and dissolve in the warmer waters of the Pacific.

About the 25th April the bearing of the island was again changed, the whole ice-field had moved round from east to west twelve points, so that Cape Bathurst pointed to the north-west. The last remains of the ice-wall now shut in the northern horizon, so that there could be no doubt that the ice-field was moving freely in the strait, and that it nowhere touched any land.

The fatal moment was approaching. Diurnal or nocturnal observations gave the exact position of the island, and consequently of the ice-field. On the 30th of April, both were together drifting across Kotzebue Sound, a large triangular gulf running some distance inland on the American coast, and bounded on the south by Cape Prince of Wales, which might, perhaps, arrest the course of the island if it should deviate in the very least from the middle of the narrow pass.

The weather was now pretty fine, and the column of mercury often marked 50° Fahrenheit. The colonists had left off their winter garments some weeks before, and held themselves in constant readiness to leave the island. Thomas Black had already transported his instruments and books into the boat, which was waiting on the beach. A good many provisions had also been embarked and some of the most valuable furs.

On the 2d of May a very carefully taken observation showed that Victoria Island had a tendency to drift towards the east, and consequently to reach the American continent. This was fortunate, as they were now out of danger of being taken any farther by the Kamtchaka Current, which, as is well known, runs along the coast of Asia. At last the tide was turning in favour of the colonists!

"I think our bad fortune is at last at an end," observed Sergeant Long to Mrs Barnett, "and that our misfortunes
are really over; I don’t suppose there are any more dangers to be feared now."

"I quite agree with you," replied Mrs Barnett, "and it is very fortunate that we had to give up our journey across 
the ice-field a few months ago; we ought to be very thankful that it was impassible!"

Mrs Barnett was certainly justified in speaking as she did, for what fearful fatigue and sufferings they would all 
have had to undergo in crossing five hundred miles of ice in the darkness of the Polar night!

On the 5th May, Hobson announced that Victoria Island had just crossed the Arctic Circle. It had at last re-
entered that zone of the terrestrial sphere in which at one period of the year the sun does not set. The poor people all 
felt that they were returning to the inhabited globe.

The event of crossing the Arctic Circle was celebrated in much the same way as crossing the Equator for the first 
time would be on board ship, and many a glass of spirits was drank in honour of the event.

There was now nothing left to do but to wait till the broken and half-melted ice should allow of the passage of 
the boat, which was to bear the whole colony to the land.

During the 7th May the island turned round to the extent of another quarter of its circumference. Cape Bathurst 
now pointed due north, and those masses of the old chain of icebergs which still remained standing were now above 
it, so that it occupied much the same position as that assigned to it in maps when it was united to the American 
continent. The island had gradually turned completely round, and the sun had risen successively on every point of its 
shores.

The observations of the 8th May showed that the island had become stationary near the middle of the passage, at 
least forty miles from Cape Prince of Wales, so that land was now at a comparatively short distance from it, and the 
safety of all seemed to be secured.

In the evening a good supper was served in the large room, and the healths of Mrs Barnett and of Lieutenant 
Hobson were proposed.

The same night the Lieutenant determined to go and see if any changes had taken place in the ice-field on the 
south, hoping that a practicable passage might have been opened.

Mrs Barnett was anxious to accompany him, but he persuaded her to rest a little instead, and started off, 
accompanied only by Sergeant Long.

Mrs Barnett, Madge, and Kalumah returned to the principal house after seeing them off, and the soldiers and 
women had already gone to bed in the different apartments assigned to them.

It was a fine night, there was no moon, but the stars shone very brightly, and as the ice-field vividly reflected 
their light, it was possible to see for a considerable distance.

It was nine o’clock when the two explorers left the fort and turned towards that part of the coast between Port 
Barnett and Cape Michael. They followed the beach for about two miles, and found the ice-field in a state of 
positive chaos. The sea was one vast aggregation of crystals of every size, it looked as if it had been petrified 
suddenly when tossing in a tempest, and, alas, there was even now no free passage between the ice-masses—it 
would be impossible for a boat to pass yet.

Hobson and Long remained on the ice-field talking and looking about them until midnight, and then seeing that 
there was still nothing to do but to wait, they decided to go back to Fort Hope and rest for a few hours.

They had gone some hundred paces, and had reached the dried-up bed of Paulina River, when an unexpected 
noise arrested them. It was a distant rumbling from the northern part of the ice-field, and it became louder and louder 
until it was almost deafening. Something dreadful was going on in the quarter from which it came, and Hobson 
fancied he felt the ice beneath his feet trembling, which was certainly far from reassuring.

"The noise comes from the chain of icebergs," exclaimed Long, "what can be going on there?"

Hobson did not answer, but feeling dreadfully anxious he rushed towards the fort dragging his companion after 
him.

"To the fort! to the fort." he cried at last, "the ice may have opened, we may be able to launch our boat on the 
sea!"

And the two ran as fast as ever they could towards Fort Hope by the shortest way.

A thousand conjectures crowded upon them. From what new phenomenon did the unexpected noise proceed? 
Did the sleeping inhabitants of the fort know what was going on? They must certainly have heard the noise, for, in 
vulgar language, it was loud enough to wake the dead.

Hobson and Long crossed the two miles between them and Fort Hope in twenty minutes, but before they reached 
the enceinte they saw the men and women they had left asleep hurrying away in terrified disorder, uttering cries of 
despair.

The carpenter Mac-Nab, seeing the Lieutenant, ran towards him with his little boy in his arms.

"Look, sir, look!" he cried, drawing his master towards a little hill which rose a few yards behind the fort.

Hobson obeyed, and saw that part of the ice-wall, which, when he left, was two or three miles off in the offing,
had fallen upon the coast of the island. Cape Bathurst no longer existed, the mass of earth and sand of which it was composed had been swept away by the icebergs and scattered over the palisades. The principal house and all the buildings connected with it on the north were buried beneath the avalanche. Masses of ice were crowding upon each other and tumbling over with an awful crash, crushing everything beneath them. It was like an army of icebergs taking possession of the island.

The boat which had been built at the foot of the cape was completely destroyed. The last hope of the unfortunate colonists was gone!

As they stood watching the awful scene, the buildings, formerly occupied by the soldiers and women, and from which they had escaped in time, gave way beneath an immense block of ice which fell upon them. A cry of despair burst from the lips of the houseless outcasts.

"And the others, where are they?" cried the Lieutenant in heart-rending tones.

"There!" replied Mac-Nab, pointing to the heap of sand, earth, and ice, beneath which the principal house had entirely disappeared.

Yes, the illustrious lady traveller, Madge, Kalumah, and Thomas Black, were buried beneath the avalanche which had surprised them in their sleep!

CHAPTER XVIII.

ALL AT WORK.

Fearful catastrophe had occurred. The ice-wall had been flung upon the wandering island, the volume below the water being five times that of the projecting part, it had come under the influence of the submarine currents, and, opening a way for itself between the broken ice-masses, it had fallen bodily upon Victoria Island, which, driven along by this mighty propelling force, was drifting rapidly to the south.

Mac-Nab and his companions, aroused by the noise of the avalanche dashing down upon the dog-house, stable, and principal house, had been able to escape in time, but now the work of destruction was complete. Not a trace remained of the buildings in which they had slept, and the island was bearing all its inhabitants with it to the unfathomable depths of the ocean! Perhaps, however, Mrs Barnett, Madge, Kalumah, and the astronomer, were still living! Dead or alive they must be dug out.

At this thought Hobson recovered his composure and shouted—

"Get shovels and pickaxes! The house is strong! it may have held together! Let us set to work!"

There were plenty of tools and pickaxes, but it was really impossible to approach the enceinte. The masses of ice were rolling down from the summits of the icebergs, and some parts of the ice-wall still towered amongst the ruins two hundred feet above the island. The force with which the tossing masses, which seemed to be surging all along the northern horizon, were overthrown can be imagined; the whole coast between the former Cape Bathurst and Cape Esquimaux was not only hemmed in, but literally invaded by these moving mountains, which, impelled by a force they could not resist, had already advanced more than a quarter of a mile inland.

Every moment the trembling of the ground and a loud report gave notice that another of these masses had rolled over, and there was a danger that the island would sink beneath the weight thrown upon it. A very apparent lowering of the level had taken place all along that part of the coast near Cape Bathurst, it was evidently gradually sinking down, and the sea had already encroached nearly as far as the lagoon.

The situation of the colonists was truly terrible, unable as they were to attempt to save their companions, and driven from the enceinte by the crashing avalanches, over which they had no power whatever. They could only wait, a prey to the most awful forebodings.

Day dawned at last, and how fearful a scene was presented by the districts around Cape Bathurst! The horizon was shut in on every side by ice-masses, but their advance appeared to be checked for the moment at least. The ruins of the ice-wall were at rest, and it was only now and then that a few blocks rolled down from the still tottering crests of the remaining icebergs. But the whole mass—a great part of its volume being sunk beneath the surface of the sea—was in the grasp of a powerful current, and was driving the island along with it to the south, that is to say, to the ocean, in the depths of which they would alike be engulfed.

Those who were thus borne along upon the island were not fully conscious of the peril in which they stood. They had their comrades to save, and amongst them the brave woman who had so won all their hearts, and for whom they would gladly have laid down their lives. The time for action had come, they could again approach the palisades, and there was not a moment to lose, as the poor creatures had already been buried beneath the avalanche for six hours.

We have already said that Cape Bathurst no longer existed. Struck by a huge iceberg it had fallen bodily upon the factory, breaking the boat and crushing the dog-house and stable with the poor creatures in them. The principal house next disappeared beneath the masses of earth and sand, upon which rolled blocks of ice to a height of fifty or sixty feet. The court of the fort was filled up, of the palisade not a post was to be seen, and it was from beneath this accumulation of earth, sand, and ice, that the victims were to be dug out.
Before beginning to work Hobson called the head carpenter to him, and asked if he thought the house could bear the weight of the avalanche.

"I think so, sir," replied Mac-Nab; "in fact, I may almost say I am sure of it. You remember how we strengthened it, it has been 'casemated,' and the vertical beams between the ceilings and floors must have offered great resistance; moreover, the layer of earth and sand with which the roof was first covered must have broken the shock of the fall of the blocks of ice from the icebergs." "God grant you may be right, Mac-Nab," replied Hobson, "and that we may be spared the great grief of losing our friends!"

The Lieutenant then sent for Mrs Joliffe, and asked her if plenty of provisions had been left in the house.

"Oh, yes," replied Mrs Joliffe, "there was plenty to eat in the pantry and kitchen."

"And any water?"

"Yes, water and rum too."

"All right, then," said Hobson, "they will not be starved—but how about air?"

To this question Mac-Nab could make no reply, and if, as he hoped, the house had not given way, the want of air would be the chief danger of the four victims. By prompt measures, however, they might yet be saved, and the first thing to be done was to open a communication with the outer air.

All set to work zealously, men and women alike seizing shovels and pickaxes. The masses of ice, sand, and earth, were vigorously attacked at the risk of provoking fresh downfalls; but the proceedings were ably directed by Mac-Nab.

It appeared to him best to begin at the top of the accumulated masses, so as to roll down loose blocks on the side of the lagoon. The smaller pieces were easily dealt with, with pick and crowbar, but the large blocks had to be broken up. Some of great size were melted with the aid of a large fire of resinous wood, and every means was tried to destroy or get rid of the ice in the shortest possible time.

But so great was the accumulation, that although all worked without pause, except when they snatched a little food, there was no sensible diminution in its amount when the sun disappeared below the horizon. It was not, however, really of quite so great a height as before, and it was determined to go on working from above through the night, and when there was no longer any danger of fresh falls Mac-Nab hoped to be able to sink a vertical shaft in the compact mass, so as to admit the outer air to the house as soon as possible.

All night long the party worked at the excavation, attacking the masses with iron and heat, as the one or the other seemed more likely to be effective. The men wielded the pickaxe whilst the women kept up the fires; but all were animated by one purpose—the saving of the lives of Mrs Barnett, Madge, Kalumah, and the astronomer.

When morning dawned the poor creatures had been buried for thirty hours in air necessarily very impure under so thick a cover.

The progress made in the night had been so great that Mac-Nab prepared to sink his shaft, which he meant to go straight down to the top of the house; and which, according to his calculation, would not have to be more than fifty feet deep. It would be easy enough to sink this shaft through the twenty feet of ice; but great difficulty would be experienced when the earth and sand were reached, as, being very brittle, they would of course constantly fill in the shaft, and its sides would therefore have to be lined. Long pieces of wood were prepared for this purpose, and the boring proceeded. Only three men could work at it together, and the soldiers relieved each other constantly, so that the excavation seemed likely to proceed rapidly.

As might be supposed the poor fellows alternated between hope and fear when some obstacle delayed them. When a sudden fall undid their work they felt discouraged, and nothing but Mac-Nab’s steady voice could have rallied them. As the men toiled in turn at their weary task the women stood watching them from the foot of a hill, saying little, but often praying silently. They had now nothing to do but to prepare the food, which the men devoured in their short intervals of repose.

The boring proceeded without any very great difficulty, but the ice was so hard that the progress was but slow. At the end of the second day Mac-Nab had nearly reached the layer of earth and sand, and could not hope to get to the top of the house before the end of the next day.

Night fell, but the work was continued by the light of torches. A "snow-house" was hastily dug out in one of the hummocks on the shore as a temporary shelter for the women and the little boy. The wind had veered to the southwest, and a cold rain began to fall, accompanied with occasional squalls; but neither the Lieutenant nor his men dreamt of leaving off work.

Now began the worst part of the task. It was really impossible to bore in the shifting masses of sand and earth, and it became necessary to prop up the sides of the shaft with wood, the loose earth being drawn to the surface in a bucket hung on a rope. Of course under the circumstances the work could not proceed rapidly, falls might occur at any moment, and the miners were in danger of being buried in their turn.

Mac-Nab was generally the one to remain at the bottom of the narrow shaft, directing the excavation, and
frequently sounding with a long pick, but as it met with no resistance, it was evident that it did not reach the roof of
the house.

When the morning once more dawned, only ten feet had been excavated in the mass of earth and sand, so that
twenty remained to be bored through before the roof of the house could be reached, that is to say, if it had not given
way, and still occupied the position it did before the fall of the avalanche.

It was now fifty-four hours since Mrs Barnett and her companions were buried!

Mac-Nab and the Lieutenant often wondered if they on their side had made any effort to open a communication
with the outer air. They felt sure that with her usual courage, Mrs Barnett would have tried to find some way out if
her movements were free. Some tools had been left in the house, and Kellet, one of the carpenter’s men,
remembered leaving his pickaxe in the kitchen. The prisoners might have broken open one of the doors and begun to
pierce a gallery across the layer of earth. But such a gallery could only be driven in a horizontal direction, and would
be a much longer business than the sinking of a shaft from above, for the masses flung down by the avalanche,
although only sixty feet deep, covered a space more than five hundred feet in diameter. Of course the prisoners
could not be aware of this fact, and if they should succeed in boring their horizontal gallery, it would be eight days
at least before they could cut through the last layer of ice, and by that time they would be totally deprived of air, if
not of food.

Nevertheless the Lieutenant carefully went over every portion of the accumulation himself, and listened intently
for any sounds of subterranean digging, but he heard nothing.

On the return of day the men toiled with fresh energy, bucket after bucket was drawn to the surface of the shaft
loaded with earth. The clumsy wooden props answered admirably in keeping the earth from filling in the pit, a few
falls occurred, but they were rapidly checked, and no fresh misfortunes occurred throughout the day, except that the
soldier Garry received a blow on the head from a falling block of ice. The wound was not however severe, and he
would not leave his work.

At four o’clock the shaft was fifty feet deep altogether, having been sunk through twenty feet of ice and thirty of
sand and earth.

It was at this depth that Mac-Nab had expected to reach the roof of the house, if it had resisted the pressure of
the avalanche.

He was then at the bottom of the shaft, and his disappointment and dismay can be imagined when, on driving his
pickaxe into the ground as far as it would go, it met with no resistance whatever.

Sabine was with him, and for a few moments he remained with his arms crossed, silently looking at his
companion.

"No roof then?" inquired the hunter.

"Nothing whatever," replied the carpenter, "but let us work on, the roof has bent of course, but the floor of the
loft cannot have given way. Another ten feet and we shall come to that floor, or else"——

Mac-Nab did not finish his sentence, and the two resumed their work with the strength of despair.

At six o’clock in the evening, another ten or twelve feet had been dug out.

Mac-Nab sounded again, nothing yet, his pick still sunk in the shifting earth, and flinging it from him, he buried
his face in his hands and muttered——

"Poor things, poor things!" He then climbed to the opening of the shaft by means of the wood-work.

The Lieutenant and the Sergeant were together in greater anxiety than ever, and taking them aside, the carpenter
told them of his dreadful disappointment.

"Then," observed Hobson, "the house must have been crushed by the avalanche, and the poor people in it"——

"No!" cried the head-carpenter with earnest conviction, "no, it cannot have been crushed, it must have resisted,
strengthened as it was. It cannot—it cannot have been crushed!"

"Well, then, what has happened?" said the Lieutenant in a broken voice, his eyes filling with tears.

"Simply this," replied Mac Nab, "the house itself has remained intact, but the ground on which it was built must
have sunk. The house has gone through the crust of ice which forms the foundation of the island. It has not been
crushed, but engulfed, and the poor creatures in it"——

"Are drowned!" cried Long.

"Yes, Sergeant, drowned without a moment’s notice—drowned like passengers on a foundered vessel!"

For some minutes the three men remained silent. Mac-Nab’s idea was probably correct. Nothing was more likely
than that the ice forming the foundation of the island had given way under such enormous pressure. The vertical
props which supported the beams of the ceiling, and rested on those of the floor, had evidently aided the catastrophe
by their weight, and the whole house had been engulfed.

"Well, Mac-Nab," said Hobson at last, "if we cannot find them alive"——

"We must recover their bodies," added the head carpenter.
“And with these words Mac-Nab, accompanied by the Lieutenant, went back to his work at the bottom of the shaft without a word to any of his comrades of the terrible form his anxiety had now assumed.

The excavation continued throughout the night, the men relieving each other every hour, and Hobson and Mac-Nab watched them at work without a moment’s rest.

At three o’clock in the morning Kellet’s pickaxe struck against something hard, which gave out a ringing sound. The head carpenter felt it almost before he heard it.

“We have reached them!” cried the soldier, “they are saved.”

“Hold your tongue, and go on working,” replied the Lieutenant in a choked voice.

It was now seventy-six hours since the avalanche fell upon the house!

Kellet and his companion Pond resumed their work. The shaft must have nearly reached the level of the sea, and Mac Nab therefore felt that all hope was gone.

In less than twenty minutes the hard body which Kellet had struck was uncovered, and proved to be one of the rafters of the roof. The carpenter flung himself to the bottom of the shaft, and seizing a pickaxe sent the laths of the roof flying on every side. In a few moments a large aperture was made, and a figure appeared at it which it was difficult to recognise in the darkness.

It was Kalumah!

"Help! help!” she murmured feebly.

Hobson let himself down through the opening, and found himself up to the waist in ice-cold water. Strange to say, the roof had not given way, but as Mac-Nab had supposed, the house had sunk, and was full of water. The water did not, however, yet fill the loft, and was not more than a foot above the floor. There was still a faint hope!

The Lieutenant, feeling his way in the darkness, came across a motionless body, and dragging it to the opening he consigned it to Pond and Kellet. It was Thomas Black.

Madge, also senseless, was next found; and she and the astronomer were drawn up to the surface of the ground with ropes, where the open air gradually restored them to consciousness.

Mrs Barnett was still missing, but Kalumah led Hobson to the very end of the loft, and there he found the unhappy lady motionless and insensible, with her head scarcely out of the water.

The Lieutenant lifted her in his arms and carried her to the opening, and a few moments later he had reached the outer air with his burden, followed by Mac-Nab with Kalumah.

Every one gathered round Mrs Barnett in silent anxiety, and poor Kalumah, exhausted as she was, flung herself across her friend’s body.

Mrs Barnett still breathed, her heart still beat feebly, and revived by the pure fresh air she at last opened her eyes.

A cry of joy burst from every lip, a cry of gratitude to Heaven for the great mercy vouchsafed, which was doubtless heard above.

Day was now breaking in the east, the sun was rising above the horizon, lighting up the ocean with its brilliant beams, and Mrs Barnett painfully staggered to her feet. Looking round her from the summit of the new mountain formed by the avalanche, which overlooked the whole island, she murmured in a changed and hollow voice——

"The sea! the sea!”

Yes, the ocean now encircled the wandering island, the sea was open at last, and a true sea-horizon shut in the view from east to west.

CHAPTER XIX.

BEHRING SEA.

The island, driven by the ice-wall, had then drifted at a great speed into Behring Sea, after crossing the strait without running aground on its shores! It was still hurrying on before the icy barrier, which was in the grasp of a powerful submarine current, hastening onwards on to its inevitable dissolution in the warmer waters of the Pacific, and the boat on which all had depended was useless!

As soon as Mrs Barnett had entirely recovered consciousness, she related in a few words the history of the seventy-four hours spent in the house now in the water. Thomas Black, Madge, and Kalumah had been aroused by the crash of the avalanche, and had rushed to the doors or windows. There was no longer any possibility of getting out, the mass of earth and sand, which was but a moment before Cape Bathurst, completely covered the house, and almost immediately afterwards the prisoners heard the crash of the huge ice-masses which were flung upon the factory.

In another quarter of an hour all felt that the house, whilst resisting the enormous pressure, was sinking through the soil of the island. They knew that the crust of the ice must have given way, and that the house would fill with water!

To seize a few provisions remaining in the pantry, and to take refuge in the loft, was the work of a moment. This
the poor creatures did from a dim instinct of self-preservation, but what hope could they really have of being saved! However, the loft seemed likely to resist, and two blocks of ice abutting from the roof saved it from being immediately crushed.

Whilst thus imprisoned the poor creatures could hear the constant falls from the icebergs, whilst the sea was gradually rising through the lower rooms. They must either be crushed or drowned!

But by little short of a miracle, the roof of the house, with its strong framework, resisted the pressure, and after sinking a certain depth the house remained stationary, with the water rather above the floor of the loft. The prisoners were obliged to take refuge amongst the rafters of the roof, and there they remained for many hours. Kalumah devoted herself to the service of the others, and carried food to them through the water. They could make no attempt to save themselves, succour could only come from without.

It was a terrible situation, for breathing was difficult in the vitiated air deficient as it was in oxygen, and charged with a great excess of carbonic acid.... A few hours later Hobson would only have found the corpses of his friends!

The horror of the position was increased by the gushing of the water through the lower rooms, which convinced Mrs Barnett that the island was drifting to the south. She had, in fact, guessed the whole truth; she knew that the ice-wall had heeled over and fallen upon the island, and concluded that the boat was destroyed. It was this last fact which gave such terrible significance to her first words when she looked around her after her swoon—

"The sea! the sea!"

Those about her, however, could think of nothing yet but the fact, that they had saved her for whom they would have died, and with her Madge, Kalumah, and Thomas Black. Thus far not one of those who had joined the Lieutenant in his disastrous expedition had succumbed to any of the fearful dangers through which they had passed.

But matters were not yet at their worst, and fresh troubles were soon to hasten the final catastrophe.

Hobson's first care after Mrs Barnett's recovery was to take the bearings of the inland. It was listless now to think of quitting it, as the sea was open and their boat destroyed. A few ruins alone remained of the mighty ice-wall, the upper portion of which had crushed Cape Bathurst whilst the submerged base was driving the island to the south.

The instruments and maps belonging to the astronomer were found in the ruins of the house, and were fortunately uninjured. The weather was cloudy, but Hobson succeeded in taking the altitude of the sun with sufficient accuracy for his purpose.

We give the result obtained at noon on the 12th May. Victoria Island was then situated in longitude 168°12’ west of Greenwich, and in latitude 63°37’ N. The exact spot was looked out on the chart, and proved to be in Norton Sound, between Cape Tchaplin on the Asiatic and Cape Stephens on the American coast, but a hundred miles from either.

"We must give up all hope of making the land of the continent then!" said Mrs Barnett.

"Yes, madam," replied Hobson; "all hope of that is at an end; the current is carrying us with great rapidity out into the offing, and our only chance is, that we may pass within sight of a whaler."

"Well, but," added Mrs Barnett, "if we cannot make the land of either continent, might not the current drive us on to one of the islands of Behring Sea?"

There was, in fact, a slight possibility that such a thing might happen, and all eagerly clutched at the hope, like a drowning man at a plank. There are plenty of islands in Behring Sea, St Lawrence, St Matthew, Nunivak, St Paul, George island, &c. The wandering island was in fact at that moment not far from St Lawrence, which is of a considerable size, and surrounded with islets; and should it pass it without stopping, there was yet a hope that the cluster of the Aleutian Islands, bounding Behring Sea on the south, might arrest its course.

Yes! St Lawrence might be a harbour of refuge for the colonists, and if it failed them, St Matthew, and the group of islets of which it is the centre, would still be left. It would not do, however, to count upon the Aleutian Islands, which were more than eight hundred miles away, and which they might never reach. Long, long before they got so far, Victoria Island, worn away by the warm sea-waves, and melted by the rays of the sun, which was already in the sign of Gemini, would most likely have sunk to the bottom of the ocean.

There is, however, no fixed point beyond which floating ice does not advance. It approaches nearer to the equator in the southern than in the northern hemisphere. Icebergs have been seen off the Cape of Good Hope, at about thirty-six degrees south latitude, but those which come down from the Arctic Ocean have never passed forty degrees north latitude. The weather conditions, which are of course variable, determine the exact locality where ice will melt; in severe and prolonged winters it remains solid in comparatively low latitudes, and vice versa in early springs.

Now the warm season of 1861 had set in very early, and this would hasten the dissolution of Victoria Island. The waters of Behring Sea had already changed from blue to green, as the great navigator Hudson observed they always do on the approach of icebergs, so that a catastrophe might be expected at any moment.

Hobson determined to do his best to avert the coming misfortune, and ordered a raft to be constructed which
would carry the whole colony, and might be guided to the continent somehow or other. There was every chance of meeting vessels now that the whaling season had commenced, and Mac-Nab was commissioned to make a large solid raft which would float when Victoria Island was engulfed.

But first of all, it was necessary to construct some shelter for the homeless inhabitants of the island. The simple plan appeared to be to dig out the old barracks, which had been built on to the principal house, and the walls of which were still standing. Every one set to work with a hearty good-will, and in a few days a shelter was provided from the inclemencies of the fickle weather.

Search was also made in the ruins of the large house, and a good many articles of more or less value were saved from the submerged rooms—tools, arms, furniture, the air pumps, and the air vessel, &c.

On the 13th May all hope of drifting on to the island of St Lawrence had to be abandoned. When the bearings were taken, it was found that they were passing at a considerable distance to the east of that island; and, as Hobson was well aware, currents do not run against natural obstacles, but turn them, so that little hope could be entertained of thus making the land. It is true the network of islands in the Catherine Archipelago, scattered over several degrees of latitude, might stop the island if it ever got so far. But, as we have before stated, that was not probable, although it was advancing at great speed; for this speed must decrease considerably when the ice-wall which was driving it along should be broken away or dissolved, unprotected as it was from the heat of the sun by any covering of earth or sand.

Lieutenant Hobson, Mrs Barnett, Sergeant Long, and the head carpenter often discussed these matters, and came to the conclusion that the island could certainly never reach the Aleutian group with so many chances against it.

On the 14th May, Mac-Nab and his men commenced the construction of a huge raft. It had to be as high as possible above the water, to prevent the waves from breaking over it, so that it was really a formidable undertaking. The blacksmith, Rae, had fortunately found a large number of the iron bolts which had been brought from Fort Reliance, and they were invaluable for firmly fastening together the different portions of the framework of the raft.

We must describe the novel site for the building of the raft suggested by Lieutenant Hobson. Instead of joining the timbers and planks together on the ground, they were joined on the surface of the lake. The different pieces of wood were prepared on the banks, and launched separately. They were then easily fitted together on the water. This mode of proceeding had two advantages:—

1. The carpenter would be able at once to judge of the point of flotation, and the stability which should be given to the raft.
2. When Victoria Island melted, the raft would already be floating, and would not be liable to the shocks it would receive if on land when the inevitable break-up came.

Whilst these works were going on, Hobson would wander about on the beach, either alone or with Mrs Barnett, examining the state of the sea, and the ever-changing windings of the coast-line, worn by the constant action of the waves. He would gaze upon the vast deserted ocean, from which the very icebergs had now disappeared, watching, ever watching, like a shipwrecked mariner, for the vessel which never came. The ocean solitudes were only frequented by cetacea, which came to feed upon the microscopic animalcules which form their principal food, and abounded in the green waters. Now and then floating trees of different kinds, which had been brought by the great ocean currents from warm latitudes, passed the island on their way to the north.

On the 16th May, Mrs Barnett and Madge were walking together on that part of the island between the former Cape Bathurst and Port Barnett. It was a fine warm day, and there had been no traces of snow on the ground for some time; all that recalled the bitter cold of the Polar regions were the relics left by the ice-wall on the northern part of the island; but even these were rapidly melting, and every day fresh waterfalls poured from their summits and bathed their sides. Very soon the sun would have completely dissolved every atom of ice.

Strange indeed was the aspect of Victoria Island. But for their terrible anxiety, the colonists must have gazed at it with eager interest. The ground was more prolific than it could have been in any former spring, transferred as it was to milder latitudes. The little mosses and tender flowers grew rapidly, and Mrs Joliffe’s garden was wonderfully successful. The vegetation of every kind, hitherto checked by the rigour of the Arctic winter, was not only more abundant, but more brilliantly coloured. The hues of leaves and flowers were no longer pale and watery, but warm and glowing, like the sunbeams which called them forth. The arbutus, willow, birch, fir, and pine trees were clothed with dark verdure; the sap—sometimes heated in a temperature of 68° Fahrenheit—burst open the young buds; in a word, the Arctic landscape was completely transformed, for the island was now beneath the same parallel of latitude as Christiania or Stockholm, that is to say, in one of the finest districts of the temperate zones.

But Mrs Barnett had now no eyes for these wonderful phenomena of nature. The shadow of the coming doom clouded her spirit. She shared the feeling of depression manifested by the hundreds of animals now collected round the factory. The foxes, martens, ermines, lynxes, beavers, musk-rats, gluttons, and even the wolves, rendered less savage by their instinctive knowledge of a common danger, approached nearer and nearer to their old enemy man, as if man could save them. It was a tacit, a touching acknowledgment of human superiority, under circumstances in
which that superiority could be of absolutely no avail.

No! Mrs Barnett cared no longer for the beauties of nature, and gazed without ceasing upon the boundless, pitiless, infinite ocean with its unbroken horizon.

"Poor Madge!" she said at last to her faithful companion; "it was I who brought you to this terrible pass—you who have followed me everywhere, and whose fidelity deserved a far different recompense! Can you forgive me?"

"There is but one thing I could never have forgiven you," replied Madge,—"a death I did not share!"

"Ah, Madge!" cried Mrs Barnett, "if my death could save the lives of all these poor people, how gladly would I die!"

"My dear girl," replied Madge, "have you lost all hope at last?"

"I have indeed," murmured Mrs Barnett, hiding her face on Madge's shoulder.

The strong masculine nature had given way at last, and Mrs Barnett was for a moment a feeble woman. Was not her emotion excusable in so awful a situation?

Mrs Barnett sobbed aloud, and large tears rolled down her cheeks.

Madge kissed and caressed her, and tried all she could to reassure her; and presently, raising her head, her poor mistress said—

"Do not tell them, Madge, how I have given way—do not betray that I have wept."

"Of course not," said Madge, "and they would not believe me if I did. It was but a moment's weakness. Be yourself, dear girl; cheer up, and take fresh courage."

"Do you mean to say you still hope yourself!" exclaimed Mrs Barnett, looking anxiously into her companion's face.

"I still hope!" said Madge simply.

But a few days afterwards, every chance of safety seemed to be indeed gone, when the wandering island passed outside the St Matthew group, and drifted away from the last land in Behring Sea!

CHAPTER XX.

IN THE OFFING.

Victoria Island was now floating in the widest part of Behring Sea, six hundred miles from the nearest of the Aleutian Islands, and two hundred miles from the nearest land, which was on the east. Supposing no accident happened, it would be three weeks at least before this southern boundary of Behring Sea could be reached.

Could the island last so long? Might it not burst open at any moment, subject as it was even now to the constant action of tepid water, the mean temperature of which was more than 50° Fahrenheit?

Lieutenant Hobson pressed on the construction of the raft as rapidly as possible, and the lower framework was already floating on the lagoon. Mac-Nab wished to make it as strong as possible, for it would have a considerable distance to go to reach the Aleutian Islands, unless they were fortunate enough to meet with a whaler.

No important alteration had lately taken place in the general configuration of the island. Reconnaissances were taken everyday, but great caution was necessary, as a fracture of the ground might at any moment cut off the explorers from the rest of the party.

The wide gulf near Cape Michael, which the winter had closed, had reopened gradually, and now ran a mile inland, as far as the dried-up bed of the little river. It was probable that it was soon to extend to the bed itself, which was of course of little thickness, having been hollowed out by the stream. Should it do so, the whole district between Cape Michael and Port Barnett, bounded on the west by the river bed, would disappear—that is to say, the colonists would lose a good many square miles of their domain. On this account Hobson warned every one not to wander far, as a rough sea would be enough to bring about the dreaded catastrophe.

Soundings were, however, taken, in several places with a view to ascertaining where the ice was thickest, and it was found that, near Cape Bathurst, not only was the layer of earth and sand of greater extent—which was of little importance—but the crust of ice was thicker than anywhere else. This was a most fortunate circumstance, and the holes made in sounding were kept open, so that the amount of diminution in the base of the island could be estimated every day. This diminution was slow but sure, and, making allowance for the unfortunate fact that the island was drifting into warmer waters, it was decided that it was impossible for it to last another three weeks.

The next week, from the 19th to the 25th May, the weather was very bad. A fearful storm broke over the island, accompanied by flash after flash of lightning and peals of thunder. The sea rose high, lashed by a powerful northwest wind, and its waves broke over the doomed island, making it tremble ominously. The little colony were on the watch, ready on an emergency to embark in the raft, the scaffolding of which was nearly finished, and some provisions and fresh water were taken on board.

Rain heavy enough to penetrate to the ice-crust fell in large quantities during this storm, and melted it in many places. On the slopes of some of the hills the earth was washed away, leaving the white foundations bare. These ravines were hastily filled up with soil to protect the ice from the action of the warm air and rain, and but for this
precaution the soil would have been everywhere perforated.

Great havoc was caused amongst the woods by this storm; the earth and sand were washed away from the roots of the trees, which fell in large numbers. In a single night the aspect of the country between the lake and the former Port Barnett was completely changed. A few groups of birch trees and thickets of firs alone remained—a fact significant of approaching decomposition, which no human skill could prevent! Every one knew and felt that the ephemeral inland was gradually succumbing—every one, except perhaps Thomas Black, who was still gloomily indifferent to all that was going on.

On the 23d of May, during the storm, the hunter Sabine left the house in the thick fog, and was nearly drowned in a large hole which had opened during the night on the site formerly occupied by the principal house of the factory.

Hitherto, as we are aware, the house, three quarters submerged, and buried beneath a mass of earth and sand, had remained fixed in the ice-crust beneath the island; but now the sea had evidently enlarged the crevasse, and the house with all it contained had sunk to rise no more. Earth and sand were pouring through this fissure, at the bottom of which surged the tempest-tossed waves.

Sabine’s comrades, hearing his cries, rushed to his assistance, and were just in time to save him as he was still clinging to the slippery walls of the abyss. He escaped with a ducking which might have had tragic consequences.

A little later the beams and planks of the house, which had slid under the island, were seen floating about in the offing like the spars of a wrecked vessel. This was the worst evil the storm had wrought, and would compromise the solidity of the island yet more, as the waves would now eat away the ice all round the crevasse.

In the course of the 25th May, the wind veered to the north-east, and although it blew strongly, it was no longer a hurricane; the rain ceased, and the sea became calmer. After a quiet night the sun rose upon the desolate scene, the Lieutenant was able to take the bearings accurately, and obtained the following result:

At noon on the 25th May, Victoria Island was in latitude 56° 13’, and longitude 170° 23’.

It had therefore advanced at great speed, having drifted nearly eight hundred miles since the breaking up of the ice set it free in Behring Strait two months before.

This great speed made the Lieutenant once more entertain a slight hope. He pointed out the Aleutian Islands on the map to his comrades, and said—

"Look at these islands; they are not now two hundred miles from us, and we may reach them in eight days."

"Eight days!" repeated Long, shaking his head; "eight days is a long time."

"I must add," continued Hobson, "that if our island had followed the hundred and sixty-eighth meridian, it would already have reached the parallel of these islands, but in consequence of a deviation of the Behring current, it is bearing in a south-westerly direction."

The Lieutenant was right, the current seemed likely to drag the island away from all land, even out of sight of the Aleutian Islands, which only extend as far as the hundred and seventieth meridian.

Mrs Barnett examined the map in silence. She saw the pencil-mark which denoted the exact spot then occupied by the island.

The map was made on a large scale, and the point representing the island looked but a speck upon the vast expanse of the Behring Sea. She traced back the route by which the island had come to its present position, marvelling at the fatality, or rather the immutable law, by which the currents which had borne it along had avoided all land, sheering clear of islands, and never touching either continent; and she saw the boundless Pacific Ocean, towards which she and all with her were hurrying.

She mused long upon this melancholy subject, and at last exclaimed suddenly—

"Could not the course of the island be controlled? Eight days at this pace would bring us to the last island of the Aleutian group."

"Those eight days are in the hands of God," replied Lieutenant Hobson gravely; "we can exercise no control upon them. Help can only come to us from above; there is nothing left for us to try."

"I know, I know!" said Mrs Barnett; "but Heaven helps those who help themselves. Is there really nothing we can do?"

Hobson shook his head doubtfully. His only hope was in the raft, and he was undecided whether to embark every one on it at once, contrive some sort of a sail with clothes, &c., and try to reach the nearest land, or to wait yet a little longer.

He consulted Sergeant Long, Mac-Nab, Rae, Marbre, and Sabine, in whom he had great confidence, and all agreed that it would be unwise to abandon the island before they were obliged. The raft, constantly swept as it would be by the waves, could only be a last resource, and would not move at half the pace of the island, still driven towards the south by the remains of the ice-wall. The wind generally blew from the east, and would be likely to drift the raft out into the offing from all land. They must still wait then, always wait; for the island was drifting rapidly.
towards the Aleutians. When they really approached the group they would be able to see what it would be best to do.

This was certainly the wisest course to take. In eight days, if the present speed were maintained, the island would either stop at the southern boundary of Behring Sea, or be dragged to the south west to the waters of the Pacific Ocean, where certain destruction awaited it.

But the adverse fate which seemed all along to have followed the hapless colonists had yet another blow in store for them: the speed on which they counted was now to fail them, as everything else had done.

During the night of the 26th May, the orientation of the island changed once more; and this time the results of the displacement were extremely serious. The island turned half round, and the icebergs still remaining of the huge ice-wall, which had shut in the northern horizon, were now on the south.

In the morning the shipwrecked travellers—what name could be more appropriate?—saw the sun rise above Cape Esquimaux instead of above Port Barnett.

Hardly a hundred yards off rose the icebergs, rapidly melting, but still of a considerable size, which till then had driven the island before them. The southern horizon was now partly shut in by them.

What would be the consequences of this fresh change of position? Would not the icebergs now float away from the island, with which they were no longer connected?

All were oppressed with a presentiment of some new misfortune, and understood only too well what Kellet meant when he exclaimed—

"This evening we shall have lost our screw!"

By this Kellet meant that the icebergs, being before instead of behind the island, would soon leave it, and as it was they which imparted to it its rapid motion, in consequence of their very great draught of water—their volume being six or seven feet below the sea level for every one above—they would now go on without it, impelled by the submarine current, whilst Victoria Island, not deep enough in the water to come under the influence of the current, would be left floating helplessly on the waves.

Yes! Kellet was right; the island would then be like a vessel with disabled masts and a broken screw.

No one answered the soldier's remark, and a quarter of an hour had not elapsed before a loud cracking sound was heard. The summits of the icebergs trembled, large masses broke away, and the icebergs, irresistibly drawn along by the submarine current, drifted rapidly to the south.

CHAPTER XXI.

THE ISLAND BECOMES AN ISLET.

Three hours later the last relics of the ice-wall had disappeared, proving that the island now remained stationary, and that all the force of the current was deep down below the waves, not on the surface of the sea.

The bearings were taken at noon with the greatest care and twenty-four hours later it was found that Victoria Island had not advanced one mile.

The only remaining hope was that some vessel should sight the poor shipwrecked creatures, either whilst still on the island, or after they had taken to their raft.

The island was now in 54° 33' latitude, and 177° 19' longitude, several hundred miles from the nearest land, namely, the Aleutian Islands.

Hobson once more called his comrades together, and asked them what they thought it would be best to do.

All agreed that they should remain on the island until it broke up, as it was too large to be affected by the state of the sea, and only take to the raft when the dissolution actually commenced. Once on the frail vessel, they must wait. Still wait!

The raft was now finished. Mac-Nab had made one large shed or cabin big enough to hold every one, and to afford some little shelter from the weather. A mast had been prepared, which could be put up if necessary, and the sails intended for the boat had long been ready. The whole structure was strong, although clumsy; and if the wind were favourable, and the sea not too rough, this rude assortment of planks and timbers might save the lives of the whole party.

"Nothing," observed Mrs Barnett,—"nothing is impossible to Him who rules the winds and waves."

Hobson carefully looked over the stores of provisions. The reserves had been much damaged by the avalanche, but there were plenty of animals still on the island, and the abundant shrubs and mosses supplied them with food. A few reindeer and hares were slaughtered by the hunters, and their flesh salted for future needs.

The health of the colonists was on the whole good. They had suffered little in the preceding mild winter, and all the mental trials they had gone through had not affected their physical well-being. They were, however, looking forward with something of a shrinking horror to the moment when they would have to abandon their island home, or, to speak more correctly, when it abandoned them. It was no wonder that they did not like the thought of floating on the ocean in a rude structure of wood subject to all the caprices of winds and waves. Even in tolerably fine weather seas would be shipped and every one constantly drenched with saltwater. Moreover, it must be remembered
that the men were none of them sailors, accustomed to navigation, and ready to risk their lives on a few planks, but soldiers, trained for service on land. Their island was fragile, it is true, and rested on a thin crust of ice; but then it was covered with a productive soil, trees and shrubs flourished upon it, its huge bulk rendered it insensible to the motion of the waves, and it might have been supposed to be stationary. They had, in fact, become attached to Victoria Island, on which they had lived nearly two years; every inch of the ground had become familiar to them; they had tilled the soil, and had come safely through so many perils in their wandering home, that in leaving it they felt as if they were parting from an old and sorely-tried friend.

Hobson fully sympathised with the feelings of his men, and understood their repugnance to embarking on the raft; but then he also knew that the catastrophe could not now be deferred much longer, and ominous symptoms already gave warning of its rapid approach.

We will now describe this raft. It was thirty feet square, and its deck rose two feet above the water. Its bulwarks would therefore keep out the small but not the large waves. In the centre the carpenter had built a regular deck-house, which would hold some twenty people. Round it were large lockers for the provisions and water-casks, all firmly fixed to the deck with iron bolts. The mast, thirty feet high, was fastened to the deck-house, and strengthened with stays attached to the corners of the raft. This mast was to have a square sail, which would only be useful when the wind was aft. A sort of rudder was fixed to this rough structure, the fittings of which were necessarily incomplete.

Such was the raft constructed by the head carpenter, on which twenty-one persons were to embark. It was floating peacefully on the little lake, strongly moored to the shore.

It was certainly constructed with more care than if it had been put together in haste on a vessel at sea doomed to immediate destruction. It was stronger and better fitted up; but, after all, it was but a raft.

On the 1st June a new incident occurred. Hope, one of the soldiers, went to fetch some water from the lake for culinary purposes, and when Mrs Joliffe tasted it, she found that it was salt. She called Hope, and said she wanted fresh, not salt water.

The man replied that he had brought it from the lake as usual, and as he and Mrs Joliffe were disputing about it, the Lieutenant happened to come in. Hearing Hope's repeated assertions that he had fetched the water from the lake, he turned pale and hurried to the lagoon.

The waters were quite salt; the bottom of the lake had evidently given way, and the sea had flowed in.

"No more fresh water!" exclaimed all the poor creatures together.

Lake Barnett had in fact disappeared, as Paulina River had done before.

Lieutenant Hobson hastened to reassure his comrades about drinkable water.

"There will be plenty of ice, my friends," he said. "We can always melt a piece of our island, and," he added, with a ghastly attempt at a smile, "I don't suppose we shall drink it all."

It is, in fact, well known that salt separates from sea-water in freezing and evaporation. A few blocks of ice were therefore "disinterred," if we may so express it, and melted for daily use, and to fill the casks on board the raft.

It would not do, however, to neglect this fresh warning given by nature. The invasion of the lake by the sea proved that the base of the island was rapidly melting. At any moment the ground might give way, and Hobson forbade his men to leave the factory, as they might be drifted away before they were aware of it.

The animals seemed more keenly alive than ever to approaching danger; they gathered yet more closely round the firmer part, and after the disappearance of the fresh water lake, they came to lick the blocks of ice. They were all uneasy, and some seemed to be seized with madness, especially the wolves, who rushed wildly towards the factory, and dashed away again howling piteously. The furred animals remained huddled together round the large well where the principal house had formerly stood. There were several hundreds of them, of different species, and the solitary bear roamed backwards and forwards, showing no more hostility to the quadrupeds than to men.

The number of birds, which had hitherto been considerable, now decreased. During the last few days all those capable of long-sustained flight—such as swans, &c, migrated towards the Aleutian Islands in the south, where they would find a sure refuge. This significant and ominous fact was noticed by Mrs Barnett and Madge, who were walking together on the beach.

"There is plenty of food for these birds on the island," observed Mrs Barnett, "and yet they leave it—they have a good reason, no doubt."

"Yes," replied Madge; "their instinct of self-preservation makes them take flight, and they give us a warning by which we ought to profit. The animals also appear more uneasy than usual."

Hobson now decided to take the greater part of the provisions and all the camping apparatus on board the raft, and when that was done, to embark with the whole party.

The sea was, however, very rough, and the waters of the former lake—now a kind of Mediterranean in miniature
were greatly agitated. The waves, confined in the narrow space, dashed mountains high, and broke violently upon the steep banks. The raft tossed up and down, and shipped sea after sea. The embarkation of provisions, &c., had to be put off.

Every one wished to pass one more quiet night on land, and Hobson yielded against his better judgment, determined, if it were calmer the next day, to proceed with the embarkation.

The night was more peaceful than had been expected; the wind went down, and the sea became calmer; it had but been swept by one of those sudden and brief hurricanes peculiar to these latitudes.

At eight o’clock in the evening the tumult ceased, and a slight surface agitation of the waters of lake and sea alone remained.

It was some slight comfort that the island would not now be broken up suddenly, as it must have done had the storm continued. Its dissolution was, of course, still close at hand, but would not, it was hoped, be sudden and abrupt.

The storm was succeeded by a slight fog, which seemed likely to thicken during the night. It came from the north, and owing to the changed position of the island, would probably cover the greater part of it.

Before going to bed, Hobson went down and examined the moorings of the raft, which were fastened to some strong birch-trees. To make security doubly sure, he tightened them, and the worst that could now happen would be, that the raft would drift out on to the lagoon, which was not large enough to be lost upon it.

CHAPTER XXII.

THE FOUR FOLLOWING DAYS.

The night was calm, and in the morning the Lieutenant resolved to order the embarkation of everything and everybody that very day. He, therefore, went down to the lake to look at the raft.

The fog was still thick, but the sunbeams were beginning to struggle through it. The clouds had been swept away by the hurricane of the preceding day, and it seemed likely to be hot.

When Hobson reached the banks of the lake, the fog was still too dense for him to make out anything on its surface, and he was waiting for it to clear away, when he was joined by Mrs Barnett, Madge, and several others.

The fog gradually cleared off, drawing back to the end of the lake, but the raft was nowhere to be seen.

Presently a gust of wind completely swept away the fog.

The raft was gone! There was no longer a lake! The boundless ocean stretched away before the astonished colonists!

Hobson could not check a cry of despair; and when he and his companions turned round and saw the sea on every side, they realised with a shock of horror that their island was now nothing more than an islet!

During the night six-sevenths of the district once belonging to Cape Bathurst had silently floated away, without producing a shock of any kind, so completely had the ice been worn away by the constant action of the waves, the raft had drifted out into the offing, and those whose last hope it had been could not see a sign of it on the desolate sea.

The unfortunate colonists were now overwhelmed with despair; their last hope gone, they were hanging above an awful abyss ready to swallow them up; and some of the soldiers in a fit of madness were about to throw themselves into the sea, when Mrs Barnett flung herself before them, entreating them to desist. They yielded, some of them weeping like children.

The awful situation of the colonists was indeed manifest enough, and we may well pity the Lieutenant surrounded by the miserable despairing creatures. Twenty-one persons on an islet of ice which must quickly melt beneath their feet! The wooded hills had disappeared with the mass of the island now engulfed; not a tree was left. There was no wood remaining but the planks of the rough lodging, which would not be nearly enough to build a raft to hold so many. A few days of life were all the colonists could now hope for; June had set in, the mean temperature exceeded 68° Fahrenheit, and the islet must rapidly melt.

As a forlorn hope, Hobson thought he would make a reconnoissance of his limited domain, and see if any part of it was thicker than where they were all now encamped. In this excursion he was accompanied by Mrs Barnett and Madge.

"Do you still hope!" inquired the lady of her faithful companion.

"I hope ever!" replied Madge.

Mrs Barnett did not answer, but walked rapidly along the coast at the Lieutenant’s side. No alteration had taken place between Cape Bathurst and Cape Esquimaux, that is to say, for a distance of eight miles. It was at Cape Esquimaux that the fracture had taken place, and running inland, it followed a curved line as far as the beginning of the lagoon, from which point the shores of the lake, now bathed by the waves of the sea, formed the new coast-line. Towards the upper part of the lagoon there was another fracture, running as far as the coast, between Cape Bathurst and what was once Port Barnett, so that the islet was merely an oblong strip, not more than a mile wide anywhere.
Of the hundred and forty square miles which once formed the total superficial area of the island, only twenty remained.

Hobson most carefully examined the new conformation of the islet, and found that its thickest part was still at the site of the former factory. He decided, therefore, to retain the encampment where it was, and, strange to say, the instinct of the quadrupeds still led them to congregate about it.

A great many of the animals had, however, disappeared with the rest of the island, amongst them many of the dogs which had escaped the former catastrophe. Most of the quadrupeds remaining were rodents; and the bear, which seemed terribly puzzled, paced round and round the islet like a caged animal.

About five o’clock in the evening the three explorers returned to the camp. The men and women were gathered together in gloomy silence in the rough shelter still remaining to them, and Mrs Joliffe was preparing some food. Sabine, who was less overcome than his comrades, was wandering about in the hope of getting some fresh venison, and the astronomer was sitting apart from everyone, gazing at the sea in an absent indifferent manner, as if nothing could ever rouse or astonish him again.

The Lieutenant imparted the results of his excursion to the whole party. He told them that they were safer where they were than they would be on any other spot, and he urged them not to wander about, as there were signs of another approaching fracture half way between the camp and Cape Esquimaux. The superficial area of the islet would soon be yet further reduced, and they could do nothing, absolutely nothing.

The day was really quite hot. The ice which had been “disinterred” for drinkable water melted before it was brought near the fire. Thin pieces of the ice crust of the steep beach fell off into the sea, and it was evident that the general level of the islet was being lowered by the constant wearing away of its base in the tepid waters.

No one slept the next night. Who could have closed his eyes with the knowledge that the abyss beneath might open at any moment?—who but the little unconscious child who still smiled in his mother’s arms, and was never for one instant out of them?

The next morning, June 4th, the sun rose in a cloudless sky. No change had taken place in the conformation of the islet during the night.

In the course of this day a terrified blue fox rushed into the shed, and could not be induced to leave it. The martens, ermines, polar hares, musk-rats, and beavers literally swarmed upon the site of the former factory. The wolves alone were unrepresented, and had probably all been swallowed up with the rest of the island. The bear no longer wandered from Cape Bathurst, and the furred animals seemed quite unconscious of its presence; nor did the colonists notice it much, absorbed as they were in the contemplation of the approaching doom, which had broken down all the ordinary distinctions of race.

A little before noon a sudden hope—too soon to end in disappointment—revived the drooping spirits of the colonists.

Sabine, who had been standing for some time on the highest part of the islet looking at the sea, suddenly cried—

"A boat! a boat!"

It was as if an electric shock had suddenly run through the group, for all started up and rushed towards the hunter.

The Lieutenant looked at him inquiringly, and the man pointed to a white vapour on the horizon. Not a word was spoken, but all watched in breathless silence as the form of a vessel gradually rose against the sky.

It was indeed a ship, and most likely a whaler. There was no doubt about it, and at the end of an hour even the keel was visible.

Unfortunately this vessel appeared on the east of the islet, that is to say, on the opposite side to that from which the raft had drifted, so that there could be no hope that it was coming to their rescue after meeting with the raft, which would have suggested the fact of fellow-creatures being in danger.

The question now was, would those in this vessel perceive the islet? Would they be able to make out signals on it? Alas! in broad daylight, with a bright sun shining, it was not likely they would. Had it been night some of the planks of the remaining shed might have made a fire large enough to be seen at a considerable distance, but the boat would probably have disappeared before the darkness set in; and, although it seemed of little use, signals were made, and guns fired on the islet.

The vessel was certainly approaching, and seemed to be a large three-master, evidently a whaler from New Archangel, which was on its way to Behring Strait after having doubled the peninsula of Alaska. It was to the windward of the islet, and tacking to starboard with its lower sails, top sails, and top-gallant sails all set. It was steadily advancing to the north. A sailor would have seen at a glance that it was not bearing towards the islet, but it might even yet perceive it, and alter its course.

"If it does see us," whispered Hobson in Long’s ear, "it is more likely to avoid us than to come nearer."

The Lieutenant was right, for there is nothing vessels dread more in these latitudes than the approach of icebergs.
and ice-floes; they look upon them as floating rocks, against which there is a danger of striking, especially in the night, and they therefore hasten to change their course when ice is sighted; and this vessel would most likely do the same, if it noticed the islet at all.

The alternations of hope and despair through which the anxious watchers passed may be imagined, but cannot be described. Until two o’clock in the afternoon they were able to believe that Heaven had at last taken pity on them—that help was coming—that their safety was assured. The vessel continued to approach in an oblique direction, and was presently not more than six miles from the islet. Signal after signal was tried, gun after gun fired, and some of the planks of the shed were burnt.

All in vain—either they were not seen, or the vessel was anxious to avoid the islet.

At half-past two it luffed slightly, and bore away to the northeast.

In another hour a white vapour was all that was visible, and that soon disappeared.

On this the soldier Kellet burst into a roar of hysterical laughter, and flinging himself on the ground, rolled over and over like a madman.

Mrs Barnett turned and looked Madge full in the face, as if to ask her if she still hoped, and Madge turned away her head.

On this same ill-fated day a crackling noise was heard, and the greater part of the islet broke off, and plunged into the sea. The cries of the drowning animals rent the air, and the islet was reduced to the narrow strip between the site of the engulfed house and Cape Bathurst. It was now merely a piece of ice.

CHAPTER XXIII.

ON A PIECE OF ICE.

A piece of ice, a jagged triangular strip of ice, measuring one hundred feet at its base, and scarcely five hundred in its greatest extent; and on it twenty-one human beings, some hundred furred animals, a few dogs, and a large bear, which was at this moment crouching at the very edge!

Yes! all the luckless colonists were there. Not one had yet been swallowed up. The last rupture had occurred when they were all in the shed. Thus far fate had spared them, probably that they might all perish together.

A silent sleepless night ensued. No one spoke or moved, for the slightest shake or blow might suffice to break the ice.

No one would touch the salt-meat served round by Mrs Joliffe. What would be the good of eating?

Nearly every one remained in the open air, feeling that it would be better to be drowned in the open sea than in a narrow wooden shed.

The next day, June 5th, the sun shone brightly down upon the heads of the doomed band of wanderers. All were still silent, and seemed anxious to avoid each other. Many gazed with troubled anxious eyes at the perfect circle of the horizon, of which the miserable little strip of ice formed the centre. But the sea was absolutely deserted—not a sail, not an ice-floe, not an islet! Their own piece of ice was probably the very last floating on the Behring Sea.

The temperature continued to rise. The wind had gone down, and a terrible calm had set in, a gentle swell heaved the surface of the sea, and the morsel of earth and ice, which was all that was left of Victoria Island, rose and sank without change of position, like a wreck—and what was it but a wreck?

But a wreck, a piece of woodwork, a broken mast, or a few planks, remain floating; they offer some resistance to the waves, they will not melt; but this bit of ice, this solidified water, must dissolve with the heat of the sun!

This piece of ice had formed the thickest part of the island, and this will explain its having lasted so long. A layer of earth and plenty of vegetation covered it, and the base of ice must have been of considerable thickness. The long bitter Polar winters must have “fed it with fresh ice,” in the countless centuries during which it was connected with the mainland. Even now its mean height was five or six feet above the sea level, and its base was probably of about the same thickness. Although in these quiet waters it was not likely to be broken, it could not fail gradually to melt, and the rapid dissolution could actually be watched at the edges, for as the long waves licked the sides, piece after piece of ground with its verdant covering sank to rise no more.

On this 5th June a fall of this nature occurred at about one o’clock P.M., on the site of the shed itself, which was very near the edge of the ice. There was fortunately no one in it at the time, and all that was saved was a few planks, and two or three of the timbers of the roofs. Most of the cooking utensils and all the astronomical instruments were lost. The colonists were now obliged to take refuge on the highest part of the islet, where nothing protected them from the weather, but fortunately a few tools had been left there, with the air pumps and the air-vessel, which Hobson had employed for catching a little of the rain-water for drinking purposes, as he no longer dared to draw for a supply upon the ice, every atom of which was of value.

At about four o’clock P.M., the soldier Kellet, the same who had already given signs of insanity, came to Mrs Barnett and said quietly—

"I am going to drown myself, ma’am."
"What, Kellet?" exclaimed the lady.

"I tell you I am going to drown myself," replied the soldier. "I have thought the matter well over: there is no escape for us, and I prefer dying at once to waiting to be killed."

"Kellet!" said Mrs Barnett, taking the man's hand and looking into his face, which was strangely composed, "you will not do that?"

"Yes, I will, ma'am; and as you have always been very good to us all, I wanted to wish you good-bye. Good-bye, ma'am!"

And Kellet turned towards the sea. Mrs Barnett, terrified at his manner, threw herself upon him and held him back. Her cries brought Hobson and Long to her assistance, and they did all in their power to dissuade the unhappy man from carrying out his purpose, but he was not to be moved, and merely shook his head.

His mind was evidently disordered, and it was useless to reason with him. It was a terrible moment, as his example might lead some of his comrades to commit suicide also. At all hazards he must be prevented from doing as he threatened.

"Kellet," said Mrs Barnett gently, with a half smile, "we have always been very good friends, have we not?"

"Yes, ma'am," replied Kellet calmly.

"Well, Kellet, if you like we will die together, but not to-day."

"What, ma'am?"

"No, my brave fellow, I am not ready; but to-morrow, to-morrow if you like."

The soldier looked more fixedly than ever at the courageous woman, and seemed to hesitate an instant; then he cast a glance of fierce longing at the sea, and passing his hand over his eyes, said—

"To-morrow!"

And without another word he quietly turned away and went back to his comrades.

"Poor fellow." murmured Mrs Barnett; "I have asked him to wait till to-morrow, and who can say whether we shall not all be drowned by that time!"

Throughout that night Hobson remained motionless upon the beach, pondering whether there might not yet be some means to check the dissolution of the islet—if it might not yet be possible to preserve it until they came in sight of land of some sort.

Mrs Barnett and Madge did not leave each other for an instant. Kalumah crouched like a dog at the feet of her mistress, and tried to keep her warm. Mrs Mac-Nab, wrapped in a few furs, the remains of the rich stores of Fort Hope, had fallen into a kind of torpor, with her baby clasped in her arms.

The stars shone with extraordinary brilliancy, and no sounds broke the stillness of the night but the rippling of the waves and the splash of pieces of ice as they fell into the sea. The colonists, stretched upon the ground in scattered groups, were as motionless as corpses on an abandoned wreck.

Sometimes Sergeant Long rose and peered into the night-mists, but seeing nothing, he resumed his horizontal position. The bear, looking like a great white snowball, cowered motionless at the very edge of the strip of ice.

This night also passed away without any incident to modify the situation. The grey morning dawned in the east, and the sun rose and dispersed the shadows of the night.

The Lieutenant's first care, as soon as it was light, was to examine the piece of ice. Its perimeter was still more reduced, and, alas! its mean height above the sea level had sensibly diminished. The waves, quiet as they were, washed over the greater part of it; the summit of the little hill alone was still beyond their reach.

Long, too, saw the changes which had taken place during the night, and felt that all hope was gone.

Mrs Barnett joined Lieutenant Hobson, and said to him—

"It will be to-day then!"

"Yes, madam, and you will keep your promise to Kellet!"

"Lieutenant Hobson," said the lady solemnly, "have we done all in our power!"

"We have, madam."

"Then God's will be done!"

One last attempt was, however, made during the day. A strong breeze set in from the offing, that is to say, a wind bearing to the south-east, the direction in which were situated the nearest of the Aleutian Islands. How far off no one could say, as without instruments the bearings of the island could not be taken. It was not likely to have drifted far, however, unless under the influence of the current, as it gave no hold to the wind.

Still it was just possible that they might be nearer land than they thought. If only a current, the direction of which it was impossible to ascertain, had taken them nearer to the much-longed-for Aleutian Islands, then, as the wind was bearing down upon those very islands, it might drive the strip of ice before it if a sail of some kind could be concocted. The ice had still several hours to float, and in several hours the land might come in sight, or, if not the land, some coasting or fishing vessel.
A forlorn hope truly, but it suggested an idea to the Lieutenant which he resolved to carry out. Could not a sail be contrived on the islet as on an ordinary raft? There could be no difficulty in that; and when Hobson suggested it to Mac-Nab, he exclaimed—

"You are quite right, sir;" adding to his men, "bring out all the canvas there is!"

Every one was quite revived by this plan, slight as was the chance it afforded, and all lent a helping hand, even Kellet, who had not yet reminded Mrs Barnett of her promise.

A beam, which had once formed part of the roof of the barracks, was sunk deep into the earth and sand of which the little hill was composed, and firmly fixed with ropes arranged like shrouds and a stay. A sail made of all the clothes and coverlets still remaining fastened on to a strong pole for a yard, was hoisted on the mast. This sail, or rather collection of sails, suitably set, swelled in the breeze, and by the wake it left, it was evident that the strip of ice was rapidly moving towards the south-east.

It was a success, and every one was cheered with newly-awakened hope. They were no longer stationary; they were advancing slowly, it was true, but still they were advancing. The carpenter was particularly elated; all eagerly scanned the horizon, and had they been told that no land could be sighted, they would have refused to believe it.

So it appeared, however; for the strip of ice floated along on the waves for three hours in the centre of an absolutely circular and unbroken horizon. The poor colonists still hoped on.

Towards three o'clock, the Lieutenant took the Sergeant aside, and said to him—

"We are advancing at the cost of the solidity and duration of our islet."

"What do you mean, sir?"

"I mean that the ice is being rapidly fretted away as it moves along. Its speed is hastening its dissolution, and since we set sail it has diminished one-third."

"Are you quite sure?"

"Absolutely certain. The ice is longer and flatter. Look, the sea is not more than ten feet from the hill!"

It was true, and the result was what might naturally have been expected from the motion of the ice.

"Sergeant," resumed Hobson, "do you think we ought to take down our sail?"

"I think," replied Long, after a moment's reflection, "that we should consult our comrades. We ought all to share the responsibility of a decision now."

The Lieutenant bent his head in assent, and the two returned to their old position on the little hill.

Hobson put the case before the whole party.

"The speed we have given to the ice," he said, "is causing it to wear away rapidly, and will perhaps hasten the inevitable catastrophe by a few hours. My friends, you must decide whether we shall still go on."

"Forwards!" cried all with one voice.

So it was decided, and, as it turned out, the decision was fraught with consequences of incalculable importance.

At six o'clock P.M. Madge rose, and pointing to a point on the south-east, cried—

"Land!"

Every one started up as if struck by lightning. Land there was indeed, on the south-east, twelve miles from the island.

"More sail! more sail!" shouted Hobson.

He was understood, and fresh materials were hastily brought. On the shrouds a sort of studding sail was rigged up of clothes, furs, everything, in short, that could give hold to the wind.

The speed increased as the wind freshened, but the ice was melting everywhere; it trembled beneath the feet of the anxious watchers, and might open at any moment. But they would not think of that; they were buoyed up with hope; safety was at hand, on the land they were rapidly nearing. They shouted—they made signals—they were in a delirium of excitement.

At half-past seven the ice was much nearer the land, but it was visibly melting, and sinking rapidly; water was gushing from it, and the waves were washing over it, sweeping off the terrified quadrupeds before the eyes of the colonists. Every instant they expected the whole mass to be engulfed, and it was necessary to lighten it like a sinking vessel. Every means was tried to check the dissolution; the earth and sand were carefully spread about, especially at the edges of the ice, to protect it from the direct influence of the sunbeams; and furs were laid here and there, as being bad conductors of heat. But it was all of no avail; the lower portion of the ice began to crack, and several fissures opened in the surface. It was now but a question of moments!

Night set in, and there was nothing left for the poor colonists to do to quicken the speed of the islet. Some of them tried to paddle about on planks. The coast was still four miles to windward.

It was a dark gloomy night, without any moon, and Hobson, whose heroic courage did not even now fail him, shouted—

"A signal, my friends! a signal!" A pile was made of all the remaining combustibles—two or three planks and a
beam. It was set fire to, and bright flames soon shot up, but the strip of ice continued to melt and sink. Presently the little hill alone remained above water, and on it the despairing wretches, with the few animals left alive, huddled together, the bear growling fiercely.

The water was still rising, and there was no sign that any one on land had seen the signal. In less than a quarter of an hour they must all be swallowed up.

Could nothing be done to make the ice last longer? In three hours, three short hours, they might reach the land, which was now but three miles to windward.

"Oh!" cried Hobson, "if only I could stop the ice from melting! I would give my life to know how! Yes, I would give my life!"

"There is one way," suddenly replied a voice.

It was Thomas Black who spoke, the astronomer, who had not opened his lips for so long, and who had long since appeared dead to all that was going on.

"Yes," he continued, "there is one way of checking the dissolution of the ice—there is one way of saving us all."

All gathered eagerly round the speaker, and looked at him inquiringly. They thought they must have misheard what he said.

"Well!" asked Hobson, "what way do you mean?"

"To the pumps!" replied Black simply.

Was he mad? Did he take the ice for a sinking vessel, with ten feet of water in the hold?

The air pumps were at hand, together with the air vessel, which Hobson had been using as a reservoir for drinking water, but of what use could they be? Could they harden the ice, which was melting all over?

"He is mad!" exclaimed Long.

"To the pumps!" repeated the astronomer; "fill the reservoir with air!"

"Do as he tells you!" cried Mrs Barnett.

The pumps were attached to the reservoir, the cover of which was closed and bolted. The pumps were then at once set to work, and the air was condensed under the pressure of several atmospheres. Then Black, taking one of the leather pipes connected with the reservoir, and opening the cock, let the condensed air escape, walking round the ice wherever it was melting.

Every one was astonished at the effect produced. Wherever the air was projected by the astronomer, the fissures filled up, and the surface re-froze.

"Hurrah! hurrah!" shouted all with one voice.

It was tiring enough to work the pumps, but there were plenty of volunteers. The edges of the ice were again solidified, as if under the influence of intense cold.

"You have saved us, Mr Black," said Lieutenant Hobson.

"Nothing could be more natural," replied the astronomer quietly.

Nothing, in fact, could have been more natural; and the physical effect produced may be described as follows:—

There were two reasons for the relegation:—First, under the pressure of the air, the water vaporised on the surface of the ice produced intense cold, and the compressed air in expanding abstracted the heat from the thawed surface, which immediately re-froze. Wherever the ice was opening the cold cemented the edges, so that it gradually regained its original solidity.

This went on for several hours, and the colonists, buoyed up by hope, toiled on with unwearying zeal.

They were nearing the coast, and when they were about a quarter of a mile from it, the bear plunged into the sea, and swimming to the shore, soon disappeared.

A few minutes afterwards the ice ran aground upon a beach, and the few animals still upon it hurried away in the darkness. The colonists "disembarked," and falling on their knees, returned thanks to God for their miraculous deliverance.

CHAPTER XXIV
CONCLUSION.

It was on the island of Blejinie, the last of the Aleutian group, at the extreme south of Behring Sea, that all the colonists of Fort Hope at last landed, after having traversed eighteen hundred miles since the breaking-up of the ice. They were hospitably received by some Aleutian fishermen who had hurried to their assistance, and were soon able to communicate with some English agents of the Hudson’s Bay Company.

After all the details we have given, it is needless to dwell on the courage and energy of the brave little band, which had proved itself worthy of its noble leader. We know how all struggled with their misfortunes, and how patiently they had submitted to the will of God. We have seen Mrs Barnett cheering every one by her example and sympathy; and we know that neither she nor those with her yielded to despair when the peninsula on which Fort Hope had been built was converted into a wandering island, when that island became an islet, and the islet a strip of
ice, nor even when that strip of ice was melting beneath the combined influence of sun and waves. If the scheme of
the Company was a failure, if the new fort had perished, no one could possibly blame Hobson or his companions,
who had gone through such extraordinary and unexpected trials. Of the nineteen persons under the Lieutenant’s
charge, not one was missing, and he had even two new members in his little colony, Kalumah and Mrs Barnett’s
godson, Michael Mac-Nab.

Six days after their rescue the shipwrecked mariners arrived at New Archangel, the capital of Russian America.
Here the friends, bound together by so many dangers shared, must part, probably for ever! Hobson and his men
were to return to Fort Reliance across English America, whilst Mrs Barnett, accompanied by Kalumah, who would
not leave her, Madge, and Thomas Black, intended to go back to Europe via San Francisco and the United States.

But whilst they were still altogether, the Lieutenant, addressing Mrs Barnett, said with considerable emotion—
"God bless you, madam, for all you have been to us. You have been our comforter, our consoler, the very soul of
our little world; and I thank you in the name of all."

Three cheers for Mrs Barnett greeted this speech, and each soldier begged to shake her by the hand, whilst the
women embraced her affectionately.

The Lieutenant himself had conceived so warm an affection for the lady who had so long been his friend and
counsellor, that he could not bid her good-bye without great emotion.

"Can it be that we shall never meet again?" he exclaimed.

"No, Lieutenant," replied Mrs Barnett;" we must, we shall meet again. If you do not come and see me in Europe,
I will come back to you at Fort Reliance, or to the new factory you will found some day yet."

On hearing this, Thomas Black, who had regained the use of his tongue since he had landed on terra firma, came
forward and said, with an air of the greatest conviction—

"Yes, we shall meet again in thirty-six years. My friends, I missed the eclipse of 1860, but I will not miss that
which will take place under exactly similar conditions in the same latitudes in 1896. And therefore I appoint a
meeting with you, Lieutenant, and with you, my dear madam, on the confines of the Arctic Ocean thirty six years
hence."

THE MASTER OF THE WORLD
By
Jules Verne

Chapter 1
WHAT HAPPENED IN THE MOUNTAINS

If I speak of myself in this story, it is because I have been deeply involved in its startling events, events
doubtless among the most extraordinary which this twentieth century will witness. Sometimes I even ask myself if
all this has really happened, if its pictures dwell in truth in my memory, and not merely in my imagination. In my
position as head inspector in the federal police department at Washington, urged on moreover by the desire, which
has always been very strong in me, to investigate and understand everything which is mysterious, I naturally became
much interested in these remarkable occurrences. And as I have been employed by the government in various
important affairs and secret missions since I was a mere lad, it also happened very naturally that the head of my
department placed In my charge this astonishing investigation, wherein I found myself wrestling with so many
impenetrable mysteries.

In the remarkable passages of the recital, it is important that you should believe my word. For some of the facts I
can bring no other testimony than my own. If you do not wish to believe me, so be it. I can scarce believe it all
myself.

The strange occurrences began in the western part of our great American State of North Carolina. There, deep
amid the Blue Ridge Mountains rises the crest called the Great Eyrie. Its huge rounded form is distinctly seen from
the little town of Morganton on the Catawba River, and still more clearly as one approaches the mountains by way
of the village of Pleasant Garden.

Why the name of Great Eyrie was originally given this mountain by the people of the surrounding region, I am
not quite sure. It rises rocky and grim and inaccessible, and under certain atmospheric conditions has a peculiarly
blue and distant effect. But the idea one would naturally get from the name is of a refuge for birds of prey, eagles
condors, vultures; the home of vast numbers of the feathered tribes, wheeling and screaming above peaks beyond the
reach of man. Now, the Great Eyrie did not seem particularly attractive to birds; on the contrary, the people of the
neighborhood began to remark that on some days when birds approached its summit they mounted still further, circled high above the crest, and then flew swiftly away, troubling the air with harsh cries.

Why then the name Great Eyrie? Perhaps the mount might better have been called a crater, for in the center of those steep and rounded walls there might well be a huge deep basin. Perhaps there might even lie within their circuit a mountain lake, such as exists in other parts of the Appalachian mountain system, a lagoon fed by the rain and the winter snows.

In brief was not this the site of an ancient volcano, one which had slept through ages, but whose inner fires might yet reawake? Might not the Great Eyrie reproduce in its neighborhood the violence of Mount Krakatoa or the terrible disaster of Mont Pelee? If there were indeed a central lake, was there not danger that its waters, penetrating the strata beneath, would be turned to steam by the volcanic fires and tear their way forth in a tremendous explosion, deluging the fair plains of Carolina with an eruption such as that of 1902 in Martinique?

Indeed, with regard to this last possibility there had been certain symptoms recently observed which might well be due to volcanic action. Smoke had floated above the mountain and once the country folk passing near had heard subterranean noises, unexplainable rumblings. A glow in the sky had crowned the height at night.

When the wind blew the smoky cloud eastward toward Pleasant Garden, a few cinders and ashes drifted down from it. And finally one stormy night pale flames, reflected from the clouds above the summit, cast upon the district below a sinister, warning light.

In presence of these strange phenomena, it is not astonishing that the people of the surrounding district became seriously disquieted. And to the disquiet was joined an imperious need of knowing the true condition of the mountain. The Carolina newspapers had flaring headlines, "The Mystery of Great Eyrie!" They asked if it was not dangerous to dwell in such a region. Their articles aroused curiosity and fear--curiosity among those who being in no danger themselves were interested in the disturbance merely as a strange phenomenon of nature, fear in those who were likely to be the victims if a catastrophe actually occurred. Those more immediately threatened were the citizens of Morganton, and even more the good folk of Pleasant Garden and the hamlets and farms yet closer to the mountain.

Assuredly it was regrettable that mountain climbers had not previously attempted to ascend to the summit of the Great Eyrie. The cliffs of rock which surrounded it had never been scaled. Perhaps they might offer no path by which even the most daring climber could penetrate to the interior. Yet, if a volcanic eruption menaced all the western region of the Carolinas, then a complete examination of the mountain was become absolutely necessary.

Now before the actual ascent of the crater, with its many serious difficulties, was attempted, there was one way which offered an opportunity of reconnoitering the interior, with out clambering up the precipices. In the first days of September of that memorable year, a well-known aeronaut named Wilker came to Morganton with his balloon. By waiting for a breeze from the east, he could easily rise in his balloon and drift over the Great Eyrie. There from a safe height above he could search with a powerful glass into its deeps. Thus he would know if the mouth of a volcano really opened amid the mighty rocks. This was the principal question. If this were settled, it would be known if the surrounding country must fear an eruption at some period more or less distant.

The ascension was begun according to the programme suggested. The wind was fair and steady; the sky clear; the morning clouds were disappearing under the vigorous rays of the sun. If the interior of the Great Eyrie was not filled with smoke, the aeronaut would be able to search with his glass its entire extent. If the vapors were rising, he, no doubt, could detect their source.

The balloon rose at once to a height of fifteen hundred feet, and there rested almost motionless for a half an hour. Evidently the east wind, which was brisk upon the Surface of the earth, did not make itself felt at that height. Then, unlucky chance, the balloon was caught in an adverse current, and began to drift toward the east. Its distance from the mountain chain rapidly increased. Despite all the efforts of the aeronaut, the citizens of Morganton saw the balloon disappear on the wrong horizon. Later, they learned that it had landed in the neighborhood of Raleigh, the capital of North Carolina.

This attempt having failed, it was agreed that it should be tried again under better conditions. Indeed, fresh rumblings were heard from the mountain, accompanied by heavy clouds and wavering glimmerings of light at night. Folk began to realize that the Great Eyrie was a serious and perhaps imminent source of danger. Yes, the entire country lay under the threat of some seismic or volcanic disaster.

During the first days of April of that year, these more or less vague apprehensions turned to actual panic. The newspapers gave prompt echo to the public terror. The entire district between the mountains and Morganton was sure that an eruption was at hand.

The night of the fourth of April, the good folk of Pleasant Garden were awakened by a sudden uproar. They thought that the mountains were falling upon them. They rushed from their houses, ready for instant flight, fearing to see open before them some immense abyss, engulfing the farms and villages for miles around.
The night was very dark. A weight of heavy clouds pressed down upon the plain. Even had it been day the crest of the mountains would have been invisible.

In the midst of this impenetrable obscurity, there was no response to the cries which arose from every side. Frightened groups of men, women, and children groped their way along the black roads in wild confusion. From every quarter came the screaming voices: "It is an earthquake!

"It is an eruption!

"Whence comes it?

"From the Great Eyrie!"

Into Morganton sped the news that stones, lava, ashes, were raining down upon the country.

Shrewd citizens of the town, however, observed that if there were an eruption the noise would have continued and increased, the flames would have appeared above the crater; or at least their lurid reflections would have penetrated the clouds. Now, even these reflections were no longer seen. If there had been an earthquake, the terrified people saw that at least their houses had not crumbled beneath the shock. It was possible that the uproar had been caused by an avalanche, the fall of some mighty rock from the summit of the mountains.

An hour passed without other incident. A wind from the west sweeping over the long chain of the Blue Ridge, set the pines and hemlocks wailing on the higher slopes. There seemed no new cause for panic; and folk began to return to their houses. All, however, awaited impatiently the return of day.

Then suddenly, toward three o'clock in the morning, another alarm! Flames leaped up above the rocky wall of the Great Eyrie. Reflected from the clouds, they illuminated the atmosphere for a great distance. A crackling, as if of many burning trees, was heard.

Had a fire spontaneously broken out? And to what cause was it due? Lightning could not have started the conflagration; for no thunder had been heard. True, there was plenty of material for fire; at this height the chain of the Blue Ridge is well wooded. But these flames were too sudden for any ordinary cause.

"An eruption! An eruption!"

The cry resounded from all sides. An eruption! The Great Eyrie was then indeed the crater of a volcano buried in the bowels of the mountains. And after so many years, so many ages even, had it reawakened? Added to the flames, was a rain of stones and ashes about to follow? Were the lavas going to pour down torrents of molten fire, destroying everything in their passage, annihilating the towns, the villages, the farms, all this beautiful world of meadows, fields and forests, even as far as Pleasant Garden and Morganton?

This time the panic was overwhelming; nothing could stop it. Women carrying their infants, crazed with terror, rushed along the eastward roads. Men, deserting their homes, made hurried bundles of their most precious belongings and set free their livestock, cows, sheep, pigs, which fled in all directions. What disorder resulted from this agglomeration, human and animal, under darkest night, amid forests, threatened by the fires of the volcano, along the border of marshes whose waters might be upheaved and overflow! With the earth itself threatening to disappear from under the feet of the fugitives! Would they be in time to save themselves, if a cascade of glowing lava came rolling down the slope of the mountain across their route?

Nevertheless, some of the chief and shrewder farm owners were not swept away in this mad flight, which they did their best to restrain. Venturing within a mile of the mountain, they saw that the glare of the flames was decreasing. In truth it hardly seemed that the region was immediately menaced by any further upheaval. No stones were being hurled into space; no torrent of lava was visible upon the slopes; no rumblings rose from the ground. There was no further manifestation of any seismic disturbance capable of overwhelming the land.

At length, the flight of the fugitives ceased at a distance where they seemed secure from all danger. Then a few ventured back toward the mountain. Some farms were reoccupied before the break of day.

By morning the crests of the Great Eyrie showed scarcely the least remnant of its cloud of smoke. The fires were certainly at an end; and if it were impossible to determine their cause, one might at least hope that they would not break out again.

It appeared possible that the Great Eyrie had not really been the theater of volcanic phenomena at all. There was no further evidence that the neighborhood was at the mercy either of eruptions or of earthquakes.

Yet once more about five o'clock, from beneath the ridge of the mountain, where the shadows of night still lingered, a strange noise swept across the air, a sort of whirring, accompanied by the beating of mighty wings. And had it been a clear day, perhaps the farmers would have seen the passage of a mighty bird of prey, some monster of the skies, which having risen from the Great Eyrie sped away toward the east.

Chapter 2

I REACH MORGANTON

The twenty-seventh of April, having left Washington the night before, I arrived at Raleigh, the capital of the State of North Carolina.
Two days before, the head of the federal police had called me to his room. He was awaiting me with some impatience. "John Strock," said he, "are you still the man who on so many occasions has proven to me both his devotion and his ability?"

"Mr. Ward," I answered, with a bow, "I cannot promise success or even ability, but as to devotion, I assure you, it is yours."

"I do not doubt it," responded the chief. "And I will ask you instead this more exact question: Are you as fond of riddles as ever? As eager to penetrate into mysteries, as I have known you before?"

"I am, Mr. Ward."

"Good, Strock; then listen."

Mr. Ward, a man of about fifty years, of great power and intellect, was fully master of the important position he filled. He had several times entrusted to me difficult missions which I had accomplished successfully, and which had won me his confidence. For several months past, however, he had found no occasion for my services. Therefore I awaited with impatience what he had to say. I did not doubt that his questioning implied a serious and important task for me.

"Doubtless you know," said he, "what has happened down in the Blueridge Mountains near Morganton."

"Surely, Mr. Ward, the phenomena reported from there have been singular enough to arouse anyone's curiosity."

"They are singular, even remarkable, Strock. No doubt about that. But there is also reason to ask, if these phenomena about the Great Eyrie are not a source of continued danger to the people there, if they are not forerunners of some disaster as terrible as it is mysterious."

"It is to be feared, sir."

"So we must know, Strock, what is inside of that mountain. If we are helpless in the face of some great force of nature, people must be warned in time of the danger which threatens them."

"It is clearly the duty of the authorities, Mr. Ward," responded I, "to learn what is going on within there."

"True, Strock; but that presents great difficulties. Everyone reports that it is impossible to scale the precipices of the Great Eyrie and reach its interior. But has anyone ever attempted it with scientific appliances and under the best conditions? I doubt it, and believe a resolute attempt may bring success."

"Nothing is impossible, Mr. Ward; what we face here is merely a question of expense."

"We must not regard expense when we are seeking to reassure an entire population, or to preserve it from a catastrophe. There is another suggestion I would make to you. Perhaps this Great Eyrie is not so inaccessible as is supposed. Perhaps a band of malefactors have secreted themselves there, gaining access by ways known only to themselves."

"What! You suspect that robbers--"

"Perhaps I am wrong, Strock; and these strange sights and sounds have all had natural causes. Well, that is what we have to settle, and as quickly as possible."

"I have one question to ask."

"Go ahead, Strock."

"When the Great Eyrie has been visited, when we know the source of these phenomena, if there really is a crater there and an eruption is imminent, can we avert it?"

"No, Strock; but we can estimate the extent of the danger. If some volcano in the Alleghanies threatens North Carolina with a disaster similar to that of Martinique, buried beneath the outpourings of Mont Pelee, then these people must leave their homes."

"I hope, sir, there is no such widespread danger."

"I think not, Strock; it seems to me highly improbable that an active volcano exists in the Blueridge mountain chain. Our Appalachian mountain system is nowhere volcanic in its origin. But all these events cannot be without basis. In short, Strock, we have decided to make a strict inquiry into the phenomena of the Great Eyrie, to gather all the testimony, to question the people of the towns and farms. To do this, I have made choice of an agent in whom we have full confidence; and this agent is you, Strock."

"Good! I am ready, Mr. Ward," cried I, "and be sure that I shall neglect nothing to bring you full information."

"I know it, Strock, and I will add that I regard you as specially fitted for the work. You will have a splendid opportunity to exercise, and I hope to satisfy, your favorite passion of curiosity."

"As you say, sir."

"You will be free to act according to circumstances. As to expenses, if there seems reason to organize an ascension party, which will be costly, you have carte blanche."

"I will act as seems best, Mr. Ward."

"Let me caution you to act with all possible discretion. The people in the vicinity are already over-excited. It will be well to move secretly. Do not mention the suspicions I have suggested to you. And above all, avoid arousing any
fresh panic."
"It is understood."
"You will be accredited to the Mayor of Morganton, who will assist you. Once more, be prudent, Strock, and acquaint no one with your mission, unless it is absolutely necessary. You have often given proofs of your intelligence and address; and this time I feel assured you will succeed."
I asked him only "When shall I start?"
"Tomorrow."
"Tomorrow, I shall leave Washington; and the day after, I shall be at Morganton."
How little suspicion had I of what the future had in store for me!
I returned immediately to my house where I made my preparations for departure; and the next evening found me in Raleigh. There I passed the night, and in the course of the next afternoon arrived at the railroad station of Morganton.
Morganton is but a small town, built upon strata of the jurassic period, particularly rich in coal. Its mines give it some prosperity. It also has numerous unpleasant mineral waters, so that the season there attracts many visitors. Around Morganton is a rich farming country, with broad fields of grain. It lies in the midst of swamps, covered with mosses and reeds. Evergreen forests rise high up the mountain slopes. All that the region lacks is the wells of natural gas, that invaluable natural source of power, light, and warmth, so abundant in most of the Alleghany valleys. Villages and farms are numerous up to the very borders of the mountain forests. Thus there were many thousands of people threatened, if the Great Eyrie proved indeed a volcano, if the convulsions of nature extended to Pleasant Garden and to Morganton.

The mayor of Morganton, Mr. Elias Smith, was a tall man, vigorous and enterprising, forty years old or more, and of a health to defy all the doctors of the two Americas. He was a great hunter of bears and panthers, beasts which may still be found in the wild gorges and mighty forests of the Alleghanies.

Mr. Smith was himself a rich land-owner, possessing several farms in the neighborhood. Even his most distant tenants received frequent visits from him. Indeed, whenever his official duties did not keep him in his so-called home at Morganton, he was exploring the surrounding country, irresistibly drawn by the instincts of the hunter.
I went at once to the house of Mr. Smith. He was expecting me, having been warned by telegram. He received me very frankly, without any formality, his pipe in his mouth, a glass of brandy on the table. A second glass was brought in by a servant, and I had to drink to my host before beginning our interview.
"Mr. Ward sent you," said he to me in a jovial tone. "Good; let us drink to Mr. Ward's health."
I clinked glasses with him, and drank in honor of the chief of police.
"And now," demanded Elias Smith, "what is worrying him?"
At this I made known to the mayor of Morganton the cause and the purpose of my mission in North Carolina. I assured him that my chief had given me full power, and would render me every assistance, financial and otherwise, to solve the riddle and relieve the neighborhood of its anxiety relative to the Great Eyrie.
Elias Smith listened to me without uttering a word, but not without several times refilling his glass and mine. While he puffed steadily at his pipe, the close attention which he gave me was beyond question. I saw his cheeks flush at times, and his eyes gleam under their bushy brows. Evidently the chief magistrate of Morganton was uneasy about Great Eyrie, and would be as eager as I to discover the cause of these phenomena.

When I had finished my communication, Elias Smith gazed at me for some moments in silence. Then he said, softly, "So at Washington they wish to know what the Great Eyrie hides within its circuit?"
"Yes, Mr. Smith."
"And you, also?"
"I do."
"So do I, Mr. Strock."
He and I were as one in our curiosity.
"You will understand," added he, knocking the cinders from his pipe, "that as a land-owner, I am much interested in these stories of the Great Eyrie, and as mayor, I wish to protect my constituents."
"A double reason," I commented, "to stimulate you to discover the cause of these extraordinary occurrences! Without doubt, my dear Mr. Smith, they have appeared to you as inexplicable and as threatening as to your people."
"Inexplicable, certainly, Mr. Strock. For on my part, I do not believe it possible that the Great Eyrie can be a volcano; the Alleghanies are nowhere of volcanic origins. I, myself, in our immediate district, have never found any geological traces of scoria, or lava, or any eruptive rock whatever. I do not think, therefore, that Morganton can possibly be threatened from such a source."
"You really think not, Mr. Smith?"
"Certainly."
"But these tremblings of the earth that have been felt in the neighborhood!"
"Yes these tremblings! These tremblings!" repeated Mr. Smith, shaking his head; "but in the first place, is it certain that there have been tremblings? At the moment when the flames showed most sharply, I was on my farm of Wildon, less than a mile from the Great Eyrie. There was certainly a tumult in the air, but I felt no quivering of the earth."
"But in the reports sent to Mr. Ward--"
"Reports made under the impulse of the panic," interrupted the mayor of Morganton. "I said nothing of any earth tremors in mine."
"But as to the flames which rose clearly above the crest?"
"Yes, as to those, Mr. Strock, that is different. I saw them; saw them with my own eyes, and the clouds certainly reflected them for miles around. Moreover noises certainly came from the crater of the Great Eyrie, hissings, as if a great boiler were letting off steam."
"You have reliable testimony of this?"
"Yes, the evidence of my own ears."
"And in the midst of this noise, Mr. Smith, did you believe that you heard that most remarkable of all the phenomena, a sound like the flapping of great wings?"
"I thought so, Mr. Strock; but what mighty bird could this be, which sped away after the flames had died down, and what wings could ever make such tremendous sounds. I therefore seriously question, if this must not have been a deception of my imagination. The Great Eyrie a refuge for unknown monsters of the sky! Would they not have been seen long since, soaring above their immense nest of stone? In short, there is in all this a mystery which has not yet been solved."
"But we will solve it, Mr. Smith, if you will give me your aid."
"Surely, Mr. Strock; tomorrow we will start our campaign."
"Tomorrow." And on that word the mayor and I separated. I went to a hotel, and established myself for a stay which might be indefinitely prolonged. Then having dined, and written to Mr. Ward, I saw Mr. Smith again in the afternoon, and arranged to leave Morganton with him at daybreak.

Our first purpose was to undertake the ascent of the mountain, with the aid of two experienced guides. These men had ascended Mt. Mitchell and others of the highest peaks of the Blue Ridge. They had never, however, attempted the Great Eyrie, knowing that its walls of inaccessible cliffs defended it on every side. Moreover, before the recent startling occurrences the Great Eyrie had not particularly attracted the attention of tourists. Mr. Smith knew the two guides personally as men daring, skillful and trustworthy. They would stop at no obstacle; and we were resolved to follow them through everything.

Moreover Mr. Smith remarked at the last that perhaps it was no longer as difficult as formerly to penetrate within the Great Eyrie.
"And why?" asked I.
"Because a huge block has recently broken away from the mountain side and perhaps it has left a practicable path or entrance."
"That would be a fortunate chance, Mr. Smith."
"We shall know all about it, Mr. Strock, no later than tomorrow."
"Till tomorrow, then."

Chapter 3
THE GREAT EYRIE
The next day at dawn, Elias Smith and I left Morganton by a road which, winding along the left bank of the Catawba River, led to the village of Pleasant Garden. The guides accompanied us, Harry Horn, a man of thirty, and James Bruck, aged twenty-five. They were both natives of the region, and in constant demand among the tourists who climbed the peaks of the Blue Ridge and Cumberland Mountains.

A light wagon with two good horses was provided to carry us to the foot of the range. It contained provisions for two or three days, beyond which our trip surely would not be protracted. Mr. Smith had shown himself a generous provider both in meats and in liquors. As to water the mountain springs would furnish it in abundance, increased by the heavy rains, frequent in that region during springtime.

It is needless to add that the Mayor of Morganton in his role of hunter, had brought along his gun and his dog, Nisko, who gamboled joyously about the wagon. Nisko, however, was to remain behind at the farm at Wildon, when we attempted our ascent. He could not possibly follow us to the Great Eyrie with its cliffs to scale and its crevasses to cross.
The day was beautiful, the fresh air in that climate is still cool of an April morning. A few fleecy clouds sped rapidly overhead, driven by a light breeze which swept across the long plains, from the distant Atlantic. The sun peeping forth at intervals, illuminated all the fresh young verdure of the countryside.

An entire world animated the woods through which we passed. From before our equipage fled squirrels, field-mice, parroquets of brilliant colors and deafening loquacity. Opossums passed in hurried leaps, bearing their young in their pouches. Myriads of birds were scattered amid the foliage of banyans, palms, and masses of rhododendrons, so luxuriant that their thickets were impenetrable.

We arrived that evening at Pleasant Garden, where we were comfortably located for the night with the mayor of the town, a particular friend of Mr. Smith. Pleasant Garden proved little more than a village; but its mayor gave us a warm and generous reception, and we supped pleasantly in his charming home, which stood beneath the shades of some giant beech-trees.

Naturally the conversation turned upon our attempt to explore the interior of the Great Eyrie. "You are right," said our host, "until we all know what is hidden within there, our people will remain uneasy."

"Has nothing new occurred," I asked, "since the last appearance of flames above the Great Eyrie?"

"Nothing, Mr. Strock. From Pleasant Garden we can see the entire crest of the mountain. Not a suspicious noise has come down to us. Not a spark has risen. If a legion of devils is in hiding there, they must have finished their infernal cookery, and soared away to some other haunt."

"Devils!" cried Mr. Smith. "Well, I hope they have not decamped without leaving some traces of their occupation, some parings of hoofs or horns or tails. We shall find them out."

On the morrow, the twenty-ninth of April, we started again at dawn. By the end of this second day, we expected to reach the farm of Wildon at the foot of the mountain. The country was much the same as before, except that our road led more steeply upward. Woods and marshes alternated, though the latter grew sparser, being drained by the sun as we approached the higher levels. The country was also less populous. There were only a few little hamlets, almost lost beneath the beech trees, a few lonely farms, abundantly watered by the many streams that rushed downward toward the Catawba River.

The smaller birds and beasts grew yet more numerous. "I am much tempted to take my gun," said Mr. Smith, "and to go off with Nisko. This will be the first time that I have passed here without trying my luck with the partridges and hares. The good beasts will not recognize me. But not only have we plenty of provisions, but we have a bigger chase on hand today. The chase of a mystery."

"And let us hope," added I, "we do not come back disappointed hunters."

In the afternoon the whole chain of the Blue Ridge stretched before us at a distance of only six miles. The mountain crests were sharply outlined against the clear sky. Well wooded at the base, they grew more bare and showed only stunted evergreens toward the summit. There the scraggly trees, grotesquely twisted, gave to the rocky heights a bleak and bizarre appearance. Here and there the ridge rose in sharp peaks. On our right the Black Dome, nearly seven thousand feet high, reared its gigantic head, sparkling at times above the clouds.

"Have you ever climbed that dome, Mr. Smith?" I asked.

"No," answered he, "but I am told that it is a very difficult ascent. A few mountaineers have climbed it; but they report that it has no outlook commanding the crater of the Great Eyrie."

"That is so," said the guide, Harry Horn. "I have tried it myself."

"Perhaps," suggested I, "the weather was unfavorable."

"On the contrary, Mr. Strock, it was unusually clear. But the wall of the Great Eyrie on that side rose so high, it completely hid the interior."

"Forward," cried Mr. Smith. "I shall not be sorry to set foot where no person has ever stepped, or even looked, before."

Certainly on this day the Great Eyrie looked tranquil enough. As we gazed upon it, there rose from its heights neither smoke nor flame.

Toward five o'clock our expedition halted at the Wildon farm, where the tenants warmly welcomed their landlord. The farmer assured us that nothing notable had happened about the Great Eyrie for some time. We supped at a common table with all the people of the farm; and our sleep that night was sound and wholly untroubled by premonitions of the future.

On the morrow, before break of day, we set out for the ascent of the mountain. The height of the Great Eyrie scarce exceeds five thousand feet. A modest altitude, often surpassed in this section of the Alleghanies. As we were already more than three thousand feet above sea level, the fatigue of the ascent could not be great. A few hours should suffice to bring us to the crest of the crater. Of course, difficulties might present themselves, precipices to scale, clefts and breaks in the ridge might necessitate painful and even dangerous detours. This was the unknown, the spur to our attempt. As I said, our guides knew no more than we upon this point. What made me anxious, was, of
course, the common report that the Great Eyrie was wholly inaccessible. But this remained unproven. And then there was the new chance that a fallen block had left a breach in the rocky wall.

"At last," said Mr. Smith to me, after lighting the first pipe of the twenty or more which he smoked each day, "we are well started. As to whether the ascent will take more or less time--"

"In any case, Mr. Smith," interrupted I, "you and I are fully resolved to pursue our quest to the end."

"Fully resolved, Mr. Strock."

"My chief has charged me to snatch the secret from this demon of the Great Eyrie."

"We will snatch it from him, willing or unwilling," vowed Mr. Smith, calling Heaven to witness. "Even if we have to search the very bowels of the mountain."

"As it may happen, then," said I, "that our excursion will be prolonged beyond today, it will be well to look to our provisions."

"Be easy, Mr. Strock; our guides have food for two days in their knapsacks, besides what we carry ourselves. Moreover, though I left my brave Nisko at the farm, I have my gun. Game will be plentiful in the woods and gorges of the lower part of the mountain, and perhaps at the top we shall find a fire to cook it, already lighted."

"Already lighted, Mr. Smith?"

"And why not, Mr. Strock? These flames! These superb flames, which have so terrified our country folk! Is their fire absolutely cold, is no spark to be found beneath their ashes? And then, if this is truly a crater, is the volcano so wholly extinct that we cannot find there a single ember? Bah! This would be but a poor volcano if it hasn't enough fire even to cook an egg or roast a potato. Come, I repeat, we shall see! We shall see!"

At that point of the investigation I had, I confess, no opinion formed. I had my orders to examine the Great Eyrie. If it proved harmless, I would announce it, and people would be reassured. But at heart, I must admit, I had the very natural desire of a man possessed by the demon of curiosity. I should be glad, both for my own sake, and for the renown which would attach to my mission if the Great Eyrie proved the center of the most remarkable phenomena—which I would discover the cause.

Our ascent began in this order. The two guides went in front to seek out the most practicable paths. Elias Smith and I followed more leisurely. We mounted by a narrow and not very steep gorge amid rocks and trees. A tiny stream trickled downward under our feet. During the rainy season or after a heavy shower, the water doubtless bounded from rock to rock in tumultuous cascades. But it evidently was fed only by the rain, for now we could scarcely trace its course. It could not be the outlet of any lake within the Great Eyrie.

After an hour of climbing, the slope became so steep that we had to turn, now to the right, now to the left; and our progress was much delayed. Soon the gorge became wholly impracticable; its cliff-like sides offered no sufficient foothold. We had to cling by branches, to crawl upon our knees. At this rate the top would not be reached before sundown.

"Faith!" cried Mr. Smith, stopping for breath, "I realize why the climbers of the Great Eyrie have been few, so few, that it has never been ascended within my knowledge."

"The fact is," I responded, "that it would be much toil for very little profit. And if we had not special reasons to persist in our attempt."

"You never said a truer word," declared Harry Horn. "My comrade and I have scaled the Black Dome several times, but we never met such obstacles as these."

"The difficulties seem almost impassable," added James Bruck.

The question now was to determine to which side we should turn for a new route; to right, or to left, arose impenetrable masses of trees and bushes. In truth even the scaling of cliffs would have been more easy. Perhaps if we could get above this wooded slope we could advance with surer foot. Now, we could only go ahead blindly, and trust to the instincts of our two guides. James Bruck was especially useful. I believe that that gallant lad would have equaled a monkey in lightness and a wild goat in agility. Unfortunately, neither Elias Smith nor I was able to climb where he could.

However, when it is a matter of real need with me, I trust I shall never be backward, being resolute by nature and well-trained in bodily exercise. Where James Bruck went, I was determined to go, also; though it might cost me some uncomfortable falls. But it was not the same with the first magistrate of Morganton, less young, less vigorous, larger, stouter, and less persistent than we others. Plainly he made every effort, not to retard our progress, but he panted like a seal, and soon I insisted on his stopping to rest.

In short, it was evident that the ascent of the Great Eyrie would require far more time than we had estimated. We had expected to reach the foot of the rocky wall before eleven o'clock, but we now saw that mid-day would still find us several hundred feet below it.

Toward ten o'clock, after repeated attempts to discover some more practicable route, after numberless turnings and returnings, one of the guides gave the signal to halt. We found ourselves at last on the upper border of the heavy
wood. The trees, more thinly spaced, permitted us a glimpse upward to the base of the rocky wall which constituted the true Great Eyrie.

"Whew!" exclaimed Mr. Smith, leaning against a mighty pine tree, "a little respite, a little repose, and even a little repast would not go badly."

"We will rest an hour," said I.

"Yes; after working our lungs and our legs, we will make our stomachs work."

We were all agreed on this point. A rest would certainly freshen us. Our only cause for inquietude was now the appearance of the precipitous slope above us. We looked up toward one of those bare strips called in that region, slides. Amid this loose earth, these yielding stones, and these abrupt rocks there was no roadway.

Harry Horn said to his comrade, "It will not be easy."

"Perhaps impossible," responded Bruck.

Their comments caused me secret uneasiness. If I returned without even having scaled the mountain, my mission would be a complete failure, without speaking of the torturing to my curiosity. And when I stood again before Mr. Ward, shamed and confused, I should cut but a sorry figure.

We opened our knapsacks and lunched moderately on bread and cold meat. Our repast finished, in less than half an hour, Mr. Smith sprang up eager to push forward once more. James Bruck took the lead; and we had only to follow him as best we could.

We advanced slowly. Our guides did not attempt to conceal their doubt and hesitation. Soon Horn left us and went far ahead to spy out which road promised most chance of success.

Twenty minutes later he returned and led us onward toward the northwest. It was on this side that the Black Dome rose at a distance of three or four miles. Our path was still difficult and painful, amid the sliding stones, held in place only occasionally by wiry bushes. At length after a weary struggle, we gained some two hundred feet further upward and found ourselves facing a great gash, which, broke the earth at this spot. Here and there were scattered roots recently upturned, branches broken off, huge stones reduced to powder, as if an avalanche had rushed down this flank of the mountain.

"That must be the path taken by the huge block which broke away from the Great Eyrie," commented James Bruck.

"No doubt," answered Mr. Smith, "and I think we had better follow the road that it has made for us."

It was indeed this gash that Harry Horn had selected for our ascent. Our feet found lodgment in the firmer earth which had resisted the passage of the monster rock. Our task thus became much easier, and our progress was in a straight line upward, so that toward half past eleven we reached the upper border of the "slide."

Before us, less than a hundred feet away, but towering a hundred feet straight upwards in the air rose the rocky wall which formed the final crest, the last defence of the Great Eyrie.

From this side, the summit of the wall showed capriciously irregular, rising in rude towers and jagged needles. At one point the outline appeared to be an enormous eagle silhouetted against the sky, just ready to take flight. Upon this side, at least, the precipice was insurmountable.

"Rest a minute," said Mr. Smith, "and we will see if it is possible to make our way around the base of this cliff."

"At any rate," said Harry Horn, "the great block must have fallen from this part of the cliff; and it has left no breach for entering."

They were both right; we must seek entrance elsewhere. After a rest of ten minutes, we clambered up close to the foot of the wall, and began to make a circuit of its base.

Assuredly the Great Eyrie now took on to my eyes an aspect absolutely fantastic. Its heights seemed peopled by dragons and huge monsters. If chimeras, griffins, and all the creations of mythology had appeared to guard it, I should have been scarcely surprised.

With great difficulty and not without danger we continued our tour of this circumvallation, where it seemed that nature had worked as man does, with careful regularity. Nowhere was there any break in the fortification; nowhere a fault in the strata by which one might clamber up. Always this mighty wall, a hundred feet in height!

After an hour and a half of this laborious circuit, we regained our starting-place. I could not conceal my disappointment, and Mr. Smith was not less chagrined than I.

"A thousand devils!" cried he, "we know no better than before what is inside this confounded Great Eyrie, nor even if it is a crater."

"Volcano, or not," said I, "there are no suspicious noises now; neither smoke nor flame rises above it; nothing whatever threatens an eruption."

This was true. A profound silence reigned around us; and a perfectly clear sky shone overhead. We tasted the perfect calm of great altitudes.

It was worth noting that the circumference of the huge wall was about twelve or fifteen hundred feet. As to the
space enclosed within, we could scarce reckon that without knowing the thickness of the encompassing wall. The surroundings were absolutely deserted. Probably not a living creature ever mounted to this height, except the few birds of prey which soared high above us.

Our watches showed three o'clock, and Mr. Smith cried in disgust, "What is the use of stopping here all day! We shall learn nothing more. We must make a start, Mr. Strock, if we want to get back to Pleasant Garden to-night."

I made no answer, and did not move from where I was seated; so he called again, "Come, Mr. Strock; you don't answer."

In truth, it cut me deeply to abandon our effort, to descend the slope without having achieved my mission. I felt an imperious need of persisting; my curiosity had redoubled. But what could I do? Could I tear open this unyielding earth? Overleap the mighty cliff? Throwing one last defiant glare at the Great Eyrie, I followed my companions.

The return was effected without great difficulty. We had only to slide down where we had so laboriously scrambled up. Before five o'clock we descended the last slopes of the mountain, and the farmer of Wildon welcomed us to a much needed meal.

"Then you didn't get inside?" said he.

"No," responded Mr. Smith, "and I believe that the inside exists only in the imagination of our country folk."

At half past eight our carriage drew up before the house of the Mayor of Pleasant Garden, where we passed the night. While I strove vainly to sleep, I asked myself if I should not stop there in the village and organize a new ascent. But what better chance had it of succeeding than the first? The wisest course was, doubtless, to return to Washington and consult Mr. Ward.

So, the next day, having rewarded our two guides, I took leave of Mr. Smith at Morganton, and that same evening left by train for Washington.

Chapter 4
A MEETING OF THE AUTOMOBILE CLUB

Was the mystery of the Great Eyrie to be solved some day by chances beyond our imagining? That was known only to the future. And was the solution a matter of the first importance? That was beyond doubt, since the safety of the people of western Carolina perhaps depended upon it.

Yet a fortnight after my return to Washington, public attention was wholly distracted from this problem by another very different in nature, but equally astonishing.

Toward the middle of that month of May the newspapers of Pennsylvania informed their readers of some strange occurrences in different parts of the state. On the roads which radiated from Philadelphia, the chief city, there circulated an extraordinary vehicle, of which no one could describe the form, or the nature, or even the size, so rapidly did it rush past. It was an automobile; all were agreed on that. But as to what motor drove it, only imagination could say; and when the popular imagination is aroused, what limit is there to its hypotheses?

At that period the most improved automobiles, whether driven by steam, gasoline, or electricity, could not accomplish much more than sixty miles an hour, a speed that the railroads, with their most rapid expresses, scarce exceed on the best lines of America and Europe. Now, this new automobile which was astonishing the world, traveled at more than double this speed.

It is needless to add that such a rate constituted an extreme danger on the highroads, as much so for vehicles, as for pedestrians. This rushing mass, coming like a thunder-bolt, preceded by a formidable rumbling, caused a whirlwind, which tore the branches from the trees along the road, terrified the animals browsing in adjoining fields, and scattered and killed the birds, which could not resist the suction of the tremendous air currents engendered by its passage.

And, a bizarre detail to which the newspapers drew particular attention, the surface of the roads was scarcely even scratched by the wheels of the apparition, which left behind it no such ruts as are usually made by heavy vehicles. At most there was a light touch, a mere brushing of the dust. It was only the tremendous speed which raised behind the vehicle such whirlwinds of dust.

"It is probable," commented the New York Herald, "that the extreme rapidity of motion destroys the weight."

Naturally there were protests from all sides. It was impossible to permit the mad speed of this apparition which threatened to overthrow and destroy everything in its passage, equipages and people. But how could it be stopped? No one knew to whom the vehicle belonged, nor whence it came, nor whither it went. It was seen but for an instant as it darted forward like a bullet in its dizzy flight. How could one seize a cannon-ball in the air, as it leaped from the mouth of the gun?

I repeat, there was no evidence as to the character of the propelling engine. It left behind it no smoke, no steam, no odor of gasoline, or any other oil. It seemed probable, therefore, that the vehicle ran by electricity, and that its
accumulators were of an unknown model, using some unknown fluid.

The public imagination, highly excited, readily accepted every sort of rumor about this mysterious automobile. It was said to be a supernatural car. It was driven by a specter, by one of the chauffeurs of hell, a goblin from another world, a monster escaped from some mythological menagerie, in short, the devil in person, who could defy all human intervention, having at his command invisible and infinite satanic powers.

But even Satan himself had no right to run at such speed over the roads of the United States without a special permit, without a number on his car, and without a regular license. And it was certain that not a single municipality had given him permission to go two hundred miles an hour. Public security demanded that some means be found to unmask the secret of this terrible chauffeur.

Moreover, it was not only Pennsylvania that served as the theater of his sportive eccentricities. The police reported his appearance in other states; in Kentucky near Frankfort; in Ohio near Columbus; in Tennessee near Nashville; in Missouri near Jefferson; and finally in Illinois in the neighborhood of Chicago.

The alarm having been given, it became the duty of the authorities to take steps against this public danger. To arrest or even to halt an apparition moving at such speed was scarcely practicable. A better way would be to erect across the roads solid gateways with which the flying machine must come in contact sooner or later, and be smashed into a thousand pieces.

"Nonsense!" declared the incredulous. "This madman would know well how to circle around such obstructions."

"And if necessary," added others, "the machine would leap over the barriers."

"And if he is indeed the devil, he has, as a former angel, presumably preserved his wings, and so he will take to flight."

But this last was but the suggestion of foolish old gossips who did not stop to study the matter. For if the King of Hades possessed a pair of wings, why did he obstinately persist in running around on the earth at the risk of crushing his own subjects, when he might more easily have hurled himself through space as free as a bird.

Such was the situation when, in the last week of May, a fresh event occurred, which seemed to show that the United States was indeed helpless in the hands of some unapproachable monster. And after the New World, would not the Old in its turn, be desecrated by the mad career of this remarkable automobilist?

The following occurrence was reported in all the newspapers of the Union, and with what comments and outcries it is easy to imagine.

A race was to be held by the automobile Club of Wisconsin, over the roads of that state of which Madison is the capital. The route laid out formed an excellent track, about two hundred miles in length, starting from Prairie-du-chien on the western frontier, passing by Madison and ending a little above Milwaukee on the borders of Lake Michigan. Except for the Japanese road between Nikko and Namode, bordered by giant cypresses, there is no better track in the world than this of Wisconsin. It runs straight and level as an arrow for sometimes fifty miles at a stretch. Many and noted were the machines entered for this great race. Every kind of motor vehicle was permitted to compete, even motorcycles, as well as automobiles. The machines were of all makes and nationalities. The sum of the different prizes reached fifty thousand dollars, so that the race was sure to be desperately contested. New records were expected to be made.

Calculating on the maximum speed hitherto attained, of perhaps eighty miles an hour, this international contest covering two hundred miles would last about three hours. And, to avoid all danger, the state authorities of Wisconsin had forbidden all other traffic between Prairie-du-chien and Milwaukee during three hours on the morning of the thirtieth of May. Thus, if there were any accidents, those who suffered would be themselves to blame.

There was an enormous crowd; and it was not composed only of the people of Wisconsin. Many thousands gathered from the neighboring states of Illinois, Michigan, Iowa, Indiana, and even from New York. Among the sportsmen assembled were many foreigners, English, French, Germans and Austrians, each nationality, of course, supporting the chauffeurs of its land. Moreover, as this was the United States, the country of the greatest gamblers of the world, bets were made of every sort and of enormous amounts.

The start was to be made at eight o’clock in the morning; and to avoid crowding and the accidents which must result from it, the automobiles were to follow each other at two minute intervals, along the roads whose borders were black with spectators.

The first ten racers, numbered by lot, were dispatched between eight o’clock and twenty minutes past. Unless there was some disastrous accident, some of these machines would surely arrive at the goal by eleven o’clock. The others followed in order.

An hour and a half had passed. There remained but a single contestant at Prairie-du-chien. Word was sent back and forth by telephone every five minutes as to the order of the racers. Midway between Madison and Milwaukee, the lead was held by a machine of Renault brothers, four cylindered, of twenty horsepower, and with Michelin tires. It was closely followed by a Harvard-Watson car and by a Dion-Bouton. Some accidents had already occurred, other
machines were hopelessly behind. Not more than a dozen would contest the finish. Several chauffeurs had been injured, but not seriously. And even had they been killed, the death of men is but a detail, not considered of great importance in that astonishing country of America.

Naturally the excitement became more intense as one approached the finishing line near Milwaukee. There were assembled the most curious, the most interested; and there the passions of the moment were unchained. By ten o'clock it was evident, that the first prize, twenty thousand dollars, lay between five machines, two American, two French, and one English. Imagine, therefore, the fury with which bets were being made under the influence of national pride. The regular book makers could scarcely meet the demands of those who wished to wager. Offers and amounts were hurled from lip to lip with feverish rapidity. "One to three on the Harvard-Watson!"

"One to two on the Dion-Bouton!"

"Even money on the Renault!"

These cries rang along the line of spectators at each new announcement from the telephones.

Suddenly at half-past nine by the town clock of Prairie-du-chien, two miles beyond that town was heard a tremendous noise and rumbling which proceeded from the midst of a flying cloud of dust accompanied by shrieks like those of a naval siren.

Scarcely had the crowds time to draw to one side, to escape a destruction which would have included hundreds of victims. The cloud swept by like a hurricane. No one could distinguish what it was that passed with such speed. There was no exaggeration in saying that its rate was at least one hundred and fifty miles an hour.

The apparition passed and disappeared in an instant, leaving behind it a long train of white dust, as an express locomotive leaves behind a train of smoke. Evidently it was an automobile with a most extraordinary motor. If it maintained this arrow-like speed, it would reach the contestants in the fore-front of the race; it would pass them with this speed double their own; it would arrive first at the goal.

And then from all parts arose an uproar, as soon as the spectators had nothing more to fear.

"It is that infernal machine."

"Yes; the one the police cannot stop."

"But it has not been heard of for a fortnight."

"It was supposed to be done for, destroyed, gone forever."

"It is a devil's car, driven by hellfire, and with Satan driving!"

In truth, if he were not the devil, who could this mysterious chauffeur be, driving with this unbelievable velocity, his no less mysterious machine? At least it was beyond doubt that this was the same machine which had already attracted so much attention. If the police believed that they had frightened it away, that it was never to be, heard of more, well, the police were mistaken which happens in America as elsewhere.

The first stunned moment of surprise having passed, many people rushed to the telephones to warn those further along the route of the danger which menaced, not only the people, but also the automobiles scattered along the road. When this terrible madman arrived like an avalanche they would be smashed to pieces, ground into powder, annihilated!

And from the collision might not the destroyer himself emerge safe and sound? He must be so adroit, this chauffeur of chauffeurs, he must handle his machine with such perfection of eye and hand, that he knew, no doubt, how to escape from every situation. Fortunately the Wisconsin authorities had taken such precautions that the road would be clear except for contesting automobiles. But what right had this machine among them!

And what said the racers themselves, who, warned by telephone, had to sheer aside from the road in their struggle for the grand prize? By their estimate, this amazing vehicle was going at least one hundred and thirty miles an hour. Fast as was their speed, it shot by them at such a rate that they could hardly make out even the shape of the machine, a sort of lengthened spindle, probably not over thirty feet long. Its wheels spun with such velocity that they could scarce be seen. For the rest, the machine left behind it neither smoke nor scent.

As for the driver, hidden in the interior of his machine, he had been quite invisible. He remained as unknown as when he had first appeared on the various roads throughout the country.

Milwaukee was promptly warned of the coming of this interloper. Fancy the excitement the news caused! The immediate purpose agreed upon was to stop this projectile, to erect across its route an obstacle against which it would smash into a thousand pieces. But was there time? Would not the machine appear at any moment? And what need was there, since the track ended on the edge of Lake Michigan, and so the vehicle would be forced to stop there anyway, unless its supernatural driver could ride the water as well as the land.

Here, also, as all along the route, the most extravagant suggestions were offered. Even those who would not admit that the mysterious chauffeur must be Satan in person allowed that he might be some monster escaped from the fantastic visions of the Apocalypse.

And now there were no longer minutes to wait. Any second might bring the expected apparition.
It was not yet eleven o'clock when a rumbling was heard far down the track, and the dust rose in violent whirlwinds. Harsh whistlings shrieked through the air warning all to give passage to the monster.

It did not slacken speed at the finish. Lake Michigan was not half a mile beyond, and the machine must certainly be hurled into the water! Could it be that the mechanician was no longer master of his mechanism?

There could be little doubt of it. Like a shooting star, the vehicle flashed through Milwaukee. When it had passed the city, would it plunge itself to destruction in the waters of Lake Michigan?

At any rate when it disappeared at a slight bend in the road no trace was to be found of its passage.

Chapter 5

ALONG THE SHORES OF NEW ENGLAND

At the time when the newspapers were filled with these reports, I was again in Washington. On my return I had presented myself at my chief's office, but had been unable to see him. Family affairs had suddenly called him away, to be absent some weeks. Mr. Ward, however, undoubtedly knew of the failure of my mission. The newspapers, especially those of North Carolina, had given full details of our ascent of the Great Eyrie.

Naturally, I was much annoyed by this delay which further fretted my restless curiosity. I could turn to no other plans for the future. Could I give up the hope of learning the secret of the Great Eyrie? No! I would return to the attack a dozen times if necessary, and despite every failure.

Surely, the winning of access within those walls was not a task beyond human power. A scaffolding might be raised to the summit of the cliff; or a tunnel might be pierced through its depth. Our engineers met problems more difficult every day. But in this case it was necessary to consider the expense, which might easily grow out of proportion to the advantages to be gained. A tunnel would cost many thousand dollars, and what good would it accomplish beyond satisfying the public curiosity and my own?

My personal resources were wholly insufficient for the achievement. Mr. Ward, who held the government's funds, was away. I even thought of trying to interest some millionaire. Oh, if I could but have promised one of them some gold or silver mines within the mountain! But such an hypothesis was not admissible. The chain of the Appalachians is not situated in a gold bearing region like that of the Pacific mountains, the Transvaal, or Australia.

It was not until the fifteenth of June that Mr. Ward returned to duty. Despite my lack of success he received me warmly. "Here is our poor Strock!" cried he, at my entrance. "Our poor Strock, who has failed!"

"No more, Mr. Ward, than if you had charged me to investigate the surface of the moon," answered I. "We found ourselves face to face with purely natural obstacles insurmountable with the forces then at our command."

"I do not doubt that, Strock, I do not doubt that in the least. Nevertheless, the fact remains that you have discovered nothing of what is going on within the Great Eyrie."

"Nothing, Mr. Ward."
"You saw no sign of fire?"
"None."
"And you heard no suspicious noises whatever?"
"None."
"Then it is still uncertain if there is really a volcano there?"
"Still uncertain, Mr. Ward. But if it is there, we have good reason to believe that it has sunk into a profound sleep."

"Still," returned Mr. Ward, "there is nothing to show that it will not wake up again any day, Strock. It is not enough that a volcano should sleep, it must be absolutely extinguished unless indeed all these threatening rumors have been born solely in the Carolinian imagination."

"That is not possible, sir," I said. "Both Mr. Smith, the mayor of Morganton and his friend the mayor of Pleasant Garden, are reliable men. And they speak from their own knowledge in this matter. Flames have certainly risen above the Great Eyrie. Strange noises have issued from it. There can be no doubt whatever of the reality of these phenomena."

"Granted," declared Mr. Ward. "I admit that the evidence is unassailable. So the deduction to be drawn is that the Great Eyrie has not yet given up its secret."

"If we are determined to know it, Mr. Ward, the solution is only a solution of expense. Pickaxes and dynamite would soon conquer those walls."

"No doubt," responded the chief, "but such an undertaking hardly seems justified, since the mountain is now quiet. We will wait awhile and perhaps nature herself will disclose her mystery."

"Mr. Ward, believe me that I regret deeply that I have been unable to solve the problem you entrusted to me," I said.
“Nonsense! Do not upset yourself, Strock. Take your defeat philosophically. We cannot always be successful, even in the police. How many criminals escape us! I believe we should never capture one of them, if they were a little more intelligent and less imprudent, and if they did not compromise themselves so stupidly. Nothing, it seems to me, would be easier than to plan a crime, a theft or an assassination, and to execute it without arousing any suspicions, or leaving any traces to be followed. You understand, Strock, I do not want to give our criminals lessons; I much prefer to have them remain as they are. Nevertheless there are many whom the police will never be able to track down.”

On this matter I shared absolutely the opinion of my chief. It is among rascals that one finds the most fools. For this very reason I had been much surprised that none of the authorities had been able to throw any light upon the recent performances of the "demon automobile." And when Mr. Ward brought up this subject, I did not conceal from him my astonishment.

He pointed out that the vehicle was practically unpursuable; that in its earlier appearances, it had apparently vanished from all roads even before a telephone message could be sent ahead. Active and numerous police agents had been spread throughout the country, but no one of them had encountered the delinquent. He did not move continuously from place to place, even at his amazing speed, but seemed to appear only for a moment and then to vanish into thin air. True, he had at length remained visible along the entire route from Prairie-du-Chien to Milwaukee, and he had covered in less than an hour and a half this track of two hundred miles.

But since then, there had been no news whatever of the machine. Arrived at the end of the route, driven onward by its own impetus, unable to stop, had it indeed been engulfed within the waters of Lake Michigan? Must we conclude that the machine and its driver had both perished, that there was no longer any danger to be feared from either? The great majority of the public refused to accept this conclusion. They fully expected the machine to reappear.

Mr. Ward frankly admitted that the whole matter seemed to him most extraordinary; and I shared his view. Assuredly if this infernal chauffeur did not return, his apparition would have to be placed among those superhuman mysteries which it is not given to man to understand.

We had fully discussed this affair, the chief and I; and I thought that our interview was at an end, when, after pacing the room for a few moments, he said abruptly, "Yes, what happened there at Milwaukee was very strange. But here is something no less so!"

With this he handed me a report which he had received from Boston, on a subject of which the evening papers had just begun to apprise their readers. While I read it, Mr. Ward was summoned from the room. I seated myself by the window and studied with extreme attention the matter of the report.

For some days the waters along the coast of Maine, Connecticut, and Massachusetts had been the scene of an appearance which no one could exactly describe. A moving body would appear amid the waters, some two or three miles off shore, and go through rapid evolutions. It would flash for a while back and forth among the waves and then dart out of sight.

The body moved with such lightning speed that the best telescopes could hardly follow it. Its length did not seem to exceed thirty feet. Its cigar-shaped form and greenish color, made it difficult to distinguish against the background of the ocean. It had been most frequently observed along the coast between Cape Cod and Nova Scotia. From Providence, from Boston, from Portsmouth, and from Portland motor boats and steam launches had repeatedly attempted to approach this moving body and even to give it chase. They could not get anywhere near it. Pursuit seemed useless. It darted like an arrow beyond the range of view.

Naturally, widely differing opinions were held as to the nature of this object. But no hypothesis rested on any secure basis. Seamen were as much at a loss as others. At first sailors thought it must be some great fish, like a whale. But it is well known that all these animals come to the surface with a certain regularity to breathe, and spout up columns of mingled air and water. Now, this strange animal, if it was an animal, had never "blown" as the whalers say; nor, had it ever made any noises of breathing. Yet if it were not one of these huge marine mammals, how was this unknown monster to be classed? Did it belong among the legendary dwellers in the deep, the krakens, the octopuses, the leviathans, the famous sea-serpents?

At any rate, since this monster, whatever it was, had appeared along the New England shores, the little fishing-smacks and pleasure boats dared not venture forth. Wherever it appeared the boats fled to the nearest harbor, as was but prudent. If the animal was of a ferocious character, none cared to await its attack.

As to the large ships and coast steamers, they had nothing to fear from any monster, whale or otherwise. Several of them had seen this creature at a distance of some miles. But when they attempted to approach, it fled rapidly away. One day, even, a fast United States gun boat went out from Boston, if not to pursue the monster, at least to send after it a few cannon shot. Almost instantly the animal disappeared, and the attempt was vain. As yet, however, the monster had shown no intention of attacking either boats or people.
At this moment Mr. Ward returned and I interrupted my reading to say, "There seems as yet no reason to complain of this sea-serpent. It flees before big ships. It does not pursue little ones. Feeling and intelligence are not very strong in fishes."

"Yet their emotions exist, Strock, and if strongly aroused---"

"But, Mr. Ward, the beast seems not at all dangerous. One of two things will happen. Either it will presently quit these coasts, or finally it will be captured and we shall be able to study it at our leisure here in the museum of Washington."

"And if it is not a marine animal?" asked Mr. Ward.

"What else can it be?" I protested in surprise.

"Finish your reading," said Mr. Ward.

I did so; and found that in the second part of the report, my chief had underlined some passages in red pencil.

For some time no one had doubted that this was an animal; and that, if it were vigorously pursued, it would at last be driven from our shores. But a change of opinion had come about. People began to ask if, instead of a fish, this were not some new and remarkable kind of boat.

Certainly in that case its engine must be one of amazing power. Perhaps the inventor before selling the secret of his invention, sought to attract public attention and to astound the maritime world. Such surety in the movements of his boat, grace in its every evolution, such ease in defying pursuit by its arrow-like speed, surely, these were enough to arouse world-wide curiosity!

At that time great progress had been made in the manufacture of marine engines. Huge transatlantic steamers completed the ocean passage in five days. And the engineers had not yet spoken their last word. Neither were the navies of the world behind. The cruisers, the torpedo boats, the torpedo-destroyers, could match the swiftest steamers of the Atlantic and Pacific, or of the Indian trade.

If, however, this were a boat of some new design, there had as yet been no opportunity to observe its form. As to the engines which drove it, they must be of a power far beyond the fastest known. By what force they worked, was equally a problem. Since the boat had no sails, it was not driven by the wind; and since it had no smoke-stack, it was not driven by steam.

At this point in the report, I again paused in my reading and considered the comment I wished to make.

"What are you puzzling over, Strock?" demanded my chief.

"It is this, Mr. Ward; the motive power of this so-called boat must be as tremendous and as unknown as that of the remarkable automobile which has so amazed us all."

"So that is your idea, is it, Strock?"

"Yes, Mr. Ward."

There was but one conclusion to be drawn. If the mysterious chauffeur had disappeared, if he had perished with his machine in Lake Michigan, it was equally important now to win the secret of this no less mysterious navigator. And it must be won before he in his turn plunged into the abyss of the ocean. Was it not the interest of the inventor to disclose his invention? Would not the American government or any other give him any price he chose to ask?

Yet unfortunately, since the inventor of the terrestrial apparition had persisted in preserving his incognito, was it not to be feared that the inventor of the marine apparition would equally preserve his? Even if the first machine still existed, it was no longer heard from; and would not the second, in the same way, after having disclosed its powers, disappear in its turn, without a single trace?

What gave weight to this probability was that since the arrival of this report at Washington twenty-four hours before, the presence of the extraordinary boat hadn't been announced from anywhere along the shore. Neither had it been seen on any other coast. Though, of course, the assertion that it would not reappear at all would have been hazardous, to say the least.

I noted another interesting and possibly important point. It was a singular coincidence which indeed Mr. Ward suggested to me, at the same moment that I was considering it. This was that only after the disappearance of the wonderful automobile had the no less wonderful boat come into view. Moreover, their engines both possessed a most dangerous power of locomotion. If both should go rushing at the same time over the face of the world, the same danger would threaten mankind everywhere, in boats, in vehicles, and on foot. Therefore it was absolutely necessary that the police should in some manner interfere to protect the public ways of travel.

That is what Mr. Ward pointed out to me; and our duty was obvious. But how could we accomplish this task? We discussed the matter for some time; and I was just about to leave when Mr. Ward made one last suggestion.

"Have you not observed, Strock," said he, "that there is a sort of fantastic resemblance between the general appearance of this boat and this automobile?"

"There is something of the sort, Mr. Ward."

"Well, is it not possible that the two are one?"
Chapter 6
THE FIRST LETTER

After leaving Mr. Ward I returned to my home in Long Street. There I had plenty of time to consider this strange case uninterrupted by either wife or children. My household consisted solely of an ancient servant, who having been formerly in the service of my mother, had now continued for fifteen years in mine.

Two months before I had obtained a leave of absence. It had still two weeks to run, unless indeed some unforeseen circumstance interrupted it, some mission which could not be delayed. This leave, as I have shown, had already been interrupted for four days by my exploration of the Great Eyrie.

And now was it not my duty to abandon my vacation, and endeavor to throw light upon the remarkable events of which the road to Milwaukee and the shore of New England had been in turn the scene? I would have given much to solve the twin mysteries, but how was it possible to follow the track of this automobile or this boat?

Seated in my easy chair after breakfast, with my pipe lighted, I opened my newspaper. To what should I turn? Politics interested me but little, with its eternal strife between the Republicans and the Democrats. Neither did I care for the news of society, nor for the sporting page. You will not be surprised, then, that my first idea was to see if there was any news from North Carolina about the Great Eyrie. There was little hope of this, however, for Mr. Smith had promised to telegraph me at once if anything occurred. I felt quite sure that the mayor of Morganton was as eager for information and as watchful as could have been myself. The paper told me nothing new. It dropped idly from my hand; and I remained deep in thought.

What most frequently recurred to me was the suggestion of Mr. Ward that perhaps the automobile and the boat which had attracted our attention were in reality one and the same. Very probably, at least, the two machines had been built by the same hand. And beyond doubt, these were similar engines, which generated this remarkable speed, more than doubling the previous records of earth and sea.

"The same inventor!" repeated I.

Evidently this hypothesis had strong grounds. The fact that the two machines had not yet appeared at the same time added weight to the idea. I murmured to myself, "After the mystery of Great Eyrie, comes that of Milwaukee and Boston. Will this new problem be as difficult to solve as was the other?"

I noted idly that this new affair had a general resemblance to the other, since both menaced the security of the general public. To be sure, only the inhabitants of the Blueridge region had been in danger from an eruption or possible earthquake at Great Eyrie. While now, on every road of the United States, or along every league of its coasts and harbors, every inhabitant was in danger from this vehicle or this boat, with its sudden appearance and insane speed.

I found that, as was to be expected, the newspapers not only suggested, but enlarged upon the dangers of the case. Timid people everywhere were much alarmed. My old servant, naturally credulous and superstitious, was particularly upset. That same day after dinner, as she was clearing away the things, she stopped before me, a water bottle in one hand, the serviette in the other, and asked anxiously, "Is there no news, sir?"

"None," I answered, knowing well to what she referred.

"The automobile has not come back?"

"No."

"Nor the boat?"

"Nor the boat There is no news even-in the best informed papers."

"But--your secret police information?"

"We are no wiser."

"Then, sir, if you please, of what use are the police?"

It is a question which has phased me more than once.

"Now you see what will happen," continued the old housekeeper, complainingly, "Some fine morning, he will come without warning, this terrible chauffeur, and rush down our street here, and kill us all!"

"Good! When that happens, there will be some chance of catching him."

"He will never be arrested, sir."

"Why not?"

"Because he is the devil himself, and you can't arrest the devil!"

Decidedly, thought I, the devil has many uses; and if he did not exist we would have to invent him, to give people some way of explaining the inexplicable. It was he who lit the flames of the Great Eyrie. It was he who smashed the record in the Wisconsin race. It is he who is scurrying along the shores of Connecticut and Massachusetts. But putting to one side this evil spirit who is so necessary, for the convenience of the ignorant, there
was no doubt that we were facing a most bewildering problem. Had both of these machines disappeared forever? They had passed like a meteor, like a star shooting through space; and in a hundred years the adventure would become a legend, much to the taste of the gossips of the next century.

For several days the newspapers of America and even those of Europe continued to discuss these events. Editorials crowded upon editorials. Rumors were added to rumors. Story tellers of every kind crowded to the front. The public of two continents was interested. In some parts of Europe there was even jealousy that America should have been chosen as the field of such an experience. If these marvelous inventors were American, then their country, their army and navy, would have a great advantage over others. The United States might acquire an incontestable superiority.

Under the date of the tenth of June, a New York paper published a carefully studied article on this phase of the subject. Comparing the speed of the swiftest known vessels with the smallest minimum of speed which could possibly be assigned to the new boat, the article demonstrated that if the United States secured this secret, Europe would be but three days away from her, while she would still be five days from Europe.

If our own police had searched diligently to discover the mystery of the Great Eyrie, the secret service of every country in the world was now interested in these new problems.

Mr. Ward referred to the matter each time I saw him. Our chat would begin by his rallying me about my ill-success in Carolina, and I would respond by reminding him that success there was only a question of expense.

"Never mind, my good Strock," said he, "there will come a chance for our clever inspector to regain his laurels. Take now this affair of the automobile and the boat. If you could clear that up in advance of all the detectives of the world, what an honor it would be to our department! What glory for you!"

"It certainly would, Mr. Ward. And if you put the matter in my charge--"

"Who knows, Strock? Let us wait a while! Let us wait!"

Matters stood thus when, on the morning of June fifteenth, my old servant brought me a letter from the letter-carrier, a registered letter for which I had to sign. I looked at the address. I did not know the handwriting. The postmark, dating from two days before, was stamped at the post office of Morganton.

Morganton! Here at last was, no doubt, news from Mr. Elias Smith.

"Yes!" exclaimed I, speaking to my old servant, for lack of another, "it must be from Mr. Smith at last. I know no one else in Morganton. And if he writes he has news!"

"Morganton?" said the old woman, "isn't that the place where the demons set fire to their mountain?"

"Exactly."

"Oh, sir! I hope you don't mean to go back there!"

"Because you will end by being burned up in that furnace of the Great Eyrie. And I wouldn't want you buried that way, sir."

"Cheer up, and let us see if it is not better news than that."

The envelope was sealed with red sealing wax, and stamped with a sort of coat of arms, surmounted with three stars. The paper was thick and very strong. I broke the envelope and drew out a letter. It was a single sheet, folded in four, and written on one side only. My first glance was for the signature.

There was no signature! Nothing but three initials at the end of the last line!

"The letter is not from the Mayor of Morganton," said I.

"Morganton?" said the old woman, "isn't that the place where the demons set fire to their mountain?"

"Exactly."

"Oh, sir! I hope you don't mean to go back there!"

"Because you will end by being burned up in that furnace of the Great Eyrie. And I wouldn't want you buried that way, sir."

"Cheer up, and let us see if it is not better news than that."

The hand-writing was bold. Both up strokes and down strokes very sharp, about twenty lines in all. Here is the letter, of which I, with good reason, retained an exact copy. It was dated, to my extreme stupefaction, from that mysterious Great Eyrie:

Great Eyrie, Blueridge Mtns,
To Mr. Strock: North Carolina, June 13th.
Chief Inspector of Police,
34 Long St., Washington, D. C.

Sir,

You were charged with the mission of penetrating the Great Eyrie.

You came on April the twenty-eighth, accompanied by the Mayor of Morganton and two guides.
You mounted to the foot of the wall, and you encircled it, finding it too high and steep to climb.
You sought a breech and you found none. Know this: none enter the Great Eyrie; or if one enters, he never returns.

"Do not try again, for the second attempt will not result as did the first, but will have grave consequences for
you.

"Heed this warning, or evil fortune will come to you.

"M. o. W."

Chapter 7
A THIRD MACHINE
I confess that at first this letter dumfounded me. "Ohs!" and "Ahs!" slipped from my open mouth. The old servant stared at me, not knowing what to think.

"Oh, sir! is it bad news?"

I answered for I kept few secrets from this faithful soul by reading her the letter from end to end. She listened with much anxiety.

"A joke, without doubt," said I, shrugging my shoulders.

"Well," returned my superstitious handmaid, "if it isn't from the devil, it's from the devil's country, anyway."

Left alone, I again went over this unexpected letter. Reflection inclined me yet more strongly to believe that it was the work of a practical joker. My adventure was well known. The newspapers had given it in full detail. Some satirist, such as exists even in America, must have written this threatening letter to mock me.

To assume, on the other hand, that the Eyrie really served as the refuge of a band of criminals, seemed absurd. If they feared that the police would discover their retreat, surely they would not have been so foolish as thus to force attention upon themselves. Their chief security would lie in keeping their presence there unknown. They must have realized that such a challenge from them would only arouse the police to renewed activity. Dynamite or melinitel would soon open an entrance to their fortress. Moreover, how could these men have, themselves, gained entrance into the Eyrie unless there existed a passage which we had failed to discover? Assuredly the letter came from a jester or a madman; and I need not worry over it, nor even consider it.

Hence, though for an instant I had thought of showing this letter to Mr. Ward, I decided not to do so. Surely he would attach no importance to it. However, I did not destroy it, but locked it in my desk for safe keeping. If more letters came of the same kind, and with the same initials, I would attach as little weight to them as to this.

Several days passed quietly. There was nothing to lead me to expect that I should soon quit Washington; though in my line of duty one is never certain of the morrow. At any moment I might be sent speeding from Oregon to Florida, from Maine to Texas. And this unpleasant thought haunted me frequently if my next mission were no more successful than that to the Great Eyrie, I might as well give up and hand in my resignation from the force. Of the mysterious chauffeur or chauffeurs, nothing more was heard. I knew that our own government agents, as well as foreign ones, were keeping keen watch over all the roads and rivers, all the lakes and the coasts of America. Of course, the size of the country made any close supervision impossible; but these twin inventors had not before chosen secluded and unfrequented spots in which to appear. The main highway of Wisconsin on a great race day, the harbor of Boston, incessantly crossed by thousands of boats, these were hardly what would be called hiding-places! If the daring driver had not perished of which there was always strong probability; then he must have left America. Perhaps he was in the waters of the Old World, or else resting in some retreat known only to himself, and in that case--

"Ah!" I repeated to myself, many times, "for such a retreat, as secret as inaccessible, this fantastic personage could not find one better than the Great Eyrie!" But, of course, a boat could not get there, any more than an automobile. Only high-flying birds of prey, eagles or condors, could find refuge there.

The nineteenth of June I was going to the police bureau, when, on leaving my house, I noticed two men who looked at me with a certain keenness. Not knowing them, I took no notice; and if my attention was drawn to the matter, it was because my servant spoke of it when I returned.

For some days, she said, she had noticed that two men seemed to be spying upon me in the street. They stood constantly, perhaps a hundred steps from my house; and she suspected that they followed me each time I went up the street.

"You are sure?" I asked.

"Yes, sir and no longer ago than yesterday, when you came into the house, these men came slipping along in your footsteps, and then went away as soon as the door was shut behind you."

"You must be mistaken?"

"I am not, sir."

"And if you met these two men, you would know them?"

"I would."

"Good;" I cried, laughing, "I see you have the very spirit for a detective. I must engage you as a member of our
"Joke if you like, sir. But I have still two good eyes, and I don't need spectacles to recognize people. Someone is spying on you, that's certain; and you should put some of your men to track them in turn."

"All right; I promise to do so," I said, to satisfy her. "And when my men get after them, we shall soon know what these mysterious fellows want of me."

In truth I did not take the good soul's excited announcement very seriously. I added, however, "When I go out, I will watch the people around me with great care."

"That will be best, sir."

My poor old housekeeper was always frightening herself at nothing. "If I see them again," she added, "I will warn you before you set foot out of doors."

"Agreed!" And I broke off the conversation, knowing well that if I allowed her to run on, she would end by being sure that Beelzebub himself and one of his chief attendants were at my heels.

The two following days, there was certainly no one spying on me, either at my exits or entrances. So I concluded my old servant had made much of nothing, as usual. But on the morning of the twenty-second of June, after rushing upstairs as rapidly as her age would permit, the devoted old soul burst into my room and in a half whisper gasped "Sir! Sir!"

"What is it?"

"They are there!"

"Who?" I queried, my mind on anything but the web she had been spinning about me.

"The two spies!"

"Ah, those wonderful spies!"

"Themselves! In the street! Right in front of our windows! Watching the house, waiting for you to go out."

I went to the window and raising just an edge of the shade, so as not to give any warning, I saw two men on the pavement.

They were rather fine-looking men, broad-shouldered and vigorous, aged somewhat under forty, dressed in the ordinary fashion of the day, with slouched hats, heavy woolen suits, stout walking shoes and sticks in hand. Undoubtedly, they were staring persistently at my apparently unwatchful house. Then, having exchanged a few words, they strolled off a little way, and returned again.

"Are you sure these are the same men you saw before?"

"Yes, sir."

Evidently, I could no longer dismiss her warning as an hallucination; and I promised myself to clear up the matter. As to following the men myself, I was presumably too well known to them. To address them directly would probably be of no use. But that very day, one of our best men should be put on watch, and if the spies returned on the morrow, they should be tracked in their turn, and watched until their identity was established.

At the moment, they were waiting to follow me to police headquarters? For it was there that I was bound, as usual. If they accompanied me I might be able to offer them a hospitality for which they would scarce thank me.

I took my hat; and while the housekeeper remained peeping from the window, I went down stairs, opened the door, and stepped into the street.

The two men were no longer there.

Despite all my watchfulness, that day I saw no more of them as I passed along the streets. From that time on, indeed, neither my old servant nor I saw them again before the house, nor did I encounter them elsewhere. Their appearance, however, was stamped upon my memory, I would not forget them.

Perhaps after all, admitting that I had been the object of their espionage, they had been mistaken in my identity. Having obtained a good look at me, they now followed me no more. So in the end, I came to regard this matter as of no more importance than the letter with the initials, M. o. W.

Then, on the twenty-fourth of June, there came a new event, to further stimulate both my interest and that of the general public in the previous mysteries of the automobile and the boat. The Washington Evening Star published the following account, which was next morning copied by every paper in the country.

"Lake Kirdall in Kansas, forty miles west of Topeka, is little known. It deserves wider knowledge, and doubtless will have it hereafter, for attention is now drawn to it in a very remarkable way.

This lake, deep among the mountains, appears to have no outlet. What it loses by evaporation, it regains from the little neighboring streamlets and the heavy rains.

Lake Kirdall covers about seventy-five square miles, and its level is but slightly below that of the heights which surround it. Shut in among the mountains, it can be reached only by narrow and rocky gorges. Several villages, however, have sprung up upon its banks. It is full of fish, and fishing-boats cover its waters.

Lake Kirdall is in many places fifty feet deep close to shore. Sharp, pointed rocks form the edges of this huge
basin. Its surges, roused by high winds, beat upon its banks with fury, and the houses near at hand are often deluged
with spray as if with the downpour of a hurricane. The lake, already deep at the edge, becomes yet deeper toward the
center, where in some places soundings show over three hundred feet of water.

"The fishing industry supports a population of several thousands, and there are several hundred fishing boats in
addition to the dozen or so of little steamers which serve the traffic of the lake. Beyond the circle of the mountains
lie the railroads which transport the products of the fishing industry throughout Kansas and the neighboring states.

"This account of Lake Kirdall is necessary for the understanding of the remarkable facts which we are about to
report."

And this is what the Evening Star then reported in its startling article. "For some time past, the fishermen have
noticed a strange upheaval in the waters of the lake. Sometimes it rises as if a wave surged up from its depths. Even
in perfectly calm weather, when there is no wind whatever, this upheaval sometimes arises in a mass of foam.

"Tossed about by violent waves and unaccountable currents, boats have been swept beyond all control. Sometimes
they have been dashed one against another, and serious damage has resulted.

"This confusion of the waters evidently has its origin somewhere in the depths of the lake; and various
explanations have been offered to account for it. At first, it was suggested that the trouble was due to seismic forces,
to some volcanic action beneath the lake; but this hypothesis had to be rejected when it was recognized that the
disturbance was not confined to one locality, but spread itself over the entire surface of the lake, either at one part or
another, in the center or along the edges, traveling along almost in a regular line and in a way to exclude entirely all
idea of earthquake or volcanic action.

"Another hypothesis suggested that it was a marine monster who thus upheaved the waters. But unless the beast
had been born in the lake and had there grown to its gigantic proportions unsuspected, which was scarce possible, he
must have come there from outside. Lake Kirdall, however, has no connection with any other waters. If this lake
were situated near any of the oceans, there might be subterranean canals; but in the center of America, and at the
height of some thousands of feet above sea-level, this is not possible. In short, here is another riddle not easy to
solve, and it is much easier to point out the impossibility of false explanations, than to discover the true one.

"Is it possible that a submarine boat is being experimented with beneath the lake? Such boats are no longer
impossible today. Some years ago, at Bridgeport, Connecticut, there was launched a boat, The Protector, which
could go on the water, under the water, and also upon land. Built by an inventor named Lake, supplied with two
motors, an electric one of seventy-five horse power, and a gasoline one of two hundred and fifty horse power, it was
also provided with wheels a yard in diameter, which enabled it to roll over the roads, as well as swim the seas.

"But even then, granting that the turmoil of Lake Kirdall might be produced by a submarine, brought to a high
degree of perfection, there remains as before the question how could it have reached Lake Kirdall? The lake, shut in
on all sides by a circle of mountains, is no more accessible to a submarine than to a sea-monster.

"In whatever way this last puzzling question may be solved, the nature of this strange appearance can no longer
be disputed since the twentieth of June. On that day, in the afternoon, the schooner 'Markel' while speeding with all
sails set, came into violent collision with something just below the water level. There was no shoal nor rock near; for
the lake in this part is eighty or ninety feet deep. The schooner with both her bow and her side badly broken, ran
great danger of sinking. She managed, however, to reach the shore before her decks were completely submerged.

"When the 'Markel' had been pumped out and hauled up on shore, an examination showed that she had received
a blow near the bow as if from a powerful ram.

"From this it seems evident that there is actually a submarine boat which darts about beneath the surface of Lake
Kirdall with most remarkable rapidity.

"The thing is difficult to explain. Not only is there a question as to how did the submarine get there? But why is
it there? Why does it never come to the surface? What reason has its owner for remaining unknown? Are other
disasters to be expected from its reckless course?"

The article in the Evening Star closed with this truly striking suggestion: "After the mysterious automobile, came
the mysterious boat. Now comes the mysterious submarine.

"Must we conclude that the three engines are due to the genius of the same inventor, and that the three vehicles
are in truth but one?"

Chapter 8
AT ANY COST

The suggestion of the Star came like a revelation. It was accepted everywhere. Not only were these three
vehicles the work of the same inventor; they were the same machine!

It was not easy to see how the remarkable transformation could be practically accomplished from one means of
locomotion to the other. How could an automobile become a boat, and yet more, a submarine? All the machine seemed to lack was the power of flying through the air. Nevertheless, everything that was known of the three different machines, as to their size, their shape, their lack of odor or of steam, and above all their remarkable speed, seemed to imply their identity. The public, grown blase with so many excitements, found in this new marvel a stimulus to reawaken their curiosity.

The newspapers dwelt now chiefly on the importance of the invention. This new engine, whether in one vehicle or three, had given proofs of its power. What amazing proofs! The invention must be bought at any price. The United States government must purchase it at once for the use of the nation. Assuredly, the great European powers would stop at nothing to be beforehand with America, and gain possession of an engine so invaluable for military and naval use. What incalculable advantages would it give to any nation, both on land and sea! Its destructive powers could not even be estimated, until its qualities and limitations were better known. No amount of money would be too great to pay for the secret; America could not put her millions to better use.

But to buy the machine, it was necessary to find the inventor; and there seemed the chief difficulty. In vain was Lake Kirdall searched from end to end. Even its depths were explored with a sounding-line without result. Must it be concluded that the submarine no longer lurked beneath its waters? But in that case, how had the boat gotten away? For that matter, how had it come? An insoluble problem!

The submarine was heard from no more, neither in Lake Kirdall nor elsewhere. It had disappeared like the automobile from the roads, and like the boat from the shores of America. Several times in my interviews with Mr. Ward, we discussed this matter, which still filled his mind. Our men continued everywhere on the lookout, but as unsuccessfully as other agents.

On the morning of the twenty-seventh of June, I was summoned into the presence of Mr. Ward.

"Well, Strock," said he, "here is a splendid chance for you to get your revenge."

"Revenge for the Great Eyrie disappointment?"

"Of course."

"What chance?" asked I, not knowing if he spoke seriously, or in jest.

"Why, here," he answered. "Would you not like to discover the inventor of this three-fold machine?"

"I certainly should, Mr. Ward. Give me the order to take charge of the matter, and I will accomplish the impossible, in order to succeed. It is true, I believe it will be difficult."

"Undoubtedly, Strock. Perhaps even more difficult than to penetrate into the Great Eyrie."

It was evident that Mr. Ward was intent on rallying me about my unsuccess. He would not do that, I felt assured, out of mere unkindness. Perhaps then he meant to rouse my resolution. He knew me well; and realized that I would have given anything in the world to recoup my defeat. I waited quietly for new instructions.

Mr. Ward dropped his jesting and said to me very generously, "I know, Strock, that you accomplished everything that depended on human powers; and that no blame attaches to you. But we face now a matter very different from that of the Great Eyrie. The day the government decides to force that secret, everything is ready. We have only to spend some thousands of dollars, and the road will be open."

"That is what I would urge."

"But at present," said Mr. Ward, shaking his head, "it is much more important to place our hands on this fantastic inventor, who so constantly escapes us. That is work for a detective, indeed; a master detective!"

"He has not been heard from again?"

"No; and though there is every reason to believe that he has been, and still continues, beneath the waters of Lake Kirdall, it has been impossible to find any trace of him anywhere around there. One would almost fancy he had the power of making himself invisible, this Proteus of a mechanic!"

"It seems likely," said I, "that he will never be seen until he wishes to be."

"True, Strock. And to my mind there is only one way of dealing with him, and that is to offer him such an enormous price that he cannot refuse to sell his invention."

Mr. Ward was right. Indeed, the government had already made the effort to secure speech with this hero of the day, than whom surely no human being has ever better merited the title. The press had widely spread the news, and this extraordinary individual must assuredly know what the government desired of him, and how completely he could name the terms he wished.

"Surely," added Mr. Ward, "this invention can be of no personal use to the man, that he should hide it from the rest of us. There is every reason why he should sell it. Can this unknown be already some dangerous criminal who, thanks to his machine, hopes to defy all pursuit?"

My chief then went on to explain that it had been decided to employ other means in search of the inventor. It was possible after all that he had perished with his machine in some dangerous maneuver. If so, the ruined vehicle might prove almost as valuable and instructive to the mechanical world as the man himself. But since the accident to the
schooner "Markel" on Lake Kirdall, no news of him whatever had reached the police.

On this point Mr. Ward did not attempt to hide his disappointment and his anxiety. Anxiety, yes, for it was manifestly becoming more and more difficult for him to fulfill his duty of protecting the public. How could we arrest criminals, if they could flee from justice at such speed over both land and sea? How could we pursue them under the oceans? And when dirigible balloons should also have reached their full perfection, we would even have to chase men through the air! I asked myself if my colleagues and I would not find ourselves some day reduced to utter helplessness? If police officials, become a useless incumbrance, would be definitely discarded by society?

Here, there recurred to me the jesting letter I had received a fortnight before, the letter which threatened my liberty and even my life. I recalled, also, the singular espionage of which I had been the subject. I asked myself if I had better mention these things to Mr. Ward. But they seemed to have absolutely no relation to the matter now in hand. The Great Eyrie affair had been definitely put aside by the government, since an eruption was no longer threatening. And they now wished to employ me upon this newer matter. I waited, then, to mention this letter to my chief at some future time, when it would be not so sore a joke to me.

Mr. Ward again took up our conversation. "We are resolved by some means to establish communication with this inventor. He has disappeared, it is true; but he may reappear at any moment, and in any part of the country. I have chosen you, Strock, to follow him the instant he appears. You must hold yourself ready to leave Washington on the moment. Do not quit your house, except to come here to headquarters each day; notify me, each time by telephone, when you start from home, and report to me personally the moment you arrive here."

"I will follow orders exactly, Mr. Ward," I answered. "But permit me one question. Ought I to act alone, or will it not be better to join with me?"

"That is what I intend," said the chief, interrupting me. "You are to choose two of our men whom you think the best fitted."

"I will do so, Mr. Ward. And now, if some day or other I stand in the presence of our man, what am I to do with him?"

"Above all things, do not lose sight of him. If there is no other way, arrest him. You shall have a warrant."

"A useful precaution, Mr. Ward. If he started to jump into his automobile and to speed away at the rate we know of, I must stop him at any cost. One cannot argue long with a man making two hundred miles an hour!"

"You must prevent that, Strock. And the arrest made, telegraph me. After that, the matter will be in my hands."

"Count on me, Mr. Ward; at any hour, day or night, I shall be ready to start with my men. I thank you for having entrusted this mission to me. If it succeeds, it will be a great honor-""

"And of great profit," added my chief, dismissing me.

Returning home, I made all preparations for a trip of indefinite duration. Perhaps my good housekeeper imagined that I planned a return to the Great Eyrie, which she regarded as an ante-chamber of hell itself. She said nothing, but went about her work with a most despairing face. Nevertheless, sure as I was of her discretion, I told her nothing. In this great mission I would confide in no one.

My choice of the two men to accompany me was easily made. They both belonged to my own department, and had many times under my direct command given proofs of their vigor, courage and intelligence. One, John Hart, of Illinois, was a man of thirty years; the other, aged thirty-two, was Nab Walker, of Massachusetts. I could not have had better assistants.

Several days passed, without news, either of the automobile, the boat, or the submarine. There were rumors in plenty; but the police knew them to be false. As to the reckless stories that appeared in the newspapers, they had most of them, no foundation whatever. Even the best journals cannot be trusted to refuse an exciting bit of news on the mere ground of its unreliability.

Then, twice in quick succession, there came what seemed trustworthy reports of the "man of the hour." The first asserted that he had been seen on the roads of Arkansas, near Little Rock. The second, that he was in the very middle of Lake Superior.

Unfortunately, these two notices were absolutely unreconcilable; for while the first gave the afternoon of June twenty-sixth, as the time of appearance, the second set it for the evening of the same day. Now, these two points of the United States territory are not less than eight hundred miles apart. Even granting the automobile this unthinkable speed, greater than any it had yet shown, how could it have crossed all the intervening country unseen? How could it traverse the States of Arkansas, Missouri, Iowa and Wisconsin, from end to end without anyone of our agents giving us warning, without any interested person rushing to a telephone?

After these two momentary appearances, if appearances they were, the machine again dropped out of knowledge. Mr. Ward did not think it worth while to dispatch me and my men to either point whence it had been reported.

Yet since this marvelous machine seemed still in existence, something must be done. The following official
notice was published in every newspaper of the United States under July 3d. It was couched in the most formal terms.

"During the month of April, of the present year, an automobile traversed the roads of Pennsylvania, of Kentucky, of Ohio, of Tennessee, of Missouri, of Illinois; and on the twenty-seventh of May, during the race held by the American Automobile Club, it covered the course in Wisconsin. Then it disappeared.

"During the first week of June, a boat maneuvering at great speed appeared off the coast of New England between Cape Cod and Cape Sable, and more particularly around Boston. Then it disappeared.

"In the second fortnight of the same month, a submarine boat was run beneath the waters of Lake Kirdall, in Kansas. Then it disappeared.

"Everything points to the belief that the same inventor must have built these three machines, or perhaps that they are the same machine, constructed so as to travel both on land and water.

"A proposition is therefore addressed to the said inventor, whoever he be, with the aim of acquiring the said machine.

"He is requested to make himself known and to name the terms upon which he will treat with the United States government. He is also requested to answer as promptly as possible to the Department of Federal Police, Washington, D. C., United States of America."

Such was the notice printed in large type on the front page of every newspaper. Surely it could not fail to reach the eye of him for whom it was intended, wherever he might be. He would read it. He could scarce fail to answer it in some manner. And why should he refuse such an unlimited offer? We had only to await his reply.

One can easily imagine how high the public curiosity rose. From morning till night, an eager and noisy crowd pressed about the bureau of police, awaiting the arrival of a letter or a telegram. The best reporters were on the spot. What honor, what profit would come to the paper which was first to publish the famous news! To know at last the name and place of the undiscoverable unknown! And to know if he would agree to some bargain with the government. If necessary all the millionaires in the country would open their inexhaustible purses!

The day passed. To how many excited and impatient people it seemed to contain more than twenty-four hours! And each hour held far more than sixty minutes! There came no answer, no letter, no telegram! The night following, there was still no news. And it was the same the next day and the next.

There came, however another result, which had been fully foreseen. The cables informed Europe of what the United States government had done. The different Powers of the Old World hoped also to obtain possession of the wonderful invention. Why should they not struggle for an advantage so tremendous? Why should they not enter the contest with their millions?

In brief, every great Power took part in the affair, France, England, Russia, Italy, Austria, Germany. Only the states of the second order refrained from entering, with their smaller resources, upon a useless effort. The European press published notices identical with that of the United States. The extraordinary "chauffeur" had only to speak, to become a rival to the Vanderbilts, the Astors, the Goulds, the Morgans, and the Rothschilds of every country of Europe.

And, when the mysterious inventor made no sign, what attractive offers were held forth to tempt him to discard the secrecy in which he was enwrapped! The whole world became a public market, an auction house whence arose the most amazing bids. Twice a day the newspapers would add up the amounts, and these kept rising from millions to millions. The end came when the United States Congress, after a memorable session, voted to offer the sum of twenty million dollars. And there was not a citizen of the States of whatever rank, who objected to the amount, so much importance was attached to the possession of this prodigious engine of locomotion. As for me, I said emphatically to my old housekeeper: "The machine is worth even more than that."

Evidently the other nations of the world did not think so, for their bids remained below the final sum. But how useless was this mighty struggle of the great rivals! The inventor did not appear! He did not exist! He had never existed! It was all a monstrous pretense of the American newspapers. That, at least, became the announced view of the Old World.

And so the time passed. There was no further news of our man, there was no response from him. He appeared no more. For my part, not knowing what to think, I commenced to lose all hope of reaching any solution to the strange affair.

Then on the morning of the fifteenth of July, a letter without postmark was found in the mailbox of the police bureau. After the authorities had studied it, it was given out to the Washington journals, which published it in facsimile, in special numbers. It was couched as follows:
Chapter 9
THE SECOND LETTER
On Board the Terror
July 15.
To the Old and New World,

The propositions emanating from the different governments of Europe, as also that which has finally been made by the United States of America, need expect no other answer than this:

I refuse absolutely and definitely the sums offered for my invention.

My machine will be neither French nor German, nor Austrian nor Russian, nor English nor American.

The invention will remain my own, and I shall use it as pleases me.

With it, I hold control of the entire world, and there lies no force within the reach of humanity which is able to resist me, under any circumstances whatsoever.

Let no one attempt to seize or stop me. It is, and will be, utterly impossible. Whatever injury anyone attempts against me, I will return a hundredfold.

As to the money which is offered me, I despise it! I have no need of it. Moreover, on the day when it pleases me to have millions, or billions, I have but to reach out my hand and take them.

Let both the Old and the New World realize this: They can accomplish nothing against me; I can accomplish anything against them.

I sign this letter:

The Master of the World.

Chapter 10
OUTSIDE THE LAW

Such was the letter addressed to the government of the United States. As to the person who had placed it in the mail-box of the police, no one had seen him.

The sidewalk in front of our offices had probably not been once vacant during the entire night. From sunset to sunrise, there had always been people, busy, anxious, or curious, passing before our door. It is true, however, that even then, the bearer of the letter might easily have slipped by unseen and dropped the letter in the box. The night had been so dark, you could scarcely see from one side of the street to the other.

I have said that this letter appeared in facsimile in all the newspapers to which the government communicated it. Perhaps one would naturally imagine that the first comment of the public would be, "This is the work of some practical joker." It was in that way that I had accepted my letter from the Great Eyrie, five weeks before.

But this was not the general attitude toward the present letter, neither in Washington, nor in the rest of America. To the few who would have maintained that the document should not be taken seriously, an immense majority would have responded. "This letter has not the style nor the spirit of a jester. Only one man could have written it; and that is the inventor of this unapproachable machine."

To most people this conclusion seemed indisputable owing to a curious state of mind easily explainable. For all the strange facts of which the key had hitherto been lacking, this letter furnished an explanation. The theory now almost universally accepted was as follows. The inventor had hidden himself for a time, only in order to reappear more startlingly in some new light. Instead of having perished in an accident, he had concealed himself in some retreat where the police were unable to discover him. Then to assert positively his attitude toward all governments he had written this letter. But instead of dropping it in the post in any one locality, which might have resulted in its being traced to him, he had come to Washington and deposited it himself in the very spot suggested by the government's official notice, the bureau of police.

Well! If this remarkable personage had reckoned that this new proof of his existence would make some noise in two worlds, he certainly figured rightly. That day, the millions of good folk who read and re-read their daily paper could to employ a well-known phrase, scarcely believe their eyes.

As for myself, I studied carefully every phrase of the defiant document. The hand-writing was black and heavy. An expert at chirography would doubtless have distinguished in the lines traces of a violent temperament, of a character stern and unsocial. Suddenly, a cry escaped me a cry that fortunately my housekeeper did not hear. Why had I not noticed sooner the resemblance of the handwriting to that of the letter I had received from Morganton?

Moreover, a yet more significant coincidence, the initials with which my letter had been signed, did they not stand for the words "Master of the World?"

And whence came the second letter? "On Board the 'Terror.'" Doubtless this name was that of the triple machine commanded by the mysterious captain. The initials in my letter were his own signature; and it was he who had
threatened me, if I dared to renew my attempt on the Great Eyrie.

I rose and took from my desk the letter of June thirteenth. I compared it with the facsimile in the newspapers. There was no doubt about it. They were both in the same peculiar hand-writing.

My mind worked eagerly. I sought to trace the probable deductions from this striking fact, known only to myself. The man who had threatened me was the commander of this "Terror"--startling name, only too well justified! I asked myself if our search could not now be prosecuted under less vague conditions. Could we not now start our men upon a trail which would lead definitely to success? In short, what relation existed between the "Terror" and the Great Eyrie? What connection was there between the phenomena of the Blueridge Mountains, and the no less phenomenal performances of the fantastic machine?

I knew what my first step should be; and with the letter in my pocket, I hastened to police headquarters. Inquiring if Mr. Ward was within and receiving an affirmative reply, I hastened toward his door, and rapped upon it with unusual and perhaps unnecessary vigor. Upon his call to enter, I stepped eagerly into the room.

The chief had spread before him the letter published in the papers, not a facsimile, but the original itself which had been deposited in the letter-box of the department.

"You come as if you had important news, Strock?"

"Judge for yourself, Mr. Ward;" and I drew from my pocket the letter with the initials.

Mr. Ward took it, glanced at its face, and asked, "What is this?"

"A letter signed only with initials, as you can see."

"And where was it posted?"

"In Morganton, in North Carolina."

"When did you receive it?"

"A month ago, the thirteenth of June."

"What did you think of it then?"

"That it had been written as a joke."

"And now Strock?"

"I think, what you will think, Mr. Ward, after you have studied it."

My chief turned to the letter again and read it carefully. "It is signed with three initials," said he.

"Yes, Mr. Ward, and those initials belong to the words, 'Master of the World,' in this facsimile."

"Of which this is the original," responded Mr. Ward, taking it up.

"It is quite evident," I urged, "that the two letters are by the same hand."

"It seems so."

"You see what threats are made against me, to protect the Great Eyrie."

"Yes, the threat of death! But Strock, you have had this letter for a month. Why have you not shown it to me before?"

"Because I attached no importance to it. Today, after the letter from the 'Terror,' it must be taken seriously."

"I agree with you. It appears to me most important. I even hope it may prove the means of tracking this strange personage."

"That is what I also hope, Mr. Ward."

"Only what connection can possibly exist between the 'Terror' and the Great Eyrie?"

"That I do not know. I cannot even imagine."

"There can be but one explanation," continued Mr. Ward, "though it is almost inadmissible, even impossible."

"And that is?"

"That the Great Eyrie was the spot selected by the inventor, where he gathered his material."

"That is impossible!" cried I. "In what way would he get his material in there? And how get his machine out? After what I have seen, Mr. Ward, your suggestion is impossible."

"Unless, Strock--"

"Unless what?" I demanded.

"Unless the machine of this Master of the World has also wings, which permit it to take refuge in the Great Eyrie."

At the suggestion that the "Terror," which had searched the deeps of the sea, might be capable also of rivaling the vultures and the eagles, I could not restrain an expressive shrug of incredulity. Neither did Mr. Ward himself dwell upon the extravagant hypothesis.

He took the two letters and compared them afresh. He examined them under a microscope, especially the signatures, and established their perfect identity. Not only the same hand, but the same pen had written them.

After some moments of further reflection, Mr. Ward said, "I will keep your letter, Strock. Decidedly, I think, that you are fated to play an important part in this strange affair or rather in these two affairs. What thread attaches them,
I cannot yet see; but I am sure the thread exists. You have been connected with the first, and it will not be surprising if you have a large part in the second."

"I hope so, Mr. Ward. You know how inquisitive I am."

"I do, Strock. That is understood. Now, I can only repeat my former order; hold yourself in readiness to leave Washington at a moment's warning."

All that day, the public excitement caused by the defiant letter mounted steadily higher. It was felt both at the White House and at the Capitol that public opinion absolutely demanded some action. Of course, it was difficult to do anything. Where could one find this Master of the World? And even if he were discovered, how could he be captured? He had at his disposal not only the powers he had displayed, but apparently still greater resources as yet unknown. How had he been able to reach Lake Kirdall over the rocks; and how had he escaped from it? Then, if he had indeed appeared on Lake Superior, how had he covered all the intervening territory unseen?

What a bewildering affair it was altogether! This, of course, made it all the more important to get to the bottom of it. Since the millions of dollars had been refused, force must be employed. The inventor and his invention were not to be bought. And in what haughty and menacing terms he had couched his refusal! So be it! He must be treated as an enemy of society, against whom all means became justified, that he might be deprived of his power to injure others. The idea that he had perished was now entirely discarded. He was alive, very much alive; and his existence constituted a perpetual public danger!

Influenced by these ideas, the government issued the following proclamation:

"Since the commander of the 'Terror' has refused to make public his invention, at any price whatever, since the use which he makes of his machine constitutes a public menace, against which it is impossible to guard, the said commander of the 'Terror' is hereby placed beyond the protection of the law. Any measures taken in the effort to capture or destroy either him or his machine will be approved and rewarded."

It was a declaration of war, war to the death against this "Master of the World" who thought to threaten and defy an entire nation, the American nation!

Before the day was over, various rewards of large amounts were promised to anyone who revealed the hiding place of this dangerous inventor, to anyone who could identify him, and to anyone who should rid the country of him.

Such was the situation during the last fortnight of July. All was left to the hazard of fortune. The moment the outlaw re-appeared he would be seen and signaled, and when the chance came he would be arrested. This could not be accomplished when he was in his automobile on land or in his boat on the water. No; he must be seized suddenly, before he had any opportunity to escape by means of that speed which no other machine could equal.

I was therefore all alert, awaiting an order from Mr. Ward to start out with my men. But the order did not arrive for the very good reason that the man whom it concerned remained undiscovered. The end of July approached. The newspapers continued the excitement. They published repeated rumors. New clues were constantly being announced. But all this was mere idle talk. Telegrams reached the police bureau from every part of America, each contradicting and nullifying the others. The enormous rewards offered could not help but lead to accusations, errors, and blunders, made, many of them, in good faith. One time it would be a cloud of dust, which must have contained the automobile. At another time, almost any wave on any of America's thousand lakes represented the submarine. In truth, in the excited state of the public imagination, apparitions assailed us from every side.

At last, on the twenty-ninth of July, I received a telephone message to come to Mr. Ward on the instant. Twenty minutes later I was in his cabinet.

"You leave in an hour, Strock," said he.

"Where for?"

"For Toledo."

"It has been seen?"

"Yes. At Toledo you will get your final orders."

"In an hour, my men and I will be on the way."

"Good! And, Strock, I now give you a formal order."

"What is it, Mr. Ward?"

"To succeed! This time to succeed!"

Chapter 11

THE CAMPAIGN

So the undiscoverable commander had reappeared upon the territory of the United States! He had never shown himself in Europe either on the roads or in the seas. He had not crossed the Atlantic, which apparently he could have
traversed in three days. Did he then intend to make only America the scene of his exploits? Ought we to conclude from this that he was an American?

Let me insist upon this point. It seemed clear that the submarine might easily have crossed the vast sea which separates the New and the Old World. Not only would its amazing speed have made its voyage short, in comparison to that of the swiftest steamship, but also it would have escaped all the storms that make the voyage dangerous. Tempests did not exist for it. It had but to abandon the surface of the waves, and it could find absolute calm a few score feet beneath.

But the inventor had not crossed the Atlantic, and if he were to be captured now, it would probably be in Ohio, since Toledo is a city of that state.

This time the fact of the machine's appearance had been kept secret, between the police and the agent who had warned them, and whom I was hurrying to meet. No journal--and many would have paid high for the chance--was printing this news. We had decided that nothing should be revealed until our effort was at an end. No indiscretion would be committed by either my comrades or myself.

The man to whom I was sent with an order from Mr. Ward was named Arthur Wells. He awaited us at Toledo. The city of Toledo stands at the western end of Lake Erie. Our train sped during the night across West Virginia and Ohio. There was no delay; and before noon the next day the locomotive stopped in the Toledo depot.

John Hart, Nab Walker and I stepped out with traveling bags in our hands, and revolvers in our pockets. Perhaps we should need weapons for an attack, or even to defend ourselves. Scarcely had I stepped from the train when I picked out the man who awaited us. He was scanning the arriving passengers impatiently, evidently as eager and full of haste as I.

I approached him. "Mr. Wells?" said I.
"Mr. Strock?" asked he.
"Yes."
"I am at your command," said Mr. Wells.
"Are we to stop any time in Toledo?" I asked.
"No; with your permission, Mr. Strock. A carriage with two good horses is waiting outside the station; and we must leave at once to reach our destination as soon as possible."
"We will go at once," I answered, signing to my two men to follow us. "Is it far?"
"Twenty miles."
"And the place is called?"
"Black Rock Creek."

Having left our bags at a hotel, we started on our drive. Much to my surprise I found there were provisions sufficient for several days packed beneath the seat of the carriage. Mr. Wells told me that the region around Black Rock Creek was among the wildest in the state. There was nothing there to attract either farmers or fishermen. We would find not an inn for our meals nor a room in which to sleep. Fortunately, during the July heat there would be no hardship even if we had to lie one or two nights under the stars.

More probably, however, if we were successful, the matter would not occupy us many hours. Either the commander of the "Terror" would be surprised before he had a chance to escape, or he would take to flight and we must give up all hope of arresting him.

I found Arthur Wells to be a man of about forty, large and powerful. I knew him by reputation to be one of the best of our local police agents. Cool in danger and enterprising always, he had proven his daring on more than one occasion at the peril of his life. He had been in Toledo on a wholly different mission, when chance had thrown him on the track of the "Terror."

We drove rapidly along the shore of Lake Erie, toward the southwest. This inland sea of water is on the northern boundary of the United States, lying between Canada on one side and the States of Ohio, Pennsylvania and New York on the other. If I stop to mention the geographical position of this lake, its depth, its extent, and the waters nearest around, it is because the knowledge is necessary for the understanding of the events which were about to happen.

The surface of Lake Erie covers about ten thousand square miles. It is nearly six hundred feet above sea level. It is joined on the northwest, by means of the Detroit River, with the still greater lakes to the westward, and receives their waters. It has also rivers of its own though of less importance, such as the Rocky, the Cuyahoga, and the Black. The lake empties at its northeastern end into Lake Ontario by means of Niagara River and its celebrated falls.

The greatest known depth of Lake Erie is over one hundred and thirty feet. Hence it will be seen that the mass of its waters is considerable. In short, this is a region of most magnificent lakes. The land, though not situated far northward, is exposed to the full sweep of the Arctic cold. The region to the northward is low, and the winds of winter rush down with extreme violence. Hence Lake Erie is sometimes frozen over from shore to shore.
The principal cities on the borders of this great lake are Buffalo at the east, which belongs to New York State, and Toledo in Ohio, at the west, with Cleveland and Sandusky, both Ohio cities, at the south. Smaller towns and villages are numerous along the shore. The traffic is naturally large, its annual value being estimated at considerably over two million dollars.

Our carriage followed a rough and little used road along the borders of the lake; and as we toiled along, Arthur Wells told me, what he had learned.

Less than two days before, on the afternoon of July twenty-seventh Wells had been riding on horseback toward the town of Herly. Five miles outside the town, he was riding through a little wood, when he saw, far up across the lake, a submarine which rose suddenly above the waves. He stopped, tied his horse, and stole on foot to the edge of the lake. There, from behind a tree he had seen with his own eyes seen this submarine advance toward him, and stop at the mouth of Black Rock Creek. Was it the famous machine for which the whole world was seeking, which thus came directly to his feet?

When the submarine was close to the rocks, two men climbed out upon its deck and stepped ashore. Was one of them this Master of the World, who had not been seen since he was reported from Lake Superior? Was this the mysterious "Terror" which had thus risen from the depths of Lake Erie?

"I was alone," said Wells. "Alone on the edge of the Creek. If you and your assistants, Mr. Strock had been there, we four against two, we would have been able to reach these men and seize them before they could have regained their boat and fled."

"Probably," I answered. "But were there no others on the boat with them? Still, if we had seized the two, we could at least have learned who they were."

"And above all," added Wells, "if one of them turned out to be the captain of the 'Terror'!"

"I have only one fear, Wells; this submarine, whether it is the one we seek or another, may have left the creek since your departure."

"We shall know about that in a few hours, now. Pray Heaven they are still there! Then when night comes?"

"But," I asked, "did you remain watching in the wood until night?"

"No; I left after an hour's watching, and rode straight for the telegraph station at Toledo. I reached there late at night and sent immediate word to Washington."

"That was night before last. Did you return yesterday to Black Rock Creek?"

"Yes."

"The submarine was still there?"

"In the same spot."

"And the two men?"

"The same two men. I judge that some accident had happened, and they came to this lonely spot to repair it."

"Probably so," said I. "Some damage which made it impossible for them to regain their usual hiding-place. If only they are still here!"

"I have reason to believe they will be, for quite a lot of stuff was taken out of the boat, and laid about upon the shore; and as well as I could discern from a distance they seemed to be working on board."

"Only the two men?"

"Only the two."

"But," protested I, "can two be sufficient to handle an apparatus of such speed, and of such intricacy, as to be at once automobile, boat and submarine?"

"I think not, Mr. Strock; but I only saw the same two. Several times they came to the edge of the little wood where I was hidden, and gathered sticks for a fire which they made upon the beach. The region is so uninhabited and the creek so hidden from the lake that they ran little danger of discovery. They seemed to know this."

"You would recognize them both again?"

"Perfectly. One was of middle size, vigorous, and quick of movement, heavily bearded. The other was smaller, but stocky and strong. Yesterday, as before, I left the wood about five o'clock and hurried back to Toledo. There I found a telegram from Mr. Ward, notifying me of your coming; and I awaited you at the station."

Summed up, then, the news amounted to this: For forty hours past a submarine, presumably the one we sought, had been hidden in Black Rock Creek, engaged in repairs. Probably these were absolutely necessary, and we should find the boat still there. As to how the "Terror" came to be in Lake Erie, Arthur Wells and I discussed that, and agreed that it was a very probable place for her. The last time she had been seen was on Lake Superior. From there to Lake Erie the machine could have come by the roads of Michigan, but since no one had remarked its passage and as both the police and the people were specially aroused and active in that portion of the country, it seemed more probable, that the "Terror" had come by water. There was a clear route through the chain of the Great Lakes and their rivers, by which in her character of a submarine she could easily proceed undiscovered.
And now, if the "Terror" had already left the creek, or if she escaped when we attempted to seize her, in what direction would she turn? In any case, there was little chance of following her. There were two torpedo-destroyers at the port of Buffalo, at the other extremity of Lake Erie. By treaty between the United States and Canada, there are no vessels of war whatever on the Great Lakes. These might, however, have been little launches belonging to the customs service. Before I left Washington Mr. Ward had informed me of their presence; and a telegram to their commanders would, if there were need, start them in pursuit of the "Terror." But despite their splendid speed, how could they vie with her! And if she plunged beneath the waters, they would be helpless. Moreover Arthur Wells averred that in case of a battle, the advantage would not be with the destroyers, despite their large crews, and many guns. Hence, if we did not succeed this night, the campaign would end in failure.

Arthur Wells knew Black Rock Creek thoroughly, having hunted there more than once. It was bordered in most places with sharp rocks against which the waters of the lake beat heavily. Its channel was some thirty feet deep, so that the "Terror" could take shelter either upon the surface or under water. In two or three places the steep banks gave way to sand beaches which led to little gorges reaching up toward the woods, two or three hundred feet.

It was seven in the evening when our carriage reached these woods. There was still daylight enough for us to see easily, even in the shade of the trees. To have crossed openly to the edge of the creek would have exposed us to the view of the men of the "Terror," if she were still there, and thus give her warning to escape.

"Had we better stop here?" I asked Wells, as our rig drew up to the edge of the woods.

"No, Mr. Strock," said he. "We had better leave the carriage deeper in the woods, where there will be no chance whatever of our being seen."

"Can the carriage drive under these trees?"

"It can," declared Wells. "I have already explored these woods thoroughly. Five or six hundred feet from here, there is a little clearing, where we will be completely hidden, and where our horses may find pasture. Then, as soon as it is dark, we will go down to the beach, at the edge of the rocks which shut in the mouth of the creek. Thus if the 'Terror' is still there, we shall stand between her and escape."

Eager as we all were for action, it was evidently best to do as Wells suggested and wait for night. The intervening time could well be occupied as he said. Leading the horses by the bridle, while they dragged the empty carriage, we proceeded through the heavy woods. The tall pines, the stalwart oaks, the cypress scattered here and there, made the evening darker overhead. Beneath our feet spread a carpet of scattered herbs, pine needles and dead leaves. Such was the thickness of the upper foliage that the last rays of the setting sun could no longer penetrate here. We had to feel our way; and it was not without some knocks that the carriage reached the clearing ten minutes later.

This clearing, surrounded by great trees, formed a sort of oval, covered with rich grass. Here it was still daylight, and the darkness would scarcely deepen for over an hour. There was thus time to arrange an encampment and to rest awhile after our hard trip over the rough and rocky roads.

Of course, we were intensely eager to approach the Creek and see if the "Terror" was still there. But prudence restrained us. A little patience, and the night-would enable us to reach a commanding position unsuspected. Wells urged this strongly; and despite my eagerness, I felt that he was right.

The horses were unharnessed, and left to browse under the care of the coachman who had driven us. The provisions were unpacked, and John Hart and Nab Walker spread out a meal on the grass at the foot of a superb cypress which recalled to me the forest odors of Morganton and Pleasant Garden. We were hungry and thirsty; and food and drink were not lacking. Then our pipes were lighted to calm the anxious moments of waiting that remained.

Silence reigned within the wood. The last song of the birds had ceased. With the coming of night the breeze fell little by little, and the leaves scarcely quivered even at the tops of the highest branches. The sky darkened rapidly after sundown and twilight deepened into obscurity.

I looked at my watch, it was half-past eight. "It is time, Wells."

"When you will, Mr. Strock."

"Then let us start."

We cautioned the coachman not to let the horses stray beyond the clearing. Then we started. Wells went in advance, I followed him, and John Hart and Nab Walker came behind. In the darkness, we three would have been helpless without the guidance of Wells. Soon we reached the farther border of the woods; and before us stretched the banks of Black Rock Creek.

All was silent; all seemed deserted. We could advance without risk. If the "Terror" was there, she had cast anchor behind the rocks. But was she there? That was the momentous question! As we approached the denouement of this exciting affair, my heart was in my throat.

Wells motioned to us to advance. The sand of the shore crunched beneath our steps. The two hundred feet between us and the mouth of the Creek were crossed softly, and a few minutes sufficed to bring us to the rocks at the
edge of the lake.

There was nothing! Nothing!
The spot where Wells had left the "Terror" twenty-four hours before was empty. The "Master of the World" was no longer at Black Rock Creek.

Chapter 12
BLACK ROCK CREEK
Human nature is prone to illusions. Of course, there had been all along a probability that the "Terror" had deserted the locality, even admitting that it was she Wells had seen the previous day. If some damage to her triple system of locomotion had prevented her from regaining either by land or by water her usual hiding-place, and obliged her to seek refuge in Black Rock Creek, what ought we to conclude now upon finding her here no longer? Obviously, that, having finished her repairs, she had continued on her way, and was already far beyond the waters of Lake Erie.

But probable as this result had been from the first, we had more and more ignored it as our trip proceeded. We had come to accept as a fact that we should meet the "Terror," that we should find her anchored at the base of the rocks where Wells had seen her.

And now what disappointment! I might even say, what despair! All our efforts gone for nothing! Even if the "Terror" was still upon the lake, to find her, reach her and capture her, was beyond our power, and it might as well be fully recognized beyond all human power.

We stood there, Wells and I, completely crushed, while John Hart and Nab Walker, no less chagrined, went tramping along the banks of the Creek, seeking any trace that had been left behind.

Posted there, at the mouth of the Creek, Wells and I exchanged scarcely a word. What need was there of words to enable us to understand each other! After our eagerness and our despair, we were now exhausted. Defeated in our well-planned attempt, we felt as unwilling to abandon our campaign, as we were unable to continue it.

Nearly an hour slipped by. We could not resolve to leave the place. Our eyes still sought to pierce the night. Sometimes a glimmer, due to the sparkle of the waters, trembled on the surface of the lake. Then it vanished, and with it the foolish hope that it had roused. Sometimes again, we thought we saw a shadow outlined against the dark, the silhouette of an approaching boat. Yet again some eddies would swirl up at our feet, as if the Creek had been stirred within its depths. These vain imaginings were dissipated one after the other. They were but the illusions raised by our strained fancies.

At length our companions rejoined us. My first question was, "Nothing new?"

"Nothing," said John Hart.
"You have explored both banks of the Creek?"
"Yes," responded Nab Walker, "as far as the shallow water above; and we have not seen even a vestige of the things which Mr. Wells saw laid on the shore."
"Let us wait awhile," said I, unable to resolve upon a return to the woods.
At that moment our attention was caught by a sudden agitation of the waters, which swelled upward at the foot of the rocks.
"It is like the swell from a vessel," said Wells.
"Yes," said I, instinctively lowering my voice. "What has caused it? The wind has completely died out. Does it come from something on the surface of the lake?"
"Or from something underneath," said Wells, bending forward, the better to determine.
The commotion certainly seemed as if caused by some boat, whether from beneath the water, or approaching the creek from outside upon the lake.
Silent, motionless, we strained eyes and ears to pierce the profound obscurity. The faint noise of the waves of the lake lapping on the shore beyond the creek, came to us distinctly through the night. John Hart and Nab Walker drew a little aside upon a higher ridge of rocks. As for me, I leaned close to the water to watch the agitation. It did not lessen. On the contrary it became momentarily more evident, and I began to distinguish a sort of regular throbbing, like that produced by a screw in motion.
"There is no doubt," declared Wells, leaning close to me, "there is a boat coming toward us."
"There certainly is," responded I, "unless they have whales or sharks in Lake Erie."
"No, it is a boat," repeated Wells. "Is she headed toward the mouth of the creek, or is she going further up it?"
"This is just where you saw the boat twice before?"
"Yes, just here."
"Then if this is the same one, and it can be no other, she will probably return to the same spot."
“There!” whispered Wells, extending his hand toward the entrance of the creek.

Our companions rejoined us, and all four, crouching low upon the bank, peered in the direction he pointed.

We vaguely distinguished a black mass moving through the darkness. It advanced very slowly and was still outside the creek, upon the lake, perhaps a cable's length to the northeast. We could scarcely hear even now the faint throbbing of its engines. Perhaps they had stopped and the boat was only gliding forward under their previous impulse.

It seemed, then, that this was indeed the submarine which Wells had watched, and it was returning to pass this night, like the last, within the shelter of the creek.

Why had it left the anchorage, if only to return? Had it suffered some new disaster, which again impaired its power? Or had it been before compelled to leave, with its repairs still unfinished? What cause constrained it to return here? Was there some imperious reason why it could no longer be turned into an automobile, and go darting away across the roads of Ohio?

To all these questions which came crowding upon me, I could give no answer. Furthermore both Wells and I kept reasoning under the assumption that this was really the "Terror" commanded by the "Master of the World" who had dated from it his letter of defiance to the government. Yet this premise was still unproven, no matter how confident we might feel of it.

Whatever boat this was, that stole so softly through the night, it continued to approach us. Assuredly its captain must know perfectly the channels and shores of Black Rock Creek, since he ventured here in such darkness. Not a light showed upon the deck. Not a single ray from within the cabin glimmered through any crevice.

A moment later, we heard some machinery moving very softly. The swell of the eddies grew stronger, and in a few moments the boat touched the quay.

This word "quay," only used in that region, exactly describes the spot. The rocks at our feet formed a level, five or six feet above the water, and descending to it perpendicularly, exactly like a landing wharf.

"We must not stop here," whispered Wells, seizing me by the arm.

"No," I answered, "they might see us. We must lie crouched upon the beach! Or we might hide in some crevice of the rocks."

"We will follow you."

There was not a moment to lose. The dark mass was now close at hand, and on its deck, but slightly raised above the surface of the water, we could trace the silhouettes of two men.

Were there, then, really only two on board? We stole softly back to where the ravines rose toward the woods above. Several niches in the rocks were at hand. Wells and I crouched down in one, my two assistants in another. If the men on the "Terror" landed, they could not see us; but we could see them, and would be able to act as opportunity offered.

There were some slight noises from the boat, a few words exchanged in our own language. It was evident that the vessel was preparing to anchor. Then almost instantly, a rope was thrown out, exactly on the point of the quay where we had stood.

Leaning forward, Wells could discern that the rope was seized by one of the mariners, who had leaped ashore. Then we heard a grappling-iron scrape along the ground.

Some moments later, steps crunched upon the sand. Two men came up the ravine, and went onward toward the edge of the woods, guiding their steps by a ship lantern.

Where were they going? Was Black Rock Creek a regular hiding place of the "Terror?" Had her commander a depot here for stores or provisions? Did they come here to restock their craft, when the whim of their wild voyaging brought them to this part of the continent? Did they know this deserted, uninhabited spot so well, that they had no fear of ever being discovered here?

"What shall we do?" whispered Wells.

"Wait till they return, and then--" My words were cut short by a surprise. The men were not thirty feet from us, when one of them chancing to turn suddenly, the light of their lantern fell full upon his face.

He was one of the two men who had watched before my house in Long Street! I could not be mistaken! I recognized him as positively as my old servant had done. It was he; it was assuredly one of the spies of whom I had never been able to find any further traces! There was no longer any doubt, my warning letter had come from them. It was therefore from the "Master of the World"; it had been written from the "T error" and this was the "Terror." Once more I asked myself what could be the connection between this machine and the Great Eyrie!

In whispered words, I told Wells of my discovery. His only comment was, "It is all incomprehensible!"

Meanwhile the two men had continued on their way to the woods, and were gathering sticks beneath the trees.

"What if they discover our encampment?" murmured Wells.

"No danger, if they do not go beyond the nearest trees."
"But if they do discover it?"
"They will hurry back to their boat, and we shall be able to cut off their retreat."

Toward the creek, where their craft lay, there was no further sound. I left my hiding-place; I descended the ravine to the quay; I stood on the very spot where the grappling-iron was fast among the rocks.

The "Terror" lay there, quiet at the end of its cable. Not a light was on board; not a person visible, either on the deck, or on the bank. Was not this my opportunity? Should I leap on board and there await the return of the two men?

"Mr. Strock!" It was Wells, who called to me softly from close at hand.

I drew back in all haste and crouched down beside him. Was it too late to take possession of the boat? Or would the attempt perhaps result in disaster from the presence of others watching on board?

At any rate, the two men with the lantern were close at hand returning down the ravine. Plainly they suspected nothing. Each carrying a bundle of wood, they came forward and stopped upon the quay.

Then one of them raised his voice, though not loudly. "Hullo! Captain!"

"All right," answered a voice from the boat.

Wells murmured in my ear, "There are three!"

"Perhaps four," I answered, "perhaps five or six!"

The situation grew more complicated. Against a crew so numerous, what ought we to do? The least imprudence might cost us dear! Now that the two men had returned, would they re-embark with their faggots? Then would the boat leave the creek, or would it remain anchored until day? If it withdrew, would it not be lost to us? It could leave the waters of Lake Erie, and cross any of the neighboring states by land; or it could retrace its road by the Detroit River which would lead it to Lake Huron and the Great Lakes above. Would such an opportunity as this, in the narrow waters of Black Rock Creek, ever occur again!

"At least," said I to Wells, "we are four. They do not expect attack; they will be surprised. The result is in the hands of Providence."

I was about to call our two men, when Wells again seized my arm. "Listen!" said he.

One of the men hailed the boat, and it drew close up to the rocks. We heard the Captain say to the two men ashore, "Everything is all right, up there?"

"Everything, Captain."

"There are still two bundles of wood left there?"

"Two."

"Then one more trip will bring them all on board the 'Terror.'"

The "Terror!" It WAS she!

"Yes; just one more trip," answered one of the men.

"Good; then we will start off again at daybreak."

Were there then but three of them on board? The Captain, this Master of the World, and these two men?

Evidently they planned to take aboard the last of their wood. Then they would withdraw within their machine, and go to sleep. Would not that be the time to surprise them, before they could defend themselves?

Rather than to attempt to reach and capture the ship in face of this resolute Captain who was guarding it, Wells and I agreed that it was better to let his men return unassailed, and wait till they were all asleep.

It was now half an hour after ten. Steps were once more heard upon the shore. The man with a lantern and his companion, again remounted the ravine toward the woods. When they were safely beyond hearing, Wells went to warn our men, while I stole forward again to the very edge of the water.

The "Terror" lay at the end of a short cable. As well as I could judge, she was long and slim, shaped like a spindle, without chimney, without masts, without rigging, such a shape as had been described when she was seen on the coast of New England.

I returned to my place, with my men in the shelter of the ravine; and we looked to our revolvers, which might well prove of service.

Five minutes had passed since the men reached the woods, and we expected their return at any moment. After that, we must wait at least an hour before we made our attack; so that both the Captain and his comrades might be deep in sleep. It was important that they should have not a moment either to send their craft darting out upon the waters of Lake Erie, or to plunge it beneath the waves where we would have been entrapped with it.

In all my career I have never felt such impatience. It seemed to me that the two men must have been detained in the woods. Something had barred their return.

Suddenly a loud noise was heard, the tumult of run-away horses, galloping furiously along the shore!

They were our own, which, frightened, and perhaps neglected by the driver, had broken away from the clearing, and now came rushing along the bank.
At the same moment, the two men reappeared, and this time they were running with all speed. Doubtless they had discovered our encampment, and had at once suspected that there were police hidden in the woods. They realized that they were watched, they were followed, they would be seized. So they dashed recklessly down the ravine, and after loosening the cable, they would doubtless endeavor to leap aboard. The “Terror” would disappear with the speed of a meteor, and our attempt would be wholly defeated!

"Forward," I cried. And we scrambled down the sides of the ravine to cut off the retreat of the two men.

They saw us and, on the instant, throwing down their bundles, fired at us with revolvers, hitting John Hart in the leg.

We fired in our turn, but less successfully. The men neither fell nor faltered in their course. Reaching the edge of the creek, without stopping to unloose the cable, they plunged overboard, and in a moment were clinging to the deck of the "Terror."

Their captain, springing forward, revolver in hand, fired. The ball grazed Wells.

Nab Walker and I seizing the cable, pulled the black mass of the boat toward shore. Could they cut the rope in time to escape us?

Suddenly the grappling-iron was torn violently from the rocks. One of its hooks caught in my belt, while Walker was knocked down by the flying cable. I was entangled by the iron and the rope and dragged forward--

The "Terror," driven by all the power of her engines, made a single bound and darted out across Black Rock Creek.

Chapter 13
ON BOARD THE TERROR

When I came to my senses it was daylight. A half light pierced the thick glass port-hole of the narrow cabin wherein someone had placed me--how many hours ago, I could not say! Yet it seemed to me by the slanting rays, that the sun could not be very far above the horizon.

I was resting in a narrow bunk with coverings over me. My clothes, hanging in a corner, had been dried. My belt, torn in half by the hook of the iron, lay on the floor.

I felt no wound nor injury, only a little weakness. If I had lost consciousness, I was sure it had not been from a blow. My head must have been drawn beneath the water, when I was tangled in the cable. I should have been suffocated, if someone had not dragged me from the lake.

Now, was I on board the "Terror?" And was I alone with the Captain and his two men? This seemed probable, almost certain. The whole scene of our encounter rose before my eyes, Hart lying wounded upon the bank; Wells firing shot after shot, Walker hurled down at the instant when the grappling hook caught my belt! And my companions? On their side, must not they think that I had perished in the waters of Lake Erie?

Where was the "Terror" now, and how was it navigating? Was it moving as an automobile? Speeding across the roads of some neighboring State? If so, and if I had been unconscious for many hours, the machine with its tremendous powers must be already far away. Or, on the other hand, were we, as a submarine, following some course beneath the lake?

No, the "Terror" was moving upon some broad liquid surface. The sunlight, penetrating my cabin, showed that the window was not submerged. On the other hand, I felt none of the jolting that the automobile must have suffered even on the smoothest highway. Hence the "Terror" was not traveling upon land.

As to deciding whether she was still traversing Lake Erie, that was another matter. Had not the Captain reascended the Detroit River, and entered Lake Huron, or even Lake Superior beyond? It was difficult to say.

At any rate I decided to go up on deck. From there I might be able to judge. Dragging myself somewhat heavily from the bunk, I reached for my clothes and dressed, though without much energy. Was I not probably locked within this cabin?

The only exit seemed by a ladder and hatchway above my head. The hatch rose readily to my hand, and I ascended half way on deck.

My first care was to look forward, backward, and on both sides of the speeding "Terror." Everywhere a vast expanse of waves! Not a shore in sight! Nothing but the horizon formed by sea and sky!

Whether it was a lake or the ocean I could easily settle. As we shot forward at such speed the water cut by the bow, rose furiously upward on either side, and the spray lashed savagely against me.

I tasted it. It was fresh water, and very probably that of Lake Erie. The sun was but midway toward the zenith so it could scarcely be more than seven or eight hours since the moment when the "Terror" had darted from Black Rock Creek.

This must therefore be the following morning, that of the thirty-first of July.
Considering that Lake Erie is two hundred and twenty miles long, and over fifty wide, there was no reason to be surprised that I could see no land, neither that of the United States to the southeast nor of Canada to the northwest.

At this moment there were two men on the deck, one being at the bow on the look-out, the other in the stern, keeping the course to the northeast, as I judged by the position of the sun. The one at the bow was he whom I had recognized as he ascended the ravine at Black Rock. The second was his companion who had carried the lantern. I looked in vain for the one whom they had called Captain. He was not in sight.

It will be readily appreciated how eager was my desire to stand in the presence of the creator of this prodigious machines of this fantastic personage who occupied and preoccupied the attention of all the world, the daring inventor who did not fear to engage in battle against the entire human race, and who proclaimed himself "Master of the World."

I approached the man on the look-out, and after a minute of silence I asked him, "Where is the Captain?"

He looked at me through half-closed eyes. He seemed not to understand me. Yet I knew, having heard him the night before, that he spoke English. Moreover, I noticed that he did not appear surprised to see me out of my cabin. Turning his back upon me, he continued to search the horizon.

I stepped then toward the stern, determined to ask the same question about the Captain. But when I approached the steersman, he waved me away with his hand, and I obtained no other response.

It only remained for me to study this craft, from which we had been repelled with revolver shots, when we had seized upon its anchor rope.

I therefore set leisurely to work to examine the construction of this machine, which was carrying me--whither? The deck and the upper works were all made of some metal which I did not recognize. In the center of the deck, a scuttle half raised covered the room where the engines were working regularly and almost silently. As I had seen before, neither masts, nor rigging! Not even a flagstaff at the stern! Toward the bow there arose the top of a periscope by which the "Terror" could be guided when beneath the water.

On the sides were folded back two sort of outshoots resembling the gangways on certain Dutch boats. Of these I could not understand the use.

In the bow there rose a third hatch-way which presumably covered the quarters occupied by the two men when the "Terror" was at rest.

At the stern a similar hatch gave access probably to the cabin of the captain, who remained unseen. When these different hatches were shut down, they had a sort of rubber covering which closed them hermetically tight, so that the water could not reach the interior when the boat plunged beneath the ocean.

As to the motor, which imparted such prodigious speed to the machine, I could see nothing of it, nor of the propeller. However, the fast speeding boat left behind it only a long, smooth wake. The extreme fineness of the lines of the craft, caused it to make scarcely any waves, and enabled it to ride lightly over the crest of the billows even in a rough sea.

As was already known, the power by which the machine was driven, was neither steam nor gasoline, nor any of those similar liquids so well known by their odor, which are usually employed for automobiles and submarines. No doubt the power here used was electricity, generated on board, at some high power. Naturally I asked myself whence comes this electricity, from piles, or from accumulators? But how were these piles or accumulators charged? Unless, indeed, the electricity was drawn directly from the surrounding air or from the water, by processes hitherto unknown. And I asked myself with intense eagerness if in the present situation, I might be able to discover these secrets.

Then I thought of my companions, left behind on the shore of Black Rock Creek. One of them, I knew, was wounded; perhaps the others were also. Having seen me dragged overboard by the hawser, could they possibly suppose that I had been rescued by the "Terror?" Surely not! Doubtless the news of my death had already been telegraphed to Mr. Ward from Toledo. And now who would dare to undertake a new campaign against this "Master of the World"?

These thoughts occupied my mind as I awaited the captain's appearance on the deck. He did not appear.

I soon began to feel very hungry; for I must have fasted now nearly twenty-four hours. I had eaten nothing since our hasty meal in the woods, even if that had been the night before. And judging by the pangs which now assailed my stomach, I began to wonder if I had not been snatched on board the "Terror" two days before,--or even more.

Happily the question if they meant to feed me, and how they meant to feed me, was solved at once. The man at the bow left his post, descended, and reappeared. Then, without saying a word, he placed some food before me and returned to his place. Some potted meat, dried fish, sea-biscuit, and a pot of ale so strong that I had to mix it with water, such was the meal to which I did full justice. My fellow travelers had doubtless eaten before I came out of the cabin, and they did not join me.

There was nothing further to attract my eyes, and I sank again into thought. How would this adventure finish?
Would I see this invisible captain at length, and would he restore me to liberty? Could I regain it in spite of him? That would depend on circumstances! But if the "Terror" kept thus far away from the shore, or if she traveled beneath the water, how could I escape from her? Unless we landed, and the machine became an automobile, must I not abandon all hope of escape?

Moreover--why should I not admit it?--to escape without having learned anything of the "Terror's" secrets would not have contented me at all. Although I could not thus far flatter myself upon the success of my campaign, and though I had come within a hairbreadth of losing my life and though the future promised far more of evil than of good, yet after all, a step forward had been attained. To be sure, if I was never to be able to re-enter into communication with the world, if, like this Master of the World who had voluntarily placed himself outside the law, I was now placed outside humanity, then the fact that I had reached the "Terror" would have little value.

The craft continued headed to the northeast, following the longer axis of Lake Erie. She was advancing at only half speed; for, had she been doing her best, she must some hours before have reached the northeastern extremity of the lake.

At this end Lake Erie has no other outlet than the Niagara River, by which it empties into Lake Ontario. Now, this river is barred by the famous cataract some fifteen miles beyond the important city of Buffalo. Since the "Terror" had not retreated by the Detroit River, down which she had descended from the upper lakes, how was she to escape from these waters, unless indeed she crossed by land?

The sun passed the meridian. The day was beautiful; warm but not unpleasantly so, thanks to the breeze made by our passage. The shores of the lake continued invisible on both the Canadian and the American side.

Was the captain determined not to show himself? Had he some reason for remaining unknown? Such a precaution would indicate that he intended to set me at liberty in the evening, when the "Terror" could approach the shore unseen.

Toward two o'clock, however, I heard a slight noise; the central hatchway was raised. The man I had so impatiently awaited appeared on deck.

I must admit he paid no more attention to me, than his men had done. Going to the stern, he took the helm. The man whom he had relieved, after a few words in a low tone, left the deck, descending by the forward hatchway. The captain, having scanned the horizon, consulted the compass, and slightly altered our course. The speed of the "Terror" increased.

This man, so interesting both to me and to the world, must have been some years over fifty. He was of middle height, with powerful shoulders still very erect; a strong head, with thick hair rather gray than white, smooth shaven cheeks, and a short, crisp beard. His chest was broad, his jaw prominent, and he had that characteristic sign of tremendous energy, bushy eyebrows drawn sharply together. Assuredly he possessed a constitution of iron, splendid health, and warm red blood beneath his sun burned skin.

Like his companions the captain was dressed in sea-clothes covered by an oil-skin coat, and with a woolen cap which could be pulled down to cover his head entirely, when he so desired.

Need I add that the captain of the "Terror" was the other of the two men, who had watched my house in Long street. Moreover, if I recognized him, he also must recognize me as chief-inspector Strock, to whom had been assigned the task of penetrating the Great Eyrie.

I looked at him curiously. On his part, while he did not seek to avoid my eyes, he showed at least a singular indifference to the fact that he had a stranger on board.

As I watched him, the idea came to me, a suggestion which I had not connected with the first view of him in Washington, that I had already seen this characteristic figure. Was it in one of the photographs held in the police department, or was it merely a picture in some shop window? But the remembrance was very vague. Perhaps I merely imagined it.

Well, though his companions had not had the politeness to answer me, perhaps he would be more courteous. He spoke the same language as I, although I could not feel quite positive that he was of American birth. He might indeed have decided to pretend not to understand me, so as to avoid all discussion while he held me prisoner.

In that case, what did he mean to do with me? Did he intend to dispose of me without further ceremony? Was he only waiting for night to throw me overboard? Did even the little which I knew of him, make me a danger of which he must rid himself? But in that case, he might better have left me at the end of his anchor line. That would have saved him the necessity of drowning me over again.

I turned, I walked to the stern, I stopped full in front of him. Then, at length, he fixed full upon me a glance that burned like a flame.

"Are you the captain?" I asked.
He was silent.
"This boat! Is it really the 'Terror'?

To this question also there was no response. Then I reached toward him; I would have taken hold of his arm.
He repelled me without violence, but with a movement that suggested tremendous restrained power.
Planting myself again before him, I demanded in a louder tone, "What do you mean to do with me?"
Words seemed almost ready to burst from his lips, which he compressed with visible irritation. As though to check his speech he turned his head aside. His hand touched a regulator of some sort, and the machine rapidly increased its speed.

Anger almost mastered me. I wanted to cry out "So be it! Keep your silence! I know who you are, just as I know your machine, recognized at Madison, at Boston, at Lake Kirdall. Yes; it is you, who have rushed so recklessly over our roads, our seas and our lakes! Your boat is the 'Terror' and you her commander, wrote that letter to the government. It is you who fancy you can fight the entire world. You, who call yourself the Master of the World!"

And how could he have denied it! I saw at that moment the famous initials inscribed upon the helm!
Fortunately I restrained myself; and despairing of getting any response to my questions, I returned to my seat near the hatchway of my cabin.

For long hours, I patiently watched the horizon in the hope that land would soon appear. Yes, I sat waiting! For I was reduced to that! Waiting! No doubt, before the day closed, the "Terror" must reach the end of Lake Erie, since she continued her course steadily to the northeast.

Chapter 14
NIAGARA
The hours passed, and the situation did not change. The steersman returned on deck, and the captain, descending, watched the movement of the engines. Even when our speed increased, these engines continued working without noise, and with remarkable smoothness. There was never one of those inevitable breaks, with which in most motors the pistons sometimes miss a stroke. I concluded that the "Terror," in each of its transformations must be worked by rotary engines. But I could not assure myself of this.

For the rest, our direction did not change. Always we headed toward the northeast end of the lake, and hence toward Buffalo.

Why, I wondered, did the captain persist in following this route? He could not intend to stop at Buffalo, in the midst of a crowd of boats and shipping of every kind. If he meant to leave the lake by water, there was only the Niagara River to follow; and its Falls would be impassable, even to such a machine as this. The only escape was by the Detroit River, and the "Terror" was constantly leaving that farther behind.

Then another idea occurred to me. Perhaps the captain was only waiting for night to return to the shore of the lake. There, the boat, changed to an automobile, would quickly cross the neighboring States. If I did not succeed in making my escape, during this passage across the land, all hope of regaining my liberty would be gone.

True, I might learn where this Master of the World hid himself. I might learn what no one had yet been able to discover, assuming always that he did not dispose of me at one time or another--and what I expected his "disposal" would be, is easily comprehended.

I knew the northeast end of Lake Erie well, having often visited that section of New York State which extends westward from Albany to Buffalo. Three years before, a police mission had led me to explore carefully the shores of the Niagara River, both above and below the cataract and its Suspension Bridge. I had visited the two principal islands between Buffalo and the little city of Niagara Falls, I had explored Navy Island and also Goat Island, which separates the American falls from those of the Canadian side.

Thus if an opportunity for flight presented itself, I should not find myself in an unknown district. But would this chance offer? And at heart, did I desire it, or would I seize upon it? What secrets still remained in this affair in which good fortune or was it evil fortune--had so closely entangled me!

On the other hand, I saw no real reason to suppose that there was any chance of my reaching the shores of the Niagara River. The "Terror" would surely not venture into this trap which had no exit. Probably she would not even go to the extremity of the lake.

Such were the thoughts that spun through my excited brain, while my eyes remained fixed upon the empty horizon.

And always one persistent question remained insolvable. Why had the captain written to me personally that threatening letter? Why had he spied upon me in Washington? What bond attached him to the Great Eyrie? There might indeed be subterranean canals which gave him passage to Lake Kirdall, but could he pierce the impenetrable fortress of the Eyrie? No! That was beyond him!

Toward four o'clock in the afternoon, reckoning by the speed of the "Terror" and her direction, I knew we must be approaching Buffalo; and indeed, its outlines began to show some fifteen miles ahead. During our passage, a few
boats had been seen, but we had passed them at a long distance, a distance which our captain could easily keep as great as he pleased. Moreover, the "Terror" lay so low upon the water, that at even a mile away it would have been difficult to discover her.

Now, however, the hills encircling the end of Lake Erie, came within vision, beyond Buffalo, forming the sort of funnel by which Lake Erie pours its waters into the channel of the Niagara river. Some dunes rose on the right, groups of trees stood out here and there. In the distance, several freight steamers and fishing smacks appeared. The sky became spotted with trails of smoke, which were swept along by a light eastern breeze.

What was our captain thinking of in still heading toward the port of Buffalo! Did not prudence forbid him to venture further? At each moment, I expected that he would give a sweep of the helm and turn away toward the western shore of the lake. Or else, I thought, he would prepare to plunge beneath the surface. But this persistence in holding our bow toward Buffalo was impossible to understand!

At length the helmsman, whose eyes were watching the northeastern shore, made a sign to his companion. The latter, leaving the bow, went to the central hatchway, and descended into the engine room. Almost immediately the captain came on deck, and joining the helmsman, spoke with him in a low voice.

The latter, extending his hand toward Buffalo, pointed out two black spots, which showed five or six miles distant on the starboard side. The captain studied them attentively. Then shrugging his shoulders, he seated himself at the stern without altering the course of the "Terror."

A quarter of an hour later, I could see plainly that there were two smoke clouds at the point they had studied so carefully. Little by little the black spots beneath these became more defined. They were two long, low steamers, which, coming from the port of Buffalo, were approaching rapidly.

Suddenly it struck me that these were the two torpedo destroyers of which Mr. Ward had spoken, and which I had been told to summon in case of need.

These destroyers were of the newest type, the swiftest boats yet constructed in the country. Driven by powerful engines of the latest make, they had covered almost thirty miles an hour. It is true, the "Terror" commanded an even greater speed, and always, if she were surrounded so that flight was impossible, she could submerge herself out of reach of all pursuit. In truth, the destroyers would have had to be submarines to attack the "Terror" with any chance of success. And I know not, if even in that case, the contest would have been equal.

Meanwhile, it seemed to me evident that the commanders of the two ships had been warned, perhaps by Mr. Wells who, returning swiftly to Toledo, might have telegraphed to them the news of our defeat. It appeared, moreover, that they had seen the "Terror," for they were headed at full speed toward her. Yet our captain, seemingly giving them no thought whatever, continued his course toward the Niagara River.

What would the torpedo destroyers do? Presumably, they would maneuver so as to seek to shut the "Terror" within the narrowing end of the lake where the Niagara offered her no passage.

Our captain now took the helm. One of the men was at the bow, the other in the engine room. Would the order be given for me to go down into the cabin?

It was not, to my extreme satisfaction. To speak frankly, no one paid any attention to me. It was as if I had not been on board. I watched, therefore, not without mixed emotions, the approach of the destroyers. Less than two miles distant now they separated in such a way as to hold the "Terror" between their fires.

As to the Master of the World, his manner indicated only the most profound disdain. He seemed sure that these destroyers were powerless against him. With a touch to his machinery he could distance them, no matter what their speed! With a few turns of her engine, the "Terror" would dart beyond their cannon shots! Or, in the depths of the lake, what projectiles could find the submarine?

Five minutes later, scarcely a mile separated us from the two powerful fighters which pursued us. Our captain permitted them to approach still closer. Then he pressed upon a handle. The "Terror," doubling the action of her propellers, leaped across the surface of the lake. She played with the destroyers! Instead of turning in flight, she continued her forward course. Who knew if she would not even have the audacity to pass between her two enemies, to coax them after her, until the hour when, as night closed in, they would be forced to abandon the useless pursuit!

The city of Buffalo was now in plain view on the border of the lake. I saw its huge buildings, its church towers, its grain elevators. Only four or five miles ahead, Niagara river opened to the northward.

Under these new conditions which way should I turn? When we passed in front of the destroyers, or perhaps between them, should I not throw myself into the waters I was a good swimmer, and such a chance might never occur again. The captain could not stop to recapture me. By diving could I not easily escape, even from a bullet? I should surely be seen by one or other of the pursuers. Perhaps, even, their commanders had been warned of my presence on board the "Terror." Would not a boat be sent to rescue me?

Evidently my chance of success would be even greater, if the "Terror" entered the narrow waters of Niagara River. At Navy Island I would be able to set foot on territory that I knew well. But to suppose that our captain would
rush into this river where he might be swept over the great cataract! That seemed impossible! I resolved to await the destroyers' closest approach and at the last moment I would decide.

Yet my resolution to escape was but half-hearted. I could not resign myself thus to lose all chance of following up this mystery. My instincts as a police official revolted. I had but to reach out my hand in order to seize this man who had been outlawed! Should I let him escape me! No! I would not save myself! Yet, on the other hand, what fate awaited me, and where would I be carried by the "Terror," if I remained on board?

It was a quarter past six. The destroyers, quivering and trembling under the strain of their speed, gained on us perceptibly. They were now directly astern, leaving between them a distance of twelve or fifteen cable lengths. The "Terror," without increasing her speed, saw one of them approach on the port side, the other to starboard.

I did not leave my place. The man at the bow was close by me. Immovable at the helm, his eyes burning beneath his contracted brows, the captain waited. He meant, perhaps, to finish the chase by one last maneuver.

Suddenly, a puff of smoke rose from the destroyer on our left. A projectile, brushing the surface of the water, passed in front of the "Terror," and sped beyond the destroyer on our right.

I glanced around anxiously. Standing by my side, the lookout seemed to await a sign from the captain. As for him, he did not even turn his head; and I shall never forget the expression of disdain imprinted on his visage.

At this moment, I was pushed suddenly toward the hatchway of my cabin, which was fastened above me. At the same instant the other hatchways were closed; the deck became watertight. I heard a single throb of the machinery, and the plunge was made, the submarine disappeared beneath the waters of the lake.

Cannon shot still boomed above us. Their heavy echo reached my ear; then everything was peace. Only a faint light penetrated through the porthole into my cabin. The submarine, without the least rolling or pitching, sped silently through the deeps.

I had seen with what rapidity, and also with what ease the transformation of the "Terror" had been made. No less easy and rapid, perhaps, would be her change to an automobile.

And now what would this Master of the World do? Presumably he would change his course, unless, indeed, he preferred to speed to land, and there continue his route along the roads. It still seemed more probable, however, that he would turn back toward the west, and after distancing the destroyers, regain the Detroit River. Our submersion would probably only last long enough to escape out of cannon range, or until night forbade pursuit.

Fate, however, had decreed a different ending to this exciting chase. Scarce ten minutes had passed when there seemed some confusion on board. I heard rapid words exchanged in the engine room. The steadily moving machinery became noisy and irregular. At once I suspected that some accident compelled the submarine to reascend.

I was not mistaken. In a moment, the semi-obscurity of my cabin was pierced by sunshine. The "Terror" had risen above water. I heard steps on the deck, and the hatchways were re-opened, including mine. I sprang up the ladder.

The captain had resumed his place at the helm, while the two men were busy below. I looked to see if the destroyers were still in view. Yes! Only a quarter of a mile away! The "Terror" had already been seen, and the powerful vessels which enforced the mandates of our government were swinging into position to give chase. Once more the "Terror" sped in the direction of Niagara River.

I must confess, I could make nothing of this maneuver. Plunging into a cul-de-sac, no longer able to seek the depths because of the accident, the "Terror" might, indeed, temporarily distance her pursuers; but she must find her path barred by them when she attempted to return. Did she intend to land, and if so, could she hope to outrun the telegrams which would warn every police agency of her approach?

We were now not half a mile ahead. The destroyers pursued us at top speed, though being now directly behind, they were in poor position for using their guns. Our captain seemed content to keep this distance; though it would have been easy for him to increase it, and then at nightfall, to dodge back behind the enemy.

Already Buffalo had disappeared on our right, and a little after seven o'clock the opening of the Niagara River appeared ahead. If he entered there, knowing that he could not return, our captain must have lost his mind! And in truth was he not insane, this man who proclaimed himself, who believed himself, Master of the World?

I watched him there, calm, impassive not even turning his head to note the progress of the destroyers and I wondered at him.

This end of the lake was absolutely deserted. Freight steamers bound for the towns on the banks of the upper Niagara are not numerous, as its navigation is dangerous. Not one was in sight. Not even a fishing-boat crossed the path of the "Terror." Even the two destroyers would soon be obliged to pause in their pursuit, if we continued our mad rush through these dangerous waters.

I have said that the Niagara River flows between New York and Canada. Its width, of about three quarters of a mile, narrows as it approaches the falls. Its length, from Lake Erie to Lake Ontario, is about fifteen leagues. It flows in a northerly direction, until it empties the waters of Lake Superior, Michigan, Huron, and Erie into Ontario, the last
lake of this mighty chain. The celebrated falls, which occur in the midst of this great river have a height of over a hundred and fifty feet. They are called sometimes the Horse-shoe Falls, because they curve inward like the iron shoe. The Indians have given them the name of “Thunder of Waters,” and in truth a mighty thunder roars from them without cessation, and with a tumult which is heard for several miles away.

Between Lake Erie, and the little city of Niagara Falls, two islands divide the current of the river, Navy Island, a league above the cataract, and Goat Island, which separates the American and the Canadian Falls. Indeed, on the lower point of this latter isle stood once that “Terrapin Tower” so daringly built in the midst of the plunging waters on the very edge of the abyss. It has been destroyed; for the constant wearing away of the stone beneath the cataract makes the ledge move with the ages slowly up the river, and the tower has been drawn into the gulf.

The town of Fort Erie stands on the Canadian shore at the entrance of the river. Two other towns are set along the banks above the falls, Schlosser on the right bank, and Chippewa on the left, located on either side of Navy Island. It is at this point that the current, bound within a narrower channel, begins to move at tremendous speed, to become two miles further on, the celebrated cataract.

The “Terror” had already passed Fort Erie. The sun in the west touched the edge of the Canadian horizon, and the moon, faintly seen, rose above the mists of the south. Darkness would not envelop us for another hour.

The destroyers, with huge clouds of smoke streaming from their funnels, followed us a mile behind. They sped between banks green with shade trees and dotted with cottages which lay along lovely gardens.

Obviously the “Terror” could no longer turn back. The destroyers shut her in completely. It is true their commanders did not know, as I did, that an accident to her machinery had forced her to the surface, and that it was impossible for her to escape them by another plunge. Nevertheless, they continued to follow, and would assuredly maintain their pursuit to the very last.

I marveled at the intrepidity of their chase through these dangerous waters. I marveled still more at the conduct of our captain. Within a half hour now, his course would be barred by the cataract. No matter how perfect his machine, it could not escape the power of the great falls. If the current once mastered our engines, we should inevitably disappear in the gulf nearly two hundred feet deep which the waters have dug at the base of the fall! Perhaps, however, our captain had still power to turn to one of the shores and flee by the automobile routes.

In the midst of this excitement, what action should I take personally? Should I attempt to gain the shores of Navy Island, if we indeed advanced that far? If I did not seize this chance, never after what I had learned of his secrets, never would the Master of the World restore me to liberty.

I suspected, however, that my flight was no longer possible. If I was not confined within my cabin, I no longer remained unwatched. While the captain retained his place at the helm, his assistant by my side never removed his eyes from me. At the first movement, I should be seized and locked within my room. For the present, my fate was evidently bound up with that of the “Terror.”

The distance which separated us from the two destroyers was now growing rapidly less. Soon they were but a few cable-lengths away. Could the motor of the “Terror,” since the accident, no longer hold its speeds? Yet the captain showed not the least anxiety, and made no effort to reach land!

We could hear the hissing of the steam which escaped from the valves of the destroyers, to mingle with the streamers of black smoke. But we heard, even more plainly, the roar of the cataract, now less than three miles away.

The “Terror” took the left branch of the river in passing Navy Island. At this point, she was within easy reach of the shore, yet she shot ahead. Five minutes later, we could see the first trees of Goat Island. The current became more and more irresistible. If the “Terror” did not stop, the destroyers could not much longer follow her. If it pleased our accursed captain to plunge us into the vortex of the falls, surely they did not mean to follow into the abyss!

Indeed, at this moment they signaled each other, and stopped the pursuit. They were scarce more than six hundred feet from the cataract. Then their thunders burst on the air and several cannon shot swept over the “Terror” without hitting its low-lying deck.

The sun had set, and through the twilight the moon’s rays shone upon us from the south. The speed of our craft, doubled by the speed of the current, was prodigious! In another moment, we should plunge into that black hollow which forms the very center of the Canadian Falls.

With an eye of horror, I saw the shores of Goat Island flashed by, then came the Isles of the Three Sisters, drowned in the spray from the abyss.

I sprang up; I started to throw myself into the water, in the desperate hope of gaining this last refuge. One of the men seized me from behind.

Suddenly a sharp noise was heard from the mechanism which throbbed within our craft. The long gangways folded back on the sides of the machine, spread out like wings, and at the moment when the “Terror” reached the very edge of the falls, she arose into space, escaping from the thundering cataract in the center of a lunar rainbow.
Chapter 15
THE EAGLE'S NEST

On the morrow, when I awoke after a sound sleep, our vehicle seemed motionless. It seemed to me evident that we were not running upon land. Yet neither were we rushing through or beneath the waters; nor yet soaring across the sky. Had the inventor regained that mysterious hiding-place of his, where no human being had ever set foot before him?

And now, since he had not disembarrassed himself of my presence, was his secret about to be revealed to me?

It seemed astonishing that I had slept so profoundly during most of our voyage through the air. It puzzled me and I asked if this sleep had not been caused by some drug, mixed with my last meal, the captain of the "Terror" having wished thus to prevent me from knowing the place where we landed. All that I can recall of the previous night is the terrible impression made upon me by that moment when the machine, instead of being caught in the vortex of the cataract rose under the impulse of its machinery like a bird with its huge wings beating with tremendous power!

So this machine actually fulfilled a four-fold use! It was at the same time automobile, boat, submarine, and airship. Earth, sea and air,—it could move through all three elements! And with what power! With what speed! All few instants sufficed to complete its marvelous transformations. The same engine drove it along all its courses! And I had been a witness of its metamorphoses! But that of which I was still ignorant, and which I could perhaps discover, was the source of the energy which drove the machine, and above all, who was the inspired inventor who, after having created it, in every detail, guided it with so much ability and audacity!

At the moment when the "Terror" rose above the Canadian Falls, I was held down against the hatchway of my cabin. The clear, moonlit evening had permitted me to note the direction taken by the air-ship. It followed the course of the river and passed the Suspension Bridge three miles below the falls. It is here that the irresistible rapids of the Niagara River begin, where the river bends sharply to descend toward Lake Ontario.

On leaving this point, I was sure that we had turned toward the east. The captain continued at the helm. I had not addressed a word to him. What good would it do? He would not have answered. I noted that the "Terror" seemed to be guided in its course through the air with surprising ease. Assuredly the roads of the air were as familiar to it as those of the seas and of the lands!

In the presence of such results, could one not understand the enormous pride of this man who proclaimed himself Master of the World? Was he not in control of a machine infinitely superior to any that had ever sprung from the hand of man, and against which men were powerless? In truth, why should he sell this marvel? Why should he accept the millions offered him? Yes, I comprehended now that absolute confidence in himself which was expressed in his every attitude. And where might not his ambition carry him, if by its own excess it mounted some day into madness!

A half hour after the "Terror" soared into the air, I had sunk into complete unconsciousness, without realizing its approach. I repeat, it must have been caused by some drug. Without doubt, our commander did not wish me to know the road he followed.

Hence I cannot say whether the aviator continued his flight through space, or whether the mariner sailed the surface of some sea or lake, or the chauffeur sped across the American roads. No recollection remains with me of what passed during that night of July thirty-first.

Now, what was to follow from this adventure? And especially concerning myself, what would be its end?

I have said that at the moment when I awoke from my strange sleep, the "Terror" seemed to me completely motionless. I could hardly be mistaken; whatever had been her method of progress, I should have felt some movement, even in the air. I lay in my berth in the cabin, where I had been shut in without knowing it, just as I had been on the preceding night which I had passed on board the "Terror" on Lake Erie.

My business now was to learn if I would be allowed to go on deck here where the machine had landed. I attempted to raise the hatchway. It was fastened.

"Ah!" said I, "am I to be kept here until the 'Terror' recommences its travels?" Was not that, indeed, the only time when escape was hopeless?

My impatience and anxiety may be appreciated. I knew not how long this halt might continue.

I had not a quarter of an hour to wait. A noise of bars being removed came to my ear. The hatchway was raised from above. A wave of light and air penetrated my cabin.

With one bound I reached the deck. My eyes in an instant swept round the horizon.

The "Terror," as I had thought, rested quiet on the ground. She was in the midst of a rocky hollow measuring from fifteen to eighteen hundred feet in circumference. A floor of yellow gravel carpeted its entire extent, unrelieved by a single tuft of herbage.

This hollow formed an almost regular oval, with its longer diameter extending north and south. As to the
surrounding-wall, what was its height, what the character of its crest, I could not judge. Above us was gathered a fog so heavy, that the rays of the sun had not yet pierced it. Heavy trails of cloud drifted across the sandy floor, Doubtless the morning was still young, and this mist might later be dissolved.

It was quite cold here, although this was the first day of August. I concluded therefore that we must be far in the north, or else high above sea-level. We must still be somewhere on the New Continent; though where, it was impossible to surmise. Yet no matter how rapid our flight had been, the air-ship could not have traversed either ocean in the dozen hours since our departure from Niagara.

At this moment, I saw the captain come from an opening in the rocks, probably a grotto, at the base of this cliff hidden in the fog. Occasionally, in the mists above, appeared the shadows of huge birds. Their raucous cries were the sole interruption to the profound silence. Who knows if they were not affrighted by the arrival of this formidable, winged monster, which they could not match either in might or speed.

Everything led me to believe that it was here that the Master of the World withdrew in the intervals between his prodigious journeys. Here was the garage of his automobile; the harbor of his boat; the hangar of his air-ship.

And now the "Terror" stood motionless at the bottom of this hollow. At last I could examine her; and it looked as if her owners had no intention of preventing me. The truth is that the commander seemed to take no more notice of my presence than before. His two companions joined him, and the three did not hesitate to enter together into the grotto I had seen. What a chance to study the machine, at least its exterior! As to its inner parts, probably I should never get beyond conjecture.

In fact, except for that of my cabin, the hatchways were closed; and it would be vain for me to attempt to open them. At any rate, it might be more interesting to find out what kind of propeller drove the "Terror" in these many transformations.

I jumped to the ground and found I was left at leisure, to proceed with this first examination.

The machine was as I have said spindle-shaped. The bow was sharper than the stern. The body was of aluminium, the wings of a substance whose nature I could not determine. The body rested on four wheels, about two feet in diameter. These had pneumatic tires so thick as to assure ease of movement at any speed. Their spokes spread out like paddles or battledores; and when the "Terror" moved either on or under the water, they must have increased her pace.

These wheels were not however, the principal propeller. This consisted of two "Parsons" turbines placed on either side of the keel. Driven with extreme rapidity by the engine, they urged the boat onward in the water by twin screws, and I even questioned if they were not powerful enough to propel the machine through the air.

The chief aerial support, however, was that of the great wings, now again in repose, and folded back along the sides. Thus the theory of the "heavier than air" flying machine was employed by the inventor, a system which enabled him to dart through space with a speed probably superior to that of the largest birds.

As to the agent which set in action these various mechanisms, I repeat, it was, it could be, no other than electricity. But from what source did his batteries get their power? Had he somewhere an electric factory, to which he must return? Were the dynamos, perhaps working in one of the caverns of this hollow?

The result of my examination was that, while I could see that the machine used wheels and turbine screws and wings, I knew nothing of either its engine, nor of the force which drove it. To be sure, the discovery of this secret would be of little value to me. To employ it I must first be free. And after what I knew--little as that really was--the Master of the World would never release me.

There remained, it is true, the chance of escape. But would an opportunity ever present itself? If there could be none during the voyages of the "Terror," might there possibly be, while we remained in this retreat?

The first question to be solved was the location of this hollow. What communication did it have with the surrounding region? Could one only depart from it by a flying-machine? And in what part of the United States were we? Was it not reasonable to estimate, that our flight through the darkness had covered several hundred leagues?

There was one very natural hypothesis which deserved to be considered, if not actually accepted. What more natural harbor could there be for the "Terror" than the Great Eyrie? Was it too difficult a flight for our aviator to reach the summit? Could he not soar anywhere that the vultures and the eagles could? Did not that inaccessible Eyrie offer to the Master of the World just such a retreat as our police had been unable to discover, one in which he might well believe himself safe from all attacks? Moreover, the distance between Niagara Falls and this part of the Blue Ridge Mountains, did not exceed four hundred and fifty miles, a flight which would have been easy for the "Terror."

Yes, this idea more and more took possession of me. It crowded out a hundred other unsupported suggestions. Did not this explain the nature of the bond which existed between the Great Eyrie and the letter which I had received with our commander's initials? And the threats against me if I renewed the ascent! And the espionage to which I had been subjected! And all the phenomena of which the Great Eyrie had been the theater, were they not to be attributed...
to this same cause—though what lay behind the phenomena was not yet clear? Yes, the Great Eyrie! The Great Eyrie!

But since it had been impossible for me to penetrate here, would it not be equally impossible for me to get out again, except upon the "Terror?" Ah, if the mists would but lift! Perhaps I should recognize the place. What was as yet a mere hypothesis, would become a starting point to act upon.

However, since I had freedom to move about, since neither the captain nor his men paid any heed to me, I resolved to explore the hollow. The three of them were all in the grotto toward the north end of the oval. Therefore I would commence my inspection at the southern end.

Reaching the rocky wall, I skirted along its base and found it broken by many crevices; above, arose more solid rocks of that feldspar of which the chain of the Alleghanies largely consists. To what height the rock wall rose, or what was the character of its summit, was still impossible to see. I must wait until the sun had scattered the mists.

In the meantime, I continued to follow along the base of the cliff. None of its cavities seemed to extend inward to any distance. Several of them contained debris from the hand of man, bits of broken wood, heaps of dried grasses. On the ground were still to be seen the footprints that the captain and his men must have left, perhaps months before, upon the sand.

My jailers, being doubtless very busy in their cabin, did not show themselves until they had arranged and packed several large bundles. Did they purpose to carry those on board the "Terror?" And were they packing up with the intention of permanently leaving their retreat?

In half an hour my explorations were completed and I returned toward the center. Here and there were heaped up piles of ashes, bleached by weather. There were fragments of burned planks and beams; posts to which clung rusted iron-work; armatures of metal twisted by fire; all the remnants of some intricate mechanism destroyed by the flames.

Clearly at some period not very remote the hollow had been the scene of a conflagration, accidental or intentional. Naturally I connected this with the phenomena observed at the Great Eyrie, the flames which rose above the crest, the noises which had so frightened the people of Pleasant Garden and Morganton. But of what mechanisms were these the fragments, and what reason had our captain for destroying them?

At this moment I felt a breath of air; a breeze came from the east. The sky swiftly cleared. The hollow was filled with light from the rays of the sun which appeared midway between the horizon and the zenith.

A cry escaped me! The crest of the rocky wall rose a hundred feet above me. And on the eastern side was revealed that easily recognizable pinnacle, the rock like a mounting eagle. It was the same that had held the attention of Mr. Elias Smith and myself, when we had looked up at it from the outer side of the Great Eyrie.

Thus there was no further doubt. In its flight during the night the airship had covered the distance between Lake Erie and North Carolina. It was in the depth of this Eyrie that the machine had found shelter! This was the nest, worthy of the gigantic and powerful bird created by the genius of our captain! The fortress whose mighty walls none but he could scale! Perhaps even, he had discovered in the depths of some cavern, some subterranean passage by which he himself could quit the Great Eyrie, leaving the "Terror" safely sheltered within.

At last I saw it all! This explained the first letter sent me from the Great Eyrie itself with the threat of death. If we had been able to penetrate into this hollow, who knows if the secrets of the Master of the World might not have been discovered before he had been able to set them beyond our reach?

I stood there, motionless; my eyes fixed on that mounting eagle of stone, prey to a sudden, violent emotion. Whatsoever might be the consequences to myself, was it not my duty to destroy this machine, here and now, before it could resume its menacing flight of mastery across the world!

Steps approached behind me. I turned. The inventor stood by my side, and pausing looked me in the face.

I was unable to restrain myself; the words burst forth—"The Great Eyrie! The Great Eyrie!"

"Yes, Inspector Strock."

"And you! You are the Master of the World?"

"Of that world to which I have already proved myself to be the most powerful of men."

"You!" I reiterated, stupefied with amazement.

"I," responded he, drawing himself up in all his pride, "I, Robur--Robur, the Conqueror!"

Chapter 16

ROBUR, THE CONQUEROR

Robur, the Conqueror! This then was the likeness I had vaguely recalled. Some years before the portrait of this extraordinary man had been printed in all the American newspapers, under date of the thirteenth of June, the day after this personage had made his sensational appearance at the meeting of the Weldon Institute at Philadelphia.

I had noted the striking character of the portrait at the time; the square shoulders; the back like a regular
trapezoid, its longer side formed by that geometrical shoulder line; the robust neck; the enormous spheroidal head.
The eyes at the least emotion, burned with fire, while above them were the heavy, permanently contracted brows,
which signified such energy. The hair was short and crisp, with a glitter as of metal in its lights. The huge breast rose
and fell like a blacksmith's forge; and the thighs, the arms and hands, were worthy of the mighty body. The narrow
beard was the same also, with the smooth shaven cheeks which showed the powerful muscles of the jaw.

And this was Robur the Conqueror, who now stood before me, who revealed himself to me, hurling forth his
name like a threat, within his own impenetrable fortress!

Let me recall briefly the facts which had previously drawn upon Robur the Conqueror the attention of the entire
world. The Weldon Institute was a club devoted to aeronautics under the presidency of one of the chief personages
of Philadelphia, commonly called Uncle Prudent. Its secretary was Mr. Phillip Evans. The members of the Institute
were devoted to the theory of the "lighter than air" machine; and under their two leaders were constructing an
enormous dirigible balloon, the "Go-Ahead."

At a meeting in which they were discussing the details of the construction of their balloon, this unknown Robur
had suddenly appeared and, ridiculing all their plans, had insisted that the only true solution of flight lay with the
heavier than air machines, and that he had proven this by constructing one.

He was in this turn doubted and ridiculed by the members of the club, who called him in mockery Robur the
Conqueror. In the tumult that followed, revolver shots were fired; and the intruder disappeared.

That same night he had by force abducted the president and the secretary of the club, and had taken them, much
against their will upon a voyage in the wonderful air-ship, the "Albatross," which he had constructed. He meant thus
to prove to them beyond argument the correctness of his assertions. This ship, a hundred feet long, was upheld in the
air by a large number of horizontal screws and was driven forward by vertical screws at its bow and stern. It was
managed by a crew of at least half a dozen men, who seemed absolutely devoted to their leader, Robur.

After a voyage almost completely around the world, Mr. Prudent and Mr. Evans managed to escape from the
"Albatross" after a desperate struggle. They even managed to cause an explosion on the airship, destroying it, and
involving the inventor and all his crew in a terrific fall from the sky into the Pacific ocean.

Mr. Prudent and Mr. Evans then returned to Philadelphia. They had learned that the "Albatross" had been
constructed on an unknown isle of the Pacific called Island X; but since the location of this hiding-place was wholly
unknown, its discovery lay scarcely within the bounds of possibility. Moreover, the search seemed entirely
unnecessary, as the vengeful prisoners were quite certain that they had destroyed their jailers.

Hence the two millionaires, restored to their homes, went calmly on with the construction of their own machine,
the "Go-Ahead." They hoped by means of it to soar once more into the regions they had traversed with Robur, and
to prove to themselves that their lighter than air machine was at least the equal of the heavy "Albatross." If they had
not persisted, they would not have been true Americans.

On the twentieth of April in the following year the "Go-Ahead" was finished and the ascent was made, from
Fairmount Park in Philadelphia. I myself was there with thousands of other spectators. We saw the huge balloon rise
gracefully; and, thanks to its powerful screws, it maneuvered in every direction with surprising ease. Suddenly a cry
was heard, a cry repeated from a thousand throats. Another airship had appeared in the distant skies and it now
approached with marvelous rapidity. It was another "Albatross," perhaps even superior to the first. Robur and his
men had escaped death in the Pacific; and, burning for revenge, they had constructed a second airship in their secret
Island X.

Like a gigantic bird of prey, the "Albatross" hurled itself upon the "Go-Ahead." Doubtless, Robur, while
avenging himself wished also to prove the immeasurable superiority of the heavier than air machines.

Mr. Prudent and Mr. Evans defended themselves as best they could. Knowing that their balloon had nothing like
the horizontal speed of the "Albatross," they attempted to take advantage of their superior lightness and rise above
her. The "Go-Ahead," throwing out all her ballast, soared to a height of over twenty thousand feet. Yet even there
the "Albatross" rose above her, and circled round her with ease.

Suddenly an explosion was heard. The enormous gas-bag of the "Go-Ahead," expanding under the dilation of its
contents at this great height, had finally burst.

Half-empty, the balloon fell rapidly.

Then to our universal astonishment, the "Albatross" shot down after her rival, not to finish the work of
destruction but to bring rescue. Yes! Robur, forgetting his vengeance, rejoined the sinking "Go-Ahead," and his men
lifted Mr. Prudent, Mr. Evans, and the aeronaut who accompanied them, onto the platform of his craft. Then the
balloon, being at length entirely empty, fell to its destruction among the trees of Fairmount Park.

The public was overwhelmed with astonishment, with fear! Now that Robur had recaptured his prisoners, how
would he avenge himself? Would they be carried away, this time, forever?

The "Albatross" continued to descend, as if to land in the clearing at Fairmount Park. But if it came within reach,
would not the infuriated crowd throw themselves upon the airship, tearing both it and its inventor to pieces?

The "Albatross" descended within six feet of the ground. I remember well the general movement forward with which the crowd threatened to attack it. Then Robur's voice rang out in words which even now I can repeat almost as he said them:

"Citizens of the United States, the president and the secretary of the Weldon Institute are again in my power. In holding them prisoners I would but be exercising my natural right of reprisal for the injuries they have done me. But the passion and resentment which have been roused both in them and you by the success of the 'Albatross,' show that the souls of men are not yet ready for the vast increase of power which the conquest of the air will bring to them. Uncle Prudent, Phillip Evans, you are free."

The three men rescued from the balloon leaped to the ground. The airship rose some thirty feet out of reach, and Robur recommenced:

"Citizens of the United States, the conquest of the air is made; but it shall not be given into your hands until the proper time. I leave, and I carry my secret with me. It will not be lost to humanity, but shall be entrusted to them when they have learned not to abuse it. Farewell, Citizens of the United States!"

Then the "Albatross" rose under the impulse of its mighty screws, and sped away amidst the hurrahs of the multitude.

I have ventured to remind my readers of this last scene somewhat in detail, because it seemed to reveal the state of mind of the remarkable personage who now stood before me. Apparently he had not then been animated by sentiments hostile to humanity. He was content to await the future; though his attitude undeniably revealed the immeasurable confidence which he had in his own genius, the immense pride which his almost superhuman powers had aroused within him.

It was not astonishing, moreover, that this haughtiness had little by little been aggravated to such a degree that he now presumed to enslave the entire world, as his public letter had suggested by its significant threats. His vehement mind had with time been roused to such over-excitement that he might easily be driven into the most violent excesses.

As to what had happened in the years since the last departure of the "Albatross," I could only partly reconstruct this even with my present knowledge. It had not sufficed the prodigious inventor to create a flying machine, perfect as that was! He had planned to construct a machine which could conquer all the elements at once. Probably in the workshops of Island X, a selected body of devoted workmen had constructed, one by one, the pieces of this marvelous machine, with its quadruple transformation. Then the second "Albatross" must have carried these pieces to the Great Eyrie, where they had been put together, within easier access of the world of men than the far-off island had permitted. The "Albatross" itself had apparently been destroyed, whether by accident or design, within the eyrie. The "Terror" had then made its appearance on the roads of the United States and in the neighboring waters. And I have told under what conditions, after having been vainly pursued across Lake Erie, this remarkable masterpiece had risen through the air carrying me a prisoner on board.

Chapter 17
IN THE NAME OF THE LAW

What was to be the issue of this remarkable adventure? Could I bring it to any denouement whatever, either sooner or later? Did not Robur hold the results wholly in his own hands? Probably I would never have such an opportunity for escape as had occurred to Mr. Prudent and Mr. Evans amid the islands of the Pacific. I could only wait. And how long might the waiting last!

To be sure, my curiosity had been partly satisfied. But even now I knew only the answer to the problems of the Great Eyrie. Having at length penetrated its circle, I comprehended all the phenomena observed by the people of the Blue Ridge Mountains. I was assured that neither the country-folk throughout the region, nor the townfolk of Pleasant Garden and Morganton were in danger of volcanic eruptions or earthquakes. No subterranean forces whatever were battling within the bowels of the mountains. No crater had arisen in this corner of the Alleghanies. The Great Eyrie served merely as the retreat of Robur the Conqueror. This impenetrable hiding-place where he stored his materials and provisions, had without doubt been discovered by him during one of his aerial voyages in the "Albatross." It was a retreat probably even more secure than that as yet undiscovered Island X in the Pacific.

This much I knew of him; but of this marvelous machine of his, of the secrets of its construction and propelling force, what did I really know? Admitting that this multiple mechanism was driven by electricity, and that this electricity was, as we knew it had been in the "Albatross," extracted directly from the surrounding air by some new process, what were the details of its mechanism? I had not been permitted to see the engine; doubtless I should never see it.
On the question of my liberty I argued thus: Robur evidently intends to remain unknown. As to what he intends to do with his machine, I fear, recalling his letter, that the world must expect from it more of evil than of good. At any rate, the incognito which he has so carefully guarded in the past he must mean to preserve in the future. Now only one man can establish the identity of the Master of the World with Robur the Conqueror. This man is I his prisoner, I who have the right to arrest him, I, who ought to put my hand on his shoulder, saying, "In the Name of the Law--"

On the other hand, could I hope for a rescue from without? Evidently not. The police authorities must know everything that had happened at Black Rock Creek. Mr. Ward, advised of all the incidents, would have reasoned on the matter as follows: when the "Terror" quitted the creek dragging me at the end of her hawser, I had either been drowned or, since my body had not been recovered, I had been taken on board the "Terror," and was in the hands of its commander.

In the first case, there was nothing more to do than to write "deceased" after the name of John Strock, chief inspector of the federal police in Washington.

In the second case, could my confreres hope ever to see me again? The two destroyers which had pursued the "Terror" into the Niagara River had stopped, perforce, when the current threatened to drag them over the falls. At that moment, night was closing in, and what could be thought on board the destroyers but that the "Terror" had been engulfed in the abyss of the cataract? It was scarce possible that our machine had been seen when, amid the shades of night, it rose above the Horseshoe Falls, or when it winged its way high above the mountains on its route to the Great Eyrie.

With regard to my own fate, should I resolve to question Robur? Would he consent even to appear to hear me? Was he not content with having hurled at me his name? Would not that name seem to him to answer everything? That day wore away without bringing the least change to the situation. Robur and his men continued actively at work upon the machine, which apparently needed considerable repair. I concluded that they meant to start forth again very shortly, and to take me with them. It would, however, have been quite possible to leave me at the bottom of the Eyrie. There would have been no way by which I could have escaped, and there were provisions at hand sufficient to keep me alive for many days.

What I studied particularly during this period was the mental state of Robur. He seemed to me under the dominance of a continuous excitement. What was it that his ever-seething brain now meditated? What projects was he forming for the future? Toward what region would he now turn? Would he put in execution the menaces expressed in his letter--the menaces of a madman?

The night of that first day, I slept on a couch of dry grass in one of the grottoes of the Great Eyrie. Food was set for me in this grotto each succeeding day. On the second and third of August, the three men continued at their work scarcely once, however, exchanging any words, even in the midst of their labors. When the engines were all repaired to Robur's satisfaction, the men began putting stores aboard their craft, as if expecting a long absence. Perhaps the "Terror" was about to traverse immense distances; perhaps even, the captain intended to regain his Island X, in the midst of the Pacific.

Sometimes I saw him wander about the Eyrie buried in thought, or he would stop and raise his arm toward heaven as if in defiance of that God with Whom he assumed to divide the empire of the world. Was not his overweening pride leading him toward insanity? An insanity which his two companions, hardly less excited than he, could do nothing to subdue! Had he not come to regard himself as mightier than the elements which he had so audaciously defied even when he possessed only an airship, the "Albatross?" And now, how much more powerful had he become, when earth, air and water combined to offer him an infinite field where none might follow him!

Hence I had much to fear from the future, even the most dread catastrophes. It was impossible for me to escape from the Great Eyrie, before being dragged into a new voyage. After that, how could I possibly get away while the "Terror" sped through the air or the ocean? My only chance must be when she crossed the land, and did so at some moderate speed. Surely a distant and feeble hope to cling to!

It will be recalled that after our arrival at the Great Eyrie, I had attempted to obtain some response from Robur, as to his purpose with me; but I had failed. On this last day I made another attempt.

In the afternoon I walked up and down before the large grotto where my captors were at work. Robur, standing at the entrance, followed me steadily with his eyes. Did he mean to address me?

"Captain," said I, "I have already asked you a question, which you have not answered. I ask it again: What do you intend to do with me?"

We stood face to face scarce two steps apart. With arms folded, he glared at me, and I was terrified by his glance. Terrified, that is the word! The glance was not that of a sane man. Indeed, it seemed to reflect nothing whatever of humanity within.

I repeated my question in a more challenging tone. For an instant I thought that Robur would break his silence.
and burst forth.
"What do you intend to do with me? Will you set me free?"

Evidently my captor's mind was obsessed by some other thought, from which I had only distracted him for a moment. He made again that gesture which I had already observed; he raised one defiant arm toward the zenith. It seemed to me as if some irresistible force drew him toward those upper zones of the sky, that he belonged no more to the earth, that he was destined to live in space; a perpetual dweller in the clouds.

Without answering me, without seeming to have understood me, Robur reentered the grotto.

How long this sojourn or rather relaxation of the "Terror" in the Great Eyrie was to last, I did not know. I saw, however, on the afternoon of this third of August that the repairs and the embarkation of stores were completed. The hold and lockers of our craft must have been completely crowded with the provisions taken from the grottoes of the Eyrie.

Then the chief of the two assistants, a man whom I now recognized as that John Turner who had been mate of the "Albatross," began another labor. With the help of his companion, he dragged to the center of the hollow all that remained of their materials, empty cases, fragments of carpentry, peculiar pieces of wood which clearly must have belonged to the "Albatross," which had been sacrificed to this new and mightier engine of locomotion. Beneath this mass there lay a great quantity of dried grasses. The thought came to me that Robur was preparing to leave this retreat forever!

In fact, he could not be ignorant that the attention of the public was now keenly fixed upon the Great Eyrie; and that some further attempt was likely to be made to penetrate it. Must he not fear that some day or other the effort would be successful, and that men would end by invading his hiding-place? Did he not wish that they should find there no single evidence of his occupation?

The sun disappeared behind the crests of the Blue Ridge. His rays now lighted only the very summit of Black Dome towering in the northwest. Probably the "Terror" awaited only the night in order to begin her flight. The world did not yet know that the automobile and boat could also transform itself into a flying machine. Until now, it had never been seen in the air. And would not this fourth transformation be carefully concealed, until the day when the Master of the World chose to put into execution his insensate menaces?

Toward nine o’clock profound obscurity enwrapped the hollow. Not a star looked down on us. Heavy clouds driven by a keen eastern wind covered the entire sky. The passage of the "Terror" would be invisible, not only in our immediate neighborhood, but probably across all the American territory and even the adjoining seas.

At this moment Turner, approaching the huge stack in the middle of the eyrie, set fire to the grass beneath.

The whole mass flared up at once. From the midst of a dense smoke, the roaring flames rose to a height which towered above the walls of the Great Eyrie. Once more the good folk of Morganton and Pleasant Garden would believe that the crater had reopened. These flames would announce to them another volcanic upheaval.

I watched the conflagration. I heard the roarings and cracklings which filled the air. From the deck of the "Terror," Robur watched it also.

Turner and his companion pushed back into the fire the fragments which the violence of the flames cast forth. Little by little the huge bonfire grew less. The flames sank down into a mere mass of burnt-out ashes; and once more all was silence and blackest night.

Suddenly I felt myself seized by the arm. Turner drew me toward the "Terror." Resistance would have been useless. And moreover what could be worse than to be abandoned without resources in this prison whose walls I could not climb?

As soon as I set foot on the deck, Turner also embarked. His companion went forward to the look-out; Turner climbed down into the engine-room, lighted by electric bulbs, from which not a gleam escaped outside.

Robur himself was at the helm, the regulator within reach of his hand, so that he could control both our speed and our direction. As to me, I was forced to descend into my cabin, and the hatchway was fastened above me. During that night, as on that of our departure from Niagara, I was not allowed to watch the movements of the "Terror."

Nevertheless, if I could see nothing of what was passing on board, I could hear the noises of the machinery. I had first the feeling that our craft, its bow slightly raised, lost contact with the earth. Some swerves and balancings in the air followed. Then the turbines underneath spun with prodigious rapidity, while the great wings beat with steady regularity.

Thus the "Terror," probably forever, had left the Great Eyrie, and launched into the air as a ship launches into the waters. Our captain soared above the double chain of the Alleghanies, and without doubt he would remain in the upper zones of the air until he had left all the mountain region behind.

But in what direction would he turn? Would he pass in flight across the plains of North Carolina, seeking the Atlantic Ocean? Or would he head to the west to reach the Pacific? Perhaps he would seek, to the south, the waters
of the Gulf of Mexico. When day came how should I recognize which sea we were upon, if the horizon of water and sky encircled us on every side?

Several hours passed; and how long they seemed to me! I made no effort to find forgetfulness in sleep. Wild and incoherent thoughts assailed me. I felt myself swept over worlds of imagination, as I was swept through space, by an aerial monster. At the speed which the "Terror" possessed, whither might I not be carried during this interminable night? I recalled the unbelievable voyage of the "Albatross," of which the Weldon Institute had published an account, as described by Mr. Prudent and Mr. Evans. What Robur, the Conqueror, had done with his first airship, he could do even more readily with this quadruple machine.

At length the first rays of daylight brightened my cabin. Would I be permitted to go out now, to take my place upon the deck, as I had done upon Lake Erie?

I pushed upon the hatchway: it opened. I came half way out upon the deck.

All about was sky and sea. We floated in the air above an ocean, at a height which I judged to be about a thousand or twelve hundred feet. I could not see Robur, so he was probably in the engine room. Turner was at the helm, his companion on the look-out.

Now that I was upon the deck, I saw what I had not been able to see during our former nocturnal voyage, the action of those powerful wings which beat upon either side at the same time that the screws spun beneath the flanks of the machine.

By the position of the sun, as it slowly mounted from the horizon, I realized that we were advancing toward the south. Hence if this direction had not been changed during the night this was the Gulf of Mexico which lay beneath us.

A hot day was announced by the heavy livid clouds which clung to the horizon. These warnings of a coming storm did not escape the eye of Robur when toward eight o'clock he came on deck and took Turner's place at the helm. Perhaps the cloud-bank recalled to him the waterspout in which the "Albatross" had so nearly been destroyed, or the mighty cyclone from which he had escaped only as if by a miracle above the Antarctic Sea.

It is true that the forces of Nature which had been too strong for the "Albatross," might easily be evaded by this lighter and more versatile machine. It could abandon the sky where the elements were in battle and descend to the surface of the sea; and if the waves beat against it there too heavily, it could always find calm in the tranquil depths.

Doubtless, however, there were some signs by which Robur, who must be experienced in judging, decided that the storm would not burst until the next day.

He continued his flight; and in the afternoon, when we settled down upon the surface of the sea, there was not a sign of bad weather. The "Terror" is a sea bird, an albatross or frigate-bird, which can rest at will upon the waves! Only we have this advantage, that fatigue has never any hold upon this metal organism, driven by the inexhaustible electricity!

The whole vast ocean around us was empty. Not a sail nor a trail of smoke was visible even on the limits of the horizon. Hence our passage through the clouds had not been seen and signaled ahead.

The afternoon was not marked by any incident. The "Terror" advanced at easy speed. What her captain intended to do, I could not guess. If he continued in this direction, we should reach some one of the West Indies, or beyond that, at the end of the Gulf, the shore of Venezuela or Colombia. But when night came, perhaps we would again rise in the air to clear the mountainous barrier of Guatemala and Nicaragua, and take flight toward Island X, somewhere in the unknown regions of the Pacific.

Evening came. The sun sank in an horizon red as blood. The sea glistened around the "Terror," which seemed to raise a shower of sparks in its passage. There was a storm at hand. Evidently our captain thought so. Instead of being allowed to remain on deck, I was compelled to re-enter my cabin, and the hatchway was closed above me.

In a few moments from the noises that followed, I knew that the machine was about to be submerged. In fact, five minutes later, we were moving peacefully forward through the ocean's depths.

Thoroughly worn out, less by fatigue than by excitement and anxious thought, I fell into a profound sleep, natural this time and not provoked by any soporific drug. When I awoke, after a length of time which I could not reckon, the "Terror" had not yet returned to the surface of the sea.

This maneuver was executed a little later. The daylight pierced my porthole; and at the same moment I felt the pitching and tossing to which we were subjected by a heavy sea.

I was allowed to take my place once more outside the hatchway; where my first thought was for the weather. A storm was approaching from the northwest. Vivid lightning darted amid the dense, black clouds. Already we could hear the rumbling of thunder echoing continuously through space. I was surprised--more than surprised, frightened!- -by the rapidity with which the storm rushed upward toward the zenith. Scarcely would a ship have had time to furl her sails to escape the shock of the blast, before it was upon her! The advance was as swift as it was terrible.

Suddenly the wind was unchained with unheard of violence, as if it had suddenly burst from this prison of cloud.
In an instant a frightful sea uprose. The breaking waves, foaming along all their crests, swept with their full weight over the "Terror." If I had not been wedged solidly against the rail, I should have been swept overboard!

There was but one thing to do--to change our machine again into a submarine. It would find security and calm at a few dozen feet beneath the surface. To continue to brave the fury of this outrageous sea was impossible.

Robur himself was on deck, and I awaited the order to return to my cabin--an order which was not given. There was not even any preparation for the plunge. With an eye more burning than ever, impassive before this frightful storm, the captain looked it full in the face, as if to defy it, knowing that he had nothing to fear.

It was imperative that the terror should plunge below without losing a moment. Yet Robur seemed to have no thought of doing so. No! He preserved his haughty attitude as of a man who in his immeasurable pride, believed himself above or beyond humanity.

Seeing him thus I asked myself with almost superstitious awe, if he were not indeed a demoniac being, escaped from some supernatural world.

A cry leaped from his mouth, and was heard amid the shrieks of the tempest and the howlings of the thunder. "I, Robur! Robur!--The master of the world!"

He made a gesture which Turner and his companions understood. It was a command; and without any hesitation these unhappy men, insane as their master, obeyed it.

The great wings shot out, and the airship rose as it had risen above the falls of Niagara. But if on that day it had escaped the might of the cataract, this time it was amidst the might of the hurricane that we attempted our insensate flight.

The air-ship soared upward into the heart of the sky, amid a thousand lightning flashes, surrounded and shaken by the bursts of thunder. It steered amid the blinding, darting lights, courting destruction at every instant.

Robur's position and attitude did not change. With one hand on the helm, the other on the speed regulators while the great wings beat furiously, he headed his machine toward the very center of the storm, where the electric flashes were leaping from cloud to cloud.

I must throw myself upon this madman to prevent him from driving his machine into the very middle of this aerial furnace! I must compel him to descend, to seek beneath the waters, a safety which was no longer possible either upon the surface of the sea or in the sky! Beneath, we could wait until this frightful outburst of the elements was at an end!

Then amid this wild excitement my own passion, all my instincts of duty, arose within me! Yes, this was madness! Yet must I not arrest this criminal whom my country had outlawed, who threatened the entire world with his terrible invention? Must I not put my hand on his shoulder and summon him to surrender to justice! Was I or was I not Strock, chief inspector of the federal police? Forgetting where I was, one against three, uplifted in mid-sky above a howling ocean, I leaped toward the stern, and in a voice which rose above the tempest, I cried as I hurled myself upon Robur:

"In the name of the law, I--"

Suddenly the "Terror" trembled as if from a violent shock. All her frame quivered, as the human frame quivers under the electric fluid. Struck by the lightning in the very middle of her powerful batteries, the air-ship spread out on all sides and went to pieces.

With her wings fallen, her screws broken, with bolt after bolt of the lightning darting amid her ruins, the "Terror" fell from the height of more than a thousand feet into the ocean beneath.

Chapter 18

THE OLD HOUSEKEEPER'S LAST COMMENT

When I came to myself after having been unconscious for many hours, a group of sailors whose care had restored me to life surrounded the door of a cabin in which I lay. By my pillow sat an officer who questioned me; and as my senses slowly returned, I answered to his questioning.

I told them everything. Yes, everything! And assuredly my listeners must have thought that they had upon their hands an unfortunate whose reason had not returned with his consciousness.

I was on board the steamer Ottawa, in the Gulf of Mexico, headed for the port of New Orleans. This ship, while flying before the same terrific thunder-storm which destroyed the "Terror," had encountered some wreckage, among whose fragments was entangled my helpless body. Thus I found myself back among humankind once more, while Robur the Conqueror and his two companions had ended their adventurous careers in the waters of the Gulf. The Master of the World had disappeared forever, struck down by those thunder-bolts which he had dared to brave in the regions of their fullest power. He carried with him the secret of his extraordinary machine.

Five days later the Ottawa sighted the shores of Louisiana; and on the morning of the tenth of August she
reached her port. After taking a warm leave of my rescuers, I set out at once by train for Washington, which more
than once I had despaired of ever seeing again.

I went first of all to the bureau of police, meaning to make my earliest appearance before Mr. Ward.

What was the surprise, the stupefaction, and also the joy of my chief, when the door of his cabinet opened before
me! Had he not every reason to believe, from the report of my companions, that I had perished in the waters of Lake
Erie?

I informed him of all my experiences since I had disappeared, the pursuit of the destroyers on the lake, the
soaring of the "Terror" from amid Niagara Falls, the halt within the crater of the Great Eyrie, and the catastrophe,
during the storm, above the Gulf of Mexico.

He learned for the first time that the machine created by the genius of this Robur, could traverse space, as it did
the earth and the sea.

In truth, did not the possession of so complete and marvelous a machine justify the name of Master of the World,
which Robur had taken to himself? Certain it is that the comfort and even the lives of the public must have been
forever in danger from him; and that all methods of defence must have been feeble and ineffective.

But the pride which I had seen rising bit by bit within the heart of this prodigious man had driven him to give
equal battle to the most terrible of all the elements. It was a miracle that I had escaped safe and sound from that
frightful catastrophe.

Mr. Ward could scarcely believe my story. "Well, my dear Strock," said he at last, "you have come back; and
that is the main thing. Next to this notorious Robur, you will be the man of the hour. I hope that your head will not
be turned with vanity, like that of this crazy inventor!"

"No, Mr. Ward," I responded, "but you will agree with me that never was inquisitive man put to greater straits to
satisfy his curiosity."

"I agree, Strock; and the mysteries of the Great Eyrie, the transformations of the "Terror," you have discovered
them! But unfortunately, the still greater secrets of this Master of the World have perished with him."

The same evening the newspapers published an account of my adventures, the truthfulness of which could not be
doubted. Then, as Mr. Ward had prophesied, I was the man of the hour.

One of the papers said, "Thanks to Inspector Strock the American police still lead the world. While others have
accomplished their work, with more or less success, by land and by sea, the American police hurl themselves in
pursuit of criminals through the depths of lakes and oceans and even through the sky."

Yet, in following, as I have told, in pursuit of the "Terror," had I done anything more than by the close of the
present century will have become the regular duty of my successors?

It is easy to imagine what a welcome my old housekeeper gave me when I entered my house in Long Street.
When my apparition--does not the word seem just--stood before her, I feared for a moment she would drop dead,
poor woman! Then, after hearing my story, with eyes streaming with tears, she thanked Providence for having saved
me from so many perils.

"Now, sir," said she, "now--was I wrong?"

"Wrong? About what?"

"In saying that the Great Eyrie was the home of the devil?"

"Nonsense; this Robur was not the devil!"

"Ah, well!" replied the old woman, "he was worthy of being so!"

THE PEARL OF LIMA: A STORY OF TRUE LOVE
by JULIÁN VERNE

CHAPTER I.

THE PLAZA-MAYOR.

The sun had disappeared behind the snowy peaks of the Cordilleras; but the beautiful Peruvian sky long retains,
through the transparent veil of night, the reflection of his rays; the atmosphere is impregnated with a refreshing
coolness, which in these burning latitudes affords freedom of breath; it is the hour in which one can live a European
life, and seek without on the verandas some cooling gentle zephyr; it seems as if a metallic roof was then interposed
between the sun and the earth, which, retaining the heat and suffering only the light to pass, offers beneath its shelter
a reparative repose.

This much desired hour had at last sounded from the clock of the cathedral. While the earliest stars were rising
above the horizon, the numerous promenaders were traversing the streets of Lima, wrapped in their light mantles,
and conversing gravely on the most trivial affairs. There was a great movement of the populace on the Plaza-Mayor, that forum of the ancient city of kings; artisans were profiting by the coolness to quit their daily labors; they circulated actively among the crowd, crying their various merchandise; the ladies of Lima, carefully enveloped in the mantillas which mask their countenances, with the exception of the right eye, darted stealthy glances on the surrounding masses; they undulated through the groups of smokers, like foam at the will of the waves; other señoritas, in ball costume, coiffed only with their abundant hair or some natural flowers, passed in large calêches, throwing on the caballeros nonchalant regards.

But these glances were not bestowed indiscriminately upon the young cavaliers; the thoughts of the noble ladies could rest only on aristocratic heights. The Indians passed without lifting their eyes upon them, knowing themselves to be beneath their notice; betraying by no gesture or word, the bitter envy of their hearts. They contrasted strongly with the half-breeds, or mestizos, who, repulsed like the former, vented their indignation in cries and protestations.

The proud descendants of Pizarro marched with heads high, as in the times when their ancestors founded the city of kings; their traditional scorn rested alike on the Indians whom they had conquered, and the mestizos, born of their relations with the natives of the New World. The Indians, on the contrary, were constantly struggling to break their chains, and cherished alike aversion toward the conquerors of the ancient empire of the Incas and their haughty and insolent descendants.

But the mestizos, Spanish in their contempt for the Indians, and Indian in their hatred which they had vowed against the Spaniards, burned with both these vivid and impassioned sentiments.

A group of these young people stood near the pretty fountain in the centre of the Plaza-Mayor. Clad in their poncho, a piece of cloth or cotton in the form of a parallelogram, with an opening in the middle to give passage to the head, in large pantaloons, striped with a thousand colors, coiffed with broad-brimmed hats of Guayaquil straw, they were talking, declaiming, gesticulating.

"You are right, André," said a very obsequious young man, whom they called Milleflores.

This was the friend, the parasite of André Certa, a young mestizo of swarthy complexion, whose thin beard gave a singular appearance to his countenance.

André Certa, the son of a rich merchant killed in the last émeute of the conspirator Lafuente, had inherited a large fortune; this he freely scattered among his friends, whose humble salutations he demanded in exchange for handfuls of gold.

"Of what use are these changes in government, these eternal pronunciamientos which disturb Peru to gratify private ambition?" resumed André, in a loud voice; "what is it to me whether Gambarra or Santa Cruz rule, if there is no equality."

"Well said," exclaimed Milleflores, who, under the most republican government, could never have been the equal of a man of sense.

"How is it," resumed André Certa, "that I, the son of a merchant, can ride only in a calêche drawn by mules? Have not my ships brought wealth and prosperity to the country? Is not the aristocracy of piasters worth all the titles of Spain?"

"It is a shame!" resumed the young mestizo. "There is Don Fernand, who passes in his carriage drawn by two horses! Don Fernand d'Aiquillo! He has scarcely property enough to feed his coachman and horses, and he must come to parade himself proudly about the square. And, hold! here is another! the Marquis Don Vegal!"

A magnificent carriage, drawn by four fine horses, at that moment entered the Plaza-Mayor; its only occupant was a man of proud mien, mingled with sadness; he gazed, without seeming to see them, on the multitude assembled to breathe the coolness of the evening. This man was the Marquis Don Vegal, knight of Alcantara, of Malta, and of Charles III. He had a right to appear in this pompous equipage; the viceroy and the archbishop could alone take precedence of him; but this great nobleman came here from ennui and not from ostentation; his thoughts were not depicted on his countenance, they were concentrated beneath his bent brow; he received no impression from exterior objects, on which he bestowed not a look, and heard not the envious reflections of the mestizos, when his four horses made their way through the crowd.

"I hate that man," said André Certa.

"You will not hate him long."

"I know it! All these nobles are displaying the last splendors of their luxury; I can tell where their silver and their family jewels go."

"You have not your entrée with the Jew Samuel for nothing."

"Certainly not! On his account-books are inscribed aristocratic creditors; in his strong-box are piled the wrecks of great fortunes; and in the day when the Spaniards shall be as ragged as their Caesar de Bazan, we will have fine sport."

"Yes, we will have fine sport, dear André, mounted on your millions, on a golden pedestal! And you are about to
double your fortune! When are you to marry the beautiful young daughter of old Samuel, a Limanienne to the end of her nails, with nothing Jewish about her but her name of Sarah?"

"In a month," replied André Certa, proudly, "there will be no fortune in Peru which can compete with mine."

"But why," asked some one, "do you not espouse some Spanish girl of high descent?"

"I despise these people as much as I hate them."

André Certa concealed the fact of his having been repulsed by several noble families, into which he had sought to introduce himself.

His interlocutor still wore an expression of doubt, and the brow of the mestizo had contracted, when the latter was rudely elbowed by a man of tall stature, whose gray hairs proclaimed him to be at least fifty, while the muscular force of his firmly knit limbs seemed undiminished by age.

This man was clad in a brown vest, through which appeared a coarse shirt with a broad collar; his short breeches, striped with green, were fastened by red garters to stockings of clay-color; on his feet were sandals made of _ojotas_, ox-hide prepared for this purpose; beneath his high-pointed hat gleamed large ear-rings. His complexion was dark. After having jostled André Certa, he looked at him fixedly, but with no particular expression.

"Miserable Indian!" exclaimed the mestizo, raising his hand upon him.

His companions restrained him. Milleflores, whose face was pale with terror, exclaimed:

"André! André! take care."

"A vile slave! to presume to elbow me!"

"It is a madman! it is the _Sambo_!"

The _Sambo_, as the name indicated, was an Indian of the mountains; he continued to fix his eyes on the mestizo, whom he had intentionally jostled. The latter, whose anger was unbounded, had seized a poignard at his girdle, and was about to have rushed on the impassable aggressor, when a guttural cry, like that of the _cilguero_, (a kind of linnet of Peru,) re-echoed in the midst of the tumult of promenaders, and the Sambo disappeared.

"Brutal and cowardly!" exclaimed André.

"Control yourself," said Milleflores, softly. "Let us leave the Plaza-Mayor; the Limanienne ladies are too haughty here."

As he said these words, the brave Milleflores looked cautiously around to see whether he was not within reach of the foot or arm of some Indian in the neighborhood.

"In an hour, I must be at the house of Jew Samuel," said André.

"In an hour! we have time to pass to the _Calle del Peligro_; you can offer some oranges or ananas to the charming _tapadas_ who promenade there. Shall we go, gentlemen?"

The group directed their steps toward the extremity of the square, and began to descend the street of Danger, where Milleflores hoped his good looks would be appreciated; but it was nightfall, and the young Limaniennes merited better than ever their name of _tapadas_ (hidden), for they drew their mantles more closely over their countenances.

The Plaza-Mayor was all alive; the cries and the tumult were redoubled; the guards on horseback, stationed before the central portico of the viceroy's palace, situated on the north side of the square, could scarcely maintain their position amid the shifting crowd; there were merchants for all customers and customers for all merchants. The greatest variety of trades seemed to be congregated there, and from the _Portal de Escribanos_ to the _Portal de Botoneros_, there was one immense display of articles of every kind, the Plaza-Mayor serving at once as promenade, bazaar, market and fair. The ground-floor of the viceroy's palace is occupied by shops; along the first story runs an immense gallery for this purpose; the crowd can promenade on days of public rejoicing; on the east side of the square rises the cathedral, with its steeples and light balustrades, proudly adorning its two towers; the basement story of the edifice being ten feet high, and containing warehouses full of the products of tropical climates.

In the centre of this square is situated the beautiful fountain, constructed in 1653, by the orders of the viceroy, the Comte de Salvatierra. From the top of the pillar, which rises in the middle of the fountain and is surmounted with a statue of Fame, the water falls in sheets, and is discharged into a basin beneath through the mouths of lions. It is here that the water-carriers (_aguadores_) load their mules with barrels, attach a bell to a hoop, and mount behind their liquid merchandise.

This square is therefore noisy from morning till evening, and when the stars of night rise above the snowy summits of the Cordilleras, the tumult of the _élite_ of Lima equals the matinal hubbub of the merchants.

Nevertheless, when the _oracion_ (evening _angelus_) sounds from the bell of the cathedral, all this noise suddenly ceases; to the clamor of pleasure succeeds the murmur of prayer; the women pause in their walk and put their hands on their rosaries, invoking the Virgin Mary. Then, not a merchant dares sell his merchandise, not a customer thinks of buying, and this square, so recently animated, seems to have become a vast solitude.

While the Limanians paused and knelt at the sound of the _angelus_, a young girl, carefully surrounded by her
discreet mantle, sought to pass through the praying multitude; she was followed by a mestizo woman, a sort of
duenna, who watched every glance and step. The duenna, as if she had not understood the warning bell, continued
her way through the devout populace: to the general surprise succeeded harsh epithets. The young girl would have
stopped, but the duenna kept on.

"Do you see that daughter of Satan?" said some one near her.

"Who is that _balarina_—that impious dancer?"

"It is one of the Carcaman women." (A reproachful name bestowed upon Europeans.)

The young girl at last stopped, blushing and confused.

Suddenly a _gaucho_, a merchant of mules, seized her by the shoulder, and would have compelled her to kneel;
but he had scarcely laid his hand upon her when a vigorous arm rudely felled him to the ground. This scene, rapid as
lightning, was followed by a moment of confusion.

"Save yourself, miss," said a gentle and respectful voice in the ear of the young girl.

The latter turned, pale with terror, and saw a young Indian of tall stature, who, with his arms tranquilly folded,
was awaiting with firm foot the attack of his adversary.

"We are lost!" exclaimed the duenna; "_niña, niña_, let us go, for the love of God!" and she seized the arm of the
young girl, who disappeared, while the crowd rose and dispersed.

The _gaucho_ had risen, bruised with his fall, and thinking it not prudent to seek revenge, rejoined his mules,
muttering threats.

CHAPTER II.

EVENING IN THE STREETS OF LIMA.

Night had succeeded, almost without intervening twilight, the glare of day. The two women quickened their
pace, for it was late; the young girl, still under the influence of strong emotion, maintained silence, while the duenna
murmured some mysterious paternosters—they walked rapidly through one of the sloping streets leading from the
Plaza-Mayor.

This place is situated more than four hundred feet above the level of the sea, and about a hundred and fifty rods
from the bridge thrown over the river Rimac, which forms the diameter of the city of Lima, arranged in a semicircle.

The city of Lima lies in the valley of the Rimac, nine leagues from its mouth; at the north and east commence the
first undulations of ground which form a part of the great chain of the Andes: the valley of Lungaucho, formed by
the mountains of San Cristoval and the Amancaës, which rise behind Lima, terminates in its suburbs. The city lies
on one bank of the river; the other is occupied by the suburb of San Lazaro, and is united to the city by a bridge of
five arches, the upper piers of which are triangular to break the force of the current; while the lower ones present to
the promenaders circular benches, on which the fashionables may lounge during the summer evenings, and where
they can contemplate a pretty cascade.

The city is two miles long from east to west, and only a mile and a quarter wide from the bridge to the walls; the
latter, twelve feet in height, ten feet thick at their base, are built of _adobes_, a kind of brick dried in the sun, and
made of potter's clay mingled with a great quantity of chopped straw: these walls are calculated to resist
earthquakes; the enclosure, pierced with seven gates and three posterns, terminates at its south-east extremity by the
little citadel of Santa Caterina.

Such is the ancient city of kings, founded in 1534 by Pizarro, on the day of Epiphany; it has been and is still the
theatre of constantly renewed revolutions. Lima, situated three miles from the sea, was formerly the principal
storehouse of America on the Pacific Ocean, thanks to its Port of Callao, built in 1779, in a singular manner. An old
vessel, filled with stones, sand, and rubbish of all sorts, was wrecked on the shore; piles of the mangrove-tree,
brung from Guayaquil and impervious to water, were driven around this as a centre, which became the immovable
base on which rose the mole of Callao.

The climate, milder and more temperate than that of Carthagena or Bahia, situated on the opposite side of
America, makes Lima one of the most agreeable cities of the New World: the wind has two directions from which it
never varies; either it blows from the south-east, and becomes cool by crossing the Pacific Ocean; or it comes from
the south-west, impregnated with the mild atmosphere of the forests and the freshness which it has derived from the
icy summits of the Cordilleras.

The nights beneath tropical latitudes are very beautiful and very clear; they mysteriously prepare that beneficent
dew which fertilizes a soil exposed to the rays of a cloudless sky—so the inhabitants of Lima prolong their nocturnal
conversations and receptions; household labors are quietly finished in the dwellings refreshed by the shadows, and
the streets are soon deserted; scarcely is some _pulperia_ still haunted by the drinkers of _chica_ or _quarapo_.

These, the young girl, whom we have seen, carefully avoided; crossing in the middle of the numerous squares
scattered about the city, she arrived, without interruption, at the bridge of the Rimac, listening to catch the slightest sound—which her emotion exaggerated, and hearing only the bells of a train of mules conducted by its _arriero_, or the joyous _stribillo_ of some Indian.

This young girl was called Sarah, and was returning to the house of the Jew Samuel, her father; she was clad in a _saya_ of satin—a kind of petticoat of a dark color, plaited in elastic folds, and very narrow at the bottom, which compelled her to take short steps, and gave her that graceful delicacy peculiar to the Limanienne ladies; this petticoat, ornamented with lace and flowers, was in part covered with a silk mantle, which was raised above the head and enveloped it like a hood; stockings of exquisite fineness and little satin shoes peeped out beneath the graceful _saya_; bracelets of great value encircled the arms of the young girl, whose rich toilet was of exquisite taste, and her whole person redolent of that charm so well expressed by the Spanish word _donaire_.

Milleflores might well say to André Certa that his betrothed had nothing of the Jewess but the name, for she was a faithful specimen of those admirable señoras whose beauty is above all praise.

The duenna, an old Jewess, whose countenance was expressive of avarice and cupidity, was a devoted servant of Samuel, who paid her liberally.

At the moment when these two women entered the suburb of San Lazaro, a man, clad in the robe of a monk, and with his head covered with a cowl, passed near them and looked at them attentively. This man, of tall stature, possessed a countenance expressive of gentleness and benevolence; it was Padre Joachim de Camarones; he threw a glance of intelligence on Sarah, who immediately looked at her follower.

The latter was still grumbling, muttering and whining, which prevented her seeing any thing; the young girl turned toward the good father and made a graceful sign with her hand.

"Well, señora," said the old woman, sharply, "is it not enough to have been insulted by these Christians, that you should stop to look at a priest?"

Sarah did not reply.

"Shall we see you one day, with rosary in hand, engaged in the ceremonies of the church?"

The ceremonies of the church—_las funciones de iglesia_—are the great business of the Limanian ladies.

"You make strange suppositions," replied the young girl, blushing.

"Strange as your conduct! What would my master Samuel say, if he knew what had taken place this evening?"

"Am I to blame because a brutal muleteer chose to address me?"

"I understand, señora," said the old woman, shaking her head, "and will not speak of the _gaucho__._"

"Then the young man did wrong in defending me from the abuse of the populace?"

"Is it the first time the Indian has thrown himself in your way?"

The countenance of the young girl was fortunately sheltered by her mantle, for the darkness would not have sufficed to conceal her emotion from the inquisitive glance of the duenna.

"But let us leave the Indian where he is," resumed the old woman, "it is not my business to watch him. What I complain of is, that in order not to disturb these Christians, you wished to remain among them! Had you not some desire to kneel with them? Ah, señora, your father would soon dismiss me if I were guilty of such apostasy."

But the young girl no longer heard; the remark of the old woman on the subject of the young Indian had inspired her with sweeter thoughts; it seemed to her that the intervention of this young man was providential; and she turned several times to see if he had not followed her in the shadow. Sarah had in her heart a certain natural confidence which became her wonderfully; she felt herself to be the child of these warm latitudes, which the sun decorates with surprising vegetation; proud as a Spaniard, if she had fixed her regards on this man, it was because he had stood proudly in the presence of her pride, and had not begged a glance as a reward of his protection.

In imagining that the Indian was near her, Sarah was not mistaken; Martin Paz, after having come to the assistance of the young girl, wished to ensure her safe retreat; so when the promenaders had dispersed, he followed her, without being perceived by her, but without concealing himself; the darkness alone favoring his pursuit.

This Martin Paz was a handsome young man, wearing with unparalleled nobility the national costume of the Indian of the mountains; from his broad-brimmed straw hat escaped fine black hair, whose curls harmonized with the bronze of his manly face. His eyes shone with infinite sweetness, like the transparent atmosphere of starry nights; his well-formed nose surmounted a pretty mouth, unlike that of most of his race. He was one of the noblest descendants of Manco-Capac, and his veins were full of that ardent blood which leads men to the accomplishment of lofty deeds.

He was proudly draped in his _poncho_ of brilliant colors; at his girdle hung one of those Malay poignards, so terrible in a practiced hand, for they seem to be riveted to the arm which strikes. In North America, on the shores of Lake Ontario, Martin Paz would have been a great chief among those wandering tribes which have fought with the English so many heroic combats.

Martin Paz knew that Sarah was the daughter of the wealthy Samuel; he knew her to be the most charming
woman in Lima; he knew her to be betrothed to the opulent mestizo André Certa; he knew that by her birth, her position and her wealth she was beyond the reach of his heart; but he forgot all these impossibilities in his all-absorbing passion. It seemed to him that this beautiful young girl belonged to him, as the llama to the Peruvian forests, as the eagle to the depths of immensity.

Plunged in his reflections, Martin Paz hastened his steps to see the saya of the young girl sweep the threshold of the paternal dwelling; and Sarah herself, half-opening then her mantilla, cast on him a bewildering glance of gratitude.

He was quickly joined by two Indians of the species of zambos, pillagers and robbers, who walked beside him.

"Martin Paz," said one of them to him, "you ought this very evening to meet our brethren in the mountains."

"I shall be there," coldly replied the other.

"The schooner Annonciation has appeared in sight from Callao, tacked for a few moments, then, protected by the point, rapidly disappeared. She will undoubtedly approach the land near the mouth of the Rimac, and our bark canoes must be there to relieve her of her merchandise. We shall need your presence."

"You are losing time by your observations. Martin Paz knows his duty and he will do it."

"It is in the name of the Sambo that we speak to you here."

"It is in my own name that I speak to you."

"Do you not fear that he will find your presence in the suburb of San Lazaro at this hour unaccountable?"

"I am where my fancy and my will have brought me."

"Before the house of the Jew?"

"Those of my brethren who are disposed to find fault can meet me to-night in the mountain."

The eyes of the three men sparkled, and this was all. The zambos regained the bank of the Rimac, and the sound of their footsteps died away in the darkness.

Martin Paz had hastily approached the house of the Jew. This house, like all those of Lima, had but two stories; the ground floor, built of bricks, was surmounted with walls formed of canes tied together and covered with plaster; all this part of the building, constructed to resist earthquakes, imitated, by a skillful painting, the bricks of the lower story; the square roof, called asoetas, was covered with flowers, and formed a terrace full of perfumes and pretty points of view.

A vast gate, placed between two pavilions, gave access to a court; but as usual, these pavilions had no window opening upon the street.

The clock of the parish church was striking eleven when Martin Paz stopped before the dwelling of Sarah. Profound silence reigned around; a flickering light within proved that the saloon of the Jew Samuel was still occupied.

Why does the Indian stand motionless before these silent walls? The cool atmosphere woos him with its transparency and its perfumes; the radiant stars send down upon the sleeping earth rays of diaphanous mildness; the white constellations illumine the darkness with their enchanting light; his heart believes in those sympathetic communications which brave time and distance.

A white form appears upon the terrace amid the flowers to which night has only left a vague outline, without diminishing their delicious perfumes; the dahlias mingle with the mentzelias, with the helianthus, and, beneath the occidental breeze, form a waving basket which surrounds Sarah, the young and beautiful Jewess.

Martin Paz involuntarily raises his hands and clasps them with adoration. Suddenly the white form sinks down, as if terrified.

Martin Paz turns, and finds himself face to face with André Certa.

"Since when do the Indians pass their nights in contemplation?"

André Certa spoke angrily.

"Since the Indians have trodden the soil of their ancestors."

"Have they no longer, on the mountain side, some yaravis to chant, some boleros to dance with the girls of their caste?"

"The cholos," replied the Indian, in a high voice, "bestow their devotion where it is merited; the Indians love according to their hearts."

André Certa became pale with anger; he advanced a step toward his immovable rival.

"Wretch! will you quit this place?"

"Rather quit it yourself," shouted Martin Paz; and two poignards gleamed in the two right hands of the adversaries; they were of equal stature, they seemed of equal strength, and the lightnings of their eyes were reflected in the steel of their arms.

André Certa rapidly raised his arm, which he dropped still more quickly. But his poignard had encountered the
Malay poignard of the Indian; at the fire which flashed from this shock, André saw the arm of Martin Paz suspended over his head, and immediately rolled on the earth, his arm pierced through.

"Help, help!" he exclaimed.

The door of the Jew's house opened at his cries. Some mestizoes ran from a neighboring house; some pursued the Indian, who fled rapidly; others raised the wounded man. He had swooned.

"Who is this man?" said one of them. "If he is a sailor, take him to the hospital of Spiritu Santo; if an Indian, to the hospital of Santa Anna."

An old man advanced toward the wounded youth; he had scarcely looked upon him when he exclaimed:

"Let the poor young man be carried into my house. This is a strange mischance."

This man was the Jew Samuel; he had just recognized the betrothed of his daughter.

Martin Paz, thanks to the darkness and the rapidity of his flight, may hope to escape his pursuers; he has risked his life; an Indian assassin of a mestizo! If he can gain the open country he is safe, but he knows that the gates of the city are closed at eleven o'clock in the evening, not to be re-opened till four in the morning.

He reaches at last the stone bridge which he had already crossed. The Indians, and some soldiers who had joined them, pursue him closely; he springs upon the bridge. Unfortunately a patrol appears at the opposite extremity; Martin Paz can neither advance nor retrace his steps; without hesitation he clears the parapet and leaps into the rapid current which breaks against the corners of the stones.

The pursuers spring upon the banks below the bridge to seize the swimmer at his landing.

But it is in vain; Martin Paz does not re-appear.

CHAPTER III.

THE JEW EVERY WHERE A JEW.

André Certa, once introduced into the house of Samuel, and laid in a bed hastily prepared, recovered his senses and pressed the hand of the old Jew. The physician, summoned by one of the domestics, was promptly in attendance. The wound appeared to be a slight one; the shoulder of the mestizo had been pierced in such a manner that the steel had only glided among the flesh. In a few days, André Certa might be once more upon his feet.

When Samuel was left alone with André, the latter said to him:

"You would do well to wall up the gate which leads to your terrace, Master Samuel."

"What fear you, André?"

"I fear lest Sarah should present herself there to the contemplation of the Indians. It was not a robber who attacked me; it was a rival, from whom I have escaped but by miracle!"

"By the holy tables, it is a task to bring up young girls!" exclaimed the Jew. "But you are mistaken, señor," he resumed, "Sarah will be a dutiful spouse. I spare no pains that she may do you honor."

André Certa half raised himself on his elbow.

"Master Samuel, there is one thing which you do not enough remember, that I pay you for the hand of Sarah a hundred thousand piasters."

"Señor," replied the Jew, with a miserly chuckle, "I remember it so well, that I am ready now to exchange this receipt for the money."

As he said this, Samuel drew from his pocket-book a paper which André Certa repulsed with his hand.

"The bargain is not complete until Sarah has become my wife, and she will never be such if her hand is to be disputed by such an adversary. You know, Master Samuel, what is my object; in espousing Sarah, I wish to be the equal of this nobility which casts such scornful glances upon us."

"And you will, señor, for you see the proudest grandees of Spain throng our saloons, around the pearl of Lima."

"Where has Sarah been this evening?"

"To the Israelitish temple, with old Ammon."

"Why should Sarah attend your religious rites?"

"I am a Jew, señor," replied Samuel proudly, "and would Sarah be my daughter if she did not fulfill the duties of my religion?"

The old Jew remained sad and silent for several minutes. His bent brow rested on one of his withered hands. His face usually bronze, was now almost pale; beneath a brown cap appeared locks of an indescribable color. He was clad in a sort of great-coat fastened around the waist.

This old man trafficked every where and in every thing; he might have been a descendant of the Judas who sold his Master for thirty pieces of silver. He had been a resident of Lima ten years; his taste and his economy had led him to choose his dwelling at the extremity of the suburb of San Lazaro, and from thence he entered into various speculations to make money. By degrees, Samuel assumed a luxury uncommon in misers; his house was
sumptuously furnished; his numerous domestics, his splendid equipages betokened immense revenues. Sarah was then eight years of age. Already graceful and charming, she pleased all, and was the idol of the Jew. All her inclinations were unhesitatingly gratified. Always elegantly dressed, she attracted the eyes of the most fastidious, of which her father seemed strangely careless. It will readily be understood how the mestizo, André Certa, became enamored of the beautiful Jewess. What would have appeared inexplicable to the public, was the hundred thousand piasters, the price of her hand; but this bargain was secret. And besides, Samuel trafficked in sentiments as in native productions. A banker, usurer, merchant, ship-owner, he had the talent to do business with everybody. The schooner _Annonciation_, which was hovering about the mouth of the Rimac, belonged to the Jew Samuel.

Amid this life of business and speculation this man fulfilled the duties of his religion with scrupulous punctuality; his daughter had been carefully instructed in the Israelitish faith and practices.

So, when the mestizo had manifested his displeasure on this subject, the old man remained mute and pensive, and André Certa broke the silence, saying:

"Do you forget that the motive for which I espouse Sarah will compel her to become a convert to Catholicism? It is not my fault," added the mestizo; "but in spite of you, in spite of me, in spite of herself, it will be so."

"You are right," said the Jew sadly; "but, by the Bible, Sarah shall be a Jewess as long as she is my daughter."

At this moment the door of the chamber opened, and the major-domo of the Jew Samuel respectfully entered.

"Is the murderer arrested?" asked the old man.

"We have reason to believe he is dead!"

"Dead!" repeated André, with a joyful exclamation.

"Caught between us and a company of soldiers," replied the major-domo, "he was obliged to leap over the parapet of the bridge."

"He has thrown himself into the Rimac!" exclaimed André.

"And how do you know that he has not reached the shore?" asked Samuel.

"The melting of the snow has made the current rapid at that spot; besides, we stationed ourselves on each side of the river, and he did not re-appear. I have left sentinels who will pass the night in watching the banks."

"It is well," said the old man; "he has met with a just fate. Did you recognize him in his flight?"

"Perfectly, sir; it was Martin Paz, the Indian of the mountains."

"Has this man been observing Sarah for some time past?"

"I do not know," replied the servant.

"Summon old Ammon."

The major-domo withdrew.

"These Indians," said the old man, "have secret understandings among themselves; I must know whether the pursuit of this man dates from a distant period."

The duenna entered, and remained standing before her master.

"Does my daughter," asked Samuel, "know any thing of what has taken place this morning?"

"When the cries of your servants awoke me, I ran to the chamber of the señora, and found her almost motionless and of a mortal paleness."

"Fatality!" said Samuel; "continue," added he, seeing that the mestizo was apparently asleep.

"To my urgent inquiries as to the cause of her agitation, the señora would not reply; she retired without accepting my services, and I withdrew."

"Has this Indian often thrown himself in her way?"

"I do not know, master; nevertheless I have often met him in the streets of San Lazaro."

"And you have told me nothing of this?"

"He came to her assistance this evening on the Plaza-Mayor," added the old duenna.

"Her assistance! how?"

The old woman related the scene with downcast head.

"Ah! my daughter wish to kneel among these Christians!" exclaimed the Jew, angrily; "and I knew nothing of all this! You deserve that I should dismiss you."

The duenna went out of the room in confusion.

"Do you not see that the marriage should take place soon?" said André Certa. "I am not asleep, Master Samuel! But I need rest, now, and I will dream of our espousals."

At these words, the old man slowly retired. Before regaining his room, he wished to assure himself of the condition of his daughter, and softly entered the chamber of Sarah.

The young girl was in an agitated slumber, in the midst of the rich silk drapery around her; a watch-lamp of alabaster, suspended from the arabesques of the ceiling, shed its soft light upon her beautiful countenance; the half-open window admitted, through lowered blinds, the quiet coolness of the air, impregnated with the penetrating
perfumes of the aloes and magnolia; creole luxury was displayed in the thousand objects of art which good taste and grace had dispersed on richly carved _étagères_; and, beneath the vague and placid rays of night, it seemed as if the soul of the child was sporting amid these wonders.

The old man approached the bed of Sarah: he bent over her to listen. The beautiful Jewess seemed disturbed by sorrowful thoughts, and more than once the name of Martin Paz escaped her lips.

Samuel regained his chamber, uttering maledictions.

At the first rays of morning, Sarah hastily arose. Liberta, a full-blooded Indian attached to her service, hastened to her; and, in pursuance of her orders, saddled a mule for his mistress and a horse for himself.

Sarah was accustomed to take morning-rides, accompanied by this Indian, who was entirely devoted to her.

She was clad in a _saya_ of a brown color, and a mantle of cashmere with long tassels; her head was not covered with the usual hood, but sheltered beneath the broad brim of a straw hat, which left her long black tresses to float over her shoulders; and to conceal any unusual pre-occupation, she held between her lips a _cigarette_ of perfumed tobacco.

Liberta, clad like an Indian of the mountains, prepared to accompany his mistress.

"Liberta," said the young girl to him, "remember to be blind and dumb."

Once in the saddle, Sarah left the city as usual, and began to ride through the country; she directed her way toward Callao. The port was in full animation: there had been a conflict during the night between the revenue-officers and a schooner, whose undecided movements betrayed a fraudulent speculation. The _Annonciation_ seemed to have been awaiting some suspicious barks near the mouth of the Rimac; but before the latter could reach her, she had been compelled to flee before the custom-house boats, which had boldly given her chase.

Various rumors were in circulation respecting the destination of this vessel—which bore no name on her stern. According to some, this schooner, laden with Colombian troops, was seeking to seize the principal vessels of Callao; for Bolivar had it in his heart to revenge the affront given to the soldiers left by him in Peru, and who had been driven from it in disgrace.

According to others, the schooner was simply a smuggler of European goods.

Without troubling herself about these rumors, more or less important, Sarah, whose ride to the port had been only a pretext, returned toward Lima, which she reached near the banks of the Rimac.

She ascended them toward the bridge: numbers of soldiers, mestizoes, and Indians, were stationed at various points on the shore.

Liberta had acquainted the young girl with the events of the night. In compliance with her orders, he interrogated some Indians leaning over the parapet, and learned that although Martin Paz had been undoubtedly drowned, his body had not yet been recovered.

Sarah was pale and almost fainting; it required all her strength of soul not to abandon herself to her grief.

Among the people wandering on the banks, she remarked an Indian with ferocious features—the Sambo! He was crouched on the bank, and seemed a prey to despair.

As Sarah passed near the old mountaineer, she heard these words, full of gloomy anger:

"Wo! wo! They have killed the son of the Sambo! They have killed my son!"

The young girl resolutely drew herself up, made a sign to Liberta to follow her; and this time, without caring whether she was observed or not, went directly to the church of Santa Anna; left her mule in charge of the Indian, entered the Catholic temple, and asking for the good Father Joachim, knelt on the stone steps, praying to Jesus and Mary for the soul of Martin Paz.

CHAPTER IV.

A SPANISH GRANDEE.

Any other than the Indian, Martin Paz, would have, indeed, perished in the waters of the Rimac; to escape death, his surprising strength, his insurmountable will, and especially his sublime coolness, one of the privileges of the free hordes of the _pampas_ of the New World, had all been found necessary.

Martin knew that his pursuers would concentrate their efforts to seize him below the bridge; it seemed impossible for him to overcome the current, and that the Indian must be carried down; but by vigorous strokes he succeeded in stemming the torrent; he dived repeatedly, and finding the under-currents less strong, at last ventured to land, and concealed himself behind a thicket of mangrove-trees.

But what was to become of him? Retreat was perilous; the soldiers might change their plans and ascend the river; the Indian must then inevitably be captured; he would lose his life, and, worse yet, Sarah. His decision was rapidly made; through the narrow streets and deserted squares he plunged into the heart of the city; but it was important that he should be supposed dead; he therefore avoided being seen, since his garments, dripping with water
and covered with sea-weed, would have betrayed him.

To avoid the indiscreet glances of some belated inhabitants, Martin Paz was obliged to pass through one of the widest streets of the city; a house still brilliantly illuminated presented itself: the _port-cochere_ was open to give passage to the elegant equipages which were issuing from the court, and conveying to their respective dwellings the nobles of the Spanish aristocracy.

The Indian adroitly glided into this magnificent dwelling; he could not remain in the street, where curious _zambos_ were thronging around, attracted by the carriages. The gates of the hotel were soon carefully closed, and the Indian found flight impossible.

Some lacqueys were going to and fro in the court; Martin Paz rapidly passed up a rich stairway of cedar-wood, ornamented with valuable tapestry; the saloons, still illuminated, presented no convenient place of refuge; he crossed them with the rapidity of lightning, and disappeared in a room filled with protecting darkness.

The last lustres were quickly extinguished, and the house became profoundly silent.

The Indian Paz, as a man of energy to whom moments are precious, hastened to reconnoitre the place, and to find the surest means of evasion; the windows of this chamber opened on an interior garden; flight was practicable, and Martin Paz was about to spring from them, when he heard these words:

"Señor, you have forgotten to take the diamonds which I had left on that table!"

Martin Paz turned. A man of noble stature and of great pride of countenance was pointing to a jewel-case.

At this insult Martin Paz laid his hand on his poignard. He approached the Spaniard, who stood unmoved, and, in a first impulse of indignation, raised his arm to strike him; but turning his weapon against himself, said, in a deep tone,

"Señor, if you repeat such words, I will kill myself at your feet."

The Spaniard, astonished, looked at the Indian more attentively, and through his tangled and dripping locks perceived so lofty a frankness, that he felt a strange sympathy fill his heart. He went toward the window, gently closed it, and returned toward the Indian, whose poignard had fallen to the ground.

"Who are you?" said he to him.

"The Indian, Martin Paz. I am pursued by soldiers for having defended myself against a mestizo who attacked me, and levelled him to the ground with a blow from my poignard. This mestizo is the betrothed of a young girl whom I love. Now, señor, you can deliver me to my enemies, if you judge it noble and right."

"Sir," replied the Spaniard, gravely, "I depart to-morrow for the Baths of Chorillos; if you please to accompany me, you will be for the present safe from pursuit, and will never have reason to complain of the hospitality of the Marquis Don Vegal."

Martin Paz bent coldly without manifesting any emotion.

"You can rest until morning on this bed," resumed Don Vegal; "no one here will suspect your retreat. Good-night, señor!"

The Spaniard went out of the room, and left the Indian, moved to tears by a confidence so generous; he yielded himself entirely to the protection of the marquis, and without thinking that his slumbers might be taken advantage of to seize him, slept with peaceful security.

The next day, at sunrise, the marquis gave the last orders for his departure, and summoned the Jew Samuel to come to him; in the meantime he attended the morning mass.

This was a custom generally observed by the aristocracy. From its very foundation Lima had been essentially Catholic. Besides its numerous churches, it numbered twenty-two convents, seventeen monasteries, and four _beaterios_, or houses of retreat for females who did not take the vows. Each of these establishments possessed a chapel, so that there were at Lima more than a hundred edifices for worship, where eight hundred secular or regular priests, three hundred _religieuses_, lay-brothers and sisters, performed the duties of religion.

As Don Vegal entered the church of Santa Anna, he noticed a young girl kneeling in prayer and in tears. There was so much of grief in her depression, that the marquis could not look at her without emotion; and he was preparing to console her by some kind words, when Father Joachim de Camarones approached him, saying in a low voice:

"Señor Don Vegal, pray do not approach her."

Then he made a sign to Sarah, who followed him to an obscure and deserted chapel.

Don Vegal directed his steps to the altar and listened to the mass; then, as he was returning, he thought involuntarily of the deep sadness of the kneeling maiden. Her image followed him to his hotel, and remained deeply engraven in his soul.

Don Vegal found in his saloon the Jew Samuel, who had come in compliance with his request. Samuel seemed to have forgotten the events of the night; the hope of gain animated his countenance with a natural gayety.

"What is your lordship's will?" asked he of the Spaniard.
"I must have thirty thousand piasters within an hour."
"Thirty thousand piasters! And who has them! By the holy king David, my lord, I am far from being able to furnish such a sum."
"Here are some jewels of great value," resumed Don Vegal, without noticing the language of the Jew; "besides I can sell you at a low price a considerable estate near Cusco."
"Ah! señor, lands ruin us—we have not arms enough left to cultivate them; the Indians have withdrawn to the mountains, and our harvests do not pay us for the trouble they cost."
"At what value do you estimate these diamonds?"
Samuel drew from his pocket a little pair of scales and began to weigh the stones with scrupulous skill. As he did this, he continued to talk, and, as was his custom, depreciated the pledges offered him.
"Diamonds! a poor investment! What would they bring? One might as well bury money! You will notice, señor, that this is not of the purest water. Do you know that I do not find a ready market for these costly ornaments? I am obliged to send such merchandise to the United Provinces! The Americans would buy them, undoubtedly, but to give them up to the sons of Albion. They wish besides, and it is very just, to gain an honest per centage, so that the depreciation falls upon me. I think that ten thousand piasters should satisfy your lordship. It is little, I know; but----"
"Have I not said," resumed the Spaniard, with a sovereign air of scorn, "that ten thousand piasters would not suffice?"
"Señor, I cannot give you a half real more!"
"Take away these caskets and bring me the sum I ask for. To complete the thirty thousand piasters which I need, you will take a mortgage on this house. Does it seem to you to be solid?"
"Ah, señor, in this city, subject to earthquakes, one knows not who lives or dies, who stands or falls."
And, as he said this, Samuel let himself fall on his heels several times to test the solidity of the floors.
"Well, to oblige your lordship, I will furnish you with the required sum; although, at this moment I ought not to part with money; for I am about to marry my daughter to the _caballero_ André Certa. Do you know him, sir?"
"I do not know him, and I beg of you to send me this instant, the sum agreed upon. Take away these jewels."
"Will you have a receipt for them?" asked the Jew.
Don Vegal passed into the adjoining room, without replying.
"Proud Spaniard!" muttered Samuel, "I will crush thy insolence, as I disperse thy riches! By Solomon! I am a skillful man, since my interests keep pace with my sentiments."

Don Vegal, on leaving the Jew, had found Martin Paz in profound dejection of spirits, mingled with mortification.
"What is the matter?" he asked affectionately.
"Señor, it is the daughter of the Jew whom I love."
"A Jewess!" exclaimed Don Vegal, with disgust.
But seeing the sadness of the Indian, he added:
"Let us go, _amigo_, we will talk of these things afterward!"

An hour later, Martin Paz, clad in Spanish costume, left the city, accompanied by Don Vegal, who took none of his people with him.

The Baths of Chorillos are situated at two leagues from Lima. This Indian parish possesses a pretty church; during the hot season it is the rendezvous of the fashionable Limanian society. Public games, interdicted at Lima, are permitted at Chorillos during the whole summer. The señoras there display unwonted ardor, and, in decorating himself for these pretty partners, more than one rich cavalier has seen his fortune dissipated in a few nights.

Chorillos was still little frequented; so Don Vegal and Martin Paz retired to a pretty cottage, built on the seashore, could live in quiet contemplation of the vast plains of the Pacific Ocean.

The Marquis Don Vegal, belonging to one of the most ancient families of Peru, saw about to terminate in himself the noble line of which he was justly proud; so his countenance bore the impress of profound sadness. After having mingled for some time in political affairs, he had felt an inexpressible disgust for the incessant revolutions brought about to gratify personal ambition; he had withdrawn into a sort of solitude, interrupted only at rare intervals by the duties of strict politeness.

His immense fortune was daily diminishing. The neglect into which his vast domains had fallen for want of laborers, had compelled him to borrow at a disadvantage; but the prospect of approaching mediocrity did not alarm him; that carelessness natural to the Spanish race, joined to the ennui of a useless existence, had rendered him insensible to the menaces of the future. Formerly the husband of an adored wife, the father of a charming little girl, he had seen himself deprived, by a horrible event, of both these objects of his love. Since then, no bond of affection had attached him to earth, and he suffered his life to float at the will of events.

Don Vegal had thought his heart to be indeed dead, when he felt it palpitate at contact with that of Martin Paz.
This ardent nature awoke fire beneath the ashes; the proud bearing of the Indian suited the chivalric hidalgo; and then, weary of the Spanish nobles, in whom he no longer had confidence, disgusted with the selfish mestizoes, who wished to aggrandize themselves at his expense, he took a pleasure in turning to that primitive race, who have disputed so valiantly the American soil with the soldiers of Pizarro.

According to the intelligence received by the marquis, the Indian passed for dead at Lima; but, looking on his attachment for the Jewess as worse than death itself, the Spaniard resolved doubly to save his guest, by leaving the daughter of Samuel to marry André Certa.

While Martin Paz felt an infinite sadness pervade his heart, Don Vegal avoided all allusion to the past, and conversed with the young Indian on indifferent subjects.

Meanwhile, one day, saddened by his gloomy preoccupations, the Spaniard said to him:

"Why, my friend, do you lower the nobility of your nature by a sentiment so much beneath you? Was not that bold Manco-Capac, whom his patriotism placed in the rank of heroes, your ancestor? There is a noble part left for a valiant man, who will not suffer himself to be overcome by an unworthy passion. Have you no heart to regain your independence?"

"We are laboring for this, señor," said the Indian; "and the day when my brethren shall rise _en masse_ is perhaps not far distant."

"I understand you; you allude to the war for which your brethren are preparing among their mountains; at a signal they will descend on the city, arms in hand--and will be conquered as they have always been! See how your interests will disappear amid these perpetual revolutions of which Peru is the theatre, and which will ruin it entirely, Indians and Spaniards, to the profit of the mestizoes, who are neither."

"We will save it ourselves," exclaimed Martin Paz.

"Yes, you will save it if you understand how to play your part! Listen to me, Paz, you whom I love from day to day as a son! I speak only the truth, and I should perjure myself were I to take an oath to that effect."

Don Vegal was silent. The passion of the young Indian increased from day to day; the marquis trembled to see him incur certain death by re-appearing at Lima. He hastened by all his desires, he would have hastened by all his efforts, the marriage of the Jewess!

To ascertain himself the state of things he quitted Chorillos one morning, returned to the city, and learned that André Certa had recovered from his wound. His approaching marriage was the topic of general conversation.

Don Vegal wished to see this woman whose image troubled the mind of Martin Paz. He repaired, at evening, to the Plaza-Mayor. The crowd was always numerous there. There he met Father Joachim de Camarones, his confessor and his oldest friend; he acquainted him with his mode of life. What was the astonishment of the good father to learn the existence of Martin Paz. He promised Don Vegal to watch also himself over the young Indian, and to convey to the marquis any intelligence of importance.

Suddenly the glances of Don Vegal rested on a young girl, enveloped in a black mantle, reclining in a calèche.

"Who is that beautiful person?" asked he of the father.

"It is the betrothed of André Certa, the daughter of the Jew Samuel."

"She! the daughter of the Jew!"

The marquis could hardly suppress his astonishment, and, pressing the hand of Father Joachim, pensively took the road to Chorillos.

He had just recognized in Sarah, the pretended Jewess, the young girl whom he had seen praying with such Christian fervor, at the church of Santa Anna.

CHAPTER V.
The Hatred of the Indians.
Since the Colombian troops, confided by Bolivar to the orders of General Santa Cruz, had been driven from lower Peru, this country, which had been incessantly agitated by _pronunciamentos_, military revolts, had recovered some calmness and tranquillity.

In fact, private ambition no longer had anything to expect; the president Gambarra seemed immovable in his palace of the Plaza-Mayor. In this direction there was nothing to fear; but the true danger, concealed, imminent, was not from these rebellions, as promptly extinguished as kindled, and which seemed to flatter the taste of the Americans for military parades.

This unknown peril escaped the eyes of the Spaniards, too lofty to perceive it, and the attention of the mestizoes, who never wished to look beneath them.

And yet there was an unusual agitation among the Indians of the city; they often mingled with the _serranos_, the inhabitants of the mountains; these people seemed to have shaken off their natural apathy. Instead of rolling themselves in their _ponchos_, with their feet turned to the spring sun, they were scattered throughout the country, stopping one another, exchanging private signals, and haunting the least frequented _pulperias_, in which they could converse without danger.

This movement was principally to be observed on one of the squares remote from the centre of the city. At the corner of a street stood a house, of only one story, whose wretched appearance struck the eye disagreeably.

A tavern of the lowest order, a _chingana_, kept by an old Indian woman, offered to the lowest _zambos_ the _chica_, beer of fermented maize, and the _quarapo_, a beverage made of the sugar-cane.

The concourse of Indians on this square took place only at certain hours, and principally when a long pole was raised on the roof of the inn as a signal of assemblage, then the _zambos_ of every profession, the _capataz_, _arrieros_, muleteers, the _carreteros_, carters, entered the _chingana_, one by one, and immediately disappeared in the great hall; the _padrona_ (hostess) seemed very busy, and leaving to her servant the care of the shop, hastened to serve herself her usual customers.

A few days after the disappearance of Martin Paz, there was a numerous assembly in the hall of the inn; one could scarcely through the darkness, rendered still more obscure by the tobacco-smoke, distinguish the frequenters of this tavern. Fifty Indians were ranged around a long table; some were chewing the _coca_, a kind of tea-leaf, mingled with a little piece of fragrant earth called _manubi_; others were drinking from large pots of fermented maize; but these occupations did not distract their attention, and they were closely listening to the speech of an Indian.

This was the Sambo, whose fixed eyes were strangely wild. He was clad as on the Plaza-Mayor. After having carefully observed his auditors, the Sambo commenced in these terms:

"The children of the Sun can converse on grave affairs; there is no perfidious ear to hear them; on the square, some of our friends, disguised as street-singers, will attract the attention of the passers-by, and we shall enjoy entire liberty."

In fact the tones of a mandoline and of a _viguela_ were echoing without.

The Indians within, knowing themselves in safety, lent therefore close attention to the words of the Sambo, in whom they placed entire confidence.

"What news can the Sambo give us of Martin Paz?" asked an Indian.

"None--is he dead or not? The Great Spirit only knows. I am expecting some of our brethren, who have descended the river to its mouth, perhaps they will have found the body of Martin Paz."

"He was a good chief," said Manangani, a ferocious Indian, much dreaded; "but why was he not at his post on the day when the schooner brought us arms?"

"Let the hour come," said the Sambo; "do my brethren know what enemy their arms should strike first?"

"These are the monopolizers of the riches of the soil, who will not suffer us to purchase a little comfort for our old age."
"You are mistaken; and your first blows must be struck elsewhere," said the Sambo, growing animated; "these are not the men who have dared for three hundred years past to tread the soil of our ancestors; it is not these rich men gorged with gold who have dragged to the tomb the sons of Manco-Capac; no, it is these proud Spaniards whom Fate has thrust on our independent shores! These are the true conquerors of whom you are the true slaves! If they have no longer wealth, they have authority; and, in spite of Peruvian emancipation, they crush and trample upon our natural rights. Let us forget what we are, to remember what our fathers have been!"

"Anda! anda!" exclaimed the assembly, with stamps of approbation.

After a few moments of silence, the Sambo assured himself, by interrogating various conspirators, that the friends of Cusco and of all Bolivia were ready to strike as a single man.

Then, resuming with fire:

"And our brethren of the mountains, brave Manangani, if they have all a heart of hatred equal to thine, a courage equal to thine, they will fall on Lima like an avalanche from the summit of the Cordilleras."

"The Sambo shall not complain of their boldness on the day appointed. Let the Indian leave the city, he shall not go far without seeing throng around him zambos burning for vengeance! In the gorges of San Cristoval and the Amancaës, more than one is couched on his poncho, with his poignard at his girdle, waiting until a long carbine shall be confided to his skillful hand. They also have not forgotten that they have to revenge on the vain Spaniards the defeat of Manco-Capac."

"Well said! Manangani; it is the god of hatred who speaks from thy mouth. My brethren shall know before long whom their chiefs have chosen to lead this great vengeance. President Gambarra is seeking only to consolidate his power; Bolivar is afar, Santa Cruz has been driven away; we can act with certainty. In a few days, the fête of the Amancaës will summon our oppressors to pleasure; then, let each be ready to march, and let the news be carried to the most remote villages of Bolivia."

At this moment three Indians entered the great hall. The Sambo hastened to meet them.

"Well?" said he to them.

"The body of Martin Paz has not been recovered; we have sounded the river in every direction; our most skillful divers have explored it with religious care, and the son of the Sambo cannot have perished in the waters of the Rimac."

"Have they killed him? What has become of him? Oh! wo, wo to them if they have killed my son! Let my brethren separate in silence; let each return to his post, look, watch and wait!"

The Indians went out and dispersed; the Sambo alone remained with Manangani, who asked him:

"Does the Sambo know what sentiment conducted his son to San Lazaro? The Sambo, I trust, is sure of his son?"

The eyes of the Indian flashed, and the blood mounted to his cheek. The ferocious Manangani recoiled.

But the Indian controlled himself, and said:

"If Martin Paz has betrayed his brethren, I will first kill all those to whom he has given his friendship, all those to whom he has given his love! Then I will kill him, and myself afterward, that nothing may be left beneath the sun of an infamous, and dishonored race."

At this moment, the padrona opened the door of the room, advanced toward the Sambo, and handed him a billet directed to his address.

"Who gave you this?" said he.

"I do not know; this paper may have been designedly forgotten by a _chica_-drinker. I found it on the table."

"Have there been any but Indians here?"

"There have been none but Indians."

The padrona went out; the Sambo unfolded the billet, and read aloud:

"A young girl has prayed for the return of Martin Paz, for she has not forgotten that the young Indian protected her and risked his life for her. If the Sambo has any news of his poor son, or any hope of finding him, let him surround his arm with a red handkerchief; there are eyes which see him pass daily."

The Sambo crushed the billet in his hand.

"The unhappy boy," said he, "has suffered himself to be caught by the eyes of a woman."

"Who is this woman?" asked Manangani.

"It is not an Indian," replied the Sambo, observing the billet; "it is some young girl of the other classes. Martin Paz, I no longer know thee!"

"Shall you do what this woman requests?"

"No," replied the Indian, violently; "let her lose all hope of seeing him again; let her die, if she will."

And the Sambo tore the billet in a rage.

"It must have been an Indian who brought this billet," observed Manangani.

"Oh, it cannot have been one of ours! He must have known that I often came to this inn, but I will set my foot in
it no more. We have occupied ourselves long enough with trifling affairs," resumed he, coldly; "let my brother return to the mountains; I will remain to watch over the city. We shall see whether the fête of the Amancaës will be joyous for the oppressors or the oppressed!"

The two Indians separated.

The plan of the conspiracy was well conceived and the hour of its execution well chosen. Peru, almost depopulated, counted only a small number of Spaniards and mestizos. The invasion of the Indians, gathered from every direction, from the forests of Brazil, as well as the mountains of Chili and the plains of La Plata, would cover the theatre of war with a formidable army. The great cities, like Lima, Cusco, Puña, might be utterly destroyed; and it was not to be expected that the Colombian troops, so recently driven away by the Peruvian government, would come to the assistance of their enemies in peril.

This social overturn might therefore have succeeded, if the secret had remained buried in the hearts of the Indians, and there surely could not be traitors among them?

But they were ignorant that a man had obtained private audience of the President Gambarra. This man informed him that the schooner _Annonciation_ had been captured from him by Indian pirates! That it had been laden with arms of all sorts; that canoes had unloaded it at the mouth of the Rimac; and he claimed a high indemnity for the service he thus rendered to the Peruvian government.

And yet this man had let his vessel to the agents of the Sambo; he had received for it a considerable sum, and had come to sell the secret which he had surprised.

By these traits the reader will recognize the Jew Samuel.

CHAPTER VI.
THE BETROTHAL.

André Certa, entirely recovered, sure of the death of Martin Paz, pressed his marriage: he was impatient to parade the young and beautiful Jewess through the streets of Lima.

Sarah constantly manifested toward him a haughty indifference; but he cared not for it, considering her as an article of sale, for which he had paid a hundred thousand piasters.

And yet André Certa suspected the Jew, and with good reason; if the contract was dishonorable, the contractors were still more so. So the mestizo wished to have a secret interview with Samuel, and took him one day to the Baths of Chorillos.

He was not sorry, besides, to try the chances of play before his wedding: public gaming, prohibited at Lima, is perfectly tolerated elsewhere. The passion of the Limanian ladies and gentlemen for this hazardous amusement is singular and irresistible.

The games were open some days before the arrival of the Marquis Don Vegal; thenceforth there was a perpetual movement of the populace on the road from Lima: some came on foot, who returned in carriages; others were about to risk and lose the last remnants of their fortunes.

Don Vegal and Martin Paz took no part in these exciting pleasures. The reveries of the young Indian had more noble causes; he was thinking of Sarah and of his benefactor.

The concourse of the Limanians to the Baths of Chorillos was without danger for him; little known by the inhabitants of the city, like all the mountain Indians he easily concealed himself from all eyes.

After his evening walk with the marquis, Martin Paz would return to his room, and leaning his elbow on the window, pass long hours in allowing his tumultuous thoughts to wander over the Pacific Ocean. Don Vegal lodged in a neighboring chamber, and guarded him with paternal tenderness.

The Spaniard always remembered the daughter of Samuel, whom he had so unexpectedly seen at prayer in the Catholic temple. But he had not dared to confide this important secret to Martin Paz while instructing him by degrees in Christian truths; he feared to re-animate sentiments which he wished to extinguish—for the poor Indian, unknown and proscribed, must renounce all hope of happiness! Father Joachim kept Don Vegal informed of the progress of affairs: the police had at last ceased to trouble themselves about Martin Paz; and with time and the influence of his protector, the Indian, become a man of merit and capable of great things, might one day take rank in the highest Peruvian society.

Weary of the uncertainty into which his incognito plunged him, Paz resolved to know what had become of the young Jewess. Thanks to his Spanish costume, he could glide into a gaming-saloon, and listen to the conversation of its various frequenters. André Certa was a man of so much importance, that his marriage, if it was approaching, would be the subject of conversation.

One evening, instead of directing his steps toward the sea, the Indian climbed over the high rocks on which the principal habitations of Chorillos are built; a house, fronted by broad stone steps, struck his eyes—he entered it
without noise.
The day had been hard for many of the wealthy Limanians; some among them, exhausted with the fatigues of the preceding night, were reposing on the ground, wrapped in their _ponchos_.

Other players were seated before a large green table, divided into four compartments by two lines, which intersected each other at the centre in right angles; on each of these compartments were the first letters of the words _azar_ and _suerte_, (chance and fate,) A and S.

At this moment, the parties of the _monte_ were animated; a mestizo was pursuing the unfavorable chance with feverish ardor.

"Two thousand piasters!" exclaimed he.
The banker shook the dice, and the player burst into imprecations.
"Four thousand piasters!" said he, again. And he lost once more.
Martin Paz, protected by the obscurity of the saloon, could look the player in the face, and he turned pale.
It was André Certa!
Near him, was standing the Jew Samuel.
"You have played enough, Señor André," said Samuel to him; "the luck is not for you."
"What business is it of yours?" replied the mestizo, roughly.
Samuel bent down to his ear.
"If it is not my business, it is your business to break off these habits during the days which precede your marriage."
"Eight thousand piasters!" resumed André Certa.
He lost again: the mestizo suppressed a curse and the banker resumed--"Play on!"
André Certa, drawing from his pocket some bills, was about to have hazarded a considerable sum; he had even deposited it on one of the tables, and the banker, shaking his dice, was about to have decided its fate, when a sign from Samuel stopped him short. The Jew bent again to the ear of the mestizo, and said--
"If nothing remains to you to conclude our bargain, it shall be broken off this evening!"
André Certa shrugged his shoulders, took up his money, and went out.
"Continue now," said Samuel to the banker; "you may ruin this gentleman after his marriage."
The banker bowed submissively. The Jew Samuel was the founder and proprietor of the games of Chorillos.
Wherever there was a _real_ to be made this man was to be met with.
He followed the mestizo; and finding him on the stone steps, said to him--
"I have secrets of importance to communicate. Where can we converse in safety?"
"Wherever you please," replied Certa, roughly.
"Señor, let not your passions ruin your prospects. I would neither confide my secret to the most carefully closed chambers, nor the most lonely plains. If you pay me dearly for it, it is worth telling and worth keeping."
As they spoke thus, these two men had reached the sea, near the cabins destined for the use of the bathers. They knew not that they were seen, heard and watched by Martin Paz, who glided like a serpent in the shadow.
"Let us take a canoe," said André, "and go out into the open sea; the sharks may, perhaps, show themselves discreet."
André detached from the shore a little boat, and threw some money to its guardian. Samuel embarked with him, and the mestizo pushed off. He vigorously plied two flexible oars, which soon took them a mile from the shore.
But as he saw the canoe put off, Martin Paz, concealed in a crevice of the rock, hastily undressed, and precipitating himself into the sea, swam vigorously toward the boat.
The sun had just buried his last rays in the waves of the ocean, and darkness hovered over the crests of the waves.
Martin Paz had not once reflected that sharks of the most dangerous species frequented these fatal shores. He stopped not far from the boat of the mestizo, and listened.
"But what proof of the identity of the daughter shall I carry to the father?" _ asked André Certa of the Jew.
"You will recall to him the circumstances under which he lost her."
"What were these circumstances?"
Martin Paz, now scarcely above the waves, listened without understanding. In a girdle attached to his body, he had a poignard; he waited.
"Her father," said the Jew, "lived at Concencion, in Chili: he was then the great nobleman he is now; only his fortune equalled his nobility. Obliged to come to Lima on business, he set out alone, leaving at Concencion his wife, and child aged fifteen months. The climate of Peru agreed with him, and he sent for the marchioness to rejoin him. She embarked on the _San-José_ of Valparaiso, with her confidential servants.
"I was going to Peru in the same ship. The _San-José_ was about to enter the harbor of Lima; but, near Juan
Fernandez, was struck by a terrific hurricane, which disabled her and threw her on her side—it was the affair of half an hour. The _San-José_ filled with water and was slowly sinking; the passengers and crew took refuge in the boat, but at sight of the furious waves, the marchioness refused to enter it; she pressed her infant in her arms, and remained in the ship. I remained with her—the boat was swallowed up at a hundred fathoms from the _San-José_, with all her crew. We were alone—the tempest blew with increasing violence. As my fortune was not on board, I had nothing to lose. The _San-José_, having five feet of water in her hold, drifted on the rocks of the shore, where she broke to pieces. The young woman was thrown into the sea with her daughter: fortunately, for me," said the Jew, with a gloomy smile, "I could seize the child, and reach the shore with it."

"All these details are exact?"

"Perfectly so. The father will recognize them. I had done a good day's work, señor; since she is worth to me the hundred thousand piasters which you are about to pay me. Now, let the marriage take place to-morrow."

"What does this mean?" asked Martin Paz of himself, still swimming in the shadow.

"Here is my pocket-book, with the hundred thousand piasters—take it, Master Samuel," replied André Certa to the Jew.

"Thanks, Señor Andrè," said the Israelite, seizing the treasure; "take this receipt in exchange—I pledge myself to restore you double this sum, if you do not become a member of one of the proudest families of Spain."

But the Indian had not heard this last sentence; he had dived to avoid the approach of the boat, and his eyes could see a shapeless mass gliding rapidly toward him. He thought it was the canoe—he was mistaken.

It was a _tintorea_—a shark of the most ferocious species.

Martin Paz did not quail, or he would have been lost. The animal approached him—the Indian dived; but he was obliged to come up, in order to breathe.... He looked at the sky, as if he was never to behold it again. The stars sparkled above his head; the _tintorea_ continued to approach. A vigorous blow with his tail struck the swimmer; Martin Paz felt his slimy scales brush his breast. The shark, in order to snatch at him, turned on his back and opened his jaws, armed with a triple row of teeth. Martin Paz saw the white belly of the animal gleam beneath the wave, and with a rapid hand struck it with his poignard.

Suddenly he found the waters around him red with blood. He dived—came up again at ten fathoms' distance—thought of the daughter of Samuel; and seeing nothing more of the boat of the mestizo, regained the shore in a few strokes, already forgetting that he had just escaped death.

He quickly rejoined Don Vegal. The latter, not having found him on his return, was anxiously waiting him. Paz made no allusion to his recent adventures; but seemed to take a lively pleasure in his conversation.

But the next day Martin Paz had left Chorillos, and Don Vegal, tortured with anxiety, hastily returned to Lima.

The marriage of André Certa with the daughter of the wealthy Samuel, was an important event. The beautiful señoritas had not given themselves a moment's rest; they had exhausted their ingenuity to invent some pretty corsage or novel head-dress; they had adorned themselves in trying without cessation the most varied toilets.

Numerous preparations were also going on in the house of Samuel; it was a part of the Jew's plan to give great publicity to the marriage of Sarah. The frescoes which adorned his dwelling according to the Spanish custom, had been newly painted; the richest hangings fell in large folds at the windows and doors of the habitation. Furniture carved in the latest fashion, of precious or fragrant wood, was crowded in vast saloons, impregnated with a delicious coolness. Rare shrubs, the productions of warm countries, seized the eye with their splendid colors, and one would have thought Spring had stolen along the balconies and terraces, to inundate them with flowers and perfumes.

Meanwhile, amid these smiling marvels, the young girl was weeping; Sarah no longer had hope, since the Sambo had none; and the Sambo had no hope, since he wore no sign of hope! The negro Liberta had watched the steps of the old Indian; he had seen nothing. Ah! if the poor child could have followed the impulses of her heart, she would have immured herself in one of those tranquil _beaterios_, to die there amid tears and prayer.

Urged by an irresistible attraction to the doctrines of Catholicism, the young Jewess had been secretly converted; by the cares of the good Father Joachim, she had been won over to a religion more in accordance with her feelings than that in which she had been educated. If Samuel had destined her for a Jew, she would have avowed her faith; but, about to espouse a Catholic, she reserved for her husband the secret of her conversion.

Father Joachim, in order to avoid scandal, and besides, better read in his breviary than in the human heart, had suffered Sarah to believe in the death of Martin Paz. The conversion of the young girl was the most important thing to him; he saw it assured by her union with André Certa, and he sought to accustom her to the idea of this marriage, the conditions of which he was far from respecting.

At last the day so joyous for some, so sad for others, had arrived. André Certa had invited the entire city to his nuptials; his invitations were refused by the noble families, who excused themselves on various pretexts. The mestizo, meanwhile, proudly held up his head, and scarcely looked at those of his own class. The little Millefiores in vain essayed his humblest vows; but he consoled himself with the idea that he was about to figure as an active party
in the repast which was to follow.

In the meantime, the young mestizoes were discoursing with him in the brilliant saloons of the Jew, and the
crowd of guests thronged around André Certa, who proudly displayed the splendors of his toilet.

The contract was soon to be signed; the sun had long been set, and the young girl had not appeared.

Doubtless she was discussing with her duenna and her maids the place of a ribbon or the choice of an ornament.
Perhaps, that enchanting timidity which so beautifully adorns the cheeks of a young girl, detained her still from their
inquisitive regards.

The Jew Samuel seemed a prey to secret uneasiness; André Certa bent his brow in an impatient manner; a sort of
embarrassment was depicted on the countenance of more than one guest, while the thousand of wax-lights, reflected
by the mirrors, filled the saloon with dazzling splendor.

Without, a man was wandering in mortal anxiety; it was the Marquis Don Vegal.

CHAPTER VII.
ALL INTERESTS AT STAKE.

Meanwhile, Sarah was left alone, alone with her anguish and her grief! She was about to give up her whole life
to a man whom she did not love! She leaned over the perfumed balcony of her chamber, which overlooked the
interior gardens. Through the green jalousies, her ear listened to the sounds of the slumbering country. Her lace
mantle, gliding over her arms, revealed a profusion of diamonds sparkling on her shoulders. Her sorrow, proud and
majestic, appeared through all her ornaments, and she might have been taken for one of those beautiful Greek slaves,
nobly draped in their antique garments.

Suddenly her glance rested on a man who was gliding silently among the avenues of the magnolia; she
recognized him; it was Liberta, her servant. He seemed to be watching some invisible enemy, now sheltering
himself behind a statue, now crouching on the ground.

Sarah was afraid, and looked around her. She was alone, entirely alone. Her eyes rested on the gardens, and she
became pale, paler still! Before her was transpiring a terrible scene. Liberta was in the grasp of a man of tall stature,
who had thrown him down; stifled sighs proved that a robust hand was pressing the lips of the Indian.

The young girl, summoning all her courage, was about to cry out, when she saw the two men rise! The negro
was looking fixedly at his adversary.

"It is you, then! it is you!" exclaimed he.

And he followed this man in a strange stupefaction. They arrived beneath the balcony of Sarah. Suddenly, before
she had time to utter a cry, Martin Paz appeared to her, like a phantom from another world; and, like the negro when
overthrown by the Indian, the young girl, bending before the glance of Martin Paz, could in her turn only repeat
these words,

"It is you, then! it is you!"

The young Indian fixed on her his motionless eyes, and said:

"Does the betrothed hear the sound of the festival? The guests are thronging into the saloons to see happiness
radiate from her countenance! Is it then a victim, prepared for the sacrifice, who is about to present herself to their
impatient eyes? Is it with these features, pale with sorrow, with eyes in which sparkle bitter tears, that the young girl
is to appear herself before her betrothed?"

Martin Paz spoke thus, in a tone full of sympathizing sadness, and Sarah listened vaguely as to those harmonies
which we hear in dreams!

The young Indian resumed with infinite sweetness:

"Since the soul of the young girl is in mourning, let her look beyond the house of her father, beyond the city
where she suffers and weeps; beyond the mountains, the palm-trees lift up their heads in freedom, the birds strike the
air with an independent wing; men have immensity to live in, and the young girls may unfold their spirits and their
hearts!"

Sarah raised her head toward Martin Paz. The Indian had drawn himself up to his full height, and with his arm
extended toward the summits of the Cordilleras, was pointing out to the young girl the path to liberty.

Sarah felt herself constrained by an irresistible force. Already the sound of voices reached her; they approached
her chamber; her father was undoubtedly about to enter; perhaps her lover would accompany him! The Indian
suddenly extinguished the lamp suspended above his head. A whistling, similar to the cry of the _cilguero_, and
reminding one of that heard on the Plaza-Mayor, pierced the silent darkness of night; the young girl swooned.

The door opened hastily; Samuel and André Certa entered. The darkness was profound; some servants ran with
torches. The chamber was empty.

"Death and fury!" exclaimed the mestizo.
"Where is she?" asked Samuel.
"You are responsible for her," said André, brutally.
At these words, the Jew felt a cold sweat freeze even his bones.
"Help! help!" he exclaimed.
And, followed by his domestics, he sprang out of the house.
Martin Paz fled rapidly through the streets of the city. The negro Liberta followed him; but did not appear disposed to dispute with him the possession of the young girl.
At two hundred paces from the dwelling of the Jew, Paz found some Indians of his companions, who had assembled at the whistle uttered by him.
"To our mountain _ranchos_!" exclaimed he.
"To the house of the Marquis Don Vegal!" said another voice behind him.
Martin Paz turned; the Spaniard was at his side.
"Will you not confide this young girl to me?" asked the marquis.
The Indian bent his head, and said in a low voice to his companions:
"To the dwelling of the Marquis Don Vegal!"
They turned their steps in this direction.

An extreme confusion reigned then in the saloons of the Jew. The news of Sarah's disappearance was a thunderbolt; the friends of André hastened to follow him. The _faubourg_ of San Lazaro was explored, hastily searched; but nothing could be discovered. Samuel tore his hair in despair. During the whole night the most active research was useless.
"Martin Paz is living!" exclaimed André Certa, in a moment of fury.
And the presentiment quickly acquired confirmation. The police were immediately informed of the elopement; its most active agents bestirred themselves; the Indians were closely watched, and if the retreat of the young girl was not discovered, evident proofs of an approaching revolt came to light, which accorded with the denunciations of the Jew.

André Certa lavished gold freely, but could learn nothing. Meanwhile, the gate-keepers declared that they had seen no person leave Lima; the young girl must therefore be concealed in the city.
Liberta, who returned to his master, was often interrogated; but no person seemed more astonished than himself at the elopement of Sarah.
Meanwhile, one man besides André Certa had seen in the disappearance of the young Jewess, a proof of the existence of Martin Paz; it was the Sambo. He was wandering in the streets of Lima, when the cry uttered by the Indian fixed his attention; it was a signal of rally well known to him! The Sambo was therefore a spectator of the capture of the young girl, and followed her to the dwelling of the marquis.
The Spaniard entered by a secret door, of which he alone had the key; so that his domestics suspected nothing. Martin Paz carried the young girl in his arms and laid her on a bed.
When Don Vegal, who had returned to re-enter by the principal door, reached the chamber where Sarah was reposing, he found Martin Paz kneeling beside her. The marquis was about to reproach the Indian with his conduct, when the latter said to him:
"You see, my father, whether I love you! Ah! why did you throw yourself in my way? We should have been already free in our mountains. But how, should I not have obeyed your words?"
Don Vegal knew not what to reply, his heart was seized with a powerful emotion. He felt how much he was beloved by Martin Paz.
"The day on which Sarah shall quit your dwelling to be restored to her father and her betrothed," sighed the Indian, "you will have a son and a friend less in the world."
As he said these last words, Paz moistened with his tears the hand of Don Vegal. They were the first tears this man had shed!
The reproaches of Don Vegal died away before this respectful submission. The young girl had become his guest; she was sacred! He could not help admiring Sarah, still in a swoon; he was prepared to love her, of whose conversion he had been a witness, and whom he would have been pleased to bestow as a companion upon the young Indian.
It was then that, on opening her eyes, Sarah found herself in the presence of a stranger.
"Where am I?" said she, with a sentiment of terror.
"With a generous man who has permitted me to call him my father," replied Martin Paz, pointing to the Spaniard.
The young girl, restored by the voice of the Indian to a consciousness of her position, covered her face with her trembling hands, and began to sob.
"Withdraw, friend," said Don Vegal to the young man; "withdraw."

Martin Paz slowly left the room, not without having pressed the hand of the Spaniard, and cast on Sarah a lingering look.

Then Don Vegal bestowed upon this poor child consolations of exquisite delicacy; he conveyed in suitable language his sentiments of nobility and honor. Attentive and resigned, the young girl comprehended what danger she had escaped; and she confided her future happiness to the care of the Spaniard. But amid phrases interrupted by sighs and mingled with tears, Don Vegal perceived the intense attachment of this simple heart for him whom she called her deliverer. He induced Sarah to take some repose, and watched over her with the solicitude of a father.

Martin Paz comprehended the duties that honor required of him, and, in spite of perils and dangers, would not pass the night beneath the roof of Don Vegal.

He therefore went out; his head was burning, his blood was boiling with fever in his veins.

He had not gone a hundred paces in the street, when five or six men threw themselves upon him, and, notwithstanding his obstinate defense, succeeded in binding him. Martin Paz uttered a cry of despair, which was lost in the night. He believed himself in the power of his enemies, and gave a last thought to the young girl.

A short time afterward the Indian was deposited in a room. The bandage which had covered his eyes was taken off. He looked around him, and saw himself in the lower hall of that tavern where his brethren had organized their approaching revolt.

The Sambo, Manangani, and others, surrounded him. A gleam of indignation flashed from his eyes, which was reciprocated by his captors.

"My son had then no pity on my tears," said the Sambo, "since he suffered me for so long a time to believe in his death?"

"Is it on the eve before a revolt that Martin Paz, our chief, should be found in the camp of our enemies?"

Martin Paz replied neither to his father, nor to Manangani.

"So our most important interests have been sacrificed to a woman!"

As he spoke thus, Manangani had approached Martin Paz; a poignard was gleaming in his hand. Martin Paz did not even look at him.

"Let us first speak," said the Sambo; "we will act afterward. If my son fails to conduct his brethren to the combat, I shall know now on whom to avenge his treason. Let him take care! the daughter of the Jew Samuel is not so well concealed that she can escape our hatred. My son will reflect. Struck with a mortal condemnation, proscribed, wandering among our masters, he will not have a stone on which to rest his sorrows. If, on the contrary, we resume our ancient country and our ancient power, Martin Paz, the chief of numerous tribes, may bestow upon his betrothed both happiness and glory."

Martin Paz remained silent; but a terrific conflict was going on within him. The Sambo had roused the most sensitive chords of his proud nature to vibrate; placed between a life of fatigues, of dangers, of despair, and an existence happy, honored, illustrious, he could not hesitate. But should he then abandon the Marquis Don Vegal, whose noble hopes destined him as the deliverer of Peru!

"Oh!" thought he, as he looked at his father, "they will kill Sarah, if I forsake them."

"What does my son reply to us?" imperiously demanded the Sambo.

"That Martin Paz is indispensable to your projects; that he enjoys a supreme authority over the Indians of the city; that he leads them at his will, and, at a sign, could have them dragged to death. He must therefore resume his place in the revolt, in order to ensure victory."

The bonds which still enchained him were detached by order of the Sambo; Martin Paz arose free among his brethren.

"My son," said the Indian, who was observing him attentively, "tomorrow, during the fête of the Amancaës, our brethren will fall like an avalanche on the unarmed Limanians. There is the road to the Cordilleras, there is the road to the city; you will go wherever your good pleasure shall lead you. Tomorrow! tomorrow! you will find more than one mestizo breast to break your poignard against. You are free."

"To the mountains!" exclaimed Martin Paz, with a stern voice.

The Indian had again become an Indian amid the hatred which surrounded him.

"To the mountains," repeated he, "and wo to our enemies, wo!"

And the rising sun illumined with its earliest rays the council of the Indian chiefs in the heart of the Cordilleras. These rays were joyless to the heart of the poor young girl, who wept and prayed. The marquis had summoned Father Joachim; and the worthy man had there met his beloved penitent. What happiness was it for her to kneel at the feet of the old priest, and to pour out her anguish and her afflictions.

But Sarah could not longer remain in the dwelling of the Spaniard. Father Joachim suggested this to Don Vegal, who knew not what part to take, for he was a prey to extreme anxiety. What had become of Martin Paz? He had fled
the house. Was he in the power of his enemies? Oh! how the Spaniard regretted having suffered him to leave it during that night of alarms! He sought him with the ardor, with the affection of a father; he found him not.

"My old friend," said he to Joachim, "the young girl is in safety near you; do not leave her during this fatal night."

"But her father, who seeks her--her betrothed, who awaits her?"

"One day--one single day! You know not whose existence is bound to that of this child. One day--one single day! at least until I find Martin Paz, he whom my heart and God have named my son!"

Father Joachim returned to the young girl; Don Vegal went out and traversed the streets of Lima.

The Spaniard was surprised at the noise, the commotion, the agitation of the city. It was that the great fête of the Amancaës, forgotten by him alone, the 24th of June, the day of St. John, had arrived. The neighboring mountains were covered with verdure and flowers; the inhabitants, on foot, on horseback, in carriages, were repairing to a celebrated table-land, situated at half a league from Lima, where the spectators enjoyed an admirable prospect; mestizoes and Indians mingled in the common fête; they walked gayly by groups of relatives or friends; each group, calling itself by the name of _partida_, carried its provisions, and was preceded by a player on the guitar, who chanted, accompanying himself, the most popular _yaravis_ and _llantos_. These joyous promenaders advanced with cries, sports, endless jests, through the fields of maize and of _alfalfa_, through the groves of banana, whose fruits hung to the ground; they traversed those beautiful _alamedas_, planted with willows, and forests of citron, and orange-trees, whose intoxicating perfumes were mingled with the wild fragrance from the mountains. All along the road, traveling cabarets offered to the promenaders the brandy of _pisco_ and the _chica_, whose copious libations excited to laughter and clamor; cavaliers made their horses caracole in the midst of the throng, and rivaled each other in swiftness, address, and dexterity; all the dances in vogue, from the _loudon_ to the _mismis_, from the _boleros_ to the _zamacuecas_, agitated and hurried on the _caballeros_ and black-eyed _sambas_. The sounds of the _viguela_ were soon no longer sufficient for the disordered movements of the dancers; the musicians uttered wild cries, which stimulated them to delirium; the spectators beat the measure with their feet and hands, and the exhausted couples sunk one after another to the ground.

There reigned in this fête, which derives its name from the little mountain-flowers, an inconceivable transport and freedom; and yet no private brawl mingled among the cries of public rejoicing; a few lancers on horseback, ornamented with their shining cuirasses, maintained here and there order among the populace.

The various classes of Limanian society mingled in these rejoicings, which are repeated every day throughout the month of July. Pretty _tapadas_ laughingly elbow beautiful girls, who bravely come, with uncovered faces, to meet joyous cavaliers; and when at last this multitude arrive at the _plateau_ of the Amancaës, an immense clamor of admiration is repeated by the mountain echoes.

At the feet of the spectators extends the ancient city of kings, proudly lifting toward heaven its towers and its steeples, whose bells are ringing joyous peals. San Pedro, Saint Augustine, the Cathedral, attract the eye to their roofs, resplendent with the rays of the sun. San Domingo, the rich church, the Madonna of which is never clad in the same garments two days in succession, raises above her neighbors her tapering spire; on the right, the vast plains of the Pacific Ocean are undulating to the breath of the occidental breeze, and the eye, as it roves from Callao to Lima, rests on those funereal _chulpas_, the last remains of the great dynasty of the Incas; at the horizon, Cape Morro-Solar frames, with its sloping hills, the wonderful splendors of this picture.

So the Limanians are never satisfied with these admirable prospects, and their noisy approbation deafens every year the echoes of San Cristoval and the Amancaës.

Now, while they fearlessly enjoyed these picturesque views, and were giving themselves up to an irresistible delight, a gloomy bloody funereal drama was preparing on the snowy summits of the Cordilleras.

CHAPTER VIII.

CONQUERORS AND CONQUERED.

A prey to his blind grief, Don Vegal walked at random. After having lost his daughter, the hope of his race and of his love, was he about to see himself also deprived of the child of his adoption whom he had wrested from death? Don Vegal had forgotten Sarah, to think only of Martin Paz.

He was struck with the great number of Indians, of _zambos_, of _chiños_, who were wandering about the streets; these men, who usually took an active part in the sports of the Amancaës, were now walking silently with singular pre-occupation. Often some busy chief gave them a secret order, and went on his way; and all, notwithstanding their _detours_, were assembling by degrees in the wealthiest quarters of Lima, in proportion as the Limanians were scattered abroad in the country.

Don Vegal, absorbed in his own researches, soon forgot this singular state of things. He traversed San Lazaro
throughout, saw André Certa there, enraged and armed, and the Jew Samuel, in the extremity of distress, not for the loss of his daughter, but for the loss of his hundred thousand piasters; but he found not Martin Paz, whom he was impatiently seeking. He ran to the consistorial prison. Nothing! He returned home. Nothing! He mounted his horse and hastened to Chorillos. Nothing! He returned at last, exhausted with fatigue, to Lima; the clock of the cathedral was striking four.

Don Vegal remarked some groups of Indians before his dwelling; but he could not, without compromising the man of whom he was in search, ask them--

"Where is Martin Paz?"

He re-entered, more despairing than ever.

Immediately a man emerged from a neighboring alley, and came directly to the Indians. This man was the Sambo.

"The Spaniard has returned," said he to them; "you know him now; he is one of the representatives of the race which crushes us--wo to him!"

"And when shall we strike?"

"When five o'clock sounds, and the tocsin from the mountain gives the signal of vengeance."

Then the Sambo marched with hasty steps to the _chingana_, and rejoined the chief of the revolt.

Meanwhile the sun had begun to sink beneath the horizon; it was the hour in which the Limanian aristocracy went in its turn to the Amancaés; the richest toilets shone in the equipages which defiled to the right and left beneath the trees along the road; there was an inextricable mêlée of foot-passengers, carriages, horses; a confusion of cries, songs, instruments, and vociferations.

The clock on the tower of the cathedral suddenly struck five! and a shrill funereal sound vibrated through the air; the tocsin thundered over the crowd, frozen in its delirium.

An immense cry resounded in the city. From every square, every street, every house issued the Indians, with arms in their hands, and fury in their eyes. The principal places of the city were thronged with these men, some of whom shook above their heads burning torches!

"Death to the Spaniards! death to the oppressors!" such was the watch-word of the rebels.

Those who attempted to return to Lima must have recoiled before these masses; but the summits of the hills were quickly covered with other enemies, and all retreat was impossible; the _zambos_ precipitated themselves like a thunderbolt on this crowd, exhausted with the fatigues of the festival, while the mountain Indians cleared for themselves a bloody path to rejoin their brethren of the city.

Imagine the aspect presented by Lima at this terrible moment. The rebels had left the square of the tavern, and were scattered in all quarters; at the head of one of the columns, Martin Paz was waving the black flag--the flag of independence; while the Indians in the other streets were attacking the houses appointed to ruin, Martin Paz took possession of the Plaza-Mayor with his company; near him, Manangani was uttering ferocious yells, and proudly displaying his bloody arms.

But the soldiers of the government, forewarned of the revolt, were ranged in battle array before the palace of the president; a frightful _fusillade_ greeted the insurgents at their entrance on the square; surprised by this unexpected discharge, which extended a goodly number of them on the ground, they sprang upon the troops with insurmountable impatience; a horrible mêlée followed, in which men fought body to body. Martin Paz and Manangani performed prodigies of valor, and escaped death only by miracle.

It was necessary at all hazards that the palace should be taken and occupied by their men.

"Forward!" cried Martin Paz, and his voice led the Indians to the assault. Although they were crushed in every direction, they succeeded in making the body of troops around the palace recoil. Already had Manangani sprang on the first steps; but he suddenly stopped as the opening ranks of soldiers unmasked two pieces of cannon ready to fire on the assailants.

There was not a moment to lose; the battery must be seized before it could be discharged.

"On!" cried Manangani, addressing himself to Martin Paz.

But the young Indian had just stooped and no longer heard him, for an Indian had whispered these words in his ear:

"They are pillaging the house of Don Vegal, perhaps assassinating him!"

At these words Martin Paz recoiled. Manangani seized him by the arm; but, repulsing him with a vigorous hand, the Indian darted toward the square.

"Traitor! infamous traitor!" exclaimed Manangani, discharging his pistols at Martin Paz.

At this moment the cannons were fired, and the grape swept the Indians on the steps.

"This way, brethren," cried Martin Paz, and a few fugitives, his devoted companions, joined him; with this little company he could make his way through the soldiers.
This flight had all the consequences of treason; the Indians believed themselves abandoned by their chief. Manangani in vain attempted to bring them back to the combat; a rapid _fusillade_ sent among them a shower of balls; thenceforth it was no longer possible to rally them; the confusion was at its height and the rout complete. The flames which arose in certain quarters attracted some fugitives to pillage; but the conquering soldiers pursued them with the sword, and killed a great number without mercy.

Meanwhile, Martin Paz had gained the house of Don Vegal; it was the theatre of a bloody struggle, headed by the Sambo himself; he had a double interest in being there; while contending with the Spanish noblemen, he wished to seize Sarah, as a pledge of the fidelity of his son.

On seeing Martin Paz return, he no longer doubted his treason, and turned his brethren against him.

The overthrown gate and walls of the court revealed Don Vegal, sword in hand, surrounded by his faithful servants, and contending with an invading mass. This man's courage and pride were sublime; he was the first to present himself to mortal blows, and his formidable arm had surrounded him with corpses.

But what could be done against this crowd of Indians, which was then increasing with all the conquered of the Plaza-Mayor. Don Vegal felt that his defenders were becoming exhausted, and nothing remained for him but death, when Martin Paz arrived, rapid as the thunderbolt, charged the aggressors from behind, forced them to turn against him, and, amid balls, poignard-strokes and maledictions, reached Don Vegal, to whom he made a rampart of his body. Courage revived in the hearts of the besieged.

"Well done, my son, well done!" said Don Vegal to Martin Paz, pressing his hand.

But the young Indian was gloomy.

"Well done! Martin Paz," exclaimed another voice which went to his very soul; he recognized Sarah, and his arm traced a bloody circle around him.

The company of Sambo gave way in its turn. Twenty times had this modern Brutus directed his blows against his son, without being able to reach him, and twenty times Martin had turned away the weapon about to strike his father.

Suddenly the ferocious Manangani, covered with blood, appeared beside the Sambo.

"Thou hast sworn," said he, "to avenge the treason of a wretch on his kindred, on his friends, on himself. Well, it is time! the soldiers are coming; the mestizo, André Certa, is with them."

"Come then," said the Sambo, with a ferocious laugh: "come then, for our vengeance approaches."

And both abandoned the house of Don Vegal, while their companions were being killed there. They went directly to the company who were arriving. The latter aimed at them; but without being intimidated, the Sambo approached the mestizo.

"You are André Certa," said he; "well, your betrothed is in the house of Don Vegal, and Martin Paz is about to carry her to the mountains."

This said, the Indians disappeared. Thus the Sambo had put face to face two mortal enemies, and, deceived by the presence of Martin Paz in the house of Don Vegal, the soldiers rushed upon the dwelling of the marquis.

André Certa was intoxicated with rage. As soon as he perceived Martin Paz, he rushed upon him.

"Here!" exclaimed the young Indian, and quitting the stone steps which he had so valiantly defended, he joined the mestizo. Meanwhile the companions of Martin Paz were repulsing the soldiers body to body.

Martin Paz had seized André Certa with his powerful hand, and clasped him so closely that the mestizo could not use his pistols. They were there, foot against foot, breast against breast, their faces touched, and their glances mingled in a single gleam; their movements became rapid, even invisible; neither friends nor enemies could approach them; in this terrible embrace respiration failed, both fell. André Certa raised himself above Martin Paz, whose poignard had escaped his grasp. The mestizo raised his arm, but the Indian succeeded in seizing it before it had struck. The moment was horrible. André Certa in vain attempted to disengage himself; Martin Paz, with supernatural strength, turned against the mestizo the poignard and the arm which held it, and plunged it into his heart.

Martin Paz arose all bloody. The place was free, the soldiers flying in every direction. Martin Paz might have conquered had he remained on the Plaza-Mayor. He fell into the arms of Don Vegal.

"To the mountains, my son; flee to the mountains! now I command it."

"Is my enemy indeed dead?" said Martin Paz, returning to the corpse of André Certa.

A man was that moment searching it, and held a pocket-book which he had taken from it. Martin Paz sprang on this man and overthrew him; it was the Jew Samuel.

The Indian picked up the pocket-book, opened it hastily, searched it, uttered a cry of joy, and springing toward the marquis, put in his hand a paper on which were written these words:

"Received of the Señor André Certa the sum of 100,000 piasters; I pledge myself to restore this sum doubled, if Sarah, whom I saved from the shipwreck of the _San-José_, and whom he is about to espouse, is not the daughter
and only heir of the Marquis Don Vegal.

"SAMUEL."

"My daughter! my daughter!" exclaimed the Spaniard, and he fell into the arms of Martin Paz, who carried him to the chamber of Sarah.

Alas! the young girl was no longer there; Father Joachim, bathed in his own blood, could articulate only these words:

"The Sambo!—carried off!--toward the river of Madeira!—"

And he fainted.

CHAPTER IX.

THE CATARACTS OF THE MADEIRA.

"On! on!" Martin Paz had exclaimed. And without saying a word, Don Vegal followed the Indian. His daughter!—he must find again his daughter! Mules were brought, prepared for a long journey among the Cordilleras; the two men mounted them, wrapped in their _ponchos_; large gaiters were attached by thongs above their knees; immense stirrups, armed with long spurs, surrounded their feet, and broad-brimmed Guayaquil hats sheltered their heads. Arms filled the holsters of each saddle; a carbine, formidable in the hands of Don Vegal, was suspended at his side. Martin Paz had encircled himself with his lasso, one extremity of which was fixed to the harness of his mule.

The Spaniard and the Indian spurred their horses to their utmost speed. At the moment of leaving the walls of the city they were joined by an Indian equipped like themselves. It was Liberta—Don Vegal recognized him; the faithful servant wished to share in their pursuit.

Martin Paz knew all the plains, all the mountains, which they were to traverse; he knew among what savage tribes, into what desert country the Sambo had conveyed his betrothed. His betrothed! he no longer dared give this name to the daughter of Don Vegal.

"My son," said the latter, "have you any hope in your heart?"

"As much as hatred and tenderness."

"The daughter of the Jew, in becoming my blood, has not ceased to be thine."

"Let us press on!" hastily replied Martin Paz.

On their way the travelers saw a great number of Indians flying to regain their _ranchos_ amid the mountains. The defection of Martin Paz had been followed by defeat. If the _émeute_ had triumphed in some places, it had received its death-blow at Lima.

The three cavaliers traveled rapidly, having but one idea, one object. They soon buried themselves among the almost impracticable passes of the Cordilleras. Difficult pathways circulated through these reddish masses, planted here and there with cocoanut and pine trees; the cedars, cotton-trees, and aloes were left behind them, with the plains covered with maize and lucerne; some thorny cactuses sometimes pricked their mules, and made them hesitate on the verge of precipices.

It was a difficult task to traverse the Cordilleras during these summer months; the melting of snows beneath the sun of June often made unforeseen cataracts spout from beneath the steps of the traveler; often frightful masses, detaching themselves from the summits of the peaks, were engulfed near them in fathomless abysses!

But they continued their march, fearing neither the hurricane nor the cold of these high solitudes; they traveled day and night, finding neither cities nor dwellings where they might for a moment repose; happy if in some deserted hut they found a mat of _tortora_ upon which to extend their wearied limbs, some pieces of meat dried in the sun, some calabashes full of muddy water.

They reached at last the summit of the Andes, 14,000 feet above the level of the sea. There, no more trees, no more vegetation; sometimes an _oso_ or _ucuman_, a sort of enormous black bear, came to meet them. Often, during the afternoon, they were enveloped in those formidable storms of the Cordilleras, which raise whirlwinds of snow from the loftiest summits. Don Vegal sometimes paused, unaccustomed to these frightful perils. Martin Paz then supported him in his arms, and sheltered him against the drifting snow. And yet lightnings flashed from the clouds, and thunders broke over these barren peaks, and filled the mountain recesses with their terrific roar.

At this point, the most elevated of the Andes, the travelers were seized with a malady called by the Indians _soroche_, which deprives the most intrepid man of his courage and his strength. A superhuman will is then necessary to keep one from falling motionless on the stones of the road, and being devoured by those immense condors which display above their vast wings! These three men spoke little; each wrapped himself in the silence which these vast deserts inspired.

On the eastern slope of the Cordilleras, they hoped to find traces of their enemies; they therefore traveled on, and were at last descending the chain of mountains; but the Andes are composed of a great number of salient peaks, so
that inaccessible precipices were constantly rising before them.

Nevertheless they soon found the trees of inferior levels; the llamas, the vigonias, which feed on the thin grass, announced the neighborhood of men. Sometimes they met _gauchos_ conducting their _arias_ of mules; and more than one _capataz_ (leader of a convoy) exchanged fresh animals for their exhausted ones.

In this manner they reached the immense virgin forests which cover the plains situated between Peru and Brazil; they began thenceforth to recover traces of the captors; and it was in the midst of these inextricable woods that Martin Paz recovered all his Indian sagacity.

Courage returned to the Spaniard, strength returned to Liberta, when a half-extinct fire and prints of footsteps proved the proximity of their enemies. Martin Paz noted all and studied all, the breaking of the little branches, the nature of the vestiges.

Don Vegal feared lest his unfortunate daughter should have been dragged on foot through the stones and thorns; but the Indian showed him some pebbles strongly imbedded in the earth, which indicated the pressure of an animal’s foot; above, branches had been pushed aside in the same direction, which could have been reached only by a person on horseback. The poor father comforted himself and recovered life and hope, and then Martin Paz was so confident, so skillful, so strong, that there were for him neither impassable obstacles nor insurmountable perils.

Nevertheless immense forests contracted the horizon around them, and trees multiplied incessantly before their fatigued eyes.

One evening, while the darkness was gathering beneath the opaque foliage, Martin Paz, Liberta and Don Vegal were compelled by fatigue to stop. They had reached the banks of a river; it was the river Madeira, which the Indian recognized perfectly; immense mangrove trees bent above the sleeping wave and were united to the trees on the opposite shore by capricious _lianes_ (vines), on which were balancing the _titipaying_ and the _concoulies_.

Had the captors ascended the banks? had they descended the course of the river? had they crossed it in a direct line? Such were the questions with which Martin Paz puzzled himself. He stepped a little aside from his companions, following with infinite difficulty some fugitive tracks; these brought him to a clearing a little less gloomy. Some footsteps indicated that a company of men had, perhaps, crossed the river at this spot, which was the opinion of the Indian, although he found around him no proof of the construction of a canoe; he knew that the Sambo might have cut down some tree in the middle of the forest, and having spoiled it of its bark, made of it a boat, which could have been carried on the arms of men to the shores of the Madeira. Nevertheless, he was still hesitating, when he saw a sort of black mass move near a thicket; he quickly prepared his lasso and made ready for an attack; he advanced a few paces, and perceived an animal lying on the ground, a prey to the final convulsions—it was a mule. The poor, expiring beast had been struck at a distance from the spot whither it had been dragged, leaving long traces of blood on its passage. Martin Paz no longer doubted that the Indians, unable to induce it to cross the river, had killed it with the stroke of a poignard, as a deep wound indicated. From this moment he felt certain of the direction of his enemies; and returned to his companions, who were already uneasy at his long absence.

"To-morrow, perhaps, we shall see the young girl!" said he to them.

"My daughter! Oh! my son! let us set out this instant," said the Spaniard; "I am no longer fatigued, and strength returns with hope—let us go!"

"But we must cross this river, and we cannot lose time in constructing a canoe."

"We will swim across."

"Courage, then, my father! Liberta and myself will sustain you."

All three laid aside their garments, which Martin Paz carried in a bundle upon his head; and all three glided silently into the water, for fear of awakening some of these dangerous _caïmans_ so numerous in the rivers of Brazil and Peru.

They arrived safely at the opposite shore: the first care of Martin Paz was to recover traces of the Indians; but in vain did he scrutinize the smallest leaves, the smallest pebbles—he could discover nothing; as the rapid current had carried them down in crossing, he ascended the bank of the river to the spot opposite that where he had found the mule, but nothing indicated the direction taken by the captors. It must have been that these, that their tracks might be entirely lost, had descended the river for several miles, in order to land far from the spot of their embarkation.

Martin Paz, that his companions might not be discouraged, did not communicate to them his fears; he said not even a word to Don Vegal respecting the mule, for fear of saddening him still more with the thought that his daughter must now be dragged through these difficult passes.

When he returned to the Spaniard, he found him asleep—fatigue had prevailed over grief and resolution; Martin Paz was careful not to awaken him; a little sleep might do him much good; but, while he himself watched, resting the head of Don Vegal on his knees and piercing with his quick glances the surrounding shadows, he sent Liberta to seek below on the river some trace which might guide them at the first rays of the sun.

The Indian departed in the direction indicated, gliding like a serpent between the high brush with which the
shores were bristling, and the sound of his footsteps was soon lost in the distance.

Thenceforth Martin Paz remained alone amid these gloomy solitudes: the Spaniard was sleeping peacefully; the names of his daughter and the Indian sometimes mingled in his dreams, and alone disturbed the silence of these obscure forests.

The young Indian was not mistaken; the Sambo had descended the Madeira three miles, then had landed with the young girl and his numerous companions, among whom might be numbered Manangani, still covered with hideous wounds.

The company of Sambo had increased during the journey. The Indians of the plains and the mountains had awaited with impatience the triumph of the revolt; on learning the failure of their brethren, they fell a prey to a gloomy despair; hearing that they had been betrayed by Martin Paz, they uttered yells of rage; when they saw that they had a victim to be sacrificed to their anger, they burst forth in cries of joy and followed the company of the old Indian.

They marched thus to the approaching sacrifice, devouring the young girl with sanguinary glances—it was the betrothed, the beloved of Martin Paz whom they were about to put to death; abuse was heaped upon her, and more than once the Sambo, who wished his revenge to be public, with difficulty wrested Sarah from their fury.

The young girl, pale, languishing, was without thought and almost without life amid this frightful horde; she had no longer the sentiment of motion, of will, of existence—she advanced, because bloody hands urged her onward; they might have abandoned her in the midst of these great solitudes—she could not have taken a step to have escaped death. Sometimes the remembrance of her father and of the young Indian passed before her eyes, but like a gleam of lightning bewildering her; then she fell again an inert mass on the poor mule, whose wounded feet could no longer sustain her. When beyond the river she was compelled to follow her captors on foot, two Indians taking her by the arm dragged her rapidly along, and a trace of blood marked on the sand and dead leaves her painful passage.

But the Sambo was no longer afraid of pursuit; he cared little that this blood betrayed the direction he had taken—he was approaching the termination of his journey, and soon the cataracts which abound in the currents of the great river sent up their deafening clamor.

The numerous company of Indians arrived at a sort of village, composed of a hundred huts, made of reeds interlaced and clay; at their approach, a multitude of women and children darted toward them with loud cries of joy—more than one found there his anxious family—more than one wife missed the father of her children!

These women soon learned the defeat of their party; their sadness was transformed into rage on learning the defection of Martin Paz, and on seeing his betrothed devoted to death.

Sarah remained immovable before these enemies and looked at them with a dim eye; all these hideous faces were making grimaces around her, and the most terrific threats were uttered in her ears—the poor child might have thought herself delivered over to the torturers of the infernal regions.

"Where is my husband?" said one; "it is thou who hast caused him to be killed!"

"And my brother, who will never again return to the cabin—what hast thou done with him? Death! death! Let each of us have a piece of her flesh! let each of us have a pain to make her suffer! Death! death!"

And these women, with dishevelled hair, brandishing knives, waving flaming brands, bearing enormous stones, approached the young girl, surrounded her, pressed her, crushed her.

"Back!" cried the Sambo, "back! and let all await the decision of their chiefs! This girl must disarm the anger of the Great Spirit, which has rested upon our arms; and she shall not serve for private revenge alone!"

The women obeyed the words of the old Indian, casting frightful glances on the young girl; the latter, covered with blood, remained extended on the pebbly shore.

Above this village, plunges, from a height of more than a hundred feet, a foaming cataract, which breaks against sharp rocks; the Madeira, contracted into a deep bed, precipitates this dense mass of water with frightful rapidity; a cloud of mist is eternally suspended above this torrent, whose fall sends its formidable and thundering roar afar.

It was in the midst of this foaming tempest that the unfortunate young girl was destined to die; at the first rays of the sun, exposed in a bark canoe above the cataract, she was to be precipitated with the mass of waters on the rude rocks against which the Madeira broke.

So the council of chiefs had decided; and they had delayed until the morrow the punishment of their victim, to give her a night of anguish, of torment, and of terror.

When the sentence was made known, cries of joy welcomed it, and a furious delirium seized the Indians.

It was a night of orgies—a night of blood and of horror; brandy increased the excitement of these wild natives; dances, accompanied with perpetual yells, surrounded the young girl, and wound their fantastic chains about the stake to which she was fastened. Sometimes the circle narrowed, and enclosed her in its furious whirls: the Indians ran through the uncultivated fields, brandishing blazing pine-branches, and surrounding the victim with light.
And it was thus until sunrise, and worse yet when its first rays illuminated the scene. The young girl was detached from the stake, and a hundred arms were stretched out to drag her to execution, when the name of Martin Paz involuntarily escaped her lips, and cries of hatred and of vengeance responded.

It was necessary to climb by steep paths the immense pile of rocks which led to the upper level of the river, and the victim arrived there all bloody; a canoe of bark awaited her a hundred paces above the fall; she was deposited in it, and fastened by bonds which entered her flesh.

"Vengeance and death!" exclaimed the whole tribe, with one voice.

The canoe was hurried on with increasing rapidity and began to whirl.

Suddenly a man appeared on the opposite shore—It is Martin Paz! Beside him, are Don Vegal and Liberta.

"My daughter! my daughter!" exclaims the father, kneeling on the shore.

"My father!" replied Sarah, raising herself up with superhuman strength.

The scene was indescribable. The canoe was rapidly hastening to the cataract, in whose foam it was already enveloped.

Martin Paz, standing on a rock, balanced his lasso which whistled around his head. At the instant the boat was about to be precipitated, the long leathern thong unfolded from above the head of the Indian, and surrounded the canoe with its noose.

"My daughter! my daughter!" exclaimed Don Vegal.

"My betrothed! my beloved!" cried Martin Paz.

"Death!" yelled the savage multitude.

Meanwhile Martin Paz redoubles his efforts; the canoe remains suspended over the abyss; the current cannot prevail over the strength of the young Indian; the canoe is drawn to him; the enemies are far on the opposite shore; the young girl is saved.

Suddenly an arrow whistles through the air, and pierces the heart of Martin Paz. He falls forward in the bark of the victim; and, re-descending the current of the river in her arms, is engulfed with Sarah in the vortex of the cataract.

A yell of triumph is heard above the sound of the torrent.

Liberta bore off the Spaniard amid a cloud of arrows, and disappeared with him.

Don Vegal regained Lima, where he died with grief and exhaustion.

The Sambo, who remained among his sanguinary tribes, was never heard of more.

The Jew Samuel kept the hundred thousand piasters he had received, and continued his usuries at the expense of the Limanian nobles.

Martin Paz and Sarah were, in their brief and final re-union, betrothed for eternity.
October, other men had unexpectedly appeared in sight of the island, on that deserted sea!

There could be no doubt about it! A vessel was there! But would she pass on, or would she put into port? In a few hours the colonists would definitely know what to expect.

Cyrus Harding and Herbert having immediately called Gideon Spilett, Pencroft, and Neb into the dining-room of Granite House, told them what had happened. Pencroft, seizing the telescope, rapidly swept the horizon, and stopping on the indicated point, that is to say, on that which had made the almost imperceptible spot on the photographic negative--

"I'm blessed but it is really a vessel!" he exclaimed, in a voice which did not express any great amount of satisfaction.

"Is she coming here?" asked Gideon Spilett.

"Impossible to say anything yet," answered Pencroft, "for her rigging alone is above the horizon, and not a bit of her hull can be seen."

"What is to be done?" asked the lad.

"Wait," replied Harding.

And for a considerable time the settlers remained silent, given up to all the thoughts, all the emotions, all the fears, all the hopes, which were aroused by this incident—the most important which had occurred since their arrival in Lincoln Island. Certainly, the colonists were not in the situation of castaways abandoned on a sterile islet, constantly contending against a cruel nature for their miserable existence, and incessantly tormented by the longing to return to inhabited countries. Pencroft and Neb, especially, who felt themselves at once so happy and so rich, would not have left their island without regret. They were accustomed, besides, to this new life in the midst of the domain which their intelligence had as it were civilised. But at any rate this ship brought news from the world, perhaps even from their native land. It was bringing fellow-creatures to them, and it may be conceived how deeply their hearts were moved at the sight!

From time to time Pencroft took the glass and rested himself at the window. From thence he very attentively examined the vessel, which was at a distance of twenty miles to the east. The colonists had as yet, therefore, no means of signalling their presence. A flag would not have been perceived; a gun would not have been heard; a fire would not have been visible. However, it was certain that the island, overtopped by Mount Franklin, could not have escaped the notice of the vessel's look-out. But why was this ship coming there? Was it simple chance which brought it to that part of the Pacific, where the maps mentioned no land except Tabor Islet, which itself was out of the route usually followed by vessels from the Polynesian Archipelagos, from New Zealand, and from the American coast? To this question, which each one asked himself, a reply was suddenly made by Herbert.

"Can it be the Duncan?" he cried.

The Duncan, as has been said, was Lord Glenarvan's yacht, which had left Ayrton on the islet, and which was to return there some day to fetch him. Now, the islet was not so far distant from Lincoln Island, but that a vessel, standing for the one, could pass in sight of the other. A hundred and fifty miles only separated them in longitude, and seventy in latitude.

"We must tell Ayrton," said Gideon Spilett, "and send for him immediately. He alone can say if it is the Duncan."

This was the opinion of all, and the reporter, going to the telegraphic apparatus which placed the corral in communication with Granite House, sent this telegram:--"Come with all possible speed."

In a few minutes the bell sounded.

"I am coming," replied Ayrton.

Then the settlers continued to watch the vessel.

"If it is the Duncan," said Herbert, "Ayrton will recognise her without difficulty, since he sailed on board her for some time."

"And if he recognises her," added Pencroft, "it will agitate him exceedingly!"

"Yes," answered Cyrus Harding; "but now Ayrton is worthy to return on board the Duncan, and pray Heaven that it is indeed Lord Glenarvan's yacht, for I should be suspicious of any other vessel. These are ill-famed seas, and I have always feared a visit from Malay pirates to our island."

"We could defend it," cried Herbert.

"No doubt, my boy," answered the engineer smiling, "but it would be better not to have to defend it."

"A useless observation," said Spilett. "Lincoln Island is unknown to navigators, since it is not marked even on the most recent maps. Do you not think, Cyrus, that that is a sufficient motive for a ship, finding herself unexpectedly in sight of new land, to try and visit rather than avoid it?"

"Certainly," replied Pencroft.

"I think so too," added the engineer. "It may even be said that it is the duty of a captain to come and survey any
land or island not yet known, and Lincoln Island is in this position."

"Well," said Pencroft, "suppose this vessel comes and anchors there a few cables-lengths from our island, what shall we do?" This sudden question remained at first without any reply. But Cyrus Harding, after some moments' thought, replied in the calm tone which was usual to him--

"What we shall do, my friends? What we ought to do is this:--we will communicate with the ship, we will take our passage on board her, and we will leave our island, after having taken possession of it in the name of the United States. Then we will return with any who may wish to follow us to colonise it definitely, and endow the American Republic with a useful station in this part of the Pacific Ocean!"

"Hurrah!" exclaimed Pencroft, "and that will be no small present which we shall make to our country! The colonisation is already almost finished; names are given to every part of the island; there is a natural port, fresh water, roads, a telegraph, a dockyard, and manufactories; and there will be nothing to be done but to inscribe Lincoln Island on the maps!"

"But if any one seizes it in our absence?" observed Gideon Spilett.

"Hang it!" cried the sailor. "I would rather remain all alone to guard it: and trust to Pencroft, they shouldn't steal it from him, like a watch from the pocket of a swell!"

For an hour it was impossible to say with any certainty whether the vessel was or was not standing towards Lincoln Island. She was nearer, but in what direction was she sailing? This Pencroft could not determine. However, as the wind was blowing from the north-east, in all probability the vessel was sailing on the starboard tack. Besides, the wind was favourable for bringing her towards the island, and, the sea being calm, she would not be afraid to approach although the shallows were not marked on the chart.

Towards four o'clock--an hour after he had been sent for--Ayrton arrived at Granite House. He entered the dining-room, saying--

"At your service, gentlemen."

Cyrus Harding gave him his hand, as was his custom to do, and, leading him to the window--

"Ayrton," said he, "we have begged you to come here for an important reason. A ship is in sight of the island."

Ayrton at first paled slightly, and for a moment his eyes became dim; then, leaning out of the window, he surveyed the horizon, but could see nothing.

"Take this telescope," said Spilett, "and look carefully, Ayrton, for it is possible that this ship may be the Duncan come to these seas for the purpose of taking you home again."

"The Duncan!" murmured Ayrton. "Already?" This last word escaped Ayrton's lips as if involuntarily, and his head drooped upon his hands.

Did not twelve years' solitude on a desert island appear to him a sufficient expiation? Did not the penitent yet feel himself pardoned, either in his own eyes or in the eyes of others?

"No," said he, "no! it cannot be the Duncan!"

"Look, Ayrton," then said the engineer, "for it is necessary that we should know beforehand what to expect."

Ayrton took the glass and pointed it in the direction indicated. During some minutes he examined the horizon without moving, without uttering a word. Then--

"It is indeed a vessel," said he, "but I do not think she is the Duncan."

"Why do you not think so?" asked Gideon Spilett. "Because the Duncan is a steam-yacht, and I cannot perceive any trace of smoke either above or near that vessel."

"Perhaps she is simply sailing," observed Pencroft. "The wind is favourable for the direction which she appears to be taking, and she may be anxious to economise her coal, being so far from land."

"It is possible that you may be right, Mr Pencroft," answered Ayrton, "and that the vessel has extinguished her fires. We must wait until she is nearer, and then we shall soon know what to expect."

So saying, Ayrton sat down in a corner of the room and remained silent. The colonists again discussed the strange ship, but Ayrton took no part in the conversation. All were in such a mood that they found it impossible to continue their work. Gideon Spilett and Pencroft were particularly nervous, going, coming, not able to remain still in one place. Herbert felt more curiosity. Neb alone maintained his usual calm manner. Was not his country that where his master was? As to the engineer, he remained plunged in deep thought, and in his heart feared rather than desired the arrival of the ship. In the meanwhile, the vessel was a little nearer the island. With the aid of the glass, it was ascertained that she was a brig, and not one of those Malay proas, which are generally used by the pirates of the Pacific. It was, therefore, reasonable to believe that the engineer's apprehensions would not be justified, and that the presence of this vessel in the vicinity of the island was fraught with no danger. Pencroft, after a minute examination, was able positively to affirm that the vessel was rigged as a brig, and that she was standing obliquely towards the coast, on the starboard tack, under her topsails and topgallant-sails. This was confirmed by Aytron. But by continuing in this direction she must soon disappear behind Claw Cape, as the wind was from the south-west, and to
watch her it would be then necessary to ascend the heights of Washington Bay, near Port Balloon—a provoking
circumstance, for it was already five o'clock in the evening, and the twilight would soon make any observation
extremely difficult.

"What shall we do when night comes on?" asked Gideon Spilett. "Shall we light a fire, so as to signal our
presence, on the coast?"

This was a serious question, and yet, although the engineer still retained some of his presentiments, it was
answered in the affirmative. During the night the ship might disappear and leave for ever, and, this ship gone, would
another ever return to the waters of Lincoln Island? Who could foresee what the future would then have in store for
the colonists?

"Yes," said the reporter, "we ought to make known to that vessel, whoever she may be, that the island is
inhabited. To neglect the opportunity which is offered to us might be to create everlasting regrets."

It was, therefore, decided that Neb and Pencroft should go to Port Balloon, and that there, at nightfall, they
should light an immense fire, the blaze of which would necessarily attract the attention of the brig.

But at the moment when Neb and the sailor were preparing to leave Granite House, the vessel suddenly altered
her course, and stood directly for Union Bay. The brig was a good sailer, for she approached rapidly. Neb and
Pencroft put off their departure, therefore, and the glass was put into Ayrton's hands, that he might ascertain for
certain whether the ship was or was not the Duncan. The Scotch yacht was also rigged as a brig. The question was,
whether a chimney could be discerned between the two masts of the vessel, which was now at a distance of only five
miles.

The horizon was still very clear. The examination was easy, and Ayrton soon let the glass fall again, saying—
"It is not the Duncan! It could not be her!"

Pencroft again brought the brig within the range of the telescope, and could see that she was of between three
and four hundred tons burden, wonderfully narrow, well-masted, admirably built, and must be a very rapid sailer.
But to what nation did she belong? That was difficult to say.

"And yet," added the sailor, "a flag is floating from her peak, but I cannot distinguish the colours of it."

"In half an hour we shall be certain about that," answered the reporter. "Besides, it is very evident that the
intention of the captain of this ship is to land, and, consequently, if not to-day, to-morrow at the latest, we shall
make his acquaintance."

"Never mind!" said Pencroft. "It is best to know whom we have to deal with, and I shall not be sorry to recognise
that fellow's colours!"

And, while thus speaking, the sailor never left the glass. The day began to fade, and with the day the breeze fell
also. The brig's ensign hung in folds, and it became more and more difficult to observe it.

"It is not the American flag," said Pencroft from time to time, "nor the English, the red of which could be easily
seen, nor the French or German colours, nor the white flag of Russia, nor the yellow of Spain. One would say it was
all one colour. Let's see: in these seas, what do we generally meet with? The Chilian flag?—but that is tri-colour.
Brazilian?—it is green. Japanese?—it is yellow and black, whilst this—"

At that moment the breeze blew out the unknown flag. Ayrton, seizing the telescope which the sailor had put
down, put it to his eye, and in a hoarse voice—

"The black flag!" he exclaimed.

And indeed the sombre bunting was floating from the mast of the brig, and they had now good reason for
considering her to be a suspicious vessel!

Had the engineer, then, been right in his presentiments? Was this a pirate vessel? Did she scour the Pacific,
competing with the Malay proas which still infest it? For what had she come to look at the shores of Lincoln Island?
Was it to them an unknown island, ready to become a magazine for stolen cargoes? Had she come to find on the
coast a sheltered port for the winter months? Was the settler's honest domain destined to be transformed into an
infamous refuge—the headquarters of the piracy of the Pacific?

All these ideas instinctively presented themselves to the colonists' imaginations. There was no doubt, besides, of
the signification which must be attached to the colour of the hoisted flag. It was that of pirates! It was that which the
Duncan would have carried, had the convicts succeeded in their criminal design! No time was lost before discussing
it.

"My friends," said Cyrus Harding, "perhaps this vessel only wishes to survey the coast of the island. Perhaps her
crew will not land. There is a chance of it. However that may be, we ought to do everything we can to hide our
presence here. The windmill on Prospect Heights is too easily seen. Let Ayrton and Neb go and take down the sails.
We must also conceal the windows of Granite House with thick branches. All the fires must be extinguished, so that
nothing may betray the presence of men on the island."

"And our vessel?" said Herbert.
"Oh," answered Pencroft, "she is sheltered in Port Balloon, and I defy any of those rascals there to find her!"

The engineer's orders were immediately executed. Neb and Ayrton ascended the plateau, and took the necessary precautions to conceal any indication of a settlement. Whilst they were thus occupied, their companions went to the border of Jacamar Wood, and brought back a large quantity of branches and creepers, which would at some distance appear as natural foliage, and thus disguise the windows in the granite cliff. At the same time, the ammunition and guns were placed ready so as to be at hand in case of an unexpected attack.

When all these precautions had been taken--

"My friends," said Harding, and his voice betrayed some emotion, "if these wretches endeavour to seize Lincoln Island, we shall defend it-- shall we not?"

"Yes, Cyrus," replied the reporter, "and if necessary we will die to defend it!"

The engineer extended his hand to his companions, who pressed it warmly.

Ayrton alone remained in his corner, not joining the colonists. Perhaps he, the former convict, still felt himself unworthy to do so!

Cyrus Harding understood what was passing in Ayrton's mind, and going to him--

"And you, Ayrton," he asked, "what will you do?"

"My duty," answered Ayrton.

He then took up his station near the window and gazed through the foliage.

It was now half-past seven. The sun had disappeared twenty minutes ago behind Granite House. Consequently the eastern horizon was becoming gradually obscured. In the meanwhile the brig continued to advance towards Union Bay. She was now not more than two miles off, and exactly opposite the plateau of Prospect Heights, for after having tacked off Claw Cape, she had drifted towards the north in the current of the rising tide. One might have said that at this distance she had already entered the vast bay, for a straight line drawn from Claw Cape to Cape Mandible would have rested on her starboard quarter.

Was the brig about to penetrate far into the bay? That was the first question. When once in the bay, would she anchor there? That was the second. Would she not content herself with only surveying the coast, and stand out to sea again without landing her crew? They would know this in an hour. The colonists could do nothing but wait.

Cyrus Harding had not seen the suspected vessel hoist the black flag without deep anxiety. Was it not a direct menace against the work which he and his companions had till now conducted so successfully? Had these pirates--for the sailors of the brig could be nothing else--already visited the island, since on approaching it they had hoisted their colours. Had they formerly invaded it, so that certain unaccountable peculiarities might be explained in this way? Did there exist in the as yet unexplored parts some accomplice ready to enter into communication with them?

To all these questions which he mentally asked himself, Harding knew not what to reply; but he felt that the safety of the colony could not but be seriously threatened by the arrival of the brig.

However, he and his companions were determined to fight to the last gasp. It would have been very important to know if the pirates were numerous and better armed than the colonists. But how was this information to be obtained?

Night fell. The new moon had disappeared. Profound darkness enveloped the island and the sea. No light could pierce through the heavy piles of clouds on the horizon. The wind had died away completely with the twilight. Not a leaf rustled on the trees, not a ripple murmured on the shore. Nothing could be seen of the ship, all her lights being extinguished, and if she was still in sight of the island, her whereabouts could not be discovered.

"Well! who knows?" said Pencroft. "Perhaps that cursed craft will stand off during the night, and we shall see nothing of her at daybreak."

As if in reply to the sailor's observation, a bright light flashed in the darkness, and a cannon-shot was heard.

The vessel was still there and had guns on board.

Six seconds elapsed between the flash and the report.

Therefore the brig was about a mile and a quarter from the coast.

At the same time, the chains were heard rattling through the hawse-holes.

The vessel had just anchored in sight of Granite House!

CHAPTER TWO.

DISCUSSIONS--PRESENTIMENTS--AYRTON'S PROPOSAL--IT IS ACCEPTED--AYRTON AND PENCROFT ON GRANT ISLET--CONVICTS FROM NORFOLK ISLAND--AYRTON'S HEROIC ATTEMPT--HIS RETURN--SIX AGAINST FIFTY.

There was no longer any doubt as to the pirates' intentions. They had dropped anchor at a short distance from the island, and it was evident that the next day by means of their boats they purposed to land on the beach!
Cyrus Harding and his companions were ready to act, but, determined though they were, they must not forget to be prudent. Perhaps their presence might still be concealed in the event of the pirates contenting themselves with landing on the shore without examining the interior of the island. It might be, indeed, that their only intention was to obtain fresh water from the Mercy, and it was not impossible that the bridge, thrown across a mile and a half from the mouth, and the manufactory at the Chimneys might escape their notice.

But why was that flag hoisted at the brig’s peak? What was that shot fired for? Pure bravado doubtless, unless it was a sign of the act of taking possession. Harding knew now that the vessel was well-armed. And what had the colonists of Lincoln Island to reply to the pirates’ guns? A few muskets only.

"However," observed Cyrus Harding, "here we are in an impregnable position. The enemy cannot discover the mouth of the outlet, now that it is hidden under reeds and grass, and consequently it would be impossible for them to penetrate into Granite House."

"But our plantations, our poultry-yard, our corral, all, everything!" exclaimed Pencroft, stamping his foot. "They may spoil everything, destroy everything in a few hours!"

"Everything, Pencroft," answered Harding, "and we have no means of preventing them."

"Are they numerous? that is the question," said the reporter. "If they are not more than a dozen, we shall be able to stop them, but forty, fifty, more perhaps!"

"Captain Harding," then said Ayrton, advancing towards the engineer, "will you give me leave."

"For what, my friend?"

"To go to that vessel to find out the strength of her crew."

"But Ayrton--" answered the engineer, hesitating, "you will risk your life--"

"Why not, sir?"

"That is more than your duty."

"I have more than my duty to do," replied Ayrton.

"Will you go to the ship in the boat?" asked Gideon Spilett.

"No, sir, but I will swim. A boat would be seen where a man may glide between wind and water."

"Do you know that the brig is a mile and a quarter from the shore?" said Herbert.

"I am a good swimmer, Mr Herbert."

"I tell you it is risking your life," said the engineer.

"That is no matter," answered Ayrton. "Captain Harding, I ask this as a favour. Perhaps it will be a means of raising me in my own eyes!"

"Go, Ayrton," replied the engineer, who felt sure that a refusal would have deeply wounded the former convict, now become an honest man.

"I will accompany you," said Pencroft.

"You mistrust me!" said Ayrton quickly.

Then more humbly,--

"Alas!"

"No! no!" exclaimed Harding with animation, "no, Ayrton, Pencroft does not mistrust you. You interpret his words wrongly."

"Indeed," returned the sailor, "I only propose to accompany Ayrton as far as the islet. It may be, although it is scarcely possible, that one of these villains has landed, and in that case two men will not be too many to hinder him from giving the alarm. I will wait for Ayrton on the islet, and he shall go alone to the vessel, since he has proposed to do so." These things agreed to, Ayrton made preparations for his departure. His plan was bold, but it might succeed, thanks to the darkness of the night. Once arrived at the vessel’s side, Ayrton, holding onto the main-chains, might reconnoitre the number and perhaps overhear the intentions of the pirates.

Ayrton and Pencroft, followed by their companions, descended to the beach. Ayrton undressed and rubbed himself with grease, so as to suffer less from the temperature of the water, which was still cold. He might, indeed, be obliged to remain in it for several hours.

Pencroft and Neb, during this time, had gone to fetch the boat, moored a few hundred feet higher up, on the bank of the Mercy, and by the time they returned, Ayrton was ready to start. A coat was thrown over his shoulders, and the settlers all came round him to press his hand.

Ayrton then shoved off with Pencroft in the boat.

It was half-past ten in the evening when the two adventurers disappeared in the darkness. Their companions returned to wait at the Chimneys.

The channel was easily traversed, and the boat touched the opposite shore of the islet. This was not done without precaution, for fear lest the pirates might be roaming about there. But after a careful survey, it was evident that the islet was deserted. Ayrton then, followed by Pencroft, crossed it with a rapid step, scaring the birds nestled in the
holes of the rocks; then, without hesitating, he plunged into the sea, and swam noiselessly in the direction of the
ship, in which a few lights had recently appeared, showing her exact situation. As to Pencroft, he crouched down in
a cleft of the rock, and awaited the return of his companion.

In the meanwhile, Ayrton, swimming with a vigorous stroke, glided through the sheet of water without
producing the slightest ripple. His head just emerged above it and his eyes were fixed on the dark hull of the brig,
from which the lights were reflected in the water. He thought only of the duty which he had promised to accomplish,
and nothing of the danger which he ran, not only on board the ship, but in the sea, often frequented by sharks. The
current bore him along and he rapidly receded from the shore.

Half an hour afterwards, Ayrton, without having been either seen or heard, arrived at the ship and caught hold
of the main-chains. He took breath, then, hoisting himself up, he managed to reach the extremity of the cutwater. There
were drying several pairs of sailors' trousers. He put on a pair. Then settling himself firmly, he listened. They were
not sleeping on board the brig. On the contrary, they were talking, singing, laughing. And these were the sentences,
accompanied with oaths, which principally struck Ayrton:--

"Our brig is a famous acquisition."
"She sails well, and merits her name of the Speedy."
"She would show all the navy of Norfolk a clean pair of heels."
"Hurrah for her captain!"
"Hurrah for Bob Harvey!"

What Ayrton felt when he overheard this fragment of conversation may be understood when it is known that in
this Bob Harvey he recognised one of his old Australian companions, a daring sailor, who had continued his
criminal career. Bob Harvey had seized, on the shores of Norfolk Island, this brig, which was loaded with arms,
ammunition, utensils, and tools of all sorts, destined for one of the Sandwich Islands. All his gang had gone on
board, and pirates after having been convicts, these wretches, more ferocious than the Malays themselves, scoured
the Pacific, destroying vessels, and massacring their crews.

The convicts spoke loudly, they recounted their deeds, drinking deeply at the same time, and this is what Ayrton
gathered. The actual crew of the Speedy was composed solely of English prisoners, escaped from Norfolk Island.

Here it may be well to explain what this island was. In 29 degrees 2 minutes south latitude, and 165 degrees 42
minutes east longitude, to the east of Australia, is found a little island, six miles in circumference, overlooked by
Mount Pitt, which rises to a height of 1100 feet above the level of the sea. This is Norfolk Island, once the seat of an
establishment in which were lodged the most intractable convicts from the English penitentiaries. They numbered
500, under an iron discipline, threatened with terrible punishments, and were guarded by 150 soldiers, and 150
employed under the orders of the governor. It would be difficult to imagine a collection of greater ruffians.
Sometimes,—although very rarely,—notwithstanding the extreme surveillance of which they were the object, many
managed to escape, and seizing vessels which they surprised, they infested the Polynesian Archipelagos. [Note.
Norfolk Island has long since been abandoned as a penal settlement.]

Thus had Bob Harvey and his companions done. Thus had Ayrton formerly wished to do. Bob Harvey had
seized the brig Speedy, anchored in sight of Norfolk Island; the crew had been massacred; and for a year this ship
had scoured the Pacific, under the command of Harvey, now a pirate, and well-known to Ayrton!

The convicts were, for the most part, assembled under the poop; but a few, stretched on the deck, were talking
loudly.

The conversation still continued amidst shouts and libations. Ayrton learned that chance alone had brought the
Speedy in sight of Lincoln Island: Bob Harvey had never yet set foot on it; but, as Cyrus Harding had conjectured,
finding this unknown land in his course, its position being marked on no chart, he had formed the project of visiting
it, and, if he found it suitable, of making it the brig's headquarters.

As to the black flag hoisted at the Speedy's peak, and the gun which had been fired, in imitation of men-of-war
when they lower their colours, it was pure piratical bravado. It was in no way a signal, and no communication yet
existed between the convicts and Lincoln Island.

The settlers' domain was now menaced with terrible danger. Evidently the island, with its water, its harbour, its
resources of all kinds so increased in value by the colonists, and the concealment afforded by Granite House, could
not but be convenient for the convicts; in their hands it would become an excellent place of refuge, and, being
unknown, it would assure them, for a long time perhaps, impunity and security. Evidently, also, the lives of the
settlers would not be respected, and Bob Harvey and his accomplices' first care would be to massacre them without
mercy. Harding and his companions had, therefore, not even the choice of flying and hiding themselves in the
island, since the convicts intended to reside there, and since, in the event of the Speedy departing on an expedition, it
was probable that some of the crew would remain on shore, so as to settle themselves there. Therefore, it would be
necessary to fight, to destroy every one of these scoundrels, unworthy of pity, and against whom any means would
be right. So thought Ayrton, and he well knew that Cyrus Harding would be of his way of thinking.

But was resistance and, in the last place, victory possible? That would depend on the equipment of the brig, and the number of men which she carried.

This Ayrton resolved to learn at any cost, and as an hour after his arrival the vociferations had begun to die away, and as a large number of the convicts were already buried in a drunken sleep, Ayrton did not hesitate to venture onto the Speedy's deck, which the extinguished lanterns now left in total darkness. He hoisted himself onto the cutwater, and by the bowsprit arrived at the forecastle. Then, gliding among the convicts stretched here and there, he made the round of the ship, and found that the Speedy carried four guns, which would throw shot of from eight to ten pounds in weight. He found also, on touching them, that these guns were breech-loaders. They were, therefore, of modern make, easily used, and of terrible effect.

As to the men lying on the deck, they were about ten in number, but it was to be supposed that more were sleeping down below. Besides, by listening to them, Ayrton had understood that there were fifty on board. That was a large number for the six settlers of Lincoln Island to contend with! But now, thanks to Ayrton's devotion, Cyrus Harding would not be surprised, he would know the strength of his adversaries, and would make his arrangements accordingly.

There was nothing more for Ayrton to do but to return, and render to his companions an account of the mission with which he had charged himself, and he prepared to regain the bows of the brig, so that he might let himself down into the water.

But to this man, whose wish was, as he had said, to do more than his duty, there came an heroic thought. This was to sacrifice his own life, but save the island and the colonists. Cyrus Harding evidently could not resist fifty ruffians, all well-armed, who, either by penetrating by main force into Granite House, or by starving out the besieged, could obtain from them what they wanted. And then he thought of his preservers—those who had made him again a man, and an honest man, those to whom he owed all—murdered without pity, their works destroyed, their island turned into a pirates' den! He said to himself that he, Ayrton, was the principal cause of so many disasters, since his old companion, Bob Harvey, had but realised his own plans, and a feeling of horror took possession of him. Then he was seized with an irresistible desire to blow up the brig, and with her, all whom she had on board. He would perish in the explosion, but he would have done his duty.

Ayrton did not hesitate. To reach the powder-room, which is always situated in the after-part of a vessel, was easy. There would be no want of powder in a vessel which followed such a trade, and a spark would be enough to destroy it in an instant.

Ayrton stole carefully along the between-decks, strewn with numerous sleepers, overcome more by drunkenness than sleep. A lantern was lighted at the foot of the mainmast, round which was hung a gun-rack, furnished with weapons of all sorts.

Ayrton took a revolver from the rack, and assured himself that it was loaded and primed. Nothing more was needed to accomplish the work of destruction. He then glided towards the stern, so as to arrive under the brig's poop at the powder-magazine.

It was difficult to proceed along the dimly-lighted deck without stumbling over some half-sleeping convict, who retorted by oaths and kicks. Ayrton was, therefore, more than once obliged to halt. But at last he arrived at the partition dividing the after-cabin, and found the door opening into the magazine itself.

Ayrton, compelled to force it open, set to work. It was a difficult operation to perform without noise, for he had to break a padlock. But under his vigorous hand, the padlock broke, and the door was open.

At that moment a hand was laid on Ayrton's shoulder.

"What are you doing here?" asked a tall man, in a harsh voice, who, standing in the shadow, quickly threw the light of a lantern on Ayrton's face.

Ayrton drew back. In the rapid flash of the lantern, he had recognised his former accomplice, Bob Harvey, who could not have known him, as he must have thought Ayrton long since dead.

"What are you doing here?" again said Bob Harvey, seizing Ayrton by the waistband.

But Ayrton, without replying, wrenched himself from his grasp and attempted to rush into the magazine. A shot fired into the midst of the powder-casks, and all would be over!

"Help, lads!" shouted Bob Harvey.

At his shout two or three pirates awoke, jumped up, and, rushing on Ayrton, endeavoured to throw him down. He soon extricated himself from their grasp. He fired his revolver, and two of the convicts fell; but a blow from a knife which he could not ward off made a gash in his shoulder.

Ayrton perceived that he could no longer hope to carry out his project. Bob Harvey had reclosed the door of the powder-magazine, and a movement on the deck indicated a general awakening of the pirates. Ayrton must reserve himself to fight at the side of Cyrus Harding. There was nothing for him but flight!
But was flight still possible? It was doubtful, yet Ayrton resolved to dare everything in order to rejoin his companions.

Four barrels of the revolver were still undischarged. Two were fired-- one, aimed at Bob Harvey, did not wound him, or at any rate only slightly; and Ayrton, profiting by the momentary retreat of his adversaries, rushed towards the companion-ladder to gain the deck. Passing before the lantern, he smashed it with a blow from the butt of his revolver. A profound darkness ensued, which favoured his flight. Two or three pirates, awakened by the noise, were descending the ladder at the same moment. A fifth shot from Ayrton laid one low, and the others drew back, not understanding what was going on. Ayrton was on deck in two bounds, and three seconds later, having discharged his last barrel in the face of a pirate who was about to seize him by the throat, he leapt over the bulwarks into the sea.

Ayrton had not made six strokes before shots were splashing around him like hail.

What were Pencroft's feelings, sheltered under a rock on the islet! what were those of Harding, the reporter, Herbert, and Neb, crouched in the Chimneys, when they heard the reports on board the brig! They rushed out onto the beach, and, their guns shouldered, they stood ready to repel any attack.

They had no doubt about it themselves! Ayrton, surprised by the pirates, had been murdered, and, perhaps, the wretches would profit by the night to make a descent on the island!

Half an hour was passed in terrible anxiety. The firing had ceased, and yet neither Ayrton nor Pencroft had reappeared. Was the islet invaded? Ought they not to fly to the help of Ayrton and Pencroft? But how? The tide being high at that time, rendered the channel impassable. The boat was not there! We may imagine the horrible anxiety which took possession of Harding and his companions!

At last, towards half-past twelve, a boat, carrying two men, touched the beach. It was Ayrton, slightly wounded in the shoulder, and Pencroft, safe and sound, whom their friends received with open arms.

All immediately took refuge in the Chimneys. There Ayrton recounted all that had passed, even to his plan for blowing up the brig, which he had attempted to put into execution.

All hands were extended to Ayrton, who did not conceal from them that their situation was serious. The pirates had been alarmed. They knew that Lincoln Island was inhabited. They would land upon it in numbers and well-armed. They would respect nothing. Should the settlers fall into their hands, they must expect no mercy!

"Well, we shall know how to die!" said the reporter.
"Let us go in and watch," answered the engineer.
"Have we any chance of escape, captain?" asked the sailor.
"Yes, Pencroft."
"Hum! six against fifty!"
"Yes! six! without counting--"
"Who?" asked Pencroft.
Cyrus did not reply, but pointed upwards.

CHAPTER THREE.

The night passed without incident. The colonists were on the qui vive, and did not leave their post at the Chimneys. The pirates, on their side, did not appear to have made any attempt to land. Since the last shots fired at Ayrton not a report, not even a sound, had betrayed the presence of the brig in the neighbourhood of the island. It might have been fancied that she had weighed anchor, thinking that she had to deal with her match, and had left the coast.

But it was no such thing, and when day began to dawn the settlers could see a confused mass through the morning mist. It was the Speedy.

"These, my friends," said the engineer, "are the arrangements which appear to me best to make before the fog completely clears away. It hides us from the eyes of the pirates, and we can act without attracting their attention. The most important thing is, that the convicts should believe that the inhabitants of the island are numerous, and consequently capable of resisting them. I therefore propose that we divide into three parties, the first of which shall be posted at the Chimneys, the second at the mouth of the Mercy. As to the third, I think it would be best to place it on the islet, so as to prevent, or at all events delay, any attempt at landing. We have the use of two rifles and four muskets. Each of us will be armed, and, as we are amply provided with powder and shot, we need not spare our fire. We have nothing to fear from the muskets, nor even from the guns of the brig. What can they do against these rocks? And, as we shall not fire from the windows of Granite House, the pirates will not think of causing irreparable
damage by throwing shell against it. What is to be feared is, the necessity of meeting hand-to-hand, since the convicts have numbers on their side. We must, therefore, try to prevent them from landing, but without discovering ourselves. Therefore, do not economise the ammunition. Fire often, but with a sure aim. We have each eight or ten enemies to kill, and they must be killed!"

Cyrus Harding had clearly represented their situation, although he spoke in the calmest voice, as if it was a question of directing a piece of work, and not ordering a battle. His companions approved these arrangements without even uttering a word. There was nothing more to be done but for each to take his place before the fog should be completely dissipated. Neb and Pencroft immediately ascended to Granite House and brought back a sufficient quantity of ammunition. Gideon Spilett and Ayrton, both very good marksmen, were armed with the two rifles, which carried nearly a mile. The four other muskets were divided amongst Harding, Neb, Pencroft, and Herbert.

The posts were arranged in the following manner:

Cyrus Harding and Herbert remained in ambush at the Chimneys, thus commanding the shore to the foot of Granite House.

Gideon Spilett and Neb crouched among the rocks at the mouth of the Mercy, from which the drawbridges had been raised, so as to prevent any one from crossing in a boat or landing on the opposite shore.

As to Ayrton and Pencroft, they shoved off in the boat, and prepared to cross the channel and to take up two separate stations on the islet. In this way, shots being fired from four different points at once, the convicts would be led to believe that the island was both largely peopled and strongly defended.

In the event of a landing being effected without their having been able to prevent it, and also if they saw that they were on the point of being cut off by the brig's boat, Ayrton and Pencroft were to return in their boat to the shore and proceed towards the threatened spot.

Before starting to occupy their posts, the colonists for the last time wrung each other's hands.

Pencroft succeeded in controlling himself sufficiently to suppress his emotion when he embraced Herbert, his boy! and then they separated.

In a few moments Harding and Herbert on one side, the reporter and Neb on the other, had disappeared behind the rocks, and five minutes later Ayrton and Pencroft, having without difficulty crossed the channel, disembarked on the islet and concealed themselves in the clefts of its eastern shore.

None of them could have been seen, for they themselves could scarcely distinguish the brig in the fog.

It was half-past six in the morning.

Soon the fog began to clear away, and the topmasts of the brig issued from the vapour. For some minutes great masses rolled over the surface of the sea, then a breeze sprang up, which rapidly dispelled the mist.

The Speedy now appeared in full view, with a spring on her cable, her head to the north, presenting her larboard side to the island. Just as Harding had calculated, she was not more than a mile and a quarter from the coast.

The sinister black flag floated from the peak.

The engineer, with his telescope, could see that the four guns on board were pointed at the island. They were evidently ready to fire at a moment's notice.

In the meanwhile the Speedy remained silent. About thirty pirates could be seen moving on the deck. A few were on the poop; two others posted in the shrouds, and armed with spy-glasses, were attentively surveying the island.

Certainly, Bob Harvey and his crew would not be able easily to give an account of what had happened during the night on board the brig. Had this half-naked man, who had forced the door of the powder-magazine, and with whom they had struggled, who had six times discharged his revolver at them, who had killed one and wounded two others, escaped their shot? Had he been able to swim to shore? Whence did he come? What had been his object? Had his design really been to blow up the brig, as Bob Harvey had thought? All this must be confused enough to the convicts' minds. But what they could no longer doubt was that the unknown island before which the Speedy had cast anchor was inhabited, and that there was, perhaps, a numerous colony ready to defend it. And yet no one was to be seen, neither on the shore, nor on the heights. The beach appeared to be absolutely deserted. At any rate, there was no trace of dwellings. Had the inhabitants fled into the interior? Thus probably the pirate captain reasoned, and doubtless, like a prudent man, he wished to reconnoitre the locality before he allowed his men to venture there.

During an hour and a half, no indication of attack or landing could be observed on board the brig. Evidently Bob Harvey was hesitating. Even with his strongest telescopes he could not have perceived one of the settlers crouched among the rocks. It was not even probable that his attention had been awakened by the screen of green branches and creepers hiding the windows of Granite House, and showing rather conspicuously on the bare rock. Indeed, how could he imagine that a dwelling was hollowed out, at that height, in the solid granite. From Claw Cape to the Mandible Capes, in all the extent of Union Bay, there was nothing to lead him to suppose that the island was or could be inhabited.
At eight o'clock, however, the colonists observed a movement on board the Speedy. A boat was lowered, and seven men jumped into her. They were armed with muskets: one took the yoke-lines, four others the oars, and the two others, kneeling in the bows, ready to fire, reconnoitred the island. Their object was no doubt to make an examination but not to land, for in the latter case they would have come in larger numbers. The pirates from their look-out could have seen that the coast was sheltered by an islet, separated from it by a channel half a mile in width. However, it was soon evident to Cyrus Harding, on observing the direction followed by the boat, that they would not attempt to penetrate into the channel, but would land on the islet.

Pencroft and Ayrton, each hidden in a narrow cleft of the rock, saw them coming directly towards them, and waited till they were within range.

The boat advanced with extreme caution. The oars only dipped into the water at long intervals. It could now be seen that one of the convicts held a lead-line in his hand, and that he wished to fathom the depth of the channel hollowed out by the current of the Mercy. This showed that it was Bob Harvey's intention to bring his brig as near as possible to the coast. About thirty pirates, scattered in the rigging, followed every movement of the boat, and took the bearings of certain landmarks which would allow them to approach without danger. The boat was not more than two cables-lengths off the islet when she stopped. The man at the tiller stood up and looked for the best place at which to land.

At that moment two shots were heard. Smoke curled up from among the rocks of the islet. The man at the helm and the man with the lead-line fell backwards into the boat. Ayrton's and Pencraft's balls had struck them both at the same moment.

Almost immediately a louder report was heard, a cloud of smoke issued from the brig's side, and a ball, striking the summit of the rock which sheltered Ayrton and Pencroft, made it fly in splinters, but the two marksmen remained unhurt.

Horrible imprecations burst from the boat, which immediately continued its way. The man who had been at the tiller was replaced by one of his comrades, and the oars were rapidly plunged into the water. However, instead of returning on board as might have been expected, the boat coasted along the islet, so as to round its southern point. The pirates pulled vigorously at their oars that they might get out of range of the bullets.

They advanced to within five cables-lengths of that part of the shore terminated by Flotsam Point, and after having rounded it in a semicircular line, still protected by the brig's guns, they proceeded towards the mouth of the Mercy.

Their evident intention was to penetrate into the channel, and cut off the colonists posted on the islet, in such a way, that whatever their number might be, being placed between the fire from the boat and the fire from the brig, they would find themselves in a very disadvantageous position.

A quarter of an hour passed whilst the boat advanced in this direction. Absolute silence, perfect calm reigned in the air and on the water.

Pencroft and Ayrton, although they knew they ran the risk of being cut off, had not left their post, both that they did not wish to show themselves as yet to their assailants, and expose themselves to the Speedy's guns, and that they relied on Neb and Gideon Spilett, watching at the mouth of the river, and on Cyrus Harding and Herbert, in ambush among the rocks at the Chimneys.

Twenty minutes after the first shots were fired, the boat was less than two cables-lengths off the Mercy. As the tide was beginning to rise with its accustomed violence, caused by the narrowness of the straits, the pirates were drawn towards the river, and it was only by dint of hard rowing that they were able to keep in the middle of the channel. But, as they were passing within good range of the mouth of the Mercy, two balls saluted them, and two more of their number were laid in the bottom of the boat. Neb and Spilett had not missed their aim.

The brig immediately sent a second ball on the post betrayed by the smoke, but without any other result than that of splintering the rock.

The boat now contained only three able men. Carried on by the current, it shot through the channel with the rapidity of an arrow, passed before Harding and Herbert, who, not thinking it within range, withheld their fire, then, rounding the northern point of the islet with the two remaining oars, they pulled towards the brig.

Hitherto the settlers had nothing to complain of. Their adversaries had certainly had the worst of it. The latter already counted four men seriously wounded if not dead; they, on the contrary, unwounded, had not missed a shot. If the pirates continued to attack them in this way, if they renewed their attempt to land by means of a boat, they could be destroyed one by one.

It was now seen how advantageous the engineer's arrangements had been. The pirates would think that they had to deal with numerous and well-armed adversaries, whom they could not easily get the better of.

Half an hour passed before the boat, having to pull against the current, could get alongside the Speedy. Frightful cries were heard when they returned on board with the wounded, and two or three guns were fired with no result.
But now about a dozen other convicts, maddened with rage, and possibly by the effect of the evening’s potations, threw themselves into the boat. A second boat was also lowered, in which eight men took their places, and whilst the first pulled straight for the islet, to dislodge the colonists from thence, the second manoeuvred so as to force the entrance of the Mercy.

The situation was evidently becoming very dangerous for Pencroft and Ayrton, and they saw that they must regain the mainland.

However, they waited till the first boat was within range, when two well-directed balls threw its crew into disorder. Then, Pencroft and Ayrton, abandoning their posts, under fire from the dozen muskets, ran across the islet at full speed, jumped into their boat, crossed the channel at the moment the second boat reached the southern end, and ran to hide themselves in the Chimneys.

They had scarcely rejoined Cyrus Harding and Herbert, before the islet was overrun with pirates in every direction. Almost at the same moment, fresh reports resounded from the Mercy station, to which the second boat was rapidly approaching. Two, out of the eight men who manned her, were mortally wounded by Gideon Spilett and Neb, and the boat herself, carried irresistibly onto the reefs, was stoved in at the mouth of the Mercy. But the six survivors, holding their muskets above their heads to preserve them from contact with the water, managed to land on the right bank of the river. Then, finding they were exposed to the fire of the ambush there, they fled in the direction of Flotsam Point, out of range of the balls.

The actual situation was this: on the islet were a dozen convicts, of whom some were no doubt wounded, but who had still a boat at their disposal; on the island were six, but who could not by any possibility reach Granite House, as they could not cross the river, all the bridges being raised.

"Hallo," exclaimed Pencroft as he rushed into the Chimneys, "hallo, captain! What do you think of it, now?"

"I think," answered the engineer, "that the combat will now take a new form, for it cannot be supposed that the convicts will be so foolish as to remain in a position so unfavourable for them!"

"They won't cross the channel," said the sailor. "Ayrton and Mr Spilett's rifles are there to prevent them. You know that they carry more than a mile!"

"No doubt," replied Herbert; "but what can two rifles do against the brig's guns?"

"Well, the brig isn't in the channel yet, I fancy!" said Pencroft.

"But suppose she does come there?" said Harding.

"That's impossible, for she would risk running aground and being lost!"

"It is possible," said Ayrton. "The convicts might profit by the high tide to enter the channel, with the risk of grounding at low tide, it is true; but then, under the fire from her guns, our posts would be no longer tenable."

"Confound them!" exclaimed Pencroft. "It really seems as if the blackguards were preparing to weigh anchor."

"Perhaps we shall be obliged to take refuge in Granite House!" observed Herbert.

"We must wait!" answered Cyrus Harding.

"But Mr Spilett and Neb?" said Pencroft.

"They will know when it is best to rejoin us. Be ready, Ayrton. It is yours and Spilett's rifles which must speak now."

It was only too true. The Speedy was beginning to weigh her anchor, and her intention was evidently to approach the islet. The tide would be rising for an hour and a half, and the ebb current being already weakened, it would be easy for the brig to advance. But as to entering the channel, Pencroft, contrary to Ayrton's opinion, could not believe that she would dare to attempt it.

In the meanwhile, the pirates who occupied the islet had gradually advanced to the opposite shore, and were now only separated from the mainland by the channel.

Being armed with muskets alone, they could do no harm to the settlers, in ambush at the Chimneys and the mouth of the Mercy; but, not knowing the latter to be supplied with long range rifles, they on their side did not believe themselves to be exposed. Quite uncovered, therefore, they surveyed the islet, and examined the shore.

Their illusion was of short duration. Ayrton's and Gideon Spilett's rifles then spoke, and no doubt imparted some very disagreeable intelligence to two of the convicts, for they fell backwards.

"Eight less!" exclaimed Pencroft. "Really, one would have thought that Mr Spilett and Ayrton had given the word to fire together!"

"Gentlemen," said Ayrton, as he reloaded his gun, "this is becoming more serious. The brig is making sail!"

"The anchor is weighed!" exclaimed Pencroft.

"Yes; and she is already moving."
In fact, they could distinctly hear the creaking of the windlass. The Speedy was at first held by her anchor; then, when that had been raised, she began to drift towards the shore. The wind was blowing from the sea; the jib and the fore-topsail were hoisted, and the vessel gradually approached the island.

From the two posts of the Mercy and the Chimneys they watched her without giving a sign of life; but not without some emotion. What could be more terrible for the colonists than to be exposed, at a short distance, to the brig's guns, without being able to reply with any effect? How could they then prevent the pirates from landing?

Cyrus Harding felt this strongly, and he asked himself what it would be possible to do. Before long, he would be called upon for his determination. But what was it to be? To shut themselves up in Granite House, to be besieged there, to remain there for weeks, for months even, since they had an abundance of provisions? So far good! But after that? The pirates would not be less masters of the island, which they would ravage at their pleasure, and in time they would end by having their revenge on the prisoners in Granite House.

However, one chance yet remained; it was that Bob Harvey, after all, would not venture his ship into the channel, and that he would keep outside the islet. He would be still separated from the coast by half a mile, and at that distance his shot could not be very destructive.

"Never!" repeated Pencroft, "Bob Harvey will never, if he is a good seaman, enter that channel! He knows well that it would risk the brig, if the sea got up ever so little! And what would become of him without his vessel?"

In the meanwhile the brig approached the islet, and it could be seen that she was endeavouring to make the lower end. The breeze was light, and as the current had then lost much of its force, Bob Harvey had absolute command over his vessel.

The route previously followed by the boats had allowed her to reconnoitre the channel, and she boldly entered it.

The pirate's design was now only too evident: he wished to bring her broadside to bear on the Chimneys and from there to reply with shell and ball to the shot which had till then decimated her crew.

Soon the Speedy reached the point of the islet; she rounded it with ease; the mainsail was braced up, and the brig hugging the wind, stood across the mouth of the Mercy.

"The scoundrels! they are coming!" said Pencroft.

At that moment, Cyrus Harding, Ayrton, the sailor, and Herbert, were rejoined by Neb and Gideon Spilett.

The reporter and his companion had judged it best to abandon the post at the Mercy, from which they could do nothing against the ship, and they had acted wisely. It was better that the colonists should be together at the moment when they were about to engage in a decisive action. Gideon Spilett and Neb had arrived by dodging behind the rocks, though not without attracting a shower of bullets, which had not, however, reached them.

"Spilett! Neb!" cried the engineer, "you are not wounded?"

"No," answered the reporter; "a few bruises only from the ricochet! But that cursed brig has entered the channel!"

"Yes," replied Pencroft, "and in ten minutes she will have anchored before Granite House!"

"Have you formed any plan, Cyrus?" asked the reporter.

"We must take refuge in Granite House whilst there is still time, and the convicts cannot see us."

"That is my opinion, too," replied Gideon Spilett; "but once shut up--"

"We must be guided by circumstances," said the engineer.

"Let us be off, then, and make haste!" said the reporter.

"Would you not wish, captain, that Ayrton and I should remain here?" asked the sailor.

"What would be the use of that, Pencroft?" replied Harding. "No. We will not separate!"

There was not a moment to be lost. The colonists left the Chimneys. A bend of the cliff prevented them from being seen by those in the brig; but two or three reports, and the crash of bullets on the rock, told them that the Speedy was at no great distance.

To spring into the lift, hoist themselves up to the door of Granite House, where Top and Jup had been shut up since the evening before, to rush into the large room, was the work of a minute only.

It was quite time, for the settlers, through the branches, could see the Speedy, surrounded with smoke, gliding up the channel. The firing was incessant, and shot from the four guns struck blindly, both on the Mercy post, although it was not occupied, and on the Chimneys. The rocks were splintered, and cheers accompanied each discharge. However, they were hoping that Granite House would be spared, thanks to Harding's precaution of concealing the windows, when a shot, piercing the door, penetrated into the passage.

"We are discovered!" exclaimed Pencroft.

The colonists had not, perhaps, been seen; but it was certain that Bob Harvey had thought proper to send a ball through the suspected foliage which concealed that part of the cliff. Soon he redoubled his attack, when another ball having torn away the leafy screen, disclosed a gaping aperture in the granite.

The colonists' situation was desperate. Their retreat was discovered. They could not oppose any obstacle to these
missiles, nor protect the stone, which flew in splinters around them. There was nothing to be done but to take refuge in the upper passage of Granite House, and leave their dwelling to be devastated, when a deep roar was heard, followed by frightful cries!

Cyrus Harding and his companions rushed to one of the windows--

The brig, irresistibly raised on a sort of water-spout, had just split in two, and in less than ten seconds she was swallowed up with all her criminal crew!

---

CHAPTER FOUR.

"She has blown up!" cried Herbert.

"Yes! blown up, just as if Ayrton had set fire to the powder!" returned Pencroft, throwing himself into the lift together with Neb and the lad.

"But what has happened?" asked Gideon Spilett, quite stunned by this unexpected catastrophe.

"Oh! this time, we shall know," answered the engineer quickly.

"What shall we know?--"

"Later! later! Come, Spilett. The main point is that these pirates have been exterminated!"

And Cyrus Harding, hurrying away the reporter and Ayrton, joined Pencroft, Neb, and Herbert on the beach.

Nothing could be seen of the brig, not even her masts. After having been raised by the water-spout, she had fallen on her side, and had sunk in that position, doubtless in consequence of some enormous leak. But as in that place the channel was not more than twenty feet in depth, it was certain that the sides of the submerged brig would reappear at low-water.

A few things from the wreck floated on the surface of the water. A raft could be seen consisting of spare spars, coops of poultry with their occupants still living, boxes and barrels, which gradually came to the surface, after having escaped through the hatchways, but no pieces of the wreck appeared, neither planks from the deck, nor timber from the hull,--which rendered the sudden disappearance of the Speedy perfectly inexplicable.

However, the two masts, which had been broken and escaped from the shrouds and stays, came up, with their sails, some furled and the others spread. But it was not necessary to wait for the tide to bring up these riches, and Ayrton and Pencroft, jumped into the boat with the intention of towing the pieces of wreck either to the beach or to the islet. But just as they were shoving off an observation from Gideon Spilett arrested them.

"What about those six convicts who disembarked on the right bank of the Mercy?" said he.

In fact, it would not do to forget that the six men whose boat had gone to pieces on the rocks, had landed at Flotsam Point.

They looked in that direction. None of the fugitives were visible. It was probable that, having seen their vessel engulfed in the channel, they had fled into the interior of the island.

"We will deal with them later," said Harding. "As they are armed, they will still be dangerous; but as it is six against six, the chances are equal. To the most pressing business first."

Ayrton and Pencroft pulled vigorously towards the wreck.

The sea was calm and the tide very high, as there had been a new moon but two days before. A whole hour at least would elapse before the hull of the brig could emerge from the water of the channel.

Ayrton and Pencroft were able to fasten the masts and spars by means of ropes, the ends of which were carried to the beach. There, by the united efforts of the settlers the pieces of wreck were hauled up. Then the boat picked up all that was floating, coops, barrels, and boxes, which were immediately carried to the Chimneys.

Several bodies floated also. Amongst them, Ayrton recognised that of Bob Harvey, which he pointed out to his companion, saying with some emotion--

"That is what I have been, Pencroft."

"But what you are no longer, brave Ayrton!" returned the sailor warmly.

It was singular enough that so few bodies floated. Only five or six were counted, which were already being carried by the current towards the open sea. Very probably the convicts had not had time to escape, and the ship lying over on her side, the greater number of them had remained below. Now the current, by carrying the bodies of these miserable men out to sea, would spare the colonists the sad task of burying them in some corner of their island.

For two hours, Cyrus Harding and his companions were solely occupied in hauling up the spars onto the sand, and then in spreading the sails, which were perfectly uninjured, to dry. They spoke little, for they were absorbed in
their work, but what thoughts occupied their minds!

The possession of this brig, or rather all that she contained, was a perfect mine of wealth. In fact, a ship is like a
little world in miniature, and the stores of the colony would be increased by a large number of useful articles. It
would be, on a large scale, equivalent to the chest found at Flotsam Point.

"And besides," thought Pencroft, "why should it be impossible to refloat the brig? If she has only a leak, that
may be stopped up; a vessel from three to four hundred tons, why she is a regular ship compared to our
Bonadventure! And we could go a long distance in her! We could go anywhere we liked! Captain Harding, Ayrton
and I must examine her! She would be well worth the trouble!"

In fact, if the brig was still fit to navigate, the colonists' chances of returning to their native land was singularly
increased. But, to decide this important question, it was necessary to wait until the tide was quite low, so that every
part of the brig's hull might be examined.

When their treasures had been safely conveyed on shore, Harding and his companions agreed to devote some
minutes to breakfast. They were almost famished: fortunately, the larder was not far off, and Neb was noted for
being an expeditious cook. They breakfasted, therefore, near the Chimneys, and during their repast, as may be
supposed, nothing was talked of but the unexpected event which had so miraculously saved the colony.

"Miraculous is the word," repeated Pencroft, "for it must be acknowledged that those rascals blew up just at the
right moment! Granite House was beginning to be uncomfortable as a habitation!"

"And can you guess, Pencroft," asked the reporter, "how it happened, or what can have occasioned the
explosion?"

"Oh! Mr Spilett, nothing is more simple," answered Pencroft. "A convict vessel is not disciplined like a man-of-
war! Convicts are not sailors. Of course the powder-magazine was open, and as they were firing incessantly, some
careless or clumsy fellow just blew up the vessel!"

"Captain Harding," said Herbert, "what astonishes me is that the explosion has not produced more effect. The
report was not loud, and besides there are so few planks and timbers torn out. It seems as if the ship had rather
foundered than blown up."

"Does that astonish you, my boy?" asked the engineer.

"Yes, captain."

"And it astonishes me also Herbert," replied he, "but when we visit the hull of the brig, we shall no doubt find
the explanation of the matter."

"Why, captain," said Pencroft, "you don't suppose that the Speedy simply foundered like a ship which has struck
on a rock?"

"Why not," observed Neb, "if there are rocks in the channel?"

"Nonsense, Neb," answered Pencroft, "you did not look at the right moment. An instant before she sank, the
brig, as I saw perfectly well, rose on an enormous wave, and fell back on her larboard side. Now, if she had only
struck, she would have sunk quietly and gone to the bottom like an honest vessel."

"It was just because she was not an honest vessel!" returned Neb.

"Well, we shall soon see, Pencroft," said the engineer.

"We shall soon see," rejoined the sailor, "but I would wager my head there are no rocks in the channel. Look
here, captain, to speak candidly, do you mean to say that there is anything marvellous in the occurrence?"

Cyrus Harding did not answer.

"At any rate," said Gideon Spilett, "whether rock or explosion, you will agree, Pencroft, that it occurred just in
the nick of time!"

"Yes! yes!" replied the sailor, "but that is not the question. I ask Captain Harding if he sees anything supernatural
in all this."

"I cannot say, Pencroft," said the engineer. "That is all the answer I can make."

A reply which did not satisfy Pencroft at all. He stuck to "an explosion," and did not wish to give it up. He would
never consent to admit that in that channel, with its fine sandy bed, just like the beach, which he had often crossed at
low-water, there could be an unknown rock.

And besides, at the time the brig foundered, it was high-water, that is to say, there was enough water to carry the
vessel clear over any rocks which would not be uncovered at low tide. Therefore, there could not have been a
collision. Therefore, the vessel had not struck. Therefore, she had blown up.

And it must be confessed that the sailor's arguments were not without reason.

Towards half-past one, the colonists embarked in the boat to visit the wreck. It was to be regretted that the brig's
two boats had not been saved; but one, as has been said, had gone to pieces at the mouth of the Mercy, and was
absolutely useless; the other had disappeared when the brig went down, and had not again been seen, having
doubtless been crushed.
The hull of the Speedy was just beginning to issue from the water. The brig was lying right over on her side, for her masts being broken, pressed down by the weight of the ballast displaced by the shock, the keel was visible along her whole length. She had been regularly turned over by the inexplicable but frightful submarine action, which had been at the same time manifested by an enormous water-spout.

The settlers rowed round the hull, and, in proportion as the tide went down, they could ascertain, if not the cause which had occasioned the catastrophe, at least the effect produced.

Towards the bows, on both sides of the keel, seven or eight feet from the beginning of the stem, the sides of the brig were frightfully torn. Over a length of at least twenty feet there opened two large leaks, which it would be impossible to stop up. Not only had the copper sheathing and the planks disappeared, reduced, no doubt, to powder, but also the ribs, the iron bolts, and tree-nails which united them. From the entire length of the hull to the stern the false keel had been separated with unaccountable violence, and the keel itself, torn from the carline in several places, was split in all its length.

"I've a notion!" exclaimed Pencroft, "that this vessel will be difficult to get afloat again."

"It will be impossible," said Ayrton.

"At any rate," observed Gideon Spilett to the sailor, "the explosion, if there has been one, has produced singular effects! It has split the lower part of the hull, instead of blowing up the deck and topsides! These great rents appear rather to have been made by a rock than by the explosion of a powder-magazine."

"There is not a rock in the channel!" answered the sailor. "I will admit anything you like, except the rock."

"Let us try to penetrate into the interior of the brig," said the engineer; "perhaps we shall then know what to think of the cause of her destruction."

This was the best thing to be done, and it was agreed, besides, to take an inventory of all the treasures on board, and to arrange for their preservation.

Access to the interior of the brig was now easy. The tide was still going down, and the deck was practicable. The ballast, composed of heavy masses of iron, had broken through in several places. The noise of the sea could be heard as it rushed out at the holes in the hull.

Cyrus Harding and his companions, hatchets in hand, advanced along the shattered deck. Cases of all sorts encumbered it, and, as they had been but a very short time in the water, their contents were perhaps uninjured.

They then busied themselves in placing all this cargo in safety. The water would not return for several hours, and these hours must be employed in the most profitable way. Ayrton and Pencroft had, at the entrance made in the hull, discovered tackle, which would serve to hoist up the barrels and chests. The boat received them and transported them to the shore. They took the articles as they came, intending to sort them afterwards.

At any rate, the settlers saw at once, with extreme satisfaction, that the brig possessed a very varied cargo—an assortment of all sorts of articles, utensils, manufactured goods, and tools—such as the ships which make the great coasting-trade of Polynesia are usually laden with. It was probable that they would find a little of everything, and they agreed that it was exactly what was necessary for the colony of Lincoln Island.

However—and Cyrus Harding observed it in silent astonishment—not only, as has been said, had the hull of the brig enormously suffered from the shock, whatever it was, that had occasioned the catastrophe, but the interior arrangements had been destroyed, especially towards the bows. Partitions and staunchions were smashed, as if some tremendous shell had burst in the interior of the brig. The colonists could easily go fore and aft, after having removed the cases as they were extricated. They were not heavy bales, which would have been difficult to remove, but simple packages, of which the stowage, besides, was no longer recognisable.

The colonists then reached the stern of the brig—the part formerly surmounted by the poop. It was there that, following Ayrton's directions, they must look for the powder-magazine. Cyrus Harding thought that it had not exploded; that it was possible some barrels might be saved, and that the powder, which is usually enclosed in metal coverings, might not have suffered from contact with the water.

This, in fact, was just what had happened. They extricated from amongst a large number of shot twenty barrels, the insides of which were lined with copper. Pencroft was convinced by the evidence of his own eyes that the destruction of the Speedy could not be attributed to an explosion. That part of the hull in which the magazine was situated was, moreover, that which had suffered least.

"It may be so," said the obstinate sailor; "but as to a rock, there is not one in the channel!"

"Then, how did it happen?" asked Herbert.

"I don't know," answered Pencroft, "Captain Harding doesn't know, and nobody knows or ever will know!"

Several hours had passed during these researches, and the tide began to flow. Work must be suspended for the present. There was no fear of the brig being carried away by the sea, for she was already fixed as firmly as if moored by her anchors.

They could therefore, without inconvenience, wait until the next day to resume operations; but, as to the vessel
herself, she was doomed, and it would be best to hasten to save the remains of her hull, as she would not be long in disappearing in the quicksands of the channel.

It was now five o'clock in the evening. It had been a hard day's work for the men. They ate with good appetite, and, notwithstanding their fatigue, they could not resist, after dinner, their desire of inspecting the cases which composed the cargo of the Speedy.

Most of them contained clothes, which, as may be believed, were well received. There were enough to clothe a whole colony—linen for every one's use, shoes for every one's feet.

"We are too rich!" exclaimed Pencroft. "But what are we going to do with all this?"

And every moment burst forth the hurrahs of the delighted sailor when he caught sight of the barrels of gunpowder, fire-arms and side-arms, balls of cotton, implements of husbandry, carpenter's, joiner's, and blacksmith's tools, and boxes of all kinds of seeds, not in the least injured by their short sojourn in the water. Ah, two years before, how these things would have been prized! And now, even although the industrious colonists had provided themselves with tools, these treasures would find their use.

There was no want of space in the store-rooms of Granite House, but that daytime would not allow them to stow away the whole. It would not do also to forget that the six survivors of the Speedy's crew had landed on the island, for they were in all probability scoundrels of the deepest dye, and it was necessary that the colonists should be on their guard against them. Although the bridges over the Mercy were raised, the convicts would not be stopped by a river or a stream, and, rendered desperate, these wretches would be capable of anything.

They would see later what plan it would be best to follow; but in the meantime it was necessary to mount guard over cases and packages heaped up near the Chimneys, and thus the settlers employed themselves in turn during the night.

The morning came, however, without the convicts having attempted any attack. Master Jup and Top, on guard at the foot of Granite House, would have quickly given the alarm. The three following days--the 19th, 20th, and 21st of October--were employed in saving everything of value, or of any use whatever, either from the cargo or rigging of the brig. At low tide they overhauled the hold—at high tide they stowed away the rescued articles. A great part of the copper sheathing had been torn from the hull, which every day sank lower. But before the sand had swallowed the heavy things which had fallen through the bottom, Ayrton and Pencroft, diving to the bed of the channel, recovered the chains and anchors of the brig, the iron of her ballast, and even four guns, which, floated by means of empty casks, were brought to shore.

It may be seen that the arsenal of the colony had gained by the wreck, as well as the store-rooms of Granite House. Pencroft, always enthusiastic in his projects, already spoke of constructing a battery to command the channel and the mouth of the river. With four guns, he engaged to prevent any fleet, "however powerful it might be," from venturing into the waters of Lincoln Island!

In the meantime, when nothing remained of the brig but a useless hulk, bad weather came on, which soon finished her. Cyrus Harding had intended to blow her up, so as to collect the remains on the shore, but a strong gale from the north-east and a heavy sea compelled him to economise his powder.

In fact, on the night of the 23rd, the hull entirely broke up, and some of the wreck was cast up on the beach.

As to the papers on board, it is useless to say that, although he carefully searched the lockers of the poop, Harding did not discover any trace of them. The pirates had evidently destroyed everything that concerned either the captain or the owners of the Speedy, and, as the name of her port was not painted on her counter, there was nothing which would tell them her nationality. However, by the shape of her boats Ayrton and Pencroft believed that the brig was of English build.

A week after the catastrophe—or, rather, after the fortunate, though inexplicable, event to which the colony owed its preservation—nothing more could be seen of the vessel, even at low tide. The wreck had disappeared, and Granite House was enriched by nearly all it had contained.

However, the mystery which enveloped its strange destruction would doubtless never have been cleared away if, on the 30th of November, Neb, strolling on the beach, had not found a piece of a thick iron cylinder, bearing traces of explosion. The edges of this cylinder were twisted and broken, as if they had been subjected to the action of some explosive substance.

Neb brought this piece of metal to his master, who was then occupied with his companions in the workshop of the Chimneys.

Cyrus Harding examined the cylinder attentively, then, turning to Pencroft—
"You persist, my friend," said he, "in maintaining that the Speedy was not lost in consequence of a collision?"
"Yes, captain," answered the sailor. "You know as well as I do that there are no rocks in the channel."
"But suppose she had run against this piece of iron?" said the engineer, showing the broken cylinder.
"What, that bit of pipe!" exclaimed Pencroft in a tone of perfect incredulity.
"My friends," resumed Harding, "you remember that before she foundered the brig rose on the summit of a regular water-spout?"

"Yes, captain," replied Herbert.

"Well, would you like to know what occasioned that water-spout? It was this," said the engineer, holding up the broken tube.

"That?" returned Pencroft.

"Yes! This cylinder is all that remains of a torpedo!"

"A torpedo!" exclaimed the engineer's companions.

"And who put the torpedo there?" demanded Pencroft, who did not like to yield.

"All that I can tell you is, that it was not I," answered Cyrus Harding; "but it was there, and you have been able to judge of its incomparable power!"

CHAPTER FIVE.
THE ENGINEER'S DECLARATION--PENCROFT'S GRAND HYPOTHESIS--AN AERIAL BATTERY--THE FOUR CANNONS--THE SURVIVING CONVICTS--ARYTON'S HESITATION--CYRUS HARDING'S GENEROUS SENTIMENTS--PENCROFT'S REGRET.

So, then, all was explained by the submarine explosion of this torpedo. Cyrus Harding could not be mistaken, as, during the war of the Union, he had had occasion to try these terrible engines of destruction. It was under the action of this cylinder, charged with some explosive substance, nitro-glycerine, picrate, or some other material of the same nature, that the water of the channel had been raised like a dome, the bottom of the brig crushed in, and she had sunk instantly, the damage done to her hull being so considerable that it was impossible to refloat her. The Speedy had not been able to withstand a torpedo that would have destroyed an ironclad as easily as a fishing-boat!

Yes! all was explained, everything--except the presence of the torpedo in the waters of the channel!

"My friends, then," said Cyrus Harding, "we can no longer be in doubt as to the presence of a mysterious being, a castaway like us, perhaps, abandoned on our island, and I say this in order that Ayrton may be acquainted with all the strange events which have occurred during these two years. Who this beneficent stranger is, whose intervention has, so fortunately for us, been manifested on many occasions, I cannot imagine. What his object can be in acting thus, in concealing himself after rendering us so many services, I cannot understand. But his services are not the less real, and are of such a nature that only a man possessed of prodigious power, could render them. Ayrton is indebted to him as much as we are, for, if it was the stranger who saved me from the waves after the fall from the balloon, evidently it was he who wrote the document, who placed the bottle in the channel, and who has made known to us the situation of our companion. I will add that it was he who guided that chest, provided with everything we wanted, and stranded it on Flotsam Point; that it was he who lighted that fire on the heights of the island, which permitted you to land; that it was he who fired that bullet found in the body of the peccary; that it was he, who as everything leads us to believe, saved you from the waves, and that under circumstances in which any one else would not have been able to act? If it was he, he possesses a power which renders him master of the elements."

"You are right in speaking thus, my dear Cyrus," replied Gideon Spilett. "Yes, there is an almost all-powerful being, hidden in some part of the island, and whose influence has been singularly useful to our colony. I will add that the unknown appears to possess means of action which border on the supernatural if, in the events of practical life, the supernatural were recognisable. Is it he who is in secret communication with us by the well in Granite House, and has he thus a knowledge of all our plans? Was it he who threw us that bottle, when the vessel made her first cruise? Was it he who threw Top out of the lake, and killed the dugong? Was it he, who as everything leads us to believe, saved you from the waves, and that under circumstances in which any one else would not have been able to act? If it was he, he possesses a power which renders him master of the elements."

The reporter's reasoning was just, and every one felt it to be so.

"Yes," rejoined Cyrus Harding, "if the intervention of a human being is not more questionable for us, I agree that he has at his disposal means of action beyond those possessed by humanity. There is a mystery still, but if we discover the man, the mystery will be discovered also. The question, then, is, ought we to respect the incognito of this generous being, or ought we to do everything to find him out? What is your opinion on the matter?"

"My opinion," said Pencroft, "is that, whoever he may be, he is a brave man, and he has my esteem!"

"Be it so," answered Harding, "but that is not an answer, Pencroft."

"Master," then said Neb, "my idea is, that we may search as long as we like for this gentleman whom you are talking about, but that we shall not discover him till he pleases."
"That's not bad, what you say, Neb," observed Pencroft.

"I am of Neb's opinion," said Gideon Spilett, "but that is no reason for not attempting the adventure. Whether we find this mysterious being or not, we shall at least have fulfilled our duty towards him."

"And you, my boy, give us your opinion," said the engineer, turning to Herbert.

"Oh," cried Herbert, his countenance full of animation, "how I should like to thank him, he who saved you first, and who has now saved us!"

"Of course, my boy," replied Pencroft, "so would I and all of us. I am not inquisitive, but I would give one of my eyes to see this individual face to face! It seems to me that he must be handsome, tall, strong, with a splendid beard, radiant hair, and that he must be seated on the clouds, a great ball in his hands!"

"But, Pencroft," answered Spilett, "you are describing a picture of the Creator."

"Possibly, Mr Spilett," replied the sailor, "but that is how I imagine him!"

"And you, Ayrton?" asked the engineer.

"Captain Harding," replied Ayrton, "I can give you no better advice in this matter. Whatever you do will be best, when you wish me to join you in your researches, I am ready to follow you."

"I thank you, Ayrton," answered Cyrus Harding, "but I should like a more direct answer to the question I put to you. You are our companion; you have already endangered your life several times for us, and you, as well as the rest, ought to be consulted in the matter of any important decision. Speak, therefore."

"Captain Harding," replied Ayrton, "I think that we ought to do everything to discover this unknown benefactor. Perhaps he is alone. Perhaps he is suffering. Perhaps he has a life to be renewed. I, too, as you said, have a debt of gratitude to pay him. It was he, it could be only he who must have come to Tabor Island, who found there the wretch you knew, and who made known to you that there was an unfortunate man there to be saved! Therefore it is, thanks to him, that I have become a man again. No, I will never forget him!"

"That is settled, then," said Cyrus Harding. "We will begin our researches as soon as possible. We will not leave a corner of the island unexplored. We will search into its most secret recesses, and will hope that our unknown friend will pardon us in consideration of our intentions!"

For several days the colonists were actively employed in haymaking and harvest. Before putting their project of exploring the yet unknown parts of the island into execution, they wished to get all possible work finished. It was also the time for collecting the various vegetables from the Tabor Island plants. All was stowed away, and happily there was no want of room in Granite House, in which they might have housed all the treasures of the island. The products of the colony were there, methodically arranged, and in a safe place, as may be believed, sheltered as much from animals as from man.

There was no fear of damp in the middle of that thick mass of granite. Many natural excavations situated in the upper passage were enlarged either by pick-axe or mine, and Granite House thus became a general warehouse, containing all the provisions, arms, tools, and spare utensils--in a word, all the stores of the colony.

As to the guns obtained from the brig, they were pretty pieces of ordnance, which, at Pencroft's entreaty, were hoisted by means of tackle and pulleys, right up into Granite House; embrasures were made between the windows, and the shining muzzles of the guns could soon be seen through the granite cliff. From this height they commanded all Union Bay. It was like a little Gibraltar, and any vessel anchored off the islet would inevitably be exposed to the fire of this aerial battery.

"Captain," said Pencroft one day, it was the 8th of November, "now that our fortifications are finished, it would be a good thing if we tried the range of our guns."

"Do you think that is useful?" asked the engineer.

"It is more than useful, it is necessary! Without that how are we to know to what distance we can send one of those pretty shot with which we are provided?"

"Try them, Pencroft," replied the engineer. "However, I think that in making the experiment, we ought to employ, not the ordinary powder, the supply of which, I think, should remain untouched, but the pyroxile which will never fail us."

"Can the cannon support the shock of the pyroxile?" asked the reporter, who was not less anxious than Pencroft to try the artillery of Granite House.

"I believe so. However," added the engineer, "we will be prudent."

The engineer was right in thinking that the guns were of excellent make. Made of forged steel, and breech-loaders, they ought consequently to be able to bear a considerable charge, and also have an enormous range. In fact, as regards practical effect, the transit described by the ball ought to be as extended as possible, and this tension could only be obtained under the condition that the projectile should be impelled with a very great initial velocity.

"Now," said Harding to his companions, "the initial velocity is in proportion to the quantity of powder used. In the fabrication of these pieces, everything depends on employing a metal with the highest possible power of
resistance, and steel is incontestably that metal of all others which resists the best. I have, therefore, reason to believe that our guns will bear without risk the expansion of the pyroxile gas, and will give excellent results."

"We shall be a great deal more certain of that when we have tried them!" answered Pencroft.

It is unnecessary to say that the four cannons were in perfect order. Since they had been taken from the water, the sailor had bestowed great care upon them. How many hours he had spent, in rubbing, greasing, and polishing them, and in cleaning the mechanism! And now the pieces were as brilliant as if they had been on board a frigate of the United States' Navy.

On this day, therefore, in presence of all the members of the colony, including Master Jup and Top, the four cannon were successively tried. They were charged with pyroxile, taking into consideration its explosive power, which, as has been said, is four times that of ordinary powder: the projectile to be fired was cylindro-conic.

Pencroft, holding the end of the quick-match, stood ready to fire.

At Harding's signal, he fired. The shot, passing over the islet, fell into the sea at a distance which could not be calculated with exactitude.

The second gun was pointed at the rocks at the end of Flotsam Point, and the shot, striking a sharp rock nearly three miles from Granite House, made it fly into splinters. It was Herbert who had pointed this gun and fired it, and very proud he was of his first shot. Pencroft only was prouder than he! Such a shot, the honour of which belonged to his dear boy.

The third shot, aimed this time at the downs forming the upper side of Union Bay, struck the sand at a distance of four miles, then having ricocheted, was lost in the sea in a cloud of spray.

For the fourth piece Cyrus Harding slightly increased the charge, so as to try its extreme range. Then, all standing aside for fear of its bursting, the match was lighted by means of a long cord.

A tremendous report was heard, but the piece had held good, and the colonists rushing to the windows, saw the shot graze the rocks of Mandible Cape, nearly five miles from Granite House, and disappear in Shark Gulf.

"Well, captain," exclaimed Pencroft, whose cheers might have rivalled the reports themselves, "what do you say of our battery? All the pirates in the Pacific have only to present themselves before Granite House! Not one can land there now without our permission!"

"Believe me, Pencroft," replied the engineer, "it would be better not to have to make the experiment."

"Well," said the sailor, "what ought to be done with regard to those six villains who are roaming about the island? Are we to leave them to overrun our forests, our fields, our plantations. These pirates are regular jaguars, and it seems to me we ought not to hesitate to treat them as such! What do you think, Ayrton?" added Pencroft, turning to his companion.

Ayrton hesitated at first to reply, and Cyrus Harding regretted that Pencroft had so thoughtlessly put this question. And he was much moved when Ayrton replied in a humble tone--

"I have been one of those jaguars, Mr Pencroft. I have no right to speak."

And with a slow step he walked away.

Pencroft understood.

"What a brute I am!" he exclaimed. "Poor Ayrton! He has as much right to speak here as any one!"

"Yes," said Gideon Spilett, "but his reserve does him honour, and it is right to respect the feeling which he has about his sad past."

"Certainly, Mr Spilett," answered the sailor, "and there is no fear of my doing so again. I would rather bite my tongue off than cause Ayrton any pain! But to return to the question. It seems to me that these ruffians have no right to any pity, and that we ought to rid the island of them as soon as possible."

"Is that your opinion, Pencroft?" asked the engineer.

"Quite my opinion."

"And before hunting them mercilessly, you would not wait until they had committed some fresh act of hostility against us?"

"Isn't what they have done already enough?" asked Pencroft, who did not understand these scruples.

"They may adopt other sentiments!" said Harding, "and perhaps repent."

"They repent!" exclaimed the sailor, shrugging his shoulders.

"Pencroft, think of Ayrton!" said Herbert, taking the sailor's hand. "He became an honest man again!"

Pencroft looked at his companions one after the other. He had never thought of his proposal being met with any objection. His rough nature could not allow that they ought to come to terms with the rascals who had landed on the island with Bob Harvey's accomplices, the murderers of the crew of the Speedy; and he looked upon them as wild beasts which ought to be destroyed without delay and without remorse.

"Come!" said he. "Everybody is against me! You wish to be generous to those villains! Very well; I hope we mayn't repent it!"
"What danger shall we run," said Herbert, "if we take care to be always on our guard!"

"Hum!" observed the reporter, who had not given any decided opinion. "They are six and well-armed. If they each lay hid in a corner, and each fired at one of us, they would soon be masters of the colony!"

"Why have they not done so?" said Herbert. "No doubt because it was not their interest to do it. Besides, we are six also."

"Well, well!" replied Pencroft, whom no reasoning could have convinced. "Let us leave these good people to do what they like, and don't think anything more about them!"

"Come, Pencroft," said Neb, "don't make yourself out so bad as all that! Suppose one of these unfortunate men were here before you, within good range of your gun, you would not fire."

"I would fire on him as I would on a mad dog, Neb," replied Pencroft coldly.

"Pencroft," said the engineer, "you have always shown much deference to my advice; will you, in this matter, yield to me?"

"I will do as you please, Captain Harding," answered the sailor, who was not at all convinced.

"Very well, wait, and we will not attack them unless we are attacked first."

Thus their behaviour towards the pirates was agreed upon, although Pencroft augured nothing good from it. They were not to attack them, but were to be on their guard. After all, the island was large and fertile. If any sentiment of honesty yet remained in the bottom of their hearts, these wretches might perhaps be reclaimed. Was it not their interest in the situation in which they found themselves to begin a new life? At any rate, for humanity's sake alone, it would be right to wait. The colonists would no longer, as before, be able to go and come without fear. Hitherto they had only wild beasts to guard against, and now six convicts of the worst description, perhaps, were roaming over their island. It was serious, certainly, and to less brave men, it would have been security lost! No matter! At present, the colonists had reason on their side against Pencroft. Would they be right in the future? That remained to be seen.

CHAPTER SIX.

EXPEDITIONS PLANNED--AYRTON AT THE CORRAL--VISIT TO PORT BALLOON--PENCROFT'S OBSERVATIONS ON BOARD THE BONADVENTURE--DESPATCH SENT TO THE CORRAL--NO REPLY FROM AYRTON--DEPARTURE THE NEXT DAY--THE REASON WHY THE WIRE DID NOT WORK--A REPORT.

However, the chief business of the colonists was to make that complete exploration of the island which had been decided upon, and which would have two objects: to discover the mysterious being whose existence was now indisputable, and at the same time to find out what had become of the pirates, what retreat they had chosen, what sort of life they were leading, and what was to be feared from them. Cyrus Harding wished to set out without delay; but as the expedition would be of some days' duration, it appeared best to load the cart with different materials and tools in order to facilitate the organisation of the encampments. One of the onagers, however, having hurt its leg, could not be harnessed at present, and a few days' rest was necessary. The departure was, therefore, put off for a week, until the 20th of November. The month of November in this latitude corresponds to the month of May in the northern zones. It was, therefore, the fine season. The sun was entering the tropic of Capricorn, and gave the longest days in the year. The time was, therefore, very favourable for the projected expedition, which, if it did not accomplish its principal object, would at any rate be fruitful in discoveries, especially of natural productions, since Harding proposed to explore those dense forests of the Far West, which stretched to the extremity of the Serpentine Peninsula.

During the nine days which preceded their departure, it was agreed that the work on Prospect Heights should be finished off.

Moreover, it was necessary for Ayrton to return to the corral, where the domesticated animals required his care. It was decided that he should spend two days there, and return to Granite House after having liberally supplied the stables.

As he was about to start, Harding asked him if he would not like one of them to accompany him, observing that the island was less safe than formerly. Ayrton replied that this was unnecessary, as he was enough for the work, and that besides he apprehended no danger. If anything occurred at the corral, or in the neighbourhood, he could instantly warn the colonists by sending a telegram to Granite House.

Ayrton departed at dawn on the 9th, taking the cart drawn by one onager, and two hours after, the electric wire announced that he had found all in order at the corral.

During these two days Harding busied himself in executing a project which would completely guard Granite House against any surprise. It was necessary to completely conceal the opening of the old outlet, which was already
walled up and partly hidden under grass and plants, at the southern angle of Lake Grant. Nothing was easier, since if the level of the lake was raised two or three feet, the opening would be quite beneath it. Now, to raise this level they had only to establish a dam at the two openings made by the lake, and by which were fed Creek Glycerine and Falls River.

The colonists worked with a will, and the two dams, which besides did not exceed eight feet in width by three in height, were rapidly erected by means of well-cemented blocks of stone.

This work finished, it would have been impossible to guess that at that part of the lake, there existed a subterranean passage through which the overflow of the lake formerly escaped.

Of course the little stream which fed the reservoir of Granite House and worked the lift had been carefully preserved, and the water could not fail. The lift once raised, this sure and comfortable retreat would be safe from any surprise.

This work had been so quickly done, that Pencroft, Gideon Spilett, and Herbert found time to make an expedition to Port Balloon. The sailor was very anxious to know if the little creek in which the Bonadventure was moored, had been visited by the convicts.

"These gentlemen," he observed, "landed on the south coast, and if they followed the shore, it is to be feared that they may have discovered the little harbour, and in that case, I wouldn't give half-a-dollar for our Bonadventure."

Pencroft's apprehensions were not without foundation, and a visit to Port Balloon appeared to be very desirable. The sailor and his companions set off on the 10th of November, after dinner, well-armed. Pencroft, ostentatiously slipping two bullets into each barrel of his rifle, shook his head in a way which betokened nothing good to any one who approached too near to him, whether "man or beast," as he said. Gideon Spilett and Herbert also took their guns, and about three o'clock all three left Granite House.

Neb accompanied them to the turn of the Mercy, and after they had crossed, he raised the bridge. It was agreed that a gun-shot should announce the colonists' return, and that at the signal Neb should return and re-establish the communication between the two banks of the river.

The little band advanced directly along the road which led to the southern coast of the island. This was only a distance of three miles and a half, but Gideon Spilett and his companions took two hours to traverse it. They examined all the border of the road, the thick forest, as well as Tabor Marsh. They found no trace of the fugitives who, no doubt, not having yet discovered the number of the colonists, or the means of defence which they had at their disposal, had gained the less accessible parts of the island.

Arrived at Port Balloon, Pencroft saw with extreme satisfaction that the Bonadventure was tranquilly floating in the narrow creek. However, Port Balloon was so well hidden amongst high rocks that it could scarcely be discovered either from the land or the sea.

"Come," said Pencroft, "the blackguards have not been there yet. Long grass suits reptiles best, and evidently we shall find them in the Far West."

"And it's very lucky, for if they had found the Bonadventure," added Herbert, "they would have gone off in her, and we should have been prevented from returning to Tabor Island."

"Indeed," remarked the reporter, "it will be important to take a document there which will make known the situation of Lincoln Island, and Ayrton's new residence, in case the Scotch yacht returns to fetch him."

"Well, the Bonadventure is always there, Mr Spilett," answered the sailor. "She and her crew are ready to start at a moment's notice!"

"I think, Pencroft, that that is a thing to be done after our exploration of the island is finished. It is possible after all that the stranger, if we manage to find him, may know as much about Tabor Island as about Lincoln Island. Do not forget that he is certainly the author of the document, and he may, perhaps, know how far we may count on the return of the yacht!"

"But!" exclaimed Pencroft, "who in the world can he be? The fellow knows us and we know nothing about him! If he is a simple castaway, why should he conceal himself? We are honest men, I suppose, and the society of honest men isn't unpleasant to any one. Did he come here voluntarily? Can he leave the island if he likes? Is he here still? Will he remain any longer?"

Chatting thus, Pencroft, Gideon Spilett, and Herbert got on board and looked about the deck of the Bonadventure. All at once, the sailor having examined the bitts to which the cable of the anchor was secured--

"Hallo," he cried, "this is queer!"

"What is the matter, Pencroft?" asked the reporter.

"The matter is, that it was not I who made this knot!"

And Pencroft showed a rope which fastened the cable to the bitt itself.

"What, it was not you?" asked Gideon Spilett.

"No! I can swear to it. This is a reef knot, and I always make a running bowline."
"You must be mistaken, Pencroft."
"I am not mistaken!" declared the sailor. "My hand does it so naturally, and one's hand is never mistaken!"
"Then can the convicts have been on board?" asked Herbert.
"I know nothing about that," answered Pencroft, "but what is certain, is that some one has weighed the Bonadventure's anchor and dropped it again! And look here, here is another proof! The cable of the anchor has been run out, and its service is no longer at the hawse-hole. I repeat that some one has been using our vessel!"
"But if the convicts had used her, they would have pillaged her, or rather gone off with her."
"Gone off! where to——to Tabor Island?" replied Pencroft. "Do you think they would risk themselves in a boat of such small tonnage?"
"We must, besides, be sure that they know of the islet," rejoined the reporter.
"However that may be," said the sailor, "as sure as my name is Bonadventure Pencroft, of the Vineyard, our Bonadventure has sailed without us!"

The sailor was so positive that neither Gideon Spilett nor Herbert could dispute his statement. It was evident that the vessel had been moved, more or less, since Pencroft had brought her to Port Balloon. As to the sailor, he had not the slightest doubt that the anchor had been raised and then dropped again. Now, what was the use of these two manoeuvres, unless the vessel had been employed in some expedition?

"But how was it we did not see the Bonadventure pass in sight of the island?" observed the reporter, who was anxious to bring forward every possible objection.
"Why, Mr Spilett," replied the sailor, "they would only have to start in the night with a good breeze, and they would be out of sight of the island in two hours."
"Well," resumed Gideon Spilett, "I ask again, what object could the convicts have had in using the Bonadventure, and why, after they had made use of her, should they have brought her back to port?"
"Why, Mr Spilett," replied the sailor, "we must put that among the unaccountable things, and not think anything more about it. The chief thing is that the Bonadventure was there, and she is there now. Only, unfortunately, if the convicts take her a second time, we shall very likely not find her again in her place!"
"Then, Pencroft," said Herbert, "would it not be wisest to bring the Bonadventure off to Granite House?"
"Yes and no," answered Pencroft, "or rather no. The mouth of the Mercy is a bad place for a vessel, and the sea is heavy there."

"But by hauling her up on the sand, to the foot of the Chimneys?"
"Perhaps yes," replied Pencroft. "At any rate, since we must leave Granite House for a long expedition, I think the Bonadventure will be safer here during our absence, and we shall do best to leave her here until the island is rid of these blackguards."

"That is exactly my opinion," said the reporter. "At any rate in the event of bad weather, she will not be exposed here as she would be at the mouth of the Mercy."

"But suppose the convicts pay her another visit," said Herbert.
"Well, my boy," replied Pencroft, "not finding her here, they would not be long in finding her on the sands of Granite House, and, during our absence, nothing could hinder them from seizing her! I agree, therefore, with Mr Spilett, that she must be left in Port Balloon. But, if on our return we have not rid the island of those rascals, it will be prudent to bring our boat to Granite House, until the time when we need not fear any unpleasant visits."

"That's settled. Let us be off," said the reporter.

Pencroft, Herbert, and Gideon Spilett, on their return to Granite House, told the engineer all that had passed, and the latter approved of their arrangements both for the present and the future. He also promised the sailor that he would study that part of the channel situated between the islet and the coast; so as to ascertain if it would not be possible to make an artificial harbour there by means of dams. In this way, the Bonadventure would be always within reach, under the eyes of the colonists, and if necessary, under lock and key.

That evening a telegram was sent to Ayrton, requesting him to bring from the corral a couple of goats, which Neb wished to acclimatise to the plateau. Singularly enough, Ayrton did not acknowledge the receipt of the despatch, as he was accustomed to do. This could not but astonish the engineer. But it might be that Ayrton was not at that moment in the corral, or even that he was on his way back to Granite House. In fact, two days had already passed since his departure, and it had been decided that on the evening of the 10th or at the latest the morning of the 11th, he should return. The colonists waited, therefore, for Ayrton to appear on Prospect Heights. Neb and Herbert even watched at the bridge so as to be ready to lower it the moment their companion presented himself.

But up to ten in the evening, there were no signs of Ayrton. It was, therefore, judged best to send a fresh despatch, requiring an immediate reply.

The bell of the telegraph at Granite House remained mute.

The colonists' uneasiness was great. What had happened? Was Ayrton no longer at the corral, or if he was still
there, had he no longer control over his movements? Could they go to the corral in this dark night?

They consulted. Some wished to go, the others to remain.

"But," said Herbert, "perhaps some accident had happened to the telegraphic apparatus, so that it works no longer?"

"That may be," said the reporter.

"Wait till to-morrow," replied Cyrus Harding. "It is possible, indeed, that Ayrton has not received our despatch, or even that we have not received his."

They waited, of course not without some anxiety.

At dawn of day, the 11th of November, Harding again sent the electric current along the wire and received no reply.

He tried again: the same result.

"Off to the corral," said he.

"And well-armed!" added Pencroft.

It was immediately decided that Granite House should not be left alone and that Neb should remain there. After having accompanied his friends to Creek Glycerine, he raised the bridge; and waiting behind a tree he watched for the return of either his companions or Ayrton.

In the event of the pirates presenting themselves and attempting to force the passage, he was to endeavour to stop them by firing on them, and as a last resource he was to take refuge in Granite House, where, the lift once raised, he would be in safety.

Cyrus Harding, Gideon Spilett, Herbert, and Pencroft were to repair to the corral, and if they did not find Ayrton, search the neighbouring woods.

At six o'clock in the morning, the engineer and his three companions had passed Creek Glycerine, and Neb posted himself behind a small mound crowned by several dragoniners on the left bank of the stream.

The colonists, after leaving the plateau of Prospect Heights, immediately took the road to the corral. They shouldered their guns, ready to fire on the smallest hostile demonstration. The two rifles and the two guns had been loaded with ball.

The wood was thick on each side of the road and might easily have concealed the convicts, who owing to their weapons would have been really formidable.

The colonists walked rapidly and in silence. Top preceded them, sometimes running on the road, sometimes taking a ramble into the wood, but always quiet and not appearing to fear anything unusual. And they could be sure that the faithful dog would not allow them to be surprised, but would bark at the least appearance of danger.

Cyrus Harding and his companions followed beside the road the wire which connected the corral with Granite House. After walking for nearly two miles, they had not as yet discovered any explanation of the difficulty. The posts were in good order, the wire regularly expended. However, at that moment the engineer observed that the wire appeared to be slack, and on arriving at post Number 74, Herbert, who was in advance stopped, exclaiming--

"The wire is broken!"

His companions hurried forward and arrived at the spot where the lad was standing. The post was rooted up and lying across the path. The unexpected explanation of the difficulty was here, and it was evident that the despatches from Granite House had not been received at the corral, nor those from the corral at Granite House.

"It wasn't the wind that blew down this post," observed Pencroft.

"No," replied Gideon Spilett. "The earth has been dug up round its foot, and it has been torn up by the hand of man."

"Besides, the wire is broken," added Herbert, showing that the wire had been snapped.

"Is the fracture recent?" asked Harding.

"Yes," answered Herbert, "it has certainly been done quite lately."

"To the corral! to the corral!" exclaimed the sailor.

The colonists were now half way between Granite House and the corral, having still two miles and a half to go.

They pressed forward with redoubled speed.

Indeed, it was to be feared that some serious accident had occurred in the corral. No doubt, Ayrton might have sent a telegram which had not arrived, but this was not the reason why his companions were so uneasy, for, a more unaccountable circumstance, Ayrton, who had promised to return the evening before, had not reappeared. In short, it was not without a motive that all communication had been stopped between the corral and Granite House, and who but the convicts could have any interest in interrupting this communication?

The settlers hastened on, their hearts oppressed with anxiety. They were sincerely attached to their new companion. Were they to find him struck down by the hands of those of whom he was formerly the leader?

Soon they arrived at the place where the road led along the side of a little stream which flowed from the Red
Creek and watered the meadows of the corral. They then moderated their pace so that they should not be out of breath at the moment when a struggle might be necessary. Their guns were in their hands ready cocked. The forest was watched on every side. Top uttered sullen groans which were rather ominous.

At last the palisade appeared through the trees. No trace of any damage could be seen. The gate was shut as usual. Deep silence reigned in the corral. Neither the accustomed bleating of the sheep nor Ayrton's voice could be heard.

"Let us enter," said Cyrus Harding.

And the engineer advanced, whilst his companions, keeping watch about twenty paces behind him, were ready to fire at a moment's notice.

Harding raised the inner latch of the gate and was about to push it back, when Top barked loudly. A report sounded and was responded to by a cry of pain.

Herbert, struck by a bullet, lay stretched on the ground.

CHAPTER SEVEN.

THE REPORTER AND PENCROFT IN THE CORRAL--HERBERT'S WOUND--THE SAILOR'S DESPAIR--CONSULTATION BETWEEN THE REPORTER AND THE ENGINEER--MODE OF TREATMENT--HOPE NOT ABANDONED--HOW IS NEB TO BE WARNED--A SURE AND FAITHFUL MESSENGER--NEB'S REPLY.

At Herbert's cry Pencroft, letting his gun fall, rushed towards him.

"They have killed him!" he cried. "My boy! They have killed him!"

Cyrus Harding and Gideon Spilett ran to Herbert.

The reporter listened to ascertain if the poor lad's heart was still beating.

"He lives," said he; "but he must be carried--"

"To Granite House? that is impossible!" replied the engineer.

"Into the corral, then!" said Pencroft.

"In a moment," said Harding.

And he ran round the left corner of the palisade. There he found a convict who, aiming at him, sent a ball through his hat. In a few seconds, before he had even time to fire his second barrel, he fell, struck to the heart by Harding's dagger, more sure even than his gun.

During this time, Gideon Spilett and the sailor hoisted themselves over the palisade, leapt into the enclosure, threw down the props which supported the inner door, ran into the empty house, and soon poor Herbert was lying on Ayrton's bed. In a few moments, Harding was by his side.

On seeing Herbert senseless, the sailor's grief was terrible. He sobbed, he cried, he tried to beat his head against the wall. Neither the engineer nor the reporter could calm him. They themselves were choked with emotion. They could not speak.

However, they knew that it depended on them to rescue from death the poor boy who was suffering beneath their eyes. Gideon Spilett had not passed through the many incidents by which his life had been chequered without acquiring some slight knowledge of medicine. He knew a little of everything, and several times he had been obliged to attend to wounds produced either by a sword-bayonet or shot. Assisted by Cyrus Harding, he proceeded to render the aid Herbert required.

The reporter was immediately struck by the complete stupor in which Herbert lay, a stupor owing either to the haemorrhage, or to the shock, the ball having struck a bone with sufficient force to produce a violent concussion.

Herbert was deadly pale, and his pulse so feeble that Spilett only felt it beat at long intervals, as if it was on the point of stopping. These symptoms were very serious. Herbert's chest was laid bare, and the blood having been staunched with handkerchiefs, it was bathed with cold water. The contusion, or rather the contused wound appeared,--an oval below the chest between the third and fourth ribs. It was there that Herbert had been hit by the bullet.

Cyrus Harding and Gideon Spilett then turned the poor boy over; as they did so, he uttered a moan so feeble that they almost thought it was his last sigh.

Herbert's back was covered with blood from another contused wound, by which the ball had immediately escaped.

"God be praised!" said the reporter, "the ball is not in the body, and we shall not have to extract it."

"But the heart?" asked Harding.

"The heart has not been touched; if it had been, Herbert would be dead!"

"Dead!" exclaimed Pencroft, with a groan. The sailor had only heard the last words uttered by the reporter.
"No, Pencroft," replied Cyrus Harding, "no! He is not dead. His pulse still beats. He has even uttered a moan. But for your boy's sake, calm yourself. We have need of all our self-possession. Do not make us lose it, my friend."

Pencroft was silent, but a reaction set in, and great tears rolled down his cheeks.

In the meanwhile, Gideon Spilett endeavoured to collect his ideas, and proceed methodically. After his examination he had no doubt that the ball, entering in front, between the seventh and eighth ribs, had issued behind between the third and fourth. But what mischief had the ball committed in its passage? What important organs had been reached? A professional surgeon would have had difficulty in determining this at once, and still more so the reporter.

However, he knew one thing, this was that he would have to prevent the inflammatory strangulation of the injured parts, then to contend with the local inflammation and fever which would result from the wound, perhaps mortal! Now, what stiptics, what antiphlogistics ought to be employed? By what means could inflammation be prevented?

At any rate, the most important thing was that the two wounds should be dressed without delay. It did not appear necessary to Gideon Spilett that a fresh flow of blood should be caused by bathing them in tepid water, and compressing their lips. The haemorrhage had been very abundant, and Herbert was already too much enfeebled by the loss of blood.

The reporter, therefore, thought it best to simply bathe the two wounds with cold water. Herbert was placed on his left side, and was maintained in that position.

"He must not be moved," said Gideon Spilett. "He is in the most favourable position for the wounds in his back and chest to suppurate easily, and absolute rest is necessary."

"What! can't we carry him to Granite House?" asked Pencroft.

"No, Pencroft," replied the reporter.

"I'll pay the villains off!" cried the sailor, shaking his fist in a menacing manner.

"Pencroft!" said Cyrus Harding.

Gideon Spilett had resumed his examination of the wounded boy. Herbert was still so frightfully pale that the reporter felt anxious.

"Cyrus," said he, "I am not a surgeon. I am in terrible perplexity. You must aid me with your advice, your experience!"

"Take courage, my friend," answered the engineer, pressing the reporter's hand. "Judge coolly. Think only of this: Herbert must be saved!"

These words restored to Gideon Spilett that self-possession which he had lost in a moment of discouragement on feeling his great responsibility. He seated himself close to the bed. Cyrus Harding stood near. Pencroft had torn up his shirt, and was mechanically making lint.

Spilett then explained to Cyrus Harding that he thought he ought first of all to stop the haemorrhage, but not close the two wounds, or cause their immediate cicatrization, for there had been internal perforation, and the suppuration must not be allowed to accumulate in the chest.

Harding approved entirely, and it was decided that the two wounds should be dressed without attempting to close them by immediate coaptation.

And now, did the colonists possess an efficacious agent to act against the inflammation which might occur?

Yes. They had one, for nature had generously lavished it. They had cold water, that is to say, the most powerful sedative that can be employed against inflammation of wounds, the most efficacious therapeutic agent in grave cases, and the one which is now adopted by all physicians. Cold water has, moreover, the advantage of leaving the wound in absolute rest, and preserving it from all premature dressing, a considerable advantage, since it has been found by experience that contact with the air is dangerous during the first days.

Gideon Spilett and Cyrus Harding reasoned thus with their simple good sense, and they acted as the best surgeon would have done. Compresses of linen were applied to poor Herbert's two wounds, and were kept constantly wet with cold water.

The sailor had at first lighted a fire in the hut, which was not wanting in things necessary for life. Maple sugar, medicinal plants, the same which the lad had gathered on the banks of Lake Grant, enabled them to make some refreshing drinks, which they gave him without his taking any notice of it. His fever was extremely high, and all that day and night passed without his becoming conscious.

Herbert's life hung on a thread, and this thread might break at any moment. The next day, the 12th of November, the hopes of Harding and his companions slightly revived. Herbert had come out of his long stupor. He opened his eyes, he recognised Cyrus Harding, the reporter, and Pencroft. He uttered two or three words. He did not know what had happened. They told him, and Spilett begged him to remain perfectly still, telling him that his life was not in danger, and that his wounds would heal in a few days. However, Herbert scarcely suffered at all, and the cold water
with which they were constantly bathed, prevented any inflammation of the wounds. The supputation was established in a regular way, the fever did not increase, and it might now be hoped that this terrible wound would not involve any catastrophe. Pencroft felt the swelling of his heart gradually subside. He was like a sister of mercy, like a mother by the bed of her child.

Herbert dozed again, but his sleep appeared more natural.

"Tell me again that you hope, Mr Spilett," said Pencroft. "Tell me again that you will save Herbert!"

"Yes, we will save him!" replied the reporter. "The wound is serious, and, perhaps, even the ball has traversed the lungs, but the perforation of this organ is not fatal."

"God bless you!" answered Pencroft.

As may be believed, during the four-and-twenty hours they had been in the corral, the colonists had no other thought than that of nursing Herbert. They did not think either of the danger which threatened them should the convicts return, or of the precautions to be taken for the future.

But on this day, whilst Pencroft watched by the sick-bed, Cyrus Harding and the reporter consulted as to what it would be best to do.

First of all they examined the corral. There was not a trace of Ayrton. Had the unhappy man been dragged away by his former accomplices? Had he resisted, and been overcome in the struggle? This last supposition was only too probable. Gideon Spilett, at the moment he scaled the palisade, had clearly seen some one of the convicts running along the southern spur of Mount Franklin, towards whom Top had sprung. It was one of those whose object had been so completely defeated by the rocks at the mouth of the Mercy. Besides, the one killed by Harding, and whose body was found outside the enclosure, of course belonged to Bob Harvey's crew.

As to the corral, it had not suffered any damage. The gates were closed, and the animals had not been able to disperse in the forest. Nor could they see traces of any struggle, any devastation, either in the hut, or in the palisade. The ammunition only, with which Ayrton had been supplied, had disappeared with him.

"The unhappy man has been surprised," said Harding, "and as he was a man to defend himself, he must have been overpowered."

"Yes, that is to be feared!" said the reporter. "Then, doubtless, the convicts installed themselves in the corral where they found plenty of everything, and only fled when they saw us coming. It is very evident, too, that at this moment Ayrton, whether living or dead, is not here!"

"We shall have to beat the forest," said the engineer, "and rid the island of these wretches. Pencroft's presentiments were not mistaken, when he wished to hunt them as wild beasts. That would have spared us all these misfortunes!"

"Yes," answered the reporter, "but now we have the right to be merciless!"

"At any rate," said the engineer, "we are obliged to wait some time, and to remain at the corral until we can carry Herbert without danger to Granite House."

"But Neb?" asked the reporter.

"Neb is in safety."

"But if, uneasy at our absence, he would venture to come?"

"He must not come!" returned Cyrus Harding quickly. "He would be murdered on the road!"

"It is very probable, however, that he will attempt to rejoin us!"

"Ah, if the telegraph still acted, he might be warned! But that is impossible now! As to leaving Pencroft and Herbert here alone, we could not do it! Well, I will go alone to Granite House."

"No, no! Cyrus," answered the reporter, "you must not expose yourself! Your courage would be of no avail. The villains are evidently watching the corral, they are hidden in the thick woods which surround it, and if you go we shall soon have to regret two misfortunes instead of one!"

"But Neb?" repeated the engineer. "It is now four-and-twenty hours since he has had any news of us! He will be sure to come!"

"And as he will be less on his guard than we should be ourselves," added Spilett, "he will be killed!"

"Is there really no way of warning him?"

Whilst the engineer thought, his eyes fell on Top, who, going backwards and forwards, seemed to say--

"Am not I here?"

"Top!" exclaimed Cyrus Harding.

The animal sprang at his master's call.

"Yes, Top will go," said the reporter, who had understood the engineer. "Top can go where we cannot! He will carry to Granite House the news of the corral, and he will bring back to us that from Granite House!"

"Quick!" said Harding. "Quick!"

Spilett rapidly tore a leaf from his notebook, and wrote these words:--
"Herbert wounded. We are at the corral. Be on your guard. Do not leave Granite House. Have the convicts appeared in the neighbourhood? Reply by Top."

This laconic note contained all that Neb ought to know, and at the same time asked all the colonists wished to know. It was folded and fastened to Top's collar in a conspicuous position.

"Top, my dog," said the engineer, caressing the animal, "Neb, Top! Neb! Go, go!"

Top bounded at these words. He understood, he knew what was expected of him. The road to the corral was familiar to him. In less than an hour he could clear it, and it might be hoped that where neither Cyrus Harding nor the reporter could have ventured without danger, Top, running amongst the grass or in the wood, would pass unperceived.

The engineer went to the gate of the corral and opened it.

"Neb, Top! Neb!" repeated the engineer, again pointing in the direction of Granite House.

Top sprang forwards, and almost immediately disappeared.

"He will get there!" said the reporter.

"Yes, and he will come back, the faithful animal!"

"What o'clock is it?" asked Gideon Spilett.

"Ten."

"In an hour he may be here. We will watch for his return."

The gate of the corral was closed. The engineer and the reporter re-entered the house. Herbert was still in a sleep. Pencroft kept the compressor always wet. Spilett, seeing there was nothing he could do at that moment, busied himself in preparing some nourishment, whilst attentively watching that part of the enclosure against the hill, at which an attack might be expected.

The settlers awaited Top's return with much anxiety. A little before eleven o'clock, Cyrus Harding and the reporter, rifle in hand, were behind the gate, ready to open it at the first bark of their dog.

They did not doubt that if Top had arrived safely at Granite House, Neb would have sent him back immediately. They had both been there for about ten minutes, when a report was heard, followed by repeated barks.

The engineer opened the gate, and seeing smoke a hundred feet off in the wood, he fired in that direction.

Almost immediately Top bounded into the corral, and the gate was quickly shut.

"Top, Top!" exclaimed the engineer, taking the dog's great honest head between his hands.

A note was fastened to his neck, and Cyrus Harding read these words, traced in Neb's large writing:

"No pirates in the neighbourhood of Granite House. I will not stir. Poor Mr Herbert!"

CHAPTER EIGHT.

THE CONVICTS IN THE NEIGHBOURHOOD OF THE CORRAL--PROVISIONAL ESTABLISHMENT--CONTINUATION OF THE TREATMENT OF HERBERT--PENCROFT'S FIRST REJOICINGS--CONVERSATION ON PAST EVENTS--WHAT THE FUTURE HAS IN RESERVE--CYRUS HARDING'S IDEAS ON THIS SUBJECT.

So the convicts were still there, watching the corral, and determined to kill the settlers one after the other. There was nothing to be done but to treat them as wild beasts. But great precautions must be taken, for just now the wretches had the advantage on their side, seeing, and not being seen, being able to surprise by the suddenness of their attack, yet not to be surprised themselves. Harding made arrangements, therefore, for living in the corral, of which the provisions would last for a tolerable length of time. Ayrton's house had been provided with all that was necessary for existence, and the convicts, scared by the arrival of the settlers, had not had time to pillage it. It was probable, as Gideon Spilett observed, that things had occurred as follows:--The six convicts, disembarking on the island, had followed the southern shore, and after having traversed the double shore of the Serpentine Peninsula, not being inclined to venture into the Far West woods, they had reached the mouth of Falls River. From this point, by following the right bank of the watercourse, they would arrive at the spurs of Mount Franklin, among which they would naturally seek a retreat, and they could not have been long in discovering the corral, then uninhabited. There they had regularly installed themselves, awaiting the moment to put their abominable schemes into execution. Ayrton's arrival had surprised them, but they had managed to overpower the unfortunate man, and--the rest may be easily imagined!

Now, the convicts,--reduced to five, it is true, but well-armed,--were roaming the woods, and to venture there was to expose themselves to their attacks, which could be neither guarded against nor prevented.

"Wait! There is nothing else to be done!" repeated Cyrus Harding. "When Herbert is cured, we can organise a general battue of the island, and have satisfaction of these convicts. That will be the object of our grand expedition at the same time--"
"As the search for our mysterious protector," added Gideon Spilett, finishing the engineer's sentence. "Ah, it must be acknowledged, my dear Cyrus, that this time his protection was wanting at the very moment when it was most necessary to us!"

"Who knows?" replied the engineer.

"What do you mean?" asked the reporter.

"That we are not at the end of our trouble yet, my dear Spilett, and that his powerful invention may, perhaps, have another opportunity of exercising itself. But that is not the question now. Herbert's life before everything."

This was the colonists' saddest thought. Several days passed, and the poor boy's state was happily no worse. Cold water, always kept at a suitable temperature, had completely prevented the inflammation of the wounds. It even seemed to the reporter that this water, being slightly sulphurous,--which was explained by the neighbourhood of the volcano,--had a more direct action on the healing. The suppuration was much less abundant, and--thanks to the incessant care by which he was surrounded!--Herbert returned to life, and his fever abated. He was besides subjected to a severe diet, and consequently his weakness was and would be extreme; but there was no want of refreshing drinks, and absolute rest was of the greatest benefit to him. Cyrus Harding, Gideon Spilett, and Pencroft had become very skilful in dressing the lad's wounds. All the linen in the house had been sacrificed. Herbert's wounds, covered with compresses and lint, were pressed neither too much nor too little, so as to cause their cicatrisation without determining on inflammatory reaction. The reporter used extreme care in the dressing, knowing well the importance of it, and repeating to his companions that which most surgeons willingly admit, that it is perhaps rarer to see a dressing well done than an operation well performed.

In ten days, on the 22nd of November, Herbert was considerably better. He had begun to take some nourishment. The colour was returning to his cheeks, and his bright eyes smiled at his nurses. He talked a little, notwithstanding Pencroft's efforts, who talked incessantly to prevent him from beginning to speak, and told him the most improbable stories. Herbert had questioned him on the subject of Ayrton, whom he was astonished not to see near him, thinking that he was at the corral. But the sailor, not wishing to distress Herbert, contented himself by replying that Ayrton had rejoined Neb, so as to defend Granite House.

"Humph!" said Pencroft, "these pirates! they are gentlemen who have no right to any consideration! And the captain wanted to win them by kindness! I'll send them some kindness, but in the shape of a good bullet!"

"And have they not been seen again?" asked Herbert.

"No, my boy," answered the sailor, "but we shall find them, and when you are cured we shall see if the cowards, who strike us from behind, will dare to meet us face to face!"

"I am still very weak, my poor Pencroft!"

"Well! your strength will return gradually! What's a ball through the chest? Nothing but a joke! I've seen many, and I don't think much of them!"

At last things appeared to be going on well, and if no complication occurred, Herbert's recovery might be regarded as certain. But what would have been the condition of the colonists if his state had been aggravated,—if, for example, the ball had remained in his body, if his arm or his leg had had to be amputated?

"No," said Spilett more than once, "I have never thought of such a contingency without shuddering!"

"And yet, if it had been necessary to operate," said Harding one day to him, "you would not have hesitated?"

"No, Cyrus!" said Gideon Spilett, "but thank God that we have been spared this complication!"

As in so many other conjectures, the colonists had appealed to the logic of that simple good sense of which they had made use so often, and once more, thanks to their general knowledge, it had succeeded! But might not a time come when all their science would be at fault? They were alone on the island. Now, men in all states of society are necessary to each other. Cyrus Harding knew this well, and sometimes he asked himself if some circumstance might not occur which they would be powerless to surmount. It appeared to him besides, that he and his companions, till then so fortunate, had entered into an unlucky period. During the three years and a half which had elapsed since their escape from Richmond, it might be said that they had had everything their own way. The island had abundantly supplied them with minerals, vegetables, animals, and as Nature had constantly loaded them, their science had known how to take advantage of what she offered them.

The well-being of the colony was therefore complete. Moreover, in certain occurrences an inexplicable influence had come to their aid! ... But all that could only be for a time.

In short, Cyrus Harding believed that fortune had turned against them.

In fact, the convicts' ship had appeared in the waters of the island, and if the pirates had been, so to speak, miraculously destroyed, six of them, at least, had escaped the catastrophe. They had disembarked on the island, and it was almost impossible to get at the five who survived. Ayrton had no doubt been murdered by these wretches, who possessed fire-arms, and at the first use that they had made of them, Herbert had fallen, wounded almost mortally. Were these the first blows aimed by adverse fortune at the colonists? This was often asked by Harding.
This was often repeated by the reporter; and it appeared to him also that the intervention, so strange, yet so efficacious, which till then had served them so well, had now failed them. Had this mysterious being, whatever he was, whose existence could not be denied, abandoned the island? Had he in his turn succumbed?

No reply was possible to these questions. But it must not be imagined that because Harding and his companion spoke of these things, they were men to despair. Far from that. They looked their situation in the face, they analysed the chances, they prepared themselves for any event, they stood firm and straight before the future, and if adversity was at last to strike them, it would find in them men prepared to struggle against it.

CHAPTER NINE.

NO NEWS OF NEB--A PROPOSAL FROM PENCROFT AND THE REPORTER, WHICH IS NOT ACCEPTED--SEVERAL SORTIES BY GIDEON SPILETT--A RAG OF CLOTH--A MESSAGE--HASTY DEPARTURE--ARRIVAL ON THE PLATEAU OF PROSPECT HEIGHTS.

The convalescence of the young invalid was regularly progressing. One thing only was now to be desired, that his state would allow him to be brought to Granite House. However well built and supplied the corral house was, it could not be so comfortable as the healthy granite dwelling. Besides, it did not offer the same security, and its tenants, notwithstanding their watchfulness, were here always in fear of some shot from the convicts. There, on the contrary, in the middle of that impregnable and inaccessible cliff, they would have nothing to fear, and any attack on their persons would certainly fail. They therefore waited impatiently for the moment when Herbert might be moved without danger from his wound, and they were determined to make this move, although the communication through Jacamar Wood was very difficult.

They had no news from Neb, but were not uneasy on that account. The courageous negro, well intrenched in the depths of Granite House, would not allow himself to be surprised. Top had not been sent again to him, as it appeared useless to expose the faithful dog to some shot which might deprive the settlers of their most useful auxiliary.

They waited, therefore, although they were anxious to be reunited at Granite House. It pained the engineer to see his forces divided, for it gave great advantage to the pirates. Since Ayrton's disappearance they were only four against five, for Herbert could not yet be counted, and this was not the least care of the brave boy, who well understood the trouble of which he was the cause.

The question of knowing how, in their condition, they were to act against the pirates, was thoroughly discussed on the 29th of November by Cyrus Harding, Gideon Spilett, and Pencroft, at a moment when Herbert was asleep and could not hear them.

"My friends," said the reporter, after they had talked of Neb and of the impossibility of communicating with him, "I think, like you, that to venture on the road to the corral would be to risk receiving a gun-shot without being able to return it. But do you not think that the best thing to be done now is to openly give chase to these wretches?"

"That is just what I was thinking," answered Pencroft. "I believe we're not fellows to be afraid of a bullet, and as for me, if Captain Harding approves, I'm ready to dash into the forest! Why, hang it, one man is equal to another!"

"But is he equal to five?" asked the engineer.

"I will join Pencroft," said the reporter, "and both of us, well-armed and accompanied by Top--"

"My dear Spilett, and you, Pencroft," answered Harding, "let us reason coolly. If the convicts were hid in one spot of the island, if we knew that spot, and had only to dislodge them, I would undertake a direct attack; but is there not occasion to fear, on the contrary, that they are sure to fire the first shot."

"Well, captain," cried Pencroft, "a bullet does not always reach its mark."

"That which struck Herbert did not miss, Pencroft," replied the engineer. "Besides, observe that if both of you left the corral I should remain here alone to defend it. Do you imagine that the convicts will not see you leave it, that they will not allow you to enter the forest, and that they will not attack it during your absence, knowing that there is no one here but a wounded boy and a man?"

"You are right, captain," replied Pencroft, his chest swelling with sullen anger. "You are right; they will do all they can to retake the corral, which they know to be well stored; and alone you could not hold it against them."

"Oh, if we were only at Granite House!"

"If we were at Granite House," answered the engineer, "the case would be very different. There I should not be afraid to leave Herbert with one, whilst the other three went to search the forests of the island. But we are at the corral, and it is best to stay here until we can leave it together."

Cyrus Harding's reasoning was unanswerable, and his companions understood it well.

"If only Ayrton was still one of us!" said Gideon Spilett. "Poor fellow! his return to social life will have been but of short duration."

"If he is dead," added Pencroft, in a peculiar tone.
"Do you hope, then, Pencroft, that the villains have spared him?" asked Gideon Spilett.
"Yes, if they had any interest in doing so."
"What! you suppose that Ayrton, finding his old companions, forgetting all that he owes us--"
"Who knows?" answered the sailor, who did not hazard this shameful supposition without hesitating.
"Pencroft," said Harding, taking the sailor's arm, "that is a wicked idea of yours, and you will distress me much if you persist in speaking thus. I will answer for Ayrton's fidelity."
"And I also," added the reporter quickly.
"Yes, yes, captain, I was wrong," replied Pencroft; "it was a wicked idea indeed that I had, and nothing justifies it. But what can I do? I'm not in my senses. This imprisonment in the corral wearies me horribly, and I have never felt so excited as I do now."

"Be patient, Pencroft," replied the engineer. "How long will it be, my dear Spilett, before you think Herbert may be carried to Granite House?"
"That is difficult to say, Cyrus," answered the reporter, "for any imprudence might involve terrible consequences. But his convalescence is progressing, and if he continues to gain strength, in eight days from now--well, we shall see."

Eight days! That would put off the return to Granite House until the first days of December. At this time two months of spring had already passed. The weather was fine, and the heat began to be great. The forests of the island were in full leaf, and the time was approaching when the usual crops ought to be gathered. The return to the plateau of Prospect Heights would, therefore, be followed by extensive agricultural labours, interrupted only by the projected expedition through the island.

It can, therefore, be well understood how injurious this seclusion in the corral must be to the colonists. But if they were compelled to bow before necessity, they did not do so without impatience.

Once or twice the reporter ventured out into the road and made the tour of the palisade. Top accompanied him, and Gideon Spilett, his gun cocked, was ready for any emergency.

He met with no misadventure and found no suspicious traces. His dog would have warned him of any danger, and, as Top did not bark, it might be concluded that there was nothing to fear at that moment at least, and that the convicts were occupied in another part of the island.

However, on his second sortie, on the 27th of November, Gideon Spilett, who had ventured a quarter of a mile into the wood, towards the south of the mountains, remarked that Top scented something. The dog had no longer his unconcerned manner; he went backwards and forwards, ferreting amongst the grass and bushes as if his smell had revealed some suspicious object to him.

Gideon Spilett followed Top, encouraged him, excited him by his voice, whilst keeping a sharp look-out, his gun ready to fire, and sheltering himself behind the trees. It was not probable that Top scented the presence of man, for in that case, he would have announced it by half-uttered, sullen, angry barks. Now, as he did not growl, it was because danger was neither near nor approaching.

Nearly five minutes passed thus, Top rummaging, the reporter following him prudently, when, all at once, the dog rushed towards a thick bush, and drew out a rag.

It was a piece of cloth, stained and torn, which Spilett immediately brought back to the corral. There it was examined by the colonists, who found that it was a fragment of Ayrton's waistcoat, a piece of that felt, manufactured solely by the Granite House factory.

"You see, Pencroft," observed Harding, "there has been resistance on the part of the unfortunate Ayrton. The convicts have dragged him away in spite of himself! Do you still doubt his honesty?"

"No, captain," answered the sailor, "and I repented of my suspicion a long time ago! But it seems to me that something may be learned from the incident."

"What is that?" asked the reporter.

"It is that Ayrton was not killed at the corral! That they dragged him away living, since he has resisted. Therefore, perhaps, he is still living!"

"Perhaps, indeed," replied the engineer, who remained thoughtful.

This was a hope, to which Ayrton's companions could still hold. Indeed, they had before believed that, surprised in the corral, Ayrton had fallen by a bullet, as Herbert had fallen. But if the convicts had not killed him at first, if they had brought him living to another part of the island, might it not be admitted that he was still their prisoner? Perhaps, even, one of them had found in Ayrton his old Australian companion Ben Joyce, the chief of the escaped convicts. And who knows but that they had conceived the impossible hope of bringing back Ayrton to themselves? He would have been very useful to them, if they had been able to make him turn traitor!

This incident was, therefore, favourably interpreted at the corral, and it no longer appeared impossible that they should find Ayrton again. On his side, if he was only a prisoner, Ayrton would no doubt do all he could to escape
from the hands of the villains, and this would be a powerful aid to the settlers!

"At any rate," observed Gideon Spilett, "if happily Ayrton did manage to escape, he would go directly to Granite House, for he could not know of the attempt of assassination of which Herbert has been a victim, and consequently would never think of our being imprisoned in the corral!"

"Oh! I wish that he was there, at Granite House!" cried Pencroft, "and that we were there, too! For, although the rascals can do nothing to our house, they may plunder the plateau, our plantations, our poultry-yard!"

Pencroft had become a thorough farmer, heartily attached to his crops. But it must be said that Herbert was more anxious than any to return to Granite House, for he knew how much the presence of the settlers was needed there. And it was he who was keeping them at the corral! Therefore, one idea occupied his mind—to leave the corral, and when! He believed he could bear removal to Granite House. He was sure his strength would return more quickly in his room, with the air and sight of the sea!

Several times he pressed Gideon Spilett, but the latter, fearing, with good reason, that Herbert's wounds, half healed, might reopen on the way, did not give the order to start.

However, something occurred which compelled Cyrus Harding and his two friends to yield to the lad's wish, and God alone knew that this determination might cause them grief and remorse.

It was the 29th of November, seven o'clock in the evening. The three settlers were talking in Herbert's room, when they heard Top utter quick barks.

Harding, Pencroft, and Spilett seized their guns and ran out of the house. Top, at the foot of the palisade, was jumping, barking, but it was with pleasure, not anger.

"Some one is coming."
"Yes."
"It is not an enemy!"
"Neb, perhaps?"
"Or Ayrton?"

These words had hardly been exchanged between the engineer and his two companions when a body leapt over the palisade and fell on the ground inside the corral.

It was Tup, Master Jup in person, to whom Top immediately gave a most cordial reception.
"Jup!" exclaimed Pencroft.
"Neb has sent him to us," said the reporter.
"Then," replied the engineer, "he must have some note on him."

Pencroft rushed up to the orang. Certainly if Neb had any important matter to communicate to his master he could not employ a more sure or more rapid messenger, who could pass where neither the colonists could, nor even Top himself.

Cyrus Harding was not mistaken. At Jup's neck hung a small bag, and in this bag was found a little note traced by Neb's hand.

The despair of Harding and his companions may be imagined when they read these words:--
"Friday, six o'clock in the morning.
"Plateau invaded by convicts.
"Neb."

They gazed at each other without uttering a word, then they re-entered the house. What were they to do? The convicts on Prospect Heights! that was disaster, devastation, ruin.

Herbert, on seeing the engineer, the reporter, and Pencroft re-enter, guessed that their situation was aggravated, and when he saw Jup, he no longer doubted that some misfortune menaced Granite House.

"Captain Harding," said he, "I must go; I can bear the journey. I must go."

Gideon Spilett approached Herbert; then, having looked at him--
"Let us go, then!" said he.

The question was quickly decided whether Herbert should be carried on a litter or in the cart which had brought Ayrton to the corral. The motion of the litter would have been more easy for the wounded lad, but it would have necessitated two bearers, that is to say, there would have been two guns less for defence if an attack was made on the road. Would they not, on the contrary, by employing the cart leave every arm free? Was it impossible to place the mattress on which Herbert was lying in it, and to advance with so much care than any jolt should be avoided? It could be done.

The cart was brought. Pencroft harnessed the onaga. Cyrus Harding and the reporter raised Herbert's mattress and placed it on the bottom of the cart. The weather was fine. The sun's bright rays glanced through the trees.

"Are the guns ready?" asked Cyrus Harding.

They were. The engineer and Pencroft, each armed with a double-barrelled gun, and Gideon Spilett carrying his
rifle, had nothing to do but start.

"Are you comfortable, Herbert?" asked the engineer.

"Ah, captain," replied the lad, "don't be uneasy, I shall not die on the road!"

Whilst speaking thus, it could be seen that the poor boy had called up all his energy, and by the energy of a powerful will had collected his failing strength.

The engineer felt his heart sink painfully. He still hesitated to give the signal for departure; but that would have driven Herbert to despair—killed him perhaps.

"Forward!" said Harding.

The gate of the corral was opened. Jup and Top, who knew when to be silent, ran in advance. The cart came out, the gate was reclosed, and the onaga, led by Pencroft, advanced at a slow pace.

Certainly, it would have been safer to have taken a different road than that which led straight from the corral to Granite House, but the cart would have met with great difficulties in moving under the trees. It was necessary, therefore, to follow this way, although it was well-known to the convicts.

Cyrus Harding and Gideon Spilett walked one on each side of the cart, ready to answer to any attack. However, it was not probable that the convicts would have yet left the plateau of Prospect Heights.

Neb's note had evidently been written and sent as soon as the convicts had shown themselves there. Now, this note was dated six o'clock in the morning, and the active orang, accustomed to come frequently to the corral, had taken scarcely three quarters of an hour to cross the five miles which separated it from Granite House. They would, therefore, be safe at that time, and if there was any occasion for firing, it would probably not be until they were in the neighbourhood of Granite House. However, the colonists kept a strict watch. Top and Jup, the latter armed with his club, sometimes in front, sometimes beating the wood at the sides of the road, signalised no danger.

The cart advanced slowly under Pencroft's guidance. It had left the corral at half-past seven. An hour after four out of the five miles had been cleared, without any incident having occurred. The road was as deserted as all that part of the Jacamar Wood which lay between the Mercy and the lake. There was no occasion for any warning. The wood appeared as deserted as on the day when the colonists first landed on the island.

They approached the plateau. Another mile and they would see the bridge over Creek Glycerine. Cyrus Harding expected to find it in its place; supposing that the convicts; would have crossed it, and that, after having passed one of the streams which enclosed the plateau, they would have taken the precaution to lower it again, so as to keep open a retreat.

At length an opening in the trees allowed the sea-horizon to be seen. But the cart continued its progress, for not one of its defenders thought of abandoning it.

At that moment Pencroft stopped the onaga, and in a hoarse voice—

"Oh! the villains!" he exclaimed.

And he pointed to a thick smoke rising from the mill, the sheds, and the buildings at the poultry-yard.

A man was moving about in the midst of the smoke. It was Neb.

His companions uttered a shout. He heard, and ran to meet them.

The convicts had left the plateau nearly half-an-hour before, having devastated it!

"And Mr Herbert?" asked Neb.

Gideon Spilett returned to the cart.

Herbert had lost consciousness!

CHAPTER TEN.

HERBERT CARRIED TO GRANITE HOUSE—NEB RELATES ALL THAT HAS HAPPENED—HARDING'S VISIT TO THE PLATEAU—RUIN AND DEVASTATION—THE COLONISTS BAFFLED BY HERBERT'S ILLNESS—WILLOW BARK—A DEADLY FEVER—TOP BARKS AGAIN!

Of the convicts, the dangers which menaced Granite House, the ruins with which the plateau was covered, the colonists thought no longer. Herbert's critical state outweighed all other considerations. Would the removal prove fatal to him by causing some internal injury? The reporter could not affirm it, but he and his companions almost despaired of the result. The cart was brought to the bend of the river. There some branches, disposed as a litter, received the mattress on which lay the unconscious Herbert. Ten minutes after, Cyrus Harding, Spilett, and Pencroft were at the foot of the cliff, leaving Neb to take the cart onto the plateau of Prospect Heights. The lift was put in motion, and Herbert was soon stretched on his bed in Granite House.

What cares were lavished on him to bring him back to life! He smiled for a moment on finding himself in his room, but could scarcely even murmur a few words, so great was his weakness. Gideon Spilett examined his wounds. He feared to find them reopened, having been imperfectly healed. There was nothing of the sort. From
whence, then, came this prostration? Why was Herbert so much worse? The lad then fell into a kind of feverish sleep, and the reporter and Pencroft remained near the bed. During this time, Harding told Neb all that had happened at the corral, and Neb recounted to his master the events of which the plateau had just been the theatre.

It was only during the preceding night that the convicts had appeared on the edge of the forest, at the approaches to Creek Glycerine. Neb, who was watching near the poultry-yard, had not hesitated to fire at one of the pirates, who was about to cross the stream; but in the darkness he could not tell whether the man had been hit or not. At any rate, it was not enough to frighten away the band, and Neb had only just time to get up to Granite House, where at least he was in safety.

But what was he to do there? How prevent the devastations with which the convicts threatened the plateau? Had Neb any means by which to warn his master? And, besides, in what situation were the inhabitants of the corral themselves? Cyrus Harding and his companions had left on the 11th of November, and it was now the 29th. It was, therefore, nineteen days since Neb had had other news than that brought by Top--disastrous news: Ayrton disappeared, Herbert severely wounded, the engineer, reporter, and sailor, as it were, imprisoned in the corral!

What was he to do? asked poor Neb. Personally he had nothing to fear, for the convicts could not reach him in Granite House. But the buildings, the plantations, all their arrangements at the mercy of the pirates! Would it not be best to let Cyrus Harding judge of what he ought to do, and to warn him, at least, of the danger which threatened him?

Neb then thought of employing Jup, and confiding a note to him. He knew the orang's great intelligence, which had been often put to the proof. Jup understood the word corral, which had been frequently pronounced before him, and it may be remembered, too, that he had often driven the cart thither in company with Pencroft. Day had not yet dawned. The active orang would know how to pass unperceived through the woods, of which the convicts, besides, would think he was a native.

Neb did not hesitate. He wrote the note, he tied it to Jup's neck, he brought the ape to the door of Granite House, from which he let down a long cord to the ground; then, several times, he repeated these words--

"Jup, Jup! corral, corral!"

The creature understood, seized the cord, glided rapidly down to the beach, and disappeared in the darkness without the convicts' attention having been in the least excited.

"You did well, Neb," said Harding; "but perhaps in not warning us you would have done still better!"

And, in speaking thus, Cyrus Harding thought of Herbert, whose recovery the removal had so seriously checked.

Neb ended his account. The convicts had not appeared at all on the beach. Not knowing the number of the island's inhabitants, they might suppose that Granite House was defended by a large party. They must have remembered that during the attack by the brig numerous shot had been fired both from the lower and upper rocks, and no doubt they did not wish to expose themselves. But the plateau of Prospect Heights was open to them, and not covered by the fire of Granite House. They gave themselves up, therefore, to their instinct of destruction,--plundering, burning, devastating everything,--and only retiring half an hour before the arrival of the colonists, whom they believed still confined in the corral.

On their retreat, Neb hurried out. He climbed the plateau at the risk of being perceived and fired at, tried to extinguish the fire which was consuming the buildings of the poultry-yard, and had struggled, though in vain, against it until the cart appeared at the edge of the wood.

Such had been these serious events. The presence of the convicts constituted a permanent source of danger to the settlers in Lincoln Island, until then so happy, and who might now expect still greater misfortunes.

Spilett remained in Granite House with Herbert and Pencroft, while Cyrus Harding, accompanied by Neb, proceeded to judge for himself of the extent of the disaster.

It was fortunate that the convicts had not advanced to the foot of Granite House. The workshop at the Chimneys would in that case not have escaped destruction. But after all, this evil would have been more easily reparable than the ruins accumulated on the plateau of Prospect Heights. Harding and Neb proceeded towards the Mercy, and ascended its left bank without meeting with any trace of the convicts; nor on the other side of the river, in the depths of the wood, could they perceive any suspicious indications.

Besides, it might be supposed that in all probability either the convicts knew of the return of the settlers to Granite House, by having seen them pass on the road from the corral, or, after the devastation of the plateau, they had penetrated into Jacamar Wood, following the course of the Mercy, and were thus ignorant of their return.

In the former case, they must have returned towards the corral, now without defenders, and which contained valuable stores.

In the latter, they must have regained their encampment, and would wait an opportunity to recommence the attack.

It was, therefore, possible to prevent them, but any enterprise to clear the island was now rendered difficult by
reason of Herbert's condition. Indeed, their whole force would have been barely sufficient to cope with the convicts, and just now no one could leave Granite House.

The engineer and Neb arrived on the plateau. Desolation reigned everywhere. The fields had been trampled over; the ears of wheat, which were nearly full grown, lay on the ground. The other plantations had not suffered less.

The kitchen-garden was destroyed. Happily, Granite House possessed a store of seed which would enable them to repair these misfortunes.

As to the wall and buildings of the poultry-yard and the onagas' stable, the fire had destroyed all. A few terrified creatures roamed over the plateau. The birds, which during the fire had taken refuge on the waters of the lake, had already returned to their accustomed spot, and were dabbling on the banks. Everything would have to be reconstructed.

Cyrus Harding's face, which was paler than usual, expressed an internal anger which he commanded with difficulty, but he did not utter a word. Once more he looked at his devastated fields, and at the smoke which still rose from the ruins, then he returned to Granite House.

The following days were the saddest of any that the colonists had passed on the island! Herbert's weakness visibly increased. It appeared that a more serious malady, the consequence of the profound physiological disturbance he had gone through, threatened to declare itself, and Gideon Spilett feared such an aggravation of his condition that he would be powerless to fight against it!

In fact, Herbert remained in an almost continuous state of drowsiness, and symptoms of delirium began to manifest themselves. Refreshing drinks were the only remedies at the colonists' disposal. The fever was not as yet very high, but it soon appeared that it would probably recur at regular intervals. Gideon Spilett first recognised this on the 6th of December.

The poor boy, whose fingers, nose, and ears had become extremely pale, was at first seized with slight shiverings, horripilations, and tremblings. His pulse was weak and irregular, his skin dry, his thirst intense. To this soon succeeded a hot fit; his face became flushed; his skin reddened; his pulse quick; then a profuse perspiration broke out, after which the fever seemed to diminish. The attack had lasted nearly five hours.

Gideon Spilett had not left Herbert, who, it was only too certain was now seized by an intermittent fever, and this fever must be cured at any cost before it should assume a more serious aspect.

"And in order to cure it," said Spilett to Cyrus Harding, "we need a febrifuge."

"A febrifuge," answered the engineer. "We have neither Peruvian bark, nor sulphate of quinine?"

"No," said Gideon Spilett, "but there are willows on the border of the lake, and the bark of the willow might, perhaps, prove to be a substitute for quinine."

"Let us try it without losing a moment," replied Cyrus Harding.

The bark of the willow has, indeed, been justly considered as a succedaneum for Peruvian bark, as has also that of the horse-chestnut-tree, the leaf of the holly, the snake-root, etcetera. It was evidently necessary to make trial of this substance, although not so valuable as Peruvian bark, and to employ it in its natural state, since they had no means for extracting its essence.

Cyrus Harding went himself to cut from the trunk of a species of black willow, a few pieces of bark; he brought them back to Granite House, and reduced them to a powder, which was administered that same evening to Herbert.

The night passed without any important change. Herbert was somewhat delirious, but the fever did not reappear in the night, and did not return either during the following day.

Pencroft again began to hope. Gideon Spilett said nothing. It might be that the fever was not quotidian, but tertian, and that it would return next day. Therefore, he awaited the next day with the greatest anxiety.

It might have been remarked besides that during this period Herbert remained utterly prostrate, his head weak and giddy. Another symptom alarmed the reporter to the highest degree. Herbert's liver became congested, and soon a more intense delirium showed that his brain was also affected.

Gideon Spilett was overwhelmed by this new complication. He took the engineer aside.

"It is a malignant fever," said he.

"A malignant fever!" cried Harding. "You are mistaken, Spilett. A malignant fever does not declare itself spontaneously; its germ must previously have existed."

"I am not mistaken," replied the reporter. "Herbert no doubt contracted the germ of this fever in the marshes of the island. He has already had one attack; should a second come on and should we not be able to prevent a third, he is lost."

"But the willow bark?"

"That is insufficient," answered the reporter; "and the third attack of a malignant fever, which is not arrested by means of quinine, is always fatal."

Fortunately, Pencroft heard nothing of this conversation or he would have gone mad.
It may be imagined what anxiety the engineer and the reporter suffered during the day of the 7th of December and the following night.

Towards the middle of the day the second attack came on. The crisis was terrible. Herbert felt himself sinking. He stretched his arms towards Cyrus Harding, towards Spilett, towards Pencroft. He was so young to die! The scene was heartrending. They were obliged to send Pencroft away.

The fit lasted five hours. It was evident that Herbert could not survive a third.

The night was frightful. In his delirium Herbert uttered words which went to the hearts of his companions. He struggled with the convicts, he called to Ayrton, he poured forth entreaties to that mysterious being,—that powerful unknown protector,—whose image was stamped upon his mind; then he again fell into a deep exhaustion which completely prostrated him. Several times Gideon Spilett thought that the poor boy was dead.

The next day, the 8th of December, was but a succession of the fainting fits. Herbert's thin hands clutched the sheets. They had administered further doses of pounded bark, but the reporter expected no result from it.

"If before to-morrow morning we have not given him a more energetic febrifuge," said the reporter, "Herbert will be dead."

Night arrived—the last night, it was too much to be feared, of the good, brave, intelligent boy, so far in advance of his years, and who was loved by all as their own child. The only remedy which existed against this terrible malignant fever, the only specific which could overcome it, was not to be found in Lincoln Island.

During the night of the 8th of December, Herbert was seized by a more violent delirium. His liver was fearfully congested, his brain affected, and already it was impossible for him to recognise any one.

Would he live until the next day, until that third attack which must infallibly carry him off? It was not probable. His strength was exhausted, and in the intervals of fever he lay as one dead.

Towards three o'clock in the morning Herbert uttered a piercing cry. He seemed to be torn by a supreme convulsion. Neb, who was near him, terrified, ran into the next room where his companions were watching.

Top, at that moment, barked in a strange manner.

All rushed in immediately and managed to restrain the dying boy, who was endeavouring to throw himself out of his bed, whilst Spilett, taking his arm, felt his pulse gradually quicken.

It was five in the morning. The rays of the rising sun began to shine in at the windows of Granite House. It promised to be a fine day, and this day was to be poor Herbert's last!

A ray glanced on the table placed near the bed.

Suddenly Pencroft, uttering a cry, pointed to the table.

On it lay a little oblong box, of which the cover bore these words:—

"Sulphate of Quinine."

CHAPTER ELEVEN.

Gideon Spilett took the box and opened it. It contained nearly two hundred grains of a white powder, a few particles of which he carried to his lips. The extreme bitterness of the substance precluded all doubt; it was certainly the precious extract of quinine, that pre-eminent antifebrile.

This powder must be administered to Herbert without delay. How it came there might be discussed later.

"Some coffee!" said Spilett.

In a few moments Neb brought a cup of the warm infusion. Gideon Spilett threw into it about eighteen grains of quinine, and they succeeded in making Herbert drink the mixture.

There was still time, for the third attack of the malignant fever had not yet shown itself. How they longed to be able to add that it would not return!

Besides, it must be remarked, the hopes of all had now revived. The mysterious influence had been again exerted, and in a critical moment, when they had despaired of it.

In a few hours Herbert was much calmer. The colonists could now discuss this incident. The intervention of the stranger was more evident than ever. But how had he been able to penetrate during the night into Granite House? It was inexplicable, and, in truth, the proceedings of the genius of the island were not less mysterious than was that genius himself. During this day the sulphate of quinine was administered to Herbert every three hours.

The next day some improvement in Herbert's condition was apparent. Certainly, he was not out of danger, intermittent fevers being subject to frequent and dangerous relapses, but the most assiduous care was bestowed on him. And besides, the specific was at hand; nor, doubtless, was he who had brought it far-distant! and the hearts of
all were animated by returning hope.

This hope was not disappointed. Ten days after, on the 20th of December, Herbert's convalescence commenced.

He was still weak, and strict diet had been imposed upon him, but no access of fever supervened. And then, the poor boy submitted with such docility to all the prescriptions ordered him! He longed so to get well!

Pencroft was as a man who has been drawn up from the bottom of an abyss. Fits of joy approaching to delirium seized him. When the time for the third attack had passed by, he nearly suffocated the reporter in his embrace. Since then, he always called him Dr Spilett.

The real doctor, however, remained undiscovered.

"We will find him!" repeated the sailor.

Certainly, this man, whoever he was, might expect a somewhat too energetic embrace from the worthy Pencroft!

The month of December ended, and with it the year 1867, during which the colonists of Lincoln Island had of late been so severely tried. They commenced the year 1868 with magnificent weather, great heat, and a tropical temperature, delightfully cooled by the sea-breeze. Herbert's recovery progressed, and from his bed, placed near one of the windows of Granite House, he could inhale the fresh air, charged with ozone, which could not fail to restore his health. His appetite returned, and what numberless delicate, savoury little dishes Neb prepared for him!

"It is enough to make one wish to have a fever oneself!" said Pencroft.

During all this time, the convicts did not once appear in the vicinity of Granite House. There was no news of Ayrton, and though the engineer and Herbert still had some hopes of finding him again, their companions did not doubt but that the unfortunate man had perished. However, this uncertainty could not last, and when once the lad should have recovered, the expedition, the result of which must be so important, would be undertaken. But they would have to wait a month, perhaps, for all the strength of the colony must be put into requisition to obtain satisfaction from the convicts.

However, Herbert's convalescence progressed rapidly. The congestion of the liver had disappeared, and his wounds might be considered completely healed.

During the month of January, important work was done on the plateau of Prospect Heights; but it consisted solely in saving as much as was possible from the devastated crops, either of corn or vegetables. The grain and the plants were gathered, so as to provide a new harvest for the approaching half-season. With regard to rebuilding the poultry-yard, wall, or stables, Cyrus Harding preferred to wait. Whilst he and his companions were in pursuit of the convicts, the latter might very probably pay another visit to the plateau, and it would be useless to give them an opportunity of recommencing their work of destruction. When the island should be cleared of these miscreants, they would set about rebuilding. The young convalescent began to get up in the second week of January, at first for one hour a day, then two, then three. His strength visibly returned, so vigorous was his constitution. He was now eighteen years of age. He was tall, and promised to become a man of noble and commanding presence. From this time his recovery, while still requiring care,—and Dr Spilett was very strict,—made rapid progress. Towards the end of the month, Herbert was already walking about on Prospect Heights, and the beach.

He derived, from several sea-baths, which he took in company with Pencroft and Neb, the greatest possible benefit. Cyrus Harding thought he might now settle the day for their departure, for which the 15th of February was fixed. The nights, very clear at this time of year, would be favourable to the researches they intended to make all over the island.

The necessary preparations for this exploration were now commenced, and were important, for the colonists had sworn not to return to Granite House until their twofold object had been achieved; on the one hand, to exterminate the convicts, and rescue Ayrton, if he was still living; on the other, to discover who it was that presided so effectually over the fortunes of the colony.

Of Lincoln Island, the settlers knew thoroughly all the eastern coast from Claw Cape to the Mandible Capes, the extensive Tadorn Marsh, the neighbourhood of Lake Grant, Jacamar Wood, between the road to the corral and the Mercy, the courses of the Mercy and Red Creek, and lastly, the spurs of Mount Franklin, among which the corral had been established.

They had explored, though only in an imperfect manner, the vast shore of Washington Bay from Claw Cape to Reptile End, the woody and marshy border of the west coast, and the interminable downs, ending at the open mouth of Shark Gulf. But they had in no way surveyed the woods which covered the Serpentine Peninsula, all to the right of the Mercy, the left bank of Falls River, and the wilderness of spurs and valleys which supported three quarters of the base of Mount Franklin, to the east, the north, and the west, and where doubtless many secret retreats existed. Consequently, many millions of acres of the island had still escaped their investigations.

It was, therefore, decided that the expedition should be carried through the Far West, so as to include all that region situated on the right of the Mercy.

It might, perhaps, be better worth while to go direct to the corral, where it might be supposed that the convicts
had again taken refuge, either to pillage or to establish themselves there. But either the devastation of the corral would have been an accomplished fact by this time, and it would be too late to prevent it; or it had been the convicts' interest to intrench themselves there, and there would be still time to go and turn them out on their return.

Therefore, after some discussion, the first plan was adhered to, and the settlers resolved to proceed through the wood to Reptile End. They would make their way with their hatchets, and thus lay the first draft of a road which would place Granite House in communication with the end of the peninsula for a length of from sixteen to seventeen miles.

The cart was in good condition. The onagas, well rested, could go a long journey. Provisions, camp effects, a portable stove, and various utensils were packed in the cart, as also weapons and ammunition, carefully chosen from the new complete arsenal of Granite House. But it was necessary to remember that the convicts were, perhaps, roaming about the woods, and that in the midst of these thick forests a shot might quickly be fired and received. It was therefore resolved that the little band of settlers should remain together and not separate under any pretext whatever.

It was also decided that no one should remain at Granite House. Top and Jup themselves were to accompany the expedition; the inaccessible dwelling needed no guard. The 14th of February, eve of the departure, was Sunday. It was consecrated entirely to repose, and thanksgivings addressed by the colonists to the Creator. A place in the cart was reserved for Herbert, who, though thoroughly convalescent, was still a little weak. The next morning, at daybreak, Cyrus Harding took the necessary measures to protect Granite House from any invasion. The ladders, which were formerly used for the ascent, were brought to the Chimneys and buried deep in the sand, so that they might be available on the return of the colonists, for the machinery of the lift had been taken to pieces, and nothing of the apparatus remained. Pencroft stayed the last in Granite House in order to finish this work, and he then lowered himself down by means of a double rope held below, and which, when once hauled down, left no communication between the upper landing and the beach.

The weather was magnificent.
"We shall have a warm day of it," said the reporter, laughing.
"Pooh! Dr Spilett," answered Pencroft, "we shall walk under the shade of the trees and shan't even see the sun!"
"Forward!" said the engineer.

The cart was waiting on the beach before the Chimneys. The reporter made Herbert take his place in it during the first hours at least of the journey, and the lad was obliged to submit to his doctor's orders.

Neb placed himself at the onagas' heads. Cyrus Harding, the reporter, and the sailor, walked in front. Top bounded joyfully along. Herbert offered a seat in his vehicle to Jup, who accepted it without ceremony. The moment for departure had arrived, and the little band set out.

The cart first turned the angle of the mouth of the Mercy, then, having ascended the left bank for a mile, crossed the bridge, at the other side of which commenced the road to Port Balloon and there the explorers, leaving this road on their left, entered the cover of the immense woods which formed the region of the Far West.

For the first two miles the widely-scattered trees allowed the cart to pass with ease; from time to time it became necessary to cut away a few creepers and bushes, but no serious obstacle impeded the progress of the colonists.

The thick foliage of the trees threw a grateful shade on the ground. Deodars, douglas-firs, casuarinas, banksias, gum-trees, dragon-trees, and other well-known species, succeeded each other far as the eye could reach. The feathered tribes of the island were all represented--tetras, jacamars, pheasants, lories, as well as the chattering cockatoos, parrots, and paroquets. Agouties, kangaroos, and capybaras fled swiftly at their approach; and all this reminded the settlers of the first excursions they had made on their arrival at the island.

"Nevertheless," observed Cyrus Harding, "I notice that these creatures, both birds and quadrupeds, are more timid than formerly. These woods have, therefore, been recently traversed by the convicts, and we shall certainly find some traces of them."

And, in fact, in several places they could distinguish traces, more or less recent, of the passage of a band of men-here branches broken off the trees, perhaps to mark out the way; there the ashes of a fire, and footprints in clayey spots; but nothing which appeared to belong to a settled encampment.

The engineer had recommended his companions to refrain from hunting. The reports of the fire-arms might give the alarm to the convicts, who, were, perhaps, roaming through the forest. Moreover, the hunters would necessarily ramble some distance from the cart, which it was dangerous to leave unguarded.

In the after-part of the day, when about six miles from Granite House, their progress became much more difficult. In order to make their way through some thickets, they were obliged to cut down trees. Before entering such places Harding was, careful to send in Top and Jup, who faithfully accomplished their commission, and when the dog and orang returned without giving any warning, there was evidently nothing to fear, either from convicts or wild beasts, two varieties of the animal kingdom, whose ferocious instincts placed them on the same level. On the
evening of the first day the colonists encamped about nine miles from Granite House, on the border of a little stream falling into the Mercy, and of the existence of which they had till then been ignorant; it evidently, however, belonged to the hydrographical system to which the soil owed its astonishing fertility. The settlers made a hearty meal, for their appetites were sharpened, and measures were then taken that the night might be passed in safety. If the engineer had had only to deal with wild beasts, jaguars, or others, he would have simply lighted fires all round his camp, which would have sufficed for its defence; but the convicts would be rather attracted than terrified by the flames, and it was, therefore, better to be surrounded by the profound darkness of night.

The watch was, however, carefully organised. Two of the settlers were to watch together, and every two hours it was agreed that they should be relieved by their comrades. And so, notwithstanding his wish to the contrary, Herbert was exempted from guard, Pencroft and Gideon Spilett in one party, the engineer and Neb in another, mounted guard in turns over the camp.

The night, however, was but of few hours. The darkness was due rather to the thickness of the foliage than to the disappearance of the sun. The silence was scarcely disturbed by the howling of jaguars and the chattering of the monkeys, the latter appearing to particularly irritate master Jup. The night passed without incident, and on the next day, the 15th of February, the journey through the forest, rather tedious than difficult, was continued. This day they could not accomplish more than six miles, for every moment they were obliged to cut a road with their hatchets.

Like true settlers, the colonists spared the largest and most beautiful trees, which would besides have cost immense labour to fell, and the small ones only were sacrificed, but the result was that the road took a very winding direction, and lengthened itself by numerous detours.

During the day Herbert discovered several new specimens not before met with in the island, such as the tree-fern, with its leaves spread out like the waters of a fountain, locust-trees, on the long pods of which the onagas browsed greedily, and which supplied a sweet pulp of excellent flavour. There, too, the colonists again found groups of magnificent kauries, their cylindrical trunks, crowned with a cone of verdure, rising to a height of two hundred feet. These were the tree-kings of New Zealand, as celebrated as the cedars of Lebanon.

As to the fauna, there was no addition to those species already known to the hunters. Nevertheless, they saw, though unable to get near them, a couple of those large birds peculiar to Australia, a sort of cassowary, called emu, five feet in height, and with brown plumage, which belong to the tribe of waders. Top darted after them as fast as his four legs could carry him, but the emus distanced him with ease, so prodigious was their speed.

As to the traces left by the convicts, a few more were discovered. Some footprints found near an apparently recently-extinguished fire were attentively examined by the settlers. By measuring them one after the other, according to their length and breadth, the marks of five men's feet were easily distinguished. The five convicts had evidently camped on this spot; but,--and this was the object of so minute an examination,--a sixth foot-print could not be discovered, which in that case would have been that of Ayrton.

"Ayrton was not with them!" said Herbert.

"No," answered Pencroft, "and if he was not with them, it was because the wretches had already murdered him! but then these rascals have not a den to which they may be tracked like tigers!"

"No," replied the reporter; "it is more probable that they wander at random, and it is their interest to rove about until the time when they will be masters of the island!"

"The masters of the island!" exclaimed the sailor; "the masters of the island!" he repeated, and his voice was choked, as if his throat was seized in an iron grasp. Then in a calmer tone, "Do you know, Captain Harding," said he, "what the ball is which I have rammed into my gun?"

"No, Pencroft!"

"It is the ball that went through Herbert's chest, and I promise you it won't miss its mark!"

But this just retaliation would not bring Ayrton back to life, and from the examination of the footprints left in the ground, they must, alas! conclude that all hopes of ever seeing him again must be abandoned.

That evening they encamped fourteen miles from Granite House, and Cyrus Harding calculated that they could not be more than five miles from Reptile Point.

And, indeed, the next day the extremity of the peninsula was reached, and the whole length of the forest had been traversed; but there was nothing to indicate the retreat in which the convicts had taken refuge, nor that, no less secret, which sheltered the mysterious unknown.

CHAPTER TWELVE.

EXPLORATION OF THE SERPENTINE PENINSULA--ENCAMPMENT AT THE MOUTH OF FALLS RIVER--GIDEON SPILETT AND PENCROFT RECONNOITRE--THEIR RETURN-- FORWARD, ALL!--AN OPEN DOOR--A LIGHTED WINDOW--BY THE LIGHT OF THE MOON!
The next day, the 18th of February, was devoted to the exploration of all that wooded region forming the shore from Reptile End to Falls River. The colonists were able to search this forest thoroughly, for, as it was comprised between the two shores of the Serpentine Peninsula, it was only from three to four miles in breadth. The trees, both by their height and their thick foliage, bore witness to the vegetative power of the soil, more astonishing here than in any other part of the island. One might have said that a corner from the virgin forests of America or Africa had been transported into this temperate zone. This led them to conclude that the superb vegetation found a heat in this soil, damp in its upper layer, but warmed in the interior by volcanic fires, which could not belong to a temperate climate. The most frequently-occurring trees were kauries and eucalypti of gigantic dimensions.

But the colonists’ object was not simply to admire the magnificent vegetation. They knew already that in this respect Lincoln Island would have been worthy to take the first rank in the Canary group, to which the first name given was that of the Happy Isles. Now, alas! their island no longer belonged to them entirely; others had taken possession of it, miscreants polluted its shores, and they must be destroyed to the last man.

No traces were found on the western coast, although they were carefully sought for. No more footprints, no more broken branches, no more deserted camps.

"This does not surprise me," said Cyrus Harding to his companions. "The convicts first landed on the island in the neighbourhood of Flotsam Point, and they immediately plunged into the Far West forests, after crossing Tadorn Marsh. They then followed almost the same route that we took on leaving Granite House. This explains the traces we found in the wood. But, arriving on the shore, the convicts saw at once that they would discover no suitable retreat there, and it was then that, going northwards again, they came upon the corral."

"Where they have perhaps returned," said Pencroft.

"I do not think so," answered the engineer, "for they would naturally suppose that our researches would be in that direction. The corral is only a store-house to them, and not a definitive encampment."

"I am of Cyrus' opinion," said the reporter, "and I think that it is among the spurs of Mount Franklin that the convicts will have made their lair."

"Then, captain, straight to the corral!" cried Pencroft. "We must finish them off, and till now we have only lost time!"

"No, my friend," replied the engineer; "you forget that we have a reason for wishing to know if the forests of the Far West do not contain some habitation. Our exploration has a double object, Pencroft. If, on the one hand, we have to chastise crime, we have, on the other, an act of gratitude to perform."

"That was well said, captain," replied the sailor; "but, all the same, it is my opinion that we shall not find that gentleman until he pleases."

And truly Pencroft only expressed the opinion of all. It was probable that the stranger's retreat was not less mysterious than he himself.

That evening the cart halted at the mouth of Falls River. The camp was organised as usual, and the customary precautions were taken for the night. Herbert, become again the healthy and vigorous lad he was before his illness, derived great benefit from this life in the open air, between the sea-breezes and the vivifying air from the forests. His place was no longer in the cart, but at the head of the troop.

The next day, the 19th of February, the colonists, leaving the shore, where, beyond the mouth, basalts of every shape were so picturesquely piled up, ascended the river by its left bank. The settlers were now about six miles from Mount Franklin.

The engineer's plan was this:—To minutely survey the valley forming the bed of the river, and to cautiously approach the neighbourhood of the corral; if the corral was occupied, to seize it by force; if it was not, to intrench themselves there and make it the centre of the operations which had for their object the exploration of Mount Franklin.

This plan was unanimously approved by the colonists, for they were impatient to regain entire possession of their island.

They made their way along the narrow valley separating two of the largest spurs of Mount Franklin. The trees, crowded on the river's bank, became rare on the upper slopes of the mountain. The ground was hilly and rough, very suitable for ambushes, and over which they did not venture without extreme precaution. Top and Jup skirmished on the flanks, springing right and left through the thick brushwood, and emulating each other in intelligence and activity. But nothing showed that the banks of the stream had been recently frequented—nothing announced either the presence or the proximity of the convicts. Towards five in the evening the cart stopped nearly 600 feet from the palisade. A semicircular screen of trees still hid it.

It was necessary to reconnoitre the corral, in order to ascertain if it was occupied. To go there openly, in broad daylight, when the convicts were probably in ambush, would be to expose themselves, as poor Herbert had done, to
the fire-arms of the ruffians. It was better, then, to wait until night came on.

However, Gideon Spilett wished without further delay to reconnoitre the approaches to the corral, and Pencroft, who was quite out of patience, volunteered to accompany him.

"No, my friends," said the engineer, "wait till night. I will not allow one of you to expose himself in open day."

"But, captain," answered the sailor, little disposed to obey.

"I beg you, Pencroft," said the engineer.

"Very well!" replied the sailor, who vented his anger in another way, by bestowing on the convicts the worst names in his maritime vocabulary.

The colonists remained, therefore, near the cart, and carefully watched the neighbouring parts of the forest.

Three hours passed thus. The wind had fallen, and absolute silence reigned under the great trees. The snapping of the smallest twig, a footstep on the dry leaves, the gliding of a body amongst the grass, would have been heard without difficulty. All was quiet. Besides, Top, lying on the grass, his head stretched out on his paws, gave no signs of uneasiness. At eight o'clock the day appeared far enough advanced for the reconnaissance to be made under favourable conditions. Gideon Spilett declared himself ready to set out accompanied by Pencroft. Cyrus Harding consented. Top and Jup were to remain with the engineer, Herbert, and Neb, for a bark or a cry at a wrong moment would give the alarm.

"Do not be imprudent," said Harding to the reporter and Pencroft; "you have not to gain possession of the corral, but only to find out whether it is occupied or not."

"All right," answered Pencroft.

And the two departed.

Under the trees, thanks to the thickness of their foliage, the obscurity rendered any object invisible beyond a radius of from thirty to forty feet. The reporter and Pencroft, halting at any suspicious sound, advanced with great caution.

They walked a little distance apart from each other so as to offer a less mark for a shot. And, to tell the truth, they expected every moment to hear a report. Five minutes after leaving the cart, Gideon Spilett and Pencroft arrived at the edge of the wood before the clearing beyond which rose the palisade.

They stopped. A few straggling beams still fell on the field clear of trees. Thirty feet distant was the gate of the corral, which appeared to be closed. This thirty feet, which it was necessary to cross from the border of the wood to the palisade, constituted the dangerous zone, to coin a term: in fact, one or more bullets fired from behind the palisade might knock over any one who ventured onto this zone. Gideon Spilett and the sailor were not men to draw back, but they knew that any imprudence on their part, of which they would be the first victims, would fall afterwards on their companions. If they themselves were killed, what would become of Harding, Neb, and Herbert?

But Pencroft, excited at feeling himself so near the corral where he supposed the convicts had taken refuge, was about to press forward, when the reporter held him back with a grasp of iron.

"In a few minutes it will be quite dark," whispered Spilett in the sailor's ear; "then will be the time to act."

Pencroft, convulsively clasping the butt-end of his gun, restrained his eagerness, and waited, swearing to himself.

Soon the last of the twilight faded away. Darkness, which seemed as if it issued from the dense forest, covered the clearing. Mount Franklin rose like an enormous screen before the western horizon, and night spread rapidly over all, as it does in regions of low latitudes. Now was the time.

The reporter and Pencroft, since posting themselves on the edge of the wood, had not once lost sight of the palisade. The corral appeared to be absolutely deserted. The top of the palisade formed a line, a little darker than the surrounding shadow, and nothing disturbed its distinctness. Nevertheless, if the convicts were there, they must have posted one of their number to guard against any surprise.

Spilett grasped his companion's hand, and both crept towards the corral, their guns ready to fire.

They reached the gate without the darkness being illuminated by a single ray of light.

Pencroft tried to push open the gate, which, as the reporter and he had supposed, was closed. However, the sailor was able to ascertain that the outer bars had not been put up. It might, then, be concluded that the convicts were there in the corral, and that very probably they had fastened the gate in such a way that it could not be forced open.

Gideon Spilett and Pencroft listened. Not a sound could be heard inside the palisade. The musmons and the goats, sleeping no doubt in their huts, in no way disturbed the calm of night.

The reporter and the sailor hearing nothing, asked themselves whether they had not better scale the palisades and penetrate into the corral. This would have been contrary to Cyrus Harding's instructions.

It is true that the enterprise might succeed, but it might also fail. Now, if the convicts were suspecting nothing, if they knew nothing of the expedition against them, if, lastly, there now existed a chance of surprising them, ought this chance to be lost by inconsiderately attempting to cross the palisade?
This was not the reporter's opinion. He thought it better to wait until all the settlers were collected together before attempting to penetrate into the corral. One thing was certain, that it was possible to reach the palisade without being seen, and also that it did not appear to be guarded. This point settled, there was nothing to be done but to return to the cart, where they would consult.

Pencroft probably agreed with this decision, for he followed the reporter without making any objection when the latter turned back to the wood.

In a few minutes the engineer was made acquainted with the state of affairs.

"Well," said he, after a little thought, "I now have reason to believe that the convicts are not in the corral."

"We shall soon know," said Pencroft, "when we have scaled the palisade."

"To the corral, my friends!" said Cyrus Harding.

"Shall we leave the cart in the wood?" asked Neb.

"No," replied the engineer, "it is our waggon of ammunition and provisions, and, if necessary, it would serve as an intrenchment."

"Forward, then!" said Gideon Spilett.

The cart emerged from the wood and began to roll noiselessly towards the palisade. The darkness was now profound, the silence as complete as when Pencroft and the reporter crept over the ground. The thick grass completely muffled their footsteps.

The colonists held themselves ready to fire. Jup, at Pencroft's orders, kept behind. Neb led Top in a leash, to prevent him from bounding forward.

The clearing soon came in sight. It was deserted. Without hesitating, the little band moved towards the palisade. In a short space of time the dangerous zone was passed. Not a shot had been fired. When the cart reached the palisade, it stopped. Neb remained at the onagas' heads to hold them. The engineer, the reporter, Herbert, and Pencroft, proceeded to the door, in order to ascertain if it was barricaded inside. It was open!

"What do you say now?" asked the engineer, turning to the sailor and Spilett. Both were stupefied.

"I can swear," said Pencroft, "that this gate was shut just now!"

The colonists now hesitated. Were the convicts in the corral when Pencroft and the reporter made their reconnaissance? it could not be doubted, as the gate then closed could only have been opened by them. Were they still there, or had one of their number just gone out?

All these questions presented themselves simultaneously to the minds of the colonists, but how could they be answered?

At that moment, Herbert, who had advanced a few steps into the enclosure, drew back hurriedly, and seized Harding's hand.

"What's the matter?" asked the engineer. "Alight!"

"In the house?"

"Yes!"

All five advanced and indeed, through the window fronting them, they saw glimmering a feeble light. Cyrus Harding made up his mind rapidly. "It is our only chance," said he to his companions, "of finding the convicts collected in this house, suspecting nothing! They are in our power! Forward!" The colonists crossed through the enclosure, holding their guns ready in their hands. The cart had been left outside under the charge of Jup and Top, who had been prudently tied to it.

Cyrus Harding, Pencroft, and Gideon Spilett on one side, Herbert and Neb on the other, going along by the palisade, surveyed the absolutely dark and deserted corral.

In a few moments they were near the closed door of the house.

Harding signed to his companions not to stir, and approached the window, then feebly lighted by the inner light.

He gazed into the apartment.

On the table burned a lantern. Near the table was the bed formerly used by Ayrton.

On the bed lay the body of a man.

Suddenly Cyrus Harding drew back, and in a hoarse voice--

"Ayrton!" he exclaimed.

Immediately the door was forced rather than opened, and the colonists rushed into the room.

Ayrton appeared to be asleep. His countenance showed that he had long and cruelly suffered. On his wrists and ankles could be seen great bruises.

Harding bent over him.

"Ayrton!" cried the engineer, seizing the arm of the man whom he had just found again under such unexpected circumstances.

At this exclamation Ayrton opened his eyes, and, gazing at Harding, then at the others--
"You!" he cried, "you?"
"Ayrton! Ayrton!" repeated Harding.
"Where am I?"
"In the house in the corral!"
"Alone?"
"Yes!"
"But they will come back!" cried Ayrton. "Defend yourselves! defend yourselves!"
And he fell back exhausted.

"Spilett," exclaimed the engineer, "we may be attacked at any moment. Bring the cart into the corral. Then barricade the door, and all come back here."

Pencroft, Neb, and the reporter hastened to execute the engineer's orders. There was not a moment to be lost. Perhaps even now the cart was in the hands of the convicts!

In a moment the reporter and his two companions had crossed the corral and reached the gate of the palisade behind which Top was heard growling sullenly.

The engineer, leaving Ayrton for an instant, came out ready to fire. Herbert was at his side. Both surveyed the crest of the spur overlooking the corral. If the convicts were lying in ambush there, they might knock the settlers over one after the other.

At that moment the moon appeared in the east, above the black curtain of the forest, and a white sheet of light spread over the interior of the enclosure. The corral, with its clumps of trees, the little stream which watered it, and its wide carpet of grass, was suddenly illuminated. From the side of the mountain, the house and a part of the palisade stood out white in the moonlight. On the opposite side towards the door, the enclosure remained dark.

A black mass soon appeared. This was the cart entering the circle of light, and Cyrus Harding could hear the noise made by the door, as his companions shut it and fastened the interior bars.

But, at that moment, Top, breaking loose, began to bark furiously and rush to the back of the corral, to the right of the house.

"Be ready to fire, my friends!" cried Harding.
The colonists raised their pieces and waited the moment to fire.
Top still barked, and Jup, running towards the dog, uttered shrill cries.
The colonists followed him, and reached the borders of the little stream, shaded by large trees. And there, in the bright moonlight, what did they see? Five corpses, stretched on the bank!
They were those of the convicts who, four months previously, had landed on Lincoln Island!

CHAPTER THIRTEEN.

How had it happened? Who had killed the convicts? Was it Ayrton? No, for a moment before he was dreading their return.

But Ayrton was now in a profound stupor, from which it was no longer possible to rouse him. After uttering those few words he had again become unconscious, and had fallen back motionless on the bed.

The colonists, a prey to a thousand confused thoughts, under the influence of violent excitement, waited all night, without leaving Ayrton's house, or returning to the spot where lay the bodies of the convicts. It was very probable that Ayrton would not be able to throw any light on the circumstances under which the bodies had been found, since he himself was not aware that he was in the corral. But at any rate he would be in a position to give an account of what had taken place before this terrible execution. The next day Ayrton awoke from his torpor, and his companions cordially manifested all the joy they felt, on seeing him again, almost safe and sound, after a hundred and four days' separation.

Ayrton then in a few words recounted what had happened, or at least as much as he knew.

The day after his arrival at the corral, on the 10th of last November, at nightfall, he was surprised by the convicts, who had scaled the palisade. They bound and gagged him; then he was led to a dark cavern, at the foot of Mount Franklin, where the convicts had taken refuge.

His death had been decided upon, and the next day the convicts were about to kill him, when one of them recognised him, and called him by the name which he bore in Australia. The wretches had no scruples as to murdering Ayrton! They spared Ben Joyce!
But from that moment Ayrton was exposed to the importunities of his former accomplices. They wished him to join them again, and relied upon his aid to enable them to gain possession of Granite House, to penetrate into that hitherto inaccessible dwelling, and to become masters of the island, after murdering the colonists!

Ayrton remained firm. The once convict, now repentant and pardoned, would rather die than betray his companions. Ayrton—bound, gagged, and closely watched—lived in this cave for four months.

Nevertheless the convicts had discovered the corral a short time after their arrival in the island, and since then they had subsisted on Ayrton's stores, but did not live at the corral.

On the 11th of November, two of the villains, surprised by the colonists' arrival, fired at Herbert, and one of them returned, boasting of having killed one of the inhabitants of the island; but he returned alone. His companion, as is known, fell by Cyrus Harding's dagger.

Ayrton's anxiety and despair may be imagined when he learnt the news of Herbert's death. The settlers were now only four, and, as it seemed, at the mercy of the convicts. After this event, and during all the time that the colonists, detained by Herbert's illness, remained in the corral, the pirates did not leave their cavern, and even after they had pillaged the plateau of Prospect Heights, they did not think it prudent to abandon it.

The ill-treatment inflicted on Ayrton was now redoubled. His hands and feet still bore the bloody marks of the cords which bound him day and night. Every moment he expected to be put to death, nor did it appear possible that he could escape.

Matters remained thus until the third week of February. The convicts, still watching for a favourable opportunity, rarely quitted their retreat, and only made a few hunting excursions, either to the interior of the island, or the south coast.

Ayrton had no further news of his friends, and relinquished all hope of ever seeing them again. At last, the unfortunate man, weakened by ill-treatment, fell into a prostration so profound that sight and hearing failed him. From that moment, that is to say, since the last two days, he could give no information whatever of what had occurred.

"But, Captain Harding," he added, "since I was imprisoned in that cavern, how is it that I find myself in the corral?"

"How is it that the convicts are lying yonder dead, in the middle of the enclosure?" answered the engineer.

"Dead!" cried Ayrton, half rising from his bed, notwithstanding his weakness.

His companions supported him. He wished to get up, and with their assistance he did so. They then proceeded together towards the little stream.

It was now broad daylight.

There, on the bank, in the position in which they had been stricken by death in its most instantaneous form, lay the corpses of the five convicts!

Ayrton was astounded. Harding and his companions looked at him without uttering a word. On a sign from the engineer, Neb and Pencroft examined the bodies, already stiffened by the cold.

They bore no apparent trace of any wound.

Only, after carefully examining them, Pencroft found on the forehead of one, on the chest of another, on the back of this one, on the shoulder of that, a little red spot, a sort of scarcely visible bruise, the cause of which it was impossible to conjecture.

"It is there that they have been struck!" said Cyrus Harding.

"But with what weapon?" cried the reporter.

"A weapon, lightning-like in its effects, and of which we have not the secret!"

"And who has struck the blow?" asked Pencroft.

"The avenging power of the island," replied Harding, "he who brought you here, Ayrton, whose influence has once more manifested itself, who does for us all that which we cannot do for ourselves, and who, his will accomplished, conceals himself from us."

"Let us make search for him, then!" exclaimed Pencroft.

"Yes, we will search for him," answered Harding; "but we shall not discover this powerful being who performs such wonders, until he pleases to call us to him!"

This invisible protection, which rendered their own action unavailing, both irritated and piqued the engineer. The relative inferiority which it proved was of a nature to wound a haughty spirit. A generosity evinced in such a manner as to elude all tokens of gratitude, implied a sort of disdain for those on whom the obligation was conferred, which in Cyrus Harding's eyes marred, in some degree, the worth of the benefit.

"Let us search," he resumed, "and God grant that we may some day be permitted to prove to this haughty protector that he has not to deal with ungrateful people! What would I not give could we repay him, by rendering him in our turn, although at the price of our lives, some signal service!"
From this day, the thoughts of the inhabitants of Lincoln Island were solely occupied with the intended search. Everything incited them to discover the answer to this enigma, an answer which could only be the name of a man endowed with a truly inexplicable, and in some degree superhuman power. In a few minutes, the settlers re-entered the house, where their influence soon restored to Ayrton his moral and physical energy.

Neb and Pencroft carried the corpses of the convicts into the forest, some distance from the corral, and buried them deep in the ground.

Ayrton was then made acquainted with the facts which had occurred during his seclusion. He learnt Herbert's adventures, and through what various trials the colonists had passed. As to the settlers, they had despaired of ever seeing Ayrton again, and had been convinced that the convicts had ruthlessly murdered him.

"And now," said Cyrus Harding, as he ended his recital, "a duty remains for us to perform. Half of our task is accomplished, but although the convicts are no longer to be feared, it is not owing to ourselves that we are once more masters of the island."

"Well!" answered Gideon Spilett, "let us search all this labyrinth of the spurs of Mount Franklin. We will not leave a hollow, not a hole unexplored! Ah! if ever a reporter found himself face to face with a mystery, it is I who now speak to you, my friends!"

"And we will not return to Granite House until we have found our benefactor," said Herbert.

"Yes," said the engineer, "we will do all that it is humanly possible to do, but I repeat we shall not find him until he himself permits us."

"Shall we stay at the corral?" asked Pencroft.

"We shall stay here," answered Harding. "Provisions are abundant, and we are here in the very centre of the circle we have to explore. Besides, if necessary, the cart will take us rapidly to Granite House."

"Good!" answered the sailor. "Only I have a remark to make."

"What is it?"

"Here is the fine season getting on, and we must not forget that we have a voyage to make."

"A voyage?" said Gideon Spilett.

"Yes, to Tabor Island," answered Pencroft. "It is necessary to carry a notice there to point out the position of our island and say that Ayrton is here in case the Scotch yacht should come to take him off. Who knows if it is not already too late?"

"But, Pencroft," asked Ayrton, "how do you intend to make this voyage?"

"In the Bonadventure."

"The Bonadventure!" exclaimed Ayrton. "She no longer exists."

"My Bonadventure exists no longer!" shouted Pencroft, bounding from his seat.

"No," answered Ayrton. "The convicts discovered her in her little harbour only eight days ago, they put to sea in her, and--"

"And?" said Pencroft, his heart beating.

"And not having Bob Harvey to steer her, they ran on the rocks, and the vessel went to pieces."

"Oh, the villains, the cut-throats, the infamous scoundrels!" exclaimed Pencroft.

"Pencroft," said Herbert, taking the sailor's hand, "we will build another Bonadventure—a larger one. We have all the iron-work—all the rigging of the brig at our disposal."

"But do you know," returned Pencroft, "that it will take at least five or six months to build a vessel of from thirty to forty tons?"

"We can take our time," said the reporter, "and we must give up the voyage to Tabor Island for this year."

"Oh, my Bonadventure! my poor Bonadventure!" cried Pencroft, almost broken-hearted at the destruction of the vessel of which he was so proud.

The loss of the Bonadventure was certainly a thing to be lamented by the colonists, and it was agreed that this loss should be repaired as soon as possible. This settled, they now occupied themselves with bringing their researches to bear on the most secret parts of the island.

The exploration was commenced at daybreak on the 19th of February, and lasted an entire week. The base of the mountain, with its spurs and their numberless ramifications, formed a labyrinth of valleys and elevations. It was evident that there, in the depths of these narrow gorges, perhaps even in the interior of Mount Franklin itself, was the proper place to pursue their researches. No part of the island could have been more suitable to conceal a dwelling whose occupant wished to remain unknown. But so irregular was the formation of the valleys that Cyrus Harding was obliged to conduct the exploration in a strictly methodical manner.

The colonists first visited the valley opening to the south of the volcano, and which first received the waters of Falls River. There Ayrton showed them the cavern where the convicts had taken refuge, and in which he had been imprisoned until his removal to the corral. This cavern was just as Ayrton had left it. They found there a
considerable quantity of ammunition and provisions, conveyed thither by the convicts in order to form a reserve.

The whole of the valley bordering on the cave, shaded by fir and other trees, was thoroughly explored, and on turning the point of the south-western spur, the colonists entered a narrower gorge similar to the picturesque columns of basalt on the coast. Here the trees were fewer. Stones took the place of grass. Goats and musmons gambolled among the rocks. Here began the barren part of the island. It could already be seen that, of the numerous valleys branching off at the base of Mount Franklin, three only were wooded and rich in pasturage like that of the corral, which bordered on the west on the Falls River valley, and on the east on the Red Creek valley. These two streams, which lower down became rivers by the absorption of several tributaries, were formed by all the springs of the mountain and thus caused the fertility of its southern part. As to the Mercy, it was more directly fed from ample springs concealed under the cover of Jacamar Wood, and it was by springs of this nature, spreading in a thousand streamlets, that the soil of the Serpentine Peninsula was watered.

Now, of these three well-watered valleys, either might have served as a retreat to some solitary who would have found there everything necessary for life. But the settlers had already explored them, and in no part had they discovered the presence of man.

Was it then in the depths of those barren gorges, in the midst of the piles of rock, in the rugged northern ravines, among the streams of lava, that this dwelling and its occupant would be found?

The northern part of Mount Franklin was at its base composed solely of two valleys, wide, not very deep, without any appearance of vegetation, strewn with masses of rock, paved with lava, and varied with great blocks of mineral. This region required a long and careful exploration. It contained a thousand cavities, comfortless no doubt, but perfectly concealed and difficult of access.

The colonists even visited dark tunnels, dating from the volcanic period, still black from the passage of the fire, and penetrated into the depths of the mountain. They traversed these sombre galleries, waving lighted torches; they examined the smallest excavations; they sounded the shallowest depths, but all was dark and silent. It did not appear that the foot of man had ever before trodden these ancient passages, or that his arm had ever displaced one of these blocks, which remained as the volcano had cast them up above the waters, at the time of the submersion of the island.

However, although these passages appeared to be absolutely deserted, and the obscurity was complete, Cyrus Harding was obliged to confess that absolute silence did not reign there.

On arriving at the end of one of these gloomy caverns, extending several hundred feet into the interior of the mountain, he was surprised to hear a deep rumbling noise, increased in intensity by the sonorousness of the rocks. Gideon Spilett, who accompanied him, also heard these distant mutterings, which indicated a revivification of the subterranean fires. Several times both listened, and they agreed that some chemical process was taking place in the bowels of the earth.

"Then the volcano is not totally extinct?" said the reporter.

"It is possible that since our exploration of the crater," replied Cyrus Harding, "some change has occurred. Any volcano, although considered extinct, may evidently again burst forth."

"But if an eruption of Mount Franklin occurred," asked Spilett, "would there not be some danger to Lincoln Island?"

"I do not think so," answered the reporter. "The crater--that is to say, the safety-valve, exists, and the overflow of smoke and lava would escape, as it did formerly, by its customary outlet."

"Unless the lava opened a new way for itself towards the fertile parts of the island!"

"And why, my dear Spilett," answered Cyrus Harding, "should it not follow the road naturally traced out for it?"

"Well, volcanoes are capricious," returned the reporter.

"Notice," answered the engineer, "that the inclination of Mount Franklin favours the flow of water towards the valleys which we are exploring just now. To turn aside this flow, an earthquake would be necessary to change the mountain's centre of gravity."

"But an earthquake is always to be feared at these times," observed Gideon Spilett.

"Always," replied the engineer, "especially when the subterranean forces begin to awake, as they risk meeting with some obstruction, after a long rest. Thus, my dear Spilett, an eruption would be a serious thing for us, and it would be better that the volcano should not have the slightest desire to wake up. But we could not prevent it, could we? At any rate, even if it should occur, I do not think Prospect Heights would be seriously threatened. Between them and the mountain, the ground is considerably depressed, and if the lava should ever take a course towards the lake, it would be cast on the downs and the neighbouring parts of Shark Gulf."

"We have not yet seen any smoke at the top of the mountain, to indicate an approaching eruption," said Gideon Spilett.

"No," answered Harding, "not a vapour escapes from the crater, for it was only yesterday that I attentively
surveyed the summit. But it is probable that at the lower part of the chimney, time may have accumulated rocks, cinders, hardened lava, and that this valve of which I spoke, may at any time become overcharged. But at the first serious effort, every obstacle will disappear, and you may be certain, my dear Spilett, that neither the island, which is the boiler, nor the volcano, which is the chimney, will burst under the pressure of gas. Nevertheless, I repeat, it would be better that there should not be an eruption."

"And yet we are not mistaken," remarked the reporter. "Mutterings can be distinctly heard in the very bowels of the volcano!"

"You are right," said the engineer, again listening attentively. "There can be no doubt of it. A commotion is going on there, of which we can neither estimate the importance nor the ultimate result."

Cyrus Harding and Spilett, on coming out, rejoined their companions, to whom they made known the state of affairs.

"Very well!" cried Pencroft, "the volcano wants to play his pranks! Let him try, if he likes! He will find his master!"

"Who?" asked Neb.

"Our good genius, Neb, our good genius, who will shut his mouth for him, if he so much as pretends to open it!"

As may be seen, the sailor's confidence in the tutelary deity of his island was absolute, and, certainly, the occult power, manifested until now in so many inexplicable ways, appeared to be unlimited; but also it knew how to escape the colonists' most minute researches, for, in spite of all their efforts, in spite of the more than zeal,---the obstinacy,---with which they carried on their exploration, the retreat of the mysterious being could not be discovered.

From the 19th to the 25th of February the circle of investigation was extended to all the northern region of Lincoln Island, whose most secret nooks were explored. The colonists even went the length of tapping every rock. The search was extended to the extreme verge of the mountain. It was explored thus to the very summit of the truncated cone terminating the first row of rocks, then to the upper ridge of the enormous hat, at the bottom of which opened the crater.

They did more; they visited the gulf, now extinct, but in whose depths the rumbling could be distinctly heard. However, no sign of smoke or vapour, no heating of the rock, indicated an approaching eruption. But neither there, nor in any other part of Mount Franklin, did the colonists find any traces of him of whom they were in search.

Their investigations were then directed to the downs. They carefully examined the high lava-cliffs of Shark Gulf from the base to the crest, although it was extremely difficult to reach even the level of the gulf. No one!--nothing!

In short, in these two words was summed up so much fatigue uselessly expended, so much energy producing no result, that somewhat of anger mingled with the discomfiture of Cyrus Harding and his companions.

It was now time to think of returning, for these researches could not be prolonged indefinitely. The colonists were certainly right in believing that the mysterious being did not reside on the surface of the island, and the wildest fancies haunted their excited imaginations. Pencroft and Neb, particularly, were not contented with the mystery, but allowed their imaginations to wander into the domain of the supernatural.

On the 25th of February the colonists re-entered Granite House, and by means of the double cord, carried by an arrow to the threshold of the door, they re-established communication between their habitation and the ground.

A month later they commemorated, on the 25th of March, the third anniversary of their arrival on Lincoln Island.

CHAPTER FOURTEEN.
THREE YEARS HAVE PASSED--THE NEW VESSEL--WHAT IS AGREED ON--PROSPERITY OF THE COLONY--THE DOCKYARD--COLD OF THE SOUTHERN HEMISPHERE--WASHING LINEN--MOUNT FRANKLIN.

Three years had passed away since the escape of the prisoners from Richmond, and how often during those three years had they spoken of their country, always present in their thoughts!

They had no doubt that the civil war was at an end, and to them it appeared impossible that the just cause of the North had not triumphed. But what had been the incidents of this terrible war? How much blood had it not cost? How many of their friends must have fallen in the struggle? They often spoke of these things, without as yet being able to foresee the day when they would be permitted once more to see their country. To return thither, were it but for a few days, to renew the social link with the inhabited world, to establish a communication between their native land and their island, then to pass the longest, perhaps the best, portion of their existence in this colony founded by them, and which would then be dependent of their country, was this a dream impossible to realise?

There were only two ways of accomplishing it--either a ship must appear off Lincoln Island, or the colonists must themselves build a vessel strong enough to sail to the nearest land.

"Unless," said Pencroft, "our good genius himself provides us with the means of returning to our country."
And, really, had any one told Pencroft and Neb that a ship of 300 tons was waiting for them in Shark Gulf or at Port Balloon, they would not even have made a gesture of surprise. In their state of mind nothing appeared improbable.

But Cyrus Harding, less confident, advised them to confine themselves to fact, and more especially so with regard to the building of a vessel—a really urgent work, since it was for the purpose of depositing, as soon as possible, at Tabor Island a document indicating Ayrton's new residence.

As the Bonadventure no longer existed, six months at least would be required for the construction of a new vessel. Now winter was approaching, and the voyage could not be made before the following spring.

"We have time to get everything ready for the fine season," remarked the engineer, who was consulting with Pencroft about these matters. "I think, therefore, my friend, that since we have to rebuild our vessel it will be best to give her larger dimensions. The arrival of the Scotch yacht at Tabor Island is very uncertain. It may even be that, having arrived several months ago, she has again sailed after having vainly searched for some trace of Ayrton. Will it not then be best to build a ship which, if necessary, could take us either to the Polynesian Archipelago or to New Zealand? What do you think?"

"I think, captain," answered the sailor; "I think that you are as capable of building a large vessel as a small one. Neither the wood nor the tools are wanting. It is only a question of time."

"And how many months would be required to build a vessel of from 250 to 300 tons?" asked Harding.

"Seven or eight months at least," replied Pencroft. "But it must not be forgotten that winter is drawing near, and that in severe frost wood is difficult to work. We must calculate on several weeks' delay, and if our vessel is ready by next November we may think ourselves very lucky."

"Well," replied Cyrus Harding, "that will be exactly the most favourable time for undertaking a voyage of any importance, either to Tabor Island or to a more distant land."

"So it will, captain," answered the sailor. "Make out your plans then; the workmen are ready, and I imagine that Ayrton can lend us a good helping hand."

The colonists, having been consulted, approved the engineer's plan, and it was, indeed, the best thing to be done. It is true that the construction of a ship of from two to three hundred tons would be great labour, but the colonists had confidence in themselves, justified by their previous success.

Cyrus Harding then busied himself in drawing the plan of the vessel and making the model. During this time his companions employed themselves in felling and carting trees to furnish the ribs, timbers, and planks. The forest of the Far West supplied the best oaks and elms. They took advantage of the opening already made on their last excursion to form a practicable road, which they named the Far West Road, and the trees were carried to the Chimneys, where the dockyard was established. As to the road in question, the choice of trees had rendered its direction somewhat capricious, but that at the same time facilitated the access to a large part of the Serpentine Peninsula.

It was important that the trees should be quickly felled and cut up, for they could not be used while yet green, and some time was necessary to allow them to get seasoned. The carpenters, therefore, worked vigorously during the month of April, which was troubled only by a few equinoctial gales of some violence. Master Jup aided them dexterously, either by climbing to the top of a tree to fasten the ropes or by lending his stout shoulders to carry the lopped trunks.

All this timber was piled up under a large shed, built near the Chimneys, and there awaited the time for use.

The month of April was tolerably fine, as October often is in the northern zone. At the same time other work was actively continued, and soon all trace of devastation disappeared from the plateau of Prospect Heights. The mill was rebuilt, and new buildings rose in the poultry-yard. It had appeared necessary to enlarge their dimensions, for the feathered population had increased considerably. The stable now contained five onagas, four of which were well broken, and allowed themselves to be either driven or ridden, and a little colt. The colony now possessed a plough, to which the onagas were yoked like regular Yorkshire or Kentucky oxen. The colonists divided their work, and their arms never tired. Then who could have enjoyed better health than these workers, and what good humour enlivened the evenings in Granite House as they formed a thousand plans for the future!

As a matter of course Ayrton shared the common lot in every respect, and there was no longer any talk of his going to live at the corral. Nevertheless he was still sad and reserved, and joined more in the work than in the pleasures of his companions. But he was a valuable workman at need—strong, skilful, ingenious, intelligent. He was esteemed and loved by all, and he could not be ignorant of it.

In the meanwhile the corral was not abandoned. Every other day one of the settlers, driving the cart or mounted on an onaga, went to look after the flock of musmons and goats and bring back the supply of milk required by Neb. These excursions at the same time afforded opportunities for hunting. Therefore Herbert and Gideon Spilett, with Top in front, traversed more often than their companions the road to the corral, and with the capital guns which they
carried, capybaras, agouties, kangaroos, and wild pigs for large game, ducks, tetras, grouse, jacamars, and snipe for small, were never wanting in the house. The produce of the warren, of the oyster-bed, several turtles which were taken, excellent salmon which came up the Mercy, vegetables from the plateau, wild fruit from the forest, were riches upon riches, and Neb, the head cook, could scarcely by himself store them away.

The telegraphic wire between the corral and Granite House had of course been repaired, and it was worked whenever one or other of the settlers was at the corral and found it necessary to spend the night there. Besides, the island was safe now and no attacks were to be feared, at any rate from men.

However, that which had happened might happen again. A descent of pirates, or even of escaped convicts, was always to be feared. It was possible that companions or accomplices of Bob Harvey had been in the secret of his plans, and might be tempted to imitate him. The colonists, therefore, were careful to observe the sea around the island, and every day their telescope swept the horizon enclosed by the Union and Washington Bays. When they went to the corral they examined the sea to the west with no less attention, and by climbing the spur their gaze extended over a large section of the western horizon.

Nothing suspicious was discerned, but still it was necessary for them to be on their guard.

The engineer one evening imparted to his friends a plan which he had conceived for fortifying the corral. It appeared prudent to him to heighten the palisade and to flank it with a sort of block-house, which, if necessary, the settlers could hold against the enemy. Granite House might, by its very position, be considered impregnable; therefore the corral with its buildings, its stores, and the animals it contained, would always be the object of pirates, whoever they were, who might land on the island, and should the colonists be obliged to shut themselves up there they ought also to be able to defend themselves without any disadvantage. This was a project which might be left for consideration, and they were, besides, obliged to put off its execution until the next spring.

About the 15th of May the keel of the new vessel lay along the dockyard, and soon the stem and stern-post, mortised at each of its extremities, rose almost perpendicularly. The keel, of good oak, measured 110 feet in length, this allowing a width of five-and-twenty feet to the midship beam. But this was all the carpenters could do before the arrival of the frosts and bad weather. During the following week they fixed the first of the stern timbers, but were then obliged to suspend work.

During the last days of the month the weather was extremely bad. The wind blew from the east, sometimes with the violence of a tempest. The engineer was somewhat uneasy on account of the dockyard sheds—which, besides, he could not have established in any other place near to Granite House—for the islet only imperfectly sheltered the shore from the fury of the open sea, and in great storms the waves beat against the very foot of the granite cliff.

But, very fortunately, these fears were not realised. The wind shifted to the south-east, and there the beach of Flotsam Point.

Pencroft and Ayrton, the most zealous workmen at the new vessel, pursued their labour as long as they could. They were not men to mind the wind tearing at their hair, nor the rain wetting them to the skin, and a blow from a hammer is worth just as much in bad as in fine weather. But when a severe frost succeeded this wet period, the wood, its fibres acquiring the hardness of iron, became extremely difficult to work, and about the 10th of June ship-building was obliged to be entirely discontinued.

Cyrus Harding and his companions had not omitted to observe how severe was the temperature during the winters of Lincoln Island. The cold was comparable to that experienced in the States of New England, situated at almost the same distance from the equator. In the northern hemisphere, or at any rate in the part occupied by British America and the north of the United States, this phenomenon is explained by the flat conformation of the territories bordering on the pole, and on which there is no intumescence of the soil to oppose any obstacle to the north winds; here, in Lincoln Island, this explanation would not suffice.

"It has even been observed," remarked Harding one day to his companions, "that in equal latitudes the islands and coast regions are less tried by the cold than inland countries. I have often heard it asserted that the winters of Lombardy, for example, are not less rigorous than those of Scotland, which results from the sea restoring during the winter the heat which it received during the summer. Islands are, therefore, in a better situation for benefiting by this restitution."

"But then, Captain Harding," asked Herbert, "why does Lincoln Island appear to escape the common law?"

"That is difficult to explain," answered the engineer. "However, I should be disposed to conjecture that this peculiarity results from the situation of the island in the southern hemisphere, which, as you know, my boy, is colder than the northern hemisphere."

"Yes," said Herbert, "and icebergs are met with in lower latitudes in the south than in the north of the Pacific."

"That is true," remarked Pencroft, "and when I have been serving on board whalers I have seen icebergs off Cape Horn."

"The severe cold experienced in Lincoln Island," said Gideon Spilett, "may then perhaps be explained by the
presence of floes or icebergs comparatively near to Lincoln Island."

"Your opinion is very admissible indeed, my dear Spilett," answered Cyrus Harding, "and it is evidently to the proximity of icebergs that we owe our rigorous winters. I would draw your attention also to an entirely physical cause, which renders the southern colder than the northern hemisphere. In fact, since the sun is nearer to this hemisphere during the summer, it is necessarily more distant during the winter. This explains then the excess of temperature in the two seasons, for, if we find the winters very cold in Lincoln Island, we must not forget that the summers here, on the contrary, are very hot."

"But why, if you please, captain," asked Pencroft, knitting his brows, "why should our hemisphere, as you say, be so badly divided? It isn't just, that!"

"Friend Pencroft," answered the engineer, laughing, "whether just or not, we must submit to it, and here lies the reason for this peculiarity. The earth does not describe a circle round the sun, but an ellipse, as it must by the laws of rational mechanics. Now, the earth occupies one of the centres of the ellipse, and consequently, at the time of its transfer, it is further from the sun, that is to say, at its apogee, and at another time nearer, that is to say, at its perigee. Now it happens that it is during the winter of the southern countries that it is at its most distant point from the sun, and consequently, in a situation for those regions to feel the greatest cold. Nothing can be done to prevent that, and men, Pencroft, however learned they may be, can never change anything of the cosmographical order established by God Himself."

"And yet," added Pencroft, persisting, "the world is very learned. What a big book, captain, might be made with all that is known!"

"And what a much bigger book still with all that is not known!" answered Harding.

At last, for one reason or another, the month of June brought the cold with its accustomed intensity, and the settlers were often confined to Granite House. Ah! how wearisome this imprisonment was to them, and more particularly to Gideon Spilett.

"Look here," said he to Neb one day, "I would give you by notarial deed all the estates which will come to me some day, if you were a good-enough fellow to go, no matter where, and subscribe to some newspaper for me! Decidedly the thing that is most essential to my happiness is the knowing every morning what has happened the day before in other places than this!"

Neb began to laugh.

"'Pon my word," he replied, "the only thing I think about is my daily work!"

The truth was that indoors as well as out there was no want of work.

The colony of Lincoln Island was now at its highest point of prosperity, achieved by three years of continued hard work. The destruction of the brig had been a new source of riches. Without speaking of the complete rig which would serve for the vessel now on the stocks, utensils and tools of all sorts, weapons and ammunition, clothes and instruments, were now piled in the store-rooms of Granite House. It had not even been necessary to resort again to the manufacture of the coarse felt materials. Though the colonists had suffered from cold during their first winter, the bad season might now come without their having any reason to dread its severity. Linen was plentiful also, and besides, they kept it with extreme care. From chloride of sodium, which is nothing else than sea salt, Cyrus Harding easily extracted the soda and chlorine. The soda, which it was easy to change into carbonate of soda, and the chlorine, of which he made chloride of lime, were employed for various domestic purposes, and especially in bleaching linen. Besides, they did not wash more than four times a year, as was done by families in the olden time, and it may be added, that Pencroft and Gideon Spilett, whilst waiting for the postman to bring him his newspaper, distinguished themselves as washermen.

So passed the winter months, June, July, and August. They were very severe, and the average observations of the thermometer did not give more than eight degrees of Fahrenheit. It was therefore lower in temperature than the preceding winter. But then, what splendid fires blazed continually on the hearths of Granite House, the smoke marking the granite wall with long, zebra-like streaks! Fuel was not spared, as it grew naturally a few steps from them. Besides, the chips of the wood destined for the construction of the ship enabled them to economise the coal, which required more trouble to transport.

Men and animals were all well. Master Jup was a little chilly, it must be confessed. This was perhaps his only weakness, and it was necessary to make him a well-wadded dressing-gown. But what a servant he was, clever, zealous, indefatigable, not indiscreet, not talkative, and he might have been with reason proposed as a model for all his biped brothers in the Old and the New World!

"As for that," said Pencroft, "when one has four hands at one's service, of course one's work ought to be done so much the better!"

And indeed the intelligent creature did it well.

During the seven months which had passed since the last researches made round the mountain, and during the
month of September, which brought back fine weather, nothing was heard of the genius of the island. His power was not manifested in any way. It is true that it would have been inutile, for no incident occurred to put the colonists to any painful trial.

Cyrus Harding even observed that if by chance the communication between the unknown and the tenants of Granite House had ever been established through the granite, and if Top’s instinct had as it were felt it, there was no further sign of it during this period. The dog’s growling had entirely ceased, as well as the uneasiness of the orang. The two friends—for they were so—no longer prowled round the opening of the inner well, nor did they bark or whine in that singular way which from the first the engineer had noticed. But could he be sure that this was all that was to be said about this enigma, and that he should never arrive at a solution? Could he be certain that some conjunction would not occur which would bring the mysterious personage on the scene? Who could tell what the future might have in reserve?

At last the winter was ended, but an event, the consequences of which might be serious, occurred in the first days of the returning spring.

On the 7th of September, Cyrus Harding, having observed the crater, saw smoke curling round the summit of the mountain, its first vapours rising in the air.

CHAPTER FIFTEEN.

The colonists, warned by the engineer, left their work and gazed in silence at the summit of Mount Franklin. The volcano had awoke, and the vapour had penetrated the mineral layer heaped up at the bottom of the crater. But would the subterranean fires provoke any violent eruption? This was an event which could not be foreseen. However, even while admitting the possibility of an eruption, it was not probable that the whole of Lincoln Island would suffer from it. The flow of volcanic matter is not always disastrous, and the island had already undergone this trial, as was shown by the streams of lava hardened on the northern slopes of the mountain. Besides, from the shape of the crater—the opening broken in the upper edge—the matter would be thrown to the side opposite the fertile regions of the island.

However, the past did not necessarily answer for the future. Often, at the summit of volcanoes, the old craters close and new ones open. This has occurred in the two hemispheres—at Etna, Popocatepetl, at Orizaba—and on the eve of an eruption there is everything to be feared. In fact, an earthquake—a phenomenon which often accompanies volcanic eruptions—is enough to change the interior arrangement of a mountain, and to open new outlets for the burning lava.

Cyrus Harding explained these things to his companions, and, without exaggerating the state of things, he told them all the pros and cons. After all they could not prevent it. It did not appear likely that Granite House would be threatened unless the ground was shaken by an earthquake. But the corral would be in great danger should a new crater open in the southern side of Mount Franklin.

From that day the smoke never disappeared from the top of the mountain, and it could even be perceived that it increased in height and thickness, without any flame mingling in its heavy volumes. The phenomenon was still concentrated in the lower part of the central crater.

However, with the fine days work had been continued. The building of the vessel was hastened as much as possible, and, by means of the waterfall on the shore, Cyrus Harding managed to establish an hydraulic saw-mill, which rapidly cut the trunks of trees into planks and joists. The mechanism of this apparatus was as simple as those used in the rustic saw-mills of Norway. A first horizontal movement to move the piece of wood, a second vertical movement to move the saw—this was all that was wanted; and the engineer succeeded by means of a wheel, two cylinders, and pulleys properly arranged. Towards the end of the month of September the skeleton of the vessel, which was to be rigged as a schooner, lay in the dockyard. The ribs were almost entirely completed, and, all the timbers having been sustained by a provisional band, the shape of the vessel could already be seen. This schooner, sharp in the bows, very slender in the after-part, would evidently be suitable for a long voyage, if wanted; but laying the planking would still take a considerable time. Very fortunately, the iron-work of the pirate brig had been saved after the explosion. From the planks and injured ribs Pencroft and Ayrton had extracted the bolts and a large quantity of copper nails. It was so much work saved for the smiths, but the carpenters had much to do.

Ship-building was interrupted for a week for the harvest, the haymaking, and the gathering in of the different crops on the plateau. This work finished, every moment was devoted to finishing the schooner. When night came the
workmen were really quite exhausted. So as not to lose any time they had changed the hours for their meals; they
dined at twelve o'clock, and only had their supper when daylight failed them. They then ascended to Granite House,
when they were always ready to go to bed.

Sometimes, however, when the conversation bore on some interesting subject the hour for sleep was delayed for
a time. The colonists then spoke of the future, and talked willingly of the changes which a voyage in the schooner to
inhabited lands would make in their situation. But always, in the midst of these plans, prevailed the thought of a
subsequent return to Lincoln Island. Never would they abandon this colony, founded with so much labour and with
such success, and to which a communication with America would afford a fresh impetus. Pencroft and Neb
especially hoped to end their days there.

"Herbert," said the sailor, "you will never abandon Lincoln Island?"
"Never, Pencroft, and especially if you make up your mind to stay there."
"That was made up long ago, my boy," answered Pencroft. "I shall expect you. You will bring me your wife and
children, and I shall make jolly little chaps of your youngsters!"
"That's agreed," replied Herbert, laughing and blushing at the same time.
"And you, Captain Harding," resumed Pencroft enthusiastically, "you will be still the governor of the island! Ah!
how many inhabitants could it support? Ten thousand at least!"

They talked in this way, allowing Pencroft to run on, and at last the reporter actually started a newspaper--the
New Lincoln Herald!
So is man's heart. The desire to perform a work which will endure, which will survive him, is the origin of his
superiority over all other living creatures here below. It is this which has established his dominion, and this it is
which justifies it, over all the world.

After that, who knows if Jup and Top had not themselves their little dream of the future.
Ayrton silently said to himself that he would like to see Lord Glenarvan again and show himself to all restored.
One evening, on the 15th of October, the conversation was prolonged later than usual. It was nine o'clock.
Already, long badly-concealed yawns gave warning of the hour of rest, and Pencroft was proceeding towards his
bed, when the electric bell, placed in the dining-room, suddenly rang.

All were there, Cyrus Harding, Gideon Spilett, Herbert, Ayrton, Pencroft, Neb. Therefore none of the colonists
were at the corral.
Cyrus Harding rose. His companions stared at each other, scarcely believing their ears.
"What does that mean?" cried Neb. "Was it the devil who rang it?"
No one answered.
"The weather is stormy," observed Herbert. "Might not its influence of electricity--"
Herbert did not finish his phrase. The engineer, towards whom all eyes were turned, shook his head negatively.
"We must wait," said Gideon Spilett. "If it is a signal, whoever it may be who has made it, he will renew it."
"But who do you think it is?" cried Neb. "Who?" answered Pencroft, "but he--"
The sailor's sentence was cut short by a new tinkle of the bell.
Harding went to the apparatus, and sent this question to the tenants of Granite House:--
"What do you want?"
A few moments later the needle, moving on the alphabetic dial, gave this reply to the tenants of Granite House:--
"Come to the corral immediately."
"At last!" exclaimed Harding.

Yes! At last! The mystery was about to be unveiled. The colonists' fatigue had disappeared before the
tremendous interest which was about to urge them to the corral, and all wish for rest had ceased. Without having
uttered a word, in a few moments they had left Granite House, and were standing on the beach. Jup and Top alone
were left behind. They could do without them.
The night was black. The new moon had disappeared at the same time as the sun. As Herbert had observed great
stormy clouds formed a lowering and heavy vault, preventing any star rays. A few lightning-flashes, reflections from
distant storm, illuminated the horizon.

It was possible that a few hours later the thunder would roll over the island itself. The night was very
threatening. But however deep the darkness was, it would not prevent them from finding the familiar road to the
corral.
They ascended the left bank of the Mercy, reached the plateau, passed the bridge over Creek Glycerine, and
advanced through the forest.
They walked at a good pace, a prey to the liveliest emotions. There was no doubt but that they were now going
to learn the long-searched-for answer to the enigma, the name of that mysterious being, so deeply concerned in their
life, so generous in his influence, so powerful in his action! Must not this stranger have indeed mingled with their
existence, have known the smallest details, have heard all that was said in Granite House, to have been able always
to act in the very nick of time?

Every one, wrapped up in his own reflections, pressed forward. Under the arch of trees the darkness was such
that the edge of the road even could not be seen. Not a sound in the forest. Both animals and birds, influenced by the
heaviness of the atmosphere, remained motionless and silent. Not a breath disturbed the leaves. The footsteps of the
colonists alone resounded on the hardened ground.

During the first quarter of an hour the silence was only interrupted by this remark from Pencroft:--
"We ought to have brought a torch."

And by this reply from the engineer:--
"We shall find one at the corral."

Harding and his companions had left Granite House at twelve minutes past nine. At forty-seven minutes past
nine they had traversed three out of the five miles which separated the mouth of the Mercy from the corral.

At that moment sheets of lightning spread over the island and illumined the dark trees. The flashes dazzled and
almost blinded them. Evidently the storm would not be long in bursting forth.

The flashes gradually became brighter and more rapid. Distant thunder growled in the sky. The atmosphere was
stifling.

The colonists proceeded as if they were urged onwards by some irresistible force.

At ten o'clock a vivid flash showed them the palisade, and as they reached the gate the storm burst forth with
tremendous fury.

In a minute the corral was crossed, and Harding stood before the hut.

Probably the house was occupied by the stranger, since it was from thence that the telegram had been sent.
However, no light shone through the window.

The engineer knocked at the door.

No answer.

Cyrus Harding opened the door, and the settlers entered the room, which was perfectly dark. A light was struck
by Neb, and in a few moments the lantern was lighted and the light thrown into every corner of the room.

There was no one there. Everything was in the state in which it had been left.

"Have we been deceived by an illusion?" murmured Cyrus Harding.

No! that was not possible! The telegram had clearly said--
"Come to the corral immediately."

They approached the table specially devoted to the use of the wire. Everything was in order--the pile and the box
containing it, as well as all the apparatus.

"Who came here the last time?" asked the engineer.

"I did, captain," answered Ayrton.

"And that was--"

"Four days ago."

"Ah! a note!" cried Herbert, pointing to a paper lying on the table.

On this paper were written these words in English:--
"Follow the new wire."

"Forward!" cried Harding, who understood that the despatch had not been sent from the corral, but from the
mysterious retreat, communicating directly with Granite House by means of a supplementary wire joined to the old
one.

Neb took the lighted lantern, and all left the corral. The storm then burst forth with tremendous violence. The
interval between each lightning-flash and each thunder-clap diminished rapidly. The summit of the volcano, with its
plume of vapour, could be seen by occasional flashes.

There was no telegraphic communication in any part of the corral between the house and the palisade; but the
engineer, running straight to the first post, saw by the light of a flash a new wire hanging from the isolater to the
ground.

"There it is!" said he.

This wire lay along the ground, and was surrounded with an isolating substance like a submarine cable, so as to
assure the free transmission of the current. It appeared to pass through the wood and the southern spurs of the
mountain, and consequently it ran towards the west.

"Follow it!" said Cyrus Harding.

And the settlers immediately pressed forward, guided by the wire.

The thunder continued to roar with such violence that not a word could be heard. However, there was no
occasion for speaking, but to get forward as fast as possible.
Cyrus Harding and his companions then climbed the spur rising between the corral valley and that of Falls River, which they crossed at its narrowest part. The wire, sometimes stretched over the lower branches of the trees, sometimes lying on the ground, guided them surely. The engineer had supposed that the wire would perhaps stop at the bottom of the valley, and that the stranger's retreat would be there.

Nothing of the sort. They were obliged to ascend the south-western spur, and re-descend on that arid plateau terminated by the strangely-wild basalt cliff. From time to time one of the colonists stooped down and felt for the wire with his hands; but there was now no doubt that the wire was running directly towards the sea. There, to a certainty, in the depths of those rocks, was the dwelling so long sought for in vain.

The sky was literally on fire. Flash succeeded flash. Several struck the summit of the volcano in the midst of the thick smoke. It appeared there as if the mountain was vomiting flame. At a few minutes to eleven the colonists arrived on the high cliff overlooking the ocean to the west. The wind had risen. The surf roared 500 feet below.

Harding calculated that they had gone a mile and a half from the coral.

At this point the wire entered among the rocks, following the steep side of a narrow ravine. The settlers followed it at the risk of occasioning a fall of the slightly-balanced rocks, and being dashed into the sea. The descent was extremely perilous, but they did not think of the danger; they were no longer masters of themselves, and an irresistible attraction drew them towards this mysterious place as the magnet draws iron.

Thus they almost unconsciously descended this ravine, which even in broad daylight would have been considered impracticable.

The stones rolled and sparkled like fiery balls when they crossed through the gleams of light. Harding was first--Ayrton last. On they went, step by step. Now they slid over the slippery rock; then they struggled to their feet and scrambled on.

At last the wire touched the rocks on the beach. The colonists had reached the bottom of the basalt cliff.

There appeared a narrow ridge, running horizontally and parallel with the sea. The settlers followed the wire along it. They had not gone a hundred paces when the ridge by a moderate incline sloped down to the level of the sea.

The engineer seized the wire and found that it disappeared beneath the waves.

His companions were stupefied.

A cry of disappointment, almost a cry of despair, escaped them! Must they then plunge beneath the water and seek there for some submarine cavern? In their excited state they would not have hesitated to do it.

The engineer stopped them.

He led his companions to a hollow in the rocks, and there--

"We must wait," said he. "The tide is high. At low-water the way will be open."

"But what can make you think--" asked Pencroft.

"He would not have called us if the means had been wanting to enable us to reach him!"

Cyrus Harding spoke in a tone of such thorough conviction that no objection was raised. His remark, besides, was logical. It was quite possible that an opening, practicable at low-water, though hidden now by the high tide, opened at the foot of the cliff.

There was some time to wait. The colonists remained silently crouching in a deep hollow. Rain now began to fall in torrents. The thunder was re-echoed among the rocks with a grand sonorousness.

The colonists' emotion was great. A thousand strange and extraordinary ideas crossed their brains, and they expected some grand and superhuman apparition, which alone could come up to the notion they had formed of the mysterious genius of the island.

At midnight, Harding, carrying the lantern, descended to the beach to reconnoitre.

The engineer was not mistaken. The beginning of an immense excavation could be seen under the water. There the wire, bending at a right angle, entered the yawning gulf.

Cyrus Harding returned to his companions, and said simply--

"In an hour the opening will be practicable."

"It is there, then?" said Pencroft.

"Did you doubt it?" returned Harding.

"But this cavern must be filled with water to a certain height," observed Herbert.

"Either the cavern will be completely dry," replied Harding, "and in that case we can traverse it on foot, or it will not be dry, and some means of transport will be put at our disposal."

An hour passed. All climbed down through the rain to the level of the sea. There was now eight feet of the opening above the water. It was like the arch of a bridge, under which rushed the foaming water.

Leaning forward, the engineer saw a black object floating on the water. He drew it towards him. It was a boat, moored to some interior projection of the cave. This boat was iron-plated. Two oars lay at the bottom.
"Jump in!" said Harding.
In a moment the settlers were in the boat. Neb and Ayrton took the oars, Pencroft the rudder. Cyrus Harding in the bows, with the lantern, lighted the way.

The elliptical roof, under which the boat at first passed, suddenly rose; but the darkness was too deep, and the light of the lantern too slight, for either the extent, length, height, or depth of the cave to be ascertained. Solemn silence reigned in this basaltic cavern. Not a sound could penetrate into it, even the thunder peals could not pierce its thick sides.

Such immense caves exist in various parts of the world, natural crypts dating from the geological epoch of the globe. Some are filled by the sea; others contain entire lakes in their sides. Such is Fingal's Cave, in the island of Staffa, one of the Hebrides; such are the caves of Morgat, in the bay of Douarucuez, in Brittany, the caves of Bonifacier, in Corsica, those of Lyse-Fjord, in Norway; such are the immense Mammoth caverns in Kentucky, 500 feet in height, and more than twenty miles in length! In many parts of the globe, nature has excavated these caverns, and preserved them for the admiration of man.

Did the cavern which the settlers were now exploring extend to the centre of the island? For a quarter of an hour the boat had been advancing, making detours, indicated to Pencroft by the engineer in short sentences, when all at once--

"More to the right!" he commanded. The boat, altering its course, came up alongside the right wall. The engineer wished to see if the wire still ran along the side. The wire was there fastened to the rock. "Forward!" said Harding.

And the two oars, plunging into the dark waters, urged the boat onwards.

On they went for another quarter of an hour, and a distance of half-a-mile must have been cleared from the mouth of the cave, when Harding's voice was again heard. "Stop!" said he.

The boat stopped, and the colonists perceived a bright light illuminating the vast cavern, so deeply excavated in the bowels of the island, of which nothing had ever led them to suspect the existence.

At a height of a hundred feet rose the vaulted roof, supported on basalt shafts. Irregular arches, strange mouldings, appeared on the columns erected by nature in thousands from the first epochs of the formation of the globe. The basalt pillars, fitted one into the other, measured from forty to fifty feet in height, and the water, calm in spite of the tumult outside, washing their base. The brilliant focus of light, pointed out by the engineer, touched every point of rock, and flooded the walls with light. By reflection the water reproduced the brilliant sparkles, so that the boat appeared to be floating between two glittering zones.

They could not be mistaken in the nature of the irradiation thrown from the centre light, whose clear rays broke all the angles, all the projections of the cavern. This light proceeded from an electric source, and its white colour betrayed its origin. It was the sun of this cave, and it filled it entirely.

At a sign from Cyrus Harding the oars again plunged into the water, causing a regular shower of gems, and the boat was urged forward towards the light, which was now not more than half a cable's length distant.

At this place the breadth of the sheet of water measured nearly 350 feet, and beyond the dazzling centre could be seen an enormous basaltic wall, blocking up any issue on that side. The cavern widened here considerably, the sea forming a little lake. But the roof, the side walls, the end cliff, all the prisms, all the peaks, were flooded with the electric fluid, so that the brilliancy belonged to them, and as if the light issued from them.

In the centre of the lake a long cigar-shaped object floated on the surface of the water, silent, motionless. The brilliancy which issued from it escaped from its sides as from two kilns heated to a white heat. This apparatus, similar in shape to an enormous whale, was about 250 feet long, and rose about ten or twelve above the water.

The boat slowly approached it. Cyrus Harding stood up in the bows. He gazed, a prey to violent excitement. Then, all at once, seizing the reporter's arm--

"It is he! It can only be he!" he cried, "he!--"

Then, falling back on the seat, he murmured a name which Gideon Spilett alone could hear.

The reporter evidently knew this name, for it had a wonderful effect upon him, and he answered in a hoarse voice--

"He! an outlawed man!"

"He!" said Harding.

At the engineer's command the boat approached this singular floating apparatus. The boat touched the left side, from which escaped a ray of light through a thick glass.

Harding and his companions mounted on the platform. An open hatchway was there. All darted down the opening.

At the bottom of the ladder was a deck, lighted by electricity. At the end of this deck was a door, which Harding opened.

A richly-ornamented room, quickly traversed by the colonists, was joined to a library, over which a luminous
ceiling shed a flood of light.
At the end of the library a large door, also shut, was opened by the engineer.
An immense saloon—a sort of museum, in which were heaped up, with all the treasures of the mineral world, works of art, marvels of industry—appeared before the eyes of the colonists, who almost thought themselves suddenly transported into a land of enchantment.
Stretched on a rich sofa they saw a man, who did not appear to notice their presence.
Then Harding raised his voice, and to the extreme surprise of his companions, he uttered these words—
"Captain Nemo, you asked for us! We are here."

CHAPTER SIXTEEN.
CAPTAIN NEMO—HIS FIRST WORDS—THE HISTORY OF THE RECLUSE—HIS ADVENTURES—HIS
SENTIMENTS—HIS COMRADES—SUBMARINE LIFE—ALONE—THE LAST REFUGE OF THE NAUTILUS
IN LINCOLN ISLAND—THE MYSTERIOUS GENIUS OF THE ISLAND.
At these words the reclining figure rose, and the electric light fell upon his countenance; a magnificent head, the forehead high, the glance commanding, beard white, hair abundant and falling over the shoulders.
His hand rested upon the cushion of the divan from which he had just risen. He appeared perfectly calm. It was evident that his strength had been gradually undermined by illness, but his voice seemed yet powerful, as he said in English, and in a tone which evinced extreme surprise—
"Sir, I have no name."
"Nevertheless, I know you!" replied Cyrus Harding.
Captain Nemo fixed his penetrating gaze upon the engineer as though he were about to annihilate him.
Then, falling back amid the pillows of the divan—
"After all, what matters now?" he murmured; "I am dying!"
Cyrus Harding drew near the captain, and Gideon Spilett took his hand— it was of a feverish heat. Ayrton, Pencroft, Herbert, and Neb, stood respectfully apart in an angle of the magnificent saloon, whose atmosphere was saturated with the electric fluid.
Meanwhile Captain Nemo withdrew his hand, and motioned the engineer and the reporter to be seated.
All regarded him with profound emotion. Before them they beheld that being whom they had styled the "genius of the island," the powerful protector whose intervention, in so many circumstances, had been so efficacious, the benefactor to whom they owed such a debt of gratitude! Their eyes beheld a man only, and a man at the point of death, where Pencroft and Neb had expected to find an almost supernatural being!
But how happened it that Cyrus Harding had recognised Captain Nemo? Why had the latter so suddenly risen on hearing this name uttered, a name which he had believed known to none?
The captain had resumed his position on the divan, and leaning on his arm, he regarded the engineer, seated near him.
"You know the name I formerly bore, sir?" he asked.
"I do," answered Cyrus Harding, "and also that of this wonderful submarine vessel—"
"The Nautilus?" said the captain, with a faint smile.
"The Nautilus!"
"But do you—do you know who I am?"
"I do."
"It is nevertheless many years since I have held any communication with the inhabited world; three long years have I passed in the depths of the sea, the only place where I have found liberty! Who then can have betrayed my secret?"
"A man who was bound to you by no tie, Captain Nemo, and who, consequently, cannot be accused of treachery."
"The Frenchman who was cast on board my vessel by chance sixteen years since?"
"The same."
"He and his two companions did not then perish in the Maelstrom, in the midst of which the Nautilus was struggling."
"They escaped, and a book has appeared under the title of Twenty Thousand Leagues under the Sea, which contains your history."
"The history of a few months only of my life!" interrupted the captain impetuously.
"It is true," answered Cyrus Harding, "but a few months of that strange life have sufficed to make you known—"
"As a great criminal, doubtless!" said Captain Nemo, a haughty smile curling his lips. "Yes, a rebel, perhaps an
outlaw against humanity!"

The engineer was silent.

"Well, sir?"

"It is not for me to judge you, Captain Nemo," answered Cyrus Harding, "at any rate as regards your past life. I
am, with the rest of the world, ignorant of the motives which induced you to adopt this strange mode of existence,
and I cannot judge of effects without knowing their causes; but what I do know is, that a beneficent hand has
constantly protected us since our arrival on Lincoln Island, that we all owe our lives to a good, generous, and
powerful being, and that this being so powerful, good and generous, Captain Nemo, is yourself!"

"It is I," answered the captain simply.

The engineer and reporter rose. Their companions had drawn near, and the gratitude with which their hearts were
charged was about to express itself in their gestures and words.

Captain Nemo stopped them by a sign, and in a voice which betrayed more emotion than he doubtless intended
to show.

"Wait till you have heard all," he said. [See Note 1.]

And the captain, in a few concise sentences, ran over the events of his life.

His narrative was short, yet he was obliged to summon up his whole remaining energy to arrive at the end. He
was evidently contending against extreme weakness. Several times Cyrus Harding entreated him to repose for a
while, but he shook his head as a man to whom the morrow may never come, and when the reporter offered his
assistance--

"It is useless," he said; "my hours are numbered."

Captain Nemo was an Indian, the Prince Dakkar, son of a rajah of the then independent territory of Bundelkund.
His father sent him, when ten years of age, to Europe, in order that he might receive an education in all respects
complete, and in the hopes that by his talents and knowledge he might one day take a leading part in raising his long
degraded and heathen country to a level with the nations of Europe.

From the age of ten years to that of thirty Prince Dakkar, endowed by Nature with her richest gifts of intellect,
accumulated knowledge of every kind, and in science, literature, and art his researches were extensive and profound.

He travelled over the whole of Europe. His rank and fortune caused him to be everywhere sought after; but the
pleasures of the world had for him no attractions. Though young and possessed of every personal advantage, he was
ever grave--sombre even--devoured by an unquenchable thirst for knowledge, and cherishing in the recesses of his
heart the hope that he might become a great and powerful ruler of a free and enlightened people.

Still, for long the love of science triumphed over all other feelings. He became an artist deeply impressed by the
marvels of art, a philosopher to whom no one of the higher sciences was unknown, a statesman versed in the policy
of European courts. To the eyes of those who observed him superficially he might have passed for one of those
cosmopolitans, curious of knowledge, but disdaining action; one of those opulent travellers, haughty and cynical,
who move incessantly from place to place, and are of no country.

This artist, this philosopher, this man was, however, still cherishing the hope instilled into him from his earliest
days.

Prince Dakkar returned to Bundelkund in the year 1849. He married a noble Indian lady, who was imbued with
an ambition not less ardent than that by which he was inspired. Two children were born to them, whom they
tenderly loved. But domestic happiness did not prevent him from seeking to carry out the object at which he aimed.
He waited an opportunity. At length, as he vainly fancied, it presented itself.

Instigated by princes equally ambitious and less sagacious and more unscrupulous than he was, the people of
India were persuaded that they might successfully rise against their English rulers, who had brought them out of a
state of anarchy and constant warfare and misery, and had established peace and prosperity in their country. Their
ignorance and gross superstition made them the facile tools of their designing chiefs.

In 1857 the great sepoy revolt broke out. Prince Dakkar, under the belief that he should thereby have the
opportunity of attaining the object of his long-cherished ambition, was easily drawn into it. He forthwith devoted his
talents and wealth to the service of this cause. He aided it in person; he fought in the front ranks; he risked his life
equally with the humblest of the wretched and misguided fanatics; he was ten times wounded in twenty
engagements, seeking death but finding it not, when at length the sanguinary rebels were utterly defeated, and the
atrocious mutiny was brought to an end.

Never before had the British power in India been exposed to such danger, and if, as they had hoped, the sepoys
had received assistance from without, the influence and supremacy in Asia of the United Kingdom would have been
a thing of the past.

The name of Prince Dakkar was at that time well-known. He had fought openly and without concealment. A
price was set upon his head, but he managed to escape from his pursuers.

Prince Dakkar, unable to find that death he courted, returned to the mountain fastnesses of Bundelkund. There,
alone in the world, overcome by disappointment at the destruction of all his vain hopes, a prey to profound disgust
for all human beings, filled with hatred of the civilised world, he realised the wreck of his fortune, assembled some
score of his most faithful companions, and one day disappeared, leaving no trace behind.

Where, then, did he seek that liberty denied him upon the inhabited earth? Under the waves, in the depths of the
ocean, where none could follow.
The warrior became the man of science. Upon a deserted island of the Pacific he established his dockyard, and
there a submarine vessel was constructed from his designs. By methods which will at some future day be revealed
he had rendered subservient the illimitable forces of electricity, which, extracted from inexhaustible sources, was
employed for all the requirements of his floating equipage, as a moving, lighting, and heating agent. The sea, with
its countless treasures, its myriads of fish, its numberless wrecks, its enormous mammalia, and not only all that
nature supplied, but also all that man had lost in its depths, sufficed for every want of the prince and his crew--and
thus was his most ardent desire accomplished, never again to hold communication with the earth. He named his
submarine vessel the Nautilus, called himself simply Captain Nemo, and disappeared beneath the seas.

During many years this strange being visited every ocean, from pole to pole. Outcast of the inhabited earth in
these unknown worlds he gathered incalculable treasures. The millions lost in the Bay of Vigo, in 1702, by the
galleons of Spain, furnished him with a mine of inexhaustible riches which he devoted always, anonymously, in
favour of those nations who fought for the independence of their country. [See Note 2.]

For long, however, he had held no communication with his fellow-creatures, when, during the night of the 6th of
November, 1866, three men were cast on board his vessel. They were a French professor, his servant, and a
Canadian fisherman. These three men had been hurled overboard by a collision which had taken place between the
Nautilus and the United States frigate Abraham Lincoln, which had chased her.

Captain Nemo learnt from this professor that the Nautilus, taken now for a gigantic mammal of the whale
species, now for a submarine vessel carrying a crew of pirates, was sought for in every sea.

He might have returned these three men to the ocean, from whence chance had brought them in contact with his
mysterious existence. Instead of doing this he kept them prisoners, and during seven months they were enabled to
behold all the wonders of a voyage of twenty thousand leagues under the sea.

One of these ports was hollowed beneath Lincoln Island, and at this moment furnished an asylum to the
Nautilus.

One day, the 22nd of June, 1867, these three men, who knew nothing of the past history of Captain Nemo,
 succeeds in escaping in one of the Nautilus's boats. But as at this time the Nautilus was drawn into the vortex of the
Maelstrom, off the coast of Norway, the captain naturally believed that the fugitives, engulfed in that frightful
whirlpool, found their death at the bottom of the abyss. He was ignorant that the Frenchman and his two companions
had been miraculously cast on shore, that the fishermen of the Loffoden Islands had rendered them assistance, and
that the professor, on his return to France, had published that work in which seven months of the strange and
eventful navigation of the Nautilus were narrated and exposed to the curiosity of the public.

For a long time after this, Captain Nemo continued to live thus, traversing every sea. But one by one his
companions died, and found their last resting-place in their cemetery of coral, in the bed of the Pacific. At last
Captain Nemo remained the solitary survivor of all those who had taken refuge with him in the depths of the ocean.

He was now sixty years of age. Although alone, he succeeded in navigating the Nautilus towards one of those
submarine caverns which had sometimes served him as a harbour.

One of these ports was hollowed beneath Lincoln Island, and at this moment furnished an asylum to the
Nautilus.

The captain had now remained there six years, navigating the ocean no longer, but awaiting death, and that
moment when he should rejoin his former companions, when by chance he observed the descent of the balloon
which carried the prisoners of the Confederates. Clad in his diving-dress he was walking beneath the water at a few
cables' length from the shore of the island, when the engineer had been thrown into the sea. Moved by a feeling of
compassion the captain saved Cyrus Harding.

His first impulse was to fly from the vicinity of the five castaways; but his harbour of refuge was closed, for in
consequence of an elevation of the basalt, produced by the influence of volcanic action, he could no longer pass
through the entrance of the vault. Though there was sufficient depth of water to allow a light craft to pass the bar,
there was not enough for the Nautilus, whose draught of water was considerable.

Captain Nemo was compelled, therefore, to remain. He observed these men thrown without resources upon a
desert island, but had no wish to be himself discovered by them. By degrees he became interested in their efforts
when he saw them honest, energetic, and bound to each other by the ties of friendship. As if despite his wishes, he
penetrated all the secrets of their existence. By means of the diving-dress he could easily reach the well in the
interior of Granite House, and climbing by the projections of rock to its upper orifice he heard the colonists as they recounted the past, and studied the present and future. He learnt from them the tremendous conflict of America with America itself, for the abolition of slavery. Yes, these men were worthy to reconcile Captain Nemo with that humanity which they represented so nobly in the island.

Captain Nemo had saved Cyrus Harding. It was he also who had brought back the dog to the Chimneys, who rescued Top from the waters of the lake, who caused to fall at Flotsam Point the case containing so many things useful to the colonists, who conveyed the canoe back into the stream of the Mercy, who cast the cord from the top of Granite House at the time of the attack by the baboons, who made known the presence of Ayrton upon Tabor Island, by means of the document enclosed in the bottle, who caused the explosion of the brig by the shock of a torpedo placed at the bottom of the canal, who saved Herbert from a certain death by bringing the sulphate of quinine; and finally, it was he who had killed the convicts with the electric balls, of which he possessed the secret, and which he employed in the chase of submarine creatures. Thus were explained so many apparently supernatural occurrences, and which all proved the generosity and power of the captain.

Nevertheless, this noble misanthrope longed to benefit his proteges still further. There yet remained much useful advice to give them, and, his heart being softened by the approach of death, he invited, as we are aware, the colonists of Granite House to visit the Nautilus, by means of a wire which connected it with the corral. Possibly he would not have done this had he been aware that Cyrus Harding was sufficiently acquainted with his history to address him by the name of Nemo.

The captain concluded the narrative of his life. Cyrus Harding then spoke; he recalled all the incidents which had exercised so beneficent an influence upon the colony, and in the names of his companions and himself thanked the generous being to whom they owed so much.

But Captain Nemo paid little attention; his mind appeared to be absorbed by one idea, and without taking the proffered hand of the engineer--

"Now, sir," said he, "now that you know my history, your judgment!"

In saying this, the captain evidently alluded to an important incident witnessed by the three strangers thrown on board his vessel, and which the French professor had related in his work, causing a profound and terrible sensation. Some days previous to the flight of the professor and his two companions, the Nautilus, being chased by a frigate in the north of the Atlantic, had hurled herself as a ram upon this frigate, and sunk her without mercy.

Cyrus Harding understood the captain's allusion, and was silent.

"It was an enemy's frigate," exclaimed Captain Nemo, transformed for an instant into the Prince Dakkar, "an enemy's frigate! It was she who attacked me--I was in a narrow and shallow bay--the frigate barred my way--and I sank her!"

A few moments of silence ensued; then the captain demanded--

"What think you of my life, gentlemen?"

Cyrus Harding extended his hand to the ci-devant prince and replied gravely, "Sir, your error was in supposing that the past can be resuscitated, and in contending against inevitable progress. It is one of those errors which some admire, others blame; which God alone can judge. He who is mistaken in an action which he sincerely believes to be right may be an enemy, but retains our esteem. Your error is one that we may admire, and your name has nothing to fear from the judgment of history, which does not condemn heroic folly, but its results."

The old man's breast swelled with emotion, and raising his hand to heaven--

"Was I wrong, or in the right?" he murmured.

Cyrus Harding replied, "All great actions return to God, from whom they are derived. Captain Nemo, we, whom you have succoured, shall ever mourn your loss."

Herbert, who had drawn near the captain, fell on his knees and kissed his hand.

A tear glistened in the eyes of the dying man. "My child," he said, "may God bless you!"

Note 1. The history of Captain Nemo has, in fact, been published under the title of Twenty Thousand Leagues under the Sea. Here, therefore, will apply the observation already made as to the adventures of Ayrton with regard to the discrepancy of dates. Readers should therefore refer to the note already published on this point.

Note 2. This refers to the insurrection of the Candiotes, who were, in fact largely assisted by Captain Nemo.

CHAPTER SEVENTEEN.
LAST MOMENTS OF CAPTAIN NEMO--WISHES OF THE DYING MAN--A PARTING GIFT TO HIS FRIENDS OF A DAY--CAPTAIN NEMO'S COFFIN--ADVICE TO THE COLONISTS-- THE SUPREME MOMENT--AT THE BOTTOM OF THE SEA.
Day had returned. No ray of light penetrated into the profundity of the cavern. It being high-water, the entrance was closed by the sea. But the artificial light, which escaped in long streams from the skylights of the Nautilus, was as vivid as before, and the sheet of water shone around the floating vessel.

An extreme exhaustion now overcame Captain Nemo, who had fallen back upon the divan. It was useless to contemplate removing him to Granite House, for he had expressed his wish to remain in the midst of those marvels of the Nautilus which millions could not have purchased, and to await there for that death which was swiftly approaching.

During a long interval of prostration, which rendered him almost unconscious, Cyrus Harding and Gideon Spilett attentively observed the condition of the dying man. It was apparent that his strength was gradually diminishing. That frame, once so robust, was now but the fragile tenement of a departing soul. All of life was concentrated in the heart and head.

The engineer and reporter consulted in whispers. Was it possible to render any aid to the dying man? Might his life, if not saved, be prolonged for some days? He himself had said that no remedy could avail, and he awaited with tranquillity that death which had for him no terrors.

"We can do nothing," said Gideon Spilett.
"But of what is he dying?" asked Pencroft.
"Life is simply fading out," replied the reporter.
"Nevertheless," said the sailor, "if we moved him into the open air, and the light of the sun, he might perhaps recover."

"No, Pencroft," answered the engineer, "it is useless to attempt it. Besides, Captain Nemo would never consent to leave his vessel. He has lived for a dozen years on board the Nautilus, and on board the Nautilus he desires to die."

Without doubt Captain Nemo heard Cyrus Harding's reply, for he raised himself slightly, and in a voice more feeble, but always intelligible--
"You are right, sir," he said. "I shall die here--it is my wish; and therefore I have a request to make of you."

Cyrus Harding and his companions had drawn near the divan, and now arranged the cushions in such a manner as to better support the dying man.

They saw his eyes wander over all the marvels of this saloon, lighted by the electric rays which fell from the arabesques of the luminous ceiling. He surveyed, one after the other, the pictures hanging from the splendid tapestries of the partitions, the chef-d'oeuvres of the Italian, Flemish, French, and Spanish masters; the statues of marble and bronze on their pedestals; the magnificent organ, leaning against the after-partition; the aquarium, in which bloomed the most wonderful productions of the sea--marine plants, zoophytes, chaplets of pearls of inestimable value; and, finally, his eyes rested on this device, inscribed over the pediment of the museum--the motto of the Nautilus--

"Mobilis in mobile."

His glance seemed to rest fondly for the last time on these masterpieces of art and of nature, to which he had limited his horizon during a sojourn of so many years in the abysses of the seas.

Cyrus Harding respected the captain's silence, and waited till he should speak.

After some minutes, during which, doubtless, he passed in review his whole life, Captain Nemo turned to the colonists and said--
"You consider yourselves, gentlemen, under some obligations to me?"
"Captain, believe us that we would give our lives to prolong yours."
"Promise, then," continued Captain Nemo, "to carry out my last wishes, and I shall be repaid for all I have done for you."

"We promise," said Cyrus Harding.

And by this promise he bound both himself and his companions.
"Gentlemen," resumed the captain, "to-morrow I shall be dead."

Herbert was about to utter an exclamation, but a sign from the captain arrested him.

"To-morrow I shall die, and I desire no other tomb than the Nautilus. It is my grave! All my friends repose in the depths of the ocean; their resting-place shall be mine."

These words were received with profound silence.
"Pay attention to my wishes," he continued. "The Nautilus is imprisoned in this grotto, the entrance of which is blocked up; but, although egress is impossible, the vessel may at least sink in the abyss, and there bury my remains."

The colonists listened reverently to the words of the dying man.
"To-morrow, after my death, Mr Harding," continued the captain, "yourself and companions will leave the Nautilus, for all the treasures it contains must perish with me. One token alone will remain with you of Prince
Dakkar, with whose history you are now acquainted. That coffer yonder contains diamonds of the value of many millions, most of them mementoes of the time when, husband and father, I thought happiness possible for me, and a collection of pearls gathered by my friends and myself in the depths of the ocean. Of this treasure, at a future day, you may make good use. In the hands of such men as yourself and your comrades, Captain Harding, money will never be a source of danger. From on high I shall still participate in your enterprises, and I fear not but that they will prosper."

After a few moments’ repose, necessitated by his extreme weakness, Captain Nemo continued--

"To-morrow you will take the coffer, you will leave the saloon, of which you will close the door; then you will ascend onto the deck of the Nautilus, and you will lower the main-hatch so as entirely to close the vessel."

"It shall be done, captain," answered Cyrus Harding.

"Good. You will then embark in the canoe which brought you hither; but, before leaving the Nautilus, go to the stern and there open two large stop-cocks which you will find upon the water-line. The water will penetrate into the reservoirs, and the Nautilus will gradually sink beneath the water to repose at the bottom of the abyss."

And, comprehending a gesture of Cyrus Harding, the captain added--

"Fear nothing! You will but bury a corpse!"

Neither Cyrus Harding nor his companions ventured to offer any observation to Captain Nemo. He had expressed his last wishes, and they had nothing to do but to conform to them.

"I have your promise, gentlemen?" added Captain Nemo.

"You have, captain," replied the engineer.

The captain thanked the colonists by a sign, and requested them to leave him for some hours. Gideon Spilett wished to remain near him, in the event of a crisis coming on, but the dying man refused, saying, "I shall live until to-morrow, sir."

All left the saloon, passed through the library and the dining-room, and arrived forward, in the machine-room, where the electrical apparatus was established, which supplied not only heat and light but the mechanical power of the Nautilus.

The Nautilus was a masterpiece, containing masterpieces within itself, and the engineer was struck with astonishment.

The colonists mounted the platform, which rose seven or eight feet above the water. There they beheld a thick glass lenticular covering, which protected a kind of large eye, from which flashed forth light. Behind this eye was apparently a cabin containing the wheels of the rudder, and in which was stationed the helmsman, when he navigated the Nautilus over the bed of the ocean, which the electric rays would evidently light up to a considerable distance.

Cyrus Harding and his companions remained for a time silent, for they were vividly impressed by what they had just seen and heard, and their hearts were deeply touched by the thought that he whose arm had so often aided them, the protector whom they had known but a few hours, was at the point of death.

Whatever might be the judgment pronounced by posterity upon the events of this, so to speak, extra-human existence, the character of Prince Dakkar would ever remain as one of those whose memory time can never efface.

"What a man!" said Pencroft. "Is it possible that he can have lived at the bottom of the sea? And it seems to me that perhaps he has not found peace there any more than elsewhere."

"The Nautilus," observed Ayrton, "might have enabled us to leave Lincoln Island and reach some inhabited country."

"Good Heavens!" exclaimed Pencroft, "I for one would never risk myself in such a craft. To sail on the seas, good; but under the seas, never!"

"I believe, Pencroft," answered the reporter, "that the navigation of a submarine vessel such as the Nautilus ought to be very easy, and that we should soon become accustomed to it. There would be no storms, no lee-shore to fear. At some feet beneath the surface the waters of the ocean are as calm as those of a lake."

"That may be," replied the sailor, "but I prefer a gale of wind on board a well-found craft. A vessel is built to sail on the sea, and not beneath it."

"My friends," said the engineer, "it is useless, at any rate as regards the Nautilus, to discuss the question of submarine vessels. The Nautilus is not ours, and we have not the right to dispose of it. Moreover, we could in no case avail ourselves of it. Independently of the fact that it would be impossible to get it out of this cavern, whose entrance is now closed by the uprising of the basaltic rocks, Captain Nemo's wish is that it shall be buried with him. His wish is our law, and we will fulfil it."

After a somewhat prolonged conversation, Cyrus Harding and his companions again descended to the interior of the Nautilus. There they took some refreshment and returned to the saloon.

Captain Nemo had somewhat rallied from the prostration which had overcome him, and his eyes shone with
their wonted fire. A faint smile even curled his lips.

The colonists drew around him.

"Gentlemen," said the captain, "you are brave and honest men. You have devoted yourselves to the common weal. Often have I observed your conduct. I have esteemed you--I esteem you still! Your hand, Mr Harding!"

Cyrus Harding gave his hand to the captain, who clasped it affectionately.

"It is well!" he murmured.

He resumed--

"But enough of myself. I have to speak concerning yourselves, and this Lincoln Island, upon which you have taken refuge. You desire to leave it?"

"To return, captain!" answered Pencroft quickly.

"To return, Pencroft?" said the captain, with a smile. "I know, it is true, your love for this island. You have helped to make it what it now is, and it seems to you a paradise!"

"Our project, captain," interposed Cyrus Harding, "is to annex it to the United States, and to establish for our shipping a port so fortunately situated in this part of the Pacific."

"Your thoughts are with your country, gentlemen," continued the captain; "your toils are for her prosperity and glory. You are right. One's native land!--there should one live! there die! And I! I die far from all I loved!"

"You have some last wish to transmit," said the engineer with emotion, "some souvenir to send to those friends you have left in the mountains of India?"

"No, Captain Harding; no friends remain to me! I am the last of my race, and to all whom I have known I have long been as are the dead.-- But to return to yourselves. Solitude, isolation, are painful things, and beyond human endurance. I die of having thought it possible to live alone! You should, therefore, dare all in the attempt to leave Lincoln Island, and see once more the land of your birth. I am aware that those wretches have destroyed the vessel you had built."

"We propose to construct a vessel," said Gideon Spilett, "sufficiently large to convey us to the nearest land; but if we should succeed, sooner or later we shall return to Lincoln Island. We are attached to it by too many recollections ever to forget it."

"It is here that we have known Captain Nemo," said Cyrus Harding.

"It is here only that we can make our home!" added Herbert.

"And here shall I sleep the sleep of eternity, if--" replied the captain.

He paused for a moment, and, instead of completing the sentence, said simply--

"Mr Harding, I wish to speak with you--alone!"

The engineer's companions, respecting the wish of the dying man, retired.

Cyrus Harding remained but a few minutes alone with Captain Nemo, and soon recalled his companions; but he said nothing to them of the private matters which the dying man had confided to him.

Gideon Spilett now watched the captain with extreme care. It was evident that he was no longer sustained by his moral energy, which had lost the power of reaction against his physical weakness.

The day closed without change. The colonists did not quit the Nautilus for a moment. Night arrived, although it was impossible to distinguish it from day in the cavern.

Captain Nemo suffered no pain, but he was visibly sinking. His noble features, paled by the approach of death, were perfectly calm. Inaudible words escaped at intervals from his lips, bearing upon various incidents of his chequered career. Life was evidently ebbing slowly, and his extremities were already cold.

Once or twice more he spoke to the colonists who stood around him, and smiled on them with that last smile which continues after death.

At length, shortly after midnight, Captain Nemo by a supreme effort succeeded in folding his arms across his breast, as if wishing in that attitude to compose himself for death.

By one o'clock his glance alone showed signs of life. A dying light gleamed in those eyes once so brilliant. Then, murmuring the words, "God and my country!" he quietly expired.

Cyrus Harding, bending low, closed the eyes of him who had once been the Prince Dakkar, and was now not even Captain Nemo.

Herbert and Pencroft sobbed aloud. Tears fell from Ayrton's eyes. Neb was on his knees by the reporter's side, motionless as a statue.

Then Cyrus Harding, extending his hand over the forehead of the dead, said solemnly--

"May his soul be with God! Let us pray!"

Some hours later the colonists fulfilled the promise made to the captain by carrying out his dying wishes.

Cyrus Harding and his companions quitted the Nautilus, taking with them the only memento left them by their benefactor, that coffer which contained wealth amounting to millions.
The marvellous saloon, still flooded with light, had been carefully closed. The iron door leading on deck was then securely fastened in such a manner as to prevent even a drop of water from penetrating to the interior of the Nautilus.

The colonists then descended into the canoe, which was moored to the side of the submarine vessel. The canoe was now brought round to the stern. There, at the water-line, were two large stop-cocks, communicating with the reservoirs employed in the submersion of the vessel.

The stop-cocks were opened, the reservoirs filled, and the Nautilus, slowly sinking, disappeared beneath the surface of the lake.

But the colonists were yet able to follow its descent through the waves. The powerful light it gave forth lighted up the translucent water, while the cavern became gradually obscure. At length this vast effusion of electric light faded away, and soon after the Nautilus, now the tomb of Captain Nemo, reposed in its ocean bed.

CHAPTER EIGHTEEN.

At break of day the colonists regained in silence the entrance of the cavern, to which they gave the name of "Dakkar Grotto," in memory of Captain Nemo. It was now low-water, and they passed without difficulty under the arcade, washed on the right by the sea.

The canoe was left here, carefully protected from the waves. As an excess of precaution, Pencroft, Neb, and Ayrton drew it up on a little beach which bordered one of the sides of the grotto, in a spot where it could run no risk of harm.

The storm had ceased during the night. The last low mutterings of the thunder died away in the west. Rain fell no longer, but the sky was yet obscure by clouds. On the whole, this month of October, the first of the southern spring, was not ushered in by satisfactory tokens, and the wind had a tendency to shift from one point of the compass to another, which rendered it impossible to count upon settled weather.

Cyrus Harding and his companions, on leaving Dakkar Grotto, had taken the road to the corral. On their way Neb and Herbert were careful to preserve the wire which had been laid down by the captain between the corral and the grotto, in a spot where it could run no risk of harm.

The colonists spoke but little on the road. The various incidents of the night of the 15th October had left a profound impression on their minds. The unknown being whose influence had so effectually protected them, the man whom their imagination had endowed with supernatural powers, Captain Nemo, was no more. His Nautilus and he were buried in the depths of the abyss. To each one of them their existence seemed even more isolated than before. They had been accustomed to count upon the intervention of that power which existed no longer, and Gideon Spilett, and even Cyrus Harding, could not escape this impression. Thus they maintained a profound silence during their journey to the corral.

Towards nine in the morning the colonists arrived at Granite House.

It had been agreed that the construction of the vessel should be actively pushed forward, and Cyrus Harding more than ever devoted his time and labour to this object. It was impossible to divine what future lay before them. Evidently the advantage to the colonists would be great of having at their disposal a substantial vessel, capable of keeping the sea even in heavy weather, and large enough to attempt, in case of need, a voyage of some duration. Even if, when their vessel should be completed, the colonists should not resolve to leave Lincoln Island as yet, in order to gain either one of the Polynesian archipelagos of the Pacific or the shores of New Zealand, they might at least, sooner or later, proceed to Tabor Island, to leave there the notice relating to Ayrton. This was a precaution rendered indispensable by the possibility of the Scotch yacht reappearing in those seas, and it was of the highest importance that nothing should be neglected on this point.

The works were then resumed. Cyrus Harding, Pencroft, and Ayrton, assisted by Neb, Gideon Spilett, and Herbert, except when unavoidably called off by other necessary occupations, worked without cessation. It was important that the new vessel should be ready in five months—thus to say, by the beginning of March—if they wished to visit Tabor Island before the equinoctial gales rendered the voyage impracticable. Therefore the carpenters lost not a moment. Moreover, it was unnecessary to manufacture rigging, that of the Speedy having been saved entire, so that the hull only of the vessel needed to be constructed.

The end of the year 1868 found them occupied by these important labours, to the exclusion of almost all others. At the expiration of two months and a half the ribs had been set up and the first planks adjusted. It was already
evident that the plans made by Cyrus Harding were admirable, and that the vessel would behave well at sea.

Pencroft brought to the task a devouring energy, and scrupled not to grumble when one or the other abandoned the carpenter's axe for the gun of the hunter. It was nevertheless necessary to keep up the stores of Granite House, in view of the approaching winter. But this did not satisfy Pencroft. The brave honest sailor was not content when the workmen were not at the dockyard. When this happened he grumbled vigorously, and, by way of venting his feelings, did the work of six men.

The weather was very unfavourable during the whole of the summer season. For some days the heat was overpowering, and the atmosphere, saturated with electricity, was only cleared by violent storms. It was rarely that the distant growling of the thunder could not be heard, like a low but incessant murmur, such as is produced in the equatorial regions of the globe.

The 1st of January, 1869, was signalised by a storm of extreme violence, and the thunder burst several times over the island. Large trees were struck by the electric fluid and shattered, and among others one of those gigantic micocouliers which shaded the poultry-yard at the southern extremity of the lake. Had this meteor any relation to the phenomena going on in the bowels of the earth? Was there any connection between the commotion of the atmosphere and that of the interior of the earth? Cyrus Harding was inclined to think that such was the case, for the development of these storms was attended by the renewal of volcanic symptoms.

It was on the 3rd of January that Herbert, having ascended at daybreak to the plateau of Prospect Heights to harness one of the onagas, perceived an enormous hat-shaped cloud rolling from the summit of the volcano.

"Ah!" exclaimed Pencroft, "those are not vapours this time! It seems to me that the giant is not content with breathing; he must smoke!"

This figure of speech employed by the sailor exactly expressed the changes going on at the mouth of the volcano. Already for three months had the crater emitted vapours more or less dense, but which were as yet produced only by an internal ebullition of mineral substances. But now the vapours were replaced by a thick smoke, rising in the form of a greyish column, more than three hundred feet in width at its base, and which spread like an immense mushroom to a height of from seven to eight hundred feet above the summit of the mountain.

"The fire is in the chimney," observed Gideon Spilett.

"And we can't put it out!" replied Herbert.

"The volcano ought to be swept," observed Neb, who spoke as if perfectly serious.

"Well said, Neb!" cried Pencroft, with a shout of laughter; "and you'll undertake the job, no doubt?"

Cyrus Harding attentively observed the dense smoke emitted by Mount Franklin, and even listened, as if expecting to hear some distant muttering. Then, turning towards his companions, from whom he had gone somewhat apart, he said--

"The truth is, my friends, we must not conceal from ourselves that an important change is going forward. The volcanic substances are no longer in a state of ebullition, they have caught fire, and we are undoubtedly menaced by an approaching eruption."

"Well, captain," said Pencroft, "we shall witness the eruption; and if it is a good one, we'll applaud it. I don't see that we need concern ourselves further about the matter."

"It may be so," replied Cyrus Harding, "for the ancient track of the lava is still open; and thanks to this, the crater has hitherto overflowed towards the north. And yet--"

"And yet, as we can derive no advantage from an eruption, it might be better it should not take place," said the reporter.

"Who knows?" answered the sailor. "Perhaps there may be some valuable substance in this volcano, which it will spout forth, and which we may turn to good account!"

Cyrus Harding shook his head with the air of a man who augured no good from the phenomenon whose developments had been so sudden. He did not regard so lightly as Pencroft the results of an eruption. If the lava, in consequence of the position of the crater, did not directly menace the wooded and cultivated parts of the island, other complications might present themselves. In fact, eruptions are not unfrequently accompanied by earthquakes; and an island of the nature of Lincoln Island formed of substances so varied, basalt on one side, granite on the other, lava on the north, rich soil on the south, substances which consequently could not be firmly attached to each other, would be exposed to the risk of disintegration. Although, therefore, the spreading of the volcanic matter might not constitute a serious danger, any movement of the terrestrial structure which should shake the island might entail the gravest consequences.

"It seems to me," said Ayrton, who had reclined so as to place his ear to the ground, "it seems to me that I can hear a dull, rumbling sound, like that of a wagon loaded with bars of iron."

The colonists listened with the greatest attention, and were convinced that Ayrton was not mistaken. The
rumbling was mingled with a subterranean roar, which formed a sort of rinforzando, and died slowly away, as if some violent storm had passed through the profundities of the globe. But no explosion, properly so termed, could be heard. It might therefore be concluded that the vapours and smoke found a free passage through the central shaft; and that the safety-valve being sufficiently large, no convulsion would be produced, no explosion was to be apprehended.

"Well, then!" said Pencroft, "are we not going back to work? Let Mount Franklin smoke, groan, bellow, or spout forth fire and flame as much as it pleases, that is no reason why we should be idle! Come, Ayrton, Neb, Herbert, Captain Harding, Mr Spilett, every one of us must turn to at our work to-day! We are going to place the keelson, and a dozen pair of hands would not be too many. Before two months I want our new Bonadventure--for we shall keep the old name, shall we not?--to float on the waters of Port Balloon! Therefore there is not an hour to lose!"

All the colonists, their services thus requisitioned by Pencroft, descended to the dockyard, and proceeded to place the keelson, a thick mass of wood which forms the lower portion of a ship and unites firmly the timbers of the hull. It was an arduous undertaking, in which all took part.

They continued their labours during the whole of this day, the 3rd of January, without thinking further of the volcano, which could not, besides, be seen from the shore of Granite House. But once or twice, large shadows, veiling the sun, which described its diurnal arc through an extremely clear sky, indicated that a thick cloud of smoke passed between its disc and the island. The wind, blowing on the shore, carried all these vapours to the westward. Cyrus Harding and Gideon Spilett remarked these sombre appearances, and from time to time discussed the evident progress of the volcanic phenomena, but their work went on without interruption. It was, besides, of the first importance from every point of view, that the vessel should be finished with the least possible delay. In presence of the eventualities which might arise, the safety of the colonists would be to a great extent secured by their ship. Who could tell that it might not prove some day their only refuge?

In the evening, after supper, Cyrus Harding, Gideon Spilett, and Herbert, again ascended the plateau of Prospect Heights. It was already dark, and the obscurity would permit them to ascertain if flames or incandescent matter thrown up by the volcano were mingled with the vapour and smoke accumulated at the mouth of the crater.

"The crater is on fire!" said Herbert, who, more active than his companions, first reached the plateau.

Mount Franklin, distant about six miles, now appeared like a gigantic torch, around the summit of which turned fuliginous flames. So much smoke, and possibly scoriae and cinders were mingled with them, that their light gleamed but faintly amid the gloom of the night. But a kind of lurid brilliancy spread over the island, against which stood out confusedly the wooded masses of the heights. Immense whirlwinds of vapour obscured the sky, through which glimmered a few stars.

"The change is rapid!" said the engineer. "That is not surprising," answered the reporter. "The re-awakening of the volcano already dates back some time. You may remember, Cyrus, that the first vapours appeared about the time we searched the sides of the mountain to discover Captain Nemo’s retreat. It was, if I mistake not, about the 15th of October."

"Yes," replied Herbert, "two months and a half ago!"

"The subterranean fires have therefore been smouldering for ten weeks," resumed Gideon Spilett, "and it is not to be wondered at that they now break out with such violence!"

"Do not you feel a certain vibration of the soil?" asked Cyrus Harding.

"Yes," replied Gideon Spilett, "but there is a great difference between that and an earthquake."

"I do not affirm that we are menaced with an earthquake," answered Cyrus Harding, "may God preserve us from that! No; these vibrations are due to the effervescence of the central fire. The crust of the earth is simply the shell of a boiler, and you know that such a shell, under the pressure of steam, vibrates like a sonorous plate. It is this effect which is being produced at this moment."

"What magnificent flames!" exclaimed Herbert.

At this instant a kind of bouquet of flames shot forth from the crater, the brilliancy of which was visible even through the vapours. Thousands of luminous sheets and barbed tongues of fire were cast in various directions. Some, extending beyond the dome of smoke, dissipated it, leaving behind an incandescent powder. This was accompanied by successive explosions, resembling the discharge of a battery of mitrailleuses.

Cyrus Harding, the reporter, and Herbert, after spending an hour on the plateau of Prospect Heights, again descended to the beach, and returned to Granite House. The engineer was thoughtful and preoccupied, so much so, indeed, that Gideon Spilett inquired if he apprehended any immediate danger, of which the eruption might directly or indirectly be the cause.

"Yes, and no," answered Cyrus Harding.

"Nevertheless," continued the reporter, "would not the greatest misfortune which could happen to us be an earthquake which would overturn the island? Now, I do not suppose that this is to be feared, since the vapours and
lava have found a free outlet."

"True," replied Cyrus Harding, "and I do not fear an earthquake in the sense in which the term is commonly
applied to convulsions of the soil provoked by the expansion of subterranean gases. But other causes may produce
great disasters."

"How so, my dear Cyrus?"

"I am not certain. I must consider. I must visit the mountain. In a few days I shall learn more on this point."

Gideon Spilett said no more, and soon, in spite of the explosions of the volcano, whose intensity increased, and
which were repeated by the echoes of the island, the inhabitants of Granite House were sleeping soundly.

Three days passed by—the 4th, 5th, and 6th of January. The construction of the vessel was diligently continued,
and without offering further explanations the engineer pushed forward the work with all his energy. Mount Franklin
was now hooded by a sombre cloud of sinister aspect, and, amid the flames, vomited forth incandescent rocks, some
of which fell back into the crater itself. This caused Pencroft, who would only look at the matter in the light of a
joke, to exclaim—

"Ah! the giant is playing at cup and ball; he is a conjuror."

In fact, the substances thrown up fell back again into the abyss, and it did not seem that the lava, though swollen
by the internal pressure, had yet risen to the orifice of the crater. At any rate, the opening on the north-east, which
was partly visible, poured out no torrent upon the northern slope of the mountain.

Nevertheless, however pressing was the construction of the vessel, other duties demanded the presence of the
colonists on various portions of the island. Before everything it was necessary to go to the corral, where the flocks of
musmons and goats were enclosed, and replenish the provision of forage for those animals. It was accordingly
arranged that Ayrton should proceed thither the next day, the 7th of January; and as he was sufficient for the task, to
which he was accustomed, Pencroft and the rest were somewhat surprised on hearing the engineer say to Ayrton—

"As you are going to-morrow to the corral I will accompany you."

"But, Captain Harding," exclaimed the sailor, "our working days will not be many, and if you go also we shall be
two pair of hands short!"

"We shall return to-morrow," replied Cyrus Harding, "but it is necessary that I should go to the corral. I must
learn how the eruption is progressing."

"The eruption! always the eruption!" answered Pencroft, with an air of discontent. "An important thing, truly,
this eruption! I trouble myself very little about it."

Whatever might be the sailor's opinion, the expedition projected by the engineer was settled for the next day.
Herbert wished to accompany Cyrus Harding, but he would not vex Pencroft by his absence.

The next day, at dawn, Cyrus Harding and Ayrton, mounting the cart drawn by two onagas, took the road to the
 corral and set off at a round trot.

Above the forest were passing large clouds, to which the crater of Mount Franklin incessantly added fuliginous
matter. These clouds, which rolled heavily in the air, were evidently composed of heterogeneous substances. It was
not alone from the volcano that they derived their strange opacity and weight. Scorias, in a state of dust, like
powdered pumice-stone, and greyish ashes as small as the finest feculae, were held in suspension in the midst of
their thick folds. These ashes are so fine that they have been observed in the air for whole months. After the eruption
of 1783 in Iceland for upwards of a year the atmosphere was thus charged with volcanic dust through which the rays
of the sun were only with difficulty discernible.

But more often this pulverised matter falls, and this happened on the present occasion. Cyrus Harding and
Ayrton had scarcely reached the corral when a sort of black snow like fine gunpowder fell, and instantly changed the
appearance of the soil. Trees, meadows, all disappeared beneath a covering several inches in depth. But, very
fortunately, the wind blew from the north-east, and the greater part of the cloud dissolved itself over the sea.

"This is very singular, Captain Harding," said Ayrton.

"It is very serious," replied the engineer. "This powdered pumice-stone, all this mineral dust, proves how grave
is the convulsion going forward in the lower depths of the volcano."

"But can nothing be done?"

"Nothing, except to note the progress of the phenomenon. Do you, therefore, Ayrton, occupy yourself with the
necessary work at the corral. In the meantime I will ascend just beyond the source of Red Creek and examine the
condition of the mountain upon its northern aspect. Then—"

"Well, Captain Harding?"

"Then we will pay a visit to Dakkar Grotto. I wish to inspect it. At any rate I will come back for you in two
hours."

Ayrton then proceeded to enter the corral, and, while waiting the engineer's return, busied himself with the
musmons and goats, which seemed to feel a certain uneasiness in presence of these first signs of an eruption.
Meanwhile Cyrus Harding ascended the crest of the eastern spur, passed Red Creek, and arrived at the spot where he and his companions had discovered a sulphureous spring at the time of their first exploration.

How changed was everything! Instead of a single column of smoke he counted thirteen, forced through the soil as if violently propelled by some piston. It was evident that the crust of the earth was subjected in this part of the globe to a frightful pressure. The atmosphere was saturated with gases and carbonic acid, mingled with aqueous vapours. Cyrus Harding felt the volcanic tufa with which the plain was strewn, and which were but pulverised cinders hardened into solid blocks by time, tremble beneath him, but he could discover no traces of fresh lava.

The engineer became more assured of this when he observed all the northern part of Mount Franklin. Pillars of smoke and flame escaped from the crater; a hail of scoriæ fell on the ground; but no current of lava burst from the mouth of the volcano, which proved that the volcanic matter had not yet attained the level of the superior orifice of the central shaft.

"But I would prefer that it were so," said Cyrus Harding to himself. "At any rate, I should then know that the lava had followed its accustomed track. Who can say that they may not take a new course? But the danger does not consist in that! Captain Nemo foresaw it clearly! No, the danger does not lie there!"

Cyrus Harding advanced towards the enormous causeway whose prolongation enclosed the narrow Shark Gulf. He could now sufficiently examine on this side the ancient channels of the lava. There was no doubt in his mind that the most recent eruption had occurred at a far-distant epoch.

He then returned by the same way, listening attentively to the subterranean mutterings which rolled like long-continued thunder, interrupted by deafening explosions. At nine in the morning he reached the corral.

Ayrton awaited him.

"The animals are cared for, Captain Harding," said Ayrton.

"Good, Ayrton."

"They seem uneasy, Captain Harding."

"Yes, instinct speaks through them, and instinct is never deceived."

"Are you ready?"

"Take a lamp, Ayrton," answered the engineer; "we will start at once."

Ayrton did as desired. The onagas, unharnessed, roamed in the corral. The gate was secured on the outside, and Cyrus Harding, preceding Ayrton, took the narrow path which led westward to the shore.

The soil they walked upon was choked with the pulverised matter fallen from the cloud. No quadruped appeared in the woods. Even the birds had fled. Sometimes a passing breeze raised the covering of ashes, and the two colonists, enveloped in a whirlwind of dust, lost sight of each other. They were then careful to cover their eyes and mouths with handkerchiefs, for they ran the risk of being blinded and suffocated.

It was impossible for Cyrus Harding and Ayrton, with these impediments, to make rapid progress. Moreover, the atmosphere was close, as if the oxygen had been partly burnt up, and had become unfit for respiration. At every hundred paces they were obliged to stop to take breath. It was therefore past ten o’clock when the engineer and his companion reached the crest of the enormous mass of rocks of basalt and porphyry which composed the north-west coast of the island.

Ayrton and Cyrus Harding commenced the descent of this abrupt declivity, following almost step for step the difficult path which, during that stormy night, had led them to Dakkar Grotto. In open day the descent was less perilous, and, besides, the bed of ashes which covered the polished surface of the rock enabled them to make their footing more secure.

The ridge at the end of the shore, about forty feet in height, was soon reached. Cyrus Harding recollected that this elevation gradually sloped towards the level of the sea. Although the tide was at present low, no beach could be seen, and the waves, thickened by the volcanic dust, beat upon the basaltic rocks.

Cyrus Harding and Ayrton found without difficulty the entrance to Dakkar Grotto, and paused for a moment at the last rock before it.

"The iron boat should be there," said the engineer.

"It is here, Captain Harding," replied Ayrton, drawing towards him the fragile craft, which was protected by the arch of a vault.

"On board, Ayrton!"

The two colonists stepped into the boat. A slight undulation of the waves carried it farther under the low arch of the crypt, and there Ayrton, with the aid of flint and steel, lighted the lamp. He then took the oars, and the lamp having been placed in the bow of the boat, so that its rays fell before them, Cyrus Harding took the helm and steered through the shades of the grotto.

The Nautilus was there no longer to illuminate the cavern with its electric light. Possibly it might not yet be extinguished, but no ray escaped from the depths of the abyss in which reposed all that was mortal of Captain Nemo.
The light afforded by the lamp, although feeble, nevertheless enabled the engineer to advance slowly, following
the wall of the cavern. A deathlike silence reigned under the vaulted roof, or at least in the anterior portion, for soon
Cyrus Harding distinctly heard the rumbling which proceeded from the bowels of the mountain.
"That comes from the volcano," he said.
Besides these sounds, the presence of chemical combinations was soon betrayed by their powerful odour, and
the engineer and his companion were almost suffocated by sulphureous vapours.
"This is what Captain Nemo feared," murmured Cyrus Harding, changing countenance. "We must go to the end,
notwithstanding."
"Forward!" replied Ayrton, bending to his oars and directing the boat towards the head of the cavern.
Twenty-five minutes after entering the mouth of the grotto the boat reached the extreme end.
Cyrus Harding then, standing up, cast the light of the lamp upon the walls of the cavern which separated it from
the central shaft of the volcano. What was the thickness of this wall? It might be ten feet or a hundred feet—it was
impossible to say. But the subterranean sounds were too perceptible to allow of the supposition that it was of any
great thickness.
The engineer, after having explored the wall at a certain height horizontally, fastened the lamp to the end of an
oar, and again surveyed the basaltic wall at a greater elevation.
There, through scarcely visible clefts and joinings, escaped a pungent vapour, which infected the atmosphere of
the cavern. The wall was broken by large cracks, some of which extended to within two or three feet of the water's
edge.
Cyrus Harding thought for a brief space. Then he said in a low voice—
"Yes! the captain was right! The danger lies there, and a terrible danger!"
Ayrton said not a word, but, upon a sign from Cyrus Harding, resumed the oars, and half an hour later the
engineer and he reached the entrance of Dakkar Grotto.

CHAPTER NINETEEN.
CYRUS HARDING GIVES AN ACCOUNT OF HIS EXPLORATION--THE CONSTRUCTION OF THE
SHIP PUSHED FORWARD--A LAST VISIT TO THE CORRAL--THE BATTLE BETWEEN FIRE AND
WATER--ALL THAT REMAINS OF THE ISLAND--IT IS DECIDED TO LAUNCH THE VESSEL--THE
NIGHT OF THE 8TH OF MARCH.
The next day, the 8th of January, after a day and night passed at the corral, where they left all in order, Cyrus
Harding and Ayrton arrived at Granite House.
The engineer immediately called his companions together, and informed them of the imminent danger which
threatened Lincoln Island, and from which no human power could deliver them.
"My friends," he said, and his voice betrayed the depth of his emotion, "our island is not among those which will
endure while this earth endures. It is doomed to more or less speedy destruction, the cause of which it bears within
itself, and from which nothing can save it."
The colonists looked at each other, then at the engineer. They did not clearly comprehend him.
"Explain yourself, Cyrus!" said Gideon Spilett.
"I will do so," replied Cyrus Harding, "or rather I will simply afford you the explanation which, during our few
minutes of private conversation, was given me by Captain Nemo."
"Captain Nemo!" exclaimed the colonists.
"Yes, and it was the last service he desired to render us before his death!"
"The last service!" exclaimed Pencroft, "the last service! You will see that though he is dead he will render us
others yet!"
"But what did the captain say?" inquired the reporter.
"I will tell you, my friends," said the engineer. "Lincoln Island does not resemble the other islands of the Pacific,
and a fact of which Captain Nemo has made me cognisant must sooner or later bring about the subversion of its
foundation."
"Nonsense! Lincoln Island, it can't be!" cried Pencroft, who, in spite of the respect he felt for Cyrus Harding,
could not prevent a gesture of incredulity.
"Listen, Pencroft," resumed the engineer, "I will tell you what Captain Nemo communicated to me, and which I
myself confirmed yesterday, during the exploration of Dakkar Grotto. This cavern stretches under the island as far as
the volcano, and is only separated from its central shaft by the wall which terminates it. Now, this wall is seamed
with fissures and clefts which already allow the sulphureous gases generated in the interior of the volcano to
escape."
"Well?" said Pencroft, his brow suddenly contracting.

"Well, then, I saw that these fissures widen under the internal pressure from within, that the wall of basalt is gradually giving way, and that after a longer or shorter period it will afford a passage to the waters of the lake which fill the cavern."

"Good!" replied Pencroft, with an attempt at pleasantry. "The sea will extinguish the volcano, and there will be an end of the matter!"

"Not so!" said Cyrus Harding, "should a day arrive when the sea, rushing through the wall of the cavern, penetrates by the central shaft into the interior of the island to the boiling lava, Lincoln Island will that day be blown into the air--just as would happen to the island of Sicily were the Mediterranean to precipitate itself into Mount Etna."

The colonists made no answer to these significant words of the engineer. They now understood the danger by which they were menaced.

It may be added that Cyrus Harding had in no way exaggerated the danger to be apprehended. Many persons have formed an idea that it would be possible to extinguish volcanoes, which are almost always situated on the shores of a sea or lake, by opening a passage for the admission of the water. But they are not aware that this would be to incur the risk of blowing up a portion of the globe, like a boiler whose steam is suddenly expanded by intense heat. The water, rushing into a cavity whose temperature might be estimated at thousands of degrees, would be converted into steam with a sudden energy which no enclosure could resist.

It was not therefore doubtful that the island, menaced by a frightful and approaching convulsion, would endure only so long as the wall of Dakkar Grotto itself should endure. It was not even a question of months, nor of weeks; but of days, it might be of hours.

The first sentiment which the colonists felt was that of profound sorrow. They thought not so much of the peril which menaced themselves personally, but of the destruction of the island which had sheltered them, which they had cultivated, which they loved so well, and had hoped to render so flourishing. So much effort ineffectually expended, so much labour lost.

Pencroft could not prevent a large tear from rolling down his cheek, nor did he attempt to conceal it.

Some further conversation now took place. The chances yet in favour of the colonists were discussed; but finally it was agreed that there was not an hour to be lost, that the building and fitting of the vessel should be pushed forward with their utmost energy, and that this was the sole chance of safety for the inhabitants of Lincoln Island.

All hands, therefore, set to work on the vessel. What could it now avail to sow, to reap, to hunt, to increase the stores of Granite House? The contents of the store-house and outbuildings contained more than sufficient to provide the ship for a voyage, however long might be its duration. But it was imperative that the ship should be ready to receive them before the inevitable catastrophe should arrive.

Their labours were now carried on with feverish ardour. By the 23rd of January the vessel was half-decked over. Up to this time no change had taken place in the summit of the volcano. Vapour and smoke mingled with flames and incandescent stones were thrown up from the crater. But during the night of the 23rd, in consequence of the lava attaining the level of the first stratum of the volcano, the hat-shaped cone which formed over the latter disappeared. A frightful sound was heard. The colonists at first thought the island was rent asunder, and rushed out of Granite House.

This occurred about two o'clock in the morning.

The sky appeared on fire. The superior cone, a mass of rock a thousand feet in height, and weighing thousands of millions of pounds, had been thrown down upon the island, making it tremble to its foundation. Fortunately, this cone inclined to the north, and had fallen upon the plain of sand and tufa stretching between the volcano and the sea. The aperture of the crater being thus enlarged projected towards the sky a glare so intense that by the simple effect of reflection the atmosphere appeared red-hot. At the same time a torrent of lava, bursting from the new summit, poured out in long cascades, like water escaping from a vase too full, and a thousand tongues of fire crept over the sides of the volcano.

"The corral! the corral!" exclaimed Ayrton.

It was, in fact, towards the corral that the lava was rushing, as the new crater faced the east, and consequently the fertile portions of the island, the springs of Red Creek and Jacamar Wood, were menaced with instant destruction.

At Ayrton's cry the colonists rushed to the onagas' stables. The cart was at once harnessed. All were possessed by the same thought--to hasten to the corral and set at liberty the animals it enclosed.

Before three in the morning they arrived at the corral. The cries of the terrified musmons and goats indicated the alarm which possessed them. Already a torrent of burning matter and liquefied minerals fell from the side of the mountain upon the meadows as far as the side of the palisade. The gate was burst open by Ayrton, and the animals, bewildered with terror, fled in all directions.
An hour afterwards the boiling lava filled the corral, converting into vapour the water of the little rivulet which ran through it, burning up the house like dry grass, and leaving not even a post of the palisade to mark the spot where the corral once stood.

To contend against this disaster would have been folly--nay, madness. In presence of Nature's grand convulsions man is powerless.

It was now daylight--the 24th of January. Cyrus Harding and his companions, before returning to Granite House, desired to ascertain the probable direction this inundation of lava was about to take. The soil sloped gradually from Mount Franklin to the east coast, and it was to be feared that, in spite of the thick Jacamar Wood, the torrent would reach the plateau of Prospect Heights.

"The lake will cover us," said Gideon Spilett.

"I hope so!" was Cyrus Harding's only reply.

The colonists were desirous of reaching the plain upon which the superior cone of Mount Franklin had fallen, but the lava arrested their progress. It had followed, on one side, the valley of Red Creek, and on the other that of Falls River, evaporating those watercourses in its passage. There was no possibility of crossing the torrent of lava; on the contrary, the colonists were obliged to retreat before it. The volcano, without its crown, was no longer recognisable, terminated as it was by a sort of flat table which replaced the ancient crater. From two openings in its southern and eastern sides an unceasing flow of lava poured forth, thus forming two distinct streams. Above the new crater a cloud of smoke and ashes, mingled with those of the atmosphere, massed over the island. Loud peals of thunder broke, and could scarcely be distinguished from the rumblings of the mountain, whose mouth vomited forth ignited rocks, which, hurled to more than a thousand feet, burst in the air like shells. Flashes of lightning rivalled in intensity the volcano's eruption.

Towards seven in the morning the position was no longer tenable by the colonists, who accordingly took shelter in the borders of Jacamar Wood. Not only did the projectiles begin to rain around them, but the lava, overflowing the bed of Red Creek, threatened to cut off the road to the corral. The nearest rows of trees caught fire, and their sap, suddenly transformed into vapour, caused them to explode with loud reports, whilst others, less moist, remained unhurt in the midst of the inundation.

The colonists had again taken the road to the corral. They proceeded but slowly, frequently looking back; but, in consequence of the inclination of the soil, the lava gained rapidly in the east, and as its lower waves became solidified, others at boiling heat covered them immediately.

Meanwhile, the principal stream of Red Creek valley became more and more menacing. All this portion of the forest was on fire, and enormous wreaths of smoke rolled over the trees, whose trunks were already consumed by the lava. The colonists halted near the lake, about half a mile from the mouth of Red Creek. A question of life or death was now to be decided.

Cyrus Harding, accustomed to the consideration of important crises, and aware that he was addressing men capable of hearing the truth, whatever it might be, then said--

"Either the lake will arrest the progress of the lava, and a part of the island will be preserved from utter destruction, or the stream will overrun the forests of the Far West, and not a tree or plant will remain on the surface of the soil. We shall have no prospect but that of starvation upon these barren rocks--a death which will probably be anticipated by the explosion of the island."

"In that case," replied Pencroft, folding his arms and stamping his foot, "what's the use of working any longer on the vessel?"

"Pencroft," answered Cyrus Harding, "we must do our duty to the last!"

At this instant the river of lava, after having broken a passage through the noble trees it devoured in its course, reached the borders of the lake. At this point there was an elevation of the soil which, had it been greater, might have sufficed to arrest the torrent.

"To work!" cried Cyrus Harding.

The engineer's thought was at once understood. It might be possible to dam, as it were, the torrent, and thus compel it to pour itself into the lake.

The colonists hastened to the dockyard. They returned with shovels, picks, axes, and by means of banking the earth with the aid of fallen trees they succeeded in a few hours in raising an embankment three feet high and some hundreds of paces in length. It seemed to them, when they had finished, as if they had scarcely been working more than a few minutes.

It was not a moment too soon. The liquefied substances soon after reached the bottom of the barrier. The stream of lava swelled like a river about to overflow its banks, and threatened to demolish the sole obstacle which could prevent it from overrunning the whole Far West. But the dam held firm, and after a moment of terrible suspense the torrent precipitated itself into Grant Lake from a height of twenty feet.
The colonists, without moving or uttering a word, breathlessly regarded this strife of the two elements.

What a spectacle was this conflict between water and fire! What pen could describe the marvellous horror of this scene—what pencil could depict it? The water hissed as it evaporated by contact with the boiling lava. The vapour whirled in the air to an immeasurable height, as if the valves of an immense boiler had been suddenly opened. But, however considerable might be the volume of water contained in the lake, it must eventually be absorbed, because it was not replenished, whilst the stream of lava, fed from an inexhaustible source, rolled on without ceasing new waves of incandescent matter.

The first waves of lava which fell in the lake immediately solidified, and accumulated so as speedily to emerge from it. Upon their surface fell other waves, which in their turn became stone, but a step nearer the centre of the lake. In this manner was formed a pier which threatened to gradually fill up the lake, which could not overflow, the water displaced by the lava being evaporated. The hissing of the water rent the air with a deafening sound, and the vapour, blown by the wind, fell in rain upon the sea. The pier became longer and longer, and the blocks of lava piled themselves one on another. Where formerly stretched the calm waters of the lake now appeared an enormous mass of smoking rocks, as if an upheaving of the soil had formed immense shoals. Imagine the waters of the lake aroused by a hurricane, then suddenly solidified by an intense frost, and some conception may be formed of the aspect of the lake three hours after the irruption of this irresistible torrent of lava.

This time water would be vanquished by fire.

Nevertheless it was a fortunate circumstance for the colonists that the effusion of lava should have been in the direction of Lake Grant. They had before them some days' respite. The plateau of Prospect Heights, Granite House, and the dockyard were for the moment preserved. And these few days it was necessary to employ them in planking, carefully caulking the vessel, and launching her. The colonists would then take refuge on board the vessel, content to rig her after she should be afloat on the waters. With the danger of an explosion which threatened to destroy the island there could be no security on shore. The walls of Granite House, once so sure a retreat, might at any moment fall in upon them.

During the six following days, from the 25th to the 30th of January, the colonists accomplished as much of the construction of their vessel as twenty men could have done. They hardly allowed themselves a moment's repose, and the glare of the flames which shot from the crater enabled them to work night and day. The flow of lava continued, but perhaps less abundantly. This was fortunate, for Lake Grant was almost entirely choked up, and if more lava should accumulate it would inevitably spread over the plateau of Prospect Heights, and thence upon the beach.

But if the island was thus partially protected on this side, it was not so with the western part.

In fact, the second stream of lava, which had followed the valley of Falls River, a valley of great extent, the land on both sides of the creek being flat, met with no obstacle. The burning liquid had then spread through the forest of the Far West. At this period of the year, when the trees were dried up by a tropical heat, the forest caught fire instantaneously, in such a manner that the conflagration extended itself both by the trunks of the trees and by their higher branches, whose interlacement favoured its progress. It even appeared that the current of flame spread more rapidly among the summits of the trees than the current of lava at their bases.

Thus it happened that the wild animals, jaguars, wild boars, cabybaras, koulas, and game of every kind, mad with terror, had fled to the banks of the Mercy and to the Tadorn Marsh, beyond the road to Port Balloon. But the colonists were too much occupied with their task to pay any attention to even the most formidable of these animals. They had abandoned Granite House, and would not even take shelter at the Chimneys, but encamped under a tent, near the mouth of the Mercy.

Each day Cyrus Harding and Gideon Spilett ascended the plateau of Prospect Heights. Sometimes Herbert accompanied them, but never Pencroft, who could not bear to look upon the prospect of the island now so utterly devastated.

It was, in truth, a heartrending spectacle. All the wooded part of the island was now completely bare. One single clump of green trees raised their heads at the extremity of Serpentine Peninsula. Here and there were a few grotesque blackened and branchless stumps. The site of the devastated forest was even more barren than Tadorn Marsh. The irruption of the lava had been complete. Where formerly sprang up that charming verdure, the soil was now nothing but a savage mass of volcanic tufa. In the valleys of the Falls and Mercy rivers no drop of water now flowed towards the sea, and should Lake Grant be entirely dried up, the colonists would have no means of quenching their thirst. But, fortunately, the lava had spared the southern corner of the lake, containing all that remained of the drinkable water of the island. Towards the north-west stood out the rugged and well-defined outlines of the sides of the volcano, like a gigantic claw hovering over the island. What a sad and fearful sight, and how painful to the colonists, who, from a fertile domain covered with forests, irrigated by watercourses, and enriched by the produce of their toils, found themselves, as it were, transported to a desolate rock, upon which, but for their reserves of provisions, they could not even gather the means of subsistence!
"It is enough to break one's heart!" said Gideon Spilett, one day.

"Yes, Spilett," answered the engineer. "May God grant us the time to complete this vessel, now our sole refuge!"

"Do not you think, Cyrus, that the violence of the eruption has somewhat lessened? The volcano still vomits forth lava, but somewhat less abundantly, if I mistake not."

"It matters little," answered Cyrus Harding. "The fire is still burning in the interior of the mountain, and the sea may break in at any moment. We are in the condition of passengers whose ship is devoured by a conflagration which they cannot extinguish, and who know that sooner or later the flames must reach the powder-magazine. To work, Spilett, to work, and let us not lose an hour!"

During eight days more, that is to say until the 7th of February, the lava continued to flow, but the eruption was confined within the previous limits. Cyrus Harding feared above all lest the liquefied matter should overflow the shore, for in that event the dockyard could not escape. Moreover, about this time the colonists felt in the frame of the island vibrations which alarmed them to the highest degree.

It was the 20th of February. Yet another month must elapse before the vessel would be ready for sea. Would the island hold together till then? The intention of Pencroft and Cyrus Harding was to launch the vessel as soon as the hull should be complete. The deck, the upper-works, the interior woodwork and the rigging, might be finished afterwards, but the essential point was that the colonists should have an assured refuge away from the island. Perhaps it might be even better to conduct the vessel to Port Balloon, that is to say, as far as possible from the centre of eruption, for at the mouth of the Mercy, between the islet and the wall of granite, it would run the risk of being crushed in the event of any convulsion. All the exertions of the voyagers were therefore concentrated upon the completion of the hull.

Thus the 3rd of March arrived, and they might calculate upon launching the vessel in ten days.

Hope revived in the hearts of the colonists, who had, in this fourth year of their sojourn on Lincoln Island, suffered so many trials. Even Pencroft lost in some measure the sombre taciturnity occasioned by the devastation and ruin of his domain. His hopes, it is true, were concentrated upon his vessel.

"We shall finish it," he said to the engineer, "we shall finish it, captain, and it is time, for the season is advancing and the equinox will soon be here. Well, if necessary, we must put in to Tabor Island to spend the winter. But think of Tabor Island after Lincoln Island. Ah, how unfortunate! Who could have believed it possible?"

"Let us get on," was the engineer's invariable reply.

And they worked away without losing a moment.

"Master," asked Neb, a few days later, "do you think all this could have happened if Captain Nemo had been still alive?"

"Certainly, Neb," answered Cyrus Harding.

"I, for one, don't believe it!" whispered Pencroft to Neb.

"Nor I!" answered Neb seriously.

During the first week of March appearances again became menacing. Thousands of threads like glass, formed of fluid lava, fell like rain upon the island. The crater was again boiling with lava which overflowed the back of the volcano. The torrent flowed along the surface of the hardened tufa, and destroyed the few meagre skeletons of trees which had withstand the first eruption. The stream flowing this time towards the south-west shore of Lake Grant, stretched beyond Creek Glycerine, and invaded the plateau of Prospect Heights. This last blow to the work of the colonists was terrible. The mill, the buildings of the inner court, the stables, were all destroyed. The affrighted poultry fled in all directions. Top and Jup showed signs of the greatest alarm, as if their instinct warned them of an impending catastrophe. A large number of the animals of the island had perished in the first eruption. Those which survived found no refuge but Tadorn Marsh, save a few to which the plateau of Prospect Heights afforded an asylum. But even this last retreat was now closed to them, and the lava-torrent, flowing over the edge of the granite wall, began to pour down upon the beach its cataracts of fire. The sublime horror of this spectacle passed all description. During the night it could only be compared to a Niagara of molten fluid, with its incandescent vapours above and its boiling masses below.

The colonists were driven to their last entrenchment, and although the upper seams of the vessel were not yet caulked, they decided to launch her at once.

Pencroft and Ayrton therefore set about the necessary preparations for the launch, which was to take place the morning of the next day, the 9th of March.

But, during the night of the 8th an enormous column of vapour escaping from the crater rose with frightful explosions to a height of more than three thousand feet. The wall of Dakkar Grotto had evidently given way under the pressure of the gases, and the sea, rushing through the central shaft into the igneous gulf, was at once converted into vapour. But the crater could not afford a sufficient outlet for this vapour. An explosion, which might have been heard at a distance of a hundred miles, shook the air. Fragments of mountains fell into the Pacific, and, in a few
minutes, the ocean rolled over the spot where Lincoln Island once stood.

CHAPTER TWENTY.

AN ISOLATED ROCK IN THE PACIFIC--THE LAST REFUGE OF THE COLONISTS OF LINCOLN ISLAND--DEATH THEIR ONLY PROSPECT--UNEXPECTED SUCCOUR--WHY AND HOW IT ARRIVES--A LAST KINDNESS--AN ISLAND ON TERRA FIRMA--THE TOMB OF CAPTAIN PRINCE DAKkar NEMO.

An isolated rock, thirty feet in length, twenty in breadth, scarcely ten from the water's edge, such was the only solid point which the waves of the Pacific had not engulfed.

It was all that remained of the structure of Granite House! The wall had fallen headlong and been then shattered to fragments, and a few of the rocks of the large room were piled one above another to form this point. All around had disappeared in the abyss; the inferior cone of Mount Franklin, rent asunder by the explosion; the lava jaws of Shark Gulf, the plateau of Prospect Heights, Safety Islet, the granite rocks of Port Balloon, the basaltis of Dakkar Grotto, the long Serpentine Peninsula, so distant nevertheless from the centre of the eruption. All that could now be seen of Lincoln Island was the narrow rock which now served as a refuge to the six colonists and their dog Top.

The animals had also perished in the catastrophe; the birds, as well as those representing the fauna of the island--all either crushed or drowned, and the unfortunate Jup himself had, alas! found his death in some crevice of the soil.

If Cyrus Harding, Gideon Spilett, Herbert, Pencroft, Neb, and Ayrton had survived, it was because, assembled under their tent, they had been hurled into the sea at the instant when the fragments of the island rained down on every side.

When they reached the surface they could only perceive, at half a cable's length, this mass of rocks, towards which they swam and on which they found footing.

On this barren rock they had now existed for nine days. A few provisions taken from the magazine of Granite House before the catastrophe, a little fresh water from the rain which had fallen in a hollow of the rock, was all that the unfortunate colonists possessed. Their last hope, the vessel, had been shattered to pieces. They had no means of quitting the reef; no fire, nor any means of obtaining it. It seemed that they must inevitably perish.

This day, the 18th of March, there remained only provisions for two days, although they limited their consumption to the bare necessities of life. All their science and intelligence could avail them nothing in their present position. They were in the hand of God.

Cyrus Harding was calm, Gideon Spilett more nervous, and Pencroft, a prey to sullen anger, walked to and fro on the rock. Herbert did not for a moment quit the engineer's side as if demanding from him that assistance he had no power to give. Neb and Ayrton were resigned to their fate.

"Ah, what a misfortune! what a misfortune!" often repeated Pencroft. "If we had but a walnut-shell to take us to Tabor Island! But we have nothing, nothing!"

"Captain Nemo did right to die," said Neb.

During the five ensuing days Cyrus Harding and his unfortunate companions husbanded their provisions with the most extreme care, eating only what would prevent them from succumbing to starvation. Their weakness was extreme. Herbert and Neb began to show symptoms of delirium.

Under these circumstances was it possible for them to retain even the shadow of a hope? No! What was their sole remaining chance? That a vessel should appear in sight off the rock? But they knew only too well from experience that no ships ever visited this part of the Pacific. Could they calculate that, by a truly providential coincidence, the Scotch yacht would arrive precisely at this time in search of Ayrton at Tabor Island? It was scarcely probable; and, besides, supposing she should come there, as the colonists had not been able to deposit a notice pointing out Ayrton's change of abode, the commander of the yacht, after having explored Tabor Island without result, would again set sail and return to lower latitudes.

No! no hope of being saved could be retained, and a horrible death, death from hunger and thirst, awaited them upon this rock.

Already they were stretched on the rock, inanimate, and no longer conscious of what passed around them. Ayrton alone, by a supreme effort, from time to time raised his head, and cast a despairing glance over the desert ocean.

But on the morning of the 24th of March Ayrton's arms were extended towards a point in the horizon; he raised himself, at first on his knees, then upright, and his hand seemed to make a signal.

A sail was in sight off the rock. She was evidently not without an object. The reef was the mark for which she was making in a direct line, under all steam, and the unfortunate colonists might have made her out some hours before if they had had the strength to watch the horizon.

"The Duncan!" murmured Ayrton--and fell back without sign of life.
When Cyrus Harding and his companions recovered consciousness, thanks to the attention lavished upon them, they found themselves in the cabin of a steamer, without being able to comprehend how they had escaped death.

A word from Ayrton explained everything.

"The Duncan!" he murmured.

"The Duncan!" exclaimed Cyrus Harding. And raising his hand to Heaven, he said, "Oh! Almighty God! mercifully hast Thou preserved us!"

It was, in fact, the Duncan, Lord Glenarvan's yacht, now commanded by Robert, son of Captain Grant, who had been despatched to Tabor Island to find Ayrton, and bring him back to his native land after twelve years of expiation.

The colonists were not only saved, but already on the way to their native country.

"Captain Grant," asked Cyrus Harding, "who can have suggested to you the idea, after having left Tabor Island, where you did not find Ayrton, of coming a hundred miles farther north-east?"

"Captain Harding," replied Robert Grant, "it was in order to find, not only Ayrton, but yourself and your companions."

"My companions and myself?"

"Doubtless, at Lincoln Island."

"At Lincoln Island!" exclaimed in a breath Gideon Spilett, Herbert, Neb, and Pencroft, in the highest degree astonished.

"How could you be aware of the existence of Lincoln Island?" inquired Cyrus Harding, "it is not even named in the charts."

"I knew of it from a document left by you on Tabor Island," answered Robert Grant.

"A document?" cried Gideon Spilett.

"Without doubt, and here it is;" answered Robert Grant, producing a paper which indicated the longitude and latitude of Lincoln Island, "the present residence of Ayrton and five American colonists."

"It is Captain Nemo!" cried Cyrus Harding, after having read the notice, and recognised that the handwriting was similar to that of the paper found at the corral.

"Ah!" said Pencroft, "it was then he who took our Bonadventure and hazarded himself alone to go to Tabor Island!"

"In order to leave this notice," added Herbert.

"I was then right in saying," exclaimed the sailor, "that even after his death the captain would render us a last service."

"My friends," said Cyrus Harding, in a voice of the profoundest emotion, "may the God of mercy have had pity on the soul of Captain Nemo, our benefactor!"

The colonists uncovered themselves at these last words of Cyrus Harding, and murmured the name of Captain Nemo.

Then Ayrton, approaching the engineer, said simply, "Where should this coffer be deposited?"

It was the coffer which Ayrton had saved at the risk of his life, at the very instant that the island had been engulfed, and which he now faithfully handed to the engineer.

"Ayrton! Ayrton!" said Cyrus Harding, deeply touched. Then, addressing Robert Grant, "Sir," he added, "you left behind you a criminal; you find in his place a man who has become honest by penitence, and whose hand I am proud to clasp in mine."

Robert Grant was now made acquainted with the strange history of Captain Nemo and the colonists of Lincoln Island. Then, observations being taken of what remained of this shoal, which must henceforward figure on the charts of the Pacific, the order was given to make all sail.

A few weeks afterwards the colonists landed in America, and found their country once more at peace after the terrible conflict in which right and justice had triumphed.

Of the treasures contained in the coffer left by Captain Nemo to the colonists of Lincoln Island, the larger portion was employed in the purchase of a vast territory in the State of Iowa. One pearl alone, the finest, was reserved from the treasure and sent to Lady Glenarvan in the name of the castaways restored to their country by the Duncan.

There, upon this domain, the colonists invited to labour, that is to say, to wealth and happiness, all those to whom they had hoped to offer the hospitality of Lincoln Island. There was founded a vast colony to which they gave the name of that island sunk beneath the waters of the Pacific. A river was there called the Mercy, a mountain took the name of Mount Franklin, a small lake was named Lake Grant, and the forests became the forests of the Far West. It might have been an island on terra firma.

There, under the intelligent hands of the engineer and his companions, everything prospered. Not one of the
former colonists of Lincoln Island was absent, for they had sworn to live always together. Neb was with his master; Ayton was there ready to sacrifice himself for all; Pencroft was more a farmer than he had even been a sailor; Herbert, who completed his studies under the superintendence of Cyrus Harding; and Gideon Spilett, who founded the New Lincoln Herald, the best-informed journal in the world.

There Cyrus Harding and his companions received at intervals visits from Lord and Lady Glenarvan, Captain John Mangles and his wife, the sister of Robert Grant, Robert Grant himself, Major McNab, and all those who had taken part in the history both of Captain Grant and Captain Nemo.

There, to conclude, all were happy, united in the present as they had been in the past; but never could they forget that island upon which they had arrived poor and friendless, that island which, during four years, had supplied all their wants, and of which there remained but a fragment of granite washed by the waves of the Pacific, the tomb of him who had borne the name of Captain Nemo.

FINIS.

THE SURVIVORS OF THE CHANCELLOR.
DIARY OF J.R.KAZALLON, PASSENGER.
By Jules Verne

CHAPTER I.

CHARLESTON, SEPTEMBER 27th, 1869.--It is high tide, and three o'clock in the afternoon when we leave the Battery-quay; the ebb carries us off shore, and as Captain Huntly has hoisted both main and top sails, the northerly breeze drives the "Chancellor" briskly across the bay. Fort Sumter ere long is doubled, the sweeping batteries of the mainland on our left are soon passed, and by four o'clock the rapid current of the ebbing tide has carried us through the harbour-mouth.

But as yet we have not reached the open sea; we have still to thread our way through the narrow channels which the surge has hollowed out amongst the sand-banks. The captain takes a south-west course, rounding the lighthouse at the corner of the fort; the sails are closely trimmed; the last sandy point is safely coasted, and at length, at seven o'clock in the evening; we are out free upon the wide Atlantic.

The "Chancellor" is a fine square-rigged three-master, of 900 tons burden, and belongs to the wealthy Liverpool firm of Laird Brothers. She is two years old, is sheathed and secured with copper, her decks being of teak, and the base of all her masts, except the mizzen, with all their fittings, being of iron. She is registered first class A I, and is now on her third voyage between Charleston and Liverpool. As she wended her way through the channels of Charleston harbour, it was the British flag that was lowered from her mast-head; but without colours at all, no sailor could have hesitated for a moment in telling her nationality,—for English she was, and nothing but English from her water-line upwards to the truck of her masts.

I must now relate how it happens that I have taken my passage on board the "Chancellor" on her return voyage to England. At present there is no direct steamship service between South Carolina and Great Britain, and all who wish to cross must go either northwards to New York or southwards to New Orleans. It is quite true that if I had chosen to start from New York I might have found plenty of vessels belonging to English, French, or Hamburg lines, any of which would have conveyed me by a rapid voyage to my destination; and it is equally true that if I had selected New Orleans for my embarkation I could readily have reached Europe by one of the vessels of the National Steam Navigation Company, which join the French Transatlantic line of Colon and Aspinwall. But it was fated to be otherwise.

One day, as I was loitering about the Charleston quays, my eye lighted upon this vessel. There was something about the "Chancellor" that pleased me, and a kind of involuntary impulse took me on board, where I found the internal arrangements perfectly comfortable. Yielding to the idea that a voyage in a sailing vessel had certain charms beyond the transit in a steamer, and reckoning that with wind and wave in my favour there would be little material difference in time; considering, moreover, that in these low latitudes the weather in early autumn is fine and unbroken, I came to my decision, and proceeded forthwith to secure my passage by this route to Europe.

Have I done right or wrong? Whether I shall have reason to regret my determination is a problem to be solved in the future. However, I will begin to record the incidents of our daily experience, dubious as I feel whether the lines of my chronicle will ever find a reader.

CHAPTER II.
SEPTEMBER 28th.--John Silas Huntly, the captain of the "Chancellor," has the reputation of being an experienced navigator of the Atlantic. He is a Scotchman, a native of Dundee, and is about fifty years of age. He is of middle height and slight build, and has a small head, which he has a habit of holding a little over his left shoulder. I do not pretend to be much of a physiognomist, but I am inclined to believe that my few hours' acquaintance with our captain has given me considerable insight into his character. That he is a good seaman and thoroughly understands his duties I could not for a moment venture to deny; but that he is a man of resolute temperament, or that he possesses the amount of courage that would render him, physically or morally, capable of coping with any great emergency, I confess I cannot believe. I observe a certain heaviness and dejection about his whole carriage. His wavering glances, the listless motions of his hands, and his slow, unsteady gait, all seem to me to indicate a weak and sluggish disposition. He does not appear as though he could be energetic enough ever to be stubborn; he never frowns, sets his teeth, or clenches his fist. There is something enigmatical about him; however, I shall study him closely and do what I can to understand the man who, as commander of a vessel, should be to those around him "second only to God."

Unless I am greatly mistaken there is another man on board who, if circumstances should require it, would take the more prominent position—I mean the mate. I have hitherto, however, had such little opportunity of observing his character, that I must defer saying more about him at present.

Besides the captain and this mate, whose name is Robert Curtis, our crew consists of Walter, the lieutenant, the boatswain, and fourteen sailors, all English or Scotch, making eighteen altogether, a number quite sufficient for working a vessel of 900 tons burden. Up to this time my sole experience of their capabilities is, that under the command of the mate, they brought us skillfully enough through the narrow channels of Charleston; and I have no reason to doubt but that they are well up to their work.

My list of the ship's officials is incomplete unless I mention Hobart, the steward, and Jynxstrop, the negro cook.

In addition to these, the "Chancellor" carries eight passengers, including myself. Hitherto, the bustle of embarkation, the arrangement of cabins, and all the variety of preparations inseparable from starting on a voyage for at least twenty or five-and-twenty days have precluded the formation of any acquaintanceships; but the monotony of the voyage, the close proximity into which we must be thrown, and the natural curiosity to know something of each other's affairs, will doubtless lead us in due time to an interchange of ideas. Two days have elapsed and I have not even seen all the passengers. Probably sea-sickness has prevented some of them from making their appearance at the common table. One thing, however, I do know; namely, that there are two ladies occupying the stern-cabins, the windows of which are in the aft-board of the vessel.

I have seen the ship's list and subjoin a list of the passengers. They are as follow:--Mr. and Mrs. Kear, Americans, of Buffalo. Miss Herbey, a young English lady, companion to Mrs. Kear. M. Letourneur and his son Andre, Frenchmen, of Havre. William Falsten, a Manchester engineer. John Ruby, a Cardiff merchant; and myself, J. R. Kazallon, of London.

CHAPTER III.

SEPTEMBER 29th.—Captain Huntly's bill of lading, that is to say, the document that describes the "Chancellor's" cargo and the conditions of transport, is couched in the following terms:--

"BRONSFIELD AND CO., AGENTS, CHARLESTON.

"I, John Silas Huntly, of Dundee, Scotland, commander of the ship 'Chancellor,' of about 900 tons burden, now at Charleston, do purpose, by the blessing of God, at the earliest convenient season, and by the direct route, to sail for the port of Liverpool, where I shall obtain my discharge. I do hereby acknowledge that I have received from you, Messrs. Bronsfeld and Co., Commission Agents, Charleston, and have placed the same under the gun-deck of the aforesaid ship, seventeen hundred bales of cotton, of the estimated value of 26,000l., all in good condition, marked and numbered as in the margin; which goods I do undertake to transport to Liverpool, and there to deliver, free from injury (save only such injury as shall have been caused by the chances of the sea), to Messrs. Laird Brothers, or to their order, or to their representative, who shall on due delivery of the said freight pay me the sum of 2000l. inclusive, according to the charter-party and damages in addition, according to the usages and customs of the sea.

"And for the fulfillment of the above covenant, I have pledged and do pledge my person, my property, and my interest in the vessel aforesaid, with all its appurtenances. In witness whereof, I have signed three agreements, all of the same purport; on the condition that when the terms of one are accomplished, the other two shall be absolutely null and void.

"Given at Charleston, September 13th, 1869,

"J. S. HUNTLY."

From the foregoing document it will be understood that the "Chancellor" is conveying 1700 bales of cotton to
Liverpool; that the shippers are Bronsfield, of Charleston, and the consignees are Laird Brothers, of Liverpool. The ship was constructed with the especial design of carrying cotton, and the entire hold, with the exception of a very limited space reserved for passengers' luggage, is closely packed with the bales. The lading was performed with the utmost care, each bale being pressed into its proper place by the aid of screw-jacks, so that the whole freight forms one solid and compact mass; not an inch of space is wasted, and the vessel is thus made capable of carrying her full complement of cargo.

CHAPTER IV.
SEPTEMBER 30th to OCTOBER 6th.--The "Chancellor" is a rapid sailer, and more than a match for many a vessel of the same dimensions. She scuds along merrily in the freshening breeze, leaving in her wake, far as the eye can reach, a long white line of foam as well defined as a delicate strip of lace stretched upon an azure ground.

The Atlantic is not visited by many gales, and I have every reason to believe that the rolling and pitching of the vessel no longer incommode any of the passengers, who are all more or less accustomed to the sea. A vacant seat at our table is now very rare; we are beginning to know something about each other, and our daily life, in consequence, is becoming somewhat less monotonous.

M. Letourneur, our French fellow-passenger, often has a chat with me. He is a fine tall man, about fifty years of age, with white hair and a grizzly beard. To say the truth, he looks older than he really is: his drooping head, his dejected manner, and his eye, ever and again suffused with tears, indicate that he is haunted by some deep and abiding sorrow. He never laughs; he rarely even smiles, and then only on his son: his countenance ordinariily bearing a look of bitterness tempered by affection, while his general expression is one of caressing tenderness. It excites an involuntary commiseration to learn that M. Letourneur is consuming himself by exaggerated reproaches on account of the infirmity of an afflicted son.

Andre Letourneur is about twenty years of age, with a gentle, interesting countenance, but, to the irrepressible grief of his father, is a hopeless cripple. His left leg is miserably deformed, and he is quite unable to walk without the assistance of a stick. It is obvious that the father's life is bound up with that of his son; his devotion is unceasing; every thought, every glance is for Andre; he seems to anticipate his most trifling wish, watches his slightest movement, and his arm is ever ready to support or otherwise assist the child whose sufferings he more than shares.

M. Letourneur seems to have taken a peculiar fancy to myself, and constantly talks about Andre. This morning, in the course of conversation, I said,--

"You have a good son, M. Letourneur. I have just been talking to him. He is a most intelligent young man."

"Yes, Mr. Kazallon," replied M. Letourneur, brightening up into a smile, "his afflicted frame contains a noble mind. He is like his mother, who died at his birth."

"He is full of reverence and love for you, sir," I remarked.

"Dear boy!" muttered the father half to himself. "Ah, Mr. Kazallon," he continued, "you do not know what it is to a father to have a son a cripple, beyond hope of cure."

"M. Letourneur," I answered, "you take more than your share of the affliction which has fallen upon you and your son. That M. Andre is entitled to the very greatest commiseration no one can deny; but you should remember, that after all a physical infirmity is not so hard to bear as mental grief. Now, I have watched your son pretty closely, and unless I am much mistaken there is nothing, that troubles him so much as the sight of your own sorrow."

"But I never let him see it," he broke in hastily. "My sole thought is how to divert him. I have discovered, that in spite of his physical weakness, he delights in travelling; so for the last few years we have been constantly on the move. We first went all over Europe, and are now returning from visiting the principal places in the United States. I never allowed my son to go to college, but instructed him entirely myself, and these travels, I hope, will serve to complete his education. He is very intelligent, and has a lively imagination, and I am sometimes tempted to hope that in contemplating the wonders of nature he forgets his own infirmity."

"Yes, sir, of course he does," I assented.

"But," continued M. Letourneur, taking my hand, "although, perhaps, HE may forget, I can never forget. Ah, sir, do you suppose that Andre can ever forgive his parents for bringing him into the world a cripple?"

The remorse of the unhappy father was very distressing, and I was about to say a few kind words of sympathy when Andre himself made his appearance. M. Letourneur hastened toward him and assisted him up the few steep steps that led to the poop.

As soon as Andre was comfortably seated on one of the benches, and his father had taken his place by his side, I joined them, and we fell into conversation upon ordinary topics, discussing the various points of the "Chancellor," the probable length of the passage, and the different details of our life on board. I find that M. Letourneur's estimate of Captain Huntly's character very much coincided with my own, and that, like me, he is impressed with the man's
undecided manner and sluggish appearance. Like me, too, he has formed a very favourable opinion of Robert Curtis, the mate, a man of about thirty years of age, of great muscular power, with a frame and a will that seem ever ready for action.

Whilst we were still talking of him, Curtis himself came on deck, and as I watched his movements I could not help being struck with his physical development; his erect and easy carriage, his fearless glance and slightly contracted brow all betokened a man of energy, thoroughly endowed with the calmness and courage that are indispensable to the true sailor. He seems a kind-hearted fellow, too, and is always ready to assist and amuse young Letourneur, who evidently enjoys his company. After he had scanned the weather and examined the trim of the sails, he joined our party and proceeded to give us some information about those of our fellow-passengers with whom at present we have made but slight acquaintance.

Mr. Kear, the American, who is accompanied by his wife, has made a large fortune in the petroleum springs in the United States. He is a man of about fifty, a most uninteresting companion, being overwhelmed with a sense of his own wealth and importance, and consequently supremely indifferent to all around him. His hands are always in his pockets, and the chink of money seems to follow him wherever he goes. Vain and conceited, a fool as well as an egotist, he struts about like a peacock showing its plumage, and to borrow the words of the physiognomist Gratiolet, "il se flaire, il se savoure, il se goute." Why he should have taken his passage on board a mere merchant vessel instead of enjoying the luxuries of a Transatlantic steamer, I am altogether at a loss to explain.

The wife is an insignificant, insipid woman, of about forty years of age. She never reads, never talks, and I believe I am not wrong in saying, never thinks. She seems to look without seeing, and listen without hearing, and her sole occupation consists in giving her orders to her companion, Miss Herbey, a young English girl of about twenty.

Miss Herbey is extremely pretty. Her complexion is fair and her eyes deep blue, whilst her pleasing countenance is altogether free from that insignificance of feature which is not unfrequently alleged to be characteristic of English beauty. Her mouth would be charming if she ever smiled, but exposed as she is to the ridiculous whims and fancies of a capricious mistress, her lips rarely relax from their ordinary grave expression. Yet humiliating as her position must be, she never utters a word of open complaint, but quietly and gracefully performs her duties accepting without a murmur the paltry salary which the bumptious petroleum-merchant condescends to allow her.

The Manchester engineer, William Falsten, looks like a thorough Englishman. He has the management of some extensive hydraulic works in South Carolina, and is now on his way to Europe to obtain some improved apparatus, and more especially to visit the mines worked by centrifugal force, belonging to the firm of Messrs. Cail. He is forty-five years of age, with all his interests so entirely absorbed by his machinery that he seems to have neither a thought nor a care beyond his mechanical calculations. Once let him engage you in conversation, and there is no chance of escape; you have no help for it but to listen as patiently as you can until he has completed the explanation of his designs.

The last of our fellow-passengers, Mr. Ruby, is the type of a vulgar tradesman. Without any originality or magnanimity in his composition, he has spent twenty years of his life in mere buying and selling, and as he has generally contrived to do business at a profit, he has realized a considerable fortune. What he is going to do with the money, he does not seem able to say: his ideas do not go beyond retail trade, his mind having been so long closed to all other impressions that it appears incapable of thought or reflection on any subject besides. Pascal says, "L'homme est visiblement fait pour penser. C'est toute sa dignité et tout-son merite;" but to Mr. Ruby the phrase seems altogether inapplicable.

CHAPTER V.

OCTOBER 7th.--This is the tenth day since we left Charleston, and I should think our progress has been very rapid. Robert Curtis, the mate, with whom I continue to have many a friendly chat, informed me that we could not be far off Cape Hatteras in the Bermudas; the ship's bearings, he said were lat. 32deg. 20min. N. and long. 64deg. 50min. W., so that he had every reason to believe that we should sight St. George's Island before night.

"The Bermudas!" I exclaimed. "But how is it we are off the Bermudas? I should have thought that a vessel sailing from Charleston to Liverpool, would have kept northwards, and have followed the track of the Gulf Stream."

"Yes, indeed; sir," replied Curtis, "that is the usual course; but you see that this time the captain hasn't chosen to take it."

"But why not?" I persisted.

"That's not for me to say, sir; he ordered us eastwards, and eastwards we go."

"Haven't you called his attention to it?" I inquired.

Curtis acknowledged that he had already pointed out what an unusual route they were taking, but that the captain
had said that he was quite aware what he was about. The mate made no further remark; but the knit of his brow, as he passed his hand mechanically across his forehead, made me fancy that he was inclined to speak out more strongly.

"All very well, Curtis," I said, "but I don't know what to think about trying new routes. Here we are at the 7th of October, and if we are to reach Europe before the bad weather sets in, I should suppose there is not a day to be lost."

"Right, sir, quite right; there is not a day to be lost."

Struck by his manner, I ventured to add, "Do you mind, Mr. Curtis giving me your honest opinion of Captain Huntly?"

He hesitated a moment, and then replied shortly, "He is my captain, sir."

This evasive answer of course put an end to any further interrogation on my part, but it only set me thinking the more.

Curtis was not mistaken. At about three o'clock the lookout man sung out that there was land to windward, and descried what seemed as if it might be a line of smoke in the north-east horizon. At six, I went on deck with M. Letourneur and his son, and we could then distinctly make out the low group of the Bermudas, encircled by their formidable chain of breakers.

"There," said Andre Letourneur to me, as we stood gazing at the distant land, "there lies the enchanted Archipelago, sung by your poet Moore. The exile Waller, too, as long ago as 1643, wrote an enthusiastic panegyric on the islands, and I have been told that at one time English ladies would wear no other bonnets than such as were made of the leaves of the Bermuda palm."

"Yes," I replied, "the Bermudas were all the rage in the seventeenth century, although latterly they have fallen into comparative oblivion."

"But let me tell you, M. Andre," interposed Curtis, who had as usual joined our party, "that although poets may rave, and be as enthusiastic as they like about these islands, sailors will tell a different tale. The hidden reefs that lie in a semicircle about two or three leagues from shore make the attempt to land a very dangerous piece of business. And another thing, I know. Let the natives boast as they will about their splendid climate, they, are visited by the most frightful hurricanes. They get the fag-end of the storms that rage over the Antilles; and the fag-end of a storm is like the tail of a whale; it's just the strongest bit of it. I don't think you'll find a sailor listening much to your poets,-your Moores, and your Wallers."

"No, doubt you are right, Mr. Curtis," said Andre, smiling, "but poets are like proverbs; you can always find one to contradict another. Although Waller and Moore have chosen to sing the praises of the Bermudas, it has been supposed that Shakspeare was depicting them in the terrible scenes that are found in 'The Tempest.'"

The whole vicinity of these islands is beyond a question extremely perilous to mariners. Situated between the Antilles and Nova Scotia, the Bermudas have ever since their discovery belonged to the English, who have mainly used them for a military station. But this little archipelago, comprising some hundred and fifty different isles and islets, is destined to increase, and that, perhaps, on a larger scale than has yet been anticipated. Beneath the waves there are madrepores, in infinity of number, silently but ceaselessly pursuing their labours; and with time, that fundamental element in nature's workings, who shall tell whether these may not gradually build up island after island, which shall unite and form another continent?

I may mention that there was not another of our fellow-passengers who took the trouble to come on deck and give a glance at this strange cluster of islands. Miss Herbey, it is true, was making an attempt to join us, but she had barely reached the poop, when Mrs. Kear's languid voice was heard recalling her for some trifling service to her side.

CHAPTER VI.

OCTOBER 8th to OCTOBER 13th.--The wind is blowing hard from the north-east; and the "Chancellor" under low-reefed top-sail and fore-sail, and labouring against a heavy sea, has been obliged to be brought ahull. The joists and girders all creak again until one's teeth are set on edge. I am the only passenger not remaining below; but I prefer being on deck notwithstanding the driving rain, fine as dust, which penetrates to my very skin. We have been driven along in this fashion for the best part of two days; the "stiffish breeze" has gradually freshened into "a gale;" the top-gallants have been lowered, and, as I write, the wind is blowing with a velocity of fifty or sixty miles an hour. Although the "Chancellor" has many good points, her drift is considerable, and we have been carried far to the south we can only guess at our precise position, as the cloudy atmosphere entirely precludes us from taking the sun's altitude.

All along throughout this period, my fellow-passengers are totally ignorant of the extraordinary course that we are taking England lies to the NORTH-EAST, yet we are sailing directly SOUTH-EAST, and Robert Curtis owns
that he is quite bewildered; he cannot comprehend why the captain, ever since this north-easterly gale has been blowing, should persist in allowing the ship to drive to the south, instead of tacking to the north-west until she gets into better quarters.

I was alone with Curtis to-day upon the poop, and could not help saying to him "Curtis, is your captain mad?"

"Perhaps, sir, I might be allowed to ask what YOU think upon that matter," was his cautious reply.

"Well to say the truth," I answered, "I can hardly tell; but I confess there is every now and then a wandering in his eye, and an odd look on his face that I do not like. Have you ever sailed with him before?"

"No; this is our first voyage together. Again last night I spoke to him about the route we were taking, but he only said he knew all about it, and that it was all right."

"What do Lieutenant Walter and your boatswain think of it all?" I inquired.

"Think; why they think just the same as I do," replied the mate; "but if the captain chooses to take the ship to China we should obey his orders."

"But surely," I exclaimed, "there must be some limit to your obedience! Suppose the man is actually mad, what then?"

"If he should be mad enough, Mr. Kazallon, to bring the vessel into any real danger, I shall know what to do."

With this assurance I am forced to be content. Matters, however, have taken a different turn to what I bargained for when I took my passage on board the "Chancellor." The weather has become worse and worse. As I have already said, the ship under her large low-reefed top-sail and fore stay-sail has been brought ahull, that is to say, she copes directly with the wind, by presenting her broad bows to the sea; and so we go on still drift, drift, continually to the south.

How southerly our course has been is very apparent; for upon the night of the 11th we fairly entered upon that portion of the Atlantic which is known as the Sargassos Sea. An extensive tract of water is this, enclosed by the warm current of the Gulf Stream, and thickly covered with the wrack, called by the Spaniards "sargasso," the abundance of which so seriously impeded the progress of Columbus's vessels on his first voyage across the ocean.

Each morning at daybreak the Atlantic has presented an aspect so remarkable, that at my solicitation, M. Letourneur and his son have ventured upon deck to witness the unusual spectacle. The squally gusts make the metal shrouds vibrate like harp-strings; and unless we were on our guard to keep our clothes wrapped tightly to us, they would have been torn off our backs in shreds. The scene presented to our eyes is one of strangest interest. The sea, carpeted thickly with masses of prolific fucus, is a vast unbroken plain of vegetation, through which the vessel makes her way as a plough. Long strips of seaweed caught up by the wind become entangled in the rigging, and hang between the masts in festoons of verdure; whilst others, varying from two to three hundred feet in length, twine themselves up to the very mast-heads, from whence they float like streaming pendants. For many hours now, the "Chancellor" has been contending with this formidable accumulation of algae; her masts are circled with hydrophytes; her rigging is wreathed everywhere with creepers, fantastic as the untrammelled tendrils of a vine, and as she works her arduous course, there are times when I can only compare her to an animated grove of verdure making its mysterious way over some illimitable prairie.

CHAPTER VII.

OCTOBER 14th.--At last we are free from the sea of vegetation, the boisterous gale has moderated into a steady breeze, the sun is shining brightly, the weather is warm and genial, and thus, two reefs in her top-sails, briskly and merrily sails the "Chancellor."

Under conditions so favourable, we have been able to take the ship's bearings: our latitude, we find, is 21deg. 33min. N., our longitude 50deg. 17min. W.

Incomprehensible altogether is the conduct of Captain Huntly. Here we are, already more than ten degrees south of the point from which, we started, and yet still we are persistently following a south-easterly course! I cannot bring myself to the conclusion that the man is mad. I have had various conversations with him: he has always spoken rationally and sensibly. He shows no tokens of insanity. Perhaps his case is one of those in which insanity is partial, and where the mania is of a character which extends only to the matters connected with his profession. Yet it is unaccountable.

I can get nothing out of Curtis; he listens coldly whenever I allude to the subject, and only repeats what he has said before, that nothing short of an overt act of madness on the part of the captain could induce him to supersede the captain's authority and that the imminent peril of the ship could alone justify him in taking so decided a measure.

Last evening I went to my cabin about eight o'clock, and after an hour's reading by the light of my cabin-lamp, I retired to my berth and was soon asleep. Some hours later I was aroused by an unaccustomed noise on deck. There were heavy footsteps hurrying to and fro, and the voices of the men were loud and eager, as if the crew were
agitated by some strange disturbance. My first impression was, that some tacking had been ordered which rendered it needful to fathom the yards; but the vessel continuing to lie to starboard convinced me that this was not the origin of the commotion, I was curious to know the truth, and made all haste I could to go on deck; but before I was ready, the noise had ceased. I heard Captain Huntly return to his cabin, and accordingly I retired again to my own berth. Whatever may have been the meaning of the manoeuvre, I cannot tell; it did not seem to have resulted in any improvement in the ship's pace; still it must be owned there was not much wind to speed us along.

At six o'clock this morning I mounted the poop and made as keen a scrutiny as I could of everything on board. Everything appeared as usual. The "Chancellor" was running on the larboard tack, and carried low-sails, top-sails, and gallant-sails. Well braced she was; and under a fresh, but not uneasy breeze, was making no less than eleven knots an hour.

Shortly afterwards M. Letourneur and Andre came an deck. The young man enjoyed the early morning air, laden with its briny fragrance, and I assisted him to mount the poop. In answer to my inquiry as to whether they had been disturbed by any bustle in the night, Andre replied that he did not wake at all, and had heard nothing.

"I am glad, my boy," said his father, "that you have slept so soundly. I heard the noise of which Mr. Kazallon speaks. It must have been about three o'clock this morning, and it seemed to me as though they were shouting. I thought I heard them say, 'Here, quick, look to the hatches!' but as nobody was called up, I presumed that nothing serious was the matter."

As he spoke I cast my eye at the panel-slides, which fore and aft of the main-mast open into the hold. They seemed to be all close as usual, but I now observed for the first time that they were covered with heavy tarpauling. Wondering; in my own mind what could be the reason for these extra precautions I did not say anything to M. Letourneur, but determined to wait until the mate should come on watch, when he would doubtless give me, I thought, an explanation of the mystery.

The sun rose gloriously, with every promise of a fine dry day. The waning moon was yet above the western horizon, for as it still wants three days to her last quarter she does not set until 10.57 am. On consulting my almanac, I find that there will be a new moon on the 24th, and that on that day, little as it may affect us here in mid ocean, the phenomenon of the high syzygian tides will take place on the shores of every continent and island.

At the breakfast hour M. Letourneur and Andre went below for a cup of tea, and I remained on the poop alone. As I expected, Curtis appeared, that he might relieve Lieutenant Walter of the watch. I advanced to meet him, but before he even wished me good morning, I saw him cast a quick and searching glance upon the deck, and then, with a slightly contracted brow, proceed to examine the state of the weather and the trim of the sails.

"Where is Captain Huntly?" he said to Walter.
"I have seen nothing of him," answered the lieutenant "is there anything fresh up?"
"Nothing, whatever," was the curt reply.

They then conversed for a few moments in an undertone, and I could see that Walter by his gesture gave a negative answer to some question which the mate had asked him. "Send me the boatswain, Walter," said Curtis aloud as the lieutenant moved away.

The boatswain immediately appeared, and another conversation was carried on in whispers. The man repeatedly shook his head as he replied to Curtis's inquiries, and then, in obedience to orders, called the men who were on watch, and made them plentifully water the tarpauling that covered the great hatchway.

Curious to fathom the mystery I went up to Curtis and began to talk to him upon ordinary topics, hoping that he would himself introduce the subject that was uppermost in my mind; finding, however, that he did not allude to it; I asked him point blank.

"What was the matter in the night, Curtis?"
"He looked at me steadily, but made no reply.
"What was it?" I repeated. "M. Letourneur and myself were both of us disturbed by a very unusual commotion overhead."
"Oh, a mere nothing," he said at length; "the man at the helm had made a false move, and we had to pipe hands to brace the ship a bit; but it was soon all put to rights. It was nothing, nothing at all."

I said no more; but I cannot resist the impression that Robert Curtis has not acted with me in his usual straightforward manner.

CHAPTER VIII.

OCTOBER 15th to OCTOBER 18th.--The wind is still in the north-east. There is no change in the "Chancellor's" course, and to an unprejudiced eye all would appear to be going on as usual. But I have an uneasy consciousness that something is not quite right. Why should the hatchways be so hermetically closed as though a
mutinous crew was imprisoned between decks? I cannot help thinking too that there is something in the sailors so constantly standing in groups and breaking off their talk so suddenly whenever we approach; and several times I have caught the word "hatches" which arrested M. Letourneur's attention on the night of the disturbance.

On the 15th, while I was walking on the forecastle, I overheard one of the sailors, a man named Owen say to his mates,—

"Now I just give you all warning that I am not going to wait until the last minute. Every one for himself, say I."

"Why, what do you mean to do?" asked Jynxstrop, the cook.

"Pshaw!" said Owen, "do you suppose that longboats were only made for porpoises?"

Something at that moment occurred to interrupt the conversation, and I heard no more. It occurred to me whether there was not some conspiracy among the crew, of which probably Curtis had already detected the symptoms. I am quite aware that some sailors are most rebelliously disposed, and require to be ruled with a rod of iron.

Yesterday and to-day I have observed Curtis remonstrating somewhat vehemently with Captain Huntly, but there is no obvious result arising from their interviews; the Captain apparently being bent upon some purpose, of which it is only too manifest that the mate decidedly disapproves.

Captain Huntly is undoubtedly labouring under strong nervous excitement; and M. Letourneur has more than once remarked how silent he has become at meal-times; for although Curtis continually endeavours to start some subject of general interest, yet neither Mr. Falsten, Mr. Kear, nor Mr. Ruby are the men to take it up, and consequently the conversation flags hopelessly, and soon drops. The passengers too are now, with good cause, beginning to murmur at the length of the voyage, and Mr. Kear, who considers that the very elements ought to yield to his convenience, lets the captain know by his consequential and haughty manner that he holds him responsible for the delay.

During the course of yesterday the mate gave repeated orders for the deck to be watered again and again, and although as a general rule this is a business which is done, once for all, in the early morning, the crew did not utter a word of complaint at the additional work thus imposed upon them. The tarpaulins on the hatches have thus been kept continually wet, so that their close and heavy texture is rendered quite impervious to the air, The "Chancellor's" pumps afford a copious supply of water, so that I should not suppose that even the daintiest and most luxurious craft belonging to an aristocratic yacht-club was ever subject to a more thorough scouring. I tried to reconcile myself to the belief that it was the high temperature of the tropical regions upon which we are entering, that rendered such extra sousings a necessity, and recalled to my recollection how, during the night of the 13th, I had found the atmosphere below deck so stifling that in spite of the heavy swell I was obliged to open the porthole of my cabin, on the starboard side, to get a breath of air.

This morning at daybreak I went on deck. The sun had scarcely risen, and the air was fresh and cool, in strange contrast to the heat which below the poop had been quite oppressive. The sailors as usual were washing the deck, A great sheet of water, supplied continuously by the pumps was rolling in tiny wavelets, and escaping now to starboard, now to larboard through the scupper-holes. After watching the men for a while as they ran about bare-footed, I could not resist the desire to join them, so taking off my shoes and stockings I proceeded to dabble in the flowing water.

Great was my amazement to find the deck perfectly hot to my feet! Curtis heard my exclamation of surprise, and before I could put my thoughts into words, said,—

"Yes! there is fire on board!"

CHAPTER IX.

OCTOBER 19th.--Everything, then, is clear. The uneasiness of the crew, their frequent conferences, Owen's mysterious words, the constant scourings of the deck and the oppressive heat of the cabins which had been noticed even by my fellow-passengers, all are explained.

After his grave communication, Curtis remained silent. I shivered with a thrill of horror; a calamity the most terrible that can befall a voyager stared me in the face, and it was some seconds before I could recover sufficient composure to inquire when the fire was first discovered.

"Six days ago," replied the mate.

"Six days ago!" I exclaimed; "why, then, it was that night."

"Yes," he said, interrupting me; "it was the night you heard the disturbance upon deck. The men on watch noticed a slight smoke issuing from the large hatchway and immediately called Captain Huntly and myself. We found beyond all doubt, that the cargo was on fire, and what was worse, that there was no possibility of getting at the seat of the combustion. What could we do? Why; we took the only precaution that was practicable under the circumstances, and resolved most carefully to exclude every breath of air from penetrating into the hold, For some
time I hoped that we had been successful. I thought that the fire was stifled; but during the last three days there is
every reason to make us know that it has been gaining strength. Do what we will, the deck gets hotter and hotter, and
unless it were kept constantly wet, it would be unbearable to the feet. But I am glad, Mr. Kazallon," he added; "that
you have made the discovery. It is better that you should know it."

I listened in silence, I was now fully aroused to the gravity of the situation and thoroughly comprehended how
we were in the very face of a calamity which it seemed that no human power could avert.

"Do you know what has caused the fire?" I presently inquired.

"It probably arose," he answered, "from the spontaneous combustion of the cotton. The case is rare, but it is far
from unknown. Unless the cotton is perfectly dry when it is shipped, its confinement in a damp or ill-ventilated hold
will sometimes cause it to ignite; and I have no doubt it is this that has brought about our misfortune."

"But after all," I said, "the cause matters very little. Is there no remedy? Is there nothing to be done?"

"Nothing; Mr. Kazallon," he said. "As I told you before, we have adopted the only possible measure within our
power to check the fire. At one time I thought of knocking a hole in the ship's timbers just on her waterline, and
letting in just as much water as the pumps could afterwards get rid of again; but we found the combustion was right
in the middle of the cargo and that we should be obliged to flood the entire hold before we could get at the right
place. That scheme consequently was no good. During the night, I had the deck bored in various places and water
poured down through the holes; but that again seemed all of no use. There is only one thing that can be done; we
must persevere in excluding most carefully every breath of outer air, so that perhaps the conflagration deprived of
oxygen may smoulder itself out. That is our only hope."

"But, you say the fire is increasing?"

"Yes; and that shows that in spite of all our care there is some aperture which we have not been able to discover,
by which, somehow or other, air gets into the hold."

"Have you ever heard of a vessel surviving such circumstances?" I asked.

"Yes, Mr. Kazallon," said Curtis; "it is not at all an unusual thing for ships laden with cotton to arrive at
Liverpool or Havre with a portion of their cargo consumed; and I have myself known more than one captain run into
port with his deck scorching his very feet, and who, to save his vessel and the remainder of his freight has been
compelled to unload with the utmost expedition. But, in such cases, of course the fire has been more or less under
control throughout the voyage; with us, it is increasing day by day, and I tell you I am convinced there is an aperture
somewhere which has escaped our notice."

"But would it not be advisable for us to retrace our course, and make for the nearest land?"

"Perhaps it would," he answered. "Walter and I, and the boatswain, are going to talk the matter over seriously
with the captain to-day. But, between ourselves, I have taken the responsibility upon myself; I have already changed
the tack to the south-west; we are now straight before the wind, and consequently we are sailing towards the coast."

"I need hardly ask," I added; "whether any of the other passengers are at all aware of the imminent danger in
which we are placed."

"None of them," he said; "not in the least; and I hope you will not enlighten them. We don't want terrified
women and cowardly men to add to our embarrassment; the crew are under orders to keep a strict silence on the
subject. Silence is indispensable."

I promised to keep the matter a profound secret, as I fully entered into Curtis's views as to the absolute necessity
for concealment.

CHAPTER X.

OCTOBER 20th AND 21st.--The "Chancellor" is now crowded with all the canvas she can carry, and at times
her top-masts threaten to snap with the pressure. But Curtis is ever on the alert; he never leaves his post beside the
man at the helm, and without compromising the safety of the vessel, he contrives by tacking to the breeze, to urge
her on at her utmost speed.

All day long on the 20th, the passengers were assembled on the poop. Evidently they found the heat of the
 cabins painfully oppressive, and most of them lay stretched upon benches and quietly enjoyed the gentle rolling of
the vessel. The increasing heat of the deck did not reveal itself to their well-shod feet and the constant scouring of
the boards did not excite any suspicion in their torpid minds. M. Letourneur, it is true, did express his surprise that
the crew of an ordinary merchant vessel should be distinguished by such extraordinary cleanliness, but as I replied to
him in a very casual tone, he passed no further remark. I could not help regretting that I had given Curtis my pledge
of silence, and longed intensely to communicate the melancholy secret to the energetic Frenchman; for at times
when I reflect upon the eight-and-twenty victims who may probably, only too soon, be a prey to the relentless
flames, my heart seems ready to burst.
The important consultation between captain, mate, lieutenant, and boatswain has taken place. Curtis has confided the result to me. He says that Huntly, the captain, is completely demoralized; he has lost all power and energy; and practically leaves the command of the ship to him. It is now certain the fire is beyond control, and that sooner or later it will burst out in full violence. The temperature of the crew's quarters has already become almost unbearable. One solitary hope remained; it is that we may reach the shore before the final catastrophe occurs. The Lesser Antilles are the nearest land; and although they are some five or six hundred miles away, if the wind remains north-east there is yet a chance of reaching them in time.

Carrying royals and studding-sails, the "Chancellor" during the last four-and-twenty hours has held a steady course. M. Letourneur is the only one of all the passengers who has remarked the change of tack; Curtis however, has set all speculation on his part to rest by telling him that he wanted to get ahead of the wind, and that he was tacking to the west to catch a favourable current.

To-day, the 21st, all has gone on as usual; and as far as the observation of the passengers has reached, the ordinary routine has been undisturbed. Curtis indulges the hope even yet that by excluding the air, the fire may be stifled before it ignites the general cargo; he has hermetically closed every accessible aperture, and has even taken the precaution of plugging the orifices of the pumps, under the impression that their suction-tubes, running as they do to the bottom of the hold, may possibly be channels for conveying some molecules of air. Altogether, he considers it a good sign that the combustion has not betrayed itself by some external issue of smoke.

The day would have passed without any incident worth recording if I had not chanced to overhear a fragment of a conversation which demonstrated that our situation hitherto precarious enough, had now become most appalling.

As I was sitting on the poop, two of my fellow-passengers, Falsten, the engineer, and Ruby, the merchant whom I had observed to be often in company, were engaged in conversation almost close to me. What they said was evidently not intended for my hearing, but my attention was directed towards them by some very emphatic gestures of dissatisfaction on the part of Falsten, and I could not forbear listening to what followed.

"Preposterous! shameful!" exclaimed Falsten; "nothing could be more imprudent."
"Pooh! pooh!" replied Ruby; "it's all right; it is not the first time I have done it."
"But don't you know that any shock at any time might cause an explosion?"
"Oh, it's all properly secured," said Ruby, "tight enough; I have no fears on that score, Mr. Falsten."
"But why," asked Falsten, "did you not inform the captain?"
"Just because if I had informed him, he would not have taken the case on board."

The wind dropped for a few seconds; and for a brief interval I could not catch what passed; but I could see that Falsten continued to remonstrate, whilst Ruby answered by shrugging his shoulders. At length I heard Falsten say,--

"Well, at any rate the captain must be informed of this, and the package shall be thrown overboard. I don't want, to be blown up."

I started. To what could the engineer be alluding? Evidently he had not the remotest suspicion that the cargo was already on fire. In another moment the words "picrate of potash" brought me to my feet? and with an involuntary impulse I rushed up to Ruby, and seized him by the shoulder.

"Is there picrate of potash on board?" I almost shrieked.
"Yes," said Falsten, "a case containing thirty pounds."
"Where is it?" I cried.
"Down in the hold, with the cargo."

CHAPTER XI.

What my feelings were I cannot describe; but it was hardly in terror so much as with a kind of resignation that I made my way to Curtis on the forecastle, and made him aware that the alarming character of our situation was now complete, as there was enough explosive matter on board to blow up a mountain. Curtis received the information as coolly as it was delivered, and after I had made him acquainted with all the particulars said,--

"Not a word of this must be mentioned to any one else, Mr. Kazallon, where is Ruby now?"
"On the poop," I said.
"Will you then come with me, sir?"

Ruby and Falsten were sitting just as I had left them. Curtis walked straight up to Ruby, and asked him whether what he had been told was true.

"Yes, quite true," said Ruby, complacently, thinking that the worst that could befall him would be that he might be convicted of a little smuggling.

I observed that Curtis was obliged for a moment or two to clasp his hands tightly together behind his back to prevent himself from seizing the unfortunate passenger by the throat; but suppressing his indignation, he proceeded
quietly, though sternly, to interrogate him about the facts of the case. Ruby only confirmed what I had already told him. With characteristic Anglo-Saxon incautiousness he had brought on board with the rest of his baggage, a case containing no less than thirty pounds of picrate, and had allowed the explosive matter to be stowed in the hold with as little compunction as a Frenchman would feel in smuggling a single bottle of wine. He had not informed the captain of the dangerous nature of the contents of the package, because he was perfectly aware that he would have been refused permission to bring the package on board.

"Any way," he said, with a shrug of his shoulders, "you can't hang me for it; and if the package gives you so much concern, you are quite at liberty to throw it into the sea. My luggage is insured."

I was beside myself with fury, and not being endowed with Curtis's reticence and self-control, before he could interfere to stop me, I cried out,--

"You fool! don't you know that there is fire on board?"

In an instant I regretted my words. Most earnestly I wished them unuttered, But it was too late: their effect upon Ruby was electrical. He was paralyzed with terror his limbs stiffened convulsively; his eye was dilated; he gasped for breath, and was speechless. All of a sudden he threw up his arms and, as though he momentarily expected an explosion, he darted down from the poop, and paced frantically up and down the deck, gesticulating like a madman, and shouting,--

"Fire on board! Fire! Fire!"

On hearing the outcry, all the crew, supposing that the fire had now in reality broken out, rushed on deck; the rest of the passengers soon joined them, and the scene that ensued was one of the utmost confusion. Mrs. Kear fell down senseless on the deck, and her husband, occupied in looking after himself, left her to the tender mercies of Miss Herbey. Curtis endeavoured to silence Ruby's ravings, whilst I, in as few words as I could, made M. Letourneur aware of the extent to which the cargo was on fire. The father's first thought was for Andre but the young man preserved an admirable composure, and begged his father not to be alarmed, as the danger was not immediate. Meanwhile the sailors had loosened all the tacklings of the long-boat; and were preparing to launch it, when Curtis's voice was heard peremptorily bidding them to desist; he assured them that the fire had made no further progress; that Mr. Ruby had been unduly excited and not conscious of what he had said; and he pledged his word that when the right moment should arrive he would allow them all to leave the ship; but that moment, he said, had not yet come.

At the sound of a voice which they had learned to honour and respect, the crew paused in their operations, and the long-boat remained suspended in its place. Fortunately, even Ruby himself in the midst of his ravings, had not dropped a word about the picrate that had been deposited in the hold; for although the mate had a power over the sailors that Captain Huntly had never possessed, I feel certain that if the true state of the case had been known, nothing on earth would have prevented some of them, in their consternation, from effecting an escape. As it was, only Curtis, Falsten, and myself were cognizant of the terrible secret.

As soon as order was restored, the mate and, I joined Falsten on the poop, where he had remained throughout the panic, and where we found him with folded arms, deep in thought, as it might be, solving some hard mechanical problem. He promised, at my request, that he would reveal nothing of the new danger to which we were exposed through Ruby's imprudence. Curtis himself took the responsibility of informing Captain Huntly of our critical situation.

In order to insure complete secrecy, it was necessary to secure the person of the unhappy Ruby, who, quite beside himself, continued to rave up and down the deck with the incessant cry of "Fire! fire!" Accordingly Curtis gave orders to some of his men to seize him and gag him; and before he could make any resistance the miserable man was captured and safely lodged in confinement in his own cabin.

CHAPTER XII.

OCTOBER 22nd.--Curtis has told the captain everything; for he persists in ostensibly recognizing him as his superior officer, and refuses to conceal from him our true situation. Captain Huntly received the communication in perfect silence, and merely passing his hand across his forehead as though to, banish some distressing thought, re-entered his cabin without a word.

Curtis, Lieutenant Walter, Falsten, and myself have been discussing the chances of our safety, and I am surprised to find with how much composure we can all survey our anxious predicament.

"There is no doubt" said Curtis, "that we must abandon all hope of arresting the fire; the heat towards the bow has already become well-nigh unbearable, and the time must come when the flames will find a vent through the deck. If the sea is calm enough for us to make use of the boats, well and good; we shall of course get quit of the ship as quietly as we can; if on the other hand, the weather should be adverse, or the wind be boisterous, we must stick to our place, and contend with the flames to the very last; perhaps, after all, we shall fare better with the fire as a
declared enemy than as a hidden one."

Falsten and I agreed with what he said, but I pointed out to him that he had quite overlooked the fact of there being thirty pounds of combustible matter in the hold.

"No" he gravely replied, "I have not forgotten it, but it is a circumstance of which I do not trust myself to think I dare not run the risk of admitting air into the hold by going down to search for the powder, and yet I know not at what moment it may explode. No; it is a matter that I cannot take at all into my reckoning, it must remain in higher hands than mine."

We bowed our heads in a silence which was solemn. In the present state of the weather, immediate flight was, we knew, impossible.

After a considerable pause, Falsten, as calmly as though he were delivering some philosophic dogma, observed,-

"The explosion, if I may use the formula of science, is not necessary, but contingent."

"But tell me, Mr. Falsten," I asked, "is it possible for picrate of potash to ignite without concussion?"

"Certainly it is," replied the engineer. "Under-ordinary circumstances, picrate of potash although not MORE inflammable than common powder, yet possesses the same degree of inflammability."

We now prepared to go on deck. As we left the saloon, in which we had been sitting, Curtis seized my hand.

"Oh, Mr. Kazallon," he exclaimed, "if you only knew the bitterness of the agony I feel at seeing this fine vessel doomed to be devoured by flames, and at being so powerless to save her." Then quickly recovering himself, he continued, "But I am forgetting myself; you, if no other, must know what I am suffering. It is all over now," he said more cheerfully.

"Is our condition quite desperate?" I asked.

"It is just this," he answered deliberately "we are over a mine, and already the match has been applied to the train. How long that train may be, 'tis not for me to say." And with these words he left me.

The other passengers, in common with the crew, are still in entire ignorance of the extremity of peril to which we are exposed, although they are all aware that there is fire in the hold. As soon as the fact was announced, Mr. Kear, after communicating to Curtis his instructions that he thought he should have the fire immediately extinguished and intimating that he held him responsible for all contingencies that might happen, retired to his cabin, where he has remained ever since, fully occupied in collecting and packing together the more cherished articles of his property and without the semblance of a care or a thought for his unfortunate wife, whose condition, in spite of her ludicrous complaints, was truly pitiable. Miss Herbey, however, is unrelaxing in her attentions, and the unremitted diligence with which she fulfills her offices of duty, commands my highest admiration.

OCTOBER 23rd.--This morning, Captain Huntly sent for Curtis into his cabin, and the mate has since made me acquainted with what passed between them.

"Curtis," began the captain, his haggard eye betraying only too plainly some mental derangement, "I am a sailor, am I not?"

"Certainly, captain," was the prompt acquiescence of the mate.

"I do not know how it is," continued the captain, "but I seem bewildered; I cannot recollect anything. Are we not bound for Liverpool? Ah! yes! of course. And have we kept a north-easterly direction since we left?"

"No, sir, according to your orders we have been sailing south-east, and here we are in the tropics."

"And what is the name of the ship?"

"The 'Chancellor,' sir."

"Yes, yes, the 'Chancellor,' so it is. Well, Curtis, I really can't take her back to the north. I hate the sea, the very sight of it makes me ill, I would much rather not leave my cabin."

Curtis went on to tell me how he had tried to persuade him that with a little time and care he would soon recover his indisposition, and feel himself again; but the captain had interrupted him by saying,--

"Well, well; we shall see by-and-by; but for the present you must take this for my positive order; you must, from this time, at once take the command of the ship, and act just as if I were not on board. Under present circumstances, I can do nothing. My brain is all in a whirl, you cannot tell what I am suffering;" and the unfortunate man pressed both his hands convulsively against his forehead.

"I weighed the matter carefully for a moment," added Curtis, "and seeing what his condition too truly was, I acquiesced in all that he required and withdrew, promising him that all his orders should be obeyed."

After hearing these particulars, I could not help remarking how fortunate it was that the captain had resigned of his own accord, for although he might not be actually insane, it was very evident that his brain was in a very morbid condition.

"I succeed him at a very critical moment;" said Curtis thoughtfully; "but I shall endeavour to do my duty."

A short time afterwards he sent for the boatswain, and ordered him to assemble the crew at the foot of the main-
mast. As soon as the men were together, he addressed them very calmly, but very firmly.

"My men," he said, "I have to tell you that Captain Huntly, on account of the dangerous situation in which circumstances have placed us, and for other reasons known to myself, has thought right to resign his command to me. From this time forward, I am captain of this vessel."

Thus quietly and simply the change was effected, and we have the satisfaction of knowing that the "Chancellor" is now under the command of a conscientious, energetic man, who will shirk nothing that he believes to be for our common good. M. Letourneur, Andre, Mr. Falsten, and myself immediately offered him our best wishes, in which Lieutenant Walter and the boatswain most cordially joined.

The ship still holds her course south-west and Curtis crowds on all sail and makes as speedily as possible for the nearest of the Lesser Antilles.

CHAPTER XIII.

OCTOBER 24th to 29th.--For the last five days the sea has been very heavy, and although the "Chancellor" sails with wind and wave in her favour, yet her progress is considerably impeded. Here on board this veritable fireship I cannot help contemplating with a longing eye this vast ocean that surrounds us. The water supply should be all we need.

"Why not bore the deck?" I said to Curtis. "Why not admit the water by tons into the hold? What could be the harm? The fire would be quenched; and what would be easier than to pump the water out again?"

"I have already told you, Mr. Kazallon," said Curtis, "that the very moment we admit the air, the flames will rush forth to the very top of the masts. No; we must have courage and patience; we must wait. There is nothing whatever to be done, except to close every aperture."

The fire continued to progress even more rapidly than we had hitherto suspected. The heat gradually drove the passengers nearly all, on deck, and the two stern cabins, lighted, as I said, by their windows in the aft-board were the only quarters below that were inhabitable. Of these Mrs. Kear occupied one, and Curtis reserved the other for Ruby, who, a raving maniac, had to be kept rigidly under restraint. I went down occasionally to see him, but invariably found him in a state of abject terror, uttering horrible shrieks, as though possessed with the idea that he was being scorched by the most excruciating heat.

Once or twice, too, I looked in upon the ex-captain. He was always calm and spoke quite rationally upon any subject except his own profession; but in connexion with that he prated away the merest nonsense. He suffered greatly, but steadily declined all my offers of attention, and pertinaciously refused to leave his cabin.

To-day, an acrid, nauseating smoke made its way through the panellings that partition off the quarters of the crew. At once Curtis ordered the partition to be enveloped in wet tarpaulin, but the fumes penetrated even this, and filled the whole neighbourhood of the ship's bows with a reeking vapour that was positively stifling. As we listened, too, we could hear a dull rumbling sound, but we were as mystified as ever to comprehend where the air could have entered that was evidently fanning the flames. Only too certainly, it was now becoming a question not of days nor even of hours before we must be prepared for the final catastrophe. The sea was still running high, and escape by the boats was plainly impossible. Fortunately, as I have said, the main-mast and the mizzen are of iron; otherwise the heat at their base would long ago have brought them down and our chances of safety would have been much imperiled; but by crowding on sail the "Chancellor" in the full north-east wind continued to make her way with undiminished speed.

It is now a fortnight since the fire was first discovered, and the proper working of the ship has gradually become a more and more difficult matter. Even with thick shoes any attempt to walk upon deck up to the forecastle was soon impracticable, and the poop, simply because its door is elevated somewhat above the level of the hold, is now the only available standing-place. Water began to lose its effect upon the scorched and shrivelling planks; the resin oozed out from the knots in the wood, the seams burst open, and the tar, melted by the heat, followed the rollings of the vessel, and formed fantastic patterns about the deck.

Then to complete our perplexity, the wind shifted suddenly round to the north-west, whence it blew a perfect hurricane. To no purpose did Curtis do everything in his power to bring the ship ahull; every effort was vain; the "Chancellor" could not bear her triesail, so there was nothing to be done but to let her go with the wind, and drift further and further from the land for which we are longing so eagerly.

To-day, the 29th, the tempest seemed to reach its height; the waves appeared to us mountains high, and dashed the spray most violently across the deck. A boat could not live for a moment in such a sea.

Our situation is terrible. We all wait in silence, some few on the forecastle, the great proportion of us on the poop. As for the picrate, for the time we have quite forgotten its existence; indeed it might almost seem as though its explosion would come as a relief, for no catastrophe, however terrible, could far exceed the torture of our suspense.
While he had still the remaining chance, Curtis rescued from the store-room such few provisions as the heat of the compartment allowed him to obtain; and a lot of cases of salt meat and biscuits, a cask of brandy, some barrels of fresh water, together with some sails and wraps, a compass and other instruments are now lying packed in a mass all ready for prompt removal to the boats whenever we shall be obliged to leave the ship.

About eight o'clock in the evening, a noise is heard, distinct even above the raging of the hurricane. The panels of the deck are upheaved, and volumes of black smoke issue upwards as if from a safety-valve. An universal consternation seizes one and all: we must leave the volcano which is about to burst beneath our feet. The crew run to Curtis for orders. He hesitates; looks first at the huge and threatening waves; looks then at the boats. The long-boat is there, suspended right along the centre of the deck; but it is impossible to approach it now; the yawl, however, hoisted on the starboard side, and the whale-boat suspended aft, are still available. The sailors make frantically for the yawl.

"Stop, stop," shouts Curtis; "do you mean to cut off our last and only chance of safety? Would you launch a boat in such a sea as this?"

A few of them, with Owen at their head, give no heed to what he says. Rushing to the poop, and seizing a cutlass, Curtis shouts again,—

"Touch the tackling of the davit, one of you; only touch it, and I'll cleave your skull."

Awed by his determined manner, the men retire, some clambering into the shrouds, whilst others mount to the very top of the masts.

At eleven o'clock, several loud reports are heard, caused by the bursting asunder of the partitions of the hold. Clouds of smoke issue from the front, followed by a long tongue of lambent flame that seems to encircle the mizen-mast. The fire now reaches to the cabin occupied by Mrs. Kear, who, shrieking wildly, is brought on deck by Miss Herbey. A moment more, and Silas Huntly makes his appearance, his face all blackened with the grimy smoke; he bows to Curtis, as he passes, and then proceeds in the calmest manner to mount the aft-shrouds, and installs himself at the very top of the mizen.

The sight of Huntly recalls to my recollection the prisoner still below, and my first impulse is to rush to the staircase and do what I can to set him free. But the maniac has already eluded his confinement, and with singed hair and his clothes already alight, rushes upon deck. Like a salamander he passes across the burning deck with unscathed feet, and glides through the stifling smoke with unchoked breath. Not a sound escapes his lips.

Another loud report; the long-boat is shivered into fragments; the middle panel bursts the tarpaulin that covered it, and a stream of fire, free at length from the restraint that had held it, rises half-mast high.

"The picrate! the picrate!" shrieks the madman; "we shall all be blown up! the picrate will blow us all up."

And in an instant, before we can get near him, he has hurled himself, through the open hatchway, down into the fiery furnace below.

CHAPTER XIV.

OCTOBER 29th:--NIGHT.--The scene, as night came on, was terrible indeed. Notwithstanding the desperateness of our situation, however, there was not one of us so paralyzed by fear, but that we fully realized the horror of it all.

Poor Ruby, indeed, is lost and gone, but his last words were productive of serious consequences. The sailors caught his cry of "Picrate, picrate!" and being thus for the first time made aware of the true nature of their peril, they resolved at every hazard to accomplish their escape. Beside themselves with terror, they either did not or would not, see that no boat could brave the tremendous waves that were raging around, and accordingly they made a frantic rush towards the yawl. Curtis again made a vigorous endeavour to prevent them, but this time all in vain; Owen urged them on, and already the tackling was loosened, so that the boat was swung over to the ship's side. For a moment it hung suspended in mid-air, and then, with a final effort from the sailors, it was quickly lowered into the sea. But scarcely had it touched the water, when it was caught by an enormous wave which, recoiling with resistless violence, dashed it to atoms against the "Chancellor's" side.

The men stood aghast; they were dumbfoundered. Long-boat and yawl both gone, there was nothing now remaining to us but a small whale-boat. Not a word was spoken; not a sound was heard but the hoarse whistling of the wind, and the mournful roaring of the flames. From the centre of the ship, which was hollowed out like a furnace, there issued a column of sooty vapour that ascended to the sky. All the passengers, and several of the crew, took refuge in the aft-quarters of the poop. Mrs. Kear was lying senseless on one of the hen-coops; M. Letourneur held his son tightly clasped to his bosom. I saw Falsten calmly consult his watch, and note down the time in his memorandum-book, but I was far from sharing his, composure, for I was overcome by a nervous agitation that I could not suppress.
As far as we knew, Lieutenant Walter, the boatswain, and such of the crew as were not with us, were safe in the bow; but it was impossible to tell how they were faring because the sheet of fire intervened like a curtain, and cut off all communication between stem and stern.

I broke the dismal silence, saying "All over now, Curtis."

"No, sir, not yet," he replied, "now that the panel is open we will set to work, and pour water with all our might down into the furnace, and may be, we shall put it out, even yet."

"But how can you work your pumps while the deck is burning? and how can you get at your men beyond that sheet of flame?"

He made no answer to my impetuous questions, and finding that he had nothing more to say, I repeated that it was all over now.

After a pause, he said, "As long as a plank of the ship remains to stand on, Mr. Kazallon, I shall not give up my hope."

But the conflagration raged with redoubled fury, the sea around us was lighted with a crimson glow, and the clouds above shone with a lurid glare. Long jets of fire darted across the hatchways, and we were forced to take refuge on the taffrail at the extreme end of the poop. Mrs. Kear was laid in the whale-boat that hung from the stern, Miss Herbey persisting to the last in retaining her post by her side.

No pen could adequately portray the horrors of this fearful night. The "Chancellor" under bare poles, was driven, like a gigantic fire-ship with frightful velocity across the raging ocean; her very speed as it were, making common cause with the hurricane to fan the fire that was consuming her. Soon there could be no alternative between throwing ourselves into the sea, or perishing in the flames.

But where, all this time, was the picrate? perhaps, after all, Ruby had deceived us and there was no volcano, such as we dreaded, below our feet.

At half-past eleven, when the tempest seems at its very height there is heard a peculiar roar distinguishable even above the crash of the elements. The sailors in an instant recognize its import.

"Breakers to starboard!" is the cry.

Curtis leaps on to the netting, casts a rapid glance at the snow-white billows, and turning to the helmsman shouts with all his might "Starboard the helm!"

But it is too late. There is a sudden shock; the ship is caught up by an enormous wave; she rises upon her beam ends; several times she strikes the ground; the mizzen-mast snaps short off level with the deck, falls into the sea, and the "Chancellor" is motionless.

CHAPTER XV.

THE NIGHT OF THE 29th CONTINUED.--It was not yet midnight; the darkness was most profound, and we could see nothing. But was it probable that we had stranded on the coast of America?

Very shortly after the ship had thus come to a standstill a clanking of chains was heard proceeding from her bows.

"That is well," said Curtis; "Walter and the boatswain have cast both the anchors. Let us hope they will hold."

Then, clambering along the starboard side, on which the ship had heeled, as far as the flames would allow him. He clung to the holdfasts of the shrouds, and in spite of the heavy seas that dashed against the vessel he maintained his position for a considerable time, evidently listening to some sound that had caught his ear in the midst of the tempest. In about a quarter of an hour he returned to the poop.

"Heaven be praised!" he said, "the water is coming in, and perhaps may get the better of the fire."

"True," said I, "but what then?"

"That," he replied, "is a question for by-and-by. We can now only think of the present."

Already I fancied that the violence of the flames was somewhat abated, and that the two opposing elements were in fierce contention. Some plank in the ship's side was evidently stove in, admitting free passage for the waves. But how, when the water had mastered the fire, should we be able to master the water? Our natural course would be to use the pumps, but these, in the very midst of the conflagration, were quite unavailable.

For three long hours, in anxious suspense, we watched and watched, and waited. Where we were we could not tell. One thing alone was certain: the tide was ebbing beneath us, and the waves were relaxing in their violence. Once let the fire be extinguished, and then, perhaps, there would be room to hope that the next high tide would set us afloat.

Towards half-past four in the morning the curtain of fire and smoke, which had shut off communication between the two extremities of the ship, became less dense, and we could faintly distinguish that party of the crew who had taken refuge in the forecastle; and before long, although it was impracticable to step upon the deck, the lieutenant
and the boatswain contrived to clamber over the gunwale, along the rails, and joined Curtis on the poop.

Here they held a consultation, to which I was admitted. They were all of opinion that nothing could be done until daylight should give us something of an idea of our actual position. If we then found that we were near the shore, we would, weather permitting, endeavour to land, either in the boat or upon a raft. If, on the other hand, no land were in sight, and the "Chancellor" were ascertained to be stranded on some isolated reef, all we could do would be to get her afloat, and put her into condition for reaching the nearest coast. Curtis told us that it was long since he had been able to take any observation of altitude, but there was no doubt the north-west wind had driven us far to the south; and he thought, as he was ignorant of the existence of any reef in this part of the Atlantic, that it was just possible that we had been driven on to the coast of some portion of South America.

I reminded him that we were in momentary expectation of an explosion, and suggested that it would be advisable to abandon the ship and take refuge on the reef. But he would not hear of such a proceeding, said that the reef would probably be covered at high tide, and persisted in the original resolution, that no decided action could be taken before the daylight appeared.

I immediately reported this decision of the captain to my fellow passengers. None of them seem to realize the new danger to which the "Chancellor" may be exposed by being cast upon an unknown reef, hundreds of miles it may be from land. All are for the time possessed with one idea, one hope; and that is, that the fire may now be quenched and the explosion averted.

And certainly their hopes seem in a fair way of being fulfilled. Already the raging flames that poured forth from the hatches have given place to dense black smoke, and although occasionally some fiery streaks dart across the dusky fumes, yet they are instantly extinguished. The waves are doing what pumps and buckets could never have effected; by their inundation they are steadily stifling the fire which was as steadily spreading to the whole bulk of the 1700 bales of cotton.

CHAPTER XVI.

OCTOBER 30th.--At the first gleam of daylight we eagerly scanned the southern and western horizons, but the morning mists limited our view. Land was nowhere to be seen. The tide was now almost at its lowest ebb, and the colour of the few peaks of rock that jutted up around us showed that the reef on which we had stranded was of basaltic formation. There were now only about six feet of water around the "Chancellor," though with a full freight she draws about fifteen. It was remarkable how far she had been carried on to the shelf of rock, but the number of times that she had touched the bottom before she finally ran aground left us no doubt that she had been lifted up and borne along on the top of an enormous wave. She now lies with her stern considerably higher than her bows, a position which renders walking upon the deck anything but an easy matter; moreover as the tide-receded she heeled over so much to larboard that at one time Curtis feared she would altogether capsize; that fear, however, since the tide has reached its lowest mark, has happily proved groundless.

At six o'clock some violent blows were felt against the ship's side, and at the same time a voice was distinguished, shouting loudly, "Curtis! Curtis!" Following the direction of the cries we saw that the broken mizzen-mast was being washed against the vessel, and in the dusky morning twilight we could make out the figure of a man clinging to the rigging. Curtis, at the peril of his life, hastened to bring the man on board. It proved to be none other than Silas Huntly, who, after being carried overboard with the mast, had thus, almost by a miracle, escaped a watery grave. Without a word of thanks to his deliverer, the ex-captain, passive, like an automaton, passed on and took his seat in the most secluded corner of the poop. The broken mizen may, perhaps, be of service to us at some future time, and with that idea it has been rescued from the waves and lashed securely to the stern.

By this time it was light enough to see for a distance of three miles round; but as yet nothing could be discerned to make us think that we were near a coast. The line of breakers ran for about a mile from south-west to north-east, and two hundred fathoms to the north of the ship an irregular mass of rocks formed a small islet. This islet rose about fifty feet above the sea, and was consequently above the level of the highest tides; whilst a sort of causeway, available at low water, would enable us to reach the island, if necessity required. But there the reef ended; beyond it the sea again resumed its sombre hue, betokening deep water. In all probability, then, this was a solitary shoal, unattached to a shore, and the gloom of a bitter disappointment began to weigh upon our spirits.

In another hour the mists had totally disappeared, and it was broad daylight. I and M. Letourneur stood watching Curtis as he continued eagerly to scan the southern horizon. Astonishment was written on his countenance; to him it appeared perfectly incredible that, after our course for so long had been due south from the Bermudas, no land should be in sight. But not a speck, however minute, broke the clearly-defined line that joined sea and sky. After a time Curtis made his way along the netting to the shrouds, and swung himself quickly up to the top of the mainmast. For several minutes he remained there examining the open space around, then seizing one of the backstays he glided
down and rejoined us on the poop.

"No land in sight," he said, in answer to our eager looks of inquiry.

At this point Mr. Kear interposed, and in a gruff, ill-tempered tone, asked Curtis where we were. Curtis replied that he did not know.

"You don't know, sir? Then all I can say is that you ought to know!" exclaimed the petroleum merchant.

"That may be, sir; but at present I am as ignorant of our whereabouts as you are yourself," said Curtis.

"Well," said Mr. Kear, "just please to know that I don't want to stay for ever on your everlasting ship, so I beg you will make haste and start off again."

Curtis condescended to make no other reply than a shrug of the shoulders, and turning away he informed M. Letourneur and myself that if the sun came out he intended to take its altitude and find out to what part of the ocean we had been driven. His next care was to distribute preserved meat and biscuit amongst the passengers and crew already half fainting with hunger and fatigue, and then he set to work to devise measures for setting the ship afloat.

The conflagration was greatly abated; no flames now appeared, and although some black smoke still issued from the interior, yet its volume was far less than before. The first step was to discover how much water had entered the hold. The deck was still too hot to walk upon; but after two hours' irrigation the boards became sufficiently cool for the boatswain to proceed to take some soundings, and he shortly afterwards announced that there were five feet of water below. This the captain determined should not be pumped out at present, as he wanted it thoroughly to do its duty before he got rid of it.

The next subject for consideration was whether it would be advisable to abandon the vessel, and to take refuge on the reef. Curtis thought not; and the lieutenant and the boatswain agreed with him. The chances of an explosion were greatly diminished, as it had been ascertained that the water had reached that part of the hold in which Ruby's luggage had been deposited; while, on the other hand, in the event of rough weather, our position even upon the most elevated points of rock might be very critical. It was accordingly resolved that both passengers and crew were safest on board.

Acting upon this decision we proceeded to make a kind of encampment on the poop, and the few mattresses that were rescued uninjured have been given up for the use of the two ladies. Such of the crew as had saved their hammocks have been told to place them under the forecastle where they would have to stow themselves as best they could, their ordinary quarters being absolutely uninhabitable.

Fortunately, although the store-room has been considerably exposed to the heat, its contents are not very seriously damaged, and all the barrels of water and the greater part of the provisions are quite intact. The stack of spare sails, which had been packed away in front, is also free from injury. The wind has dropped considerably since the early morning, and the swell in the sea is far less heavy. On the whole our spirits are reviving, and we begin to think we may yet find a way out of our troubles.

M. Letourneur, his son, and I, have just had a long conversation about the ship's officers. We consider their conduct, under the late trying circumstances, to have been most exemplary, and their courage, energy, and endurance to have been beyond all praise. Lieutenant Walter, the boatswain, and Dowlas the carpenter have all alike distinguished themselves, and made us feel that they are men to be relied on. As for Curtis, words can scarcely be found to express our admiration of his character; he is the same as he has ever been, the very life of his crew, cheering them on by word or gesture; finding an expedient for every difficulty, and always foremost in every action.

The tide turned at seven this morning, and by eleven all the rocks were submerged, none of them being visible except the cluster of those which formed the rim of a small and almost circular basin from 250 to 300 feet in diameter, in the north angle of which the ship is lying. As the tide rose the white breakers disappeared, and the sea, fortunately for the "Chancellor," was pretty calm; otherwise the dashing of the waves against her sides, as she lies motionless, might have been attended by serious consequences.

As might be supposed, the height of the water in the hold increased with the tide from five feet to nine; but this was rather a matter for congratulation, insomuch as it sufficed to inundate another layer of cotton.

At half-past eleven the sun, which had been behind the clouds since ten o'clock, broke forth brightly. The captain, who had already in the morning been able to calculate an horary angle, now prepared to take the meridian altitude, and succeeded at midday in making his observation most satisfactorily. After retiring for a short time to calculate the result; he returned to the poop and announced that we are in lat. 18 deg. 5 min. N. and long. 45 deg. 53 min. W., but that the reef on which we are aground is not marked upon the charts. The only explanation that can be given for the omission is that the islet must be of recent formation, and has been caused by some subterranean volcanic disturbance. But whatever may be the solution of the mystery, here we are 800 miles from land; for such, on consulting the map, we find to be the actual distance to the coast of Guiana, which is the nearest shore. Such is the position to which we have been brought, in the first place, by Huntly's senseless obstinacy, and, secondly, by the furious north-west gale.
Yet, after all, the captain's communication does not dishearten us. As I said before, our spirits are reviving. We have escaped the peril of fire; the fear of explosion is past and gone; and oblivious of the fact that the ship with a hold full of water is only too likely to Found when she puts out to sea, we feel a confidence in the future that forbids us to despond.

Meanwhile Curtis prepares to do all that common sense demands. He proposes, when the fire is quite extinguished, to throw overboard the whole, or the greater portion of the cargo, including of course, the picrate; he will next plug up the leak, and then, with a lightened ship, he will take advantage of the first high tide to quit the reef as speedily as possible.

CHAPTER XVII.
OCTOBER 30th.---Once again I talked to M. Letourneur about our situation, and endeavoured to animate him with the hope that we should not be detained for long in our present predicament; but he could not be brought to take a very sanguine view of our prospects.

"But surely," I protested, "it will not be difficult to throw overboard a few hundred bales of cotton; two or three days at most will suffice for that."

"Likely enough," he replied, "when the business is once begun; but you must remember, Mr. Kazallon, that the very heart of the cargo is still smouldering, and that it will still be several days before any one will be able to venture into the hold. Then the leak, too, that has to be caulked; and, unless it is stopped up very effectually, we shall be only doomed most certainly to perish at sea. Don't, then, be deceiving yourself; it must be three weeks at least before you can expect to put out to sea. I can only hope meanwhile that the weather will continue propitious; it wouldn't take many storms to knock the 'Chancellor,' shattered as she is, completely into pieces."

Here, then, was the suggestion of a new danger to which we were to be exposed; the fire might be extinguished, the water might be got rid of by the pumps, but, after all, we must be at the mercy of the wind and waves; and, although the rocky island might afford a temporary refuge from the tempest, what was to become of passengers and crew if the vessel should be reduced to a total wreck? I made no remonstrance, however, to this view of our case, but merely asked M. Letourneur if he had confidence in Robert Curtis?

"Perfect confidence," he answered; "and I acknowledge it most gratefully, as a providential circumstance, that Captain Huntly had given him the command in time. Whatever man can do I know that Curtis will not leave undone to extricate us from our dilemma."

Prompted by this conversation with M. Letourneur I took the first opportunity of trying to ascertain from Curtis himself, how long he reckoned we should be obliged to remain upon the reef; but he merely replied, that it must depend upon circumstances, and that he hoped the weather would continue favourable. Fortunately the barometer is rising steadily, and there is every sign of a prolonged calm.

Meantime Curtis is taking active measures for totally extinguishing the fire. He is at no great pains to spare the cargo, and as the bales that lie just above the level of the water are still a-light he has resorted to the expedient of thoroughly saturating the upper layers of the cotton, in order that the combustion may be stifled between the moisture descending from above and that ascending from below. This scheme has brought the pumps once more into requisition. At present the crew are adequate to the task of working them, but I and some of our fellow passengers are ready to offer our assistance whenever it shall be necessary.

With no immediate demand upon our labour, we are thrown upon our own resources for passing our time. Letourneur, Andre and myself, have frequent conversations; I also devote an hour or two to my diary. Falsten holds little communication with any of us, but remains absorbed in his calculations, and amuses himself by tracing mechanical diagrams with ground-plan, section, elevation, all complete. It would be a happy inspiration if he could invent some mighty engine that could set us all afloat again. Mr. and Mrs. Kear, too, hold themselves aloof from their fellow passengers, and we are not sorry to be relieved from the necessity of listening to their incessant grumbling; unfortunately, however, they carry off Miss Herbey with them, so that we enjoy little or nothing of the young lady's society. As for Silas Huntly, he has become a complete nonentity; he exists, it is true, but merely, it would seem, to vegetate.

Hobart, the steward, an obsequious, sly sort of fellow, goes through his routine of duties just as though the vessel were pursuing her ordinary course; and, as usual, is continually falling out with Jynxstrop, the cook, an impudent, ill-favoured negro, who interferes with the other sailors in a manner which, I think, ought not to be allowed.

Since it appears likely that we shall have abundance of time on our hands, I have proposed to M. Letourneur and his son that we shall together explore the reef on which we are stranded. It is not very probable that we shall be able to discover much about the origin of this strange accumulation of rock, yet the attempt will at least occupy us for some hours, and will relieve us from the monotony of our confinement on board. Besides, as the reef is not marked
in any of the maps, I could not but believe that it would be rendering a service to hydrography if we were to take an accurate plan of the rocks, of which Curtis could afterwards verify the true position by a second observation made with a closer precision than the one he has already taken.

M. Letourneur agrees to my proposal, Curtis has promised to let us have the boat and some sounding-lines, and to allow one of the sailors to accompany us; so to-morrow morning, we hope to make our little voyage of investigation.

CHAPTER XVIII.

OCTOBER 31st to NOVEMBER 5th.—Our first proceeding on the morning of the 31st was to make the proposed tour of the reef, which is about a quarter of a mile long. With the aid of our sounding-lines we found that the water was deep, right up to the very rocks, and that no shelving shores prevented us coasting along them. There was not a shadow of doubt as to the rock being of purely volcanic origin, upheaved by some mighty subterranean convulsion. It is formed of blocks of basalt, arranged in perfect order, of which the regular prisms give the whole mass the effect of being one gigantic crystal; and the remarkable transparency of the sea enabled us plainly to observe the curious shafts of the prismatic columns that support the marvelous substructure.

"This is indeed a singular island," said M. Letourneur; "evidently it is of quite a recent origin."

"Yes, father," said Andre, "and I should think it has been caused by a phenomenon similar to those which produced the Julia Island, off the coast of Sicily, or the group of the Santorini, in the Grecian Archipelago. One could almost fancy that it had been created expressly for the 'Chancellor' to stand upon."

"It is very certain," I observed, "that some upheaving has lately taken place. This is by no means an unfrequented part of the Atlantic, so that it is not at all likely that it could have escaped the notice of sailors if it had been always in existence; yet it is not marked even in the most modern charts. We must try and explore it thoroughly and give future navigators the benefit of our observations."

"But, perhaps, it will disappear as it came," said Andre. "You are no doubt aware, Mr. Kazallon, that these volcanic islands sometimes have a very transitory existence. Not impossibly, by the time it gets marked upon the maps it may no longer be here."

"Never mind, my boy," answered his father, "it is better to give warning of a danger that does not exist than overlook one that does. I daresay the sailors will not grumble much, if they don't find a reef where we have marked one."

"No, I daresay not, father," said Andre. "and after all this island is very likely as firm as a continent. However, if it is to disappear, I expect Captain Curtis would be glad to see it take its departure as soon as possible after he has finished his repairs; it would save him a world of trouble in getting his ship afloat."

"Why, what a fellow you are Andre!" I said, laughing. "I believe you would like to rule Nature with a magic wand; first of all, you would call up a reef from the depth of the ocean to give the 'Chancellor' time to extinguish her flames, and then you would make it disappear just that the ship might be free again."

Andre smiled; then, in a more serious tone, he expressed his gratitude for the timely help that had been vouchsafed us in our hour of need.

The more we examined the rocks that formed the base of the little island, the more we became convinced that its formation was quite recent. Not a mollusk, not a tuft of seaweed was found clinging to the sides of the rocks; not a germ had the wind carried to its surface, not a bird had taken refuge amidst the crags upon its summits. To a lover of natural history, the spot did not yield a single point of interest; the geologist alone would find subject of study in the basaltic mass.

When we reached the southern point of the island I proposed that we should disembark. My companions readily assented, young Letourneur jocosely observing that if the little island was destined to vanish, it was quite right that it should first be visited by human beings. The boat was accordingly brought alongside, and we set, foot upon the reef, and began to ascend the gradual slope that leads to its highest elevation.

The walking was not very rough, and as Andre could get along tolerably well without the assistance of an arm, he led the way, his father and I following close behind. A quarter of an hour sufficed to bring us to the loftiest point in the islet, when we seated ourselves on the basaltic prism that crowned its summit.

Andre took a sketch-book from his pocket, and proceeded to make a drawing of the reef. Scarcely had he completed the outline when his father exclaimed,—

"Why, Andre, you have drawn a ham!"

"Something uncommonly like it, I confess," replied Andre. "I think we had better ask Captain Curtis to let us call our island Ham Rock."

"Good," said I; "though sailors will need to keep it at a respectful distance, for they will scarcely find that their
M. Letourneur was quite correct; the outline of the reef as it stood clearly defined against the deep green water resembled nothing so much as a fine York ham, of which the little creek, where the "Chancellor" had been stranded, corresponded to the hollow place above the knuckle. The tide at this time was low, and the ship now lay heeled over very much to the starboard side, the few points of rock that emerged in the extreme south of the reef plainly marking the narrow passage through which she had been forced before she finally ran aground.

As soon as Andre had finished his sketch we descended by a slope as gradual as that by which we had come up, and made our way towards the west. We had not gone very far when a beautiful grotto, perfect as an architectural structure, arrested our attention. M. Letourneur and Andre who have visited the Hebrides, pronounced it to be a Fingal's cave in miniature; a Gothic chapel that might form a fit vestibule for the cathedral cave of Staffa. The basaltic rocks had cooled down into the same regular concentric prisms; there was the same dark canopied roof with its interstices filled up with its yellow lutings; the same precision of outline in the prismatic angles, sharp as though chiselled by a sculptor's hand; the same sonorous vibration of the air across the basaltic rocks, of which the Gaelic poets have feigned that the harps of the Fingal minstrelsy were made. But whereas at Staffa the floor of the cave is always covered with a sheet of water, here the grotto was beyond the reach of all but the highest waves, whilst the prismatic shafts themselves formed quite a solid pavement.

After remaining nearly an hour in our newly-discovered grotto we returned to the "Chancellor," and communicated the result of our explorations to Curtis, who entered the island upon his chart by the name that Andre Letourneur had proposed.

Since its discovery we have not permitted a day to pass without spending some time in our Ham Rock grotto. Curtis has taken an opportunity of visiting it, but he is too preoccupied with other matters to have much interest to spare for the wonders of nature. Falsten, too, came once and examined the character of the rocks, knocking and chipping them about with all the mercilessness of a geologist. Mr. Kear would not trouble himself to leave the ship; and although I asked his wife to join us in one of our excursions she declined, upon the plea that the fatigue, as well as the inconvenience of embarking in the boat, would be more than she could bear.

Miss Herbey, only too thankful to escape even for an hour from her capricious mistress, eagerly accepted M. Letourneur's invitation to pay a visit to the reef but to her great disappointment Mrs. Kear at first refused point-blank to allow her to leave the ship. I felt intensely annoyed, and resolved to intercede in Miss Herbey's favour; and as I had already rendered that self-indulgent lady sundry services which she thought she might probably be glad again to accept, I gained my point, and Miss Herbey has several times been permitted to accompany us across the rocks, where the young girl's delight at her freedom has been a pleasure to behold.

Sometimes we fish along the shore, and, then enjoy a luncheon in the grotto, whilst the basalt columns vibrate like harps to the breeze. This arid reef, little as it is, compared with the cramped limits of the "Chancellor's" deck is like some vast domain; soon there will be scarcely a stone with which we are not familiar, scarcely a portion of its surface which we have not merrily trodden, and I am sure that when the hour of departure arrives we shall leave it with regret.

In the course of conversation, Andre Letourneur one day happened to say that he believed the island of Staffa belonged to the Macdonald family, who let it for the small sum of 12 pounds a year.

"I suppose then," said Miss Herbey, "that we should hardly get more than half-a-crown a year for our pet little island."

"I don't think you would get a penny for it, Miss Herbey; but are you thinking of taking a lease?" I said, laughing.

"Not at present," she said; then added, with a half-suppressed sigh, "and yet it is a place where I have seemed to know what it is to be really happy."

Andre murmured some expression of assent, and we all felt that there was something touching in the words of the orphaned, friendless girl who had found her long-lost sense of happiness on a lonely rock in the Atlantic.
the weather should be favourable, I believe we could reach the shore. What I now propose to do is to stop the leak
are now 800 miles from the coast of Paramaribo, the nearest portion of Dutch Guiana, and in ten or twelve days, if
construct a smaller vessel that might have carried us safely to land; but I dare not run the risk of remaining here. We
suspected, and that her hull is very seriously damaged. If we had been stranded anywhere than on a barren reef,
passengers and crew, and announcing to them the facts of the case.
not long since gaped completely open.
started away from the butt-ends and seams; so much so that it was little short of a miracle that the whole ship had
of the fire on the flanks of the ship had been of a much more serious character; a long portion of the inside boarding
less injured than they expected, and the thick, heavy planks had only been scorched very superficially. But the action
had been done by the conflagration. They found that the deck and the cross-beams that supported it had been much
of the island, and there it remains.

the damage would be to careen the ship, and to shift the planking, but the appliances are wanting for such an
action of the pumps; so Curtis ordered that a number of the bales should be piled up inside against the broken
planks. The scheme succeeded very well, and as the water got lower and lower in the hold the men were enabled to
resume their task of unlading.

Curtis thinks it quite probable that the leaks may be mended from the interior. By far the best way of repairing
the damage would be to careen the ship, and to shift the planking, but the appliances are wanting for such an
undertaking; moreover, any bad weather which might occur while the ship was on her flank would only too certainly
be fatal to her altogether. But the captain has very little doubt that by some device or other he shall manage to patch
up the hole in such a way as will insure our reaching land in safety.

After two days' toil the water was entirely reduced and without further difficulty the unlading was completed. All
of us, including even Andre Letourneur, have been taking our turn at the pumps, for the work is so extremely
fatiguing that the crew require some occasional respite; arms and back soon become strained and weary with the
incessant swing of the handles, and I can well understand the dislike which sailors always express to the labour.

One thing there is which is much in our favour; the ship lies on a firm and solid bottom, and we have the
satisfaction of knowing that we are not contending with a flood that encroaches faster than it can be resisted. Heaven
grant that we may not be called to make like efforts, and to make them hopelessly, for a foundering ship!

CHAPTER XX.

NOVEMBER 15th to 20th.--The examination of the hold has at last been made. Amongst the first things that
were found was the case of picrate, perfectly intact; having neither been injured by the water, nor of course reached
by the flames. Why it was not at once pitched into the sea I cannot say; but it was merely conveyed to the extremity of
the island, and there it remains.

While they were below, Curtis and Dowlas made themselves acquainted with the full extent of the mischief that
had been done by the conflagration. They found that the deck and the cross-beams that supported it had been much
less injured than they expected, and the thick, heavy planks had only been scorched very superficially. But the action
of the fire on the flanks of the ship had been of a much more serious character; a long portion of the inside boarding
had been burnt away, and the very ribs of the vessel were considerably damaged; the oakum caulking had all
started away from the butt-ends and seams; so much so that it was little short of a miracle that the whole ship had
not long since gaped completely open.

The captain and the carpenter returned to the deck with anxious faces. Curtis lost no time in assembling
passengers and crew, and announcing to them the facts of the case.

"My friends," he said, "I am here to tell you that the 'Chancellor' has sustained far greater injuries than we
suspected, and that her hull is very seriously damaged. If we had been stranded anywhere else than on a barren reef,
that may at any time be overwhelmed by a tempestuous sea I should not have hesitated to take the ship to pieces, and
construct a smaller vessel that might have carried us safely to land; but I dare not run the risk of remaining here. We
are now 800 miles from the coast of Paramaribo, the nearest portion of Dutch Guiana, and in ten or twelve days, if
the weather should be favourable, I believe we could reach the shore. What I now propose to do is to stop the leak
by the best means we can command, and make at once for the nearest port."

As no better plan seemed to suggest itself, Curtis's proposal was unanimously accepted. Dowlas and his assistants immediately set to work to repair the charred frame-work of the ribs, and to stop the leak; they took care thoroughly to caulk from the outside all the seams that were above low water mark; lower than that they were unable to work, and had to content themselves with such repairs as they could effect in the interior. But after all the pains there is no doubt the "Chancellor" is not fit for a long voyage, and would be condemned as unseaworthy at any port at which we might put in.

To-day, the 20th, Curtis having done all that human power could do to repair his ship, determined to put her to sea.

Ever since the "Chancellor" had been relieved of her cargo, and of the water in her hold, she had been able to float in the little natural basin into which she had been driven. The basin was enclosed on either hand by rocks that remained uncovered even at high water, but was sufficiently wide to allow the vessel to turn quite round at its broadest part, and by means of hawsers fastened on the reef to be brought with her bows towards the south; while, to prevent her being carried back on to the reef, she has been anchored fore and aft.

To all appearance, then, it seemed as though it would be an easy matter to put the "Chancellor" to sea; if the wind were favourable the sails would be hoisted, if otherwise, she would have to be towed through the narrow passage. All seemed simple. But unlooked-for difficulties had yet to be surmounted.

The mouth of the passage is guarded by a kind of ridge of basalt, which at high tide we knew was barely covered with sufficient water to float the "Chancellor," even when entirely unfreighted. To be sure she had been carried over the obstacle once before, but then, as I have already said, she had been caught up by an enormous wave, and might have been said to be LIFTED over the barrier into her present position. Besides, on that ever-memorable night, there had not only been the ordinary spring-tide, but an equinoctial tide, such a one as could not be expected to occur again for many months. Waiting was out of the question; so Curtis determined to run the risk, and to take advantage of the spring-tide, which would occur to-day, to make an attempt to get the ship, lightened as she was, over the bar; after which, he might ballast her sufficiently to sail.

The wind was blowing from the north-west, and consequently right in the direction of the passage. The captain, however, after a consultation, preferred to tow the ship over the ridge, as he considered it was scarcely safe to allow a vessel of doubtful stability at full sail to charge an obstacle that would probably bring her to a dead lock. Before the operation was commenced, Curtis took the precaution of having an anchor ready in the stern, for, in the event of the attempt being unsuccessful, it would be necessary to bring the ship back to her present moorings. Two more anchors were next carried outside the passage, which was not more than two hundred feet in length. The chains were attached to the windlass, the sailors worked away at the handspikes, and at four o'clock in the afternoon the "Chancellor" was in motion.

High tide would be at twenty minutes past four, and at ten minutes before that time the ship had been hauled as far as her sea-range would allow; her keel grazed the ridge, and her progress was arrested. When the lowest part of her stern, however, just cleared the obstruction, Curtis deemed that there was no longer any reason why the mechanical action of the wind should not be brought to bear and contribute its assistance. Without delay, all sails were unfurled and trimmed to the wind. The tide was exactly at its height, passengers and crew together were at the windlass, M. Letourneur, Andre, Falsten, and myself being at the starboard bar. Curtis stood upon the poop, giving his chief attention to the sails; the lieutenant was on the forecastle; the boatswain by the helm. The sea seemed propitiously calm and, as it swelled gently to and fro, lifted the ship several times.

"Now, my boys," said Curtis in his calm clear voice, "all together! Off!!"

Round went the windlass; click, click, clanked the chains as link by link they were forced through the hawse-holes.
The breeze freshened, and the masts gave to the pressure of the sails, but round and round we went, keeping time in regular monotony to the sing-song tune hummed by one of the sailors.

We had gained about twenty feet, and were redoubling our efforts when the ship grounded again.

And now no effort would avail; all was in vain; the tide began to turn; and the "Chancellor" would not advance an inch. Was there time to go back? She would inevitably go to pieces if left balanced upon the ridge. In an instant the captain has ordered the sails to be furled, and the anchor dropped from the stern.

One moment of terrible anxiety, and all is well. The "Chancellor" tacks to stern, and glides back into the basin, which is once more her prison.

"Well, captain," says the boatswain, "what's to be done now?"

"I don't know" said Curtis, "but we shall get across somehow."
CHAPTER XXI.

NOVEMBER 21st to 24th.—There was assuredly no time to be lost before we ought to leave Ham Rock reef. The barometer had been falling ever since the morning, the sea was getting rougher, and there was every symptom that the weather, hitherto so favourable, was on the point of breaking; and in the event of a gale the "Chancellor" must inevitably be dashed to pieces on the rocks.

In the evening, when the tide was quite low, and the rocks uncovered, Curtis, the boatswain, and Dowlas went to examine the ridge which had proved so serious an obstruction, Falsten and I accompanied them. We came to the conclusion that the only way of effecting a passage was by cutting away the rocks with pikes over a surface measuring ten feet by six. An extra depth of nine or ten inches would give a sufficient gauge, and the channel might be accurately marked out by buoys; in this way it was conjectured the ship might be got over the ridge and so reach the deep water beyond.

"But this basalt is as hard as granite," said the boatswain; "besides, we can only get at it at low water, and consequently could only work at it for two hours out of the twenty-four."

"All the more reason why we should begin at once, boatswain," said Curtis.

"But if it is to take us a month, captain, perhaps by that time the ship may be knocked to atoms. Couldn't we manage to blow up the rock? we have got some powder on board."

"Not enough for that;" said the boatswain.

"You have something better than powder," said Falsten.

"What's that?" asked the captain.

"Picrate of potash," was the reply.

And so the explosive substance with which poor Ruby had so grievously imperilled the vessel was now to serve her in good stead, and I now saw what a lucky thing it was that the case had been deposited safely on the reef, instead of being thrown into the sea.

Picric acid is a crystalline bitter product extracted from coal-tar, and forming, in combination with potash, a yellow salt known as picrate of potash. The explosive power of this substance is inferior to that of gun-cotton or of dynamite, but far greater than that of ordinary gunpowder; one grain of picric powder producing an effect equal to that of thirteen grains of common powder. Picrate is easily ignited by any sharp or violent shock, and some gun-priming which we had in our possession would answer the purpose of setting it alight.

The sailors went off at once for their pikes, and Dowlas and his assistants, under the direction of Falsten, who, as an engineer, understood such matters, proceeded to hollow out a mine wherein to deposit the powder. At first we hoped that everything would be ready for the blasting to take place on the following morning, but when daylight appeared we found that the men, although they had laboured with a will, had only been able to work for an hour at low water and that four tides must ebb before the mine had been sunk to the required depth.

Not until eight o'clock on the morning of the 23rd was the work complete. The hole was bored obliquely in the rock, and was large enough to contain about ten pounds of explosive matter. Just as the picrate was being introduced into the aperture, Falsten interposed:--

"Stop," he said, "I think it will be best to mix the picrate with common powder, as that will allow us to fire the mine with a match instead of the gun-priming which would be necessary to produce a shock. Besides, it is an understood thing that the addition of gunpowder renders picrate far more effective in blasting such rocks as this, as then the violence of the picrate prepares the way for the powder which, slower in its action, will complete the dismemberment of the basalt."

Falsten is not a great talker, but what he does say is always very much to the point. His good advice was immediately followed; the two substances were mixed together, and after a match had been introduced the compound was rammed closely into the hole.

Notwithstanding that the "Chancellor" was at a distance from the rocks that insured her from any danger of being injured by the explosion, it was thought advisable that the passengers and crew should take refuge in the grotto at the extremity of the reef, and even Mr. Kear, in spite of his many objections, was forced to leave the ship. Falsten, as soon as he had set fire to the match, joined us in our retreat.

The train was to burn for ten minutes, and at the end of that time the explosion took place; the report, on account of the depth of the mine, being muffled, and much less noisy than we had expected. But the operation had been perfectly successful. Before we reached the ridge we could see that the basalt had been literally reduced to powder, and that a little channel, already being filled by the rising tide, had been cut right through the obstacle. A loud hurrah rang through the air; our prison-doors were opened, and we were prisoners no more!

At high tide the "Chancellor" weighed anchor and floated out into the open sea, but she was not in a condition to sail until she had been ballasted; and for the next twenty-four hours the crew were busily employed in taking up blocks of stone, and such of the bales of cotton as had sustained the least amount of injury.
In the course of the day, M. Letourneur, Andre, Miss Herbey, and I took a farewell walk round the reef, and Andre with artistic skill, carved on the wall of the grotto the word "Chancellor,"--the designation Ham Rock, which we had given to the reef,--and the date of our running aground. Then we bade adieu to the scene of our three week's sojourn, where we had passed days that to some at least of our party will be reckoned as far from being the least happy of their lives.

At high tide this morning, the 24th, with low, top, and gallant sails all set, the "Chancellor" started on her onward way, and two hours later the last peak of Ham Rock had vanished below the horizon.

CHAPTER XXII.

NOVEMBER 24th to DECEMBER 1st.--Here we were then once more at sea, and although on board a ship of which the stability was very questionable, we had hopes, if the wind continued favourable, of reaching the coast of Guiana in the course of a few days.

Our way was south-west and consequently with the wind, and although Curtis would not crowd on all sail lest the extra speed should have a tendency to spring the leak afresh, the "Chancellor" made a progress that was quite satisfactory. Life on board began to fall back into its former routine; the feeling of insecurity and the consciousness that we were merely retracing our path doing much, however, to destroy the animated intercourse that would otherwise go on between passenger and passenger.

The first few days passed without any incident worth recording, then on the 29th, the wind shifted to the north, and it became necessary to brace the yards, trim the sails, and take a starboard tack. This made the ship lurch very much on one side, and as Curtis felt that she was labouring far too heavily, he clued up the top-gallants, prudently reckoning that, under the circumstances, caution was far more important than speed.

The night came on dark and foggy. The breeze freshened considerably, and, unfortunately for us, hailed from the north-west. Although we carried no top-sails at all, the ship seemed to heel over more than ever. Most of the passengers had retired to their cabins, but all the crew remained on deck, whilst Curtis never quitted his post upon the poop.

Towards two o'clock in the morning I was myself preparing to go to my cabin, when Burke, one of the sailors who had been down into the hold, came on deck with the ominous cry,--

"Two feet of water below."

In an instant Curtis and the boatswain had descended the ladder. The startling news was only too true; the seawater was entering the hold, but whether the leak had sprung afresh, or whether the caulking in some of the seams was insufficient, it was then impossible to determine; all that could be done was to let the ship go with the wind and wait for day.

At daybreak they sounded again:--"Three feet of water!" was the report, I glanced at Curtis, his lips were white, but he had not lost his self-possession. He quietly informed such of the passengers as were already on deck of the new danger that threatened us; it was better that they should know the worst, and the fact could not be long concealed. I told M. Letourneur that I could not help hoping that there might yet be time to reach the land before the last crisis came. Falsten was about to give vent to an expression of despair, but he was soon silenced by Miss Herbey asserting her confidence that all would yet be well.

Curtis at once divided the crew into two sets, and made them work incessantly, turn and turn about at the pumps. The men applied themselves to their task with resignation rather than with ardour; the labour was hard and scarcely repaid them; the pumps were constantly getting out of order, the valves being choked up by the ashes and bits of cotton that were floating about in the hold, while every moment that was spent in cleaning or repairing them was so much time lost.

Slowly, but surely, the water continued to rise, and on the following morning the soundings gave five feet for its depth, I noticed that Curtis's brow contracted each time that the boatswain or the lieutenant brought him their report. There was no doubt it was only a question of time, and not for an instant must the efforts for keeping down the level be relaxed. Already the ship had sunk a foot lower in the water, and as her weight increased she no longer rose buoyantly with the waves, but pitched and rolled considerably.

All yesterday, and last night, the pumping continued; but still the sea gained upon us. The crew are weary and discouraged, but the second officer and the boatswain set them a fine example of endurance, and the passengers have now begun to take their turn at the pumps.

But all are conscious of toiling almost against hope; we are no longer secured firmly to the solid soil of the Ham Rock reef, but we are floating over an abyss which daily, nay hourly, threatens to swallow us into its depths.
DECEMBER 2nd and 3rd.--For four hours we have succeeded in keeping the water in the hold to one level; now, however, it is very evident that the time cannot be far distant when the pumps will be quite unequal to their task.

Yesterday Curtis, who does not allow himself a minute's rest, made a personal inspection of the hold. I, with the boatswain and carpenter, accompanied him. After dislodging some of the bales of cotton we could hear a splashing, or rather gurgling sound; but whether the water was entering at the original aperture, or whether it found its way in through a general dislocation of the seams, we were unable to discover. But whichever might be the case, Curtis determined to try a plan which, by cutting off communication between the interior and exterior of the vessel, might, if only for a few hours, render her hull more watertight. For this purpose he had some strong, well-tarred sails drawn upwards by ropes from below the keel, as high as the previous leaking-place, and then fastened closely and securely to the side of the hull. The scheme was dubious, and the operation difficult, but for a time it was effectual, and at the close of the day the level of the water had actually been reduced by several inches. The diminution was small enough, but the consciousness that more water was escaping through the scupper-holes than was finding its way into the hold gave us fresh courage to persevere with our work.

The night was dark, but the captain carried all the sail he could, eager to take every possible advantage of the wind, which was freshening considerably. If he could have sighted a ship he would have made signals of distress, and would not have hesitated to transfer the passengers, and even have allowed the crew to follow, if they were ready to forsake him; for himself his mind was made up, he should remain on board the "Chancellor" until she foundered beneath his feet. No sail, however, hove in sight; consequently escape by such means was out of our power.

During the night the canvas covering yielded to the pressure of the waves, and this morning, after taking the sounding, the boatswain could not suppress an oath when he announced "Six feet of water in the hold!"

The ship, then, was filling once again, and already had sunk considerably below her previous water-line. With aching arms and bleeding hands we worked harder than ever at the pumps, and Curtis makes those who are not pumping form a line and pass buckets, with all the speed they can, from hand to hand.

But all in vain! At half-past eight more water is reported in the hold, and some of the sailors, overcome by despair, refuse to work one minute longer.

The first to abandon his post was Owen, a man whom I have mentioned before, as exhibiting something of a mutinous spirit, He is about forty years of age, and altogether unprepossessing in appearance; his face is bare, with the exception of a reddish beard, which terminates in a point; his forehead is furrowed with sinister-looking wrinkles, his lips curl inwards, and his ears protrude, whilst his bleared and bloodshot eyes are encircled with thick red rings.

Amongst the five or six other men who had struck work, I noticed Jynxstrop the cook, who evidently shared all Owen's ill feelings.

Twice did Curtis order the men back to the pumps, and twice did Owen, acting as spokesman for the rest, refuse; and when Curtis made a step forward as though to approach him, he said savagely,--

"I advise you not to touch me," and walked away to the forecastle.

Curtis descended to his cabin, and almost immediately returned with a loaded revolver in his hand.

For a moment Owen surveyed the captain with a frown of defiance; but at a sign from Jynxstrop he seemed to recollect himself; and, with the remainder of the men, he returned to his work.

DECEMBER 4th.--The first attempt at mutiny being thus happily suppressed, it is to be hoped that Curtis will succeed as well in future. An insubordinate crew would render us powerless indeed.

Throughout the night the pumps were kept, without respite, steadily at work, but without producing the least sensible benefit. The ship became so water-logged and heavy that she hardly rose at all to the waves, which consequently often washed over the deck and contributed their part towards aggravating our case. Our situation was rapidly becoming as terrible as it had been when the fire was raging in the midst of us; and the prospect of being swallowed by the devouring billows was no less formidable than that of perishing in the flames.

Curtis kept the men up to the mark, and, willing or unwilling, they had no alternative but to work on as best they might; but, in spite of all their efforts, the water perpetually rose, till, at length, the men in the hold who were passing the buckets found themselves immersed up to their waists and were obliged to come on deck.

This morning, after a somewhat protracted consultation with Walter and the boatswain, Curtis resolved to abandon the ship. The only remaining boat was far too small to hold us all, and it would therefore be necessary to
construct a raft that should carry those who could not find room in her. Dowlas the carpenter, Mr. Falsten, and ten sailors were told off to put the raft in hand, the rest of the crew being ordered to continue their work assiduously at the pumps, until the time came and everything was ready for embarkation.

Hatchet or saw in hand, the carpenter and his assistants made a beginning without delay by cutting and trimming the spare yards and extra spars to a proper length. These were then lowered into the sea, which was propitiously calm, so as to favour the operation (which otherwise would have been very difficult) of lashing them together into a firm framework, about forty feet long and twenty-five feet wide, upon which the platform was to be supported.

I kept my own place steadily at the pumps, and Andre Letourneur worked at my side; I often noticed his father glance at him sorrowfully, as though he wondered what would become of him if he had to struggle with waves to which even the strongest man could hardly fail to succumb. But come what may, his father will never forsake him, and I myself shall not be wanting in rendering him whatever assistance I can.

Mrs. Kear, who had been for some time in a state of drowsy unconsciousness, was not informed of the immediate danger, but when Miss Herbey, looking somewhat pale with fatigue, paid one of her flying visits to the deck, I warned her to take every precaution for herself and to be ready for any emergency.

"Thank you, doctor, I am always ready," she cheerfully replied, and returned to her duties below. I saw Andre follow the young girl with his eyes, and a look of melancholy interest passed over his countenance.

Towards eight o'clock in the evening the framework for the raft was almost complete, and the men were lowering empty barrels, which had first been securely bunged, and were lashing them to the wood-work to insure its floating.

Two hours later and suddenly there arose the startling cry, "We are sinking! we are sinking!"

Up to the poop rushed Mr. Kear, followed immediately by Falsten and Miss Herbey, who were bearing the inanimate form of Mrs. Kear. Curtis ran to his cabin, instantly returning with a chart; a sextant, and a compass in his hand.

The scene that followed will ever be engraven in my memory; the cries of distress, the general confusion, the frantic rush of the sailors towards the raft that was not yet ready to support them, can never be forgotten. The whole period of my life seemed to be concentrated into that terrible moment when the planks bent below my feet and the ocean yawned beneath me.

Some of the sailors had taken their delusive refuge in the shrouds, and I was preparing to follow them when a hand was laid upon my shoulder. Turning round I beheld M. Letourneur, with tears in his eyes, pointing towards his son. "Yes, my friend," I said, pressing his hand, "we will save him, if possible."

But Curtis had already caught hold of the young man, and was hurrying him to the main-mast shrouds, when the "Chancellor," which had been scudding along rapidly with the wind, stopped suddenly, with a violent shock, and began to settle. The sea rose over my ankles and almost instinctively I clutched at the nearest rope. All at once, when it seemed all over, the ship ceased to sink, and hung motionless in mid-ocean.

CHAPTER XXV.

NIGHT OF DECEMBER 4th.--Curtis caught young Letourneur again in his arms, and running with him across the flooded deck deposited him safely in the starboard shrouds, whither his father and I climbed up beside him. I now had time to look about me. The night was not very dark, and I could see that Curtis had returned to his post upon the poop; whilst in the extreme aft near the taffrail, which was still above water, I could distinguish the forms of Mr. and Mrs. Kear, Miss Herbey, and Mr. Falsten. The lieutenant and the boatswain were on the far end of the forecastle; the remainder of the crew in the shrouds and top-masts.

By the assistance of his father, who carefully guided his feet up the rigging, Andre was hoisted into the main-top. Mrs. Kear could not be induced to join him in his elevated position, in spite of being told that if the wind were to freshen she would inevitably be washed overboard by the waves; nothing could induce her to listen to remonstrance, and she insisted upon remaining on the poop, Miss Herbey, of course, staying by her side.

As soon as the captain saw the "Chancellor" was no longer sinking, he set to work to take down all the sails, yards and all, and the top-gallants, in the hope that by removing everything that could compromise the equilibrium of the ship he might diminish the chance of her capsizing altogether.

"But may she not founder at any moment?" I said to Curtis, when I had joined him for a while upon the poop. "Everything depends upon the weather," he replied, in his calmest manner; "that, of course, may change at any hour. One thing, however, is certain, the 'Chancellor' preserves her equilibrium for the present."

"But do you mean to say," I further asked, "that she can sail with two feet of water over her deck?" No, Mr. Kazallon, she can't sail, but she can drift with the wind, and if the wind remains in its present quarter, in the course of a few days we might possibly sight the coast. Besides, we shall have our raft as a last resource; in a
few hours it will be ready, and at daybreak we can embark."

"You have not then," I added, "abandoned all hope even yet?" I marvelled at his composure.

"While there's life there's hope, you know Mr. Kazallon; out of a hundred chances, ninety-nine may be against us, but perhaps the odd one may be in our favour. Besides, I believe that our case is not without precedent. In the year 1795 a three-master, the 'Juno,' was precisely in the same half-sunk, water-logged condition as ourselves; and yet with her passengers and crew clinging to her top-masts she drifted for twenty days, until she came in sight of land, when those who had survived the deprivation and fatigue were saved. So let us not despair; let us hold on to the hope that the survivors of the 'Chancellor' may be equally fortunate."

I was only too conscious that there was not much to be said in support of Curtis's sanguine view of things, and that the force of reason pointed all the other way; but I said nothing, deriving what comfort I could from the fact that the captain did not yet despond of an ultimate rescue.

As it was necessary to be prepared to abandon the ship almost at a moment's notice, Dowlas was making every exertion to hurry on the construction of the raft. A little before midnight he was on the point of conveying some planks for this purpose, when, to his astonishment and horror, he found that the framework had totally disappeared. The ropes that had attached it to the vessel had snapped as she became vertically displaced, and probably it had been adrift for more than an hour.

The crew were frantic at this new misfortune, and shouting "Overboard with the masts!" they began to cut down the rigging preparatory to taking possession of the masts for a new raft.

But here Curtis interposed:--

"Back to your places, my men; back to your places. The ship will not sink yet, so don't touch a rope until I give you leave."

The firmness of the captain's voice brought the men to their senses, and although some of them could ill disguise their reluctance, all returned to their posts.

When daylight had sufficiently advanced Curtis mounted the mast, and looked around for the missing raft; but it was nowhere to be seen. The sea was far too rough for the men to venture to take out the whaleboat in search of it, and there was no choice but to set to work and to construct a new raft immediately.

Since the sea has become so much rougher, Mrs. Kear has been induced to leave the poop, and has managed to join M. Letourneur and his son on the main-top, where she lies in a state of complete prostration. I need hardly add that Miss Herbey continues in her unwearied attendance. The space to which these four people are limited is necessarily very small, nowhere measuring twelve feet across; to prevent them losing their balance some spars have been lashed from shroud to shroud, and for the convenience of the two ladies Curtis has contrived to make a temporary awning of a sail. Mr. Kear has installed himself with Silas Huntly on the foretop.

A few cases of preserved meat and biscuit and some barrels of water, that floated between the masts after the submersion of the deck, have been hoisted to the top-masts and fastened firmly to the stays. These are now our only provisions.

CHAPTER XXVI.

DECEMBER 5th.--The day was very hot. December in latitude 16deg. N. is a summer month, and unless a breeze should rise to temper the burning sun, we might expect to suffer from an oppressive heat.

The sea still remained very rough, and as the heavy waves broke over the ship as though she were a reef, the foam flew up to the very top-masts, and our clothes were perpetually drenched by the spray.

The "Chancellor's" hull is three-fourths immersed; besides the three masts and the bowsprit, to which the whaleboat was suspended, the poop and the forecastle are the only portions that now are visible; and as the intervening section of the deck is quite below the water, these appear to be connected only by the framework of the netting that runs along the vessel's sides. Communication between the top-masts is extremely difficult, and would be absolutely precluded, were it not that the sailors, with practised dexterity, manage to hoist themselves about by means of the stays. For the passengers, cowering on their narrow and unstable platform, the spectacle of the raging sea below was truly terrific; every wave that dashed over the ship shook the masts till they trembled again, and one could venture scarcely to look or to think lest he should be tempted to cast himself into the vast abyss.

Meanwhile, the crew worked away with all their remaining vigour at the second raft, for which the top-gallants and yards were all obliged to be employed; the planks, too, which were continually being loosened and broken away by the violence of the waves from the partitions of the ship, were rescued before they had drifted out of reach, and were brought into use. The symptoms of the ship foundering did not appear to be immediate; so that Curtis insisted upon the raft being made with proper care to insure its strength; we were still several hundred miles from the coast of Guiana, and for so long a voyage it was indispensable to have a structure of considerable solidity. The
reasonableness of this was self-apparent, and as the crew had recovered their assurance they spared no pains to accomplish their work effectually.

Of all the number, there was but one, an Irishman, named O'Ready, who seemed to question the utility of all their toil. He shook his head with an oracular gravity. He is an oldish man, not less than sixty, with his hair and beard bleached with the storms of many travels. As I was making my way towards the poop, he came up to me and began talking.

"And why, bedad, I'd like to know, why is it that they'll all be afther lavin' of the ship?"

He turned his quid with the most serene composure, and continued,—

"And isn't it me myself that's been wrecked nine times already? and sure, poor fools are they that ever have put their trust in rafts or boats sure and they found a wathery grave. Nay, nay; while the ould ship lasts, let's stick to her, says I."

Having thus unburdened his mind he relapsed, into silence, and soon went away.

About three o'clock I noticed that Mr. Kear and Silas Huntly were holding an animated conversation in the foretop. The petroleum merchant had evidently some difficulty in bringing the ex-captain round to his opinion, for I saw him several times shake his head as he gave long and scrutinizing looks at the sea and sky. In less than an hour afterwards I saw Huntly let himself down by the forestays and clamber along to the forecastle where he joined the group of sailors, and I lost sight of him.

I attached little importance to the incident, and shortly afterwards joined the party in the main-top, where we continued talking for some hours. The heat was intense, and if it had not been for the shelter afforded by the sail-tent, would have been unbearable. At five o'clock we took as refreshment some dried meat and biscuit, each individual being also allowed half a glass of water. Mrs. Kear, prostrate with fever, could not touch a mouthful; and nothing could be done by Miss Herbey to relieve her, beyond occasionally moistening her parched lips. The unfortunate lady suffers greatly, and sometimes I am inclined to think that she will succumb to the exposure and privation. Not once had her husband troubled himself about her; but when shortly afterwards I heard him hail some of the sailors on the forecastle and ask them to help him down from the foretop, I began to think that the selfish fellow was coming to join his wife.

At first the sailors took no notice of his request, but on his repeating it with the promise of paying them handsomely for their services, two of them, Burke and Sandon, swung themselves along the netting into the shrouds, and were soon at his side.

A long discussion ensued. The men evidently were asking more than Mr. Kear was inclined to give, and at one time it seemed as though the negotiation would fall through altogether. But at length the bargain was struck, and I saw Mr. Kear take a bundle of paper dollars from his waistcoat pocket, and hand a number of them over to one of the men. The man counted them carefully, and from the time it took him, I should think that he could not have pocketed anything less than a hundred dollars.

The next business was to get Mr. Kear down from the foretop, and Burke and Sandon proceeded to tie a rope round his waist, which they afterwards fastened to the forestay; then, in a way which provoked shouts of laughter from their mates, they gave the unfortunate man a shove, and sent him rolling down like a bundle of dirty clothes on to the forecastle.

I was quite mistaken as to his object. Mr. Kear had no intention of looking after his wife, but remained by the side of Silas Huntly until the gathering darkness hid them both from view.

As night drew on, the wind grew calmer, but the sea remained very rough. The moon had been up ever since four in the afternoon, though she only appeared at rare intervals between the clouds. Some long lines of vapour on the horizon were tinged with a rosy glare that foreboded a strong breeze for the morrow, and all felt anxious to know from which quarter the breeze would come, for any but a north-easter would bear the frail raft on which we were to embark far away from land.

About eight o'clock in the evening Curtis mounted to the main-top but he seemed preoccupied and anxious, and did not speak to any one. He remained for a quarter of an hour, then after silently pressing my hand, he returned to his old post.

I laid myself down in the narrow space at my disposal, and tried to sleep; but my mind was filled with strange forebodings, and sleep was impossible. The very calmness of the atmosphere was oppressive; scarcely a breath of air vibrated through the metal rigging, and yet the sea rose with a heavy swell as though it felt the warnings of a coming tempest.

All at once, at about eleven o'clock, the moon burst brightly forth through a rift in the clouds, and the waves sparkled again as if illumined by a submarine glimmer. I start up and look around me. Is it merely imagination? or do I really see a black speck floating on the dazzling whiteness of the waters, a speck that cannot be a rock; because it rises and falls with the heaving motion of the billows? But the moon once again becomes overclouded; the sea, is
darkened, and I return to my uneasy couch close to the larboard shrouds.

CHAPTER XXVII.

DECEMBER 6th.--I must have fallen asleep for a few hours, when at four o'clock in the morning, I was rudely aroused by the roaring of the wind, and could distinguish Curtis's voice as he shouted in the brief intervals between the heavy gusts.

I got up, and holding tightly to the purlin--for the waves made the masts tremble with their violence--I tried to look around and below me. The sea was literally raging beneath, and great masses of livid-looking foam were dashing between the masts, which were oscillating terrifically. It was still dark, and I could only faintly distinguish two figures on the stern, whom, by the sound of their voices, that I caught occasionally above the tumult, I made out to be Curtis and the boatswain.

Just at that moment a sailor, who had mounted to the main-top to do something to the rigging, passed close behind me.

"What's the matter?" I asked,

"The wind has changed," he answered, adding something which I could not hear distinctly, but which sounded like "dead against us."

Dead against us! then, thought I, the wind had shifted to the south-west, and my last night's forebodings had been correct.

When daylight at length appeared, I found the wind although not blowing actually from the south-west, had veered round to the north-west, a change which was equally disastrous to us, inasmuch as it was carrying us away from land. Moreover, the ship had sunk considerably during the night, and there were now five feet of water above deck; the side netting had completely disappeared, and the forecastle and the poop were now all but on a level with the sea, which washed over them incessantly. With all possible expedition Curtis and his crew were labouring away at their raft, but the violence of the swell materially impeded their operations, and it became a matter of doubt as to whether the woodwork would not fall asunder before it could be properly fastened together.

As I watched the men at their work M. Letourneur, with one arm supporting his son, came and stood by my side.

"Don't you think this main-top will soon give way?" he said, as the narrow platform on which we stood creaked and groaned with the swaying of the masts.

Miss Herbey heard his words, and pointing towards Mrs. Kear, who was lying prostrate at her feet, asked what we thought ought to be done.

"We can do nothing but stay where we are," I replied.

"No;" said Andre "this is our best refuge; I hope you are not afraid."

"Not for myself," said the young girl quietly "only for those to whom life is precious."

At a quarter to eight we heard the boatswain calling to the sailors in the bows.

"Ay, ay, sir," said one of the men--O'Ready, I think.

"Where's the whale boat?" shouted the boatswain.

"I don't know, sir. Not with us," was the reply.

"She's gone adrift, then!"

And sure enough the whale-boat was no longer hanging from the bowsprit; and in a moment the discovery was made that Mr. Kear, Silas Huntly, and three sailors,--a Scotchman and two Englishmen,--were missing. Afraid that the "Chancellor" would founder before the completion of the raft, Kear and Huntly had plotted together to effect their escape, and had bribed the three sailors to seize the only remaining boat.

This, then, was the black speck that I had seen during the night. The miserable husband had deserted his wife, the faithless captain had abandoned the ship that had once been under his command.

"There are five saved, then," said the boatswain.

"Faith, an it's five lost ye'll be maning," said O'Ready; and the state of the sea fully justified his opinion.

The crew were furious when they heard of the surreptitious flight, and loaded the fugitives with all the invectives they could lay their tongues to. So enraged were they at the dastardly trick of which they had been made the dupes, that if chance should bring the deserters again on board I should be sorry to answer for the consequences.

In accordance with my advice, Mrs. Kear has not been informed of her husband's disappearance. The unhappy lady is wasting away with a fever for which we are powerless to supply a remedy, for the medicine chest was lost when the ship began to sink. Nevertheless, I do not think we have anything to regret on that score, feeling as I do, that in a case like Mrs. Kear's, drugs would be of no avail.
CHAPTER XXVIII.

DECEMBER 6th CONTINUED.--The "Chancellor" no longer maintained her equilibrium; we felt that she was gradually going down, and her hull was probably breaking up. The main-top was already only ten feet above the water, whilst the bowsprit, with the exception of the extreme end, that rose obliquely from the waves, was entirely covered.

The "Chancellor's" last day, we felt, had come.

Fortunately the raft was all but finished, and unless Curtis preferred to wait till morning we should be able to embark in the evening.

The raft is a very solid structure. The spars that form the framework are crossed one above another and lashed together with stout ropes, so that the whole pile rises a couple of feet above the water. The upper platform is constructed from the planks that were broken from the ship's sides by the violence of the waves, and which had not drifted away. The afternoon has been employed in charging the raft with such provisions, sails, tools, and instruments as we have been able to save.

And how can I attempt to give any idea of the feelings with which, one and all, we now contemplated the fate before us? For my own part I was possessed rather by a benumbed indifference than by any sense of genuine resignation. M. Letourneur was entirely absorbed in his son, who, in his turn, thought only of his father; at the same time exhibiting a calm Christian fortitude, which was shown by no one else of the party except Miss Herbey, who faced her danger with the same brave composure. Incredible as it may seem, Falsten remained the same as ever, occupying himself with writing down figures and memoranda in his pocket-book. Mrs. Kear, in spite of all that Miss Herbey could do for her, was evidently dying.

With regard to the sailors, two or three of them were calm enough, but the rest had well-nigh lost their wits. Some of the more ill-disposed amongst them seemed inclined to run into excesses; and their conduct, under the bad influence of Owen and Jynxstrop, made it doubtful whether they would submit to control when once we were limited to the narrow dimensions of the raft. Lieutenant Walter, although his courage never failed him, was worn out with bodily fatigue, and obliged to give up all active labour; but Curtis and the boatswain were resolute, energetic and firm as ever. To borrow an expression from the language of metallurgic art, they were men "at the highest degree of hardness."

At five o'clock one of our companions in misfortune was released from her sufferings. Mrs. Kear, after a most distressing illness, through which her young companion tended her with the most devoted care, has breathed her last. A few deep sighs and all was over, and I doubt whether the sufferer was ever conscious of the peril of her situation.

The night passed on without further incident. Towards morning I touched the dead woman's hand, and it was cold and stiff. The corpse could not remain any longer on the main-top, and after Miss Herbey and I had carefully wrapped the garments about it, with a few short prayers the body of the first victim of our miseries was committed to the deep.

As the sea closed over the body I heard one of the men in the shrouds say,--
"There goes a carcass that we shall be sorry we have thrown away!"

I looked round sharply. It was Owen who had spoken, But horrible as were his words, the conviction was forced upon my mind that the day could not be far distant when we must want for food.

CHAPTER XXIX.

DECEMBER 7th.--The ship was sinking rapidly; the water had risen to the fore-top; the poop and forecastle were completely submerged; the top of the bowsprit had disappeared, and only the three mast-tops projected from the waves.

But all was ready on the raft; an erection had been made on the fore to hold a mast, which was supported by shrouds fastened to the sides of the platform; this mast carried a large royal.

Perhaps, after all, these few frail planks will carry us to the shore which the "Chancellor" has failed to reach; at any rate, we cannot yet resign all hope.

We were just on the point of embarking at 7 a.m. when the "Chancellor" all at once began to sink so rapidly that the carpenter and men who were on the raft were obliged with all speed to cut the ropes that secured it to the vessel to prevent it from being swallowed up in the eddying waters. Anxiety, the most intense, took possession of us all. At the very moment when the ship was descending into the fathomless abyss, the raft, our only hope of safety, was drifting off before our eyes. Two of the sailors and an apprentice, beside themselves with terror, threw themselves headlong into the sea; but it was evident from the very first that they were quite powerless to combat the winds and waves. Escape was impossible; they could neither reach the raft, nor return to the ship. Curtis tied a rope round his waist and tried to swim to their assistance; but long before he could reach them the unfortunate men, after a vain
struggle for life, sank below the waves and were seen no more. Curtis, bruised and beaten with the surf that raged about the mast-heads, was hauled back to the ship.

Meantime, Dowlas and his men, by means of some spars which they used as oars, were exerting themselves to bring back the raft, which had drifted about two cables-lengths away; but, in spite of all their efforts, it was fully an hour,—an hour which seemed to us, waiting as we were with the water up to the level of the top-masts, like an eternity—before they succeeded in bringing the raft alongside, and lashing it once again to the "Chancellor's" main-mast.

Not a moment was then to be lost. The waves were eddying like a whirlpool around the submerged vessel, and numbers of enormous air-bubbles were rising to the surface of the water.

The time was come. At Curtis's word "Embark!" we all hurried to the raft. Andre who insisted upon seeing Miss Herbey go first, was helped safely on to the platform, where his father immediately joined him. In a very few minutes all except Curtis and old O'Ready had left the "Chancellor."

Curtis remained standing on the main-top, deeming it not only his duty, but his right, to be the last to leave the vessel he had loved so well, and the loss of which he so much deplored.

"Now then, old fellow off of this!" cried the captain to the old Irishman, who did not move.

"And is it quite sure ye are that she's sinkin?" he said.

"Ay, ay! sure enough, my man; and you'd better look sharp."

"Faith, then, and I think I will;" and not a moment too soon (for the water was up to his waist) he jumped on to the raft.

Having cast one last, lingering look around him, Curtis then left the ship; the rope was cut and we went slowly adrift.

All eyes were fixed upon the spot where the "Chancellor" lay foundering. The top of the mizzen was the first to disappear, then followed the main-top; and soon, of what had been a noble vessel, not a vestige was to be seen.

CHAPTER XXX.

Will this frail float, forty feet by twenty, bear us in safety? Sink it cannot; the material of which it is composed is of a kind that must surmount the waves. But it is questionable whether it will hold together. The cords that bind it will have a tremendous strain to bear in resisting the violence of the sea. The most sanguine amongst us trembles to face the future; the most confident dares to think only of the present. After the manifold perils of the last seventy-two days' voyage all are too agitated to look forward without dismay to what in all human probability must be a time of the direst distress.

Vain as the task may seem, I will not pause in my work of registering the events of our drama, as scene after scene they are unfolded before our eyes.

Of the twenty-eight persons who left Charleston in the "Chancellor," only eighteen are left to huddle together upon this narrow raft; this number includes the five passengers, namely M. Letourneur, Andre, Miss Herbey, Falsten, and myself; the ship's officers, Captain Curtis, Lieutenant Walter, the boatswain, Hobart the steward, Jynxstrop the cook, and Dowlas the carpenter; and seven sailors, Austin, Owen, Wilson, O'Ready, Burke, Sandon, and Flaypole.

Such are the passengers on the raft; it is but a brief task to enumerate their resources.

The greater part of the provisions in the store-room were destroyed at the time when the ship's deck was submerged, and the small quantity that Curtis has been able to save will be very inadequate to supply the wants of eighteen people, who too probably have many days to wait ere they sight either land or a passing vessel. One cask of biscuit, another of preserved meat, a small keg of brandy, and two barrels of water complete our store, so that the utmost frugality in the distribution of our daily rations becomes absolutely necessary.

Of spare clothes we have positively none; a few sails will serve for shelter by day, and covering by night. Dowlas has his carpenter's tools, we have each a pocket-knife, and O'Ready an old tin pot; of which he takes the most tender care; in addition to these, we are in possession of a sextant, a compass, a chart, and a metal tea-kettle, everything else that was placed on deck in readiness for the first raft having been lost in the partial submersion of the vessel.

Such then is our situation; critical indeed, but after all perhaps not desperate. We have one great fear; some there are amongst us whose courage, moral as well as physical, may give way, and over failing spirits such as these we may have no control.

CHAPTER XXXI.
DECEMBER 7th CONTINUED.--Our first day on the raft has passed without any special incident. At eight o'clock this morning Curtis asked our attention for a moment.

"My friends," he said, "listen to me. Here on this raft, just as when we were on board the 'Chancellor,' I consider myself your captain; and as your captain, I expect that all of you will strictly obey my orders. Let me beg of you, one and all, to think solely of our common welfare; let us work with one heart and with one soul, and may Heaven protect us!"

After delivering these few words with an emotion that evidenced their earnestness, the captain consulted his compass, and found that the freshening breeze was blowing from the north. This was fortunate for us, and no time was to be lost in taking advantage of it to speed us on our dubious way. Dowlas was occupied in fixing the mast into the socket that had already been prepared for its reception, and in order to support it more firmly he placed spurs of wood, forming arched buttresses, on either side. While he was thus employed the boatswain and the other seamen were stretching the large royal sail on the yard that had been reserved for that purpose.

By half-past nine the mast was hoisted, and held firmly in its place by some shrouds attached securely to the sides of the raft; then the sail was run up and trimmed to the wind, and the raft began to make a perceptible progress under the brisk breeze.

As soon as we had once started, the carpenter set to work to contrive some sort of a rudder, that would enable us to maintain our desired direction. Curtis and Falsten assisted him with some serviceable suggestions, and in a couple of hours' time he had made and fixed to the back of the raft a kind of paddle, very similar to those used by the Malays.

At noon, after the necessary preliminary observations, Curtis took the altitude of the sun. The result gave lat. 15deg. 7min. N. by long. 49deg. 35min. W. as our position, which, on consulting the chart, proved to be about 650 miles north-east of the coast of Paramaribo in Dutch Guiana.

Now even under the most favourable circumstances, with trade-winds and weather always in our favour, we cannot by any chance hope to make more than ten or twelve miles a day, so that the voyage cannot possibly be performed under a period of two months. To be sure there is the hope to be indulged that we may fall in with a passing vessel, but as the part of the Atlantic into which we have been driven is intermediate between the tracks of the French and English Transatlantic steamer either from the Antilles or the Brazils, we cannot reckon at all upon such a contingency happening in our favour; whilst if a calm should set in, or worse still, if the wind were to blow from the east, not only two months, but twice, nay, three times that length of time will be required to accomplish the passage.

At best, however, our provisions, even though used with the greatest care, will barely last three months. Curtis has called us into consultation, and as the working of the raft does not require such labour as to exhaust our physical strength, all have agreed to submit to a regimen which, although it will suffice to keep us alive, will certainly not fully satisfy the cravings of hunger and thirst.

As far as we can estimate, we have somewhere about 500 lbs. of meat and about the same quantity of biscuit. To make this last for three months we ought not to consume very much more than 5 lbs. a day of each, which, when divided among eighteen people, will make the daily ration 5 oz. of meat and 5 oz. of biscuit for each person. Of water we have certainly not more than 200 gallons, but by reducing each person's allowance to a pint a day, we hope to eke out that, too, over the space of three months.

It is arranged that the food shall be distributed under the boatswain's superintendence every morning at ten o'clock. Each person will then receive his allowance of meat and biscuit, which may be eaten when and how he pleases. The water will be given out twice a day--at ten in the morning and six in the evening; but as the only drinking-vessels in our possession are the tea-kettle and the old Irishman's tin pot, the water has to be consumed immediately on distribution. As for the brandy, of which there are only five gallons, it will be doled out with the strictest limitation, and no one will be allowed to touch it except with the captain's express permission.

I should not forget that there are two sources from which we may hope to increase our store. First, any rain that may fall will add to our supply of water, and two empty barrels have been placed ready to receive it; secondly, we hope to do something in the way of fishing, and the sailors have already begun to prepare some lines.

All have mutually agreed to abide by the rules that have been laid down, for all are fully aware that by nothing but the most precise regimen can we hope to avert the horrors of famine, and forewarned by the fate, of many who in similar circumstances have miserably perished, we are determined to do all that prudence can suggest for husbanding our stores.

CHAPTER XXXII.

DECEMBER 8th to 17th.--When night came we wrapped ourselves in our sails. For my own part, worn out with
the fatigue of the long watch in the top-mast, I slept for several hours; M. Letourneur and Andre did the same, and Miss Herbey obtained sufficient rest to relieve the tired expression that her countenance had lately been wearing. The night passed quietly. As the raft was not very heavily laden the waves did not break over it at all, and we were consequently able to keep ourselves perfectly dry. To say the truth, it was far better for us that the sea should remain somewhat boisterous, for any diminution in the swell of the waves would indicate that; the wind had dropped, and it was with a feeling of regret that when the morning came I had to note down "weather calm" in my journal.

In these low latitudes the heat in the day-time is so intense, and the sun burns with such an incessant glare, that the entire atmosphere becomes pervaded with a glowing vapour. The wind, too, blows only in fitful gusts and through long intervals of perfect calm the sails flap idly and uselessly against the mast. Curtis and the boatswain, however, are of opinion that we are not entirely dependent on the wind. Certain indications, which a sailor's eye alone could detect, make them almost sure that we are being carried along by a westerly current, that flows at the rate of three or four miles an hour. If they are not mistaken, this is a circumstance that may materially assist our progress, and at which we can hardly fail to rejoice, for the high temperature often makes our scanty allowance of water quite inadequate to allay our thirst.

But with all our hardships I must confess that our condition is far preferable to what it was when we were still clinging to the "Chancellor." Here at least we have a comparatively solid platform beneath our feet, and we are relieved from the incessant dread of being carried down with a foundering vessel. In the day-time we can move about with a certain amount of freedom, discuss the weather, watch the sea, and examine our fishing-lines; whilst at night we can rest securely under the shelter of our sails.

"I really think, Mr. Kazallon," said Andre Letourneur to me a few days after we had embarked, "that our time on board the raft passes as pleasantly as it did upon Ham Rock; and the raft has one advantage even over the reef, for it is capable of motion."

"Yes, Andre," replied, "as long as the wind continues favourable the raft has decidedly the advantage; but supposing the wind shifts, what then?"

"Oh, we musn't think about that," he said; "let us keep up our courage while we can."

I felt that he was right, and that the dangers we had escaped should make us more hopeful for the future; and I think that nearly all of us are inclined to share his opinion.

Whether the captain is equally sanguine I am unable to say. He holds himself very much aloof, and as he evidently feels that he has the great responsibility of saving other lives than his own, we are reluctant to disturb his silent meditations.

Such of the crew as are not on watch spend the greater portion of their time in dozing on the fore part of the raft. The aft, by the captain's orders, has been reserved for the use of us passengers, and by erecting some uprights we have contrived to make a sort of tent, which affords some shelter from the burning sun. On the whole our bill of health is tolerably satisfactory. Lieutenant Walter is the only invalid, and he, in spite of all our careful nursing, seems to get weaker every day.

Andre Letourneur is the life of our party, and I have never appreciated the young man so well. His originality of perception makes his conversation both lively and entertaining and as he talks, his wan and suffering countenance lights up with an intelligent animation. His father seems to become more devoted to him than ever, and I have seen him sit for an hour at a time, with his hand resting on his son's, listening eagerly to his every word.

Miss Herbey occasionally joins in our conversation, but although we all do our best to make her forget that she has lost those who should have been her natural protectors, M. Letourneur is the only one amongst us to whom she speaks without a certain reserve. To him, whose age gives him something of the authority of a father, she has told the history of her life—a life of patience and self-denial such as not unfrequently falls to the lot of orphans. She had been, she said, two years with Mrs. Kear, and although now left alone in the world, homeless and without resources, hope for the future does not fail her. The young lady's modest deportment and energy of character command the respect of all on board, and I do not think that even the coarsest of the sailors has either by word or gesture acted towards her in a way that she could deem offensive.

The 12th, 13th, and 14th of December passed away without any change in our condition. The wind continued to blow in irregular gusts, but always in the same direction, and the helm, or rather the paddle at the back of the raft has never once required shifting; and the watch, who are posted on the fore, under orders to examine the sea with the most scrupulous attention, have had no change of any kind to report.

At the end of a week we found ourselves growing accustomed to our limited diet, and as we had no manual exertion, and no wear and tear of our physical constitution, we managed very well. Our greatest deprivation was the short supply of water, for, as I said before, the unmitigated heat made our thirst at times very painful.

On the 15th we held high festival. A shoal of fish, of the sparus tribe, swarmed round the raft, and although our tackle consisted merely of long cords baited with morsels of dried meat stuck upon bent nails, the fish were so
voracious that in the course of a couple of days we had caught as many as weighed almost 200lbs., some of which were grilled, and others boiled in sea-water over a fire made on the fore part of the raft. This marvelous haul was doubly welcome, inasmuch as it not only afforded us a change of diet, but enabled us to economize our stores; if only some rain had fallen at the same time we should have been more than satisfied.

Unfortunately the shoal of fish did not remain long in our vicinity. On the 17th they all disappeared, and some sharks, not less than twelve or fifteen feet long, belonging to the species of spotted dog-fish, took their place. These horrible creatures have black backs and fins, covered with white spots and stripes. Here, on our low raft, we seem almost on a level with them, and more than once their tails have struck the spars with terrible violence. The sailors manage to keep them at a distance by means of handspikes, but I shall not be surprised if they persist in following us, instinctively intelligent that we are destined to become their prey. For myself, I confess that they give me a feeling of uneasiness; they seem to me like monsters of ill-omen.

CHAPTER XXXIII.

DECEMBER 18th to 20th.--On the 18th the wind freshened a little, but as it blew from the same favourable quarter we did not complain, and only took the precaution of putting an extra support to the mast, so that it should not snap with the tension of the sail. This done, the raft was carried along with something more than its ordinary speed, and left a long line of foam in its wake.

In the afternoon the sky became slightly overclouded, and the heat consequently somewhat less oppressive. The swell made it more difficult for the raft to keep its balance, and we shipped two or three heavy seas; but the carpenter managed to make with some planks a kind of wall about a couple of feet high, which protected us from the direct action of the waves. Our casks of food and water were secured to the raft with double ropes, for we dared not run the risk of their being carried overboard, an accident that would at once have reduced us to the direst distress.

In the course of the day the sailors gathered some of the marine plants known by the name of sargassos, very similar to those we saw in such profusion between the Bermudas and Ham Rock. I advised my companions to chew the laminary tangles, which they would find contained a saccharine juice, affording considerable relief to their parched lips and throats.

The remainder of the day passed without incident. I should not, however, omit to mention that the frequent conferences held amongst the sailors, especially between Owen, Burke, Flaypole, Wilson, and Jynxstrop, the negro, aroused some uneasy suspicions in my mind. What was the subject of their conversation I could not discover, for they became silent immediately that a passenger or one of the officers approached them. When I mentioned the matter to Curtis I found he had already noticed these secret interviews, and that they had given him enough concern to make him determined to keep a strict eye upon Jynxstrop and Owen, who, rascals as they were themselves, were evidently trying to disaffect their mates.

On the 19th the heat was again excessive. The sky was cloudless, and as there was not enough wind to fill the sail the raft lay motionless upon the surface of the water. Some of the sailors found a transient alleviation for their thirst by plunging into the sea, but as we were fully aware that the water all round was infested with sharks, none of us was rash enough to follow their example, though if, as seems likely, we remain long becalmed, we shall probably in time overcome our fears, and feel constrained to indulge ourselves with a bath.

The health of Lieutenant Walter continues to cause us grave anxiety, the young man being weakened by attacks of intermittent fever. Except for the loss of the medicine-chest we might have temporarily reduced this by quinine; but it is only too evident that the poor fellow is consumptive, and that that hopeless malady is making ravages upon him that no medicine could permanently arrest. His sharp dry cough, his short breathing, his profuse perspirations, more especially in the morning; the pinched-in nose, the hollow cheeks, of which the general pallour is only relieved by a hectic flush, the contracted lips, the too brilliant eye and wasted form—all bear witness to a slow but sure decay.

To-day, the 20th, the temperature is as high as ever, and the raft still motionless. The rays of the sun penetrate even through the shelter of our tent, where we sit literally gasping with the heat. The impatience with which we awaited the moment when the boatswain should dole out our meagre allowance of water, and the eagerness with which those lukewarm drops were swallowed, can only be realized by those who for themselves have endured the agonies of thirst.

Lieutenant Walter suffers more than any of us from the scarcity of water, and I noticed that Miss Herbey reserved almost the whole of her own share for his use. Kind and compassionate as ever, the young girl does all that lies in her power to relieve the poor fellow's sufferings.

"Mr. Kazallon," she said to me this morning, "that young man gets manifestly weaker every day."

"Yes, Miss Herbey," I replied, "and how sorrowful it is that we can do nothing for him, absolutely nothing."

"Hush!" she said, with her wonted consideration, "perhaps he will hear what we are saying."
And then she sat down near the edge of the raft, where, with her head resting on her hands, she remained lost in thought.

An incident sufficiently unpleasant occurred to-day. For nearly an hour Owen, Flaypole, Burke, and Jynxstrop had been engaged in close conversation and, although their voices were low, their gestures had betrayed that they were animated by some strong excitement. At the conclusion of the colloquy Owen got up and walked deliberately to the quarter of the raft that has been reserved for the use of the passengers.

"Where are you off to now, Owen?" said the boatswain.

"That's my business," said the man insolently, and pursued his course.

The boatswain was about to stop him, but before he could interfere Curtis was standing and looking Owen steadily in the face.

"Ah, captain, I've got a word from my mates to say to you," he said, with all the effrontery imaginable.

"Say on, then," said the captain coolly.

"We should like to know about that little keg of brandy. Is it being kept for the porpoises or the officers?"

Finding that he obtained no reply, he went on,--

"Look here, captain, what we want is to have our grog served out every morning as usual."

"Then you certainly will not," said the captain.

"What! what!" exclaimed Owen, "don't you mean to let us have our grog?"

"Once and for all, no."

For a moment, with a malicious grin upon his lips, Owen stood confronting the captain; then, as though thinking better of himself, he turned round and rejoined his companions, who were still talking together in an undertone.

When I was afterwards discussing the matter with Curtis I asked him whether he was sure he had done right in refusing the brandy.

"Right!" he cried, "to be sure I have. Allow those men to have brandy! I would throw it all overboard first."

CHAPTER XXXIV.

DECEMBER 21st.--No further disturbance has taken place amongst the men. For a few hours the fish appeared again, and we caught a great many of them, and stored them away in an empty barrel. This addition to our stock of provisions makes us hope that food, at least, will not fail us.

Usually the nights in the tropics are cool, but to-day, as evening drew on, the wonted freshness did not return, but the air remained stifling and oppressive, whilst heavy masses of vapour hung over the water.

There was no moonlight; there would be a new moon at half-past one in the morning, but the night was singularly dark, except for dazzling flashes of summer lightning that from time to time illumined the horizon far and wide. There was, however, no answering roll of thunder, and the silence of the atmosphere seemed almost awful.

For a couple of hours, in the vain hope of catching a breath of air, Miss Herbey, Andre Letourneur, and I, sat watching the imposing struggle of the electric vapours. The clouds appeared like embattled turrets crested with flame, and the very sailors, coarse-minded men as they were, seemed struck with the grandeur of the spectacle, and regarded attentively, though with an anxious eye, the preliminary tokens of a coming storm. Until midnight we kept our seats upon the stern of the raft, whilst the lightning ever and again shed around us a livid glare similar to that produced by adding salt to lighted alcohol.

"Are you afraid of a storm, Miss Herbey?" said Andre to the girl.

"No, Mr. Andre, my feelings are always rather those of awe than of fear," she replied. "I consider a storm one of the sublimest phenomena that we can behold--don't you think so too?"

"Yes, and especially when the thunder is pealing," he said; "that majestic rolling, far different to the sharp crash of artillery, rises and falls like the long-drawn notes of the grandest music, and I can safely say that the tones of the most accomplished ARTISTE have never moved me like that incomparable voice of nature."

"Rather a deep bass, though," I said, laughing.

"That may be," he answered; "but I wish we might hear it now, for this silent lightning is somewhat unexpressive."

"Never mind that, Andre" I said; "enjoy a storm when it comes, if you like, but pray don't wish for it."

"And why not?" said he; "a storm will bring us wind, you know."

"And water, too," added Miss Herbey, "the water of which we are so seriously in need."

The young people evidently wished to regard the storm from their own point of view, and although I could have opposed plenty of common sense to their poetical sentiments, I said no more, but let them talk on as they pleased for fully an hour.

Meantime the sky was becoming quite overclouded, and after the zodiacal constellations had disappeared in the
mists that hung round the horizon, one by one the stars above our heads were veiled in dark rolling masses of
vapour, from which every instant there issued forth sheets of electricity that formed a vivid background to the dark
grey fragments of cloud that floated beneath.

As the reservoir of electricity was confined to the higher strata of the atmosphere, the lightning was still
unaccompanied by thunder; but the dryness of the air made it a weak conductor. Evidently the fluid could only
escape by terrible shocks, and the storm must ere long burst forth with fearful violence.

This was the opinion of Curtis and the boatswain. The boatswain is only weather-wise from his experience as a
sailor; but Curtis, in addition to his experience, has some scientific knowledge, and he pointed out to me an
appearance in the sky known to meteorologists as a "cloud-ring," and scarcely ever seen beyond the regions of the
torrid zone, which are impregnated by damp vapours brought from all quarters of the ocean by the action of the
trade-winds.

"Yes, Mr. Kazallon," said Curtis, "our raft has been driven into the region of storms, of which it has been justly
remarked that any one endowed with very sensitive organs can at any moment distinguish the growlings of thunder."

"Hark!" I said, as I strained my ears to listen, "I think I can hear it now."

"You can," he answered; "yet what you hear is but the first warning of the storm which, in a couple of hours, will
burst upon us with all its fury. But never mind, we must be ready for it."

Sleep, even if we wished it, would have been impossible in that stifling temperature. The lightning increased in
brilliancy, and appeared from all quarters of the horizon, each flash covering large arcs, varying from 100deg. to
150deg., leaving the atmosphere pervaded by one incessant phosphorescent glow.

The thunder became at length more and more distinct, the reports, if I may use the expression, being "round,"
rather than rolling. It seemed almost as though the sky were padded with heavy clouds of which the elasticity
muffled the sound of the electric bursts.

Hitherto, the sea had been calm, almost stagnant as a pond. Now, however, long undulations took place, which
the sailors recognized, all too well, as being the rebound produced by a distant tempest. A ship, in such a case,
would have been instantly brought ahull, but no manoeuvring could be applied to our raft, which could only drift
before the blast.

At one o'clock in the morning one vivid flash, followed, after the interval of a few seconds, by a loud report of
thunder, announced that the storm was rapidly approaching. Suddenly the horizon was enveloped in a vapourous
fog, and seemed to contract until it was close around us. At the same instant the voice of one of the sailors was heard
shouting,--

"A squall! a squall!"

CHAPTER XXXV.

DECEMBER 21st, NIGHT.--The boatswain rushed to the halliards that supported the sail, and instantly lowered
the yard; and not a moment too soon, for with the speed of an arrow the squall was upon us, and if it had not been
for the sailor's timely warning we must all have been knocked down and probably precipitated into the sea; as it was,
our tent on the back of the raft was carried away.

The raft itself, however, being so nearly level with the water, had little peril to encounter from the actual wind;
but from the mighty waves now raised by the hurricane we had everything to dread. At first the waves had been
crushed and flattened as it were by the pressure of the air, but now, as though strengthened by the reaction, they rose
with the utmost fury. The raft followed the motions of the increasing swell, and was tossed up and down, to and fro,
and from side to side with the most violent oscillations. "Lash yourselves tight," cried the boatswain, as he threw us
some ropes; and in a few moments, with Curtis's assistance, M. Letourneur, Andre, Falsten, and myself were
fastened so firmly to the raft, that nothing but its total disruption could carry us away. Miss Herbey was bound by a
rope passed round her waist to one of the uprights that had supported our tent, and by the glare of the lightning I
could see that her countenance was as serene and composed as ever.

Then the storm began to rage indeed. Flash followed flash, peal followed peal in quick succession. Our eyes
were blinded, our ears deafened, with the roar and glare. The clouds above, the ocean beneath, seemed verily to have
taken fire, and several times I saw forked lightnings dart upwards from the crest of the waves, and mingle with those
that radiated from the fiery vault above. A strong odour of sulphur pervaded the air, but though thunderbolts fell
thick around us, not one had touched our raft.

By two o'clock the storm had reached its height. The hurricane had increased, and the heavy waves, heated to a
strange heat by the general temperature, dashed over us until we were drenched to the skin. Curtis, Dowlas, the
boatswain, and the sailors did what they could to strengthen the raft with additional ropes. M. Letourneur placed
himself in front of Andre to shelter him from the waves. Miss Herbey stood upright and motionless as a statue.
Soon dense masses of lurid clouds came rolling up, and a crackling, like the rattle of musketry, resounded through the air. This was produced by a series of electrical concussions, in which volleys of hailstones were discharged from the cloud-batteries above. In fact, as the storm-sheet came in contact with a current of cold air, hail was formed with great rapidity, and hailstones, large as nuts, came pelting down, making the platform of the raft re-echo with a metallic ring.

For about half an hour the meteoric shower continued to descend, and during that time the wind slightly abated in violence; but after having shifted from quarter to quarter, it once more blew with all its former fury. The shrouds were broken, but happily the mast, already bending almost double, was removed by the men from its socket before it should be snapped short off. One gust caught away the tiller, which went adrift beyond all power of recovery, and the same blast blew down several of the planks that formed the low parapet on the larboard side, so that the waves dashed in without hindrance through the breach.

The carpenter and his mates tried to repair the damage, but, tossed from wave to wave, the raft was inclined to an angle of more than forty-five degrees, making it impossible for them to keep their footing, and rolling one over another, they were thrown down by the violent shocks. Why they were not altogether carried away, why we were not all hurled into the sea, was to me a mystery. Even if the cords that bound us should retain their hold, it seemed perfectly incredible that the raft itself should not be overturned, so that we should be carried down and stifled in the seething waters.

At last, towards three in the morning, when the hurricane seemed to be raging more fiercely than ever, the raft, caught up on the crest of an enormous wave, stood literally perpendicularly on its edge. For an instant, by the illumination of the lightning, we beheld ourselves raised to an incomprehensible height above the foaming breakers. Cries of terror escaped our lips. All must be over now! But no; another moment, and the raft had resumed its horizontal position. Safe, indeed, we were, but the tremendous upheaval was not without its melancholy consequences. The cords that secured the cases of provisions had burst asunder. One case rolled overboard, and the side of one of the water-barrels was staved in, so that the water which it contained was rapidly escaping. Two of the sailors rushed forward to rescue the case of preserved meat; but one of them caught his foot between the planks of the platform, and, unable to disengage it, the poor fellow stood uttering cries of distress.

I tried to go to his assistance, and had already untied the cord that was round me; but I was too late. Another heavy sea dashed over us, and by the light of a dazzling flash I saw the unhappy man, although he had managed without assistance to disengage his foot, washed overboard before it was in my power to get near him. His companion had also disappeared.

The same ponderous wave laid me prostrate on the platform, and as my head came in collision with the corner of a spar, for a time I lost all consciousness.

CHAPTER XXXVI.

DECEMBER 22nd.—Daylight came at length, and the sun broke through and dispersed the clouds that the storm had left behind. The struggle of the elements, while it lasted, had been terrific, but the swoon into which I was thrown by my fall, prevented me from observing the final incidents of the visitation. All that I know is, that shortly after we had shipped the heavy sea that I have mentioned, a shower of rain had the effect of calming the severity of the hurricane, and tended to diminish the electric tension of the atmosphere.

Thanks to the kind care of M. Letourneur and Miss Herbey, I recovered consciousness, but I believe that it is to Robert Curtis that I owe my real deliverance, for he it was that prevented me from being carried away by a second heavy wave.

The tempest, fierce as it was, did not last more than a few hours; but even in that short space of time what an irreparable loss we have sustained, and what a load of misery seems stored up for us in the future!

Of the two sailors who perished in the storm, one was Austin, a fine active young man of about eight-and-twenty; the other was old O'Ready, the survivor of so many ship wrecks. Our party is thus reduced to sixteen souls, leaving a total barely exceeding half the number of those who embarked on board the “Chancellor” at Charleston.

Curtis's first care had been to take a strict account of the remnant of our provisions. Of all the torrents of rain that fell in the night we were unhappily unable to catch a single drop; but water will not fail us yet, for about fourteen gallons still remain in the bottom of the broken barrel, whilst the second barrel has not yet been touched. But of food we have next to nothing. The cases containing the dried meat, and the fish that we had preserved, have both been washed away, and all that now remains to us is about sixty pounds of biscuit. Sixty pounds of biscuit between sixteen persons! Eight days, with half a pound a day apiece, will consume it all.

The day has passed away in silence. A general depression has fallen upon all: the spectre of famine has appeared amongst us, and each has remained wrapped in his own gloomy meditations, though each has doubtless but one idea
dominant in his mind.

Once, as I passed near the group of sailors lying on the fore part of the raft, I heard Flaypole say with a sneer,--
"Those who are going to die had better make haste about it."

"Yes," said Owen, "leave their share of food to others."

At the regular hour each person received his half-pound of biscuit. Some, I noticed, swallowed it ravenously,
others reserved it for another time. Falsten divided his ration into several portions, corresponding, I believe, to the
number of meals to which he was ordinarily accustomed. What prudence he shows! If any one survives this misery,
I think it will be he.

CHAPTER XXXVII.

DECEMBER 23rd to 30th--After the storm the wind settled back into its old quarter, blowing pretty briskly from
the north-east. As the breeze was all in our favour it was important to make the most of it, and after Dowlas had
carefully readjusted the mast, the sail was once more hoisted, and we were carried along at the rate of two or two
and a half knots an hour. A new rudder, formed of a spar and a good-sized plank, has been fitted in the place of the
one we lost, but with the wind in its present quarter it is in little requisition. The platform of the raft has been
repaired, the disjointed planks have been closed by means of ropes and wedges, and that portion of the parapet that
was washed away has been replaced, so that we are no longer wetted by the waves. In fact, nothing has been left
undone to insure the solidity of our raft, and to render it capable of resisting the wear and tear of the wind and
waves. But the dangers of wind and waves are not those which we have most to dread.

Together with the unclouded sky came a return of the tropical heat, which during the preceding days had caused
us such serious inconvenience; fortunately on the 23rd the excessive warmth was somewhat tempered by the breeze,
and as the tent was once again put up, we were able to find shelter under it by turns.

But the want of food was beginning to tell upon us sadly, and our sunken cheeks and wasted forms were visible
tokens of what we were enduring. With most of us hunger seemed to attack the entire nervous system, and the
constriction of the stomach produced an acute sensation of pain. A narcotic, such as opium or tobacco, might have
availed to soothe, if not to cure, the gnawing agony; but of sedatives we had none, so the pain must be endured.

One alone there was amongst us who did not feel the pangs of hunger. Lieutenant Walter seemed as it were to
feed upon the fever that raged within him; but then he was the victim of the most torturing thirst, Miss Herbey,
besides reserving for him a portion of her own insufficient allowance, obtained from the captain a small extra supply
of water, with which every quarter of an hour she moistened the parched lips of the young man, who almost too
weak to speak, could only express his thanks by a grateful smile. Poor fellow! all our care cannot avail to save him
now; he is doomed, most surely doomed to die.

On the 23rd he seemed to be conscious of his condition, for he made a sign to me to sit down by his side, and
then summoning up all his strength to speak, he asked me in a few broken words how long I thought he had to live?
Slight as my hesitation was, Walter noticed it immediately.

"The truth," he said; "tell me the plain truth."

"My dear fellow, I am not a doctor, you know," I began, "and I can scarcely judge--"

"Never mind," he interrupted, "tell me just what you think."

I looked at him attentively for some moments, then laid my ear against his chest. In the last few days his malady
had made fearfully rapid strides, and it was only too evident that one lung had already ceased to act, whilst the other
was scarcely capable of performing the work of respiration. The young man was now suffering from the fever which
is the sure symptom of the approaching end in all tuberculous complaints.

The lieutenant kept his eye fixed upon me with a look of eager inquiry. I knew not what to say, and sought to
 evade his question.

"My dear boy," I said, "in our present circumstances not one of us can tell how long he has to live. Not one of us
knows what may happen in the course of the next eight days."

"The next eight days," he murmured, as he looked eagerly into my face.

And then, turning away his head, he seemed to fall into a sort of doze.

The 24th, 25th, and 26th passed without any alteration in our circumstances, and strange, nay, incredible as it
may sound, we began to get accustomed to our condition of starvation. Often, when reading the histories of
shipwrecks, I have suspected the accounts to be greatly exaggerated; but now I fully realize their truth, and marvel
when I find on how little nutriment it is possible to exist for so long a time. To our daily half-pound of biscuit the
captain has thought to add a few drops of brandy, and the stimulant helps considerably to sustain our strength. If we
had the same provisions for two months, or even for one, there might be room for hope; but our supplies diminish
rapidly, and the time is fast approaching when of food and drink there will be none.
The sea had furnished us with food once, and, difficult as the task of fishing had now become, at all hazards the attempt must be made again. Accordingly the carpenter and the boatswain set to work and made lines out of some untwisted hemp, to which they fixed some nails that they pulled out of the flooring of the raft, and bent into proper shape. The boatswain regarded his device with evident satisfaction.

"I don't mean to say," said he to me, "that these nails are first-rate fish-hooks; but one thing I do know, and that is, with proper bait they will act as well as the best. But this biscuit is no good at all. Let me but just get hold of one fish, and I shall know fast enough how to use it to catch some more."

And the true difficulty was how to catch the first fish. It was evident that fish were not abundant in these waters, nevertheless the lines were cast. But the biscuit with which they were baited dissolved at once in the water, and we did not get a single bite. For two days the attempt was made in vain, and as it only involved what seemed a lavish waste of our only means of subsistence, it was given up in despair.

To-day, the 30th, as a last resource, the boatswain tried what a piece of coloured rag might do by way of attracting some voracious fish, and having obtained from Miss Herbey a little piece of the red shawl she wears, he fastened it to his hook. But still no success; for when, after several hours, he examined his lines, the crimson shred was still hanging intact as he had fixed it. The man was quite discouraged at his failure.

"But there will be plenty of bait before long," he said to me in a solemn undertone.

"What do you mean?" said I, struck by his significant manner.

"You'll know soon enough," he answered.

What did he insinuate? The words, coming from a man usually so reserved, have haunted me all night.

CHAPTER XXXVIII.

JANUARY 1st to 5th.--More than three months had elapsed since we left Charleston in the "Chancellor," and for no less than twenty days had we now been borne along on our raft at the mercy of the wind and waves. Whether we were approaching the American coast, or whether we were drifting farther and farther to sea, it was now impossible to determine, for, in addition to the other disasters caused by the hurricane, the captain's instruments had been hopelessly smashed, and Curtis had no longer any compass by which to direct his course, nor a sextant by which he might make an observation.

Desperate, however, as our condition might be judged, hope did not entirely abandon our hearts, and day after day, hour after hour were our eyes strained towards the horizon, and many and many a time did our imagination shape out the distant land. But ever and again the illusion vanished; a cloud, a mist, perhaps even a wave, was all that had deceived us; no land, no sail ever broke the grey line that united sea and sky, and our raft remained the centre of the wide and dreary waste.

On the 1st of January we swallowed our last morsel of biscuit. The 1st of January! New Year's Day! What a rush of sorrowful recollections overwhelmed our minds! Had we not always associated the opening of another year with new hopes, new plans, and coming joys? And now, where were we? Could we dare to look at one another, and breathe a new year's greeting?

The boatswain approached me with a peculiar look on his countenance.

"You are surely not going to wish me a happy new year?" I said.

"No indeed, sir," he replied, "I was only going to wish you well through the first day of it; and that is pretty good assurance on my part, for we have not another crumb to eat."

True as it was, we scarcely realized the fact of there being actually nothing until on the following morning the hour came round for the distribution of the scanty ration, and then, indeed, the truth was forced upon us in a new and startling light. Towards evening I was seized with violent pains in the stomach, accompanied by a constant desire to yawn and gape that was most distressing; but in a couple of hours the extreme agony passed away, and on the 3rd I was surprised to find that I did not suffer more. I felt, it is true, that there was some great void within myself, but the sensation was quite as much moral as physical. My head was so heavy that I could not hold it up; it was swimming with giddiness, as though I were looking over a precipice.

My symptoms were not shared by all my companions, some of whom endured the most frightful tortures. Dowlas and the boatswain especially, who were naturally large eaters, uttered involuntary cries of agony, and were obliged to gird themselves tightly with ropes to subdue the excruciating pain that was gnawing their very vitals.

And this was only the second day of our misery! what would we not have given for half, nay, for a quarter of the meagre ration which a few days back we had deemed so inadequate to supply our wants, and which now, eked out crumb by crumb, might, perhaps, serve for several days? In the streets of a besieged city, dire as the distress may be, some gutter, some rubbish-heap, some corner may yet be found that will furnish a dry bone or a scrap of refuse that may for a moment allay the pangs of hunger; but these bare planks, so many times washed clean by the relentless
waves, offer nothing to our eager search, and after every fragment of food that the wind carried into their interstices has been scraped out devoured, our resources are literally at an end.

The nights seem even longer than the days. Sleep, when it comes, brings no relief; it is rather a feverish stupour, broken and disturbed by frightful nightmares. Last night, however, overcome by fatigue, I managed to rest for several hours.

At six o'clock this morning I was roused by the sound of angry voices, and, starting up, I saw Owen and Jynxstrop, with Flaypole, Wilson, Burke, and Sandon, standing in a threatening attitude. They had taken possession of the carpenter's tools, and now, armed with hatchets, chisels, and hammers, they were preparing to attack the captain, the boatswain, and Dowlas. I attached myself in a moment to Curtis's party. Falsten followed my example, and although our knives were the only weapons at our disposal, we were ready to defend ourselves to the very last extremity.

Owen and his men advanced towards us. The miserable wretches were all drunk, for during the night they had knocked a hole in the brandy-barrel, and had recklessly swallowed its contents. What they wanted they scarcely seemed to know, but Owen and Jynxstrop, not quite so much intoxicated as the rest; seemed to be urging them on to massacre the captain and the officers.

"Down with the captain! Overboard with Curtis! Owen shall take the command!" they shouted from time to time in their drunken fury; and, armed as they were, they appeared completely masters of the situation.

"Now, then, down with your arms!" said Curtis sternly, as he advanced to meet them.

"Overboard with the captain!" howled Owen, as by word and gesture he urged on his accomplices.

Curtis' pushed aside the excited rascals, and, walking straight up to Owen, asked him what he wanted.

"What do we want? Why, we want no more captains; we are all equals now."

Poor stupid fool! as though misery and privation had not already reduced us all to the same level.

"Owen," said the captain once, again, "down with your arms!"

"Come on, all of you," shouted Owen to his companions, without giving the slightest heed to Curtis's words.

A regular struggle ensued. Owen and Wilson attacked Curtis, who defended himself with a piece of a spar; Burke and Flaypole rushed upon Falsten and the boatswain, whilst I was left to confront the negro Jynxstrop, who attempted to strike me with the hammer which he brandished in his hand. I endeavoured to paralyze his movements by pinioning his arms, but the rascal was my superior in muscular strength. After wrestling for a few moments, I felt that he was getting the mastery over me when all of a sudden he rolled over on to the platform, dragging me with him. Andre Letourneur had caught hold of one of his legs, and thus saved my life. Jynxstrop dropped his weapon in his fall; I seized it instantly, and was about to cleave the fellow's skull, when I was myself arrested by Andre's hand upon my arm.

By this time the mutineers had been driven back to the forepart of the raft, and Curtis, who had managed to parry the blows which had been aimed at him, had caught hold of a hatchet, with which he was preparing to strike at Owen. But Owen made a sidelong movement to avoid the blow, and the weapon caught Wilson full in the chest. The unfortunate man rolled over the side of the raft and instantly disappeared.

"Save him! save him!" shouted the boatswain.

"It's too late; he's dead!" said Dowlas.

"Ah, well! he'll do for--" began the boatswain; but he did not finish his sentence.

Wilson's death, however, put an end to the fray. Flaypole and Burke were lying prostrate in a drunken stupour, and Jynxstrop was soon overpowered, and lashed tightly to the foot of the mast. The carpenter and the boatswain seized hold of Owen.

"Now then," said Curtis, as he raised his blood-stained hatchet, "make your peace with God, for you have not a moment to live."

"Oh, you want to eat me, do you?" sneered Owen, with the most hardened effrontery.

But the audacious reply saved his life; Curtis turned as pale as death, the hatchet dropped from his hand, and he went and seated himself moodily on the farthest corner of the raft.

CHAPTER XXXIX.

JANUARY 5th and 6th.--The whole scene made a deep impression on our minds, and Owen's speech coming as a sort of climax, brought before us our misery with a force that was well-nigh overwhelming.

As soon as I recovered my composure, I did not forget to thank Andre Letourneur for the act of intervention that had saved my life.

"Do you thank me for that; Mr. Kazallon?" he said; "it has only served to prolong your misery."

"Never mind, M. Letourneur," said Miss Herbey; "you did your duty."
Enfeebled and emaciated as the young girl is, her sense of duty never deserts her, and although her torn and bedraggled garments float dejectedly about her body, she never utters a word of complaint, and never loses courage.

"Mr. Kazallon," she said to me, "do you think we are fated to die of hunger?"

"Yes; Miss Herbey, I do," I replied in a hard, cold tone.

"How long do you suppose we have to live?" she asked again.

"I cannot say; perhaps we shall linger on longer than we imagine."

"The strongest constitutions suffer the most, do they not?" she said.

"Yes; but they have one consolation; they die the soonest;" I replied coldly.

Had every spark of humanity died out of my breast that I thus brought the girl face to face with the terrible truth without a word of hope or comfort? The eyes of Andre and his father, dilated with hunger, were fixed upon me, and I saw reproach and astonishment written in their faces.

Afterwards, when we were quite alone, Miss Herbey asked me if I would grant her a favour.

"Certainly, Miss Herbey; anything you like to ask," I replied; and this time my manner was kinder and more genial.

"Mr. Kazallon," she said, "I am weaker than you, and shall probably die first. Promise me that, if I do, you will throw my body into the sea."

"Oh, Miss Herbey," I began, "it was very wrong of me to speak to you as I did!"

"No, no," she replied, half smiling; "you were quite right. But it is a weakness of mine; I don't mind what they do with me as long as I am alive, but when I am dead--" she stopped and shuddered. "Oh, promise me that you will throw me into, the sea!"

I gave her the melancholy promise, which she acknowledged by pressing my hand feebly with her emaciated fingers.

Another night passed away. At times my sufferings were so intense that cries of agony involuntarily escaped my lips; then I became calmer, and sank into a kind of lethargy. When I awoke, I was surprised to find my companions still alive.

The one of our party who seems to bear his privations the best is Hobart the steward, a man with whom hitherto I have had very little to do. He is small, with a fawning expression remarkable for its indecision, and has a smile which is incessantly playing round his lips; he goes about with his eyes half-closed, as though he wished to conceal his thoughts, and there is something altogether false and hypocritical about his whole demeanour. I cannot say that he bears his privations without a murmur, for he sighs and moans incessantly; but, with it all, I cannot but think that there is a want of genuineness in his manner, and that the privation has not really told upon him as much as it has upon the rest of us. I have my suspicions about the man, and intend to watch him carefully. To-day, the 6th, M. Letourneur drew me aside to the stern of the raft, saying that he had a secret to communicate, but that he wished neither to be seen nor heard speaking to me. I withdrew with him to the larboard corner of the raft; and, as it was growing dusk, nobody observed what we were doing.

"Mr. Kazallon," M. Letourneur began in a low voice, "Andre is dying of hunger: he is growing weaker and weaker, and oh! I cannot, will not see him die!"

He spoke passionately, almost fiercely, and I fully understood his feelings. Taking his hand, I tried to reassure him.

"We will not despair yet," I said, "perhaps some passing ship--"

"Ship!" he cried impatiently, "don't try to console me with empty commonplaces; you know as well as I do that there is no chance of falling in with a passing ship." Then, breaking off suddenly, he asked, "How long is it since my son and all of you have had anything to eat?"

Astonished at his question, I replied that it was now four days since the biscuit had failed.

"Four days," he repeated; "well, then, it is eight since I have tasted anything. I have been saving my share for my son."

Tears rushed to my eyes; for a few moments I was unable to speak, and could only once more grasp his hand in silence.

"What do you want me to do?" I asked at length.

"Hush! not so loud; some one will hear us," he said, lowering his voice, "I want you to offer it to Andre as though it came from yourself. He would not accept it from me; he would think I had been depriving myself for him. Let me implore you to do me this service and for your trouble," and here he gently stroked my hand, "for your trouble you shall have a morsel for yourself."

I trembled like a child as I listened to the poor father's words, and my heart was ready to burst when I felt a tiny piece of biscuit slipped into my hand.

"Give it him," M. Letourneur went on under his breath, "give it him; but do not let any one see you; the monsters
would murder you if they knew it. This is only for to-day; I will give you some more to-morrow."

The poor fellow did not trust me, and well he might not, for I had the greatest difficulty to withstand the temptation to carry the biscuit to my mouth, But I resisted the impulse, and those alone who have suffered like me can know what the effort was.

Night came on with the rapidity peculiar to these low latitudes, and I glided gently up to Andre and slipped the piece of biscuit into his hand as "a present from myself." The young man clutched at it eagerly.

"But my father?" he said inquiringly.

I assured him that his father and I had each had our share, and that he must eat this now, and, perhaps, I should be able to bring him some more another time. Andre asked no more questions, and eagerly devoured the morsel of food.

So this evening at least, notwithstanding M. Letourneur's offer, I have tasted nothing.

CHAPTER XL.

JANUARY 7th.--During the last few days since the wind has freshened, the salt water constantly dashing over the raft has terribly punished the feet and legs of some of the sailors. Owen, whom the boatswain ever since the revolt kept bound to the mast, is in a deplorable state, and at our request has been released from his restraint. Sandon and Burke are also suffering from the severe smarting caused in this way, and it is only owing to our more sheltered position on the aft-part of the raft, that we have not; all shared the same inconvenience.

Today the boatswain, maddened by starvation, laid hands upon everything that met his voracious eyes, and I could hear the grating of his teeth as he gnawed at fragments of sails and bits of wood, instinctively endeavouring to fill his stomach by putting the mucus' into circulation at length, by dint of an eager search, he came upon a piece of leather hanging to one of the spars that supported the platform. He snatched it off and devoured it greedily, and as it was animal matter, it really seemed as though the absorption of the substance afforded him some temporary relief. Instantly we all followed his example; a leather hat, the rims of caps, in short, anything that contained any animal matter at all, were gnawed and sucked with the utmost avidity. Never shall I forget the scene. We were no longer human, the impulses and instincts of brute beasts seemed to actuate our every movement.

For a moment the pangs of hunger were somewhat allayed; but some of us revolted against the loathsome food, and were seized either with violent nausea or absolute sickness. I must be pardoned for giving these distressing details, but how otherwise can I depict the misery, moral and physical, which we are enduring? And with it all, I dare not venture to hope that we have reached the climax of our sufferings.

The conduct of Hobart during the scene that I have just described has only served to confirm my previous suspicions of him. He took no part in the almost fiendish energy with which we gnawed at our scraps of leather, and although by his conduct and perpetual groanings, he might be considered to be dying of inanition, yet to me he has the appearance of being singularly exempt from the tortures which we are all enduring. But whether the hypocrite is being sustained, by some secret store of food, I have been unable to discover.

Whenever the breeze drops the heat is overpowering; but although our allowance of water is very meagre, at present the pangs of hunger far exceed the pain of thirst. It has often been remarked that extreme thirst is far less endurable than extreme hunger. Is it possible that still greater agonies are in store for us? I cannot, dare not, believe it. Fortunately, the broken barrel still contains a few pints of water, and the other one has not yet been opened. But I am glad to say that notwithstanding our diminished numbers, and in spite of some opposition, the captain has thought right to reduce the daily allowance to half a pint for each person. As for the brandy, of which there is only a quart now left, it has been stowed away safely in the stern of the raft.

This evening has ended the sufferings of another of our companions, making our number now only fourteen. My attentions and Miss Herbey's nursing could do nothing for Lieutenant Walter, and about half-past seven he expired in my arms.

Before he died, in a few broken words he thanked Miss Herbey and myself for the kindness we had shown him. A crumpled letter fell from his hand, and in a voice that was scarcely audible from weakness, he said,--

"It is my mother's letter: the last I had from her--she was expecting me home; but she will never see me more. Oh, put it to my lips--let me kiss it before I die. Mother! mother! Oh my God!"

I placed the letter in his cold hand, and raised it to his lips; his eye lighted for a moment; we heard the faint sound of a kiss, and all was over!

CHAPTER XLI.

JANUARY 8th.--All night I remained by the side of the poor fellow's corpse, and several times Miss Herbey...
joined me in my mournful watch.

Before daylight dawned the body was quite cold, and as I knew there must be no delay in throwing it overboard, I asked Curtis to assist me in the sad office. The body was frightfully emaciated, and I had every hope that it would not float.

As soon as it was quite light, taking every precaution that no one should see what we were about, Curtis and I proceeded to our melancholy task. We took a few articles from the lieutenant's pockets, which we purposed, if either of us should survive, to remit to his mother. But as we wrapped him in his tattered garments that would have to suffice for his winding-sheet, I started back with a thrill of horror. The right foot had gone, leaving the leg a bleeding stump!

No doubt that, overcome by fatigue, I must have fallen asleep for an interval during the night, and some one had taken advantage of my slumber to mutilate the corpse. But who could have been guilty of so foul a deed! Curtis looked around with anger flashing in his eye; but all seemed as usual, and the silence was only broken by a few groans of agony.

But there was no time to be lost; perhaps we were already observed, and more horrible scenes might be likely to occur. Curtis said a few short prayers, and we cast the body into the sea. It sank immediately.

"They are feeding the sharks well, and no mistake," said a voice behind me.

I turned round quickly, and found that it was Jynxstrop who had spoken.

As the boatswain now approached, I asked him whether he thought it possible that any of the wretched men could have taken the dead man's foot.

"Oh yes, I dare say," he replied, in a significant tone "and perhaps they thought they were right."

"Right! what do you mean?" I exclaimed.

"Well, sir," he said coldly, "isn't it better to eat a dead man than a living one?"

I was at a loss to comprehend him, and, turning away, laid myself down at the end of the raft.

Towards eleven o'clock, a most suspicious incident occurred. The boatswain, who had cast his lines early in the morning, caught three large cod, each more than thirty inches long, of the species which, when dried, is known by the name of stock-fish. Scarcely had he hauled them on board, when the sailors made a dash at them, and it was with the utmost difficulty that Curtis, Falsten, and myself could restore order, so that we might divide the fish into equal portions. Three cod were not much amongst fourteen starving persons, but, small as the quantity was, it was allotted in strictly equal shares. Most of us devoured the food raw, almost I might say, alive; only Curtis, Andre and Miss Herbey having the patience to wait until their allowance had been boiled at a fire which they made with a few scraps of wood. For myself, I confess that I swallowed my portion of fish just as it was,--raw and bleeding. M. Letourneur followed my example; the poor man devoured his food like a famished wolf, and it is only a wonder to me how, after his lengthened fast, he came to be alive at all.

The boatswain's delight at his success was, excessive, and amounted almost to delirium. I went up to him, and encouraged him to repeat his attempt.

"Oh, yes," he said; "I'll try again. I'll try again."

"And why not try at once," I asked.

"Not now," he said evasively; "the night is the best time for catching large fish. Besides, I must manage to get some bait, for we have been improvident enough not to save a single scrap."

"But you have succeedced once without bait; why may you not succeed again?"

"Oh! I had some very good bait last night," he said. I stared at him in amazement. He steadily returned my gaze, but said nothing.

"Have you none left?" at last I asked.

"Yes!" he almost whispered and left me without another word.

Our meal, meagre as it had been, served to rally our shattered energies; our hopes were slightly raised; there was no reason why the boatswain should not have the same good luck again.

One evidence of the degree to which our spirits were revived was that our minds were no longer fixed upon the miserable present and hopeless future, but we began to recall and discuss the past; and M. Letourneur, Andre Mr. Falsten, and I held a long conversation with the captain about the various incidents of our eventful voyage, speaking of our lost companions, of the fire, of the stranding of the ship, of our sojourn on Ham Rock, of the springing of the leak, of our terrible voyage in the top-masts, of the construction of the raft, and of the storm. All these things seemed to have happened so long ago, and yet we were living still. Living, did I say? Ay, if such an existence as ours could be called a life, fourteen of us were living still. Who would be the next to go? We should then be thirteen.

"An unlucky number!" said Andre with a mournful smile.

During the night the boatswain cast his lines from the stern of the raft, and, unwilling to trust them to any one else, remained watching them himself. In the morning I went to ascertain what success had attended his patience. It
was scarcely light, and with eager eyes he was peering down into the water. He had neither seen nor heard me coming.

"Well, boatswain!" I said, touching him on the shoulder.

He turned round quickly.

"Those villainous sharks have eaten every morsel of my bait," he said, in a despairing voice.

"And you have no more left?" I asked.

"No more," he said. Then grasping my arm he added, "and that only shows me that it is no good doing things by halves."

The truth flashed upon me at once, and I laid my hand upon his mouth. Poor Walter!

CHAPTER XLII.

JANUARY 9th and 10th.--On the 9th the wind dropped, and there was a dead calm; not a ripple disturbed the surface of the long undulations as they rose and fell beneath us; and if it were not for the slight current which is carrying us we know not whither, the raft would be absolutely stationary.

The heat was intolerable; our thirst more intolerable still; and now it was that for the first time I fully realized how the insufficiency of drink could cause torture more unendurable than the pangs of hunger. Mouth, throat, pharynx, all alike were parched and dry, every gland becoming hard as horn under the action of the hot air we breathed. At my urgent solicitation the captain was for once induced to double our allowance of water; and this relaxation of the ordinary rule enabled us to attempt to slake our thirst four times in the day, instead of only twice. I use the word "attempt" advisedly; for the water at the bottom of the barrel, though kept covered by a sail, became so warm that it was perfectly flat and unrefreshing.

It was a most trying day, and the sailors relapsed into a condition of deep despondency. The moon was nearly full, but when she rose the breeze did not return. Continuance of high temperature in daytime is a sure proof that we have been carried far to the south, and here, on this illimitable ocean, we have long ceased even to look for land; it might almost seem as though this globe of ours had veritably become a liquid sphere!

To-day we are still becalmed, and the temperature is as high as ever. The air is heated like a furnace, and the sun scorches like fire. The torments of famine are all forgotten: our thoughts are concentrated with fevered expectation upon the longed-for moment when Curtis shall dole out the scanty measure of lukewarm water that makes up our ration. O for one good draught, even if it should exhaust the whole supply! At least, it seems as if we then could die in peace!

About noon we were startled by sharp cries of agony, and looking round I saw Owen writhing in the most horrible convulsions. I went towards him, for, detestable as his conduct had been, common humanity prompted me to see whether I could afford him any relief. But before I reached him, a shout from Flaypole arrested my attention. The man was up in the mast, and with great excitement pointing to the east.

"A ship! A ship!" he cried.

In an instant all were on their feet. Even Owen stopped his cries and stood erect. It was quite true that in the direction indicated by Flaypole there was a white speck visible upon the horizon. But did it move? Would the sailors with their keen vision pronounce it to be a sail? A silence the most profound fell upon us all. I glanced at Curtis as he stood with folded arms intently gazing at the distant point. His brow was furrowed, and he contracted every feature, as with half-closed eyes, he concentrated his power of vision upon that one faint spot in the far-off horizon.

But at length he dropped his arms and shook his head. I looked again, but the spot was no longer there. If it were a ship, that ship had disappeared; but probably it had been a mere reflection, or, more likely still, only the crest of some curling wave.

A deep dejection followed this phantom ray of hope. All returned to their accustomed places. Curtis alone remained motionless, but his eye no longer scanned the distant view.

Owen now began to shriek more wildly than ever. He presented truly a most melancholy sight; he writhed with the most hideous contortions, and had all the appearance of suffering from tetanus. His throat was contracted by repeated spasms, his tongue was parched, his body swollen, and his pulse, though feeble, was rapid and irregular. The poor wretch's symptoms were precisely such as to lead us to suspect that he had taken some corrosive poison. Of course it was quite out of our power to administer any antidote; all that we could devise was to make him swallow something that might act as an emetic. I asked Curtis for a little of the lukewarm water. As the contents of the broken barrel were now exhausted, the captain, in order to comply with my request, was about to tap the other barrel, when Owen started suddenly to his knees, and with a wild, unearthly shriek, exclaimed,--

"No! no! no! of that water I will not touch a drop."

I supposed he did not understand what we were going to do, and endeavoured to explain; but all in vain; he
persisted in refusing to taste the water in the second barrel. I then tried to induce vomiting by tickling his uvula, and he brought off some bluish secretion from his stomach, the character of which confirmed our previous suspicions—that he had been poisoned by oxide of copper. We now felt convinced that any efforts on our part to save him would be of no avail. The vomiting, however, had for the time relieved him, and he was able to speak.

Curtis and I both implored him to let us know what he had taken to bring about consequences so serious. His reply fell upon us as a startling blow.

The ill fated wretch had stolen several pints of water from the barrel that had been untouched, and that water had poisoned him!

CHAPTER XLIII.

JANUARY 11th to 14th.--Owen's convulsions returned with increased violence, and in the course of the night he expired in terrible agony. His body was thrown overboard almost directly; it had decomposed so rapidly that the flesh had not even consistency enough for any fragments of it to be reserved for the boatswain to use to bait his lines. A plague the man had been to us in his life; in his death he was now of no service!

And now, perhaps, still more than ever, did the horror of our situation stare us in the face. There was no doubt that the poisoned barrel had at some time or other contained copperas; but what strange fatality had converted it into a water-cask, or what fatality, stranger still, had caused it to be brought on board the raft, was a problem that none could solve. Little, however, did it matter now: the fact was evident; the barrel was poisoned, and of water we had not a drop.

One and all, we fell into the gloomiest silence. We were too irritable to bear the sound of each other's voices; and it did not require a word, a mere look or gesture was enough, to provoke us to anger that was little short of madness. How it was that we did not all become raving maniacs, I cannot tell.

Throughout the 12th no drain of moisture crossed our lips, and not a cloud arose to warrant the expectation of a passing shower; in the shade, if shade it might be called, the thermometer would have registered at least 100deg., and, perhaps, considerably more.

No change next day. The salt water began to chafe my legs, but although the smarting was at times severe, it was an inconvenience to which I gave little heed; others who had suffered from the same trouble had become no worse. Oh! if this water that surrounds us could be reduced to vapour or to ice! its particles of salt extracted, it would be available for drink. But no! we have no appliances, and we must suffer on.

At the risk of being devoured by the sharks, the boatswain and two sailors took a morning bath, and as their plunge seemed to refresh them, I and three of my companions resolved to follow their example. We had never learnt to swim, and had to be fastened to the end of a rope and lowered into the water; while Curtis during the half-hour of our bath, kept a sharp look-out to give warning of any danger from approaching sharks. No recommendation, however, on our part, nor any representation of the benefit we felt we had derived, could induce Miss Herbey to allay her sufferings in the same way.

At about eleven o'clock, the captain came up to me, and whispered in my ear,--
"Don't say a word, Mr. Kazallon; I do not want to raise false hopes, but I think I see a ship."

It was as well that the captain had warned me; otherwise, I should have raised an involuntary shout of joy; as it was, I had the greatest difficulty in restraining my expressions of delight. "Look behind to larboard," he continued in an undertone.

Affecting an indifference which I was far from feeling, I cast an anxious glance to that quarter of the horizon of which he spoke, and there, although mine is not a nautical eye, I could plainly distinguish the outline of a ship under sail.

Almost at the same moment the boatswain who happened to be looking in the same direction, raised the cry, "Ship ahoy!"

Whether it was that no one believed it, or whether all energies were exhausted, certain it is that the announcement produced none of the effects that might have been expected. Not a soul exhibited the slightest emotion, and it was only when the boatswain had several times sung out his tidings that all eyes turned to the horizon. There, most undeniably, was the ship, and the question rose at once to the minds of all, and to the lips of many, "Would she see us?"

The sailors immediately began discussing the build of the vessel, and made all sorts of conjectures as to the direction she was taking. Curtis was far more deliberate in his judgment. After examining her attentively for some time, he said, "She is a brig running close upon the wind, on the starboard tack, If she keeps her course for a couple of hours, she will come right athwart our track."

A couple of hours! The words sounded to our ears like a couple of centuries. The ship might change her course
at any moment; closely trimmed as she was, it was very probable that she was only tacking about to catch the wind, in which case, as soon as she felt a breeze, she would resume her larboard tack and make away again. On the other hand, if she were really sailing with the wind, she would come nearer to us, and there would be good ground for hope.

Meantime, no exertion must be spared, and no means left untried, to make our position known. The brig was about twelve miles to the east of us, so that it was out of the question to think of any cries of ours being overheard; but Curtis gave directions that every possible signal should be made. We had no fire-arms by which we could attract attention, and nothing else occurred to us beyond hoisting a flag of distress. Miss Herbey's red shawl, as being of a colour most distinguishable against the background of sea and sky, was run up to the mast-head, and was caught by the light breeze that just then was ruffling the surface of the water. As a drowning man clutches at a straw, so our hearts bounded with hope every time that our poor flag fluttered in the wind.

For an hour our feelings alternated between hope and despair. The ship was evidently making her way in the direction of the raft, but every now and then she seemed to stop, and then our hearts would almost stand still with agony lest she was going to put about. She carried all her canvas, even to her royals and stay-sails, but her hull was only partially visible above the horizon.

How slowly she advanced! The breeze was very, very feeble, and perhaps soon it would drop altogether! We felt that we would give years of our life to know the result of the coming hour!

At half-past twelve the captain and the boatswain considered that the brig was about nine miles away; she had, therefore, gained only three miles in an hour and a half, and it was doubtful whether the light breeze that had been passing over our heads had reached her at all. I fancied, too, that her sails were no longer filled, but were hanging loose against her masts. Turning to the direction of the wind I tried to make out some chance of a rising breeze; but no, the waves were calm and torpid, and the little puff of air that had aroused our hopes had died away across the sea.

I stood aft with M. Letourneur, Andre and Miss Herbey, and our glances perpetually wandered from the distant ship to our captain's face. Curtis stood leaning against the mast, with the boatswain by his side; their eyes seemed never for a moment to cease to watch the brig, but their countenances clearly expressed the varying emotions that passed through their minds. Not a word was uttered, nor was the silence broken, until the carpenter exclaimed, in accents of despair,—

"She's putting about!"

All started up: some to their knees, others to their feet, The boatswain dropped a frightful oath. The ship was still nine miles away, and at such a distance it was impossible for our signal to be seen; our tiny raft, a mere speck upon the waters, would be lost in the intense irradiation of the sunbeams. If only we could be seen, no doubt all would be well; no captain would have the barbarous inhumanity to leave us to our fate; but there had been no chance; only too well we knew that we had not been within the range of sight.

"My friends," said Curtis, "we must make a fire; it is our last and only chance."

Some planks were quickly loosened and thrown into a heap upon the fore part of the raft. They were damp and troublesome to light; but the very dampness made the smoke more dense, and ere long a tall column of dusky fumes was rising straight upwards in the air. If darkness should come on before the brig was completely out of view, the flames we hoped might still be visible. But the hours passed on; the fire died out; and yet no signs of help.

The temper of resignation now deserted me entirely; faith, hope, confidence—all vanished from my mind, and like the boatswain, I swore long and loudly. A gentle hand was laid upon my arm, and turning round I saw Miss Herbey with her finger pointing to the sky. I could stand it no longer, but gliding underneath the tent I hid my face in my hands and wept aloud.

Meanwhile the brig had altered her tack, and was moving slowly to the east. Three hours later and the keenest eye could not have discerned her top-sails above the horizon.

CHAPTER XLIV.

JANUARY 15th.—After this further shattering of our excited hopes death alone now stares us in the face; slow and lingering as that death may be, sooner or later it must inevitably come.

To-day some clouds that rose in the west have brought us a few puffs of wind; and in spite of our prostration, we appreciate the moderation, slight as it is, in the temperature. To my parched throat the air seemed a little less trying but it is now seven days since the boatswain took his haul of fish, and during that period we have eaten nothing even Andre Letourneur finished yesterday the last morsel of the biscuit which his sorrowful and self-denying father had entrusted to my charge.

Jynxstrop the negro has broken loose from his confinement, but Curtis has taken no measures for putting him
handle of the hammer. Another moment and it had turned round and was completely gone.

A short sharp snap was heard. The shark had closed its jaws, and bitten through the wooden animal could possibly release it. Dowlas seized his hatchet, ready to despatch the brute the moment if should be in need, under the hope that either the sharp edge of the adze or the pointed extremity opposite would stick firmly into the jaws of any shark that might swallow it. The wooden handle of the hammer was secured to the rope, which, in its turn, was tightly fastened to the raft.

With eager, almost breathless, excitement we stood watching the preparations, at the same time using every means in our power to attract the attention of the sharks. As soon as the whirl was ready the boatswain began to think about bait; and, talking rapidly to himself, ransacked every corner of the raft, as though he expected to find some dead body coming opportunely to sight. But his search ended in nothing; and the only plan that suggested itself was again to have recourse to Miss Herbey's red shawl, of which a fragment was wrapped round the head of the hammer. After testing the strength of his line, and reassuring-himself that it was fastened firmly both to the hammer and to the raft, the boatswain lowered it into the water.

The sea was quite transparent, and any object was clearly visible to a depth of two hundred feet below the surface. Leaning over the low parapet of the raft we looked on in breathless silence, as the scarlet rag, distinct as it was against the blue mass of water, made its slow descent. But one by one the sharks seemed to disappear. They could not, however, have gone far away, and it was not likely that anything in the shape of bait dropped near them would long escape their keen voracity.

Suddenly, without speaking, the boatswain raised his hand and pointed to a dark mass skimming along the surface of the water, and making straight in our direction. It was a shark, certainly not less than twelve feet long. As soon as the creature was about four fathoms from the raft, the boatswain gently drew in his line until the whirl was in such a position that the shark must cross right over it; at the same time he shook the line a little, that he might give the whirl the appearance, if he could, of being something alive and moving. As the creature came near, my heart beat violently; I could see its eyes flashing above the waves; and its gaping jaws, as it turned half over on its back, exhibited long rows of pointed teeth.

I know not who it was, but some one at that moment uttered an involuntary cry of horror. The shark came to a standstill, turned about, and escaped quite out of sight. The boatswain was pale with anger.

"The first man who speaks," he said, "I will kill him on the spot."

Again he applied himself to his task. The whirl again was lowered, this time to the depth of twenty fathoms, but for half an hour or more not a shark could be distinguished; but as the waters far below seemed somehow to be troubled I could not help believing that some of the brutes at least were still there.

All at once, with a violent jerk, the cord was wrested from the boatswain's hands; firmly attached, however, as it was to the raft, it was not lost. The bait had been seized by a shark, and the iron had made good its hold upon the creature's flesh.

"Now, then, my lads," cried the boatswain, "haul away!"

Passengers and sailors, one and all, put forth what strength they had to drag the rope, but so violent were the creature's struggles that it required all our efforts (and it is needless to say that they were willing enough) to bring it to the surface. At length, after exertions that almost exhausted us, the water became agitated by the violent flappings of the tail and fins; and looking down I saw the huge carcass of the shark writhing convulsively amidst waves that were stained with blood.

"Steady! steady!" said the boatswain, as the head appeared above.

The whirl had passed right through the jaw into the middle of the throat; so that no struggle on the part of the animal could possibly release it. Dowlas seized his hatchet, ready to despatch the brute the moment if should be landed on the raft. A short sharp snap was heard. The shark had closed its jaws, and bitten through the wooden handle of the hammer. Another moment and it had turned round and was completely gone.

A howl of despair burst from all our lips. All the labour and the patience, all had been in vain. Dowlas made a
few more unsuccessful attempts, but as the whirl was lost, and they had no means of replacing it, there was no further room for hope. They did, indeed, lower some cords twisted into running knots, but (as might have been expected) these only slipped over, without holding, the slimy bodies of the sharks. As a last resource the boatswain allowed his naked leg to hang over the side of the raft; the monsters, however, were proof even against this attraction.

Reduced once again to a gloomy despondency, all turned to their places, to await the end that cannot now be long deferred.

Just as I moved away I heard the boatswain say to Curtis,—
"Captain, when shall we draw lots?"

The captain made no reply.

CHAPTER XLV.

JANUARY 16th.—If the crew of any passing vessel had caught sight of us as we lay still and inanimate upon our sail-cloth, they would scarcely, at first sight, have hesitated to pronounce us dead.

My sufferings were terrible; tongue, lips, and throat were so parched and swollen that if food had been at hand I question whether I could have swallowed it. So exasperated were the feelings of us all, however, that we glanced at each other with looks as savage as though we were about to slaughter and without delay eat up one another.

The heat was aggravated by the atmosphere being somewhat stormy. Heavy vapours gathered on the horizon, and there was a look as if it were raining all around. Longing eyes and gasping mouths turned involuntarily towards the clouds, and M. Letourneur, on bended knee, was raising his hands, as it might be in supplication to the relentless skies.

It was eleven o'clock in the morning. I listened for distant rumblings which might announce an approaching storm, but although the vapours had obstructed the sun's rays, they no longer presented the appearance of being charged with electricity. Thus our prognostications ended in disappointment; the clouds, which in the early morning had been marked by the distinctness of their outline, had melted one into another and assumed an uniform dull grey tint; in fact, we were enveloped in an ordinary fog. But was it not still possible that this fog might turn to rain?

Happily this hope was destined to be realized; for in a very short time, Dowlas, with a shout of delight, declared that rain was actually coming; and sure enough, not half a mile from the raft, the dark parallel streaks against the sky testified that there at least the rain was falling. I fancied I could see the drops rebounding from the surface of the water. The wind was fresh and bringing the cloud right on towards us, yet we could not suppress our trepidation lest it should exhaust itself before it reached us.

But no: very soon large heavy drops began to fall, and the storm-cloud, passing over our heads, was outpouring its contents upon us. The shower, however, was very transient; already a bright streak of light along the horizon marked the limit of the cloud and warned us that we must be quick to make the most of what it had to give us. Curtis had placed the broken barrel in the position that was most exposed, and every sail was spread out to the fullest extent our dimensions would allow.

We all laid ourselves down flat upon our backs and kept our mouths wide open. The rain splashed into my face, wetted my lips, and trickled down my throat. Never can I describe the ecstasy with which I imbibed that renovating moisture. The parched and swollen glands relaxed, I breathed afresh, and my whole being seemed revived with a strange and requickened life.

The rain lasted about twenty minutes, when the cloud, still only half exhausted, passed quite away from over us.

We grasped each other's hands as we rose from the platform on which we had been lying, and mutual congratulations, mingled with gratitude, poured forth from our long silent lips. Never can I describe the ecstasy with which I imbibed that renovating moisture. The parched and swollen glands relaxed, I breathed afresh, and my whole being seemed revived with a strange and requickened life.

The next consideration was how to preserve and economize what little had been collected by the barrel, or imbibed by the outspread sails. It was found that only a few pints of rain-water had fallen into the barrel to this small quantity the sailors were about to add what they could by wringing out the saturated sails, when Curtis made them desist from their intention.

"Stop, stop!" he said, "we must wait a moment; we must see whether this water from the sails is drinkable."

I looked at him in amazement. Why should not this be as drinkable as the other? He squeezed a few drops out of one of the folds of a sail into the tin pot, and put it to his lips. To my surprise, he rejected it immediately, and upon tasting it for myself I found it not merely brackish, but briny as the sea itself. The fact was that the canvas had been so long exposed to the action of the waves, that it had become thoroughly impregnated by salt, which of course was taken up again by the water that fell upon it. Disappointed we were; but with several pints of water in our
possession, we were not only contented for the present, but sanguine in our prospect for the future.

CHAPTER XLVI.

JANUARY 17th.--As a natural consequence of the alleviation of our thirst, the pangs of hunger returned more violently than ever. Although we had no bait, and even if we had we could not use it for want of a whirl, we could not help asking whether no possible means could be devised for securing one out of the many sharks that were still perpetually swimming about the raft. Armed with knives, like the Indians in the pearl fisheries, was it not practicable to attack the monsters in their own element? Curtis expressed his willingness personally to make the attempt, but so numerous were the sharks that we would not for one moment hear of his risking his life in a venture of which the danger was as great as the success was doubtful.

By plunging into the sea, or by gnawing at a piece of metal, we could always, or at least often, do something that cheated us into believing that we were mitigating the pains of thirst; but with hunger it was different. The prospect, too, of rain seemed hopeful, whilst for getting food there appeared no chance; and, as we knew that nothing could compensate for the lack of nutritive matter, we were soon all cast down again. Shocking to confess, it would be untrue to deny that we surveyed each other with the eye of an eager longing; and I need hardly explain to what a degree of savageness the one idea that haunted us had reduced our feelings.

Ever since the storm-cloud brought us the too transient shower the sky has been tolerably clear, and although at that time the wind had slightly freshened, it has since dropped, and the sail hangs idly against our mast. Except for the trifling relief it brings by modifying the temperature we care little now for any breeze. Ignorant as we are as to what quarter of the Atlantic we have been carried by the currents, it matters very little to us from what direction the wind may blow if only it would bring, in rain or dew, the moisture of which we are so dreadfully in need.

The moon was entering her last quarter, so that it was dark till nearly midnight, and the stars were misty, not glowing with that lustre which is so often characteristic of cool nights. Half frantic with that sense of hunger which invariably returns with redoubled vigour at the close of every day, I threw myself, in a kind of frenzy, upon a bundle of sails that was lying on the starboard of the raft, and leaning over, I tried to get some measure of relief by inhaling the moist coolness that rarely fails to circulate just above the water. My brain was haunted by the most horrible nightmares; not that I suppose I was in any way more distressed than my companions, who were lying in their usual places, vainly endeavouring to forget their sufferings in sleep.

After a time I fell into a restless, dreamy doze. I was neither asleep nor awake. How long I remained in that state of stupor I could hardly say, but at length a strange sensation half brought me to myself. Was I dreaming, or was there not really some unaccustomed odour floating in the air? My nostrils became distended, and I could scarcely suppress a cry of astonishment; but some instinct kept me quiet, and I laid myself down again with the puzzled sensation sometimes experienced when we have forgotten a word or name. Only a few minutes, however, had elapsed before another still more savoury puff induced me to take several long inhalations. Suddenly, the truth seemed to dash across my mind. "Surely," I muttered to myself "this must be cooked meat that I can smell."

Again and again I sniffed and became more convinced than ever that my senses were not deceiving me. But from what part of the raft could the smell proceed? I rose to my knees, and having satisfied myself that the odour came from the front, I crept stealthily as a cat under the sails and between the spars in that direction. Following the promptings of my scent, rather than my vision, like a bloodhound in the track of his prey, I searched everywhere I could, now finding, now losing, the smell according to my change of position, or the dropping of the wind. At length I got the true scent; once for all, so that I could go straight to the object for which I was in search.

Approaching the starboard angle of the raft, I came to the conclusion that the smell that had thus keenly excited my cravings was the smell of smoked bacon; the membranes of my tongue almost bristled with the intenseness of my longing.

Crawling along a little farther, under a thick roll of sail-cloth, I was not long in securing my prize. Forcing my arm below the roll, I felt my hand in contact with something wrapped up in paper. I clutched it up, and carried it off to a place where I could examine it by the help of the light of the moon that had now made its appearance above the horizon. I almost shrieked for joy. It was a piece of bacon. True, it did not weigh many ounces, but small as it was it would suffice to alleviate the pangs of hunger for one day at least. I was just on the point of raising it to my mouth, when a hand was laid upon my arm. It was only by a most determined effort that I kept myself from screaming out one instant more, and I found myself face to face with Hobart.

In a moment I understood all. Plainly this rascal Hobart had saved some provision from the wreck, upon which he had been subsisting ever since. The steward had provided for himself, whilst all around him were dying of starvation. Detestable wretch! This accounts for the inconsistency of his well-to-do looks and his piteous groans. Vile hypocrite!
Yet why, it struck me, should I complain? Was not I reaping the benefit of that secret store that he, for himself, had saved?

But Hobart had no idea of allowing me the peaceable possession of what he held to be his own. He made a dash at the fragment of bacon, and seemed determined to wrest it from my grasp. We struggled with each other, but although our wrestling was very violent, it was very noiseless. We were both of us aware that it was absolutely necessary that not one of those on board should know anything at all about the prize for which we were contending. Nor was my own determination lessened by hearing him groan out that it was his last, his only morsel. "His!" I thought; "it shall be mine now!"

And still careful that no noise of commotion should arise, I threw him on his back, and grasping his throat so that it gurgled again, I held him down until, in rapid mouthfuls, I had swallowed up the last scrap of the food for which we had fought so hard.

I released my prisoner, and quietly crept back to my own quarters.

And not a soul is aware that I have broken my fast!

CHAPTER XLVII.

JANUARY 18th.--After this excitement I awaited the approach of day with a strange anxiety. My conscience told me that Hobart had the right to denounce me in the presence of all my fellow-passengers; yet my alarm was vain. The idea of my proceedings being exposed by him was quite absurd; in a moment he would himself be murdered without pity by the crew, if it should be revealed that, unknown to them, he had been living on some private store which, by clandestine cunning, he had reserved. But, in spite of my anxiety, I had a longing for day to come.

The bit of food that I had thus stolen was very small; but small as it was it had alleviated my hunger, and I was now tortured with remorse, because I had not shared the meagre morsel with my fellow-sufferers. Miss Herbey, Andre, his father, all had been forgotten, and from the bottom of my heart I repented of my cruel selfishness.

Meantime the moon rose high in the heavens, and the first streaks of dawn appeared. There is no twilight in these low latitudes, and the full daylight came well nigh at once. I had not closed my eyes since my encounter with the steward, and ever since the first blush of day I had laboured under the impression that I could see some unusual dark mass half way up the mast. But although it again and again caught my eye, it hardly roused my curiosity, and I did not rise from the bundle of sails on which I was lying to ascertain what it really was. But no sooner did the rays of the sun fall full upon it than I saw at once that it was the body of a man, attached to a rope, and swinging to and fro with the motion of the raft.

A horrible presentiment carried me to the foot of the mast, and, just as I had guessed, Hobart had hanged himself. I could not for a moment; doubt that it was I myself that had impelled him to the suicide. A cry of horror had scarcely escaped my lips, when my fellow-passengers were at my side, and the rope was cut. Then came the sailors. And what was it that made the group gather so eagerly around the body? Was it a humane desire to see whether any spark of life remained? No, indeed; the corpse was cold, and the limbs were rigid; there was no chance that animation should be restored. What then was it that kept them lingering so close around? It was only too apparent what they were about to do.

But I did not, could not, look. I refused to take part in the horrible repast that was proposed. Neither would Miss Herbey, Andre nor his father, consent to alleviate their pangs of hunger by such revolting means. I know nothing for certain as to what Curtis did, and I did not venture to inquire; but of the others,--Falsten, Dowlas, the boatswain, and all the rest,--I know that, to assuage their cravings, they consented to reduce themselves to the level of beasts of prey; they were transformed from human beings into ravenous brutes.

The four of us who sickened at the idea of partaking of the horrid meal withdrew to the seclusion of our tent; it was bad enough to hear; without witnessing the appalling operation. But, in truth, I had the greatest difficulty in the world in preventing Andre from rushing out upon the cannibals, and snatching the odious food from their clutches. I represented to him the hopelessness of his attempt, and tried to reconcile him by telling him that if they liked the food they had a right to it. Hobart had not been murdered; he had died by his own hand; and, after all, as the boatswain had once remarked to me, "it was better to eat a dead man than a live one."

Do what I would, however, I could not quiet Andre's feeling of abhorrence; in his disgust and loathing he seemed for the time to have quite forgotten his own sufferings.

Meanwhile, there was no concealing the truth that we were ourselves dying of starvation, whilst our eight companions would probably, by their loathsome diet, escape that frightful destiny. Owing to his secret hoard of provisions Hobart had been by far the strongest amongst us; he had been supported, so that no organic disease had affected his tissues, and really might be said to be in good health when his chagrin drove him to his desperate
suicide. But what was I thinking of! whither were my meditations carrying me away? was it not coming to pass that the cannibals were rousing my envy instead of exciting my horror?

Very shortly after this I heard Dowlas talking about the possibility of obtaining salt by evaporating sea-water in the sun; "and then," he added, "we can salt down the rest."

The boatswain assented to what the carpenter had said, and probably the suggestion was adopted.

Silence, the most profound, now reigns upon the raft. I presume that nearly all have gone to sleep. One thing I do know, that they are no longer hungry!

CHAPTER XLVIII.

JANUARY 19th.--All through the day the sky remained unclouded and the heat intense; and night came on without bringing much sensible moderation in the temperature. I was unable to get any sleep, and, towards morning, was disturbed by hearing an angry clamour going on outside the tent; it aroused M. Letourneur, Andre and Miss Herbey, as much as myself, and we were anxious to ascertain the cause of the tumult.

The boatswain, Dowlas, and all the sailors were storming at each other in frightful rage; and Curtis, who had come forward from the stern, was vainly endeavouring to pacify them.

"But who has done it? we must know who has done it," said Dowlas, scowling with vindictive passion on the group around him.

"There's a thief," howled out the boatswain, "and he shall be found! Let's know who has taken it."

"I haven't taken it!" "Nor I!" "Nor I!" cried the sailors one after another.

And then they set to work again to ransack every quarter of the raft; they rolled every spar aside, they overturned everything on board, and only grew more and more incensed with anger as their search proved fruitless.

"Can YOU tell us," said the boatswain, coming up to me, "who is the thief?"

"Thief!" I replied. "I don't know what you mean."

And while we were speaking the others all came up together, and told me that they had looked everywhere else, and that they were going now to search the tent.

"Shame!" I said. "You ought to allow those whom you know to be dying of hunger at least to die in peace. There is not one of us who has left the tent all night. Why suspect us?"

"Now just look here, Mr. Kazallon," said the boatswain, in a voice which he was endeavouring to calm down into moderation, "we are not accusing you of anything; we know well enough you, and all the rest of you, had a right to your shares as much as anybody; but that isn't it. It's all gone somewhere, every bit."

"Yes," said Sandon gruffly; "it's all gone somewheres, and we are a going to search the tent."

Resistance was useless, and Miss Herbey, M. Letourneur, and Andre were all turned out.

I confess I was very fearful. I had a strong suspicion that for the sake of his son, for whom he was ready to venture anything, M. Letourneur had committed the theft; in that case I knew that nothing would have prevented the infuriated men from tearing the devoted father to pieces. I beckoned to Curtis for protection, and he came and stood beside me. He said nothing, but waited with his hands in his pockets, and I think I am not mistaken in my belief that there was some sort of a weapon in each.

To my great relief the search was ineffectual. There was no doubt that the carcase of the suicide had been thrown overboard, and the rage of the disappointed cannibals knew no bounds.

Yet who had ventured to do the deed! I looked at M. Letourneur and Miss Herbey; but their countenances at once betrayed their ignorance. Andre turned his face away, and his eyes did not meet my own. Probably it is he; but, if it be, I wonder whether he has reckoned up the consequences of so rash an act.

CHAPTER XLIX.

JANUARY 20th to 22nd.--For the day or two after the horrible repast of the 18th those who had partaken of it appeared to suffer comparatively little either from hunger or thirst; but for the four of us who had tasted nothing, the agony of suffering grew more and more intense. It was enough to make us repine over the loss of the provision that had so mysteriously gone; and if any one of us should die, I doubt whether the survivors would a second time resist the temptation to assuage their pangs by tasting human flesh.

As is always the case with shipwrecked men, we were tormented by thirst far more than by hunger; and if, in the height of our sufferings, we had been offered our choice between a few drops of water and a few crumbs of biscuit, I
do not doubt that we should, without exception, have preferred to take the water.

And what a mockery to our condition did it seem that all this while there was water, water, nothing but water, everywhere around us! Again and again, incapable of comprehending how powerless it was to relieve me, I put a few drops within my lips, but only with the invariable result of bringing on a most trying nausea, and rendering my thirst more unendurable than before.

Forty-two days had passed since we quitted the sinking "Chancellor." There could be no hope now; all of us must die, and by the most deplorable of deaths. I was quite conscious that a mist was gathering over my brain; I felt my senses sinking into a condition of torpor; I made an effort, but all in vain, to master the delirium that I was aware was taking possession of my reason. It is out of my power to decide for how long I lost my consciousness; but when I came to myself I found that Miss Herbey had folded some wet bandages around my forehead. I am somewhat better; but I am weakened, mind and body, and I am conscious that I have not long to live.

A frightful fatality occurred to-day. The scene was terrible. Jynxstrop the negro went raving mad. Curtis and several of the men tried their utmost to control him, but in spite of everything he broke loose, and tore up and down the raft, uttering fearful yells. He had gained possession of a handspike, and rushed upon us all with the ferocity of an infuriated tiger; how we contrived to escape mischief from his attacks, I know not. All at once, by one of those unaccountable impulses of madness, his rage turned against himself. With his teeth and nails he gnawed and tore away at his own flesh; dashing the blood into our faces, he shrieked out with a demoniacal grin, "Drink, drink!" and flinging us gory morsels, kept saying "Eat, eat!" In the midst of his insane shrieks he made a sudden pause, then dashing back again from the stern to the front, he made a bound and disappeared beneath the waves.

Falsten, Dowlas, and the boatswain, made a rush that at least they might secure the body; but it was too late; all that they could see was a crimson circle in the water, and some huge sharks disporting themselves around the spot.

CHAPTER L.

JANUARY 23rd.--Only eleven of us now remain; and the probability is very great that every day must now carry off at least its one victim, and perhaps more. The end of the tragedy is rapidly approaching, and save for the chance, which is next to an impossibility, of our sighting land, or being picked up by a passing vessel, ere another week has elapsed not a single survivor of the "Chancellor" will remain.

The wind freshened considerably in the night, and it is now blowing pretty briskly from the north-east. It has filled our sail, and the white foam in our wake is an indication that we are making some progress. The captain reckons that we must be advancing at the rate of about three miles an hour.

Curtis and Falsten are certainly in the best condition amongst us, and in spite of their extreme emaciation they bear up wonderfully under the protracted hardships we have all endured. Words cannot describe the melancholy state to which poor Miss Herbey bodily is reduced; her whole being seems absorbed into her soul, but that soul is brave and resolute as ever, living in heaven rather than on earth. The boatswain, strong, energetic man that he was, has shrunk into a mere shadow of his former self, and I doubt whether any one would recognize him to be the same man. He keeps perpetually to one corner of the raft, his head dropped upon his chest, and his long, bony hands lying upon knees that project sharply from his worn-out trowsers. Unlike Miss Herbey, his spirit seems to have sunk into apathy, and it is at times difficult to believe that he is living at all, so motionless and statue-like does he sit.

Silence continues to reign upon the raft. Not a sound, not even a groan, escapes our lips. We do not exchange ten words in the course of the day, and the few syllables that our parched tongue and swollen lips can pronounce are almost unintelligible. Wasted and bloodless, we are no longer human beings; we are spectres.

CHAPTER LI.

JANUARY 24th.--I have inquired more than once of Curtis if he has the faintest idea to what quarter of the Atlantic we have drifted, and each time he has been unable to give me a decided answer, though from his general observation of the direction of the wind and currents he imagines that we have been carried westwards, that is to say, towards the land.

To-day the breeze has dropped entirely, but the heavy swell is still upon the sea, and is an unquestionable sign that a tempest has been raging at no great distance. The raft labours hard against the waves, and Curtis, Falsten, and the boatswain, employ the little energy that remains to them in strengthening the joints. Why do they give themselves such trouble? Why not let the few frail planks part asunder, and allow the ocean to terminate our miserable existence? Certain it seems that our sufferings must have reached their utmost limit, and nothing could exceed the torture that we are enduring. The sky pours down upon us a heat like that of molten lead, and the sweat that saturates the tattered clothes that hang about our bodies goes far to aggravate the agonies of our thirst. No words
of mine can describe this dire distress; these sufferings are beyond human estimate.

Even bathing, the only means of refreshment that we possessed, has now become impossible, for ever since
Jynxstrop's death the sharks have hung about the raft in shoals.

To-day I tried to gain a few drops of fresh water by evaporation, but even with the exercise of the greatest
patience, it was with the utmost difficulty that I obtained enough to moisten a little scrap of linen; and the only kettle
that we had was so old and battered, that it would not bear the fire, so that I was obliged to give up the attempt in
despair.

Falsten is now almost exhausted, and if he survives us at all, it can only be for a few days. Whenever I raised my
head I always failed to see him, but he was probably lying sheltered somewhere beneath the sails. Curtis was the
only man who remained on his feet, but with indomitable pluck he continued to stand on the front of the raft,
waiting, watching, hoping. To look at him, with his unflagging energy, almost tempted me to imagine that he did
well to hope, but I dared nor entertain one sanguine thought; and there I lay, waiting, nay, longing for death.

How many hours passed away thus I cannot tell, but after a time a loud peal of laughter burst upon my ear Some
one else, then, was going mad, I thought; but the idea did not rouse me in the least. The laughter was repeated with
greater vehemence, but I never raised my head. Presently I caught a few incoherent words.

"Fields, fields, gardens and trees! Look, there's an inn under the trees! Quick, quick! brandy, gin, water! a guinea
a drop! I'll pay for it! I've lots of money! lots! lots!"

Poor deluded wretch! I thought again; the wealth of a nation could not buy a drop of water here. There was
silence for a minute, when all of a sudden I heard the shout of "Land! land!"

The words acted upon me like an electric shock, and, with a frantic effort, I started to my feet. No land, indeed,
was visible, but Flaypole, laughing, singing, and gesticulating, was raging up and down the raft. Sight, taste and
hearing—-all were gone; but the cerebral derangement supplied their place, and in imagination the maniac was
conversing with absent friends, inviting them into the George Inn at Cardiff, offering them gin, whisky, and, above
all water! Stumbling at every step, and singing in a cracked, discordant voice, he staggered about amongst us like an
intoxicated man. With the loss of his senses all his sufferings had vanished, and his thirst was appeased. It was hard
not to wish to be a partaker of his hallucination.

Dowlas, Falsten, and the boatswain, seemed to think that the unfortunate wretch would, like Jynxstrop, put an
end to himself by leaping into the sea; but, determined this time to preserve the body, that it might serve a better
purpose than merely feeding the sharks, they rose and followed the madman everywhere he went, keeping a strict
eye upon his every movement.

But the matter did not end as they expected. As though he were really intoxicated by the stimulants of which he
had been raving, Flaypole at last sank down in a heap in a corner of the raft, where he lay lost in a heavy slumber.

CHAPTER LII.

JANUARY 25th.--Last night was very misty, and for some unaccountable reason, one of the hottest that can be
imagined. The atmosphere was really so stifling, that it seemed as if it only required a spark to set it alight. The raft
was not only quite stationary, but did not even rise and fall with any motion of the waves.

During the night I tried to count how many there were now on board, but I was utterly unable to collect my ideas
sufficiently to make the enumeration. Sometimes I counted ten, sometimes twelve, and although I knew that eleven,
since Jynxstrop was dead, was the correct number, I could never bring my reckoning right. Of one thing I felt quite
sure, and that was that the number would very soon be ten. I was convinced that I could myself last but very little
longer. All the events and associations of my life passed rapidly through my brain, My country, my friends, and my
family all appeared as it were in a vision, and seemed as though they had come to bid me a last farewell.

Towards morning I woke from my sleep, if the languid stupor into which I had fallen was worthy of that name.
One fixed idea had taken possession of my brain; I would put an end to myself, and I felt a sort of pleasure as I
glouted over the power that I had to terminate my sufferings. I told Curtis, with the utmost composure, of my
intention, and he received the intelligence as calmly as it was delivered.

"Of course you will do as you please," he said; "for, my own part, I shall not abandon my post. It is my duty to
remain here, and unless death comes to carry me away, I shall stay where I am to the very last."

The dull grey fog still hung heavily over the ocean, but the sun was evidently shining above the mist, and would,
in course of time, dispel the vapour. Towards seven o'clock I fancied I heard the cries of birds above my head. The
sound was repeated three times, and as I went up to the captain to ask him about it, I heard him mutter to himself,--

"Birds! why, that looks as if land were not far off."

But although Curtis might still cling to the hope of reaching land, I knew not what it was to have one sanguine
thought. For me there was neither continent nor island; the world was one fluid sphere, uniform, monotonous, as in
the most primitive period of its formation. Nevertheless it must be owned that it was with a certain amount of
impatience that I awaited the rising of the mist, for I was anxious to shake off the phantom fallacies that Curtis's
words had suggested to my mind.

Not till eleven o'clock did the fog begin to break, and as it rolled in heavy folds along the surface of the water, I
could every now and then catch glimpses of a clear blue sky beyond. Fierce sunbeams pierced the cloud-ripts,
scorching and burning our bodies like red-hot iron; but it was only above our heads that there was any sunlight to
condense the vapour; the horizon was still quite invisible. There was no wind, and for half an hour longer the fog
hung heavily round the raft; whilst Curtis, leaning against the side, strove to penetrate the obscurity. At length the
sun burst forth in full power, and, sweeping the surface of the ocean, dispelled the fog, and left the horizon opened
to our eyes.

There, exactly as we had seen it for the last six weeks, was the circle that bounded sea and sky, unbroken,
definite, distinct as ever! Curtis gazed with intensest scrutiny, but did not speak a word. I pitied him sincerely, for he
alone of us all felt that he had not the right to put an end to his misery. For myself I had fully determined that if I
lived till the following day, I would die by my own hand. Whether my companions were still alive, I hardly cared to
know; it seemed as though days had passed since I had seen them.

Night drew on, but I could not sleep for a moment. Towards two o'clock in the morning my thirst was so intense
that I was unable to suppress loud cries of agony. Was there nothing that would serve to quench the fire that was
burning within me? What if instead of drinking the blood of others I were to drink my own? It would be all
unavailing, I was well aware, but scarcely had the thought crossed my mind, than I proceeded to put it into
execution. I unclasped my knife, and, stripping my arm, with a steady thrust I opened a small vein. The blood oozed
out slowly, drop by drop, and as I eagerly swallowed the source of my very life, I felt that for a moment my
torments were relieved, But only for a moment; all energy had failed my pulses, and almost immediately the blood
had ceased to flow.

How long it seemed before the morning dawned! and when that morning came it brought another fog, heavy as
before that again shut out the horizon. The fog was hot as the burning steam that issues from a boiler. It was to be
my last day upon earth, and I felt that I would like to press the hand of a friend before I died. Curtis was standing
near, and crawling up to him, I took his hand in my own. He seemed to know that I was taking my farewell, and
with one last lingering hope he endeavoured to restrain me. But all in vain, my mind was finally made up.

I should have like to speak once again to M. Letourneur, Andre and Miss Herbey, but my courage failed me. I
knew that the young girl would read my resolution in my eyes, and that she would speak to me of duty and of God,
and of eternity, and I dared not meet her gaze; and I would not run the risk of being persuaded to wait until a
lingering death should overtake me. I returned to the back of the raft, and after making several efforts, I managed to
get on to my feet. I cast one long look at the pitiless ocean and the unbroken horizon; if a sail or the outline of a
coast had broken on my view, I believe that I should only have deemed myself the victim of an illusion; but nothing
of the kind appeared, and the sea was dreary as a desert.

It was ten o'clock in the morning. The pangs of hunger and the torments of thirst were racking me with
redoubled vigour. All instinct of self-preservation had left me, and I felt that the hour had come when I must cease to
suffer. Just as I was on the point of casting myself headlong into the sea, a voice, which I recognized as Dowlas's;
broke upon my ear.

"Captain," he said, "we are going to draw lots."
Involuntarily I paused; I did not take my plunge, but returned to my place upon the raft.

CHAPTER LIII.

JANUARY 26th.--All heard and understood the proposition; in fact, it had been in contemplation for several
days, but no one had ventured to put the idea into words. However, it was done now; lots were to be drawn, and to
each would be assigned his share of the body of the one ordained by fate to be the victim. For my own part, I profess
that I was quite resigned for the lot to fall upon myself. I thought I heard Andre Letourneur beg for an exception to
be made in favour of Miss Herbey, but the sailors raised a murmur of dissent. As there were eleven of us on board,
there were ten chances to one in each one's favour, a proportion which would be diminished if Miss Herbey were
excluded, so that the young lady was forced to take her chance among the rest.

It was then half-past ten, and the boatswain, who had been roused from his lethargy by what the carpenter had
said, insisted that the drawing should take place immediately. There was no reason for postponing the fatal lottery.
There was not one of us that clung in the least to life, and we knew that at the worst, whoever should be doomed to
die, would only precede the rest by a few days, or even hours. All that we desired was just once to slake our raging
thirst and moderate our gnawing hunger.
How all the names found their way to the bottom of a hat I cannot tell. Very likely Falsten wrote them upon a leaf torn from his memorandum-book. But be that as it may, the eleven names were there, and it was unanimously agreed that the last name drawn should be the victim.

But who would draw the names? There was hesitation for a moment; then, "I will," said a voice behind me. Turning round, I beheld M. Letourneur standing with outstretched hand, and with his long white hair falling over his thin livid face that was almost sublime in its calmness. I divined at once the reason of this voluntary offer; I knew that it was the father's devotion in self-sacrifice that led him to undertake the office.

"As soon as you please," said the boatswain, and handed him the hat.

M. Letourneur proceeded to draw out the folded strips of paper one by one, and after reading out aloud the name upon it, handed it to its owner.

The first name called was that of Burke, who uttered a cry of delight; then followed Flaypole and the boatswain. What his name really was I never could exactly learn. Then came Falsten, Curtis, Sandon. More than half had now been called, and my name had not yet been drawn. I calculated my remaining chance; it was still four to one in my favour.

M. Letourneur continued his painful task. Since Burke's first exclamation of joy not a sound had escaped our lips, but all were listening in breathless silence. The seventh name was Miss Herbey's, but the young girl heard it without a start. Then came mine, yes, mine! and the ninth was that of Letourneur.

"Which one?" asked the boatswain.

With one cry Andre fell back senseless. Only two names now remained in the hat; those of Dowlas and of M. Letourneur himself.

"Go on," almost roared the carpenter, surveying his partner in peril as though he could devour him. M. Letourneur almost had a smile upon his lips, as he drew forth the last paper but one, and with a firm, unfaltering voice, marvelous for his age, unfolded it slowly, and read the name of Dowlas. The carpenter gave a yell of relief as he heard the word.

M. Letourneur took the last bit of paper from the hat, and without looking at it, tore it to pieces. But, unperceived by all but myself, one little fragment flew into a corner of the raft. I crawled towards it and picked it up. On one side of it was written Andr--; the rest of the word was torn away. M. Letourneur saw what I had done, and rushing towards me, snatched the paper from my hands, and flung it into the sea.

CHAPTER LIV.

JANUARY 26th.--I understood it all; the devoted father having nothing more to give, had given his life for his son.

M. Letourneur was no longer a human being in the eyes of the famished creatures who were now yearning to see him sacrificed to their cravings. At the very sight of the victim thus provided, all the tortures of hunger returned with redoubled violence. With lips distended, and teeth displayed, they waited like a herd of carnivora until they could attack their prey with brutal voracity; it seemed almost doubtful whether they would not fall upon him while he was still alive. It seemed impossible that any appeal to their humanity could, at such a moment, have any weight; nevertheless, the appeal was made, and, incredible as it may seem, prevailed.

Just as the boatswain was about to act the part of butcher, and Dowlas stood, hatchet in hand, ready to complete the barbarous work, Miss Herbey advanced, or rather crawled, towards them.

"My friends," she pleaded, "will you not wait just one more day? If no land or ship is in sight to-morrow, then I suppose our poor companion must become your victim. But allow him one more day; in the name of mercy I entreat, I implore you."

My heart bounded as she made her pitiful appeal. It seemed to me as though the noble girl had spoken with an inspiration on her lips, and I fancied that, perhaps, in super-natural vision she had viewed the coast or the ship of which she spoke; and one more day was not much to us who had already suffered so long, and endured so much.

Curtis and Falsten agreed with me, and we all united to support Miss Herbey's merciful petition. The sailors did not utter a murmur, and the boatswain in a smothered voice said,--

"Very well, we will wait till daybreak tomorrow," and threw down his hatchet.

To-morrow, then, unless land or a sail appear, the horrible sacrifice will be accomplished. Stifling their sufferings by a strenuous effort, all returned to their places. The sailors crouched beneath the sails, caring nothing about scanning the ocean. Food was in store for them to-morrow, and that was enough for them.

As soon as Andre Letourneur came to his senses, his first thought was for his father, and I saw him count the passengers on the raft. He looked puzzled; when he lost consciousness there had been only two names left in the hat,
those of his father and the carpenter; and yet M. Letourneur and Dowlas were both there still. Miss Herbey went up to him and told him quietly that the drawing of the lots had not yet been finished. Andre asked no further question, but took his father's hand. M. Letourneur's countenance was calm and serene; he seemed to be conscious of nothing except that the life of his son was spared, and as the two sat conversing in an undertone at the back of the raft, their whole existence seemed bound up in each other.

Meantime, I could not disabuse my mind of the impression caused by Miss Herbey's intervention. Something told me that help was near at hand, and that we were approaching the termination of our suspense and misery; the chimeras that were floating through my brain resolved themselves into realities, so that nothing appeared to me more certain than that either land or sail, be they miles away, would be discovered somewhere to leeward.

I imparted my convictions to M. Letourneur and his son. Andre was as sanguine as myself; poor boy! he little thinks what a loss there is in store for him tomorrow. His father listened gravely to all we said, and whatever he might think in his own mind, he did not give us any discouragement; Heaven, he said, he was sure would still spare the survivors of the "Chancellor," and then he lavished on his son caresses which he deemed to be his last.

Some time afterwards, when I was alone with him, M. Letourneur whispered in my ear,--

"Mr. Kazallon, I commend my boy to your care, and mark you, he must never know--"

His voice was choked with tears, and he could not finish his sentence.

But I was full of hope, and, without a moment's intermission, I kept my eyes fixed upon the unbroken horizon, Curtis, Miss Herbey, Falsten, and even the boatswain, were also eagerly scanning the broad expanse of sea.

Night has come on; but I have still a profound conviction that through the darkness some ship will approach, and that at daybreak our raft will be observed.

CHAPTER LV.

JANUARY 27th.--I did not close my eyes all night, and was keenly alive to the faintest sounds, and every ripple of the water, and every murmur of the waves, broke distinctly on my ear. One thing I noticed and accepted as a happy omen; not a single shark now lingered-round the raft. The waning moon rose at a quarter to one, and through the feeble glimmer which she cast across the ocean, many and many a time I fancied I caught sight of the longed-for sail, lying only a few cables' lengths away.

But when morning came, the sun rose once again upon a desert ocean, and my hopes began to fade. Neither ship nor shore had appeared, and as the shocking hour of execution drew near, my dreams of deliverance melted away; I shuddered in my very soul as I was brought face to face with the stern reality. I dared not look upon the victim, and whenever his eyes, so full of calmness and resignation, met my own, I turned away my head. I felt choked with horror, and my brain reeled as though I were intoxicated.

It was now six o'clock, and all hope had vanished from my breast; my heart beat rapidly, and a cold sweat of agony broke out all over me. Curtis and the boatswain stood by the mast attentively scanning the horizon. The boatswain's countenance was terrible to look upon; one could see that although he would not forestall the hour, he was determined not to wait a moment after it arrived. As for the captain, it was impossible to tell what really passed within his mind; his face was livid, and his whole existence seemed concentrated in the exercise of his power of vision. The sailors were crawling about the platform, with their eyes gleaming, like wild beasts ready to pounce upon their devoted prey.

I could no longer keep my place, and glided along to the front of the raft. The boatswain was still standing intent on his watch, but all of a sudden, in a voice that made me start he shouted,--

"Now then, time's up!" and followed by Dowlas, Burke, Flaypole, and Sandon, ran to the back of the raft. As Dowlas seized the hatchet convulsively, Miss Herbey could not suppress a cry of terror. Andre started to his feet.

"What are you going to do to my father?" he asked in accents choked with emotion.

"My boy," said M. Letourneur, "the lot has fallen upon me, and I must die!"

"Never!" shrieked Andre, throwing his arms about his father, "They shall kill me first. It was I who threw Hobart's body into the sea, and it is I who ought to die!"

But the words of the unhappy youth had no other effect than to increase the fury of the men who were so staunchly bent upon their bloody purpose.

"Come, come, no more fuss," said Dowlas, as he tore the young man away from his father's embrace. Andre fell upon his back, in which position two of the sailors held him down so tightly that he could not move, whilst Burke and Sandon carried off their victim to the front.

All this had taken place much more rapidly than I have been able to describe it. I was transfixed with horror, and much as I wished to throw myself between M. Letourneur and his executioners, I seemed to be rooted to the spot where I was standing.
Meantime the sailors had been taking off some of M. Letourneur's clothes, and his neck and shoulders were already bare.

"Stop a moment!" he said in a tone in which was the ring of indomitable courage. "Stop! I don't want to deprive you of your ration; but I suppose you will not require to eat the whole of me today."

The sailors, taken aback by his suggestion, stared at him with amazement.

"There are ten of you," he went on. "My two arms will give you each a meal; cut them off for to-day, and to-morrow you shall have the rest of me."

"Agreed!" cried Dowlas; and as M. Letourneur held out his bare arms, quick as lightning the carpenter raised his hatchet.

Curtis and I could bear this scene no longer; whilst we were alive to prevent it, this butchery should not be permitted, and we rushed forwards simultaneously to snatch the victim from his murderers. A furious struggle ensued, and in the midst of the MELEE I was seized by one of the sailors, and hurled violently into the sea.

Closing my lips, I tried to die of suffocation in the water; but in spite of myself, my mouth opened, and a few drops trickled down my throat.

Merciful Heaven! the water was fresh!

CHAPTER LVI.

JANUARY 27th CONTINUED.--A change came over me as if by miracle. No longer had I any wish to die, and already Curtis, who had heard my cries, was throwing me a rope. I seized it eagerly, and was hauled up on to the raft, "Fresh water!" were the first words I uttered.

"Fresh water?" cried Curtis, "why then, my friends, we are not far from land!"

It was not too late; the blow had not been struck, and so the victim had not yet fallen. Curtis and Andre (who had regained his liberty) had fought with the cannibals, and it was just as they were yielding to overpowering numbers that my voice had made itself heard.

The struggle came to an end. As soon as the words "Fresh water" had escaped my lips, I leaned over the side of the raft and swallowed the life-giving liquid in greedy draughts. Miss Herbey was the first to follow my example, but soon Curtis, Falsten, and all the rest were on their knees and drinking eagerly, The rough sailors seemed as if by a magic touch transformed back from ravenous beasts to human beings, and I saw several of them raise their hands to heaven in silent gratitude, Andre and his father were the last to drink.

"But where are we?" I asked at length.

"The land is there," said Curtis pointing towards the west.

We all stared at the captain as though he were mocking us; no land was in sight, and the raft, just as ever, was the centre of a watery waste. Yet our senses had not deceived us the water we had been drinking was perfectly fresh.

"Yes," repeated the captain, "land is certainly there, not more than twenty miles to leeward."

"What land?" inquired the boatswain.

"South America," answered Curtis, "and near the Amazon; no other river has a current strong enough to freshen the ocean twenty miles from shore!"

CHAPTER LVII.

JANUARY 27th CONTINUED.--Curtis, no doubt was right. The discharge from the mouth of the Amazon is enormously large, but we had probably drifted into the only spot in the Atlantic where we could find fresh water so far from land. Yet land, undoubtedly was there, and the breeze was carrying us onwards slowly but surely to our deliverance.

Miss Herbey's voice was heard pouring out fervent praise to Heaven, and we were all glad to unite our thanksgivings with hers. Then the whole of us (with the exception of Andre and his father, who remained by themselves together at the stern) clustered in a group, and kept our expectant gaze upon the horizon.

We had not long to wait. Before an hour had passed Curtis, leaped in ecstasy and raised the joyous shout of "Land ahoy!"

* * * *

My journal has come to a close.

I have only to relate, as briefly as possible, the circumstances that finally brought us to our destination.

A few hours after we first sighted land the raft was off Cape Magoari, on the Island of Marajo, and was observed by some fishermen who, with kind-hearted alacrity picked us up, and tended us most carefully. They conveyed us to Para, where we became the objects of unbounded sympathy.
The raft was brought to land in lat. 0° 12′ N., so that since we abandoned the "Chancellor" we had drifted at least fifteen degrees to the south-west. Except for the influence of the Gulf Stream we must have been carried far, far to the south, and in that case we should never have reached the mouth of the Amazon, and must inevitably have been lost.

Of the thirty-two souls—nine passengers, and twenty-three seamen—who left Charleston on board the ship, only five passengers and six seamen remain. Eleven of us alone survive.

An official account of our rescue was drawn up by the Brazilian authorities. Those who signed were Miss Herbey, J. R. Kazallon, M. Letourneur, Andre Letourneur, Mr. Falsten, the boatswain, Dowlas, Burke, Flaypole, Sandon, and last, though not least,

"Robert Curtis, captain."

At Para we soon found facilities for continuing our homeward route. A vessel took us to Cayenne, where we secured a passage on board one of the steamers of the French Transatlantic Aspinwall line, the "Ville de St. Nazaire," which conveyed us to Europe.

After all the dangers and privations which we have undergone together, it is scarcely necessary to say that there has arisen between the surviving passengers of the "Chancellor" a bond of friendship too indissoluble, I believe, for either time or circumstance to destroy; Curtis must ever remain the honoured and valued friend of those whose welfare he consulted so faithfully in their misfortunes; his conduct was beyond all praise.

When we were fairly on our homeward way, Miss Herbey by chance intimated to us her intention of retiring from the world and devoting the remainder of her life to the care of the sick and suffering.

"Then why not come and look after my son?" said M. Letourneur, adding, "he is an invalid, and he requires, as he deserves, the best of nursing."

Miss Herbey, after some deliberation, consented to become a member of their family, and finds in M. Letourneur a father, and in Andre a brother. A brother, I say; but may we not hope that she may be united by a dearer and a closer tie, and that the noble-hearted girl may experience the happiness that so richly she deserves?

THE UNDERGROUND CITY
OR
THE BLACK INDIES
(Sometimes Called The Child of the Cavern)

CHAPTER I. CONTRADICTORY LETTERS
To Mr. F. R. Starr, Engineer, 30 Canongate, Edinburgh.

IF Mr. James Starr will come to-morrow to the Aberfoyle coal-mines, Dochart pit, Yarrow shaft, a communication of an interesting nature will be made to him.

"Mr. James Starr will be awaited for, the whole day, at the Callander station, by Harry Ford, son of the old overman Simon Ford."

"He is requested to keep this invitation secret."

Such was the letter which James Starr received by the first post, on the 3rd December, 18—, the letter bearing the Aberfoyle postmark, county of Stirling, Scotland.

The engineer's curiosity was excited to the highest pitch. It never occurred to him to doubt whether this letter might not be a hoax. For many years he had known Simon Ford, one of the former foremen of the Aberfoyle mines, of which he, James Starr, had for twenty years, been the manager, or, as he would be termed in English coal-mines, the viewer. James Starr was a strongly-constituted man, on whom his fifty-five years weighed no more heavily than if they had been forty. He belonged to an old Edinburgh family, and was one of its most distinguished members. His labors did credit to the body of engineers who are gradually devouring the carboniferous subsoil of the United Kingdom, as much at Cardiff and Newcastle, as in the southern counties of Scotland. However, it was more particularly in the depths of the mysterious mines of Aberfoyle, which border on the Alloa mines and occupy part of the county of Stirling, that the name of Starr had acquired the greatest renown. There, the greater part of his existence had been passed. Besides this, James Starr belonged to the Scottish Antiquarian Society, of which he had been made president. He was also included amongst the most active members of the Royal Institution; and the Edinburgh Review frequently published clever articles signed by him. He was in fact one of those practical men to
whom is due the prosperity of England. He held a high rank in the old capital of Scotland, which not only from a physical but also from a moral point of view, well deserves the name of the Northern Athens.

We know that the English have given to their vast extent of coal-mines a very significant name. They very justly call them the "Black Indies," and these Indies have contributed perhaps even more than the Eastern Indies to swell the surprising wealth of the United Kingdom.

At this period, the limit of time assigned by professional men for the exhaustion of coal-mines was far distant and there was no dread of scarcity. There were still extensive mines to be worked in the two Americas. The manufactory, appropriated to so many different uses, locomotives, steamers, gas works, &c., were not likely to fail for want of the mineral fuel; but the consumption had so increased during the last few years, that certain beds had been exhausted even to their smallest veins. Now deserted, these mines perforated the ground with their useless shafts and forsaken galleries. This was exactly the case with the pits of Aberfoyle.

Ten years before, the last butty had raised the last ton of coal from this colliery. The underground working stock, traction engines, trucks which run on rails along the galleries, subterranean tramways, frames to support the shaft, pipes—in short, all that constituted the machinery of a mine had been brought up from its depths. The exhausted mine was like the body of a huge fantastically-shaped mastodon, from which all the organs of life have been taken, and only the skeleton remains.

Nothing was left but long wooden ladders, down the Yarrow shaft—the only one which now gave access to the lower galleries of the Dochart pit. Above ground, the sheds, formerly sheltering the outside works, still marked the spot where the shaft of that pit had been sunk, it being now abandoned, as were the other pits, of which the whole constituted the mines of Aberfoyle.

It was a sad day, when for the last time the workmen quitted the mine, in which they had lived for so many years. The engineer, James Starr, had collected the hundreds of workmen which composed the active and courageous population of the mine. Overmen, brakemen, putters, wastemen, barrowmen, masons, smiths, carpenters, outside and inside laborers, women, children, and old men, all were collected in the great yard of the Dochart pit, formerly heaped with coal from the mine.

Many of these families had existed for generations in the mine of old Aberfoyle; they were now driven to seek the means of subsistence elsewhere, and they waited sadly to bid farewell to the engineer.

James Starr stood upright, at the door of the vast shed in which he had for so many years superintended the powerful machines of the shaft. Simon Ford, the foreman of the Dochart pit, then fifty-five years of age, and other managers and overseers, surrounded him. James Starr took off his hat. The miners, cap in hand, kept a profound silence. This farewell scene was of a touching character, not wanting in grandeur.

"My friends," said the engineer, "the time has come for us to separate. The Aberfoyle mines, which for so many years have united us in a common work, are now exhausted. All our researches have not led to the discovery of a new vein, and the last block of coal has just been extracted from the Dochart pit." And in confirmation of his words, James Starr pointed to a lump of coal which had been kept at the bottom of a basket.

"This piece of coal, my friends," resumed James Starr, "is like the last drop of blood which has flowed through the veins of the mine! We shall keep it, as the first fragment of coal is kept, which was extracted a hundred and fifty years ago from the bearings of Aberfoyle. Between these two pieces, how many generations of workmen have succeeded each other in our pits! Now, it is over! The last words which your engineer will address to you are a farewell. You have lived in this mine, which your hands have emptied. The work has been hard, but not without profit for you. Our great family must disperse, and it is not probable that the future will ever again unite the scattered members. But do not forget that we have lived together for a long time, and that it will be the duty of the miners of Aberfoyle to help each other. Your old masters will not forget you either. When men have worked together, they must never be stranger to each other again. We shall keep our eye on you, and wherever you go, our recommendations shall follow you. Farewell then, my friends, and may Heaven be with you!"

So saying, James Starr wrung the horny hand of the oldest miner, whose eyes were dim with tears. Then the overmen of the different pits came forward to shake hands with him, whilst the miners waved their caps, shouting, "Farewell, James Starr, our master and our friend!"

This farewell would leave a lasting remembrance in all these honest hearts. Slowly and sadly the population quitted the yard. The black soil of the roads leading to the Dochart pit resounded for the last time to the tread of miners' feet, and silence succeeded to the bustling life which had till then filled the Aberfoyle mines.

One man alone remained by James Starr. This was the overman, Simon Ford. Near him stood a boy, about fifteen years of age, who for some years already had been employed down below.

James Starr and Simon Ford knew and esteemed each other well. "Good-by, Simon," said the engineer.

"Good-by, Mr. Starr," replied the overman, "let me add, till we meet again!"

"Yes, till we meet again. Ford!" answered James Starr. "You know that I shall be always glad to see you, and
talk over old times."

"I know that, Mr. Starr."

"My house in Edinburgh is always open to you."

"It's a long way off, is Edinburgh!" answered the man shaking his head. "Ay, a long way from the Dochart pit."

"A long way, Simon? Where do you mean to live?"

"Even here, Mr. Starr! We're not going to leave the mine, our good old nurse, just because her milk is dried up! My wife, my boy, and myself, we mean to remain faithful to her!"

"Good-by then, Simon," replied the engineer, whose voice, in spite of himself, betrayed some emotion.

"No, I tell you, it's TILL WE MEET AGAIN, Mr. Starr, and not Just 'good-by,'" returned the foreman. "Mark my words, Aberfoyle will see you again!"

The engineer did not try to dispel the man's illusion. He patted Harry's head, again wrung the father's hand, and left the mine.

All this had taken place ten years ago; but, notwithstanding the wish which the overman had expressed to see him again, during that time Starr had heard nothing of him. It was after ten years of separation that he got this letter from Simon Ford, requesting him to take without delay the road to the old Aberfoyle colliery.

A communication of an interesting nature, what could it be? Dochart pit. Yarrow shaft! What recollections of the past these names brought back to him! Yes, that was a fine time, that of work, of struggle,—the best part of the engineer's life. Starr re-read his letter. He pondered over it in all its bearings. He much regretted that just a line more had not been added by Ford. He wished he had not been quite so laconic.

Was it possible that the old foreman had discovered some new vein? No! Starr remembered with what minute care the mines had been explored before the definite cessation of the works. He had himself proceeded to the lowest soundings without finding the least trace in the soil, burrowed in every direction. They had even attempted to find coal under strata which are usually below it, such as the Devonian red sandstone, but without result. James Starr had therefore abandoned the mine with the absolute conviction that it did not contain another bit of coal.

"No," he repeated, "no! How is it possible that anything which could have escaped my researches, should be revealed to those of Simon Ford. However, the old overman must well know that such a discovery would be the one thing in the world to interest me, and this invitation, which I must keep secret, to repair to the Dochart pit!" James Starr always came back to that.

On the other hand, the engineer knew Ford to be a clever miner, peculiarly endowed with the instinct of his trade. He had not seen him since the time when the Aberfoyle colliery was abandoned, and did not know either what he was doing or where he was living, with his wife and his son. All that he now knew was, that a rendezvous had been appointed him at the Yarrow shaft, and that Harry, Simon Ford's son, was to wait for him during the whole of the next day at the Callander station.

"I shall go, I shall go!" said Starr, his excitement increasing as the time drew near.

Our worthy engineer belonged to that class of men whose brain is always on the boil, like a kettle on a hot fire. In some of these brain kettles the ideas bubble over, in others they just simmer quietly. Now on this day, James Starr's ideas were boiling fast.

But suddenly an unexpected incident occurred. This was the drop of cold water, which in a moment was to condense all the vapors of the brain. About six in the evening, by the third post, Starr's servant brought him a second letter. This letter was enclosed in a coarse envelope, and evidently directed by a hand unaccustomed to the use of a pen. James Starr tore it open. It contained only a scrap of paper, yellowed by time, and apparently torn out of an old copy book.

On this paper was written a single sentence, thus worded:

"It is useless for the engineer James Starr to trouble himself, Simon Ford's letter being now without object."

No signature.

CHAPTER II. ON THE ROAD

The course of James Starr's ideas was abruptly stopped, when he got this second letter contradicting the first.

"What does this mean?" said he to himself. He took up the torn envelope, and examined it. Like the other, it bore the Aberfoyle postmark. It had therefore come from the same part of the county of Stirling. The old miner had evidently not written it. But, no less evidently, the author of this second letter knew the overman's secret, since it expressly contradicted the invitation to the engineer to go to the Yarrow shaft.

Was it really true that the first communication was now without object? Did someone wish to prevent James Starr from troubling himself either uselessly or otherwise? Might there not be rather a malevolent intention to thwart Ford's plans?
This was the conclusion at which James Starr arrived, after mature reflection. The contradiction which existed between the two letters only wrought in him a more keen desire to visit the Dochart pit. And besides, if after all it was a hoax, it was well worth while to prove it. Starr also thought it wiser to give more credence to the first letter than to the second; that is to say, to the request of such a man as Simon Ford, rather than to the warning of his anonymous contradictor.

"Indeed," said he, "the fact of anyone endeavoring to influence my resolution, shows that Ford's communication must be of great importance. To-morrow, at the appointed time, I shall be at the rendezvous."

In the evening, Starr made his preparations for departure. As it might happen that his absence would be prolonged for some days, he wrote to Sir W. Elphiston, President of the Royal Institution, that he should be unable to be present at the next meeting of the Society. He also wrote to excuse himself from two or three engagements which he had made for the week. Then, having ordered his servant to pack a traveling bag, he went to bed, more excited than the affair perhaps warranted.

The next day, at five o'clock, James Starr jumped out of bed, dressed himself warmly, for a cold rain was falling, and left his house in the Canongate, to go to Granton Pier to catch the steamer, which in three hours would take him up the Forth as far as Stirling.

For the first time in his life, perhaps, in passing along the Canongate, he did NOT TURN TO LOOK AT HOLYROOD, the palace of the former sovereigns of Scotland. He did not notice the sentinels who stood before its gateways, dressed in the uniform of their Highland regiment, tartan kilt, plaid and sporran complete. His whole thought was to reach Callander where Harry Ford was supposedly awaiting him.

The better to understand this narrative, it will be as well to hear a few words on the origin of coal. During the geological epoch, when the terrestrial spheroid was still in course of formation, a thick atmosphere surrounded it, saturated with watery vapors, and copiously impregnated with carbonic acid. The vapors gradually condensed in diluvial rains, which fell as if they had leapt from the necks of thousands of millions of seltzer water bottles. This liquid, loaded with carbonic acid, rushed in torrents over a deep soft soil, subject to sudden or slow alterations of form, and maintained in its semi-fluid state as much by the heat of the sun as by the fires of the interior mass. The internal heat had not as yet been collected in the center of the globe. The terrestrial crust, thin and incompletely hardened, allowed it to spread through its pores. This caused a peculiar form of vegetation, such as is probably produced on the surface of the inferior planets, Venus or Mercury, which revolve nearer than our earth around the radiant sun of our system.

The soil of the continents was covered with immense forests. Carbonic acid, so suitable for the development of the vegetable kingdom, abounded. The feet of these trees were drowned in a sort of immense lagoon, kept continually full by currents of fresh and salt waters. They eagerly assimilated to themselves the carbon which they, little by little, extracted from the atmosphere, as yet unfit for the function of life, and it may be said that they were destined to store it, in the form of coal, in the very bowels of the earth.

It was the earthquake period, caused by internal convulsions, which suddenly modified the unsettled features of the terrestrial surface. Here, an intumescence which was to become a mountain, there, an abyss which was to be filled with an ocean or a sea. There, whole forests sunk through the earth's crust, below the unfixed strata, either until they found a resting-place, such as the primitive bed of granitic rock, or, settling together in a heap, they formed a solid mass.

As the waters were contained in no bed, and were spread over every part of the globe, they rushed where they liked, tearing from the scarcely-formed rocks material with which to compose schists, sandstones, and limestones. This the roving waves bore over the submerged and now peaty forests, and deposited above them the elements of rocks which were to superpose the coal strata. In course of time, periods of which include millions of years, these earths hardened in layers, and enclosed under a thick carapace of pudding-stone, schist, compact or friable sandstone, gravel and stones, the whole of the massive forests.

And what went on in this gigantic crucible, where all this vegetable matter had accumulated, sunk to various depths? A regular chemical operation, a sort of distillation. All the carbon contained in these vegetables had agglomerated, and little by little coal was forming under the double influence of enormous pressure and the high temperature maintained by the internal fires, at this time so close to it.

Thus there was one kingdom substituted for another in this slow but irresistible reaction. The vegetable was transformed into a mineral. Plants which had lived the vegetative life in all the vigor of first creation became petrified. Some of the substances enclosed in this vast herbal left their impression on the other more rapidly mineralized products, which pressed them as an hydraulic press of incalculable power would have done.

Thus also shells, zoophytes, star-fish, polypi, spirofiores, even fish and lizards brought by the water, left on the yet soft coal their exact likeness, "admirably taken off."

Pressure seems to have played a considerable part in the formation of carboniferous strata. In fact, it is to its
degree of power that are due the different sorts of coal, of which industry makes use. Thus in the lowest layers of the coal ground appears the anthracite, which, being almost destitute of volatile matter, contains the greatest quantity of carbon. In the higher beds are found, on the contrary, lignite and fossil wood, substances in which the quantity of carbon is infinitely less. Between these two beds, according to the degree of pressure to which they have been subjected, are found veins of graphite and rich or poor coal. It may be asserted that it is for want of sufficient pressure that beds of peaty bog have not been completely changed into coal. So then, the origin of coal mines, in whatever part of the globe they have been discovered, is this: the absorption through the terrestrial crust of the great forests of the geological period; then, the mineralization of the vegetables obtained in the course of time, under the influence of pressure and heat, and under the action of carbonic acid.

Now, at the time when the events related in this story took place, some of the most important mines of the Scottish coal beds had been exhausted by too rapid working. In the region which extends between Edinburgh and Glasgow, for a distance of ten or twelve miles, lay the Aberfoyle colliery, of which the engineer, James Starr, had so long directed the works. For ten years these mines had been abandoned. No new seams had been discovered, although the soundings had been carried to a depth of fifteen hundred or even of two thousand feet, and when James Starr had retired, it was with the full conviction that even the smallest vein had been completely exhausted.

Under these circumstances, it was plain that the discovery of a new seam of coal would be an important event. Could Simon Ford's communication relate to a fact of this nature? This question James Starr could not cease asking himself. Was he called to make conquest of another corner of these rich treasure fields? Fain would he hope it was so.

The second letter had for an instant checked his speculations on this subject, but now he thought of that letter no longer. Besides, the son of the old overman was there, waiting at the appointed rendezvous. The anonymous letter was therefore worth nothing.

The moment the engineer set foot on the platform at the end of his journey, the young man advanced towards him.

"Are you Harry Ford?" asked the engineer quickly.
"Yes, Mr. Starr." 
"I should not have known you, my lad. Of course in ten years you have become a man!"
"I knew you directly, sir," replied the young miner, cap in hand. "You have not changed. You look just as you did when you bade us good-by in the Dochart pit. I haven't forgotten that day."
"Put on your cap, Harry," said the engineer. "It's pouring, and politeness needn't make you catch cold."
"Shall we take shelter anywhere, Mr. Starr?" asked young Ford.
"No, Harry. The weather is settled. It will rain all day, and I am in a hurry. Let us go on."
"I am at your orders," replied Harry.
"Tell me, Harry, is your father well?"
"Very well, Mr. Starr."
"And your mother?"
"She is well, too."
"Was it your father who wrote telling me to come to the Yarrow shaft?"
"No, it was I."
"Then did Simon Ford send me a second letter to contradict the first?" asked the engineer quickly.
"No, Mr. Starr," answered the young miner.
"Very well," said Starr, without speaking of the anonymous letter. Then, continuing, "And can you tell me what you father wants with me?"
"Mr. Starr, my father wishes to tell you himself."
"But you know what it is?"
"I do, sir."
"Well, Harry, I will not ask you more. But let us get on, for I'm anxious to see Simon Ford. By-the-bye, where does he live?"
"In the mine."
"What! In the Dochart pit?"
"Yes, Mr. Starr," replied Harry.
"Really! has your family never left the old mine since the cessation of the works?"
"Not a day, Mr. Starr. You know my father. It is there he was born, it is there he means to die!"
"I can understand that, Harry. I can understand that! His native mine! He did not like to abandon it! And are you happy there?"
"Yes, Mr. Starr," replied the young miner, "for we love one another, and we have but few wants."
"Well, Harry," said the engineer, "lead the way."

And walking rapidly through the streets of Callander, in a few minutes they had left the town behind them.

CHAPTER III. THE DOCHART PIT

HARRY FORD was a fine, strapping fellow of five and twenty. His grave looks, his habitually passive expression, had from childhood been noticed among his comrades in the mine. His regular features, his deep blue eyes, his curly hair, rather chestnut than fair, the natural grace of his person, altogether made him a fine specimen of a lowlander. Accustomed from his earliest days to the work of the mine, he was strong and hardy, as well as brave and good. Guided by his father, and impelled by his own inclinations, he had early begun his education, and at an age when most lads are little more than apprentices, he had managed to make himself of some importance, a leader, in fact, among his fellows, and few are very ignorant in a country which does all it can to remove ignorance. Though, during the first years of his youth, the pick was never out of Harry's hand, nevertheless the young miner was not long in acquiring sufficient knowledge to raise him into the upper class of the miners, and he would certainly have succeeded his father as overman of the Dochart pit, if the colliery had not been abandoned.

James Starr was still a good walker, yet he could not easily have kept up with his guide, if the latter had not slackened his pace. The young man, carrying the engineer's bag, followed the left bank of the river for about a mile. Leaving its winding course, they took a road under tall, dripping trees. Wide fields lay on either side, around isolated farms. In one field a herd of hornless cows were quietly grazing; in another sheep with silky wool, like those in a child's toy sheep fold.

The Yarrow shaft was situated four miles from Callander. Whilst walking, James Starr could not but be struck with the change in the country. He had not seen it since the day when the last ton of Aberfoyle coal had been emptied into railway trucks to be sent to Glasgow. Agricultural life had now taken the place of the more stirring, active, industrial life. The contrast was all the greater because, during winter, field work is at a standstill. But formerly, at whatever season, the mining population, above and below ground, filled the scene with animation. Great wagons of coal used to be passing night and day. The rails, with their rotten sleepers, now disused, were then constantly ground by the weight of wagons. Now stony roads took the place of the old mining tramways. James Starr felt as if he was traversing a desert.

The engineer gazed about him with a saddened eye. He stopped now and then to take breath. He listened. The air was no longer filled with distant whistlings and the panting of engines. None of those black vapors which the manufacturer loves to see, hung in the horizon, mingling with the clouds. No tall cylindrical or prismatic chimney vomited out smoke, after being fed from the mine itself; no blast-pipe was puffing out its white vapor. The ground, formerly black with coal dust, had a bright look, to which James Starr's eyes were not accustomed.

When the engineer stood still, Harry Ford stopped also. The young miner waited in silence. He felt what was passing in his companion's mind, and he shared his feelings; he, a child of the mine, whose whole life had been passed in its depths.

"Yes, Harry, it is all changed," said Starr. "But at the rate we worked, of course the treasures of coal would have been exhausted some day. Do you regret that time?"

"I do regret it, Mr. Starr," answered Harry. "The work was hard, but it was interesting, as are all struggles."

"No doubt, my lad. A continuous struggle against the dangers of landslips, fires, inundations, explosions of firedamp, like claps of thunder. One had to guard against all those perils! You say well! It was a struggle, and consequently an exciting life."

"The miners of Alva have been more favored than the miners of Aberfoyle, Mr. Starr!"

"Ay, Harry, so they have," replied the engineer.

"Indeed," cried the young man, "it's a pity that all the globe was not made of coal; then there would have been enough to last millions of years!"

"No doubt there would, Harry; it must be acknowledged, however, that nature has shown more forethought by forming our sphere principally of sandstone, limestone, and granite, which fire cannot consume."

"Do you mean to say, Mr. Starr, that mankind would have ended by burning their own globe?"

"Yes! The whole of it, my lad," answered the engineer. "The earth would have passed to the last bit into the furnaces of engines, machines, steamers, gas factories; certainly, that would have been the end of our world one fine day!"

"There is no fear of that now, Mr. Starr. But yet, the mines will be exhausted, no doubt, and more rapidly than the statistics make out!"

"That will happen, Harry; and in my opinion England is very wrong in exchanging her fuel for the gold of other nations! I know well," added the engineer, "that neither hydraulics nor electricity has yet shown all they can do, and
that some day these two forces will be more completely utilized. But no matter! Coal is of a very practical use, and lends itself easily to the various wants of industry. Unfortunately man cannot produce it at will. Though our external forests grow incessantly under the influence of heat and water, our subterranean forests will not be reproduced, and if they were, the globe would never be in the state necessary to make them into coal."

James Starr and his guide, whilst talking, had continued their walk at a rapid pace. An hour after leaving Callander they reached the Dochart pit.

The most indifferent person would have been touched at the appearance this deserted spot presented. It was like the skeleton of something that had formerly lived. A few wretched trees bordered a plain where the ground was hidden under the black dust of the mineral fuel, but no cinders nor even fragments of coal were to be seen. All had been carried away and consumed long ago.

They walked into the shed which covered the opening of the Yarrow shaft, whence ladders still gave access to the lower galleries of the pit. The engineer bent over the opening. Formerly from this place could be heard the powerful whistle of the air inhaled by the ventilators. It was now a silent abyss. It was like being at the mouth of some extinct volcano.

When the mine was being worked, ingenious machines were used in certain shafts of the Aberfoyle colliery, which in this respect was very well off; frames furnished with automatic lifts, working in wooden slides, oscillating ladders, called "man-engines," which, by a simple movement, permitted the miners to descend without danger.

But all these appliances had been carried away, after the cessation of the works. In the Yarrow shaft there remained only a long succession of ladders, separated at every fifty feet by narrow landings. Thirty of these ladders placed thus end to end led the visitor down into the lower gallery, a depth of fifteen hundred feet. This was the only way of communication which existed between the bottom of the Dochart pit and the open air. As to air, that came in by the Yarrow shaft, from whence galleries communicated with another shaft whose orifice opened at a higher level; the warm air naturally escaped by this species of inverted siphon.

"I will follow you, my lad," said the engineer, signing to the young man to precede him.

"As you please, Mr. Starr."

"Have you your lamp?"

"Yes, and I only wish it was still the safety lamp, which we formerly had to use!"

"Sure enough," returned James Starr, "there is no fear of fire-damp explosions now!"

Harry was provided with a simple oil lamp, the wick of which he lighted. In the mine, now empty of coal, escapes of light carburetted hydrogen could not occur. As no explosion need be feared, there was no necessity for interposing between the flame and the surrounding air that metallic screen which prevents the gas from catching fire. The Davy lamp was of no use here. But if the danger did not exist, it was because the cause of it had disappeared, and with this cause, the combustible in which formerly consisted the riches of the Dochart pit.

Harry descended the first steps of the upper ladder. Starr followed. They soon found themselves in a profound obscurity, which was only relieved by the glimmer of the lamp. The young man held it above his head, the better to light his companion. A dozen ladders were descended by the engineer and his guide, with the measured step habitual to the miner. They were all still in good condition.

James Starr examined, as well as the insufficient light would permit, the sides of the dark shaft, which were covered by a partly rotten lining of wood.

Arrived at the fifteenth landing, that is to say, half way down, they halted for a few minutes.

"Decidedly, I have not your legs, my lad," said the engineer, panting.

"You are very stout, Mr. Starr," replied Harry, "and it's something too, you see, to live all one's life in the mine."

"Right, Harry. Formerly, when I was twenty, I could have gone down all at a breath. Come, forward!"

But just as the two were about to leave the platform, a voice, as yet far distant, was heard in the depths of the shaft. It came up like a sonorous billow, swelling as it advanced, and becoming more and more distinct.

"Halloo! who comes here?" asked the engineer, stopping Harry.

"I cannot say," answered the young miner.

"Is it not your father?"

"My father, Mr. Starr? no."

"Some neighbor, then?"

"We have no neighbors in the bottom of the pit," replied Harry. "We are alone, quite alone."

"Well, we must let this intruder pass," said James Starr. "Those who are descending must yield the path to those who are ascending."

They waited. The voice broke out again with a magnificent burst, as if it had been carried through a vast speaking trumpet; and soon a few words of a Scotch song came clearly to the ears of the young miner.

"The Hundred Pipers!" cried Harry. "Well, I shall be much surprised if that comes from the lungs of any man but
Jack Ryan."

"And who is this Jack Ryan?" asked James Starr.

"An old mining comrade," replied Harry. Then leaning from the platform, "Halloo! Jack!" he shouted.

"Is that you, Harry?" was the reply. "Wait a bit, I'm coming." And the song broke forth again.

In a few minutes, a tall fellow of five and twenty, with a merry face, smiling eyes, a laughing mouth, and sandy hair, appeared at the bottom of the luminous cone which was thrown from his lantern, and set foot on the landing of the fifteenth ladder. His first act was to vigorously wring the hand which Harry extended to him.

"Delighted to meet you!" he exclaimed. "If I had only known you were to be above ground to-day, I would have spared myself going down the Yarrow shaft!"

"This is Mr. James Starr," said Harry, turning his lamp towards the engineer, who was in the shadow.

"Mr. Starr!" cried Jack Ryan. "Ah, sir, I could not see. Since I left the mine, my eyes have not been accustomed to see in the dark, as they used to do."

"Ah, I remember a lad who was always singing. That was ten years ago. It was you, no doubt?"

"Ay, Mr. Starr, but in changing my trade, I haven't changed my disposition. It's far better to laugh and sing than to cry and whine!"

"You're right there, Jack Ryan. And what do you do now, as you have left the mine?"

"I am working on the Melrose farm, forty miles from here. Ah, it's not like our Aberfoyle mines! The pick comes better to my hand than the spade or hoe. And then, in the old pit, there were vaulted roofs, to merrily echo one's songs, while up above ground!—But you are going to see old Simon, Mr. Starr?"

"Yes, Jack," answered the engineer.

"Don't let me keep you then."

"Tell me, Jack," said Harry, "what was taking you to our cottage to-day?"

"I wanted to see you, man," replied Jack, "and ask you to come to the Irvine games. You know I am the piper of the place. There will be dancing and singing."

"Thank you, Jack, but it's impossible."

"Impossible?"

"Yes; Mr. Starr's visit will last some time, and I must take him back to Callander."

"Well, Harry, it won't be for a week yet. By that time Mr. Starr's visit will be over, I should think, and there will be nothing to keep you at the cottage."

"Indeed, Harry," said James Starr, "you must profit by your friend Jack's invitation."

"Well, I accept it, Jack," said Harry, "in a week we will meet at Irvine."

"In a week, that's settled," returned Ryan. "Good-by, Harry! Your servant, Mr. Starr. I am very glad to have seen you again! I can give news of you to all my friends. No one has forgotten you, sir."

"And I have forgotten no one," said Starr.

"Thanks for all, sir," replied Jack.

"Good-by, Jack," said Harry, shaking his hand. And Jack Ryan, singing as he went, soon disappeared in the heights of the shaft, dimly lighted by his lamp.

A quarter of an hour afterwards James Starr and Harry descended the last ladder, and set foot on the lowest floor of the pit.

From the bottom of the Yarrow shaft radiated numerous empty galleries. They ran through the wall of schist and sandstone, some shored up with great, roughly-hewn beams, others lined with a thick casing of wood. In every direction embankments supplied the place of the excavated veins. Artificial pillars were made of stone from neighboring quarries, and now they supported the ground, that is to say, the double layer of tertiary and quaternary soil, which formerly rested on the seam itself. Darkness now filled the galleries, formerly lighted either by the miner's lamp or by the electric light, the use of which had been introduced in the mines.

"Will you not rest a while, Mr. Starr?" asked the young man.

"No, my lad," replied the engineer, "for I am anxious to be at your father's cottage."

"Follow me then, Mr. Starr. I will guide you, and yet I daresay you could find your way perfectly well through this dark labyrinth."

"Yes, indeed! I have the whole plan of the old pit still in my head."

Harry, followed by the engineer, and holding his lamp high the better to light their way, walked along a high gallery, like the nave of a cathedral. Their feet still struck against the wooden sleepers which used to support the rails.

They had not gone more than fifty paces, when a huge stone fell at the feet of James Starr. "Take care, Mr. Starr!" cried Harry, seizing the engineer by the arm.

"A stone, Harry! Ah! these old vaultings are no longer quite secure, of course, and--"
"Mr. Starr," said Harry Ford, "it seems to me that stone was thrown, thrown as by the hand of man!"

"Thrown!" exclaimed James Starr. "What do you mean, lad?"

"Nothing, nothing, Mr. Starr," replied Harry evasively, his anxious gaze endeavoring to pierce the darkness. "Let us go on. Take my arm, sir, and don't be afraid of making a false step."

"Here I am, Harry." And they both advanced, whilst Harry looked on every side, throwing the light of his lamp into all the corners of the gallery.

"Shall we soon be there?" asked the engineer.

"In ten minutes at most."

"Good."

"But," muttered Harry, "that was a most singular thing. It is the first time such an accident has happened to me. That stone falling just at the moment we were passing."

"Harry, it was a mere chance."

"Chance," replied the young man, shaking his head. "Yes, chance." He stopped and listened.

"What is the matter, Harry?" asked the engineer.

"I thought I heard someone walking behind us," replied the young miner, listening more attentively. Then he added, "No, I must have been mistaken. Lean harder on my arm, Mr. Starr. Use me like a staff."

"A good solid staff, Harry," answered James Starr. "I could not wish for a better than a fine fellow like you."

They continued in silence along the dark nave. Harry was evidently preoccupied, and frequently turned, trying to catch, either some distant noise, or remote glimmer of light.

But behind and before, all was silence and darkness.

CHAPTER IV. THE FORD FAMILY

TEN minutes afterwards, James Starr and Harry issued from the principal gallery. They were now standing in a glade, if we may use this word to designate a vast and dark excavation. The place, however, was not entirely deprived of daylight. A few rays straggled through the opening of a deserted shaft. It was by means of this pipe that ventilation was established in the Dochart pit. Owing to its lesser density, the warm air was drawn towards the Yarrow shaft. Both air and light, therefore, penetrated in some measure into the glade.

Here Simon Ford had lived with his family ten years, in a subterranean dwelling, hollowed out in the schistous mass, where formerly stood the powerful engines which worked the mechanical traction of the Dochart pit.

Such was the habitation, "his cottage," as he called it, in which resided the old overman. As he had some means saved during a long life of toil, Ford could have afforded to live in the light of day, among trees, or in any town of the kingdom he chose, but he and his wife and son preferred remaining in the mine, where they were happy together, having the same opinions, ideas, and tastes. Yes, they were quite fond of their cottage, buried fifteen hundred feet below Scottish soil. Among other advantages, there was no fear that tax gatherers, or rent collectors would ever come to trouble its inhabitants.

At this period, Simon Ford, the former overman of the Dochart pit, bore the weight of sixty-five years well. Tall, robust, well-built, he would have been regarded as one of the most conspicuous men in the district which supplies so many fine fellows to the Highland regiments.

Simon Ford was descended from an old mining family, and his ancestors had worked the very first carboniferous seams opened in Scotland. Without discussing whether or not the Greeks and Romans made use of coal, whether the Chinese worked coal mines before the Christian era, whether the French word for coal (HOUILLE) is really derived from the farrier Houillos, who lived in Belgium in the twelfth century, we may affirm that the beds in Great Britain were the first ever regularly worked. So early as the eleventh century, William the Conqueror divided the produce of the Newcastle bed among his companions-in-arms. At the end of the thirteenth century, a license for the mining of "sea coal" was granted by Henry III. Lastly, towards the end of the same century, mention is made of the Scotch and Welsh beds.

It was about this time that Simon Ford's ancestors penetrated into the bowels of Caledonian earth, and lived there ever after, from father to son. They were but plain miners. They labored like convicts at the work of extracting the precious combustible. It is even believed that the coal miners, like the salt-makers of that period, were actual slaves.

However that might have been, Simon Ford was proud of belonging to this ancient family of Scotch miners. He had worked diligently in the same place where his ancestors had wielded the pick, the crowbar, and the mattock. At thirty he was overman of the Dochart pit, the most important in the Aberfoyle colliery. He was devoted to his trade. During long years he zealously performed his duty. His only grief had been to perceive the bed becoming impoverished, and to see the hour approaching when the seam would be exhausted.

It was then he devoted himself to the search for new veins in all the Aberfoyle pits, which communicated
underground one with another. He had had the good luck to discover several during the last period of the working. His miner's instinct assisted him marvelously, and the engineer, James Starr, appreciated him highly. It might be said that he divined the course of seams in the depths of the coal mine as a hydroscope reveals springs in the bowels of the earth. He was par excellence the type of a miner whose whole existence is indissolubly connected with that of his mine. He had lived there from his birth, and now that the works were abandoned he wished to live there still. His son Harry foraged for the subterranean housekeeping; as for himself, during those ten years he had not been ten times above ground.

"Go up there! What is the good?" he would say, and refused to leave his black domain. The place was remarkably healthy, subject to an equable temperature; the old overman endured neither the heat of summer nor the cold of winter. His family enjoyed good health; what more could he desire?

But at heart he felt depressed. He missed the former animation, movement, and life in the well-worked pit. He was, however, supported by one fixed idea. "No, no! the mine is not exhausted!" he repeated.

And that man would have given serious offense who could have ventured to express before Simon Ford any doubt that old Aberfoyle would one day revive! He had never given up the hope of discovering some new bed which would restore the mine to its past splendor. Yes, he would willingly, had it been necessary, have resumed the miner's pick, and with his still stout arms vigorously attacked the rock. He went through the dark galleries, sometimes alone, sometimes with his son, examining, searching for signs of coal, only to return each day, wearied, but not in despair, to the cottage.

Madge, Simon's faithful companion, his "gude-wife," to use the Scotch term, was a tall, strong, comely woman. Madge had no wish to leave the Dochart pit any more than had her husband. She shared all his hopes and regrets. She encouraged him, she urged him on, and talked to him in a way which cheered the heart of the old overman. "Aberfoyle is only asleep," she would say. "You are right about that, Simon. This is but a rest, it is not death!"

Madge, as well as the others, was perfectly satisfied to live independent of the outer world, and was the center of the happiness enjoyed by the little family in their dark cottage.

The engineer was eagerly expected. Simon Ford was standing at his door, and as soon as Harry's lamp announced the arrival of his former viewer he advanced to meet him.

"Welcome, Mr. Starr!" he exclaimed, his voice echoing under the roof of schist. "Welcome to the old overman's cottage! Though it is buried fifteen hundred feet under the earth, our house is not the less hospitable."

"And how are you, good Simon?" asked James Starr, grasping the hand which his host held out to him.

"Very well, Mr. Starr. How could I be otherwise here, sheltered from the inclemencies of the weather? Your ladies who go to Newhaven or Portobello in the summer time would do much better to pass a few months in the coal mine of Aberfoyle! They would run no risk here of catching a heavy cold, as they do in the damp streets of the old capital."

"I'm not the man to contradict you, Simon," answered James Starr, glad to find the old man just as he used to be. "Indeed, I wonder why I do not change my home in the Canongate for a cottage near you."

"And why not, Mr. Starr? I know one of your old miners who would be truly pleased to have only a partition wall between you and him."

"And how is Madge?" asked the engineer.

"The goodwife is in better health than I am, if that's possible," replied Ford, "and it will be a pleasure to her to see you at her table. I think she will surpass herself to do you honor."

"We shall see that, Simon, we shall see that!" said the engineer, to whom the announcement of a good breakfast could not be indifferent, after his long walk.

"Are you hungry, Mr. Starr?"

"Ravenously hungry. My journey has given me an appetite. I came through horrible weather."

"Ah, it is raining up there," responded Simon Ford.

"Yes, Simon, and the waters of the Forth are as rough as the sea."

"Well, Mr. Starr, here it never rains. But I needn't describe to you all the advantages, which you know as well as myself. Here we are at the cottage. That is the chief thing, and I again say you are welcome, sir."

Simon Ford, followed by Harry, ushered their guest into the dwelling. James Starr found himself in a large room lighted by numerous lamps, one hanging from the colored beams of the roof.

"The soup is ready, wife," said Ford, "and it mustn't be kept waiting any more than Mr. Starr. He is as hungry as a miner, and he shall see that our boy doesn't let us want for anything in the cottage! By-the-bye, Harry," added the old overman, turning to his son, "Jack Ryan came here to see you."

"I know, father. We met him in the Yarrow shaft."

"He's an honest and a merry fellow," said Ford; "but he seems to be quite happy above ground. He hasn't the true miner's blood in his veins. Sit down, Mr. Starr, and have a good dinner, for we may not sup till late."
As the engineer and his hosts were taking their places:

"One moment, Simon," said James Starr. "Do you want me to eat with a good appetite?"

"It will be doing us all possible honor, Mr. Starr," answered Ford.

"Well, in order to eat heartily, I must not be at all anxious. Now I have two questions to put to you."

"Go on, sir."

"Your letter told me of a communication which was to be of an interesting nature."

"It is very interesting indeed."

"To you?"

"To you and to me, Mr. Starr. But I do not want to tell it you until after dinner, and on the very spot itself. Without that you would not believe me."

"Simon," resumed the engineer, "look me straight in the face. An interesting communication? Yes. Good! I will not ask more," he added, as if he had read the reply in the old overman's eyes.

"And the second question?" asked the latter.

"Do you know, Simon, who the person is who can have written this?" answered the engineer, handing him the anonymous letter.

Ford took the letter and read it attentively. Then giving it to his son, "Do you know the writing?" he asked.

"No, father," replied Harry.

"And had this letter the Aberfoyle postmark?" inquired Simon Ford.

"Yes, like yours," replied James Starr.

"What do you think of that, Harry?" said his father, his brow darkening.

"I think, father," returned Harry, "that someone has had some interest in trying to prevent Mr. Starr from coming to the place where you invited him."

"But who," exclaimed the old miner, "who could have possibly guessed enough of my secret?" And Simon fell into a reverie, from which he was aroused by his wife.

"Let us begin, Mr. Starr," she said. "The soup is already getting cold. Don't think any more of that letter just now."

On the old woman's invitation, each drew in his chair, James Starr opposite to Madge--to do him honor--the father and son opposite to each other. It was a good Scotch dinner. First they ate "hotchpotch," soup with the meat swimming in capital broth. As old Simon said, his wife knew no rival in the art of preparing hotchpotch. It was the same with the "cockyleeky," a cock stewed with leeks, which merited high praise. The whole was washed down with excellent ale, obtained from the best brewery in Edinburgh.

But the principal dish consisted of a "haggis," the national pudding, made of meat and barley meal. This remarkable dish, which inspired the poet Burns with one of his best odes, shared the fate of all the good things in this world--it passed away like a dream.

Madge received the sincere compliments of her guest. The dinner ended with cheese and oatcake, accompanied by a few small glasses of "usquebaugh," capital whisky, five and twenty years old--just Harry's age. The repast lasted a good hour. James Starr and Simon Ford had not only eaten much, but talked much too, chiefly of their past life in the old Aberfoyle mine.

Harry had been rather silent. Twice he had left the table, and even the house. He evidently felt uneasy since the incident of the stone, and wished to examine the environs of the cottage. The anonymous letter had not contributed to reassure him.

Whilst he was absent, the engineer observed to Ford and his wife, "That's a fine lad you have there, my friends."

"Yes, Mr. Starr, he is a good and affectionate son," replied the old overman earnestly.

"Is he happy with you in the cottage?"

"He would not wish to leave us."

"Don't you think of finding him a wife, some day?"

"A wife for Harry," exclaimed Ford. "And who would it be? A girl from up yonder, who would love merry-makings and dancing, who would prefer her clan to our mine! Harry wouldn't do it!"

"Simon," said Madge, "you would not forbid that Harry should take a wife."

"I would forbid nothing," returned the old miner, "but there's no hurry about that. Who knows but we may find one for him."

Harry re-entered at that moment, and Simon Ford was silent.

When Madge rose from the table, all followed her example, and seated themselves at the door of the cottage.

"Well, Simon," said the engineer, "I am ready to hear you."

"Mr. Starr," responded Ford, "I do not need your ears, but your legs. Are you quite rested?"

"Quite rested and quite refreshed, Simon. I am ready to go with you wherever you like."
"Harry," said Simon Ford, turning to his son, "light our safety lamps."
"Are you going to take safety lamps!" exclaimed James Starr, in amazement, knowing that there was no fear of
explosions of fire-damp in a pit quite empty of coal.
"Yes, Mr. Starr, it will be prudent."
"My good Simon, won't you propose next to put me in a miner's dress?"
"Not just yet, sir, not just yet!" returned the old overman, his deep-set eyes gleaming strangely.
Harry soon reappeared, carrying three safety lamps. He handed one of these to the engineer, the other to his
father, and kept the third hanging from his left hand, whilst his right was armed with a long stick.
"Forward!" said Simon Ford, taking up a strong pick, which was leaning against the wall of the cottage.
"Forward!" echoed the engineer. "Good-by, Madge."
"GOD speed you!" responded the good woman.
"A good supper, wife, do you hear?" exclaimed Ford. "We shall be hungry when we come back, and will do it
justice!"

CHAPTER V. SOME STRANGE PHENOMENA

Many superstitious beliefs exist both in the Highlands and Lowlands of Scotland. Of course the mining
population must furnish its contingent of legends and fables to this mythological repertory. If the fields are peopled
with imaginary beings, either good or bad, with much more reason must the dark mines be haunted to their lowest
depths. Who shakes the seam during tempestuous nights? who puts the miners on the track of an as yet unworked
vein? who lights the fire-damp, and presides over the terrible explosions? who but some spirit of the mine? This, at
least, was the opinion commonly spread among the superstitious Scotch.

In the first rank of the believers in the supernatural in the Dochart pit figured Jack Ryan, Harry's friend. He was
the great partisan of all these superstitions. All these wild stories were turned by him into songs, which earned him
great applause in the winter evenings.

But Jack Ryan was not alone in his belief. His comrades affirmed, no less strongly, that the Aberfoyle pits were
haunted, and that certain strange beings were seen there frequently, just as in the Highlands. To hear them talk, it
would have been more extraordinary if nothing of the kind appeared. Could there indeed be a better place than a
dark and deep coal mine for the freaks of fairies, elves, goblins, and other actors in the fantastical dramas? The
scenery was all ready, why should not the supernatural personages come there to play their parts?

So reasoned Jack Ryan and his comrades in the Aberfoyle mines. We have said that the different pits
communicated with each other by means of long subterranean galleries. Thus there existed beneath the county of
Stirling a vast tract, full of burrows, tunnels, bored with caves, and perforated with shafts, a subterranean labyrinth,
which might be compared to an enormous ant-hill.

Miners, though belonging to different pits, often met, when going to or returning from their work. Consequently
there was a constant opportunity of exchanging talk, and circulating the stories which had their origin in the mine,
from one pit to another. These accounts were transmitted with marvelous rapidity, passing from mouth to mouth,
and gaining in wonder as they went.

Two men, however, better educated and with more practical minds than the rest, had always resisted this
temptation. They in no degree believed in the intervention of spirits, elves, or goblins. These two were Simon Ford
and his son. And they proved it by continuing to inhabit the dismal crypt, after the desertion of the Dochart pit.
Perhaps good Madge, like every Highland woman, had some leaning towards the supernatural. But she had to repeat
all these stories to herself, and so she did, most conscientiously, so as not to let the old traditions be lost.

Even had Simon and Harry Ford been as credulous as their companions, they would not have abandoned the
mine to the imps and fairies. For ten years, without missing a single day, obstinate and immovable in their
convictions, the father and son took their picks, their sticks, and their lamps. They went about searching, sounding
the rock with a sharp blow, listening if it would return a favorable sound. So long as the soundings had not been
pushed to the granite of the primary formation, the Fords were agreed that the search, unsuccessful to-day, might
succeed to-morrow, and that it ought to be resumed. They spent their whole life in endeavoring to bring Aberfoyle
back to its former prosperity. If the father died before the hour of success, the son was to go on with the task alone.

It was during these excursions that Harry was more particularly struck by certain phenomena, which he vainly
sought to explain. Several times, while walking along some narrow cross-alley, he seemed to hear sounds similar to
those which would be produced by violent blows of a pickax against the wall.

Harry hastened to seek the cause of this mysterious work. The tunnel was empty. The light from the young
miner's lamp, thrown on the wall, revealed no trace of any recent work with pick or crowbar. Harry would then ask
himself if it was not the effect of some acoustic illusion, or some strange and fantastic echo. At other times, on
suddenly throwing a bright light into a suspicious-looking cleft in the rock, he thought he saw a shadow. He rushed forward. Nothing, and there was no opening to permit a human being to evade his pursuit!

Twice in one month, Harry, whilst visiting the west end of the pit, distinctly heard distant reports, as if some miner had exploded a charge of dynamite. The second time, after many careful researches, he found that a pillar had just been blown up.

By the light of his lamp, Harry carefully examined the place attacked by the explosion. It had not been made in a simple embankment of stones, but in a mass of schist, which had penetrated to this depth in the coal stratum. Had the object of the explosion been to discover a new vein? Or had someone wished simply to destroy this portion of the mine? Thus he questioned, and when he made known this occurrence to his father, neither could the old overman nor he himself answer the question in a satisfactory way.

"It is very queer," Harry often repeated. "The presence of an unknown being in the mine seems impossible, and yet there can be no doubt about it. Does someone besides ourselves wish to find out if a seam yet exists? Or, rather, has he attempted to destroy what remains of the Aberfoyle mines? But for what reason? I will find that out, if it should cost me my life!"

A fortnight before the day on which Harry Ford guided the engineer through the labyrinth of the Dochart pit, he had been on the point of attaining the object of his search. He was going over the southwest end of the mine, with a large lantern in his hand. All at once, it seemed to him that a light was suddenly extinguished, some hundred feet before him, at the end of a narrow passage cut obliquely through the rock. He darted forward.

His search was in vain. As Harry would not admit a supernatural explanation for a physical occurrence, he concluded that certainly some strange being prowled about in the pit. But whatever he could do, searching with the greatest care, scrutinizing every crevice in the gallery, he found nothing for his trouble.

If Jack Ryan and the other superstitious fellows in the mine had seen these lights, they would, without fail, have called them supernatural, but Harry did not dream of doing so, nor did his father. And when they talked over these phenomena, evidently due to a physical cause, "My lad," the old man would say, "we must wait. It will all be explained some day."

However, it must be observed that, hitherto, neither Harry nor his father had ever been exposed to any act of violence. If the stone which had fallen at the feet of James Starr had been thrown by the hand of some ill-disposed person, it was the first criminal act of that description.

James Starr was of opinion that the stone had become detached from the roof of the gallery; but Harry would not admit of such a simple explanation. According to him, the stone had not fallen, it had been thrown; for otherwise, without rebounding, it could never have described a trajectory as it did.

Harry saw in it a direct attempt against himself and his father, or even against the engineer.

CHAPTER VI. SIMON FORD'S EXPERIMENT

THE old clock in the cottage struck one as James Starr and his two companions went out. A dim light penetrated through the ventilating shaft into the glade. Harry's lamp was not necessary here, but it would very soon be of use, for the old overman was about to conduct the engineer to the very end of the Dochart pit.

After following the principal gallery for a distance of two miles, the three explorers--for, as will be seen, this was a regular exploration--arrived at the entrance of a narrow tunnel. It was like a nave, the roof of which rested on woodwork, covered with white moss. It followed very nearly the line traced by the course of the river Forth, fifteen hundred feet above.

"So we are going to the end of the last vein?" said James Starr.

"Ay! You know the mine well still."

"Well, Simon," returned the engineer, "it will be difficult to go further than that, if I don't mistake."

"Yes, indeed, Mr. Starr. That was where our picks tore out the last bit of coal in the seam. I remember it as if it were yesterday. I myself gave that last blow, and it re-echoed in my heart more dismally than on the rock. Only sandstone and schist were round us after that, and when the truck rolled towards the shaft, I followed, with my heart as full as though it were a funeral. It seemed to me that the soul of the mine was going with it."

The gravity with which the old man uttered these words impressed the engineer, who was not far from sharing his sentiments. They were those of the sailor who leaves his disabled vessel--of the proprietor who sees the house of his ancestors pulled down. He pressed Ford's hand; but now the latter seized that of the engineer, and, wringing it:

"That day we were all of us mistaken," he exclaimed. "No! The old mine was not dead. It was not a corpse that the miners abandoned; and I dare to assert, Mr. Starr, that its heart beats still."

"Speak, Ford! Have you discovered a new vein?" cried the engineer, unable to contain himself. "I know you have! Your letter could mean nothing else."
"Mr. Starr," said Simon Ford, "I did not wish to tell any man but yourself."

"And you did quite right, Ford. But tell me how, by what signs, are you sure?"

"Listen, sir!" resumed Simon. "It is not a seam that I have found."

"What is it, then?"

"Only positive proof that such a seam exists."

"And the proof?"

"Could fire-damp issue from the bowels of the earth if coal was not there to produce it?"

"No, certainly not!" replied the engineer. "No coal, no fire-damp. No effects without a cause."

"Just as no smoke without fire."

"And have you recognized the presence of light carburetted hydrogen?"

"An old miner could not be deceived," answered Ford. "I have met with our old enemy, the fire-damp!"

"But suppose it was another gas," said Starr. "Firedamp is almost without smell, and colorless. It only really betrays its presence by an explosion."

"Mr. Starr," said Simon Ford, "will you let me tell you what I have done? Harry had once or twice observed something remarkable in his excursions to the west end of the mine. Fire, which suddenly went out, sometimes appeared along the face of the rock or on the embankment of the further galleries. How those flames were lighted, I could not and cannot say. But they were evidently owing to the presence of fire-damp, and to me fire-damp means a vein of coal."

"Did not these fires cause any explosion?" asked the engineer quickly.

"Yes, little partial explosions," replied Ford, "such as I used to cause myself when I wished to ascertain the presence of fire-damp. Do you remember how formerly it was the custom to try to prevent explosions before our good genius, Humphry Davy, invented his safety-lamp?"

"Yes," replied James Starr. "You mean what the 'monk,' as the men called him, used to do. But I have never seen him in the exercise of his duty."

"Indeed, Mr. Starr, you are too young, in spite of your five-and-fifty years, to have seen that. But I, ten years older, often saw the last 'monk' working in the mine. He was called so because he wore a long robe like a monk. His proper name was the 'fireman.' At that time there was no other means of destroying the bad gas but by dispersing it in little explosions, before its buoyancy had collected it in too great quantities in the heights of the galleries. The monk, as we called him, with his face masked, his head muffled up, all his body tightly wrapped in a thick felt cloak, crawled along the ground. He could breathe down there, when the air was pure; and with his right hand he waved above his head a blazing torch. When the firedamp had accumulated in the air, so as to form a detonating mixture, the explosion occurred without being fatal, and, by often renewing this operation, catastrophes were prevented. Sometimes the 'monk' was injured or killed in his work, then another took his place. This was done in all mines until the Davy lamp was universally adopted. But I knew the plan, and by its means I discovered the presence of firedamp and consequently that of a new seam of coal in the Dochart pit."

All that the old overman had related of the so-called "monk" or "fireman" was perfectly true. The air in the galleries of mines was formerly always purified in the way described.

Fire-damp, marsh-gas, or carburetted hydrogen, is colorless, almost scentless; it burns with a blue flame, and makes respiration impossible. The miner could not live in a place filled with this injurious gas, any more than one could live in a gasometer full of common gas. Moreover, fire-damp, as well as the latter, a mixture of inflammable gases, forms a detonating mixture as soon as the air unites with it in a proportion of eight, and perhaps even five to the hundred. When this mixture is lighted by any cause, there is an explosion, almost always followed by a frightful catastrophe.

As they walked on, Simon Ford told the engineer all that he had done to attain his object; how he was sure that the escape of fire-damp took place at the very end of the farthest gallery in its western part, because he had provoked small and partial explosions, or rather little flames, enough to show the nature of the gas, which escaped in a small jet, but with a continuous flow.

An hour after leaving the cottage, James Starr and his two companions had gone a distance of four miles. The engineer, urged by anxiety and hope, walked on without noticing the length of the way. He pondered over all that the old miner had told him, and mentally weighed all the arguments which the latter had given in support of his belief. He agreed with him in thinking that the continued emission of carburetted hydrogen certainly showed the existence of a new coal-seam. If it had been merely a sort of pocket, full of gas, as it is sometimes found amongst the rock, it would soon have been empty, and the phenomenon have ceased. But far from that. According to Simon Ford, the fire-damp escaped incessantly, and from that fact the existence of an important vein might be considered certain. Consequently, the riches of the Dochart pit were not entirely exhausted. The chief question now was, whether this was merely a vein which would yield comparatively little, or a bed occupying a large extent.
Harry, who preceded his father and the engineer, stopped.

"Here we are!" exclaimed the old miner. "At last, thank Heaven! you are here, Mr. Starr, and we shall soon know." The old overman's voice trembled slightly.

"Be calm, my man!" said the engineer. "I am as excited as you are, but we must not lose time."

The gallery at this end of the pit widened into a sort of dark cave. No shaft had been pierced in this part, and the gallery, bored into the bowels of the earth, had no direct communication with the surface of the earth.

James Starr, with intense interest, examined the place in which they were standing. On the walls of the cavern the marks of the pick could still be seen, and even holes in which the rock had been blasted, near the termination of the working. The schist was excessively hard, and it had not been necessary to bank up the end of the tunnel where the works had come to an end. There the vein had failed, between the schist and the tertiary sandstone. From this very place had been extracted the last piece of coal from the Dochart pit.

"We must attack the dyke," said Ford, raising his pick; "for at the other side of the break, at more or less depth, we shall assuredly find the vein, the existence of which I assert."

"And was it on the surface of these rocks that you found out the fire-damp?" asked James Starr.

"Just there, sir," returned Ford, "and I was able to light it only by bringing my lamp near to the cracks in the rock. Harry has done it as well as I."

"At what height?" asked Starr.

"Ten feet from the ground," replied Harry.

James Starr had seated himself on a rock. After critically inhaling the air of the cavern, he gazed at the two miners, almost as if doubting their words, decided as they were. In fact, carburetted hydrogen is not completely scentless, and the engineer, whose sense of smell was very keen, was astonished that it had not revealed the presence of the explosive gas. At any rate, if the gas had mingled at all with the surrounding air, it could only be in a very small stream. There was no danger of an explosion, and they might without fear open the safety lamp to try the experiment, just as the old miner had done before.

What troubled James Starr was, not lest too much gas mingled with the air, but lest there should be little or none. "Could they have been mistaken?" he murmured. "No: these men know what they are about. And yet--"

He waited, not without some anxiety, until Simon Ford's phenomenon should have taken place. But just then it seemed that Harry, like himself, had remarked the absence of the characteristic odor of fire-damp; for he exclaimed in an altered voice, "Father, I should say the gas was no longer escaping through the cracks!"

"No longer!" cried the old miner--and, pressing his lips tight together, he snuffed the air several times. Then, all at once, with a sudden movement, "Hand me your lamp, Harry," he said.

Ford took the lamp with a trembling hand. He drew off the wire gauze case which surrounded the wick, and the flame burned in the open air.

As they had expected, there was no explosion, but, what was more serious, there was not even the slight crackling which indicates the presence of a small quantity of firedamp. Simon took the stick which Harry was holding, fixed his lamp to the end of it, and raised it high above his head, up to where the gas, by reason of its buoyancy, would naturally accumulate. The flame of the lamp, burning straight and clear, revealed no trace of the carburetted hydrogen.

"Close to the wall," said the engineer.

"Yes," responded Ford, carrying the lamp to that part of the wall at which he and his son had, the evening before, proved the escape of gas.

The old miner's arm trembled whilst he tried to hoist the lamp up. "Take my place, Harry," said he.

Harry took the stick, and successively presented the lamp to the different fissures in the rock; but he shook his head, for of that slight crackling peculiar to escaping fire-damp he heard nothing. There was no flame. Evidently not a particle of gas was escaping through the rock.

"Nothing!" cried Ford, clenching his fist with a gesture rather of anger than disappointment.

A cry escaped Harry.

"What's the matter?" asked Starr quickly.

"Someone has stopped up the cracks in the schist!"

"Is that true?" exclaimed the old miner.

"Look, father!" Harry was not mistaken. The obstruction of the fissures was clearly visible by the light of the lamp. It had been recently done with lime, leaving on the rock a long whitish mark, badly concealed with coal dust.

"It's he!" exclaimed Harry. "It can only be he!"

"He?" repeated James Starr in amazement.

"Yes!" returned the young man, "that mysterious being who haunts our domain, for whom I have watched a hundred times without being able to get at him--the author, we may now be certain, of that letter which was intended
CHAPTER VII. NEW ABERFOYLE

THE old overman's experiment had succeeded. Firedamp, it is well known, is only generated in coal seams; therefore the existence of a vein of precious combustible could no longer be doubted. As to its size and quality, that must be determined later.

"Yes," thought James Starr, "behind that wall lies a carboniferous bed, undiscovered by our soundings. It is vexatious that all the apparatus of the mine, deserted for ten years, must be set up anew. Never mind. We have found the vein which was thought to be exhausted, and this time it shall be worked to the end!"

"Well, Mr. Starr," asked Ford, "what do you think of our discovery? Was I wrong to trouble you? Are you sorry to have paid this visit to the Dochart pit?"

"No, no, my old friend!" answered Starr. "We have not lost our time; but we shall be losing it now, if we do not return immediately to the cottage. To-morrow we will come back here. We will blast this wall with dynamite. We will lay open the new vein, and after a series of soundings, if the seam appears to be large, I will form a new Aberfoyle Company, to the great satisfaction of the old shareholders. Before three months have passed, the first corves full of coal will have been taken from the new vein."

"Well said, sir!" cried Simon Ford. "The old mine will grow young again, like a widow who remarries! The bustle of the old days will soon begin with the blows of the pick, and mattock, blasts of powder, rumbling of wagons, neighing of horses, creaking of machines! I shall see it all again! I hope, Mr. Starr, that you will not think me too old to resume my duties of overman?"

"No, Simon, no indeed! You wear better than I do, my old friend!"

"And, sir, you shall be our viewer again. May the new working last for many years, and pray Heaven I shall have the consolation of dying without seeing the end of it!"

The old miner was overflowing with joy. James Starr fully entered into it; but he let Ford rave for them both. Harry alone remained thoughtful. To his memory recurred the succession of singular, inexplicable circumstances attending the discovery of the new bed. It made him uneasy about the future.

An hour afterwards, James Starr and his two companions were back in the cottage. The engineer supped with good appetite, listening with satisfaction to all the plans unfolded by the old overman; and had it not been for his excitement about the next day's work, he would never have slept better than in the perfect stillness of the cottage.

The following day, after a substantial breakfast, James Starr, Simon Ford, Harry, and even Madge herself, took the road already traversed the day before. All looked like regular miners. They carried different tools, and some dynamite with which to blast the rock. Harry, besides a large lantern, took a safety lamp, which would burn for twelve hours. It was more than was necessary for the journey there and back, including the time for the working--supposing a working was possible.

"To work! to work!" shouted Ford, when the party reached the further end of the passage; and he grasped a heavy crowbar and brandished it.

"Stop one instant," said Starr. "Let us see if any change has taken place, and if the fire-damp still escapes through the crevices."

"You are right, Mr. Starr," said Harry. "Whoever stopped it up yesterday may have done it again to-day!"

Madge, seated on a rock, carefully observed the excavation, and the wall which was to be blasted.

It was found that everything was just as they left it. The crevices had undergone no alteration; the carburetted hydrogen still filtered through, though in a small stream, which was no doubt because it had had a free passage since
the day before. As the quantity was so small, it could not have formed an explosive mixture with the air inside. James Starr and his companions could therefore proceed in security. Besides, the air grew purer by rising to the heights of the Dochart pit; and the fire-damp, spreading through the atmosphere, would not be strong enough to make any explosion.

"To work, then!" repeated Ford; and soon the rock flew in splinters under his skilful blows. The break was chiefly composed of pudding-stone, interspersed with sandstone and schist, such as is most often met with between the coal veins. James Starr picked up some of the pieces, and examined them carefully, hoping to discover some trace of coal.

Starr having chosen the place where the holes were to be drilled, they were rapidly bored by Harry. Some cartridges of dynamite were put into them. As soon as the long, tarred safety match was laid, it was lighted on a level with the ground. James Starr and his companions then went off to some distance.

"Oh! Mr. Starr," said Simon Ford, a prey to agitation, which he did not attempt to conceal, "never, no, never has my old heart beaten so quick before! I am longing to get at the vein!"

"Patience, Simon!" responded the engineer. "You don't mean to say that you think you are going to find a passage all ready open behind that dyke?"

"Excuse me, sir," answered the old overman; "but of course I think so! If there was good luck in the way Harry and I discovered this place, why shouldn't the good luck go on?"

As he spoke, came the explosion. A sound as of thunder rolled through the labyrinth of subterranean galleries. Starr, Madge, Harry, and Simon Ford hastened towards the spot.

"Mr. Starr! Mr. Starr!" shouted the overman. "Look! the door is broken open!"

Ford's comparison was justified by the appearance of an excavation, the depth of which could not be calculated. Harry was about to spring through the opening; but the engineer, though excessively surprised to find this cavity, held him back. "Allow time for the air in there to get pure," said he.

"Yes! beware of the foul air!" said Simon.

A quarter of an hour was passed in anxious waiting. The lantern was then fastened to the end of a stick, and introduced into the cave, where it continued to burn with unaltered brilliancy. "Now then, Harry, go," said Starr, "and we will follow you."

The opening made by the dynamite was sufficiently large to allow a man to pass through. Harry, lamp in hand, entered unhesitatingly, and disappeared in the darkness. His father, mother, and James Starr waited in silence. A minute--which seemed to them much longer--passed. Harry did not reappear, did not call. Gazing into the opening, James Starr could not even see the light of his lamp, which ought to have illuminated the dark cavern.

Had the ground suddenly given way under Harry's feet? Had the young miner fallen into some crevice? Could his voice no longer reach his companions?

The old overman, dead to their remonstrances, was about to enter the opening, when a light appeared, dim at first, but gradually growing brighter, and Harry's voice was heard shouting, "Come, Mr. Starr! come, father! The road to New Aberfoyle is open!"

If, by some superhuman power, engineers could have raised in a block, a thousand feet thick, all that portion of the terrestrial crust which supports the lakes, rivers, gulfs, and territories of the counties of Stirling, Dumbarton, and Renfrew, they would have found, under that enormous lid, an immense excavation, to which but one other in the world can be compared--the celebrated Mammoth caves of Kentucky. This excavation was composed of several hundred divisions of all sizes and shapes. It might be called a hive with numberless ranges of cells, capriciously arranged, but a hive on a vast scale, and which, instead of bees, might have lodged all the ichthyosauri, megatheriums, and pterodactyles of the geological epoch.

A labyrinth of galleries, some higher than the most lofty cathedrals, others like cloisters, narrow and winding--these following a horizontal line, those on an incline or running obliquely in all directions--connected the caverns and allowed free communication between them.

The pillars sustaining the vaulted roofs, whose curves allowed of every style, the massive walls between the passages, the naves themselves in this layer of secondary formation, were composed of sandstone and schistous rocks. But tightly packed between these useless strata ran valuable veins of coal, as if the black blood of this strange mine had circulated through their tangled network. These fields extended forty miles north and south, and stretched even under the Caledonian Canal. The importance of this bed could not be calculated until after soundings, but it would certainly surpass those of Cardiff and Newcastle.

We may add that the working of this mine would be singularly facilitated by the fantastic dispositions of the secondary earths; for by an unaccountable retreat of the mineral matter at the geological epoch, when the mass was solidifying, nature had already multiplied the galleries and tunnels of New Aberfoyle.

Yes, nature alone! It might at first have been supposed that some works abandoned for centuries had been
discovered afresh. Nothing of the sort. No one would have deserted such riches. Human termites had never gnawed away this part of the Scottish subsoil; nature herself had done it all. But, we repeat, it could be compared to nothing but the celebrated Mammoth caves, which, in an extent of more than twenty miles, contain two hundred and twenty-six avenues, eleven lakes, seven rivers, eight cataracts, thirty-two unfathomable wells, and fifty-seven domes, some of which are more than four hundred and fifty feet in height. Like these caves, New Aberfoyle was not the work of men, but the work of the Creator.

Such was this new domain, of matchless wealth, the discovery of which belonged entirely to the old overman. Ten years' sojourn in the deserted mine, an uncommon pertinacity in research, perfect faith, sustained by a marvelous mining instinct—all these qualities together led him to succeed where so many others had failed. Why had the soundings made under the direction of James Starr during the last years of the working stopped just at that limit, on the very frontier of the new mine? That was all chance, which takes great part in researches of this kind.

However that might be, there was, under the Scottish subsoil, what might be called a subterranean county, which, to be habitable, needed only the rays of the sun, or, for want of that, the light of a special planet.

Water had collected in various hollows, forming vast ponds, or rather lakes larger than Loch Katrine, lying just above them. Of course the waters of these lakes had no movement of currents or tides; no old castle was reflected there; no birch or oak trees waved on their banks. And yet these deep lakes, whose mirror-like surface was never ruffled by a breeze, would not be without charm by the light of some electric star, and, connected by a string of canals, would well complete the geography of this strange domain.

Although unfit for any vegetable production, the place could be inhabited by a whole population. And who knows but that in this steady temperature, in the depths of the mines of Aberfoyle, as well as in those of Newcastle, Alloa, or Cardiff—when their contents shall have been exhausted—who knows but that the poorer classes of Great Britain will some day find a refuge?

CHAPTER VIII. EXPLORING

AT Harry's call, James Starr, Madge, and Simon Ford entered through the narrow orifice which put the Dochart pit in communication with the new mine. They found themselves at the beginning of a tolerably wide gallery. One might well believe that it had been pierced by the hand of man, that the pick and mattock had emptied it in the working of a new vein. The explorers question whether, by a strange chance, they had not been transported into some ancient mine, of the existence of which even the oldest miners in the county had ever known.

No! It was merely that the geological layers had left this passage when the secondary earths were in course of formation. Perhaps some torrent had formerly dashed through it; but now it was as dry as if it had been cut some thousand feet lower, through granite rocks. At the same time, the air circulated freely, which showed that certain natural vents placed it in communication with the exterior atmosphere.

This observation, made by the engineer, was correct, and it was evident that the ventilation of the new mine would be easily managed. As to the fire-damp which had lately filtered through the schist, it seemed to have been contained in a pocket now empty, and it was certain that the atmosphere of the gallery was quite free from it. However, Harry prudently carried only the safety lamp, which would insure light for twelve hours.

James Starr and his companions now felt perfectly happy. All their wishes were satisfied. There was nothing but coal around them. A sort of emotion kept them silent; even Simon Ford restrained himself. His joy overflowed, not in long phrases, but in short ejaculations.

It was perhaps imprudent to venture so far into the crypt. Pooh! they never thought of how they were to get back. The gallery was practicable, not very winding. They met with no noxious exhalations, nor did any chasm bar the path. There was no reason for stopping for a whole hour; James Starr, Madge, Harry, and Simon Ford walked on, though there was nothing to show them what was the exact direction of this unknown tunnel.

And they would no doubt have gone farther still, if they had not suddenly come to the end of the wide road which they had followed since their entrance into the mine.

The gallery ended in an enormous cavern, neither the height nor depth of which could be calculated. At what altitude arched the roof of this excavation—at what distance was its opposite wall—the darkness totally concealed; but by the light of the lamp the explorers could discover that its dome covered a vast extent of still water—pond or lake—whose picturesque rocky banks were lost in obscurity.

"Halt!" exclaimed Ford, stopping suddenly. "Another step, and perhaps we shall fall into some fathomless pit."

"Let us rest awhile, then, my friends," returned the engineer. "Besides, we ought to be thinking of returning to the cottage."

"Our lamp will give light for another ten hours, sir," said Harry.

"Well, let us make a halt," replied Starr; "I confess my legs have need of a rest. And you, Madge, don't you feel
tired after so long a walk?"

"Not over much, Mr. Starr," replied the sturdy Scotchwoman; "we have been accustomed to explore the old Aberfoyle mine for whole days together."

"Tired? nonsense!" interrupted Simon Ford; "Madge could go ten times as far, if necessary. But once more, Mr. Starr, wasn't my communication worth your trouble in coming to hear it? Just dare to say no, Mr. Starr, dare to say no!"

"Well, my old friend, I haven't felt so happy for a long while!" replied the engineer; "the small part of this marvelous mine that we have explored seems to show that its extent is very considerable, at least in length."

"In width and in depth, too, Mr. Starr!" returned Simon Ford.

"That we shall know later."

"And I can answer for it! Trust to the instinct of an old miner! It has never deceived me!"

"I wish to believe you, Simon," replied the engineer, smiling. "As far as I can judge from this short exploration, we possess the elements of a working which will last for centuries!"

"Centuries!" exclaimed Simon Ford; "I believe you, sir! A thousand years and more will pass before the last bit of coal is taken out of our new mine!"

"Heaven grant it!" returned Starr. "As to the quality of the coal which crops out of these walls?"

"Superb! Mr. Starr, superb!" answered Ford; "just look at it yourself!"

And so saying, with his pick he struck off a fragment of the black rock.

"Look! look!" he repeated, holding it close to his lamp; "the surface of this piece of coal is shining! We have here fat coal, rich in bituminous matter; and see how it comes in pieces, almost without dust! Ah, Mr. Starr! twenty years ago this seam would have entered into a strong competition with Swansea and Cardiff! Well, stokers will quarrel for it still, and if it costs little to extract it from the mine, it will not sell at a less price outside."

"Indeed," said Madge, who had taken the fragment of coal and was examining it with the air of a connoisseur; "that's good quality of coal. Carry it home, Simon, carry it back to the cottage! I want this first piece of coal to burn under our kettle."

"Well said, wife!" answered the old overman, "and you shall see that I am not mistaken."

"Mr. Starr," asked Harry, "have you any idea of the probable direction of this long passage which we have been following since our entrance into the new mine?"

"No, my lad," replied Harry; "with a compass I could perhaps find out its general bearing; but without a compass I am here like a sailor in open sea, in the midst of fogs, when there is no sun by which to calculate his position."

"No doubt, Mr. Starr," replied Ford; "but pray don't compare our position with that of the sailor, who has everywhere and always an abyss under his feet! We are on firm ground here, and need never be afraid of foundering."

"I won't tease you, then, old Simon," answered James Starr. "Far be it from me even in jest to depreciate the New Aberfoyle mine by an unjust comparison! I only meant to say one thing, and that is that we don't know where we are."

"We are in the subsoil of the county of Stirling, Mr. Starr," replied Simon Ford; "and that I assert as if--"

"Listen!" said Harry, interrupting the old man. All listened, as the young miner was doing. His ears, which were very sharp, had caught a dull sound, like a distant murmur. His companions were not long in hearing it themselves. It was above their heads, a sort of rolling sound, in which though it was so feeble, the successive CRESCEndo and DIMINUENDO could be distinctly heard.

All four stood for some minutes, their ears on the stretch, without uttering a word. All at once Simon Ford exclaimed, "Well, I declare! Are trucks already running on the rails of New Aberfoyle?"

"Father," replied Harry, "it sounds to me just like the noise made by waves rolling on the sea shore."

"We can't be under the sea though!" cried the old overman.

"No," said the engineer, "but it is not impossible that we should be under Loch Katrine."

"The roof cannot have much thickness just here, if the noise of the water is perceptible."

"Very little indeed," answered James Starr, "and that is the reason this cavern is so huge."

"You must be right, Mr. Starr," said Harry.

"Besides, the weather is so bad outside," resumed Starr, "that the waters of the loch must be as rough as those of the Firth of Forth."

"Well! what does it matter after all?" returned Simon Ford; "the seam won't be any the worse because it is under a loch. It would not be the first time that coal has been looked for under the very bed of the ocean! When we have to work under the bottom of the Caledonian Canal, where will be the harm?"

"Well said, Simon," cried the engineer, who could not restrain a smile at the overman's enthusiasm; "let us cut
our trenches under the waters of the sea! Let us bore the bed of the Atlantic like a strainer; let us with our picks join our brethren of the United States through the subsoil of the ocean! let us dig into the center of the globe if necessary, to tear out the last scrap of coal."

"Are you joking, Mr. Starr?" asked Ford, with a pleased but slightly suspicious look.

"I joking, old man? no! but you are so enthusiastic that you carry me away into the regions of impossibility! Come, let us return to the reality, which is sufficiently beautiful; leave our picks here, where we may find them another day, and let's take the road back to the cottage."

Nothing more could be done for the time. Later, the engineer, accompanied by a brigade of miners, supplied with lamps and all necessary tools, would resume the exploration of New Aberfoyle. It was now time to return to the Dochart pit. The road was easy, the gallery running nearly straight through the rock up to the orifice opened by the dynamite, so there was no fear of their losing themselves.

But as James Starr was proceeding towards the gallery Simon Ford stopped him.

"Mr. Starr," said he, "you see this immense cavern, this subterranean lake, whose waters bathe this strand at our feet? Well! it is to this place I mean to change my dwelling, here I will build a new cottage, and if some brave fellows will follow my example, before a year is over there will be one town more inside old England."

James Starr, smiling approval of Ford's plans, pressed his hand, and all three, preceding Madge, re-entered the gallery, on their way back to the Dochart pit. For the first mile no incident occurred. Harry walked first, holding his lamp above his head. He carefully followed the principal gallery, without ever turning aside into the narrow tunnels which radiated to the right and left. It seemed as if the returning was to be accomplished as easily as the going, when an unexpected accident occurred which rendered the situation of the explorers very serious.

Just at a moment when Harry was raising his lamp there came a rush of air, as if caused by the flapping of invisible wings. The lamp escaped from his hands, fell on the rocky ground, and was broken to pieces.

James Starr and his companions were suddenly plunged in absolute darkness. All the oil of the lamp was spilt, and it was of no further use. "Well, Harry," cried his father, "do you want us all to break our necks on the way back to the cottage?"

Harry did not answer. He wondered if he ought to suspect the hand of a mysterious being in this last accident? Could there possibly exist in these depths an enemy whose unaccountable antagonism would one day create serious difficulties? Had someone an interest in defending the new coal field against any attempt at working it? In truth that seemed absurd, yet the facts spoke for themselves, and they accumulated in such a way as to change simple presumptions into certainties.

In the meantime the explorers' situation was bad enough. They had now, in the midst of black darkness, to follow the passage leading to the Dochart pit for nearly five miles. There they would still have an hour's walk before reaching the cottage.

"Come along," said Simon Ford. "We have no time to lose. We must grope our way along, like blind men. There's no fear of losing our way. The tunnels which open off our road are only just like those in a molehill, and by following the chief gallery we shall of course reach the opening we got in at. After that, it is the old mine. We know that, and it won't be the first time that Harry and I have found ourselves there in the dark. Besides, there we shall find the lamps that we left. Forward then! Harry, go first. Mr. Starr, follow him. Madge, you go next, and I will bring up the rear. Above everything, don't let us get separated."

All complied with the old overman's instructions. As he said, by groping carefully, they could not mistake the way. It was only necessary to make the hands take the place of the eyes, and to trust to their instinct, which had with Simon Ford and his son become a second nature.

James Starr and his companions walked on in the order agreed. They did not speak, but it was not for want of thinking. It became evident that they had an adversary. But what was he, and how were they to defend themselves against these mysteriously-prepared attacks? These disquieting ideas crowded into their brains. However, this was not the moment to get discouraged.

Harry, his arms extended, advanced with a firm step, touching first one and then the other side of the passage. If a cleft or side opening presented itself, he felt with his hand that it was not the main way; either the cleft was too shallow, or the opening too narrow, and he thus kept in the right road.

In darkness through which the eye could not in the slightest degree pierce, this difficult return lasted two hours. By reckoning the time since they started, taking into consideration that the walking had not been rapid, Starr calculated that he and his companions were near the opening. In fact, almost immediately, Harry stopped.

"Have we got to the end of the gallery?" asked Simon Ford.

"Yes," answered the young miner.

"Well! have you not found the hole which connects New Aberfoyle with the Dochart pit?"

"No," replied Harry, whose impatient hands met with nothing but a solid wall.
The old overman stepped forward, and himself felt the schistous rock. A cry escaped him.

Either the explorers had strayed from the right path on their return, or the narrow orifice, broken in the rock by the dynamite, had been recently stopped up. James Starr and his companions were prisoners in New Aberfoyle.

CHAPTER IX. THE FIRE-MAIDENS

A WEEK after the events just related had taken place, James Starr's friends had become very anxious. The engineer had disappeared, and no reason could be brought forward to explain his absence. They learnt, by questioning his servant, that he had embarked at Granton Pier. But from that time there were no traces of James Starr. Simon Ford's letter had requested secrecy, and he had said nothing of his departure for the Aberfoyle mines.

Therefore in Edinburgh nothing was talked of but the unaccountable absence of the engineer. Sir W. Elphiston, the President of the Royal Institution, communicated to his colleagues a letter which James Starr had sent him, excusing himself from being present at the next meeting of the society. Two or three others produced similar letters. But though these documents proved that Starr had left Edinburgh—which was known before—they threw no light on what had become of him. Now, on the part of such a man, this prolonged absence, so contrary to his usual habits, naturally first caused surprise, and then anxiety.

A notice was inserted in the principal newspapers of the United Kingdom relative to the engineer James Starr, giving a description of him and the date on which he left Edinburgh; nothing more could be done but to wait. The time passed in great anxiety. The scientific world of England was inclined to believe that one of its most distinguished members had positively disappeared. At the same time, when so many people were thinking about James Starr, Harry Ford was the subject of no less anxiety. Only, instead of occupying public attention, the son of the old overman was the cause of trouble alone to the generally cheerful mind of Jack Ryan.

It may be remembered that, in their encounter in the Yarrow shaft, Jack Ryan had invited Harry to come a week afterwards to the festivities at Irvine. Harry had accepted and promised expressly to be there. Jack Ryan knew, having had it proved by many circumstances, that his friend was a man of his word. With him, a thing promised was a thing done. Now, at the Irvine merry-making, nothing was wanting; neither song, nor dance, nor fun of any sort—nothing but Harry Ford.

The notice relative to James Starr, published in the papers, had not yet been seen by Ryan. The honest fellow was therefore only worried by Harry's absence, telling himself that something serious could alone have prevented him from keeping his promise. So, the day after the Irvine games, Jack Ryan intended to take the railway from Glasgow and go to the Dochart pit; and this he would have done had he not been detained by an accident which nearly cost him his life. Something which occurred on the night of the 12th of December was of a nature to support the opinions of all partisans of the supernatural, and there were many at Melrose Farm.

Irvine, a little seaport of Renfrew, containing nearly seven thousand inhabitants, lies in a sharp bend made by the Scottish coast, near the mouth of the Firth of Clyde. The most ancient and the most famed ruins on this part of the coast were those of this castle of Robert Stuart, which bore the name of Dundonald Castle.

At this period Dundonald Castle, a refuge for all the stray goblins of the country, was completely deserted. It stood on the top of a high rock, two miles from the town, and was seldom visited. Sometimes a few strangers took it into their heads to explore these old historical remains, but then they always went alone. The inhabitants of Irvine would not have taken them there at any price. Indeed, several legends were based on the story of certain "fire-maidens," who haunted the old castle.

The most superstitious declared they had seen these fantastic creatures with their own eyes. Jack Ryan was naturally one of them. It was a fact that from time to time long flames appeared, sometimes on a broken piece of wall, sometimes on the summit of the tower which was the highest point of Dundonald Castle.

Did these flames really assume a human shape, as was asserted? Did they merit the name of fire-maidens, given them by the people of the coast? It was evidently just an optical delusion, aided by a good deal of credulity, and science could easily have explained the phenomenon.

However that might be, these fire-maidens had the reputation of frequenting the ruins of the old castle and there performing wild strathspeys, especially on dark nights. Jack Ryan, bold fellow though he was, would never have dared to accompany those dances with the music of his bagpipes.

"Old Nick is enough for them!" said he. "He doesn't need me to complete his infernal orchestra."

We may well believe that these strange apparitions frequently furnished a text for the evening stories. Jack Ryan was ending the evening with one of these. His auditors, transported into the phantom world, were worked up into a state of mind which would believe anything.

All at once shouts were heard outside. Jack Ryan stopped short in the middle of his story, and all rushed out of the barn. The night was pitchy dark. Squalls of wind and rain swept along the beach. Two or three fishermen, their
backs against a rock, the better to resist the wind, were shouting at the top of their voices.

Jack Ryan and his companions ran up to them. The shouts were, however, not for the inhabitants of the farm, but to warn men who, without being aware of it, were going to destruction. A dark, confused mass appeared some way out at sea. It was a vessel whose position could be seen by her lights, for she carried a white one on her foremast, a green on the starboard side, and a red on the outside. She was evidently running straight on the rocks.

"A ship in distress?" said Ryan.

"Ay," answered one of the fishermen, "and now they want to tack, but it's too late!"

"Do they want to run ashore?" said another.

"It seems so," responded one of the fishermen, "unless he has been misled by some--"

The man was interrupted by a yell from Jack. Could the crew have heard it? At any rate, it was too late for them to beat back from the line of breakers which gleamed white in the darkness.

But it was not, as might be supposed, a last effort of Ryan's to warn the doomed ship. He now had his back to the sea. His companions turned also, and gazed at a spot situated about half a mile inland. It was Dundonald Castle. A long flame twisted and bent under the gale, on the summit of the old tower.

"The Fire-Maiden!" cried the superstitious men in terror.

Clearly, it needed a good strong imagination to find any human likeness in that flame. Waving in the wind like a luminous flag, it seemed sometimes to fly round the tower, as if it was just going out, and a moment after it was seen again dancing on its blue point.

"The Fire-Maiden! the Fire-Maiden!" cried the terrified fishermen and peasants.

All was then explained. The ship, having lost her reckoning in the fog, had taken this flame on the top of Dundonald Castle for the Irvine light. She thought herself at the entrance of the Firth, ten miles to the north, when she was really running on a shore which offered no refuge.

What could be done to save her, if there was still time? It was too late. A frightful crash was heard above the tumult of the elements. The vessel had struck. The white line of surf was broken for an instant; she heeled over on her side and lay among the rocks.

At the same time, by a strange coincidence, the long flame disappeared, as if it had been swept away by a violent gust. Earth, sea, and sky were plunged in complete darkness.

"The Fire-Maiden!" shouted Ryan, for the last time, as the apparition, which he and his companions believed supernatural, disappeared. But then the courage of these superstitious Scotchmen, which had failed before a fancied danger, returned in face of a real one, which they were ready to brave in order to save their fellow-creatures. The tempest did not deter them. As heroic as they had before been credulous, fastening ropes round their waists, they rushed into the waves to the aid of those on the wreck.

Happily, they succeeded in their endeavors, although some--and bold Jack Ryan was among the number--were severely wounded on the rocks. But the captain of the vessel and the eight sailors who composed his crew were hauled up, safe and sound, on the beach.

The ship was the Norwegian brig MOTALA, laden with timber, and bound for Glasgow. Of the MOTALA herself nothing remained but a few spars, washed up by the waves, and dashed among the rocks on the beach.

Jack Ryan and three of his companions, wounded like himself, were carried into a room of Melrose Farm, where every care was lavished on them. Ryan was the most hurt, for when with the rope round his waist he had rushed into the sea, the waves had almost immediately dashed him back against the rocks. He was brought, indeed, very nearly lifeless on to the beach.

The brave fellow was therefore confined to bed for several days, to his great disgust. However, as soon as he was given permission to sing as much as he liked, he bore his trouble patiently, and the farm echoed all day with his jovial voice. But from this adventure he imbibed a more lively sentiment of fear with regard to brownies and other goblins who amuse themselves by plaguing mankind, and he made them responsible for the catastrophe of the Motala. It would have been vain to try and convince him that the Fire-Maidens did not exist, and that the flame, so suddenly appearing among the ruins, was but a natural phenomenon. No reasoning could make him believe it. His companions were, if possible, more obstinate than he in their credulity. According to them, one of the Fire-Maidens had maliciously attracted the MOTALA to the coast. As to wishing to punish her, as well try to bring the tempest to justice! The magistrates might order what arrests they pleased, but a flame cannot be imprisoned, an impalpable being can't be handcuffed. It must be acknowledged that the researches which were ultimately made gave ground, at least in appearance, to this superstitious way of explaining the facts.

The inquiry was made with great care. Officials came to Dundonald Castle, and they proceeded to conduct a most vigorous search. The magistrate wished first to ascertain if the ground bore any footprints, which could be attributed to other than goblins' feet. It was impossible to find the least trace, whether old or new. Moreover, the earth, still damp from the rain of the day before, would have preserved the least vestige.
The result of all this was, that the magistrates only got for their trouble a new legend added to so many others—a legend which would be perpetuated by the remembrance of the catastrophe of the MOTALA, and indisputably confirm the truth of the apparition of the Fire-Maidens.

A hearty fellow like Jack Ryan, with so strong a constitution, could not be long confined to his bed. A few sprains and bruises were not quite enough to keep him on his back longer than he liked. He had not time to be ill.

Jack, therefore, soon got well. As soon as he was on his legs again, before resuming his work on the farm, he wished to go and visit his friend Harry, and learn why he had not come to the Irvine merry-making. He could not understand his absence, for Harry was not a man who would willingly promise and not perform. It was unlikely, too, that the son of the old overman had not heard of the wreck of the MOTALA, as it was in all the papers. He must know the part Jack had taken in it, and what had happened to him, and it was unlike Harry not to hasten to the farm and see how his old chum was going on.

As Harry had not come, there must have been something to prevent him. Jack Ryan would as soon deny the existence of the Fire-Maidens as believe in Harry's indifference.

Two days after the catastrophe Jack left the farm merrily, feeling nothing of his wounds. Singing in the fullness of his heart, he awoke the echoes of the cliff, as he walked to the station of the railway, which VIA Glasgow would take him to Stirling and Callander.

As he was waiting for his train, his attention was attracted by a bill posted up on the walls, containing the following notice:

"On the 4th of December, the engineer, James Starr, of Edinburgh, embarked from Granton Pier, on board the Prince of Wales. He disembarked the same day at Stirling. From that time nothing further has been heard of him.

"Any information concerning him is requested to be sent to the President of the Royal Institution, Edinburgh."

Jack Ryan, stopping before one of these advertisements, read it twice over, with extreme surprise.

"Mr. Starr!" he exclaimed. "Why, on the 4th of December I met him with Harry on the ladder of the Dochart pit! That was ten days ago! And he has not been seen from that time! That explains why my chum didn't come to Irvine."

And without taking time to inform the President of the Royal Institution by letter, what he knew relative to James Starr, Jack jumped into the train, determining to go first of all to the Yarrow shaft. There he would descend to the depths of the pit, if necessary, to find Harry, and with him was sure to be the engineer James Starr.

"They haven't turned up again," said he to himself. "Why? Has anything prevented them? Could any work of importance keep them still at the bottom of the mine? I must find out!" and Ryan, hastening his steps, arrived in less than an hour at the Yarrow shaft.

Externally nothing was changed. The same silence around. Not a living creature was moving in that desert region. Jack entered the ruined shed which covered the opening of the shaft. He gazed down into the dark abyss—nothing was to be seen. He listened—nothing was to be heard.

"My lamp!" he exclaimed; "suppose it isn't in its place!" The lamp which Ryan used when he visited the pit was usually deposited in a corner, near the landing of the topmost ladder. He had disappeared.

"Here is a nuisance!" said Jack, beginning to feel rather uneasy. Then, without hesitating, superstitious though he was, "I will go," said he, "though it's as dark down there as in the lowest depths of the infernal regions!"

And he began to descend the long flight of ladders, which led down the gloomy shaft. Jack Ryan had not forgotten his old mining habits, and he was well acquainted with the Dochart pit, or he would scarcely have dared to venture thus. He went very carefully, however. His foot tried each round, as some of them were worm-eaten. A false step would entail a deadly fall, through this space of fifteen hundred feet. He counted each landing as he passed it, knowing that he could not reach the bottom of the shaft until he had left the thirtieth. Once there, he would have no trouble, so he thought, in finding the cottage, built, as we have said, at the extremity of the principal passage.

Jack Ryan went on thus until he got to the twenty-sixth landing, and consequently had two hundred feet between him and the bottom.

Here he put down his leg to feel for the first rung of the twenty-seventh ladder. But his foot swinging in space found nothing to rest on. He knelt down and felt about with his hand for the top of the ladder. It was in vain.

"Old Nick himself must have been down this way!" said Jack, not without a slight feeling of terror.

He stood considering for some time, with folded arms, and longing to be able to pierce the impenetrable darkness. Then it occurred to him that if he could not get down, neither could the inhabitants of the mine get up. There was now no communication between the depths of the pit and the upper regions. If the removal of the lower ladders of the Yarrow shaft had been effected since his last visit to the cottage, what had become of Simon Ford, his wife, his son, and the engineer?

The prolonged absence of James Starr proved that he had not left the pit since the day Ryan met with him in the shaft. How had the cottage been provisioned since then? The food of these unfortunate people, imprisoned fifteen
hundred feet below the surface of the ground, must have been exhausted by this time.

All this passed through Jack's mind, as he saw that by himself he could do nothing to get to the cottage. He had no doubt but that communication had been interrupted with a malevolent intention. At any rate, the authorities must be informed, and that as soon as possible. Jack Ryan bent forward from the landing.

"Harry! Harry!" he shouted with his powerful voice.

Harry's name echoed and re-echoed among the rocks, and finally died away in the depths of the shaft.

Ryan rapidly ascended the upper ladders and returned to the light of day. Without losing a moment he reached the Callander station, just caught the express to Edinburgh, and by three o'clock was before the Lord Provost.

There his declaration was received. His account was given so clearly that it could not be doubted. Sir William Elphiston, President of the Royal Institution, and not only colleague, but a personal friend of Starr's, was also informed, and asked to direct the search which was to be made without delay in the mine. Several men were placed at his disposal, supplied with lamps, picks, long rope ladders, not forgetting provisions and cordials. Then guided by Jack Ryan, the party set out for the Aberfoyle mines.

The same evening the expedition arrived at the opening of the Yarrow shaft, and descended to the twenty-seventh landing, at which Jack Ryan had been stopped a few hours previously. The lamps, fastened to long ropes, were lowered down the shaft, and it was thus ascertained that the four last ladders were wanting.

As soon as the lamps had been brought up, the men fixed to the landing a rope ladder, which unrolled itself down the shaft, and all descended one after the other. Jack Ryan's descent was the most difficult, for he went first down the swinging ladders, and fastened them for the others.

The space at the bottom of the shaft was completely deserted; but Sir William was much surprised at hearing Jack Ryan exclaim, "Here are bits of the ladders, and some of them half burnt!"

"Burnt?" repeated Sir William. "Indeed, here sure enough are cinders which have evidently been cold a long time!"

"Do you think, sir," asked Ryan, "that Mr. Starr could have had any reason for burning the ladders, and thus breaking of communication with the world?"

"Certainly not," answered Sir William Elphiston, who had become very thoughtful. "Come, my lad, lead us to the cottage. There we shall ascertain the truth."

Jack Ryan shook his head, as if not at all convinced. Then, taking a lamp from the hands of one of the men, he proceeded with a rapid step along the principal passage of the Dochart pit. The others all followed him.

In a quarter of an hour the party arrived at the excavation in which stood Simon Ford's cottage. There was no light in the window. Ryan darted to the door, and threw it open. The house was empty.

They examined all the rooms in the somber habitation. No trace of violence was to be found. All was in order, as if old Madge had been still there. There was even an ample supply of provisions, enough to last the Ford family for several days.

The absence of the tenants of the cottage was quite unaccountable. But was it not possible to find out the exact time they had quitted it? Yes, for in this region, where there was no difference of day or night, Madge was accustomed to mark with a cross each day in her almanac.

The almanac was pinned up on the wall, and there the last cross had been made at the 6th of December; that is to say, a day after the arrival of James Starr, to which Ryan could positively swear. It was clear that on the 6th of December, ten days ago, Simon Ford, his wife, son, and guest, had quitted the cottage. Could a fresh exploration of the mine, undertaken by the engineer, account for such a long absence? Certainly not.

It was intensely dark all round. The lamps held by the men gave light only just where they were standing. Suddenly Jack Ryan uttered a cry. "Look there, there!"

His finger was pointing to a tolerably bright light, which was moving about in the distance. "After that light, my men!" exclaimed Sir William.

"It's a goblin light!" said Ryan. "So what's the use? We shall never catch it."

The president and his men, little given to superstition, darted off in the direction of the moving light. Jack Ryan, bravely following their example, quickly overtook the head-most of the party.

It was a long and fatiguing chase. The lantern seemed to be carried by a being of small size, but singular agility.

Every now and then it disappeared behind some pillar, then was seen again at the end of a cross gallery. A sharp turn would place it out of sight, and it seemed to have completely disappeared, when all at once there would be the light as bright as ever. However, they gained very little on it, and Ryan's belief that they could never catch it seemed far from groundless.

After an hour of this vain pursuit Sir William Elphiston and his companions had gone a long way in the southwest direction of the pit, and began to think they really had to do with an impalpable being. Just then it seemed as if the distance between the goblin and those who were pursuing it was becoming less. Could it be fatigued, or did
this invisible being wish to entice Sir William and his companions to the place where the inhabitants of the cottage had perhaps themselves been enticed. It was hard to say.

The men, seeing that the distance lessened, redoubled their efforts. The light which had before burnt at a distance of more than two hundred feet before them was now seen at less than fifty. The space continued to diminish. The bearer of the lamp became partially visible. Sometimes, when it turned its head, the indistinct profile of a human face could be made out, and unless a sprite could assume bodily shape, Jack Ryan was obliged to confess that here was no supernatural being. Then, springing forward,--

"Courage, comrades!" he exclaimed; "it is getting tired! We shall soon catch it up now, and if it can talk as well as it can run we shall hear a fine story."

But the pursuit had suddenly become more difficult. They were in unknown regions of the mine; narrow passages crossed each other like the windings of a labyrinth. The bearer of the lamp might escape them as easily as possible, by just extinguishing the light and retreating into some dark refuge.

"And indeed," thought Sir William, "if it wishes to avoid us, why does it not do so?"

Hitherto there had evidently been no intention to avoid them, but just as the thought crossed Sir William's mind the light suddenly disappeared, and the party, continuing the pursuit, found themselves before an extremely narrow natural opening in the schistous rocks.

To trim their lamps, spring forward, and dart through the opening, was for Sir William and his party but the work of an instant. But before they had gone a hundred paces along this new gallery, much wider and loftier than the former, they all stopped short. There, near the wall, lay four bodies, stretched on the ground--four corpses, perhaps!

"James Starr!" exclaimed Sir William Elphiston.

"Harry! Harry!" cried Ryan, throwing himself down beside his friend.

It was indeed the engineer, Madge, Simon, and Harry Ford who were lying there motionless. But one of the bodies moved slightly, and Madge's voice was heard faintly murmuring, "See to the others! help them first!"

Sir William, Jack, and their companions endeavored to reanimate the engineer and his friends by getting them to swallow a few drops of brandy. They very soon succeeded. The unfortunate people, shut up in that dark cavern for ten days, were dying of starvation. They must have perished had they not on three occasions found a loaf of bread and a jug of water set near them. No doubt the charitable being to whom they owed their lives was unable to do more for them.

Sir William wondered whether this might not have been the work of the strange sprite who had allured them to the very spot where James Starr and his companions lay.

However that might be, the engineer, Madge, Simon, and Harry Ford were saved. They were assisted to the cottage, passing through the narrow opening which the bearer of the strange light had apparently wished to point out to Sir William. This was a natural opening. The passage which James Starr and his companions had made for themselves with dynamite had been completely blocked up with rocks laid one upon another.

So, then, whilst they had been exploring the vast cavern, the way back had been purposely closed against them by a hostile hand.

---

CHAPTER X. COAL TOWN

THREE years after the events which have just been related, the guide-books recommended as a "great attraction," to the numerous tourists who roam over the county of Stirling, a visit of a few hours to the mines of New Aberfoyle.

No mine in any country, either in the Old or New World, could present a more curious aspect.

To begin with, the visitor was transported without danger or fatigue to a level with the workings, at fifteen hundred feet below the surface of the ground. Seven miles to the southwest of Callander opened a slanting tunnel, adorned with a castellated entrance, turrets and battlements. This lofty tunnel gently sloped straight to the stupendous crypt, hollowed out so strangely in the bowels of the earth.

A double line of railway, the wagons being moved by hydraulic power, plied from hour to hour to and from the village thus buried in the subsoil of the county, and which bore the rather ambitious title of Coal Town.

Arrived in Coal Town, the visitor found himself in a place where electricity played a principal part as an agent of heat and light. Although the ventilation shafts were numerous, they were not sufficient to admit much daylight into New Aberfoyle, yet it had abundance of light. This was shed from numbers of electric discs; some suspended from the vaulted roofs, others hanging on the natural pillars--all, whether suns or stars in size, were fed by continuous currents produced from electro-magnetic machines. When the hour of rest arrived, an artificial night was easily produced all over the mine by disconnecting the wires.

Below the dome lay a lake of an extent to be compared to the Dead Sea of the Mammoth caves--a deep lake
whose transparent waters swarmed with eyeless fish, and to which the engineer gave the name of Loch Malcolm.

There, in this immense natural excavation, Simon Ford built his new cottage, which he would not have exchanged for the finest house in Prince's Street, Edinburgh. This dwelling was situated on the shores of the loch, and its five windows looked out on the dark waters, which extended further than the eye could see. Two months later a second habitation was erected in the neighborhood of Simon Ford’s cottage: this was for James Starr. The engineer had given himself body and soul to New Aberfoyle, and nothing but the most imperative necessity ever caused him to leave the pit. There, then, he lived in the midst of his mining world.

On the discovery of the new field, all the old colliers had hastened to leave the plow and harrow, and resume the pick and mattock. Attracted by the certainty that work would never fail, allured by the high wages which the prosperity of the mine enabled the company to offer for labor, they deserted the open air for an underground life, and took up their abode in the mines.

The miners’ houses, built of brick, soon grew up in a picturesque fashion; some on the banks of Loch Malcolm, others under the arches which seemed made to resist the weight that pressed upon them, like the piers of a bridge. So was founded Coal Town, situated under the eastern point of Loch Katrine, to the north of the county of Stirling. It was a regular settlement on the banks of Loch Malcolm. A chapel, dedicated to St. Giles, overlooked it from the top of a huge rock, whose foot was laved by the waters of the subterranean sea.

When this underground town was lighted up by the bright rays thrown from the discs, hung from the pillars and arches, its aspect was so strange, so fantastic, that it justified the praise of the guide-books, and visitors flocked to see it.

It is needless to say that the inhabitants of Coal Town were proud of their place. They rarely left their laboring village—in that imitating Simon Ford, who never wished to go out again. The old overman maintained that it always rained “up there,” and, considering the climate of the United Kingdom, it must be acknowledged that he was not far wrong. All the families in New Aberfoyle prospered well, having in three years obtained a certain competency which they could never have hoped to attain on the surface of the county. Dozens of babies, who were born at the time when the works were resumed, had never yet breathed the outer air.

This made Jack Ryan remark, “It’s eighteen months since they were weaned, and they have not yet seen daylight!”

It may be mentioned here, that one of the first to run at the engineer’s call was Jack Ryan. The merry fellow had thought it his duty to return to his old trade. But though Melrose farm had lost singer and piper it must not be thought that Jack Ryan sang no more. On the contrary, the sonorous echoes of New Aberfoyle exerted their strong lungs to answer him.

Jack Ryan took up his abode in Simon Ford’s new cottage. They offered him a room, which he accepted without ceremony, in his frank and hearty way. Old Madge loved him for his fine character and good nature. She in some degree shared his ideas on the subject of the fantastic beings who were supposed to haunt the mine, and the two, when alone, told each other stories wild enough to make one shudder—stories well worthy of enriching the hyperborean mythology.

Jack thus became the life of the cottage. He was, besides being a jovial companion, a good workman. Six months after the works had begun, he was made head of a gang of hewers.

“That was a good work done, Mr. Ford,” said he, a few days after his appointment. “You discovered a new field, and though you narrowly escaped paying for the discovery with your life—well, it was not too dearly bought.”

“No, Jack, it was a good bargain we made that time!” answered the old overman. “But neither Mr. Starr nor I have forgotten that to you we owe our lives.”

“Not at all,” returned Jack. “You owe them to your son Harry, when he had the good sense to accept my invitation to Irvine.”

“And not to go, isn’t that it?” interrupted Harry, grasping his comrade’s hand. “No, Jack, it is to you, scarcely healed of your wounds— to you, who did not delay a day, no, nor an hour, that we owe our being found still alive in the mine!”

“Rubbish, no!” broke in the obstinate fellow. “I won’t have that said, when it’s no such thing. I hurried to find out what had become of you, Harry, that’s all. But to give everyone his due, I will add that without that unapproachable goblin—”

“Ah, there we are!” cried Ford. “A goblin!”

“A goblin, a brownie, a fairy’s child,” repeated Jack Ryan, “a cousin of the Fire-Maidens, an Urisk, whatever you like! It’s not the less certain that without it we should never have found our way into the gallery, from which you could not get out.”

“No doubt, Jack,” answered Harry. “It remains to be seen whether this being was as supernatural as you choose to believe.”
"Supernatural!" exclaimed Ryan. "But it was as supernatural as a Will-o'-the-Wisp, who may be seen skipping along with his lantern in his hand; you may try to catch him, but he escapes like a fairy, and vanishes like a shadow! Don't be uneasy, Harry, we shall see it again some day or other!"

"Well, Jack," said Simon Ford, "Will-o'-the-Wisp or not, we shall try to find it, and you must help us."

"You'll get into a scrap if you don't take care, Mr. Ford!" responded Jack Ryan.

"We'll see about that, Jack!"

We may easily imagine how soon this domain of New Aberfoyle became familiar to all the members of the Ford family, but more particularly to Harry. He learnt to know all its most secret ins and outs. He could even say what point of the surface corresponded with what point of the mine. He knew that above this seam lay the Firth of Clyde, that there extended Loch Lomond and Loch Katrine. Those columns supported a spur of the Grampian mountains. This vault served as a basement to Dumbarton. Above this large pond passed the Balloch railway. Here ended the Scottish coast. There began the sea, the tumult of which could be distinctly heard during the equinoctial gales. Harry would have been a first-rate guide to these natural catacombs, and all that Alpine guides do on their snowy peaks in daylight he could have done in the dark mine by the wonderful power of instinct.

He loved New Aberfoyle. Many times, with his lamp stuck in his hat, did he penetrate its furthest depths. He explored its ponds in a skillfully-managed canoe. He even went shooting, for numerous birds had been introduced into the crypt—pintails, snipes, ducks, who fed on the fish which swarmed in the deep waters. Harry's eyes seemed made for the dark, just as a sailor's are made for distances. But all this while Harry felt irresistibly animated by the hope of finding the mysterious being whose intervention, strictly speaking, had saved himself and his friends. Would he succeed? He certainly would, if presentiments were to be trusted; but certainly not, if he judged by the success which had as yet attended his researches.

The attacks directed against the family of the old overman, before the discovery of New Aberfoyle, had not been renewed.

CHAPTER XI. HANGING BY A THREAD

ALTHOUGH in this way the Ford family led a happy and contented life, yet it was easy to see that Harry, naturally of a grave disposition, became more and more quiet and reserved. Even Jack Ryan, with all his good humor and usually infectious merriment, failed to rouse him to gayety of manner.

One Sunday—it was in the month of June—the two friends were walking together on the shores of Loch Malcolm. Coal Town rested from labor. In the world above, stormy weather prevailed. Violent rains fell, and dull sultry vapors brooded over the earth; the atmosphere was most oppressive.

Down in Coal Town there was perfect calm; no wind, no rain. A soft and pleasant temperature existed instead of the strife of the elements which raged without. What wonder then, that excursionists from Stirling came in considerable numbers to enjoy the calm fresh air in the recesses of the mine?

The electric discs shed a brilliancy of light which the British sun, oftener obscured by fogs than it ought to be, might well envy. Jack Ryan kept talking of these visitors, who passed them in noisy crowds, but Harry paid very little attention to what he said.

"I say, do look, Harry!" cried Jack. "See what numbers of people come to visit us! Cheer up, old fellow! Do the honors of the place a little better. If you look so glum, you'll make all these outside folks think you envy their life above-ground."

"Never mind me, Jack," answered Harry. "You are jolly enough for two, I'm sure; that's enough."

"I'll be hanged if I don't feel your melancholy creeping over me though!" exclaimed Jack. "I declare my eyes are getting quite dull, my lips are drawn together, my laugh sticks in my throat; I'm forgetting all my songs. Come, man, what's the matter with you?"

"You know well enough, Jack."

"What? the old story?"

"Yes, the same thoughts haunt me."

"Ah, poor fellow!" said Jack, shrugging his shoulders. "If you would only do like me, and set all the queer things down to the account of the goblins of the mine, you would be easier in your mind."

"But, Jack, you know very well that these goblins exist only in your imagination, and that, since the works here have been reopened, not a single one has been seen."

"That's true, Harry; but if no spirits have been seen, neither has anyone else to whom you could attribute the extraordinary doings we want to account for."

"I shall discover them."

"Ah, Harry! Harry! it's not so easy to catch the spirits of New Aberfoyle!"
"I shall find out the spirits as you call them," said Harry, in a tone of firm conviction.
"Do you expect to be able to punish them?"
"Both punish and reward. Remember, if one hand shut us up in that passage, another hand delivered us! I shall not soon forget that."
"But, Harry, how can we be sure that these two hands do not belong to the same body?"
"What can put such a notion in your head, Jack?" asked Harry.
"Well, I don't know. Creatures that live in these holes, Harry, don't you see? they can't be made like us, eh?"
"But they ARE just like us, Jack."
"Oh, no! don't say that, Harry! Perhaps some madman managed to get in for a time."
"A madman! No madman would have formed such connected plans, or done such continued mischief as befell us after the breaking of the ladders."
"Well, but anyhow he has done no harm for the last three years, either to you, Harry, or any of your people."
"No matter, Jack," replied Harry; "I am persuaded that this malignant being, whoever he is, has by no means given up his evil intentions. I can hardly say on what I found my convictions. But at any rate, for the sake of the new works, I must and will know who he is and whence he comes."
"For the sake of the new works did you say?" asked Jack, considerably surprised.
"I said so, Jack," returned Harry. "I may be mistaken, but, to me, all that has happened proves the existence of an interest in this mine in strong opposition to ours. Many a time have I considered the matter; I feel almost sure of it. Just consider the whole series of inexplicable circumstances, so singularly linked together. To begin with, the anonymous letter, contradictory to that of my father, at once proves that some man had become aware of our projects, and wished to prevent their accomplishment. Mr. Starr comes to see us at the Dochart pit. No sooner does he enter it with me than an immense stone is cast upon us, and communication is interrupted by the breaking of the ladders in the Yarrow shaft. We commence exploring. An experiment, by which the existence of a new vein would be proved, is rendered impossible by stoppage of fissures. Notwithstanding this, the examination is carried out, the vein discovered. We return as we came, a prodigious gust of air meets us, our lamp is broken, utter darkness surrounds us. Nevertheless, we make our way along the gloomy passage until, on reaching the entrance, we find it blocked up. There we were--imprisoned. Now, Jack, don't you see in all these things a malicious intention? Ah, yes, believe me, some being hitherto invisible, but not supernatural, as you will persist in thinking, was concealed in the mine. For some reason, known only to himself, he strove to keep us out of it. WAS there, did I say? I feel an inward conviction that he IS there still, and probably prepares some terrible disaster for us. Even at the risk of my life, Jack, I am resolved to discover him."
Harry spoke with an earnestness which strongly impressed his companion. "Well, Harry," said he, "if I am forced to agree with you in certain points, won't you admit that some kind fairy or brownie, by bringing bread and water to you, was the means of--"
"Jack, my friend," interrupted Harry, "it is my belief that the friendly person, whom you will persist in calling a spirit, exists in the mine as certainly as the criminal we speak of, and I mean to seek them both in the most distant recesses of the mine."
"But," inquired Jack, "have you any possible clew to guide your search?"
"Perhaps I have. Listen to me! Five miles west of New Aberfoyle, under the solid rock which supports Ben Lomond, there exists a natural shaft which descends perpendicularly into the vein beneath. A week ago I went to ascertain the depth of this shaft. While sounding it, and bending over the opening as my plumb-line went down, it seemed to me that the air within was agitated, as though beaten by huge wings."
"Some bird must have got lost among the lower galleries," replied Jack.
"But that is not all, Jack. This very morning I went back to the place, and, listening attentively, I thought I could detect a sound like a sort of groaning."
"Groaning!" cried Jack, "that must be nonsense; it was a current of air--unless indeed some ghost--"
"I shall know to-morrow what it was," said Harry.
"To-morrow?" answered Jack, looking at his friend.
"Yes; to-morrow I am going down into that abyss."
"Harry! that will be a tempting of Providence."
"No, Jack, Providence will aid me in the attempt. Tomorrow, you and some of our comrades will go with me to that shaft. I will fasten myself to a long rope, by which you can let me down, and draw me up at a given signal. I may depend upon you, Jack?"
"Well, Harry," said Jack, shaking his head, "I will do as you wish me; but I tell you all the same, you are very wrong."
"Nothing venture nothing win," said Harry, in a tone of decision. "To-morrow morning, then, at six o'clock. Be
silent, and farewell!"

It must be admitted that Jack Ryan's fears were far from groundless. Harry would expose himself to very great danger, supposing the enemy he sought for lay concealed at the bottom of the pit into which he was going to descend. It did not seem likely that such was the case, however.

"Why in the world," repeated Jack Ryan, "should he take all this trouble to account for a set of facts so very easily and simply explained by the supernatural intervention of the spirits of the mine?"

But, notwithstanding his objections to the scheme, Jack Ryan and three miners of his gang arrived next morning with Harry at the mouth of the opening of the suspicious shaft. Harry had not mentioned his intentions either to James Starr or to the old overman. Jack had been discreet enough to say nothing.

Harry had provided himself with a rope about 200 feet long. It was not particularly thick, but very strong--sufficiently so to sustain his weight. His friends were to let him down into the gulf, and his pulling the cord was to be the signal to withdraw him.

The opening into this shaft or well was twelve feet wide. A beam was thrown across like a bridge, so that the cord passing over it should hang down the center of the opening, and save Harry from striking against the sides in his descent.

He was ready.

"Are you still determined to explore this abyss?" whispered Jack Ryan.

"Yes, I am, Jack."

The cord was fastened round Harry's thighs and under his arms, to keep him from rocking. Thus supported, he was free to use both his hands. A safety-lamp hung at his belt, also a large, strong knife in a leather sheath.

Harry advanced to the middle of the beam, around which the cord was passed. Then his friends began to let him down, and he slowly sank into the pit. As the rope caused him to swing gently round and round, the light of his lamp fell in turns on all points of the side walls, so that he was able to examine them carefully. These walls consisted of pit coal, and so smooth that it would be impossible to ascend them.

Harry calculated that he was going down at the rate of about a foot per second, so that he had time to look about him, and be ready for any event.

During two minutes—that is to say, to the depth of about 120 feet, the descent continued without any incident.

No lateral gallery opened from the side walls of the pit, which was gradually narrowing into the shape of a funnel. But Harry began to feel a fresher air rising from beneath, whence he concluded that the bottom of the pit communicated with a gallery of some description in the lowest part of the mine.

The cord continued to unwind. Darkness and silence were complete. If any living being whatever had sought refuge in the deep and mysterious abyss, he had either left it, or, if there, by no movement did he in the slightest way betray his presence.

Harry, becoming more suspicious the lower he got, now drew his knife and held it in his right hand. At a depth of 180 feet, his feet touched the lower point and the cord slackened and unwound no further.

Harry breathed more freely for a moment. One of the fears he entertained had been that, during his descent, the cord might be cut above him, but he had seen no projection from the walls behind which anyone could have been concealed.

The bottom of the abyss was quite dry. Harry, taking the lamp from his belt, walked round the place, and perceived he had been right in his conjectures.

An extremely narrow passage led aside out of the pit. He had to stoop to look into it, and only by creeping could it be followed; but as he wanted to see in which direction it led, and whether another abyss opened from it, he lay down on the ground and began to enter it on hands and knees.

An obstacle speedily arrested his progress. He fancied he could perceive by touching it, that a human body lay across the passage. A sudden thrill of horror and surprise made him hastily draw back, but he again advanced and felt more carefully.

His senses had not deceived him; a body did indeed lie there; and he soon ascertained that, although icy cold at the extremities, there was some vital heat remaining. In less time than it takes to tell it, Harry had drawn the body from the recess to the bottom of the shaft, and, seizing his lamp, he cast its lights on what he had found, exclaiming immediately, "Why, it is a child!"

The child still breathed, but so very feebly that Harry expected it to cease every instant. Not a moment was to be lost; he must carry this poor little creature out of the pit, and take it home to his mother as quickly as he could. He eagerly fastened the cord round his waist, stuck on his lamp, clasped the child to his breast with his left arm, and, keeping his right hand free to hold the knife, he gave the signal agreed on, to have the rope pulled up.

It tightened at once; he began the ascent. Harry looked around him with redoubled care, for more than his own life was now in danger.
For a few minutes all went well, no accident seemed to threaten him, when suddenly he heard the sound of a great rush of air from beneath; and, looking down, he could dimly perceive through the gloom a broad mass arising until it passed him, striking him as it went by.

It was an enormous bird—of what sort he could not see; it flew upwards on mighty wings, then paused, hovered, and dashed fiercely down upon Harry, who could only wield his knife in one hand. He defended himself and the child as well as he could, but the ferocious bird seemed to aim all its blows at him alone. Afraid of cutting the cord, he could not strike it as he wished, and the struggle was prolonged, while Harry shouted with all his might in hopes of making his comrades hear.

He soon knew they did, for they pulled the rope up faster; a distance of about eighty feet remained to be got over. The bird ceased its direct attack, but increased the horror and danger of his situation by rushing at the cord, clinging to it just out of his reach, and endeavoring, by pecking furiously, to cut it.

Harry felt overcome with terrible dread. One strand of the rope gave way, and it made them sink a little.

A shriek of despair escaped his lips.

A second strand was divided, and the double burden now hung suspended by only half the cord.

Harry dropped his knife, and by a superhuman effort succeeded, at the moment the rope was giving way, in catching hold of it with his right hand above the cut made by the beak of the bird. But, powerfully as he held it in his iron grasp, he could feel it gradually slipping through his fingers.

He might have caught it, and held on with both hands by sacrificing the life of the child he supported in his left arm. The idea crossed him, but was banished in an instant, although he believed himself quite unable to hold out until drawn to the surface. For a second he closed his eyes, believing they were about to plunge back into the abyss.

He looked up once more; the huge bird had disappeared; his hand was at the very extremity of the broken rope—when, just as his convulsive grasp was failing, he was seized by the men, and with the child was placed on the level ground.

The fearful strain of anxiety removed, a reaction took place, and Harry fell fainting into the arms of his friends.

CHAPTER XII. NELL ADOPTED

A COUPLE of hours later, Harry still unconscious, and the child in a very feeble state, were brought to the cottage by Jack Ryan and his companions. The old overman listened to the account of their adventures, while Madge attended with the utmost care to the wants of her son, and of the poor creature whom he had rescued from the pit.

Harry imagined her a mere child, but she was a maiden of the age of fifteen or sixteen years.

She gazed at them with vague and wondering eyes; and the thin face, drawn by suffering, the pallid complexion, which light could never have tinged, and the fragile, slender figure, gave her an appearance at once singular and attractive. Jack Ryan declared that she seemed to him to be an uncommonly interesting kind of ghost.

It must have been due to the strange and peculiar circumstances under which her life hitherto had been led, that she scarcely seemed to belong to the human race. Her countenance was of a very uncommon cast, and her eyes, hardly able to bear the lamp-light in the cottage, glanced around in a confused and puzzled way, as if all were new to them.

As this singular being reclined on Madge's bed and awoke to consciousness, as from a long sleep, the old Scotchwoman began to question her a little.

"What do they call you, my dear?" said she.

"Nell," replied the girl.

"Do you feel anything the matter with you, Nell?"

"I am hungry. I have eaten nothing since—since—"

Nell uttered these few words like one unused to speak much. They were in the Gaelic language, which was often spoken by Simon and his family. Madge immediately brought her some food; she was evidently famished. It was impossible to say how long she might have been in that pit.

"How many days had you been down there, dearie?" inquired Madge.

Nell made no answer; she seemed not to understand the question.

"How many days, do you think?"

"Days?" repeated Nell, as though the word had no meaning for her, and she shook her head to signify entire want of comprehension.

Madge took her hand, and stroked it caressingly. "How old are you, my lassie?" she asked, smiling kindly at her. Nell shook her head again.

"Yes, yes," continued Madge, "how many years old?"

"Years?" replied Nell. She seemed to understand that word no better than days! Simon, Harry, Jack, and the rest,
looked on with an air of mingled compassion, wonder, and sympathy. The state of this poor thing, clothed in a miserable garment of coarse woolen stuff, seemed to impress them painfully.

Harry, more than all the rest, seemed attracted by the very peculiarity of this poor stranger. He drew near, took Nell's hand from his mother, and looked directly at her, while something like a smile curved her lip. "Nell," he said, "Nell, away down there--in the mine--were you all alone?"

"Alone! alone!" cried the girl, raising herself hastily. Her features expressed terror; her eyes, which had appeared to soften as Harry looked at her, became quite wild again. "Alone!" repeated she, "alone!"--and she fell back on the bed, as though deprived of all strength.

"The poor bairn is too weak to speak to us," said Madge, when she had adjusted the pillows. "After a good rest, and a little more food, she will be stronger. Come away, Simon and Harry, and all the rest of you, and let her go to sleep." So Nell was left alone, and in a very few minutes slept profoundly.

This event caused a great sensation, not only in the coal mines, but in Stirlingshire, and ultimately throughout the kingdom. The strangeness of the story was exaggerated; the affair could not have made more commotion had they found the girl enclosed in the solid rock, like one of those antediluvian creatures who have occasionally been released by a stroke of the pickax from their stony prison. Nell became a fashionable wonder without knowing it. Superstitious folks made her story a new subject for legendary marvels, and were inclined to think, as Jack Ryan told Harry, that Nell was the spirit of the mines.

"Be it so, Jack," said the young man; "but at any rate she is the good spirit. It can have been none but she who brought us bread and water when we were shut up down there; and as to the bad spirit, who must still be in the mine, we'll catch him some day."

Of course James Starr had been at once informed of all this, and came, as soon as the young girl had sufficiently recovered her strength, to see her, and endeavor to question her carefully.

She appeared ignorant of nearly everything relating to life, and, although evidently intelligent, was wanting in many elementary ideas, such as time, for instance. She had never been used to its division, and the words signifying hours, days, months, and years were unknown to her.

Her eyes, accustomed to the night, were pained by the glare of the electric discs; but in the dark her sight was wonderfully keen, the pupil dilated in a remarkable manner, and she could see where to others there appeared profound obscurity. It was certain that her brain had never received any impression of the outer world, that her eyes had never looked beyond the mine, and that these somber depths had been all the world to her.

The poor girl probably knew not that there were a sun and stars, towns and counties, a mighty universe composed of myriads of worlds. But until she comprehended the significance of words at present conveying no precise meaning to her, it was impossible to ascertain what she knew.

As to whether or not Nell had lived alone in the recesses of New Aberfoyle, James Starr was obliged to remain uncertain; indeed, any allusion to the subject excited evident alarm in the mind of this strange girl. Either Nell could not or would not reply to questions, but that some secret existed in connection with the place, which she could have explained, was manifest.

"Should you like to stay with us? Should you like to go back to where we found you?" asked James Starr.

"Oh, yes!" exclaimed the maiden, in answer to his first question; but a cry of terror was all she seemed able to say to the second.

James Starr, as well as Simon and Harry Ford, could not help feeling a certain amount of uneasiness with regard to this persistent silence. They found it impossible to forget all that had appeared so inexplicable at the time they made the discovery of the coal mine; and although that was three years ago, and nothing new had happened, they always expected some fresh attack on the part of the invisible enemy.

They resolved to explore the mysterious well, and did so, well armed and in considerable numbers. But nothing suspicious was to be seen; the shaft communicated with lower stages of the crypt, hollowed out in the carboniferous bed.

Many a time did James Starr, Simon, and Harry talk over these things. If one or more malevolent beings were concealed in the coal-pit, and there concocted mischief, Nell surely could have warned them of it, yet she said nothing. The slightest allusion to her past life brought on such fits of violent emotion, that it was judged best to avoid the subject for the present. Her secret would certainly escape her by-and-by.

By the time Nell had been a fortnight in the cottage, she had become a most intelligent and zealous assistant to old Madge. It was clear that she instinctively felt she should remain in the dwelling where she had been so charitably received, and perhaps never dreamt of quitting it. This family was all in all to her, and to the good folks themselves Nell had seemed an adopted child from the moment when she first came beneath their roof. Nell was in truth a charming creature; her new mode of existence added to her beauty, for these were no doubt the first happy days of her life, and her heart was full of gratitude towards those to whom she owed them. Madge felt towards her as a
mother would; the old woman doted upon her; in short, she was beloved by everybody. Jack Ryan only regretted one thing, which was that he had not saved her himself. Friend Jack often came to the cottage. He sang, and Nell, who had never heard singing before, admired it greatly; but anyone might see that she preferred to Jack's songs the graver conversation of Harry, from whom by degrees she learnt truths concerning the outer world, of which hitherto she had known nothing.

It must be said that, since Nell had appeared in her own person, Jack Ryan had been obliged to admit that his belief in hobgoblins was in a measure weakened. A couple of months later his credulity experienced a further shock. About that time Harry unexpectedly made a discovery which, in part at least, accounted for the apparition of the fire-maidens among the ruins of Dundonald Castle at Irvine.

During several days he had been engaged in exploring the remote galleries of the prodigious excavation towards the south. At last he scrambled with difficulty up a narrow passage which branched off through the upper rock. To his great astonishment, he suddenly found himself in the open air. The passage, after ascending obliquely to the surface of the ground, led out directly among the ruins of Dundonald Castle.

There was, therefore, a communication between New Aberfoyle and the hills crowned by this ancient castle. The upper entrance to this gallery, being completely concealed by stones and brushwood, was invisible from without; at the time of their search, therefore, the magistrates had been able to discover nothing.

A few days afterwards, James Starr, guided by Harry, came himself to inspect this curious natural opening into the coal mine. "Well," said he, "here is enough to convince the most superstitious among us. Farewell to all their brownies, goblins, and fire-maidens now!"

"I hardly think, Mr. Starr, we ought to congratulate ourselves," replied Harry. "Whatever it is we have instead of these things, it can't be better, and may be worse than they are."

"That's true, Harry," said the engineer; "but what's to be done? It is plain that, whatever the beings are who hide in the mine, they reach the surface of the earth by this passage. No doubt it was the light of torches waved by them during that dark and stormy night which attracted the MOTALA towards the rocky coast, and like the wreckers of former days, they would have plundered the unfortunate vessel, had it not been for Jack Ryan and his friends. Anyhow, so far it is evident, and here is the mouth of the den. As to its occupants, the question is--Are they here still?"

"I say yes; because Nell trembles when we mention them--yes, because Nell will not, or dare not, speak about them," answered Harry in a tone of decision.

Harry was surely in the right. Had these mysterious denizens of the pit abandoned it, or ceased to visit the spot, what reason could the girl have had for keeping silence?

James Starr could not rest till he had penetrated this mystery. He foresaw that the whole future of the new excavations must depend upon it. Renewed and strict precautions were therefore taken. The authorities were informed of the discovery of the entrance. Watchers were placed among the ruins of the castle. Harry himself lay hid for several nights in the thickets of brushwood which clothed the hill-side.

Nothing was discovered--no human being emerged from the opening. So most people came to the conclusion that the villains had been finally dislodged from the mine, and that, as to Nell, they must suppose her to be dead at the bottom of the shaft where they had left her.

While it remained unworked, the mine had been a safe enough place of refuge, secure from all search or pursuit. But now, circumstances being altered, it became difficult to conceal this lurking-place, and it might reasonably be hoped they were gone, and that nothing for the future was to be dreaded from them.

James Starr, however, could not feel sure about it; neither could Harry be satisfied on the subject, often repeating, "Nell has clearly been mixed up with all this secret business. If she had nothing more to fear, why should she keep silence? It cannot be doubted that she is happy with us. She likes us all--she adores my mother. Her absolute silence as to her former life, when by speaking out she might benefit us, proves to me that some awful secret, which she dares not reveal, weighs on her mind. It may also be that she believes it better for us, as well as for herself, that she should remain mute in a way otherwise so unaccountable."

In consequence of these opinions, it was agreed by common consent to avoid all allusion to the maiden's former mode of life. One day, however, Harry was led to make known to Nell what James Starr, his father, mother, and himself believed they owed to her interference.

It was a fete-day. The miners made holiday on the surface of the county of Stirling as well as in its subterranean domains. Parties of holiday-makers were moving about in all directions. Songs resounded in many places beneath the sonorous vaults of New Aberfoyle. Harry and Nell left the cottage, and slowly walked along the left bank of Loch Malcolm.

Then the electric brilliance darted less vividly, and the rays were interrupted with fantastic effect by the sharp angles of the picturesque rocks which supported the dome. This imperfect light suited Nell, to whose eyes a glare
was very unpleasant.

"Nell," said Harry, "your eyes are not fit for daylight yet, and could not bear the brightness of the sun."

"Indeed they could not," replied the girl; "if the sun is such as you describe it to me, Harry."

"I cannot by any words, Nell, give you an idea either of his splendor or of the beauty of that universe which your eyes have never beheld. But tell me, is it really possible that, since the day when you were born in the depths of the coal mine, you never once have been up to the surface of the earth?"

"Never once, Harry," said she; "I do not believe that, even as an infant, my father or mother ever carried me thither. I am sure I should have retained some impression of the open air if they had."

"I believe you would," answered Harry. "Long ago, Nell, many children used to live altogether in the mine; communication was then difficult, and I have met with more than one young person, quite as ignorant as you are of things above-ground. But now the railway through our great tunnel takes us in a few minutes to the upper regions of our country. I long, Nell, to hear you say, 'Come, Harry, my eyes can bear daylight, and I want to see the sun! I want to look upon the works of the Almighty.'"

"I shall soon say so, Harry, I hope," replied the girl; "I shall soon go with you to the world above; and yet--"

"What are you going to say, Nell?" hastily cried Harry; "can you possibly regret having quitted that gloomy abyss in which you spent your early years, and whence we drew you half dead?"

"No, Harry," answered Nell; "I was only thinking that darkness is beautiful as well as light. If you but knew what eyes accustomed to its depth can see! Shades flit by, which one longs to follow; circles mingle and intertwine, and one could gaze on them forever; black hollows, full of indefinite gleams of radiance, lie deep at the bottom of the mine. And then the voice-like sounds! Ah, Harry! one must have lived down there to understand what I feel, what I can never express."

"And were you not afraid, Nell, all alone there?"

"It was just when I was alone that I was not afraid."

Nell's voice altered slightly as she said these words; however, Harry thought he might press the subject a little further, so he said, "But one might be easily lost in these great galleries, Nell. Were you not afraid of losing your way?"

"Oh, no, Harry; for a long time I had known every turn of the new mine."

"Did you never leave it?"

"Yes, now and then," answered the girl with a little hesitation; "sometimes I have been as far as the old mine of Aberfoyle."

"So you knew our old cottage?"

"The cottage! oh, yes; but the people who lived there I only saw at a great distance."

"They were my father and mother," said Harry; "and I was there too; we have always lived there--we never would give up the old dwelling."

"Perhaps it would have been better for you if you had," murmured the maiden.

"Why so, Nell? Was it not just because we were obstinately resolved to remain that we ended by discovering the new vein of coal? And did not that discovery lead to the happy result of providing work for a large population, and restoring them to ease and comfort? and did it not enable us to find you, Nell, to save your life, and give you the love of all our hearts?"

"Ah, yes, for me indeed it is well, whatever may happen," replied Nell earnestly; "for others--who can tell?"

"What do you mean?"

"Oh, nothing--nothing. But it used to be very dangerous at that time to go into the new cutting--yes, very dangerous indeed, Harry! Once some rash people made their way into these chasms. They got a long, long way; they were lost!"

"They were lost!" said Harry, looking at her."

"Yes, lost!" repeated Nell in a trembling voice. "They could not find their way out."

"And there," cried Harry, "they were imprisoned during eight long days! They were at the point of death, Nell; and, but for a kind and charitable being--an angel perhaps--sent by God to help them, who secretly brought them a little food; but for a mysterious guide, who afterwards led to them their deliverers, they never would have escaped from that living tomb!"

"And how do you know about that?" demanded the girl.

"Because those men were James Starr, my father, and myself, Nell!"

Nell looked up hastily, seized the young man's hand, and gazed so fixedly into his eyes that his feelings were stirred to their depths. "You were there?" at last she uttered.

"I was indeed," said Harry, after a pause, "and she to whom we owe our lives can have been none other than yourself, Nell!"
Nell hid her face in her hands without speaking. Harry had never seen her so much affected.
"Those who saved your life, Nell," added he in a voice tremulous with emotion, "already owed theirs to you; do you think they will ever forget it?"

CHAPTER XIII. ON THE REVOLVING LADDER

THE mining operations at New Aberfoyle continued to be carried on very successfully. As a matter of course, the engineer, James Starr, as well as Simon Ford, the discoverers of this rich carboniferous region, shared largely in the profits.

In time Harry became a partner. But he never thought of quitting the cottage. He took his father's place as overman, and diligently superintended the works of this colony of miners. Jack Ryan was proud and delighted at the good fortune which had befallen his comrade. He himself was getting on very well also.

They frequently met, either at the cottage or at the works in the pit. Jack did not fail to remark the sentiments entertained by Harry towards Nell. Harry would not confess to them; but Jack only laughed at him when he shook his head and tried to deny any special interest in her.

It must be noted that Jack Ryan had the greatest possible wish to be of the party when Nell should pay her first visit to the upper surface of the county of Stirling. He wished to see her wonder and admiration on first beholding the yet unknown face of Nature. He very much hoped that Harry would take him with them when the excursion was made. As yet, however, the latter had made no proposal of the kind to him, which caused him to feel a little uneasy as to his intentions.

One morning Jack Ryan was descending through a shaft which led from the surface to the lower regions of the pit. He did so by means of one of those ladders which, continually revolving by machinery, enabled persons to ascend and descend without fatigue. This apparatus had lowered him about a hundred and fifty feet, when at a narrow landing-place he perceived Harry, who was coming up to his labors for the day.

"Well met, my friend!" cried Jack, recognizing his comrade by the light of the electric lamps.
"Ah, Jack!" replied Harry, "I am glad to see you. I've got something to propose."
"I can listen to nothing till you tell me how Nell is," interrupted Jack Ryan.
"Nell is all right, Jack--so much so, in fact, that I hope in a month or six weeks--"
"To marry her, Harry?"
"Jack, you don't know what you are talking about!"
"Ah, that's very likely; but I know quite well what I shall do."
"What will you do?"
"Marry her myself, if you don't; so look sharp," laughed Jack. "By Saint Mungo! I think an immense deal of bonny Nell! A fine young creature like that, who has been brought up in the mine, is just the very wife for a miner. She is an orphan--so am I; and if you don't care much for her, and if she will have me--"

Harry looked gravely at Jack, and let him talk on without trying to stop him. "Don't you begin to feel jealous, Harry?" asked Jack in a more serious tone.
"Not at all," answered Harry quietly.
"But if you don't marry Nell yourself, you surely can't expect her to remain a spinster?"
"I expect nothing," said Harry.

A movement of the ladder machinery now gave the two friends the opportunity--one to go up, the other down the shaft. However, they remained where they were.
"Harry," quoth Jack, "do you think I spoke in earnest just now about Nell?"
"No, that I don't, Jack."
"Well, but now I will!"
"You? speak in earnest?"
"My good fellow, I can tell you I am quite capable of giving a friend a bit of advice."
"Let's hear, then, Jack!"
"Well, look here! You love Nell as heartily as she deserves. Old Simon, your father, and old Madge, your mother, both love her as if she were their daughter. Why don't you make her so in reality? Why don't you marry her?"
"Come, Jack," said Harry, "you are running on as if you knew how Nell felt on the subject."
"Everybody knows that," replied Jack, "and therefore it is impossible to make you jealous of any of us. But here goes the ladder again--I'm off!"
"Stop a minute, Jack!" cried Harry, detaining his companion, who was stepping onto the moving staircase.
"I say! you seem to mean me to take up my quarters here altogether!"
"Do be serious and listen, Jack! I want to speak in earnest myself now."
"Well, I'll listen till the ladder moves again, not a minute longer."
"Jack," resumed Harry, "I need not pretend that I do not love Nell; I wish above all things to make her my wife."
"That's all right!"
"But for the present I have scruples of conscience as to asking her to make me a promise which would be irrevocable."
"What can you mean, Harry?"
"I mean just this--that, it being certain Nell has never been outside this coal mine in the very depths of which she was born, it stands to reason that she knows nothing, and can comprehend nothing of what exists beyond it. Her eyes--yes, and perhaps also her heart--have everything yet to learn. Who can tell what her thoughts will be, when perfectly new impressions shall be made upon her mind? As yet she knows nothing of the world, and to me it would seem like deceiving her, if I led her to decide in ignorance, upon choosing to remain all her life in the coal mine. Do you understand me, Jack?"
"Hem!--yes--pretty well. What I understand best is that you are going to make me miss another turn of the ladder."
"Jack," replied Harry gravely, "if this machinery were to stop altogether, if this landing-place were to fall beneath our feet, you must and shall hear what I have to say."
"Well done, Harry! that's how I like to be spoken to! Let's settle, then, that, before you marry Nell, she shall go to school in Auld Reekie."
"No indeed, Jack; I am perfectly able myself to educate the person who is to be my wife."
"Sure that will be a great deal better, Harry!"
"But, first of all," resumed Harry, "I wish that Nell should gain a real knowledge of the upper world. To illustrate my meaning, Jack, suppose you were in love with a blind girl, and someone said to you, 'In a month's time her sight will be restored,' would you not wait till after she was cured, to marry her?"
"Faith, to be sure I would!" exclaimed Jack.
"Well, Jack, Nell is at present blind; and before she marries me, I wish her to see what I am, and what the life really is to which she would bind herself. In short, she must have daylight let in upon the subject!"
"Well said, Harry! Very well said indeed!" cried Jack. "Now I see what you are driving at. And when may we expect the operation to come off?"
"In a month, Jack," replied Harry. "Nell is getting used to the light of our reflectors. That is some preparation. In a month she will, I hope, have seen the earth and its wonders--the sky and its splendors. She will perceive that the limits of the universe are boundless."

But while Harry was thus giving the rein to his imagination, Jack Ryan, quitting the platform, had leaped on the step of the moving machinery.
"Hullo, Jack! Where are you?"
"Far beneath you," laughed the merry fellow. "While you soar to the heights, I plunge into the depths."
"Fare ye well. Jack!" returned Harry, himself laying hold of the rising ladder; "mind you say nothing about what I have been telling you."
"Not a word," shouted Jack, "but I make one condition."
"What is that?"
"That I may be one of the party when Nell's first excursion to the face of the earth comes off!"
"So you shall, Jack, I promise you!"

A fresh throb of the machinery placed a yet more considerable distance between the friends. Their voices sounded faintly to each other. Harry, however, could still hear Jack shouting:
"I say! do you know what Nell will like better than either sun, moon, or stars, after she's seen the whole of them?"
"No, Jack!"
"Why, you yourself, old fellow! still you! always you!" And Jack's voice died away in a prolonged "Hurrah!"

Harry, after this, applied himself diligently, during all his spare time, to the work of Nell's education. He taught her to read and to write, and such rapid progress did she make, it might have been said that she learnt by instinct. Never did keen intelligence more quickly triumph over utter ignorance. It was the wonder of all beholders.

Simon and Madge became every day more and more attached to their adopted child, whose former history continued to puzzle them a good deal. They plainly saw the nature of Harry's feelings towards her, and were far from displeased thereof. They recollected that Simon had said to the engineer on his first visit to the old cottage, "How can our son ever think of marrying? Where could a wife possibly be found suitable for a lad whose whole life must be passed in the depths of a coal mine?"
Well! now it seemed as if the most desirable companion in the world had been led to him by Providence. Was not this like a blessing direct from Heaven? So the old man made up his mind that, if the wedding did take place, the miners of New Aberfoyle should have a merry-making at Coal Town, which they would never during their lives forget. Simon Ford little knew what he was saying!

It must be remarked that another person wished for this union of Harry and Nell as much as Simon did—and that was James Starr, the engineer. Of course he was really interested in the happiness of the two young people. But another motive, connected with wider interests, influenced him to desire it.

It has been said that James Starr continued to entertain a certain amount of apprehension, although for the present nothing appeared to justify it. Yet that which had been might again be. This mystery about the new cutting--Nell was evidently the only person acquainted with it. Now, if fresh dangers were in store for the miners of Aberfoyle, how were they possibly to be guarded against, without so much as knowing the cause of them?

"Nell has persisted in keeping silence," said James Starr very often, "but what she has concealed from others, she will not long hide from her husband. Any danger would be danger to Harry as well as to the rest of us. Therefore, a marriage which brings happiness to the lovers, and safety to their friends, will be a good marriage, if ever there is such a thing here below."

Thus, not illogically, reasoned James Starr. He communicated his ideas to old Simon, who decidedly appreciated them. Nothing, then, appeared to stand in the way of the match. What, in fact, was there to prevent it? They loved each other; the parents desired nothing better for their son. Harry's comrades envied his good fortune, but freely acknowledged that he deserved it. The maiden depended on no one else, and had but to give the consent of her own heart.

Why, then, if there were none to place obstacles in the way of this union--why, as night came on, and, the labors of the day being over, the electric lights in the mine were extinguished, and all the inhabitants of Coal Town at rest within their dwellings--why did a mysterious form always emerge from the gloomier recesses of New Aberfoyle, and silently glide through the darkness?

What instinct guided this phantom with ease through passages so narrow as to appear to be impracticable?

Why should the strange being, with eyes flashing through the deepest darkness, come cautiously creeping along the shores of Lake Malcolm? Why so directly make his way towards Simon's cottage, yet so carefully as hitherto to avoid notice? Why, bending towards the windows, did he strive to catch, by listening, some fragment of the conversation within the closed shutters?

And, on catching a few words, why did he shake his fist with a menacing gesture towards the calm abode, while from between his set teeth issued these words in muttered fury, "She and he? Never! never!"

CHAPTER XIV. A SUNRISE

A MONTH after this, on the evening of the 20th of August, Simon Ford and Madge took leave, with all manner of good wishes, of four tourists, who were setting forth from the cottage.

James Starr, Harry, and Jack Ryan were about to lead Nell's steps over yet untrodden paths, and to show her the glories of nature by a light to which she was as yet a stranger. The excursion was to last for two days. James Starr, as well as Harry, considered that during these eight and forty hours spent above ground, the maiden would be able to see everything of which she must have remained ignorant in the gloomy pit; all the varied aspects of the globe, towns, plains, mountains, rivers, lakes, gulfs, and seas would pass, panorama-like, before her eyes.

In that part of Scotland lying between Edinburgh and Glasgow, nature would seem to have collected and set forth specimens of every one of these terrestrial beauties. As to the heavens, they would be spread abroad as over the whole earth, with their changeful clouds, serene or veiled moon, their radiant sun, and clustering stars. The expedition had been planned so as to combine a view of all these things.

Simon and Madge would have been glad to go with Nell; but they never left their cottage willingly, and could not make up their minds to quit their subterranean home for a single day.

James Starr went as an observer and philosopher, curious to note, from a psychological point of view, the novel impressions made upon Nell; perhaps also with some hope of detecting a clue to the mysterious events connected with her childhood. Harry, with a little trepidation, asked himself whether it was not possible that this rapid initiation into the things of the exterior world would change the maiden he had known and loved hitherto into quite a different girl. As for Jack Ryan, he was as joyous as a lark rising in the first beams of the sun. He only trusted that his gayety would prove contagious, and enliven his traveling companions, thus rewarding them for letting him join them. Nell was pensive and silent.

James Starr had decided, very sensibly, to set off in the evening. It would be very much better for the girl to pass gradually from the darkness of night to the full light of day; and that would in this way be managed, since between
midnight and noon she would experience the successive phases of shade and sunshine, to which her sight had to get accustomed.

Just as they left the cottage, Nell took Harry's hand saying, "Harry, is it really necessary for me to leave the mine at all, even for these few days?"

"Yes, it is, Nell," replied the young man. "It is needful for both of us."

"But, Harry," resumed Nell, "ever since you found me, I have been as happy as I can possibly be. You have been teaching me. Why is that not enough? What am I going up there for?"

Harry looked at her in silence. Nell was giving utterance to nearly his own thoughts.

"My child," said James Starr, "I can well understand the hesitation you feel; but it will be good for you to go with us. Those who love you are taking you, and they will bring you back again. Afterwards you will be free, if you wish it, to continue your life in the coal mine, like old Simon, and Madge, and Harry. But at least you ought to be able to compare what you give up with what you choose, then decide freely. Come!"

"Come, dear Nell!" cried Harry.

"Harry, I am willing to follow you," replied the maiden. At nine o'clock the last train through the tunnel started to convey Nell and her companions to the surface of the earth. Twenty minutes later they alighted on the platform where the branch line to New Aberfoyle joins the railway from Dumbarton to Stirling. 

The night was already dark. From the horizon to the zenith, light vapory clouds hurried through the upper air, driven by a refreshing northwesterly breeze. The day had been lovely; the night promised to be so likewise.

On reaching Stirling, Nell and her friends, quitting the train, left the station immediately. Just before them, between high trees, they could see a road which led to the banks of the river Forth.

The first physical impression on the girl was the purity of the air inhaled eagerly by her lungs.

"Breathe it freely, Nell," said James Starr; "it is fragrant with all the scents of the open country."

"What is all that smoke passing over our heads?" inquired Nell.

"Those are clouds," answered Harry, "blown along by the westerly wind."

"Ah!" said Nell, "how I should like to feel myself carried along in that silent whirl! And what are those shining sparks which glance here and there between rents in the clouds?"

"Those are the stars I have told you about, Nell. So many suns they are, so many centers of worlds like our own, most likely."

The constellations became more clearly visible as the wind cleared the clouds from the deep blue of the firmament. Nell gazed upon the myriad stars which sparkled overhead. "But how is it," she said at length, "that if these are suns, my eyes can endure their brightness?"

"My child," replied James Starr, "they are indeed suns, but suns at an enormous distance. The nearest of these millions of stars, whose rays can reach us, is Vega, that star in Lyra which you observe near the zenith, and that is fifty thousand millions of leagues distant. Its brightness, therefore, cannot affect your vision. But our own sun, which will rise to-morrow, is only distant thirty-eight millions of leagues, and no human eye can gaze fixedly upon that, for it is brighter than the blaze of any furnace. But come, Nell, come!"

They pursued their way, James Starr leading the maiden, Harry walking by her side, while Jack Ryan roamed about like a young dog, impatient of the slow pace of his masters. The road was lonely. Nell kept looking at the great trees, whose branches, waving in the wind, made them seem to her like giants gesticulating wildly. The sound of the breeze in the tree-tops, the deep silence during a lull, the distant line of the horizon, which could be discerned when the road passed over open levels—all these things filled her with new sensations, and left lasting impressions on her mind.

After some time she ceased to ask questions, and her companions respected her silence, not wishing to influence by any words of theirs the girl's highly sensitive imagination, but preferring to allow ideas to arise spontaneously in her soul.

At about half past eleven o'clock, they gained the banks of the river Forth. There a boat, chartered by James Starr, awaited them. In a few hours it would convey them all to Granton. Nell looked at the clear water which flowed up to her feet, as the waves broke gently on the beach, reflecting the starlight. "Is this a lake?" said she.

"No," replied Harry, "it is a great river flowing towards the sea, and soon opening so widely as to resemble a gulf. Taste a little of the water in the hollow of your hand, Nell, and you will perceive that it is not sweet like the waters of Lake Malcolm."

The maiden bent towards the stream, and, raising a little water to her lips, "This is quite salt," said she.

"Yes, the tide is full; the sea water flows up the river as far as this," answered Harry.

"Oh, Harry! Harry!" exclaimed the maiden, "what can that red glow on the horizon be? Is it a forest on fire?"

"No, it is the rising moon, Nell."

"To be sure, that's the moon," cried Jack Ryan, "a fine big silver plate, which the spirits of air hand round and
round the sky to collect the stars in, like money."

"Why, Jack," said the engineer, laughing, "I had no idea you could strike out such bold comparisons!"

"Well, but, Mr. Starr, it is a just comparison. Don't you see the stars disappear as the moon passes on? so I suppose they drop into it."

"What you mean to say, Jack, is that the superior brilliancy of the moon eclipses that of stars of the sixth magnitude, therefore they vanish as she approaches."

"How beautiful all this is!" repeated Nell again and again, with her whole soul in her eyes. "But I thought the moon was round?"

"So she is, when 'full,'" said James Starr; "that means when she is just opposite to the sun. But to-night the moon is in the last quarter, shorn of her just proportions, and friend Jack's grand silver plate looks more like a barber's basin."

"Oh, Mr. Starr, what a base comparison!" he exclaimed, "I was just going to begin a sonnet to the moon, but your barber's basin has destroyed all chance of an inspiration."

Gradually the moon ascended the heavens. Before her light the lingering clouds fled away, while stars still sparkled in the west, beyond the influence of her radiance. Nell gazed in silence on the glorious spectacle. The soft silvery light was pleasant to her eyes, and her little trembling hand expressed to Harry, who clasped it, how deeply she was affected by the scene.

"Let us embark now," said James Starr. "We have to get to the top of Arthur's Seat before sunrise."

The boat was moored to a post on the bank. A boatman awaited them. Nell and her friends took their seats; the sail was spread; it quickly filled before the northwesterly breeze, and they sped on their way.

What a new sensation was this for the maiden! She had been rowed on the waters of Lake Malcolm; but the oar, handled ever so lightly by Harry, always betrayed effort on the part of the oarsman. Now, for the first time, Nell felt herself borne along with a gliding movement, like that of a balloon through the air. The water was smooth as a lake, and Nell reclined in the stern of the boat, enjoying its gentle rocking. Occasionally the effect of the moonlight on the waters was as though the boat sailed across a glittering silver field. Little wavelets rippled along the banks. It was enchanting.

At length Nell was overcome with drowsiness, her eyelids drooped, her head sank on Harry's shoulder--she slept. Harry, sorry that she should miss any of the beauties of this magnificent night, would have aroused her.

"Let her sleep!" said the engineer. "She will better enjoy the novelties of the day after a couple of hours' rest."

At two o'clock in the morning the boat reached Granton pier. Nell awoke. "Have I been asleep?" inquired she.

"No, my child," said James Starr. "You have been dreaming that you slept, that's all."

The night continued clear. The moon, riding in mid-heaven, diffused her rays on all sides. In the little port of Granton lay two or three fishing boats; they rocked gently on the waters of the Firth. The wind fell as the dawn approached. The atmosphere, clear of mists, promised one of those fine autumn days so delicious on the sea coast.

A soft, transparent film of vapor lay along the horizon; the first sunbeam would dissipate it; to the maiden it exhibited that aspect of the sea which seems to blend it with the sky. Her view was now enlarged, without producing the impression of the boundless infinity of ocean.

Harry taking Nell's hand, they followed James Starr and Jack Ryan as they traversed the deserted streets. To Nell, this suburb of the capital appeared only a collection of gloomy dark houses, just like Coal Town, only that the roof was higher, and gleamed with small lights.

She stepped lightly forward, and easily kept pace with Harry. "Are you not tired, Nell?" asked he, after half an hour's walking.

"No! my feet seem scarcely to touch the earth," returned she. "This sky above us seems so high up, I feel as if I could take wing and fly!"

"I say! keep hold of her!" cried Jack Ryan. "Our little Nell is too good to lose. I feel just as you describe though, myself, when I have not left the pit for a long time."

"It is when we no longer experience the oppressive effect of the vaulted rocky roof above Coal Town," said James Starr, "that the spacious firmament appears to us like a profound abyss into which we have, as it were, a desire to plunge. Is that what you feel, Nell?"

"Yes, Mr. Starr, it is exactly like that," said Nell. "It makes me feel giddy."

"Ah! you will soon get over that, Nell," said Harry. "You will get used to the outer world, and most likely forget all about our dark coal pit."

"No, Harry, never!" said Nell, and she put her hand over her eyes, as though she would recall the remembrance of everything she had lately quitted.

Between the silent dwellings of the city, the party passed along Leith Walk, and went round the Calton Hill, where stood, in the light of the gray dawn, the buildings of the Observatory and Nelson's Monument. By Regent's
Bridge and the North Bridge they at last reached the lower extremity of the Canongate. The town still lay wrapt in slumber.

Nell pointed to a large building in the center of an open space, asking, "What great confused mass is that?"

"That confused mass, Nell, is the palace of the ancient kings of Scotland; that is Holyrood, where many a sad scene has been enacted! The historian can here invoke many a royal shade; from those of the early Scottish kings to that of the unhappy Mary Stuart, and the French king, Charles X. When day breaks, however, Nell, this palace will not look so very gloomy. Holyrood, with its four embattled towers, is not unlike some handsome country house. But let us pursue our way. There, just above the ancient Abbey of Holyrood, are the superb cliffs called Salisbury Crags. Arthur's Seat rises above them, and that is where we are going. From the summit of Arthur's Seat, Nell, your eyes shall behold the sun appear above the horizon seaward."

They entered the King's Park, then, gradually ascending they passed across the Queen's Drive, a splendid carriageway encircling the hill, which we owe to a few lines in one of Sir Walter Scott's romances.

Arthur's Seat is in truth only a hill, seven hundred and fifty feet high, which stands alone amid surrounding heights. In less than half an hour, by an easy winding path, James Starr and his party reached the crest of the crouching lion, which, seen from the west, Arthur's Seat so much resembles. There, all four seated themselves; and James Starr, ever ready with quotations from the great Scottish novelist, simply said, "Listen to what is written by Sir Walter Scott in the eighth chapter of the Heart of Mid-Lothian. 'If I were to choose a spot from which the rising or setting sun could be seen to the greatest possible advantage, it would be from this neighborhood.' Now watch, Nell! the sun will soon appear, and for the first time you will contemplate its splendor."

The maiden turned her eyes eastward. Harry, keeping close beside her, observed her with anxious interest. Would the first beams of day overpower her feelings? All remained quiet, even Jack Ryan. A faint streak of pale rose tinted the light vapors of the horizon. It was the first ray of light attacking the laggards of the night. Beneath the hill lay the silent city, massed confusedly in the twilight of dawn. Here and there lights twinkled among the houses of the old town. Westward rose many hill-tops, soon to be illuminated by tips of fire.

Now the distant horizon of the sea became more plainly visible. The scale of colors fell into the order of the solar. Every instant they increased in intensity, rose color became red, red became fiery, daylight dawned. Nell now glanced towards the city, of which the outlines became more distinct. Lofty monuments, slender steeples emerged from the gloom; a kind of ashy light was spread abroad. At length one solitary ray struck on the maiden's sight. It was that ray of green which, morning or evening, is reflected upwards from the sea when the horizon is clear.

An instant afterwards, Nell turned, and pointing towards a bright prominent point in the New Town, "Fire!" cried she.

"No, Nell, that is no fire," said Harry. "The sun has touched with gold the top of Sir Walter Scott's monument"--and, indeed, the extreme point of the monument blazed like the light of a pharos.

It was day—the sun arose—his disc seemed to glitter as though he indeed emerged from the waters of the sea. Appearing at first very large from the effects of refraction, he contracted as he rose and assumed the perfectly circular form. Soon no eye could endure the dazzling splendor; it was as though the mouth of a furnace was opened through the sky.

Nell closed her eyes, but her eyelids could not exclude the glare, and she pressed her fingers over them. Harry advised her to turn in the opposite direction. "Oh, no," said she, "my eyes must get used to look at what yours can bear to see!"

Even through her hands Nell perceived a rosy light, which became more white as the sun rose above the horizon. As her sight became accustomed to it, her eyelids were raised, and at length her eyes drank in the light of day.

The good child knelt down, exclaiming, "Oh Lord God! how beautiful is Thy creation!" Then she rose and looked around. At her feet extended the panorama of Edinburgh—the clear, distinct lines of streets in the New Town, and the irregular mass of houses, with their confused network of streets and lanes, which constitutes Auld Reekie, properly so called. Two heights commanded the entire city; Edinburgh Castle, crowning its huge basaltic rock, and the Calton Hill, bearing on its rounded summit, among other monuments, ruins built to represent those of the Parthenon at Athens.

Fine roadways led in all directions from the capital. To the north, the coast of the noble Firth of Forth was indented by a deep bay, in which could be seen the seaport town of Leith, between which and this Modern Athens of the north ran a street, straight as that leading to the Piraeus.

Beyond the wide Firth could be seen the soft outlines of the county of Fife, while beneath the spectator stretched the yellow sands of Portobello and Newhaven.

Nell could not speak. Her lips murmured a word or two indistinctly; she trembled, became giddy, her strength failed her; overcome by the purity of the air and the sublimity of the scene, she sank fainting into Harry's arms, who, watching her closely, was ready to support her.
The youthful maiden, hitherto entombed in the massive depths of the earth, had now obtained an idea of the
universe—of the works both of God and of man. She had looked upon town and country, and beyond these, into the
immensity of the sea, the infinity of the heavens.

CHAPTER XV. LOCH LOMOND AND LOCH KATRINE

HARRY bore Nell carefully down the steeps of Arthur's Seat, and, accompanied by James Starr and Jack Ryan,
they reached Lambert's Hotel. There a good breakfast restored their strength, and they began to make further plans
for an excursion to the Highland lakes.

Nell was now refreshed, and able to look boldly forth into the sunshine, while her lungs with ease inhaled the
free and healthful air. Her eyes learned gladly to know the harmonious varieties of color as they rested on the green
trees, the azure skies, and all the endless shades of lovely flowers and plants.

The railway train, which they entered at the Waverley Station, conveyed Nell and her friends to Glasgow. There,
from the new bridge across the Clyde, they watched the curious sea-like movement of the river. After a night's rest
at Comrie's Royal Hotel, they betook themselves to the terminus of the Edinburgh and Glasgow Railway, from
whence a train would rapidly carry them, by way of Dumbarton and Balloch, to the southern extremity of Loch
Lomond.

"Now for the land of Rob Roy and Fergus MacIvor!—the scenery immortalized by the poetical descriptions of
Walter Scott," exclaimed James Starr. "You don't know this country, Jack?"

"Only by its songs, Mr. Starr," replied Jack; "and judging by those, it must be grand."

"So it is, so it is!" cried the engineer, "and our dear Nell shall see it to the best advantage."

A steamboat, the SINCLAIR by name, awaited tourists about to make the excursion to the lakes. Nell and her
companions went on board. The day had begun in brilliant sunshine, free from the British fogs which so often veil
the skies.

The passengers were determined to lose none of the beauties of nature to be displayed during the thirty miles'
voyage. Nell, seated between James Starr and Harry, drank in with every faculty the magnificent poetry with which
lovely Scottish scenery is fraught. Numerous small isles and islets soon appeared, as though thickly sown on the
bosom of the lake. The SINCLAIR steamed her way among them, while between them glimpses could be had of
quiet valleys, or wild rocky gorges on the mainland.

"Nell," said James Starr, "every island here has its legend, perhaps its song, as well as the mountains which
overshadow the lake. One may, without much exaggeration, say that the history of this country is written in gigantic
characters of mountains and islands."

Nell listened, but these fighting stories made her sad. Why all that bloodshed on plains which to her seemed
enormous, and where surely there must have been room for everybody?

The shores of the lake form a little harbor at Luss. Nell could for a moment catch sight of the old tower of its
ancient castle. Then, the SINCLAIR turning northward, the tourists gazed upon Ben Lomond, towering nearly 3,000
feet above the level of the lake.

"Oh, what a noble mountain!" cried Nell; "what a view there must be from the top!"

"Yes, Nell," answered James Starr; "see how haughtily its peak rises from amidst the thicket of oaks, birches,
and heather, which clothe the lower portion of the mountain! From thence one may see two-thirds of old Caledonia.
This eastern side of the lake was the special abode of the clan McGregor. At no great distance, the struggles of the
Jacobites and Hanoverians repeatedly dyed with blood these lonely glens. Over these scenes shines the pale moon,
called in old ballads 'Macfarlane's lantern.' Among these rocks still echo the immortal names of Rob Roy and
McGregor Campbell."

As the SINCLAIR advanced along the base of the mountain, the country became more and more abrupt in
character. Trees were only scattered here and there; among them were the willows, slender wands of which were
formerly used for hanging persons of low degree.

"To economize hemp," remarked James Starr.

The lake narrowed very much as it stretched northwards.

The steamer passed a few more islets, Inveruglas, Eilad-whow, where stand some ruins of a stronghold of the
clan MacFarlane. At length the head of the loch was reached, and the SINCLAIR stopped at Inversnaid.

Leaving Loch Arklet on the left, a steep ascent led to the Inn of Stronachlacar, on the banks of Loch Katrine.

There, at the end of a light pier, floated a small steamboat, named, as a matter of course, the Rob Roy. The
travelers immediately went on board; it was about to start. Loch Katrine is only ten miles in length; its width never
exceeds two miles. The hills nearest it are full of a character peculiar to themselves.

"Here we are on this famous lake," said James Starr. "It has been compared to an eel on account of its length and
windings: and justly so. They say that it never freezes. I know nothing about that, but what we want to think of is, that here are the scenes of the adventures in the Lady of the Lake. I believe, if friend Jack looked about him carefully, he might see, still gliding over the surface of the water, the shade of the slender form of sweet Ellen Douglas."

"To be sure, Mr. Starr," replied Jack; "why should I not? I may just as well see that pretty girl on the waters of Loch Katrine, as those ugly ghosts on Loch Malcolm in the coal pit."

It was by this time three o'clock in the afternoon. The less hilly shores of Loch Katrine westward extended like a picture framed between Ben An and Ben Venue. At the distance of half a mile was the entrance to the narrow bay, where was the landing-place for our tourists, who meant to return to Stirling by Callander.

Nell appeared completely worn out by the continued excitement of the day. A faint ejaculation was all she was able to utter in token of admiration as new objects of wonder or beauty met her gaze. She required some hours of rest, were it but to impress lastingly the recollection of all she had seen.

Her hand rested in Harry's, and, looking earnestly at her, he said, "Nell, dear Nell, we shall soon be home again in the gloomy region of the coal mine. Shall you not pine for what you have seen during these few hours spent in the glorious light of day?"

"No, Harry," replied the girl; "I shall like to think about it, but I am glad to go back with you to our dear old home."

"Nell!" said Harry, vainly attempting to steady his voice, "are you willing to be bound to me by the most sacred tie? Could you marry me, Nell?"

"Yes, Harry, I could, if you are sure that I am able to make you happy," answered the maiden, raising her innocent eyes to his.

Scarcely had she pronounced these words when an unaccountable phenomenon took place. The Rob Roy, still half a mile from land, experienced a violent shock. She suddenly grounded. No efforts of the engine could move her. The cause of this accident was simply that Loch Katrine was all at once emptied, as though an enormous fissure had opened in its bed. In a few seconds it had the appearance of a sea beach at low water. Nearly the whole of its contents had vanished into the bosom of the earth.

"My friends!" exclaimed James Starr, as the cause of this marvel became suddenly clear to him, "God help New Aberfoyle!"

CHAPTER XVI. A FINAL THREAT

ON that day, in the colliery of New Aberfoyle, work was going on in the usual regular way. In the distance could be heard the crash of great charges of dynamite, by which the carboniferous rocks were blasted. Here masses of coal were loosened by pick-ax and crowbar; there the perforating machines, with their harsh grating, bored through the masses of sandstone and schist.

Hollow, cavernous noises resounded on all sides. Draughts of air rushed along the ventilating galleries, and the wooden swing-doors slammed beneath their violent gusts. In the lower tunnels, trains of trucks kept passing along at the rate of fifteen miles an hour, while at their approach electric bells warned the workmen to cower down in the refuge places. Lifts went incessantly up and down, worked by powerful engines on the surface of the soil. Coal Town was throughout brilliantly lighted by the electric lamps at full power.

Mining operations were being carried on with the greatest activity; coal was being piled incessantly into the trucks, which went in hundreds to empty themselves into the corves at the bottom of the shaft. While parties of miners who had labored during the night were taking needful rest, the others worked without wasting an hour.

Old Simon Ford and Madge, having finished their dinner, were resting at the door of their cottage. Simon smoked a good pipe of tobacco, and from time to time the old couple spoke of Nell, of their boy, of Mr. Starr, and wondered how they liked their trip to the surface of the earth. Where would they be now? What would they be doing? How could they stay so long away from the mine without feeling homesick?

Just then a terrific roaring noise was heard. It was like the sound of a mighty cataract rushing down into the mine. The old people rose hastily. They perceived at once that the waters of Loch Malcolm were rising. A great wave, unfurling like a billow, swept up the bank and broke against the walls of the cottage. Simon caught his wife in his arms, and carried her to the upper part of their dwelling.

At the same moment, cries arose from all parts of Coal Town, which was threatened by a sudden inundation. The inhabitants fled for safety to the top of the schist rocks bordering the lake; terror spread in all directions; whole families in frantic haste rushed towards the tunnel in order to reach the upper regions of the pit.

It was feared that the sea had burst into the colliery, for its galleries and passages penetrated as far as the Caledonian Canal. In that case the entire excavation, vast as it was, would be completely flooded. Not a single
inhabitant of New Aberfoyle would escape death.

But when the foremost fugitives reached the entrance to the tunnel, they encountered Simon Ford, who had quitted his cottage. "Stop, my friends, stop!" shouted the old man; "if our town is to be overwhelmed, the floods will rush faster than you can; no one can possibly escape. But see! the waters are rising no further! it appears to me the danger is over."

"And our comrades at the far end of the works--what about them?" cried some of the miners.

"There is nothing to fear for them," replied Simon; "they are working on a higher level than the bed of the loch."

It was soon evident that the old man was in the right. The sudden influx of water had rushed to the very lowest bed of the vast mine, and its only ultimate effect was to raise the level of Loch Malcolm a few feet. Coal Town was uninjured, and it was reasonable to hope that no one had perished in the flood of water which had descended to the depths of the mine never yet penetrated by the workmen.

Simon and his men could not decide whether this inundation was owing to the overflow of a subterranean sheet of water penetrating fissures in the solid rock, or to some underground torrent breaking through its worn bed, and precipitating itself to the lowest level of the mine. But that very same evening they knew what to think about it, for the local papers published an account of the marvelous phenomenon which Loch Katrine had exhibited.

The surprising news was soon after confirmed by the four travelers, who, returning with all possible speed to the cottage, learned with extreme satisfaction that no serious damage was done in New Aberfoyle.

The bed of Loch Katrine had fairly given way. The waters had suddenly broken through by an enormous fissure into the mine beneath. Of Sir Walter Scott's favorite loch there was not left enough to wet the pretty foot of the Lady of the Lake; all that remained was a pond of a few acres at the further extremity.

This singular event made a profound sensation in the country. It was a thing unheard of that a lake should in the space of a few minutes empty itself, and disappear into the bowels of the earth. There was nothing for it but to erase Loch Katrine from the map of Scotland until (by public subscription) it could be refilled, care being of course taken, in the first place, to stop the rent up tight. This catastrophe would have been the death of Sir Walter Scott, had he still been in the world.

The accident was explicable when it was ascertained that, between the bed of the lake and the vast cavity beneath, the geological strata had become reduced to a thin layer, incapable of longer sustaining the weight of water.

Now, although to most people this event seemed plainly due to natural causes, yet to James Starr and his friends, Simon and Harry Ford, the question constantly recurred, was it not rather to be attributed to malevolence? Uneasy suspicions continually harassed their minds. Was their evil genius about to renew his persecution of those who ventured to work this rich mine?

At the cottage, some days later, James Starr thus discussed the matter with the old man and his son: "Well, Simon," said he, "to my thinking we must class this circumstance with the others for which we still seek elucidation, although it is no doubt possible to explain it by natural causes."

"I am quite of your mind, Mr. James," replied Simon, "but take my advice, and say nothing about it; let us make all researches ourselves."

"Oh, I know the result of such research beforehand!" cried the engineer.

"And what will it be, then?"

"We shall find proofs of malevolence, but not the malefactor."

"But he exists! he is there! Where can he lie concealed? Is it possible to conceive that the most depraved human being could, single-handed, carry out an idea so infernal as that of bursting through the bed of a lake? I believe I shall end by thinking, like Jack Ryan, that the evil demon of the mine revenges himself on us for having invaded his domain."

Nell was allowed to hear as little as possible of these discussions. Indeed, she showed no desire to enter into them, although it was very evident that she shared in the anxieties of her adopted parents. The melancholy in her countenance bore witness to much mental agitation.

It was at length resolved that James Starr, together with Simon and Harry, should return to the scene of the disaster, and endeavor to satisfy themselves as to the cause of it. They mentioned their project to no one. To those unacquainted with the group of facts on which it was based, the opinion of Starr and his friends could not fail to appear wholly inadmissible.

A few days later, the three friends proceeded in a small boat to examine the natural pillars on which had rested the solid earth forming the basin of Loch Katrine. They discovered that they had been right in suspecting that the massive columns had been undermined by blasting. The blackened traces of explosion were to be seen, the waters having subsided below the level of these mysterious operations. Thus the fall of a portion of the vast vaulted dome was proved to have been premeditated by man, and by man's hand had it been effected.

"It is impossible to doubt it," said James Starr; "and who can say what might not have happened had the sea,
instead of a little loch, been let in upon us?"

"You may well say that," cried the old overman, with a feeling of pride in his beloved mine; "for nothing less than a sea would have drowned our Aberfoyle. But, once more, what possible interest could any human being have in the destruction of our works?"

"It is quite incomprehensible," replied James Starr. "This case is something perfectly unlike that of a band of common criminals, who, concealing themselves in dens and caves, go forth to rob and pillage the surrounding country. The evil deeds of such men would certainly, in the course of three years have betrayed their existence and lurking-places. Neither can it be, as I sometimes used to think, that smugglers or coiners carried on their illegal practices in some distant and unknown corner of these prodigious caverns, and were consequently anxious to drive us out of them. But no one coins false money or obtains contraband goods only to conceal them!

"Yet it is clear that an implacable enemy has sworn the ruin of New Aberfoyle, and that some interest urges him to seek in every possible way to wreak his hatred upon us. He appears to be too weak to act openly, and lays his schemes in secret; but displays such intelligence as to render him a most formidable foe.

"My friends, he must understand better than we do the secrets of our domain, since he has all this time eluded our vigilance. He must be a man experienced in mining, skilled beyond the most skillful--that's certain, Simon! We have proof enough of that.

"Let me see! Have you never had a personal enemy, to whom your suspicions might point? Think well! There is such a thing as hatred which time never softens. Go back to recollections of your earliest days. What befalls us appears the work of a stern and patient will, and to explain it demands every effort of thought and memory."

Simon did not answer immediately--his mind evidently engaged in a close and candid survey of his past life. Presently, raising his head, "No," said he; "no! Heaven be my witness, neither Madge nor I have ever injured anybody. We cannot believe that we have a single enemy in the world."

"Ah! if Nell would only speak!" cried the engineer.

"Mr. Starr--and you, father," said Harry, "I do beg of you to keep silence on this matter, and not to question my poor Nell. I know she is very anxious and uneasy; and I feel positive that some great secret painfully oppresses her heart. Either she knows nothing it would be of any use for us to hear, or she considers it her duty to be silent. It is impossible to doubt her affection for us--for all of us. If at a future time she informs me of what she has hitherto concealed from us, you shall know about it immediately."

"So be it, then, Harry," answered the engineer; "and yet I must say Nell's silence, if she knows anything, is to me perfectly inexplicable."

Harry would have continued her defense; but the engineer stopped him, saying, "All right, Harry; we promise to say no more about it to your future wife."

"With my father's consent she shall be my wife without further delay."

"My boy," said old Simon, "your marriage shall take place this very day month. Mr. Starr, will you undertake the part of Nell's father?"

"You may reckon upon me for that, Simon," answered the engineer.

They then returned to the cottage, but said not a word of the result of their examinations in the mine, so that to the rest of its inhabitants, the bursting in of the vaulted roof of the caverns continued to be regarded as a mere accident. There was but a loch the less in Scotland.

Nell gradually resumed her customary duties, and Harry made good use of her little visit to the upper air, in the instructions he gave her. She enjoyed the recollections of life above ground, yet without regretting it. The somber region she had loved as a child, and in which her wedded life would be spent, was as dear to her as ever.

The approaching marriage created great excitement in New Aberfoyle. Good wishes poured in on all sides, and foremost among them were Jack Ryan's. He was detected busily practicing his best songs in preparation for the great day, which was to be celebrated by the whole population of Coal Town.

During the month preceding the wedding-day, there were more accidents occurring in New Aberfoyle than had ever been known in the place. One would have thought the approaching union of Harry and Nell actually provoked one catastrophe after another. These misfortunes happened chiefly at the further and lowest extremity of the works, and the cause of them was always in some way mysterious.

Thus, for instance, the wood-work of a distant gallery was discovered to be in flames, which were extinguished by Harry and his companions at the risk of their lives, by employing engines filled with water and carbonic acid, always kept ready in case of necessity. The lamp used by the incendiary was found; but no clew whatever as to who he could be.

Another time an inundation took place in consequence of the stanchions of a water-tank giving way; and Mr. Starr ascertained beyond a doubt that these supports had first of all been partially sawn through. Harry, who had been overseeing the works near the place at the time, was buried in the falling rubbish, and narrowly escaped death.
A few days afterwards, on the steam tramway, a train of trucks, which Harry was passing along, met with an obstacle on the rails, and was overturned. It was then discovered that a beam had been laid across the line. In short, events of this description became so numerous that the miners were seized with a kind of panic, and it required all the influence of their chiefs to keep them on the works.

"You would think that there was a whole band of these ruffians," Simon kept saying, "and we can't lay hands on a single one of them."

Search was made in all directions. The county police were on the alert night and day, yet discovered nothing. The evil intentions seeming specially designed to injure Harry. Starr forbade him to venture alone beyond the ordinary limits of the works.

They were equally careful of Nell, although, at Harry's entreaty, these malicious attempts to do harm were concealed from her, because they might remind her painfully of former times. Simon and Madge watched over her by day and by night with a sort of stern solicitude. The poor child yielded to their wishes, without a remark or a complaint. Did she perceive that they acted with a view to her interest? Probably she did. And on her part, she seemed to watch over others, and was never easy unless all whom she loved were together in the cottage.

When Harry came home in the evening, she could not restrain expressions of child-like joy, very unlike her usual manner, which was rather reserved than demonstrative. As soon as day broke, she was astir before anyone else, and her constant uneasiness lasted all day until the hour of return home from work.

Harry became very anxious that their marriage should take place. He thought that, when the irrevocable step was taken, malevolence would be disarmed, and that Nell would never feel safe until she was his wife. James Starr, Simon, and Madge, were all of the same opinion, and everyone counted the intervening days, for everyone suffered from the most uncomfortable forebodings.

It was perfectly evident that nothing relating to Nell was indifferent to this hidden foe, whom it was impossible to meet or to avoid. Therefore it seemed quite possible that the solemn act of her marriage with Harry might be the occasion of some new and dreadful outbreak of his hatred.

One morning, a week before the day appointed for the ceremony, Nell, rising early, went out of the cottage before anyone else. No sooner had she crossed the threshold than a cry of indescribable anguish escaped her lips. Her voice was heard throughout the dwelling; in a moment, Madge, Harry, and Simon were at her side. Nell was pale as death, her countenance agitated, her features expressing the utmost horror. Unable to speak, her eyes were riveted on the door of the cottage, which she had just opened.

With rigid fingers she pointed to the following words traced upon it during the night: "Simon Ford, you have robbed me of the last vein in our old pit. Harry, your son, has robbed me of Nell. Woe betide you! Woe betide you all! Woe betide New Aberfoyle!--SILFAX."

"Silfax!" exclaimed Simon and Madge together.

"Who is this man?" demanded Harry, looking alternately at his father and at the maiden.

"Silfax!" repeated Nell in tones of despair, "Silfax!"--and, murmuring this name, her whole frame shuddering with fear and agitation, she was borne away to her chamber by old Madge.

James Starr, hastening to the spot, read the threatening sentences again and again.

"The hand which traced these lines," said he at length, "is the same which wrote me the letter contradicting yours, Simon. The man calls himself Silfax. I see by your troubled manner that you know him. Who is this Silfax?"

CHAPTER XVII. THE "MONK"

THIS name revealed everything to the old overman. It was that of the last "monk" of the Dochart pit.

In former days, before the invention of the safety-lamp, Simon had known this fierce man, whose business it was to go daily, at the risk of his life, to produce partial explosions of fire-damp in the passages. He used to see this strange solitary being, prowling about the mine, always accompanied by a monstrous owl, which he called Harfang, who assisted him in his perilous occupation, by soaring with a lighted match to places Silfax was unable to reach.

One day this old man disappeared, and at the same time also, a little orphan girl born in the mine, who had no relation but himself, her great-grandfather. It was perfectly evident now that this child was Nell. During the fifteen years, up to the time when she was saved by Harry, they must have lived in some secret abyss of the mine.

The old overman, full of mingled compassion and anger, made known to the engineer and Harry all that the name of Silfax had revealed to him. It explained the whole mystery. Silfax was the mysterious being so long vainly sought for in the depths of New Aberfoyle.

"So you knew him, Simon?" demanded Mr. Starr.

"Yes, that I did," replied the overman. "The Harfang man, we used to call him. Why, he was old then! He must be fifteen or twenty years older than I am. A wild, savage sort of fellow, who held aloof from everyone and was
known to fear nothing—neither fire nor water. It was his own fancy to follow the trade of 'monk,' which few would have liked. The constant danger of the business had unsettled his brain. He was prodigiously strong, and he knew the mine as no one else—at any rate, as well as I did. He lived on a small allowance. In faith, I believed him dead years ago."

"But," resumed James Starr, "what does he mean by those words, 'You have robbed me of the last vein of our old mine'?"

"Ah! there it is," replied Simon; "for a long time it had been a fancy of his—I told you his mind was deranged—that he had a right to the mine of Aberfoyle; so he became more and more savage in temper the deeper the Dochart pit—his pit!—was worked out. It just seemed as if it was his own body that suffered from every blow of the pickax. You must remember that, Madge?"

"Ay, that I do, Simon," replied she.

"I can recollect all this," resumed Simon, "since I have seen the name of Silfax on the door. But I tell you, I thought the man was dead, and never imagined that the spiteful being we have so long sought for could be the old fireman of the Dochart pit."

"Well, now, then," said Starr, "it is all quite plain. Chance made known to Silfax the new vein of coal. With the egotism of madness, he believed himself the owner of a treasure he must conceal and defend. Living in the mine, and wandering about day and night, he perceived that you had discovered the secret, and had written in all haste to beg me to come. Hence the letter contradicting yours; hence, after my arrival, all the accidents that occurred, such as the block of stone thrown at Harry, the broken ladder at the Yarrow shaft, the obstruction of the openings into the wall of the new cutting; hence, in short, our imprisonment, and then our deliverance, brought about by the kind assistance of Nell, who acted of course without the knowledge of this man Silfax, and contrary to his intentions."

"You describe everything exactly as it must have happened, Mr. Starr," returned old Simon. "The old 'Monk' is mad enough now, at any rate!"

"All the better," quoth Madge.

"I don't know that," said Starr, shaking his head; "it is a terrible sort of madness this."

"Ah! now I understand that the very thought of him must have terrified poor little Nell, and also I see that she could not bear to denounce her grandfather. What a miserable time she must have had of it with the old man!"

"Miserable with a vengeance," replied Simon, "between that savage and his owl, as savage as himself. Depend upon it, that bird isn't dead. That was what put our lamp out, and also so nearly cut the rope by which Harry and Nell were suspended."

"And then, you see," said Madge, "this news of the marriage of our son with his granddaughter added to his rancor and ill-will."

"To be sure," said Simon. "To think that his Nell should marry one of the robbers of his own coal mine would just drive him wild altogether."

"He will have to make up his mind to it, however," cried Harry. "Mad as he is, we shall manage to convince him that Nell is better off with us here than ever she was in the caverns of the pit. I am sure, Mr. Starr, if we could only catch him, we should be able to make him listen to reason."

"My poor Harry! there is no reasoning with a madman," replied the engineer. "Of course it is better to know your enemy than not; but you must not fancy all is right because we have found out who he is. We must be on our guard, my friends; and to begin with, Harry, you positively must question Nell. She will perceive that her silence is no longer reasonable. Even for her grandfather's own interest, she ought to speak now. For his own sake, as well as for ours, these insane plots must be put a stop to."

"I feel sure, Mr. Starr," answered Harry, "that Nell will of herself propose to tell you what she knows. You see it was from a sense of duty that she has been silent hitherto. My mother was very right to take her to her room just now. She much needed time to recover her spirits; but now I will go for her."

"You need not do so, Harry," said the maiden in a clear and firm voice, as she entered at that moment the room in which they were. Nell was very pale; traces of tears were in her eyes; but her whole manner showed that she had nervèd herself to act as her loyal heart dictated as her duty.

"Nell!" cried Harry, springing towards her.

The girl arrested her lover by a gesture, and continued, "Your father and mother, and you, Harry, must now know all. And you too, Mr. Starr, must remain ignorant of nothing that concerns the child you have received, and whom Harry—unfortunately for him, alas!—drew from the abyss."

"Oh, Nell! what are you saying?" cried Harry.

"Allow her to speak," said James Starr in a decided tone.

"I am the granddaughter of old Silfax," resumed Nell. "I never knew a mother till the day I came here," added she, looking at Madge.
“Blessed be that day, my daughter!” said the old woman.

“I knew no father till I saw Simon Ford,” continued Nell; “nor friend till the day when Harry’s hand touched mine. Alone with my grandfather I have lived during fifteen years in the remote and most solitary depths of the mine. I say WITH my grandfather, but I can scarcely use the expression, for I seldom saw him. When he disappeared from Old Aberfoyle, he concealed himself in caverns known only to himself. In his way he was kind to me, dreadful as he was; he fed me with whatever he could procure from outside the mine; but I can dimly recollect that in my earliest years I was the nursling of a goat, the death of which was a bitter grief to me. My grandfather, seeing my distress, brought me another animal—a dog he said it was. But, unluckily, this dog was lively, and barked. Grandfather did not like anything cheerful. He had a horror of noise, and had taught me to be silent; the dog he could not teach to be quiet, so the poor animal very soon disappeared. My grandfather’s companion was a ferocious bird, Harfang, of which, at first, I had a perfect horror; but this creature, in spite of my dislike to it, took such a strong affection for me, that I could not help returning it. It even obeyed me better than its master, which used to make me quite uneasy, for my grandfather was jealous. Harfang and I did not dare to let him see us much together; we both knew it would be dangerous. But I am talking too much about myself: the great thing is about you.”

“No, my child,” said James Starr, “tell us everything that comes to your mind.”

“My grandfather,” continued Nell, “always regarded your abode in the mine with a very evil eye—not that there was any lack of space. His chosen refuge was far—very far from you. But he could not bear to feel that you were there. If I asked any questions about the people up above us, his face grew dark, he gave no answer, and continued quite silent for a long time afterwards. But when he perceived that, not content with the old domain, you seemed to think of encroaching upon his, then indeed his anger burst forth. He swore that, were you to succeed in reaching the new mine, you should assuredly perish. Notwithstanding his great age, his strength is astonishing, and his threats used to make me tremble.”

“Go on, Nell, my child,” said Simon to the girl, who paused as though to collect her thoughts.

“On the occasion of your first attempt,” resumed Nell, “as soon as my grandfather saw that you were fairly inside the gallery leading to New Aberfoyle, he stopped up the opening, and turned it into a prison for you. I only knew you as shadows dimly seen in the gloom of the pit, but I could not endure the idea that you would die of hunger in these horrid places; and so, at the risk of being detected, I succeeded in obtaining bread and water for you during some days. I should have liked to help you to escape, but it was so difficult to avoid the vigilance of my grandfather. You were about to die. Then arrived Jack Ryan and the others. By the providence of God I met with them, and instantly guided them to where you were. When my grandfather discovered what I had done, his rage against me was terrible. I expected death at his hands. After that my life became insupportable to me. My grandfather completely lost his senses. He proclaimed himself King of Darkness and Flame; and when he heard your tools at work on coal-beds which he considered entirely his own, he became furious and beat me cruelly. I would have fled from him, but it was impossible, so narrowly did he watch me. At last, in a fit of ungovernable fury, he threw me down into the abyss where you found me, and disappeared, vainly calling on Harfang, which faithfully stayed by me, to follow him. I know not how long I remained there, but I felt I was at the point of death when you, my Harry, came and saved me. But now you all see that the grandchild of old Silfax can never be the wife of Harry Ford, because it would be certain death to you all!”

“No!” cried Harry.

“No,” continued the maiden, “my resolution is taken. By one means only can your ruin be averted; I must return to my grandfather. He threatens to destroy the whole of New Aberfoyle. His is a soul incapable of mercy or forgiveness, and no mortal can say to what horrid deed the spirit of revenge will lead him. My duty is clear; I should have taught me what happiness is. Whatever may befall, believe that my whole heart remains with you.”

“Nell! is it possible you would leave us?”

James Starr put them all aside with an air of authority, and, going straight up to Nell, he took both her hands in his, saying quietly, “Very right, my child; you have said exactly what you ought to say; and now listen to what we have to say in reply. We shall not let you go away; if necessary, we shall keep you by force. Do you think we could be so base as to accept of your generous proposal? These threats of Silfax are formidable—no doubt about it! But, after all, a man is but a man, and we can take precautions. You will tell us, will you not, even for his own sake, all you can about his habits and his lurking-places? All we want to do is to put it out of his power to do harm, and perhaps bring him to reason.”

“You want to do what is quite impossible,” said Nell. “My grandfather is everywhere and nowhere. I have never seen his retreats. I have never seen him sleep. If he meant to conceal himself, he used to leave me alone, and vanish. When I took my resolution, Mr. Starr, I was aware of everything you could say against it. Believe me, there is but
one way to render Silfax powerless, and that will be by my return to him. Invisible himself, he sees everything that goes on. Just think whether it is likely he could discover your very thoughts and intentions, from that time when the letter was written to Mr. Starr, up to now that my marriage with Harry has been arranged, if he did not possess the extraordinary faculty of knowing everything. As far as I am able to judge, my grandfather, in his very insanity, is a man of most powerful mind. He formerly used to talk to me on very lofty subjects. He taught me the existence of God, and never deceived me but on one point, which was--that he made me believe that all men were base and perfidious, because he wished to inspire me with his own hatred of all the human race. When Harry brought me to the cottage, you thought I was simply ignorant of mankind, but, far beyond that, I was in mortal fear of you all. Ah, forgive me! I assure you, for many days I believed myself in the power of wicked wretches, and I longed to escape. You, Madge, first led me to perceive the truth, not by anything you said, but by the sight of your daily life, for I saw that your husband and son loved and respected you! Then all these good and happy workmen, who so revere and trust Mr. Starr, I used to think they were slaves; and when, for the first time, I saw the whole population of Aberfoyle come to church and kneel down to pray to God, and praise Him for His infinite goodness, I said to myself, 'My grandfather has deceived me.' But now, enlightened by all you have taught me, I am inclined to think he himself is deceived. I mean to return to the secret passages I formerly frequented with him. He is certain to be on the watch. I will call to him; he will hear me, and who knows but that, by returning to him, I may be able to bring him to the knowledge of the truth?"

The maiden spoke without interruption, for all felt that it was good for her to open her whole heart to her friends. But when, exhausted by emotion, and with eyes full of tears, she ceased speaking, Harry turned to old Madge and said, "Mother, what should you think of the man who could forsake the noble girl whose words you have been listening to?"

"I should think he was a base coward," said Madge, "and, were he my son, I should renounce and curse him."

"Nell, do you hear what our mother says?" resumed Harry. "Wherever you go I will follow you. If you persist in leaving us, we will go away together."

"Harry! Harry!" cried Nell.

Overcome by her feelings, the girl's lips blanched, and she sank into the arms of Madge, who begged she might be left alone with her.

CHAPTER XVIII. NELL'S WEDDING

IT was agreed that the inhabitants of the cottage must keep more on their guard than ever. The threats of old Silfax were too serious to be disregarded. It was only too possible that he possessed some terrible means by which the whole of Aberfoyle might be annihilated.

Armed sentinels were posted at the various entrances to the mine, with orders to keep strict watch day and night. Any stranger entering the mine was brought before James Starr, that he might give an account of himself. There being no fear of treason among the inhabitants of Coal Town, the threatened danger to the subterranean colony was made known to them. Nell was informed of all the precautions taken, and became more tranquil, although she was not free from uneasiness. Harry's determination to follow her wherever she went compelled her to promise not to escape from her friends.

During the week preceding the wedding, no accident whatever occurred in Aberfoyle. The system of watching was carefully maintained, but the miners began to recover from the panic, which had seriously interrupted the work of excavation. James Starr continued to look out for Silfax. The old man having vindictively declared that Nell should never marry Simon's son, it was natural to suppose that he would not hesitate to commit any violent deed which would hinder their union.

The examination of the mine was carried on minutely. Every passage and gallery was searched, up to those higher ranges which opened out among the ruins of Dundonald Castle. It was rightly supposed that through this old building Silfax passed out to obtain what was needful for the support of his miserable existence (which he must have done, either by purchasing or thieving).

As to the "fire-maidens," James Starr began to think that appearance must have been produced by some jet of fire-damp gas which, issuing from that part of the pit, could be lighted by Silfax. He was not far wrong; but all search for proof of this was fruitless, and the continued strain of anxiety in this perpetual effort to detect a malignant and invisible being rendered the engineer--outwardly calm--an unhappy man.

As the wedding-day approached, his dread of some catastrophe increased, and he could not but speak of it to the old overman, whose uneasiness soon more than equaled his own. At length the day came. Silfax had given no token of existence.
By daybreak the entire population of Coal Town was astir. Work was suspended; overseers and workmen alike desired to do honor to Simon Ford and his son. They all felt they owed a large debt of gratitude to these bold and persevering men, by whose means the mine had been restored to its former prosperity. The ceremony was to take place at eleven o'clock, in St. Giles's chapel, which stood on the shores of Loch Malcolm.

At the appointed time, Harry left the cottage, supporting his mother on his arm, while Simon led the bride. Following them came Starr, the engineer, composed in manner, but in reality nerved to expect the worst, and Jack Ryan, stepping superb in full Highland piper's costume. Then came the other mining engineers, the principal people of Coal Town, the friends and comrades of the old overman--every member of this great family of miners forming the population of New Aberfoyle.

In the outer world, the day was one of the hottest of the month of August, peculiarly oppressive in northern countries. The sultry air penetrated the depths of the coal mine, and elevated the temperature. The air which entered through the ventilating shafts, and the great tunnel of Loch Malcolm, was charged with electricity, and the barometer, it was afterwards remarked, had fallen in a remarkable manner. There was, indeed, every indication that a storm might burst forth beneath the rocky vault which formed the roof of the enormous crypt of the very mine itself.

But the inhabitants were not at that moment troubling themselves about the chances of atmospheric disturbance above ground. Everybody, as a matter of course, had put on his best clothes for the occasion. Madge was dressed in the fashion of days gone by, wearing the "toy" and the "rokelay," or Tartan plaid, of matrons of the olden time, old Simon wore a coat of which Bailie Nicol Jarvie himself would have approved.

Nell had resolved to show nothing of her mental agitation; she forbade her heart to beat, or her inward terrors to betray themselves, and the brave girl appeared before all with a calm and collected aspect. She had declined every ornament of dress, and the very simplicity of her attire added to the charming elegance of her appearance. Her hair was bound with the "snood," the usual head-dress of Scottish maidens.

All proceeded towards St. Giles's chapel, which had been handsomely decorated for the occasion.

The electric discs of light which illuminated Coal Town blazed like so many suns. A luminous atmosphere pervaded New Aberfoyle. In the chapel, electric lamps shed a glow over the stained-glass windows, which shone like fiery kaleidoscopes. At the porch of the chapel the minister awaited the arrival of the wedding party.

It approached, after having passed in stately procession along the shore of Loch Malcolm. Then the tones of the organ were heard, and, preceded by the minister, the group advanced into the chapel. The Divine blessing was first invoked on all present. Then Harry and Nell remained alone before the minister, who, holding the sacred book in his hand, proceeded to say, "Harry, will you take Nell to be your wife, and will you promise to love her always?"

"I promise," answered the young man in a firm and steady voice.

"And you, Nell," continued the minister, "will you take Harry to be your husband, and--"

Before he could finish the sentence, a prodigious noise resounded from without. One of the enormous rocks, on which was formed the terrace overhanging the banks of Loch Malcolm, had suddenly given way and opened without explosion, disclosing a profound abyss, into which the waters were now wildly plunging.

In another instant, among the shattered rocks and rushing waves appeared a canoe, which a vigorous arm propelled along the surface of the lake. In the canoe was seen the figure of an old man standing upright. He was clothed in a dark mantle, his hair was dishevelled, a long white beard fell over his breast, and in his hand he bore a lighted Davy safety lamp, the flame being protected by the metallic gauze of the apparatus.

In a loud voice this old man shouted, "The fire-damp is upon you! Woe--woe betide ye all!"

At the same moment the slight smell peculiar to carburetted hydrogen was perceptibly diffused through the atmosphere. And, in truth, the fall of the rock had made a passage of escape for an enormous quantity of explosive gas, accumulated in vast cavities, within the which the waters were now wildly plunging.

Jets and streams of the fire-damp now rose upward in the vaulted dome; and well did that fierce old man know that the consequence of what he had done would be to render explosive the whole atmosphere of the mine.

James Starr and several others, having hastily quitted the chapel, and perceived the imminence of the danger, now rushed back, crying out in accents of the utmost alarm, "Fly from the mine! Fly instantly from the mine!"

"Now for the fire-damp! Here comes the fire-damp!" yelled the old man, urging his canoe further along the lake.

Harry with his bride, his father and his mother, left the chapel in haste and in terror.

"Fly! fly for your lives!" repeated James Starr. Alas! it was too late to fly! Old Silfax stood there, prepared to fulfill his last dreadful threat--prepared to stop the marriage of Nell and Harry by overwhelming the entire population of the place beneath the ruins of the coal mine.

As he stood ready to accomplish this act of vengeance, his enormous owl, whose white plumage was marked with black spots, was seen hovering directly above his head.

At that moment a man flung himself into the waters of the lake, and swam vigorously towards the canoe.

It was Jack Ryan, fully determined to reach the madman before he could do the dreadful deed of destruction.
Silfax saw him coming. Instantly he smashed the glass of his lamp, and, snatching out the burning wick, waved it in the air.

Silence like death fell upon the astounded multitude. James Starr, in the calmness of despair, marvelled that the inevitable explosion was even for a moment delayed.

Silfax, gazing upwards with wild and contracted features, appeared to become aware that the gas, lighter than the lower atmosphere, was accumulating far up under the dome; and at a sign from him the owl, seizing in its claw the lighted match, soared upwards to the vaulted roof, towards which the madman pointed with outstretched arm.

Another second and New Aberfoyle would be no more.

Suddenly Nell sprang from Harry's arms, and, with a bright look of inspiration, she ran to the very brink of the waters of the lake. "Harfang! Harfang!" cried she in a clear voice; "here! come to me!"

The faithful bird, surprised, appeared to hesitate in its flight. Presently, recognizing Nell's voice, it dropped the burning match into the water, and, describing a wide circle, flew downwards, alighting at the maiden's feet.

Then a terrible cry echoed through the vaulted roofs. It was the last sound uttered by old Silfax.

Just as Jack Ryan laid his hand on the edge of the canoe, the old man, foiled in his purpose of revenge, cast himself headlong into the waters of the lake.

"Save him! oh, save him!" shrieked Nell in a voice of agony. Immediately Harry plunged into the water, and, swimming towards Jack Ryan, he dived repeatedly.

But his efforts were useless. The waters of Loch Malcolm yielded not their prey: they closed forever over Silfax.

CHAPTER XIX. THE LEGEND OF OLD SILFAX

Six months after these events, the marriage, so strangely interrupted, was finally celebrated in St. Giles's chapel, and the young couple, who still wore mourning garments, returned to the cottage. James Starr and Simon Ford, henceforth free from the anxieties which had so long distressed them, joyously presided over the entertainment which followed the ceremony, and prolonged it to the following day.

On this memorable occasion, Jack Ryan, in his favorite character of piper, and in all the glory of full dress, blew up his chanter, and astonished the company by the unheard of achievement of playing, singing, and dancing all at once.

It is needless to say that Harry and Nell were happy. These loving hearts, after the trials they had gone through found in their union the happiness they deserved.

As to Simon Ford, the ex-overman of New Aberfoyle, he began to talk of celebrating his golden wedding, after fifty years of marriage with good old Madge, who liked the idea immensely herself.

"And after that, why not golden wedding number two?"

"You would like a couple of fifties, would you, Mr. Simon?" said Jack Ryan.

"All right, my boy," replied the overman quietly, "I see nothing against it in this fine climate of ours, and living far from the luxury and intemperance of the outer world."

Will the dwellers in Coal Town ever be called to witness this second ceremony? Time will show. Certainly the strange bird of old Silfax seemed destined to attain a wonderful longevity. The Harfang continued to haunt the gloomy recesses of the cave. After the old man's death, Nell had attempted to keep the owl, but in a very few days he flew away. He evidently disliked human society as much as his master had done, and, besides that, he appeared to have a particular spite against Harry. The jealous bird seemed to remember and hate him for having carried off Nell from the deep abyss, notwithstanding all he could do to prevent him. Still, at long intervals, Nell would see the creature hovering above Loch Malcolm.

Could he possibly be watching for his friend of yore? Did he strive to pierce, with keen eye, the depths which had engulfed his master?

The history of the Harfang became legendary, and furnished Jack Ryan with many a tale and song. Thanks to him, the story of old Silfax and his bird will long be preserved, and handed down to future generations of the Scottish peasantry.

THE WAIF OF THE "CYNTHIA."

By

Jules Verne and André Laurie
CHAPTER I.
MR. MALARIUS' FRIEND.

There is probably neither in Europe nor anywhere else a scholar whose face is more universally known than that of Dr. Schwaryencrona, of Stockholm. His portrait appears on the millions of bottles with green seals, which are sent to the confines of the globe.

Truth compels us to state that these bottles only contain cod liver oil, a good and useful medicine; which is sold to the inhabitants of Norway for a "couronnes," which is worth one franc and thirty-nine centimes.

Formerly this oil was made by the fishermen, but now the process is a more scientific one, and the prince of this special industry is the celebrated Dr. Schwaryencrona.

There is no one who has not seen his pointed beard, his spectacles, his hooked nose, and his cap of otter skin. The engraving, perhaps, is not very fine, but it is certainly a striking likeness. A proof of this is what happened one day in a primary school in Noroe, on the western coast of Norway, a few leagues from Bergen.

Two o'clock had struck. The pupils were in their classes in the large, sanded hall—the girls on the left and the boys on the right—occupied in following the demonstration which their teacher, Mr. Malarius, was making on the black-board. Suddenly the door opened, and a fur coat, fur boots, fur gloves, and a cap of otter, made their appearance on the threshold.

The pupils immediately rose respectfully, as is usual when a stranger visits the class-room. None of them had ever seen the new arrival before, but they all whispered when they saw him, "Doctor Schwaryencrona," so much did the picture engraved on the bottles resemble the doctor.

We must say that the pupils of Mr. Malarius had the bottles continually before their eyes, for one of the principal manufactories of the doctor was at Noroe. But for many years the learned man had not visited that place, and none of the children consequently could have beheld him in the flesh. In imagination it was another matter, for they often spoke of him in Noroe, and his ears must have often tingled, if the popular belief has any foundation. Be this as it may, his recognition was unanimous, and a triumph for the unknown artist who had drawn his portrait—a triumph of which this modest artist might justly be proud, and of which more than one photographer in the world might well be jealous.

But what astonished and disappointed the pupils a little was to discover that the doctor was a man below the ordinary height, and not the giant which they had imagined him to be. How could such an illustrious man be satisfied with a height of only five feet three inches? His gray head hardly reached the shoulder of Mr. Malarius, and he was already stooping with age. He was also much thinner than the doctor, which made him appear twice as tall. His large brown overcoat, to which long use had given a greenish tint, hung loosely around him; he wore short breeches and shoes with buckles, and from beneath his black silk cap a few gray locks had made their escape. His rosy cheeks and smiling countenance gave an expression of great sweetness to his face. He also wore spectacles, through which he did not cast piercing glances like the doctor, but through them his blue eyes shone with inexhaustible benevolence.

In the memory of his pupils Mr. Malarius had never punished a scholar. But, nevertheless, they all respected him, and loved him. He had a brave soul, and all the world knew it very well. They were not ignorant of the fact that in his youth he had passed brilliant examinations, and that he had been offered a professorship in a great university, where he might have attained to honor and wealth. But he had a sister, poor Kristina, who was always ill and suffering. She would not have left her native village for the world, for she felt sure that she would die if they removed to the city. So Mr. Malarius had submitted gently to her wishes, and sacrificed his own prospects. He had accepted the humble duty of the village school-master, and when twenty years afterward Kristina had died, blessing him, he had become accustomed to his obscure and retired life, and did not care to change it. He was absorbed in his work, and forgot the world. He found a supreme pleasure in becoming a model instructor, and in having the best-conducted school in his country. Above all, he liked to instruct his best pupils in the higher branches, to initiate them into scientific studies, and in ancient and modern literature, and give them the information which is usually the portion of the higher classes, and not bestowed upon the children of fishermen and peasants.

"What is good for one class, is good for the other," he argued. "If the poor have not as many comforts, that is no reason why they should be denied an acquaintance with Homer and Shakespeare; the names of the stars which guide them across the ocean, or of the plants which grow on the earth. They will soon see them laid low by their ploughs, but in their infancy at least they will have drunk from pure sources, and participated in the common patrimony of mankind." In more than one country this system would have been thought imprudent, and calculated to disgust the lowly with their humble lot in life, and lead them to wander away in search of adventures. But in Norway nobody thinks of these things. The patriarchal sweetness of their dispositions, the distance between the villages, and the laborious habits of the people, seem to remove all danger of this kind. This higher instruction is more frequent than a stranger would believe to be possible. Nowhere is education more generally diffused, and nowhere is it carried so
high; as well in the poorest rural schools, as in the colleges.

Therefore the Scandinavian Peninsula may flatter herself, that she has produced more learned and distinguished
men in proportion to her population, than any other region of Europe. The traveler is constantly astonished by the
contrast between the wild and savage aspect of nature, and the manufactures, and works of art, which represent the
most refined civilization.

But perhaps it is time for us to return to Noroe, and Dr. Schwaryencrona, whom we have left on the threshold of
the school. If the pupils had been quick to recognize him, although they had never seen him before, it had been
different with the instructor, whose acquaintance with him dated further back.

"Ah! good-day, my dear Malarius!" said the visitor cordially, advancing with outstretched hands toward the
school-master.

"Sir! you are very welcome," answered the latter, a little surprised, and somewhat timidly, as is customary with
all men who have lived secluded lives; and are interrupted in the midst of their duties. "But excuse me if I ask whom
I have the honor of--"

"What! Have I changed so much since we ran together over the snow, and smoked our long pipes at Christiania;
have you forgotten our Krauss boarding-house, and must I name your comrade and friend?"

"Schwaryencrona!" cried Mr. Malarius. "Is it possible.--Is it really you.--Is it the doctor?"

"Oh! I beg of you, omit all ceremony. I am your old friend Roff, and you are my brave Olaf, the best, the dearest
friend of my youth. Yes, I know you well. We have both changed a little in thirty years; but our hearts are still
young, and we have always kept a little corner in them for those whom we learned to love, when we were students,
and eat our dry bread side by side."

The doctor laughed, and squeezed the hands of Mr. Malarius, whose eyes were moist.

"My dear friend, my good excellent doctor, you must not stay here," said he; "I will give all these youngsters a
holiday, for which they will not be sorry, I assure you, and then you must go home with me."

"Not at all!" declared the doctor, turning toward the pupils who were watching this scene with lively interest. "I
must neither interfere with your work, nor the studies of these youths. If you wish to give me great pleasure, you
will permit me to sit here near you, while you resume your teaching."

"I would willingly do so," answered Mr. Malarius, "but to tell you the truth, I have no longer any heart for
geometry; besides, having mentioned a holiday, I do not like to disappoint the children. There is one way of
arranging the matter however. If Doctor Schwaryencrona would deign to do my pupils the honor of questioning
them about their studies, and then I will dismiss them for the rest of the day."

"An excellent idea. I shall be only too happy to do so. I will become their examiner."

Then taking the master's seat, he addressed the school:

"Tell me," asked the doctor, "who is the best pupil?"

"Erik Hersebom!" answered fifty youthful voices unhesitatingly.

"Ah! Erik Hersebom! Well, Erik, will you come here?"

A young boy, about twelve years of age, who was seated on the front row of benches, approached his chair. He
was a grave, serious-looking child, whose pensive cast of countenance, and large deep set eyes, would have attracted
attention anywhere, and he was the more remarkable, because of the blonde heads by which he was surrounded.
While all his companions of both sexes had hair the color of flax, rosy complexions, and blue eyes, his hair was of
deep chestnut color, like his eyes, and his skin was brown. He had not the prominent cheek bones, the short nose,
and the stout frame of these Scandinavian children. In a word, by his physical characteristics so plainly marked, it
was evident that he did not belong to the race by whom he was surrounded.

He was clothed like them in the coarse cloth of the country, made in the style common among the peasantry of
Bergen; but the delicacy of his limbs, the smallness of his head, the easy elegance of his poise, and the natural
gracefulness of his movements and attitudes, all seemed to denote a foreign origin.

No physiologist could have helped being struck at once by these peculiarities, and such was the case with Dr.
Schwaryencrona.

However, he had no motive for calling attention to these facts, and he simply proceeded to fulfill the duty which
he had undertaken.

"Where shall we begin--with grammar?" he asked the young lad.

"I am at the command of the doctor," answered Erik, modestly.

The doctor then gave him two or three simple questions, but was astonished to hear him answer them, not only
in the Swedish language, but also in French and English. It was the usual custom of Mr. Malarius, who contended
that it was as easy to learn three languages at once as it was to learn only one.

"You teach them French and English then?" said the doctor, turning toward his friend.

"Why not? also the elements of Greek and Latin. I do not see what harm it can do them."
"Nor I," said the doctor, laughing, and Erik Hersebom translated several sentences very correctly.

In one of the sentences, reference was made to the hemlock drunk by Socrates, and Mr. Malarius asked the doctor to question him as to the family which this plant belonged to.

Erik answered without hesitation "that it was one of the family of umbelliferous plants," and described them in detail.

From botany they passed to geometry, and Erik demonstrated clearly a theorem relative to the sum of the angles of a triangle.

The doctor became every moment more and more surprised.

"Let us have a little talk about geography," he said. "What sea is it which bounds Scandinavia, Russia and Siberia on the north?"

"It is the Arctic Ocean."

"And what waters does this ocean communicate with?"

"The Atlantic on the west, and the Pacific on the east."

"Can you name two or three of the most important seaports on the Pacific?"

"I can mention Yokohama, in Japan; Melbourne, in Australia; San Francisco, in the State of California."

"Well, since the Arctic Ocean communicates on one side with the Atlantic, and on the other with the Pacific, do you not think that the shortest route to Yokohama or San Francisco would be through this Arctic Ocean?"

"Assuredly," answered Erik, "it would be the shortest way, if it were practicable, but all navigators who have attempted to follow it have been prevented by ice, and been compelled to renounce the enterprise, when they have escaped death."

"Have they often attempted to discover the north-east passage?"

"At least fifty times during the last three centuries, but without success."

"Could you mention a few of the expeditions?"

"The first was organized in 1523, under the direction of Francois Sebastian Cabot. It consisted of three vessels under the command of the unfortunate Sir Hugh Willoughby, who perished in Lapland, with all his crew. One of his lieutenants, Chancellor, was at first successful, and opened a direct route through the Polar Sea. But he also, while making a second attempt, was shipwrecked, and perished. A captain, Stephen Borough, who was sent in search of him, succeeded in making his way through the strait which separates Nova Zembla from the Island of Waigate and in penetrating into the Sea of Kara. But the fog and ice prevented him from going any further."

"Two expeditions which were sent out in 1580 were equally unsuccessful. The project was nevertheless revived by the Hollanders about fifteen years later, and they fitted out, successively, three expeditions, under the command of Barentz."

"In 1596, Barentz also perished, in the ice of Nova Zembla."

"Ten years later Henry Hudson was sent out, but also failed."

"The Danes were not more successful in 1653."

"In 1676, Captain John Wood was also shipwrecked. Since that period the north-east passage has been considered impracticable, and abandoned by the maritime powers."

"Has it never been attempted since that epoch?"

"It has been by Russia, to whom it would be of immense advantage, as well as to all the northern nations, to find a direct route between her shores and Siberia. She has sent out during a century no less than eighteen expeditions to explore the coasts of Nova Zembla, the Sea of Kara, and the eastern and western coasts of Siberia. But, although these expeditions have made these places better known, they have also demonstrated the impossibility of forcing a passage through the Arctic Ocean. The academician Van Baer, who made the last attempt in 1837, after Admiral Lutke and Pachtusow, declared emphatically that this ocean is simply a glacier, as impracticable for vessels as it would be if it were a continent."

"Must we, then, renounce all hopes of discovering a north-east passage?"

"That seems to be the conclusion which we must arrive at, from the failure of these numerous attempts. It is said, however, that a great navigator, named Nordenskiold, wishes to make another attempt, after he has prepared himself by first exploring portions of this polar sea. If he then considers it practicable, he may get up another expedition."
"Mr. Malarius may be proud of you, then," said the doctor, turning toward the master.
"I am very well satisfied with Erik," said the latter.
"He has been my pupil for eight years. When I first took him he was very young, and he has always been at the head of his section."

The doctor became silent. His piercing eyes were fixed upon Erik, with a singular intensity. He seemed to be considering some problem, which it would not be wise to mention.
"He could not have answered my question better and I think it useless to continue the examination," he said at last. "I will no longer delay your holiday, my children, and since Mr. Malarius desires it, we will stop for to-day."
At these words, the master clapped his hands. All the pupils rose at once, collected their books, and arranged themselves in four lines, in the empty spaces between the benches.
Mr. Malarias clapped his hands a second time. The column started, and marched out, keeping step with military precision.
At a third signal they broke their ranks, and took to flight with joyous cries.
In a few seconds they were scattered around the blue waters of the fiord, where might be seen also the turf roofs of the village of Noroe.

CHAPTER II.
THE HOME OF A FISHERMAN IN NOROE.
The house of Mr. Hersebom was, like all others in Noroe, covered by a turf roof, and built of enormous timbers of fir-trees, in the Scandinavian fashion. The two large rooms were separated by a hall in the center, which led to the boat-house where the canoes were kept. Here were also to be seen the fishing-tackle and the codfish, which they dry and sell. These two rooms were used both as living-rooms and bedrooms. They had a sort of wooden drawer let into the wall, with its mattress and skins, which serve for beds, and are only to be seen at night. This arrangement for sleeping, with the bright panels, and the large open fire-place, where a blazing fire of wood was always kept burning, gave to the interior of the most humble homes an appearance of neatness and domestic luxury unknown to the peasantry of Southern Europe.

This evening all the family were gathered round the fire-place, where a huge kettle was boiling, containing "sillsallat," or smoked herring, salmon and potatoes.
Mr. Hersebom, seated in a high wooden chair, was making a net, which was his usual occupation when he was not on the sea, or drying his fish. He was a hardy fisherman, whose skin had been bronzed by exposure to the arctic breezes, and his hair was gray, although he was still in the prime of life. His son Otto, a great boy, fourteen years old, who bore a strong resemblance to him, and who was destined to also become famous as a fisherman, sat near him. At present he was occupied in solving the mysteries of the rule of three, covering a little slate with figures, although his large hands looked as if they would be much more at home handling the oars.
Erik, seated before the dining-table, was absorbed in a Volume of history that Mr. Malarius had lent him.
Katrina, Hersebom, the goodwife, was occupied peacefully with her spinning-wheel, while little Vanda, a blonde of ten years, was seated on a stool, knitting a large stocking with red wool.
At their feet a large dog of a yellowish-white color, with wool as thick as that of a sheep, lay curled up sound asleep.
For more than one hour the silence had been unbroken, and the copper lamp suspended over their heads, and filled with fish oil, lighted softly this tranquil interior.
To tell the truth, the silence became oppressive to Dame Katrina, who for some moments had betrayed the desire of unloosing her tongue.
At last she could keep quiet no longer.
"You have worked long enough for to-night," she said, "it is time to lay the cloth for supper."
Without a word of expostulation. Erik lifted his large book, and seated himself nearer the fire-place, whilst Vanda laid aside her knitting, and going to the buffet brought out the plates and spoons.
"Did you say, Otto," asked the little girl, "that our Erik answered the doctor very well?"
"Very well, indeed," said Otto enthusiastically, "he talked like a book in fact. I do not know where he learned it all. The more questions the doctor asked the more he had to answer. The words came and came. Mr. Malarius was well satisfied with him."
"I am also," said Vanda, gravely.
"Oh, we were all well pleased. If you could have seen, mother, how the children all listened, with their mouths open. We were only afraid that our turn would come. But Erik was not afraid, and answered the doctor as he would have answered the master."
“Stop. Mr. Malarius is as good as the doctor, and quite as learned,” cried Erik, whom their praises seemed to annoy.

The old fisherman gave him an approving smile.

“You are right, little boy,” he said; “Mr. Malarius, if he chose, could be the superior of all the doctors in the town, and besides he does not make use of his scientific knowledge to ruin poor people.”

“Has Doctor Schwaryencrona ruined any one?” asked Erik with curiosity.

“Well—if he has not done so, it has not been his fault. Do you think that I have taken any pleasure in the erection of his factory, which is sending forth its smoke on the borders of our fiord? Your mother can tell you that formerly we manufactured our own oil, and that we sold it easily in Bergen for a hundred and fifty to two hundred kroners a year. But that is all ended now—nobody will buy the brown oil, or, if they do, they pay so little for it, that it is not worth while to take the journey. We must be satisfied with selling the livers to the factory, and God only knows how this tiresome doctor has managed to get them for such a low price. I hardly realize forty-five kroners now, and I have to take twice as much trouble as formerly. Ah, well. I say it is not just, and the doctor would do better to look after his patients in Stockholm, instead of coming here to take away our trade by which we earn our bread.”

After these bitter words they were all silent. They heard nothing for some minutes except the clicking of the plates, as Vanda arranged them, whilst her mother emptied the contents of the pot into a large dish.

Erik reflected deeply upon what Mr. Hersebom had said. Numerous objections presented themselves to his mind, and as he was candor itself—he could not help speaking.

“It seems to me that you have a right to regret your former profits, father,” he said, “but is it just to accuse Doctor Schwaryencrona of having diminished them? Is not his oil worth more than the home-made article?”

“Ah! it is clearer, that is all. It does not taste as strong as ours, they say; and that is the reason why all the fine ladies in the town prefer it, no doubt; but it does not do any more good to the lungs of sick people than our oil.”

“But for some reason or other they buy it in preference; and since it is a very useful medicine it is essential that the public should experience as little disgust as possible in taking it. Therefore, if a doctor finds out a method of making it more palatable, is it not his duty to make use of his discovery?”

Master Hersebom scratched his ear.

“Doubtless,” he said, reluctantly, “it is his duty as a doctor, but that is no reason why he should prevent poor fishermen from getting their living.”

“I believe the doctor's factory gives employment to three hundred, whilst there were only twenty in Noroe at the time of which you speak,” objected Erik, timidly.

“You are right, and that is why the business is no longer worth anything,” said Hersebom.

“Come, supper is ready. Seat yourselves at the table,” said Dame Katrina, who saw that the discussion was in danger of becoming unpleasantly warm.

Erik understood that further opposition on his part would be out of place, and he did not answer the last argument of his father, but took his habitual seat beside Vanda.

“Were the doctor and Mr. Malarius friends in childhood?” he asked, in order to give a turn to the conversation.

“Yes,” answered the fisherman, as he seated himself at the table. “They were both born in Noroe, and I can remember when they played around the school-house, although they are both ten years older than I am. Mr. Malarius was the son of the physician, and Doctor Schwaryencrona only the son of a simple fisherman. But he has risen in the world, and they say that he is now worth millions, and that his residence in Stockholm is a perfect palace. Oh, learning is a fine thing.”

After uttering this aphorism the brave man took a spoon to help the smoking fish and potatoes, when a knock at the door made him pause.

“May I come in, Master Hersebom?” said a deep-toned voice. And without waiting for permission the person who had spoken entered, bringing with him a great blast of icy air.

“Doctor Schwaryencrona!” cried the three children, while the father and mother rose quickly.

“My dear Hersebom,” said the doctor, taking the fisherman's hand, “we have not seen each other for many years, but I have not forgotten your excellent father, and thought I might call and see a friend of my childhood!”

The worthy man felt a little ashamed of the accusations which he had so recently made against his visitor, and he did not know what to say. He contented himself, therefore, with returning the doctor's shake of the hand cordially, and smiling a welcome, whilst his good wife was more demonstrative.

“Quick, Otto, Erik, help the doctor to take off his overcoat, and you, Vanda, prepare another place at the table,” she said, for, like all Norwegian housekeepers, she was very hospitable.

“Will you do us the honor, doctor, of eating a morsel with us?”

“Indeed I would not refuse, you may be sure, if I had the least appetite; for I see you have a tempting dish before you. But it is not an hour since I took supper with Mr. Malarius, and I certainly would not have called so
early if I had thought you would be at the table. It would give me great pleasure if you would resume your seats and
eat your supper."

"Oh, doctor!" implored the good wife, "at least you will not refuse some 'snorgas' and a cup of tea?"

"I will gladly take a cup of tea, but on condition that, you eat your supper first," answered the doctor, seating
himself in the large arm-chair.

Vanda immediately placed the tea-kettle on the fire, and disappeared in the neighboring room. The rest of the
family understanding with native courtesy that it would annoy their guest if they did not do as he wished, began to
eat their supper.

In two minutes the doctor was quite at his ease. He stirred the fire, and warmed his legs in the blaze of the dry
wood that Katrina had thrown on before going to supper. He talked about old times, and old friends; those who had
disappeared, and those who remained, about the changes that had taken place even in Bergen.

He made himself quite at home, and, what was more remarkable, he succeeded in making Mr. Hersebom eat his
supper.

Vanda now entered carrying a large wooden dish, upon which was a saucer, which she offered so graciously to
the doctor that he could not refuse it. It was the famous "snorgas" of Norway, slices of smoked reindeer, and shreds
of herring, and red pepper, minced up and laid between slices of black bread, spiced cheese, and other condiments;
which they eat at any hour to produce an appetite.

It succeeded so well in the doctor's case, that although he only took it out of politeness, he was soon able to do
honor to some preserved mulberries which were Dame Katrina's special pride, and so thirsty that he drank seven or
eight cups of tea.

Mr. Hersebom brought out a bottle of "schiedam," which he had bought of a Hollander.

Then supper being ended, the doctor accepted an enormous pipe which his host offered him, and smoked away
to their general satisfaction.

By this time all feeling of constraint had passed away, and it seemed as if the doctor had always been a member
of the family. They joked and laughed, and were the best of friends in the world, until the old clock of varnished
wood struck ten.

"My good friends, it is growing late," said the doctor.

"If you will send the children to bed, we will talk about more serious matters."

Upon a sign from Dame Katrina, Otto, Erik, and Vanda bade them good-night and left the room.

"You wonder why I have come," said the doctor, after a moments' silence, fixing his penetrating glance upon the
fisherman.

"My guests are always welcome," answered the fisherman, sententiously.

"Yes! I know that Noroe is famous for hospitality. But you must certainly have asked yourself what motive
could have induced me to leave the society of my old friend Malarius and come to you. I am sure that Dame
Hersebom has some suspicion of my motive."

"We shall know when you tell us," replied the good woman, diplomatically.

"Well," said the doctor, with a sigh, "since you will not help me, I must face it alone. Your son, Erik, Master
Hersebom, is a most remarkable child."

"I do not complain of him," answered the fisherman.

"He is singularly intelligent, and well informed for his age," continued the doctor. "I questioned him to-day, in
school, and I was very much surprised by the extraordinary ability which his answers displayed. I was also
astonished, when I learned his name, to see that he bore no resemblance to you, nor indeed to any of the natives of
this country."

The fisherman and his wife remained silent and motionless.

"To be brief," continued the doctor, with visible impatience, "this child not only interests me--he puzzles me. I
have talked with Malarius, who told me that he was not your son, but that he had been cast on your shore by a
shipwreck, and that you took him in and adopted him, bringing him up as your own, and bestowing your name upon
him. This is true, is it not?"

"Yes, doctor," answered Hersebom, gravely.

"If he is not our son by birth, he is in love and affection," said Katrina, with moist eyes and trembling hands.

"Between him, and Otto, and Vanda, we have made no difference--we have never thought of him only as our own
child."

"These sentiments do you both honor," said the doctor, moved by the emotion of the brave woman. "But I beg of
you, my friends, relate to me the history of this child. I have come to hear it, and I assure you that I wish him well."

The fisherman appeared to hesitate a moment. Then seeing that the doctor was waiting impatiently for him to
speak, he concluded to gratify him.
"You have been told the truth," he said, regretfully; "the child is not our son. Twelve years ago I was fishing near
the island at the entrance of the fiord, near the open sea. You know it is surrounded by a sand bank, and that cod-fish
are plentiful there. After a good day's work, I drew in my lines, and was going to hoist my sail, when something
white moving upon the water, about a mile off, attracted my attention. The sea was calm, and there was nothing
pressing to hurry me home, so I had the curiosity to go and see what this white object was. In ten minutes I had
reached it. It was a little wicker cradle, enveloped in a woolen cloth, and strongly tied to a buoy. I drew it toward
me; an emotion which I could not understand seized me; I beheld a sleeping infant, about seven or eight months old,
whose little fists were tightly clinched. He looked a little pale and cold, but did not appear to have suffered much
from his adventurous voyage, if one might judge by his lusty screams when he awoke, as he did immediately, when
he no longer felt himself rocked by the waves. Our little Otto was over two years old, and I knew how to manage
such little rogues. I rolled up a bit of rag, dipped it in some _eau de vie_ and water that I had with me, and gave it to
him to suck. This quieted him at once, and he seemed to enjoy the cordial. But I knew that he would not be quiet
long, therefore I made all haste to return to Noroe. I had untied the cradle and placed it in the boat at my feet; and
while I attended to my sail, I watched the poor little one, and asked myself where it could possibly have come from.
Doubtless from some shipwrecked vessel. A fierce tempest had been raging during the night, and there had been
many disasters. But by what means had this infant escaped the fate of those who had had the charge of him? How
had they thought of tying him to the buoy? How many hours had he been floating on the waves? Where were his
father and mother, those who loved him? But all these questions had to remain unanswered, the poor baby was
unable to give us any information. In half an hour I was at home, and gave my new possession to Katrina. We had a
cow then, and she was immediately pressed into service as a nurse for the infant. He was so pretty, so smiling, so
rosy, when he had been fed and warmed before the fire, that we fell in love with him at once; just the same as if he
had been our own. And then, you see, we took care of him; we brought him up, and we have never made any
difference between him and our own two children. Is it not true, wife?" added Mr. Hersebom, turning toward
Katrina.

"Very true, the poor little one," answered the good dame, drying her eyes, which this recital had filled with tears.
"And he is our child now, for we have adopted him. I do not know why Mr. Malarius should say anything to the
contrary."

"It is true," said Hersebom, and I do not see that it concerns any one but ourselves."

"That is so," said the doctor, in a conciliatory tone, "but you must not accuse Mr. Malarius of being indiscreet. I
was struck with the physiognomy of the child, and I begged my friend confidentially to relate his history. He told me
that Erik believed himself to be your son, and that every one in Noroe had forgotten how he had become yours.
Therefore, you see, I took care not to speak until the children had been sent to bed. You say that he was about seven
or eight months old when you found him?"

"About that; he had already four teeth, the little brigand, and I assure you that it was not long before he began to
use them," said Hersebom, laughing.

"Oh, he was a superb child," said Katrinn, eagerly. "He was so white, and strong, and plump; and such arms and
legs. You should have seen them!"

"How was he dressed?" asked Dr. Schwaryencrona.

Hersebom did not answer, but his wife was less discreet.

"Like a little prince," she answered. "Imagine a robe of piquè, trimmed all over with lace, a pelisse of quilted
satin, a cloak of white velvet, and a little cap; the son of a king could not have more. Everything he had was
beautiful. But you can see for yourself, for I have kept them all just as they were. You may be sure that we did not
dress the baby in them. Oh, no; I put Otto's little garments on him, which I had laid away, and which also served,
later on, for Vanda. But his outfit is here, and I will show it to you."

While she was speaking, the worthy woman knelt down before a large oaken chest, with an antique lock, and
after lifting the lid, began searching the compartments.

She drew out, one by one, all the garments of which she had spoken, and displayed them with pride before the
eyes of the doctor. She also showed the linen, which was exquisitely fine, a little quilt of silk, and a pair of white
merino boots. All the articles were marked with the initials "E.D.", elegantly embroidered, as the doctor saw at a
glance.

"E.D.;' is that why you named the child Erik?" he asked.

"Precisely," answered Katrina, who it was evident enjoyed this exhibition, while her husband's face grew more
gloomy. "See," she said, "this is the most beautiful of all. He wore it around his neck."

And she drew from its box a rattle of coral and gold, suspended from a little chain.

The initials "E.D." were here surrounded by a Latin motto, "Semper idem."

"We thought at first it was the baby's name, but Mr. Malarius told us it meant 'always the same,'" she continued,
seeing that the doctor was trying to decipher the motto.

"Mr. Malarius told you the truth," said the doctor. "It is evident the child belonged to a rich and distinguished family," he added, while Katrina replaced the babe's outfit in the oaken chest.

"Have you any idea what country he came from?"

"How could we know anything about it, since I found him on the sea?" replied Hersebom. "Yes, but the cradle was attached to a buoy, you said, and it is customary on all vessels to write on the buoy the name of the ship to which it belongs," answered the doctor, fixing his penetrating eyes upon those of the fisherman.

"Doubtless," said the latter, hanging his head.

"Well, this buoy, what name did it bear?"

"Doctor, I am not a _savant_. I can read my own language a little, but as for foreign tongues--and then it was so long ago."

"However, you ought to be able to remember something about it--and doubtless you showed it to Mr. Malarius, with the rest of the articles--make a little effort, Mr. Hersebom. Was not this name inscribed on the buoy, 'Cynthia'?"

"I believe it was something like that," answered the fisherman vaguely.

"It is a strange name. To what country does it belong in your judgment, Mr. Hersebom?"

"How should I know? Have I ever been beyond the shores of Noroe and Bergen, except once or twice to fish off the coast of Greenland and Iceland?" answered the good man, in a tone which grew more and more morose.

"I think it is either an English or a German name," said the doctor, taking no notice of his crossness. "It would be easy to decide on account of the shape of the letters, if I could see the buoy. Have you preserved it?"

"By my faith no. It was burnt up ages ago," answered Hersebom, triumphantly.

"As near as Mr. Malarius could remember, the letters were Roman," said the doctor, as if he were talking to himself--"and the letters on the linen certainly are. It is therefore probable that the 'Cynthia' was not a German vessel. I think it was an English one. Is not this your opinion, Mr. Hersebom?"

"Well, I have thought little about it," replied the fisherman. "Whether it was English, German, or Russian, makes no difference to me. For many years according to all appearances, they have lain beneath the sea, which alone could tell the secret."

"But you have doubtless made some effort to discover the family to whom the child belonged?" said the doctor, whose glasses seemed to shine with irony. "You doubtless wrote to the Governor of Bergen, and had him insert an advertisement in the journals?"

"I!" cried the fisherman, "I did nothing of the kind. God knows where the baby came from; why should I trouble myself about it? Can I afford to spend money to find his people, who perhaps care little for him? Put yourself in my place, doctor. I am not a millionaire, and you may be sure if we had spent all we had, we should have discovered nothing. I have done the best I could; we have raised the little one as our own son, we have loved him and taken care of him."

"Even more than the two others, if it were possible," interrupted Katrina, drying her eyes on the corner of her apron. "If we have anything to reproach ourselves for, it is for bestowing upon him too large a share of our tenderness."

"Dame Hersebom, you must not do me the injustice to suppose that your kindness to the little shipwrecked child inspires me with any other feeling than the greatest admiration," said the doctor.

"No, you must not think such a thing. But if you wish me to speak frankly--I must say that this tenderness has blinded you to your duty. You should have endeavored to discover the family of the infant, as far as your means permitted."

There was perfect silence for a few minutes.

"It is possible that we have done wrong," said Mr. Hersebom, who had hung his head under this reproach. "But what is done can not be altered. Erik belongs to us now, and I do not wish any one to speak to him about these old reminiscences."

"You need have no fear, I will not betray your confidence," answered the doctor, rising.

"I must leave you, my good friends, and I wish you good-night--a night free from remorse," he added, gravely.

Then he put on his fur cloak, and shook hands cordially with his hosts, and being conducted to the door by Hersebom, he took the road toward his factory.

The fisherman stood for a moment on the threshold, watching his retreating figure in the moonlight.

"What a devil of a man!" he murmured, as at last he closed his door.

CHAPTER III.
MR. HERSEBOM'S REFLECTIONS.
The next morning Dr. Schwaryencrona had just finished breakfast with his overseer, after having made a thorough inspection of his factory when he saw a person enter whom he did not at first recognize as Mr. Hersebom.

He was clothed in his holiday suit: his embroidered waistcoat, his furred riding coat, and his high hat, and the fisherman looked very different to what he did in his working clothes. But what made the change more apparent, was the deep sadness and humility portrayed in his countenance. His eyes were red, and looked as if he had had no sleep all the night.

This was in fact the case. Mr. Hersebom who up to this time had never felt his conscience trouble him, had passed hours of sad remorse, on his mattress of skins.

Toward morning he had exchanged confidences with Dame Katrina, who had also been unable to close her eyes.

"Wife, I have been thinking of what the doctor said to us," he said, after several hours of wakefulness.

"I have been thinking of it also, ever since he left us," answered his worthy helpmate.

"It is my opinion that there is some truth in what he said, and that we have perhaps acted more egotistically than we should have done. Who knows but that the child may have a right to some great fortune, of which he is deprived by our negligence? Who knows if his family have not mourned for him these twelve years, and they could justly accuse us of having made no attempt to restore him to them?"

"This is precisely what I have been saying to myself," answered Katrina, sighing. "If his mother is living what frightful anguish the poor woman must have endured, in believing that her infant was drowned. I put myself in her place, and imagine that we had lost Otto in this manner. We would never have been consoled."

"It is not thoughts of his mother that trouble me, for according to all appearances, she is dead," said Hersebom, after a silence broken only by their sighs.

"How can we suppose that an infant of that age would travel without her, or that it would have been tied to a buoy and left to take its chances on the ocean, if she had been living?"

"Perhaps some one has taken her infant from her--this idea has often occurred to me," answered Hersebom. "Some one might be interested in his disappearance. To expose so young a child to such a hazardous proceeding is so extraordinary that such conjectures are possible, and in this case we have become accomplices of a crime--we have contributed to its success. Is it not horrible to think of?"

"And we thought we were doing such a good and charitable work in adopting the poor little one."

"Oh, it is evident that we had no malicious intentions. We nourished it, and brought it up as well as we were able, but that does not prevent me from seeing that we have acted rashly, and the little one will have a right to reproach us some of these days."

"We need not be afraid of that, I am sure. But it is too bad that we should feel at this late day that we have done anything for which we must reproach ourselves."

"How strange it is that the same action regarded from a different point of view, can be judged so differently. I never would have thought of such a thing. And yet a few words from the doctor seems to have turned my brain."

Thus these good people talked during the night.

The result of their nocturnal conversation was that Mr. Hersebom resolved to call upon the doctor, and ask him what they could do to make amends for the error of which they had been guilty.

Dr. Schwaryencrona did not revert to the conversation which had taken place the previous evening. He appeared to regard the visit of the fisherman as simply an act of politeness, and received him cordially, and began talking about the weather and the price of fish.

Mr. Hersebom tried to lead the conversation toward the subject which occupied his mind. He spoke of Mr. Malarius' school, and at last said plainly: "Doctor, my wife and I have been thinking all night about what you said to us last evening about the boy. We never thought that we were doing him a wrong in educating him as our son. But you have changed our opinion, and we want to know what you would advise us to do, in order to repair our fault. Do you think that we still ought to seek to find Erik's family?"

"It is never too late to do our duty," said the doctor, "although the task is certainly much more difficult now than it would have been at first."

"Will you interest yourself in the matter?"

"I will, with pleasure," answered the doctor; "and I promise you to use every exertion to fulfill it, upon one condition: that is, that you let me take the boy to Stockholm."

If Mr. Hersebom had been struck on the head with a club, he would not have been more astonished than he was by this proposal.

"Intrust Erik to you! Send him to Stockholm! Why should I do this, doctor?" he asked, in an altered voice.

"I will tell you. My attention was drawn to the child, not only on account of his physical appearance, which was so different to that of his companions, but by his great intelligence and his evident taste for study. Before knowing
the circumstances which had brought him to Noroe, I said to myself that it was a shame to leave a boy so gifted in a village school--even under such a master as Malarius; for here there is nothing to assist in the development of his exceptionally great faculties. There are no museums, nor scientific collections, nor libraries, nor competitors who are worthy of him. I felt a strong desire to give him the advantages of a complete education. You can understand that, after the confidence which you have bestowed upon me, I am more anxious to do so than before. You can see, Mr. Hersebom, that your adopted son belongs to some rich and distinguished family. If I succeed in finding them, would you wish to restore to them a child educated in a village, and deprived of this education, without which he will feel out of place among his kindred? It is not reasonable; and you are too sensible not to understand it."

Mr. Hersebom hung his head: without his being aware of it, two large tears rolled down his cheeks.

"But then," he said, "this would be an entire separation. Before we ever know whether the child will find his relations, he must be taken from his home. It is asking too much, doctor--asking too much of my wife. The child is happy with us. Why can he not be left alone, at least until he is sure of a better one?"

"Happy. How do you know that he will be so when he grows older? How can you tell whether he may not regret having been saved? Intelligent and superior as he will be, perhaps he would be stiffered with the life which you would offer him in Noroe."

"But, doctor, this life which you disdain, is good enough for us. Why is it not good enough for him?"

"I do not disdain it," said the doctor. "Nobody admires and honors those who work more than I do. Do you believe, Mr. Hersebom, that I forget my birth? My father and grandfather were fishermen like yourself, and it is just because they were so far-seeing as to educate me, that I appreciate the value of it, and I would assure it to a child who merits it. It is his interest alone which guides me, I beg of you to believe."

"Ah--what do I know about it? Erik will be almost grown up when you have made a gentleman of him, and he will not know how to use his arms. Then if you do not find his family, which is more than possible, since twelve years have passed since I found him, what a beautiful future we are preparing for him! Do you not see, doctor, that a fisherman's life is a brave one--better than any other: with a good boat under his feet and four or five dozen of cod-fish at the end of his lines, a Norwegian fisherman need have no fear, nor be indebted to any one. You say that Erik would not be happy leading such a life. Permit me to believe the contrary. I know the child well, he loves his books, but, above all, he loves the sea. It also almost seems as if he felt that he had been rocked upon it, and all the museums in the world would not console him for the loss of it."

"But we have the sea around us also at Stockholm," said the doctor, smiling--touched in spite of himself by this affectionate resistance.

"Well," said the fisherman, crossing his arms, "what do you wish to do? what do you propose, doctor?"

"There, you see, after all, the necessity of doing something. Well this is my proposition--Erik is twelve years old, nearly thirteen, and he appears to be highly gifted. We will say nothing about his origin--he is worthy of being supplied with the means of developing and utilizing his faculties; that is all we need trouble ourselves about at present. I am rich, and I have no children. I will undertake to furnish the means, and give him the best masters, and all possible facilities for profiting by their instructions. I will do this for two years. During this time I will make inquiries, insert advertisements in the newspapers; make every possible exertion, move heaven and earth to discover his parents. If I do not find them in two years, we shall never do it. If his relatives are found, they will naturally decide his future career in life. If we do not find them, I will send Erik back to you. He will then be fifteen years old--he will have seen something of the world. The hour will have arrived to tell him the truth about his birth. Then aided by our advice, and the opinions of his teachers, he can choose what path he would prefer to follow. If he wishes to become a fisherman, I will not oppose it. If he wishes to continue his studies, I engage to furnish the means for him to follow any profession that he may choose. Does this seem a reasonable proposition to you?"

"More than reasonable. It is wisdom itself issuing from your lips, doctor," said Mr. Hersebom, overcome in spite of himself. "See what it is to have an education!" he continued, shaking his head. "The difficulty will be to repeat all you have said to my wife. When will you take the child away?"

"To-morrow. I can not delay my return to Stockholm any longer."

Mr. Hersebom heaved a deep sigh, which was almost a sob.

"To-morrow! So soon!" he said. "Well, what must be, must be. I will go and talk to my wife about it."

"Yes, do so, and consult Mr. Malarius also; you will find that he is of my opinion."

"I do not doubt it," answered the fisherman, with a sad smile.

He shook the hand which Dr. Schwaryencrona held out to him, and went away looking very thoughtful.

That evening before dinner the doctor again directed his steps toward the dwelling of Mr. Hersebom. He found the family assembled round the hearth, as they were the evening before, but not wearing the same appearance of peaceful happiness. The father was seated the furthest from the fire, silent, and with idle hands. Katrina, with tears in her eyes, held Erik's hands between her own, whose cheeks were reddened by the hope of the new destiny which
seemed opening before him, but who looked sad at leaving all whom he loved, and who did not know what feeling
he ought to yield to.

Little Vanda’s face was hidden in her father’s knees, and nothing could be seen except her long braids of golden
hair. Otto, also greatly troubled at this proposed separation, sat motionless beside his brother.

“How sad and disconsolate you look!” said the doctor, stopping on the threshold. “If Erik were about to set out
on a distant and most perilous expedition you could not show more grief. He is not going to do anything of the kind,
I assure you, my good friends. Stockholm is not at the antipodes, and the child is not going away forever. He can
write to you, and I do not doubt that he will do so often. He is only going away to school, like so many other boys.
In two years he will return tall, and well-informed, and accomplished, I hope. Is this anything to feel sad about?
Seriously, it is not reasonable.”

Katrina arose with the natural dignity of the peasant of the North.

“Doctor,” she said, “God is my witness that I am profoundly grateful to you for what you propose to do for Erik-
but we can not help feeling sad because of his departure. Mr. Hersebom has explained to me that it is necessary,
and I submit. Do not think that I shall feel no regret.”

“Mother,” said Erik, “I will not go, if it causes you such pain.”

“No, child,” answered the worthy woman, taking him in her arms. “Education is a benefit which we have no
right to refuse you. Go, my son, and thank the doctor who has provided it for you, and prove to him by constant
application to your studies that you appreciate his kindness.”

“There, there,” said the doctor, whose glasses were dimmed by a singular cloudiness, “let us rather speak of
practical matters, that will be better. You know, do you not, that we must set out to-morrow very early, and that you
must have everything ready. We will go by sleigh to Bergen, and thence by railroad. Erik only needs a change of
linen, I will procure everything else that is necessary at Stockholm.”

“Everything shall be ready,” answered Dame Hersebom.

“Vanda,” she added, with Norwegian hospitality, “the doctor is still standing.”

The little girl hurriedly pushed a large arm-chair toward him.

“I can not stay,” said the doctor. “I promised my friend Malarius to dine with him, and he is waiting for me.
Little girl,” he said, laying his hand gently upon Vanda’s blonde head, “I hope you do not wish me any harm because
I am taking your brother away from you?”

“No, doctor,” she answered gravely. “Erik will be happier with you—he was not intended to live in a village.”

“And you, little one, will you be very unhappy without him?”

“The shore will seem deserted,” she answered; “the seagulls will look for him without finding him, the little
waves will be astonished because they no longer see him, and the house will seem empty, but Erik will be contented,
because he will have plenty of books, and he will become a learned man.”

“And his little sister will rejoice in his happiness—is it not so, my child?” said the doctor, kissing the forehead of
the little girl. “And she will be proud of him when he returns—see we have arranged the whole matter—but I must
hurry away. Good-bye until to-morrow.”

“Doctor,” murmured Vanda, timidly, “I wish to ask a favor of you!”

“Speak, child.”

“You are going in a sleigh, you said. I wish with my papa’s and mamma’s permission to drive you to the first
relay.”

“Ah, ah! but I have already arranged that. Reguild, the daughter of my overseer, should do this.”

“Yes, I know it, but she is willing that I should take her place, if you will authorize me to do so.”

“Well, in that case you have only to obtain the permission of your father and mother.”

“I have done so.”

“Then you have mine also, dear child,” said the doctor, and he took his departure.

The next morning when the sleigh stopped before the door of Mr. Hersebom little Vanda held the reins
according to her desire, seated upon the front seat.

She was going to drive them to the next village, where the doctor would procure another horse and sleigh, and
thus procure relays until he reached Bergen. This new kind of coachman always astonishes a stranger, but it is the
custom in Norway and Sweden. The men would think it a loss of time to pursue such a calling, and it is not rare to
see children of ten or twelve years of age managing heavy equipages with perfect ease.

The doctor was already installed in the back of the sleigh, nearly hidden by his furs. Erik took his seat beside
Vanda, after having tenderly embraced his father and brother, who contented themselves by showing by their mute
sadness the sorrow which his departure caused them; but the good Katrina was more open in the expression of her
feelings.

“Adieu, my son!” she said, in the midst of her tears. “Never forget what you have learned from your poor
parents--be honest, and brave, and never tell a lie. Work as hard as you can--always protect those who are weaker than yourself--and if you do not find the happiness you merit come back and seek it with us."

Vanda touched the horse which set out at a trot, and made the bells ring. The air was cold, and the road as hard as glass. Just above the horizon a pale sun began to throw his golden beams upon the snowy landscape. In a few minutes Noroe was out of sight behind them.

CHAPTER IV.
AT STOCKHOLM.

Doctor Schwaryencrona lived in a magnificent house in Stockholm. It was in the oldest and most aristocratic quarter of the charming capital, which is one of the most pleasant and agreeable in Europe. Strangers would visit it much more frequently if it were better known and more fashionable. But tourists, unfortunately for themselves, plan their journeys much upon the same principle as they purchase their hats. Situated between Lake Melar and the Baltic, it is built upon eight small islands, connected by innumerable bridges, and bordered by splendid quays, enlivened by numerous steam-boats, which fulfill the duties of omnibuses. The population are hardworking, gay, and contented. They are the most hospitable, the most polite, and the best educated of any nation in Europe. Stockholm, with its libraries, its museums, its scientific establishments, is in fact the Athens of the North, as well as a very important commercial center.

Erik, however, had not recovered from the sadness incident upon parting from Vanda, who had left them at the first relay. Their parting had been more sorrowful than would have been expected at their age, but they had not been able to conceal their emotion.

When the carriage stopped before a large brick house, whose double windows shone resplendently with gaslight, Erik was fairly dazzled. The copper knocker of the door appeared to him to be of fine gold. The vestibule, paved with marble and ornamented with statues, bronze torches, and large Chinese-vases, completed his amazement.

A footman in livery removed his master's furs, and inquired after his health with the affectionate cordiality which is habitual with Swedish servants. Erik looked around him with amazement.

The sound of voices attracted his attention toward the broad oaken staircase, covered with heavy carpet. He turned, and saw two persons whose costumes appeared to him the height of elegance.

One was a lady with gray hair, and of medium height, who wore a dress of black cloth, short enough to show her red stockings with yellow clock-work, and her buckled shoes. An enormous bunch of keys attached to a steel chain hung at her side. She carried her head high, and looked about her with piercing eyes. This was "Fru," or Madame Greta--Maria, the lady in charge of the doctor's house, and who was the undisputed autocrat of the mansion in everything that pertained to the culinary or domestic affairs. Behind her came a little girl, eleven or twelve years old, who appeared to Erik like a fairy princess. Instead of the national costume, the only one which he had ever seen worn by a child of that age, she had on a dress of deep blue velvet, over which her yellow hair was allowed to fall loosely. She wore black stockings and satin shoes; a knot of cherry-colored ribbon was poised in her hair like a butterfly, and gave a little color to her pale cheeks, while her large eyes shone with a phosphorescent light.

"How delightful, uncle, to have you back again! Have you had a pleasant journey?" she cried, clasping the doctor around the neck. She hardly deigned to cast a glance at Erik, who stood modestly aside.

The doctor returned her caresses, and shook hands with his housekeeper, then he made a sign for Erik to advance.

"Kajsa, and Dame Greta, I ask your friendship for Erik Hersebom, whom I have brought from Norway with me!" he said, "and you, my boy, do not be afraid," he said kindly. "Dame Greta is not as severe as she looks, and you and my niece Kajsa, will soon be the best of friends, is it not so, little girl?" he added, pinching gently the cheek of the little fairy.

Kajsa only responded by making a disdainful face.

As for the housekeeper, she did not appear very enthusiastic over the new recruit thus presented to her notice.

"If you please, doctor," she said, with a severe air, as they ascended the staircase, "may I ask who this child is?"

"Certainly, Dame Greta; I will tell you all about it before long. Do not be afraid; but now, if you please, give us something to eat."

In the "matsal," or dining-room, the table was beautifully laid with damask and crystal, and the "snorgas" was ready.

Poor Erik had never seen a table covered with a white cloth, for they are unknown to the peasants of Norway, who hardly use plates, as they have only recently been introduced, and many of them still eat their fish on rounds of black bread, and find it very good. Therefore the doctor had to repeat his invitation several times before the boy took his seat at the table, and the awkwardness of his movements caused "Froken," or Miss Kajsa, to cast upon him more
than one ironical glance during the repast. However, his journey had sharpened his appetite, and this was of great assistance to him.

The "snorgas" was followed by a dinner that would have frightened a Frenchman by its massive solidity, and would have sufficed to appease the appetites of a battalion of infantry after a long march. Soup, fish, home-made bread, goose stuffed with chestnuts, boiled beef, flanked with a mountain of vegetables, a pyramid of potatoes, hard-boiled eggs by the dozen, and a raisin pudding; all these were gallantly attacked and dismantled.

This plentiful repast being ended, almost without a word having been spoken, they passed into the parlor, a large wainscoted room, with six windows draped with heavy curtains, large enough to have sufficed a Parisian artist with hangings for the whole apartment. The doctor seated himself in a corner by the fire, in a large leather arm-chair, Kajsa took her place at his feet upon a footstool, whilst Erik, intimidated and ill at ease, approached one of the windows, and would have gladly hidden himself in its deep embrasure.

But the doctor did not leave him alone long.
"Come and warm yourself, my boy!" he said, in his sonorous voice; "and tell us what you think of Stockholm."
"The streets are very black and very narrow, and the houses are very high," said Erik.
"Yes, a little higher than they are in Norway," answered the doctor, laughing.
"They prevent one from seeing the stars!" said the young boy.
"Because we are in the quarter where the nobility live," said Kajsa, piqued by his criticisms. "When you pass the bridges the streets are broader."
"I saw that as we rode along; but the best of them are not as wide as that which borders the fiord of Noroe," answered Erik.
"Ah, ah!" said the doctor, "are you home-sick already?"
"No," answered Erik, resolutely. "I am too much obliged to you, dear doctor, for having brought me. But you asked me what I thought of Stockholm, and I had to answer."

"Noroe must be a frightful little hole," said Kajsa.
"A frightful little hole!" repeated Erik, indignantly. "Those who say that must be without eyes. If you could only see our rocks of granite, our mountains, our glaciers, and our forests of pine, looking so black against the pale sky! And besides all this, the great sea; sometimes tumultuous and terrible, and sometimes so calm as scarcely to rock one; and then the flight of the sea-gulls, which are lost in infinitude, and then return, to fan you with their wings. Oh, it is beautiful! Yes, far more beautiful than a town."
"I was not speaking of the country but of the houses," said Kajsa, "they are only peasants' cabins--are they not, uncle?"
"In these peasants' cabins, your father and grandfather as well as myself were born, my child," answered the doctor, gravely.

Kajsa blushed and remained silent.
"They are only wooden houses, but they answer as well as any," said Erik.
"Often in the evening while my father mends his nets, and my mother is busy with her spinning-wheel, we three sit on a little bench, Otto, Vanda, and I, and we repeat together the old sagas, while we watch the shadows that play upon the ceiling; and when the wind blows outside, and all the fishermen are safe at home, it does one good to gather around the blazing fire. We are just as happy as if we were in a beautiful room like this."
"This is not the best room," said Kajsa proudly. "I must show you the grand drawing-room, it is worth seeing!"
"But there are so many books in this one," said Erik, "are there as many in the drawing-room?"
"Books--who cares for them? There are velvet armchairs, and sofas, lace curtains, a splendid French clock, and carpets from Turkey!"

Erik did not appear to be fascinated by this description, but cast envious glances toward the large oaken bookcase, which filled one side of the parlor.
"You can go and examine the books, and take any you like," said the doctor. Erik did not wait for him to repeat this permission. He chose a volume at once, and seating himself in a corner where there was a good light, he was soon completely absorbed in his reading. He hardly noticed the successive entrance of two old gentlemen, who were intimate friends of Dr. Schwaryencrona, and who came almost every evening to play a game of whist with him.

The first who arrived was Professor Hochstedt, a large man with cold and stately manners, who expressed in polished terms the pleasure which he felt at the doctor's safe return. He was scarcely seated in the arm-chair which had long borne the name of the "professor's seat," when a sharp ring was heard.
"It is Bredejord," exclaimed the two friends simultaneously.

The door soon opened to admit a thin sprightly little man, who entered like a gust of wind, seized both the doctor's hands, kissed Kajsa on the forehead affectionately, greeted the professor, and cast a glance as keen as that of a mouse around the room.
It was the Advocate Bredejord, one of the most illustrious lawyers of Stockholm.

"Ha! Who is this?" said he, suddenly, as he beheld Erik.

The doctor tried to explain in as few words as possible.

"What--a young fisherman, or rather a boy from Bergen--and who reads Gibbon in English?" he asked. For he saw at a glance what the book was which so absorbed the little peasant.

"Does that interest you, my boy?" he asked.

"Yes, sir, it is a work that I have wanted to read for a long time, the first volume of the 'Fall of the Roman Empire,'" answered Erik, simply.

"Upon my word," exclaimed the lawyer, "it appears that the peasants of Bergen are fond of serious reading. But are you from Bergen?" he asked.

"I am from Noroe, which is not far from there," answered Erik.

"Ah, have they usually eyes and hair as brown as yours at Noroe?"

"No, sir; my brother and sister, and all the others, are blondes like Miss Kajsa. But they are not dressed like her," he added, laughing; "therefore they do not look much like her."

"No; I have no doubt of it," said Mr. Bredejord. "Miss Kajsa is a product of civilization. And what are you going to do at Stockholm, my boy, if I am not too curious?"

"The doctor has been kind enough to offer to send me to school," said Erik.

"Ah, ah!" said Mr. Bredejord, tapping his snuff-box with the ends of his fingers. His glance seemed to question the doctor about this living problem; but the latter made a sign to him, which was almost imperceptible, not to pursue his investigations, and he changed the conversation. They then talked about court affairs, the city news, and all that had taken place since the departure of the doctor. Then Dame Greta came, and opened the card-table, and laid out the cards. Soon silence reigned, while the three friends were absorbed in the mysteries of whist.

The doctor made pretension to being a great player, and had no mercy for the mistakes of his partners. He exulted loudly when their errors caused him to win, and scolded when they made him lose. After every rubber he took pleasure in showing the delinquent where he had erred; what card he should have led, and which he should have held back. It is generally the habit of whist-players, but it is not always conducive to amiability, particularly when the victims are the same every evening.

Happily for him, the doctor's two friends never lost their temper. The professor was habitually cool, and the lawyer severely skeptical.

"You are right," the first would say gravely, in answer to the most severe reproaches.

"My dear Schwaryencrona, you know very well you are only losing your time lecturing me," Mr. Bredejord would say, laughing. "All my life I have made the greatest blunders whenever I play whist, and the worst of it is, I do not improve." What could any one do with two such hardened sinners?

The doctor was compelled to discontinue his criticisms, but it was only to renew them a quarter of an hour later, for he was incorrigible.

It happened, however, that this evening he lost every game, and his consequent ill-humor made his criticisms very severe upon his two companions, and even upon the "dummy."

But the professor coolly acknowledged his faults, and the lawyer answered his most bitter reproaches by jokes.

"Why should I alter my play, when I win by playing badly, and you lose by following your correct rules?" he said to the doctor.

They played until ten o'clock. Then Kajsa made the tea in a magnificent "samovar," and served it with pretty gracefulness; then she discreetly disappeared. Soon Dame Greta appeared, and, calling Erik, she conducted him to the apartment which had been prepared for him. It was a pretty little room, clean and well furnished, on the second floor.

The three friends were now left alone.

"Now, at last, you can tell us who this young fisherman from Noroe is, who reads Gibbon in the original text?" said Mr. Bredejord, as he put some sugar into his second cup of tea. "Or is it a forbidden subject, which it is indiscreet for me to mention?"

"There is nothing mysterious about the matter, and I will willingly tell you Erik's history, for I know that I can rely upon your discretion," answered Dr. Schwaryencrona.

"Ah! I knew that he had a history," said the lawyer, seating himself comfortably in his arm-chair. "We will listen, dear doctor. I assure you that your confidence will not be misplaced. I confess this youth arouses my curiosity like a problem."

"He is, indeed, a living problem," answered the doctor, flattered by the curiosity of his friend. "A problem which I hope to be able to solve. But I must tell you all about it, and see if you think as I do."
The doctor settled himself comfortably, and began by telling them that he had been struck by Erik's appearance in the school at Noroe, and by his unusual intelligence. He had made inquiries about him, and he related all that Mr. Malarius and Mr. Hessebom had told. He omitted none of the details. He spoke of the buoy, of the name of "Cynthia," of the little garments which Dame Katrina had shown him, of the coral ornament, of the device upon it, and of the character of the letters.

"You are now in possession of all the facts as far as I have been able to learn them," he said. "And you must bear in mind that the extraordinary ability of the child is only a secondary phenomenon, and largely due to the interest with which Mr. Malarius has always regarded him, and of which he has made the best use. It was his unusual acquirements which first drew my attention to him and led me to make inquiries about him. But in reality this has little connection with the questions which now occupy me, which are: where did this child come from, and what course would it be best for me to take in order to discover his family? We have only two facts to guide us in this search. First: The physical indications of the race to which the child belongs. Second: The name 'Cynthia,' which was engraved on the buoy.

"As to the first fact, there can be no doubt; the child belongs to the Celtic race. He presents the type of a Celt in all its beauty and purity.

"Let us pass to the second fact:

"'Cynthia' is certainly the name of the vessel to which the buoy belonged. This name might have belonged to a German vessel, as well as to an English one; but it was written in the Roman characters. Therefore, the vessel was an English one—or we will say Anglo-Saxon to be more precise. Besides, everything confirms the hypothesis, for more than one English vessel going and coming from Inverness, or the Orkneys, have been driven on the coast of Norway by a tempest; and you must not forget that the little living waif could not have been floating for a long while, since he had resisted hunger, and all the dangers of his perilous journey. Well, now you know all, and what is your conclusion my dear friends?"

Neither the professor nor the lawyer thought it prudent to utter a word.

"You have not been able to arrive at any conclusion," said the doctor, in a tone which betrayed a secret triumph. "Perhaps you even think there is a contradiction between the two facts—a child of the Celtic race—an English vessel. But this is simply because you have failed to bear in mind the existence on the coast of Great Britain of a people of the Celtic race, on her sister island, Ireland. I did not think of it at first myself, and it prevented me from solving the problem. But when it occurred to me, I said to myself: the child is Irish. Is this your opinion, Hochstedt?"

If there was anything in the world the professor disliked, it was to give a positive opinion upon any subject. It must also be confessed that to give such an opinion in this case would have been premature. He therefore contented himself with nodding his head, and saying:

"It is an incontestable fact that the Irish belong to the Celtic branch of the Arian race."

This was a sufficiently safe aphorism, but Doctor Schwaryencrona asked nothing more, and only saw in it the entire confirmation of his theory.

"You think so, yourself," he said eagerly. "The Irish were Celts, and the child has all the characteristics of the race. The 'Cynthia' having been an English vessel, it appears to me that we are in possession of the necessary links, in order to find the family of the poor child. It is in Great Britain that we must look for them. Some advertisements in the 'Times' will probably be sufficient to put us on their tracks."

The doctor continued to enlarge upon his plan of proceeding, when he remarked the obstinate silence of the lawyer and the slightly ironical expression with which he listened to his conclusions.

"If you are not of my opinion, Bredejord, I wish you would say so. You know that I do not fear to discuss the matter," he said, stopping short.

"I have nothing to say," answered Mr. Bredejord. "Hochstedt can bear witness that I have said nothing."

"No. But I see very well that you do not share my opinion; and I am curious to know why," said the doctor.

"Is Cynthia an English name?" he asked, with vehemence. "Yes! it was written in Roman characters—it could not have been German. You have heard our eminent friend, Hochstedt, affirm that the Irish are Celts. Has the child all the characteristics of the Celtic race? You can judge for yourself. You were struck by his appearance before I opened my mouth about the subject. I conclude, therefore, that it is a want of friendship for you to refuse to agree with me, and recognize the fact that the boy belongs to an Irish family."

"Want of friendship is a strong charge," answered Mr. Bredejord, "if you apply it to me. I can only say that I have not, as yet, expressed the slightest opinion."

"No; but I see that you do not spare mine."

"Have I not a right?"

"But give some facts to support your theory."

"I have not said that I have formed any."
"Then it is a systematic opposition, just for the sake of contradicting me, as you do in whist."
"Nothing is further from my thoughts, I assure you. Your reasoning appeared to me to be too peremptory, that is all."
"In what way, if you please, I am curious to know?"
"It would take too long to tell you. Eleven o'clock is striking. I will content myself with offering you a bet. Your copy of Pliny against my Quintilian, that you have not judged rightly, and that the child is not Irish."
"You know that I do not like to bet," said the doctor, softened by his unconquerable good humor. "But I shall take so much pleasure in your discomfiture that I accept your offer."
"Well, then it is a settled affair. How much time do you expect to take for your researches?"
"A few months will suffice, I hope, but I have said two years to Hersebom, in order to be sure that no efforts were wanting."
"Ah! well--I give you two years. Hochstedt shall be our witness; and there is no ill-feeling, I hope?"
"Assuredly not, but I see your Quintilian in great danger of coming to keep company with my Pliny," answered the doctor.
Then, after shaking hands with his two friends, he accompanied them to the door.

CHAPTER V.
THE THIRTEEN DAYS OF CHRISTMAS.
The next day Erik began his new life at school.
Dr. Schwaryencrona first took him to his tailors, and fitted him out with some new suits of clothes; then he introduced him to the principal of one of the best schools in town. It was called in Swedish "Hogre elementar larovek."

In this school were taught the ancient and modern languages, the elementary sciences, and all that it was necessary to learn before entering college. As in Germany and Italy, the students did not board in the college. They lived with their families in the town, with the professors, or wherever they could obtain comfortable accommodations. The charges are very moderate; in fact, they have been reduced almost to nothing. Large gymnasiums are attached to each of the higher classes, and physical culture is as carefully attended to as the intellectual.

Erik at once gained the head of his division. He learned everything with such extreme facility that he had a great deal of time to himself. The doctor therefore thought that it would be better for him to utilize his evenings by taking a course at the "Slodjskolan," the great industrial school of Stockholm. It was an establishment especially devoted to the practice of the sciences, particularly to making experiments in physics and chemistry, and to geometrical constructions which are only taught theoretically in the schools.

Doctor Schwaryencrona judged rightly that the teachings of this school, which was one of the wonders of Stockholm, would give a new impetus to the rapid progress which Erik was making, and he hoped for great results from this double training.

His young _protégé_ proved worthy of the advantages which he procured for him. He penetrated the depths of the fundamental sciences, and instead of vague and superficial ideas, the ordinary lot of so many pupils, he stored up a provision of just, precise, and definite facts. The future development of these excellent principles could only be a question of time.

Hereafter he would be able to learn without difficulty the more elevated branches of these studies which would be required in college; in fact it would be only play to him.

The same service which Mr. Malarius had rendered him, in teaching him languages, history, and botany, the "Slodjskolan" now did for him by inculcating the A, B, C, of the industrial arts; without which the best teaching so often remains a dead letter.

Far from fatiguing Erik's brain, the multiplicity and variety of his studies strengthened it much more than a special course of instruction could have done.

Besides, the gymnasium was always open to him to recruit his body when his studies were over; and here as well as in the school Erik stood first. On holidays he never failed to pay a visit to the sea which he loved with filial tenderness. He talked with the sailors and fishermen, and often brought home a fine fish, which was well received by Dame Greta.

This good woman had conceived a great affection for this new member of the household. Erik was so gentle, and naturally so courteous and obliging, so studious and so brave, that it was impossible to know him and not to like him. In eight days he had become a favorite with Mr. Bredejord and Mr. Hochstedt, as he was already with Doctor Schwaryencrona.
The only person who treated him with coldness was Kajsa. Whether the little fairy thought that her hitherto undisputed sovereignty in the house was in danger, or whether she bore Erik a grudge, because of the sarcasms which her aristocratic air toward him inspired in the doctor, nobody knew. However, she persisted in treating him with a disdainful coldness, which no courtesy or politeness on his part could overcome. Her opportunities of displaying her disdain were fortunately rare, for Erik was always either out-of-doors, or else busy in his own little room.

Time passed in the most peaceful manner, and without any notable incidents.

We will pass with our reader without further comment over the two years which Erik spent at school and return to Noroe.

Christmas had returned for the second time since Erik's departure. It is in all Central and Northern Europe the great annual festival; because it is coincident with the dull season in nearly all industries. In Norway especially, they prolong the festival for thirteen days—"Tretten yule dage" (the thirteen days of Christmas), and they make it a season of great rejoicings. It is a time for family reunions, for dinners, and even for weddings.

Provisions are abundant, even in the poorest dwellings. Everywhere the greatest hospitality is the order of the day.

The "Yule ol," or Christmas beer, is drunk freely. Every visitor is offered a bumper in a wooden cup, mounted in gold, silver, or copper, which the poorest families possess, and which cups have been transmitted to them from time immemorial. The visitor must empty this cup, and exchange with his hosts the joyful wishes of the season, and for a happy New Year.

It is also at Christmas that the servants receive their new clothes; which are often the best part of their wages—that the cows, and even the birds of the air, receive a double ration, which is exceptionally large. They say in Norway of a "poor man," that he is so poor that he can not even give the sparrows their dinner at Christmas.

Of these thirteen traditional days, Christmas-eve is the gayest. It is the custom for the young girls and boys to go around in bands on their "schnee-schuhe," or snow-shoes, and stop before the houses, and sing in chorus the old national melodies. The clear voices suddenly sounding through the fresh night air, in the lonely valleys, with their wintry surroundings, have an odd and charming effect. The doors are immediately opened, the singers are invited to enter, and they offer them cake, dried apples, and ale; and often make them dance. After this frugal supper the joyous band depart, like a flock of gulls, to perform the same ceremony further away. Distances are regarded as nothing, for on their "schnee-schuhe," which are attached to their feet by leather straps, they glide over several miles with marvelous rapidity. The peasants of Norway also use, with these show-shoes, a strong stick, to balance themselves, and help them along. This year the festival would be a joyous one for the Herseboms. They were expecting Erik.

A letter from Stockholm had announced that he would arrive that evening. Therefore Otto and Vanda could not sit still. Every moment they ran to the door, to see if he was coming. Dame Katrina, although she reproved them for their impatience, felt in the same way herself. Mr. Hersebom smoked his pipe silently, and was divided in his mind between a longing to see his adopted son, and the fear that he would not be able to keep him with them very long.

For the fiftieth time, perhaps, Otto had gone to the door, when he gave a shout and cried out:

"Mother! Vanda! I believe it is he!"

They all rushed to the door. In the distance, on the road which led from Bergen, they saw a black object. It grew larger rapidly, and soon took the shape of a young man, clothed in gray cloth, wearing a fur cap, and carrying merrily over his shoulders a knapsack of green leather. He had on snow-shoes, and would soon be near enough to recognize.

The traveler perceived those who were watching before the door, and taking off his cap, he waved it around his head.

Two minutes later Erick was in the arms of Katrina, Otto, Vanda, and even Mr. Hersebom, who had left his armchair and advanced to the door.

They hugged him, and almost stifled him with caresses. They went into ecstasies over his improved appearance. Dame Katrina among them all could not get accustomed to it.

"What—is this the dear babe that I nursed on my knees?" she cried. "This great boy, with such a frank and resolute air, with these strong shoulders, this elegant form, and on whose lip I can already see signs of a mustache. Is it possible?"

The brave woman was conscious of feeling a sort of respect for her former nursling. She was proud of him, above all for the tears of joy which she saw in his eyes. For he also was deeply affected.

"Mother, is it really you," he exclaimed. "I can hardly believe that I am with you all again. The two years have seemed so long to me. I have missed you all, as I know you have missed me."

"Yes," said Mr. Hersebom, gravely. "Not a day has passed without our having spoken of you. Morning and
evening, and at meal times, it was your name that was constantly on our lips. But you, my boy, you have not
forgotten us in the grand city? You are contented to return and see the old country and the old house?"

"I am sure that you do not doubt it," said Erik, as he embraced them all. "You were always in my thoughts. But
above all when the wind blew a gale. I thought of you, father. I said to myself, Where is he? Has he returned home
in safety? And in the evening I used to read the meteorological bulletin in the doctor's newspaper, to see what kind
of weather you had had on the coast of Norway; if it was the same as on the coast of Sweden?--and I found that you
have severe storms more often than we have in Stockholm, which come from America, and beat on our mountains.
Ah! how often I have wished that I could be with you in your little boat to help you with the sail, and overcome all
difficulties. And on the other hand when the weather was fine it seemed to me as if I was in prison in that great city,
between the tall three-story houses. Yes! I would have given all the world to be on the sea for one hour, and to feel
as formerly free, and joyfully exhilarated by the fresh air!"

A smile brightened the weather-beaten face of the fisherman.

"His books have not spoiled him," he said. "A joyful season and a happy New-Year to you, my child!" he added.
"Come, let us go to the table. Dinner is only waiting for you."

When he was once more seated in his old place on the right hand of Katrina, Erik was able to look around him,
and mark the changes that two years had made in the family. Otto was now a large, robust boy of sixteen years of
age, and who looked twenty. As for Vanda, two years had added wonderfully to her size and beauty. Her
countenance had become more refined. Her magnificent blonde hair, which lay in heavy braids upon her shoulders,
formed around her forehead a light silvery cloud. Modest and sweet as usual, she busied herself, almost
unconsciously, with seeing that no one wanted for anything.

"Vanda has grown to be a great girl!" said her mother, proudly. "And if you knew, Erik, how learned she has
become, how hard she has worked and studied since you left us! She is the best scholar in the school now, and Mr.
Malaria says she is his only consolation for no longer having you among his pupils."

"Dear Mr. Malarius! how glad I shall be to see him again," said Erik. "So our Vanda has become so learned, has
she?" he replied with interest, while the young girl blushed up to the roots of her hair at these maternal praises.

"She has learned to play the organ also, and Mr. Malarius says that she has the sweetest voice of all the choir?"

"Oh, decidedly, it is a very accomplished young person whom I find on my return," Erik said, laughing, to
relieve the embarrassment of his sister. "We must make her display all her talents to-morrow."

And without affectation he began to talk about all the good people of Noroe, asking questions about each one;
inquiring for his old school-mates, and about all that had happened since he went away. He asked about their fishing
adventures, and all the details of their daily life. Then on his part, he satisfied the curiosity of his family, by giving
an account of his mode of life in Stockholm; he told them about Dame Greta, about Kajsa, and the doctor.

"That reminds me that I have a letter for you, father," he said, drawing it out of the inside pocket of his vest. "I
do not know what it contains, but the doctor told me to take good care of it, for it was about me."

Mr. Hersebom took the letter, and laid it on the table by his side.

"Well!" said Erik, "are you not going to read it?"

"No," answered the fisherman, laconically.

"But, since it concerns me?" persisted the young man.

"It is addressed to me," said Mr. Hersebom, holding the letter before his eyes. "Yes, I will read it at my leisure."

Filiaf obedience is the basis of family government in Norway.

Erik bowed his head in acquiescence.

When they rose from the table, the three children seated themselves on their little bench in the chimney-corner,
as they had so often done before, and began one of those confidential conversations, where each one relates what the
other is curious to know, and where they tell the same things a hundred times.

Katrina busied herself about the room, putting everything in order; insisting that Vanda should for once "play the
lady," as she said, and not trouble herself about household matters.

As for Mr. Hersebom, he had seated himself in his favorite arm-chair, and was smoking his pipe in silence. It
was only after he had finished this important operation that he decided to open the doctor's letter.

He read it through without saying a single word; then he folded it up, put it in his pocket, and smoked a second
pipe, like the first, without uttering a sound. He seemed to be absorbed in his own reflections.

Although he was never a talkative man, his silence appeared singular to Dame Katrina. After she had finished
her work, she went and seated herself beside him, and made two or three attempts to draw him into conversation, but
she only received the most brief replies. Being thus repulsed, she became melancholy, and the children themselves,
after talking breathlessly for some time, began to be affected by the evident sadness of their parents.

Twenty youthful voices singing in chorus before the door suddenly greeted their ears, and made a happy
diversion. It was a merry band of Erik's old classmates, who had conceived the pleasant idea of coming to give him a
cordial welcome home.

They hastened to invite them into the house, and offered them the customary feast, whilst they eagerly pressed around their old friend to express the great pleasure which they felt in seeing him again. Erik was touched by the unexpected visit of the friends of his childhood, and was anxious to go with them on their Christmas journey, and Vanda and Otto also were, naturally, eager to be of the party. Dame Katrina charged them not to go too far, but to bring their brother back early, as he needed rest after his journey.

The door was hardly closed upon them, when she resumed her seat beside her husband.

"Well, has the doctor discovered anything?" she asked, anxiously.

Instead of answering, Mr. Hersebom took the letter from his pocket, and read it aloud, but not without hesitating over some words which were strange to him:

"MY DEAR HERSEBOM," wrote the doctor, "it is now two years since you intrusted your dear child to my care, and every day I have had renewed pleasure in watching his progress in all the studies that he has undertaken. His intelligence is as remarkable as his heart is generous. Erik is truly one of nature's nobleman, and the parents who have lost such a son, if they knew the extent of their misfortune, would be objects of pity. But it is very doubtful whether his parents are still living. As we agreed, I have spared no efforts to discover them. I have written to several persons in England who have an agency for making special researches. I have had advertisements inserted in twenty different newspapers, English, Irish, and Scotch. Not the least ray of light has been thrown upon this mystery, and I have to confess that all the information which I have succeeded in procuring has rather tended to deepen the mystery.

"The name 'Cynthia,' I find in very common use in the English navy. From Lloyd's office, they inform me, that there are seventeen ships, of different tonnage, bearing this name. Some of these ships belong to English ports, and some to Scotland and Ireland. My supposition concerning the nationality of the child is therefore confirmed, and it becomes more and more evident to me that Erik is of Irish parentage. I do not know whether you agree with me on this point, but I have already mentioned it to two of my most intimate friends in Stockholm, and everything seems to confirm it.

"Whether this Irish family are all dead, or whether they have some interest in remaining unknown, I have not been able to discover any trace of them.

"Another singular circumstance, and which I also think looks still more suspicious, is the fact that no shipwreck registered at Lloyd's, or at any of the marine insurance companies, corresponds with the date of the infant's arrival on your coast. Two vessels named 'Cynthia' have been lost, it is true, during this century; but one was in the Indian Ocean, thirty-two years ago, and the other was in sight of Portsmouth eighteen years ago.

"We are therefore obliged to conclude that the infant was not the victim of a shipwreck.

"Doubtless he was intentionally exposed to the mercy of the waves. This would explain why all my inquiries have been fruitless.

"Be this as it may, after having questioned successively all the proprietors of the vessels bearing the name of 'Cynthia,' without obtaining any information, and after exhausting all known means of pursuing my investigations, I have been compelled to conclude that there is no hope of discovering Erik's family.

"The question that arises for us to decide, my dear Hersebom, and particularly for you, is what we ought to say to the boy, and what we ought to do for him.

"If I were in your place, I should now tell him all the facts about himself which affect him so nearly, and leave him free to choose his own path in life. You know we agreed to adopt this course if my efforts should prove unsuccessful. The time has come for you to keep your word. I have wished to leave it to you to relate all this to Erik. He is returning to Noroe still ignorant that he is not your son, and he does not know whether he is to return to Stockholm or remain with you. It is for you to tell him.

"Remember, if you refuse to fulfill this duty, Erik would have the right some day, perhaps, to be astonished at you. Recall to mind also that he is a boy of too remarkable abilities to be condemned to an obscure and illiterate life. Such a sentence would have been unmerited two years ago, and now, after his brilliant career at Stockholm, it would be positively unjustifiable.

"I therefore renew my offer: let him return to me and finish his studies, and take at Upsal the degree of Doctor of Medicine. I will continue to provide for him as if he were my own son, and he has only to go on and win honors and a fortune.

"I know that, in addressing you and the excellent adopted mother of Erik, I leave his future in good hands. No personal consideration, I am sure, will prevent you from accepting my offer. Take Mr. Malarius' advice in this matter.

"While awaiting your reply, Mr. Hersebom, I greet you affectionately, and I beg you to remember me most kindly to your worthy wife and children."
"R.W. SCHWARYENCRONA, M.D."

When the fisherman had finished reading this letter, Dame Katrina, who had been silently weeping while she listened to it, asked him what he intended to do.

"My duty is very clear," he said. "I shall tell the boy everything."

"That is my opinion also; it must be done, or we should never have another peaceful moment," she murmured, as she dried her eyes.

Then they both relapsed into silence.

It was past midnight when the three children returned from their expedition. Their cheeks were rosy, and their eyes shone with pleasure from their walk in the fresh air. They seated themselves around the fire to finish gayly their Christmas-eve by eating a last cake before the enormous log which looked like a burning cavern.

CHAPTER VI.
ERIK'S DECISION.

The next day the fisherman called Erik to him, and in the presence of Katrina, Otto, and Vanda, spoke to him as follows:

"Erik, the letter of Doctor Schwaryencrona was about you. He writes that you have given entire satisfaction to your teachers, and the doctor offers to pay all the expenses of your education, if you wish to continue your studies. But this letter also requires you to decide for yourself, whether you will accept this offer, or remain with us at Noroe, which we would like so much to have you do, as you no doubt know. But before you make up your mind, I must tell you a great secret, a secret that my wife and I would have preferred to keep to ourselves."

At this moment Dame Katrina could not restrain her tears, and, sobbing, she took the hand of Erik and pressed it to her heart, as if protesting against the information which the young man was now to hear.

"This secret," continued Mr. Hersebom, in a strangely altered voice, "is that you are our son only by adoption. I found you on the sea, my child, and brought you home when you were only eight or nine months old. God is my witness that we never intended to tell you this, and neither my wife nor myself have ever made the least difference between you, and Otto, and Vanda. But Doctor Schwaryencrona requires us to do so. Therefore, I wish you to read what he has written to me."

Erik had suddenly become deadly pale. Otto and Vanda, surprised at what they had heard, both uttered a cry of astonishment. Then they put their arms around Erik, and clung closely to him, one on the right, and the other on the left.

Then Erik took the doctor's letter, and without trying to conceal his emotion, he read what he had written to Mr. Hersebom.

The fisherman then told him all the facts about himself. He explained how Dr. Schwaryencrona had undertaken to try and discover the family to which he belonged; and, also, that he had been unsuccessful. How, that but for his advice and suggestions, they would never have thought of doing so. Then Dame Katrina arose, and going to the oaken chest, brought out the garments that the baby had worn, and showed him also the coral which had been fastened around his neck. The story was naturally so full of dramatic interest to the children, that they forgot for a time, at least, how sad it was. They looked with wonder at the lace, and velvet, the golden setting of the coral, and the inscription. It almost seemed to them as if they were taking part in some fairy tale. The impossibility of obtaining any information, as reported by the doctor, only made them regard these articles as almost sacred.

Erik looked at them as if he were in a dream, and his thoughts flew to the unknown mother, who, without doubt, had herself dressed him in these little garments, and more than once shook the coral before the eyes of the baby to make him smile. It seemed to him when he touched them as if he held direct communion with her through time and space.

But where was this mother? Was she still living, or had she perished? Was she weeping for her lost son, or must the son, on the contrary, think of her as forever lost to him?

He remained for some minutes absorbed in these reflections, with his head bent, but a word from Dame Katrina recalled him to himself.

"Erik, you are always our child," she cried, disturbed by his silence.

The eyes of the young man as he looked around him fell on all their loving countenances—the maternal look of the loving wife, the honest face of Mr. Hersebom, that of Otto even more affectionate than usual, and that of Vanda, serious and troubled. As he read the tenderness and disquietude displayed on all their faces, Erik felt as if his heart was melting within him. In a moment he realized his situation, and saw vividly the scene which his father had described. The cradle abandoned to the mercy of the waves, rescued by the hardy fisherman, and carried to his wife; and these people, humble and poor as they were, had not hesitated to take care of the little stranger, to adopt and
cherish him as their own son. They had not spoken of the matter for fourteen years, and now they were hanging on his words as if they were a matter of life and death to them.

All this touched him so deeply that suddenly his tears came. An irresistible feeling of love and gratitude overwhelmed him. He felt eager on his part to repay by some devotion the tenderness which they had shown to him. He resolved to stay with them at Noroe forever, and content himself with their humble lot, while he endeavored to do everything in his power to repay them.

"Mother," said he, throwing himself into Katrina's arms, "do you think that I can hesitate, now that I know all? We will write to the doctor, and thank him for his kind offer, and tell him that I have chosen to remain with you. I will be a fisherman, like you, father, and like Otto. Since you have given me a place at your fireside, I would prefer to retain it. Since you have nourished me by the labor of your hands, I ask to be allowed to repay you in your old age for your generosity toward me when I was a helpless infant."

"God be praised!" cried Dame Katrina, pressing Erik to her heart in a transport of joy and tenderness.

"I knew that the child would prefer the sea to all their books," said Mr. Hersebom, not understanding the sacrifice that Erik's decision would be to him.

"Come, the matter is settled. We will not talk about it any more, but only try to enjoy this good festival of Christmas!"

They all embraced each other, with eyes humid with happiness, and vowed they would never be separated.

When Erik was alone he could not help a stifled sigh, as he thought about all his former dreams of work, and of the career which he had renounced. But still he experienced at the same time a joy which he believed would repay him for the sacrifice.

"Since it is the wish of my adopted parents," he said to himself, "the rest does not signify. I ought to be willing to work for them in the sphere and condition where their devotion has placed me. If I have sometimes felt ambitious to take a higher position in the world, was it not that I might be able to assist them? Since it makes them happy to have me with them, and as they desire nothing better than their present life, I must try to be contented, and endeavor by good conduct and hard work to give them satisfaction. Adieu, then, to my books."

Thus he mused, and soon his thoughts returned to the time when the fisherman had found him floating in his little cradle on the waves. What country did he belong to? Who were his parents? Were they still alive? Had he in some foreign country brothers and sisters whom he would never know?

Christmas had also been in Dr. Schwaryencrona's house in Stockholm a season of great festivity. It was at this time, as the reader doubtless remembers, that they had agreed to decide the bet between him and Mr. Bredejord, and that Professor Hochstedt was to be the umpire.

For two years not a word had been said by either of them about this bet. The doctor had been patiently pursuing his researches in England, writing to the maritime agencies, and multiplying his advertisements in the newspapers; but he had taken care not to confess that his efforts had been fruitless.

As for Mr. Bredejord, he had had the good taste to avoid all allusion to the subject, and contented himself with occasionally admiring the beautiful binding of the Pliny which was displayed in the doctor's book-case.

But when he struck his snuff-box sharply with the ends of his fingers, while he looked at the book, the doctor correctly interpreted the pantomime, which was a shock to his nerves, and said to himself:

"Oh, yes; he is thinking how well the Pliny will look beside his elegant editions of Quintilian and Horace."

On these evenings he was more merciless than ever, if his unfortunate partner made any mistakes at whist.

But time had taken its flight, and he was now obliged to submit the question to the impartial arbitration of Professor Hochstedt.

Dr. Schwaryencrona approached the subject frankly. Kajsa had hardly left him alone with his two friends when he confessed to them, as he had confessed in his letter to Mr. Hersebom, that his investigations had been without result. Nothing had occurred to throw any light on the mystery which surrounded Erik's origin, and the doctor in all sincerity declared that the problem was thought by him to be insolvable.

"But," he continued, "I should be doing myself an injustice if I did not declare with equal sincerity that I do not believe that I have lost my bet. I have not discovered Erik's family, it is true, but all the information that I have been able to obtain corroborates the conclusion which I had arrived at. The 'Cynthia' was, no doubt, an English vessel, for there are at least seventeen ships bearing this name registered at Lloyd's. As for ethnographical characteristics, they are clearly Celtic. My hypothesis, therefore, as to the nationality of Erik is victoriously confirmed. I am more than ever certain that he is of Irish extraction as I at first surmised. But I can not compel his family to come forward and acknowledge him, if they have any reasons of their own for wishing him to continue lost to them. This is all I have to say, my dear Hochstedt; and now you must be the judge as to whether the Quintilian of our friend Bredejord should not legitimately be transferred to my book-case!"

At these words, which seemed to occasion a strong inclination to laugh, the lawyer fell back in his arm-chair,
raised his hands as if in protestation, then he fixed his brilliant eyes upon Professor Hochstedt to see how he would regard the matter. The professor did not betray the embarrassment which might have been expected. He would have certainly felt miserable if the doctor had urged any incontrovertible argument, which would have compelled him to decide in favor of one or the other. His prudent character led him to speak in indefinite terms. He excelled in presenting, one after the other, both sides of a question, and he reveled in his vagaries, like a fish in water. Therefore, this evening he felt quite equal to the situation.

"The fact is incontestable," he said, shaking his head, "that there are seventeen English vessels bearing the name of 'Cynthia,' and this seems to favor the conclusion arrived at by our eminent friend. The characteristic traits also have assuredly great weight, and I do not hesitate to say that they appear to me to be quite conclusive. I do not hesitate to confess that if I were called upon to give an opinion as to Erik's nationality, I should say that he was Irish. But to decide the bet in question we require something more than probabilities; we must have facts to guide us. The chances so far greatly favor the opinion of Dr. Schwaryencrona, but Bredejord can allege that nothing has actually been proved. I see, therefore, no sufficient reason for declaring that the Quintilian has been won by the doctor; neither can I say that the professor has lost his Pliny. In my opinion, as the question remains undecided, it ought to be annulled, which is the best thing to do in such a case."

The doctor's face clearly betrayed his dissatisfaction. As for Mr. Bredejord he leaped to his feet, saying:

"Your argument is a beautiful one, my dear Hochstedt, but I think you are hasty in your conclusions. Schwaryencrona, you say, has not verified his opinions sufficiently for you to say positively that he has won the bet, although you think that all the probabilities are in his favor. What will you say then, if I prove to you immediately that the 'Cynthia' was not an English vessel at all?"

"What would I say?" said the professor, somewhat troubled by this sudden attack. "Upon my word I do not know. I would have to consider the question in a different aspect."

"Examine it then at your leisure," answered the advocate, thrusting his hand into the inner pocket of his coat, and taking out a case from which he selected a letter inclosed in one of those yellow envelopes, which betray at the first glance their American origin.

"This is a document which you can not controvert," he added, placing the letter before the doctor's eyes, who read aloud:

_"To Mr. Bredejord, Stockholm._

"NEW YORK, October 27th.

"SIR,—In reply to your letter of the 5th instant, I hasten to write you the following facts:--

"1st.—A vessel named 'Cynthia,' commanded by Captain Barton, and the property of the Canadian General Transportation Company, was lost, with her cargo and all on board, just fourteen years ago, in the neighborhood of the Faroe Islands.

"2d.—The vessel was insured in the General Steam Navigation Company of New York for the sum of eight hundred thousand dollars.

"3d.—The disappearance of the 'Cynthia' having remained unexplained, and the causes of the sad accident never having been clearly proved to the satisfaction of the insurance company, a lawsuit ensued, which was lost by the proprietors of the said vessel.

"4th.—The loss of this lawsuit occasioned the dissolution of the Canadian General Transportation Company, which has ceased to exist for the last eleven years, having gone into liquidation. While waiting to hear from you again, I beg of you, sir, to accept our sincere salutations.

"JEREMIAH SMITH, WALKER & CO., "Maritime Agents."

"Well, what do you say to that?" asked Mr. Bredejord, when the doctor had finished reading the letter. "It is a document of some value, I think. Do you agree with me?"

"I quite agree with you," answered the doctor. "How did you procure it?"

"In the simplest way in the world. That evening when you spoke to me about the 'Cynthia' being necessarily an English vessel, I thought that you were taking too limited a field for your researches, and that the vessel might be an American one. When time passed, and you received no intelligence, for you would have told us if you had, the idea occurred to me of writing to New York. The third letter brought the result which you have before you. The affair is no longer a complicated one. Do you not think that it assures to me beyond contest the possession of your Pliny?"

"It appears to me to be rather a forced conclusion," replied the doctor, taking the letter and reading it over again, to see if he could find any new arguments to support his theory.

"How forced?" cried the advocate.

"I have proved to you that the vessel was an American one, and that she was lost off the Faroe Islands, that is to say, near the coast of Norway, precisely at the time which corresponds to the arrival of the infant, and still you are not convinced of your error."
"Not in the least, my dear friend. I do not dispute the value or your document. You have discovered what I have found it impossible to do--the true 'Cynthia,' which was lost at a little distance from our coast, and at a specified epoch; but permit me to say, that this only confirms precisely my theory, for the vessel was a Canadian one, or in other words, English, and the Irish element is very strong in some parts of Canada, and I have therefore more reason than ever for being sure that the child is of Irish origin."

"Ah, is that what you find in my letter?" said Mr. Bredejord, more vexed than he was willing to appear to be.

"Then without doubt you persist in believing that you have not lost your Pliny?"

"Assuredly!"

"Perhaps you think you have a right to my Quintilian?"

"I hope in any case to be able to prove my right, thanks to your discovery, if you will only give me time by renewing the bet."

"I am willing. I ask nothing better. How much time do you want?"

"Let us take two more years, and wait until the second Christmas after this one."

"It is agreed," answered Mr. Bredejord. "But be assured, doctor, that you will finally see me in possession of your Pliny!"

"By my faith no. It will make a fine appearance in my book-case beside your Quintilian."

CHAPTER VII.

VANDA'S OPINION.

In the beginning, Erik burning with zeal at the sacrifice which he had made, devoted all his energies to a fisherman's life, and tried to forget that he had ever known any other. He was always the first to rise and prepare the boat for his adopted father, who found every morning all the arrangements completed, and he had only to step on board. If the wind failed, then Erik took the heavy oars, and rowed with all his strength, seeming to choose the hardest and most fatiguing duties. Nothing discouraged him, neither the long waiting for the fish to seize the bait, nor the various preparations to which the captive was subjected--first, the removal of the tongue, which is a most delicate morsel; then the head, then the bones, before placing them in the reservoir, where they receive their first salting. Whatever their work was, Erik did his part not only conscientiously, but eagerly. He astonished the placid Otto by his extreme application to the smallest details of their business.

"How you must have suffered, when you were shut up in the town," said the lad to him, naively. "You only seem to be in your element when you are on the borders of the fiord or on the open sea."

When their conversation took this turn, Erik always remained silent. Sometimes, however, he would revert to the subject himself, and try to prove to Otto, or rather to himself, that there was no better state of existence than their own.

"It is what I have always heard," the other would answer with his calm smile.

And poor Erik would turn away and stifle a sigh.

The truth is that he suffered cruelly after renouncing his studies and seeing himself condemned to a life of manual labor. When these thoughts came to him he fought against them with all his might. He did not wish any one to suspect that he felt in this way, and in hiding them within his own breast he suffered all the more.

A catastrophe which occurred at the beginning of the spring, only served to increase his discouragement.

One day, as there was a great deal of work to do at home in piling together the salted fish, Mr. Hersebom had intrusted it to Erik and to Otto, and had gone out to fish alone. The weather was stormy, and the sky very cloudy for the time of the year. The two young men, although they worked actively, could not help noticing that it was exceptionally dull, and they felt the atmosphere very heavy.

"It is singular!" said Erik, "but I feel a roaring in my ears as if I were some distance above the earth in a balloon."

Almost immediately his nose began to bleed. Otto had a similar sensation, although not quite so severe.

"I think the barometer must be very low," said Erik. "If I had time I would run to Mr. Malarius' and see."

"You have plenty of time," said Otto. "Our work is nearly done, and even if you were delayed I could easily finish it alone."

"Then I will go," replied Erik. "I do not know why the state of the atmosphere should trouble me so much. I wish father was home."

As he walked toward the school, he met Mr. Malarius on the road.

"Is it you, Erik?" said the teacher. "I am glad to see you, and make sure that you are not on the sea. I was just going to inquire. The barometer has fallen with such rapidity during the last half hour. I have never seen anything like it. We are surely going to have a change of weather."
Mr. Malarius had hardly finished speaking, when a distant grumbling, followed by a lugubrious roaring, fell upon their ears. The sky became covered with a cloud as black as ink, which spread rapidly in all directions, and obscured every object with great swiftness. Then suddenly, after an interval of complete silence, the leaves of the trees, the bits of straw, the sand, and even the stones, were swept away by a sudden gust of wind.

The hurricane had begun.

It raged with unheard-of violence. The chimneys, the window shutters, and in some places even the roofs of the houses were blown down; and the boat-houses without exception were carried away and destroyed by the wind. In the fiord, which was usually as calm as a well in a court-yard, the most terrible tempest raged; the waves were enormous and came and went, breaking against the shore with a deafening noise.

The cyclone raged for an hour, then arrested in its course by the heights of Norway, it moved toward the south, and swept over continental Europe. It is noted in meteorological annals as one of the most extraordinary and disastrous that ever was known upon the Atlantic coast. These great changes of the atmosphere are now generally announced beforehand by the telegraph. Most of the European sea-ports forewarned of the danger have time to warn vessels and seamen of the threatened tempest, and they seek a safe anchorage. By this means many disasters are averted.

But on the distant and less frequented coasts, in the fishing-hamlets, the number of shipwrecks was beyond computation.

In one office, that of "Veritas" in France, there were registered not less than 730.

The first thought of all the members of the Hersebom family, as well as of all the other families of fishermen, was naturally for those who were on the sea on this disastrous day. Mr. Hersebom went most often to the western coast of a large island which was about two miles distant, beyond the entrance to the fiord. It was the spot where he had first seen Erik. They hoped that during the tempest he had been able to find shelter by running his boat upon the low and sandy shore. But Erik and Otto felt so anxious that they could not wait until evening to see if this hope was well founded.

The fiord had hardly resumed its ordinary placidity, after the passage of the hurricane, when they borrowed a boat of one of their neighbors, in order to go in search of him. Mr. Malarius insisted upon accompanying the young men upon their expedition, and they all three set out, anxiously watched by Katrina and her daughter.

On the fiord the wind had nearly gone down, but it blew from the west, and to reach the entrance to the harbor they were obliged to use their oars. This took them more than an hour.

When they reached the entrance an unexpected obstacle presented itself. The tempest was still raging on the ocean, and the waves dashed against the island which, formed the entrance to the fiord of Noroe, forming two currents, which came and went with such violence in the narrow pass that it was impossible to gain the open sea. A steamboat could not have ventured through it, and a weak boat could not have resisted it for a moment.

The only thing they could do, therefore, was to return to Noroe, and wait as patiently as they could.

The hour when he habitually came home passed without bringing Mr. Hersebom, but none of the other fishermen returned; so they hoped that they were all detained by the impassable state of the entrance to the fiord, and would not believe that he had personally met with any disaster. That evening was a very sad one at all the firesides where a member was missing. As the night passed without any of the absent men making their appearance, the anxieties of their families increased. In Mr. Hersebom's house nobody went to bed. They passed the long hours of waiting seated in a circle around the fire, silent and anxious.

Dawn is late in these high latitudes in March, but when at last it grew light it was bright and clear. The wind was calm, and they hoped they would be able to get through the pass. A regular fleet of boats, composed of every one who could get away from Noroe, was ready to go in search of the absent men. Just at this moment several vessels hove in sight, and soon reached the village. They were the fishermen who had gone out the day before, not expecting such a cyclone; but Mr. Hersebom was not among them.

Nobody could give any account of him, and the fact of his not returning with the others increased their anxiety as all the men had been in great peril. Some had been surprised by the cyclone and dashed upon the shore, others had time to shelter themselves in a secure place of anchorage. A few had reached the land just in time to save themselves.

It was decided that the flotilla should go in search of those who were missing. Mr. Malarius who still wished to take part in the expedition accompanied Erik and Otto. A large yellow dog begged so earnestly to go with them, that at length they yielded. It was Kaas, the Greenland dog that Mr. Hersebom had brought back with him, after a voyage to Cape Farewell.

After issuing from the pass the boats separated, some going to the right, and others to the left, to explore the shores of the innumerable islands which lie scattered near the entrance to the fiord of Noroe, as well as all along the coast of Norway.
When they met at midday at a given point, which had been agreed upon before separating, no trace of Mr. Hersebom had been discovered. As the search had apparently been well conducted, everyone was of the opinion that they had nothing more to do but to go home.

But Erik was not willing to own himself defeated, and give up all hope so easily. He declared that having visited all the islands which lay toward the south, he now wished to explore those which were in the north. Mr. Malarius and Otto supported him; and seeing this they granted his desire.

This persistence deserved some recompense. Toward two o'clock as they approached a large island, Kaas began suddenly to bark furiously; then before they could prevent him he threw himself into the water, and swam to the shore.

Erik and Otto rowed with all their strength in the same direction. Soon they saw the dog reach the island, and bound, while he uttered loud howls, toward what appeared to be a human form lying extended upon the sand. They made all possible haste, and soon saw beyond a doubt that it was a man who was lying there, and this man was Mr. Hersebom; bloody, pale, cold, inanimate--dead, perhaps. Kaas was licking his hands, and uttering mournful cries.

Erik's first action was to drop on his knees beside the cold body, and apply his ear to his heart.

"He is alive, I feel it beat," he cried.

Mr. Malarias had taken one of Mr. Hersebom's hand's, and was feeling his pulse and he shook his head, sadly and doubtfully; but he would not neglect any of the means which are usually tried in such cases. After taking off a large woolen girdle which he wore around his waist, he tore it in three pieces, and giving one to each of the young men, they rubbed vigorously the body, the arms, and the legs of the fisherman.

It was soon manifest that this simple treatment had produced the effect of restoring the circulation. The beating of the heart grew stronger, the chest rose, and a feeble respiration escaped through the lips. In a little while Mr. Hersebom was partially restored to consciousness, for he distinctly moaned.

Mr. Malarias, and the two young men lifted him from the ground, and carried him to the boat, where they hastily arranged a bed for him of sails. As they laid him in the bottom of the boat he opened his eyes.

"A drink!" he said in a weak voice.

Erik held a flask of brandy to his lips. He swallowed a mouthful and appeared to be conscious of their arrival, for he tried to give them an affectionate and grateful smile. But fatigue overcame him almost immediately, and he fell into a heavy sleep which resembled a complete lethargy. Thinking justly that the best thing they could do was to get him home as speedily as possible, they took his oars and rowed vigorously; and in a very short time they reached Noroe.

Mr. Hersebom was carried to his bed, and his wounds were dressed with arnica. He was fed with broth, and given a glass of beer, and in a short time he recovered consciousness. His injuries were not of a very grave nature. One of his arms was fractured, and his body was covered with wound and bruises. But Mr. Malarius insisted that he should remain quiet and rest, and not fatigue himself by attempting to talk. He was soon sleeping peacefully.

It was not until the next day that they permitted him to speak and explain in a few words what had happened to him.

He had been overtaken by the cyclone just as he had hoisted his sail to return to Noroe. He had been dashed against the rocks of the island and his boat had been broken into a thousand pieces and carried away by the waves. He had thrown himself into the sea to escape the frightful shock, when she struck, but in spite of all his efforts, he had been dashed by the waves upon the rocks and terribly wounded; he had only been able to drag himself beyond the reach of the waves.

Exhausted by fatigue, one arm broken, and his whole body covered with wounds, he had lain in an unconscious state, unable to move. He could give no account of the manner in which he had passed the twenty hours; doubtless he had either been delirious or unconscious.

Now that he was saved, he began to lament for the loss of his boat, and because of his broken arm, which was now in splints. What would become of him, even admitting that he might be able to use his arm again after eight or ten weeks? The boat was the only capital possessed by the family, and the boat had been broken to pieces by the wind.

It would be very hard for a man of his age to be compelled to work for others. Besides, could he find work? It was very doubtful, for nobody in Noroe employed any assistant, and the factory even had lately reduced its hands.

Such were the bitter reflections of Mr. Hersebom, while he lay upon his bed of pain; and he felt still worse when he was able to get up, and occupy his accustomed seat in his arm-chair.

While waiting for his complete recovery, the family lived upon such provisions as they had in the house, and by the sale of the salt cod-fish which still remained. But the future looked very dark, and nobody could see how it was to be lightened.

This imminent distress had given a new turn to Erik's thoughts. For two or three days he reflected that it was by
his good fortune that Mr. Hersebom had been discovered. How could he help feeling proud, when he saw Dame Katrina and Vanda look at him with intense gratitude, as they said: "Dear Erik, our father saved you from the waves, and now, in your turn, you have snatched him from death."

Certainly it was the highest recompense that he could desire for the self-abnegation of which he had given such a noble proof, in condemning himself to a fisherman's life. To feel that he had been able to render his adopted family such an inestimable benefit was to him a thought full of sweetness and strength. This family, who had so generously shared with him all that they possessed, were now in trouble, and in want of food. But, could he remain to be a burden to them? Was it not rather his duty to try and do something to assist them?

Erik did not doubt his obligation to do this. He only hesitated as to the best way for him to do it. Should he go to Bergen and become a sailor? or was there some better occupation open to him, where he could be immediately useful to them. He resolved to consult Mr. Malarius, who listened to his reasons, and approved of them, but did not think well of his project of becoming a sailor.

"I understood, but I deplored your decision when you were resigned to remain here and share the life of your adopted parents; but I can not understand why you should condemn yourself to the life of a sailor, which would take you far away from them, when Doctor Schwaryencrona offers you every advantage to pursue a more congenial career," said Mr. Malarius. "Reflect, my dear child, before you make such a decision."

Mr. Malarius did not tell him that he had already written to Stockholm to inform the doctor of the sad state of their affairs, and the change which the cyclone of the 3d of March had made in the circumstances of Erik's family. He was not surprised, when three days after his conversation with Erik, he received the following letter, which he lost no time in carrying to the house of Mr. Hersebom.

The letter read as follows:

"STOCKHOLM, March 17th.

"MY DEAR MR. MALARIUS,--I thank you cordially for informing me of the disastrous consequences of the cyclone of the 3d of March to the worthy Mr. Hersebom. I am proud and happy to learn that Erik acted in these circumstances, as always before, like a brave boy and a devoted son. You will find a check in this letter for 500 kroners; and I beg you to give them to him from me. Tell him if it is not enough to buy at Bergen a first-class boat, he must let me know without delay. He must name this boat 'Cynthia,' and then present it to Mr. Hersebom as a souvenir of filial love. That done, if Erik wishes to please me he will return to Stockholm and resume his studies. His place is always ready for him at my fireside, and if he needs a motive to assist in this decision, I add that I have at length obtained some information, and hope yet to be able to solve the mystery enshrouding his birth.

"Believe me, my dear Malarius, your sincere and devoted friend,

"R.W. SCHWARYENCRONA, M.D."

You may imagine with what joy this letter was received. The doctor, by sending this gift to Erik, showed that he understood the character of the old fisherman. If he had offered it directly to him, it is hardly probable that Mr. Hersebom would have accepted it. But he could not refuse the boat from Erik's hand, and bearing the name of "Cynthia," which recalled how Erik had become a member of the family. Their only grief now, which already began to sadden all their countenances, was the thought that he must soon leave them again. Nobody dared to speak about it, although it was constantly in their thoughts. Erik himself, with his head bowed, was divided between the desire of satisfying the doctor, and realizing the secret wishes of his own heart, and the no less natural wish of giving no offense to his adopted parents.

It was Vanda who first broke the reserve, and spoke upon the subject.

"Erik," she said, in her sweet grave voice, "you can not say 'No' to the doctor after receiving such a letter. You can not do it, because it would be treating him most ungratefully, and sinning against yourself. Your place is among scholars, and not among fishermen. I have thought so for a long time. Nobody has dared to tell you, therefore I tell you."

"Vanda is right," said Mr. Malarius, with a smile.

"Vanda is right," repeated Dame Katrina, drying her eyes.

And in this manner, for the second time, Erik's departure was decided.

CHAPTER VIII.

PATRICK O'DONOGHAN.

The information which Dr. Schwaryencrona had received was not very important, but it sufficed to start his inquiries in a new direction.

He had learned the name of the ex-director of the Canadian Transportation Company, it was Mr. Joshua Churchill. But they did not know what had become of this gentleman since the dissolution of the company. If they
could succeed in finding him, he might be able to give them some information about the old records of the company; perhaps there might have been a list of the passengers by the "Cynthia," and the baby might have been registered with his family or with the persons who had charge of him. But their investigations proved very unsatisfactory. The solicitor who had formerly had the books in his possession as the receiver of the company about ten years before; did not know what had become of Mr. Churchill. For a moment Dr. Schwaryencrona consoled himself with a false hope. He remembered that the American newspapers usually published a list of the passengers embarking for Europe, and he sent for a number of old gazettes to see if he could find the "Cynthia's" list; but he was soon convinced that this was a fruitless effort. He discovered that the practice of publishing the names of passengers on European steamships was of comparatively recent date. But the old gazettes were of one use to him, they gave the exact date of sailing of the "Cynthia," which had left on the 3d of November, not from a Canadian port as they had at first supposed, but from New York, to go to Hamburg.

It was therefore in New York that the doctor must first make his investigations, and, if unsuccessful, then in other parts of the United States.

At Hamburg all his inquiries proved to be useless. The consignee of the Canadian Transportation Company knew nothing about the passengers of the "Cynthia," and could only give them information about the freight, which they had already obtained.

Erik had been in Stockholm six months when they learned that the ex-director, Mr. Joshua Churchill, had died several years before, in an hospital, without leaving any known heirs, or probably any money. As for the registers of the company, they had probably been sold long before as waste paper.

These long researches led to nothing, except to provoke the sarcasms of Mr. Bredejord, which were wounding, to the doctor's self-love, who, however, did not as yet give way to despair.

Erik's history was now well known in the doctor's household. They no longer forbore to speak openly about it, and the results of their researches were talked of both in the dining-room and the parlor.

Perhaps the doctor had acted more discreetly during the first two years of Erik's sojourn with him, when he had kept his affairs a secret. Now they furnished food for the gossiping of Kajsa and Dame Greta, and even occupied the thoughts of Erik himself; and his reflections were often very melancholy.

Not to know whether his parents were still living, to reflect that he might never be able to discover the secret of his birth, was in itself a sad thought to him; but it was still more sad to be ignorant of the land of his birth.

"The poorest child in the streets, the most miserable peasant, knew at least what his country was, and to what branch of the great human family he belonged," he would sometimes say to himself, as he thought of those things. "But I am ignorant of all this. I am cast on the globe like a waif, like a grain of dust tossed by the winds, and nobody knows where I came from. I have no tradition—no past. The spot where my mother was born, and where her ashes now rest, is perhaps profaned and trodden under foot, and I am powerless to defend and protect it."

These thoughts saddened Erik. Sometimes he would tell himself that he had a mother in Dame Katrina, and a home at Mr. Hersebom's, and that Noroe was his country. He vowed that he would repay their kindness to him fourfold, and would always be a devoted son to Norway, but still he felt himself in an exceptional position.

Sometimes when he caught a glimpse of himself in a mirror, he could observe the physical difference between himself and those surrounding him. The color of his eyes and his skin often occasioned him gloomy reflections. Sometimes he would ask himself which country he would prefer to be a native of if he had a choice, and he studied history and geography that he might become better acquainted with the civilization of different countries, and with the habits of their inhabitants. It was a sort of consolation to him to believe that he belonged to the Celtic race, and he sought in books a confirmation of the theory of the doctor.

But when the learned man repeated that in his opinion he was certainly Irish, Erik felt depressed. Why among all the Celtic race should he belong to the people who were the most oppressed? If he had felt absolutely sure of this, he would have loved this unfortunate country. But all proof being wanting, why might he not rather believe that he was French? There were certainly Celts in France, and it was a country that he would have been proud to claim as his own, with her glorious traditions, her dramatic history, and her fruitful principles, which she had disseminated all over the world. Oh! he could have passionately loved, and served with devotion, such a country. He would have felt a filial interest in studying her glorious annals, in reading the works of her great authors, and in studying her poets. But alas! all these delicate emotions were denied him, and he felt that the problem of his origin would never be solved, since after so many years spent in making inquiries they had learned nothing.

However, it seemed to Erik that if he could pursue these inquiries himself, and follow up the information already obtained, that he might discover something which might lead to some result, and his activity and zeal might succeed where money had failed. Would he not work with an ardor which must overcome all difficulties?

This idea took possession of his mind, and insensibly had a marked effect in his studies, giving them a special direction; although he was not aware of this fact himself. As he had made up his mind to travel, he commenced to
study cosmography and nautical matters; in fact, everything that was taught in the school for marines.

"Some day," he said to himself, "I will pass my examination as a captain, and then I shall go to New York in my own vessel, and pursue my inquiries with regard to the 'Cynthia.'"

As a natural consequence, this project of personally investigating the matter of his birth soon became known, for he was candor itself.

Dr. Schwaryencrona, Mr. Bredejord and Professor Hochstedt ended by becoming interested, and finally adopted his views as their own. The question of Erik's birth, which had at first only been an interesting problem in their eyes, engrossed them more and more. They saw how much Erik took it to heart, and as they were sincerely attached to him, they realized how important it was to him, and they were disposed to do everything in their power to cast some light upon the mystery.

One fine evening, just as the vacation was approaching, it occurred to them that it would be a good idea to make an excursion to New York together, and see if they could, obtain any further news about the matter.

Who first conceived this idea was a disputed point among them, and gave rise to many discussions between the doctor and Mr. Bredejord, each claiming a priority. Doubtless it occurred to them both simultaneously; but be this as it may, the proposal was adopted unanimously, and in the month of September the three friends, accompanied by Erik, embarked at Christiana for New York. Ten days later they had reached that city, and opened communication with the house of Jeremiah Smith, Walker & Company, from whom they had received the first intelligence.

And now a new agent appeared on the scene, whose assistance they had had little suspicion of, and this was Erik himself. In New York he only saw what would assist him in his search. He was up at daybreak visiting the wharves, accosting the sailors, whom he might chance to meet, working with indefatigable activity to collect the most minute intelligence.

"Do you know anything about the Canadian Transportation Company? Could you tell me of any officer, or passenger, or sailor, who had sailed on the 'Cynthia?'" he asked everywhere.

Thanks to his perfect knowledge of the English language, his sweet and serious countenance, and his familiarity with everything pertaining to the sea, he was well received everywhere. They mentioned to him successively several old officers, sailors, and employes, of the Canadian Transportation Company. Sometimes he was able to find them. Sometimes all traces of them were lost. But none of them could give him any useful information about the last voyage of the "Cynthia." It took fifteen days of walking, and searching incessantly, to obtain one little bit of information which might prove valuable, among all the confused and contradictory accounts which were poured into poor Erik's willing ears.

This one little truth however seemed to be worth its weight in gold.

They assured him that a sailor named Patrick O'Donoghan, had survived the shipwreck of the "Cynthia," and had even returned to New York several times since that eventful voyage. This Patrick O'Donoghan had been on the "Cynthia," on her last voyage, and had been a special attendant of the captain. In all probability he would know the first-class passengers, who always eat at the captain's table. They judged by the fineness of the infant's clothing that he belonged to this class. It was now a matter of the greatest importance to find this sailor.

This was the conclusion of Dr. Schwaryencrona and Mr. Bredejord, when Erik informed them of his discovery, when he returned to the Fifth Avenue Hotel to dinner.

As usual it led to a discussion, since the doctor tried to draw from this discovery a confirmation of his favorite theory.

"If ever there was an Irish name," he cried, "Patrick O'Donoghan is one. Did I not always say that I was sure that Erik was of Irish birth?"

"Does this discovery prove it?" asked Mr. Bredejord laughing. "An Irish cabin-boy does not prove much. It would be difficult, I fancy, to find an American vessel without one or two natives of Erin among her crew."

They discussed the matter for two or three hours, neither of them willing to give way to the other.

From that day Erik devoted all his energies to the task of finding Patrick O'Donoghan. He was not successful it is true, but by force of seeking, and questioning, he discovered a sailor who had known this man, and who was able to give him some information. Patrick O'Donoghan was a native of the County Cork. He was between thirty-three and thirty-four years old, of medium height, with red hair, black eyes, and a nose which had been broken by some accident.

"A boy one would remember among a thousand," said the sailor. "$I\text{ recollect him very well, although I have not seen him for seven or eight years.}"

"Is it in New York you usually meet him?" asked Erik.

"Yes, in New York, and in other places; but the last time was in New York."

"Do you know any one who could give me any information about him, so that I could find out what has become of him?"
"No, unless it is the proprietor of the hotel called the Red Anchor, in Brooklyn. Patrick O'Donoghan lodges there when he is in New York. The name of the hotel-keeper is Mr. Bowles, and he is an old sailor. If he does not know, I do not know of any one else who can tell you anything about him."

Erik hurried on board one of the ferry-boats that cross the East River, and ten minutes later he was in Brooklyn.

At the door-way of the Red Anchor he saw an old woman, who was neatly dressed, and busily occupied in peeling potatoes.

"Is Mr. Bowles at home?" he said, saluting her politely, after the custom of his adopted country.

"He is at home, but he is taking a nap," answered the good woman, looking with curiosity at her questioner. "If you have any message for him, you can give it to me. I am Mrs. Bowles."

"Oh, madam, you can no doubt give me the information I desire as well as Mr. Bowles," answered Erik. "I wish to know whether you are acquainted with a sailor named Patrick O'Donoghan, and whether he is now with you, or if you can tell me where I can find him?"

"Patrick O'Donoghan: yes, I know him, but it is five or six years since he has been here, and I am unable to say where he is now."

Erik's countenance displayed such great disappointment that the old woman was touched.

"Are you so anxious to find Patrick O'Donoghan that you are disappointed in not finding him here?" she asked.

"Yes, indeed," he answered. "He alone can solve a mystery that I shall seek all my life to make clear."

During the three weeks that Erik had been running everywhere in search of information, he gained a certain amount of experience in human nature. He saw that the curiosity of Mrs. Bowles was aroused by his questions, he therefore entered the hotel and asked for a glass of soda-water.

The low room in which he found himself was furnished with green tables, and wooden chairs, but it was empty. This circumstance emboldened Erik to enter into conversation with Mrs. Bowles, when she handed him the bottle of soda-water which he had ordered.

"You are doubtless wondering, madam, what I can want with Patrick O'Donoghan, and I will tell you," said he, with a smile.

"An American vessel called the 'Cynthia' was lost about seventeen years ago on the coast of Norway; Patrick O'Donoghan was employed on board. I was picked up by a Norwegian fisherman when I was about nine months old. I was floating in a cradle attached to a buoy of the 'Cynthia.' I am seeking O'Donoghan to see if he can give me any information about my family, or at least about my country."

Mrs. Bowles uttered a cry that put a stop to Erik's explanation.

"To a buoy, do you say? You were tied to a buoy?"

But without waiting for any reply she ran to the stairway. "Bowles! Bowles! come down quickly," she cried, in a piercing voice.

Erik, pale and with tightly compressed lips, hung upon his words, expecting some revelation, but this he had to wait for. Mr. Bowles obeyed without any protestation; Erik did the same. He repeated in as few words as he could what he had told the old woman.

As he listened, the countenance of Mr. Bowles dilated like a full moon, his lips parted in a broad smile, and he looked at his wife, and rubbed his hands. She on her side appeared equally well pleased.

"Must I suppose that you are already acquainted with my story?" asked Erik, with a beating heart.

Mr. Bowles made an affirmative sign, and scratching his ear, made up his mind to speak:

"I know it without your telling me," he said, at length, "and my wife knows it as well as I do. We have often talked about it without understanding it."

Erik, pale and with tightly compressed lips, hung upon his words, expecting some revelation, but this he had to wait for. Mr. Bowles had not the gift of either eloquence or clearness, and perhaps his ideas were still clouded with sleep, and in order to recover his faculties he took two or three glasses of a liquor called "pick me up," which greatly resembled gin.

After his wife had placed the bottle and two glasses before him, and he had sufficiently fortified himself, he began to speak.

His story was so confused, and mingled with so many useless details, that it was impossible to draw any
conclusions from it, but Erik listened attentively to all he said, and by questioning and insisting, and aided by Mrs. Bowles, he ended by gathering some facts about himself.

CHAPTER IX.
IN WHICH A REWARD OF FIVE HUNDRED POUNDS STERLING IS OFFERED.

Patrick O'Donoghan, as far as Erik could make out through Mr. Bowles' rambling account of him, was not a model of virtue. The proprietor of the Red Anchor had known him as a cabin-boy and sailor, both before and after the loss of the "Cynthia." Up to that time Patrick O'Donoghan had been poor, as all sailors are. After the shipwreck he had returned from Europe with a large bundle of bank-notes, pretending to have inherited some money in Ireland, which seemed likely enough.

Mr. Bowles, however, had never believed in this inheritance. He thought that this sudden accession of wealth was connected in some way with the loss of the "Cynthia," and that Patrick O'Donoghan was afraid to say so; for it was evident that contrary to the usual habit of seamen in such cases, he carefully avoided speaking about the sad occurrence. He would always turn the conversation if any one alluded to it before him, and he was very anxious to start on a long voyage before the lawsuit brought by the company to recover the insurance due on the "Cynthia" should take place. He did not wish to be summoned as a witness. This conduct appeared very suspicious, as he was the sole known survivor from the shipwreck. Mr. Bowles and his wife had always suspected him, but they had kept their own counsel.

What looked still more suspicious was the fact that when Patrick O'Donoghan was in New York he was never short of money. He brought back very little with him after a voyage, but a few days after his return he always had gold and bank-notes; and when he was tipsy, which frequently happened, he would boast of being in possession of a secret which was worth a fortune to him. The words which most frequently escaped from his lips were, "the baby tied to the buoy!"

"The baby tied to the buoy," he would say, striking the table with his fist, "The baby tied to the buoy is worth its weight in gold."

Then he would laugh, as if well satisfied with himself. But they could never draw out of him any explanation of these words, and for many years the Bowles household were lost in conjectures as to what they could possibly mean.

This accounted for Mrs. Bowles' excitement, when Erik suddenly announced to her that he was the famous baby who had been tied to a buoy.

Patrick O'Donoghan, who had been in the habit of lodging at the Red Anchor, whenever he was in New York, for more than fifteen years, had not been seen there now for more than four years. There had also been something mysterious about his last departure. He had received a visit from a man who had been closeted with him for more than an hour. After this visit Patrick O'Donoghan, who had seemed worried and troubled, had paid his board bill, taken his carpet bag, and left in a hurry.

They had never seen him since that day.

Mr. and Mrs. Bowles were naturally ignorant of the cause of his sudden departure, but they had always thought that it had some connection with the loss of the "Cynthia." In their opinion the visitor had come to warn Patrick O'Donoghan of some danger which threatened him, and the Irishman had thought it prudent to leave New York immediately. Mrs. Bowles did not think he had ever returned. If he had done so, they would have been sure to hear of him through other seamen who frequented their house, and who would have been astonished if Patrick O'Donoghan had boarded anywhere else, and would have been sure to ask questions as to the reasons for his doing so.

This was the substance of the story related to Erik, and he hastened to communicate it to his friends.

His report was naturally received with all the interest which it merited. For the first time, after so many years, they were on the track of a man who had made reiterated allusions to the baby tied to a buoy. It was true they did not know where this man was, but they hoped to find him some day. It was the most important piece of news which they had as yet obtained. They resolved to telegraph to Mrs. Bowles, and beg her to prepare a dinner for six persons. Mr. Bredejord had suggested this idea, as a good means of drawing the worthy couple out; for while they talked during the dinner, they might be able to glean some new facts.

Erik had little hopes of obtaining any further information. He thought that he already knew Mr. and Mrs. Bowles well enough to be convinced that they had told him all that they knew. But he did not take into account Mr. Bredejord's skill in questioning witnesses, and in drawing from them information which they themselves were scarcely aware of.

Mrs. Bowles had surpassed herself in preparing the dinner. She had laid the table in the best room on the first floor. She felt very much flattered at being invited to partake of it, in the society of such distinguished guests, and
answered willingly all of Mr. Bredejord's questions. They gathered from this conversation a certain number of facts which were not unimportant.

One was that Patrick O'Donoghan had said at the time, of the lawsuit against the insurance company, that he was going away to avoid being summoned as a witness. This was evident proof that he did not wish to explain the circumstances under which the shipwreck had occurred, and his subsequent conduct confirmed this theory. It was also evident that in New York or its environs he received the suspicious revenue which seemed to be connected with his secret. For when he arrived he was always without money, but after he had been about for a short time he always returned with his pockets full of gold. They could not doubt that his secret was connected with the infant tied to the buoy, for he had frequently affirmed that such was the case.

The evening before his sudden departure Patrick O'Donoghan had said that he was tired of a sea-faring life, and that he thought he should give up making voyages, and settle in New York for the remainder of his life.

Lastly, the individual who had called to see Patrick O'Donoghan was interested in his departure, for he had called the next day and asked for the Irishman who was boarding at the Red Anchor, and had seemed pleased to hear that he was no longer there. Mr. Bowles felt sure that he would recognize this man if he saw him again. By his conversation and actions he had believed him to be a detective, or some agent of the police.

Mr. Bredejord concluded from these facts that Patrick O'Donoghan had been systematically frightened by the person from whom he drew the money, and that this man had been sent to make him fear that criminal proceedings were about to be taken against him. This would explain his precipitate flight, and why he had never returned to New York.

It was important to find this detective, as well as Patrick O'Donoghan.

Mr. and Mrs. Bowles, by referring to their books, were able to give the exact date of the Irishman's departure, which was four years, lacking three months; although they had previously believed that it was four or five years ago.

Dr. Schwaryencrona was immediately struck by the fact that the date of his departure, and consequently of the visit of the detective, corresponded precisely with the date of the first advertisements which he had caused to be made in Great Britain for the survivors of the "Cynthia." This coincidence was so striking that it was impossible not to believe that there was some connection between them.

They began to understand the mystery a little better. The abandonment of Erik on the buoy had been the result of some crime—a crime of which the cabin-boy O'Donoghan had been a witness or an accomplice. He knew the authors of this crime, who lived in New York or its environs, and he had for a long time enjoyed the reward of his secrecy. Then a day had come when the excessive demands of the Irishman had become burdensome, and the announcement in the newspapers by advertisement had been made use of to frighten Patrick, and cause his hurried departure.

In any case, even if these deductions were not correct in every point, they had obtained sufficient information to entitle them to demand a judicial investigation.

Erik and his friends therefore left the Red Anchor full of hope that they would soon obtain some favorable intelligence.

The next day Mr. Bredejord was introduced by the Swedish consul to the chief of police of New York, and he made him acquainted with the facts which had become known to him. At the same time he entered into conversation with the officers of the insurance company who had refused to pay the claims due on the "Cynthia," and read the old documents relative to this matter, which had lain undisturbed so many years. But the examination of these papers did not afford him any important intelligence. The matter had been decided upon technical points, relating to an excess of insurance far above the value of the vessel and cargo. Neither side had been able to produce any person who had been a witness of the shipwreck. The owners of the "Cynthia" had not been able to prove their good faith, or to explain how the shipwreck had taken place, and the Court had decided in favor of their adversaries. Their defense had been weak, and their opponents had triumphed.

The insurance company, however, had been compelled to pay several claims on the lives of the passengers to their heirs. But, in all these law proceedings, there was no trace of any infant nine months old.

These examinations had occupied several days. Finally, the chief of police informed Mr. Bredejord that he had been unable to obtain any intelligence about the matter. Nobody in New York knew any detective who answered to Mr. Bowles' description. Nobody could tell who the individual was who was interested in the departure of Patrick O'Donoghan. As for this sailor, he did not appear to have set his foot in the United States for at least four years. All they could do was to keep the address of the place where he was born, which might prove useful some time. But the chief of police told Mr. Bredejord, without any dissimulation, that the affair had happened so long ago—now nearly twenty years—that even if Patrick O'Donoghan ever returned to New York, it was at least doubtful if the authorities would be willing to investigate the matter.

At the moment when Erik believed that he was about to obtain a solution of the mystery which clouded his life, all their investigations came to a sudden end, and without producing the slightest result. The only thing that
remained to be done was to pass through Ireland as they returned to Sweden, to see if perchance Patrick O'Donoghan had returned there to pass the remainder of his days planting cabbages.

Dr. Schwaryencrona and his friends, after taking leave of Mr. and Mrs. Bowles, resolved to pursue this route. The steamers between New York and Liverpool touch at Cork, and this was only a few miles from Innishannon, the place where Patrick was born. There they learned that Patrick O'Donoghan had never returned to his native place since he left it at the age of twelve years, and that they had never heard from him.

"Where shall we look for him now?" asked Dr. Schwaryencrona, as they embarked for England, on the way to Stockholm.

"At the seaport towns evidently, and clearly at those which are not American," answered Mr. Bredejord. "For note this point, a sailor, a sea-faring man, does not renounce his profession at the age of thirty-five. It is the only one he knows. Patrick is doubtless still on the sea. And all vessels have some port or other for their destination, and it is only there that we can hope to find this man. What do you think, Hochstedt?"

"Your reasoning seems to be just, although not altogether indisputable," answered the professor, with his customary prudence.

"Admit that it is right," continued Mr. Bredejord. "We know that Patrick O'Donoghan was frightened away and would be in dread of pursuit, perhaps of being extradited. In that case, he would avoid his old companions, and seek in preference ports where he was not likely to meet any of them. I know that my ideas can be contradicted, but let us suppose they are well founded. The number of ports which are not frequented by American vessels is not very large. I think we might begin by seeking in these places news of Patrick O'Donoghan."

"Why not have recourse to advertisements?" asked Dr. Schwaryencrona.

"Because Patrick O'Donoghan would not answer them if he is trying to hide himself; even supposing that a sailor would be likely to see your advertisement."

"But you could word your advertisement so as to assure him that you intended to do him no injury, but rather that it would be greatly to his advantage to communicate with you."

"You are right, but still I am afraid that an ordinary seaman would not be likely to see such an advertisement."

"Well, you might try offering a reward to Patrick O'Donoghan, or to any one who would give you information as to where he might be found. What do you think about it, Erik?"

"It seems to me that such an advertisement to produce any result would have to be continued for a long time, and in a great many different papers. That would cost a great deal, and might only frighten Patrick O'Donoghan, no matter how well worded the advertisement might be, provided it is to his interest to remain concealed. Would it not be better to employ some one to visit personally those seaports which this man would be likely to frequent?"

"But where could we find a trusty man who would be willing to undertake such a task?"

"I can furnish one, if you wish it," answered Erik. "I would go myself."

"You, my dear child--and what would become of your studies?"

"My studies need not suffer. There is nothing to prevent me from pursuing them, even during my travels. And another thing, doctor, I must confess to you, that I have already secured the means of doing so without costing me anything."

"How is that possible," asked Dr. Schwaryencrona, Mr. Bredejord, and Professor Hochstedt, simultaneously.

"I have simply been preparing myself for a sea-faring life. I can pass the examination to-day if necessary. Once in possession of my diploma, it would be easy for me to obtain a position as a lieutenant in any sea-port."

"And you have done all this without saying a word to me?" said the doctor, half grieved, while the lawyer and the professor both laughed heartily.

"Well," said Erik, "I do not think that I have committed any great crime. I have only made inquiries as to the requisite amount of knowledge, and I have mastered it. I should not have made any use of it without asking your permission, and I now solicit it."

"And I shall grant it, wicked boy," said the doctor, "But to let you set out all alone now is another matter--we will wait until you have attained your majority."

Erik submitted to this decision willingly and gratefully.

However, the doctor was not willing to give up his own ideas. To search the sea-ports personally he regarded as a last expedient. An advertisement on the other hand would go everywhere. If Patrick O'Donoghan was not hiding away, they might possibly find him by this means. If he was hiding, some one might see it and betray him. He therefore had this advertisement written in seven or eight different languages, and dispatched to the four quarters of the globe in a hundred of the most widely circulated newspapers.

"Patrick O'Donoghan, a sailor, has been absent from New York for four years. A reward of one hundred pounds sterling will be paid to any one who can give me news of him. Five hundred pounds sterling will be given to the said Patrick O'Donoghan if he will communicate with the advertiser. He need fear nothing, as no advantage will be taken
of him.

"DOCTOR SCHWARYENCRONA.

"Stockholm."

By the 20th of October, the doctor and his companions had returned to their homes.

The next day the advertisement was sent to the advertising agency in Stockholm, and three days afterward it had made its appearance in several newspapers. Erik could not repress a sigh and a presentiment that it would be unsuccessful as he read it.

As for Mr. Bredejord, he declared openly that it was the greatest folly in the world, and that for the future he considered the affair a failure.

But Erik and Mr. Bredejord were deceived, as events afterward proved.

CHAPTER X.
TUDOR BROWN, ESQUIRE.

One morning in May the doctor was in his office, when his servant brought him a visitor's card. This card, which was small as is usual in America, had the name of "Mr. Tudor Brown, on board the 'Albatross'" printed upon it.

"Mr. Tudor Brown," said the doctor, trying to remember whom he had ever known who bore this name.

"This gentleman asked to see the doctor," said the servant.

"Can he not come at my office-hour?" asked the doctor.

"He said his business was about a personal matter."

"Show him in, then," said the doctor, with a sigh.

He lifted his head as the door opened again, and was surprised when he beheld the singular person who answered to the feudal name of Tudor, and the plebeian name of Brown.

He was a man about fifty years of age, his forehead was covered with a profusion of little ringlets, of a carroty color, while the most superficial examination betrayed that they were made of curled silk; his nose was hooked, and surmounted with an enormous pair of gold spectacles; his teeth were as long as those of a horse, his cheeks were smooth, but under his chin he wore a little red beard. This odd head, covered by a high hat which he did not pretend to remove, surmounted a thin angular body, clothed from head to foot in a woolen suit. In his cravat he wore a pin, containing a diamond as large as a walnut; also a large gold chain, and his vest buttons were amethysts. He had a dozen rings on his fingers, which were as knotty as those of a chimpanzee. Altogether he was the most pretentious and grotesque-looking man that it was possible to behold. This person entered the doctor's office as if he had been entering a railway station, without even bowing. He stopped to say, in a voice that resembled that of Punch, its tone was so nasal and guttural:

"Are you Doctor Schwaryencrona?"

"I am," answered the doctor, very much astonished at his manners.

He was debating in his mind whether he should ring for his servant to conduct this offensive person to the door, when a word put a stop to his intention.

"I saw your advertisement about Patrick O'Donoghan," said the stranger, "and I thought you would like to know that I can tell you something about him."

"Take a seat, sir," answered the doctor.

But he perceived that the stranger had not waited to be asked.

After selecting the most comfortable arm-chair, he drew it toward the doctor, then he seated himself with his hands in his pockets, lifted his feet and placed his heels on the window-sill, and looked at the doctor with the most self-satisfied air in the world.

"I thought," he said, "that you would listen to these details with pleasure, since you offer five hundred pounds for them. That is why I have called upon you."

The doctor bowed without saying a word.

"Doubtless," continued the other, in his nasal voice, "you are wondering who I am. I am going to tell you. My card has informed you as to my name, and I am a British subject."

"Irish perhaps?" asked the doctor with interest.

The Granger, evidently surprised, hesitated a moment, and then said:

"No, Scotch. Oh, I know I do not look like a Scotchman, they take me very often for a Yankee--but that is nothing--I am Scotch."

As he gave this piece of information, he looked at Dr. Schwaryencrona as much as to say:

"You can believe what you please, it is a matter of indifference to me."

"From Inverness, perhaps?" suggested the doctor, still clinging to his favorite theory.
The stranger again hesitated for a moment. "No, from Edinburgh," he answered. "But that is of no importance after all, and has nothing to do with the matter in hand. I have an independent fortune and owe nothing to anybody. If I tell you who I am, it is because it gives me pleasure to do so, for I am not obliged to do it."

"Permit me to observe that I did not ask you," said the doctor, smiling. "No, but do not interrupt me, or we shall never reach the end of this matter. You published an advertisement to find out what became of Patrick O'Donoghan, did you not?--you therefore have some interest in knowing, I know what has become of him."

"You know?" asked the doctor, drawing his seat closer to that of the stranger. "I know, but before I tell you, I want to ask you what interest you have in finding him?"

"That is only just," answered the doctor.

In as few words as possible, he related Erik's history, to which his visitor listened with profound attention.

"And this boy is still living?" asked Tudor Brown.

"Assuredly he is living. He is in good health, and in October next he will begin his studies in the Medical University at Upsal."

"Ah! ah!" answered the stranger, who seemed lost in reflection. "Tell me," he said at length, "have you no other means of solving this mystery of his birth except by finding Patrick O'Donoghan?"

"I know of no other," replied the doctor. "After years of searching I only found out that this O'Donoghan was in possession of the secret, that he alone could reveal it to me, and that is why I have advertised for him in the papers. I must confess that I had no great hopes of finding him by this means."

"How is that?"

"Because I had reasons for believing that this O'Donoghan has grave motives for remaining unknown, consequently it was not likely that he would respond to my advertisement. I had the intention of resorting to other means. I have a description of him. I know what ports he would be likely to frequent, and I propose to employ special agents to be on the lookout for him."

Dr. Schwaryencrona did not say this lightly. He spoke with the intention of seeing what effect these words would produce on the man before him. And as he watched him intently, he saw that in spite of the affected coolness of the stranger his eyelids fell and the muscles of his mouth contracted. But almost immediately Tudor Brown recovered his self-possession, and said:

"Well, doctor, if you have no other means of solving this mystery, except by discovering Patrick O'Donoghan, I am afraid that you will never find it out. Patrick O'Donoghan is dead."

The doctor was too much taken aback by this disappointing announcement to say a word, and only looked at his visitor, who continued:

"Dead and buried, three hundred fathoms beneath the sea. This man, whose past life always appeared to me to have been mysterious, was employed three years on board my yacht, the 'Albatross.' I must tell you that my yacht is a stanch vessel, in which I often cruise for seven or eight months at a time. Nearly three years ago we were passing through the Straits of Madeira, when Patrick O'Donoghan fell overboard. I had the vessel stopped, and some boats lowered, and after a diligent search we recovered him; but though we spared no pains to restore him to life, our efforts were in vain. Patrick O'Donoghan was dead. We were compelled to return to the sea the prey which we had snatched from it. The accident was put down on the ship's log, and recorded in the notary's office at the nearest place we reached. Thinking that this act might be useful to you, I have brought you a certified copy of it."

As he said this, Mr. Tudor Brown took out his pocket-book and presented the doctor with a paper stamped with a notarial seal.

The latter read it quickly. It was a record of the death of Patrick O'Donoghan, while passing through the Straits of Madeira, duly signed and sworn to, before two witnesses, as being an exact copy of the original--it was also registered in London, at Somerset House, by the commissioners of her Britannic Majesty.

This instrument was evidently authentic. But the manner in which he had received it was so strange that the doctor could not conceal his astonishment. He took it, however, with his habitual courtesy.

"Permit me to ask one question, sir," he said to his visitor.

"Speak, doctor."

"How is it that you have this document in your pocket duly prepared and certified? And why have you brought it to me?"

"If I can count, you have asked two questions," said Tudor Brown. "I will answer them, however--I had this paper in my pocket, because I read your advertisement two months ago, and wishing to furnish you with the information which you asked for, I thought it better to give it to you, in the most complete and definite form that lay in my power. I have brought it to you personally, because I happened to be cruising in these waters; and I wished at
the same time to gratify your curiosity and my own."
    "There was nothing to answer to this reasoning--this was the only conclusion the doctor could draw.
    "Yon are here, then, with the 'Albatross'?' he asked, eagerly.
    "Without doubt."
    "And you have still on board some sailors who have known Patrick O'Donoghan?"
    "Yes, several."
    "Would you permit me to see them?"
    "As many as you please. Will you accompany me on board now?"
    "If you have no objection."
    "I have none," said the stranger, as he arose.

Dr. Schwaryencrona touched his bell, and they brought him his fur pelisse, his hat, and his cane, and he departed with Mr. Tudor Brown.

Fifteen minutes later they were on board the "Albatross."

They were received by an old gray-headed seaman, with a rubicund face, whose open countenance betrayed only truth and loyalty.

"Mr. Ward, this gentleman wishes to make some inquiries about the fate of Patrick O'Donoghan," said Mr. Tudor Brown.

"Patrick O'Donoghan," answered the old sailor, "God rest his soul. He gave us trouble enough to pick him up the day he was drowned in the Straits of Madeira. What is the use of inquiries now that he has gone to feed the fishes?"

"Had you known him for a long time?" asked the doctor.

"The rascal--no--for a year or two perhaps. I believe that it was at Zanzibar that we took him on board--am I right, Tommy Duff?"

"Is any one hailing me?" asked a young sailor, who was busily employed in polishing a copper bowl.

"Come here," said the other--"Was it at Zanzibar that we recruited Patrick O'Donoghan?"

"Patrick O'Donoghan," repeated the young sailor, as if his remembrance of the man was not very good. "Oh yes, I remember him. The man who fell overboard in the Straits of Madeira. Yes, Mr. Ward, it was at Zanzibar that he came on board."

Dr. Schwaryencrona made him describe Patrick O'Donoghan, and was convinced that it was the same man whom he was seeking. Both these men seemed honest and sincere. They had honest and open countenances. The uniformity of their answers seemed a little strange, and almost preconcerted; but after all it might be only the natural consequence of relating facts. Having known Patrick O'Donoghan only a year at the most, they would have but little to say about him, except the fact of his death.

Besides the "Albatross" was a yacht of such large proportions, that if she had been furnished with some cannon she might easily have passed for a man-of-war. The most rigorous cleanliness was observed on board. The sailors were in good condition, well clothed, and under perfect discipline. The general appearance of the vessel insensibly acted upon the doctor, and carried conviction of the truth of the statement which he had just heard. He therefore declared himself perfectly satisfied, and could not leave without inviting Mr. Tudor Brown to dine with him. But Mr. Tudor Brown did not think it best to accept this invitation. He declined it in these courteous terms:

"No--I can not--I never dine in town."

It now only remained for Dr. Schwaryencrona to retire. This he did without having obtained even the slightest bow from this strange individual.

The doctor's first thought was to go and relate his adventure to Mr. Bredejord, who listened to him without saying a word, only promising himself to institute counter inquiries.

But he, with Erik, who had been told the whole story upon his return from school, repaired to the vessel to see if they could elicit any further information, but the "Albatross" had left Stockholm, without leaving word where she was going, and they could not, therefore, obtain even the address of Mr. Tudor Brown.

All that resulted from this affair was the possession of the document, which legally proved the death of Patrick O'Donoghan.

Was this paper of any value? This was the question that Mr. Bredejord could not help doubting, in spite of the evidence of the British consul at Stockholm, whom he questioned, and who declared that the signatures and stamp were perfectly authentic. He also caused inquiries to be made at Edinburgh, but nobody knew Mr. Tudor Brown, which he thought looked suspicious.

But it was an undeniable fact that they obtained no further intelligence of Patrick O'Donoghan, and all their advertisements were ineffectual.

If Patrick O'Donoghan had disappeared for good, they had no hope of penetrating the mystery that surrounded Erik's birth. He himself saw this, and was obliged to recognize the fact that, for the future, the inquiries would have
to be based upon some other theory. He therefore made no opposition about commencing his medical studies the following autumn at the university at Upsal, according to the doctor’s wishes. He only desired, first, to pass his examination as a captain, but this sufficed to show that he had not renounced his project of traveling.

Besides, he had another trouble which lay heavy at his heart, and for which he saw no other remedy but absence. Erik wished to find some pretext for leaving the doctor’s house as soon as his studies were completed; but he wished to do this without exciting any suspicion. The only pretext which he could think of was this plan of traveling. He desired to do this because of the aversion of Kajsa, the doctor’s niece. She lost no occasion of showing her dislike; but he would not at any price have had the excellent man suspect this state of affairs between them. His relations toward the young girl had always been most singular. In the eyes of Erik during these seven years as well as on the first day of his arrival at Stockholm, the pretty little fairy had always been a model of elegance and all earthly perfections. He had bestowed on her his unreserved admiration, and had made heroic efforts to overcome her dislike, and become her friend.

But Kajsa could not make up her mind calmly to see this “intruder,” as she called Erik, take his place in the doctor’s home, be treated as an adopted son, and become a favorite of her uncle and his friends. The scholastic success of Erik, his goodness and his gentleness, far from making him pleasing in her eyes, were only new motives of jealousy.

In her heart Kajsa could not pardon the young man for being only a fisherman and a peasant. It seemed to her that he brought discredit upon the doctor’s household and on herself, who, she liked to believe, occupied a very high position in the social scale.

But it was worse when she learned that Erik was even less than a peasant, only a child that had been picked up. That appeared to her monstrous and dishonorable. She thought that such a child had a lower place in society than a cat or a dog; she manifested these sentiments by the most disdainful looks, the most mortifying silence, and the most cruel insults. If Erik was invited with her to any little social gathering at the house of a friend, she would positively refuse to dance with him. At the table she would not answer anything he said, nor pay any attention to him. She tried on all occasions, and in every possible way, to humiliate him.

Poor Erik had divined the cause of this uncharitable conduct, but he could not understand how ignorance of his family, and of the land of his birth, could be regarded by her as such a heinous crime. He tried one day to reason with Kajsa, and to make her understand the injustice and cruelty of such a prejudice, but she would not even deign to listen to him. Then as they both grew older, the abyss which separated them seemed to widen. At eighteen Kajsa made her _début_ in society. She was flattered and noticed as the rich heiress, and this homage only confirmed her in the opinion that she was superior to common mortals.

Erik, who was at first greatly afflicted by her disdain, ended by becoming indignant, and vowing to triumph over it. This feeling of humiliation had a great share in producing the passionate ardor with which he pursued his studies. He dreamed of raising himself so high in public esteem, by the force of his own industry, that every one would bow before him. But he also vowed that he would go away on the first opportunity, and that he would not remain under a roof where every day he was exposed to some secret humiliation.

Only the good doctor must be kept in ignorance of the cause of his departure. He must attribute it solely to a passion for traveling. And Erik therefore frequently spoke of his desire, when his studies were completed, of engaging in some scientific expedition. While pursuing his studies at Upsal, he prepared himself by work, and the most severe exercise, for the life of fatigue and danger which is the lot of great travelers.

CHAPTER XI.

THE "VEGA."

In the month of December, 1878, Erik had attained the age of twenty, and passed his first examination for his doctor’s degree. The learned men of Sweden were greatly excited about the proposed arctic expedition of the navigator Nordenskiöld, and their enthusiasm was shared by a large proportion of the population. After preparing himself for the undertaking by several voyages to the polar regions, and after studying the problem in all its aspects, Nordenskiöld intended to attempt once more to discover the north-east passage from the Atlantic to the Pacific, which for three centuries had defied the efforts of all the maritime nations.

The programme for the expedition had been defined by the Swedish navigator, and he announced the reasons which led him to believe that the north-east passage was practicable in summer, and the means by which he hoped to realize this geographical desideratum. The intelligent liberality of two Scandinavian gentlemen, and the assistance of the Swedish government, enabled him to organize his expedition upon a plan which he believed would insure its success.

It was on the 21st of July, 1878, that Nordenskiöld quitted From-sae, on board of the "Vega," to attempt to reach
Behring's Strait by passing to the north of Russia and Siberia. Lieutenant Palanders, of the Swedish navy, was in command of the vessel, with the instigator of the voyage, and they had also a staff of botanists, geologists, and astronomical doctors.

The "Vega," which had been especially prepared for the expedition under the surveillance of Nordenskiold, was a vessel of five hundred tons, which had been recently built at Bremen, and carried an engine of sixty-horse power. Three ships were to accompany her to successive points on the Siberian coast, which had been previously determined upon. They were all provisioned for a cruise of two years, in case it might be necessary for them to winter in those arctic regions. But Nordenskiold did not conceal his hope of being able to reach Behring's Strait before autumn, on account of his careful arrangements, and all Sweden shared this hope.

They started from the most northerly point of Norway, and the "Vega" reached Nova Zembla on the 29th of July, on the 1st of August the Sea of Kara, and on the 6th of August the mouth of the Gulf Yenisei. On the 9th of August she doubled Cape Schelynschin, or Cape North-East, the extreme point of the continent, which no vessel had hitherto been able to reach. On the 7th of September she cast anchor at the mouth of the Lena, and separated from the third of the vessels which had accompanied her thus far. On the 16th of October a telegraphic dispatch from Irkutsk announced to the world that the expedition had been successful up to this point.

We can imagine the impatience with which the friends of the Swedish navigator waited for the details of the expedition. These details did not reach them until the 1st of December. For if electricity flies over space with the rapidity of thought, it is not the same with the Siberian post. The letters from the "Vega," although deposited in the post-office at Irkutsk, at the same time that the telegraphic message was dispatched, did not reach Sweden until six weeks afterward. But they arrived at last; and on the 5th of December one of the principal newspapers of Sweden published an account of the first part of the expedition, which had been written by a young medical doctor attached to the "Vega."

That same day, at breakfast, Mr. Bredejord was occupied in reading with great interest the details of the voyage, given in four columns, when his eyes fell upon a paragraph which almost upset him. He re-read it attentively, and then read it again; then he arose, and seizing his hat and coat, he rushed to the house of Dr. Schwaryencrona.

"Have you read the correspondence of the 'Vega'?” he cried, as he rushed like a hurricane into the dining-room where the doctor and Kajsa were taking their breakfast.

"I have just commenced it,” replied the doctor, “and was intending to finish reading it after breakfast, while I smoked my pipe."

"Then you have not seen!” exclaimed Mr. Bredejord, out of breath. "You do not know what this correspondence contains?"

"No,” replied Doctor Schwaryencrona, with perfect calmness.

"Well, listen to this,” continued Mr. Bredejord, approaching the window. "It is the journal of one of your brethren, the aid of the naturalist of the 'Vega.'"

"30th and 31st of July, we entered the strait of Jugor, and cast anchor before a Samoyede village called Chabarova. We landed, and I questioned some of the natives to discover, by Holmgren's method, the extent of their perception of colors. I found that this sense was normally developed among them. Bought of a Samoyede fisherman two magnificent salmon."

"Have you read the correspondence of the 'Vega'?” he cried, as he rushed like a hurricane into the dining-room where the doctor and Kajsa were taking their breakfast.

"I have just commenced it,” replied the doctor, “and was intending to finish reading it after breakfast, while I smoked my pipe."

"Then you have not seen!” exclaimed Mr. Bredejord, out of breath. "You do not know what this correspondence contains?"

"No,” replied Doctor Schwaryencrona, with perfect calmness.

"Well, listen to this,” continued Mr. Bredejord, approaching the window. "It is the journal of one of your brethren, the aid of the naturalist of the 'Vega.'"

"30th and 31st of July, we entered the strait of Jugor, and cast anchor before a Samoyede village called Chabarova. We landed, and I questioned some of the natives to discover, by Holmgren's method, the extent of their perception of colors. I found that this sense was normally developed among them. Bought of a Samoyede fisherman two magnificent salmon."

"Pardon me,” interrupted the doctor; "but is this a charade you are reading to me. I confess I do not see how these details can interest me."

"Ah! they do not interest you?” said Mr. Bredejord, in a triumphant tone. "Well, wait a moment and you will see: Bought of a Samoyede fisherman two magnificent salmon, which I have preserved in alcohol, notwithstanding the protestations of our cook. This fisherman fell into the water as he was quitting the ship. They pulled him out half suffocated and stiffened by the cold, so that he resembled a bar of iron, and he, also, had a serious cut on his head. We were just under way, and they carried him to the infirmary of the "Vega," while still unconscious, undressed him, and put him to bed. They then discovered that this fisherman was an European. He had red hair; his nose had been broken by some accident, and on his chest, on a level with his heart, these words were tattooed: "Patrick O'Donoghane--Cynthia.""

Here Dr. Schwaryencrona uttered a cry of surprise.

"Wait! listen to the rest of it," said Mr. Bredejord; and he continued his reading:

"Bought of a Samoyede fisherman two magnificent salmon, which I have preserved in alcohol, notwithstanding the protestations of our cook. This fisherman fell into the water as he was quitting the ship. They pulled him out half suffocated and stiffened by the cold, so that he resembled a bar of iron, and he, also, had a serious cut on his head. We were just under way, and they carried him to the infirmary of the "Vega," while still unconscious, undressed him, and put him to bed. They then discovered that this fisherman was an European. He had red hair; his nose had been broken by some accident, and on his chest, on a level with his heart, these words were tattooed: "Patrick O'Donoghane--Cynthia.""

Here Dr. Schwaryencrona uttered a cry of surprise.

"Wait! listen to the rest of it," said Mr. Bredejord; and he continued his reading:

"Bought of a Samoyede fisherman two magnificent salmon, which I have preserved in alcohol, notwithstanding the protestations of our cook. This fisherman fell into the water as he was quitting the ship. They pulled him out half suffocated and stiffened by the cold, so that he resembled a bar of iron, and he, also, had a serious cut on his head. We were just under way, and they carried him to the infirmary of the "Vega," while still unconscious, undressed him, and put him to bed. They then discovered that this fisherman was an European. He had red hair; his nose had been broken by some accident, and on his chest, on a level with his heart, these words were tattooed: "Patrick O'Donoghane--Cynthia.""

He speaks English with a nasal accent like a Yankee, but pretends to be Scotch, and calls himself Tommy Bowles. He came from Nova Zembla with some fishermen, and he has lived on these shores for the last twelve years. The name tattooed upon his chest he says, 'is that of one of the friends of his infancy who has been dead for a long time.'

"It is evidently our man," cried the doctor, with great emotion.

"Yes, there can be no doubt of it," answered the lawyer. "The name, the vessel, the description, all prove it; even this choice of a pseudonym Johnny Bowles, and his declaring that Patrick O'Donoghan was dead, these are superabundant proofs!"

They were both silent, reflecting upon the possible consequences of this discovery.

"How can we go so far in search of him?" said the doctor, at length.

"It will be very difficult, evidently," replied Mr. Bredejord. "But it is something to know that he is alive, and the part of the world where he can be found. And, besides, who can tell what the future may have in store? He may even return to Stockholm in the 'Vega,' and explain all that we wish to find out. If he does not do this, perhaps we may, sooner or later, find an opportunity to communicate with him. Voyages to Nova Zembla will become more frequent, on account of this expedition of the 'Vega.' Ship-owners are already talking about sending every year some vessels to the mouth of the Yenisei."

The discussion of this topic was inexhaustible, and the two friends were still talking about the matter, when Erik arrived from Upsal, at two o'clock. He also had read this great piece of news, and had taken the train for home without losing a moment. But it was a singular fact that he was not joyful, but rather disturbed by this new intelligence.

"Do you know what I am afraid of?" said he to the doctor and Mr. Bredejord. "I fear that some misfortune has happened to the 'Vega.' You know it is now the 5th of December, and you know the leaders of the expedition counted upon arriving at Behring's Strait before October. If this expectation had been realized, we should have heard from her by this time; for she would have reached Japan, or at least Petropaulosk, in the Aleutian Islands, or some station in the Pacific, from which we should have received news of her. The dispatches and letters here came by the way of Irkutsk, and are dated the 7th of September, so that for three entire months we have heard nothing from the 'Vega.' So we must conclude that they did not reach Behring's Strait as soon as they expected, and that she has succumbed to the common fate of all expeditious which for the last three centuries have attempted to discover the north-east passage. This is the deplorable conclusion which I have been compelled to arrive at."

"The 'Vega' might have been obliged to encounter in the Polar regions a great deal which was unforeseen, and she might have been unprovided for such a contingency," replied Dr. Schwaryencrona.

"Evidently; but this is the most favorable hypothesis; and a winter in that region is surrounded by so many dangers that it is equivalent to a shipwreck. In any case, it is an indisputable fact that if we ever have any news of the 'Vega' it will not be possible to do so before next summer."

"Why, how is that?"

"Because, if the 'Vega' has not perished she is inclosed in the ice, and she will not be able, at the best, to extricate herself before June or July."

"That is true," answered Mr. Bredejord.

"What conclusion do you draw from this reasoning?" asked the doctor, disturbed by the sad tone of Erik's voice as he made the announcement.

"The conclusion that it is impossible to wait so long before solving a question which is of such great importance to me."

"What do you want to do? We must submit to what is inevitable."

"Perhaps it only appears to be so," answered Erik. "The letters which have reached us have come across the Arctic Ocean by the way of Irkutsk. Why could I not follow the same route? I would keep close to the coast of Siberia. I would endeavor to communicate with the people of that country, and find out whether any foreign vessel had been shipwrecked, or was held prisoner among the icebergs. Perhaps I might succeed in finding Nordenskiold, and Patrick O'Donoghun. It is an enterprise worth undertaking."

"In the middle of winter?"

"Why not? It is the most favorable season for traveling in sleighs in that latitude."

"Yes; but you forget that you are not there yet, and that it will be spring before you could get there."

"That is true," said Erik, who was compelled to recognize the force of this argument. He sat with his eyes fixed on the floor, absorbed in thought.

"No, matter," said he suddenly; "Nordenskiold must be found, and with him Patrick O'Donoghun. They shall be, or it will not be my fault."

Erik's plan was a very simple one. He proposed to write an anonymous letter to the leading newspapers of Stockholm, and thus proclaim his fears as to the fate of the "Vega." Had she been shipwrecked, or was she held a
prisoner by icebergs, and he concluded his communication by representing how important it was that some vessel should be sent to her assistance in the latter case.

The truth of his reasoning was so apparent, and the interest in the expedition so general, that the young student of Upsal was certain that the question would be warmly discussed in scientific circles.

But the effect of his letter was beyond his highest expectations. All the newspapers without exception expressed their approval of his proposition while commenting upon his communication.

Public opinion was unanimously in favor of fitting out a relief expedition. Commercial men, manufacturers, the members of schools and colleges, the judicial corps—in fact, all classes voluntarily contributed to the enterprise. A rich ship-owner offered to equip a vessel at his own expense, to go to the relief of the "Vega;" and he named it the "Nordenskiold."

The enthusiasm increased as days passed without bringing any intelligence of the "Vega." By the end of December, the subscription had reached a considerable sum. Dr. Sehwaryencrona and Mr. Bredejord had headed the list with a subscription of ten thousand kroners each. They were members of the committee who had chosen Erik for their secretary.

The latter was in fact the soul of the undertaking. His ardor, his modesty, his evident ability with regard to all questions relative to the expedition, which he studied untiringly, soon acquired for him a most decided influence. From the first he did not conceal the fact that it was his dream to take part in the enterprise, if only as a simple sailor, and that he had a supreme and personal interest in the matter. This only gave the greater weight to the excellent suggestions which he made to the originators of the expedition, and he personally directed all the preparatory labors.

It was agreed that a second vessel should accompany the "Nordenskiold," and that it should be like the "Vega," a steamship. Nordenskiold himself had demonstrated that the principal cause of the failure of previous attempts had been the employment of sailing vessels. Arctic navigators, especially when on an exploring expedition, must not be dependent upon the wind, but must be able to force their way speedily through a difficult or perilous pass—and above all, always be able to take the open sea, which it was often impossible to do with a sailing vessel.

This fundamental point having been established, it was decided also to cover the vessel with a lining of green oak, six inches thick, and to divide it into compartments, so that it would be better able to resist a blow from the ice. They were also desirous that she should not draw too much water, and that all her arrangements should be so made as to enable her to carry a full supply of coal. Among the offers which were made to the committee, was a vessel of one hundred and forty tons, which had been recently built at Bremen, and which had a crew of eighteen men, who could easily maneuver her. She was a schooner, but while she carried her masts, she also was furnished with an engine of eighty horse-power. One of her boilers was so arranged that it could burn oil or fat, which was easily procurable in the arctic regions, in case their coal should fail. The schooner protected by its lining of oak, was further strengthened by transverse beams, so as to offer the greatest possible resistance to the pressure of the ice. Lastly, the front of it was armed with a spur of steel, to enable it to break its way through a thick field of ice. The vessel when placed on the stocks, was named the "Alaska," on account of the direction which she was destined to take. It had been decided that while the "Nordenskiold" should pursue the same course as the "Vega" had followed, that the second vessel should take an opposite direction around the world, and gain the Siberian Ocean, by the island of Alaska and Behring's Straits. The chances of meeting the Swedish expedition, or of discovering traces of her if she had perished would thus, they thought, be double, for while one vessel followed on her track, the other would, as it were, precede her.

Erik, who had been the originator of this plan, had often asked himself which of the vessels he had better join, and he had finally concluded to attach himself to the second.

The "Nordenskiold," he said to himself, would follow the same course as the "Vega." It was therefore necessary that she should be equally successful in making the first part of the voyage, and double Cape Tchelynskin, but they might not be able to do this, since it had only been accomplished once. Besides, the last news which they had received from the "Vega," she was only two or three hundred leagues from Behring's Straits; therefore they would have a better chance of meeting her. The "Nordenskiold" might follow her for many months without overtaking her. But the other vessel could hardly fail to meet her, if she was still in existence.

The principal thing in Erik's eyes was to reach the "Vega" as quickly as possible, in order to meet Patrick O'Donoghan without delay.

The doctor and Mr. Bredejord warmly approved of his motives when he explained them to them.

The work of preparing the "Alaska" was pushed on as rapidly as possible. Her provisions, equipments, and the clothing, were all carefully chosen, for they profited by the experience of former Arctic explorers. Her crew were all experienced seamen, who had been inured to cold by frequent fishing voyages to Iceland and Greenland. Lastly, the captain chosen by the committee, was an officer of the Swedish marines, then in the employment of a maritime company, and well known on account of his voyages to the Arctic Ocean; his name was Lieutenant Marsilas. He
chose for his first lieutenant Erik himself, who seemed designed for the position by the energy he had displayed in
the service of the expedition, and who was also qualified by his diploma. The second and third officers were tried
seamen, Mr. Bosewitz and Mr. Kjellguist.

The "Alaska" carried some explosive material in order to break the ice, if it should be necessary, and abundant
provisions of an anti-scorbutic character, in order to preserve the officers and crew from the common Arctic
maladies. The vessel was furnished with a heater, in order to preserve an even temperature, and also with a portable
observatory called a "raven's nest," which they could hoist to the top of the highest mast, in those regions where they
meet with floating ice, to signal the approach of icebergs.

By Erik's proposal this observatory contained a powerful electric light, which at night could illuminate the route
of the "Alaska." Seven small boats, of which two were whale-boats, a steam-cutter, six sledges, snow-shoes for each
of the crew, four Gatling cannons and thirty guns, with the necessary ammunition, were stored away on board.
These preparations were approaching an end, when Mr. Hersebom and his son Otto arrived from Noroe with their
large dog Kaas, and solicited the favor of being employed as seamen on board of the "Alaska." They knew from a
letter of Erik's the strong personal interest which he had in this voyage, and they wished to share its dangers with
him.

Mr. Hersebom spoke of the value of his experience as a fisherman on the coast of Greenland, and of the
usefulness of his dog Kaas, who could be used as a leader of the dogs which would be necessary to draw the sledges.
Otto had only his good health, his herculean strength, and his devotion to the cause to recommend him. Thanks to
the influence of the doctor and Mr. Bredejord, they were all three engaged by the committee.

By the beginning of February, 1879, all was ready. The "Alaska" had therefore five months before the first of
June to reach Behring's Straits, which was accounted the most favorable season for the exploration. They intended
also to take the most direct route, that is to say, through the Mediterranean, the Suez Canal, the Indian Ocean, and
the China Seas, stopping successively to take in coal at Gibraltar, Aden, Colombo in Ceylon, Singapore, Hong
Kong, Yokohama, and Petropaulosk.

From all these stations the "Alaska" was to telegraph to Stockholm, and it was also agreed that, if in the
meantime any news was received of the "Vega," they should not fail to send information.

The voyage of the "Alaska," although intended primarily for an arctic exploration, would begin by a voyage
through tropical seas, and along the continents most favored by the sun. The programme had not, however, been
arranged to give them pleasure; it was the result of an imperative necessity, since they must reach Behring's Straits
by the shortest route and remain in telegraphic communication with Stockholm up to the last moment. But a serious
difficulty threatened to retard the expedition. They had spent so much in equipping the vessel that the funds which
were indispensable for the success of the enterprise, began to run short. They would require considerable to purchase
coal, and for other incidental expenses.

A new appeal for money became necessary. As soon as it was issued the committee received two letters
simultaneously.

One was from Mr. Malarius, the public teacher of Noroe, and laureate of the Botanical Society. It contained a
check for one hundred kroners, and begged that he might be attached to the expedition as the assistant naturalist of
the "Alaska."

The other contained a check for twenty-five thousand kroners, with this laconic note:
"For the voyage of the 'Alaska,' from Mr. Tudor Brown, on condition that he is received as a passenger."

CHAPTER XII.
UNEXPECTED PASSENGERS.

The request of Mr. Malarius could only be received with gratitude by the committee. It was therefore passed
enthusiastically, and the worthy teacher, whose reputation as a botanist was greater than he himself suspected, was
appointed assistant naturalist of the expedition.

As for the condition upon which Tudor Brown bestowed his donation of twenty-five thousand kroners, both Dr.
Schwaryencrona and Mr. Bredejord were strongly inclined to refuse to grant it. But if called upon to give some
motive for their repugnance, they had to confess that they would not know what to say. What sufficient reason could
they give the committee if they asked them to refuse such a large subscription? They really had no valid one. Tudor
Brown had called upon Dr. Schwaryencrona, and brought him a certified account of the death of Patrick
O'Donoghon; and now Patrick O'Donoghon appeared to be living. But they could not prove that Tudor Brown had
willfully deceived them in this matter, and the committee would require some sufficient cause before rejecting so
large a sum. Tudor Brown could easily declare that he had been truthful. His present attitude seemed to prove it.
Perhaps he intended to go himself, only to find out how Patrick O'Donoghon, whom he believed to have been
drowned in the Straits of Madeira, could now be living on the shores of Siberia. But even supposing that Tudor Brown had other projects, it would be to their interest to find them out, and keep him in their hands. For, one of two facts was certain: either Tudor Brown had no interest in the search which had occupied Erik's friends for so long a time, and in that case it would be useless to treat him as an enemy; or he had some slight personal interest in the matter, and then it would be better to watch his plans, and overthrow them.

The doctor and Mr. Bredejord therefore concluded that they would not oppose his becoming a passenger. Then they gradually were filled with a desire to study this singular man, and find out why he wished to take passage on the "Alaska." But how could they do this without sailing with him. It would not be such an absurd thing to do after all. The course which the "Alaska" was to take was a very attractive one, at least the first part of it. To be brief, Dr. Schwaryencrona, who was a great traveler, asked to be taken as a passenger, to accompany the expedition as far as the China seas, by paying such a price as the committee might judge proper.

This example immediately acted with irresistible force upon Mr. Bredejord, who had dreamed for a long time about an excursion to the land of the Sun. He also solicited a cabin under the same conditions.

Every one in Stockholm now believed that Mr. Hochstedt would do the same, partly out of scientific curiosity, and partly from terror at the thought of passing so many months without the society of his friends. But all Stockholm was deceived. The professor was strongly tempted to go, and he reviewed all the arguments for and against it, and found it almost impossible to arrive at any decision, but fate ordained that he should stay at home.

The time of their departure was irrevocably fixed for the 10th of February. On the 9th Erik went to meet Mr. Malarius, and was agreeably surprised to see Dame Hersebom, and Vanda, who had come to bid him farewell. They were modestly intending to go to a hotel in the town, but the doctor insisted that they should come and stay with him, to the great displeasure of Kajsa, who did not think that they were sufficiently distinguished.

Vanda was now a tall girl, whose beauty fulfilled its early promise. She had passed successfully a very difficult examination at Bergen which entitled her to take a professor's chair, in a superior school. But she preferred to remain at Noroe with her mother, and she was going to fill Mr. Malarius' place during his absence: always serious and gentle, she found in teaching a strange and inexplicable charm, but it had not changed the simplicity of her home life. This beautiful girl, in her quaint Norwegian costume, was able to give tranquilly her opinion on the deepest scientific subjects, or seat herself at the piano, and play with consummate skill a sonata of Beethoven. But her greatest charm was the absence of all pretension, and her perfectly natural manners. She no more thought of being vain of her talents, or of making any display of them, than she did of blushing on account of her rural costume. She bloomed like some wild flower, that, growing beside the fiord, had been transplanted by her old master, and cultivated and cherished in his little garden behind the school.

In the evening all Erik's adopted family were assembled in the parlor of Dr. Schwaryencrona; Mr. Bredejord and the doctor were about to play a last game of whist with Mr. Hochstedt. They discovered that Mr. Malarius was also an authority in this noble game, which would enable them to while away many leisure hours on board the "Alaska." Unfortunately the worthy instructor also told them, at the same time, that he was always a victim of sea-sickness, and nearly always confined to his bed as soon as he set foot upon a vessel. Only his affection for Erik had induced him to join the expedition, added to the ambition, long fondly cherished, of being able to add some more varieties to his catalogue of botanical families.

After which they had a little music: Kajsa, with a disdainful air, played a fashionable waltz; Vanda sung an old Scandinavian melody with a sweetness that surprised them all. The tea was served, and a large bowl of punch, which they drank to the success of the expedition, followed. Erik noticed that Kajsa avoided touching his glass.

"Will you not wish me a happy voyage?" he said to her, in a low tone.

"What is the use of wishing for what we do not expect to see granted?" she answered.

The next morning, at day-break, every one went on board, except Tudor Brown.

Since the receipt of his letter containing the check they had not heard a word from him. The time of departure had been fixed for ten o'clock. At the first stroke, the commander, Mr. Marsilas, had the anchor hoisted, and rang the bell to warn all visitors to leave the ship.

"Adieu, Erik!" cried Vanda, throwing her arms around his neck.

"Adieu, my son!" said Katrina, pressing the young lieutenant to her heart.

"And you, Kajsa, have you nothing to say to me?" he asked, as he walked toward her as if to embrace her also.

"I hope that you will not get your nose frozen, and that you will discover that you are a prince in disguise!" said she, laughing impertinently.

"If that should happen, then at least I might hope to win a little of your affection?" he said, trying to smile, to hide his feelings, for her sarcasm had cut him to the heart.

"Do you doubt it?" answered Kajsa, as she turned toward her uncle, to show that her adieu to him was finished.

The time of departure had indeed come. The warning bell rang imperiously.
The crowd of visitors descended the stairs to the boats which were waiting for them.

In the midst of this confusion every one noticed the arrival of a tardy passenger, who mounted to the deck with his valise in his hand.

The tardy one was Tudor Brown. He presented himself to the captain, and claimed his cabin, to which he was immediately shown.

A moment later, after two or three prolonged whistles, the engine began to work, and a sea of foam whitening the waters behind her, the "Alaska" glided majestically over the green waters of the Baltic, and soon left Stockholm behind her, followed by the acclamations of the crowd who were waving their hats and handkerchiefs.

Erik, on the bridge, directed the maneuvers of the vessel, while Mr. Bredejord and the doctor waved a last farewell to Vanda from the deck.

Mr. Malarius, already frightfully seasick, had retired to his bed. They were all so occupied with saying farewell that not one of them had noticed the arrival of Tudor Brown.

Therefore the doctor could not repress a start of surprise when as he turned around, he saw him ascending from the depths of the vessel, and marching straight toward him, with his hands in his pockets, clothed as he had been at their first interview, and with his hat always seemingly glued to his head.

"Fine weather!" said Tudor Brown, by way of salutation and introduction.

The doctor was stupefied by his effrontery. He waited for some moments to see if this strange man would make any excuse, or give any explanation of his conduct.

Seeing that he did not intend to say anything, he opened the subject himself.

"Well, sir, it appears that Patrick O'Donoghan is not dead, as we supposed!" he said, with his customary vivacity.

"That is precisely what I want to find out, and it is on that account I have undertaken this voyage."

After saying this, Tudor Brown turned away, and began to walk up and down the deck, whistling his favorite air, appearing to think that his explanation was perfectly satisfactory.

Erik and Mr. Bredejord listened to this conversation with a natural curiosity. They had never seen Tudor Brown before, and they studied him attentively, even more so than Dr. Schwaryencrona. It seemed to them that the man, although he affected indifference, cast a furtive glance at them from time to time, to see what impression he made upon them. Perceiving this, they also immediately feigned to take no notice of him, and did not address a word to him. But as soon as they descended to the saloon, upon which their cabins opened, they took counsel together.

"What could have been Tudor Brown's motive in trying to make them believe that Patrick O'Donoghan was dead? And what was his purpose in taking this voyage upon the 'Alaska'? It was impossible for them to say. But it was difficult not to believe that it had some connection with the shipwreck of the 'Cynthia,' and the infant tied to the buoy. The only interest which Patrick O'Donoghan had for Erik and his friends, was the fact of his supposed knowledge of the affair, and this was their only reason for seeking for him. Now they had before them a man who was uninvited, and who had come to them, and declared that Patrick O'Donoghan was dead. And this man had forced his society upon the members of the expedition, as soon as his assertion in the most unexpected manner had been proved to be false. They were therefore obliged to conclude that he had some personal interest in the matter, and the fact of his seeking out Doctor Schwaryencrona indicated the connection between his interests, and the inquiries instituted by the doctor."

All these facts therefore seemed to indicate that Tudor Brown was in this problem a factor quite as important as Patrick O'Donoghan himself. Who could tell whether he was not already in possession of the secret which they were trying to elucidate? If this was the case, was it a happy thing for them that they had him on board, or should they rather be disturbed by his presence?

Mr. Bredejord inclined to the latter opinion, and did not consider his appearance among them as at all reassuring. The doctor, on the other side, argued that Tudor Brown might have acted in good faith, and also that he might be honest at heart, notwithstanding his unattractive exterior.

"If he knows anything," said he, "we can hope that the familiarity which a long voyage necessarily produces may induce him to speak out; in that case it would be a stroke of good luck to have had him with us. At least we shall see what he can have to do with O'Donoghan, if we ever find the Irishman."

As for Erik, he did not even dare to express the sentiments which the sight of this man awakened in him. It was more than repulsion, it was positive hatred, and an instinctive desire to rush upon him and throw him into the sea. He was convinced that this man had had some share in the misfortune of his life, but he would have blushed to abandon himself to such a conviction, or even to speak of it. He contented himself with saying that he would never have allowed Tudor Brown to come on board if he had had any voice in the matter.

How should they treat him?

On this point also they were divided. The doctor declared that it would be politic to treat Tudor Brown with at least outward courtesy, in the hope of inducing him to speak out. Mr. Bredejord, as well as Erik, felt a great
repugnance to act out such a comedy, and it was by no means certain that Dr. Schwaryencrona himself would be able to conform to his own programme. They determined to leave the matter to be decided by circumstances, and the behavior of Tudor Brown himself.

They did not have to wait long. Precisely at midday the bell rang for dinner. Mr. Bredejord and the doctor, went to the table of the commander. There they found Tudor Brown already seated, with his hat on his head, and he did not manifest the least inclination to enter into any relations with his neighbors. The man proved to be so rude and coarse that he disarmed indignation. He seemed to be ignorant of the simplest rules of politeness. He helped himself first, chose the best portions, and ate and drank like an ogre. Two or three times the commander, and Dr. Schwaryencrona addressed a few words to him. He did not even deign to speak, but answered them by gestures.

That did not prevent him however, when he had finished his repast, and armed himself with an enormous toothpick, from throwing himself back in his seat, and saying to Mr. Marsilas:

"What day shall we reach Gibraltar?"

"About the nineteenth or twentieth I think," answered the captain.

Tudor Brown drew a book from his pocket, and examined his calendar.

"That will bring us to Malta on the twenty-second, to Alexandria on the twenty-fifth, and to Aden at the end of the month," said he, as if speaking to himself.

Then he got up, and going on deck again, began to pace up and down.

"A pleasant traveling companion truly," Mr. Marsilas could not help saying.

Mr. Bredejord was about to answer, when a frightful noise at the head of the staircase prevented him. They heard cries, and barking, and a confusion of voices. Everybody arose and ran on deck.

The tumult had been caused by Kaas, Mr. Hersebom's Greenland dog. It seemed that he did not approve of Mr. Tudor Brown, for after evincing his displeasure by low growls every time he passed and repassed him, he finished by seizing him by the legs. Tudor Brown had drawn his revolver from his pocket, and was about to use it when Otto appeared on the scene and prevented him from doing so, and then sent Kaas away to his kennel. A stormy discussion then took place. Tudor Brown, white with rage and terror, insisted that the dog's brains should be blown out. Mr. Hersebom, who had come to the rescue, protested warmly against such a project.

The commander arriving at this moment, settled the matter by desiring Tudor Brown to put away his revolver, and decreeing that henceforth Kaas must be kept chained.

This ridiculous incident was the only one that varied the monotony of their first days of voyaging. Every one became accustomed to the silence and strange manners of Tudor Brown. At the captain's table they at length took no more notice of him than if he had not been in existence. Everybody pursued their own avocations.

Mr. Malarius, after passing two days in bed, was able to crawl upon deck, he commenced to eat, and was soon able to take his place at the innumerable whist parties of the doctor and Mr. Bredejord.

Erik, very much occupied with his business as lieutenant, spent every spare moment in reading.

On the eleventh they passed the island of Oland, on the thirteenth they reached Shayer Rock, passed through the sound, signaled Heligoland on the fourteenth, and on the sixteenth they doubled Cape Hogue.

On the following night Erik was sleeping in his cabin when he was awakened by a sudden silence, and perceived that he no longer felt the vibrations of the engine. He was not however alarmed, for he knew that Mr. Kjellguist was in charge of the vessel; but out of curiosity he arose and went on deck to see what had happened.

He was told by the chief engineer that the engine had broken down, and that they would be compelled to extinguish the fires. They could proceed, however, under sail, with a light breeze from the south-west.

A careful inspection threw no light on the cause of the damage, and the engineer asked permission to repair to the nearest port to repair the injury.

Commander Marsilas, after a personal examination, was of the same opinion. They found that they were thirty miles from Brest, and the order was given to steer for the great French port.

CHAPTER XIII.
THE SHIPWRECK.

The next day the "Alaska" entered the harbor of Brest. The damage which she had sustained was fortunately not important. An engineer who was applied to immediately promised that her injuries should be repaired in three days. It was therefore not a very serious delay, and they could make up for it in a measure by taking in coal. They would therefore not be obliged to stop at Gibraltar for this purpose, as they had at first intended. Their next stopping-place was to be at Malta, which they hoped to reach twenty-four hours earlier than they had at first expected, and thus would reduce the time of their delay in reality to two days. They therefore had nothing to worry themselves about, and everyone felt disposed to view the accident in the most philosophical manner.
It soon became evident that their mischance was going to be turned into a festival. In a few hours the arrival of the "Alaska" became known through the town, and as the newspapers made known the object of the expedition, the commander of the Swedish vessel soon found himself the recipient of the most flattering attentions. The admiral and Mayor of Brest, the commander of the port, and the captains of the vessels which were lying at anchor, all came to pay an official visit to Captain Marsilas. A dinner and a ball were tendered to the hardy explorers, who were to take part in the search for the "Nordenskiold." Although the doctor and Mr. Malaris cared little for such gatherings, they were obliged to take their places at the table which was prepared for them. As for Mr. Bredejord, he was in his true element.

Among the friends invited by the admiral, was a grand-looking old man with a refined but sad countenance. He soon attracted Erik's attention, who felt a sympathy for him which he could hardly explain. It was Mr. Durrien, Honorary Consul-general, and an active member of the Geographical Society, who was well known on account of his travels and researches in Asia Minor and the Soudan.

Erik had read his works with very great interest, and he mentioned that he had done so, when he had been presented to the French _savant_, who experienced a feeling of satisfaction as he listened to the enthusiastic young man.

It is often the fate of travelers, when their adventures make a stir in the world, to receive the loud admiration of the crowd; but to find that their labors are appreciated, by those who are well informed and capable of judging, does not occur so frequently. Therefore the respectful curiosity of Erik went straight to the heart of the old geographer, and brought a smile to his pale lips.

"I have never attached any great merit to my discoveries," he said, in reply to a few words from Erik, regarding the fortunate excavations which had recently been made. "I went ahead seeking, to forget my own cruel misfortunes, and not caring so much for the results as I did for prosecuting a work which was in entire accordance with my tastes. Chance has done the rest."

Seeing Erik and Mr. Durrien so friendly, the admiral took care to seat them together at table, so that they could continue their conversation during dinner.

As they were taking their coffee, the young lieutenant of the "Alaska" was accosted by a little bald-headed man, who had been introduced to him as Dr. Kergaridec, who asked him without any preamble to what country he belonged. A little surprised at first by the question, Erik answered that he was from Sweden, or, to be more exact, from Norway, and that his family lived in the province of Bergen. Then he inquired his motive for asking the question.

"My motive is a very simple one," answered his interlocutor. "For an hour I have been studying your face across the table, while we were at dinner, and I have never seen anywhere such a perfect type of the Celt as I behold in you! I must tell you that I am devoted to Celtic studies, and it is the first time that I have met with this type among the Scandinavians. Perhaps this is a precious indication for science, and we may be able to place Norway among the regions visited by our Gaelic ancestors?"

Erik was about to explain to the worthy _savant_ the reasons which would invalidate this hypothesis, when Dr. Kergaridec turned away to pay his respects to a lady who had just entered the room, and their conversation was not resumed.

The young lieutenant of the "Alaska" would probably never have thought of this incident again, but the next day as they were passing through a street near the market, Dr. Schwaryencrona said suddenly to him:

"My dear child, if I have ever had a doubt as to your Celtic origin, I should have lost it here. See how you resemble these Bretons. They have the same brown eyes, black hair, bony neck, colored skin and general appearance. Bredejord may say what he likes, but you are a pure-blooded Celt--you may depend upon it." Erik then told him what old Dr. Kergaridec had said to him, and Dr. Schwaryencrona was so delighted that he could not talk of anything else all the day.

With the other passengers of the "Alaska," Tudor Brown had received and accepted an invitation from the prefect. They thought up to the last moment that he would go in his accustomed dress, for he had made his appearance in it just as they were all going ashore to the dinner. But doubtless the necessity of removing his precious hat appeared too hard to him, for they saw him no more that evening.

When he returned after the ball, Erik learned from Mr. Hersebom that Tudor Brown had returned at seven o'clock and dined alone. After that, he had entered the captain's room to consult a marine chart; then he had returned to the town in the same small boat which had brought him on board.

This was the last news which they received of him.

The next evening at five o'clock Tudor Brown had not made his appearance. He knew, however, that the machinery of the "Alaska" would be repaired by that time, and her fires kindled, after which it would be impossible to defer her departure. The captain had been careful to notify every one. He gave the order to hoist the anchor.
The vessel had been loosened from her moorings when a small boat was signaled making all speed toward them. Every one believed that it carried Tudor Brown, but they soon saw that it was only a letter which had been sent on board. It occasion general surprise when it was discovered that this letter was directed to Erik.

When he opened it, Erik found that it simply contained the card of Mr. Durrien, the Honorary Consul-general, and member of the Geographical Society, with these words written in pencil:

"A good voyage--a speedy return."

We can not explain Erik's feelings.

This attention from an amiable and distinguished _savant_ brought tears to his eyes. In leaving this hospitable shore where he had remained three days, it seemed to him as if he was leaving his own country. He placed Mr. Durrien's card in his memorandum book, and said to himself that this adieu from an old man could not fail to bring him good luck.

It was now the 20th of February. The weather was fine. The sun had sunk below the horizon, leaving a sky as cloudless as that of summer.

Erik had the watch during the first quarter, and he walked the quarter-deck with a light step. It seemed to him that, with the departure of Tudor Brown, the evil genius of the expedition had disappeared.

"Provided that he does not intend to rejoin us at Malta or Suez," he said to himself.

It was possible--indeed, even probable--if Tudor Brown wished to spare himself the long voyage which the "Alaska" would make before reaching Egypt. While the vessel was going around the coasts of France and Spain, he could, if it so pleased him, stay for a week in Paris, or at any other place, and then take the mail packet either to Alexandria or Suez, and rejoin the "Alaska" at either of those places; or he could even defer doing so until they reached Singapore or Yokohama.

But this was only a possibility. The fact was that he was no longer on board, and that he could not cast a damper upon the spirits of the company.

Their dinner, also, which they took at six o'clock, as usual, was the gayest which they had yet sat down to. At dessert they drank to the success of the expedition, and every one, in his heart, associated it, more or less, with the absence of Tudor Brown. Then they went on deck and smoked their cigars.

It was a dark night, but in the distance toward the north they could see the light of Cape Saint Matthew. They soon signaled, also, the little light on the shore at Bec-du-Raze, which proved that they were in their right course. A good breeze from the north-east accelerated the speed of the vessel, which rolled very little, although the sea was quite rough.

As the dinner-party reached the deck, one of the sailors approached the captain, and said: "Six knots and a quarter."

"In that case we shall not want any more coal until we arrive at Behring's Straits," answered the captain. After saying these words, he left the doctor and went down to his room. There he selected a large chart, which he spread out before him under a brilliant light, which was suspended from the ceiling. It was a map of the British Admiralty, and indicated all the details of the course which the "Alaska" intended to take. The shores, the islands, the sand-banks, the light-houses, revolving lights, and the most minute details were all clearly marked out. With such a chart and a compass it seemed as if even a child might be able to guide the largest ship through these perilous passes; and yet, a distinguished officer of the French Navy, Lieutenant Mage, who had explored the Niger, had been lost in these waters, with all his companions, and his vessel, the "Magician."

It had happened that Captain Marsilas had never before navigated in these waters. In fact, it was only the necessity of stopping at Brest which had brought him here now, otherwise he would have passed a long distance from shore. Therefore he was careful to study his chart attentively, in order to keep his proper course. It seemed a very easy matter, keeping on his left the Pointe-du-Van, the Bec-du-Raze, and the Island of Sein, the legendary abode of the nine Druidesses, and which was nearly always veiled by the spray of the roaring waters; he had only to run straight to the west and to the south to reach the open sea. The light on the island indicated clearly his position, and according to the chart, the island ended in rocky heights, bordered by the open sea, whose depth reached one hundred meters. The light on the island was a useful guide on a dark night, and he resolved to keep closer to it than he would have done in broad daylight. He therefore ascended to the deck, and told Erik to sail twenty-five degrees toward the southwest.

This order appeared to surprise the young lieutenant.

"To the south-west, did you say?" he asked in a respectful manner, believing that he had been mistaken.

"Yes, I said to the south-west!" repeated the commander, dryly: "Do you not like this route?"

"Since you ask me the question, captain, I must confess that I do not. I should have preferred running west for some time."

"To what purpose? we should only lose another night."
The commander spoke in a tone that did not permit of any contradiction, and Erik gave the order which he had received. After all the captain was an experienced seaman in whom they might have perfect confidence.

Slight as was the change in her course, it sufficed to modify sensibly the sailing of the vessel. The "Alaska" commenced to roll a great deal, and to dip her prow in the waves. The log indicated fourteen knots, and as the wind was increasing, Erik thought it prudent to take a couple of reefs.

The doctor and Mr. Bredejord both became a prey to seasickness, and descended to their cabins. The captain, who had for some time been pacing up and down the deck, soon followed their example.

He had hardly entered his own apartment when Erik stood before him.

"Captain," said the young man, "I have heard suspicious noises, like waves breaking over rocks. I feel conscientiously bound to tell you that in my opinion we are following a dangerous route."

"Certainly, sir, you are gifted with tenaciousness," cried the captain. "What danger can you fear when we have this light at least three good miles, if not four, distant from us?"

And he impatiently with his finger pointed out their position upon the chart, which he had kept spread out upon his table.

Erik followed the direction of his finger, and he saw clearly that the island was surrounded by very deep waters. Nothing could be more decisive and reassuring, in the eyes of a mariner. But still he felt sure that it was not an illusion, those noises which he had heard, and which certainly were made by waves breaking upon a rocky shore very close to them.

It was a strange case, and Erik hardly liked to acknowledge it to himself, but it did not seem to him that he could recognize in this profile of the coast which lay spread out before his eyes the dangerous spot which he had pursued. But could he venture to oppose his dim impressions and vague remembrances against a chart of the British Admiralty? Erik dared not do it. These charts are made expressly to guard navigators against errors or any illusions of their memory. He therefore bowed respectfully to his chief and returned to his position on deck.

He had scarcely reached it when he heard this cry resounding through the vessel, "Breakers on the starboard!" followed almost immediately by a second shout of "Breakers on the larboard!"

There was a loud whistle and a clattering of many feet followed by a series of effective maneuvers. The "Alaska" slackened her course, and tried to back out. The captain made a rush up the stairs.

At this moment he heard a grating noise, then suddenly a terrible shock which shook the vessel from prow to stern. Then all was silent, and the "Alaska" remained motionless.

She was wedged in between two submarine rocks.

Commander Marsilas, his head bleeding from a fall, mounted the deck, where the greatest confusion reigned. The dismayed sailors made a rush for the boats. The waves dashed furiously over the rocks upon which the vessel had been shipwrecked. The distant light-houses, with their fixed lights, seemed to reproach the "Alaska" for having thrown herself into the dangers which it was their duty to point out. Erik tried vainly to penetrate through the gloom and discover the extent of the damage which the vessel had sustained.

"What is the matter?" cried the captain, still half-stunned by his fall.

"By sailing south-west, sir, according to your orders, we have run upon breakers," replied Erik.

Commander Marsilas did not say a word. What could he answer? He turned on his heel, and walked toward the staircase again.

Their situation was a tragical one, although they did not appear to be in any immediate peril. The vessel remained motionless between the rocks which seemed to hold her firmly, and their adventure appeared to be more sad than frightful. Erik had only one thought--the expedition was brought to a full stop--his hope of finding Patrick O'Donoghan was lost.

He had scarcely made his somewhat hasty reply to the captain, which had been dictated by this bitter disappointment, than he regretted having done so. He therefore left the deck to go in search of his superior officer with the generous intention of comforting him, if it were possible to do so. But the captain had disappeared, and three minutes had not elapsed when a detonation was heard.

Erik ran to his room. The door was fastened on the inside. He forced it open with a blow of his fist.

Commander Marsilas lay stretched out upon the carpet, with a revolver in his right hand, and a bullet wound in his forehead.

Seeing that the vessel was shipwrecked by his fault, he had blown his brains out. Death had been instantaneous. The doctor and Mr. Bredejord, who had run in after the young lieutenant, could only verify the sad fact.

But there was no time for vain regrets. Erik left to his two friends the care of lifting the body and laying it upon the couch. His duty compelled him to return to the deck, and attend to the safety of the crew and passengers.

As he passed the door of Mr. Malarius, the excellent man, who had been awakened by the stopping of the vessel,
and also by the report of the pistol, opened his door and put out his white head, covered by his black silk night-cap. He had been sleeping ever since they left Brest, and was therefore ignorant of all that had occurred.

"Ah, well, what is it? Has anything happened?" he asked quietly.

"What has happened?" replied Erik. "My dear master, the 'Alaska' has been cast upon breakers, and the captain has killed himself!"

"Oh!" said Mr. Malarius, overcome with surprise. "Then, my dear child, adieu to our expedition!"

"That is another affair," said Erik. "I am not dead, and as long as a spark of life remains in me, I shall say, 'Go forward!'"

CHAPTER XIV.

ON THE ROCKS.

The "Alaska" had been thrown upon the rocks with such violence that she remained perfectly motionless, and the situation did not appear to be immediately dangerous for her crew and passengers. The waves, encountering this unusual obstacle, beat over the deck, and covered everything with their spray; but the sea was not rough enough to make this state of affairs dangerous. If the weather did not change, day would break without any further disaster. Erik saw this at a glance. He had naturally taken command of the vessel, as he was the first officer. Having given orders to close the port-holes and scuttles carefully, and to throw tarred cloths over all openings, in case the sea should become rougher, he descended to the bottom of the hold, in company with the master carpenter. There he saw with great satisfaction that no water had entered. The exterior covering of the "Alaska" had protected her, and the precaution which they had taken against polar icebergs had proved very efficacious against the rocky coast; in fact the engine had stopped at once, being disarranged by the frightful shock, but it had produced no explosion, and they had, therefore, no vital damage to deplore. Erik resolved to wait for daybreak, and then disembark his passengers if it should prove necessary.

He, therefore, contented himself with firing a cannon to ask aid from the inhabitants of the Island of Sein, and with dispatching his small steam launch to L'Orient.

He said to himself, that at no place would they find the means of repairing their damages so promptly and well as at this great maritime arsenal of Western France.

Thus in this glooming hour when everyone on board believed that their chances were irretrievably lost, he already began to feel hopeful, or rather he was one of those courageous souls who know no discouragement and never confess themselves vanquished.

"If we can only get the 'Alaska' off these rocks, everything may yet go well with us," he said.

But he was careful not to express this hope to the others, who would doubtless have considered it chimerical. He only told them when he returned from his visit to the hold that they were in no danger at present, and that there was plenty of time for them to receive aid.

Then he ordered a distribution of tea and rum to all the crew.

This sufficed to put these children of a larger growth in a good humor, and their little steam-boat was speedily launched.

Some rockets from the light-house of Sein soon announced that aid was coming to the assistance of the shipwrecked vessel. Red lights now became visible, and voices hailed them. They answered that they had been shipwrecked upon the rocks surrounding Sein.

It was a full hour before the boat could reach them. The breakers were so strong that the attempt was perilous. But at length six men succeeded in seizing a small cable, and hoisting themselves on board of the "Alaska."

They were six rude fishermen of Sein—strong, intrepid fellows—and it was not the first time they had gone to the assistance of shipwrecked mariners. They fully approved of the idea of sending to L'Orient for assistance, for their little port could not offer the necessary resources. It was agreed that two of them should depart in the little steamer with Mr. Hersebom and Otto, as soon as the moon arose above the horizon. While they were waiting for it to do so, they gave some account of the place where they were shipwrecked.

The rocks extend in a westerly direction for nine miles beyond the Island of Sein. They are divided into two parts, which are called the Pont du Sein and the Basse Froid.

The Pont du Sein is about four miles long, and a mile and a half wide. It is composed of a succession of high rocks, which form a chain above the waters. The Basse Froid extends beyond the Pont du Sein for five miles, and is two thirds of a mile wide; it consist of a great number of rocks of about an equal height, which can be seen at a great distance. The principal rocks are the Cornengen, Schomeur, Cornoc-ar-Goulet-Bas-ven, Madiou and Ar-men. These are the least dangerous, because they can be seen. The number and irregularity of their points under the water are not fully known, for the sea beats over them with extreme violence, the force of the current is very strong, and they are
the scene of many shipwrecks. Light-houses have been erected on the Island of Sein and at Bec-du-Raze, so that these rocks can be seen and avoided by vessels coming from the west, but they are very dangerous for vessels coming from the south. Unfortunately there is no rock or small island at the extreme end where a signal could be placed, and the turbulence of the waters will not permit a floating one to be placed there. Therefore it was resolved to build a light-house on the rock Ar-men, which is three miles from the extreme point. This work is so extremely difficult that although it was commenced in 1867, twelve years later, in 1879, it was only half built. They say that during the latter year it was only possible to work for eight hours, although the workmen were always ready to seize a favorable moment. The light-house therefore was not yet completed at the time when the "Alaska" met with her disaster. But this did not suffice to explain how, after leaving Brest, they had been run into such peril. Erik promised himself that he would solve this difficulty as soon as the little steam-boat had been dispatched for aid. This departure was easily effected, the moon having soon made its appearance. The young captain then appointed the night watch, and sent the rest of the crew to bed, then he descended to the captain's room.

Mr. Bredejord, Mr. Malarius, and the doctor were keeping watch beside the corpse. They arose as soon as they saw Erik.

"My poor child, what is the cause of this sad state of things? How did it happen?" asked the doctor.

"It is inexplicable," answered the young man, looking at the chart which lay open upon the table. "I felt instinctively that we were out of our route, and I said so; but in my estimation we are at least three miles from the light-house; and all the seamen agree with me," he added, designating a spot with his finger on the map—and you see no danger is indicated—no sand-banks or rocks. This coloring indicates deep water. It is inconceivable how the mistake can have occurred. We can not suppose that a chart of the British Admiralty can be at fault, for it is a region well known to mariners, as it has been minutely explored for centuries!"

"Is it not possible to make a mistake as to our position? Could not one light be mistaken for another?" asked Mr. Bredejord.

"That is scarcely possible in a voyage as short as ours has been since we left Brest," said Erik. "Remember that we have not lost, sight of land for a moment, and that we have been passing from one point to another. We can only suppose that one of the lights indicated on the chart has not been lighted or that some supplementary light has been added—in a word, we must imagine what is highly improbable. Our course has been so regular, the soundings have been so carefully made, that it seems impossible that we could have mistaken our route, and yet the fact remains that we are on the rocks, when we ought to have been some distance out to sea."

"But how is it going to end? That is what I want to know," cried the doctor.

"We shall soon see," answered Erik, "if the maritime authorities show any eagerness to come to our assistance. For the present the best thing that every one can do is to go quietly to bed, since we are as secure as if we were at anchor in some quiet bay."

The young commander did not add that it was his intention to keep watch while his friends slept.

Nevertheless this is what he did for the remainder of the night, sometimes promenading the deck and encouraging the men, sometimes descending for a few minutes to the saloon.

As day commenced to dawn he had the satisfaction of perceiving that the waves visibly receded, and if they continued to do so the "Alaska" would be left almost on dry rocks. This gave him hope of being able speedily to determine the extent of the damage which the vessel had received, and, in fact, toward seven o'clock they were able to proceed with this examination.

They found that three points of the rocks had pierced the "Alaska," and held her firmly on her rocky bed. The direction in which she lay, slightly inclined to the north, which was contrary to her course, showed that the commands given by Erik to back the vessel had saved her, and also rendered the shock, when she struck, less severe. The engine had been reversed some seconds before she touched, and she had been carried on the reef by the remainder of her previous speed, and by the force of the current. Doubtless but for this she would have gone to pieces. Besides, the waves having continued to break against her all night in the same direction, had helped to keep her in her place instead of fixing her more firmly on the rocks, which would have happened if the wind had changed. So, after all, there was a favorable view to take of the disaster. The question now was how to get the vessel off before the wind should change, and reverse these favorable conditions.

Erik resolved not to lose a moment. Immediately after breakfast he set all his men to work. He hoped that when the tow-boat should arrive, which he had sent for from L'Orient, it might be possible at high tide to disengage the "Alaska."

We can therefore imagine that the young captain waited impatiently for the first trace of smoke upon the horizon.

All turned out as he desired. The water remained calm and peaceful. Toward noon the boat arrived.

Erik, with his staff, received the mariners with due honors.
"But explain to me," said the captain of the tow-boat, "how you came to cast your vessel on these rocks after leaving Brest?"

"This chart will explain it," said Erik. "It does not point out any such danger."

The French officer examined the chart with curiosity at first, and then he looked stupefied.

"In fact the Basse-Froide is not marked down, nor the point of Sein," he cried. "What unparalleled negligence. Why, even the position of the light-house is not correctly marked. I am more and more surprised. This is a chart of the British Admiralty. I should say that some one has taken pleasure in making it as deceitful and perfidious as possible. Navigators of olden times frequently played such tricks upon their rivals. I should never have believed such traditions would be imitated in England."

"Are you sure that this is an English chart?" asked Mr. Bredejord. "For myself I suspect that the chart is the work of a rascal, and has been placed with criminal intentions among the charts of the 'Alaska.'"

"By Tudor Brown!" cried Erik, impetuously. "That evening when we dined with the authorities at Brest he entered the captain's room upon the pretense of examining the charts. Oh, the infamous wretch! This then is the reason that he did not come on board again!"

"It appears to be only too evident that he is the culprit," said Dr. Schwaryencrona. "But such a dastardly action betrays such an abyss of iniquity. What motive could he have for committing such a crime?"

"What was his motive in coming to Stockholm, expressly to tell you that Patrick O'Donoghan was dead?" answered Mr. Bredejord. "For what purpose did he subscribe twenty thousand kroners for the voyage of the 'Alaska,' when it was doubtful if she would ever make the journey? Why did he embark with us to leave us at Brest? I think we must be blind indeed if we do not see in these facts a chain of evidence as logical as it is frightful. What interest has Tudor Brown in all this? I do not know. But this interest must be very strong, very powerful, to induce him to have recourse to such means to prevent our journey; for I am convinced now that it was he who caused the accident which detained us at Brest, and it was he who led us upon these rocks, where he expected we would all lose our lives."

"It seems difficult, however, to believe that he could have foreseen the route that Captain Marsilas would choose!" objected Mr. Malarias. "Why did he not indicate this route by altering the chart? After delaying us for three days, he felt certain that the captain would take the shortest way. The latter, believing that the waters were safe around Sein, was thrown upon the rocks."

"It is true," said Erik; "but the proof that the result of his maneuvers was uncertain lies in the fact that I insisted, before Captain Marsilas, that we ought still to keep to the west."

"But who knows whether he has not prepared other charts to lead us astray, in case this one failed to do so?" said Mr. Bredejord.

"That is easily determined," answered Erik, who went and brought all the charts and maps that were in the case.

The first one which they opened was that of Corunna, and at a glance the French officer pointed out two or three grave errors. The second was that of Cape Vincent. It was the same.

The third was that of Gibraltar. Here the errors were apparent to every eye. A more thorough examination would have been superfluous, as it was impossible to doubt any longer. If the 'Alaska' had not been shipwrecked on the Island of Sein, this fate would surely have awaited her before she could have reached Malta.

A careful examination of the charts revealed the means which had been employed to effect these changes. They were undoubtedly English charts, but they had been partly effaced by some chemical process, and then retouched so as to indicate false routes among the true ones. They had been recolored so skilfully that only a very slight difference in the tints could be perceived after the most careful scrutiny.

But there was one circumstance which betrayed the criminal intentions with which they had been placed on board the 'Alaska.' All the charts belonging to the vessel bore the seal of the secretary of the Swedish navy. The forger had foreseen that they would not be examined too minutely, and had hoped that by following them they would all come to a watery grave.

These successive discoveries had produced consternation in the breasts of all who were present.

Erik was the first to break the silence which had succeeded the conversation.

"Poor Captain Marsilas!" he said, in a trembling voice, "he has suffered for us all. But since we have escaped almost by a miracle the fate which was prepared for us, let us run no more risks. The tide is rising, and it may be possible to draw the 'Alaska' off the rocks. If you are willing, gentlemen, we will go and commence operations without delay."

He spoke with simple authority and a modest dignity, with which the feeling of responsibility had already inspired him.

To see a young man of his age invested with the command of a ship under such circumstances, and for such a hazardous expedition, was certainly an unforeseen occurrence. But he felt that he was equal to the performance of all
his duties. He knew that he could rely upon himself and upon his crew, and these thoughts transfigured him. The youth of yesterday was a man to-day. The spirit of a hero burned in his eyes. He rose superior to the calamity which had befallen them. His ability impressed all who approached him. Even the doctor and Mr. Bredejord submitted to him like the others.

The operation of preparing for their morning’s work proved easier than they had hoped.

Lifted by the rising waters, the vessel only required a slight force to take her off the rocks. A few hours of hard work were sufficient to accomplish this, and the "Alaska" was once more afloat, strained indeed, and weighed down by the water which made its way into some of her compartments, and with her engine silent, but manageable.

All the crew, who were assembled on the deck, watched anxiously the result of these efforts, and a loud hurrah greeted the deliverance of the "Alaska."

The Frenchmen replied to this joyful cry with similar acclamations. It was now three o’clock in the afternoon. Above the horizon the beautiful February sun inundated the calm sparkling sea with floods of sunshine, which fell also on the rocks of the Basse-Froide, as if to efface all remembrance of the drama which had been enacted there the previous night.

That same evening the "Alaska" had been safely towed into the harbor of L’Orient.

The next day the French maritime authorities, with the utmost courtesy, authorized the necessary repairs to be made without delay. The damage which the vessel had sustained was not serious, but that of the machinery was more complicated, although not irremediable. Necessarily it would take some time to render her seaworthy, but nowhere in the world, as Erik had foreseen, could this be accomplished so speedily as at this port, which possessed such immense resources for naval construction. The house of Gainard, Norris & Co., undertook to make the repairs in three weeks. It was now the 23d of February; on the 16th of March they would be able to resume their voyage, and this time with good charts.

That would leave three months and a half for them to reach Behring’s Strait by the end of June. It was not impossible to do this, although the time was very limited. Erik would not hear of abandoning the enterprise. He feared only one thing, and that was being compelled to do so. Therefore he refused to send to Stockholm a report of the shipwreck, and he would not make a formal complaint against the presumed author of the attempt to shipwreck them for fear of being delayed by legal proceedings, yet he had his fears that this might encourage Tudor Brown to throw some new obstacle in the way of the "Alaska." This is what Dr. Schwaryencrona and Mr. Bredejord asked each other as they were playing at whist with Mr. Malarius, in the little sitting-room of the hotel to which they had gone after arriving at L’Orient.

As for Mr. Bredejord, he had no doubts about the matter.

A rascal like Tudor Brown, if he knew of the failure of his scheme—and how could any one doubt that he was acquainted with this fact?—would not hesitate to renew the attempt.

To believe that they would ever succeed in reaching Behring’s Strait was therefore more than self-delusion—it was foolishness. Mr. Bredejord did not know what steps Tudor Brown would take to prevent this, but he felt certain that he would find some means of doing so. Dr. Schwaryencrona was inclined to the same opinion, and even Mr. Malarius could not think of anything very reassuring to say. The games of whist were therefore not very lively, and the long strolls that the three friends took were not very gay.

Their principal occupation was to watch the erection of the mausoleum which they were building for poor Captain Marsilas, whose funeral obsequies had been attended by the entire population of L’Orient.

The sight of this funeral monument was not calculated to raise the spirits of the survivors of the "Alaska."

But when they joined Erik again their hopes revived. His resolution was unshakable, his activity untiring, he was so bent upon overcoming all obstacles, so certain of success, that it was impossible for them to express, or even to preserve, less heroic sentiments.

They had a new proof of the malignity of Tudor Brown, and that he still was pursuing them.

On the 14th of March, Erik saw that the work upon the machinery was almost finished. They only had to adjust the pumps, and that was to be done the next day.

But in the night, between the 14th and 15th, the body of the pump disappeared from the workshop of the Messrs. Gainard, Norris & Co.

It was impossible to find it.

How had it been taken away--who had done it?

After investigation they were unable to discover.

However, it would take ten days more to replace it, and that would make it the 25th of March before the "Alaska" could leave L’Orient.

It was a singular fact, but this incident affected Erik’s spirits more than the shipwreck had done. He saw in it a sure sign of a persistent desire to prevent the voyage of the "Alaska."
But these efforts only redoubled his ardor, and he determined that nothing should be wanting on his part to bring the expedition to a successful termination.

These ten days of delay were almost exclusively occupied by him in considering the question in all its aspects. The more he studied, the more he became convinced that he could not reach Behring's Straits in three months, for they had suffered a detention of forty days since they had left Stockholm, and to persist would only be to court failure and perhaps some irremediable disaster.

This conclusion did not stop him, but it only led him to think that some modification of their original plans was indispensable.

He took care, however, to say nothing, rightly judging that secrecy was the first condition of victory. He contented himself with watching more closely than ever the work of repairing the vessel.

But his companions thought that they perceived that he was less eager to set out.

They therefore concluded that he saw that the enterprise was impracticable, which they had also believed for some time.

But they were mistaken.

On the 25th of March, at midday, the repairs of the "Alaska" were completed, and she was once more afloat in the harbor of L'Orient.

CHAPTER XV.
THE SHORTEST ROUTE.

Night was closing in when Erik summoned his three friends and counselors to hold a serious consultation.

"I have reflected a great deal," he said to them, "upon the circumstances which have made our voyage memorable since we left Stockholm. I have been forced to arrive at one conclusion, which is that we must expect to meet with obstacles or accidents during our voyage. Perhaps they may befall us at Gibraltar or at Malta. If we are not destroyed, it appears to me certain that we shall be delayed. In that case we can not reach Behring's Straits during the summer, which is the only season when it is practicable to navigate the polar sea!"

"That is also the conclusion which I formed some time ago," declared Mr. Bredejord: "but I kept it to myself, as I did not wish to dampen your hopes, my dear boy. But I am sure that we must give up the idea of reaching Behring's Straits in three months!"

"That is also my opinion," said the doctor.

Mr. Malarius on his part indicated by a motion of his head that he agreed with them all.

"Well!" said Erik, "having settled that point, what line of conduct now remains for us to adopt?"

"There is one right course which it is our duty to take," answered Mr. Bredejord, "it is to renounce an enterprise which we see clearly is impracticable and return to Stockholm. You understand this fact, my child, and I congratulate you upon being able to look the situation calmly in the face!"

"You pay me a compliment which I can not accept," said Erik smiling, "for I do not merit it. No--I have no thoughts of abandoning the expedition, for I am far from regarding it as impracticable. I only think that it is best for us all to baffle the machinations of that scoundrel who is lying in wait for us, and the first thing to do is to change our route."

"Such a change would only complicate our difficulties," replied the doctor, "since we have adopted the shortest one. If it would be difficult to reach Behring's Straits by the Mediterranean and the Suez Canal, it would be impossible by the Cape of Good Hope, or Cape Horn, for either of these routes would necessarily take five or six months."

"There is another way which would shorten our voyage, instead of lengthening it, and where we would be sure not to meet Tudor Brown," said Erik.

"Another way?" answered Dr. Schwaryencrona; "upon my word I do not know of any unless you are thinking of the way of Panama. But it is not yet practicable for vessels, and it will not be yet for several years."

"I am not thinking of Panama, nor of Cape Horn, nor of the Cape of Good Hope," answered the young captain of the "Alaska." "The route I propose is the only one by which we can reach Behring's Strait in three months: it is to go by way of the Arctic Ocean, the north-west passage."

Then seeing that his friends were stupefied by this unexpected announcement, Erik proceeded to develop his plans.

"The north-west passage now is no longer what it was formerly, frightful to navigators--it is intermittent, since it is only open for eight or ten weeks every year, but it is now well known, marked out upon excellent charts, and frequented by hundreds of whaling-vessels. It is rarely taken by any vessel going from the Atlantic to the Pacific Ocean, I must admit. Most of them who enter it from either side only traverse it partially. It might even happen, if
circumstances were not favorable, that we might find the passage closed, or that it might not be open at the precise time when we desired to enter it. It is a risk that one must take. But I think there are many reasons to make us hopeful of success if we take this route, whilst as far as I can see there is none, if we take any of the others. This being the state of affairs, I think it is our duty—a duty which we owe to those who have fitted out the expedition—to take the shortest way of reaching Behring's Strait. An ordinary vessel equipped for navigating tropical waters might hesitate before deciding upon such a course, but with a vessel like the 'Alaska' fitted out especially for polar navigation, we need not hesitate. For my part I declare that I will not return to Stockholm before having attempted to find Nordenskiold."

Erik's reasoning was so sound that nobody tried to contradict it.

What objections could the doctor, Mr. Bredejord, and Mr. Malarius raise?

They saw the difficulties which beset the new plan. But it was possible that these difficulties might not prove insurmountable, whilst, if they pursued any other course, they must abandon all hopes of success. Besides, they did not hesitate to agree with Erik that it would be more glorious, in any case, to make the attempt, than to return to Stockholm and acknowledge themselves conquered.

"I see but one serious objection, for my part," said Dr. Schwaryencrona, after he had remained for a few moments lost in reflection. "It is the difficulty of procuring coal in the arctic regions. For without coal, adieu to the possibility of making the north-west passage, and of profiting by the time, often very short, during which it is practicable."

"I have foreseen this difficulty, which is in fact the only one," answered Erik, "and I do not think it is insurmountable. In place of going to Malta or Gibraltar, where we might doubtless expect new machinations on the part of Tudor Brown, I propose that we go to London; from there I can send, by transatlantic cable, a dispatch to a house in Montreal, to send without delay a boat loaded with coal to wait for us in Baffin's Bay, and to a house in San Francisco to send to Behring's Strait. We have the necessary funds at our disposal, and, besides, we will not require as much as we would have done if we had gone by the way of Asia, for our new route is a much shorter one. It is useless for us to reach Baffin's Bay before the end of May, and we can not hope to reach Behring's Strait before the end of June. Our correspondents in Montreal and San Francisco will therefore have plenty of time to execute our orders, which will be covered by funds deposited with bankers in London. This accomplished, we shall only have to find out whether the north-west passage is practicable, and that evidently depends upon ourselves. But, if we find the passage closed, at least we shall have the consolation of knowing that we have neglected nothing that could have insured our success."

"It is evident!" said Mr. Malarius, "that your arguments are unanswerable!"

"Gently, gently," said Mr. Bredejord. "Do not let us go too fast. I have another objection. Do you think, my dear Erik, that the 'Alaska' can pass unnoticed through these waters? No, it is not possible. The newspapers would mention our arrival. The telegraph companies would make it known. Tudor Brown would know it. He would know that we had changed our plans. What would prevent him from altering his? Do you think, for example, that it would be very difficult to prevent our boat with coals from reaching us?—and without it we could do nothing!"

"That is true," answered Erik, "and it proves that we must think of everything. We must not go to London. We must put into Lisbon as if we were _en route_ to Gibraltar and Suez. Then one of us must go _incognito_ to Madrid, and without explaining why, or for whom it is intended, must open telegraphic communications with Montreal and San Francisco, to order the supply of coal. The crews of these boats must not know for whom the coal is destined, but remain at designated points at the disposition of a captain who will carry an order to them previously agreed upon!"

"A perfect arrangement. It will be almost impossible for Tudor Brown to track us."

"You mean to track me, for I hope that you do not think of accompanying me to these arctic regions," said Erik. "Indeed that is my intention!" answered the doctor. "It shall not be said that that rascal, Tudor Brown, made me turn back!"

"Nor me either," cried Mr. Bredejord and Mr. Malarius together.

The young captain tried to combat this resolution, and explained to his friends the dangers and monotony of the voyage which they proposed to take with him. But he could not alter their decision. The perils which they had already encountered, made them feel it a duty to keep together; for the only way of rendering such a voyage acceptable to them all was not to separate. Every precaution had been taken to protect the persons on board the "Alaska" from suffering unduly from cold; and neither Swedes nor Norwegians fear frost.

Erik was obliged to yield to their wishes, only stipulating that their change of route should not be made known to the crew of the vessel.

The first part of their voyage was quickly accomplished.

On the 2d of April the "Alaska" reached Lisbon. Before the newspapers had given notice of their arrival, Mr.
Bredejord had gone to Madrid, and by means of a banking-house opened communications with two large firms, one in Montreal and one in San Francisco.

He had arranged to have two boat-loads of coal sent to two designated points, and had given the sign by which Erik was to make himself known.

This sign was the words found upon him when he was discovered floating, tied to the buoy of the "Cynthia," "Semper idem."

Finally these arrangements having all been happily concluded, on the 9th of April Mr. Bredejord returned to Lisbon, and the "Alaska" resumed her voyage.

On the twenty-fifth of the same month, having crossed the Atlantic and reached Montreal, where they took in coal, and Erik was assured that his orders had been punctually fulfilled, they left the waters of the St. Lawrence and Straits of Belle Isle, which separate Labrador from Newfoundland. On the 10th of May they reached the coast of Greenland and found the vessel with their coal, it having arrived before them.

Erik knew very well that at this early date it would be useless to attempt to force his way through the Arctic Ocean, which was still firmly frozen over the largest part of his route. But he counted upon obtaining on these shores, which were much frequented by whaling-vessels, precise information as to the best charts, and he was not mistaken. He was also able to buy, although at a high price, a dozen dogs, who with Kaas could draw their sledges if necessary.

Among the Danish stations on the coast of Greenland, he found Godhaven, which is only a poor village, and is used as a depot by dealers in oil and the furs of the country. At this time of the year the cold is not more severe than at Stockholm or Noroe. But Erik and his friends beheld with surprise the great difference between the two countries, both situated at the same distance from the pole. Godhaven is in precisely the same latitude as Bergen. But whilst the southern port of Norway is in April covered with green forests and fruit trees, and even cultivated vines trained upon trellises above green meadows, Greenland is still in May covered with ice and snow, without a tree to enliven the monotony. The shape of the Norwegian coast, deeply indented by forests and sheltered by chains of islands, which contribute almost as much as the warmth of the Gulf Stream to raise the temperature of the country. Greenland, on the contrary, has a low regular coast and receives the full shock of the cold blasts from the pole, consequently she is enveloped almost to the middle of the island by fields of ice several feet in thickness.

They spent fifteen days in the harbor and then the "Alaska" mounted Davis' Straits, and keeping along the coast of Greenland, gained the polar sea.

On the 28th of May for the first time they encountered floating ice in 70 15' of north latitude, with a temperature two degrees below zero. These first icebergs, it is true, were in a crumbling condition, rapidly breaking up into small fragments. But soon they became more dense, and frequently they had to break their way through them. Navigation, although difficult, was not as yet dangerous. By a thousand signs they perceived, however, that they were in a new world. All objects at a little distance appeared to be colorless, and almost without form; the eye could find no place to repose in this perpetually changing horizon, which every minute assumed a new aspect.

"Who can describe," says an eye-witness, "these melancholy surroundings, the roaring of the waves beating beneath the floating ice, the singular noise made by the snow as it falls suddenly into the abyss of waters? Who can imagine the beauty of the cascades which gush out on all sides, the sea of foam produced by their fall, the fright of the sea-birds who, having fallen asleep on a pyramid of ice, suddenly find their resting-place overturned and themselves obliged to fly to some other spot? And in the morning, when the sun bursts through the fog, at first only a little of the blue sky is visible, but it gradually widens, until the view is only limited by the horizon."

These spectacles, presented by the polar sea, Erik and his friends were able to contemplate at their leisure as they left the coast of Greenland, to which they had kept close until they had reached Upernavik. Then they sailed westward across Baffin's Bay. Here navigation became more difficult, for this sea is the ordinary course of the polar icebergs which are drawn in by the innumerable currents which traverse it. Sometimes they found their course checked by insurmountable barriers of ice, which it was impossible to break, and therefore they were compelled to turn aside. The "Alaska" was obliged continually to break her way through immense fields of ice. Sometimes a tempest of snow assailed them which covered the deck and the masts with a thick coat. Sometimes they were assailed by ice dashed over them by the wind, which threatened to sink the vessel by its weight. Sometimes they found themselves in a sort of lake, surrounded on all sides by fields of ice apparently firm and impassable, and from which they had great difficulty to extricate themselves and gain the open sea. Then they had to exercise great vigilance to escape some enormous iceberg sailing down from the north with incredible swiftness, a frightful mass, which could have crushed the "Alaska" like a walnut. But a greater danger still was the submarine ice, which could injure her and act like a battering-ram.

The "Alaska" lost her two large boats. One must experience the dangers which polar navigation presents at every moment to have any just appreciation of them.
After one or two weeks of such experience the most intrepid crew become exhausted, and repose is necessary for them.

Sometimes, although surrounded by all these dangers, they made rapid progress; at others they made scarcely any; but at length, on the 11th of June, they came in sight of land again, and cast anchor at the entrance to Lancaster Sound.

Erik had expected to be obliged to wait some days before being able to enter the sound; but, to his surprise and joy, he found it open, at least at the entrance. He entered resolutely, but only to find the next day his passage impeded by ice, which held them prisoners for three days; but, thanks to the violent currents which sweep through this Arctic canal, he at last was able to free his vessel and continue his route as the whalers of Godhaven had told him he would be able to do.

On the seventeenth he arrived at Barrow's Straits, and made all the speed he could; but on the nineteenth, as he was about to enter Melville Sound, he was again blocked in by the ice.

At first he patiently accepted the situation, waiting for it to break up; but day succeeded to day and still this did not happen.

There were, however, many sources of amusement open to the voyagers. They were near the coast and supplied with everything that could render their life comfortable in that latitude. They could take sleigh-rides and see in the distance the whales enjoying their diversions. The summer solstice was approaching. Since the fifteenth the occupants of the "Alaska" had beheld a new and astonishing spectacle, even for Norwegians and the natives of southern Sweden; it was the sun at midnight touching the horizon without disappearing and then mounting again in the sky. In these high latitudes and desolate coasts the star of day describes in twenty-four hours a complete circle in space. The light, it is true, is pale and languishing, objects lose their perfect shape, and all nature has a shadowy appearance. One realizes profoundly how far he is removed from the world, and how near he is to the pole. The cold, however, was not extreme. The temperature did not fall more than four or five degrees below zero, and the air was sometimes so mild that they could hardly believe that they were in the center of the arctic zone.

But those novel surroundings were not sufficient to satisfy Erik, or make him lose sight of the supreme object which had brought them there. He had not come to herbalize like Mr. Malarius, who returned every evening more and more delighted with his explorations, both of the country and of its unknown plants, which he added to his collection; nor to enjoy with Dr. Schwaryencrona and Mr. Bredejord the novelty of the sights which nature offered to them in these polar regions. He wanted to find Nordenskiold and Patrick O'Donoghans--to fulfill a sacred duty which hemmed them in. He made excursions with his sleigh and on his snow-shoes, reconnoitered in every direction for ten days, but it was all in vain. At the west, as well as the north and east, the banks of ice remained firm.

It was the 20th of June, and they were still far from the Siberian Sea.

Must he confess himself vanquished? Erik could not make up his mind to do this. Repeated soundings had revealed that under the ice there was a swift current running toward Franklin's Strait, that is to say toward the south; he told himself that some effort might suffice to break up the ice, and he resolved to attempt it.

For the length of seven marine miles he had hollowed in the ice a series of chambers, and in each of them was placed a kilogramme of dynamite. These were connected by a copper wire inclosed in gutta percha.

On the 30th of June, at eight o'clock in the morning, Erik from the deck of the "Alaska" pressed the button of the electrical machine, and a formidable explosion took place. The field of ice shook and trembled, and clouds of frightened sea-birds hovered around uttering discordant cries. When silence was restored, a long black train cut into innumerable fissures met their anxious gaze. The explosion of the terrible agent had broken up the ice field. There was, so to speak, a moment of hesitation, and then the ice acted as if it had only been waiting for some signal to move. Cracking in all parts it yielded to the action of the current, and they beheld here and there whole continents, as it were, gradually moving away from them. Some portions, however, were more slow to move; they seemed to be protesting against such violence. The next day the passage was clear, and the "Alaska" rekindled her fires.

Erik and his dynamite had done what it would probably have taken the pale arctic sun a month longer to accomplish.

On the 2d of July, the expedition arrived at Banks' Straits; on the fourth, she issued from the Arctic Sea properly speaking. From this time the route was open notwithstanding icebergs, fogs, and snow-storms. On the twelfth, the "Alaska" doubled Ice Cape; on the thirteenth, Cape Lisburne, and on the fourteenth she entered the Gulf of Kotzebue to the north of Behring's Straits and found there, according to instructions, the boat loaded with coal which had been sent from San Francisco.

Thus in two months and sixteen days they had accomplished the programme arranged by Erik before they left the coast of France.

The "Alaska" had hardly ceased to move, when Erik rushed into a small boat and hurried off to accost the officer
who had charge of the boat loaded with coal.

"_Semper idem!_" said he, as he approached.

"Lisbon!" answered the Yankee.

"How long have you been waiting here for me?"

"Five weeks--we left San Francisco one month after the arrival of your dispatch."

"Have you heard any news of Nordenskiold?"

"At San Francisco they had not received any reliable information about him. But since I have been here I have
spoken to several captains of whaling-vessels, who said that they had heard from the natives of Serdze-Kamen that
an European vessel had been frozen in by the ice for nine or ten months; they thought it was the 'Vega.'"

"Indeed!" said Erik, with a joy which we can easily understand. "And do you believe that it has not yet
succeeded in getting through the straits?"

"I am sure of it--not a vessel has passed us for the last five weeks, which I have not seen and spoken to."

"God be praised--our troubles will not be without recompense, if we succeed in finding Nordenskiold."

"You will not be the first who has done so!" said the Yankee, with an ironical smile--"an American yacht has
preceded you. It passed here three days ago, and like you was inquiring for Nordenskiold."

"An American yacht?" repeated Erik, half stupefied.

"Yes--the 'Albatross,' Captain Tudor Brown, from Vancouver's Island. I told him what I had heard, and he
immediately started for Cape Serdze-Kamen."

CHAPTER XVI.
FROM SERDZE-KAMEN TO LJAKOW.

Tudor Brown had evidently heard of the change in the route of the "Alaska." He had reached Behring's Straits
before them. But by what means? It seemed almost supernatural, but still the fact remained that he had done so.

Erik was greatly depressed by this information, but he concealed his feelings from his friends. He hurried on the
work of transporting the coal, and set out again without losing a moment.

Serdze-Kamen is a long Asiatic-promontory situated nearly a hundred miles to the west of Behring's Straits, and
whaling-vessels from the Pacific visit it every year.

The "Alaska" reached there after a voyage of twenty-four hours, and soon in the bay of Koljutschin behind a
wall of ice, they discovered the masts of the "Vega," which had been frozen in for nine months.

The barrier which held Nordenskiold captive was not more than ten kilometers in size. After passing around it,
the "Alaska" came to anchor in a little creek, where she would be sheltered from the northerly winds. Then Erik with
his three friends made their way overland to the establishment which the "Vega" had made upon the Siberian coast
to pass this long winter, and which a column of smoke pointed out to them.

This coast of the Bay of Koljutschin consists of a low and slightly undulating plain. There are no trees, only
some dwarf willows, marine grasses and lichens. Summer had already brought forth some plants, which Mr.
Malarius recognized as a species which was very common in Norway.

The encampment of the "Vega" consisted of a large store-house for their eatables, which had been made by the
orders of Nordenskiold, in case the pressure of the ice should destroy his ship, which so frequently happens on these
dangerous coasts. It was a touching fact that the poor population, although always half starved, and to whom this
depot represented incalculable wealth in the shape of food, had respected it, although it was but poorly guarded. The
huts of skin of these Tschoutskes were grouped here and there around the station. The most imposing structure was
the "Tintinjaranga," or ice-house, which they had especially arranged to use for a magnetic observatory, and where
all the necessary apparatus had been placed. It had been built of blocks of ice delicately tinted and cemented together
with snow; the roof of planks was covered with cloth.

The voyagers of the "Alaska" were cordially welcomed by the young astronomer, whom they found at the time
of their arrival holding a consultation with the man in charge of the store-house. He offered with hearty goodwill to
take them on board the "Vega" by the path which had been cut in the ice in order to keep open the means of
communication between the vessel and the land, and a rope attached to stones served as a guide on dark nights. As
they walked, he related to them their adventures since they had been unable to send home any dispatches.

After leaving the mouth of the Lena, Nordenskiold had directed his course toward the islands of New Siberia,
which he wished to explore, but finding it almost impossible to approach them, on account of the ice which
surrounded them, and the shallowness of the water in that vicinity, he abandoned the idea, and resumed his course
toward the east. The "Vega" encountered no great difficulties until the 10th of September, but about that time a
continuance of fogs, and freezing nights, compelled her to slacken her speed, besides the darkness necessitated
frequented stoppages. It was therefore the 27th of September before she reached Cape Serdze-Kamen. They cast her
anchor on a bank of ice, hoping to be able the next day to make the few miles which separated her from Behring's Straits and the free waters of the Pacific. But a north wind set in during the night, and heaped around the vessel great masses of ice. The "Vega" found herself a prisoner for the winter at the time when she had almost accomplished her work.

"It was a great disappointment to us, as you can imagine!" said the young astronomer, "but we soon rallied our forces, and determined to profit by the delay as much as possible, by making scientific investigations. We made the acquaintance of the 'Tschoutskes' of the neighborhood, whom no traveler has hitherto known well, and we have made a vocabulary of their language, and also gathered together a collection of their arms and utensils. The naturalists of the 'Vega' have also been diligent, and added many new arctic plants to their collection. Lastly, the end of the expedition has been accomplished, since we have doubled Cape Tchelynskin, and traversed the distance between it and the mouth of the Yenisei and of the Lena. Henceforth the north-east passage must become a recognized fact. It would have been more agreeable to us, if we could have effected it in two months, as we so nearly succeeded in doing. But provided we are not blocked in much longer, as the present indications lead us to hope, we will not have much to complain of, and we shall be able to return with the satisfaction of knowing that we have accomplished a useful work."

While listening to their guide with deep interest, the travelers were pursuing their way. They were now near enough to the "Vega" to see that her deck was covered over with a large canvas, and that her sides were protected by lofty masses of snow, and that her smoke-stacks had been carefully preserved from contact with the ice.

The immediate approach to the vessel was still more strange; she was not, as one would have expected, completely incrusted in a bed of ice, but she was suspended, as it were, in a labyrinth of lakes, islands, and canals, between which they had been obliged to throw bridges formed of planks.

"The explanation is very simple," said the young astronomer, in reply to a question from Erik. "All vessels that pass some months surrounded by ice form around them a bed of refuse, consisting principally of coal ashes. This is heavier than snow, and when a thaw begins, the bed around the vessel assumes the aspect which you behold."

The crew of the "Vega," in arctic clothing, with two or three officers, had already seen the visitors whom the astronomer was bringing with him. Their joy was great when they saluted them in Swedish, and when they beheld among them the well-known and popular physiognomy of Dr. Schwaryencrona.

Neither Nordenskiold nor Captain Palender were on board. They had gone upon a geological excursion into the interior of the country, and expected to be absent five or six days. This was a disappointment to the travelers, who had naturally hoped when they found the "Vega" to present their congratulations to the great explorer.

But this was not their only disappointment.[1]

[Footnote 1: They returned sooner, for on the 18th of July the ice broke up, and after 264 days of captivity the "Vega" resumed her voyage. On the 20th of July she issued from Behring's Straits and set out for Yokohama.]

They had hardly entered the officer's room, when Erik and his friends were informed that three days before the "Vega" had been visited by an American yacht, or rather by its owner, Mr. Tudor Brown. This gentleman had brought them news of the world beyond their settlement, which was very acceptable, they being confined to the limited neighborhood of the Bay of Koljutschin. He told them what had happened in Europe since their departure—the anxiety that Sweden and indeed all civilized nations felt about their fate, and that the "Alaska" had been sent to search for them. Mr. Tudor Brown came from Vancouver's Island, in the Pacific, and his yacht had been waiting there for him for three months.

"But," exclaimed a young doctor, attached to the expedition, "he told us that he had at first embarked with you, and only left you at Brest, because he doubted whether you would be able to bring the enterprise to a successful termination!"

"He had excellent reasons for doubting it," replied Erik, coolly, but not without a secret tremor.

"His yacht was at Valparaiso and he telegraphed for her to wait for him at Victoria, on the coast of Vancouver," continued the doctor; "then he took the steamer from Liverpool to New York, and the railroad to the Pacific. This explains how he was able to reach here before you."

"Did he tell you why he came?" asked Mr. Bredejord.

"He came to help us, if we stood in need of assistance, and also to inquire about a strange enough personage, whom I had incidentally mentioned in my correspondence, and in whom Mr. Tudor Brown seemed to take a great interest."

The four visitors exchanged glances.

"Patrick O'Donoughan—was not that the name?" asked Erik.

"Precisely—or at least it is the name which is tattooed on his body, although he pretends it is not his own, but that of a friend. He calls himself Johnny Bowles."

"May I ask if this man is still here?"
"He left us ten months ago. We had at first believed that he might prove useful to us by acting as interpreter between us and the natives of this coast, on account of his apparent knowledge of their language; but we soon discovered that his acquaintance with it was very superficial—confined, in fact, to a few words. Besides, until we came here, we were unable to hold any communications with the natives. This Johnny Bowles, or Patrick O’Donoghan, was lazy, drunken, and undisciplined. His presence on board would only have occasioned trouble for us. We therefore acceded without regret to his request to be landed on the large Island of Ljakow, as we were following the southern coast."

"What! did he go there? But this island is uninhabited!" cried Erik.

"Entirely; but what attracted the man appeared to be the fact that its shores are literally covered by bones, and consequently by fossil ivory. He had conceived the plan of establishing himself there, and of collecting, during the summer months, all the ivory that he could find; then when, in winter, the arm of the sea which connects Ljakow with the continent should be frozen over, to transport in a sleigh this treasure to the Siberian coast, in order to sell it to the Russian traders, who come every year in search of the products of the country."

"Did you tell these facts to Mr. Tudor Brown?" asked Erik.

"Assuredly, he came far enough to seek for them," replied the young doctor, unaware of the deep personal interest that the commander of the "Alaska" took in the answers to the questions which he addressed to him.

The conversation then became more general. They spoke of the comparative facility with which Nordenskiold had carried out his programme. He had not met with any serious difficulties, and consequently the discovery of the new route would be an advantage to the commerce of the world. "Not," said the officer of the "Vega," "that this path was ever destined to be much frequented, but the voyage of the 'Vega' would prove to the maritime nations of the Atlantic and Pacific that it was possible to hold direct communication with Siberia by water. And nowhere would these nations, notwithstanding the vulgar opinions, find a field as vast and rich."

"Is it not strange," observed Mr. Bredejord, "that they have failed completely during the last three centuries in this attempt that you have now accomplished without difficulty?"

"The singularity is only apparent," answered one of the officers. "We have profited by the experience of our predecessors, an experience often only acquired at the cost of their lives. Professor Nordenskiold has been preparing himself for this supreme effort during the last twenty years, in which he has made eight arctic expeditions. He has patiently studied the problem in all its aspects, and finally succeeded in solving it. Then we have had what our predecessors lacked, a steam vessel especially equipped for this voyage. This has enabled us to accomplish in two months a voyage that it would have taken a sailing vessel two years to do. We have also constantly been able not only to choose, but also to seek out, the most accessible route. We have fled from floating ice and been able to profit by the winds and tides. And still we have been overtaken by winter. How much more difficult it would have been for a mariner who was compelled to wait for favorable winds, and see the summer passing in the meantime."

In such conversation they passed the afternoon, and after accepting their invitation and dining on board the "Vega," they carried back with them to supper on board the "Alaska" all the officers who could be spared from duty. They mutually gave each other all the information and news in their power. Erik took care to inform himself exactly what his predecessors lacked, a steam vessel especially equipped for this voyage. This has enabled us to accomplish in two months a voyage that it would have taken a sailing vessel two years to do. We have also constantly been able not only to choose, but also to seek out, the most accessible route. We have fled from floating ice and been able to profit by the winds and tides. And still we have been overtaken by winter. How much more difficult it would have been for a mariner who was compelled to wait for favorable winds, and see the summer passing in the meantime."

The next day at dawn Erik had the 'Alaska' steering for the island of Ljakow. As for the "Vega" she had to wait until the breaking up of the ice would permit her to reach the Pacific.

The first part of Erik's task was now accomplished. He had found Nordenskiold. The second still remained to be fulfilled: to find Patrick O'Donoghan, and see if he could persuade him to disclose his secret. That this secret was an important one they were now all willing to admit, or Tudor Brown would never have committed such a dastardly crime to prevent them from becoming acquainted with it.

Would they be able to reach the Island of Ljakow before him?

It was hardly probable, for he was three days in advance of them: never mind—he would make the attempt.

The "Albatross" might lose her way, or meet with some unforeseen obstacles. As long as there was even a probability of success Erik determined to take the chances.

The weather was now mild and agreeable. Light fogs indicated an open sea, and a speedy breaking of the ice along the Siberian coast where the "Vega" had been held prisoner so long. Summer was advancing, and the "Alaska" could reasonably count upon at least ten weeks of favorable weather. The experience which they had acquired amongst the American ice had its value and would render this new enterprise comparatively easy. Lastly the northeast passage was the most direct way to return to Sweden, and besides the deep personal interest which induced Erik to take it, he had a truly scientific desire to accomplish in a reverse route the task which Nordenskiold had fulfilled. If he had succeeded, why should he not be able to do so?—this would be proving practically the experiment of the great navigator.
The wind favored the "Alaska." For ten days it blew almost constantly from the south-east, and enabled them to make from nine to ten knots at least without burning any coal. This was a precious advantage, and besides the wind drove the floating ice toward the north and rendered navigation much less difficult. During these ten days they met with very little floating ice.

On the eleventh day, it is true they had a tempestuous snow storm followed by dense fogs which sensibly retarded the progress of the "Alaska." But on the 29th of July the sun appeared in all its brilliancy, and on the morning of the 2d of August they came in sight of the Island of Ljakow.

Erik gave orders immediately to sail around it in order to see if the "Albatross" was not hidden in some of its creeks. Having done this they cast anchor in a sandy bottom about three miles from the southern shore. Then he embarked in his boat accompanied by his three friends and six of his sailors. Half an hour later they had reached the island.

Erik had not chosen the southern coast of the island to anchor his vessel without a reason. He had said to himself that Patrick O'Donoghan might have told the truth when he had stated that his object was to collect ivory; but if it was his intention to leave the island at the first opportunity which afforded, he would be sure to establish himself upon a spot where he would have a good view of the sea. He would undoubtedly choose some elevated place, and one as near as possible to the Siberian coast. Besides the necessity of sheltering himself against the polar winds would lead him to establish himself upon the southern coast of the island.

Erik did not pretend that his conclusions were necessarily incontrovertible, but he thought that, in any case, they would suffer no inconvenience from adopting them as the basis of a systematic exploration of the place. The results fully justified his expectations. The travelers had not walked along the shore for an hour, when they perceived on a height, perfectly sheltered by a chain of hills, facing the south, an object which could only be a human habitation. To their extreme surprise this little cottage, which was of a cubical form, was perfectly white, as if it had been covered with plaster. It only lacked green shutters to perfectly resemble a country home near Marseilles, or an American cottage.

After they had climbed the height and approached near to it, they discovered a solution of the mystery. The cottage was not plastered, it was simply built of enormous bones skillfully arranged, which gave it its white color. Strange as the materials were, they were forced to admit that the idea of utilizing them was a natural one; besides there was nothing else available on the island where vegetation was most meagre; but the whole place, even the neighboring hills were covered with bones, which Dr. Schwaryencrona recognized as the remains of wild beasts.

CHAPTER XVII.
AT LAST.

The door of the cottage was open. The visitors entered, and saw at a glance that the single room of which it consisted was empty, although it had been recently occupied. Upon the hearth, which was built of three large stones, lay some extinguished embers upon which the light ashes still lingered, although the lightest breeze would have been sufficient to carry them away. The bed, consisting of a wooden frame, from which was suspended a sailor's hammock, still bore the impress of a human figure.

This hammock, that Erik examined immediately, bore the stamp of the "Vega." On a sort of table formed from the shoulder-blade of some animal and supported by four thigh bones, lay some crumbs of ship's biscuit, a pewter goblet, and a wooden spoon of Swedish workmanship.

They could not doubt that they were in the dwelling-place of Patrick O'Donoghan, and according to all appearances he had only left it a short time ago. Had he quitted the island, or had he only gone to take a walk? The only thing they could do was to make a thorough exploration of the island.

Around the habitation excavations bore witness to the fact that a great amount of hard work had been done; on a sort of plateau that formed the summit of the hill, a great quantity of ivory had been piled up, and indicated the nature of the work. The voyagers perceived that all the skeletons of elephants and other animals had been despoiled of their ivory, and they arrived at the conclusion that the natives of the Siberian coast had been aware, long before the visit of Patrick O'Donoghan, of the treasure which was to be found upon the island, and had come and carried off large quantities of it. The Irishman, therefore, had not found the quantity of ivory upon the surface of the ground which he had expected, and had been compelled to make excavations and exhume it. The quality of this ivory, which had been buried probably for a long time, appeared to the travelers to be of a very inferior quality.

Now the young doctor of the "Vega" had told them, as had the proprietor of the Red Anchor, in Brooklyn, that laziness was one of the distinguishing characteristics of Patrick O'Donoghan. It therefore seemed to them very improbable that he would be resigned to follow such a laborious and unremunerative life. They therefore felt sure that he would embrace the first opportunity to leave the Island of Ljakow. The only hope that still remained of
finding him there was that which the examination of his cabin had furnished them.

A path descended to the shore, opposite to that by which our explorers had climbed up. They followed it, and
soon reached the bottom, where the melting snows had formed a sort of little lake, separated from the sea by a wall
of rocks. The path followed the shores of this quiet water, and going around the cliff they found a natural harbor.

They saw a sleigh abandoned on the land, and also traces of a recent fire; Erik examined the shore carefully, but
could find no traces of any recent embarkation. He was returning to his companions, when he perceived at the foot
of a shrub a red object, which he picked up immediately. It was one of those tin boxes painted outside with carmine
which had contained that preserved beef commonly called "endaubage," and which all vessels carry among their
provisions. It was not so great a prize, since the captain of the "Vega" had supplied Patrick O'Donoghah with food.
But what struck Erik as significant, was the fact that there was printed on the empty box the name of Martinez
Domingo, Valparaiso.

"Tudor Brown has been here," he cried. "They told us on board the 'Vega' that his vessel was at Valparaiso when
he telegraphed them to wait for him at Vancouver. Besides, this box from Chili could not have been brought here by
the 'Vega,' for it is evidently quite fresh. It can not be three days, perhaps not twenty-four hours since it has been
opened!"

Dr. Schwaryencrona and Mr. Bredejord shook their heads, as if they hesitated to accept Erik's conclusions, when
turning the box in his hands, he descried written in pencil the word "Albatross," which had doubtless been done by
the person who had furnished the vessel with the beef. He pointed it out to his friends.

"Tudor Brown has been here," he repeated, "and why should he come except to carry off Patrick O'Donoghah.
Let us go, it is evident they embarked at this creek. His men, while they were waiting for him, have taken breakfast
around this fire. He has carried off the Irishman, either willingly or unwillingly. I am as certain of it as if I saw them
embark."

Notwithstanding this firm belief, Erik carefully explored the neighborhood, to assure himself that Patrick
O'Donoghah was no longer there. An hour's walk convinced him that the island was uninhabited. There was no trace
of a path, nor the least vestige of a human being. On all sides valleys extended as far as his sight could reach,
without even a bird to animate its solitude; and above all, the gigantic bones which they beheld lying around in
every direction, gave them a feeling of disgust; it seemed as if an army of animals had taken refuge in this solitary
island only to die there.

"Let us go!" said Dr. Schwaryencrona. "There is no use in making a more complete search of the island; we have
seen sufficient to assure us that Patrick O'Donoghah would not require much urging to induce him to leave this
place!"

Four hours later they were again on board of the "Alaska," and continuing their journey.

Erik did not hide the fact that his hopes had received a severe check. Tudor Brown had been ahead of him, he
had succeeded in reaching the island first, and doubtless had carried off Patrick O'Donoghah. It was therefore hardly
probable that they would succeed in finding him again. A man capable of displaying such ability in his fiendish
attack upon the "Alaska," and who could adopt such energetic measures to carry off the Irishman from such a place,
would assuredly exert himself to the utmost to prevent them from ever coming in contact with him. The world is
large, and its waters were open to the "Albatross." Who could tell to what point of the compass Patrick O'Donoghah
and his secret would be carried?

This is what the captain of the "Alaska" said to himself, as he walked the deck of his vessel, after giving orders
to steer to the westward. And to these doleful thoughts was added a feeling of remorse that he had permitted his
friends to share the dangers and fatigue of his useless expedition. It was doubly useless, since Tudor Brown had
found Nordenskiold before the "Alaska," and also preceded them to the Island of Ljakow. They must then return to
Stockholm, if they ever succeeded in reaching it, without having accomplished one of the objects of the expedition.
It was indeed a great disappointment. But at least their returning in a contrary direction to the "Vega" would prove
the feasibility of the northeast passage. At any risk he must reach Cape Tchelynskin, and double it from east to west.
At any risk he must return to Sweden by way of the Sea of Kara. It was this redoubtable Cape Tchelynskin, formerly
considered impassable, that the "Alaska" crowded on steam to reach. They did not follow the exact route of the
"Vega," for Erik had no occasion to descend the Siberian coast.

Leaving to starboard the islands of Stolbovvi and Semenofski, which they sighted on the 4th of August, they
sailed due west, following closely the 76th degree of latitude, and made such good speed that in eight days they had
made 35 degrees of longitude, from the 140th to the 105th degree east of Greenwich. It is true that they had to burn
a great deal of coal to accomplish this, for the "Alaska" had had contrary winds almost all the time. But Erik thought
rightly that everything was subordinate to the necessity of making their way out of these dangerous passes as
speedily as possible. If they could once reach the mouth of the Yenisei, they could always procure the necessary
fuel.
On the 14th of August, at midday they were unable to make a solar observation on account of a thick fog, which covered the whole sky. But they knew that they were approaching a great Asiatic promontory, therefore Erik advanced with extreme caution, while at the same time he had the speed of the vessel slackened.

Toward night he gave orders to have the vessel stopped. These precautions were not useless. The following morning at daylight they made soundings and found that they were in only thirty fathoms of water, and an hour afterward they came in sight of land; and the "Alaska" soon reached a bay in which she could cast anchor. They resolved to wait until the fog dispersed before going on land, but as the 15th and 16th of August passed without bringing about this desired result, Erik determined to start accompanied by Mr. Bredejord, Mr. Malarius, and the doctor. A short examination showed them that the "Alaska" was at the extreme north of the two points of Cape Tchelynskin; on two sides the land lay low toward the sea, but it rose gradually toward the south, and they perceived that it was about two or three hundred feet in height. No snow or ice was to be seen in any direction, except along the borders of the sea where there was a little band, such as is commonly seen in all arctic regions. The clayey soil was covered with abundant vegetation, consisting of mossy grasses and lichens. The coast was enlivened by great numbers of wild geese and walruses. A white bear displayed himself on top of a rock. If it had not been for the fog which cast a gray mantle over everything, the general aspect of this famous Cape Tchelynskin was not particularly disagreeable; certainly there was nothing to justify the name of Cape Sever, which it had borne for three centuries.

As they advanced to the extreme point at the west of the bay, the travelers perceived a sort of monument that crowned a height, and naturally pressed forward to visit it. They saw, as they approached, that it was a sort of "cairn," or mass of stones supporting a wooden column made out of a post. This column bore two inscriptions; the first read as follows:

"On the 19th of August, 1878, the 'Vega' left the Atlantic to double Cape Tchelynskin, _en route_ for Behring's Straits."

The second read:

"On the 12th of August, 1879, the 'Albatross,' coming from Behring's Straits, doubled Cape Tchelynskin, _en route_ for the Atlantic."

Once again Tudor Brown had preceded the "Alaska." It was now the 16th of August.

He had written this inscription only four days previously.

In Erik's eyes it appeared cruel and ironical; it seemed to him to say: "I will defeat you at every turn. All your efforts will be useless. Nordenskiold has solved the problem. Tudor Brown, the counter proof."

As for himself he would return humiliated and ashamed, without having demonstrated, found or proved anything. He was going without adding a single word to the inscriptions on the column. But Dr. Schwaryencrona would not listen to him, and taking out his knife from his pocket he wrote on the bottom of the post these words:

"On the 16th of August, 1879, the 'Alaska' left Stockholm, and came here across the Atlantic and the Siberian Sea, and has doubled Cape Tchelynskin, _en route_ to accomplish the first circumpolar periplus."

There is a strange power in words. This simple phrase recalled to Erik what a geographical feat he was in hopes of accomplishing, and without his being conscious of it, restored him to good humor. It was true, after all, that the "Alaska" would be the first vessel to accomplish this voyage. Other navigators before him had sailed through the arctic-American seas, and accomplished the northwest passage. Nordenskiold and Tudor Brown had doubled Cape Tchelynskin; but no person had as yet gone from one to the other, completely around the pole, completing the three hundred and sixty degrees.

This prospect restored every one's ardor, and they were eager to depart. Erik thought it best, however, to wait until the next day and see if the fog would lift; but fogs appeared to be the chronic malady of Cape Tchelynskin, and when next morning the sun rose without dissipating it, he gave orders to hoist the anchor.

Leaving to the south the Gulf of Taymis—which is also the name of the great Siberian peninsula of which Cape Tchelynskin forms the extreme point—the "Alaska," directing her course westward, sailed uninterruptedly during the day and night of the 17th of August.

On the eighteenth, at day-break, the fog disappeared at last and the atmosphere was pure and enlivened by the sunshine. By midday they had rounded the point, and immediately descried a distant sail to the south-west.

The presence of a sailing-vessel in these unfrequented seas was too extraordinary a phenomenon not to attract special attention. Erik, with his glass in his hand, ascended to the lookout and examined the vessel carefully for a long time. It appeared to lie low in the water, was rigged like a schooner and had a smoke-stack, although he could not perceive any smoke. When he descended from the bridge the young captain said to the doctor:

"It looks exactly like the 'Albatross!'" Then he gave orders to put on all steam possible. In less than a quarter of an hour he saw that they were gaining on the vessel, whose appointments they were now able to discern with the naked eye. They could see that the breeze had slackened, and that her course was at right angles with that of the "Alaska."
But suddenly a change took place in the distant vessel; Clouds of smoke issued from her smoke-stack, and formed behind her a long black cloud. She was now going by steam and in the same direction as the "Alaska."

"There is now no doubt of it. It is the 'Albatross,'" said Erik.

He gave orders to the engineer to increase the speed of the "Alaska," if possible. They were then making fourteen knots, and in a quarter of an hour they were making sixteen knots. The vessel that they were pursuing had not been able to attain a like rate of speed, for the "Alaska" continued to gain upon her. In thirty minutes they were near enough to her to distinguish all her men who were maneuvering her. At last they could see the moldings and letters forming her name, "Albatross."

Erik gave orders to hoist the Swedish flag. The "Albatross" immediately hoisted the stars and stripes of the United States of America.

In a few minutes the two vessels were only separated by a few hundred yards. Then the captain of the "Alaska" took his speaking-trumpet and hailed the vessel in English:

"Ship ahoy! I wish to speak with your captain!"

In a few moments some one made his appearance on the bridge of the "Albatross." It was Tudor Brown.

"I am the proprietor and captain of this yacht," he said. "What do you want?"

"I wish to know whether Patrick O'Donoghan is on board!"

"Patrick O'Donoghan is on board and can speak for himself," answered Tudor Brown.

He made a sign, and a man joined him on the bridge.

"This is Patrick O'Donoghan," said Tudor Brown. "What do you want with him?"

Erik was desirous of this interview so long, he had come so far in search of this man, that when he found himself unexpectedly in his presence and recognized him by his red hair and broken nose, he was at first taken aback and scarcely knew what to say to him. But gathering his ideas together, he at last made an attempt.

"I have been wishing to talk to you confidentially for several years," he said. "I have been seeking for you, and it was to find you that I came into these seas. Will you come on board of my vessel?"

"I do not know you, and I am very well satisfied to stay where I am," answered the man.

"But I know you. I have heard through Mr. Bowles that you were on board when the 'Cynthia' was wrecked, and that you had spoken to him about the infant who was tied to a buoy. I am that infant, and it is about this matter that I wish you to give me all the information in your power."

"You must question somebody else, for I am not in the humor to give any."

"Do you wish me to suppose that the information is not to your credit?"

"You can think what you like; it is a matter of perfect indifference to me," said the man.

Erik resolved to betray no irritation.

"It would be better for you to tell me what I wish to know of your own free will than to be compelled to do so before a court of justice," he said, coolly.

"A court of justice! They will have to catch me first," answered the other, mockingly.

Here Tudor Brown interposed.

"You see it is not my fault if you have not obtained the information that you desired," said he to Erik. "The best thing is now for us both to resume our course and go where we desire."

"Why should we each go our way?" answered the young captain. "Would it not be better for us to keep together until we reach some civilized country where we can settle these matters."

"I have no business with you, and do not want any one's company," answered Tudor Brown, moving as if he was about to leave the bridge.

Erik stopped him by a sign.

"Proprieter of the 'Albatross,'" he said, "I bear a regular commission from my government, and am besides an officer of the maritime police. I therefore ask you to show me your papers immediately!"

Tudor Brown did not make the slightest answer, but descended the bridge with the man whom he had called. Erik waited a couple of minutes, and then he spoke again:

"Commander of the 'Albatross,' I accuse you of having attempted to shipwreck my vessel on the rocks of Sein, and I now summon you to come and answer this accusation before a marine tribunal. If you refuse to answer this summons it will be my duty to compel you to do so!"

"Try it if you like," cried Tudor Brown, and gave orders to resume his journey.

During this colloquy his vessel had insensibly tacked, and now stood at right angles with the "Alaska." Suddenly the wheel commenced to revolve and beat the water which boiled and foamed around it. A prolonged whistle was heard, and the "Albatross" carrying all the steam she could raise sped over the waters in the direction of the North Pole.

Two minutes later, the "Alaska" was rushing after her.
CHAPTER XVIII.
CANNON-BALLS.

At the same time that he gave orders to pursue the "Albatross," Erik also desired his men to get the cannon in readiness. The operation took some time, and when they had everything in order the enemy was beyond their reach. Doubtless they had taken advantage of the time occupied by their stoppage to increase their fires, and they were two or three miles ahead. This was not too great a distance for a Gatling gun to carry, but the rolling and speed of the two vessels made it probable that they would miss her; and they thought it better to wait, hoping that the "Alaska" would gain upon the enemy. It soon became evident, however, that the two vessels were equally matched, for the distance between them remained about the same for several hours.

They were obliged to burn an enormous amount of coal—an article which was becoming very scarce on board the "Alaska"—and this would be a heavy loss if they could not succeed in overtaking the "Albatross" before night set in. Erik did not think it right to do this without consulting his crew. He therefore mounted the bridge, and frankly explained to them the position in which he was placed.

"My friends," he said, "you know that I am anxious to seize and deliver up to justice this rascal who attempted to shipwreck our vessel on the rocks of Sein. But we have hardly coal enough left to last us for six days. Any deviation from our route will compel us to finish our voyage under sail, which may make it very long and toilsome for all of us, and may even cause us to fail in our undertaking. On the other hand, the 'Albatross' counts upon being able to get away from us during the night. To prevent this we must not slacken our speed for a moment, and we must keep her within the range of our electric light. I feel sure, however, that we will eventually overtake her, but it may take us some time to do so. I did not feel willing to continue this pursuit without laying the facts plainly before you, and asking you if you were willing to risk the dangers which may arise for us."

The men consulted together in a low tone, and then commissioned Mr. Hersebom to speak for them:

"We are of opinion that it is the duty of the 'Alaska' to capture this rascal at any sacrifice!" he said, quietly.

"Very well, then, we will do our best to accomplish it," answered Erik.

When he found that he had the confidence of his crew, he did not spare fuel, and in spite of the desperate efforts of Tudor Brown, he could not increase the distance between them. The sun had scarcely set when the electric light of the "Alaska" was brought to bear unpityingly upon the "Albatross," and continued in this position during the night. At day-break the distance between them was still the same, and they were flying toward the pole. At midday they made a solar observation, and found that they were in 78, 21', 14" of latitude north, by 90 of longitude east.

Floating ice, which they had not encountered for ten or fifteen days, now became very frequent. It was necessary to ward it off, as they had been compelled to do in Baffin's Bay. Erik, feeling sure that they would soon reach fields of ice, was careful to steer obliquely to the right of the "Albatross" so as to bar the way toward the east if she should attempt to change her course, finding her path toward the north obstructed. His foresight was soon rewarded, for in two hours a lofty barrier of ice casts its profile on the horizon. The American yacht immediately steered toward the west, leaving the ice two or three miles on its starboard. The "Alaska" immediately imitated this maneuver, but so obliquely to the left of the "Albatross" as to cut her off if she attempted to sail to the south.

The chase became very exciting. Feeling sure of the course which the "Albatross" would be compelled to take, the "Alaska" tried to push her more toward the ice. The yacht's course becomes more and more wavering, every moment they made some change, at one time steering north at another west. Erik, mounted aloft, watched every movement she made, and thwarted her attempts to escape by appropriate maneuvers. Suddenly she stopped short, swung round and faced the "Alaska." A long white line which was apparent extending westward told the reason of this change. The "Albatross" found herself so close to the ice-banks that she had no recourse but to turn and face them.

The young captain of the "Alaska" had scarcely time to descend, before some missile whistled past his head. The "Albatross" was armed, and relied upon being able to defend herself.

"I prefer that it should be so, and that he should fire the first shot," said Erik, as he gave orders to return it.

His first attack was not more successful than that of Tudor Brown—for it fell short two or three hundred yards. But the combat was now begun, and the firing became regular. An American projectile cut the large sail yards of the "Alaska," and it fell upon the deck killing two men. A small bomb from the Swedish vessel fell upon the bridge of the "Albatross," and must have made great havoc. Then other projectiles skillfully thrown lodged in various parts of the vessel.

They had been constantly approaching each other, when suddenly a distant rumbling mingled with the roar of artillery, and the crews raising their heads saw that the sky was very black in the east.

Was a storm with its accompanying fog and blinding snow, coming to interpose between the "Albatross" and the
"Alaska," to permit Tudor Brown to escape?

This Erik wished to prevent at any price. He resolved to attempt to board her. Arming his men with sabers, cutlasses, and hatchets, he crowded on all the steam the vessel could carry and rushed toward the "Albatross."

Tudor Brown tried to prevent this. He retreated toward the banks of ice, firing a shot from his cannon every five minutes. But his field of action had now become too limited; between the ice and the "Alaska" he saw that he was lost unless he made a bold attempt to regain the open sea. He attempted this after a few feigned maneuvers to deceive his adversary.

Erik let him do it. Then at the precise moment when the "Albatross" tried to pass the "Alaska," she made a gaping hole in the side of the yacht which stopped her instantly, and rendered her almost unmanageable; then she fell quickly behind and prepared to renew the assault. But the weather, which had become more and more menacing, did not give him time to do this.

The tempest was upon them. A fierce wind from the south-east, accompanied by blinding clouds of snow, which not only raised the waves to a prodigious height, but dashed against the two vessels immense masses of floating ice. It seemed as if they were attacked at all points at once. Erik realized his situation, and saw that he had not a minute to lose in escaping, unless he wished to be hemmed in perhaps permanently. He steered due east, struggling against the wind, the snow, and the dashing ice.

But he was soon obliged to confess that his efforts were fruitless. The tempest raged with such violence that neither the engine of the "Alaska" nor her steel buttress were of much use. Not only did the vessel advance very slowly, but at times she seemed to be fairly driven backward. The snow was so thick that it obscured the sky, blinded the crew, and covered the bridge a foot in depth. The ice driven against the "Alaska" by the fierce wind increased and barred their progress, so that at length they were glad to retreat toward the banks, in the hope of finding some little haven where they could remain until the storm passed over.

The American yacht had disappeared, and after the blow it had received from the "Alaska" they almost doubted if it would be able to resist the tornado.

Their own situation was so perilous that they could only think of their own safety, for every moment it grew worse.

There is nothing more frightful than those arctic tempests, in which all the primitive forces of nature seem to be awakened in order to give the navigator a specimen of the cataclysms of the glacial period. The darkness was profound although it was only five o'clock in the afternoon. The engine had stopped, and they were unable to light their electric light. To the raging of the storm was added the roars of thunder and the tumult made by the floating blocks of ice dashing against each other. The ice-banks were continually breaking with a noise like the roar of a cannon.

The "Alaska" was soon surrounded by ice. The little harbor in which she had taken refuge was soon completely filled with it, and it commenced to press upon and dash against her sides until she began to crack, and they feared every moment that she would go to pieces.

Erik resolved not to succumb to the storm without a combat with it, and he set the crew to work arranging heavy beams around the vessel so as to weaken the pressure as much as possible, and distribute it over a wider surface. But, although this protected the vessel, it led to an unforeseen result which threatened to be fatal.

The vessel, instead of being suddenly crushed, was lifted out of the water by every movement of the ice, and then fell back again on it with the force of a trip-hammer. At any moment after one of these frightful falls they might be broken up, crushed, buried. To ward off this danger there was only one resource, and this was to re-enforce their barrier by heaping up the drift ice and snow around the vessel to protect her as well as they could.

Everybody set to work with ardor. It was a touching spectacle to see this little handful of men taxing their pygmy muscles to resist the forces of nature--trying with anchors, chains, and planks to fill up the fissures made in the ice and to cover them with snow, so that there might be a uniformity of motion among the mass. After four or five hours of almost superhuman exertions, and when their strength was exhausted, they were in no less danger, for the storm had increased.

Erik held a consultation with his officers, and it was decided that they should make a depot on the ice-field for their food and ammunition in case the "Alaska" should be unable to resist the powerful shocks to which she was being subjected. At the first moment of danger every man had received provisions enough for eight days, with precise instructions in case of disaster, besides being ordered to keep his gun in his belt even while he was working. The operation of transporting twenty tons of provisions was not easy of accomplishment, but at last it was done and the food was placed about two hundred yards from the ship under a covering of tarred canvas, which was soon covered by the snow with a thick white mantle.

This precaution, having been taken, everybody felt more comfortable as to the result of a shipwreck, and the crew assembled to recruit their strength with a supper supplemented with tea and rum.
Suddenly, in the midst of supper, a more violent shock than any that had as yet agitated the vessel, split the bed of ice and snow around the "Alaska." She was lifted up in the stern with a terrible noise, and then it appeared as if she were plunging head-foremost into an abyss. There was a panic, and every one rushed on deck. Some of the men thought that the moment had come to take refuge on the ice, and without waiting for the signal of the officers they commenced clambering over the bulwarks.

Four or five of these unfortunate ones managed to leap on a snow-bank. Two others were caught between the masses of floating ice and the beams of the starboard, as the "Alaska" righted herself.

Their cries of pain and the noise of their crushed bones were lost in the storm. There was a lull, and the vessel remained motionless. The lesson which the sailors had been taught was a tragical one. Erik made use of it to enforce on the crew the necessity of each man's retaining his presence of mind, and of waiting for positive orders on all occasions.

"You must understand," he said to his men, "that to leave the ship is a supreme measure, to which we must have recourse only at the last extremity. All our efforts ought to be directed toward saving the 'Alaska.' Deprived of her, our situation will be a very precarious one on the ice. It is only in case of our vessel becoming uninhabitable that we must desert it. In any case such a movement should be made in an orderly manner to avoid disasters. I therefore expect that you will return quietly to your supper, and leave to your superior officers the task of determining what is best to do!"

The firmness with which he spoke had the effect of reassuring the most timid, and they all descended again. Erik then called Mr. Hersebom and asked him to untie his good dog Kaas, and follow him without making any noise.

"We will go on the field of ice," he said, "and seek for the fugitives and make them return to their duty, which will be better for them than wandering about."

The poor devils were huddled together on the ice, ashamed of their escapade, and at the first summons were only too glad to take the path toward the "Alaska."

Erik and Mr. Hersebom having seen them safely on board, walked as far as their depot of provisions, thinking that another sailor might have taken refuge there. They went all around it but saw no one.

"I have been asking myself the last few moments," said Erik, "if it would not be better to prevent another panic by landing part of the crew?"

"It might be better perhaps," answered the fisherman. "But would not the men who remained on board feel jealous and become demoralized by this measure?"

"That is true," said Erik. "It would be wiser to occupy them up to the last moment in struggling against the tempest, and it is in fact the only chance we have of saving the ship. But since we are on the ice we may as well take advantage of it, and explore it a little. I confess all these crackings and detonations inspire me with some doubt as to its solidity!"

Erik and his adopted father had not gone more than three hundred feet from their depot of provisions before they were stopped short by a gigantic crevasse which lay open at their feet. To cross it would have required long poles, with which they had neglected to supply themselves. They were therefore compelled to walk beside it obliquely toward the west, in order to see how far it reached.

They found that this crevasse extended for a long distance, so long that after they had walked for half an hour they could not see the end of it. Feeling more secure about the extent of this field of ice upon which they had established their depot of provisions, they turned to retreat their steps.

After they had walked over about half of the distance a new vibration occurred, followed by detonations and tumultuous heavings of ice. They were not greatly disturbed by this, but increased their speed, being anxious to discover whether this shock had had done the "Alaska" any mischief.

The depot was soon reached, then the little haven that sheltered the vessel.

Erik and Mr. Hersebom rubbed their eyes, and asked each other whether they were dreaming, for the "Alaska" was no longer there.

Their first thought was that she had been swallowed up by the waters. It was only too natural that they should think this after such an evening as they had just passed.

But immediately they were struck by the fact that no _débris_ was visible, and that the little harbor had assumed a new aspect since their departure. The drift ice which the tempest had piled up around the "Alaska" had been broken up, and much of it had drifted away. At the same time Mr. Hersebom mentioned a fact which had not struck him while they were hurrying along, and this was that the wind had changed and was now blowing from the west.

Was it not possible that the storm had carried away the floating ice in which the "Alaska" had become embedded. Yes, evidently it was possible; but it remained for them to discover whether this supposition was true. Without delaying a moment, Erik proceeded to reconnoiter, followed by Mr. Hersebom.

They walked for a long time. Everywhere the drift was floating freely, the waves came and went, but the whole
aspect of things around them looked strange and different.

At length Erik stopped. Now he understood what had befallen them. He took Mr. Hersebom's hand and pressed it with both his own.

"Father," said he, in a grave voice, "you are one of those to whom I can only speak the truth. Well, the fact is that this ice-field has split; it has broken away from that which surrounded the 'Alaska,' and we are on an island of ice hundreds of yards long, and carried along by the waters, and at the mercy of the storm."

CHAPTER XIX.

GUNSHOTS.

About two o'clock in the morning Erik and Mr. Hersebom, exhausted with fatigue, laid down side by side between two casks, under the canvas that protected their provisions. Kaas, also, was close to them and kept them warm with his thick fur. They were not long in falling asleep. When they awoke the sun was already high in the heavens, the sky was blue and the sea calm. The immense bank of ice upon which they were floating appeared to be motionless, its movement was so gentle and regular. But along the two edges of it which were nearest to them enormous icebergs were being carried along with frightful rapidity. These gigantic crystals reflected like a prism the solar rays, and they were the most marvelous that Erik had ever beheld.

Mr. Hersebom also, although but little inclined in general, and especially in his present situation, to admire the splendor of Nature in the arctic regions, could not help being impressed with them.

"How beautiful this would look were we on a good ship!" he said, sighing.

"Bah!" answered Erik, with his usual good humor. "On board a ship one must be thinking only how to avoid the icebergs so as not to be crushed to pieces, whilst on this island of ice we have none of these miseries to worry us."

As this was evidently the view of an optimist, Mr. Hersebom answered with a sad smile. But Erik was determined to take a cheerful view of things.

"Is it not an extraordinary piece of good luck that we have this depot of provisions?" he said. "Our case would, indeed, be a desperate one if we were deprived of everything; but, with twenty casks of biscuits, preserved meats, and, above all, our guns and cartridges, what have we to fear? At the most, we will only have to remain some weeks without seeing any land that we can reach. You see, dear father, that we have happened upon this adventure in the same manner as the crew of the 'Hansa.'"

"Of the 'Hansa'?’ asked Mr. Hersebom, with curiosity.

"Yes, a vessel that set out in 1869 for the arctic seas. Part of her crew were left, as we are, on a floating field of ice, while they were occupied in transporting some provisions and coal. The brave men accommodated themselves as well as they could to this new life, and after floating for six months and a half over a distance of several thousand leagues, ended by landing in the arctic regions of North America."

"May we be as fortunate!" said Mr. Hersebom, with a sigh. "But it would be well I think for us to eat something."

"That is also my opinion!" said Erik. "A biscuit and a slice of beef would be very acceptable."

Mr. Hersebom opened two casks to take out what they required for their breakfast, and as soon as his arrangements were completed they did ample justice to the provisions.

"Was the raft of the crew of the 'Hansa' as large as ours?" asked the old fisherman, after ten minutes conscientiously devoted to repairing his strength.

"I think not--ours is considerably larger. The 'Hansa's' became gradually much smaller, so that the unfortunate shipwrecked men were at last compelled to abandon it, for the waves began to dash over them. Fortunately they had a large boat which enabled them, when their island was no longer habitable, to reach another. They did this several times before they at last reached the mainland." "Ah, I see!" said Mr. Hersebom, "they had a boat--but we have not. Unless we embark in an empty hogshead I do not see how we can ever leave this island of ice."

"We shall see about it when the time comes!" answered Erik. "At the present moment I think the best thing that we can do is to make a thorough exploration of our domain."

He arose, as did Mr. Hersebom, and they commenced climbing a hill of ice and snow--a hummock is the technical name--in order to obtain a general idea of their island.

They found it from one end to the other lying and floating insensibly upon the polar ocean. But it was very difficult to form a correct estimate either of its size or shape; for a great number of hummocks intercepted their view on all sides. They resolved, however, to walk to the extremity of it. As far as they could judge from the position of the sun, that end of the island which extended toward the west had been detached from the mass of which it had formerly been a part, and was now turning to the north. They therefore supposed that their ice raft was being carried
toward the south by the influence of the tide and breeze, and the fact that they no longer saw any trace of the long barriers of ice, which are very extensive in the 78, fully corroborated this hypothesis.

Their island was entirely covered with snow, and upon this snow they saw distinctly here and there at a distance some black spots, which Mr. Hersebom immediately recognized as "ongionks," that is to say, a species of walrus of great size. These walruses doubtless inhabited the caverns and crevasses in the ice, and believing themselves perfectly secure from any attack, were basking in the sunshine.

It took Erik and Mr. Hersebom more than an hour to walk to the extreme end of their island. They had followed closely the eastern side, because that permitted them to explore at the same time both their raft and the sea. Suddenly Kaas, who ran ahead of them, put to flight some of the walruses which they had seen in the distance. They ran toward the border of the field of ice in order to throw themselves into the water. Nothing would have been more easy than to have killed a number of them. But what would have been the use of their doing so, since they could not make a fire to roast their delicate flesh? Erik was occupied about other matters. He carefully examined the ice-field, and found that it was far from being homogeneous. Numerous crevasses and fissures, which seemed to extend in many cases for a long distance, made him fear that a slight shock might divide it into several fragments. It was true that these fragments might in all probability be of considerable size; but the possibility of such an accident made them realize the necessity of keeping as close as possible to their depot of provisions, unless they wished to be deprived of them. Erik resolved to examine carefully their whole domain, and to make his abode on the most massive portion; the one that seemed capable of offering the greatest resistance. He also determined to transport to this spot their depot of provisions.

It was with this resolve that Mr. Hersebom and Erik continued their exploration of the western coast, after resting a few minutes at the northerly point. They were now following that portion of the ice-field where they had attacked the American yacht.

Kaas ran on before them, seeming to enjoy the freshness of the air, and being in his true element on this carpet of snow, which doubtless reminded him of the plains of Greenland.

Suddenly Erik saw him sniff the air and then dart forward like an arrow, and stop barking beside some dark object, which was partially hidden by a mass of ice.

"Another walrus, I suppose!" he said, hurrying forward.

It was not a walrus which lay extended on the snow, and which had so excited Kaas. It was a man, insensible, and covered with blood, whose clothing of skins was assuredly not the dress worn by any seamen of the "Alaska." It reminded Erik of the clothing worn by the man who had passed the winter on the "Vega." He raised the head of the man; it was covered with thick red hair, and it was remarkable that his nose was crushed in like that of a negro.

Erik asked himself whether he was the sport of some illusion. He opened the man's waistcoat, and bared his chest. It was perhaps as much to ascertain whether his heart still beat as to seek for his name.

He found his name tattooed in blue, on a rudely designed escutcheon. "Patrick O'Donoghan, 'Cynthia,'" and his heart still beat. The man was not dead. He had a large wound in his head, another in his shoulder, and on his chest a contusion, which greatly interfered with his respiration.

"He must be carried to our place of shelter, and restored to life," said Erik, to Mr. Hersebom. And then he added in a low tone as if he was afraid of being overheard.

"It is he, father, whom we have been seeking for such a long time without being able to find him--Patrick O'Donoghan--and see he is almost unable to breathe."

The thought that the secret of his life was known to this bloody object upon which death already appeared to have set his seal, kindled a gloomy flame in Erik's eyes. His adopted father divined his thoughts, and could not help shrugging his shoulders--he seemed to say:

"Of what use would it be to discover it now. The knowledge of all the secrets in the world would be useless to us."

He, however, took the body by the limbs, while Erik lifted him under the arms, and loaded with this burden they resumed their walk.

The motion made the wounded man open his eyes. Soon the pain caused by his wounds was so great that he began to moan and utter confused cries, among which they distinguished the English word "drink!"

They were still some distance from their depot of provisions. Erik, however, stopped and propped the unfortunate man against a hummock, and then put his leathern bottle to his lips.

It was nearly empty, but the mouthful of strong liquor that Patrick O'Donoghan swallowed seemed to restore him to life. He looked around him, heaved a deep sigh and then said:

"Where is Mr. Jones?"

"We found you alone on the ice," answered Erik. "Had you been there long?"
"I do not know!" answered the wounded man, with difficulty. "Give me something more to drink." He swallowed a second mouthful and then he recovered sufficiently to be able to speak.

"When the tempest overtook us the yacht sank," he explained. "Some of the crew had time to throw themselves into the boats, the rest perished. At the first moment of peril Mr. Jones made a sign for me to go with him into a life-boat, which was suspended in the stern of the yacht and that every one else disdained on account of its small dimensions, but which proved to be safe, as it was impossible to sink it. It is the only one which reached the ice island--all the others were upset before they reached it. We were terribly wounded by the drift ice which the waves threw into our boat, but at length we were able to draw ourselves beyond their reach and wait for the dawn of day. This morning Mr. Jones left me to go and see if he could kill a walrus, or some sea-bird, in order that we might have something to eat. I have not seen him since!"

"Is Mr. Jones one of the officers of the 'Albatross'?" asked Erik.

"He is the owner and captain of her!" answered O'Donoghan, in a tone which seemed to express surprise at the question.

"Then Mr. Tudor Brown is not the captain of the 'Albatross'?"

"I don't know," said the wounded man, hesitatingly, seeming to ask himself whether he had been too confidential in speaking as freely as he had done.

Erik did not think it wise to insist on this point. He had too many other questions to ask.

"You see," he said to the Irishman, as he seated himself on the snow beside him, "you refused the other day to come on board of my ship and talk with me, and your refusal has occasioned many disasters. But now that we have met again, let us profit by this opportunity to talk seriously and like rational men. You see you are here on a floating ice-bank, without food, and seriously wounded, incapable by your own efforts of escaping the most cruel death. My adopted father and myself have all that you need, food, fire-arms, and brandy. We will share with you, and take care of you until you are well again. In return for our care, we only ask you to treat us with a little confidence!"

The Irishman gave Erik an irresolute look in which gratitude seemed to mingle with fear--a look of fearful indecision.

"That depends on the kind of confidence that you ask for?" he said, evasively.

"Oh, you know very well," answered Erik, making an effort to smile, and taking in his hands those of the wounded man. "I told you the other day; you know what I want to find out and what I have come so far to discover. Now, Patrick O'Donoghan, make a little effort and disclose to me this secret which is of so much importance to me, tell me what you know about the infant tied to the buoy. Give me the faintest indication of who I am, so that I may find my family. What do you fear? What danger do you run in satisfying me?"

O'Donoghan did not answer, but seemed to be turning over in his obtuse brain the arguments that Erik had used.

"But," he said at last, with an effort, "if we succeed in getting away from here, and we reach some country where there are judges and courts, you could do me some harm?"

"No, I swear that I would not. I swear it by all that is sacred," said Erik, hotly. "Whatever may be the injuries you have inflicted upon me or upon others, I guarantee that you shall not suffer for them in any way. Besides, there is one fact of which you seem to be ignorant, it is that there is a limit to such matters. When such events have taken place more than twenty years ago, human justice has no longer the right to demand an accounting for them."

"Is that true?" asked Patrick O'Donoghan, distrustfully. "Mr. Jones told me that the 'Alaska' had been sent by the police, and you yourself spoke of a tribunal."

"That was about recent events--an accident that happened to us at the beginning of our journey. You may be sure that Mr. Jones was mocking you, Patrick. Doubtless he has some interest of his own for wishing you not to tell."

"You may be sure of that," said the Irishman, earnestly. "But how did you discover that I was acquainted with this secret?"

"Through Mr. and Mrs. Bowles of the Red Anchor in Brooklyn, who had often heard you speak of the infant tied to the buoy."

"That is true," said the Irishman. He reflected again. "Then you are sure that you were not sent by the police?" he said, at length.

"No--what an absurd idea. I came of my own accord on account of my ardent desire, my thirst, to discover the land of my birth and to find out who my parents were, that is all."

O'Donoghan smiled, proudly:

"Ah, that is what you want to know," he said. "Well, it is true that I can tell you. It is true that I know."

"Tell me--tell me!" cried Erik, seeing that he hesitated. "Tell me and I promise you pardon for all the evil that you have done, and my everlasting gratitude if I am ever in a position to show it!"

The Irishman gave a covetous look at the leathern bottle.

"It makes my throat dry to talk so much," he said, in a faint tone. "I will drink a little more if you are willing to
give it to me."
"There is no more here, but we can get some at our depot of provisions. We have two large cases of brandy
there," answered Erik, handing the bottle to Mr. Hersebom.

The latter immediately walked away, followed by Kaas.

"They will not be gone long," said the young man, turning toward his companion. "Now, my brave fellow, do
not make merchandise of your confidence. Put yourself in my place. Suppose that during all your life you had been
ignorant of the name of your country, and that of your mother, and that at last you found yourself in the presence of
a man who knew all about it, and who refused the information which was of such inestimable value to you, and that
at the very time when you had saved him, restored him to consciousness and life. I do not ask you to do anything
impossible. I do not ask you to criminate yourself if you have anything to reproach yourself with. Give me only an
indication, the very slightest. Put me on the track, so that I can find my family; and that is all that I shall ask of you."

"By my faith, I will do you this favor!" said Patrick, evidently moved. "You know that I was a cabin-boy on
board the 'Cynthia'?"

He stopped short.

Erik hung upon his words. Was he at last going to find out the truth? Was he going to solve this enigma and
discover the name of his family, the land of his birth? Truly the scene appeared to him almost chimerical. He
fastened his eyes upon the wounded man, ready to drink in his words with avidity. For nothing in the world would
he have interfered with his recital, neither by interruption nor gesture. He did not even observe that a shadow had
appeared behind him. It was the sight of this shadow which had stopped the story of Patrick O'Donoghan.

"Mr. Jones!" he said, in the tone of a school-boy detected in some flagrant mischief.

Erik turned and saw Tudor Brown coming around a neighboring hummock, where until this moment he had been
hidden from their sight.

The exclamation of the Irishman confirmed the suspicion which during the last hour had presented itself to his
mind.

Mr. Jones and Tudor Brown were one and the same person.
He had hardly time to make this reflection before two shots were heard.
Tudor Brown raised his gun and shot Patrick O'Donoghan through the heart, who fell backward.
Then before he had time to lower his rifle, Tudor Brown received a bullet in his forehead, and fell forward on his
face.

"I did well to come back when I saw suspicious footprints in the snow," said Mr. Hersebom, coming forward, his
gun still smoking in his hands.

CHAPTER XX.
THE END OF THE VOYAGE.

Erik gave a cry and threw himself on his knees beside Patrick O'Donoghan, seeking for some sign of life, a ray
of hope. But the Irishman was certainly dead this time, and that without revealing his secret.

As for Tudor Brown, one convulsion shook his body, his gun fell from his hands, in which he had tightly held it
at the moment of his fall, and he expired without a word.

"Father, what have you done?" cried Erik, bitterly. "Why have you deprived me of the last chance that was left to
me of discovering the secret of my birth? Would it not have been better for us to throw ourselves upon this man and
take him prisoner?"

"And do you believe that he would have allowed us to do so?" answered Mr. Hersebom. "His second shot was
intended for you, you may be sure. I have avenged the murder of this unfortunate man, punished the criminal who
attempted to shipwreck us, and who is guilty perhaps of other crimes. Whatever may be the result, I do not regret
having done so. Besides of what consequence is the mystery surrounding your birth, my child, to men in our
situation? The secret of your birth before long, without doubt, will be revealed to us by God."

He had hardly finished speaking, when the firing of a cannon was heard, and it was re-echoed by the icebergs. It
seemed like a reply to the discouraging words of the old fisherman. It was doubtless a response to the two gunshots
which had been fired on their island of ice.

"The cannon of the 'Alaska!' We are saved!" cried Erik, jumping up and climbing a hummock to get a better
view of the sea that surrounded them.

He saw nothing at first but the icebergs, driven by the wind and sparkling in the sunshine. But Mr. Hersebom,
who had immediately reloaded his gun, fired into the air, and a second discharge from the cannon answered him
almost immediately.

Then Erik discovered a thin streak of black smoke toward the west, clearly defined against the blue sky.
Gunshots, answered by the cannon, were repeated at intervals of a few minutes, and soon the "Alaska" steamed around an iceberg and made all speed toward the north of the island.

Erik and Mr. Hersebom, weeping for joy, threw themselves into each other's arms. They waved their handkerchiefs and threw their caps into the air, seeking by all means to attract the attention of their friends.

At length the "Alaska" stopped, a boat was lowered, and in twenty minutes it reached their island.

Who can describe the unbounded joy of Dr. Schwaryencrona, Mr. Bredejord, Mr. Malarius, and Otto when they found them well and safe; for through the long hours of that sad night they had mourned them as lost.

They related all that had befallen them--their fears and despair during the night, their vain appeals, their useless anger. The "Alaska" had been found in the morning to be almost entirely clear of the ice, and they had dislodged what remained with the assistance of their gunpowder. Mr. Bosewitz had taken command, being the second-officer, and had immediately started in search of the floating island, taking the direction in which the wind would carry it. This navigation amidst floating icebergs was the most perilous which the "Alaska" had as yet attempted; but thanks to the excellent training to which the young captain had accustomed his crew, and to the experience which they had acquired in maneuvering the vessel, they passed safely among these moving masses of ice without being crushed by them. The "Alaska" had had the advantage of being able to travel more swiftly than the icebergs, and she had been able to benefit by this circumstance. Kind Providence had willed that her search should not prove fruitless. At nine o'clock in the morning the island had been sighted. They recognized it by its shape, and then the two shots from the guns made them hopeful of finding their two shipwrecked friends.

All their other troubles now appeared to them as insignificant. They had a long and dangerous voyage before them, which they must accomplish under sail, for their coal was exhausted.

"No," said Erik, "we will not make it under sail. I have another plan. We will permit the ice island to tow us along, as long as she goes toward the south or west. That will spare us incessantly fighting with the icebergs, for our island will chase them ahead of her. Then we can collect here all the combustibles that we will require in order to finish the voyage, when we are ready to resume it."

"What are you talking about?" asked the doctor, laughing. "Is there an oil-well on this island?"

"Not exactly an oil-well," answered Erik, "but what will answer our purpose nearly as well, multitudes of fat walruses. I wish to try an experiment, since we have one furnace especially adapted for burning oil."

They began their labors by performing the last rites of the two dead men. They tied weights to their feet and lowered them into the sea. Then the "Alaska" made fast to the ice bank in such a manner as to follow its movements without sustaining any injury to herself. They were able, with care, to carry on board again the provisions which they had landed, and which it was important for them not to lose. That operation accomplished, they devoted all their energies to the pursuit of the walrus.

Two or three times a day, parties armed with guns and harpoons and accompanied by all their Greenland dogs landed on the ice bank, and surrounded the sleeping monsters at the mouth of their holes. They killed them by firing a ball into their ears, then they cut them up, and placed the lard with which they were filled in their sleighs, and the dogs drew it to the "Alaska." Their hunting was so easy and so productive, that in eight days they had all the lard that they could carry. The "Alaska," still towed by the floating island, was now in the seventy-fourth degree; that is to say, she had passed Nova Zembla.

The ice island was now reduced at least one-half, and cracked by the sun was full of fissures, more or less extensive, evidently ready to go to pieces. Erik resolved not to wait until this happened, and ordering their anchor to be lifted, he sailed away westward.

The lard was immediately utilized in the fire of the "Alaska," and proved an excellent combustible. The only fault was that it choked up the chimney, which necessitated a daily cleaning. As for its odor, that would doubtless have been very disagreeable to southern passengers, but to a crew composed of Swedes and Norwegians, it was only a secondary inconvenience.

Thanks to this supply, the "Alaska" was able to keep up steam during the whole of the remainder of her voyage. She proceeded rapidly, in spite of contrary winds, and arrived on the 5th of September in sight of Cape North or Norway. They pursued their route with all possible speed, turned the Scandinavian Peninsula, repassed Skager-Rack, and reached the spot from which they had taken their departure.

On the 14th of September they cast anchor before Stockholm, which they had left on the tenth of the preceding February.

Thus, in seven months and four days, the first circumpolar periplus had been accomplished by a navigator of only twenty-two years of age.

This geographical feat, which so promptly completed the great expedition of Nordenskiold, would soon make a prodigious commotion in the world. But the journals and reviews had not as yet had time to expatiate upon it. The uninitiated were hardly prepared to understand it, and one person, at least, reviewed it with suspicion--this was
The public authorities proposed a national recompense for them.

All these praises were painful to Erik. His conscience told him that the principal motive of this expedition on his part had been purely a personal one, and he felt scrupulous about accepting honors which appeared to him greatly exaggerated. He therefore availed himself of the first opportunity to state frankly that he had gone to the polar seas to discover if possible the secret of his birth, and of the shipwreck of the "Cynthia," that he had been unsuccessful in doing so.

The occasion was offered by a reporter of one of the principal newspapers of Stockholm, who presented himself on board of the "Alaska" and solicited the favor of a private interview with the young captain. The object of this intelligent gazetteer, let us state briefly, was to extract from his victim the outlines of a biography which would cover one hundred lines. He could not have fallen on a subject more willing to submit to vivisection. Erik had been eager to tell the truth, and to proclaim to the world that he did not deserve to be regarded as a second Christopher Columbus. He therefore related unreservedly his story, explaining how he had been picked up at sea by a poor fisherman of Noroe, educated by Mr. Malarius, taken to Stockholm by Dr. Schwaryencrona; how they had found out that Patrick O'Donoghan probably held the key to the mystery that surrounded him. They discovered that he was on board of the "Vega;" they had gone in search of him. He related the accident which had induced them to change their route. Erik told all this to convince the world that he was no hero. He told it because he felt ashamed of being so overwhelmed with praises for a performance that only seemed to him natural and right.

During this time the pen of the delighted reporter, Mr. Squirrelius, flew over the paper with stenographic rapidity. The dates, the names, the least details were noted with avidity. Mr. Squirrelius told himself with a beating heart that he had obtained matter not only for one hundred lines, but that he could make five or six hundred out of it. And what a story it would be--more interesting than a novel!

The next day Erik's revelations filled the columns of the most largely circulated newspaper in Stockholm, and indeed in all Sweden. As is usually the case, Erik's sincerity, instead of diminishing his popularity, only increased it, on account of his modesty, and the romantic interest attached to his history. The press and the public seized upon it with avidity. These biographical details were soon translated into all languages, and made the tour of Europe. In this way they reached Paris, and penetrated in the form of a French newspaper into a modest drawing-room on Varennes Street.

There were two persons in this room. One was a lady dressed in black, with white hair, although she still appeared to be young, but her whole appearance betrayed profound sorrow. Seated under a lighted lamp she worked mechanically at some embroidery, which at times fell from her thin fingers, while her eyes, fixed on vacancy, seemed to be thinking of some overwhelming calamity.

On the other side of the table sat a fine-looking old gentleman, who took the newspaper abstractedly which his servant brought in.

It was Mr. Durrien, the honorary consul-general of the geographical society, the same person who had been at Brest when the "Alaska" reached that place.

This was doubtless the reason why Erik's name attracted his notice, but while reading the article carefully which contained the biography of the young Swedish navigator, he was startled. Then he read it again carefully, and little
by little an intense pallor spread over his face, which was always pale. His hands trembled nervously, and his uneasiness became so evident that his companion noticed it.

"Father, are you suffering?" she asked with solicitude.

"I believe it is too warm here--I will go to the library and get some fresh air. It is nothing; it will pass off," answered Mr. Durrien, rising and walking into the adjoining room.

As if by accident, he carried the paper with him.

If his daughter could have read his thoughts, she would have known that amidst the tumults of hopes and fears that so agitated him was also a determination not to let her eyes rest upon that paper.

A moment later she thought of following him into the library, but she imagined that he wished to be alone, and discreetly yielded to his desire. Besides she was soon reassured by hearing him moving about and opening and closing the window.

At the end of an hour, she decided to look in, and see what Mr. Durrien was doing. She found that he was seated before his desk writing a letter. But she did not see that he wrote his eyes filled with tears.

CHAPTER XXI.
A LETTER FROM PARIS.

Since his return to Stockholm, Erik had received every day from all parts of Europe a voluminous correspondence. Some learned society wished for information on some point, or wrote to congratulate him; foreign governments wished to bestow upon him some honor or recompense; ship-owners, or traders, solicited some favor which would serve their interests.

Therefore he was not surprised when he received one morning two letters bearing the Paris postmark.

The first that he opened was an invitation from the Geographical Society of France, asking him and his companions to come and receive a handsome medal, which had been voted in a solemn conclave "to the navigators of the first circumpolar periphas of the arctic seas."

The second envelope made Erik start, he looked at it. On the box which closed it was a medallion upon which the letters "E.D." were engraved, surrounded by the motto "Semper idem."

These initials and devices were also stamped in the corner of the letter enclosed in the envelope, which was that from Mr. Durrien.

The letter read as follows:

"My dear child,--Let me call you this in any case. I have just read in a French newspaper a biography translated from the Swedish language, which has overcome me more than I can tell you. It was your account of yourself. You state that you were picked up at sea about twenty-two years ago by a Norwegian fisherman in the neighborhood of Bergen; that you were tied to a buoy, bearing the name of 'Cynthia;' that the especial motive of your arctic voyage was to find a survivor of the vessel of that name--ship wrecked in October, 1858; and then you state that you have returned from the voyage without having been able to gain any information about the matter.

"If all this is true (oh, what would I not give if it is true!), I ask you not to lose a moment in running to the telegraph office and letting me know it. In that case, my child, you can understand my impatience, my anxiety, and my joy. In that case you are my grandson, for whom I have mourned so many years, whom I believed lost to me forever, as did also my daughter, my poor daughter, who, broken-hearted at the tragedy of the 'Cynthia,' still mourns every day for her only child--the joy and consolation at first of her widowhood, but afterward the cause of her despair.

"But we shall see you again alive, covered with glory. Such happiness is too great, too wonderful. I dare not believe it until a word from you authorizes me to do so. But now it seems so probable, the details and dates agree so perfectly, your countenance and manners recall so vividly those of my unfortunate son-in-law. Upon the only occasion when chance led me into your society, I felt myself mysteriously drawn toward you by a deep and sudden sympathy. It seems impossible that there should be no reason for this.

"One word, telegraph me one word. I do not know how to exist until I hear from you. Will it be the response that I wait for so impatiently? Can you bring such happiness to my poor daughter and myself as will cause us to forget our past years of tears and mourning?

"E. DURRIEN, Honorary Consul-general,

"104 Rue de Varennes, Paris."

To this letter was added one of explanation, that Erik devoured eagerly. It was also in Mr. Durrien's handwriting, and read as follows:

"I was the French consul at New Orleans when my only daughter, Catherine, married a young Frenchman, Mr. George Durrien, a distant connection, and, like ourselves, of Breton origin. Mr. George Durrien was a mining
engineer. He had come to the United States to explore the recently discovered mines of petroleum and intended to remain several years. I received him into my family--he being the son of a dear friend--and when he asked for my daughter's hand, I gave her to him with joy. Shortly after their marriage I was appointed consul to Riga; and my son-in-law being detained by business interests in the United States, I was obliged to leave my daughter. She became a mother, and to her son was given my Christian name, united to that of his father--Emile Henry Georges.

"Six months afterward my son-in-law was killed by an accident in the mines. As soon as she could settle up his affairs, my poor daughter, only twenty years of age, embarked at New York on the 'Cynthia' for Hamburg, to join me by the most direct route.

"On the 7th of October, 1858, the 'Cynthia' was shipwrecked off the Faroe Islands. The circumstances of the shipwreck were suspicious, and have never been explained.

"At the moment of the disaster, when the passengers were taking their places one by one in the boat, my little grandson, seven months old--whom his mother had tied to a buoy for safety--slipped or was pushed into the sea, and was carried away by the storm and disappeared. His mother, crazed by this frightful spectacle, tried to throw herself into the sea. She was prevented by main force and placed in a fainting condition in one of the boats, in which were three other persons, and who had alone escaped from the shipwrecked vessel. In forty-nine hours this boat reached one of the Faroe Islands. From there my daughter returned to me after a dangerous illness which lasted seven weeks, thanks to the devoted attentions of the sailor who saved her and who brought her to me. This brave man, John Denman, died in my service in Asia Minor.

"We had but little hope that the baby had survived the shipwreck. I, however, sought for him among the Faroe and Shetland Islands, and upon the Norwegian coast north of Bergen. The idea of his cradle floating any further seemed impossible, but I did not give up my search for three years; and Noroe must be a very retired spot, or surely some inquiries would have been made there. When I had given up all hope I devoted myself exclusively to my daughter, whose physical and moral health required great attention. I succeeded in being sent to the Orient, and I sought, by traveling and scientific enterprises, to draw off her thoughts from her affliction. She has been my inseparable companion sharing all my labors, but I have never been able to lighten her incurable grief. We returned to France, and we now live in Paris in an old house which I own.

"Will it be my happiness to receive there my grandson, for whom we have mourned so many years? This hope fills me with too much joy, and I dare not speak of it to my daughter, until I am assured of its truth; for, if it should prove false, the disappointment would be too cruel.

"To-day is Monday: they tell me at the post-office that by next Saturday I can receive your answer."

Erik had hardly been able to read this, for the tears would obscure his sight. He also felt afraid to yield too quickly to the hope which had been so suddenly restored to him. He told himself that every detail coincided--the dates agreed; all the events down to the most minute particulars. He hardly dared to believe, however, that it could be true. It was too much happiness to recover in a moment his family, his own mother, his country. And such a country--the one that he could have chosen above all because she possessed the grandeur, the graces, the supreme gifts of humanity--because she had fostered genius, and the civilization of antiquity, and the discoveries and inventions of modern times.

He was afraid that he was only dreaming. His hopes had been so often disappointed. Perhaps the doctor would say something to dispel his illusions. Before he did anything he would submit these facts to his cooler judgment.

The doctor read the documents attentively which he carried to him, but not without exclamations of joy and surprise.

"You need not feel the slightest doubt!" he said, when he had finished. "All the details agree perfectly, even those that your correspondent omits to mention, the initials on the linen, the device engraved on the locket, which are the same as those on the letter. My dear child, you have found your family this time. You must telegraph immediately to your grandfather!"

"But what shall I tell him?" asked Erik, pale with joy.

"Tell him that to-morrow you will set out by express, to go and embrace him and your mother!"

The young captain only took time to press the hands of this excellent man, and he ran and jumped into a cab to hasten to the telegraph office.

He left Stockholm that same day, took the railroad to Malmo on the north-west coast of Sweden, crossed the strait in twenty minutes, reached Copenhagen, took the express train through to Holland and Belgium, and at Brussels the train for Paris.

On Saturday, at seven o'clock in the evening, exactly six days after Mr. Durrien had posted his letter, he had the joy of waiting for his grandson at the depot.

As soon as the train stopped they fell into each other's arms. They had thought so much about each other during these last few days that they both felt already well acquainted.
"My mother?" asked Erik.

"I have not dared to tell her, much as I was tempted to do so!" answered Mr. Durrien.

"And she knows nothing yet?"

"She suspects something, she fears, she hopes. Since your dispatch I have done my best to prepare her for the unheard-of joy that awaits her. I told her of a track upon which I had been placed by a young Swedish officer, the one whom I had met at Brest, and of whom I had often spoken to her. She does not know, she hesitates to hope for any good news, but this morning at breakfast I could see her watching me, and two or three times I felt afraid that she was going to question me. One can not tell, something might have happened to you, some other misfortune, some sudden mischance. So I did not dine with her to-night, I made an excuse to escape from a situation intolerable to me."

Without waiting for his baggage, they departed in the _coup_ that Mr. Durrien had brought.

Mme. Durrien, alone in the parlor in Varennes Street, awaited impatiently the return of her father. She had had her suspicions aroused, and was only waiting until the dinner hour arrived to ask for an explanation.

For several days she had been disturbed by his strange behavior, by the dispatches which were continually arriving, and by the double meaning which she thought she detected beneath all he said. Accustomed to talk with him about his lightest thoughts and impressions, she could not understand why he should seek to conceal anything from her. Several times she had been on the point of demanding a solution of the enigma, but she had kept silence, out of respect for the evident wishes of her father.

"He is trying to prepare me for some surprise, doubtless," she said to herself. "He is sure to tell me if anything pleasant has occurred."

But for the last two or three days, especially that morning, she had been impressed with a sort of eagerness which Mr. Durrien displayed in all his manner, as well as the happy air with which he regarded her, insisting in hearing over and over again from her lips, all the details of the disaster of the "Cynthia," which he had avoided speaking of for a long time. As she mused over his strange behavior a sort of revelation came to her. She felt sure that her father must have received some favorable intelligence which had revived the hope of finding her child. But without the least idea that he had already done so, she determined not to retire that night until she had questioned him closely.

Mme. Durrien had never definitely renounced the idea that her son was living. She had never seen him dead before her eyes, and she clung mother-like to the hope that he was not altogether lost to her. She said that the proofs were insufficient, and she nourished the possibility of his sudden return. She might be said to pass her days waiting for him. Thousands of women, mothers of soldiers and sailors, pass their lives under this touching delusion. Mrs. Durrien had a greater right than they had to preserve her faith in his existence. In truth the tragical scene enacted twenty-two years ago was always before her eyes. She beheld the "Cynthia" filling with water and ready to sink. She saw herself tying her infant to a large buoy while the passengers and sailors were rushing for the boats. They left her behind, she saw herself imploring, beseeching that they would at least take her baby. A man took her precious burden, and threw it into one of the boats, a heavy sea dashed over it, and to her horror she saw the buoy floating away on the crest of the waves. She gave a despairing cry and tried to jump after him, then came unconsciousness. When she awoke she was a prey to despair, to fever, to delirium. To this succeeded increasing grief. Yes, the poor woman recalled all this. Her whole being had in fact received a shock from which she had never recovered. It was now nearly a quarter of a century since this had happened, and Mrs. Durrien still wept for her son as on the first day. Her maternal heart so full of grief was slowly consuming her life. She sometimes pictured to herself her son passing through the successive phases of infancy, youth, and manhood. From year to year she represented to herself how he would have looked, how he was looking, for she obstinately clung to her belief of the possibility of his return.

This vain hope nothing had as yet had the power to shake--neither travels, nor useless researches, nor the passage of time.

This is why this evening she awaited her father with the firm resolution of knowing all that he had to tell.

Mr. Darrien entered. He was followed by a young gentleman, whom he presented to her in the following words:

"My daughter, this is Mr. Erik Hersebom, of whom I have often spoken to you, and who has just arrived at Paris. The Geographical Society wish to bestow upon him a grand medal, and he has done me the honor to accept our hospitality."

She had arisen from her arm-chair, and was looking kindly at him. Suddenly her eyes dilated, her lips trembled, and she stretched out her hands toward him.

"My son! you are my son!" she cried.
Then she advanced a step toward Erik.

"Yes, you are my child," she said. "Your father lives over again in you!"

When Erik, bursting into tears, fell on his knees before her, the poor woman took his head in her hands, and
CHAPTER XXII.
AT VAL-FERAY.

A month later at Val-Féray, an old homestead of the family, situated half a league from Brest, Erik's adopted family were assembled, together with his mother and grandfather. Mrs. Durrien had, with the delicacy of feeling habitual to her, desired that the good, simple-hearted beings who had saved her son's life should share her profound and inexpressible joy. She had insisted that Dame Katrina, and Vanda, Mr. Hersebom, and Otto should accompany Doctor Schwaryencrona, Kajsa, Mr. Bredejord, and Mr. Malarius, and they held a great festival together.

Amidst the rugged natural scenery of Breton and near the sea, her Norwegian guests felt more at their ease than they could have done in Varennes Street. They took long walks in the woods together, and told each other all they knew about Erik's still somewhat obscure history, and little by little many hitherto inexplicable points became clear. Their long talks and discussions cast light upon many obscure circumstances.

The first question they asked each other was, Who was Tudor Brown? What great interest did he have in preventing Patrick O'Donoghan from telling who Erik's relations were? The words of that unfortunate man had established one fact, viz., that Tudor Brown's real name was Jones, as it was the only one that the Irishman had known him by. Now, a Mr. Noah Jones had been associated with Erik's father in working a petroleum mine, that the young engineer had discovered in Pennsylvania. The simple announcement of this fact gave a sinister aspect to many events which had so long appeared mysterious: the suspicious wreck of the "Cynthia," the fall of the infant into the sea, perhaps the death of Erik's father. A document that Mr. Durrien found among his papers elucidated many of these perplexing questions.

"Several months before his marriage," he said to Erik's friends, "my son-in-law had discovered, near Harrisburg, a petroleum well. He lacked the capital necessary to purchase it, and he saw that he was in danger of losing all the advantages which the possession of it would secure to him. Chance made him acquainted with Mr. Noah Jones, who represented himself as a cattle dealer from the far West. But in reality, as he found out afterward, he was a slave-trader.

"This individual agreed to advance the sum necessary to purchase and work the petroleum mine, which was called the Vandalia. He made my son-in-law sign, in exchange for this assistance, an agreement which was very profitable to himself. I was ignorant of the terms of this contract at the time of his marriage to my daughter, and according to all appearances he thought but little of it. Unusually gifted, and understanding chemistry and mechanics, yet he was entirely ignorant of business matters, and already had to pay dearly for his inexperience. No doubt he had trusted all the arrangements to Noah Jones, according to his usual habit. Probably he signed with closed eyes the contract which was laid before him. These are the principle articles agreed upon:

"Art. III. The Vandalia shall remain the sole property of Mr. George Durrien, the discoverer, and Mr. Noah Jones, his silent partner.

"Art. IV. Mr. Noah Jones will take charge of moneys, and pay out what is necessary for the exploration of the mine, he will also sell the product, take charge of the receipts, and have a settlement with his partner every year, when they will divide the net profits.

"Art. V. If either of the partners should wish to sell his share, the other would have the first right to purchase it, and he should have three months in which to make arrangements to do so. He might then become sole proprietor by paying the capital and three per cent. on the net revenue, according to what it had been proved to be at the last inventory.

"Art. VI. Only the children of the two partners could become inheritors of these rights. In case one of the partners should die childless, or his children should not live until they were twenty-one years of age, the entire property to revert to the survivor, to the exclusion of all other heirs of the dead partner.

"N.B. The last article is on account of the different nationalities of the two partners, and because of the complications that could not fail to arise in case of the death of either of them without issue."

"Such," continued Mr. Durrien, "was the contract which my future son-in-law had signed at the time, when he had no thought of marrying, and when everybody, except, perhaps, Mr. Noah Jones, was ignorant of what immense value the Vandalia mine would become in the course of time. They had then hardly commenced operations, and they met with the usual discouragements incident to all new undertakings. Perhaps Noah Jones hoped that his associate would become disgusted with the whole business and retire, leaving him sole proprietor. The marriage of George with my daughter, the birth of his son, and the well becoming suddenly prodigiously fruitful, must have modified his plans by degrees. He could no longer hope to purchase for a trifling sum this splendid property; but before it came into the possession of Noah Jones, first George himself, and then his only child, must disappear from the world. Two
years after his marriage and six months after the birth of my grandson, George was found dead near one of the wells--asphyxiated, the doctors said, by gas. I had left the United States upon my nomination as consul to Riga. The business relating to the partnership was left to an attorney to settle. Noah Jones behaved very well, and agreed to all the arrangements that were made for the benefit of my daughter. He agreed to continue the work, and pay every six months into the Central Bank of New York that part of the net profits which belonged to the infant. Alas! he never made the first payment. My daughter took passage in the 'Cynthia' in order to join me. The 'Cynthia' was lost with her crew and freight under such suspicious circumstances that the insurance company refused to pay; and in this shipwreck the sole heir of my son-in-law disappeared.

"Noah Jones remained the sole proprietor of the Vandalia, which has yielded him at the least since that event an annual income of one hundred and eighty thousand dollars a year."

"Did you never suspect that he had had some hand in these successive catastrophies?" asked Mr. Bredejord.

"I have certainly suspected him; it was only too natural. Such an accumulation of misfortunes, and all tending to his private enrichment, seemed to point him out as the author only too clearly. But how could I prove my suspicions, particularly in a court of justice? They were only vague, and I knew too well that they would have but little weight in an international contest. And then, besides I had my daughter to console, or at least to try and draw away her thoughts from this tragedy, and a lawsuit would only have revived her grief. Briefly I resigned myself to silence. Did I do wrong? Is it to be regretted?"

"I think not, for I feel convinced that it would have produced no results. You see how difficult it is even today, after we have related all the facts in our possession, to arrive at any definite conclusion!"

"But how can you explain the part which Patrick O'Donoghan has taken in this matter?" asked Dr. Schwaryencrona.

"On this point, as on many others, we are reduced to conjectures, but it seems to me that there is one which is plausible enough. This O'Donoghan was cabin-boy on board of the 'Cynthia,' in the personal service of the captain, and consequently in constant communication with the first-class passengers, who always eat at the captain's table. He therefore certainly knew the name of my daughter, and her French origin, and he could easily have found her again.

"Had he been commissioned by Noah Jones to perform some dark mission? Had he a hand in causing the shipwreck of the 'Cynthia,' or simply in pushing the infant into the sea? this they could never know for a certainty since he was dead. One thing was evident, he was aware how important the knowledge of this fact was for Noah Jones. But did this lazy drunken man know that the infant was living? Had he any hand in saving it? Had he rescued it from the sea to leave it floating near Noroe?"

"This was a doubtful point. In any case he must have assured Noah Jones that the infant had survived. He was doubtless proud of knowing the country which had received him, and her French origin, and he could easily have found her well for his silence. He was doubtless the person from whom he received money every time he landed in New York."

"All this appears to me to be very probable," said Mr. Bredejord, "and I think that subsequent events confirm it. The first advertisements of Doctor Schwaryencrona disturbed Noah Jones, and he believed it to be an imperative necessity to get rid of Patrick O'Donoghan, but he was obliged to act prudently. He therefore contented himself with frightening the Irishman, by making him believe that he would be brought before a criminal court. The result of this we know from Mr. and Mrs. Bowles, of the Red Anchor, who told us of the haste with which Patrick O'Donoghan had taken flight. He evidently believed that he was in danger of being arrested, or he would not have gone so far, to live among the Samoyedes, and under an assumed name, which Noah Jones had doubtless advised him to do.

"But the announcement in the newspapers about Patrick O'Donoghan must have been a severe blow to him. He had made a journey to Stockholm expressly to assure us that the Irishman was dead, and doubtless to discover if possible how far we had pushed our inquiries. The publication of the correspondence of the 'Vega,' and the departure of the 'Alaska,' must have made Noah Jones, or Tudor Brown, as he called himself, feel that he was in imminent peril, for his confidence in Patrick O'Donoghan could be only very limited, and he would have revealed his secret to any one who would have assured him that he would not be punished. Happily as affairs have turned out, we may congratulate ourselves upon having escaped pretty well."

"Who knows?" said the doctor, "perhaps all the danger we have encountered has only helped to bring us to the knowledge of the truth. But for running on the rocks of the Basse-Froide, we would probably have pursued the route through the Suez Canal, and then we should have reached Behring's Strait too late to meet the 'Vega.' It is at least doubtful whether we would have undertaken the voyage to the Island of Ljakow, and more doubtful still whether we would have been able to extract any information from Patrick O'Donoghan if we had met him in company with Tudor Brown."
"So, although our entire voyage has been marked by tragical events, it is due to the fact of our having accomplished the periplus in the 'Alaska, and the consequent celebrity which has been the result for Erik, that he has at last found his family."

"Yes," said Mrs. Durrien, laying her hand proudly on the head of her son, "it is his glory which has restored him to me."

And immediately she added:

"It was a crime that deprived me of you, but your own goodness which has restored you to me!"

"And the rascality of Noah Jones has resulted in making our Erik one of the richest men in America," cried Mr. Bredejord.

Every one looked at him with surprise.

"Doubtless," answered the eminent lawyer. "Erik is his father's heir, and has a share in the income, derived from the Vandalia mine. Has he not been unjustly deprived of this for the last twenty-two years?

"We have only to give proofs of his identity, and we have plenty of witnesses, Mr. Hersebom, Dame Katrina and Mr. Malarius, besides ourselves. If Noah Jones has left any children, they are responsible for the enormous arrears which will probably consume all their share of the capital stock.

"If the rascal has left no children, by the terms of the contract which Mr. Durrien has just read, Erik is the sole inheritor of the entire property; and according to all accounts he ought to have in Pennsylvania an income of one hundred and fifty to two hundred thousand dollars a year!"

"Ah, ah," said the doctor, laughing. "Behold the little fisherman of Noroe become an eligible _parti!_ Laureate of the Geographical Society, author of the first circumpolar periplus, and afflicted with the modest income of two hundred thousand dollars. There are not many such husbands to be met with in Stockholm. What do you say Kajsa?"

The young girl blushed painfully at being thus addressed, but her uncle had no suspicion that he had made a cruel speech.

Kajsa had felt that she had not acted wisely in treating Erik as she had done, and she resolved for the future to show him more attention.

But it was a singular fact that Erik no longer cared for her, since he felt himself elevated above her unjust disdain. Perhaps it was absence, or the lonely hours which he had spent walking the deck at night, which had revealed to him the poverty of Kajsa's heart; or it might be the satisfaction he felt that she could no longer regard him as "a waif"; he only treated her now with the most perfect courtesy, to which she was entitled as a young lady and Dr. Schwaryencrona's niece.

All his preference now was for Vanda, who indeed grew every day more and more charming, and was losing all her little village awkwardness under the roof of an amiable and cultivated lady. Her exquisite goodness, her native grace, and perfect simplicity, made her beloved by all who approached her. She had not been eight days at Val-Fray, when Mrs. Durrien declared positively that it would be impossible for her ever to part with her.

Erik undertook to arrange with Mr. Hersebom and Dame Katrina that they should leave Vanda behind them, with the express condition that he would bring her himself every year to see them. He had tried to keep all his adopted family with him, even offering to transport from Noroe the house with all its furniture where he had passed his infancy. But this project of emigration was generally regarded as impracticable. Mr. Hersebom and Katrina were too old to change their habits. They would not have been perfectly happy in a country of whose language and habits they were ignorant. He was obliged, therefore, to permit them to depart, but not before making such provision for them as would enable them to spend the remainder of their days in ease and comfort, which, notwithstanding their honest, laborious lives, they had been unable to accomplish.

Erik would have liked to have kept Otto at least, but he preferred his fjord, and thought that there was no life preferable to that of a fisherman. It must also be confessed that the golden-haired and blue-eyed daughter of the overseer of the oil-works had something to do with the attractions which Noroe had for him. At least we must conclude so, since it was soon made known that he expected to marry her at the next "Yule," or Christmas.

Mr. Malarius counted upon educating their children as he had educated Erik and Vanda. He modestly resumed his position in the village school, after sharing in the honor of the decorations bestowed by the Geographical Society of France upon the captain of the "Alaska." He was also busily occupied in correcting the proofs of his magnificent work on the "Flora of the Arctic Regions." As for Dr. Schwaryencrona, he has not quite finished his "Treatise on Iconography," which will transmit his name to posterity.

The latest legal business of Mr. Bredejord has been to establish Erik's claim as sole proprietor of the Vandalia mine. He gained his case in the first instance, and also on appeal, which was no small success.

Erik took advantage of this, and of the enormous fortune thus accruing to him, to purchase the "Alaska," which he converted into a pleasure yacht. He uses it every year to go to Noroe in company with Mme. Durrien and Vanda, to visit his adopted family. Although his civil rights have been accorded to him, and his legal name is Emile Durrien,
he has added that of Hersebom, and among his relatives he is still called only Erik.

The secret desire of his mother is to see him some day married to Vanda, whom she already loves as a daughter, and, as Erik evidently shares this desire, we may suppose that it will be realized one of these days.

Kajsa still remains single, with the knowledge that she has lost her opportunity.

Dr. Schwaryencrona, Mr. Bredejord, and Professor Hochstedt still play innumerable games of whist.

One evening the doctor, having played worse than usual, Mr. Bredejord, as he tapped his snuff-box, had the pleasure of recalling to his mind a circumstance which had too long been forgotten.

"When do you intend to send me your Pliny?" he asked, with a wicked gleam in his eye. "Certainly you can no longer think that Erik is of Irish origin?"

The doctor was thunder-struck for a moment by this speech, but he soon recovered himself.

"Bah! an ex-president of the French Republic was a direct descendant of one of the Irish kings," he said, seriously. "I should not be at all surprised if Mr. Durrien belongs to the same family!"

"Evidently," replied Mr. Bredejord. "In fact it is so extremely probable that out of sport I will send you my Quintilian!"

THE END.

TICKET NO. "9672"

by

JULES VERNE

CHAPTER I.

"What time is it?" inquired Dame Hansen, shaking the ashes from her pipe, the last curling rings from which were slowly disappearing between the stained rafters overhead.

"Eight o'clock, mother," replied Hulda.

"It isn't likely that any travelers will come to-night. The weather is too stormy."

"I agree with you. At all events, the rooms are in readiness, and if any one comes, I shall be sure to hear them."

"Has your brother returned?"

"Not yet."

"Didn't he say he would be back to-night?"

"No, mother. Joel went to take a traveler to Lake Tinn, and as he didn't start until very late, I do not think he can get back to Dal before to-morrow."

"Then he will spend the night at Moel, probably."

"Yes; unless he should take it into his head to go on to Bamble to see Farmer Helmboe."

"And his daughter Siegfried."

"Yes. Siegfried, my best friend, whom I love like a sister!" replied the young girl, smiling.

"All, well, Hulda, shut up the house, and let's go to bed."

"You are not ill, are you, mother?"

"No; but I want to be up bright and early to-morrow morning. I must go to Moel."

"What for?"

"Why, we must be laying in our stock of provisions for the coming summer, and--"

"And I suppose the agent from Christiania has come down with his wagon of wines and provisions."

"Yes; Lengling, the foreman at the saw-mill, met him this afternoon, and informed me of the fact as he passed. We have very little left in the way of ham and smoked salmon, and I don't want to run any risk of being caught with an empty larder. Tourists are likely to begin their excursions to the Telemark almost any day now; especially, if the weather should become settled, and our establishment must be in a condition to receive them. Do you realize that this is the fifteenth of April?"

"The fifteenth of April!" repeated the young girl, thoughtfully.

"Yes, so to-morrow I must attend to these matters," continued Dame Hansen. "I can make all my purchases in two hours, and I will return with Joel in the kariol."

"In case you should meet the postman, don't forget to ask him if there is a letter for us--"

"And especially for you. That is quite likely, for it is a month since you heard from Ole."

"Yes, a month--a whole month."

"Still, you should not worry, child. The delay is not at all surprising. Besides, if the Moel postman has nothing
for you, that which didn't come by the way of Christiania may come by the way of Bergen, may it not?"

"Yes, mother," replied Hulda. "But how can I help worrying, when I think how far it is from here to the
Newfoundland fishing banks. The whole broad Atlantic to cross, while the weather continues so bad. It is almost a
year since my poor Ole left me, and who can say when we shall see him again in Dal?"

"And whether we shall be here when he returns," sighed Dame Hansen, but so softly that her daughter did not
hear the words.

Hulda went to close the front door of the inn which stood on the Vesfjorddal road; but she did not take the
trouble to turn the key in the lock. In hospitable Norway, such precautions are unnecessary. It is customary for
travelers to enter these country inns either by night or by day without calling any one to open the door; and even the
loneliest habitations are safe from the depredations of thieves or assassins, for no criminal attempts against life or
property ever disturb the peace of this primitive land.

The mother and daughter occupied two front rooms on the second story of the inn--two neat and airy, though
plainly furnished rooms. Above them, directly under the sloping roof, was Joel's chamber, lighted by a window
incased in a tastefully carved frame-work of pine.

From this window, the eye, after roaming over the grand mountain horizon, returned with delight to the narrow
valley through which flowed the Maan, which is half river, half torrent.

A wooden staircase, with heavy balusters and highly polished steps, led from the lower hall to the floors above,
and nothing could be more neat and attractive than the whole aspect of this establishment, in which the travelers
found a comfort that is rare in Norwegian inns.

Hulda and her mother were in the habit of retiring early when they were alone, and Dame Hansen had already
lighted her candle, and was on her way upstairs, when a loud knocking at the door made them both start.

"Dame Hansen! Dame Hansen!" cried a voice.

Dame Hansen paused on the stairs.

"Who can have come so late?" she exclaimed.

"Can it be that Joel has met with an accident?" returned Hulda, quickly.

And she hastened toward the door.

She found a lad there--one of the young rascals known as _skydskarls_, that make a living by clinging to the
back of kariols, and taking the horse back when the journey is ended.

"What do you want here at this hour?" asked Hulda.

"First of all to bid you good-evening," replied the boy, mischievously.

"Is that all?"

"No; that isn't all; but a boy oughtn't to forget his manners, ought he?"

"You are right. But who sent you?"

"Your brother Joel."

"And what for?" asked Dame Hansen, advancing to the door with the slow and measured tread that is a
characteristic of the inhabitants of Norway. There is quicksilver in the veins of their soil, but little or none in the
veins of their bodies.

The reply had evidently caused the mother some anxiety, however, for she added hastily:

"Has anything happened to my son?"

"No, but the Christiania postman gave him a letter, and--"

"A letter from Drammen?" repeated Dame Hansen, in a lower tone.

"I don't know about that," replied the youth. "All I do know is, that Joel can't get home before to-morrow, and he
sent me here to deliver the letter."

"It is important then?"

"I should judge so."

"Hand it here," said Dame Hansen, in a tone that betrayed keen anxiety.

"Here it is, clean and not wrinkled in the least. But the letter is not for you."

Dame Hansen seemed to breathe more freely.

"Then who is it for?" she asked.

"For your daughter."

"For me!" cried Hulda. "It is a letter from Ole! I am sure it is--a letter that came by way of Christiania. My
brother did not want me to be kept waiting."

Hulda had snatched the letter from the boy's hand, and now taking it to the table upon which her mother had
deposited the candle, she examined the address.

"Yes, it is from him. It is certainly from him! Heaven grant that he writes to announce the speedy return of the
"Viking!"
"Won't you come in?" said Dame Hansen, turning to the boy.
"Only for a minute. I must get back home to-night, for I am to go with a kariol to-morrow morning."
"Very well. Tell Joel, from me, that I expect to go to Moel to-morrow, and that he must wait for me there."
"To-morrow evening?"
"No; to-morrow morning, and he must not leave Moel until he sees me. We will return to Dal together."
"Very well, Dame Hansen."
"Won't you take a drop of _brandevin_?"
"With pleasure."

The boy approached the table, and Dame Hansen handed him a glass of the beverage which is such a powerful protection against the evening fogs. It is needless to say that he drained the glass, then,

"_God-aften!_" he said.

"_God-aften_, my son!"

This is the Norwegian good-night. It was simply spoken, without even an inclination of the head, and the lad instantly departed, without seeming to mind in the least the long walk that he had before him. The sound of his footsteps soon died away beneath the trees that border the swiftly flowing river.

Hulda still stood gazing at Ole's letter. Think of it! This frail envelope must have crossed the broad ocean to reach her, the broad ocean in which the rivers of western Norway lose themselves. She examined the different postmarks. Though mailed on the 15th of March, the missive had not reached Dal until the 15th of April. Why! a month had already elapsed since the letter was written! How many things might have happened in a month on the shores of Newfoundland! Was it not still winter, the dangerous season of equinoxes? Are not these fishing banks the most dangerous in the world, swept by terrible gales from the North Pole? A perilous and arduous vocation was this business of fishing which Ole followed! And if he followed it was it not that she, his betrothed, whom he was to marry on his return, might reap the benefits?

Poor Ole! What did he say in this letter? Doubtless that he loved Hulda as faithfully and truly as Hulda loved him, that they were united in thought, in spite of the distance that separated them, and that he longed for the day of his return to Dal.

Yes, he said all this, Hulda was sure of it. But perhaps he might add that the day of his return was near at hand--that the fishing cruise which had enticed the inhabitants of Bergen so far from their native land, was nearly at an end. Perhaps Ole would tell her that the "Viking" had finished taking aboard her cargo, that she was about to sail, and that the last days of April would not pass without a blissful meeting in the pleasant home at Vesfjorddal. Perhaps, too, he would assure her, at last, that she might safely appoint the day for the pastor to come to Moel to unite them in the little chapel whose steeple rose from a small grove not a hundred yards from Dame Hansen's inn.

To learn all this, it might only be necessary to break the seal, draw out Ole's letter, and read it, through the tears of joy or sorrow that its contents would be sure to bring to Hulda's eyes, and doubtless more than one impatient girl of the south, or even of Denmark or Holland, would already have known all! But Hulda was in a sort of a dream, and dreams terminate only when God chooses to end them, and how often one regrets them, so bitter is the reality.

"Is it really a letter from Ole that your brother has sent you, my daughter?" inquired Dame Hansen.
"Yes; I recognize the handwriting."
"Well, are you going to wait until to-morrow to read it?"

Hulda took one more look at the envelope, then, after slowly breaking the seal, she drew out the carefully written letter, which read as follows:

"Saint-Pierre-Miquelon, March 17th, 1862.

"My Dearest Hulda,--You will hear, with pleasure, that our fishing venture has prospered, and that it will be concluded in a few days. Yes; we are nearing the end of the season, and after a year's absence how glad I shall be to return to Dal and find myself in the midst of the only friends I have in the world--yours and mine.

"My share in the profits of the expedition amounts to quite a handsome sum, which will start us in housekeeping. Messrs. Help Bros., the owners of the ship, have been informed that the 'Viking' will probably return by the 15th or 20th of May; so you may expect to see me at that time; that is to say, in a few weeks at the very longest.

"My dear Hulda, I trust to find you looking even prettier than at my departure, and in the best of health, you and your mother as well, also that hardy, brave comrade, my cousin Joel, your brother, who asks nothing better than to become mine.

"On receipt of this, give my very best respects to Dame Hansen--I can see her now, sitting in her wooden armchair by the old stove in the big hall--and tell her I love her with a twofold love, for she is my aunt as well as your mother.

"Above all, don't take the trouble to come to Bergen to meet me, for it is quite possible that the 'Viking' will arrive at an earlier date than I have mentioned. However that may be, my dear Hulda can count upon seeing me at
We have had a pretty rough time of it, this past winter, the weather having been more severe than any our fishermen have ever encountered; but fortunately fish have been plenty. The 'Viking' brings back nearly five thousand quintals, deliverable at Bergen, and already sold by the efforts of Help Bros. And last, but not least, we have succeeded in selling at a handsome profit, and I, who have a share in the venture, will realize something quite handsome from it.

Besides, even if I should not bring a small competence home with me, I have an idea, or rather, I have a presentiment that it is awaiting me on my return. Yes; comparative wealth, to say nothing of happiness! In what way? That is my secret, my dearest Hulda, and you will forgive me for having a secret from you! It is the only one! Besides, I will tell you all about it. When? Well, as soon as an opportunity offers--before our marriage, if it should be delayed by some unforeseen misfortune--afterward, if I return at the appointed time, and you become my wife within a week after my arrival, as I trust you will.

A hundred fond kisses, my darling Hulda. Kiss Dame Hansen, and Joel, too, for me. In fancy, I imprint another kiss upon your brow, around which the shining crown of the brides of the Telemark will cast a saint-like halo. Once more, farewell, dearest Hulda, farewell!

"Your devoted lover,
"OLE KAMP."

CHAPTER II.

Dal is a modest hamlet consisting of but a few houses; some on either side of a road that is little more than a bridle-path, others scattered over the surrounding hills. But they all face the narrow valley of Vesfjorddal, with their backs to the line of hills to the north, at the base of which flows the Maan.

A little church erected in 1855, whose chancel is pierced by two narrow stained-glass windows, lifts its square belfry from out a leafy grove hard by. Here and there rustic bridges cross the rivulets that dance merrily along toward the river. In the distance are two or three primitive saw-mills, run by water-power, with a wheel to move the saw, as well as a wheel to move the beam or the tree; and seen from a little distance, the chapel, saw-mills, houses, and cabins, all seem to be enveloped in a soft olive haze that emanates from the dark-green firs and the paler birches which either singly or in groups extend from the winding banks of the Maan to the crests of the lofty mountains.

Such is the fresh and laughing hamlet of Dal, with its picturesque dwellings, painted, some of them, in delicate green or pale pink tints, others in such glaring colors as bright yellow and blood-red. The roofs of birch bark, covered with turf, which is mown in the autumn, are crowned with natural flowers. All this is indescribably charming, and eminently characteristic of the most picturesque country in the world. In short, Dal is in the Telemark, the Telemark is in Norway, and Norway is in Switzerland, with thousands of fiords that permit the sea to kiss the feet of its mountains.

The Telemark composes the broad portion of the immense horn that Norway forms between Bergen and Christiania.

This dependency of the prefecture of Batsberg, has the mountains and glaciers of Switzerland, but it is not Switzerland. It has gigantic water-falls like North America, but it is not America. The landscape is adorned with picturesque cottages, and processions of inhabitants, clad in costumes of a former age, like Holland, but it is not Holland. The Telemark is far better than any or all of these; it is the Telemark, noted above all countries in the world for the beauty of its scenery. The writer has had the pleasure of visiting it. He has explored it thoroughly, in a kariol with relays of post-horses--when he could get them--and he brought back with him such a vivid recollection of its manifold charms that he would be glad to convey some idea of it to the reader of this simple narrative.

At the date of this story, 1862, Norway was not yet traversed by the railroad that now enables one to go from Stockholm to Dronthem, by way of Christiania. Now, an extensive network of iron rails extends entirely across these two Scandinavian countries, which are so averse to a united existence. But imprisoned in a railroad-carriage, the traveler, though he makes much more rapid progress than in a kariol, misses all the originality that formerly pervaded the routes of travel. He misses the journey through Southern Sweden on the curious Gotha Canal, in which the steamboats, by rising from lock to lock, manage to reach an elevation of three hundred feet. Nor does he have an opportunity to visit the falls of Trolletann, nor Drammen, nor Kongsberg, nor any of the beauties of the Telemark.

In those days the railroad existed only upon paper. Twenty years were to elapse before one could traverse the Scandinavian kingdom from one shore to the other in forty hours, and visit the North Cape on excursion tickets to Spitzberg.

In those days Dal was, and may it long remain, the central point for foreign or native tourists, these last being for the most part students from Christiania. From Dal they could wander over the entire Telemark and Hardanger
region, explore the valley of Vesfjorddal between Lakes Mjos and Tinn, and visit the wonderful cataracts of the Rjukan Tun. The hamlet boasts of but one inn, but that is certainly the most attractive and comfortable imaginable, and one of the most important also, for it can offer four bed-chambers for the accommodation of its guests. In a word, it is Dame Hansen's inn.

A few benches surround the base of its pink walls, which are separated from the ground by a substantial granite foundation. The spruce rafters and weather-boarding have acquired such hardness and toughness with age that the sharpest hatchet can make little or no impression upon them. Between the roughly hewn rafters, which are placed horizontally one above the other, a mixture of clay and turf forms a stanch roof, through which the hardest winter rains can not force their way.

Upstairs, in the bedrooms, the ceilings are painted in dark red or black tints to contrast with the more cheerful and delicate hues of the wood-work.

In one corner of the large hall stands a huge cylinder stove, the pipe of which rises nearly to the ceiling, before it disappears in the kitchen chimney. In another corner stands a tall clock which emits a sonorous tick-tack, as its carved hands travel slowly around its enameled face. Here is a secretary, black with age, side by side with a massive iron tripod. Upon the mantel is an immense terra-cotta candlestick which can be transformed into a three-branched candelabrum by turning it upside down. The handsomest furniture in the house adorns this spacious hall--the birch-root table, with its spreading feet, the big chest with its richly wrought brass handles, in which the Sunday and holiday clothing is kept, the tall arm-chair, hard and uncomfortable as a church-pew, the painted wooden chairs, and the spinning-wheel striped with green, to contrast with the scarlet petticoat of the spinner.

Yonder stands the pot in which the butter is kept, and the paddle with which it is worked, and here is the tobacco-box, and the grater of elaborately carved bone.

And, finally, over the door which opens into the kitchen is a large dresser, with long rows of brass and copper cooking-utensils and bright-colored dishes, the little grindstone for sharpening knives, half-buried in its varnished case, and the egg-dish, old enough to serve as a chalice.

And how wonderful and amusing are the walls, hung with linen tapestries representing scenes from the Bible, and brilliant with all the gorgeous coloring of the pictures of Epinal.

As for the guests' rooms, though they are less pretentious, they are no less comfortable, with their spotless neatness, their curtains of hanging-vines that droop from the turf-covered roof, their huge beds, sheeted with snowy and fragrant linen, and their hangings with verses from the Old Testament, embroidered in yellow upon a red ground.

Nor must we forget that the floor of the main hall, and the floors of all the rooms, both upstairs and down, are strewn with little twigs of birch, pine, and juniper, whose leaves fill the house with their healthful and exhilarating odor.

Can one imagine a more charming _posada_ in Italy, or a more seductive _fonda_ in Spain? No. And the crowd of English tourists have not yet raised the scale of prices as in Switzerland--at least, they had not at the time of which I write. In Dal, the current coin is not the pound sterling, the sovereign of which the travelers' purse is soon emptied. It is a silver coin, worth about five francs, and its subdivisions are the mark, equal in value to about a franc, and the skilling, which must not be confounded with the English shilling, as it is only equivalent to a French _sou_.

Nor will the tourist have any opportunity to use or abuse the pretentious bank-note in the Telemark. One-mark notes are white; five-mark notes are blue; ten-mark notes are yellow; fifty-mark notes, green; one hundred mark notes, red. Two more, and we should have all the colors of the rainbow.

Besides--and this is a point of very considerable importance--the food one obtains at the Dal inn is excellent; a very unusual thing at houses of public entertainment in this locality, for the Telemark deserves only too well its surname of the Buttermilk Country. At Tiness, Listhus, Tinoset, and many other places, no bread is to be had, or if there be, it is of such poor quality as to be uneatable. One finds there only an oaten cake, known as _flat brod_., dry, black, and hard as pasteboard, or a coarse loaf composed of a mixture of birch-bark, lichens, and chopped straw. Eggs are a luxury, and a most stale and unprofitable one; but there is any quantity of poor beer to be had, a profusion of buttermilk, either sweet or sour, and sometimes a little coffee, so thick and muddy that it is much more like distilled soot than the products of Mocha or Rio Nunez.

In Dame Hansen's establishment, on the contrary, cellar and larder were alike well-stored. What more could the most exacting tourist ask than salmon, either salt or smoked--fresh salmon that have never tasted tainted waters, fish from the pure streams of the Telemark, fowls, neither too fat nor too lean, eggs in every style, crisp oaten and barley cakes, fruits, more especially strawberries, bread--unleavened bread, it is here, but of the very best quality--beer, and some old bottles of that Saint Julien that have spread the fame of French vineyards even to this distant land?

And this being the case, it is not strange that the inn at Dal is well and favorably known in all the countries of Northern Europe.
One can see this, too, by glancing over the register in which many travelers have not only recorded their names, but paid glowing tributes to Dame Hansen’s merits as an inn-keeper. The names are principally those of Swedes and Norwegians from every part of Scandinavia; but the English make a very respectable showing; and one of them, who had waited at least an hour for the summit of Gousta to emerge from the morning mist that enveloped it, wrote upon one of the pages:

"Patientia omnia vincit?"

CHAPTER III.

Without being very deeply versed in ethnography, one may be strongly inclined to believe, in common with many _savants_, that a close relationship exists between the leading families of the English aristocracy and the oldest families of Scandinavia. Numerous proofs of this fact, indeed, are to be found in the ancestral names which are identical in both countries. There is no aristocracy in Norway, however; still, though the democracy everywhere rules, that does not prevent it from being aristocratic to the highest degree. All are equals upon an exalted plane instead of a low one. Even in the humblest hut may be found a genealogical tree which has not degenerated in the least because it has sprung up anew in humble soil; and the walls are adorned with the proud blazons of the feudal lords from whom these plain peasants are descended.

So it was with the Hansens of Dal, who were unquestionably related, though rather remotely, to the English peers created after Rollo’s invasion of Normandy, and though rank and wealth had both departed they had at least preserved the old pride, or rather dignity, which becomes all social ranks.

It was a matter of very little consequence, however. Whether he had ancestors of lofty lineage or not, Harald Hansen was simply a village inn-keeper. The house had come down to him from his father and from his grandfather, who were widely known and respected, and after his death his widow continued the business in a way that elicited universal commendation.

Whether or not Harald had made a fortune in the business, no one was able to say; but he had been able to rear his son Joel and his daughter Hulda in comfort; and Ole Kamp, a son of his wife’s sister, had also been brought up like one of his own children. But for his uncle Harald, this orphan child would doubtless have been one of those poor creatures who come into the world only to leave it; and Ole Kamp evinced a truly filial devotion toward his parents by adoption. Nothing would ever sever the tie that bound him to the Hansen family, to which his marriage with Hulda was about to bind him still more closely.

Harald Hansen had died about eighteen months before, leaving his wife, in addition to the inn, a small farm on the mountain, a piece of property which yielded very meager returns, if any. This was especially true of late, for the seasons had been remarkably unpropitious, and agriculture of every kind had suffered greatly, even the pastures. There had been many of those “iron nights,” as the Norwegian peasants call them—nights of north-easterly gales and ice that kill the corn down to the very root—and that meant ruin to the farmers of the Telemark and the Hardanger.

Still, whatever Dame Hansen might think of the situation of affairs, she had never said a word to any living soul, not even to her children. Naturally cold and reserved, she was very uncommunicative—a fact that pained Hulda and Joel not a little. But with that respect for the head of the family innate in Northern lands, they made no attempt to break down a reserve which was eminently distasteful to them. Besides, Dame Hansen never asked aid or counsel, being firmly convinced of the infallibility of her own judgment, for she was a true Norwegian in that respect.

Dame Hansen was now about fifty years old. Advancing age had not bowed her tall form, though it had whitened her hair; nor had it dimmed the brightness of her dark-blue eyes, whose azure was reflected in the clear orbs of her daughter; but her complexion had taken on the yellow hue of old parchment, and a few wrinkles were beginning to furrow her forehead.

The madame, as they say in Scandinavia, was invariably attired in a full black skirt, for she had never laid aside her mourning since her husband’s death. Below the shoulder-straps of a brown bodice appeared the long full sleeves of an unbleached cotton chemise. On her shoulders she wore a small dark-colored fichu that crossed upon her breast, which was also covered by the large bib of her apron. She always wore as a head-dress a close-fitting black-silk cap that covered almost her entire head, and tied behind, a kind of head-dress that is rarely seen nowadays.

Seated stiffly erect in her wooden arm-chair, the grave hostess neglected her spinning-wheel only to enjoy a small birchwood pipe, whose smoke enveloped her in a faint cloud.

Really, the house would have seemed very gloomy had it not been for the presence of the two children.

A worthy lad was Joel Hansen. Twenty-five years of age, well built, tall, like all Norwegian mountaineers, proud in bearing, though not in the least boastful or conceited. He had fine hair, verging upon chestnut, with blue eyes so dark as to seem almost black. His garb displayed to admirable advantage his powerful shoulders, his broad chest, in which his lungs had full play, and stalwart limbs which never failed him even in the most difficult mountain ascents.
His dark-blue jacket, fitting tightly at the waist, was adorned on the shoulders with epaulets, and in the back with designs in colored embroidery similar to those that embellish the vests of the Breton peasantry. His yellow breeches were fastened at the knee by large buckles. Upon his head he wore a broad-brimmed brown hat with a red-and-black band, and his legs were usually incased either in coarse cloth gaiters or in long stout boots without heels.

His vocation was that of a mountain guide in the district of the Telemark, and even in the Hardanger. Always ready to start, and untiring in his exertions, he was a worthy descendant of the Norwegian hero Rollo, the walker, celebrated in the legends of that country. Between times he accompanied English sportsmen who repair to that region to shoot the riper, a species of ptarmigan, larger than that found in the Hebrides, and the jerpir, a partridge much more delicate in its flavor than the grouse of Scotland. When winter came, the hunting of wolves engrossed his attention, for at that season of the year these fierce animals, emboldened by hunger, not unfrequently venture out upon the surface of the frozen lake. Then there was bear hunting in summer, when that animal, accompanied by her young, comes to secure its feast of fresh grass, and when one must pursue it over plateaus at an altitude of from ten to twelve thousand feet. More than once Joel had owed his life solely to the great strength that enabled him to endure the embraces of these formidable animals, and to the imperturbable coolness which enabled him to eventually dispatch them.

But when there was neither tourist nor hunter to be guided through the valley of the Vesfjorddal, Joel devoted his attention to the _soetur_, the little mountain farm where a young shepherd kept guard over half a dozen cows and about thirty sheep--a _soetur_ consisting exclusively of pasture land.

Joel, being naturally very pleasant and obliging, was known and loved in every village in the Telemark; but two persons for whom he felt a boundless affection were his cousin Ole and his sister Hulda.

When Ole Kamp left Dal to embark for the last time, how deeply Joel regretted his inability to dower Hulda and thus avert the necessity for her lover's departure! In fact, if he had been accustomed to the sea, he would certainly have gone in his cousin's place. But money was needed to start them in housekeeping, and as Dame Hansen had offered no assistance, Joel understood only too well that she did not feel inclined to devote any portion of the estate to that purpose, so there was nothing for Ole to do but cross the broad Atlantic.

Joel had accompanied him to the extreme end of the valley on his way to Bergen, and there, after a long embrace, he wished him a pleasant journey and a speedy return, and then returned to console his sister, whom he loved with an affection which was at the same time fraternal and paternal in its character.

Hulda at that time was exactly eighteen years of age. She was not the _piga_, as the servant in a Norwegian inn is called, but rather the _froken_, the young lady of the house, as her mother was the madame. What a charming face was hers, framed in a wealth of pale golden hair, under a thin linen cap projecting in the back to give room for the long plaits of hair! What a lovely form incased in this tightly fitting bodice of red stuff, ornamented with green shoulder-straps and surmounted by a snowy chemisette, the sleeves of which were fastened at the wrist by a ribbon bracelet! What grace and perfect symmetry in the waist, encircled by a red belt with clasps of silver filigree which held in place the dark-green skirt, below which appeared the white stocking protected by the dainty pointed toed shoe of the Telemark!

Yes, Ole's betrothed was certainly charming, with the slightly melancholy expression of the daughters of the North softening her smiling face; and on seeing her one instantly thought of Hulda the Fair, whose name she bore, and who figures as the household fairy in Scandinavian mythology.

Nor did the reserve of a chaste and modest maiden mar the grace with which she welcomed the guests who came to the inn. She was well known to the world of tourists; and it was not one of the smallest attractions of the inn to be greeted by that cordial shake of the hand that Hulda bestowed on one and all. And after having said to her, "_Tack for mad_" (Thanks for the meal), what could be more delightful than to hear her reply in her fresh sonorous voice: "_Wed bekomme_!" (May it do you good!)

CHAPTER IV.

Ole Kamp had been absent a year; and as he said in his letter, his winter's experience on the fishing banks of Newfoundland had been a severe one. When one makes money there one richly earns it. The equinocial storms that rage there not unfrequently destroy a whole fishing fleet in a few hours; but fish abound, and vessels which escape find ample compensation for the toil and dangers of this home of the tempest.

Besides, Norwegians are excellent seamen, and shrink from no danger. In the numberless fiords that extend from Christiansand to Cape North, among the dangerous reefs of Finland, and in the channels of the Lofoden Islands, opportunities to familiarize themselves with the perils of ocean are not wanting; and from time immemorial they have given abundant proofs of their courage. Their ancestors were intrepid mariners at an epoch when the Hanse monopolized the commerce of northern Europe. Possibly they were a trifle prone to indulge in piracy in days gone
by, but piracy was then quite common. Doubtless commerce has reformed since then, though one may perhaps be 
pardoned for thinking that there is still room for improvement.

However that may be, the Norwegians were certainly fearless seamen; they are to-day, and so they will ever be. Ole Kamp was not the man to belie his origin; besides, he had served his apprenticeship under his father, who was the master of a Bergen coasting vessel. His childhood had been spent in that port, which is one of the most 
frequented in Scandinavia. Before he ventured out upon the open sea he had been an untiring fisher in the fiords, and a 
fearless robber of the sea-birds' nests, and when he became old enough to serve as cabin-boy he made a voyage 
across the North Sea and even to the waters of the Polar Ocean.

Soon afterward his father died, and as he had lost his mother several years before, his uncle Harald Hansen 
invited him to become a member of his family, which he did, though he continued to follow the same calling.

In the intervals between his voyages he invariably spent his time with the friends he loved; but he made regular 
voyages upon large fishing vessels, and rose to the rank of mate when he was but twenty-one. He was now twenty-
three years of age.

When he visited Dal, Joel found him a most congenial companion. He accompanied him on his excursions to the 
mountains, and across the highest table-lands of the Telemark. The young sailor seemed as much at home in the 
fields as in the fiords, and never lagged behind unless it was to keep his cousin Hulda company.

A close friendship gradually sprung up between Joel and Ole, and quite naturally the same sentiment assumed a 
different form in respect to the young girl. Joel, of course, encouraged it. Where would his sister ever find a better 
fellow, a more sympathetic nature, a warmer and more devoted heart? With Ole for a husband, Hulda's happiness 
was assured. So it was with the entire approval of her mother and brother that the young girl followed the natural 
promptings of her heart. Though these people of the North are undemonstrative, they must not be accused of a want 
of sensibility. No! It is only their way; and perhaps their way is as good as any other, after all.

So it came to pass that one day, when all four of them were sitting quietly together, Ole remarked, without any 
preamble whatever:

"An idea occurs to me, Hulda."
"What is it?"
"It seems to me that we ought to marry."
"I think so too."
"And so do I," added Dame Hansen as coolly as if the matter had been under discussion for some time.
"I agree with you," remarked Joel, "and in that case I shall naturally become your brother-in-law."
"Yes," said Ole; "but it is probable that I shall only love you the better for it."
"That is very possible."
"We have your consent, then?"
"Upon my word! nothing would please me better," replied Joel.
"So it is decided, Hulda?" inquired Dame Hansen.
"Yes, mother," replied the girl, quietly.
"You are really willing?" asked Ole. "I have loved you a long time, Hulda, without saying so."
"And I you, Ole."
"How it came about, I really do not know."
"Nor I."
"But it was doubtless seeing you grow more beautiful and good day by day."
"That is saying a little too much, my dear Ole."
"No; I certainly ought to be able to say that without making you blush, for it is only the truth. Didn't you see that I was beginning to love Hulda, Dame Hansen?"
"I suspected as much."
"And you, Joel?"
"I was sure of it."
"Then I certainly think that you ought to have warned me," said Ole, smiling.
"But how about your voyages, Ole?" inquired Dame Hansen. "Won't they seem intolerable to you after you are married?"
"So intolerable that I shall not follow the sea any more after my marriage."
"You will not go to sea any more?"
"No, Hulda. Do you think it would be possible for me to leave you for months at a time?"
"So this is to be your last voyage?"
"Yes, and if we have tolerable luck, this voyage will yield me quite a snug little sum of money, for Help Bros. have promised me a share in the profits."
"They are good men," remarked Joel.

"The best men living," replied Ole, "and well known and highly respected by all the sailors of Bergen."

"But what do you expect to do after you cease to follow the sea, my dear Ole?" inquired Hulda.

"I shall go into partnership with Joel in his business, I have pretty good legs, and if they are not good enough, I will improve them by going into regular training. Besides, I have thought of a plan which will not prove a bad one perhaps. Why can't we establish a messenger service between Drammen, Kongsberg and a few other towns in the Telemark Communication now is neither easy nor regular, and there might be money in the scheme. Besides, I have other plans, to say nothing of--"

"Of what?"

"Never mind, now. I will tell you on my return. But I warn you that I am firmly resolved to make my Hulda the happiest woman in the country. Yes, I am."

"If you but knew how easy that will be!" replied Hulda, offering him her hand. "Am I not that already, and is there a home in all Dal as pleasant as ours?"

Dame Hansen hastily averted her head.

"So the matter is settled?" asked Ole, cheerfully.

"Yes," replied Joel.

"And settled beyond recall?"

"Certainly."

"And you feel no regret, Hulda?"

"None whatever, my dear Ole."

"I think, however, that it would be better not to appoint the day for your marriage until after your return," remarked Joel.

"Very well, but it will go hard with me if I do not return in less than a year to lead Hulda to the church at Moel, where our friend, Pastor Andersen, will not refuse to make his best prayer for us!"

And it was in this way that the marriage of Hulda Hansen and Ole Kamp had been decided upon.

The young sailor was to go aboard his vessel a week later; but before they parted the lovers were formally betrothed in accordance with the touching custom of Scandinavian countries.

In simple and honest Norway lovers are almost invariably publicly betrothed before marriage. Sometimes the marriage is not solemnized until two or three years afterward, but one must not suppose that the betrothal is simply an interchange of vows which depend only upon the honesty of the parties interested. No, the obligation is much more sacred, and even if this act of betrothal is not binding in the eyes of the law, it is, at least, so regarded by that universal law called custom.

So, in this case, it was necessary to make arrangements for a ceremony over which Pastor Andersen should preside. There was no minister in Dal, nor in any of the neighboring hamlets. In Norway they have what they call Sunday towns, in which the minister resides, and where the leading families of the parish assemble for worship. They even lease apartments there, in which they take up their abode for twenty-four hours or more--time to perform their religious duties--and people return from the town as from a pilgrimage.

Dal, it is true, boasted of a chapel, but the pastor came only when he was summoned.

After all, Moel was not far off, only about eight miles distant, at the end of Lake Tinn, and Pastor Andersen was a very obliging man, and a good walker; so the worthy minister was invited to attend the betrothal in the twofold capacity of minister and family friend. The acquaintance was one of long standing. He had seen Joel and Hulda grow up, and loved them as well as he loved that young sea-dog, Ole Kamp, so the news of the intended marriage was very pleasing to him.

So Pastor Andersen gathered together his robe, his collar, and his prayer-book, and started off for Dal one misty, moisty morning. He arrived there in the company of Joel, who had gone half-way to meet him, and it is needless to say that his coming was hailed with delight at Dame Hansen's inn, that he had the very best room in the house, and that the floor was freshly strewn with twigs of juniper that perfumed it like a chapel.

At one o'clock on the following day the little church was thrown open, and there, in the presence of the pastor and a few friends and neighbors, Ole and Hulda solemnly promised to wed each other when the young sailor should return from the last voyage he intended to make. A year is a long time to wait, but it passes all the same, nor is it intolerable when two persons can trust each other.

And now Ole could not, without good cause, forsake her to whom he had plighted his troth, nor could Hulda retract the promise she had given to Ole; and if Ole had not left Norway a few days after the betrothal, he might have profited by the incontestable right it gave him to visit the young girl whenever he pleased, to write to her whenever he chose, walk out with her arm in arm, unaccompanied by any member of the family, and enjoy a preference over all others in the dances that form a part of all fêtes and ceremonies.
But Ole Kamp had been obliged to return to Bergen, and one week afterward the “Viking” set sail for the fishing banks of Newfoundland, and Hulda could only look forward to the letters which her betrothed had promised to send her by every mail.

And these impatiently expected letters never failed her, and always brought a ray of happiness to the house which seemed so gloomy after the departure of one of its inmates. The voyage was safely accomplished; the fishing proved excellent, and the profits promised to be large. Besides, at the end of each letter, Ole always referred to a certain secret, and of the fortune it was sure to bring him. It was a secret that Hulda would have been glad to know, and Dame Hansen, too, for reasons one would not have been likely to suspect.

Dame Hansen seemed to have become even more gloomy and anxious and reticent than ever, and a circumstance which she did not see fit to mention to her children increased her anxiety very considerably.

Three days after the arrival of Ole’s last letter, as Dame Hansen was returning alone from the saw-mill, to which place she had gone to order a bag of shavings from the foreman, Lengling, she was accosted near her own door by a man who was a stranger in that part of the country.

“This is Dame Hansen, is it not?” he inquired.

“Yes; but I do not know you,” was the reply.

“That doesn’t matter,” rejoined the man. “I arrived here only this morning from Drammen, and am now on my way back.”

“From Drammen?” repeated Dame Hansen, quickly.

“You are acquainted, I think, with a certain Monsieur Sandgoist, who lives there?”

“Monsieur Sandgoist!” repeated Dame Hansen, whose face paled at the name. “Yes, I know him.”

“Ah, well! When Monsieur Sandgoist heard that I was coming to Dal, he asked me to give his respects to you.”

“Was that all?”

“And to say to you that it was more than probable that he would pay you a visit next month. Good health to you, and good-evening, Dame Hansen.”

CHAPTER V.

Hulda was considerably surprised at the persistency with which Ole alluded in his letters to the fortune that was to be his on his return. Upon what did the young man base his expectations? Hulda could not imagine, and she was very anxious to know. Was this anxiety due solely to an idle curiosity on her part? By no means, for the secret certainly affected her deeply. Not that she was ambitious, this modest and honest young girl; nor did she in looking forward to the future ever aspire to what we call wealth. Ole’s affection satisfied, and would always satisfy her. If wealth came, she would welcome it with joy. If it did not come, she would still be content.

This is precisely what Hulda and Joel said to each other the day after Ole’s last letter reached Dal. They agreed perfectly upon this subject, as upon all others, by the way. And then Joel added:

“No; it is impossible, little sister. You certainly must be keeping something from me.”

“Keeping something from you!”

“Yes; for I can not believe that Ole went away without giving you some clew to his secret.”

“Did he say anything to you about it?”

“No; but you and I are not one and the same person.”

“Yes, we are, brother.”

“I am not Ole’s betrothed, at all events.”

“Almost,” said the young girl; “and if any misfortune should befall him, and he should not return from this voyage, you would be as inconsolable as I would be, and your tears would flow quite as freely as mine.”

“Really, little sister. I forbid you to even speak of such a thing,” replied Joel. “Ole not return from his last voyage to the great fishing banks! What can have put such an idea into your head? You surely can not mean what you say, Hulda!”

“No, certainly not. And yet, I do not know. I can not drive away certain presentiments--the result, perhaps, of bad dreams.”

“Dreams are only dreams.”

“True, brother, but where do they come from?”

“From ourselves, not from heaven. You are anxious, and so your fears haunt you in your slumber. Besides, it is almost always so when one has earnestly desired a thing and the time when one’s desires are to be realized is approaching.”

“I know it, Joel.”

“Really, I thought you were much more sensible, little sister. Yes, and more energetic. Here you have just
received a letter from Joel saying that the 'Viking' will return before the end of the month, and it is now the 19th of April, and consequently none too soon for you to begin your preparations for the wedding."

"Do you really think so, Joel?"

"Certainly I think so, Hulda. I even think that we have delayed too long already. Think of it. We must have a wedding that will not only create a sensation in Dal, but in all the neighboring villages. I intend it shall be the grandest one ever known in the district, so I am going to set to work immediately."

An affair of this kind is always a momentous occasion in all the country districts of Norway, particularly in the Telemark, so that every day Joel had a conversation with his mother on the subject. It was only a few moments after Dame Hansen's meeting with the stranger, whose message had so deeply agitated her, and though she had seated herself at her spinning-wheel as usual, it would have been plain to a close observer that her thoughts were far away.

Even Joel noticed that his mother seemed even more despondent than usual, but as she invariably replied that there was nothing the matter with her when she was questioned on the subject, her son decided to speak only of Hulda's marriage.

"Mother," he began, "you, of course, recollect that Ole announced in his last letter that he should probably return to Dal in a few weeks."

"It is certainly to be hoped that he will," replied Dame Hansen, "and that nothing will occur to occasion any further delay."

"Do you see any objection to our fixing upon the twenty-fifth of May as the day of the marriage?"

"None, whatever, if Hulda is willing."

"Her consent is already given. And now I think I had better ask you, mother, if you do not intend to do the handsome thing on that occasion?"

"What do you mean by the handsome thing?" retorted Dame Hansen, without raising her eyes from her spinning-wheel.

"Why, I am anxious, if you approve, of course, that the wedding should correspond with the position we hold in the neighborhood. We ought to invite all our friends to it, and if our own house is not large enough to accommodate them, our neighbors, I am sure, will be glad to lodge our guests."

"Who will these guests be, Joel?"

"Why, I think we ought to invite all our friends from Moel, Tiness and Bamble. I will attend to that. I think, too, that the presence of Help Bros., the shipowners, would be an honor to the family, and with your consent, I repeat, I will invite them to spend a day with us at Dal. They are very fine men, and they think a great deal of Ole, so I am almost sure that they will accept the invitation."

"Is it really necessary to make this marriage such an important event?" inquired Dame Hansen, coldly.

"I think so, mother, if only for the sake of our inn, which I am sure has maintained its old reputation since my father's death."

"Yes, Joel, yes."

"And it seems to me that it is our duty to at least keep it up to the standard at which he left it; consequently, I think it would be advisable to give considerable publicity to my sister's marriage."

"So be it, Joel."

"And do you not agree with me in thinking that it is quite time for Hulda to begin her preparations, and what do you say to my suggestion?"

"I think that you and Hulda must do whatever you think necessary," replied Dame Hansen.

Perhaps the reader will think that Joel was in too much of a hurry, and that it would have been much more sensible in him to have waited until Ole's return before appointing the wedding-day, and beginning to prepare for it, but as he said, what was once done would not have to be done over again; besides, the countless details connected with a ceremonial of this kind would serve to divert Hulda's mind from these forebodings for which there seemed to be no foundation.

The first thing to be done was to select the bride's maid of honor. That proved an easy matter, however, for Hulda's choice was already made. The bride-maid, of course, must be Hulda's intimate friend, Farmer Helmboe's daughter. Her father was a prominent man, and the possessor of a very comfortable fortune. For a long time he had fully appreciated Joel's sterling worth, and his daughter Siegfrid's appreciation, though of a rather different nature, was certainly no less profound; so it was quite probable that at no very distant day after Siegfrid had served as Hulda's maid of honor, Hulda, in turn, would act in the same capacity for her friend. This is the custom in Norway, where these pleasant duties are generally reserved for married women, so it was rather on Joel's account that Siegfrid Helmboe was to serve Hulda Hansen in this capacity.

A question of vital importance to the bride-maid as well as to the bride, is the toilet to be worn on the day of the wedding.
Siegfrid, a pretty blonde of eighteen summers, was firmly resolved to appear to the best possible advantage on the occasion. Warned by a short note from her friend Hulda--Joel had kindly made himself responsible for its safe delivery--she immediately proceeded to devote her closest attention to this important work.

In the first place, an elaborately embroidered bodice must be made to incase Siegfrid's charming figure as if in a coat of enamel. There was also much talk about a skirt composed of a series of jupons which should correspond in number with the wearer's fortune, but in no way detract from her charms of person. As for jewelry, it was no easy matter to select the design of the collar of silver filigree, set with pearls, the heart-shaped ear-rings, the double buttons to fasten the neck of the chemisette, the belt of red silk or woolen stuff from which depend four rows of small chains, the finger-rings studded with tiny bangles that tinkle musically, the bracelets of fretted silver--in short, all the wealth of country finery in which gold appears only in the shape of the thinnest plating, silver in the guise of tin and pearls, and diamonds in the shape of wax and crystal beads. But what does that matter so long as the _tout ensemble_ is pleasing to the eye? Besides, if necessary, Siegfrid would not hesitate to go to the elegant stores of M. Benett, in Christiania, to make her purchases. Her father would not object--far from it! The kind-hearted man allowed his daughter full liberty in such matters; besides, Siegfrid was sensible enough not to draw too heavily upon her father's purse, though everything else was of secondary importance provided Joel would see her at her very best on that particular day.

As for Hulda, her anxiety on the subject was no less serious, for fashions are pitiless, and give, besides, not a little trouble in the selection of their wedding-toilet.

Hulda would now be obliged to abandon the long plaits tied with bright ribbons, which had heretofore hung from under her coquettish cap, the broad belt with fancy buckles that kept her apron in place upon her scarlet skirt, the girdle to which were appended several small embroidered leather cases containing a silver tea-spoon, knife, fork, needle-case and scissors--articles which a woman makes constant use of in the household.

No, on the fast approaching day of the nuptials, Hulda's hair would be allowed to float down upon her shoulders, and it was so abundant that it would not be necessary for her to have recourse to the jute switches used by Norwegian girls less favored by nature. Indeed, for her clothing, as well as for her ornaments, Hulda would only be obliged to resort to her mother's big chest. In fact, these articles of clothing are transmitted from marriage to marriage through all the different generations of the same family. So one sees reappearing again and again upon the scene the bodice embroidered in gold, the velvet sash, the skirt of striped silk, the gold chain for the neck, and the crown--the famous Scandinavian crown--carefully preserved in the most secure of all the chests, and made of pasteboard covered with embossed gilt paper, and studded with stars, or garlanded with leaves--that takes the place of the wreath of orange-blossoms worn by brides in other European countries.

In this case the crowned betrothed, as the bride is styled, would certainly do honor to her husband; and he would be worthy of her in his gay wedding suit: a short jacket trimmed with silver buttons, silk-embroidered waistcoat, tight breeches fastened at the knee with a bunch of bright ribbons, a soft felt hat, yellow top-boots, and in his belt the Scandinavian knife--the dolknife--with which the true Norwegian is always provided.

Consequently, there was plenty to occupy the attention of the young ladies for some time to come. Two or three weeks would barely suffice if they wished to have everything in readiness before Ole's return; but even if Ole should arrive sooner than he expected, and Hulda should not be quite ready, she would not be inconsolable, nor would he.

The last weeks of April and the first weeks of May were devoted to these matters. Joel assumed charge of the invitations, taking advantage of the fact that his vocation of guide gave him considerable leisure at this season of the year. One would have supposed that he had a large number of friends in Bamble, for he went there very often. He had already written to Help Bros., inviting them to attend his sister's wedding, and in accordance with his prediction, these worthy shipowners had promptly accepted the invitation.

The fifteenth of May came, and any day now they might expect Ole to alight from his kariol, throw open the door, and shout in his hearty, cheerful voice:

"It is! Here I am!"

A little patience was all that was needed now, for everything was in readiness, and Siegfrid needed only a word to appear before them in all her splendor.

The 16th and 17th passed, and still no Ole, nor did the postman bring any letter from Newfoundland.

"There is no cause for anxiety, little sister," Joel said, again and again. "A sailing-vessel is always subject to delays. It is a long way from St. Pierre-Miquelon to Bergen. How I wish the 'Viking' were a steamer and I the engine. How I would drive along against wind and tide, even if I should burst my boiler on coming into port."

He said all this because he saw very plainly that Hulda's uneasiness was increasing from day to day.

Just at this time, too, the weather was very bad in the Telemark. Violent gales swept the high table-lands, and these winds, which blew from the west, came from America.

"They ought to have hastened the arrival of the 'Viking,'" the young girl repeated again and again.
"Yes, little sister," replied Joel; "but they are so strong that they may have hindered its progress, and compelled it to face the gale. People can't always do as they like upon the sea."

"So you are not uneasy, Joel?"

"No, Hulda, no. It is annoying, of course, but these delays are very common. No; I am not uneasy, for there is really not the slightest cause for anxiety."

On the 19th a traveler arrived at the inn, and asked for a guide to conduct him over the mountains to the Hardanger, and though Joel did not like the idea of leaving Hulda, he could not refuse his services. He would only be absent forty-eight hours at the longest, and he felt confident that he should find Ole at Dal on his return, though, to tell the truth, the kind-hearted youth was beginning to feel very uneasy. Still, he started off early the next morning, though with a heavy heart, we must admit.

On the following day, at precisely one o'clock, a loud rap resounded at the door of the inn.

"It is Ole!" cried Hulda.

She ran to the door.

There, in a kariol, sat a man enveloped in a traveling-cloak, a man whose face was unknown to her.

CHAPTER VI.

"Is this Dame Hansen's inn?" he asked.

"Yes, sir," answered Hulda.

"Is Dame Hansen at home?"

"No; but she will soon return, and if you wish to speak to her--"

"I do not. There is nothing I want to say to her."

"Would you like a room?"

"Yes; the best in the house."

"Shall we prepare dinner for you?"

"As soon as possible, and see to it that everything is of the very best quality."

These remarks were exchanged between Hulda and the traveler before the latter had alighted from the kariol, in which he had journeyed to the heart of the Telemark across the forests, lakes, and valleys of Central Norway.

Every one who has visited Scandinavia is familiar with the kariol, the means of locomotion so dear to the hearts of her people. Two long shafts, between which trots a horse wearing a square wooden collar, painted yellow and striped with black, and guided with a simple rope passed, not through his mouth, but around his nose, two large, slender wheels, whose springless axle supports a small gay-colored, shell-shaped wagon-body, scarcely large enough to hold one person--no covering, no dash-board, no step--but behind, a board upon which the _skydskarl_ perches himself. The whole vehicle strongly reminds one of an enormous spider between two huge cobwebs represented by the wheels of the vehicle.

At a sign from the traveler the _skydskarl_ sprung to the horse's head, and the stranger rose, straightened himself out, and finally alighted, though not without some difficulty, judging from two or three muttered curses.

"Will they put my kariol under shelter?" he asked, curtly, pausing upon the threshold.

"Yes, sir," replied Hulda.

"And find my horse?"

"I will have him put in the stable immediately."

"Have him well cared for."

"Certainly, sir. May I ask if you intend to remain in Dal several days?"

"I don't know yet."

The kariol and horse were taken to a small barn built under the shelter of some trees at the foot of the mountain. It was the only stable connected with the inn, but it sufficed for the requirements of its guests.

In a few moments the traveler was duly installed in the best chamber, where, after removing his cloak, he proceeded to warm himself before the fire he had ordered lighted. In the meantime, Hulda, to satisfy this exacting guest, bade the _piga_ (a sturdy peasant-girl, who helped in the kitchen, and did the rough work of the inn during the summer) prepare the best dinner possible.

A strong, hardy man was this new-comer, though he had already passed his sixtieth year. Thin, slightly round-shouldered, of medium stature, with an angular head, smoothly shaven face, thin, pointed nose, small eyes that looked you through and through from behind large spectacles, a forehead generally contracted by a frown, lips too thin for a pleasant word ever to escape them, and long, crooked fingers, he was the very personification of an avaricious usurer or miser, and Hulda felt a presentiment that this stranger would bring no good fortune to Dame Hansen's house.
He was a Norwegian unquestionably, but one of the very worst type. His traveling costume consisted of a broad-brimmed, low-crowned hat, a snuff-colored suit, the breeches fastened at the knee with a leather strap, and over all a large brown cloak, lined with sheep-skin to protect its wearer from the chilly night air.

Hulda did not ask him his name, but she would soon learn it, as he would have to enter it upon the inn register.

Just then Dame Hansen returned, and her daughter announced the arrival of a guest who demanded the best room and the best food that the inn afforded, but who vouchsafed no information in regard to the probable length of his stay.

"And he did not give his name?" asked Dame Hansen.
"No, mother."
"Nor say whence he came?"
"No."
"If he is not a tourist, what can have brought him to Dal?" said Dame Hansen to herself rather than to her daughter, and in a tone that indicated some uneasiness.

But Hulda could not answer this question, as the new-comer had acquainted her with none of his plans.

About an hour after his arrival the man came out into the main hall, from which his door opened, but seeing Dame Hansen sitting there, he paused upon the threshold.

Evidently he was as much of a stranger to his hostess as his hostess was to him; but he finally walked toward her, and after a long look at her from over his spectacles:

"You are Dame Hansen, I suppose?" he said, without even touching the hat he had not yet removed from his head.
"Yes, sir."

In the presence of this man the widow, strange to say, experienced, like her daughter, an uneasiness for which she could not account, but which her guest must have noticed.

"So you are really Dame Hansen, of Dal?" he continued.
"Certainly, sir. Have you anything particular to say to me?"
"Nothing; I only wished to make your acquaintance. Am I not your guest? And now I should like you to see that I have my dinner as soon as possible."
"Your dinner is ready," interposed Hulda, "and if you will step into the dining-room--"
"I will."

As he spoke, the stranger directed his steps toward the door indicated, and a moment afterward he was seated near the window in front of a small, neatly spread table.

The dinner was certainly good. The most fastidious traveler could not have found fault with it; nevertheless, this ill-tempered individual was not sparing in his signs and words of dissatisfaction--especially signs, for he did not appear to be very loquacious. One could hardly help wondering whether this fault-finding was due to a poor digestion or a bad temper. The soup of cherries and gooseberries did not suit him, though it was excellent, and he scarcely tasted his salmon and salt-herring. The cold ham, broiled chicken and nicely seasoned vegetables did not seem to please him, and his bottle of claret and his half bottle of champagne seemed to be equally unsatisfactory, though they came from the best cellars in France; and when the repast was concluded the guest had not even a "_tack for mad_" for his hostess.

After dinner the old curmudgeon lighted his pipe and went out for a walk along the river bank.

On reaching the stream he turned and fixed his eyes upon the inn. He seemed to be studying it under all its varied aspects, as if trying to form a correct estimate of its value.

He counted every door and window, and finally on his return to the inn he stuck his knife into the horizontal beams at its base, as if to test the quality of the wood and its state of preservation. Could it be that he was trying to find out how much Dame Hansen's inn was really worth? Did he aspire to become the owner of it, though it was not for sale? All this was certainly very strange, especially as he afterward turned his attention to the little yard, the trees and shrubs of which he counted carefully, and finally measured both sides of the inclosure with regular strides, after which the movement of his pencil over a page of his memorandum-book seemed to indicate that he was multiplying one by the other.

All the while Dame Hansen and her daughter were watching him from one of the windows of the inn. What strange creature was this, and what could be the object of his visit? It was greatly to be regretted that all this took place during Joel's absence, especially as the eccentric individual was going to spend the night at the inn.

"What if he is a madman?" said Hulda.
"A madman? no," replied Dame Hansen. "But he is a very eccentric person, to say the least."
"It is always unpleasant to be ignorant of the name of the person you are entertaining," remarked the young girl.
"Before he re-enters the house, Hulda, be sure that you carry the register into his room. Perhaps he will conclude
to write his name in it."

"Yes, mother."

Just at dusk a fine rain began to fall, so the stranger returned to the inn. He asked for a small glass of brandy, then without saying a word, or even bidding any one good-night, he took his wooden candlestick, and entering his room bolted the door behind him, and nothing further was heard from him that night.

The _skydskarl_ had taken refuge in the barn, where he was already sound asleep in company with the sorrel horse.

Dame Hansen and her daughter rose with the sun the next morning, but no sound came from the room of their guest, who was probably still sleeping. A little after nine o'clock he made his appearance even more glum and ill-tempered than the evening before, complaining that his bed had been hard, and that the noise in the house had kept him awake; then he opened the door and looked out at the sky.

The prospect was not very cheering, certainly, for the wind was blowing a gale, and the stranger concluded not to venture out. Still he did not waste his time. With his pipe in his mouth he walked about the inn as if trying to familiarize himself with the arrangement of the interior. He visited all the different rooms, examined the furniture, and peered into cupboards and sideboards with as much coolness as if he had been in his own house.

Though the man was singular in appearance, his actions were certainly even more singular. Finally he seated himself in the big arm-chair, and proceeded to question Dame Hansen in a curt, almost rude tone. How long had the inn been built? Was it her husband that built it, or did he inherit it? How much land was there around it, and what was the extent of the adjoining _souter_? Was the inn well patronized, and did it pay well? How many tourists came there on an average during the summer? Did they usually spend one or several days there? etc., etc.

It was evident that the stranger had not looked at the register that had been placed in his room, for that would have given him all the information he desired upon this last point.

In fact, the book was still on the table where Hulda had placed it the evening before, and the traveler's name was not in it.

"I do not understand how and why these matters can interest you, sir," said Dame Hansen at last; "but if you wish to know the state of our business, nothing could be easier. You have only to examine the register, in which you would greatly oblige me by entering your name according to custom."

"My name? I will write my name in it, certainly. I will write it there before I leave, which will be immediately after breakfast, as I am anxious to get back to Drammen by to-morrow evening."

"Drammen!" repeated Dame Hansen, hastily.

"Yes. Will you give me my breakfast as soon as possible?"

"Do you live in Drammen?"

"Yes. May I ask if there is anything astonishing about the fact that I reside in Drammen?"

So, after spending scarcely twenty-four hours in Dal, or rather at the inn, the traveler left without making the slightest effort to see anything of the surrounding country, Gousta, and Rjukanfos, and the wonders of the valley of the Vesfjorddal were entirely ignored.

It certainly could not have been for pleasure that he left Drammen, so he must have come on business, and the sole object of his visit seemed to have been a careful examination of Dame Hansen's establishment.

It was plain to Hulda that her mother was deeply troubled, for she seated herself in her big arm-chair, and pushing aside her spinning-wheel, remained there silent and motionless.

In the meantime the traveler had gone into the dining-room and seated himself at the table. Though the breakfast was as carefully prepared as the dinner of the evening before, it seemed to give no better satisfaction; and yet the guest eat and drank in the same leisurely fashion. His attention seemed to be chiefly bestowed upon the silver—a luxury highly prized among Norwegian peasants, where the few forks and spoons which are handed down from father to son are carefully preserved with the family jewels.

Meanwhile the _skydskarl_ busied himself with his preparations for departure; and by eleven o'clock the horse and kariol were standing before the door of the inn.

The weather was still threatening; the sky was dull and overcast, and now and then big drops of rain dashed against the window-panes; but this traveler with his heavy cloak lined with sheep-skin was not a man to worry about the weather.

Breakfast over, he called for one more glass of brandy, lighted his pipe, and put on his coat, then stepping out into the hall he called for his bill.

"I will make it out immediately," replied Hulda, seating herself at a small desk.

"Be quick about it," said the traveler. "And now," he added, "you had better bring me your book so I can write my name in it."

Dame Hansen rose and left the room to get the register, which, on her return, she placed upon the large table.
The stranger picked up a pen and took one more long look at Dame Hansen over his spectacles; then he wrote his name in a large, round hand, and closed the book.

Just at that moment Hulda handed him his bill. He took it, examined each item separately, and then proceeded to add up the figures, grumbling all the while.

"Hum!" he exclaimed. "This is very dear! Seven marks and a half for a night's lodging and two meals!"

"You forget the _skydskarl_ and the horse," remarked Hulda.

"Nevertheless, I think your charge very high. I really don't see how you can expect to prosper if you are so exorbitant in your charges."

"You owe me nothing, sir," said Dame Hansen, in a voice that trembled so that it was scarcely audible.

She had just opened the register and read the name inscribed upon it, and now taking the bill and tearing it up, she repeated:

"You owe me nothing."

"That is exactly my opinion," replied the stranger.

And without bidding them good-bye on his departure any more than he had bidden them good-day on his arrival, he climbed into his kariol, and the _skydskarl_ jumped upon the board behind him. A few seconds later he had disappeared around a turn in the road. When Hulda opened the book she found there only this name--

"Sandgoist, from Drammen."

CHAPTER VII.

It was on the afternoon of the following day that Joel was to return home; and Hulda, who knew that her brother would come back by the table-lands of the Gousta and along the left bank of the Maan, went to meet him at the ferry across that impetuous stream. On arriving there she seated herself on the little wharf which serves as a landing-place for the ferry-boat, and abandoned herself to her thoughts.

To the deep uneasiness caused by the non-arrival of the "Viking" was now added another great anxiety. This last was caused by the mysterious visit of Sandgoist, and Dame Hansen's agitation in his presence. Why had she destroyed the bill and declined to accept the money due her as soon as she learned her guest's name? There must be some secret concealed under all this--and a grave one.

Hulda was finally aroused from her reverie by the approach of Joel. She first caught a glimpse of him as he was descending the topmost slope; soon he reappeared in the midst of a narrow clearing between the burned and fallen trees. Then he vanished from sight behind a clump of pines, and at last reached the opposite bank and jumped aboard the ferry-boat. With a few vigorous strokes of the oar he propelled the boat swiftly through the rapids, and then leaped upon the little pier beside his sister.

"Has Ole returned?" he asked, hastily.

It was of Ole that he thought first of all; but his question remained unanswered.

"Have you received no letter from him?"

"Not one."

And Hulda burst into tears.

"Don't cry, little sister," exclaimed Joel, "don't cry. You make me wretched. I can not bear to see you weep. Let me see! You say you have received no letter. The matter is beginning to look a little serious, I must admit, though there is no reason to despair as yet. If you desire it, I will go to Bergen, and make inquiries there. I will call on Help Bros. Possibly they may have some news from Newfoundland. It is quite possible that the 'Viking' may have put into some port for repairs, or on account of bad weather. The wind has been blowing a hurricane for more than a week, and not unfrequently ships from Newfoundland take refuge in Iceland, or at the Faroe Islands. This very thing happened to Ole two years ago, when he was on board the 'Strenna,' you remember. I am only saying what I really think, little sister. Dry your eyes. If you make me lose heart what will become of us?"

"But I can't help it, Joel."

"Hulda! Hulda! do not lose courage. I assure you that I do not despair, not by any means."

"Can I really believe you, Joel?"

"Yes, you can. Now, to reassure you, shall I start for Bergen to-morrow morning, or this very evening?"

"No, no, you must not leave me! No, you must not!" sobbed Hulda, clunging to her brother as if he was the only friend she had left in the world.

They started toward the inn. Joel sheltered his sister from the rain as well as he could, but the wind soon became so violent that they were obliged to take refuge in the hut of the ferryman, which stood a few hundred yards from the bank of the Maan.

There they were obliged to remain until the wind abated a little, and Joel was glad of an opportunity to have a
longer conversation with his sister.

"How does mother seem?" he inquired.
"Even more depressed in spirits than usual," replied Hulda.
"Has any one been here during my absence?"
"Yes, one traveler, but he has gone away."
"So there is no tourist at the inn now, and no one has asked for a guide?"
"No, Joel."

"So much the better, for I would much rather not leave you. Besides, if this unpleasant weather continues, it is not likely that many tourists will visit the Telemark this season. But tell me, was it yesterday that your guest left Dal?"
"Yes, yesterday morning."
"Who was he?"
"A man who resides in Drammen, and whose name is Sandgoist."
"Sandgoist?"
"Do you know him?"
"No."

Hulda had asked herself more than once if she should tell her brother all that had occurred in his absence. When Joel heard how coolly their guest had conducted himself, and how he seemed to have come merely to appraise the house and its contents, what would he think? Would not he, too, fear that his mother must have had grave reasons for acting as she had? What were these reasons? What could there be in common between her and Sandgoist? Joel would certainly desire to know, and would be sure to question his mother, and as Dame Hansen, who was always so uncommunicative, would doubtless persist in the silence she had maintained hitherto, the relations between her and her children, which were so unnatural and constrained now, would become still more unpleasant.

But would Hulda be able to keep anything from Joel? A secret from him! Would it not be a violation of the close friendship that united them? No, this friendship must never be broken! So Hulda suddenly resolved to tell him all.

"Have you ever heard any one speak of this Sandgoist when you were in Drammen?" she asked.
"Never."
"But our mother knew him, Joel; at least by name."
"She knew Sandgoist?"
"Yes."

"I certainly never heard the name before."
"But she has, though she had never seen the man until day before yesterday."

Then Hulda related all the incidents that had marked Sandgoist's sojourn at the inn, not neglecting to mention Dame Hansen's singular conduct at the moment of his departure. Then she hastened to add:

"I think, Joel, it would be best not to say anything to mother about it at present. You know her disposition, and it would only make her still more unhappy. The future will probably reveal what has been concealed from us in the past. Heaven grant that Ole may be restored to us, and then if any misfortune should befall the family there will at least be three of us to share it."

Joel had listened to his sister with profound attention. Yes, it was evident that Dame Hansen must be at this man's mercy, and it was impossible to doubt that he had come to take an inventory of the property. And the destruction of the bill at the time of his departure—a destruction that seemed only right and proper to him—what could be the meaning of that?

"You are right, Hulda," said Joel. "I had better not say anything to mother about it. Perhaps she will feel sorry by and by that she has not confided in us. Heaven grant that it may not be too late! She must be wretched, poor woman! How strange it is that she can not understand that her children were born to sympathize with her."

"She will find it out some day, Joel."
"Yes; so let us wait patiently, little sister. Still, there is no reason why I should not try to find out who the man is. Perhaps Farmer Helmboe knows him. I will ask him the first time I go to Bamble, and if need be I will push on to Drammen. There it will not be difficult for me to at least learn what the man does, and what people think of him—what could be the meaning of that?

"They do not think well of him, I am sure," replied Hulda. "His face is very unprepossessing, and I shall be very much surprised if there is a noble soul concealed under such a repulsive exterior."

"Come, come, little sister, it will not do to judge people by outward appearances," exclaimed Joel. "Don't be so suspicious, Hulda, and cheer up. Ole will soon be with us, and we will scold him roundly for having kept us waiting."

The rain having ceased the pair left the hut and started up the path leading to the inn.
"By the way, I must go away again to-morrow, little sister," said Joel.
"Go away again to-morrow!" repeated Hulda.
"Yes, early in the morning. On leaving the Hardanger I was informed by a comrade that a traveler, coming from
the north by way of the Rjukanfos would arrive to-morrow."
"Who is this traveler?"
"I don't know his name, but I must be on hand to conduct him to Dal."
"Ah, well! go, then, as there is no help for it," replied Hulda, with a sigh.
"Yes, I must start to-morrow at sunrise. Do you really feel so badly about it, Hulda?"
"Yes, brother, I feel much more unhappy when you leave me, even if it is only for a few hours."
"Ah, well, this time I shall not go alone."
"Why, who is to accompany you?"
"You, little sister. You need diversion, and I am going to take you with me."
"Oh, thank you, Joel, thank you!"

CHAPTER VIII.
The brother and sister left the inn at sunrise the next morning. The fifteen mile walk from Dal to the celebrated
falls of the Rjukan, and back again, was a mere trifle for Joel, but it was necessary to economize Hulda's strength, so
Joel hired foreman Lengling's kariol. This, like all kariols, had but one seat, but the worthy man was so large that he
had been obliged to have his kariol built to order, and this being the case the vehicle was large enough to enable
Hulda and Joel to sit side by side quite comfortably; and if the expected tourist was waiting for them at Rjukanfos as
they anticipated, he could take Joel's place and the latter could either return afoot or mounted upon the step behind
the kariol.

The road from Dal to the falls is very rough but indescribably charming. It is really rather a footpath than a road.
The bridges across the countless streams that dance merrily along to the Maan are all constructed of unhewn logs,
but the Norwegian horse traverses them with a sure step, and though the kariol has no springs, its long and slightly
elastic shafts soften the jolting at least to some extent.

The day was charming, and Hulda and Joel drove along at a brisk pace through the flowery fields, bathed on the
left by the clear waters of the Maan. Clumps of birches here and there shaded the sunny road, and the dew still
glittered on the blades of grass. To the right of the torrent towered the snow-clad summit of the Gousta, which rises
to an altitude of six thousand feet.

For nearly an hour, the vehicle moved on rapidly, the ascent being comparatively slight; but soon the valley
became narrower, the gay rivulets were transformed into foaming torrents, and though the road wound in and out it
could not avoid all the inequalities of the ground. Beyond came really dangerous passes, through which Joel guided
the vehicle with no little skill; besides, with him Hulda feared nothing. When the road was very rough she clung to
his arm, and the freshness of the morning air brought a glow to the pretty face which had been unusually pale for
some time.

But it was necessary for them to ascend to still greater heights, for the valley here contracted into merely a
narrow channel for the passage of the river, a channel inclosed on either side by massive walls of rock. Over the
neighboring fields were scattered a few dilapidated farm-houses, the remains of _soeters_, which were now
abandoned, and a few shepherd's huts almost hidden from view by clumps of birches and oaks. Soon it became
impossible for them to see the river, though they could distinctly hear it dashing along in its rocky channel, and the
country assumed an indescribably wild and imposing aspect.

A drive of two hours brought them to a rough saw-mill perched upon the edge of a water-fall at least fifteen
hundred feet in height. Water-falls of this height are by no means rare in the Vesfjorddal, but the volume of water is
usually small. This is not the case with the falls of the Rjukanfos however.

On reaching the saw-mill, Joel and Hulda both alighted.
"A half hour's walk will not be too much for you, will it, little sister?" asked Joel.
"No, brother; I am not tired, and a little exercise will do me good."
"It will be a good deal instead of a little, for you will have some pretty hard climbing to do."
"I can cling to your arm, Joel."

It was evident that the kariol must be abandoned at this point, for it would be impossible for it to make its way
through the rough paths, the narrow passes, and over the big, fantastically shaped rocks that heralded the close
proximity of the great falls.

Already, they could see in the distance a thick mist, the spray from the seething waters of Rjukan.
Hulda and Joel took a shady path which is well known to guides, and which leads to the end of the valley. A few
moments afterward they found themselves upon a moss-covered rock almost in front of the fall. In fact there was no
chance of getting any nearer to it on that side.

The brother and sister would have had considerable difficulty in making themselves heard if they had wished to speak; but their thoughts were those that could be exchanged without the agency of the lips.

The volume of the Rjukan fall is enormous, its height very considerable, and its roar deafening. The earth makes an abrupt descent of nine hundred feet to the bed of the Maan midway between Lake Mjos and Lake Tinn, nine hundred feet, that is to say six times the height of Niagara, though the width of this last water-fall from the American to the Canadian shore is three miles.

The Rjukan is so grand and unique in its aspect that any description falls far short of the reality, and even a painting can not do justice to it. There are certain wonders of nature that must be seen if one would form any adequate conception of their beauty; and this water-fall, which is one of the most widely celebrated in Europe, belongs to this category.

These were the very thoughts that were passing through the mind of a tourist who was at that very moment sitting perched upon a rock on the right bank of the Maan, from which spot he could command a nearer and more extended view of the fall.

Neither Joel nor his sister had yet noticed him, though he was plainly visible from the rock on which they were seated.

In a few minutes the traveler rose and very imprudently ventured out upon the rocky slope that is rounded like a dome on the side next the Maan. What the adventurous tourist wished to see was evidently the two caverns under the fall, the one to the left, which is ever filled to the top with a mass of seething foam, and the one to the right, which is always enshrouded in a heavy mist. Possibly he was even trying to ascertain if there were not a third cavern midway down the fall to account for the fact that the Rjukan at intervals projects straight outward into space a mass of water and spray, making it appear as if the waters had suddenly been scattered in a fine spray over the surrounding fields by some terrific explosion in the rear of the fall.

And now the daring tourist was slowly but persistently making his way over the rough and slippery ledge of rock, destitute alike of shrubbery or grass, know as the Passe de Marie, or the Maristien.

It is more than probable, however, that he was ignorant of the legend that has made this pass so widely know. One day Eystein endeavored to reach his betrothed, the beautiful Marie of Vesfjorddal, by this dangerous path. His sweetheart was holding out her arms to him from the other side of the gorge, when suddenly he lost his footing, fell, slipped further and further down the ledge of rock which is as smooth as glass, and disappeared forever in the seething rapids of the Maan.

Was this rash traveler about to meet a similar fate?

It seemed only too probable; and in fact he soon perceived the danger of his position, though not until it was too late. Suddenly his foot slipped, he uttered a cry, and after rolling nearly twenty feet, he finally succeeded in securing a hold upon a projecting rock on the very edge of the abyss.

Joel and Hulda, though they had not yet caught sight of him, heard his cry.

"What is that?" exclaimed Joel, springing to his feet.

"A cry!" replied Hulda.

"Yes, a cry of distress."

"From what direction did it come?"

"Let us listen."

Both looked first to the right, and then to the left of the fall, but they saw nothing, though they had certainly heard the words "Help! help!" uttered during one of the intervals between each rebound of the Rjukan.

The cry was repeated.

"Joel, some one who is in danger is calling for help," cried Hulda. "We must go to his aid."

"Yes, sister; and he can not be far off. But in what direction? Where is he? I see no one."

Hulda hastily climbed a little knoll behind the mossy rock upon which she had been sitting.

"Joel!" she cried, suddenly.

"Do you see him?"

"There, there!"

As she spoke she pointed to the imprudent man whose body seemed to be almost overhanging the abyss. If his foothold upon a tiny ledge of rock failed him, or he was seized with dizziness, he was lost.

"We must save him!" said Hulda.

"Yes," replied Joel, "if we can keep our wits about us we shall perhaps be able to reach him."

Joel gave a loud shout to attract the attention of the traveler, who immediately turned his head toward the spot from which the sound proceeded; then the worthy fellow devoted a few moments to deciding how he could best rescue the stranger from his dangerous position.
"You are not afraid, are you, Hulda?" he asked.
"No, brother."
"You know the Maristien well, do you not?"
"I have crossed it several times."
"Then walk along the brow of the cliff, gradually getting as near the traveler as you possibly can; then allow yourself to slide down gently toward him, and take him by the hand, so as to prevent him from falling any further; but do not let him try to lift himself up, because if he should be seized with vertigo he would certainly drag you down with him, and you would both be lost."
"And you, Joel?"
"While you are traversing the brow of the cliff I will creep along the edge of it on the river-side. I shall reach him about as soon as you do, and if you should slip I shall perhaps be able to prevent you both from falling."
Then, taking advantage of another interval in the roaring of the torrent, Joel shouted in stentorian tones:
"Don't move, sir. Wait; we will try to get to you!"
Hulda had already disappeared behind the trees that crowned the ledge, in order to ascend the Maristien from the other side of the declivity, and Joel soon caught a glimpse of the fast-receding form of the brave girl at the turn in the path where the last trees grew.
He, in turn, at the peril of his life, had begun to creep slowly along the shelving edge of the ledge that surrounds the Rjukan. What wonderful coolness, what steadiness of foot and of hand were required to thus advance in safety along the edge of an abyss whose borders were drenched with the spray of the cataract!
In a parallel direction, but at least one hundred feet above his head, Hulda was advancing obliquely in order to reach the traveler more easily; but the position of the latter was such that she could not see his face, that being turned toward the cataract.
Joel, on reaching a spot directly below the unfortunate man paused, and after planting his foot firmly in a small crevice in the rock, called out:
"Hallo, sir!"
The traveler turned his head.
"Don't move, sir; don't move an inch, but hold fast!"
"I'll do that, my friend, never fear," replied the stranger in a tone that reassured Joel. "If I hadn't a good grip, I should have gone to the bottom of the Rjukan a quarter of an hour ago."
"My sister is also coming to help you," continued Joel. "She will take hold of your hand, but don't attempt to get upon your feet until I reach you. Don't even move."
"No more than a rock," replied the traveler.
Hulda had already begun to descend the ledge, carefully selecting the less slippery parts of the slope with the clear head of a true daughter of the Telemark.
And she, too, now called out as Joel had done:
"Holdfast, sir!"
The traveler turned his head.
"Yes; I am holding fast, and I assure you that I shall continue to do so as long as I can."
"And above all don't be afraid!" added Hulda.
"I am not afraid."
"We'll save you yet!" cried Joel.
"I hope so, indeed; for by Saint Olaf I shall never succeed in getting out of this scrape myself."
It was evident that the tourist had lost none of his presence of mind; but his fall had probably disabled him, and all he could do now was to keep himself upon the narrow shelf of rock that separated him from the abyss.
Meanwhile Hulda continued her descent, and in a few minutes reached the traveler; then, bracing her foot against a projecting point in the rock, she caught hold of his hand.
The traveler involuntarily attempted to raise himself a little.
"Don't move, sir, don't move," cried Hulda. "You will be sure to drag me down with you, for I am not strong enough to keep you from falling! You must wait until my brother reaches us. When he gets between us and the fall you can then try to get up."
"That is more easily said than done I fear."
"Are you so much hurt, sir? I hope you have broken no bones."
"No; but one leg is badly cut and scratched."
Joel was about twenty yards from them, the rounded shape of the brow of the cliff having prevented him from joining them at once. He was now obliged to climb this rounded surface. This was, of course, the most difficult and also the most dangerous part of his task.
"Don't make the slightest movement, Hulda!" he cried. "If you should both slip while I am not in a position to
break your fall you would both be killed."

"You need not fear that, Joel!" replied Hulda. "Think only of yourself, and may God help you!"

Joel began to crawl slowly up the rock, dragging himself along on his belly like a veritable reptile. Two or three times he narrowly escaped sliding down into the abyss below, but finally he succeeded in reaching the traveler's side.

The latter proved to be an elderly but still vigorous-looking man, with a handsome face, animated with a very genial and kindly expression.

"You have been guilty of a very imprudent act, sir," remarked Joel as soon as he recovered his breath.

"Imprudent!" repeated the traveler. "Yes, and as absurd as it was imprudent."

"You have not only risked your life, but--"

"Made you risk yours."

"Oh! that is my business," replied Joel, lightly. Then he added, in an entirely different tone: "The thing to be done now is to regain the brow of the cliff, but the most difficult part of the task is already accomplished."

"The most difficult?"

"Yes, sir. That was to reach you. Now we have only to ascend a much more gradual slope."

"Still, you had better not place much dependence upon me, my boy. I have a leg that isn't of much use to me just now, nor will it be for some time to come I fear."

"Try to raise yourself a little."

"I will gladly do so if you will assist me."

"Then take hold of my sister's arm. I will steady you and push you from below."

"Very well, my friends, I will be guided entirely by you; as you have been so kind as to come to my assistance, I can not do less than yield you implicit obedience."

Joel's plan was carried out in the most cautious manner, and though the ascent was not made without considerable difficulty and danger, all three accomplished it more easily and quickly than they had thought possible. Besides, the injury from which the traveler was suffering was neither a sprain nor dislocation, but simply a very bad abrasion of the skin; consequently, he could use his limbs to much better purpose than he had supposed, and ten minutes later he found himself safe on the other side of the Maristien.

Once there, he would have been glad to rest awhile under the pines that border the upper field of the Rjukanfos, but Joel persuaded him to make one more effort. This was to reach a hut hidden among the trees, a short distance from the rock, on which the brother and sister had seated themselves on first arriving at the fall. The traveler yielded to their solicitations, and supported on one side by Hulda, and on the other by Joel, he finally succeeded in reaching the door of the humble dwelling.

"Let us go in, sir," said Hulda. "You must want to rest a moment."

"The moment will probably be prolonged to a quarter of an hour."

"Very well, sir; but afterward you must consent to accompany us to Dal."

"To Dal? Why, that is the very place I was going to!"

"Can it be that you are the tourist who was expected from the north?" asked Joel.

"Precisely."

"Had I foreseen what was going to happen, I should have gone to the other side of the Rjukanfos to meet you."

"That would have been a good idea, my brave fellow. You would have saved me from a foolhardy act unpardonable at my age."

"Or at any age," replied Hulda.

The three entered the hut which was occupied by a family of peasants, a father and two daughters, who received their unexpected guests with great cordiality.

Joel was able to satisfy himself that the traveler had sustained no injury beyond a severe abrasion of the skin a little below the knee; but though the wound would necessitate a week's rest, the limb was neither broken nor dislocated.

Some excellent milk, an abundance of strawberries, and a little black bread were offered and accepted. Joel gave incontestable proofs of an excellent appetite, and though Hulda eat almost nothing, the traveler proved a match for her brother.

"My exertions have given me a famous appetite," he remarked; "but I must admit that my attempt to traverse the Maristien was an act of the grossest folly. To play the part of the unfortunate Eystein when one is old enough to be his father--and even his grandfather--is absurd in the highest degree."

"So you know the legend?" said Hulda.

"Of course. My nurse used to sing me to sleep with it in the happy days when I still had a nurse. Yes, I know the story, my brave girl, so I am all the more to blame for my imprudence. Now, my friends, Dal seems a long way off..."
to a cripple like myself. How do you propose to get me there?"

"Don't worry about that, sir," replied Joel. "Our kariol is waiting for us at the end of the road, about three hundred yards from here."

"Hum! three hundred yards!"

"But downhill all the way," added Hulda.

"Oh, in that case, I shall do very well if you will kindly lend me an arm."

"Why not two, as we have four at your disposal?" responded Joel.

"We will say two then. It won't cost me any more, will it?"

"It will cost you nothing."

"Except my thanks; and that reminds me that I have not yet thanked you."

"For what, sir?" inquired Joel.

"Merely for saving my life at the risk of your own."

"Are you quite ready to start?" inquired Hulda, rising to escape any further expression of gratitude.

"Certainly, certainly. I am more than willing to be guided by the wishes of the other members of the party."

The traveler settled the modest charge made by the occupants of the cottage; then, supported by Joel and Hulda, he began the descent of the winding path leading to the river bank.

The descent was not effected without many exclamations of pain; but these exclamations invariably terminated in a hearty laugh, and at last they reached the saw-mill, where Joel immediately proceeded to harness the horse into the kariol.

Five minutes later the traveler was installed in the vehicle, with Hulda beside him.

"But I must have taken your seat," he remarked to Joel.

"A seat I relinquish to you with the utmost willingness."

"But perhaps by a little crowding we might make room for you?"

"No, no, I have my legs, sir—a guide's legs. They are as good as any wheels."

Joel placed himself at the horse's head, and the little party started for Dal. The return trip was a gay one, at least on the part of the traveler, who already seemed to consider himself an old friend of the Hansen family. Before they reached their destination they found themselves calling their companion M. Silvius; and that gentleman unceremoniously called them Hulda and Joel, as if their acquaintance had been one of long standing.

About four o'clock the little belfry of Dal became visible through the trees, and a few minutes afterward the horse stopped in front of the inn. The traveler alighted from the kariol, though not without considerable difficulty. Dame Hansen hastened to the door to receive him, and though he did not ask for the best room in the house, it was given to him all the same.

CHAPTER IX.

Sylvius Hogg was the name that the stranger inscribed upon the inn register, that same evening, directly underneath the name of Sandgoist, and there was as great a contrast between the two names as between the men that bore them. Between them there was nothing whatever in common, either mentally, morally, or physically. One was generous to a fault, the other was miserly and parsimonious; one was genial and kind-hearted, in the arid soul of the other every noble and humane sentiment seemed to have withered and died.

Sylvius Hogg was nearly sixty years of age, though he did not appear nearly so old. Tall, erect, and well built, healthy alike in mind and in body, he pleased at first sight with his handsome genial face, upon which he wore no beard, but around which clustered curling locks of silvery hair; eyes which were as smiling as his lips, a broad forehead that bore the impress of noble thoughts, and a full chest in which the heart beat untrammelled. To all these charms were added an inexhaustible fund of good humor, a refined and liberal nature, and a generous and self-sacrificing disposition.

Sylvius Hogg, of Christiania—no further recommendation was needed. That told the whole story. And he was not only known, appreciated, loved and honored in the Norwegian capital, but throughout the entire country, though the sentiments he inspired in the other half of the Scandinavian kingdom, that is to say in Sweden, were of an entirely different character.

This fact can easily be explained.

Sylvius Hogg was a professor of law at Christiania. In some lands to be a barrister, civil engineer, physician, or merchant, entitles one to a place on the upper rounds of the social ladder. It is different in Norway, however. To be a professor there is to be at the top of the ladder.

Though there are four distinct classes in Sweden, the nobility, the clergy, the gentry, and the peasantry, there are but three in Norway—the nobility being utterly wanting. No aristocracy is acknowledged, not even that of the office-
The people of Scandinavia are very intelligent, not only the inhabitants of the cities, but of the most remote rural districts. Their education goes far beyond reading, writing, and arithmetic. The peasant learns with avidity. His mental faculties are ever on the alert. He takes a deep interest in the public welfare and no mean part in all political and local affairs. More than half of the Storthing is made up of members of this rank in life; but they are justly noted for their remarkable good sense, acute reasoning powers, their clear though rather slow understanding, and above all, for their incorruptibility.

Sylvius Hogg was a thorough Norwegian in heart and in soul, and stoutly defended her rights upon all occasions; so, when in 1854 the Storthing was discussing the question of having neither a viceroy nor even a governor at the head of the state, he was one of the most enthusiastic champions of the measure.

Consequently, though he was by no means popular in the eastern part of Scandinavia, he was adored in the western part of it, even in the most remote hamlets. His name was a household word throughout Norway from the dunes of Christiansand to the bleak rocks of the North Cape, and so worthy was he of this universal respect that no breath of calumny had ever sullied the reputation of either the deputy or the professor. But though he was a Norwegian to the core he was a hot-blooded man, with none of the traditional coldness and apathy of his compatriots; but much more prompt and resolute in his thoughts and acts than most Scandinavians, as was proved by the quickness of his movements, the ardor of his words, and the vivacity of his gestures. Had he been born in France, one would have unhesitatingly pronounced him a Southerner.

Sylvius Hogg's fortune had never exceeded a fair competence, for he had not entered into politics for the purpose of making money. Naturally unselfish, he never thought of himself, but continually of others; nor was he tormented by a thirst for fame. To be a deputy was enough for him; he craved no further advancement.

Just at this time Sylvius Hogg was taking advantage of a three months' vacation to recuperate after a year of severe legislative toil. He had left Christiania six weeks before, with the intention of traveling through the country about Drontheim, the Hardanger, the Telemark, and the districts of Kongsberg and Drammen. He had long been anxious to visit these provinces of which he knew nothing; and his trip was consequently one of improvement and of pleasure. He had already explored a part of the region, and it was on his return from the northern districts that the idea of visiting the famous falls of the Rjukan--one of the wonders of the Telemark--first occurred to him. So, after surveying the route of the new railroad--which as yet existed only on paper--between the towns of Drontheim and Christiania, he sent for a guide to conduct him to Dal. He was to meet this guide on the left bank of the Maan; but lured on by the beauties of the Maristien, he ventured upon the dangerous pass without waiting for his guide. An unusual want of prudence in a man like him and one that nearly cost him his life, for had it not been for the timely assistance rendered by Joel and Hulda Hansen, the journey would have ended with the traveler himself in the grim depths of the Rjukanfos.
Consequently it is not at all strange that the name of Sylvius Hogg was a household word throughout Norway, and was uttered with respect even in the wilds of the Telemark; so Dame Hansen on receiving such a widely known and highly esteemed guest, thought it only proper to tell him how highly honored she felt at having him under her roof, if only for a few days.

"I don't know that I am doing you much honor, Dame Hansen," replied Sylvius Hogg, "but I do know that it gives me great pleasure to be here. I have heard my pupils talk of this hospitable inn for years. Indeed, that is one reason I intended to stop here and rest for about a week, but by Saint Olaf! I little expected to arrive here on one leg!"

And the good man shook the hand of his hostess most cordially.

"Wouldn't you like my brother to fetch a doctor from Bamble?" inquired Hulda.

"A doctor! my little Hulda! Why! do you want me to lose the use of both my legs?"

"Oh, Mr. Sylvius!"

"A doctor! Why not send for my friend, the famous Doctor Bork, of Christiania? All this ado about a mere scratch, what nonsense!"

"But even a mere scratch may become a very serious thing if not properly attended to," remarked Joel.

"Well, Joel, will you tell me why you are so very anxious for this to become serious?"

"Indeed, I am not, sir; God forbid!"

"Oh, well, He will preserve you and me, and all Dame Hansen's household, especially if pretty little Hulda here will be kind enough to give me some attention."

"Certainly, Mr. Sylvius."

"All right, my friends. I shall be as well as ever in four or five days. How could a man help getting well in such a pretty room? Where could one hope for better care than in this excellent inn? This comfortable bed, with its mottoes, is worth a great deal more than all the nauseous prescriptions of the faculty. And that quaint window overlooking the valley of the Maan! And the stream's soft, musical murmur that penetrates to the remotest corner of my cozy nest! And the fragrant, healthful scent of the pines that fills the whole house! And the air, this pure exhilarating mountain air! Ah! is not that the very best of physicians? When one needs him one has only to open the window and in he comes and makes you well without cutting off your rations."

He said all this so gayly that it seemed as if a ray of sunshine had entered the house with him. At least, this was the impression of the brother and sister, who stood listening to him, hand in hand.

All this occurred in a chamber on the first floor, to which the professor had been conducted immediately upon his arrival; and now, half reclining in a large arm-chair, with his injured limb resting upon a stool, he gratefully accepted the kindly attentions of Joel and Hulda. A careful bathing of the wound with cold water was the only remedy he would use, and in fact no other was needed.

"Thanks, my friends, thanks!" he exclaimed, "this is far better than drugs. And now do you know that but for your timely arrival upon the scene of action, I should have become much too well acquainted with the wonders of the Rjukanfoss! I should have rolled down into the abyss like a big stone, and have added another legend to those already associated with the Maristien. And there was no excuse for me. My betrothed was not waiting for me upon the opposite bank as in the case of poor Eystein!"

"And what a terrible thing it would have been to Madame Hogg!" exclaimed Hulda. "She would never have got over it."

"Madame Hogg!" repeated the professor. "Oh! Madame Hogg wouldn't have shed a tear--"

"Oh, Mister Sylvius."

"No, I tell you, for the very good reason that there is no Madame Hogg. Nor can I ever imagine what Madame Hogg would be like, stout or thin, tall or short."

"She would, of course, be amiable, intelligent and good, being your wife," replied Hulda, naïvely.

"Do you really think so, mademoiselle? Well, well, I believe you! I believe you!"

"But on hearing of such a calamity, Mister Sylvius," remarked Joel, "your relatives and many friends--"

"I have no relatives to speak of, but I have quite a number of friends, not counting those I have just made in Dame Hansen's house, and you have spared them the trouble of weeping for me. But tell me, children, you can keep me here a few days, can you not?"

"As long as you please, Mister Sylvius," replied Hulda. "This room belongs to you."

"You see, I intended to stop awhile at Dal as all tourists do, and radiate from here all over the Telemark district; but now, whether I shall radiate, or I shall not radiate, remains to be seen."

"Oh, you will be on your feet again before the end of the week, I hope, Mister Sylvius," remarked Joel.

"So do I, my boy."

"And then I will escort you anywhere in the district that you care to go."
"We'll see about that when Richard is himself again. I still have two months leave before me, and even if I should be obliged to spend the whole of it under Dame Hansen's roof I should have no cause for complaint. Could I not explore that portion of the valley of Vesfjorddal lying between the two lakes, make the ascent of Gousta, and pay another visit to the Rjukanfos? tor though I very narrowly escaped falling head foremost into its depths I scarcely got a glimpse of it, and am resolved to see it again."

"You shall do so, Mister Sylvius," replied Hulda.

"And we will visit it next time in company with good Dame Hansen if she will be kind enough to go with us. And now I think of it, my friends, I must drop a line to Kate, my old housekeeper, and Fink, my faithful old servant in Christiania. They will be very uneasy if they do not hear from me, and I shall get a terrible scolding. And now I have a confession to make to you. The strawberries and milk were delicious and extremely refreshing, but they scarcely satisfied my hunger, and as I won't submit to being put upon short allowance may I not ask if it is not nearly your dinner hour?"

"Oh! that makes no difference whatever, Mister Sylvius."

"On the contrary, it does make a great deal of difference. Do you think that I am going to sit in solitary grandeur at the table, and in my own room, all the time I stay at Dal? No, I want to take my meals with you and your mother if Dame Hansen has no objections."

Of course Dame Hansen could but assent when she was apprised of the professor's request, especially as it would be a great honor to her and hers to have a member of the Storthing at her table.

"It is settled, then, that we are to eat together in the living room," remarked Sylvius Hogg.

"Yes, Mister Sylvius," replied Joel. "I shall only have to wheel you out in your arm-chair when dinner is ready."

"Indeed, Mister Joel! Why don't you propose a kariol? No; with the aid of a friendly arm, I shall be able to reach the table. I haven't had my leg amputated yet, that I am aware of."

"As you please, Mister Sylvius," replied Hulda. "But don't be guilty of any imprudence, I beg of you, or Joel will have to hurry off in search of a doctor."

"More threats! Oh, well, I will be as prudent and docile as possible; provided you do not put me on short allowance, you will find me the most tractable of patient. Can it be that you are not hungry, my friends?"

"Give us only a quarter of an hour," replied Hulda; "and we will set before you a nice trout from the Maan, a grouse that Joel shot in the Hardanger yesterday, and a bottle of French wine."

"Thank you, my dear child, thank you!"

Hulda left the room to superintend the dinner and set the table, while Joel took the kariol back to Lengling's stable. Sylvius Hogg was left alone, and his thoughts very naturally reverted to the honest family whose guest and debtor he was. What could he do to repay Hulda and Joel for the inestimable service they had rendered him?

He had not much time for reflection, however, for scarcely ten minutes had elapsed before he was seated in the place of honor at the family table. The dinner was excellent. It corresponded with the reputation of the inn, and the professor ate very heartily.

The rest of the evening was spent in conversation in which Sylvius Hogg took the leading part. As Dame Hansen found it well-nigh impossible to overcome her habitual reserve, Joel and Hulda were obliged to respond to their genial host's advances, and the sincere liking the professor had taken to them from the very first naturally increased.

When night came, he returned to his room with the assistance of Joel and Hulda, gave and received a friendly good-night, and had scarcely stretched himself out upon the big bed before he was sound asleep.

The next morning he woke with the sun, and began to review the situation.

"I really don't know how I shall get out of the scrape," he said to himself. "One can not allow one's self to be saved from death, nursed without any other return than a mere thank you. I am under deep obligations to Hulda and Joel, that is undeniable; but the services they have rendered me are not of a kind that can be repaid with money. On the other hand, these worthy people appear to be perfectly happy, and I can do nothing to add to their happiness! Still, we shall probably have many talks together, and while we are talking, perhaps--"

During the three or four days the professor was obliged to keep his leg upon a stool he and the young Hansens had many pleasant chats together, but unfortunately it was with some reserve on the brother's and sister's part. Neither of them had much to say about their mother, whose cold and preoccupied manner had not escaped Sylvius Hogg's notice, and from a feeling of prudence they hesitated to reveal to their guest the uneasiness excited by Ole Kamp's delay, for might they not impair his good humor by telling him their troubles?

"And yet we perhaps make a great mistake in not confiding in Mister Sylvius," Joel remarked to her sister, one day. "He is a very clever man, and through his influential acquaintances he might perhaps be able to find out whether the Naval Department is making any effort to ascertain what has become of the 'Viking.'"

"You are right, Joel," replied Hulda. "I think we had better tell him all; but let us wait until he has entirely recovered from his hurt."
"That will be very soon," rejoined Joel.

By the end of the week Sylvius Hogg was able to leave his room without assistance, though he still limped a little; and he now began to spend hours on the benches in front of the house, gazing at the snow-clad summit of Gousta, while the Maan dashed merrily along at his feet.

People were continually passing over the road that led from Dal to the Rjukanfos now. Most of them were tourists who stopped an hour or two at Dame Hanson's inn either to breakfast or dine. There were also students in plenty with knapsacks on their backs, and the little Norwegian cockade in their caps.

Many of them knew the professor, so interminable greetings were exchanged, and cordial salutations, which showed how much Sylvius Hogg was loved by these young people.

"What, you here, Mister Sylvius?" they would exclaim.

"Yes, my friend."

"You, who are generally supposed to be in the remotest depths of the Hardanger!"

"People are mistaken, then. It was in the remotest depths of the Rjukanfos that I came very near staying."

"Very well, we shall tell everybody that you are in Dal."

"Yes, in Dal, with a game leg."

"Fortunately you are at Dame Hansen's inn, where you will have the best of food and care."

"Could one imagine a more comfortable place?"

"Most assuredly not."

"Or better people?"

"There are none in the world," responded the young travelers merrily.

Then they would all drink to the health of Hulda and Joel, who were so well known throughout the Telemark.

And then the professor would tell them all about his adventure, frankly admitting his unpardonable imprudence, and telling how his life had been saved, and how grateful he felt to his preservers.

"And I shall remain here until I have paid my debt," he would add. "My course of lectures on legislation will not be resumed for a long time, I fear, and you can enjoy an extended holiday."

"Good! good! Mister Sylvius," cried the light-hearted band. "Oh, you can't fool us! It is pretty Hulda that keeps you here at Dal."

"A sweet girl she is, my friends, and as pretty as a picture, besides; and by Saint Olaf! I'm only sixty."

"Here's to the health of Mister Sylvius!"

"And to yours, my dear boys. Roam about the country, gather wisdom, and yet be merry. Life is all sunshine at your age. But keep away from the Maristien. Joel and Hulda may not be on hand to rescue such of you as are imprudent enough to venture there."

Then they would resume their journey, making the whole valley ring with their joyful _God-aften_.

Once or twice Joel was obliged to act as guide to some tourists who wished to make the ascent of Gousta. Sylvius Hogg was anxious to accompany them. He declared that he was all right again. In fact, the wound on his leg was nearly healed; but Hulda positively forbade him to undertake a trip which would certainly prove too fatiguing for him, and Hulda's word was law.

A wonderful mountain, though, is this Gousta, whose lofty summit traversed by deep snow-covered ravines, rises out of a forest of pines that form a thick green ruff about its snowy throat! And what a superb view one enjoys from its summit. To the east lies the bailiwick of Numedal; On the west, the Hardanger and its magnificent glaciers; down at the base of the mountain, the winding valley of Vesfjorddal between Lakes Tinn and Mjos, Dal, and its miniature houses, and the bright waters of the Maan leaping and dancing merrily along through the verdant meadows to the music of its own voice.

To make the ascent Joel was obliged to leave Dal at five o'clock in the morning. He usually returned about six o'clock in the evening, and Sylvius Hogg and Hulda always went to meet him. As soon as the primitive ferry-boat landed the tourists and their guide a cordial greeting ensued, and the three spent yet another pleasant evening together. The professor still limped a little, but he did not complain. Indeed, one might almost have fancied that he was in no haste to be cured, or rather to leave Dame Hansen's hospitable roof.

The time certainly passed swiftly and pleasantly there. He had written to Christiania that he should probably spend some time at Dal. The story of his adventure at the Rjukanfos was known throughout the country. The newspapers had got hold of it, and embellished the account after their fashion, so a host of letters came to the inn, to say nothing of pamphlets and newspapers. All these had to be read and answered, and the names of Joel and Hulda which were necessarily mentioned in the correspondence, soon became known throughout Norway.

Nevertheless, this sojourn at Dame Hansen's inn could not be prolonged indefinitely, though Sylvius Hogg was still as much in doubt as ever, in regard to the manner in which he should pay his debt of gratitude. Of late, however, he had begun to suspect that this family was not as happy as he had at first supposed. The impatience with which the
brother and sister awaited the arrival of the daily mail from Christiania and Bergen, their disappointment and even chagrin in finding no letters for them, all this was only too significant.

It was already the ninth of June, and still no news from the "Viking!" The vessel was now more than a fortnight overdue, and not a single line from Ole! No news to assuage Hulda's anxiety. The poor girl was beginning to despair, and Sylvius Hogg saw that her eyes were red with weeping when he met her in the morning.

"What can be the matter?" he said to himself, more than once. "They seem to be concealing some misfortunes from me. Is it a family secret, I wonder, with which a stranger can not be allowed to meddle? But do they still regard me as a stranger? No. Still, they must think so; but when I announce my departure they will perhaps understand that it is a true friend who is about to leave them."

So that very day he remarked:

"My friends, the hour is fast approaching when, to my great regret, I shall be obliged to bid you good-bye."

"So soon, Mister Sylvius, so soon?" exclaimed Joel, with a dismay he could not conceal.

"The time has passed very quickly in your company, but it is now seventeen days since I came to Dal."

"What! seventeen days!" repeated Hulda.

"Yes, my dear child, and the end of my vacation is approaching. I have only a week at my disposal if I should extend my journey to Drammen and Kongsberg. And though the Storthing is indebted to you for not being obliged to elect another deputy in my place, the Storthing will know no better how to compensate you than I do."

"Oh! Mister Sylvius," cried Hulda, placing her little hand upon his lips to silence him.

"Oh, I understand, Hulda. That is a forbidden subject, at least here."

"Here and everywhere," replied the girl, gayly.

"So be it! I am not my own master, and I must obey. But you and Joel must come and pay me a visit at Christiania."

"Pay you a visit?"

"Yes, pay me a visit; spend several weeks at my house in company with your mother, of course."

"And if we should leave the inn who will attend to things in our absence?" replied Joel.

"But your presence here is not necessary after the excursion season is over, I imagine; so I have fully made up my mind to come for you late in the autumn."

"It will be impossible, my dear Mister Sylvius, for us to accept--"

"On the contrary, it will be perfectly possible. Don't say no. I shall not be content with such an answer. Besides, when I get you there in the very best room in my house, in the care of my old Kate and faithful Fink, you will be my own children, and then you can certainly tell me what I can do for you."

"What you can do for us?" repeated Joel, with a glance at his sister.

"Brother!" exclaimed Hulda, as if divining his intention.

"Speak, my boy, speak!"

"Ah, well, Mister Sylvius, you can do us a great honor."

"How?"

"By consenting to be present at my sister Hulda's marriage, if it would not inconvenience you too much."

"Hulda's marriage!" exclaimed Sylvius Hogg. "What! my little Hulda is going to be married, and no one has said a word to me about it!"

"Oh, Mister Sylvius!" exclaimed the girl, her eyes filling with tears.

"And when is the marriage to take place?"

"As soon as it pleases God to bring her betrothed, Ole Kamp, back to us," replied the girl.

CHAPTER XI.

Joel then proceeded to relate Ole Kamp's whole history. Sylvius Hogg, deeply moved, listened to the recital with profound attention. He knew all now. He even read Ole's letter announcing his speedy return. But Ole had not returned, and there had been no tidings from the missing one. What anxiety and anguish the whole Hansen family must have suffered!

"And I thought myself an inmate of a happy home!" he said to himself.

Still, after a little reflection, it seemed to him that the brother and sister were yielding to despair while there was still some room for hope. By counting these May and June days over and over again their imaginations had doubled the number, as it were.

The professor, therefore, concluded to give them his reasons for this belief, not feigned, but really sensible and plausible reasons that would also account for the delay of the "Viking."

Nevertheless his face had become very grave, for the poor girl's evident grief touched him deeply.
"Listen to me, my children," said he. "Sit down here by me, and let us talk the matter over calmly."

"Ah! what can you say to comfort us?" cried Hulda, whose heart was full to overflowing.

"I shall tell you only what I really and truly think," replied the professor. "I have been thinking over all that Joel just told me, and it seems to me that you are more anxious and despondent than you have any real cause to be. I would not arouse any false hopes, but we must view matters as they really are."

"Alas! Mister Sylvius," replied Hulda, "my poor Ole has gone down with the 'Viking,' and I shall never see him again!"

"Sister, sister!" exclaimed Joel, "becalm, I beseech you, and hear what Mister Sylvius has to say."

"Yes, be calm, my children, and let us talk the matter over quietly. It was between the fifteenth and twentieth of May that Ole expected to return to Bergen, was it not?"

"Yes; and it is now the ninth of June."

"So the vessel is only twenty days overdue, if we reckon from the latest date appointed for the return of the 'Viking.' That is enough to excite anxiety, I admit; still, we must not expect the same punctuality from a sailing-vessel as from a steamer."

"I have told Hulda that again and again, and I tell her so yet," interrupted Joel.

"And you are quite right, my boy. Besides, it is very possible that the 'Viking' is an old vessel, and a slow sailor, like most Newfoundland ships, especially when heavily laden. On the other hand, we have had a great deal of bad weather during the past few weeks, and very possibly the vessel did not sail at the date indicated in Ole's letter. In that case a week's delay in sailing would be sufficient to account for the non-arrival of the 'Viking' and for your failure to receive a letter from your lover. What I say is the result of serious reflection. Besides, how do you know but the instructions given to the captain of the 'Viking' authorize him to take his cargo to some other port, according to the state of the market?"

"In that case, Ole would have written," replied Hulda, who could not even be cheered by this hope.

"What is there to prove that he did not write?" retorted the professor. "If he did, it is not the 'Viking' that is behind time, but the American mail. Suppose, for instance, that Ole's ship touched at some port in the United States, that would explain why none of his letters have yet reached Europe."

"The United States, Mister Sylvius!"

"That sometimes happens, and it is only necessary to miss one mail to leave one's friends without news for a long time. There is, at all events, one very easy thing for us to do; that is to make inquiries of some of the Bergen shipowners. Are you acquainted with any of them?"

"Yes," replied Joel, "Messrs. Help Bros."

"Help Bros., the sons of old Help?"

"Yes."

"Why, I know them, too; at least, the younger brother, Help, Junior, they call him, though he is not far from my own age, and one of my particular friends. He has often dined with me in Christiania. Ah, well, my children, I can soon learn through him all that can be ascertained about the 'Viking.' I'll write him this very day, and if need be I'll go and see him."

"How kind you are, Mister Sylvius!" cried Hulda and Joel in the same breath.

"No thanks, if you please; I won't allow them. Did I ever thank you for what you did for me up there? And now I find an opportunity to do you a good turn, and here you are all in a flutter."

"But you were just talking of returning to Christiania," remarked Joel.

"Well, I shall go to Bergen instead, if I find it necessary to go to Bergen."

"But you were about to leave us, Squire, for instance, said Hulda.

"Well, I have changed my mind, that is all. I am master of my own actions, I suppose; and I sha'n't go until I see you safely out of this trouble, that is, unless you are disposed to turn me out-of-doors--"

"What can you be thinking of, Mister Sylvius?"

"I have decided to remain in Dal until Ole's return. I want to make the acquaintance of my little Hulda's betrothed. He must be a brave, honest fellow, of Joel's stamp, I am inclined to think."

"Yes, exactly like him," replied Hulda.

"I was sure of it!" exclaimed the professor, whose cheerfulness had returned, at least apparently.

"Ole is Ole, Mister Sylvius," said Joel, "and that is equivalent to saying that he is the best-hearted fellow in the world."

"I believe you, my dear Joel, and what you say only makes me the more anxious to see him. I sha'n't have to wait long. Something tells me that the 'Viking' will soon come safely into port."

"God grant it!"

"And why should He not hear your prayer? Yes, I shall certainly attend Hulda's wedding, as you have been kind
enough to invite me to it. The Storthing will have to do without me a few weeks longer, that is all. It would have
been obliged to grant me a much longer leave of absence if you had let me fall into the Rjukanfos as I deserved."

"How kind it is in you to say this, Mister Sylvius, and how happy you make us!"

"Not as happy as I could wish, my friends, as I owe my life to you, and I don't know--"" Oh! please, please say no more about that trifle."

"Yes, I shall. Come now, who drew me out of the frightful jaws of the Maristien? Who risked their own lives to
save me? Who brought me to the inn at Dal, and cared for me, and nursed me without any assistance from the
Faculty? Oh! I am as stubborn as an old cart-horse, I assure you, and I have made up my mind to attend the marriage
of Hulda to Ole Kamp, and attend it I shall!"

Hopefulness is contagious, and how could any one resist such confidence as Sylvius Hogg displayed? A faint
smile crept over poor Hulda's face. She longed to believe him; she only asked to hope.

"But we must recollect that the days are passing very rapidly," continued Sylvius Hogg, "and that it is high time
we began our preparations for the wedding."

"They are already begun, Mister Sylvius," replied Hulda. "In fact, they were begun more than three weeks ago."

"So much the better; but in that case, we must take good care not to allow anything to interrupt them."

"Interrupt them!" repeated Joel. "Why, everything is in readiness."

"What, the wedding-dress, the bodice with its silver clasps, the belt and its pendants?"

"Even the pendants."

"And the radiant crown that will make you look like a saint, my little Hulda?"

"Yes"

"And the invitations are written?"

"All written," replied Joel, "even the one to which we attach most importance, yours."

"And the bride-maid has been chosen from among the sweetest maidens of the Telemark?"

"And the fairest, Mister Sylvius," added Joel, "for it is Mademoiselle Siegfrid of Bamble."

"From the tone in which he uttered those words, and the way in which he blushed as he uttered them, I judge that
Mademoiselle Siegfrid Helmboe is destined to become Madame Joel Hansen of Dal," said the professor, laughing.

"Yes, Mr. Sylvius," replied Hulda.

"Good! so there is a fair prospect of yet another wedding," exclaimed Sylvius Hogg. "And as I feel sure that I
shall be honored with an invitation, I can do no less than accept it here and now. It certainly looks as if I should be
obliged to resign my seat in the Storthing, for I really don't see how I am to find time to attend its sessions. But
never mind, I will be your best man, Joel, after first serving in that capacity at your sister's wedding. You certainly
are making me do just what you like, or rather what I like. Kiss me, little Hulda! Give me your hand, my boy, and
now let me write to my friend Help, Junior, of Bergen."

The brother and sister left the apartment of which the professor had threatened to take permanent possession, and
returned to their daily tasks with rather more hopeful hearts.

Sylvius Hogg was left alone.

"Poor child! poor child!" he murmured. "Yes, I have made her forget her sorrow for a few moments. But the
delay has been a long one; and the sea is very rough at this season of the year. What if the 'Viking' has indeed gone
down, and Ole should never return!"

A moment afterward the professor was busily engaged in writing to his Bergen friend. He asked for the fullest
possible particulars in regard to everything connected with the "Viking" and her cruise, and inquired if some event,
unforeseen or otherwise, had made it necessary to send the vessel to a different port from that for which it was
originally destined. He also expressed a strong desire to hear as soon as possible how the shipping merchants and
sailors of Bergen explained the delay. In short, he begged his friend Help to give him all possible information in
regard to the matter by return mail.

This urgent letter also explained Sylvius Hogg's interest in the mate of the "Viking," the invaluable service
rendered him by the young man's betrothed, and the pleasure it would afford him to be able to give some
encouragement to Dame Hansen's children.

As soon as this letter was finished Joel took it to Moel so it would go on the following day. It would reach
Bergen on the eleventh, so a reply to it ought to be received on the evening of the twelfth or the morning of the
thirteenth at the very latest.

Nearly three days of dreary waiting! How interminable they seemed! Still, by dint of reassuring words and
encouraging arguments, the professor contrived to alleviate the painful suspense. Now he knew Hulda's secret, was
there not a topic of conversation ever ready? And what a consolation it was to Joel and his sister to be able to talk of
the absent one!

"I am one of the family now," Sylvius Hogg repeated again and again. "Yes, I am like an uncle that has just
arrived from America or some foreign land."

And as he was one of the family, they must have no more secrets from him.

Of course he had not failed to notice the children's constrained manner toward their mother, and he felt satisfied that the reserve the parent displayed had its origin in something besides the uneasiness she felt on Ole Kamp's account. He thought he might venture to question Joel; but the latter was unable to give any satisfactory reply. The professor than ventured to sound Dame Hansen on the subject, but she was so uncommunicative that he was obliged to abandon all hope of obtaining any knowledge of her secret until some future day.

As Sylvius Hogg had predicted, the letter from Help, Junior, reached Dal on the morning of the thirteenth. Joel started out before daylight to meet the postman, and it was he who brought the letter into the large hall where the professor was sitting with Dame Hansen and her daughter.

There was a moment's silence. Hulda, who was as pale as death, was unable to utter a word so violent was the throbbing of her heart, but she seized the hand of her brother, who was equally agitated, and held it tightly.

Sylvius Hogg opened the letter and read it aloud.

To his great regret the missive contained only some very vague information; and the professor was unable to conceal his disappointment from the young people who listened to the letter with tears in their eyes.

The "Viking" had left Saint-Pierre-Miquelon on the date mentioned in Ole Kamp's last letter. This fact had been established by the reports received from other vessels which had reached Bergen since the "Viking's" departure from Newfoundland. These vessels had seen nothing of the missing ship on their homeward voyage, but they had encountered very bad weather in the neighborhood of Iceland. Still they had managed to weather the gales; so it was possible that the "Viking" had been equally fortunate, and had merely been delayed somewhere, or had put into some port for repairs. The "Viking" was a stanch craft, very substantially built, and commanded by Captain Friel, of Hammersfest, a thoroughly competent officer. Still, this delay was alarming, and if it continued much longer there would be good reason to fear that the "Viking" had gone down with all on board.

The writer regretted that he had no better news to give the young Hansens, and spoke of Ole Kamp in the most complimentary terms. He concluded his letter by assuring the professor of his sincere friendship, and that of his family, and by promising to send him without delay any intelligence that might be received at any Norwegian port, in relation to the "Viking."

Poor Hulda sunk half fainting into a chair while Sylvius Hogg was reading this letter, and she was sobbing violently when he concluded its perusal.

Joel, with his arms folded tightly upon his breast, listened in silence, without daring to glance at his sister.

Dame Hansen, as soon as the reading was concluded, went up to her room. She seemed to have been expecting the blow.

The professor beckoned Hulda and her brother to his side. He wanted to talk with them calmly and sensibly on the subject, and he expressed a confidence that was singular, to say the least, after Help, Junior's letter. They had no reason to despair. Were there not countless examples of protracted delays while navigating the seas that lie between Norway and Newfoundland? Yes, unquestionably. And was not the "Viking" a strong craft, well officered, and manned by an excellent crew, and consequently in a much better condition than many of the vessels that had come safely into port? Most assuredly.

"So let us continue to hope," he added, "and wait. If the 'Viking' had been wrecked between Iceland and Newfoundland the numerous vessels that follow the same route to reach Europe would certainly have seen some trace of the disaster. But no, not a single floating plank or spar did they meet on the whole of this route, which is so much frequented at the conclusion of the fishing season. Still, we must take measures to secure information of a more positive nature. If we receive no further news of the 'Viking' during the coming week, nor any letter from Ole, I shall return to Christiania and ask the Naval Department to make careful inquiries, and I feel sure that the result will prove eminently satisfactory to all concerned."

In spite of the hopeful manner assumed by the professor, Joel and Hulda both felt that he did not speak as confidently as he had spoken before the receipt of the letter from Bergen--a letter whose contents gave them little if any grounds for hope. In fact, Sylvius Hogg no longer dared to venture any allusion to the approaching marriage of Hulda and Ole Kamp, though he said to himself again and again:

"No, no, it is impossible! Ole Kamp never cross the threshold of Dame Hansen's house again? Ole not marry Hulda? Nothing will ever make me believe such a misfortune possible."

He was perfectly sincere in this conviction. It was due to the energy of his character, to a spirit of hopefulness that nothing could crush. But how could he hope to convince others, especially those whom the fate of the "Viking" affected so directly?

A few days were allowed to elapse. Sylvius Hogg, who was now entirely well, took a long walk every day, and persuaded Hulda and her brother to accompany him. One day all three of them went up the valley of Vesfjorddal
half-way to the falls of the Rjukan. The next day they went to Moel and Lake Tinn. Once they were even absent twenty-four hours. This time they prolonged their excursion to Bamble, where the professor made the acquaintance of Farmer Helmboe and his daughter Siegfrid. What a cordial welcome the latter gave to her friend Hulda, and what words of tenderness she found to console her!

Here, too, Sylvius Hogg did all in his power to encourage these worthy people. He had written to the Navy Department, and the government was investigating the matter. Ole would certainly return at no distant day. He might drop in upon them, indeed, at any moment. No; the wedding would not have to be postponed more than six weeks! The good man seemed so thoroughly convinced of all this, that his auditors were influenced rather by his firm conviction than by his arguments.

This visit to the Helmboe family did the young Hansens good, and they returned home much calmer than they went away.

At last the fifteenth of June came. The "Viking" was now exactly one month overdue; and as the distance from Newfoundland to the coast of Norway is comparatively short, this delay was beyond all reason, even for a sailing-vessel.

Hulda seemed to have abandoned all hope; and her brother could not find a single word to say by way of encouragement. In the presence of these poor, unhappy creatures, the professor realized the utter futility of any well-meant attempt at consolation. Hulda and Joel crossed the threshold only to stand and gaze in the direction of Moel, or to walk up the road leading to Rjukanfos. Ole Kamp would probably come by the way of Bergen, but he might come by way of Christiania if the destination of the "Viking" had been changed. The sound of an approaching kariol, a hasty cry, the form of a man suddenly rounding a curve in the road made their hearts beat wildly; but all for naught. The good people of Dal were also eagerly watching. Not unfrequently they went half-way to meet the postman. Everybody was deeply interested, for the Hansen family was exceedingly popular in the neighborhood; and poor Ole was almost a child of the Telemark. But no letter came from Bergen or Christiania giving news of the absent one.

Nothing new occurred on the sixteenth. Sylvius Hogg could scarcely restrain his restlessness. He began to understand that he must proceed to act in person, so he announced to his friends that if no news was received on the following day he should go to Christiania and satisfy himself that nothing had been left undone. Of course, it was hard for him to leave Hulda and Joel, but there was no help for it; and he would return as soon as his task was accomplished.

On the seventeenth a greater part of the most wretched day they had ever spent together passed without bringing any new developments. It had rained incessantly since early morning; the wind was blowing a gale, and the rain dashed fiercely against the window on the side of the house nearest the Maan.

Seven o'clock came. They had just finished dinner, which had been eaten in profound silence, as if in a house of mourning. Even Sylvius Hogg had been unable to keep up the conversation. What could he say that he had not already said a hundred times before?

"I shall start for Christiania to-morrow morning," he remarked at last. "Joel, I wish you would procure a kariol and drive me to Moel."

"Very well, Mr. Sylvius. But wouldn't you like me to accompany you further?"

The professor shook his head, with a meaning glance at Hulda, for he did not want to see her separated from her brother.

Just then a sound, which was as yet scarcely audible, was heard on the road in the direction of Moel. They all listened breathlessly. Soon all doubts vanished. It was the sound of an approaching kariol coming swiftly toward Dal. Was the occupant some traveler who intended to spend the night at the inn? This was scarcely probable, as tourists rarely arrived at so late an hour.

Hulda sprung up trembling in every limb. Joel went to the door, opened it and looked out.

The noise grew louder. It was certain the clatter of horse's hoofs blended with, the roll of kariol wheels; but the storm without was so violent that Joel was obliged to close the door.

Sylvius Hogg tramped up and down the room in a perfect fever of impatience. Joel and his sister held each other tightly by the hand.

The kariol could not be more than twenty yards from the house now. Would it pause or go by?

The hearts of all three throbbed with suffocation.

The kariol stopped. They heard a voice calling; but it was not the voice of Ole Kamp!

Almost immediately some one rapped at the door.

Joel opened it.

A man stood upon the threshold.

"Is Mr. Sylvius Hogg here?" he asked.
"I am he," replied the professor. "Who are you, my friend?"
"A messenger sent you by the Secretary of the Navy at Christiania."
"Have you a letter for me?"
"Yes, sir; here it is."
And the messenger handed him a large envelope sealed with the Government seal.
Hulda's limbs tottered under her, and her brother sprung forward and placed her in a chair. Neither of them dared to ask Sylvius Hogg to open the letter.
At last he broke the seal and read the following:
"MR. PROFESSOR,—In reply to your last letter, I inclose a paper picked up at sea on the 3d instant by a Danish vessel. Unfortunately this discovery dispels any lingering doubt as to the fate of the 'Viking'—"
Sylvius Hogg, without taking time to read the rest of the letter, drew the paper from the envelope. He looked at it; he turned it over.
It was a lottery ticket bearing the number 9672.
On the other side of the ticket were the following lines:
"May 3d.
"DEAREST HULDA,—The 'Viking' is going down. I have only this ticket left of all I hoped to bring back to you. I intrust it to God's hands, hoping that it may reach you safely; and as I shall not be there, I beseech you to be present at the drawing. Accept the ticket with my last thought of you. Hulda, do not forget me in your prayers. Farewell, my beloved, farewell!
"OLE KAMP."

CHAPTER XII.

So this was the young man's secret! This was the source from which he expected to derive a fortune for his promised bride—a lottery ticket, purchased before his departure. And as the 'Viking' was going down, he inclosed the ticket in a bottle and threw it into the sea with the last farewell for Hulda.

This time Sylvius Hogg was completely disconcerted. He looked at the letter, then at the ticket. He was speechless with dismay. Besides, what could he say? How could any one doubt that the 'Viking' had gone down with all on board?

While Sylvius Hogg was reading the letter Hulda had nerved herself to listen, but after the concluding words had been read, she fell back unconscious in Joel's arms, and it became necessary to carry her to her own little chamber, where her mother administered restoratives. After she recovered consciousness she asked to be left alone for awhile, and she was now kneeling by her bedside, praying for Ole Kamp's soul.

Dame Hansen returned to the hall. At first she started toward the professor, as if with the intention of speaking to him, then suddenly turning toward the staircase, she disappeared.

Joel, on returning from his sister's room, had hastily left the house. He experienced a feeling of suffocation in the dwelling over which such a dense cloud of misfortune seemed to be hanging. He longed for the outer air, the fierce blast of the tempest, and spent a part of the night in wandering aimlessly up and down the banks of the Maan.

Sylvius Hogg was therefore left alone. Stunned by the stroke at first, he soon recovered his wonted energy. After tramping up and down the hall two or three times, he paused and listened, in the hope that he might hear a summons from the young girl, but disappointed in this, he finally seated himself at the table, and abandoned himself to his thoughts.

"Can it be possible that Hulda is never to see her betrothed again?" he said to himself. "No; such a misfortune is inconceivable. Everything that is within me revolts at the thought! Even admitting that the 'Viking' has gone to the bottom of the ocean, what conclusive proof have we of Ole's death? I can not believe it. In all cases of shipwreck time alone can determine whether or not any one has survived the catastrophe. Yes; I still have my doubts, and I shall continue to have them, even if Hulda and Joel refuse to share them. If the 'Viking' really foundered, how does it happen that no floating fragments of the wreck have been seen at sea—at least nothing except the bottle in which poor Ole placed his last message, and with it all he had left in the world."

Sylvius Hogg had the ticket still in his hand, and again he looked at it, and turned it over and held it up between him and the waning light—this scrap of paper upon which poor Ole had based his hopes of fortune.

But the professor, wishing to examine it still more carefully, rose, listened again to satisfy himself that the poor girl upstairs was not calling her mother or brother, and then entered his room.

The ticket proved to be a ticket in the Christiania Schools Lottery—a very popular lottery in Norway at that time. The capital prize was one hundred thousand marks; the total value of the other prizes, ninety thousand marks, and the number of tickets issued, one million, all of which had been sold.
Ole Kamp's ticket bore the number 9672; but whether this number proved lucky or unlucky, whether the young sailor had any secret reason for his confidence in it or not, he would not be present at the drawing, which was to take place on the fifteenth of July, that is to say, in twenty-eight days; but it was his last request that Hulda should take his place on that occasion.

By the light of his candle, Sylvius Hogg carefully reread the lines written upon the back of the ticket, as if with the hope of discovering some hidden meaning.

The lines had been written with ink, and it was evident that Ole's hand had not trembled while tracing them. This showed that the mate of the 'Viking' retained all his presence of mind at the time of the shipwreck, and that he was consequently in a condition to take advantage of any means of escape that might offer, such as a floating spar or plank, in case the raging waters had not swallowed up everything when the vessel foundered.

Very often writings of this kind that are recovered from the sea state the locality in which the catastrophe occurred; but in this neither the latitude nor longitude were mentioned; nor was there anything to indicate the nearest land. Hence one must conclude that no one on board knew where the "Viking" was at the time of the disaster. Driven on, doubtless, by a tempest of resistless power, the vessel must have been carried far out of her course, and the clouded sky making a solar observation impossible, there had been no way of determining the ship's whereabouts for several days; so it was more than probable that no one would ever know whether it was near the shores of North America or of Iceland that the gallant crew had sunk to rise no more.

This was a circumstance calculated to destroy all hope, even in the bosoms of the most sanguine.

With some clow, no matter how vague, a search for the missing vessel would have been possible. A ship or steamer could be dispatched to the scene of the catastrophe and perhaps find some trace of it. Besides, was it not quite possible that one or more survivors had succeeded in reaching some point on the shores of the Arctic continent, and that they were still there, homeless, and destitute, and hopelessly exiled from their native land?

Such was the theory that gradually assumed shape in Sylvius Hogg's mind—a theory that it would scarcely do to advance to Joel and Hulda, so painful would the disappointment prove if it should be without foundation.

"And though the writing gives no clew to the scene of the catastrophe," he said to himself, "we at least know where the bottle was picked up. This letter does not state, but they must know at the Naval Department; and is it not an indication that might be used to advantage? By studying the direction of the currents and of the prevailing winds at the time of the shipwreck might it not be possible? I am certainly going to write again. Search must be made, no matter how small the chances of success. No; I will never desert poor Hulda! And until I have positive proofs of it I will never credit the death of her betrothed."

Sylvius Hogg reasoned thus; but at the same time he resolved to say nothing about the measures he intended to adopt, or the search he intended to urge on with all his influence. Hulda and her brother must know nothing about his writing to Christiania; moreover, he resolved to postpone indefinitely the departure which had been announced for the next day, or rather he would leave in a few days, but only for a trip to Bergen. There, he could learn from the Messrs. Help all the particulars concerning the "Viking," ask the opinion of the most experienced mariners, and decide upon the way in which search could best be made.

In the meantime, from information furnished by the Navy Department, the press of Christiania, then that of Norway, Sweden, and finally all Europe, gradually got hold of this story of a lottery ticket transformed into an important legal document. There was something very touching about this gift from a shipwrecked mariner to his betrothed.

The oldest of the Norwegian journals, the "Morgen-Blad," was the first to relate the story of the "Viking" and Ole Kamp; and of the thirty-seven other papers published in that country at the time, not one failed to allude to it in touching terms. The illustred "Nyhedsblad" published an ideal picture of the shipwreck. There was the sinking "Viking," with tattered sails and hull partially destroyed, about to disappear beneath the waves. Ole stood in the bow throwing the bottle containing his last message into the sea, at the same time commending his soul to God. In a luminous cloud in the dim distance a wave deposited the bottle at the feet of his betrothed. The whole picture was upon an enlarged representation of a lottery ticket bearing the number 9672 in bold relief. An unpretending conception, unquestionably, but one that could hardly fail to be regarded as a masterpiece in the land which still clings to legends of the Undines and Valkyries. Then the story was republished and commented upon in France and England, and even in the United States. The story of Hulda and Ole became familiar to every one through the medium of pencil and pen. This young Norwegian girl, without knowing it, held a prominent place in the sympathy and esteem of the public. The poor child little suspected the interest she had aroused, however; besides, nothing could have diverted her mind from the loss that engrossed her every thought.

This being the case, no one will be surprised at the effect produced upon both continents—an effect easily explained when we remember how prone we all are to superstition. A lottery ticket so providentially rescued from the waves could hardly fail to be the winning ticket. Was it not miraculously designated as the winner of the capital
prize? Was it not worth a fortune--the fortune upon which Ole Kamp had counted?

Consequently it is not surprising that overtures for the purchase of this ticket came from all parts of the country. At first, the prices offered were small, but they increased from day to day; and it was evident that they would continue to increase in proportion as the day of the drawing approached.

These offers came not only from different parts of Scandinavia, which is a firm believer in the active intervention of supernatural powers in all mundane matters--but also from foreign lands, and even from France.

Even the phlegmatic English grew excited over the matter, and subsequently the Americans, who are not prone to spend their money so unpractically. A host of letters came to Dal, and the newspapers did not fail to make mention of the large sums offered to the Hansen family. A sort of minor stock exchange seemed to have been established, in which values were constantly changing, but always for the better.

Several hundred marks were, in fact, offered for this ticket, which had only one chance in a million of winning the capital prize. This was absurd, unquestionably, but superstitious people do not stop to reason; and as their imaginations became more and more excited, they were likely to bid much higher.

This proved to be the case. One week after the event the papers announced that the amounts offered for the ticket exceeded one thousand, fifteen hundred and even two thousand marks. A resident of Manchester, England, had even offered one hundred pounds sterling, or two thousand five hundred marks; while an American, and a Bostonian at that, announced his willingness to give one thousand dollars for ticket No. 9672 of the Christiania Schools Lottery.

It is needless to say that Hulda troubled herself very little about the matter that was exciting the public to such an extent. She would not even read the letters that were addressed to her on the subject; but the professor insisted that she must not be left in ignorance of these offers, as Ole Kamp had bequeathed his right and title in this ticket to her.

Hulda refused all these offers. This ticket was the last letter of her betrothed.

No one need suppose that this refusal was due to an expectation that the ticket would win one of the prizes in the lottery. No. She saw in it only the last farewell of her shipwrecked lover--a memento she wished to reverently preserve. She cared nothing for a fortune that Ole could not share with her. What could be more touching than this worship of a souvenir?

On appraising her of these different offers, however, neither Sylvius Hogg nor Joel made any attempt to influence Hulda. She was to be guided entirely by her own wishes in the matter. They knew now what her wishes were. Joel, moreover, approved his sister's decision unreservedly. Ole Kamp's ticket must not be sold to any person at any price.

Sylvius Hogg went even further. He not only approved Hulda's decision, but he congratulated her upon it. Think of seeing this ticket sold and resold, passing from hand to hand, transformed, as it were, into a piece of merchandise, until the time appointed for the drawing arrived, when it would very probably become a worthless scrap of paper?

And Sylvius Hogg went even further. Was it, perhaps, because he was slightly superstitious? No. Still, if Ole Kamp had been there, the professor would probably have said to him:

"Keep your ticket, my boy, keep it! First, your ticket, and then you, yourself, were saved from the wreck. You had better wait and see what will come of it. One never knows; no, one never knows!"

And when Sylvius Hogg, professor of law, and; a member of the Storthing, felt in this way, one can hardly wonder at the infatuation of the public, nor that No. 9672 could be sold at an enormous premium.

So in Dame Hansen's household there was no one who protested against the young girl's decision--at least no one except the mother.

She was often heard to censure it, especially in Hulda's absence, a fact that caused poor Joel not a little mortification and chagrin, for he was very much afraid that she would not always confine herself to covert censure, and that she would urge Hulda to accept one of the offers she had received.

"Five thousand marks for the ticket!" she repeated again and again. "They offer five thousand marks for it!"

It was evident that Dame Hansen saw nothing either pathetic or commendable in her daughter's refusal. She was thinking only of this large sum of five thousand marks. A single word from Hulda would bring it into the family. She had no faith either in the extraordinary value of the ticket, Norwegian though she was; and to sacrifice fire thousand marks for a millionth chance of winning one hundred thousand was an idea too absurd to be entertained far a moment by her cool and practical mind.

All superstition aside, it is undeniable that the sacrifice of a certainty, under such conditions, was not an act of worldly wisdom; but as we said before, the ticket was not a lottery ticket in Hulda's eyes; it was Ole's last farewell, and it would have broken her heart to part with it.

Nevertheless, Dame Hansen certainly disapproved her daughter's resolve. It was evident, too, that her dissatisfaction was constantly increasing, and it seemed more than likely that at no very distant day she would endeavor to make Hulda change her decision. Indeed, she had already intimated as much to Joel, who had promptly taken his sister's part.
Sylvius Hogg was, of course, kept informed of what was going on. Such an attempt on the mother's part would only be another trial added to those Hulda was already obliged to endure, and he was anxious to avert it if possible. Joel mentioned the subject to him sometimes.

"Isn't my sister right in refusing?" he asked. "And am I not justified in upholding her in her refusal?"

"Unquestionably," replied Sylvius Hogg. "And yet, from a mathematical point of view, your mother is a million times right. But the science of mathematics does not govern everything in this world. Calculation has nothing to do with the promptings of the heart."

During the next two weeks they were obliged to watch Hulda very closely, for the state of her health was such as to excite serious anxiety. Fortunately loving care and attention were not wanting. At Sylvius Hogg's request, the celebrated Dr. Bock, a personal friend, came to Dal to see the young invalid. He could only prescribe rest, and quiet of soul, if that were possible; but the only sure means of curing her was Ole's return, and this means God only could provide. Still, Sylvius Hogg was untiring in his efforts to console the young girl. His words were ever words of hope, and strange as it may appear, Sylvius Hogg did not despair.

Thirteen days had now elapsed since the arrival of the ticket forwarded by the Navy Department. It was now the thirteenth of June. A fortnight more, and the drawing of the lottery would take place with great pomp in the main hall of the University of Christiania.

On the morning of the thirtieth day of June Sylvius Hogg received another letter from the Navy Department. This letter advised him to confer with the maritime authorities of Bergen, and authorized him to immediately organize an expedition to search for the missing "Viking."

The professor did not want Joel or Hulda to know what he intended to do, so he merely told them that he must leave them for a few days to attend to some business matters.

"Pray do not desert us, Mister Sylvius," said the poor girl.

"Desert you--you, whom I regard as my own children!" replied Sylvius Hogg.

Joel offered to accompany him, but not wishing him to know that he was going to Bergen, the professor would only allow him to go as far as Moel. Besides, it would not do for Hulda to be left alone with her mother. After being confined to her bed several days, she was now beginning to sit up a little, though she was still very weak and not able to leave her room.

At eleven o'clock the kariol was at the door of the inn, and after bidding Hulda good-bye, the professor took his seat in the vehicle beside Joel. In another minute they had both disappeared behind a large clump of birches at the turn in the road.

That same evening Joel returned to Dal.

END OF FIRST HALF.

CHAPTER XIII.

Meanwhile, Sylvius Hogg was hastening toward Bergen. His tenacious nature and energetic character, though daunted for a moment, were now reasserting themselves. He refused to credit Ole's death, nor would he admit that Hulda was doomed never to see her lover again. No, until the fact was established beyond a doubt, he was determined to regard the report as false.

But had he any information which would serve as a basis for the task he was about to undertake in Bergen? Yes, though we must admit that the clew was of a very vague nature.

He knew merely the date on which the bottle had been cast into the sea by Ole Kamp, and the date and locality in which it had been recovered from the waves. He had learned those facts through the letter just received from the Naval Department, the letter which had decided him to leave for Bergen immediately, in order that he might consult with Help Bros., and with the most experienced seamen of that port.

The journey was made as quickly as possible. On reaching Moel, Sylvius Hogg sent his companion back with the kariol, and took passage upon one of the birch-bark canoes that are used in traversing the waters of Lake Finn. Then, at Tinoset, instead of turning his steps toward the south--that is to say, in the direction of Bamble--he hired another kariol, and took the Hardanger route, in order to reach the gulf of that name in the shortest possible time. From there, a little steamer called the "Run" transported him to the mouth of the gulf, and finally, after crossing a network of fiords and inlets, between the islands and islets that stud the Norwegian coast, he landed at Bergen on the morning of the second of July.

This old city, laved by the waters of both the Logne and Hardanger, is delightfully situated in a picturesque region which would bear a striking resemblance to Switzerland if an artificial arm of the sea should ever conduct the waters of the blue Mediterranean to the foot of the Alps.

A magnificent avenue of ash trees leads to the town.
The houses, with their fantastic, pointed gables, are as dazzling in their whiteness as the habitations of Arabian cities, and are all congregated in an irregular triangle that contains a population of about thirty thousand souls. Its churches date from the twelfth century. Its tall cathedral is visible from afar to vessels returning from sea, and it is the capital of commercial Norway, though situated off the regular lines of travel, and a long distance from the two cities which rank first and second in the kingdom, politically--Christiania and Drontheim.

Under any other circumstances the professor would have taken great pleasure in studying this important city, which is Dutch rather than Norwegian in its aspect and manners. It had been one of the cities included in his original route, but since his adventure on the Maristien and his subsequent sojourn at Dal, his plans had undergone important changes.

Sylvius Hogg was no longer the traveling deputy, anxious to ascertain the exact condition of the country from a commercial as well as a political point of view. He was the guest of the Hansens, the debtor of Joel and Hulda, whose interests now outweighed all else in his estimation--a debtor who was resolved to pay his debt of gratitude at any cost, though he felt that what he was about to attempt for them was but a trifle.

On his arrival in Bergen, Sylvius Hogg landed at the lower end of the town, on the wharf used as a fish-market, but he lost no time in repairing to the part of the town known as the Tyske Bodrone quarter, where Help, Junior, of the house of Help Bros., resided.

It was raining, of course, for rain falls in Bergen on at least three hundred and sixty days of every year; but it would be impossible to find a house better protected against the wind and rain than the hospitable mansion of Help, Junior, and nowhere could Sylvius Hogg have received a warmer and more cordial welcome. His friend took possession of him very much as if he had been some precious bale of merchandise which had been consigned to his care, and which would be delivered up only upon the presentation of a formal order.

Sylvius Hogg immediately made known the object of his visit to Help, Junior. He inquired if any news had yet been received of the "Viking," and if Bergen mariners were really of the opinion that she had gone down with all on board. He also inquired if this probable shipwreck, which had plunged so many homes into mourning, had not led the maritime authorities to make some search for the missing vessel.

"But where were they to begin?" replied Help, Junior. "They do not even know where the shipwreck occurred."
"True, my dear Help, and for that very reason they should endeavor to ascertain."
"But how?"
"Why, though they do not know where the 'Viking' foundered, they certainly know where the bottle was picked up by the Danish vessel. So we have one valuable clew which it would be very wrong to ignore."
"Where was it?"
"Listen, my dear Help, and I will tell you."
Sylvius Hogg then apprised his friend of the important information which had just been received through the Naval Department, and the full permission given him to utilize it.

The bottle containing Ole Kamp's lottery-ticket had been picked up on the third of June, about two hundred miles south of Iceland, by the schooner "Christian," of Elsineur, Captain Mosselman, and the wind was blowing strong from the south-east at the time.

The captain had immediately examined the contents of the bottle, as it was certainly his duty to do, inasmuch as he might-have rendered very effectual aid to the survivors of the "Viking" had he known where the catastrophe occurred; but the lines scrawled upon the back of the lottery-ticket gave no clew, so the "Christian" could not direct her course to the scene of the shipwreck.

This Captain Mosselman was an honest man. Very possibly some less scrupulous person would have kept the ticket; but he had only one thought--to transmit the ticket to the person to whom it was addressed as soon as he entered port. Hulda Hansen, of Dal, that was enough. It was not necessary to know any more.

But on reaching Copenhagen, Captain Mosselman said to himself that it would perhaps be better to transmit the document through the hands of the Danish authorities, instead of sending it straight to the person for whom it was intended. This would be the safest, as well as the regular way. He did so, and the Naval Department at Copenhagen promptly notified the Naval Department at Christiania.

Sylvius Hogg's letter, asking for information in regard to the "Viking," had already been received, and the deep interest he took in the Hansens was well known. It was known, too, that he intended to remain in Dal some time longer, so it was there that the ticket found by the Danish sea-captain was sent, to be delivered into Hulda Hansen's hands by the famous deputy.

And ever since that time the public had taken a deep interest in the affair, which had not been forgotten, thanks to the touching details given by the newspapers of both continents.

Sylvius Hogg stated the case briefly to his friend Help, who listened to him with the deepest interest, and without once interrupting him. He concluded his recital by saying:
There is certainly one point about which there can be no possible doubt: this is, that on the third day of June, about one month after the departure from Saint-Pierre-Miquelon, the ticket was picked up two hundred miles south-west of Iceland.

"And that is all you know?"

"Yes, my dear Help, but by consulting some of the most experienced mariners of Bergen, men who are familiar with that locality, with the general direction of its winds, and, above-all, with its currents, will it not be a comparatively easy matter to decide upon the route followed by the bottle? Then, by calculating its probable speed, and the time that elapsed before it was picked up, it certainly would not be impossible to discover the spot at which it was cast into the sea by Ole Kamp, that is to say, the scene of the shipwreck."

Help, Junior, shook his head with a doubting air. Would not any search that was based upon such vague indications as these be sure to prove a failure? The shipowner, being of a decided, cool and practical turn of mind, certainly thought so, and felt it his duty to say as much to Sylvius Hogg.

"Perhaps it may prove a failure, friend Help," was the prompt rejoinder; "but the fact that we have been able to secure only vague information, is certainly no reason for abandoning the undertaking. I am anxious that nothing shall be left undone for these poor people to whom I am indebted for my life. Yes, if need be, I would not hesitate to sacrifice all I possess to find Ole Kamp, and bring him safely back to his betrothed, Hulda Hansen."

Then Sylvius Hogg proceeded to give a full account of his adventure on the Rjukanfos. He related the intrepid manner in which Joel and his sister had risked their own lives to save him, and how, but for their timely assistance, he would not have had the pleasure of being the guest of his friend Help that day.

His friend Help, as we said before, was an eminently practical man, but he was not opposed to useless and even impossible efforts when a question "of humanity was involved, and he finally approved what Sylvius Hogg wished to attempt.

"Sylvius," he said, "I will assist you by every means in my power. Yes, you are right. However small the chance of finding some survivor of the 'Viking' may be, and especially of finding this brave Ole whose betrothed saved your life, it must not be neglected."

"No, Help, no," interrupted the professor; "not if it were but one chance in a hundred thousand."

"So this very day, Sylvius, I will assemble all the most experienced seamen of Bergen in my office. I will send for all who have navigated or who are now navigating the ocean between Iceland and Newfoundland, and we will see what they advise us to do."

"And what they advise us to do we will do," added Sylvius Hogg, without an instant's hesitation. "I have the approval of the government. In fact, I am authorized to send one of its dispatch-boats in search of the 'Viking,' and I feel sure that no one will hesitate to take part in such a work."

"I will pay a visit to the marine bureau, and see what I can learn there," remarked Help, Junior.

"Would you like me to accompany you?"

"It is not necessary, and you must be fatigued."

"Fatigued! I--at my age?"

"Nevertheless, you had better rest until my return, my dear and ever-young Sylvius."

That same day there was a large meeting of captains of merchant and whaling vessels, as well as pilots, in the office of Help Bros.--an assemblage of men who were still navigating the seas, as well as of those who had retired from active service.

Sylvius Hogg explained the situation briefly but clearly. He told them the date--May 3d--on which the bottle had been cast into the sea by Ole Kamp, and the date--June 3d--on which it had been picked up by the Danish captain, two hundred miles south-west of Iceland.

The discussion that followed was long and serious. There was not one of these brave men who were not familiar with the currents of that locality, and upon the direction of these currents they must, of course, chiefly depend for a solution of the problem.

But it was an incontestable fact that at the time of the shipwreck, and during the interval that elapsed between the sailing of the "Viking" from Saint-Pierre-Miquelon, and the discovery of the bottle by the Danish vessel, constant gales from the south-east had disturbed that portion of the Atlantic. In fact, it was to one of these tempests that the catastrophe must be attributed. Probably the "Viking," being unable to carry sail in the teeth of the tempest, had been obliged to scud before the windy and it being at this season of the year that the ice from the polar seas begins to make its way down into the Atlantic, it was more than likely that a collision had taken place, and that the "Viking" had been crushed by a floating iceberg, which it was impossible to avoid.

Still, in that case, was it not more than probable that the whole, or a part, of the ship's crew had taken refuge upon one of these ice fields after having placed a quantity of provisions upon it? If they had really done so, the iceberg, having certainly been driven in a north-westerly direction by the winds which were prevailing at the time, it
was not unlikely that the survivors had been able to reach some point on the coast of Greenland, so it was in that
direction, and in those seas, that search should be made.

This was the unanimous opinion of these experienced mariners, and there could be no doubt that this was the
only feasible plan. But would they find aught save a few fragments of the "Viking" in case the vessel had been
crushed by some enormous iceberg? Could they hope to effect the rescue of any survivors?

This was more than doubtful, and the professor on putting the question perceived that the more competent could
not, or would not, reply. Still, this was no cause for inaction--they were all agreed upon that point--but action must
be taken without delay.

There are always several government vessels at Bergen, and one of the three dispatch-boats charged with the
surveillance of the western coast of Norway is attached to this port. As good luck would have it, that very boat was
now riding at anchor in the bay.

After making a note of the various suggestions advanced by the most experienced seamen who had assembled at
the office of Help, Junior, Sylvius Hogg went aboard the dispatch-boat "Telegraph," and apprised the commander of
the special mission intrusted to him by the government.

The commander received him very cordially, and declared his willingness to render all the assistance in his
power. He had become familiar with the navigation of the locality specified during several long and dangerous
voyages from the Lofoden Islands and Finmark to the Iceland and Newfoundland fisheries; so he would have
experience to aid him in the humane work he was about to undertake, as he fully agreed with the seamen already
consulted that it was in the waters between Iceland and Greenland that they must look for the survivors, or at least
for some trace of the "Viking." If he did not succeed there, he would, however, explore the neighboring shores, and
perhaps the eastern part of Baffin's Bay.

"I am all ready to start, sir," he added. "My coal and provisions are on board, my crew has been selected, and I
can set sail this very day."

"Thank you, captain," replied the professor, "not only for your promptness, but for the very kind reception you
have given me. But one question more: Can you tell me how long it will take you to reach the shores of Greenland?"

"My vessel makes about eleven knots an hour, and as the distance from Bergen to Greenland is only about
twenty degrees, I can count upon arriving there in less than a week."

"Make all possible haste, captain," replied Sylvius Hogg. "If any of the shipwrecked crew did survive the
catastrophe, two months have already elapsed since the vessel went down, and they are perhaps in a destitute and
even famishing condition upon some desert coast."

"Yes, there is no time to lose, Monsieur Hogg. I will start this very day, keep my vessel going at the top of her
speed, and as soon as I find any trace whatever I will inform the Naval Department at Christiania by a telegram from
Newfoundland."

"God-speed you, captain," replied Sylvius Hogg, "and may you succeed."

That same day the "Telegraph" set sail, followed by the sympathizing cheers of the entire population of Bergen,
and it was not without keen emotion that the kind-hearted people watched the vessel make its way down the
channel, and finally disappear behind the islands of the fiord.

But Sylvius Hogg did not confine his efforts to the expedition undertaken by the dispatch-boat "Telegraph." On
the contrary, he was resolved to multiply the chances of finding some trace of the missing "Viking." Would it not be
possible to excite a spirit of emulation in the captains of merchant vessels and fishing-smacks that navigated the
waters of Iceland and the Faroe Islands? Unquestionably. So a reward of two thousand marks was promised in the
name of the government to any vessel that would furnish any information in regard to the missing "Viking," and one
of five thousand marks to any vessel that would bring one of the survivors of the shipwreck back to his native land.

So, during the two days spent in Bergen Sylvius Hogg did everything in his power to insure the success of the
enterprise, and he was cheerfully seconded in his efforts by Help, Junior, and all the maritime authorities. M. Help
would have been glad to have the worthy deputy as a guest some time longer, but though Sylvius Hogg thanked him
cordially he declined to prolong his stay. He was anxious to rejoin Hulda and Joel, being afraid to leave them to
themselves too long, but Help, Junior, promised him that any news that might be received should be promptly
transmitted to Dal.

So, on the morning of the 4th, after taking leave of his friend Help, Sylvius Hogg re-embarked on the "Run" to
cross the fiord of the Hardanger, and if nothing unforeseen occurred he counted on reaching the Telemark by the
evening of the 5th.

CHAPTER XIV.
The day that Sylvius Hogg left Bergen proved an eventful one at the inn.
After the professor's departure the house seemed deserted. It almost seemed as if the kind friend of the young Hansens had taken away with him, not only the last hope, but the life of the family, and left only a charnel-house behind him.

During the two days that followed no guests presented themselves at the inn. Joel had no occasion to absent himself, consequently, but could remain with Hulda, whom he was very unwilling to leave alone with her own thoughts.

Dame Hansen seemed to become more and more a prey to secret anxiety. She seemed to feel no interest in anything connected with her children, not even in the loss of the "Viking." She lived a life apart, remaining shut up in her own room, and appearing only at meal-time. When she did address a word to Hulda or Joel it was only to reproach them directly or indirectly on the subject of the lottery-ticket, which neither of them felt willing to dispose of at any price. Offers for the ticket continued to pour in from every corner of the globe. A positive mania seemed to have seized certain brains. Such a ticket must certainly be predestined to win the prize of one hundred thousand marks--there could be no doubt of it, so said every one. A person would have supposed there was but one ticket in the lottery, and that the number of it was 9672. The Manchester man and the Bostonian were still at the head of the list. The Englishman had outbid his rival by a few pounds, but he, in turn, was soon distanced by an advance of several hundred dollars. The last bid was one of eight thousand marks--and it could be explained only as the result of positive madness, unless it was a question of national pride on this part of an American and an Englishman.

However this may have been Hulda refused all these offers, and her conduct excited the bitter disapproval of Dame Hansen.

"What if I should order you to sell this ticket? Yes, order you to sell it," she said to her daughter one day.
"I should be very sorry, mother, but I should be obliged to refuse."
"But if it should become absolutely necessary, what then?"
"But how can that be possible?" asked Joel.

Dame Hansen made no reply. She had turned very pale on hearing this straightforward question, and now withdrew, muttering some incoherent words.

"There is certainly something wrong," remarked Joel. "There must be some difficulty between mother and Sandgoist."
"Yes, brother, we must be prepared for some serious complications in the future."
"Have we not suffered enough during the past few weeks, my poor Hulda? What fresh catastrophe threatens us?"
"How long Monsieur Sylvius stays!" exclaimed Hulda, without paying any apparent heed to the question. "When he is here I feel less despondent."
"And yet, what can he do for us?" replied Joel.

What could there have been in Dame Hansen's past that she was unwilling to confide to her children? What foolish pride prevented her from revealing to them the cause of her disquietude? Had she any real cause to reproach herself? And on the other hand, why did she endeavor to influence her daughter in regard to Ole Kamp's ticket, and the price that was to be set upon it? Why did she seem so eager to dispose of it, or rather, to secure the money that had been offered for it? Hulda and Joel were about to learn.

On the morning of the 4th Joel escorted his sister to the little chapel where she went every morning to pray for the lost one. Her brother always waited for her, and accompanied her back to the house.

That day, on returning, they both perceived Dame Hansen in the distance, walking rapidly in the direction of the inn. She was not alone. A man was walking beside her--a man who seemed to be talking in a loud voice, and whose gestures were vehement and imperious.

Hulda and her brother both paused suddenly.
"Who is that man?" inquired Joel.
Hulda advanced a few steps.
"I know him," she said at last.
"You know him?"
"Yes, it is Sandgoist."
"Sandgoist, of Drammen, who came here during my absence?"
"Yes."
"And who acted in such a lordly way that he would seem to have mother, and us, too, perhaps, in his power?"
"The same, brother; and he has probably come to make us feel his power to-day."
"What power? This time I will know the object of his visit."

Joel controlled himself, though not without an evident effort, and followed his sister.

In a few moments Dame Hansen and Sandgoist reached the door of the inn. Sandgoist crossed the threshold first; then the door closed upon Dame Hansen and upon him, and both of them entered the large parlor.
As Joel and Hulda approached the house the threatening voice of Sandgoist became distinctly audible. They paused and listened; Dame Hansen was speaking now, but in entreating tones.

"Let us go in," remarked Joel.

Hulda entered with a heavy heart; Joel was trembling with suppressed anger and impatience.

Sandgoist sat enthroned in the big arm-chair. He did not even take the trouble to rise on the entrance of the brother and sister. He merely turned his head and stared at them over his spectacles.

"Ah! here is the charming Hulda, if I'm not mistaken," he exclaimed in a tone that incensed Joel even more deeply.

Dame Hansen was standing in front of the man in an humble almost cringing attitude, but she instantly straightened herself up, and seemed greatly annoyed at the sight of her children.

"And this is her brother, I suppose?" added Sandgoist.

"Yes, her brother," retorted Joel.

Then, advancing until within a few steps of the arm-chair, he asked, brusquely:

"What do you want here?"

Sandgoist gave him a withering look; then, in a harsh voice, and without rising, he replied:

"You will soon learn, young man. You happen in just at the right time. I was anxious to see you, and if your sister is a sensible girl we shall soon come to an understanding. But sit down, and you, too, young woman, had better do the same."

Sandgoist seemed to be doing the honors of his own house, and Joel instantly noted the fact.

"Ah, ha! you are displeased! What a touchy young man you seem to be!"

"I am not particularly touchy that I know of, but I don't feel inclined to accept civilities from those who have no right to offer them."

"Joel!" cried Dame Hansen.

"Brother, brother!" exclaimed Hulda, with an imploring look.

Joel made a violent effort to control himself, and to prevent himself from yielding to his desire to throw this coarse wretch out of the window, he retired to a corner of the room.

"Can I speak now?" inquired Sandgoist.

An affirmative sign from Dame Hansen was all the answer he obtained, but it seemed to be sufficient.

"What I have to say is this," he began, "and I would like all three of you to listen attentively, for I don't fancy being obliged to repeat my words."

That he spoke like a person who had an indisputable right to his own way was only too evident to each and every member of the party.

"I have learned through the newspapers," he continued, "of the misfortune which has befallen a certain Ole Kamp--a young seaman of Bergen--and of a lottery-ticket that he bequeathed to his betrothed, Hulda Hansen, just as his ship, the 'Viking,' was going down. I have also learned that the public at large feels convinced that this will prove the fortunate ticket by reason of the peculiar circumstances under which it was found. I have also learned that some very liberal offers for the purchase of this ticket have been received by Hulda Hansen."

He was silent for a moment, then:

"Is this true?" he asked.

"Yes, it is true," replied Joel, at last. "And what of it, if you please?"

"These offers are, in my opinion, the result of a most absurd and senseless superstition," continued Sandgoist, "but for all that, they will continue to be made, and to increase in amount, as the day appointed for the drawing approaches. Now, I am a business man myself, and I have taken it into my head that I should like to have a hand in this little speculation myself, so I left Drammen yesterday to come to Dal to arrange for the transfer of this ticket, and to beg Dame Hansen to give me the preference over all other would-be purchasers."

Hulda was about to make Sandgoist the same answer she had given to all offers of this kind, though his remarks had not been addressed directly to her, when Joel checked her.

"Before replying, I should like to ask Monsieur Sandgoist if he knows to whom this ticket belongs?" he said haughtily.

"To Hulda Hansen, I suppose."

"Very well; then it is to Hulda Hansen that this application should be addressed."

"My son!" hastily interposed Dame Hansen.

"Let me finish, mother," continued Joel. "This ticket belonged originally to our cousin, Ole Kamp, and had not Ole Kamp a perfect right to bequeath it to his betrothed?"

"Unquestionably," replied Sandgoist.
"Then it is to Hulda Hanson that you must apply, if you wish to purchase it."

"So be it, Master Formality," retorted Sandgoist. "I now ask Hulda to sell me this ticket Number 9672 that Ole Kamp bequeathed to her."

"Monsieur Sandgoist," the young girl answered in firm but quiet tones, "I have received a great many offers for this ticket, but they have been made in vain. I shall say to you exactly what I have said to others. If my betrothed sent me this ticket with his last farewell upon it it was because he wished me to keep it, so I will not part with it at any price."

Having said this Hulda turned, as if to leave the room, evidently supposing that the conversation so far as she was concerned had been terminated by her refusal, but at a gesture from her mother she paused.

An exclamation of annoyance had escaped Dame Hansen, and Sandgoist's knitted brows and flashing eyes showed that anger was beginning to take possession of him.

"Yes, remain, Hulda," said he. "This is not your final answer. If I insist it is because I certainly have a right to do so. Besides, I think I must have stated the case badly, or rather you must have misunderstood me. It is certain that the chances of this ticket have not increased because the hand of a shipwrecked seaman placed it in a bottle and it was subsequently recovered; still, the public seldom or never reasons, and there is not the slightest doubt that many persons desire to become the owners of it. They have already offered to purchase it, and other offers are sure to follow. It is simply a business transaction, I repeat, and I have come to propose a good trade to you."

"You will have some difficulty in coming to an understanding with my sister, sir," replied Joel, ironically.

"When you talk business to her she replies with sentiment."

"That is all idle talk, young man," replied Sandgoist. "When my explanation is concluded you will see that however advantageous the transaction may be to me it will be equally so to her. I may also add that it will be equally so to her mother, Dame Hansen, who is personally interested in the matter."

Joel and Hulda exchanged glances. Were they about to learn the secret Dame Hansen had so long concealed from them?

"I do not ask that this ticket shall be sold to me for what Ole Kamp paid for it," continued Sandgoist. No! Right or wrong, it has certainly acquired an increased financial value, and I am willing to make a sacrifice to become the owner of it."

"You have already been told that Hulda has refused much better offers than yours," replied Joel.

"Indeed!" exclaimed Sandgoist. "Much better offers, you say. How do you know?"

"Whatever your offer may be, my sister refuses it, and I approve of her decision."

"Ah! am I dealing with Joel or Hulda Hansen, pray?"

"My sister and I are one," retorted Joel. "It would be well for you to become satisfied of this fact, as you seem to be ignorant of it."

Sandgoist shrugged his shoulders, but without being at all disconcerted, for like a man who is sure of his arguments, he replied:

"When I spoke of the price I was willing to pay for the ticket, I ought to have told you that I could offer inducements which Hulda Hansen can hardly reject if she takes any interest in the welfare of her family."

"Indeed?"

"Yes, and it would be well for you, young man, to understand, in your turn, that I did not come to Dal to beg your sister to sell me this ticket. No, a thousand times no."

"For what, then?"

"I do not ask for it, I demand it. I will have it."

"And by what right?" exclaimed Joel, "and how dare you, a stranger, speak in this way in my mother's house?"

"By the right every man has to speak as he pleases, and when he pleases, in his own house," retorted Sandgoist.

"In his own house?"

Joel, in his indignation, stepped threateningly toward Sandgoist, who, though not easily frightened, sprung hastily out of his arm-chair. But Hulda laid a detaining hand upon her brother's arm, while Dame Hansen, burying her face in her hands, retreated to the other end of the room.

"Brother, look at her!" whispered the young girl.

Joel paused suddenly. A glance at his mother paralyzed him. Her very attitude revealed how entirely Dame Hansen was in this scoundrel's power.

Sandgoist, seeing Joel's hesitation, recovered his self-possession, and resumed his former seat.

"Yes, in his own house," he continued in a still more arrogant voice. "Ever since her husband's death, Dame Hansen has been engaging in unsuccessful speculations. After losing the small fortune your father left at his death, she was obliged to borrow money of a Christiania banker, offering this house as security for a loan of fifteen thousand marks. About a year ago I purchased the mortgage, and this house will consequently become my property--"
and very speedily--if I am not paid when this mortgage becomes due."

"When is it due?" demanded Joel.

"On the 20th of July, or eighteen days from now," replied Sandgoist. "Then, whether you like it or not, I shall be in my own house here."

"You will not be in your own house here until that date, even if you are not paid at that time," retorted Joel, "and I forbid you to speak as you have been doing in the presence of my mother and sister."

"He forbids me--me!" exclaimed Sandgoist. "But how about his mother--what does she say?"

"Speak, mother!" cried Joel, approaching Dame Hansen, and endeavoring to remove her hands from her face.

"Joel, my brother," exclaimed Hulda. "I entreat you, for my sake, to be calm."

Dame Hansen bowed her head upon her breast, not daring to meet her son's searching eyes. It was only too true that she had been endeavoring to increase her fortune by rash speculations for several years past. The small sum of money at her disposal had soon melted away, and she had been obliged to borrow at a high rate of interest. And now the mortgage had passed into the hands of this Sandgoist--a heartless and unprincipled man--a well-known usurer, who was heartily despised throughout the country. Dame Hansen, however, had seen him for the first time when he came to Dal to satisfy himself in regard to the value of the property.

This was the secret that had weighed so heavily upon her. This, too, explained her reserve, for she had not dared to confide in her children. This was the secret she had sedulously kept from those whose future she had blighted.

Hulda scarcely dared to think of what she had just heard. Yes, Sandgoist was indeed a master who had the power to enforce his will! The ticket he wished to purchase would probably be worth nothing a fortnight hence, and if she did not consent to relinquish it certain ruin would follow--their house would be sold over their heads, and the Hansen family would be homeless and penniless.

Hulda dared not even glance at Joel, but Joel was too angry to pay any heed to these threats. He could think only of Sandgoist, and if the man continued to talk in this way the impetuous youth felt that he should not be able to control himself much longer.

Sandgoist, seeing that he had once more become master of the situation, grew even more arrogant and imperious in his manner.

"I want that ticket, and I intend to have it," he repeated. "In exchange for it I offer no fixed price, but I promise to extend the mortgage for one--two, or three years--Fix the date yourself, Hulda."

Hulda's heart was so deeply oppressed with anguish that she was unable to reply, but her brother answered for her.

"Ole Kamp's ticket can not be sold by Hulda Hansen. My sister refuses your offer, in spite of your threats. Now leave the house!"

"Leave the house," repeated Sandgoist. "I shall do nothing of the kind. If the offer I have made does not satisfy you I will go even further. In exchange for the ticket I offer you--I offer you--"

Sandgoist must certainly have felt an irresistible desire to possess this ticket--or at least he must have been convinced that the purchase would prove a most advantageous one to him, for he seated himself at a table upon which lay pen, ink, and paper, and a moment afterward he added:

"Here is what I offer."

It was a receipt for the amount of Dame Hansen's indebtedness--a receipt for the amount of the mortgage on the Dal property.

Dame Hansen cowered in her corner, with hands outstretched, and eyes fixed imploringly on her daughter.

"And now give me the ticket," cried Sandgoist, "I want it to-day--this very instant. I will not leave Dal without it"

As he spoke he stepped hastily toward the poor girl as if with the intention of searching her pockets, and wresting the ticket from her.

This was more than Joel could endure, especially when he heard Hulda's startled cry of "Brother! brother!"

"Get out of here!" he shouted, roughly. And seeing that Sandgoist showed no intention of obeying, the young man was about to spring upon him, when Hulda hastily interposed.

"Here is the ticket, mother," she cried.

Dame Hansen seized it, and as she exchanged it for Sandgoist's receipt her daughter sunk, almost fainting, into an arm-chair.

"Hulda! Hulda! Oh, what have you done?" cried Joel.

"What has she done," replied Dame Hansen. "Yes, I am guilty--for my children's sake I wished to increase the property left by their father, but instead I have reduced them to poverty. But Hulda has saved us all. That is what she has done. Thank you, Hulda, thank you."

Sandgoist still lingered. Joel perceived the fact.
“You are here still,” he continued, roughly. And springing upon Sandgoist he seized him by the shoulders and hustled him out-of-doors in spite of his protests and resistance.

CHAPTER XV.

Sylvius Hogg reached Dal on the evening of the following day. He did not say a word about his journey, and no one knew that he had been to Bergen. As long as the search was productive of no results he wished the Hansen family to remain in ignorance of it. Every letter or telegram, whether from Bergen or Christiania, was to be addressed to him, at the inn, where he intended to await further developments. Did he still hope? Yes, though it must be admitted that he had some misgivings.

As soon as he returned the professor became satisfied that some important event had occurred in his absence. The altered manner of Joel and Hulda showed conclusively that an explanation must have taken place between their mother and themselves. Had some new misfortunes befallen the Hansen household?

All this of course troubled Sylvius Hogg greatly. He felt such a paternal affection for the brother and sister that he could not have been more fond of them if they had been his own children. How much he had missed them during his short absence.

“They will tell me all by and by,” he said to himself. “They will have to tell me all. Am I not a member of the family?”

Yes; Sylvius Hogg felt now that he had an undoubted right to be consulted in regard to everything connected with the private life of his young friends, and to know why Joel and Hulda seemed even more unhappy than at the time of his departure. The mystery was soon solved.

In fact both the young people were anxious to confide in the excellent man whom they loved with a truly filial devotion, but they were waiting for him to question them. During his absence they had felt lonely and forsaken—the more so from the fact that Sylvius Hogg had not seen fit to tell them where he was going. Never had the hours seemed so long. It never once occurred to them that the journey was in any way connected with a search for the “Viking,” and that Sylvius Hogg had concealed the fact from them in order to spare them additional disappointment in case of failure.

And now how much more necessary his presence seemed to have become to them! How glad they were to see him, to listen to his words of counsel and hear his kind and encouraging voice. But would they ever dare to tell him what had passed between them and the Drammen usurer, and how Dame Hansen had marred the prospects of her children? What would Sylvius Hogg say when he learned that the ticket was no longer in Hulda's possession, and when he heard that Dame Hansen had used it to free herself from her inexorable creditor?

He was sure to learn these facts, however. Whether it was Sylvius Hogg or Hulda that first broached the subject, it would be hard to say, nor does it matter much. This much is certain, however, the professor soon became thoroughly acquainted with the situation of affairs. He was told of the danger that had threatened Dame Hansen and her children, and how the usurer would have driven them from their old home in a fortnight if the debt had not been paid by the surrender of the ticket.

Sylvius Hogg listened attentively to this sad story.

“You should not have given up the ticket,” he cried, vehemently; “no, you should not have done it.”

“How could I help it, Monsieur Sylvius?” replied the poor girl, greatly troubled.

“You could not, of course, and yet--Ah, if I had only been here!”

And what would Professor Sylvius Hogg have done had he been there? He did not say, however, but continued:

“Yes, my dear Hulda; yes, Joel, you did the best you could, under the circumstances. But what enrages me almost beyond endurance is the fact that this Sandgoist will profit greatly, no doubt, by this absurd superstition on the part of the public. If poor Ole's ticket should really prove to be the lucky one this unprincipled scoundrel will reap all the benefit. And yet, to suppose that this number, 9672, will necessarily prove the lucky one, is simply ridiculous and absurd. Still, I would not have given up the ticket, I think. After once refusing to surrender it to Sandgoist Hulda would have done better to turn a deaf ear to her mother's entreaties.”

The brother and sister could find nothing to say in reply. In giving the ticket to Dame Hansen, Hulda had been prompted by a filial sentiment that was certainly to be commended rather than censured. The sacrifice she had made was not one of more or less probable chance, but of Ole Kamp's last wishes and of her last memento of her lover.

But it was too late to think of this now. Sandgoist had the ticket. It belonged to him, and he would sell it to the highest bidder. A heartless usurer would thus coin money out of the touching farewell of the shipwrecked mariner. Sylvius Hogg could not bear the thought. It was intolerable to him.

He resolved to have a talk with Dame Hansen on the subject that very day. This conversation could effect no change in the state of affairs, but it had become almost necessary.
"So you think I did wrong, Monsieur Hogg?" she asked, after allowing the professor to say all he had to say on the subject.
"Certainly, Dame Hansen."
"If you blame me for having engaged in rash speculations, and for endangering the fortune of my children, you are perfectly right; but if you blame me for having resorted to the means I did to free myself, you are wrong. What have you to say in reply?"
"Nothing."
"But seriously, do you think that I ought to have refused the offer of Sandgoist, who really offered fifteen thousand marks for a ticket that is probably worth nothing; I ask you again, do you think I ought to have refused it?"
"Yes and no, Dame Hansen."
"It can not be both yes and no, professor; it is no. Under different circumstances, and if the future had appeared less threatening--though that was my own fault, I admit--I should have upheld Hulda in her refusal to part with the ticket she had received from Ole Kamp. But when there was a certainty of being driven in a few days from the house in which my husband died, and in which my children first saw the light, I could not understand such a refusal, and you yourself, Monsieur Hogg, had you been in my place, would certainly have acted as I did."
"No, Dame Hansen, no!"
"What would you have done, then?"
"I would have done anything rather than sacrifice a ticket my daughter had received under such circumstances."
"Do these circumstances, in your opinion, enhance the value of the ticket?"
"No one can say."
"On the contrary, every one does know. This ticket is simply one that has nine hundred and ninety-nine thousand nine hundred and ninety-nine chances of losing against one of winning. Do you consider it any more valuable because it was found in a bottle that was picked up at sea?"
Sylvius Hogg hardly knew what to say in reply to this straightforward question, so he reverted to the sentimental side of the question by remarking:
"The situation now seems to be briefly as follows: Ole Kamp, as the ship went down, bequeathed to Hulda the sole earthly possession left him, with the request that she should present it on the day of the drawing, provided, of course, that the ticket reached her; and now this ticket is no longer in Hulda's possession."
"If Ole Kamp had been here, he would not have hesitated to surrender his ticket to Sandgoist," replied Dame Hansen.
"That is quite possible," replied Sylvius Hogg; "but certainly no other person had a right to do it, and what will you say to him if he has not perished and if he should return to-morrow, or this very day?"
"Ole will never return," replied Dame Hansen, gloomily. "Ole is dead, Monsieur Hogg, dead, beyond a doubt."
"You can not be sure of that, Dame Hansen," exclaimed the professor. "In fact, you know nothing at all about it. Careful search is being made for some survivor of the shipwreck. It may prove successful; yes, even before the time appointed for the drawing of this lottery. You have no right to say that Ole Kamp is dead, so long as we have no proof that he perished in the catastrophe. The reason I speak with less apparent assurance before your children is that I do not want to arouse hopes that may end in bitter disappointment. But to you, Dame Hansen, I can say what I really think, and I can not, I will not believe that Ole Kamp is dead! No, I will not believe it!"
Finding herself thus worsted, Dame Hansen ceased to argue the question, and this Norwegian, being rather superstitious in her secret heart, hung her head as if Ole Kamp was indeed about to appear before her.
"At all events, before parting with the ticket," continued Sylvius Hogg, "there was one very simple thing that you neglected to do."
"What?"
"You should first have applied to your personal friends or the friends of your family. They would not have refused to assist you, either by purchasing the mortgage of Sandgoist, or by loaning you the money to pay it."
"I have no friends of whom I could ask such a favor."
"Yes, you have, Dame Hansen. I know at least one person who would have done it without the slightest hesitation."
"And who is that, if you please?"
"Sylvius Hogg, member of the Storting."
Dame Hansen, too deeply moved to reply in words, bowed her thanks to the professor.
"But what's done can't be undone, unfortunately," added Sylvius Hogg, "and I should be greatly obliged to you, Dame Hansen, if you would refrain from saying anything to your children about this conversation."
And the two separated.
The professor had resumed his former habits, and his daily walks as well. In company with Joel and Hulda, he
spent several hours every day in visiting the points of interest in and about Dal—not going too far, however, for fear of wearying the young girl. Much of his time, too, was devoted to his extensive correspondence. He wrote letter after letter to Bergen and Christiania, stimulating the zeal all who were engaged in the good work of searching for the "Viking." To find Ole seemed to be his sole aim in life now.

He even felt it his duty to again absent himself for twenty-four hours, doubtless for an object in some way connected with the affair in which Dame Hansen's family was so deeply interested; but, as before, he maintained absolute silence in regard to what he was doing or having done in this matter.

In the meantime Hulda regained strength but slowly. The poor girl lived only upon the recollection of Ole; and her hope of seeing him again grew fainter from day to day. It is true, she had near her the two beings she loved best in the world; and one of them never ceased to encourage her; but would that suffice? Was it not necessary to divert her mind at any cost? But how was her mind to be diverted from the gloomy thoughts that bound her, as it were, to the shipwrecked "Viking?"

The 12th of July came. The drawing of the Christiania Schools Lottery was to take place in four days. It is needless to say that Sandgoist's purchase had come to the knowledge of the public. The papers announced that the famous ticket bearing the number 9672 was now in the possession of M. Sandgoist, of Drammen, and that this ticket would be sold to the highest bidder; so, if M. Sandgoist was now the owner of the aforesaid ticket, he must have purchased it for a round sum of Hulda Hansen.

Of course this announcement lowered the young girl very decidedly in public estimation. What! Hulda Hansen had consented to sell the ticket belonging to her lost lover? She had turned this last memento of him into money?

But a timely paragraph that appeared in the "Morgen-Blad" gave the readers a true account of what had taken place. It described the real nature of Sandgoist's interference, and how the ticket had come into his hands. And now it was upon the Drammen usurer that public odium fell; upon the heartless creditor who had not hesitated to take advantage of the misfortunes of the Hansen family, and as if by common consent the offers which had been made while Hulda held the ticket were not renewed. The ticket seemed to have lost its supernatural value since it had been defiled by Sandgoist's touch, so that worthy had made but a bad bargain, after all, and the famous ticket, No. 9672, appeared likely to be left on his hands.

It is needless to say that neither Hulda nor Joel was aware of what had been said, and this was fortunate, for it would have been very painful to them to become publicly mixed up in an affair which had assumed such a purely speculative character since it came into the hands of the usurer.

Late on the afternoon of the 12th of July, a letter arrived, addressed to Professor Sylvius Hogg. This missive, which came from the Naval Department, contained another which had been mailed at Christiansand, a small town situated at the mouth of the Gulf of Christiania. It could hardly have contained any news, however, for Sylvius Hogg put it in his pocket and said nothing to Joel or his sister about its contents.

But when he bade them good-night on retiring to his chamber, he remarked:

"The drawing of the lottery is to take place in three days as you are, of course, aware, my children. You intend to be present, do you not?"

"What is the use, Monsieur Sylvius?" responded Hulda.

"But Ole wished his betrothed to witness it. In fact, he particularly requested it in the last lines he ever wrote, and I think his wishes should be obeyed."

"But the ticket is no longer in Hulda's possession," remarked Joel, "and we do not even know into whose hands it has passed."

"Nevertheless, I think you both ought to accompany me to Christiania to attend the drawing," replied the professor.

"Do you really desire it, Monsieur Sylvius?" asked the young girl.

"It is not I, my dear Hulda, but Ole who desires it, and Ole's wishes must be respected."

"Monsieur Sylvius is right, sister," replied Joel. "Yes; you must go. When do you intend to start, Monsieur Sylvius?"

"To-morrow, at day-break, and may Saint Olaf protect us!"

CHAPTER XVI.

The next morning Foreman Lengling's gayly painted kariol bore away Sylvius Hogg and Hulda, seated comfortably side by side. There was not room for Joel, as we know already, so the brave fellow trudged along on foot at the horse's head.

The fourteen kilometers that lay between Dal and Moel had no terrors for this untiring walker. Their route lay along the left bank of the Maan, down the charming valley of the Vesfjorddal--a narrow, heavily
wooded valley, watered by a thousand dashing cataracts. At each turn in the path, too, one saw appearing or disappearing the lofty summit of Gousta, with its two large patches of dazzling snow.

The sky was cloudless, the weather magnificent, the air not too cool, nor the sun too warm.

Strange to say, Sylvius Hogg's face seemed to have become more serene since his departure from the inn, though it is not improbable that his cheerfulness was a trifle forced, so anxious was he that this trip should divert Joel and Hulda from their sorrowful thoughts.

It took them only about two hours and a half to reach Moel, which is situated at the end of Lake Tinn. Here they were obliged to leave the kariol and take a small boat, for at this point a chain of small lakes begins. The kariol paused near the little church, at the foot of a water-fall at least five hundred feet in height. This water-fall, which is visible for only about one fifth of its descent, loses itself in a deep crevasse before being swallowed up by the lake.

Two boatmen were standing on the shore beside a birch-bark canoe, so fragile and unstable that the slightest imprudence on the part of its occupants would inevitably overturn it.

The lake was at its very best this beautiful morning. The sun had absorbed all the mist of the previous night, and no one could have asked for a more superb summer's day.

"You are not tired, my good Joel?" inquired the professor, as he alighted from the kariol.

"No, Monsieur Sylvius. You forget that I am accustomed to long tramps through the Telemark."

"That is true. Tell me, do you know the most direct route from Moel to Christiania?"

"Perfectly, sir. But I fear when we reach Tinoset, at the further end of the lake, we shall have some difficulty in procuring a kariol, as we have not warned them of our intended arrival, as is customary in this country."

"Have no fears, my boy," replied the professor: "I attended to that. You needn't be afraid that I have any intention of making you foot it from Dal to Christiania."

"I could easily do it if necessary," remarked Joel.

"But it will not be necessary, fortunately. Now suppose we go over our route again."

"Well, once at Tinoset, Monsieur Sylvius, we for a time follow the shores of Lake Fol, passing through Vik and Bolkesko, so as to reach Mose, and afterward Kongsberg, Hangsund, and Drammen. If we travel both night and day it will be possible for us to reach Christiania to-morrow afternoon."

"Very well, Joel. I see that you are familiar with the country, and the route you propose is certainly a very pleasant one."

"It is also the shortest."

"But I am not at all particular about taking the shortest route," replied Sylvius Hogg, laughing. "I know another and even more agreeable route that prolongs the journey only a few hours, and you, too, are familiar with it, my boy, though you failed to mention it."

"What route do you refer to?"

"To the one that passes through Bamble."

"Through Bamble?"

"Yes, through Bamble. Don't feign ignorance. Yes, through Bamble, where Farmer Helmboe and his daughter Siegfrid reside."

"Monsieur Sylvius!"

"Yes, and that is the route we are going to take, following the northern shore of Lake Fol instead of the southern, but finally reaching Kongsberg all the same."

"Yes, quite as well, and even better," answered Joel smiling.

"I must thank you in behalf of my brother, Monsieur Sylvius," said Hulda, archly.

"And for yourself as well, for I am sure that you too will be glad to see your friend Siegfrid."

The boat being ready, all three seated themselves upon a pile of leaves in the stern, and the vigorous strokes of the boatsmen soon carried the frail bark a long way from the shore.

After passing Hackenoes, a tiny hamlet of two or three houses, built upon a rocky promontory laved by the narrow fiord into which the Maan empties, the lake begins to widen rapidly. At first it is walled in by tall cliffs whose real height one can estimate accurately only when a boat passes their base, appearing no larger than some aquatic bird in comparison; but gradually the mountains retire into the background.

The lake is dotted here and there with small islands, some absolutely devoid of vegetation, others covered with verdure through which peep a few fishermen's huts. Upon the lake, too, may be seen floating countless logs not yet sold to the saw-mills in the neighborhood.

This sight led Sylvius Hogg to jestingly remark--and he certainly must have been in a mood for jesting:

"If our lakes are the eyes of Norway, as our poets pretend, it must be admitted that poor Norway has more than one beam in her eye, as the Bible says."

About four o'clock the boat reached Tinoset, one of the most primitive of hamlets. Still that mattered little,
Sylvius Hogg had no intention of remaining there even for an hour. As he had prophesied to Joel, a vehicle was awaiting them on the shore, for having decided upon this journey several weeks before, he had written to Mr. Benett, of Christiania, requesting him to provide the means of making it with the least possible fatigue and delay, which explains the fact that a comfortable carriage was in attendance, with its box well stocked with eatables, thus enabling the party to dispense with the stale eggs and sour milk with which travelers are usually regaled in the hamlets of the Telemark.

Tinset is situated near the end of Lake Tinn, and here the Maan plunges majestically into the valley below, where it resumes its former course.

The horses being already harnessed to the carriage, our friends immediately started in the direction of Bamble. In those days this was the only mode of travel in vogue throughout Central Norway, and through the Telemark in particular, and perhaps modern railroads have already caused the tourist to think with regret of the national kariol and Mr. Benett's comfortable carriages.

It is needless to say that Joel was well acquainted with this region, having traversed it repeatedly on his way from Dal to Bamble.

It was eight o'clock in the evening when Sylvius Hogg and his protégées reached the latter village. They were not expected, but Farmer Helmboe received them none the less cordially on that account. Siegfrid tenderly embraced her friend, and the two young girls being left alone together for a few moments, they had an opportunity to discuss the subject that engrossed their every thought.

"Pray do not despair, my dearest Hulda," said Siegfrid; "I have not ceased to hope, by any means. Why should you abandon all hope of seeing your poor Ole again? We have learned, through the papers, that search is being made for the 'Viking.' It will prove successful, I am certain it will, and I am sure Monsieur Sylvius has not given up all hope. Hulda, my darling, I entreat you not to despair."

Hulda's tears were her only reply, and Siegfrid pressed her friend fondly to her heart.

Ah! what joy would have reigned in Farmer Helmboe's household if they could but have heard of the safe return of the absent one, and have felt that they really had a right to be happy.

"So you are going direct to Christiania?" inquired the farmer.

"Yes, Monsieur Helmboe."

"To be present at the drawing of the great lottery?"

"Certainly."

"But what good will it do now that Ole's ticket is in the hands of that wretch, Sandgoist?"

"It was Ole's wish, and it must be respected," replied the professor.

"I hear that the usurer has found no purchaser for the ticket for which he paid so dearly."

"I too have heard so, friend Helmboe."

"Well, I must say that it serves the rascal right. The man is a scoundrel, professor, a scoundrel, and it serves him right."

"Yes, friend Helmboe, it does, indeed, serve him right."

Of course they had to take supper at the farm-house. Neither Siegfrid nor her father would allow their friends to depart without accepting the invitation, but it would not do for them to tarry too long if they wished to make up for the time lost by coming around by the way of Bamble, so at nine o'clock the horses were put to the carriage.

"At my next visit I will spend six hours at the table with you, if you desire it," said Sylvius Hogg to the farmer; "but to-day I must ask your permission to allow a cordial shake of the hand from you and the loving kiss your charming Siegfrid will give Hulda to take the place of the dessert."

This done they started.

In this high latitude twilight would still last several hours. The horizon, too, is distinctly visible for a long while after sunset, the atmosphere is so pure.

It is a beautiful and varied drive from Bamble to Kongsberg. The road passes through Hitterdal and to the south of Lake Fol, traversing the southern part of the Telemark, and serving as an outlet to all the small towns and hamlets of that locality.

An hour after their departure they passed the church of Hitterdal, an old and quaint edifice, surmounted with gables and turrets rising one above the other, without the slightest regard to anything like regularity of outline. The structure is of wood--walls, roofs and turrets--and though it strongly resembles a motley collection of pepper-boxes, it is really a venerable and venerated relic of the Scandinavian architecture of the thirteenth century.

Night came on very gradually--one of those nights still impregnated with a dim light which about one o'clock begins to blend with that of early dawn.

Joel, enthroned upon the front seat, was absorbed in his reflections. Hulda sat silent and thoughtful in the interior of the carriage. But few words were exchanged between Sylvius Hogg and the postilion, and these were almost
invariably requests to drive faster. No other sound was heard save the bells on the harness, the cracking of the whip, and the rumble of wheels over the stony road. They drove on all night, without once changing horses. It was not necessary to stop at Lísthus, a dreary station, situated in a sort of natural amphitheater, surrounded by pine-clad mountains. They passed swiftly by Tiness, too, a picturesque little hamlet, perched on a rocky eminence. Their progress was rapid in spite of the rather dilapidated condition of their vehicle, whose bolts and springs rattled and creaked dolorously, and certainly there was no just cause of complaint against the driver, though he was half asleep most of the time. But for all that, he urged his horses briskly on, whipping his jaded steeds mechanically, but usually aiming his blows at the off horse, for the near one belonged to him, while the other was the property of a neighbor.

About five o'clock in the morning Sylvius Hogg opened his eyes, stretched out his arms, and drank in huge draughts of the pungent odor of the pines.

They had now reached Kongsberg. The carriage was crossing the bridge over the Laagen, and soon it stopped in front of a house near the church, and not far from the water-fall of the Larbrù.

"If agreeable to you, my friends," remarked Sylvius Hogg, "we will stop here only to change horses, for it is still too early for breakfast. I think it would be much better not to make a real halt until we reach Drammen. There we can obtain a good meal, and so spare Monsieur Benett's stock of provisions."

This being decided the professor and Joel treated themselves to a tiny glass of brandy at the Hotel des Mines, and a quarter of an hour afterward, fresh horses being in readiness, they resumed their journey.

On leaving the city they were obliged to ascend a very steep hill. The road was roughly hewn in the side of the mountain, and from it the tall towers at the mouth of the silver mines of Kongsberg were distinctly visible. Then a dense pine forest suddenly hid everything else from sight—a pine forest through which the sun's rays never penetrate.

The town of Hangsund furnished fresh horses for the carriage. There our friends again found themselves on smooth level roads, frequently obstructed by turnpike gates, where they were obliged to pay a toll of five or six shillings. This was a fertile region, abounding in trees that looked like weeping willows, so heavily did the branches droop under their burden of fruit.

As they neared Drammen, which is situated upon an arm of Christiania Bay, the country became more hilly. About noon they reached the city with its two interminable streets, lined with gayly painted houses, and its wharves where the countless rafts left but a meager space for the vessels that come here to load with the products of the Northland.

The carriage paused in front of the Scandinavian Hotel. The proprietor, a dignified-looking personage, with a long, white beard, and a decidedly professional air, promptly appeared in the doorway of his establishment.

With that keenness of perception that characterizes inn-keepers in every country on the globe, he remarked:

"I should not wonder if these gentlemen and this young lady would like breakfast."

"Yes," replied Sylvius Hogg, "but let us have it as soon as possible."

"It shall be served immediately."

The repast was soon ready, and proved a most tempting one. Mention should especially be made of a certain fish, stuffed with a savory herb, of which the professor partook with evident delight.

At half past one o'clock the carriage, to which fresh horses had been harnessed, was brought to the hotel door, and our friends started down the principal street of Drammen at a brisk trot.

As they passed a small and dingy dwelling that contrasted strongly with the gayly painted houses around it, Joel could not repress a sudden movement of loathing.

"There is Sandgoist?" he exclaimed.

"So that is Sandgoist," remarked Sylvius Hogg. "He certainly has a bad face."

It was Sandgoist smoking on his door-step. Did he recognize Joel? It is impossible to say, for the carriage passed swiftly on between the huge piles of lumber and boards.

Next came a long stretch of level road, bordered with mountain ash-trees, laden with coral berries, and then they entered the dense pine forest that skirts a lovely tract of land known as Paradise Valley.

Afterward they found themselves confronted and surrounded by a host of small hills, each of which was crowned with a villa or farm-house. As twilight came on, and the carriage began to descend toward the sea through a series of verdant meadows, the bright red roofs of neat farm-houses peeped out here and there through the trees, and soon our travelers reached Christiania Bay, surrounded by picturesque hills, and with its innumerable creeks, its tiny ports and wooden piers, where the steamers and ferry-boats land.

At nine o'clock in the evening, and while it was still light, the old carriage drove noisily into the city through the already deserted streets.

In obedience to orders previously given by Sylvius Hogg, the vehicle drew up in front of the Hotel du Nord. It was there that Hulda and Joel were to stay, rooms having been engaged for them in advance. After bidding them an affectionate good-night the professor hastened to his own home, where his faithful servants, Kate and Fink, were
CHAPTER XVII.

Christiania, though it is the largest city in Norway, would be considered a small town in either England or France; and were it not for frequent fires, the place would present very much the same appearance that it did in the eleventh century. It was really rebuilt in 1624, by King Christian, however; and its name was then changed from Opsolo, as it had been previously called, to Christiania, in honor of its royal architect.

It is symmetrically laid out with broad, straight streets: and the houses are generally of gray stone or red brick. In the center of a fine garden stands the royal palace, known as the Oscarlot, a large quadrangular building, devoid of beauty, though built in the Ionic style of architecture. There are a few churches, in which the attention of worshipers is not distracted by any marvels of art; several municipal and government buildings, and one immense bazaar, constructed in the form of a rotunda, and stocked with both native and foreign goods.

There is nothing very remarkable about all this, but one thing the traveler can certainly admire without stint, and that is the site of the city, which is encircled by mountains so varied in shape and aspect as to form a most superb frame for Christiania.

Though the city is nearly flat in the new and wealthy quarter, the hilly portions, where the poorer classes live, are covered with brick or wooden huts of gaudy tints that astonish rather than charm the beholder.

Like all cities situated upon the water's edge, and upon fertile hills, Christiania is extremely picturesque, and it would not be unjust to compare its fiord to the famous Bay of Naples. Its shores, like those of Sorrento and Castellamare, are dotted with chalets and villas, half hidden in the dark, rich verdure of the pines, and enveloped in the light mist that imparts such a wonderful softness to northern landscapes.

Sylvius Hogg had at last returned to Christiania, though under conditions that he little dreamed of at the beginning of his interrupted journey. Oh, well, he would try that again another year! He could think only of Joel and Hulda Hansen now. Had there been time to prepare for them, he would certainly have taken them to his own home, where old Fink and old Kate would have made them heartily welcome; but under the circumstances, the professor had thought it advisable to take them to the Hotel du Nord, where, as protégées of Sylvius Hogg, they were sure of every attention, though he had carefully refrained from giving their names, for there had been so much talk about the brother and sister, and especially about the young girl, that it would be very embarrassing for her if her arrival in Christiania should become known.

It had been decided that Sylvius Hogg should not see them again until breakfast the next day, that is to say, between eleven and twelve o'clock, as he had some business matters to attend to that would engross his attention all the forenoon. He would then rejoin them and remain with them until three o'clock, the hour appointed for the drawing of the lottery.

Joel, as soon as he rose the next morning, tapped at the door of his sister's room, and being anxious to divert her thoughts, which were likely to be more melancholy than ever on such a day, he proposed that they should walk about the town until breakfast-time, and Hulda, to please her brother, consented.

It was Sunday, but though the streets of northern cities are usually quiet and well-nigh deserted on that day, an air of unusual bustle and animation pervaded the scene, for not only had the townspeople refrained from going to the country, as usual, but people from the surrounding towns and country was pouring in in such numbers that the Lake Miosen Railroad had been obliged to run extra trains.

The number of disinterested persons anxious to attend the drawing of the famous lottery was even greater than the number of ticket-holders, consequently the streets were thronged with people. Whole families, and even whole villages, had come to the city, in the hope that their journey would not be in vain. Only to think of it! one million tickets had been sold, and even if they should win a prize of only one or two hundred marks, how many good people would return home rejoicing!

On leaving the hotel, Joel and Hulda first paid a visit to the wharves that line the harbor. Here the crowd was not so great except about the taverns, where huge tankards of beer were being continually called for to moisten throats that seemed to be in a state of constant thirst.

As the brother and sister wandered about among the long rows of barrels and boxes, the vessels which were anchored both near and far from the shore came in for a liberal share of their attention, for might there not be some from the port of Bergen where the "Viking" would never more be seen?

"Ole! my poor Ole!" sighed Hulda, and hearing this pathetic exclamation, Joel led her gently away from the wharves, and up into the city proper.

There, from the crowds that filled the streets and the public squares, they overheard more than one remark in relation to themselves.
"Yes," said one man; "I hear that ten thousand marks have been offered for ticket 9672."
"Ten thousand!" exclaimed another. "Why, I hear that twenty thousand marks, and even more, have been offered."
"Mr. Vanderbilt, of New York, has offered thirty thousand."
"And Messrs. Baring, of London, forty thousand."
"And the Rothschilds, sixty thousand."
So much for public exaggeration. At this rate the prices offered would soon have exceeded the amount of the capital prize.

But if these gossips were not agreed upon the sum offered to Hulda Hansen, they were all of one mind in regard to the usurer of Drammen.

"What an infernal scoundrel Sandgoist must be. That rascal who showed those poor people no mercy."
"Yes; he is despised throughout the Telemark, and this is not the first time he has been guilty of similar acts of rascality."
"They say that nobody will buy Ole Kamp's ticket of him, now he has got it."
"No; nobody wants it now."
"That is not at all surprising. In Hulda Hansen's hands the ticket was valuable."
"And in Sandgoist's it seems worthless."
"I'm glad of it. He'll have it left on his hands, and I hope he'll lose the fifteen thousand marks it cost him."
"But what if the scoundrel should win the grand prize?"
"He? Never!"
"He had better not come to the drawing."
"No. If he does he will be roughly handled. There is no question about that."
These and many other equally uncomplimentary remarks about the usurer were freely bandied about.

It was evident that he did not intend to be present at the drawing, as he was at his house in Drammen the night before; but feeling his sister's arm tremble in his, Joel led her swiftly on, without trying to hear any more.

As for Sylvius Hogg, they had hoped to meet him in the street; but in this they were disappointed, though an occasional remark satisfied them that the public was already aware of the professor's return, for early in the morning he had been seen hurrying toward the wharves, and afterward in the direction of the Naval Department.

Of course, Joel might have asked anybody where Professor Sylvius Hogg lived. Any one would have been only too delighted to point out the house or even to accompany him to it; but he did not ask, for fear of being indiscreet, and as the professor had promised to meet them at the hotel, it would be better to wait until the appointed hour.

After a time Hulda began to feel very tired, and requested her brother to take her back to the hotel, especially as these discussions, in which her name was frequently mentioned, were very trying to her, and on reaching the house she went straight up to her own room to await the arrival of Sylvius Hogg.

Joel remained in the reading-room, on the lower floor, where he spent his time in mechanically looking over the Christiania papers. Suddenly he turned pale, a mist obscured his vision, and the paper fell from his hands.

In the "Morgen-Blad," under the heading of Maritime Intelligence, he had just seen the following cablegram from Newfoundland:

"The dispatch-boat 'Telegraph' has reached the locality where the 'Viking' is supposed to have been lost, but has found no trace of the wreck. The search on the coast of Greenland has been equally unsuccessful, so it may be considered almost certain that none of the unfortunate ship's crew survived the catastrophe."

CHAPTER XVIII.
"Good-morning, Mr. Benett. It is always a great pleasure to me when I have an opportunity to shake hands with you."
"And for me, professor, it is a great honor."
"Honor, pleasure--pleasure, honor," laughed the professor. "One balances the other."
"I am glad to see that your journey through Central Norway has been safely accomplished."
"Not accomplished, only concluded, for this year."
"But tell me, pray, all about those good people you met at Dal."
"Excellent people they were, friend Benett, in every sense of the word."
"From what I can learn through the papers they are certainly very much to be pitied."
"Unquestionably, Mr. Benett. I have never known misfortune to pursue persons so relentlessly."
"It seems so, indeed, professor; for right after the loss of the 'Viking' came that miserable Sandgoist affair."
"True, Mr. Benett."
"Still, Mr. Hogg, I think Hulda Hansen did right to give up the ticket under the circumstances."
"Indeed! and why, if you please?"
"Because it is better to secure fifteen thousand marks than to run a very great risk of gaining nothing at all."
"You talk like the practical business man and merchant that you are; but if you choose to look at the matter from another point of view, it becomes a matter of sentiment, and money exerts very little influence in such cases."
"Of course, Mr. Hogg, but permit me to remark that it is more than likely that your protégée has profited greatly by the exchange."
"Why do you think so?"
"But think of it. What does this ticket represent? One chance in a million of winning."
"Yes, one chance in a million. That is very small; it is true, Mr. Benett, very small."
"Yes; and consequently such a reaction has followed the late madness that it is said that this Sandgoist who purchased the ticket to speculate upon it has been unable to find a purchaser."
"So I have heard."
"And yet, if that rascally usurer should win the grand prize, what a shame it would be!"
"A shame, most assuredly, Mr. Benett; the word is not too strong--a shame, unquestionably."

This conversation took place while Sylvius Hogg was walking through the establishment of M. Benett--an establishment well known in Christiania, and indeed throughout Norway. It is difficult to mention an article that can not be found in this bazaar. Traveling-carriages, kariols by the dozen, canned goods, baskets of wine, preserves of every kind, clothing and utensils for tourists, and guides to conduct them to the remotest villages of Finmark, Lapland, or even to the North Pole. Nor is this all. M. Benett likewise offers to lovers of natural history specimens of the different stones and metals found in the earth, as well as of the birds, insects, and reptiles of Norway. It is well, too, to know that one can nowhere find a more complete assortment of the jewelry and bric-à-brac of the country than in his show-cases.

This gentleman is consequently the good angel of all tourists desirous of exploring the Scandinavian peninsula, and a man Christiania could scarcely do without.

"By the way, you found the carriage you had ordered waiting for you at Tinoset, did you not, professor?" he asked.
"Yes. Having ordered it through you, Monsieur Benett, I felt sure that it would be there at the appointed time."
"You are a sad flatterer, I fear, Monsieur Hogg. But I judged from your letter that there were to be three of you in the party."
"There were three of us, as I told you."
"And the others?"
"They arrived here safe and sound last evening, and are now waiting for me at the Hotel du Nord, where I am soon to join them."
"And these persons are--?"
"Precisely, Monsieur Benett, precisely; but I must beg you to say nothing about it. I don't wish their arrival to be noised abroad yet."
"Poor girl!"
"Yes, she has suffered terribly."
"And you wish her to be present at the drawing, though the ticket her betrothed bequeathed to her is no longer in her possession?"
"It is not my wish, Monsieur Benett, but that of Ole Kamp, and I say to you as I have said to others, Ole Kamp's last wishes would be obeyed."
"Unquestionably. What you do is not only right, but always for the best, professor."
"You are flattering me now, dear Monsieur Benett."
"Not at all. But it was a lucky day for them when the Hansen family made your acquaintance."
"Nonsense! it was a much more fortunate thing for me that they crossed my path."
"I see that you have the same kind heart still."
"Well, as one is obliged to have a heart it is best to have a good one, isn't it?" retorted the professor, with a genial smile. "But you needn't suppose that I came here merely in search of compliments," he continued. "It was for an entirely different object, I assure you."
"Believe me, I am quite at your service."
"You are aware, I suppose, that but for the timely intervention of Joel and Hulda Hansen, the Rjukanfos would never have yielded me up alive, and I should not have the pleasure of seeing you to-day?"
"Yes, yes, I know," replied Mr. Benett. "The papers have published full accounts of your adventure, and those courageous young people really deserve to win the capital prize."
"That is my opinion," answered Sylvius Hogg, "but as that is quite out of the question now, I am unwilling for my friend Hulda to return to Dal without some little gift as a sort of memento of her visit to Christiania."

"That is certainly an excellent idea, Mr. Hogg."

"So you must assist me in selecting something that would be likely to please a young girl."

"Very willingly," responded Mr. Benett. And he forthwith invited the professor to step into the jewelry department, for was not a Norwegian ornament the most charming souvenir that one could take away with one from Christiania and from Mr. Benett's wonderful establishment?

Such at least was the opinion of Sylvius Hogg when the genial merchant exhibited the contents of his show-cases.

"As I am no connoisseur in such matters I must be guided by your taste, Mr. Benett," he remarked.

They had before them a very large and complete assortment of native jewelry, which is usually valuable rather by reason of the elaborateness of its workmanship than any costliness of material.

"What is this?" inquired the professor.

"It is a ring with pendants which emit a very pleasant sound."

"It is certainly very pretty," replied Sylvius Hogg, trying the bauble on the tip of his little finger. "Lay it aside, Mr. Benett, and let us look at something else."

"Bracelets or necklaces?"

"At a little of everything, if you please, Mr. Benett--a little of everything. What is this?"

"A set of ornaments for the corsage. Look at that delicate tracery of copper upon a red worsted groundwork. It is all in excellent taste, though not very expensive."

"The effect is certainly charming, Mr. Benett. Lay the ornaments aside with the ring."

"But I must call your attention to the fact that these ornaments are reserved for the adornment of youthful brides on their wedding-day, and that--"

"By Saint Olaf! you are right, Mr. Benett, you are quite right. Poor Hulda! Unfortunately it is not Ole who is making her this present, but myself, and it is not to a blushing bride that I am going to offer it."

"True, true, Mr. Hogg."

"Let me look then at some jewelry suitable for a young girl. How about this cross, Mr. Benett?"

"It is to be worn as a pendant, and being cut in concave facets it sparkles brilliantly with every movement of the wearer's throat."

"It is very pretty, very pretty, indeed, and you can lay it aside with the other articles, Mr. Benett. When we have gone through all the show-cases we will make our selection."

"Yes, but--"

"What is the matter now?"

"This cross, too, is intended to be worn by Scandinavian brides on their marriage-day."

"The deuce! friend Benett. I am certainly very unfortunate in my selections."

"The fact is, professor, my stock is composed principally of bridal jewelry, as that meets with the readiest sale. You can scarcely wonder at that."

"The fact doesn't surprise me at all, Mr. Benett, though it places me in a rather embarrassing position."

"Oh, well, you can still take the ring you asked me to put aside."

"Yes, but I should like some more showy ornament."

"Then take this necklace of silver filigree with its four rows of chains which will have such a charming effect upon the neck of a young girl. See! it is studded with gems of every hue, and it is certainly one of the most quaint and curious productions of the Norwegian silversmiths."

"Yes, yes," replied Sylvius Hogg. "It is a pretty ornament, though perhaps rather showy for my modest Hulda. Indeed, I much prefer the corsage ornaments you showed me just now, and the pendant. Are they so especially reserved for brides that they can not be presented to a young girl?"

"I think the Storthing has as yet passed no law to that effect," replied Mr. Benett. "It is an unpardonable oversight, probably, but--"

"Well, well, it shall be attended to immediately, Mr. Benett. In the meantime I will take the cross and corsage ornaments. My little Hulda may marry some day after all. Good and charming as she is she certainly will not want for an opportunity to utilize these ornaments, so I will buy them and take them away with me."

"Very well, very well, professor."

"Shall we have the pleasure of seeing you at the drawing, friend Benett?"

"Certainly."

"I think it will be a very interesting affair."

"I am sure of it."
"But look here," exclaimed the professor, bending over a show-case, "here are two very pretty rings I did not notice before."

"Oh, they wouldn't suit you, Mr. Hogg. These are the heavily chased rings that the pastor places upon the finger of the bride and the groom during the marriage ceremony."

"Indeed? Ah, well, I will take them all the same. And now I must bid you good-bye, Mr. Benett, though I hope to see you again very soon."

Sylvius Hogg now left the establishment, and walked briskly in the direction of the Hotel du Nord. On entering the vestibule his eyes fell upon the words _Fiat lux_, which are inscribed upon the hall lamp.

"Ah! these Latin words are certainly very appropriate," he said to himself, "Yes. _Fiat lux! Fiat lux!_"

Hulda was still in her room, sitting by the window. The professor rapped at the door, which was instantly opened.

"Oh. Monsieur Sylvius!" cried the girl, delightedly.

"Yes, here I am, here I am! But never mind about Monsieur Sylvius now; our attention must be devoted to breakfast, which is ready and waiting. I'm as hungry as a wolf. Where is Joel?"

"In the reading-room."

"Well, I will go in search of him. You, my dear child, must come right down and join us."

Sylvius Hogg left the room and went to find Joel, who was also waiting for him, but in a state of mind bordering upon despair. The poor fellow immediately showed the professor the copy of the "Morgen-Blad," containing the discouraging telegram from the commander of the "Telegraph."

"Hulda has not seen it, I hope?" inquired the professor, hastily.

"No, I thought it better to conceal from her as long as possible what she will learn only too soon."

"You did quite right, my boy. Let us go to breakfast."

A moment afterward all three were seated at a table in a private dining-room, and Sylvius Hogg began eating with great zest.

An excellent breakfast it was, equal in fact to any dinner, as you can judge from the _menu_. Cold beer soup, salmon with egg sauce, delicious veal cutlets, rare roast beef, a delicate salad, vanilla ice, raspberry and cherry preserver—the whole moistened with some very fine claret.

"Excellent, excellent!" exclaimed Sylvius Hogg. "Why, we can almost imagine ourselves in Dame Hansen's inn at Dal."

And as his mouth was otherwise occupied his eyes smiled as much as it is possible for eyes to smile.

Joel and Hulda endeavored to reply in the same strain, but they could not, and the poor girl tasted scarcely anything. When the repast was concluded:

"My children," said Sylvius Hogg, "you certainly failed to do justice to a very excellent breakfast. Still, I can not compel you to eat, and if you go without breakfast you are likely to enjoy your dinner all the more, while I very much doubt if I shall be able to compete with you to-night. Now, it is quite time for us to leave the table."

The professor was already upon his feet, and he was about to take the hat Joel handed him, when Hulda checked him by saying:

"Monsieur Sylvius, do you still insist that I shall accompany you?"

"To witness the drawing? Certainly I do, my dear girl."

"But it will be a very painful ordeal for me."

"I admit it, but Ole wished you to be present at the drawing, Hulda, and Ole's wishes must be obeyed."

This phrase was certainly becoming a sort of refrain in Sylvius Hogg's mouth.

CHAPTER XIX.

What a crowd filled the large hall of the University of Christiana in which the drawing of the great lottery was to take place—a crowd that overflowed into the very court-yards, as even the immense building was not large enough to accommodate such a throng, and even into the adjoining streets, as the court-yards, too, proved inadequate toward the last.

On that Sunday, the 15th of July, it certainly was not by their calmness and phlegm that one would have recognized these madly excited people as Norwegians. Was this unwonted excitement due solely to the interest excited by this drawing, or was it due, at least, in a measure, to the unusually high temperature of the summer's day?

The drawing was to begin at three o'clock precisely. There were one hundred prizes—divided into three classes: 1st, ninety prizes ranging in value from one hundred to one thousand marks, and amounting in all to forty-five thousand marks; 2d, nine prizes of from one thousand to nine thousand marks, and amounting to forty-five thousand marks, and 3d, one prize of one hundred thousand marks.
Contrary to the rule that is generally observed in lotteries of this kind, the drawing of the grand prize was reserved for the last. It was not to the holder of the first ticket drawn that the grand prize would be given, but to the last, that is to say, the one hundredth. Hence, there would result a series of emotions and heart-throbbings of constantly increasing violence, for it had been decided that no ticket should be entitled to two prizes, but that having gained one prize, the drawing should be considered null and void if the same number were taken from the urns a second time.

All this was known to the public, and there was nothing for people to do but await the appointed hour; but to while away the tedious interval of waiting they all talked, and, chiefly, of the pathetic situation of Hulda Hansen. Unquestionably, if she had still been the possessor of Ole Kamp's ticket each individual present would have wished her the next best luck to himself.

Several persons having seen the dispatch published in the "Morgen-Blad," spoke of it to their neighbors, and the entire crowd soon became aware that the search of the "Telegraph" had proved futile. This being the case all felt that there was no longer any hope of finding even a vestige of the lost "Viking." Not one of the crew could have survived the shipwreck, and Hulda would never see her lover again.

Suddenly another report diverted the minds of the crowd. It was rumored that Sandgoist had decided to leave Drammen, and several persons pretended that they had seen him in the streets of Christiania. Could it be that he had ventured into this hall? If he had the wretch would certainly meet with a most unflattering reception. How audacious in him to think of such a thing as being present at this drawing! It was so improbable that it could not be possible. It must certainly be a false alarm, and nothing more.

About quarter past two quite a commotion was apparent in the crowd.

It was caused by the sudden appearance of Sylvius Hogg at the gate of the University. Every one knew the prominent part he had taken in the whole affair, and how, after having been received by Dame Hansen's children, he had endeavored to repay the obligation, so the crowd instantly divided to make way for him, and there arose from every side a flattering murmur, which Sylvius acknowledged by a series of friendly bows, and this murmur soon changed into hearty applause.

But the professor was not alone. When those nearest him stepped back to make way for him they saw that he had a young girl on his arm, and that a young man was following them.

A young man! a young girl! The discovery had very much the effect of an electric shock. The same thought flashed through every mind like a spark from an electric battery.

"Hulda! Hulda Hansen!"

This was the name that burst from every lip.

Yes, it was Hulda, so deeply agitated that she could hardly walk. Indeed, she certainly would have fallen had it not been for Sylvius Hogg's supporting arm. But it upheld her firmly--her, the modest, heart-broken little heroine of the fête to which Ole Kamp's presence only was wanting. How greatly she would have preferred to remain in her own little room at Dal! How she shrunk from this curiosity on the part of those around her, sympathizing though it was! But Sylvius Hogg had wished her to come, and she had done so.

"Room! room!" was heard on all sides.

And as Sylvius Hogg, and Hulda and Joel walked up the passage-way that had been cleared for them, as if by magic, how many friendly hands were outstretched to grasp theirs, how many kind and cordial words were lavished upon them, and with what delight Sylvius Hogg listened to these expressions of friendly feeling!

"Yes; it is she, my friends, my little Hulda, whom I have brought back with me from Dal," said he. "And this is Joel, her noble brother; but pray, my good friends, do not smother them!"

Though Joel returned every grasp with interest, the less vigorous hands of the professor were fairly benumbed by such constant shaking, but his eyes sparkled with joy, though a tear was stealing down his cheek; but--and the phenomenon was certainly well worthy the attention of ophthalmologists--the tear was a luminous one.

It took them fully a quarter of an hour to cross the court-yard, gain the main hall, and reach the seats that had been reserved for the professor. When this was at last accomplished, not without considerable difficulty, Sylvius Hogg seated himself between Hulda and Joel.

At precisely half past two o'clock, the door at the rear of the platform opened, and the president of the lottery appeared, calm and dignified, and with the commanding mien befitting his exalted position. Two directors followed, bearing themselves with equal dignity. Then came six little blue-eyed girls, decked out in flowers and ribbons, six little girls whose innocent hands were to draw the lottery.

Their entrance was greeted with a burst of loud applause that testified both to the pleasure all experienced on beholding the managers of the Christiania Lottery, and to the impatience with which the crowd was awaiting the beginning of the drawing.

There were six little girls, as we have remarked before, and there were also six urns upon a table that occupied
the middle of the platform. Each of these urns contained ten numbers: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, representing the units, tens, hundreds, thousands, tens of thousands, and hundreds of thousands of the number one million. There was no seventh urn, for the million column, because it had been agreed that six ciphers drawn simultaneously should represent one million, as in this way the chances of success would be equally divided among all the numbers.

It had also been settled that the numbers should be drawn in succession from the urns, beginning with that to the left of the audience. The winning number would thus be formed under the very eyes of the spectators, first by the figure in the column of hundreds of thousands, then in the columns of tens of thousands, and so on until the column of units was reached, and the reader can judge with what emotion each person watched his chances of success increase with the drawing of each figure.

As the clock struck three, the president waved his hand, and declared the drawing begun.

The prolonged murmur that greeted the announcement lasted several minutes, after which quiet was gradually established.

The president rose, and though evidently much excited, made a short speech suited to the occasion, in which he expressed regret that there was not a prize for each ticket-holder; then he ordered the drawing of the first series of prizes, which consisted, as we have before remarked, of ninety prizes, and which would therefore consume a considerable length of time.

The six little girls began to perform their duties with automaton-like regularity, but the audience did not lose patience for an instant. It is true, however, that as the value of the prizes increased with each drawing, the excitement increased proportionately, and no one thought of leaving his seat, not even those persons whose tickets had been already drawn, and who had consequently nothing more to expect.

This went on for about an hour without producing any incident of particular interest, though people noticed that number 9672 had not been drawn, which would have taken away all chance of its winning the capital prize.

"That is a good omen for Sandgoist!" remarked one of the professor’s neighbors.

"It would certainly be an extraordinary thing if a man like that should meet with such a piece of good luck, even though he has the famous ticket," remarked another.

"A famous ticket, indeed!" replied Sylvius Hogg; "but don't ask me why, for I can't possibly tell you."

Then began the drawing of the second series of prizes, nine in number. This promised to be very interesting—the ninety-first prize being one of a thousand marks; the ninety-second, one of two thousand marks, and so on, up to the ninety-ninth, which was one of nine thousand. The third class, the reader must recollect, consisted of the capital prize only.

Number 72,521 won a prize of five thousand marks. This ticket belonged to a worthy seaman of Christiania, who was loudly cheered and who received with great dignity the congratulations lavished upon him.

Another number, 823,752, won a prize of six thousand marks, and how great was Sylvius Hogg's delight when he learned from Joel that it belonged to the charming Siegfried of Bamble.

An incident that caused no little excitement followed. When the ninety-seventh prize was drawn, the one consisting of seven thousand marks, the audience feared for a moment that Sandgoist was the winner of it. It was won, however, by ticket number 9627, which was within only forty-five points of Ole Kamp's number.

The two drawings that followed were numbers very widely removed from each other: 775 and 76,287.

The second series was now concluded, and the great prize of one hundred thousand marks alone remained to be drawn.

The excitement of the assemblage at that moment beggars all description.

At first there was a long murmur that extended from the large hall into the court-yards and even into the street. In fact, several minutes elapsed before quiet was restored. A profound silence followed, and in this calmness there was a certain amount of stupor—the stupor one experiences on seeing a prisoner appear upon the place of execution. But this time the still unknown victim was only condemned to win a prize of one hundred thousand marks, not to lose his head; that is, unless he lost it from ecstasy.

Joel sat with folded arms, gazing straight ahead of him, being the least moved, probably, in all that large assembly. Hulda, her head bowed upon her breast, was thinking only of her poor Ole. As for Sylvius Hogg—any attempt to describe the state of mind in which Sylvius Hogg found himself would be worse than useless.

"We will now conclude with the drawing of the one hundred thousand mark prize," announced the president.

"What a voice! It seemed to proceed from the inmost depths of this solemn-looking man, probably because he was the owner of several tickets which, not having yet been drawn, might still win the capital prize."

The first little girl drew a number from the left urn, and exhibited it to the audience.

"Zero!" said the president.

The zero did not create much of a sensation, however. The audience somehow seemed to have been expecting it.

"Zero!" said the president, announcing the figure drawn by the second little girl.
Two zeros. The chances were evidently increasing for all numbers between one and nine thousand nine hundred and ninety-nine, and every one recollected that Ole Kamp's ticket bore the number 9672.

Strange to say, Sylvius Hogg began to move restlessly about in his chair, as if he had suddenly been stricken with palsy.

"Nine," said the president, stating the number the third little girl had just extracted from the third urn.

Nine! That was the first figure on Ole Kamp's ticket.

"Six!" said the president.

For the fourth little girl was timidly displaying a six to all the eyes riveted upon her.

The chances of winning were now one out of a hundred for all the numbers from one to ninety-nine, inclusive.

Could it be that this ticket of Ole Kamp's was to be the means of placing one hundred thousand marks in that villainous Sandgoist's pocket. Really such a result would almost make one doubt the justice of God!

The fifth little girl plunged her hand into the next urn, and drew out the fifth figure.

"Seven!" said the president, in a voice that trembled so as to be scarcely audible, even to those seated on the first row of benches.

But those who could not hear were able to see for themselves, for the five little girls were now holding up the following figures to the gaze of the audience:

00967.

The winning number consequently must be one between 9670 and 9679, so there was now one chance out of ten for Ole Kamp's ticket to win the prize.

The suspense was at its height.

Sylvius Hogg had risen to his feet, and seized Hulda Hansen's hand. Every eye was riveted upon the young girl. In sacrificing this last moment of her betrothed, had she also sacrificed the fortune Ole Kamp had coveted for her and for himself?

The sixth little girl had some difficulty getting her hand into the urn, she was trembling so, poor thing! but at last the figure appeared.

"Two!" exclaimed the president, sinking back in his chair, quite breathless with emotion.

"Nine thousand six hundred and seventy two!" proclaimed one of the directors, in a loud voice.

This was the number of Ole Kamp's ticket, now in Sandgoist's possession. Everybody was aware of this fact, and of the manner in which the usurer had obtained it; so there was a profound silence instead of the tumultuous applause that would have filled the hall of the University if the ticket had still been in Hulda Hansen's hands.

And now was this scoundrel Sandgoist about to step forward, ticket in hand, to claim the prize?

"Number 9672 wins the prize of one hundred thousand marks!" repeated the director. "Who claims it?"

"I do."

Was it the usurer of Drammen who answered thus?

No. It was a young man--a young man with a pale face, whose features and whole person bore marks of prolonged suffering, but alive, really and truly alive.

On hearing this voice, Hulda sprung to her feet, uttering a cry that penetrated every nook and corner of the large hall; then she fell back fainting.

But the young man had forced his way impetuously through the crowd, and it was he who caught the unconscious girl in his arms.

It was Ole Kamp!

CHAPTER XX.

Yes; it was Ole Kamp! Ole Kamp, who, by a miracle, had survived the shipwreck of the "Viking." The reason the "Telegraph" had not brought him back to Europe can be easily explained. He was no longer in the region visited by the dispatch-boat, for the very good reason that he was already on his way to Christiania on board the vessel that had rescued him.

This is what Sylvius Hogg was telling. This is what he repeated to all who would listen to him. And what a crowd of listeners he had! This is what he related with the triumphant accents of a conqueror! Those around him repeated it to those who were not fortunate enough to be near him, and the good news flew from group to group until it reached the crowd that filled the court-yard and the neighboring streets.

In a few moments, all Christiania knew that the young mate of the "Viking" had returned, and that he had won the grand prize of the Schools Lottery.

It was a fortunate thing that Sylvius Hogg was acquainted with the whole story, as Ole certainly could not have told it, for Joel nearly smothered him in his embrace while Hulda was regaining consciousness.
"Hulda! dearest Hulda!" said Ole. "Yes, it is I--your betrothed--soon to be your husband!"

"Yes, soon, my children, very soon!" exclaimed Sylvius Hogg. "We will leave this very evening for Dal. And if such a thing was never seen before, it will be seen now. A professor of law, and a member of the Storthing will be seen dancing at a wedding like the wildest youth in the Telemark."

But how had Sylvius Hogg become acquainted with Ole Kamp's history? Simply through the last letter that the Naval Department had addressed to him at Dal. In fact this letter--the last he had received, and one whose receipt he had not mentioned to any one--contained another letter, dated from Christiansand. This second letter stated that the Danish brig "Genius" had just reached Christiansand, with several survivors of the "Viking" on board, among them the young mate, Ole Kamp, who would arrive in Christiania three days afterward.

The letter from the Naval Department added that these shipwrecked men had suffered so much that they were still in a very weak condition, and for this reason Sylvius Hogg had decided not to say anything to Hulda about her lover's return. In his response he had also requested the most profound secrecy in regard to this return--and in compliance with this request the facts had been carefully kept from the public.

The fact that the "Telegraph" had found no traces nor survivors of the "Viking" can also be easily explained.

During a violent tempest the vessel--which had become partially disabled--being obliged to scud along before the wind in a north-westerly direction, finally found herself about two hundred miles from the southern coast of Iceland. During the nights of the third and fourth of May the worst nights of the gale--it collided with one of those enormous icebergs that drift down from the shores of Greenland. The shock was terrible, so terrible, indeed, that the "Viking" went to pieces five minutes afterward.

It was then that Ole hastily penned his farewell message to his betrothed, and after inclosing it in a bottle, cast it into the sea.

Most of the "Viking's" crew, including the captain, perished at the time of the catastrophe, but Ole Kamp and four of his comrades succeeded in leaping upon the iceberg, just as the vessel went down; but their death would have been none the less certain if the terrible gale had not driven the mass of ice in a north-westerly direction. Two days afterward, exhausted and nearly dead with hunger, these survivors of the catastrophe were cast upon the southern coast of Greenland--a barren and deserted region--but where they nevertheless managed to keep themselves alive through the mercy of God.

If help had not reached them in a few days, it would have been all over with them, however; for they had not strength to reach the fisheries, or the Danish settlements on the other coast.

Fortunately the brig "Genius," which had been driven out of her course by the tempest, happened to pass. The shipwrecked men made signals to her. These signals were seen, and the men were saved.

The "Genius," delayed by head-winds, was a long time in making the comparatively short voyage between Greenland and Norway, and did not reach Christiansand until the 12th of July, nor Christiania until the morning of the 15th.

That very morning Sylvius Hogg went aboard the vessel. There he found Ole, who was still very weak, and told him all that had taken place since the arrival of his last letter, written from Saint-Pierre-Miquelon, after which he took the young sailor home with him, though not without having requested the crew of the "Genius" to keep the secret a few hours longer. The reader knows the rest.

It was then decided that Ole Kamp should attend the drawing of the lottery. But would he be strong enough to do it?

Yes; his strength would be equal to the ordeal, for was not Hulda to be there? But had he still any interest in this drawing? Yes, a hundred times, yes; both on his own account and that of his betrothed, for Sylvius Hogg had succeeded in getting the ticket out of Sandgoist's hands, having repurchased it from him at the same price the usurer had given for it, for Sandgoist was only too glad to dispose of it at that price now there were no more bidders for it.

"It was not for the sake of an improbable chance of gain that I wished to restore it to Hulda, my brave Ole," Sylvius Hogg remarked, as he gave him the ticket; "but because it was a last farewell you had addressed to her at the moment when you believed all was lost."

And now it seemed almost as if Professor Sylvius Hogg had been inspired of Heaven, certainly much more so than Sandgoist, who was strongly tempted to dash his brains out against the wall when he learned the result of the drawing. And now there was a fortune of one hundred thousand marks in the Hansen family. Yes, one hundred thousand marks, for Sylvius Hogg absolutely refused to take back the money he had paid to secure possession of Ole Kamp's ticket.

It was a dowry he was only too glad to offer little Hulda on her wedding-day.

Perhaps it will be considered rather astonishing that Ticket No. 9672, which had attracted so much attention from the public, should have happened to be the one that drew the grand prize.

Yes, it was astonishing, we must admit; but it was not impossible, and at all events, such was the fact.
Sylvius Hogg, Joel, and Hulda left Christiania that same evening. They returned to Dal by way of Bamble, as, of course, Siegfrid must be informed of her good fortune. As they passed the little church of Hitterdal, Hulda recollected the gloomy thoughts that beset her two days before, but the sight of Ole, seated beside her, speedily recalled her to the blissful reality.

By Saint Olaf! how beautiful Hulda looked under her bridal crown when she left the little chapel at Dal, four days afterward, leaning on her husband's arm. The brilliant festivities that followed were the talk of the whole Telemark for days and days afterward. And how happy everybody was! Siegfrid, the pretty bride-maid, her father, Farmer Helmboe, Joel, her affianced husband, and even Dame Hansen, who was no longer haunted by a fear of Sandgoist.

Perhaps the reader will ask whether all these friends and guests—Messrs. Help Bros., and hosts of others—came to witness the happiness of the newly married couple, or to see Sylvius Hogg, professor of law and a member of the Storthing, dance. It is hard to say. At all events he did dance, and very creditably, and after having opened the ball with his beloved Hulda, he closed it with the charming Siegfrid.

The next day, followed by the acclamations of the whole valley of Vesjorddal, he departed, but not without having solemnly promised to return for Joel's marriage, which was celebrated a few weeks afterward, to the great delight of the contracting parties.

This time the professor opened the ball with the charming Siegfrid, and closed it with his dear Hulda; and he has never given any display of his proficiency in the terpsichorean art since that time.

What happiness now reigned in this household which had been so cruelly tried! It was undoubtedly due in some measure, at least, to the efforts of Sylvius Hogg; but he would not admit it, and always declared:

"No, no; it is I who am still under obligations to Dame Hansen's children."

As for the famous ticket, it was returned to Ole Kamp after the drawing; and now, in a neat wooden frame, it occupies the place of honor in the hall of the inn at Dal. But what the visitor sees is not the side of the ticket upon which the famous number 9672 is inscribed, but the last farewell that the shipwrecked sailor, Ole Kamp, addressed to Hulda Hansen, his betrothed.

"TOPSY-TURVY"
BY JULES VERNE

CHAPTER I.
IN WHICH THE NORTH POLAR PRACTICAL ASSOCIATION RUSHES A DOCUMENT ACROSS TWO WORLDS

"Then Mr Maston, you pretend that a woman has never been able to make mathematical or experimental-science progress?"

"To my extreme regret, I am obliged to, Mrs. Scorbitt," answered J.T. Maston.

"That there have been some very remarkable women in mathematics, especially in Russia, I fully and willingly agree with you. But, with her cerebral conformation, she cannot become an Archimedes, much less a Newton."

"Oh, Mr. Maston, allow me to protest in the name of my sex."

"A sex, Mrs. Scorbitt, much too charming to give itself up to the higher studies."

"Well then, according to your opinion, no woman seeing an apple fall could have discovered the law of universal gravitation, so that it would have made her the most illustrious scientific person of the seventeenth century?"

"In seeing an apple fall, Mrs. Scorbitt, a woman would have but the single idea—to eat it—for example, our mother Eve."

"Pshaw, I see very well that you deny us all aptitude for high speculations."

"All aptitude? No, Mrs. Scorbitt, and in the meanwhile I would like to prove to you that since there are inhabitants on earth, and consequently women, there has not one feminine brain been found yet to which we owe any discoveries like those of Aristotle, Euclid, Kepler, Laplace, etc."

"Is this a reason? And does the past always prove the future?"

"Well, a person who has done nothing in a thousand years, without a doubt, never will do anything."

"I see now that I have to take our part, Mr. Maston, and that we are not worth much."

"In regard to being worth something"—began Mr. Maston, with as much politeness as he could command.

But Mrs. Evangelina Scorbitt, who was perfectly willing to be satisfied, answered promptly: "Each one has his or her lot in this world. You may remain the extraordinary calculator which you are, give yourself up entirely to the immense work to which your friends and yourself will devote their existence. I will be the woman in the case and bring to it my pecuniary assistance."
"And we will owe you an eternal gratitude," answered Mr. Maston.

Mrs. Evangelina Scorbitt blushed deliciously, for she felt, according to report, a singular sympathy for J.T. Maston. Besides, is not the heart of a woman an unfathomable gulf?

It was really an immense undertaking to which this rich American widow had resolved to devote large sums of money.

The scheme and its expected results, briefly outlined, were as follows:

The Arctic regions, accurately expressed, include according to Maltebrun, Roclus, Saint-Martin and other high authorities on geography:

1st. The northern Devon, including the ice-covered islands of Baffin’s Sea and Lancaster Sound.

2d. The northern Georgia, made up of banks and numerous islands, such as the islands of Sabine, Byam-Martin, Griffith, Cornwallis, and Bathurst.

3d. The archipelago of Baffin-Parry, including different parts of the circumpolar continent, embracing Cumberland, Southampton, James-Sommerset, Boothia-Felix, Melville, and other parts nearly unknown. Of this great area, crossed by the 78th parallel, there are over 1,400,000 square miles of land and over 700,000 square miles of water.

Within this area intrepid modern discoverers have advanced to the 84th-degree of latitude, reaching seacoasts lost behind the high chain of icebergs which may be called the Arctic Highlands, given names to capes, to mountains, to gulfs, to bays, etc. But beyond this 84th degree is mystery. It is the terra incognita of the chart-makers, and nobody knows as yet whether behind is hidden land or water for a distance of 6 degrees over impassable heaps of ice to the North Pole.

It was in the year 189- that the Government of the United States conceived the idea of putting the as yet undiscovered countries around the North Pole up at auction sale, and an American society had just been formed with the plan of purchasing this Arctic area and has asked the concession.

For several years, it is true, the Conference at Berlin had formulated a special plan for the guidance of such of the great powers as might wish to appropriate rights under the claim of colonization or the opening of commercial markets. This code was not acceptable to all, and the Polar region had remained without inhabitants. As that which belongs to none belongs to every one, the new Society did not wish merely to occupy it, but to purchase it outright, and so avoid further claims.

There never is in the United States any project so bold as not to find people to regard it as practical and back it with large amounts of money. This was well shown a few years ago when the Gun Club of Baltimore tried to send a projectile to the moon, hoping to obtain a direct communication with our satellite. Was it not enterprising Americans who furnished funds for this undertaking? Large amounts were necessary for this interesting trial and were promptly found. And, had it been realized, would we not have to thank the members of that club who had dared to take the risk of this super-human experience?

Should a Lesseps propose to dig a channel across Europe to Asia, from the banks of the Atlantic to the waters of China; should a well-sinker offer to bore from the curb-stones to reach the beds of molten silicates, to bring a supply to your fireplaces; should an enterprising electrician want to unite the scattered currents over the surface of the globe into one inexhaustible spring of heat and light; should a bold engineer conceive the idea of putting the excess of Summer temperature into large reservoirs for use during the Winter in our then frigid zones; should an anonymous society be founded to do any of a hundred different similar things, there would be found Americans ready to head the subscription lists and a regular stream of dollars would pour into the company safes as freely as the rivers of America flow into the ocean.

It is natural to expect that opinions were very varied when the news spread that the Arctic region was going to be sold at auction for the benefit of the highest and final bidder, particularly when no public subscription list was started in view of this purchase, as the capital had all been secured beforehand.

To use the Arctic region? Why, such an idea could "only be found in the brain of a fool," was the general verdict.

Nothing, however, was more serious than this project. A prospectus was sent to the papers of the two continents, to the European publications, to the African, Oceanic, Asiatic, and at the same time to the American journals. The American newspaper announcement read as follows:

To the Inhabitants of the Globe:

"The Arctic region situated within the eighty-fourth degree could not heretofore have been sold at auction for the very excellent reason that it had not been discovered as yet.

"The extreme points reached by navigators of different countries are the following:

"82° 45' N", reached by the English explorer, Parry, in July, 1847, on the twenty-eighth meridian, west, to the north of Spitzberg.
"83° 20' 28" , reached by Markham, with the English expedition of Sir John Georges Nares, in May, 1867, on the fiftieth meridian, west, in the north of Grinnell Land.

"83° 35' latitude, reached by Lockwood and Brainard, of the American expedition under Lieut. Greely, in May, 1882, on the forty-second meridian, west in the north of Nares Land.

The property extending from the eighty-fourth parallel to the pole on a surface of six degrees must be considered an undivided domain among the different states of the globe and not liable to be transformed into private property through a public auction sale.

"No one is compelled to live in this section, and the United States, relying on this non-ownership, has resolved to provide for the settlement and use of the domain. A company has been founded at Baltimore under the name of the North Polar Practical Association, representing officially the American Union. This Company intends to purchase the said country according to the common law, which should then give them an absolute right of proprietorship to the continent, islands, inlets, waters, rivers, etc.; in fact, of everything of which the Arctic region is composed. It is well understood by the law of nations that this title of proprietorship cannot be touched under any circumstances, no matter what shall happen.

"These conditions having been laid before all the powers, the Arctic region is to be sold at public auction for the benefit of the highest and last bidder. The date of the sale is set for the 3d of December of the current year, in the Auction Hall at Baltimore, Maryland, United States of America.

"Address for information Mr. W.S. Forster, Temporary Agent for the North Polar Practical Association, 93 High Street, Baltimore."

The reader may imagine how this communication was received by the public at large. Most people considered it as an absurd idea. Some only saw in it a sample of characteristic American humbug. Others thought that the proposition deserved to be fairly considered, and they pointed to the fact that the newly-founded company did not in any way appeal to the public for pecuniary help, but was willing to do everything with its own capital. It was with its own money that it wanted to purchase the Arctic region. The promoters did not try to put gold, silver, and bank-notes into their pockets and keep them for their own benefit. No, they only asked permission to pay for the land with their own money.

Some people who claimed to know said that the Company could have gone to work and taken possession of the country without any further ceremony, as it was their right as first occupants. But that is just where the difficulty came in, because until this time the Pole seemed to be forbidden ground to any one. Therefore, in case the United States should give possession of the country, the Company wanted a regular title to it without trouble about the matter in the future. It was unjust to blame them in any way, as in such an affair too many precautions cannot be taken. Besides, the circular had a paragraph which provided for all future chances. This paragraph was capable of so many interpretations that the exact meaning of it could not be rendered even by those who studied it closely. It was stipulated that the right of proprietorship should not depend upon any chances or changes in the country, no matter whether these changes were in the position or climate of the country.

What did this phrase mean? How could there ever be any changes in the geography or meteorology of a country like this one to be sold at auction? "Evidently," said some shrewd ones, "there must be something behind it."

The commentators had free swing and exercised it with a will. One paper in Philadelphia published the following pleasant notice:

"Undoubtedly the future purchasers of the Arctic region have information that a hard stone comet will strike this world under such conditions that its blow will produce geographic and meteorologic changes such as the purchasers of the Arctic region will profit by."

The idea of a blow with a hard stone planet was not accepted by serious people. In any case it was not likely that the would-be purchasers would have been informed of such a coming event.

"Perhaps," said a New Orleans newspaper, "the new Company thinks the precession of the equinox will in time favor the conditions likely to lead to the utilization of this domain."

"And why not? Because this movement modifies the direction of the axis of our spheroid," observed another correspondent.

"Really," answered the Scientific Review, of Paris. "As Adhemar has predicted in his book on the ocean currents, the precession of the equinox, combined with the movement of the earth’s axis, will be such as to modify in a long period the average temperature of the different parts of the earth and in the quantities of ice accumulated around the two poles."

"This is not certain," replied the Edinburgh Review, "and, besides, supposing that this would be the case, is not a lapse of 12,000 years necessary before Vega becomes our polar star in consequence of this movement and the situation of the Arctic territory consequently changed in regard to its climate?"

"Well," said the Copenhagen Dagblad, "in 12,000 years it will be time to make preparations, and before that time
risk nothing—not even a cent.”

It was possible that the Scientific Review was right with Adhemar. It was also very probable that the North Polar Practical Association had never counted on this modification of climate due to the precession of the equinox. In fact, nobody had clearly discovered what this last paragraph in the circular meant nor what kind of change it had in view.

Perhaps to know it, it would suffice to write to the Secretary of the new Society, or particularly its President. But the President was unknown. Unknown as much as the Secretary and all other members of the Council. It was not even known where the document came from. It was brought to the offices of the New York newspapers by a certain William S. Forster, a codfish dealer of Baltimore, a member of the house of Ardrinell & Co. Everything was so quiet and mysterious in the matter that the best reporters could not make out what it was all about. This North Polar Association had been so anonymous that it was impossible even to give it a definite name.

If, however, the promoters of this speculation persisted in making their personnel an absolute mystery, their intention was clearly indicated by the document spread before the public of two worlds.

Really, after all, the question was the purchase of that part of the arctic regions bounded by the 84th degree, and of which the North Pole was the central point. Nothing very exact concerning this region was known. The modern discoverers who had been nearest to this parallel were Parry, Markham, Lockwood and Brainard. In regard to the other navigators of the northern seas they stopped far short of the above-mentioned point—such as Payez, in 1874, to 82° 15’ north of the land of Francis Joseph, of New Zemble; Leout, in 1870, to 72°74’ above Siberia; De Long in the Jeanette expedition, in 1879, to 78° 45’ around the islands which bear his name. Others went around New Siberia and Greenland to the end of the Cape Bismarck, but had not passed the 76th, 77th, or 78th degree of latitude. The North Polar Practical Association wanted then a country which had never been touched before by mankind or discoverers, and which was absolutely uninhabited.

The length of this portion of the globe surrounded by the 84th degree, extending from the 84th to the 90th, making six degrees, which at sixty miles each make a radius of 360 miles and a diameter of 720 miles. The circumference therefore is, 2,260 miles and the surface 407 [square] miles. This is about the tenth part of the whole of Europe. A very desirable slice of land indeed. The document, as we have seen, also stated that these regions were not yet known geographically, belonged to no one and therefore belonged to everyone. But it could be foreseen that the adjoining States at least would consider these regions as the prolongation of their own possession towards the north and would consequently claim the right of ownership. Their pretensions would have more justice than those of discoverers who operated upon the whole of the Arctic countries and made explorations only for the glory of their own nation. The Federal Government represented in the new Society intended to make their rights valuable and to indemnify them for the price of their purchase. However it was the partisans of the North Polar Practical Association did not announce; the proprietorship was clear, and nobody being compelled to live there could object to the auction sale of this vast domain.

The countries whose rights were absolutely established as much as those of any countries could be were six in number—America, England, Russia, Denmark, Sweden-Norway and Holland.

Other countries could claim discoveries made by their mariners and their travellers.

France could interfere because some of her children had taken part in the expeditions sent out to conquer the territories around the pole.

Among the others the courageous Bellot, who died in 1853, in the islands of Beechey, during the Phoenix Expedition sent in search of Sir John Franklin. Nor must one forget Dr. Octave Pavy, who died in 1884, near Cape Sabine, while the Greely Mission was at Fort Conger. And the expedition which, in 1838-39, had gone to the Sea of Spitzberg with Charles Marmier, Bravais and his courageous companions, would it not be unfair to forget them. But despite all this France did not care to interfere in this commercial rather than scientific matter, and she abandoned all her rights for a share of the polar pie. The same of Germany. It had sent since 1671 the Hamburg expedition of Frederic Martens to the Spitsbergen, and in 1869 and ’70 the expeditions of the Germania and of the Hansa, commanded by Koldervey and Hegeman, which went as far as Cape Bismarck by going along the coast of Greenland. But even if they had made so many brilliant discoveries they did not care to add a piece of the polar empire to that of Germany. The same was true with Austria, which was already possessor of the land of Francis Joseph, situated north of Siberia.

In regard to Italy having no right to interfere, she did not interfere at all; which is as strange as it is true. Then, also, there were the Esquimaux, which are at home in those places, and the inhabitants of Greenland, of Labrador, of Baffin’s Archipelago and of the Aleutian Islands, situated between Asia and America, and also the tribe of Tchouktchis, who inhabited the old Russian Alaska and who became Americans in 1867. These people, in reality the real aborigines, had nothing at all to say about the matter. And how could these poor wretches have said anything, as they did not even have any sum of money, no matter how small, with which to pay for the land which the North Polar Practical Association was going to buy. Perhaps they could have paid a small sum by giving skins, teeth or oil,
and yet the land belonged to them more than to any others, as they were the first occupants of this domain which was going to be sold on auction. But the Esquimaux, the Tchouktchis, the Samoyedes were not consulted at all. So runs the world.

CHAPTER II.

IN WHICH THE DELEGATES FROM ENGLAND, HOLLAND, SWEDEN, DENMARK AND RUSSIA ARE PRESENTED TO THE READER.

One thing was evident to the whole world at once, namely, that if the new association should succeed in buying the Arctic regions, those regions would become absolutely the property of America or rather of the United States, a country which was always trying to acquire something. This was not a pleasing prospect to rival governments, but nevertheless, as has been said, the different States of Europe and of Asia not neighboring to these regions, refused to take part in the proposed auction sale so long as its results seemed so problematical to them. Only the powers whose property touched the eighty-fourth degree resolved to make their rights valuable by the attendance of official delegates. That was all. They did not care to buy even at a relatively moderate price land the possession of which was only a possibility. In this as in all cases insatiable England gave orders to its financial agents to make an imposing showing. The cession of the polar countries did not threaten any European trouble nor any international complication. Herr von Bismarck, the grand Iron Chancellor, who was yet living, did not even knit his heavy brow. There remained only England, Denmark, Sweden, Norway, Holland and Russia to be present and make their bids to the Commissioner of Baltimore, against those of the United States.

It was a difficult matter to fix prices for this polar earth cap, the business value of which was at least very problematic. Their main reason for presenting themselves at the sale was that some advantage might accrue to them. Sweden and Norway, proprietors of the North Cape, situated beyond the seventy-second parallel, did not conceal the fact that they thought they had certain rights of proprietorship on these vast lands which extended to Spitsbergen, and from there to the North Pole. Denmark said that it had already in its possession islands and fiords on the line of the polar circle where their colonies had been founded, such as Disko Island, in the Davis Channel; the settlements of Holstein, of Proven, of Godhaven, of Uppernavik, in the Baffin Sea, and on the west coast of Greenland. Besides, did not the famous navigator, Behring (of Danish origin, although he was then in the service of Russia), in the year 1728 pass over the channel which afterwards carried his name before he started again, thirteen years later, and died miserably with thirty of his men on a little island, which also carries his distinguished name.

In the year 1619 did not the navigator, Jean Munk, explore the east coast of Greenland and discover several points formerly totally unknown? Therefore, Denmark had, she thought, undisputable rights to be proprietor of these regions.

In regard to Holland, there were her sailors Barentz and Heemskerk, who had visited the Spitsbergen and the New Zealand about the end of the sixteenth century. It was by one of her children too, Jean Mayen, through whose courageous campaign against the north the island which carries his name came in their possession. It is situated below the 72d degree of latitude. Therefore Holland thought her past had given her rights of possession. In regard to Russia, with Alexis Tschirikof, having Behring under his command; with Paulutski, whose expedition advanced in 1751 beyond the limits of the ice-pack; with Capt. Martin Spangberg, and Lieut. William Walton, who dared to go into these unknown parts in 1739, she had taken a notable part in the search across the gulf which separates Asia and America.

Furthermore, the position of the Siberian territories, extending over 120 degrees to the extreme limits of Kamchatka, the length of the Asiatic coast, where the Samoyedes, Yakoutes, Tchuoktchis, and other conquered people lived, did Russia not rule half of the Northern Ocean? And then, on the 75th parallel to within less than nine hundred miles from the pole, did she not possess the islands of the new Siberia, the Archipelago of Liatkow, discovered in the beginning of the eighteenth century? And finally, since 1764, before the English, before the Americans, before the Swedes, did not the navigator Tschitschagoff search a passage in the North to shorten the route between the two continents? However, notwithstanding this, it seemed that the Americans were more anxious to become possessors of this particularly inaccessible point of the globe than anyone else.

They had often tried to obtain it by devoting themselves to the search of Sir John Franklin, with Grinnel, with Kane, with Hayes, with Greely, with De Long, and other courageous navigators. They could also plead the geographical situation of their country, which develops itself below the polar circle from the Behring Sea to Hudson’s Bay. And were not all these countries—all these islands—Wollaston, Prince Albert, Victoria, King William, Melville, Cockburne, Banks, Baffin, not counting the thousand small pieces of the archipelago—like a leaf spreading to the 90th degree? And then supposing that the North Pole should be attached by an uninterrupted line of territory to one of the large continents of the globe, would it not be more to America than to Asia or Europe? Therefore, nothing was more natural than the proposition to purchase this region by the Federal Government for the benefit of an American society.
If any power had undisputable modern rights to possess the polar domain it was certainly the United States of America. It must also be considered that the United Kingdom of Great Britain, which possessed Canada and British Columbia, numerous sailors of which had distinguished themselves in these Arctic countries, urged very good reasons for annexing this part of the globe to their vast empire. And its journals discussed the matter at great length. "Yes, without a doubt," answered the great English geographer, Kliptringan, in an article in a London newspaper, which made a great sensation; "yes, the Danes, the Hollanders, the Russians, and the Americans, can be proud of their rights." As for England, she did not wish to let this country escape her. Did not the northern part of the continent already belong to them? Have not these lands, these islands which composed them, been discovered and conquered by English discoverers since Willoughby, who visited Spitsbergen and New Zealand in 1739, to McClure, whose vessel made in 1853 the passage of the northwest? And then were not Frobisher, Davis, Hall, Weymouth, Hudson, Baffin, Cook, Ross, Parry, Bechey, Belcher, Franklin, Mulgrave, Scoresby, MacClintock, Kennedy, Nares, Collinson, Archer, all of Anglo-Saxon origin? And what country could make a more just claim on the portion of these Arctic regions that that which these navigators had been able to acquire? "Well," said a California journal, "let us put the matter on its real point, and as there is a question of amour-propre between the United States and England, let us ask, If the English Markham of the Nares expedition had gone 83 degrees 20 minutes of latitude and the Americans, Lockwood and Brainard, of the Greely expedition, went to 83 degrees 35 minutes, to whom then does the honor belong of having come nearest to the North Pole?"

Such were the demands and explanations, but one could see that the struggle would only be active between American dollars and English pounds sterling. However, according to the proposition made by the North Polar Practical Association all countries had to be consulted and given a chance at the auction. The sale was announced to take place Dec. 3, at Baltimore. The sum realized by the sale was to be divided among the States which were unsuccessful bidders, and they were to accept it as indemnity and renounce all their rights in the Arctic regions for the future.

The delegates, furnished with their letters of credit, left London. The Hague, Stockholm, Copenhagen, and St. Petersburg, and arrived three weeks before the day fixed for the auction sale.

Up to this time America had only been represented by Mr. W.S. Forster, of the North Polar Practical Association.

The delegates of the European powers who had been chosen were included in the following list:
For Holland—Jacques Jansen, formerly Counsellor of the Netherlandish India; fifty-three years old, stout, short, well formed, small arms, small bent legs, round and florid face, gray hair; a worthy man, only a little incredulous on the subject of an undertaking the practical consequences of which he failed to see.
For Denmark—Eric Baldenak, ex-Sub-Governor of the Greenlandish possessions; of medium height, a little bent over, large and round head, so short-sighted that the point of his nose would touch his books; not willing to listen to any claim denying the rights of his country, which he considered the legitimate proprietor of the northern region.
For the Swedish-Norwegian peninsula—Jan Harald, Professor of Cosmography in Christiania; a genuine Northern man, red-faced, beard and hair blond; he regarded it as an established fact that the Polar region, being only occupied by the Paleocristic Sea, had absolutely no value. He was, however, not much interested in the matter and went there only as a duty.
For Russia—Col. Boris Karkof, semi-military man, semi-diplomat; a stiff, stubby mustache, seeming uncomfortable in his citizen clothes and feeling absent-mindedly for his sword which he was accustomed to carry; very much puzzled to know what was hidden in the proposition of the North Polar Practical Association, and whether it would not be the cause of international difficulties.
Finally for England—Major Donellan and his secretary, Dean Toodrink. The last two named represented all the tastes and aspirations of the United Kingdom, its commercial and industrial instincts, its aptitude to consider, by a law of nature, the northern regions their own property just as any country which did not belong to anyone else.
If there ever was an Englishman it was Major Donellan, tall, meagre, bony, nervous, angular, with a little cough, a head a la Palmerston, on bending shoulders; legs well formed after his sixty years; indefatigable, a quality he had well shown when he worked on the frontiers of India. He never laughed in those days, and perhaps never had. And why should he? Did you ever see a locomotive or a steam-engine or an elevator laugh? On this point the Major was very much different from his secretary, Dean Toodrink, a talkative fellow, very pleasant, with large head, and his hair falling on his forehead, and small eyes. He became well known on account of his happy manner and his taste for fairy tales. But, even if he was cheerful, he did not seem any less personally conceited than Major Donellan when he talked about Great Britain.

These two delegates were probably going to be the most desperate opponents to the American Society. The North Pole belonged to them; it always belonged to them. It was to them as if the Lord had given the mission to the English people to keep up the rotation of the earth around its axis, and as if it was their duty to prevent it passing
into strange hands. It is necessary to observe here that France did not consider it necessary to send a delegate, but an
engineer, of France, was present at the sale, just for the fun of it. We shall introduce him later on. The delegates of
the Northern European States had arrived in Baltimore on different steamers, to give it the appearance that they had
nothing at all to do with each other. They were really rivals. Each one of them had in his pocket the necessary means
to fight against the American Society. But they could not fight with equal force. One could dispose of a sum of
money which amounted to nearly a million, another could pass that amount. And really to purchase a piece of our
globe to reach which seemed an impossibility, this ought still appear to be dear. In reality the best provided for was
the English delegate, to whose order the Government had opened a very large credit. Thanks to this credit Major
Donellan would not have very hard work to conquer his adversaries of Sweden, Denmark-Holland, and Russia. In
regard to America—well, that was a different thing. It would be much more difficult to win against the fusillade of
dollars. At least it was very probable that the mysterious society must have enough money on hand to go on in their
work. Therefore, the highest bidding, which might come to millions, was between America and England.

As soon as the European delegates had landed public opinion became more excited. The most singular stories
were printed in the newspapers. False theories were established, based on the purchase of the North Pole. What was
the Society going to do with it? And what could they do with it? Nothing; or perhaps it was all done to corner the
iceberg market. There was even a journal in Paris, the Figaro, which upheld this curious idea. But for this it would
be necessary to pass south of the eighty-fourth parallel.

Be it as it may, however, the delegates who had avoided each other during their passage over the Atlantic
became more and more associated after having arrived in Baltimore. Here is the reason: Since his arrival each one
had tried to open communications with the North Polar Practical Association separately, unknown to the other. That
which they wished to know were the motives hidden at the bottom of this affair and what profit the Society hoped to
make out of the sale. Now, until the present time nothing indicated that the Society had opened an office at
Baltimore. No office, no employees. All that could be learned was, "For information address only William S.
Forster, High Street, Baltimore." And it did not look as though the honest consignee of codfish knew any more in
this respect than the lowest street porter of the city.

The delegates could, therefore, learn nothing from him. They were accordingly compelled to rely upon the more
or less absurd guesses of the public at large. Was the secret of the Society going to be kept impenetrable as long as it
did not make it known itself? This was the question. Without doubt it did not seem inclined to give any information
on the subject until the purchase had been made. Therefore, it came that the delegates finished by seeing and
meeting each other; they made visits to each other, and finally came in close communication with each other,
perhaps with the idea of making a front against the common enemy, or, otherwise, the American Company. And so
it happened that one evening they were all together in the Hotel Wolesley, in the suite occupied by Major Donellan
and his secretary, Dean Toodrink, holding a conference. In fact, this tendency to a common understanding was
principally due to the advice of Col. Boris Karkof, the best diplomat known. At first the conversation was directed to
the commercial and industrial consequences which the Society pretended to gain by purchase of the Arctic domain.
Prof. Jan Harald asked if any one had been able to gain any information on that point. All finally agreed that they
had tried to get information from Mr. William S. Forster, to whom all letters should be addressed.

"I have failed," said Eric Baldenak.

"And I have not succeeded," added Jacques Jansen.

"In regard to myself," answered Dean Toodrink, "when I presented myself at the stores in High Street in the
name of Major Donellan I found a large man in black clothes, wearing a high hat, with a white apron, which was
short enough to show his high boots. When I asked him for information in the matter he informed me that the South
Star had arrived with a full cargo from Newfoundland and that he was ready to furnish me with a fresh stock of
codfish on account of Messrs. Ardronell & Co."

"And," answered the former councillor of the Dutch Indies, always a little sceptical, "it would be much better to
buy a load of codfish than to throw one's money into the ice-water of the North."

"This is not at all the question," says Major Donellan, with a short and high voice. "The question is not the
codfish, but the Polar region."

"Americans ought to stand on their heads," said Dean Toodrink, laughing at his own remark. "That will make
them catch cold," finally said Col. Karkof. "The question is not there," said Major Donellan. "One thing only is
certain, that for some reason or another America, represented by the N.P.P.A. (remark the word 'practical') wants to
buy a surface of 407 square miles around the North Pole, a surface which is actually (remark the word 'actually')
pierced by the eighty-fourth degree of latitude."

"We know it, Major Donellan, and much more," said Jan Harald. "But what we do not know is how the said
company will make use of those countries or waters, if they are waters, from a commercial standpoint."
"This is not the question," answered for the third time Major Donellan. "A power wants to purchase with money a large part of the globe which, by its geographical situation, seems to belong especially to England"—"to Russia," said Col. Karkof; "to Holland," said Jacques Jansen; "to Sweden-Norway," said Jan Harald; "to Denmark," said Eric Baldenak.

The five delegates jumped to their feet, and it seemed as if the Council would turn to harsh words, when Dean Toodrink tried to interfere the first time. "Gentlemen," said he, in a tone of reconciliation, "this is not the question, following the expression of my chief," of which he made such frequent use. "As long as Sweden, Norway, Russia, Denmark, Holland, and England have given large credits to their delegates, would it not be best for these nations to form a syndicate and raise a sum of money against which America could not make a bid? The delegates looked at each other. It was possible that Dean Toodrink had found the missing link. A syndicate—at present it is heard everywhere. Everything is syndicate nowadays, what one drinks, what one eats, what one reads, what one sleeps on. Nothing is more modern, in politics as well as business, than a trust. But an objection was started, or rather an explanation was needed, and Jacques Jansen tried to find out the sentiments of his colleagues by saying, "and afterwards," yes, after the purchase of the region by the syndicate, then what? "But it seems to me that England," said the Major in a rough voice, "and Russia," said the Colonel, with nostrils terribly dilated, "and Holland," said the Counsellor; "as God has given Denmark to the Danish," observed Eric Baldenak—"Excuse me, there is only one country," interrupted Dean Toodrink, "which has been given by our Lord, and that is the world." "And why," said the Swedish delegate? "Did not the poet say 'Deus nobis haec otia fecit,' " said this merryman in translating according to his fashion the close of the sixth verse of the first eclogue of Virgil. All began to laugh except Major Donellan, who stopped for the second time the discussion which threatened to finish badly. Then Dean Toodrink said, "Do not quarrel, gentlemen. What good will it do us? Let us rather form a syndicate."

"And afterwards?" asked Jan Harald.

"Afterwards," answered Dean Toodrink, "nothing more simple, gentlemen. After you shall have bought the polar domain it will remain undivided among us or will be divided after a regular indemnity to one of the States which have been purchasers. But our purpose would have already been obtained, which is to save it from the representative of America."

This proposition did some good, at least for the present moment. As very soon the delegates would not fail to fight with each other, and pull each other’s hair where there was any to pull, it would be at the moment when it was necessary to elect a final buyer of this immovable region, so much disputed and so useless.

"In all cases," cleverly remarked Dean Toodrink, "the United States will be entirely out of the question."

"It seems to me very sensible," said Eric Baldenak.

"Very handy," said Col. Karkof.

"Right," said Jan Harald.

"Mean," said Jacques Jansen.

"Very English," said Major Donellan.

Each one had given his opinion hoping to convince his colleagues.

"Then, gentlemen, it is perfectly understood that if we form a syndicate the rights of each State will be absolutely reserved for the future." ... It is understood. There was only to be found out what credit the different delegates had received from their governments. It was supposed that the whole when added up would represent such an enormous sum that there would not be the least doubt that the A.P.P.A. [N.P.P.A.] would fail to surpass this amount of money. This question of funds was met by Dean Toodrink.

Complete silence. Nobody would answer, show your pocketbook. Empty their pockets into the safes of a syndicate. Make known in advance how much each country would bid at the sale. No haste was shown. And if there should be a disagreement in this new-formed syndicate in the future, and circumstances should compel each one to make his own bids? And should the diplomat Karkof feel insulted at the trickery of Jacques Jansen, who would be insulted at the underhand intrigues of Jan Harald, who would refuse to support the high pretensions of Major Donellan, who, himself, would not stop to embroil each one of his associates. And now to show their credits—that was showing their play, when it was necessary to live up to it. There were really two ways only to answer the proper but indiscreet suggestion of Dean Toodrink. Either to exaggerate the credits, which would be very embarrassing, because it would then be the question of the payment, or to diminish them to such a point that they would be ridiculous and not to the purpose of the scheme. The ex-counsellor had this idea first, but it must be said to his credit, he did not seriously hold it. His colleagues, however, followed suit. "Gentlemen," said Holland, through its mouthpiece, "I regret, but for the purpose of the Arctic regions I can only dispose of fifty riechsthaler." "And I of
CHAPTER III.

IN WHICH THE ARCTIC REGIONS ARE SOLD AT AUCTION TO THE HIGHEST BIDDER.

Why was this sale on the 3d of December going to be held in the regular auction hall, where usually only such objects as furniture, utensils, tools, instruments, etc., or art pieces, pictures, medals, and antique objects were sold? Why, so long as it was a piece of realty, was it not sold before a referee or a court of justice appointed for such sales? And why was the aid of a public auctioneer necessary when a part of our globe was going to be sold? How could this piece of the world be compared with any movable object when it was the most fixed thing on the face of the earth? Really, this seemed to be quite illogical, but it was not so, since the whole of the Arctic regions was to be sold in such a way that the contract would be valuable. Did this not indicate that in the opinion of the N.P.P.A. the immovable object in question contained something movable?

This singularity puzzled even the most eminently sagacious minds to be found in the United States. On the other hand, there had been such a sale in the past already. One portion of our planet had been sold in the auction-rooms with the help of a public appraiser to the highest public bidder. And this case had happened in America.

It was some years before, in San Francisco, Cal., an island of the Pacific Ocean, Spencer Island, was sold to the rich William W. Kolderup, who bid $500,000 in opposition to J.R. Taskinar, of Stockton. This island had cost $4,000,000. It is true it was an island which had inhabitants, only a few miles away from the coast, with forests, water, productive and solid, with fields and prairies, in condition to be cultivated, and not a vague wild region of water covered with eternal ice, defended by impenetrable icebergs, which very probably nobody would ever live in. It was thought, therefore, that the unknown polar region would never bring so high a price if sold at auction. Nevertheless, on the day of the sale a great many serious and curious people assembled to learn the end of the affair.

The sale could hardly fail to be interesting.

Ever since their arrival in Baltimore the European delegates had found themselves very much gazed at and always surrounded by many people. Of course they were much interviewed. In view of all this it was only natural that the public of America should have become very much excited. One manner of expressing the public excitement, very characteristic of Americans, was to make bets upon the result, an example which Europe quickly began to follow. Divided as the American citizens were into those of New England, those of the Middle States, Western States, and Eastern States, there was only one wish, and that was for the well-being of their country. But there was still a great deal of uncertainty. It was neither Russia, nor Sweden, nor Norway, nor Denmark, nor Holland, the chances of which they dreaded most. But it was England, with its territorial ambitions, with its only too well-known tendency to swallow everything, and its world-known Bank of England notes. Large sums of money were placed on the result. Bets were made on America and Great Britain, the same as on race-horses, and in almost all cases even money was put up. Some offers were made of 12 and 13½ to 1 on Denmark, Sweden, Holland and Russia, but none would take such an offer.

The sale commenced at 12 o’clock.

Since early in the morning all business had been stopped in the street on account of the large crowd. By telegraph the papers were informed that most of the bets made by Americans had been taken up by the English, and Dean Toodrink immediately posted up a notice to that effect in the auction hall. The nearer the time came the higher grew the excitement. It was reported that the Government of Great Britain had placed large sums of money at the disposition of Major Donellan. “At the office of the Admiralty,” observed one of the New York papers, “the Admirals pushed the sale as much as possible, as they hoped to figure conspicuously in the expeditions fitted out.” How much truth there was in these stories no one knew. But the most conservative people in Baltimore thought that it was hardly possible that the amount of money at the command of the N.P.P.A. could cover the amount which would be bid by England, and therefore a very strong pressure was put on the Government of the United States at Washington to protect the interests of the society. In all this excitement the new society was represented by the single person, its agent, William S. Forster, who did not seem to worry at all over all these rumors and seemed quite confident of success.

As the time for the auction drew near the crowd grew larger. Three hours before the sale it was impossible to obtain admission to the auction hall. All the space set apart for the public was so much filled that there was danger that the building would fall in. There was only a small space left empty, surrounded by a railing, which had been reserved for the European delegates. They had just space enough to follow the progress of the sale, and were not even comfortably seated.
They were Eric Baldenak, Boris Karkof Jacques Jansen, Jan Harald, Major Donellan and his secretary, Dean Toodrink. They formed a solid group, standing together like soldiers on a battle-field. And were they not really going to battle for the possession of the North Pole? On the American side apparently nobody was represented. Only the codfish dealer was present and his face had an expression of the most supreme indifference.

He seemed little concerned and appeared to be thinking of his cargo which was to arrive by the next steamer. Where were the capitalists represented by this man, who, perhaps, was going to start millions of dollars rolling? This was such a mystery as to excite public curiosity to the utmost.

No one doubted that Mr. J. T. Maston and Mrs. Evangelina Scorbitt had something to do with the matter, but what could one guess on? Both were there, lost in the crowd, without any special place, surrounded by some members of the Baltimore Gun Club, friends of Mr. Maston. They seemed to be the least interested spectators in the hall. Mr. William S. Forster even did not seem to recognize them.

The auctioneer began by saying that contrary to the general rule it was impossible to show the article about to be sold. He could not pass from hand to hand the North Pole. Neither could they examine it nor look at it with a magnifying glass or touch it with their fingers to see whether the plating was real or only artificial, or whether it was an antique, which it really was, he said. It was as old as stone, it was as old as the world, since it dated back to the time the world was made.

If, however, the North Pole was not on the desk of the Public Appraiser, a large chart, clear in view of all interested persons, indicated with marked lines the parts which were going to be sold at auction. Seventeen degrees below the Polar Circle was a red line, clearly seen on the 84th parallel, which marked the section on the globe put up for sale. It appeared that there was only water in this region covered with ice of considerable thickness. But this was the risk of the purchaser. In any case he would not be disappointed in the nature of his merchandise by any misrepresentation.

At 12 o’clock exactly the public auctioneer entered by a little trap-door cut in the boards of the floor and took his place before the desk. His crier, Flint, had already arrived, and was walking up and down as agitated as a bear in a cage. Both were glad at the prospect, as they thought that the sale would run up to an enormous sum and put a large and acceptable percentage in their pockets. Of course the sale would have to be made under the regular, real American rule, “ready cash.”

The amount of money, no matter how large it would be, must be raised by the delegates. At this moment a large bell ringing with vigor indicated that the bidding was going to begin. What a solemn moment! Many hearts quivered in that neighborhood. A minor riot spread among the crowd outside and reached into the hall, and Andrew R. Gilmour, the auctioneer, had to wait until quiet was restored. He got up and looked steadily at his assistants. Then he let his eyeglasses fall on his breast and said in as quiet a voice as possible: "Gentlemen, according to the plan of the Federal government, and thanks to the acquiescence given it by the European powers, we will sell a great fixed mass, situated around the North Pole, all that is within the limits of the 84th parallel, continents, waters, bays, islands, icebergs, solid parts or liquid, whatever they may be." Then, turning towards the wall, he said "Look at this chart, which has been outlined according to the latest discoveries. You will see that the surface of this lot contains 407,000 square miles. Therefore, to make the sale easier, it has been decided that the bids should be made for each square mile. Each cent bid, for instance, will be equal to 407,000 cents and each dollar 407,000 dollars on the total purchase. A little silence, please, gentlemen."

This request was not superfluous, because the impatience of the public had reached such a degree that the voice of a bidder would hardly be heard. After partial silence had been established, thanks to the industry of the crier, Flint, who roared like a foghorn, Mr. Gilmour resumed as follows: "Before beginning I will mention only one condition of the sale. No matter what changes should happen, either from a geographical or meteorological standpoint, this region after being sold to the highest bidder is absolutely his own beyond any dispute, and the other countries have no right of possession whatever as long as the territory is not outside of the limits of the 84th degree north latitude." Again was this singular phrase mentioned at a very important moment. Some laughed at it, others considered it very seriously. "The bids are open," said the public auctioneer in a loud voice, and while his little ivory hammer was rolling in his hand he added in an undertone: "We have offers at 10 cents the square mile. Ten cents or the tenth part of a dollar—this would make an amount of $40,700 for the whole of this immovable property."

Whether the auctioneer had had such offers or not does not matter, because the bid was covered by Eric Baldenak in the name of the Danish Government. "Twenty cents," said he.

"Thirty cents," said Jan Harald, for Sweden-Norway.
"Forty cents," said Col. Boris Karkof, for Russia.

This represented already a sum of $162,800 to begin with. The representative of England had not as yet opened his mouth, not even moved his lips, which were pressed tightly together. On the other side Wm. S. Forster kept an impenetrable dumbness. Even at this moment he seemed absorbed in reading a newspaper which contained the
shipping arrivals and the financial reports of the markets each day.

"Forty cents per square mile," repeated Flint, in a voice which resembled a steam whistle, "40 cents."
The four colleagues of Major Donellan looked at each other. Had they already exhausted the credit allowed them at the beginning of the bidding? Were they already compelled to be silent?

"Go on, gentlemen," said the Auctioneer Gilmour, "40 cents. Who goes higher? Forty cents; why, the North Pole is worth much more than that, for it is guaranteed to be made of ice."
The Danish delegate said 50 cents and the Hollandish delegate promptly outbid him by 10 cents.

Nobody said a word. This 60 cents represented the respectable amount of $244,200. The lift given by Holland to the sale started a murmur of satisfaction. It seemed that the persons who had nothing in their pockets and nothing to their names were the most interested of all in this contest of dollars.

At the moment Jacques Jansen made his offer Major Donellan looked at his secretary, Dean Toodrink, and, with an almost imperceptible negative sign, kept him silent. Mr. William S. Forster, seeming very much interested in his paper, made some pencil notes. Mr. J.T. Maston, only replied to the smiles of Mrs. Evangelina Scorbitt with a nod of the head.

"Hurry up, gentlemen; a little life. Don’t let us linger. This is very weak, very slow," said the auctioneer. "Let me see. Nobody says more. Must I knock down the North Pole at such a price?" and as he spoke his hammer went up and down just like the cross in a priest’s hands when he wishes to bless his people.

"Seventy cents," said Jan Harald, with a voice which trembled a little.

"Eighty," immediately responded Col. Boris Karkof.

"Hurry up, 80 cents," said Flint, whose eyes were burning with excitement.

A gesture of Dean Toodrink made Major Donellan jump up like a spirit. "One hundred cents," said he with a short and sharp tone, becoming in one who represented Great Britain. That one word made England responsible for $407,000.

The friends of the bidders for the United Kingdom made a great hurrah, which was repeated like an echo by the outside crowd. The bidders for America looked at each other with disappointment; $407,000; this was already a very large figure for such a region as the North Pole; $407,000 for ice, icebergs, and icefields?

And the man of the N. P. A. did not say one word, did not even raise his head. Would he decide to make at last one overwhelming bid? If he wanted to wait until the Danish delegates, those of Sweden, Holland, and Russia had exhausted their credit, it would seem that the proper moment had come. Their faces plainly showed that before the "100 cents" of Major Donellan, they had decided to quit the battlefield. "One hundred cents the square mile," said the auctioneer for the second time, "One hundred, one hundred, one hundred," cried out Flint, making a speaking-trumpet of his half-closed hand. "Nobody goes higher?" questioned Auctioneer Gilmour. "Is it heard? Is it understood? No regrets afterwards? We will sell it now." And he took his position and looking at his clerk, said: "once, twice"—

"One hundred and ten," very quietly said William S. Forster, without even raising his eyes, after having turned the page of his paper.

"Hip, hip, hip," shouted the crowd who had put most of the money on America in the bets. Major Donellan was astonished. His long neck turned in all directions and he shrugged his shoulders, while his lips worked with great excitement. He tried to crush this American representative with one look, but without success, but Mr. Forster, cool as a cucumber, did not budge.

"One hundred and forty," said Major Donellan.

"One hundred and sixty," said Forster.

"One hundred and eighty," said the Major, with great excitement.

"One hundred and ninety," said Forster.

"One hundred and ninety-nine," roared the delegate of Great Britain. With this he crossed his arms and seemed to defy the United States of America.

One might have heard a mouse run, or a miller fly, or a worm creep. All hearts were beating. A life seemed hanging on the lips of Major Donellan. His head, generally restless, was still now. Dean Toodrink had sat down and was pulling out his hairs one by one. Auctioneer Gilmour let a few moments run by. They seemed as long as centuries. The codfish merchant continued reading his paper and making pencil figures which had evidently nothing at all to do with [with] the question. Was he also at the end of his credit? Did he intend to make a last offer? Did this amount of 199 cents for each square mile or $793,000 for the whole of the fixture at sale seem to him to have reached the last limit of absurdity?

"One hundred and ninety-nine cents," repeated the public auctioneer. "We will sell it," and his hammer fell on the table before him. "One hundred and ninety-nine," cried the helper. "Sell it! Sell it!" And every one was looking at the representative of the N.P.P.A.
That surprising gentleman was blowing his nose on a large handkerchief, which nearly covered his whole face. Mr. J. T. Maston was looking at him intently, and so was Mrs. Evangelina Scorbitt. It could easily be seen by their anxious faces how much they tried to suppress their violent emotion. Why was Forster hesitating to outbid Major Donellan? As for the imperturbable Forster, he blew his nose a second time, then a third time, with the noise of a real foghorn. But between the second and third blow he said as quietly as possible, with a modest and sweet voice. "Two hundred cents!"

A long shudder went through the hall. Then the American backers began to make such a noise that the very windows trembled. Major Donellan, overwhelmed, ruined, disappointed, had fallen into a seat by the side of Dean Toodrink, who himself was not in a much better condition. Two thousand miles at this price made the enormous sum of $814,000 and it was apparent that the credit of England did not permit them to overreach it.

"Two hundred cents," repeated the auctioneer. "Two hundred cents," said Flint. "Once, twice," said the auctioneer. "Does anybody go higher?" Major Donellan raised himself by a strong effort and looked wistfully at the other delegates. These only looked back their hope that by his bidding the Arctic region would escape the American bidder and would become the property of the European powers. But this was his last effort. The Major opened his mouth, closed it again, and in his person England sat down on itself. "Hip, hip, hurrah for the United States," roared the winners for victorious America. And in one instant the news of the purchase ran all over Baltimore, and by telegraph all over the United States, and by cable all over the Old World. Thus it was that the N.P.P.A. through the agency of William S. Forster, became the proprietor of the Arctic domain, including everything above the eighty-fourth parallel. The next day when Mr. Forster went to make his deposit for his purchase the name he gave was Impey Barbicane and the name of the house was Barbicane & Co.

CHAPTER IV.
IN WHICH OLD ACQUAINTANCES APPEAR TO OUR NEW READERS, AND IN WHICH A WONDERFUL MAN IS DESCRIBED.

Barbicane & Co. The president of a gunning club. And really what had gunners to do in such an operation? You will see. Is it necessary to present formally Impey Barbicane, President of the Gun Club, of Baltimore, and Capt. Nicholl, and J. T. Maston, and Tom Hunter with the wooden legs, and the lively Bilsby, and Col. Bloomsberry, and the other associates? No, if these strange persons were twenty years older than at the time when the attention of the world was upon them they had always remained the same, always as much incomplete personally, but equally noisy, equally courageous, equally confusing when it was a question of some extraordinary adventure. Time did not make an impression on these gunners; it respected them as it respects cannons no longer in use, but which decorate museums and arsenals. If the Gun Club had 1,833 members in it when it was founded, names rather than persons, for most of them had lost an arm or leg, if 30,575 corresponding members were proud to owe allegiance to the Club, these figures had not decreased. On the contrary, and even thanks to the incredible attempt which they had made to establish direct communication between earth and moon, its celebrity had grown in an enormous proportion. No one can ever forget the report on this subject which was made by this Club and which deserves a few words of mention here.

A few years after the civil war certain members of the Gun Club, tired of their idleness, proposed to send a projectile to the moon by means of a Columbiad monster. A cannon 900 feet long, nine feet broad at the bore, had been especially made at Moon City and had then been charged with 400,000 pounds of gun-cotton.

From this cannon a small cylindrical bomb had been flung towards the stars with a pressure of six milliards pounds per square inch. After having made a grand curve it fell back to the earth only to be swallowed up by the Pacific Ocean at 27° 7' of latitude and 41° 37' of longitude, west. It was in this region that the frigate, Susquehanna, of the American Navy, had fished it up to the surface of the ocean, to the great comfort of its occupants. Occupants? Yes, occupants; for two members of the Gun Club—its President, Impey Barbicane, and Capt. Nicholl—accompanied by a Frenchman well known for his boldness in such cases, had been in this flying-machine. All three of them came back well and healthy from this dangerous trip. But if the two Americans were here ready to risk any similar thing, the French Michel Ardan was not. On his return to Europe he brought a fortune with him, although it astonished a good many people, and now he is planting his own cabbage in his own garden, eating them and even digesting them, if one can believe the best-informed reporters.

After this discharge of the cannon, Impey Barbicane and Capt. Nicholl had lived on their reputation in comparative quietness. As they were always anxious to do another thing like it, they dreamt and tried to find out something else. Money they had in plenty. Out of five millions and a half which had been raised for them by subscription they had nearly $200,000 left. This money was raised in the Old and New Worlds alike. Besides, all they had to do was to exhibit themselves in their projectile in America and they could always realize large amounts of money. They had earned all the glory which the most ambitious mortal would look for. Impey Barbicane and Capt. Nicholl would have been well able to keep quiet and idle if this very idleness did not torment them. And it was
whom she would also bring a treasure of tenderness much more inexhaustible. And salt pork. Well, this fortune this generous widow would have been glad to use for the profit of J. T. Maston, to whom she would have liked to present the sum of five millions. In brief, Mrs. Evangelina Scorbitt had four millions of good sound dollars, or twenty millions at least.

There was not even a second in her heart who did not think that her appearance as the representative of our people, and the moon only our humble satellite. To his extreme regret, Mr. Maston was compelled to stay at home. Nevertheless he had not been idle. After having constructed an immense telescope, which was put on the mountain of Long’s Peak, one of the highest mountains of the Rocky range, he went up there personally, and after he had received the signal that the cannon-ball had been fired he did not once leave his post. From his place of observation he essayed the task of following his friends firing across the vast space. One might readily believe that his friends would be lost to the world; that it was very easily possible that this projectile could be compelled by the attraction of the moon to become a sub-satellite. A deviation which one might call providential had changed the direction of the projectile, and after having made one trip around the moon, in place of touching it, it was carried away in a terrible fall and returned to us with a speed of 576,000 miles a minute to the moment when it was swallowed up by the ocean. Happy it was that the great liquid mass had deadened the fall, and that the American frigate Susquehanna was present at the fall. As soon as the news reached Mr. Maston, the Secretary of the Gun Club, he rushed with all possible haste from his observation point at Long’s Peak to begin operations to save his friends. Divers were sent to the place where the projectile had fallen. And Mr. Maston even did not hesitate to put on a cork jacket to save and find his friends again. It was unnecessary to go to so much trouble. The projectile was found floating on the surface of the Pacific Ocean after having made its beautiful fall. And President Barbicane with Capt. Nicholl and Michel Ardan were found playing dominoes in their floating prison on the surface of the ocean.

To return to J.T. Maston, it is proper to say that his part in the affair deserves a good deal of credit. It is certain that he was not pretty with his metallic arm. He was not young, fifty-eight years old, at the time we write this story. But the originality of his character, the vivacity of his intelligence, the vigor which animated him, the ardor which he had in all such things, had made him the ideal of Mrs. Evangeline Scorbitt. His brain carefully hidden under his cover of gutta-percha was yet untouched, and he would still pass as one of the most remarkable calculators of his age.

Mrs. Evangelina Scorbitt, although the least figuring gave her a headache, had yet a great liking for mathematicians, even if she had no taste for mathematics. She considered them a higher and more endowed race of human beings. Heads where the X, Y, Z were mixed up like nuts in a barrel, brains which played with signs of algebra, hands which juggled with the integral triples, these were what she liked.

Yes, these wise people seemed to her worthy of all admiration and support. She felt herself drawn strongly towards them. And J.T. Maston was exactly that kind of man and one she adored, and her happiness would be complete if they two could be made one. This was the end of her mathematics. This did not disturb the Secretary of the Gun Club, who had never found happiness in unions of this kind.

Mrs Evangelina Scorbitt was not young any more. She was forty-five years old, had her hair pasted on her temples, like something which had been dyed and re-dyed; she had a mouth full of very long teeth, with not one missing; her waist was without shape, her walk without grace; in short, she had the appearance of an old maid, although she had been married only a few years before she became a widow. She was an excellent person withal, and nothing was lacking in her cup of happiness except one thing, namely, that she wished to make her appearance in the society of Baltimore as Mrs. J.T. Maston. Her fortune was very considerable. She was not rich like the Goulds, Mackays, or Vanderbilt, whose fortunes run into the millions, and who might give alms to the Rothschilds. Neither did she possess three hundred millions like Mrs. Stewart, eighty millions like Mrs. Crocker, and two hundred millions like Mrs. Carper. Neither was she rich like Mrs. Hamersley, Mrs. Hetty Green, Mrs. Maffitt, Mrs. Marshall, Mrs. Paran Stevens, Mrs. Minturn, and many others. At any rate she had a right to take a place at that memorable feast at the Fifth Avenue Hotel in New York, where there were only admitted as guests people who had at least five millions. In brief, Mrs. Evangelina Scorbitt had four millions of good sound dollars, or twenty millions of francs, which came to her from John P. Scorbitt, who made his fortune both in the business of selling dry goods and salt pork. Well, this fortune this generous widow would have been glad to use for the profit of J. T. Maston, to whom she would also bring a treasure of tenderness much more inexhaustible.

Therefore when Mrs. Evangelina Scorbitt had heard of the requirements of Mr. Maston she had gladly agreed to
put a few hundred thousand dollars in the affair of the N.P.P.A. without having the least idea of what they intended
to do with it. It is true she was convinced that as long as J.T. Maston had something to do with the affair it could not
help being grand, sublime, superhuman, etc. Thinking of the Secretary was for her future enough. One might think
that after the auction sale, when it was declared that Barbicane & Company would be the name of the new firm, and
it would be presided over by the President of the Gun Club, she would enjoy Mr. Maston’s whole confidence. Was
she not at the same time the largest stockholder in the affair? So it came about that Mrs. Evangeline Scorbitt found
herself proprietress of this polar region, all beyond the line of the eighty-fourth parallel. But what would she do with
it? Or rather, what profit would the Society get out of it? This was the question; and if it interested Mrs. Evangeline
Scorbitt from a financial standpoint it interested the whole world, more on account of the general curiosity about the
whole mystery. This excellent woman, otherwise very discreet, had often tried to get some information from Mr.
Maston on this subject before putting money at the disposal of the purchasers. Without a doubt there was a grand
enterprise, which, as Jean Jacques said, has never had its like before, and would never have any imitation, and which
would far outshine the reputation made by the Gun Club in sending a projectile to the moon and trying to get in
direct communication with our satellite. But when she persists with her queries Mr. Maston invariably replied: "Dear
madame, have patience," And if Mrs. Evangeline Scorbitt had confidence before, what an immense joy did she feel
when the triumph which the United States of America had won over the combined European powers. "But shall I not
finally know the object?" asked she, smiling at the eminent calculator.

"You will soon know it," answered Mr. Maston, shaking heartily the hand of his partner—the American lady.

This calmed for the moment the impatience of Mrs. Evangeline Scorbitt. A few days afterwards the Old and
New World were shaken up quite enough when the secret object of the company was announced, and for the
realization of which the N.P.P.A. made an appeal to the public for a subscription.

The Society had purchased this portion of the circumpolar region to make use of the coal mines of the North
Pole.

CHAPTER V.

IN WHICH THE POSSIBILITY THAT COAL MINES SURROUND THE NORTH POLE IS CONSIDERED.

Are there coal mines at the North Pole? This was the first question suggested to intelligent people. Some asked
why should there be coal mines at the North Pole? Others with equal propriety asked why should there not be? It is
well known that coal mines are spread all over the world. There are many in different parts of Europe. America also
possesses a great many, and it is probable that the United States mines are the richest of all. There are also many in
Asia, Africa, and Australia. The more our globe becomes known the more mines are discovered. We will not be in
need of coal for at least hundreds of years to come. England alone produces 160,000,000 tons every year, and over
the whole world it is estimated 400,000,000 tons are yearly produced. Naturally, this coal output must grow every
year in proportion with the constantly increasing industries. Even if electricity takes the place of steam, it will still
be necessary to use coal. We are so much in need of it that the world might be called "an animal of coal," and
therefore it is necessary to take good care of it. Coal is used not only as a fuel, but also as a crude substance of which
science makes great use. With the transformations to which it has been submitted in the laboratory, it is possible to
paint with it, perfume with it, purify, heat, light with it, and even beautify a diamond with it. It is as useful as iron or
even more so. It is fortunate that this last-mentioned metal will never be exhausted, as really the world is composed
of it. The world might be considered a vast mass of iron, as other metals, and even water and stone, stand far behind
it in the composition of our sphere. But if we are sure of a continuous supply for our consumption of iron, we are not
so of coal. Far from it. People who are competent to speak, and who look into the future for hundreds of years,
always allude to this coal famine. "But," say the opposing party—and in the United States there are many people
who like to contradict for the mere sake of argument, and who take pleasure in contradicting—"Why should there be
coal around the North Pole?"

"Why?" answered those who took the part of President Barbicane, "because, very probably at the geological
formation of the world, the sun was such that the difference of temperature around the equator and the poles were
not appreciable. Then immense forests covered this unknown polar region a long time before mankind appeared, and
when our planet was submitted to the incessant action of heat and humidity. This theory the journals, magazines, and
reviews publish in a thousand different articles either in a joking or serious way. And these large forests, which
disappeared with the gigantic changes of the earth before it had taken its present form, must certainly have changed
and transformed under the lapse of time and the action of internal heat and water into coal mines. Therefore nothing
seemed more admissible than this theory, and that the North Pole would open a large field to those who were able to
mine it. These are facts, undeniable facts. Even people who only calculated on simple probabilities could not deny
them. And these facts led many people to have great faith in them.

It was on this subject that Major Donellan and his secretary were talking together one day in the most obscure
corner of the "Two Friends" inn. "Well," said Dean Toodrink, "there is a possibility that this Barbicane (who I hope
may be hanged some day) is right."

"It is probable," said Major Donellan, "and I will almost admit that it is certain. There will be fortunes made in exploring this region around the pole. If North America possesses so many coal mines and, according to the papers, new ones are discovered quite frequently, it is not at all improbable that there are many yet to be discovered. I may add that Prof. Nordenskiol has found many kinds of different stones which contain a great variety of fossil plants in his researches in the Arctic region."

"Higher up?" asked Dean Toodrink.

"Higher up, or rather further up, in a northerly direction," answered the Major, "the presence of coal is practically established, and it seems as if you would only have to bend down to pick it up. Well, if coal is so plentiful on the surface of these countries, it is right to conclude that its beds must go all through the crust of the globe." He was right. Major Donellan knew the geological formation around the North Pole well, and he was not a safe person to dispute this question with. And he might have talked about it at length if other people in the inn had not listened. But he thought it better to keep quiet after asking: "Are you not surprised at one thing? One would expect to see engineers or at least navigators figure in this matter, while there are only gunners at the head of it?"

It is not surprising that the newspapers of the civilized world soon began to discuss the question of coal discoveries at the North Pole.

"And why not," asked the editor of an American paper who took the part of President Barbicane, "when it is remembered that Capt. Nares, in 1875 and 1876, at the eighty-second degree of latitude, discovered large flower-beds, hazel trees, poplars, beech trees, etc.?"

"And in 1881 and 1884," added a scientific publication of New York, "during the expedition of Lieut. Greely at Lady Franklin Bay, was not a layer of coal discovered by our explorers a little way from Fort Conger, near Waterhouse? And did not Dr. Pavy say that these countries are certainly full of coal, perhaps placed there to combat at some day the terrible masses of ice which are found there?"

Against such well-established facts brought out by American discoverers the enemies of President Barbicane did not know what to answer. And the people who asked why should there be coal mines began to surrender to the people who asked why should there be none. Certainly there were some, and very considerable ones, too. The circumpolar ice-cap conceals precious masses of coal contained in those regions where vegetation was formerly luxuriant. But if they could no longer dispute that there were really coal mines in this Arctic region the enemies of the association tried to get revenge in another way. "Well," said Major Donellan one day after a hard discussion which had arisen in the meeting-room of the Gun Club and during which he met President Barbicane face to face, "all right. I admit that there are coal mines; I even affirm it, there are mines in the region purchased by your society, but go and explore them—ha! ha! ha!"

"That is what we are going to do," said Impey Barbicane.

"Go over the eighty-fourth degree, beyond which no explorer as yet has been able to put his foot?"

"We will pass it—reach even the North Pole," said he. "We will reach it." And after hearing the President of the Gun Club answer with so much coolness, with so much assurance, to see his opinion so strongly, so perfectly affirmed, even the strongest opponent began to hesitate. They seemed to be in the presence of a man who had lost none of his old-time qualities, quiet, cold, and of an eminently serious mind, exact as a clock, adventurous, but carrying his practical ideas into the rashest enterprises.

Major Donellan had an ardent wish to strangle his adversary. But President Barbicane was stout and well able to stand against wind and tide, and therefore not afraid of the Major. His enemies, his friends and people who envied him knew it only too well. But there were many jealous people, and many jokes and funny stories went round in regard to the members of the Gun Club. Pictures and caricatures were made in Europe and particularly in England, where people could not get over the loss which they suffered in the matter of pounds sterling. "Ah," said they, "this Yankee has got it in his head to reach the North Pole. He wants to put his foot where, up to the present time, no living soul has yet been. He wants to build palaces and houses and, perhaps, the White House of the United States, in a part of the world which has never yet been reached, while every other part of the world is so well known to us."

And then wild caricatures appeared in the different newspapers. In the large show-windows and news-depots, as well in small cities of Europe as in the large cities of America, there appeared drawings and cartoons showing President Barbicane in the funniest of positions trying to reach the North Pole. One audacious American cut had all the members of the Gun Club trying to make an underground tunnel beneath the terrible mass of immovable icebergs, to the eighty-fourth degree of northern latitude, each with an axe in his hand. In another, Impey Barbicane, accompanied by Mr. J.T. Maston and Capt. Nicholl, had descended from a balloon on the much-desired point, and after many unsuccessful attempts and at the peril of their lives, had captured a piece of coal weighing about half a pound. This fragment was all they discovered of the anticipated coal-fields. There were also pictures made of J. T. Maston, who was as much used for such purposes as his chief. After having tried to find the electric attraction of the
North Pole, the secretary of the Gun Club became fixed to the ground by his metallic hand.

The celebrated calculator was too quick-tempered to find any pleasure in the drawings which referred to his personal conformation. He was exceedingly annoyed by them, and Mrs. Evangelina Scorbitt, it may be easily understood, was not slow to share his indignation. Another drawing in the Lanterne of Brussels represented the members of the Council and the members of the Gun Club tending a large number of fires. The idea was to melt the large quantities of ice by putting a whole sea of alcohol on them, which would convert the polar basin into a large quantity of punch. But of all these caricatures, which had the largest success was that which was published by the French Charivari, under the signature of its designer, "Stop." In the stomach of a whale Impey Barbicane and J. T. Maston were seated playing checkers and waiting their arrival at a good point. The new Jonah and his Secretary had got themselves swallowed by an immense fish, and it was in this way, after having gone under the icebergs, that they hoped to gain access to the North Pole. The President of this new Society did not care much about these pictures, and let them say and write and sing whatever they liked.

Immediately after the concession was made and the Society was absolute master of the northern region, appeal was made for a public subscription of $15,000,000. Shares were issued at $100, to be paid for at once, and the credit of Barbicane & Co. was such that the money ran in as fast as possible. The most of it came from the various States of the Union. "So much the better," said the people on the part of the N.P.P.A. "The undertaking will be entirely American."

So strong, indeed, were the foundations upon which Barbicane & Co. were established that the amount necessary to be subscribed was raised in a very short time, and even thrice the amount. Everybody was interested in the matter, and the most scientific experts did not doubt its success.

The shares were reduced one-third, and on Dec. 16 the capital of the Society was $15,000,000 in cash. This was about three times as much as the amount subscribed to the credit of the Gun Club when it was going to send a projectile from the earth to the moon.

CHAPTER VI.
IN WHICH A TELEPHONE COMMUNICATION BETWEEN MRS. SCORBITT AND J.T. MASTON IS INTERRUPTED.

President Barbicane was not only convinced that he would reach his object when the amount which had been raised took another obstacle out of his way. Had he not been perfectly sure of success he would not have made an application for a public subscription. And now the time had come when the North Pole would be conquered. It was felt certain that President Barbicane and his Council of Administration had means to succeed where so many others had failed. They would do what neither Franklin, nor Kane, nor De Long, nor Nares, nor Greely had been able to accomplish. They would pass the 84th parallel, they would take possession of the vast region purchased at an auction sale, they would make this country the thirty-ninth star in the flag of the American Union. "Fake," was all that the European delegates and their friends in the Old World could say. Nothing was more true, however, and this practical, logical means of conquering the North Pole, which was so simple that it was almost childish, was one which J.T. Maston had suggested to them. It was that brain, where ideas were constantly evolving, which had laid out this great geographical project in a way which could not but succeed.

It cannot be too often repeated that the Secretary of the Gun Club was a remarkable calculator, we might say a postgraduate calculator. But a single day was needed by him to solve the most complicated problems in mathematical science. He laughed at these difficulties whether in algebra or in plain mathematics. You should have seen him handle his figures, the signs which make up algebra, the letters in the alphabet, representing the unknown quantities, the square or crossed lines representing the way in which quantities are to be operated. All signs and lines, and radicals used in this complex language were perfectly familiar to him. And how they flew around under his pen, or rather under the piece of chalk which he attached to his iron hand, because he preferred to work on a blackboard. And this blackboard, six feet square, this was all he wanted, he was perfectly at home in his work. Nor was it figures alone which he used in his calculations. His figures were fantastic, gigantic, written with a practiced hand. His "2" and "3" were as nice and round as they could be, his "7" looked like a crutch and almost invited a person to hang on it. His 8 was as well formed as a pair of eye-glasses; and the letters with which he established his formulas, the first of the alphabet, a, b, c, which he used to represent given or known quantities, and the last, x, y, z, which he used for unknown quantities to be discovered, particularly the "x," and those Greek letters δ, ω, α. Really an Archimedes might have been well proud of them. And those other signs, made with a clean hand and without fault, it was simply astonishing. His + showed well that this sign meant an addition of one object to the other, his −, if it was a little smaller, was also in good shape. His =, too, showed that Mr. Maston lived in a country where equality was not a vain expression, at least amongst the people of the white race. Just as well were his > and his < and his ::, used in expressing proportions. And the √, which indicated the root of a certain number or quantity, it was to him a mark of triumph, and when he completed it with a horizontal line in this √—— , it seemed as if this outline on his blackboard would compel the whole world to submit to his figuring.

But do not think that Mr. J.T. Maston's mathematical intelligence was confined to elementary algebra! No; no matter what figuring he had to do, it was alike familiar to him, and with a practised hand he made all the signs and
Mrs. Evangelina Scorbitt appeared and made her last visit to Mr. Maston. He should not be disturbed by any one. This was a great disappointment for Mrs. Evangelina Scorbitt, but she was complicated and delicate to handle, involving several deep and important problems. Therefore, to avoid all impenetrable ice. He estimated that he needed at least a week to accomplish this mysterious calculation, exceedingly to the North Pole, and which would allow him to make use of those large fields of snow now covered with glittering banner. Three miles, three long miles at least separated the Palace at New Park from the “Ballistic tower on the top of the building, on which the blue and gold coat-of-arms of the Scorbitt family was upon a grand halls, its picture galleries, in which French artists held the highest places; its magnificent staircase, its great balconies, finished in the finest architecture, half Romanesque, half Gothic, with its richly-furnished apartments, its different was the mansion of Mrs. Evangelina Scorbitt, situated in the richest quarter of New Park, with facade of these walls there had been made calculations which would have made Newton, Euclid, or Laplace jealous. How and his working-studio, looking on the garden, and where the noise of the outer world could never penetrate. Within these walls there had been made calculations which would have made Newton, Euclid, or Laplace jealous. How different was the mansion of Mrs. Evangelina Scorbitt, situated in the richest quarter of New Park, with facade of balconies, finished in the finest architecture, half Romanesque, half Gothic, with its richly-furnished apartments, its grand halls, its picture galleries, in which French artists held the highest places; its magnificent staircase, its great number of domestics, its stables, its coach-houses, its garden, with the finest of flowers, statues, fountains, and the tower on the top of the building, on which the blue and gold coat-of-arms of the Scorbitt family was upon a glittering banner. Three miles, three long miles at least separated the Palace at New Park from the “Ballistic Cottage.” But a private telephone wire connected there, and in answer to "Hello! hello!" a conversation could be carried on between the mansion and cottage. If the persons could not look at each other they could at least hear each other. It will astonish none to hear that time upon time Mrs. Scorbitt began talking and ringing on the telephone to cottage was a very simple one. A ground-floor, with a veranda and a floor over it; a small parlor and small dining-room, with a kitchen and another room in an outbuilding stand at the back of the garden. Upstairs his sleeping-room and his working-studio, looking on the garden, and where the noise of the outer world could never penetrate. Within these walls there had been made calculations which would have made Newton, Euclid, or Laplace jealous. How different was the mansion of Mrs. Evangelina Scorbitt, situated in the richest quarter of New Park, with facade of balconies, finished in the finest architecture, half Romanesque, half Gothic, with its richly-furnished apartments, its grand halls, its picture galleries, in which French artists held the highest places; its magnificent staircase, its great number of domestics, its stables, its coach-houses, its garden, with the finest of flowers, statues, fountains, and the tower on the top of the building, on which the blue and gold coat-of-arms of the Scorbitt family was upon a glittering banner. Three miles, three long miles at least separated the Palace at New Park from the “Ballistic Cottage.” But a private telephone wire connected there, and in answer to "Hello! hello!" a conversation could be carried on between the mansion and cottage. If the persons could not look at each other they could at least hear each other. It will astonish none to hear that time upon time Mrs. Scorbitt began talking and ringing on the telephone to Mr. Maston when he was busily engaged with his figures. Then the calculator had to quit his work with some reluctance. He received a friendly "How do you do?" from Mrs. Scorbitt, which he answered with a grunt, which was sweetened into a kindly greeting by the distance over the telephone. After a conversation he was glad to go back to his figures. It was on the 3d of December, after a long and last conference, that Mr. Maston took leave of his friends and members of the Club to begin to do his share of the work. It was a very important work with which he had charged himself, for it was the question of figure mechanical appliance which would enable him to gain access to the North Pole, and which would allow him to make use of those large fields of snow now covered with impenetrable ice. He estimated that he needed at least a week to accomplish this mysterious calculation, exceedingly complicated and delicate to handle, involving several deep and important problems. Therefore, to avoid all unnecessary annoyance, it had been decided that the Secretary of the Gun Club should retire to his cottage and that he should not be disturbed by any one. This was a great disappointment for Mrs. Evangelina Scorbitt, but she was compelled to accept it. While President Barbicane, Capt. Nicholl and his associates, the jolly Bilbsy, Col. Bloomsberry, Tom Hunter, with the wooden legs, were all saying their good-bys to him and wishing him success, Mrs. Evangelina Scorbitt appeared and made her last visit to Mr. Maston. "You will succeed, my dear," said she at the moment of separation. "And above all do not make a mistake," added President Barbicane. "A mistake? He?" exclaimed Mrs. Scorbitt. "No more than God has made a mistake in putting together this world," modestly answered the Secretary. Then,
after shaking hands all around and after several more sighs and wishes of success and suggestions not to make too severe a work of it, the calculator was left alone. The door of the Ballistic cottage was closed and Fire-Fire had orders to admit none, not even if the President of the United States should ask admission.

During his first two days of seclusion J.T. Maston thought and thought, without even touching the piece of chalk, upon the problem which he had taken on himself. He consulted certain books relative to the elements, the earth—its size, its thickness, its volume, its form, its rotation upon its axis—all elements which he had to use as the basis of his calculations.

The principles of these elements which he used, and which we put before the reader, were as follows:

Form of the earth: An ellipsis of revolution the longest radius of which is 6,377,398 metres; the shortest, 6,356,080 meters. The circumference of the earth at the equator, 40,000 kilometres. Surface of the earth, approximate estimate, 510,000,000 of square kilometers. Bulk of the earth, about 1,000 milliards of cubic kilometres; that is, a cube having a metre in length, height, and thickness. Density of the earth, about five times that of the water.

Time of the earth on the orbit around the sun, 365 days, 6 hours, 9 minutes, 10 seconds, 37 centimes. This gives the globe a speed of 30,400 miles travelled over by the rotation of the earth upon its axis. For a point of its surface situated at the equator, 463 meters per second. These were the principal measures of space, time, bulk, etc., which Mr. Maston used in his calculations.

It was the 5th of October, about 5 o’clock in the afternoon, it is important to mention, when this remarkable work was begun, when J. T. Maston began to work upon it. He began his calculation with a diagram representing the circumference of the earth around one of its grand circles, say the equator. The blackboard was there, in a corner of his study, upon a polished oak easel, with good light shining on it, coming by one of the windows near by. Small pieces of chalk were on the board attached to the stand. The sponge was near the hand of the calculator. His right hand, or rather his right hook, was all ready for the placing of figures which he was going to use. Standing up, Mr. Maston made a large round circle, which represented the world. The equator he marked by a straight line. Then in the right corner of the blackboard he began to put the figures which represented the circumference of the earth:

40,000,000.

This done, he began figuring on his problem. He was so much occupied by it that he had not observed the weather without. For an hour a storm had raved through the country which affected all living beings. It was a terrific storm, the rain was falling in torrents, everything seemed turned upside down in nature. Two or three times lightning had illuminated the scene around him. But the mathematician, more and more absorbed in his work, saw and heard nothing. Suddenly an electric bolt, attracted by the lightning outside, sparkled in his room, and this disturbed the calculator. "Well," said Mr. Maston, "if unwelcome visitors cannot get in by the door they come by telephone. A nice invention for people who wish to be left alone. I will go to work and cut off the electric wire, so I will not be disturbed again while my figuring lasts." With this he went to the telephone and said sternly: "Who wants to talk to me? Just make it short." The reply came back: "Did you not recognize my voice, my dear Mr. Maston? It is I, Mrs. Scorbitt." "Mrs. Scorbitt! She will never give me a moment’s rest," uttered Mr. Maston to himself in a low voice that she could not hear. Then he thought he should at least answer her in a polite manner, and said: "Oh, is that you, Mrs. Scorbitt?"

"Yes, dear Mr. Maston."

"And what can I do for Mrs. Scorbitt?" asked Maston.

"I want to tell you that a terrible storm and lightning is destroying a large part of our city." "Well," he replied, "I cannot help it." "But I want to ask whether you have thought to close your windows?" Mrs. Scorbitt had hardly finished her sentence when a terrible thunderbolt struck the town. It struck in the neighborhood of the Ballistic cottage, and the electricity, passing along the wire with which the telephone was provided, threw the calculator to the floor with a terrible force. J.T. Maston made the best summersault he ever did in his life. His metal hook had touched the live wire and he was thrown down like a shuttlecock. The blackboard, which he had struck in his fall, was sent flying to another part of the room. Then the electricity passed into other objects and disappeared through the floor. The stupefied Mr. Maston got up and touched the different parts of his body to assure himself that he was not hurt internally. This done, he resumed his cold, calculating way. He picked everything up in his room, put it in the same place where it had been before and put his blackboard on the easel, picked up the small pieces of chalk and began again his work, which had been so suddenly interrupted. He noticed that on account of the fall the number which he had made on the right side of the blackboard was partly erased, and he was just about to replace it when his telephone again rang with a loud noise. "Again," said J.T. Maston, and going to the telephone he exclaimed, "who is there?" "Mistress Scorbitt." "And what does Mrs. Scorbitt want?" "Did not this terrible thunderbolt strike Ballistic cottage? I have good reason to think so. Ah, great God, the thunderbolt!"

"Don’t be alarmed, Mrs. Scorbitt."

"You have not been injured, Mr. Maston?"
"Not at all," he replied.
"You are sure you have no injuries whatever," said the lady.
"I am only touched by your kindness towards me," replied Mr. Maston, thinking it the best way to answer.
"Good evening, dear Mr. Maston."
"Good evening, dear Mrs. Scorbitt."

Returning to his work Mr. Maston said, sotto voce, "To the devil with her. If she had not handled the telephone at such a time I would not have run the risk of being hurt by electricity."

Mr. Maston did not wish to be interrupted in his work again and so took down his telephone and cut the wire. Then, taking again as basis the figure which he had written, he added different formulas of it, and finally a certain formula which he had written on his left side, and then he began to figure in all the language of algebra. A week later, on the 11th of October, this magnificent calculation was finished and the Secretary of the Gun Club brought his solution of the problem with great pride and satisfaction to the members of the Gun Club, who were awaiting it with very natural impatience. This then was the practical way to get to the North Pole mathematically discovered. Here was also a society, under the name of the N.P.P.A., to which the Government of Washington had accorded a clear title of the Arctic region in case they should buy it on auction, and we have told of the purchase made in favor of American buyers and of the appeal for a subscription of $15,000,000.

CHAPTER VII.

IN WHICH PRESIDENT BARBICANE SAYS NO MORE THAN SUITS HIS PURPOSE.

On the 22nd of December the subscribers to Barbicane & Co. were summoned to a general meeting. It is hardly necessary to say that the headquarters of the Gun Club were selected as the place of the meeting. In reality the whole block would not have been sufficient to give room to the large crowd of subscribers who assembled on that day. But a meeting in the fresh air on one of the public squares of Baltimore was not very agreeable in such cold weather. Usually the large hall of the Gun Club was decorated with models of all kinds lent by members of the Club. It was a real museum of artillery. Even the furniture, chairs and tables, sofas and divans, recalled by their strange shapes those murderous engines which had sent into a better world many brave people whose greatest wish was to die of old age.

On this meeting day all these things were taken down and out. This was not a meeting for the purpose of war, but a commercial and peaceful meeting over which Impey Barbicane was going to preside. All room possible had been made for the subscribers who arrived from all parts of the United States. In the hall as well as in the adjoining rooms the crowds were pushing and pressing each other without heeding the innumerable people who were standing on the adjoining streets. The members of the Gun Club, as first subscribers to the affair, had places reserved for them very near the desk. Among them could be found Col. Bloomsberry, more happy than ever; Tom Hunter, with his wooden legs, and the jolly Bilsby. Very snug in a comfortable armchair was Mrs. Evangelina Scorbitt, who should really have had a place on the right hand of the President, as she was in reality the owner of the Arctic region. Several other ladies were in the crowd. They could readily be seen by their large and much-decorated hats in many different colors. The large crowd on the outside tried to push into the hall, and one might easily have thought that all the people present were not merely helpmates of the members of the Gun Club, but rather their personal friends. The European delegates—Swedish, Norwegians, Danish, English, Dutch, and Russian—occupied reserved seats, and if they had bought any stock in this society it was only each one individually to such an extent as to justify a vote in the proceedings. After they had been so closely united in purchasing these regions they were united now only to annoy the purchasers. It may easily be imagined what intense curiosity they had to hear the important communication which the President was about to make to them. This communication undoubtedly would throw some information on the point as to how the society would proceed to reach the North Pole. Was this not a more difficult thing than merely to make use of the coal mines? If there should be any objections to make you may be assured that Major Donellan, backed up by his secretary, Dean Toorikin, would make them, and the other delegates would not be very slow in adding their word also. The Major had firmly decided to harass and annoy his rival, Impey Barbicane, as much as he possibly could.

It was 8 o'clock in the evening. The hall, the parlors, and all quarters occupied by the Gun Club blazed with lights which the Edison electroliers threw out. As soon as the doors were thrown open for the public a terrible crowd jammed into the hall. But everyone became silent as the ushers announced that the Council of Administration was coming. There, on a draped platform, with a table covered with black cloth, in full sight, President Barbicane, his Secretary, J.T. Maston, and his associates, took their places. A triple round of cheers, followed by hearty "tigers," rang through the hall and out to the adjoining streets. Very solemnly Mr. Maston and Capt. Nicholl took their seats. Then the President, who had remained standing, opened the proceedings. He put his right hand in his trouser's pocket and his left hand in his vest front and began as follows:

"Lady and gentlemen subscribers, the Council of Administration has called a meeting in these headquarters of
the Gun Club to make an important communication to you. You have learned by the circulars and through the
discussions in the papers that the object of our Club is to explore the large coal fields situated in the Arctic regions,
which we have recently purchased and to which we hold a title from the American Government. The amount of
money raised by public subscription will be used for these purposes. The success which will be attained by it
surpasses belief and the dividends your money will bring you will be unsurpassed in the commercial or financial
history of this or any other country." Here applause was heard for the first time and for a moment the orator was
interrupted. "You do not forget," said he, "how we have proved to you that there must be vast coal fields in these
regions, perhaps also fields of fossil ivory. The articles published on this subject do not allow any doubt that coal
fields are there, and coal is now, you know, the basis of all our commercial industry. Without mentioning the coal
which is used every year in firing and heating, we might think of coal used for many other purposes, of which I
could mention a hundred different ones. It is certain that coal is the most precious substance, and will some day, on
account of the large consumption of it; fail in its supply. Before 500 years have passed the coal mines which are at
present in use will have stopped giving coal."

"Three hundred years," cried one of those present. "Two hundred years," answered another.

"Let us say at some time sooner or later," continued the President, calmly, "and let us suppose, too, that we will
even discover new coal fields yet, whose coal will give out, say at the end of the nineteenth century." Here he
stopped to give his listeners a chance to grasp the idea. Then he began again: "Therefore, we come here, subscribers,
and I ask you to rise and go with me to the North Pole immediately." Everybody present got up and seemed about to
rush away and pack their trunks, as if President Barbicane had a vessel ready to take them direct to the North Pole.
But a remark made by Major Donellan in a clear and loud voice brought them back to reality and stopped them at
once. "Before starting" he asked, "I would like to know by what means we can reach the North Pole?"

"Either by water, or land, or by air," quietly answered President Barbicane.

All the people present sat down, and it may readily be understood with what a feeling of curiosity.

"In spite of all the devotion and courage of previous explorers, the eighty-fourth parallel has thus far been the
northern limit reached. And it may fairly be supposed that this is as far north as anybody will ever get by the means
employed at the present day. Up to the present time we have only used boats and vessels to reach the icebergs,
and rafts to pass over the fields of ice. People should not adopt such rash means and face the dangers to which they are
exposed through the low temperature. We must employ other means to reach the North Pole."

It could be seen by the excitement which took hold of the auditors, that they were on the point of hearing the
secret which has been so vigorously searched for by every one.

"And how will you reach it?" demanded the delegate of England.

"Before ten minutes have passed you will know it, Major Donellan," said President Barbicane, "and I may add in
addressing myself to all the stockholders, that they should have confidence in us as the promoters of this affair, for
we are the same who have tried to send a projectile to the moon."

"Yes," cried Dean Toodrink, sarcastically, "they tried to go as far as the moon. And we can easily see that they
are here yet,"

President Barbicane ignored the interruption. Shrugging his shoulders, he said in a loud voice: "Yes, ladies and
gentlemen, in ten minutes you will know what we are going to do."

A murmur, made up of many "Ahs!" and "Ohs!" followed this remark. It seemed to them as if the orator had said
in ten minutes they would be at the North Pole. He then continued in the following words:

"First of all, it is a continent which forms this arctic region, or it is an ocean, and has Commander Nares been
right in calling it 'paleocrystic ocean,' which means an ocean of old ice? To this question I must answer that I think
he was not right."

This is not sufficient," exclaimed Eric Baldenak. "It is not the question of supposing, it is the question of being
certain."

"Well, we are certain," came the answer to this furious inquirer. "Yes, it is a solid continent and not an ice ocean
which the N.P.P.A. has purchased and which now belongs to the United States and which no European power has
the right to touch."

A little murmur came from the neighborhood of the delegates of the Old World. "Bah!" they said. "It is full of
water, a regular washbasin which you will not be able to empty." Dean Toodrink as usual made most of the remarks
and met the hearty applause of his associates. "No, sir," answered President Barbicane, quickly. "There is a regular
continent, a platform which rises like the Gobi desert in Central Asia, three or four kilometres above the surface of
the ocean. This is very easy to be seen from the observations made in the neighboring countries, of which the polar
region is only an extension.

"After their explorations have not Nordenskiold, Perry and Maagaard stated that Greenland gets higher and
higher towards the North Pole?"
“Besides, they have found birds, different products and vegetables in the northern ice—ivory teeth also—which
dicate that this region must have been inhabited and that animals must have been there, and perhaps people as
well. There used to be large forests there, which must have been formed into coal-fields, which we will explore.
Yes, there is a continent, without a doubt, around the North Pole—a continent free from all human beings, and on
which we will place the banner of the United States.”

At this remark the auditors expressed great delight. When the noise had finally subsided Major Donellan could
be heard to remark: "Well, seven minutes have already gone by of the ten which, as you say, would be sufficient to
reach the North Pole."

"We shall be there in three minutes," coolly answered President Barbicane.

"But, even if this be a continent, which constitutes your purchase, and if it is a raised country, as we may have
reasons to believe, it is also obstructed by eternal ice, and in a condition which will make exploration extremely
difficult," responded the Major. "Impossible," cried Jan Harald, who emphasized this remark with a wave of his
hand. "Impossible, all right," said Impey Barbicane. "But it is to conquer this impossibility that we have purchased
this region. We will need neither vessels nor rafts to reach the North Pole; no, thanks to our operations, the ice and
icebergs, new or old, will melt by themselves, and it will not cost one dollar of our capital nor one minute of our
time." At this there was absolute silence. The most important moment had come.

"Gentlemen," said the President of the Gun Club, "Archimedes only asked for a lever to lift the world. Well, this
lever we have found. We are now in a position to remove the North Pole."

"What, remove the North Pole?" asked Eric Baldenak.

"Will you bring it to America?" asked Jan Harald. Without doubt President Barbicane did not wish to explain
himself just yet, for he continued: "In regard to this point of leverage—" "Do not tell it! do not tell it!" cried one of
his associates, with a terrible voice.

"In regard to this lever—"

"Keep the secret! keep the secret!" cried the majority of the spectators, taking up the cry.

"We will keep it," said President Barbicane.

Naturally, the European delegates were very much vexed at this remark. This will be easily understood. In spite
of all these exclamations the orator never had any intention of making his plan known. He continued to say: "We
obtained our object, thanks to a mechanical device, one which has no precedent in the annals of industrial art. We
will undertake it and bring it to a successful finish by means of our capital, and how I will inform you forthwith."

"Hear! hear!" said the others present.

"First of all, the idea of our plan comes from one of the ablest, most devoted and illustrious calculators and one
of our associates as well," said President Barbicane. "One to whom we owe all the calculations which allows us to
have our work in such good condition. As the exploration of the North Pole is not a piece of play the removal of the
pole is a problem which could only be solved by the highest calculations. Therefore we have called the assistance of
the honorable Secretary, Mr. J.T. Maston."

"Hip, hip, hip, hurrah, for J. T. Maston," exclaimed all the auditors, seemingly electrified by the presence of this
extraordinary calculator.

Mrs. Evangelina Scorbitt was deeply touched by this recognition of the celebrated mathematician, who had
already entirely gained her heart. He contented himself with turning his head to the right and left, bowing and
thanking his auditors.

"Already, dear subscribers," said President Barbicane, "since the great meeting in honor of the arrival of the
Frenchman, Michel Ardan, in America, some months before our departure for the moon" (and this confident Yankee
spoke of the trip to the moon as quietly as if it were no more than a trip to New York), "J T. Maston had already said
to himself: 'We must invent machines to move the North Pole. We must find a point for action and put the axis of
the earth in the right direction from the object.' Well, any or all of you who listen to me find it if you can. I can only
say the machines have been invented, the point of leverage has been found, and now let us pay our attention to the
question of fixing, in the right way, for our end of the axis of the earth." Here he stopped speaking, and the
astonishment which was expressed on the faces of his auditors it is impossible to describe.

"What!" cried Major Donellan, "you then have the idea of putting the axis of the earth in another direction?"

"Yes, sir," answered President Barbicane promptly. "We have the means of making a new one which will
hereafter regulate the routine of day and night."

"You want to modify the daily rotation of the earth?" repeated Col. Karkof, with fire in his eyes.

"Absolutely, but without affecting its duration," answered President Barbicane. This operation will bring the
pole at or about the sixty-seventh parallel of latitude, then the earth will be similar to the planet Jupiter, whose axis
is nearly perpendicular to the plane of its orbit. Now this movement of 23 degrees 28 minutes will be sufficient to
give at our North Pole such a degree of heat that it will melt in less than no time the icebergs and field which have
been there for thousands of years.”

The audience was out of breath. Nobody thought of interrupting the orator, even to applaud him. All were taken in by this idea, so ingenious and simple, of modifying the axis on which this earthly spheroid is rotating. And as for the European delegates, well, they were simply stupefied, paralyzed, and crushed, they kept their mouths shut in the last stage of astonishment. But the hurrahs seemed to rend the hall asunder, when President Barbicane made the additional remark: “It is the sun which will take upon himself the melting of the icebergs and fields around the North Pole, and thus make access to the same very easy. So, as people cannot go to the pole, the pole will come to them.”

CHAPTER VIII.

YES, JUST LIKE JUPITER.

Since that memorable meeting in honor of Michel Ardan, the Hon. J.T. Maston had talked and thought of nothing else but the “changing of the axis of the earth.” He had studied the subject as much as possible and found out all the facts and figures about it. As the problem had been solved by this eminent calculator a new axis was going to take the place of the old one upon which the earth was now turning, and the world would otherwise remain the same. In the scheme it would be possible for the climate around the North Pole to become exactly the same as that of Trondhjem, in Norway, in the Spring. Naturally, then the large amount of ice would melt under the ardent sun. At the same time the climates would be distributed over our sphere like those now on the surface of Jupiter. In other words, the new-formed society of Barbicane was going to change everything at present on the surface of the earth. And the creation of this new axis was possible, just as soon as the platform of which Archimedes had dreamed and the lever imagined by J.T. Maston were at the disposal of these courageous engineers. And as they had decided to make a secret of their invention until a future time, people could not do anything else but make their own figures. This was what all the papers did, calling on the most scientific persons and learning as well something from the most ignorant persons. If there really were people living on the surface of Jupiter, they had a good many advantages over those on the earth, advantages which had all been narrated and explained in the meeting which was held before the trip to the moon. All these advantages would come to the people living on the earth if Barbicane & Co. could accomplish what they intended to do. Twenty-four hours would then always separate two noons from each other. Twilight and dawn would always be as they are now. But the most curious thing of all would be the absence of the different seasons of the year. Now there were Summer, Winter, Fall, and Spring. The people living on Jupiter did not know these seasons at all. After this experiment people living on this globe would not know them either. As soon as the new axis would be in smooth working order there would be no more ice regions, nor torrid zones, but the whole world would have an even temperature climate.

What, after all, is the torrid zone? It is a part of the surface in which the people can see the sun twice yearly at its zenith, and the temperate zone but a part where the sun never goes to the zenith, and the icy region but a part of the world which the sun forgets entirely for a long time, and around the North Pole this extends for six months. It is simply the position of the sun which makes a country exceedingly hot or cold. Well, these things would not appear any longer on the surface of the world. The sun would be always over the equator: it would go down every twelve hours just as regularly as before. "And among the advantages of the new method," said the friends of President Barbicane, "were these, that each person could choose a climate which was best for himself and his health; no more rheumatism, no more colds, no more grippe; the variations of extreme heat would not be known any more. In short, Barbicane & Co. were going to change fixtures which had existed ever since the world was in existence. Certainly the observer would lose a few stars and things which he perhaps liked to look at now, and the poet would not have any longer his dreamy nights, etc., but what a great advantage it would be for the world at large. "And," said certain journals, "the products of the ground can be regulated so that agriculturists can give to each sort of plant life the temperature which suits it most." Other newspapers asked: "Will we no more have rain, or storms, or hail—things upon which a great deal depends in the harvest time?" "Undoubtedly," said the friends of Barbicane & Co., but these accidents will be more rare than they have been, as the temperature will be more even. Yes, taken in all, it will be a great advantage to humanity. It will be the real millennium of the earthly globe. And Barbicane & Co. will have done a service to mankind which but for them would have remained an impossibility." "Yes," said Michel Ardan, "our hemisphere, the surface of which is always either too cold or too warm, will no longer be the place for colds and rheumatism, etc." A New York paper of Dec. 27 printed the following article: "Honor to President Barbicane! His associates and himself will not only annex a new province to our American continent, and thereby enlarge the already vast possessions of the United States, but they will make the whole world more productive and inhabitable. It will be possible then to put seed in the ground as soon as the crop had grown up and been taken out; there would be no more time lost during the Winter. And the coal mines also would make the country richer than the value of its entire present reality. Barbicane & Co. will change the whole world and put it in better condition. Thanks, then, to the people who have done this greatest of benefits to humanity.”

CHAPTER IX.
IN WHICH APPEARS THE FRENCH GENTLEMAN TO WHOM WE REFERRED AT THE BEGINNING OF THIS TRUTHFUL STORY.

Such, then, were to be the profits due to the changes which were to be wrought by President Barbicane. The earth would continue to revolve and the course of the year would not be much altered. As the changes would concern the whole world it was natural that they became of interest to all. In regard to the new axis which was going to be used that was the secret which neither President Barbicane nor Capt. Nicholl nor J.T. Maston seemed to be willing to give to the public. Were they to reveal it before, or would none know of it until after the change had taken place? A degree of uncertainty began to fill the American mind. Criticisms very natural and to be expected were made in the papers. By what mechanical means was this project to be carried out which would bring about this change? It would necessarily demand a terrible power. One of the greatest papers at that time commented in the following article: "If the earth was not turning on its axis, perhaps a very feeble shock would be sufficient to give it such a movement as might be chosen, but otherwise it would be very difficult if not impossible to deviate it a fixed amount." Nothing seemed more correct after having discussed the effort which the engineers of the N.P.P.A. were to make. Discussion took on the interesting turn as to whether this result would be reached insensibly or suddenly. And if the latter, would not terrible accidents happen at the moment when the change took place? This troubled scientific people as well as ignorant people. It was not agreeable to know that a blow was to be struck and not know precisely what the after effects were to be.

It seemed as if the promoters of this undertaking had not fully considered the consequences - that they would be so very dangerous to the earth, and that it would not do as much good as first thought. The European delegates, more than ever angry at the loss which they had suffered, resolved to make the most of this question and to excite the public as much as possible upon it so as to turn feeling against the members of the Gun Club.

It will not be forgotten that France had absolutely nothing to do with these delegates, as it had no intentions of buying the Arctic region. However, a Frenchman had come to Baltimore, and for his own personal benefit and information had watched with great interest the proceedings of the Gun Club. He was an engineer, not more than thirty-five years old. He had been first in the polytechnic school, and came out of it with the highest honors. He was without doubt as skilful a calculator as Mr. J.T. Maston. This engineer was a very intelligent young man, very original, always pleasant, and with most amiable manners. He always spoke very frankly and used plain language, no matter whether he was speaking in earnest or in fun. He even went so far as to use slangy expressions when they served his purpose. He could sit for hours at his table and figure and calculate, making his figures and calculations as fast as he could write with a pen. His greatest pleasure, next to these difficult mathematical efforts, was in "whist," which he played apparently very indifferently, not forgetting to figure out all his chances. His name was Alcide Pierdeux, but he generally signed it, A. Pierd, and sometimes only A. Pie. He was very tall. His friends remarked that his height measured about the five millionth part of the quarter of the meridian, and they were not much mistaken. He had a small head, at least it looked so on his broad shoulders, but with a most lively expression on his face, and his blue eyes behind his eye-glasses twinkled merrily. This was characteristic of him, for he had one of those faces which appear merry, even when they are in sober earnest. He was at once the best scholar in his class and the best tempered. But even if his head did seem a little small on his shoulders, it is safe to say that it was filled to its highest capacity. He was a mathematician, as all his ancestors had been, but he did not study mathematics to use them in his profession, for which he never had any taste, as he disliked trade. No, he studied mathematics for themselves alone, simply to find them out more and more where there was so much unknown to man. Let us also remark that Alcide Pierdeux was a bachelor. He was as yet single, or, as he would express it, equal to one (= 1) although his greatest wish was to get married. His friends all thought that he would marry a very charming girl, gay and spirituelle. But, unhappily for him, the girl’s father said that he was too smart and that he would talk to his daughter in language which she would not be able to understand. How modest and simple this father was, indeed.

And for this reason the young engineer decided to place between himself and his country the broad ocean. He asked permission to go abroad for a year and obtained it. He thought that he could not make any better use of his time than to go to Baltimore and note the actions of the N.P.P.A. And this is how he came to be at this time in the United States. However, since he got to Baltimore he had cared little apparently for the great undertaking of Barbicane & Co. Whether the earth would have a change of the axis or not, what did it matter to him? He only wanted to know, and his curiosity was at the highest point to find out, by what means they were to move the earth. He thought again and again how they would do it and had several plans in his head and dismissed them only to consider the matter afresh. He concluded that they wanted probably to substitute a new axis, but he did not clearly see where their point of operations was to be. Then, again, he would say, "There is the daily movement. It is impossible to suppress it; how they will do it, is a perfect conundrum to me." He had no idea what the plans of Barbicane and Maston were. It is to be regretted very much that their intentions were not known to him, as he would have been able to figure out the formulae in a very short time. And so it came about that on this 29th day of December, Alcide Pierdeux was
walking with his hand at his brow, pondering, about the streets of Baltimore.

CHAPTER X.
IN WHICH A LITTLE UNEASINESS BEGINS TO SHOW ITSELF.

A month had elapsed since the meeting of the Gun Club and the stockholders of the new-formed society, and public opinion was getting much altered. The advantages of the change to be wrought in the axis of the earth were forgotten and its disadvantages began to be spoken of. It was very probable, public opinion said, that a terrible catastrophe would happen, as the change could only be brought about by a violent shock. What would this catastrophe exactly be? In regard to the change of climates, was it so desirable after all? The Esquimaux and the Laps and the Samoyeden and the Tchuktchees would benefit by it, as they had nothing to lose. The European delegates were very energetic in their talk against President Barbicane and his work. To begin with they sent information to their Government. They used the cable frequently and always sent cipher messages. They asked questions and received instructions. What, then, were these instructions, always in cipher and very guarded? "Show energy, but do not compromise our Government," said one. "Act very considerately, but do not touch the 'status quo,'" said another. Major Donellan and his associates did not fail to predict a terrible accident. "It is very evident that the American engineers have taken steps so as not to hurt, or at least as little as possible, the territory of the United States," thought Col. Boris Karkof. "But how could they do it?" asked Jan Harald. "If you shake a tree do not all its branches suffer while you are shaking it?" "And if somebody hits you on the back does not your whole body feel the pain?" said Jacques Jansen. "That is, then, what this strange paragraph of the document meant," said Dean Toodrink. "That is the reason why they mentioned certain geographical changes."

"Yes," said Eric Baldenak, "that is what we have to fear; this change will throw the sea out of its basin, and should the ocean leave its present quarters, would not certain inhabitants of this globe find themselves so located that they could not readily communicate with their fellow-citizens?"

"It is very possible that they may be brought into such a density of surrounding medium," said Jan Harald, gravely, "that they will be unable to breathe."

"We will see London at the top of Mount Blanc," exclaimed Major Donellan. And with his legs crossed and his head thrown back this gentleman looked straight up as if the capital of his country was already lost in the clouds. In short, it became a public danger and a most annoying one. True, it was only a question of a change of 23 degrees and 28 minutes, but this change might bring about a great movement of the oceans as the new earth flattened itself around the pole. Protestations were heard from all over, and the Government of the United States was asked to interfere. "It was best not to try the operation at all."

"The consequences of it might destroy this world." "God has done all things well; it was not necessary to better his work," were the comments. And yet there were people light-hearted enough to make merry at the whole matter. "Look at these Yankees," they said, "they want to turn the earth on its axis. If the earth had shown any faults in its motion it would be all right to better it, but it had gone on for millions of years and always as regularly as clockwork."

Instead of answering such questions Engineer Alcide Pierdeux tried to find which would be the countries and directions, figured out by Mathematician Maston, in which the test would take place—the exact point of the globe where the work would begin. As soon as he should know this he would be master of the situation and know exactly the place which would be in the most danger. It has been mentioned before that the countries of the old continent were probably connected with those of the new across the North Pole. Was it not possible, it was asked in Europe, that President Barbicane and Capt. Nicholl and J.T. Maston had considered only how to save their own country from any ill consequences which might come from the shock? He was a Yankee—it was pointed out they were all Yankees—and particularly this man Barbicane, who had created the idea of going to the moon. In any case, it was argued, the whole new world, from the Arctic regions to the Gulf of Mexico, would not have to fear anything from the shock. It is even probable on the other hand that America would profit immensely by it and gain some territory. "Who knows what is lying in the two oceans which wash the American coast? Was it not probable that there was some valuable territory which they wished to take possession of?" asked people who never saw anything but the

"Is it sure that there is no danger? Suppose J.T. Maston should make a mistake in his calculations? And could not the President have made a mistake when he came to put his apparatus in working order? This might happen to the smartest people. They might not always put the bullet in the target, or they might neglect to put the cannonball into the cannon," were the comments of these nervous folk. This uneasiness was fomented by the European delegates. Secretary Dean Toodrink published several articles in this line, and even stronger ones were put by him in the Standard. Jan Harald put some in the Swedish journal Aftenbladet, and Col. Boris Karkof in a Russian journal which had a large circulation. Even in America opinions differed. The Republicans were friends of President Barbicane, but the Democrats declared themselves against him. A part of the American press agreed with the European press. And as in the United States the papers had become great powers, paying yearly for news about twenty millions of dollars, they had great influence on the people. In vain did other journals of large circulation
One evening, the 13th of March, J.T. Maston was in his study at the Ballistic Cottage, very much interested in the calculator. The pressure of public opinion was so great that the Cabinet of the Government of the United States was compelled to give the Committee full permission to do what they thought most necessary and advisable in the matter. The Committee became known as the Inquiry Committee with orders to bring him to their meeting. The agent arrived at the cottage, knocked at the door, and introduced himself. He was harshly received by “Fire-Fire,” but much worse by the proprietor of the house. However, Mr. Maston thought it was no more than right that he should go to the meeting, and he went with the agent. As soon as he had arrived they began to question him.

The first question was, “Where is President Barbicane and Capt. Nicholl at present?” He answered with a steady voice, “I know where they are, but I am not at liberty to disclose this information.” Second question: “Have he and his associates made the necessary preparations to put this operation in working order?” “This,” said Maston, “is a part of the secret which I cannot reveal.” “Would he be land enough to let this Committee examine his own work, so that they could be able to judge if his Society would be in position to accomplish their intentions?” “No, most certainly I shall not allow it, never; I would rather destroy it. It is my right as a citizen of free America to refuse to communicate to any person the result of my work.”

“But,” said President Prestice in a very serious voice, “if it is your right to keep silent, it is the right of the whole United States to ask you to stop these rumors and give an explanation of the means which will be employed by your Company,” Mr. Maston did not agree that it was his right nor that it was his duty to answer further questions. In spite of their begging, threatening, etc., they could obtain nothing from this man with the iron hook. Never, never, would he say one word of it, and it was hardly possible to believe that such a strong will was concealed under that cover of “gutta-percha.” Mr. Maston went away as he had come; he was congratulated by Mrs. Evangelina Scorbitt, who was delighted by the courageous attitude taken by him. When the results of this last meeting of the Inquiry Committee became known public indignation really took a turn which threatened the security and safety of the public.

The uprising of public sentiment in the Northern, Southern, and Middle States of the Union did not allow them any other course. A commission of engineers, mechanicians, mathematicians, and geographers were appointed—fifty in all, presided over by John Prestice—by the act of the 19th of February, with full power to do anything which they considered necessary in the matter. At first the President of the Society received orders to appear before this committee. President Barbicane did not respond. Agents went to his house in Baltimore, but the President was gone. Where was he? No one knew. When did he depart? Six weeks ago, on the 11th of January, he had left the city, and the State of Maryland as well, in company with Capt. Nicholl.

Where did they both go? Nobody could tell. Evidently the two members of the Gun Club went to that mysterious region where preparations were going on for the great operation. But where could this place be? It was most important to know where this place was in order to break up and destroy the plans of these engineers before they had got too far in their work.

The consternation produced by this departure of the President and his associate was enormous. It soon changed public opinion to hatred against the N.P.P.A. and its managers. But there was one man who ought to know where the President and his associate had gone. There was one man who could answer this gigantic question, which at present excited the whole world and this man was—J.T. Maston. He was ordered to appear before the Committee of Inquiry under the Presidency of John Prestice. He did not appear. Had he also left Baltimore? Had he also gone to join his associates to aid them in their work, the results of which the whole world now expected with such immense fright? No. J.T. Maston was living still in his Ballistic Cottage, at No. 179 Franklin Street, working all the time and already beginning new calculations, only interrupting his work when he wanted to spend a social evening with Mrs. Evangelina Scorbitt at her magnificent residence at New Park. An agent was sent to him by the President of the Inquiry Committee with orders to bring him to their meeting. The agent arrived at the cottage, knocked at the door and introduced himself. He was harshly received by "Fire-Fire," but much worse by the proprietor of the house. However, Mr. Maston thought it was no more than right that he should go to the meeting, and he went with the agent. As soon as he had arrived they began to question him.

The first question was, “Where is President Barbicane and Capt. Nicholl at present?” He answered with a steady voice, “I know where they are, but I am not at liberty to disclose this information.” Second question: "Have he and his associates made the necessary preparations to put this operation in working order?” “This,” said Maston, “is a part of the secret which I cannot reveal.” “Would he be land enough to let this Committee examine his own work, so that they would be able to judge if his Society would be in position to accomplish their intentions?” “No, most certainly I shall not allow it, never; I would rather destroy it. It is my right as a citizen of free America to refuse to communicate to any person the result of my work.”

“But,” said President Prestice in a very serious voice, “if it is your right to keep silent, it is the right of the whole United States to ask you to stop these rumors and give an explanation of the means which will be employed by your Company,” Mr. Maston did not agree that it was his right nor that it was his duty to answer further questions. In spite of their begging, threatening, etc., they could obtain nothing from this man with the iron hook. Never, never, would he say one word of it, and it was hardly possible to believe that such a strong will was concealed under that cover of “gutta-percha.” Mr. Maston went away as he had come; he was congratulated by Mrs. Evangelina Scorbitt, who was delighted by the courageous attitude taken by him. When the results of this last meeting of the Inquiry Committee became known public indignation really took a turn which threatened the security and safety of the public.

The pressure of public opinion was so great that the Cabinet of the Government of the United States was compelled to give the Committee full permission to do what they thought most necessary and advisable in the matter. One evening, the 13th of March, J.T. Maston was in his study at the Ballistic Cottage, very much interested
in different figures, when suddenly the telephone bell attracted his attention. "Hello! hello!" said he, annoyed by this sudden interruption, "who wants me?" "Mme. Scorbitt." "What does Mrs. Scorbitt want?" "She wants to put you on your guard, I am informed this moment"—and she had not time to finish the phrase when Mr. Maston heard a terrible noise at the door of his house. On the stairs which led to his study there was an extraordinary racket. He could hear loud voices, many angry voices. Then the noise of a whole army of men moving towards his door. It was his servant Fire-Fire, who was trying to keep the intruders from breaking, into the house and disturbing the "home" of the master. A moment afterwards the door was violently opened and a policeman appeared, followed by several others. This policeman had a warrant to make a visit to the house and to take possession of all papers and also of J.T. Maston himself. The angry Secretary of the Gun Club reached for his revolver, and would have certainly defended himself had he not been suddenly disarmed. He was held by officers, and all his papers were put in a bundle. Suddenly he made a bold effort, freed himself, grabbed his note-book, out of which he tore the last page and began to chew it very quickly. "Now you can take it," said he, "for it will be no good to you." An hour afterwards he was a prisoner in the jail of Baltimore. This was undoubtedly the best that could happen to him, as it was extremely dangerous for him to be at liberty due to the then excited state of the public mind.

CHAPTER XI.

WHAT WAS FOUND IN THE NOTEBOOK OF J.T. MASTON AND WHAT IT NO LONGER CONTAINED.

The notebook, which was taken possession of by the police, had thirty pages covered with formulae and figures, including all the calculations of J.T. Maston. It was a work of the higher mathematics, which could only be appreciated by the highest mathematicians. The following formula,

Equation 1

[Equation 1]

which was also to be found in the calculation of From the Earth to the Moon, held a prominent place in these calculations. The majority of people could not understand anything of what was written in the notebook, but it would have given satisfaction to give out the results, which every one expected with so much curiosity. And so it was that all the newspapers, and the Inquiry Committee as well, tried to read the formulae of this celebrated calculator. In the work of Mr. Maston were found some problems correctly executed, others half solved, etc. The calculations had been made with great exactness and of course the Inquiry Committee supposed that they were absolutely correct. If the plan was carried out fully it was seen that without a doubt the earth’s axis would be greatly changed and that the terrible disasters which were predicted would take place with full force. The reports made by the Inquiry Committee to the different newspapers ran as follows:

"The idea followed by the Administrative Council of the N.P.P.A. and the object of which is to substitute a new axis for the old one is to be carried out by means of the recoil of a piece of ordnance fixed at a certain point of the earth. If the barrel of this device is immovably fixed to the ground it is not at all doubtful that it will communicate its shock over our whole planet. The engine adopted by the engineers of the Society is then nothing else but a monster cannon, the effect of shooting which would be absolutely nothing if it were pointed vertically. To produce its highest effect it is necessary to point it horizontally towards the north or south, and it is this last direction which has been chosen by Barbicane & Co. Under these conditions the recoil will produce a movement of the earth towards the north, a movement similar to that of one billiard ball touched very slightly by another."

This was really just what the clever Alcide Pierdeux had predicted. As soon as the cannon has been fired off, the center line of the earth would be displaced in a parallel direction to that of the recoil. This would change the direction of the orbit somewhat, and consequently the duration of the year, but in such a mild way that it must be considered as absolutely free from bad results. At the same time the earth takes a new movement of rotation around an axis in the plane of the equator, and the daily rotation will then be accomplished indeﬁnitely upon this new axis, as if no daily movement had existed previous to the shock. At present this movement is made around the lines of the poles, and in combination with the accessory force produced by the recoil there was created a new axis, the pole of which moves from the present to the amount of a quantity called "x." In other words, if the cannon is fired at the moment when the vernal equinox—one of the intersections of the equator and the ecliptic—is at the nadir of the point of shooting, and if the recoil is sufﬁciently strong to displace the old pole 23 degrees, 28 minutes, the new axis becomes perpendicular to the direction of the earth’s orbit, the same as it is for the planet Jupiter.

What the consequences were expected to be we already know, as President Barbicane had indicated them at the meeting of the 22d of December. But, given the mass of the earth and the quantity of momentum, which she possesses, is it possible to conceive a piece of ordnance so strong that its recoil will be able to produce a modification in the actual direction of the real pole, and especially to the extent of 23 degrees, 28 minutes? Yes, if a cannon or a series of cannons are built with the dimensions required by the laws of mechanics, or, in lieu of these dimensions, if the inventors were in possession of an explosive strong enough to impel a projectile with the
necessary velocity for such a displacement.

Now, taking as a basis model the cannon of 27 centimetres of the French Marine Corps, which throws a projectile of 180 kilograms with an initial velocity of 500 metres a second, by giving to this piece of ordnance an increased dimension of 100 times— that is, a million times in volume— it would throw a projectile of 180,000 tons: or, in other words, if the powder had strength sufficient to give to the projectile an initial velocity 5,600 times greater than that of the old black powder used for a cannon the desired result would be obtained. In fact, with a velocity of 2,800 kilometres a second, a velocity sufficient to go from Paris to St. Petersburg in one second, there was no doubt that the recoil of the projectile, acting against the earth, would put everything again in a state of quietude. Well, extraordinary as it may appear, J.T. Maston and his associates had in their possession exactly this explosive, of a nearly unlimited power, and of which the gunpowder used to throw the ball of the [C]olumbiad towards the moon gave but a faint idea. It was Capt. Nicholl who had discovered it. The substances which entered into its composition were only imperfectly entered in the notebook of Mr. Maston, and he merely named it "melimelonite." All that was known was that it was formed by the reaction of a melimelo of organic substances and azotic acids. No matter what the explosive was, with the power which it possessed it was more than sufficient to throw a projectile weighing 180,000 tons outside of the earth’s attraction, and it was evident that the recoil which it would produce to the cannon would have the effect of changing the axis, displacing the North Pole 23 degrees and 28 minutes, bringing the new axis in the direction of the ecliptic, and, as a consequence of this, effecting all the changes so justly dreaded by the inhabitants of the earth.

However, there was one chance for humanity to escape the consequences of this trial, which was to provoke such revulsions in the geographical and climatic conditions of the globe. Was it possible to build a cannon of such dimensions that it was to be a million times greater in volume than the one of 27 centimetres? It was doubtful. That was just the point and one of the reasons for thinking the attempt of Barbicane & Co. would not succeed. But there was the other possibility, for it seemed that the Company had already begun to work on their gigantic project. Now the question arose, where was their place of operations? No one knew, and consequently it was impossible to overtake these audacious operations. It was well known that Barbicane and Nicholl had left Baltimore and America. They had gone away two months ago. Where were they? Most certainly at that unknown point of the globe where the operations were under way for their grand object. It was evident that this place was indicated on the last page of the notebook of J.T. Maston. On this point there was no doubt. But this last page had been torn out and eaten up by the accomplice of Impey Barbicane, and Maston sat imprisoned in the Baltimore City Prison and absolutely refused to speak. This was the condition of affairs. If the President succeeded in making this monster cannon and its projectile—in a word, if the operation was carried out under the above stated conditions—it would modify the earth’s axis, and within six months the earth would be subject to the consequences of this audacious attempt of Barbicane & Co. This would come on the 22d day of September, twelve hours after the passage of the sun over the meridian of the place "x."

The facts that were known were: 1st. That the shooting would be done with a cannon a million times larger than the cannon of 27 centimetres. 2d. That the cannon would be loaded with a projectile of 180,000 tons. 3d. That the projectile would be animated with a velocity of 2,800 kilometres. 4th. That the shooting would take place on the 22d of September, twelve hours after the passage of the sun over the meridian of the place "x." Was it possible to deduce, under these facts, where was the spot "x," where the operation was to take place? Evidently not, said the Inquiry Committee. There was nothing by which to calculate where the point "x" was, as nothing in the calculations of Mr. Maston indicated through which point of the globe the new axis was to pass, or, in other words, on which part of the present earth the new poles would be situated. Therefore, it would be impossible to know which would be the elevated and submerged countries, due to the changed surface of the ocean, or which parts of the earth would be transformed into water, and where water would be transformed into land. It was evident that the maximum change in the ocean surface would be 8.415 metres, and that in certain points of the globe various areas would be lowered and raised to this amount. All, however, depended upon the location of the point "x," or where the shooting was to take place. In other words, "x" was the secret of the promoter of this uncertain affair. "We have," said the Committee, "only to mention again that the inhabitants of the world, no matter in what part of it they are living, are directly interested in knowing this secret, as they are all directly threatened by the actions of Barbicane & Co. Therefore all the inhabitants of Europe, Africa, Asia, America, and Australia are advised to watch all gun foundries, powder factories, etc., which are situated in their territory and to note the presence of all strangers whose arrival may appear suspicious, and to advise the Inquiry Committee at Baltimore by wire immediately. Heaven grant that this news may arrive before the 22d of September of the present year, as that date threatens to disturb the order established since the creation in our earthly system.

CHAPTER XII.
IN WHICH J.T. MASTON HEROICALLY CONTINUES TO BE SILENT.
According to a former story a gun was to be employed to throw the projectile from the earth to the moon; now the gun was to be employed to change the earth’s axis. The cannon, always the cannon; these gunners of the Gun Club had nothing else in their heads but the cannon. They had a real craze for the cannon. Was this brutal engine again threatening the universe? Yes, we are sorry to confess it, it was a cannon which was uppermost in the mind of President Barbicane and his associates. After the Columbiad of Florida, they had gone on to the monster cannon of the place “x.” We may almost hear them shout with a loud voice: “Take aim at the moon.” First act, “Fire.” “Change the axis of the earth.” Second act, “Fire.” And the wish which the whole world had for them was, “To hell.” Third act, “Fire.” And really their scheme justified the popular opinion.

As it was, the publication of this last report of the Committee in the newspapers produced an effect of which one can scarcely form an ideal. The operation to be tried by President Barbicane and Capt. Nicholl, it was very clear, was going to bring about one of the most disastrous interruptions in the daily routine of the earth. Everybody understood what the consequences of it would be. Therefore the experiment of Barbicane & Co. was generally cursed, denounced, etc. In the Old as well as in the New World the members of the N.P.P.A. had at the time only enemies. If there were indeed a few friends left to them among their cranky American admirers, they were very few.

Regarding only their personal security, President Barbicane and Capt. Nicholl had acted wisely in leaving Baltimore and America. It was safe to believe that some accident had happened to them. They could not without divine punishment threaten fourteen hundred million inhabitants by a change wrought in the habitability of the earth.

But how was it possible that the two leaders of the Gun Club had disappeared without leaving any trace behind them? How could they have sent away the material and assistants which were necessary to such an operation without any one seeing them? A hundred railroad cars, if it was by rail, a hundred vessels, if it was by water, would not have been more than sufficient to transport the loads of metal of coal, and of melimelonite. It was entirely incomprehensible how this departure could have been made incognito. However, it was done. And still more serious it appeared when it was known after inquiry that no orders had been sent to the gun foundries or powder factories, or the factories which produce chemical products in either of the two continents. How inexplicable all this was! Without doubt it would be explained some day.

At any rate, if President Barbicane and Capt. Nicholl, who had mysteriously disappeared, were sheltered from any immediate danger, their colleague, Mr. Maston, was under lock and key, and had to face all the public indignation. Nothing could make him yield, however. Deep at the bottom of the cell which he occupied in the prison of Baltimore, the Secretary of the Gun Club gave himself up more and more to thinking of those distant associates whom he was not able to follow. He pictured the vision of President Barbicane and his associate, Capt. Nicholl, preparing their gigantic operation at this unknown point of the globe, with nothing in their way. He saw them build their enormous device, combining their melimelonite, moulding the projectile which the sun would so soon count as one of its small satellites. This new star was to have the charming name “Scorbetta,” in gallant acknowledgment of the love and esteem felt towards the rich capitalist widow of New Park. J.T. Maston calculated the days which would elapse before the one on which the gun would be fired.

It was already the beginning of April. In two months and a half the meridian star, after having stopped on the Tropic of Cancer, would go back towards the Tropic of Capricorn. Three months later it would traverse the equatorial line at the Fall equinox.

And then these seasons, which have appeared annually for millions of years, and which have changed so regularly, will be brought to an end. For the last time in 189—the sphere would have submitted to this succession of days and nights. Truly, this was a magnificent work, superhuman, even divine. J.T. Maston forgot the Arctic region and the exploration of the coal mines around the pole, and he only saw, in his mind’s eye, the cosmographic consequences of the operation. The principal object of the association was now to make those changes and displacements which were to remodel the face of the earth.

But that was just the point. Did the earth wish to change her face at all? Was she not still young and charming with the one which God had given her at the first hour of her creation?

Alone and defenseless in his prison cell, nothing could induce Mr. Maston to speak about the matter, no matter what plan was tried. The members of the Inquiry Committee urged him daily to speak, and visited him daily, but they could obtain nothing. It was about this time that John Prestice had the idea of using an influence which might possibly succeed, and this was the aid of Mrs. Evangelina Scorbitt. Every one knew what feelings the generous widow entertained for Mr. Maston, how devoted she was to him, and what unlimited interest she had in this celebrated calculator. Therefore, after deliberation of the Committee, Mrs. Evangelina Scorbitt was authorized to come and go, visiting the prisoner as much as she liked.

Was she not threatened just as well as any other person on this earth by the recoil of this monster cannon? Would her palace at New Park be spared any more than the smallest hut of the Indian? Was not her very existence just as much in doubt as that of the savage living on the furthest isle of the Pacific Ocean? That is what the President of the
Inquiry Committee gave her to understand, and for this reason she was begged to use her influence with the mathematician. If he would consent to speak, and would say at what place President Barbicane and Capt. Nicholl were, and how many people they had with them to accomplish their ends, it would yet be time to go and stop them and put an end to their project, and thus save humanity from this most dangerous catastrophe which threatened the world.

Mrs. Evangelina Scorbitt was therefore admitted to the prison whenever she wished it. She was most desirous of seeing J.T. Maston again after he had been taken from his comfortable study at Ballistic Cottage by those rough police agents. If any impolite person had on the 9th of April put his ear at the door of his cell the first time when Mrs. Scorbitt entered he would have heard the following conversation:

"Ah, at last, my dear Maston, I see you again."
"You, Mrs. Scorbitt!"
"Yes, my dear friend, after four weeks—four long weeks of separation."
"Exactly twenty-eight days, five hours and forty-five minutes," answered J.T. Maston, after having consulted his watch.
"Finally we are reunited."
"But how did it happen that they allowed you to penetrate as far as this cell to see me, dear Mrs. Scorbitt?"
"Under the condition of using all my influence over you, thanks to my affection for you, in advising you to disclose the secret of the whereabouts of President Barbicane."
"What, Evangelina!" cried Mr. Maston, "and you have consented to give me such advice. You have entertained the thought that I could betray my associates."
"Me, dear Maston! Do you consider me so bad? Me! To sacrifice your security for your honor. Me! To persuade you to an act which would shame a life consecrated entirely to the highest speculations of pure mathematics."
"Bravo, Mrs. Scorbitt! I see in you once more the generous patron of our Society. No, I have never doubted your great heart."
"Thank you, Mr. Maston."
"In regard to myself," continued Maston, "allow me to say, before telling the point of the earth where our great shooting will take place—sell, so to speak, the secret which I have been able to keep so well, to allow these barbarians to fly and pursue our friends, to interrupt their works, which will make our profit and glory, I would rather die."
"Splendid, Mr. Maston!" cried Mrs. Evangelina Scorbitt.

And these two beings, united by the same enthusiasm, crazed by it if you will, one as well as the other, were well matched in understanding each other perfectly.

"No, they will never know the name of the country which my calculations have designated, and the reputation of which will become immortal," said J.T. Maston. "They can silence me if they like, but they will never have the secret from me."
"And they can kill me with you," said Mrs. Evangelina Scorbitt; "I will also be mute."
"It is lucky, dear Evangelina, that they are ignorant of your knowledge of the place."
"Do you believe that I would be capable of betraying it, because I am only a woman? Betray my associates and you! No, my friend, no. If they should raise the whole city and country against you—if the whole world would come to the door of this cell to take you away, I shall be there, too, and we will at least have one consolation—we will die together."

As if there could be any greater consolation and Mr. Maston could dream of a sweeter death than dying in the arms of Mrs. Evangelina Scorbitt! And so ended the conversation every time that this excellent woman visited the prisoner. And when the Inquiry Committee asked her what the result was, she would say: "Nothing as yet; perhaps with time I shall be able to reach my point."

Ah, women, women! What are women? "In time," she urged. But time went on with fast steps. Weeks went 'round like days, days like hours and hours like minutes.

It was already May. Mrs. Evangelina Scorbitt had not been able to get any information from J.T. Maston, and where she had failed there was no hope of any other person succeeding.

Was it, then, necessary to accept this terrible shock without interfering in any way? No, no! Under such circumstances resignation was impossible. The European delegates became more and more out of spirits. There was wrangling between them every day. Even Jacques Jansen woke up out of his Dutch placidity and annoyed his colleagues greatly by his daily charges and countercharges. Col. Boris Karkof even had a duel with the Secretary of the Inquiry Committee in which he only slightly injured his adversary. And Major Donellan; well, he neither fought with firearms nor with bare fists, quite contrary to English use, and he only looked on while his Secretary, Dean Toodrink, exchanged a few blows according to prize-ring rules with William S. Forster, the phlegmatic dealer in
codfish, the straw man of the N.P.P.A., who really knew absolutely nothing of the affair.

The whole world was leagued against the United States and wanted to hold the Americans responsible for the actions of one of their number—the celebrated Impey Barbicane. There was talk of recalling the ambassadors and the foreign Ministers at present accredited to this most reckless Government at Washington and of declaring war against the United States. Poor United States! It only wished to lay its hands on Barbicane & Co. In vain did the Republic reply to the Powers of Europe, Asia, Africa and Australia that they were at liberty to arrest these adventurous Americans wherever they found them. Nobody would listen patiently to such talk. And so, far away President Barbicane and his associate were occupied in preparing their great operation. As nothing could be found of them the foreign countries began to say: "You have their accomplice; now it is sure that Mr. Maston knows where these people are and what they are doing. Make him speak, this man, Mr. Maston. Why not use hot oil, melted lead, etc.? Why not use such means as were used formerly under circumstances less grave and for cases which only interested a few private people? But it was answered that, while such means were justified in former times, they could not be used at the end of a century as far advanced as the nineteenth century was. Therefore, J.T. Maston had nothing to fear in that line; all that was left to hope was that he would finally consider the enormity of his crime and decide to reveal his secret, or that some accident would reveal it for him.

CHAPTER XIII.

AT THE CLOSE OF WHICH J.T. MASTON UTTERS AN EPIGRAM.

Time went on, however, and very likely also the works of Barbicane and Capt. Nicholl who were going on also under these very surprising conditions, no one knew where.

How was it possible, it was asked, that an operation which required the establishment of a considerable iron foundry, the erection of high blast furnaces, capable of melting a mass of metal a million times as large as the marine corps cannon of 27 centimeters, and a projectile weighing 180,000 tons, all of which necessitated the employment of several thousand workmen, their transport, their management, etc.,—yes, how was it possible that such an operation could go on without the interested world getting any knowledge of it. In which part of the Old or New World had Barbicane & Co. secretly established a foothold so that no hint was given to people living in the vicinity? Was it on a deserted island in the Pacific Ocean or in the Indian Ocean? But there were no more deserted islands: the English had gobbled them all up. Perhaps the new Society had discovered one for this special purpose. Perhaps, one remarked, they might be in some part of the arctic regions. No, this could not be, as it was simply because they could not be reached that the N.P.P.A. was going to remove them. Therefore, to look for President Barbicane and Capt. Nicholl on one of these islands or in some inaccessible point was simply wasting time. Did not the notebook taken away from J.T. Maston state that the shooting would take place on or about the equator? And all the countries around it were inhabited by some people. It seemed impossible for them to be so secreted in any part of the habitable world without some one informing the committee at Baltimore.

Now, what did Alcide Pierdeux think of all this? He was dreaming of all kinds of consequences which this operation would have. That Capt. Nicholl had invented an explosive of such tremendous power, that he had found the melimelonite, with an expansive force three or four thousand times stronger than that of the most violent explosive known, and 5,600 times stronger than the good old black gunpowder of our ancestors, this was astonishing enough—very astonishing. But it was not impossible at all. One can hardly know what the future will bring in these days of progress when devices exist to destroy whole armies at very long distances. In any event, the change of the earth’s axis, produced by the recoil of a piece of ordnance, was not sufficiently novel to astonish the French engineer. Then, considering the plans of President Barbicane, he said: "It is evident that the earth receives daily the recoil of all the blows which are given on its surface. Hundreds of thousands of people amuse themselves daily by sending thousands of projectiles weighing a few kilograms or millions of projectiles weighing a few grammes, and even when I walk or jump, or when I stretch out my arm, all this takes place on the surface of our sphere and adds to or checks its motion. Is, then, your great machine of such a nature as to produce the recoil asked for? How in the name of candor can this recoil be sufficient to move the earth? And if the calculations of this fellow, J.T. Maston, prove it, it is easy enough to show it. Alcide Pierdeux could not but admire the ingenious calculations of the Secretary of the Gun Club, which were communicated by the members of the Inquiry Committee to those wise people who were able to understand them. And Alcide Pierdeux, who was able to read algebra like one would read a newspaper, found in this sort of reading matter an inexpressible charm. If these changes were to take place, what a terrible catastrophe it would be! Towns would be turned upside down, oceans would be thrown out of their beds, people killed by millions. It would be an earthquake of incomparable violence. If besides, said Alcide Pierdeux, this damnable powder of Capt. Nicholl were less strong, we might hope that the projectile would again strike the earth after the shooting, and after having made the trip around the globe, then everything would be replaced in a very short time and without having caused any very great destruction. But do not worry about that. Thanks to their melimelonite, the bullet will go its way and not return to the earth to beg her pardon for having deranged her by
putting her back again in her place. Pierdeux finally said: "If the place of shooting were known I would soon be able to say upon which places the movement would have the least and where the greatest effect. The people might be informed in time to save themselves before their cities and houses had fallen under the blow." But how were we to know it? "I think," he said, "the consequences of the shock may be more complicated than can even be imagined. The volcanoes, profiting by this occasion, would vomit like a person who is seasick. Perhaps a part of the ocean might fall into one of their craters. It would make small difference then. It is entirely possible that we might have explosions which would make our earth jump. Ah, this Satan Maston, imagine him juggling with our earthly globe and playing with it as if he were playing billiards!"

So talked and reasoned Alcide Pierdeux. Soon these terrible hypotheses were taken up and discussed by the newspapers. The confusion which would be the result of the scheme of Barbicane & Co. could only result in terrible accidents. And so it happened that the nearer the day came the greater the fright which took possession of the bravest people. It was the same as it was in the year 1000, when all living people supposed that they would be thrown suddenly into the jaws of death. It maybe recalled what happened at this period. According to the Apocalypse the people were led to believe that the judgment day had come. In the last year of the 10th century, says H. Martin, everything was interrupted—pleasures, business, interest, all, even the public works of the country. Thinking only of the eternity which was to begin on the morrow, provision was made only for the most necessary articles for one or two days. All possessions, real estate, castles, were bequeathed to the Church, so as to acquire protection in that kingdom of heaven where all were so soon to enter. Many donations to the churches were made with these words: "As the end of the world has come, and its ruin is imminent." When this fatal time came, all the people ran to the churches and places set apart for religious meetings, and waited to hear the seven trumpets of the seven angels of the judgment day sound and call from heaven. We know that the first day of 1,000 came and went, and nothing was changed. But this time it was not the question of a disturbance simply based upon some verse of the Bible. It was the question of removing the axis of the earth, and this was founded on very reliable calculations, and was very probable.

Under these conditions the situation of J.T. Maston became each day more and more critical. Mrs. Evangelina Scorbitt trembled lest he would become the victim of a universal cry for vengeance. Perhaps she even had in her mind the idea of making him give up the information which he so heroically held to himself. But she did not dare to mention it to him and she did well. It would have been unwise for her to expose herself to the volley of rebukes he would have given her. As we may well understand, fright had taken a strong foothold in the city of Baltimore and the inhabitants became nearly unmanageable. The excitement was increased by articles appearing in the daily papers. In any case, if J.T. Maston had been found among the crowd of people, his fate would have been soon settled. He would have been given to the wild beast. But he was content and said: "I am ready for it." No matter what happened, J.T. Maston refused to make known the situation of the "x," knowing very well that if he should unveil the secret President Barbicane and Capt. Nicholl would be unable to finish their work. It was an interesting struggle—this fight of one man against the whole world. It only made J.T. Maston a grander and better man in the eyes of Evangelina Scorbitt, and also in the opinion of his associates of the Gun Club. The Secretary of the Gun Club became such a celebrated person that he began to receive letters, as all criminals do, from people who wished to have a few lines from the hand which was going to turn the world over. But even if this was all very nice it became every day more and more dangerous for our Secretary. The population hung day and night around the prison, with great noise and great tumult. The enraged crowd wanted to lynch J.T. Maston. The police saw the moment would come when they would be unable to defend the prison and the prisoner J.T. Maston. Being desirous of giving satisfaction and information to the American people, as well as to the people of other countries, the Government at Washington decided to put J.T. Maston before a court of justice. "What other people have not been able to accomplish the Judges will not," said Alcide Pierdeux, who had after all a kind of a friendly feeling for the unhappy calculator.

On the morning of the 5th September the President of the Commission went personally to the cell of the prisoner. Mrs. Evangelina Scorbitt, at her own request, had been allowed to accompany him. Perhaps at this last attempt the influence of this excellent lady would succeed and bring the hoped-for result. There was nothing to be left undone. All means possible were to be used to make this last attempt successful. If it was not—well, we will see. "Yes, we will see." What we would see is the hanging of this brute Maston, said the people, and the event would have come off in all its horror if the people could have it their way. So it happened that at 11 o’clock J.T. Maston was ushered into the presence of Mrs. Evangelina Scorbitt and John Prestice, President of the Inquiry Committee.

The opening was a very simple one. The conversation consisted of the following questions and answers, very rapid on one side and very quiet on the other. And even under these circumstances the calm, quiet speaker was J.T. Maston.

"For the last time will you answer?" asked John Prestice.
"Answer what?" ironically observed the Secretary of the Gun Club.
"Answer the question, where is the place in which your associate, Barbicane, is at present."
"I have told it to you a hundred times."
"Repeat it for the one hundred and first time."
"He is where the shooting will take place."
"Where will the shooting take place?"
"Where my associate, Barbicane, is."
"Have a care, J.T. Maston."
"For what?"
"For the consequences of your refusal to answer, the result of which will be——"
"To prevent you from learning that which you should not know."
"What we have the right to know."
"That is not my opinion."
"We will bring you before the court."
"Go ahead."
"And the jury will condemn you."
"What care I."
"And as soon as judgment is rendered it will be executed."
"All right."
"Dear Maston," ventured Mrs. Evangelina Scorbitt, whose heart nearly broke on account of these terrible threats.
"What! You, madam?" said J.T. Maston. She hung her head and was silent.
"And do you want to know what this judgment will be?"
"If you wish to tell it," said J.T. Maston.
"That you will suffer capital punishment, as you deserve."
"Really?"
"That you will be hanged as sure, sir, as two and two make four."
"Then, sir, I have yet a chance," said J.T. Maston, reflectingly. "If you were a little better mathematician you would not say that two and two are four. You simply prove that all mathematicians have been fools until to-day in affirming that the sum of two numbers is equal to one of their parts; that is, two and two are exactly four."
"Sir!" cried the President, absolutely puzzled.
"Well," said J.T. Maston, "if you would say, as sure as one and one are two, all right. That is absolutely evident, because that is no longer a theorem; this is a definition."

After this lesson in simple arithmetic the President of the Committee went out, followed by Mrs. Evangelina Scorbitt, who had so much admiration for the calculator that she did not venture to look at him.

CHAPTER XIV.
VERY SHORT, BUT IN WHICH "X" TAKES A GEOGRAPHICAL VALUE.

Very luckily for J.T. Maston, the Federal Government received the following telegram sent by the American Consul stationed at Zanzibar:

"To John S. Wright, Minister of State, Washington, U.S.A.:
Zanzibar, Sept. 13, 5 A.M. (local time).—Great works are being executed in the Wamasai, south of the chain of Kilimanjaro. For eight months President Barbicane and Capt. Nicholl have been established there with a great number of black help under the authority of Sultan Bali-Bali. This is brought to the knowledge of the Government by its devoted
"RICHARD W. TRUST, Consul"

And this was how the secret of J.T. Maston became known. And therefore, were the Secretary of the Gun Club still in prison, he could not have been hanged.

But, after all, who knows whether he would not rather have been glad to meet with death in the full glory of his life than to live on with all the chances of disappointment.

CHAPTER XV.
WHICH CONTAINS A FEW INTERESTING DETAILS FOR THE INHABITANTS OF THE EARTHLY SPHERE.

Finally the Government of Washington had found out the place where Barbicane & Co. were operating. Should they doubt the authenticity of this cable? No, that was not reasonable. The Consul at Zanzibar was a very reliable person, and his information could be accepted without doubt. It was further corroborated by later telegrams. It was really in the center of the region of Kilimanjaro in the African Wamasai, a little under the equatorial line, where the
engineers of the N.P.P.A. were going to accomplish their gigantic works.

How could they have secretly reached this lost country, at the foot of the celebrated mountain, discovered in 1849 by Drs. Rebviani and Krapf, ascended by the travellers Otto Ehlers and Abbot? How were they able to establish their workshops there, erect a foundry and bring a large number of help, or at least enough to succeed? How had they been able to establish friendly relations with the dangerous tribes of the country and their sovereigns, as cunning as they were cruel? This we do not know. And perhaps it would never be known, as there were only a few days left before the 22d of September would arrive. J.T. Maston heard from Mrs. Evangelina Scorbitt that the mystery of Kilimanjaro had been unveiled by a telegram sent from Zanzibar. "Great Scott!" he exclaimed, sawing the air with his iron hand. "Well, we do not travel by telegram yet, nor by the telephone, and in six days the matter will be finished."

Those who saw and heard this remarkable man utter these words were astonished at the energy in the old gunner. J.T. Maston was right. There was no time left to send agents to Wamasai with orders to arrest President Barbicane. They would even have been too late had they departed from Algiers or Egypt, even from Aden, Madagascar, or Zanzibar, as they would have met thousands of difficulties in this mountainous region, and perhaps they would have met with an army composed of followers of the Sultan, who was interested in the matter. Therefore all hope of preventing this operation had to be given up. But if prevention was impossible nothing seemed more easy than the figuring out of the terrible consequences, as the exact situation of "x" was now known.

This problem was difficult enough, but all algebraists and mathematicians of large reputation ought to be able to solve it. As the cable of the Consul of Zanzibar had been sent direct to the Minister of State at Washington, the Federal Government wanted to keep it secret at first. They wished as well that its contents were published all over the country, so that they could indicate what the results would be of this displacement of the axis and the uprising of the oceans, and thus the inhabitants of the world might learn which place of refuge was open to them according to the section of the globe in which they lived. And it is easy to understand how anxious the people were to learn their fate.

On the 14th of September the cable dispatch was sent to the office of the Observatory at Washington, with orders to figure out the final consequences upon geographical locations. Two days afterwards the problem was all worked out. The Old World was notified of the results by cable and the New World by telegram. After this calculation had been published by thousands of papers, it was the only thing talked of in the great cities and everywhere. What will happen?

This was the question which everybody was asking at every point of the globe.

The following was the notice made by the Observatory at Washington:

IMPORTANT NOTICE

The operation which is being tried by President Barbicane and Capt. Nicholl is as follows:

The production of a recoil, on the 22d of September, at midnight, by means of a cannon a million times larger in volume than the cannon of twenty-seven centimetres, throwing a projectile of 180,000 tons, with a powder giving it a velocity of 2,800 kilometres.

Now, if this shooting takes place below the equatorial line, nearly on the thirty-fourth degree of latitude west of the meridian of Paris, at the foot of Kilimanjaro, and if it is directed towards the south, these are the mechanical effects which it will have on the earth’s sphere: Instantly, in consequence of the shock acting with the daily movement a new axis will be formed and, as the old axis will be displaced to the amount of twenty-three degrees and twenty-eight minutes, according to the figures obtained by J.T. Maston, the new axis will be perpendicular to the direction of the equinoctial.

Which point will the new axis start from? As the point of shooting is known, it has been easy to calculate this.

In the North the extremity of the new axis will be situated between Greenland and Grinnelland, exactly on that part of Baffin’s Sea where it cuts the Arctic polar circle. In the South it will be on the line of the antarctic circle, a few degrees east of Adelialand. Under these conditions a new zero meridian, starting from the new North Pole, will pass through Dublin in Ireland, Paris in France, Palermo in Sicily, the Gulf of Grand Sytre on the coast of Tripoli, Obed in Darfur, the mountain chain of Kilimanjaro, Madagascar; the Kerguelen Island, in the Central Pacific; the new antarctic pole, the antipodes of Paris, Cook Island, the Island of Quadra, Vancouver, on the margin of British Columbia; across North America to Melville Island, in the neighborhood of the North Pole.

In connection with this new axis of rotation, starting from Baffins’ Bay in the north, to Adelialand in the south, a new equator will be formed above which the sun will travel without ever changing his daily course. The equinocial line will cross the Kilimanjaro, at Wamasai, the Indian Ocean, Goa and Chicacola, a little below Calcutta in India, Mandalay in the Kingdom of Siam, Kesho in Tonquin, Hong Kong in China, Risa Island, Marshall Island, Gaspar Rico, Walker Island in the Pacific, the Cordilleras in the Argentine Republic, Rio de Janeiro in Brazil, the islands of Trinity and St. Helena in the Atlantic Ocean, St. Paul de Loando on the Congo, and finally it will meet again in the
territories of Wamasai, back of Kilimanjaro. This new equator being thus determined by the creation of the new axis, it became possible to calculate the changes of the ocean tides, which was so important for the security of the inhabitants of the earth. It is just to observe that the directors of the North Polar Practical Association had taken measure to weaken the shock as much as possible. If the shooting had been towards the north the consequences of it would have been much more disastrous for the more civilized parts of the earth. On the other hand, shooting towards the south the consequences would only be felt most in parts less populated and less civilized. The careful calculations made showed how the waters would be distributed when thrown out of their beds by the flattening of the sphere around the new poles. The globe would be divided by two great circles, intersecting in a right angle at Kilimanjaro, and at its antipodes in the equinoctial ocean. This would form four sections, two in the north and two in the south, separated by the lines upon which the ocean upheaval would be zero.

In the northern hemisphere: The first section west of Kilimanjaro would take in Africa from the Congo to Egypt, Europe from Turkey to Greenland, America from English Columbia to Peru, and from Brazil as high as San Salvador, and finally the whole northern Atlantic Ocean and the largest part of the temperate Atlantic zone.

The second section, east of Kilimanjaro, would include the greater part of Europe, from the Black Sea to Sweden, European and Asiatic Russia, Arabia, nearly the whole of India, Persia, Beloochistan, Afganistan, Turkestan, the Celestial Empire, Mongolia, Japan, Corea, the Black Sea, the Caspian Sea, the greater part of the Pacific Ocean, the territories of Alaska in North America, and also the polar region which belonged to the American society, North Polar Practical Association.

The southern hemisphere would embrace the third section east of Kilimanjaro, which would include Madagascar, the islands of Marion, Kerguelen, Maurice, Reunion, and all the islands of the Indian Ocean, the Antarctic Ocean (as far as the new pole), half the island of Malacca, Java, Sumatra, Borneo, the islands of Sonde, the Philippines, Australia, New Zealand, New Guinea, New Caledonia, all the northern parts of the Pacific and its numerous archipelagos, nearly up to the 160th meridian.

The fourth section, west of Kilimanjaro, would comprise the southern part of Africa, from the Congo to the canal of Mozambique to the Cape of Good Hope, the southern Atlantic Ocean from Pernambuco and Lima, Bolivia, Paraguay, Uruguay, the Argentine Republic, Patagonia, the Fire Islands, the Malouine Islands, Sandwich and Shetland Islands, and the southern part of the Pacific Ocean east of the present 160th degree of latitude.

These would be the four sections, separated by the line of zero in calculating the sea-level changes. Now, the question was to indicate the effects produced on the surface of the four sections in consequence of the displacement of the oceans.

Upon each of these sections there was a central point on which the effect would be at a maximum, either by the oceans rising up or by the waters retiring entirely. The calculations of J. T. Maston had established without a doubt, that at each of these maxima points the greatest height obtained would be 8,415 metres. It was therefore certain that the consequences would be most severe against the security of those points through the operation carried out by Barbicane & Co. The two effects may be considered separate in their action.

In two of the sections situated opposite each other in the northern hemisphere and in the southern as well, the oceans would retreat and invade the two other sections, opposing each other in each of the two hemispheres.

In the first section: The Atlantic Ocean would be nearly entirely emptied and the maximum point of depression being nearly at the region of Bermuda, where the ground would appear, if the depth of the ocean was inferior at that point to 8,415 metres. Consequently between Europe and America vast territories would be discovered which the United States, England, France, Spain, and Portugal could claim according to the geographical situation, as these powers might wish to do. It must be observed that in consequence of the falling of the oceans the air will also fall equally as much. Therefore the barometric pressure of Europe and that of America will be modified to such an extent that cities, situated even 20 or 30 degrees from the maxima points would only have the quantity of air which is now actually found in a height of one league in the atmosphere. The principal cities, such as New York, Philadelphia, Charleston, Panama, Lisbon, Madrid, Paris, London, Edinburgh, Dublin, Cairo, Constantinople, Danzig, Stockholm, on one side, and the cities corresponding in latitude on the other side, would keep their normal position with regard to the general level of the air. In regard to Bermuda, air would be missing there the same as it would be wanting to aeronauts who go higher than 8,000 metres. Therefore, it would be impossible to live there.

The same effect would obtain in the opposite section, which would contain the Indian Ocean, Australia, and a part of the Pacific Ocean, which would be thrown partly on the southern seacoasts of Australia.

The air into which they would be thrown would be very clear; there was no doubt on that point, but it would not be dense enough for human wants.

These in general were a part of the modifications which would take place in the two sections in which the oceans would be more or less emptied. There would undoubtedly appear new islands and mountains in such parts as the water did not entirely abandon.
But if the diminution of the thickness of the air did not bring enough inconveniences to those parts of the new
continents raised to the high zones of the atmosphere, what was to be the case of those parts which the eruption of
waters put below the surface? We may still breathe under the diminished pressure of air below the atmospheric
pressure. On the contrary, under a very few inches of water we cannot breathe at all, and this was the condition in
which the other two sections found themselves. In the section northwest of Kilimanjaro the maximum point would
be at Yakoutsk, in Siberia.

From this city submerged 8,415 metres under the water, less its present actual altitude, the liquid mass,
decreasing, would extend to the neutral lines, drowning the greater part of Asiatic Russia and of India, of China, of
Japan, and of American Alaska, to the Behring Sea. In regard to St. Petersburg and Moscow on one side, and
Calcutta, Bangkok, Saigon, Pekin, Hong Kong and Yeddo on the other side, these cities would disappear under a
cover of water sufficient to drown all Russians, Hindoos, Siamese, Cochin Chinese, Chinese and Japanese, if they
did not have time to emigrate before the catastrophe.

In the section southeast of Kilimanjaro the disasters would be equally marked. This section is in a great part
covered by the Atlantic and Pacific oceans, the level of which would raise 8,415 metres at the Archipelagos of the
Azores. All this vast area would disappear under this artificial deluge, among others the angle of Southern Africa
from Guinea and Kilimanjaro to the Cape of Good Hope, and the triangle of South America formed by Peru, Central
Brazil, Chili, and the Argentine Republic, as far as Terra del Fuego and Cape Horn. The Patagonians, high as they
are located, would not escape this immersion, and would not even have opportunity of taking refuge on that part of
the Andes, as the highest points of that range would not be visible at all in this part of the globe.

This, then, must be the result, the lowering of the upper and raising of the lower sections, and an entirely new
surface to the oceans, produced by the corruscations in the surface of the earth’s sphere. Such were the happenings
which would result, and against which the people of this world had no help if they could not promptly stop
Barbicane & Co. in their criminal attempt.

CHAPTER XVI.

IN WHICH A CROWD OF DISSATISFIED PEOPLE BREAK INTO THE CELL OF J. T. MASTON.

After this public notice there was nothing left but to wait for the coming danger or to run away to the neutral
lines, where there would be no danger. The threatened people were, in general, divided into two classes—"the
people who would be suffocated and those who would be drowned." This communication roused many different
suggestions, which, however, all turned into the strongest and most violent protestations against the schemer and
schemers. Among those who would suffocate were the Americans in the United States, the Europeans of France,
England, Spain, etc. Even the prospect of annexing territories now at the bottom of the ocean was not sufficient to
make them quietly accept these changes. Paris, carried towards the new pole a distance about equal to that which
separates it now from the old one, would gain nothing by it. It would have a continued Spring, it is true, but it would
lose considerable air. And this was not satisfactory to the Parisians, who like to have as much air as possible, and
boulevard property and cafés went begging. Among those who would be drowned were the inhabitants of South
America, of Australia, Canada, India, Zealand, etc. Great Britain would suffer the loss of her richest colonies, which
Barbicane & Co. would take away from her through their operation. Evidently the Gulf of Mexico would constitute
a vast kingdom of the Antilles, of which the Yankees and Mexicans could claim possession by the principles of the
Monroe doctrine. The islands of the Philippines, Celebes and the water around them would leave vast territories of
which the English and Spanish people could take possession. It is a vain compensation. It did not at all balance the
loss due to the terrible flood.

If under the new oceans only Samoyedens, Lapons of Siberia, Feugans, Patogonians—even Tartars, Chinese,
Japanese, or a few Argentines—would suffer and be lost, perhaps the civilized powers would have accepted this
sacrifice complacently. But too many powers took part in the great catastrophe not to raise a torrent of protest.

And what especially concerned Europe was, that although the central part of it would be nearly intact, it would
be raised in the west and lowered in the east, half suffocated on one side and half drowned on the other. This was not
very acceptable. The Mediterranean Sea would be almost emptied, and this would not be very agreeable to the
Frenchmen, Italians, Spaniards, Greeks, Turks, and Egyptians, who by their situation on the coast, had indisputable
rights in ocean travel. And then, what good would be the Suez Canal, which would be saved by its position on the
neutral line? But what use could be made of this immense work of Lesseps when there was no longer the
Mediterranean on one side of the isthmus and the Red Sea on the other, at least, within any reasonable distance of it?

No, never, never would England consent to see Gibralter, Malta, and Cyprus transformed into mountain-tops,
lost in the clouds, so that its men-of-war could no longer approach them. No, she would not be satisfied with the
possession of some of the territory which would be gained from the Atlantic Ocean. Major Donellan had, however,
prepared already to return to Europe to secure his rights on this new territory in case the operation of Barbicane &
Co. should succeed. It is seen how protests came from all parts of the world, even from States where the changes
These protestations became more and more violent after the arrival of the cablegram from Zanzibar which indicated the point of shooting, and which it was found necessary to publish the above report to explain. President Barbicane and Captain Nicholl as well as J.T. Maston, were put under the ban of humanity and declared outlaws. But what a business all this created for the newspapers. What sales they had, and how the circulations ran up; how on many occasions they were forced to print extra editions. It is perhaps the first time in journalistic history that they were all united with each other, as they generally quarrel incessantly. This was not a European or an American affair; it was an affair which concerned the whole world. It was like a bomb falling into a powder magazine.

In regard to Maston, it looked as if his last hour had come. A rabid crowd rushed into his prison on the evening of Sept. 17, with the intention of lynching him, and the jailer did not put any obstacles in their way. They rushed along the corridor but the cell of J.T. Maston was empty. Mrs. Evangelina Scorbitt had come to his help with a heavy purse of gold, and he had made his escape. The jailer had been bribed by an amount of money on which he could live the rest of his life without working. He remembered that Baltimore, Washington, New York, and many of the principal cities of America were on the line of those parts which would be raised, and which would still have enough air for the daily consumption of their inhabitants.

J.T. Maston had gained a quiet resting spot and a safe place from the enraged crowd of people, and so this great man owed his life to the devotion of a loving woman. There were only four days to wait, four days only before the gigantic operation of Barbicane & Co. would be accomplished. The public notice had been read far and wide and had created as much public excitement as such a momentous document only could. If there were at the beginning a few sceptics on the subject, there were none at present. The various governments had notified in haste those of their provinces which would be raised into the air and those, a much larger number, the territory of which would be overrun with water. In consequence of this advice sent by telegraph over the five continents of the world an emigration began such as had never been seen before. Every race was represented, white, black, brown, yellow, etc., in one chromatic procession. Unhappily, time was wanting for all to secure safety. The hours were now counted. A few months notice would be required for the Chinese to leave China, the Australians, Australia, the Siberians, Siberia. In some instances the danger was a local one as soon as the place of the shooting was known, so the fright became less general. Some provinces and even some States began to feel easy again. In a word, except in the regions directly threatened, there was only felt an apprehension of the terrible shock. And during all this time Alcide Pierdeux was saying to himself, "How in the wide world can President Barbicane make a cannon a million times larger than that of twenty-seven centimetres? This Maston, I would like very much to meet him—to have with him a talk upon this subject. This does not agree with anything sensible, it is too enormous and too improbable."

Be this as it may, the failure of the operation was the only hope which was left for certain parts of the world to escape more terrible destruction.

CHAPTER XVII.

WHAT HAD BEEN DONE AT KILIMANJARO DURING EIGHT MONTH OF THIS MEMORABLE YEAR.

The country of Wamasai is situated in the eastern part of Central Africa, between the coast of Zanzibar and the regions of the large lakes, where the Victoria Nyanza and the Tanganyika form a great interior ocean. The part best known is that which has been visited by the Englishman Johnston, Count Tekeli and the German doctor Meyer. This mountainous land is under the sovereignty of Sultan Bali-Bali, whose people consist of 30,000 or 40,000 Negroes.

Three degrees below the Equator is situated the chain of Kilimanjaro, which here reaches its greatest altitude. Among other peaks is the Mount of Kibo, with an altitude of 5,704 metres. The important ruler of this region has under his domination towards the south, north, and west the vast and fertile plains of Wamasai, which stretch from the lake of Victoria Nyanza across the province of Mozambique.

A few leagues below Kilimanjaro is the small village of Kisongo, the regular residence of the Sultan. This capital is in reality only a large hamlet. It is occupied by a very intelligent and industrious people, who work themselves as industriously as their slaves under the iron rule which Bali-Bali imposes on them.

This Sultan rightly ranked as one of the most remarkable rulers of those people of Central Africa who try to escape the influence, or more correctly the domination of England. At this capital of Kisongo, President Barbicane and Capt. Nicholl accompanied by six men who were devoted to them, arrived in the first week of January of the current year. On leaving the United States, whence their departure was only known to Mrs. Evangelina Scorbitt, and J. T. Maston, they had embarked in New York for the Cape of Good Hope, whence a vessel transported them to Zanzibar, on the island of the same name. There a bark secretly chartered by the Sultan brought them to the port of Mombas, on the African border on the other side of the channel. An escort sent by the Sultan waited for them at this port, and after a hard voyage nearly a hundred leagues across this terrible region, obstructed by forests, deep marshes, etc., they arrived at the royal residence. After knowing the calculations of J.T. Maston, President Barbicane had already put himself in communication with Bali-Bali through the help of a Swedish explorer, who had passed
Barbicane & Co. did not think of these difficulties. It was not a cannon, not even a mortar, which they intended to make, but simply a gallery bored in the massive rock of Kilimanjaro,—a shaft of a mine, if you wish to call it so. Barbicane & Co. had always entertained the idea of operating in this manner, and if the surface of this country was so rich in raw materials which they needed in a condition very easy to handle. A few months before leaving the United States President Barbicane had learnt from the Swedish explorer that at the foot of Kilimanjaro iron and coal were plentiful on the ground. No mines to dig into, no fields to explore a thousand feet deep in the earth’s shell. Iron and coal were so plentiful even for this great undertaking that they only had to stoop down to pick it up. In other words, there existed in the neighborhood of this mountain enormous fields of nitrate of soda and of iron pyrites, which were necessary for the manufacture of melimelonite. President Barbicane and Capt. Nicholl had taken with them only ten people, of whom they were absolutely sure, and no one else. These ten men had to supervise the 10,000 Negroes put at their disposal by Bali-Bali, and to them was given the task of manufacturing the monster cannon and its not less monster projectile. Two weeks after the arrival of President Barbicane and his associate at Wamasai three large workshops were established at the southern foot of Kilimanjaro, one for the cannon foundry, the second for the manufacture of the projectile, and the third for the manufacture of the melimelonite.

Now, first of all, how had Barbicane & Co. met the problem of manufacturing a cannon of such colossal dimensions? We will see and understand at the same time that the difficulty of creating such a device was not easily comprehensible by the inhabitants of the world. In reality the making of a cannon a million times larger than that of twenty-seven centimetres was a superhuman work. Already great difficulties had been met in the manufacture of pieces of forty-two centimetres long, which would throw projectiles of 780 kilos with 274 kilograms of powder. Barbicane & Co. did not think of these difficulties. It was not a cannon, not even a mortar, which they intended to make, but simply a gallery bored in the massive rock of Kilimanjaro,—a shaft of a mine, if you wish to call it so.

Evidently this shaft of a mine, this enormous elongated mine, could replace a metal cannon the fabrication of which would have been as dear as difficult and to which it would be necessary to give an unwieldy thickness to avoid all risk of an explosion. Barbicane & Co. had always entertained the idea of operating in this manner, and if the notebook of J. T. Maston mentioned a cannon it was that of 27 centimetres which had been used in the calculations as a basis. Consequently a spot was chosen at a height of a hundred feet on the southern slope of the mountain. Nothing would be in the way of the projectile when it would fly out of the mouth of this tunnel bored in the massive rock of Kilimanjaro. It was with extreme precision and not without very hard work that the men could dig this gallery. But Barbicane & Co. could readily make perforations with simple machines put in action by means of compressed air which was secured by using the powerful falls of water from the mountains. In the holes bored through the headings of the shaft were placed charges of melimelonite. And nothing more was necessary than this violent explosive to shiver the rock, extremely hard as it was.

The thousands of workmen, led by their ten co-operators under the general direction of Barbicane & Co., labored with a great deal of zeal and intelligence to bring the work to a speedy end. At the end of six months the shaft...
measured 27 metres in diameter and the lining of it 6 metres in thickness. As it was absolutely necessary that the projectile should glide through a bore perfectly smooth the interior of it was covered with a casting exactly prepared. In reality this part of the work was very similar to that of the celebrated Columbiad, of Moon City, which had sent the projectile to the moon. But such work as this is impossible to the ordinary engineers of this world at present.

As soon as the boring was finished the workmen pushed on with the work at the second workshop.

At the same time that this metallic lining was being made they were also employed at making the enormous projectile. For this operation it was necessary to obtain a cylindrical mass which would weigh 80,000,000 kilograms, or 180,000 tons. It must be understood that there was never any idea of melting this projectile in one single piece. It had to be manufactured in thousand-ton pieces, which would be hoisted one after the other into the shaft and put in place over the chamber where the melimelonite was stored. After having been jointed each to the other, these pieces would form a compact whole, which would fit the sides of the tubular lining. In regard to the construction of the massive furnaces to effect the melting of the metal, there was met perhaps the greatest difficulty. Ten furnaces of ten metres each in height were at the end of a month in working order and able to produce each 180 tons per day. This would be 1,800 tons for twenty-four hours—180,000 tons after 100 work-days.

In regard to the third workshop, made for the manufacture of the melimelonite, the work was easily done, but under such secret precautions, that the composition of this explosive it has not been possible to state perfectly. Everything went along splendidly. It could not have been possible to have met with more success in any factory. One would hardly expect to escape an accident of some sort on a three-hundred-thousand franc job. It is easily understood that the Sultan was delighted. He followed the operation with indefatigable interest. And the presence of His Majesty helped greatly to make these Negroes work as hard as possible. One day Bali-Bali asked what all these operations were going on for. He received his reply from President Barbicane: "It is a work," said he, "which will change the face of the earth—a work which will bring the greatest glory on the greatest Sultan of all the Eastern kings."

By the 29th of August the works were entirely finished.

The shaft was bored to the wished-for point. It was provided with a smooth bore of six metres diameter. At the bottom of the shaft were placed the 2,000 tons of melimelonite; then came the projectile 105 metres long. After deducting the space occupied by the powder and projectile there remained still 492 metres before the muzzle was reached, which secured all the effect possible by the recoil produced by the expansion of the gas.

Now, the first question which might come up was, would the projectile deviate from the trajectory assigned to it by the calculations of J.T. Maston? In no way, for the calculations were absolutely correct. They indicated to what extent the projectile would deviate to the east of the meridian of Kilimanjaro because of the rotation of the earth on its axis, and what would be the form of the curve which it would describe because of its enormous initial velocity. Secondly, would it be visible during its course? No, because in going out of the shaft it would be thrown in the shadow of the earth and it could not be seen, for in consequence of its low trajectory it would have a very sharp angle of velocity compared with the earth's course. In fact, Barbicane and Capt. Nicholl could well be proud of their work, which had so far succeeded in its every detail. Why was J.T. Maston not there to watch this great operation, founded on the figuring which he had done? And who was it that kept him so far away, so very far, when this terrible detonation would wake the echoes as far as the furthest horizon of Africa?

Thinking of him, his two associates did not know that the Secretary had been compelled to keep away from Ballistic Cottage after having got out of prison and hidden himself in a safe place away from the savage people. They did not know to what extent indignation had been roused against the engineer of the N. P. P. A. They did not know that they, too, would have been burnt or hanged and tortured to death if it had been possible to have reached them. Really, they ought to have been glad that at the moment when the shooting would take place they would only be saluted by the cries of this Negro people of Eastern Africa, "Well, at last!" said Capt. Nicholl to President Barbicane, when on the 22d of September they were standing before their finished work. "Yes, at last," said Impey Barbicane. "What a chance it was that placed at our disposition this admirable melimelonite!" said Capt. Nicholl. "Which will make you the most illustrious person on the earth, Nicholl." "Without doubt, Barbicane," modestly answered Capt. Nicholl. "But do you know how much it would have been necessary to dig out Kilimanjaro if we only had gun-cotton equal to that which threw our projectile to the moon?"

"How much, Nicholl?"
"One hundred and eighty galleries, Barbicane."
"Well, we would have digged them, Captain."
"And 180 projectiles of 180,000 tons."
"We would have melted them, Nicholl."

"It was useless to expect reasonable conversation between two persons of this type. But after they made the trip to the moon, what would they not be capable of? On the very same evening only a few hours before the minute
when the gun was to be fired, and while President Barbicane and Capt. Nicholl were congratulating themselves, Alcide Pierdeux, closeted in his studio at Baltimore, uttered a cry of hurrah! as if he were crazy.

Then, suddenly getting up from the table, which was covered with figures and calculations, he cried out:

"Ah! What a fool Maston is!—what a stupid fellow! His whole problem will go in the soup! Christopher Columbus! Why did I not see this before? If I only knew where he was at this moment I would invite him to have supper with me and to sip a glass of champagne at the very moment when they are going to fire off the gun."

And after these and many exclamations which he generally used in playing whist he said: "Oh, the old fool! Without a doubt he must have been dull when he made his calculations for this affair of Kilimanjaro. He will find it very necessary to make another. Oh, what a fool with his cannon!"

CHAPTER XVIII.

IN WHICH THE POPULATION OF WAMASAI ASSEMBLE TO HEAR PRESIDENT BARBICANE SAY "FIRE" TO CAPT. NICHOLL.

It was in the evening of the 22d of September, that memorable date which public opinion credited with an influence as unlucky as that of the 1st of January of the year 1000. Twelve hours after the sun had passed the meridian of Kilimanjaro, that is at midnight, Capt. Nicholl was to touch off the terrible cannon.

Kilimanjaro being 35 degrees east of the meridian of Paris, and Baltimore 79 degrees east of said meridian, there was a difference of 114 degrees between these two places, or 456 minutes in time, or 7 hours and 36 minutes. So the exact moment at which the shooting would take place would be 5 hours and 24 minutes post meridian in that great city of Maryland. The weather was magnificent. The sun had just gone down on the plains of Wamasai, behind a horizon of perfect purity. It was impossible to wish for a prettier night, one more calm or starry, in which to throw the projectile across space. Not a cloud would be mixed with the artificial vapors developed by the deflagration of the melimelonite.

Who knows, perhaps President Barbicane and Capt. Nicholl regretted that they were not able to get into the projectile. In the first second they would have travelled 2,800 kilometres. Sultan Bali-Bali, with the great personages of his court, that is, his Finance Ministers and his Ministers of Public Works, together with the Black Brigade, who had helped in the great work, were all assembled to watch the different steps of the shooting.

But, with great precaution, they had all taken a position three kilometres from the shaft bored in the Kilimanjaro, so that they would have nothing to fear from the concussion of the air.

Several thousand natives, deputed from Kisongo and neighboring States in the south of the province, by the orders of the Sultan, were present to witness this splendid spectacle. A wire was stretched, connecting an electric battery to the touch-hole of the shaft, ready to send the current and start the deflagration of the melimelonite. As a preliminary an excellent meal had been served at the table of the Sultan for his American guests and the persons of his court, all at the expense of Bali-Bali, who did everything very grandly as long as he was reimbursed by the members of the firm of Barbicane & Co.

It was 11 o'clock when this feast, commenced at 7:30, was finished, and at the end of it the Sultan proposed a toast to the engineers of the N. P. P. A. and to the success of their great enterprise. An hour yet, and the change in the geographical and climatic conditions of the earth would be accomplished.

President Barbicane, his associate, and his ten helpers took their places around the cannon, to the interior of which ran the wire of the electric battery. Barbicane with his chronometer in his hand counted the minutes, and never in his life did they seem so long to him. The minutes seemed not merely years but centuries. At ten minutes before midnight Capt. Nicholl and Barbicane approached the key which put the electric thread in communication with the shaft of Kilimanjaro. The Sultan, his court and the crowd of natives formed an immense circle around the cannon. It was important that the shooting should take place at the exact moment indicated in the calculations of J. T. Maston—that is, at the moment when the sun would cut that equinoctial line which it would never leave again in its apparent orbit around the earth. Five minutes to twelve, four minutes, three minutes, two minutes, one minute to twelve—

President Barbicane watched the hands of his chronometer, lighted by a lantern which was held by one of his helpers, while Capt. Nicholl, his finger on the button of the apparatus, was ready to connect the circuit of electricity.

Twenty seconds, ten seconds, five seconds, one second. Not the slightest tremor could be noted in the hand of the impassive Nicholl. His partner and himself were no more excited than, at the moment when they waited, sitting in the projectile, for the Columbiad to fire them to the regions of the moon.

"Fire," ordered President Barbicane.

At this moment Capt. Nicholl pressed the button. A terrible detonation followed, the echoes of which spread to the furthest corners of the province of Wamasai. A sharp whistle passed the crowd, a terrible rush of air, caused by the milliards of milliards of measures of gas, made by the instantaneous deflagrations of the 2,000 tons of melimelonite. It might be described as one of those meteors in which all the violence of nature is accumulated
sweeping across the earth. The effect could not have been more terrible if all the cannons of the whole globe had been joined together with all the thunderbolts of heaven and all had united in one grand report.

CHAPTER XIX.

IN WHICH J.T. MASTON REGRETS THAT THE CROWD DID NOT LYNCH HIM WHEN HE WAS IN PRISON.

The capitals of two worlds, the largest cities as well as the smaller ones, stood waiting terror-stricken. Thanks to the journals which had published the news broadcast over the world, every one knew the precise hour at which the shooting would take place and the local hour which corresponded with that of Kilimanjaro, situated 35 degrees east, allowing for the difference of longitude.

A few of the principal cities, the sun travelling a degree in four minutes were as follows:

At Paris, 9:40 P.M.
At St. Petersburg, 11:31 P.M.
At London, 9:30 P.M.
At Rome, 10:20 P.M.
At Madrid, 9:15 P.M.
At Berlin, 11:20 P.M.
At Constantinople, 11:26 P.M.
At Calcutta, 3:04 A.M.
At Nanking, 5:05 A.M.

At Baltimore, it was said, twelve hours after the passage of the sun of the meridian of Kilimanjaro, it was 5:24 P.M. It is impossible to describe the pangs which were produced at this moment. The most powerful of modern pens would be helpless at the task. The people of Baltimore stood fearing that they would be swept off the surface of the earth by the terrible mass of water which would fall on their city. They expected to see the Bay of Chesapeake empty itself upon them. Then, besides, the city, even should the waters not come upon it, would be terribly shaken up by the shock which would be produced. The monuments would be destroyed; its best quarters swallowed up at the bottom of the abysses which would open through the surface of the ground. These fears ran through the different parts of the globe which were not scheduled for submersion by the upheaval of the oceans.

Every human being felt the marrow in his bones creep and shake at this fearful moment.

Yes, all trembled, all save one person, and that one was the engineer Alcide Pierdeux. As he had not had time to make known to the public the discoveries which he had made by means of his last calculations, he drank a bumper of champagne to the health of both worlds in the café of one of the best known hotels. Just as the twenty-fourth minute after 5 o’clock, corresponding with midnight at Kilimanjaro, was reached—

At Baltimore, nothing.

Mr. John Milne, standing in his coal mine at Shamokui with a seismometer which he had arranged there, did not note the least abnormal movement in the earth’s shell in this part of the globe. In Baltimore the heavens were cloudy and it was impossible to note in the apparent movement of the stars any derangement which would have indicated the change in the earth’s axis.

What a night J.T. Maston passed in his place of safety which was unknown to all save Mrs. Evangelina Scorbitt! He was beside himself, this visionary engineer. He could not rest in his place of hiding. He seemed to have grown old in one day and looked sharply out to see if the daily course of the sun was modified. This would have been a certain proof of the success of his work. This change could not be seen even on the morning of the 23d of September, because at this date the star invariably rises in the east for all points of the globe. The next day the sun travelled over the horizon the same as it had always done.

The European delegates had assembled on the platform of their hotel. They had by their side instruments of extreme precision which would enable them to note if the sun took a course in the direction of the equator.

Well, nothing changed. A few minutes after the rising of the sun the great disc inclined away towards the Australian hemisphere. Nothing was changed in its apparent course.

Major Donellan and his associates saluted the heavenly torch with enthusiastic hurrahs, and gave it a reception like a favorite star in the theatre. The heavens were in superb condition, the horizon free from the vapors of the night, never did the great sun-god present a more beautiful aspect in such splendid condition before the astonished public. "And precisely at the place marked by the laws of astronomy," said Eric Baldenak.

"Yes by our old astronomy," said Boris Karkof, "and these fools pretended to destroy it."

"Well, they will have their expenses to pay and ridicule to endure besides," added Jacques Jansen, by whose voice Holland seemed to speak all alone.

"And the Arctic regions will eternally stay under the ice as they have discovered," said Prof. Jan Harald.
"Hurrah for the sun," said Major Donellan. "Such as it is, it has been and always will be sufficient for our earth."

"Hurrah, hurrah," repeated in single voice the representatives of old Europe. At this moment Dean Toodrink, who had not said anything so far, made this very cautious remark:

But perhaps they did not shoot yet.

"Not shoot yet," said the Major. "Heaven grant that they have fired off the cannon twice rather than once."

And that was exactly what J. T. Maston and Mrs. Evangelina Scorbitt were saying.

The wise and the ignorant were united this time by the logic of the situation. Even Alcide Pierdeux repeated it, and added: "Even if they did shoot, what is the difference? The earth will not stop waltzing on its old axis and turning as it used to do."

In fact no one knew what had happened at Kilimanjaro. But at the close of the day an answer came to the question which was engrossing the attention of mankind.

A cablegram arrived in the United States, and here is what this dispatch, sent by Richard W. Trust, Consul at Zanzibar, contained:

"Zanzibar, Sept. 23, 7:25 A.M. "To John S. Wright, Minister of State:

"The cannon was fired off yesterday evening at midnight exactly by the device bored in the southern part of Kilimanjaro. Passage of the projectile was accompanied with a powerful whirr and terrible detonation. Whole provinces destroyed by the concussion of the air. Ocean agitated as far as the Mozambique channel. A large number of vessels disabled and thrown on the coast. Towns and villages destroyed. Everything else is well. RICHARD W. TRUST."

Yes, everything else went on well. Nothing had been changed in the state of worldly affairs save the terrible disasters produced in Wamasai, which was partly deluged by the artificial waterspout, and the shipwrecks which were produced by the current of air. The same thing precisely happened when the Columbiad threw its projectile to the moon. The shock to the ground of Florida, was it not felt through a radius of 100 miles? Yes, certainly, but this time the effect should have been a hundred times stronger.

Whatever had happened the dispatch gave two pieces of information to the interested people of the old and new worlds.

First—That the enormous cannon had been erected in the flank of Kilimanjaro.

Second—That the gun had been fired at the fixed hour. And now, the whole world uttered an exclamation of intense satisfaction, followed by a great burst of laughter.

The trial which Barbicane & Co. had made had entirely failed. The calculations of J.T. Maston were good only for the waste basket. The N.P.P.A. could only announce its failure. But, perhaps, it might be that the secretary of the Gun Club had made a mistake in his calculations.

"Rather would I believe that I have been mistaken in the affection which I feel for him," said Mrs. Evangelina Scorbitt.

But beyond all, the most discontented human being was J.T. Maston. When he saw that nothing had been changed in the movement of the earth, that the conditions remained precisely the same as they were since the creation, he hoped that some accident had prevented the success of Barbicane & Co., and that his associates had met with some disaster.

But there was the cablegram from Zanzibar which stated without a doubt that the operation had taken place.

Failed! ! And what of the formulas and calculations on which he had spent so much time? Is it possible that a cylinder 600 metres long, 27 metres wide, throwing a projectile of 180,000 kilograms, with the deflagration of 200 tons of melimelonite, with an initial velocity of 2,800 kilometres, would not be sufficient to move the earthly axis? It did not seem probable.

But why?

So J.T. Maston, in a state of violent excitement, declared that he would quit his retreat. Mrs. Evangelina Scorbitt tried in vain to prevent it. Not that she feared for his life, as all danger of that sort had passed. But the insults which he would have to bear, the jokes which would be cracked about him, the remarks which would be made in regard to his work—she wanted to spare him from these. And then, moreover, what would his associates of the Gun Club say? Did they not have to thank this man for the want of success of their operation and for making them ridiculous? Was he not the man who had figured out the whole affair and on whose shoulders rested all the responsibility?

J.T. Maston would not listen to any one. He resisted the begging and tears of Mrs. Evangelina Scorbitt. He went out of the house where he had kept himself hiding. He was recognized, and those who had trembled for fear of the consequences of his work now took revenge by joking and laughing at him, and this in many thousand different ways. He was forced to listen to jeering remarks, even from the street gamins. "Ah," they shouted, "here he is who wanted to change the axis of the earth, who wanted to discover coal mines around the North Pole, who even wanted
to remove it." In short, the Secretary of the Gun Club was compelled to return to the mansion of Mrs. Evangelina Scorbitt, who used all her wealth of tenderness to console him. It was in vain, however. J.T. Maston could not be consoled, as his cannon had produced upon the earth’s sphere no more effect than a simple popgun would have done. A fortnight went by in this way, and the world resumed its daily routine and did not even think any longer of the projects of the N.P.P.A.

A fortnight and no news yet from President Barbicane and Capt. Nicholl. Had they perished by the discharge in the land of Wamasai? Had they sacrificed their lives in the most mysterious operation of modern times? No.

After the detonation both were overthrown along with the Sultan and his court, and a thousand natives in one grand tumble, but they all got up after a little time strong and hearty.

"Did you succeed?" asked Bali-Bali, rubbing his shoulder.
"Do you doubt it?"
"Me doubt it?"
"But when will you know?"
"In a few days," said Barbicane.

Did he appreciate that the operation had failed? Perhaps. But he never would have acknowledged it before the Sultan at Wamasai.

Forty-eight hours later the two partners had taken leave of Wamasai, not, however, before having paid an enormous sum for the damage done to the country. As this amount of money went into the private purse of the Sultan, and as his subjects did not receive one cent of it, he had no reason to complain of the operation.

Then the two associates, followed by their ten helpers, reached Zanzibar, where they found a vessel to take them to Suez. From there under false names the steamer Morris brought them to Marseilles; then they took the train to Paris, where they arrived without having had any collision or accident, and taking the railroad to Havre they arrived in time to go to America by the Bourgogne of the Transatlantic line. In twenty-two days they made the trip from Wamasai to New York, and on the 15th day of October the two knocked at the door of the mansion of New Park, at three minutes past noon. An instant afterwards they found themselves in the presence of Mrs. Evangelina Scorbitt and J. T. Maston.

CHAPTER XX.

IN WHICH THIS STORY, AS TRUTHFUL AS IT IS IMPROBABLE, IS FINISHED.

"Barbicane!!! Nicholl!!!"
"Maston."
"You."
"We."

And in this plural pronoun, uttered simultaneously by the two associates in a single voice, might be heard a flood of irony and reproaches.

J.T. Maston pressed his iron hook on his forehead. Then, with a voice which seemed to stick in his throat, he said:

"Did your shaft at Kilimanjaro really have a diameter of twenty-seven metres?"
"Yes, sir."
"Did your projectile really weigh 180,000,000 of kilograms?"
"Yes."
"And was the shooting really done with 2,000 pounds of melimelonite?"
"Yes."

This thrice-repeated "yes" fell on J. T. Maston like masses of stone on his head.
"Then I can only conclude"—said he.
"What?" asked President Barbicane.

"As follows," said J. T. Maston. "As the operation did not succeed, the powder did not give to the projectile an initial velocity of 2,800 kilometres."
"Really?" said Capt. Nicholl, with a tone of sarcasm.
"Yes, your melimelonite is good only to charge pistols of straw."
Capt. Nicholl sprang up at this remark, which was an outrageous insult to him.
"Maston!" said he.
"Nicholl!"
"You ought to be blown up with the melimelonite."
"No, gun cotton; that is more sure."

Mrs. Evangelina Scorbitt had to interfere and cool these two enraged gunners down.
"Gentlemen," said she, between associates.
"And anyhow," President Barbicane resumed, with a very calm expression, "what is the good of criminations? It is certain that the calculations of our friend, J. T. Maston, were correct, as it is certain that the explosive of our friend Nicholl had sufficient power. Yes, we have only employed known quantities of science. We lacked experience. Why did we fail? Perhaps we may never know."

"Well," said the Secretary of the Gun Club, "we will commence all over again." "And the money then which has been spent for this operation is a dead loss," observed Capt. Nicholl.

"But public opinion," said Evangelina Scorbitt, "would not allow you a second trial."

"What will become of our Arctic region?" said Capt. Nicholl. "Where will the stock of the N.P.P.A. fall to?" said President Barbicane. Well, it had already fallen so far that the stock was offered at the price of old paper.

This, then, was the result of the gigantic operation. This was the memorable fiasco to which the superhuman projects of Barbicane & Co. had led.

If ever engineers, unlucky engineers were laughed at in public, if ever the newspaper made drawings, songs, and paragraphs not at all flattering to the people mentioned in them, this occasion exceeded them all. President Barbicane, the Directors of the new Society and their associates of the Gun Club were universally sneered at. In every language they were made ridiculous, and to make it easier to the whole population of the world to read the scornful articles were printed in "Volapuk." In Europe, especially, all the remarks and songs to make the persons of the N.P.P.A. ridiculous were spread broadcast. The greatest hit was made by a Frenchman, who composed a ballad which was sung in every concert hall of France and America. But will we never know to what the failure of this enterprise was due? Did this failure prove that the operation was impossible of realization; that the powers at the disposal of mankind would never be sufficient to bring about a change in the earth's movement? Did it prove that the country around the North Pole would never be removed to those regions where the sun and heat would melt the ice without human help?

Information on this subject came a few days after the return of President Barbicane and Capt. Nicholl to the United States. A very simple paragraph appeared in the Times of the 17th of October. Here is the article:

"We all know that the result of the operation to create a new axis has been nothing. However, the calculations of J.T. Maston, founded on established facts, would have produced the desired result if through an unexplainable slip an error had not been embraced in them from the beginning. When the celebrated secretary of the Gun Club took for a basis of his calculations the circumference of the earth's sphere, he figured it at 40,000 metres in place of 40,000,000 metres, and to which the failing of the operation is due.

"Where could such an error come from? Who could have provoked it?... How could such a remarkable calculator commit such an error?

"It is certain that had the problem of the modification of the earth's axis been correctly figured, it would have had been exactly solved. But this forgetting of three zeros has made a change at the end of the calculation of twelve naughts.

"It is not a cannon one million times larger than that of twenty-seven centimetres, which was necessary. A trillion of these cannons throwing a trillion projectiles of 80,000 tons each would be necessary to displace the North Pole, admitting that the melimelonite had the expansive power which had been attributed to it by Capt. Nicholl.

"Therefore the whole shock under the conditions under which it was produced has displaced the North Pole only three-thousandths of a millimeter, and has only changed the level of the ocean at the most nine-thousandths of three-thousandths of a millimetre. In regard to the projectile fired, it will be a small planet, and will belong in future to the solar system, sustained by solar attraction.

ALCIDE PIERDEUX ".

So this want of attention on the part of J.T. Maston at the beginning of his calculations had produced such a humiliating result for his Company.

But even if his associates were very angry against him, if everybody laughed and joked at him, it is only fair to state in his favor that this mistake which had wrecked the operation had spared the world a terrible catastrophe.

A flood of telegrams and letters arrived from all parts of the world congratulating J.T. Maston on his mistake of three naughts. J.T. Maston, more downhearted and crushed than ever, would not listen to the hurrahs which the world now uttered for him. President Barbicane, Capt. Nicholl, Tom Hunter, with wooden legs; Col. Bloomsberry, the gay Bilsby, and his associates would never pardon him. But Mrs. Evangelina Scorbitt she could not be angry with him, most excellent lady.

J.T. Maston had begun to do his calculations over again, refusing to admit that he was wrong at that point.

He was, however; the Engineer Alcide Pierdeux had not made a mistake. Having learnt his error at the last moment, when he had no time to make it known, he had remained perfectly composed among all the fright and terror of those about him. That was why he proposed a toast in champagne at the moment when the shooting was taking place in the Old World. Yes, indeed, three naughts had been forgotten in the circumference of the earth.
Suddenly J.T. Maston remembered the whole matter.

It was at the beginning of his work when he had shut himself up in the "Ballistic Cottage," and written the number 40,000,000 on his blackboard. At that moment the electric bell began to ring with great force. J.T. Maston went to the phone. He exchanged a few words with Mrs. Evangelina Scorbitt. Suddenly a terrible stroke of lightning from the storm through the telephone knocked over his blackboard and himself. He got up, commenced to write over again the numbers which had been half rubbed out on his blackboard. He had just written the numbers 40,000 when the telephone rang for the second time. He went again to listen to Mme. Scorbitt, and when he did begin his work he forgot to put on the last three naughts of the earth’s circumference.

It was the fault of Mrs. Evangelina Scorbitt. If she had not interrupted him he would not have been thrown on the floor by the shock from the telephone. He would not have noticed anything of lightning and thunder, and all his mass of figures and calculations would not have ended in a mistake.

What a terrible blow it was to this unhappy lady when J.T. Maston was compelled to tell her the circumstances which had produced the mistake! Yes, she was the cause of the disaster. It was on her account that J.T. Maston found himself dishonored through the long years which he had yet to live, as nearly every member of the Gun Club usually lived to the age of a hundred years.

After this conversation at New Park, J. T. Maston had gone away from the mansion. He went back to his Ballistic Cottage and walked into his study muttering to himself: "Well, now I am not good for anything any more in this world."

"Not even good enough to get married," said a broken voice at his elbow.

It was that of Mrs. Evangelina Scorbitt. Absolutely crushed and heart-broken, she had followed him.

"Dear Maston"—she began.

"Well, yes," said he, "but only under one condition—that I shall never make any mathematical calculations."

"My dear friend, I have a horror of them," answered the excellent widow.

Thus it happened that the Secretary of the Gun Club made Mrs. Evangelina Scorbitt Mrs. J. T. Maston.

In regard to the article of Alcide Pierdeux, we might say that it brought him into great celebrity and reputation. It was translated into all languages, printed in every paper, and thus his name became known all over the world.

The father of his old sweetheart had refused him his daughter's hand, after telling him that he could not give him his daughter, as he was too smart. But now, after having read this article and being unable to understand it without any help, he began to feel sorry and know better. He sent him an invitation to dine with him and his daughter.

CHAPTER XXI.

VERY SHORT, SINCE ENOUGH HAS BEEN SAID TO MAKE THE WORLD'S POPULATION FEEL PERFECTLY SURE AGAIN.

And now the inhabitants of the world could again be perfectly easy. President Barbicane and Capt. Nicholl will not again begin that enterprise so woefully miscarried, J.T. Maston will not again figure out any calculations, however free from mistakes. The article of Alcide Pierdeux has told the truth. What the law of mechanics proves to us is that to produce a displacement of the axis of 23 degrees and 28 minutes, even with the melimelonite, a trillion cannons similar to the one which had been bored into the cliff of Kilimanjaro would be necessary. But our whole sphere, bored over its whole surface, is too small to accommodate them. Therefore the inhabitants of the earth may sleep in peace. To modify the conditions in which the earth is moving is beyond the efforts of humanity. It is not meet that mere humanity should change anything in the order established by our Creator in the system of the universe.

END OF THE VOYAGE EXTRAORDINAIRE

IN THE YEAR 2889

By Jules Verne

Little though they seem to think of it, the people of this twenty-ninth century live continually in fairyland. Surfeited as they are with marvels, they are indifferent in presence of each new marvel. To them all seems natural. Could they but duly appreciate the refinements of civilization in our day; could they but compare the present with the past, and so better comprehend the advance we have made! How much fairer they would find our modern towns, with populations amounting sometimes to 10,000,000 souls; their streets 300 feet wide, their houses 1000 feet in height; with a temperature the same in all seasons; with their lines of aërial locomotion crossing the sky in every direction! If they would but picture to themselves the state of things that once existed, when through muddy streets rumbling boxes on wheels, drawn by horses—yes, by horses!—were the only means of conveyance. Think of the railroads of the olden time, and you will be able to appreciate the pneumatic tubes through which to-day one travels
at the rate of 1000 miles an hour. Would not our contemporaries prize the telephone and the telephote more highly if they had not forgotten the telegraph?

Singularly enough, all these transformations rest upon principles which were perfectly familiar to our remote ancestors, but which they disregarded. Heat, for instance, is as ancient as man himself; electricity was known 3000 years ago, and steam 1100 years ago. Nay, so early as ten centuries ago it was known that the differences between the several chemical and physical forces depend on the mode of vibration of the etheric particles, which is for each specifically different. When at last the kinship of all these forces was discovered, it is simply astounding that 500 years should still have to elapse before men could analyze and describe the several modes of vibration that constitute these differences. Above all, it is singular that the mode of reproducing these forces directly from one another, and of reproducing one without the others, should have remained undiscovered till less than a hundred years ago. Nevertheless, such was the course of events, for it was not till the year 2792 that the famous Oswald Nier made this great discovery.

Truly was he a great benefactor of the human race. His admirable discovery led to many another. Hence is sprung a pleiad of inventors, its brightest star being our great Joseph Jackson. To Jackson we are indebted for those wonderful instruments the new accumulators. Some of these absorb and condense the living force contained in the sun's rays; others, the electricity stored in our globe; others again, the energy coming from whatever source, as a waterfall, a stream, the winds, etc. He, too, it was that invented the transformer, a more wonderful contrivance still, which takes the living force from the accumulator, and, on the simple pressure of a button, gives it back to space in whatever form may be desired, whether as heat, light, electricity, or mechanical force, after having first obtained from it the work required. From the day when these two instruments were contrived is to be dated the era of true progress. They have put into the hands of man a power that is almost infinite. As for their applications, they are numberless. Mitigating the rigors of winter, by giving back to the atmosphere the surplus heat stored up during the summer, they have revolutionized agriculture. By supplying motive power for aërial navigation, they have given to commerce a mighty impetus. To them we are indebted for the continuous production of electricity without batteries or dynamos, of light without combustion or incandescence, and for an unfailing supply of mechanical energy for all the needs of industry.

Yes, all these wonders have been wrought by the accumulator and the transformer. And can we not to them also trace, indirectly, this latest wonder of all, the great "Earth Chronicle" building in 253d Avenue, which was dedicated the other day? If George Washington Smith, the founder of the Manhattan "Chronicle", should come back to life tomorrow, what would he think were he to be told that this palace of marble and gold belongs to his remote descendant, Fritz Napoleon Smith, who, after thirty generations have come and gone, is owner of the same newspaper which his ancestor established!

For George Washington Smith's newspaper has lived generation after generation, now passing out of the family, anon coming back to it. When, 200 years ago, the political center of the United States was transferred from Washington to Centropolis, the newspaper followed the government and assumed the name of Earth Chronicle. Unfortunately, it was unable to maintain itself at the high level of its name. Pressed on all sides by rival journals of a more modern type, it was continually in danger of collapse. Twenty years ago its subscription list contained but a few hundred thousand names, and then Mr. Fritz Napoleon Smith bought it for a mere trifle, and originated telephonic journalism.

Every one is familiar with Fritz Napoleon Smith's system—a system made possible by the enormous development of telephony during the last hundred years. Instead of being printed, the Earth Chronicle is every morning spoken to subscribers, who, in interesting conversations with reporters, statesmen, and scientists, learn the news of the day. Furthermore, each subscriber owns a phonograph, and to this instrument he leaves the task of gathering the news whenever he happens not to be in a mood to listen directly himself. As for purchasers of single copies, they can at a very trifling cost learn all that is in the paper of the day at any of the innumerable phonographs set up nearly everywhere.

Fritz Napoleon Smith's innovation galvanized the old newspaper. In the course of a few years the number of subscribers grew to 80,000,000, and Smith's wealth went on growing, till now it reaches the almost unimaginable figure of $10,000,000,000. This lucky hit has enabled him to erect his new building, a vast edifice with four façades each 3,250 feet in length, over which proudly floats the hundred-starred flag of the Union. Thanks to the same lucky hit, he is to-day king of newspaperdom; indeed, he would be king of all the Americans, too, if Americans could ever accept a king. You do not believe it? Well, then, look at the plenipotentiaries of all nations and our own ministers themselves crowding about his door, entreating his counsels, begging for his approbation, imploring the aid of his all-powerful organ. Reckon up the number of scientists and artists that he supports, of inventors that he has under his pay.

Yes, a king is he. And in truth his is a royalty full of burdens. His labors are incessant, and there is no doubt at
all that in earlier times any man would have succumbed under the overpowering stress of the toil which Mr. Smith has to perform. Very fortunately for him, thanks to the progress of hygiene, which, abating all the old sources of unhealthfulness, has lifted the mean of human life from 37 up to 52 years, men have stronger constitutions now than heretofore. The discovery of nutritive air is still in the future, but in the meantime men today consume food that is compounded and prepared according to scientific principles, and they breathe an atmosphere freed from the micro-organisms that formerly used to swarm in it; hence they live longer than their forefathers and know nothing of the innumerable diseases of olden times.

Nevertheless, and notwithstanding these considerations, Fritz Napoleon Smith's mode of life may well astonish one. His iron constitution is taxed to the utmost by the heavy strain that is put upon it. Vain the attempt to estimate the amount of labor he undergoes; an example alone can give an idea of it. Let us then go about with him for one day as he attends to his multifarious concerns. What day? That matters little; it is the same every day. Let us then take at random September 25th of this present year 2889.

This morning Mr. Fritz Napoleon Smith awoke in very bad humor. His wife having left for France eight days ago, he was feeling disconsolate. Incredible though it seems, in all the ten years since their marriage, this is the first time that Mrs. Edith Smith, the professional beauty, has been so long absent from home; two or three days usually suffice for her frequent trips to Europe. The first thing that Mr. Smith does is to connect his phonotelephote, the wires of which communicate with his Paris mansion. The telephote! Here is another of the great triumphs of science in our time. The transmission of speech is an old story; the transmission of images by means of sensitive mirrors connected by wires is a thing but of yesterday. A valuable invention indeed, and Mr. Smith this morning was not niggard of blessings for the inventor, when by its aid he was able distinctly to see his wife notwithstanding the distance that separated him from her. Mrs. Smith, weary after the ball or the visit to the theater the preceding night, is still abed, though it is near noontide at Paris. She is asleep, her head sunk in the lace-covered pillows. What? She stirs? Her lips move. She is dreaming perhaps? Yes, dreaming. She is talking, pronouncing a name his name—Fritz! The delightful vision gave a happier turn to Mr. Smith's thoughts. And now, at the call of imperative duty, light-hearted he springs from his bed and enters his mechanical dresser.

Two minutes later the machine deposited him all dressed at the threshold of his office. The round of journalistic work was now begun. First he enters the hall of the novel-writers, a vast apartment crowned with an enormous transparent cupola. In one corner is a telephone, through which a hundred Earth Chronicle _littérateurs_ in turn recount to the public in daily installments a hundred novels. Addressing one of these authors who was waiting his turn, "Capital! Capital! my dear fellow," said he, "your last story. The scene where the village maid discusses interesting philosophical problems with her lover shows your very acute power of observation. Never have the ways of country folk been better portrayed. Keep on, my dear Archibald, keep on! Since yesterday, thanks to you, there is a gain of 5000 subscribers."

"Mr. John Last," he began again, turning to a new arrival, "I am not so well pleased with your work. Your story is not a picture of life; it lacks the elements of truth. And why? Simply because you run straight on to the end; because you do not analyze. Your heroes do this thing or that from this or that motive, which you assign without ever a thought of dissecting their mental and moral natures. Our feelings, you must remember, are far more complex than all that. In real life every act is the resultant of a hundred thoughts that come and go, and these you must study, each by itself, if you would create a living character. 'But,' you will say, 'in order to note these fleeting thoughts one must know them, must be able to follow them in their capricious meanderings.' Why, any child can do that, as you know. You have simply to make use of hypnotism, electrical or human, which gives one a two-fold being, setting free the witness-personality so that it may see, understand, and remember the reasons which determine the personality that acts. Just study yourself as you live from day to day, my dear Last. Imitate your associate whom I was complimenting a moment ago. Let yourself be hypnotized. What's that? You have tried it already? Not sufficiently, then, not sufficiently!"

Mr. Smith continues his round and enters the reporters' hall. Here 1500 reporters, in their respective places, facing an equal number of telephones, are communicating to the subscribers the news of the world as gathered during the night. The organization of this matchless service has often been described. Besides his telephone, each reporter, as the reader is aware, has in front of him a set of commutators, which enable him to communicate with any desired telephotic line. Thus the subscribers not only hear the news but see the occurrences. When an incident is described that is already past, photographs of its main features are transmitted with the narrative. And there is no confusion withal. The reporters' items, just like the different stories and all the other component parts of the journal, are classified automatically according to an ingenious system, and reach the hearer in due succession. Furthermore, the hearers are free to listen only to what specially concerns them. They may at pleasure give attention to one editor and refuse it to another.

Mr. Smith next addresses one of the ten reporters in the astronomical department—a department still in the
embryonic stage, but which will yet play an important part in journalism.

"Well, Cash, what's the news?"

"We have phototelegrams from Mercury, Venus, and Mars."

"Are those from Mars of any interest?"

"Yes, indeed. There is a revolution in the Central Empire."

"And what of Jupiter?" asked Mr. Smith.

"Nothing as yet. We cannot quite understand their signals. Perhaps ours do not reach them."

"That's bad," exclaimed Mr. Smith, as he hurried away, not in the best of humor, toward the hall of the scientific editors.

With their heads bent down over their electric computers, thirty scientific men were absorbed in transcendental calculations. The coming of Mr. Smith was like the falling of a bomb among them.

"Well, gentlemen, what is this I hear? No answer from Jupiter? Is it always to be thus? Come, Cooley, you have been at work now twenty years on this problem, and yet--"

"True enough," replied the man addressed. "Our science of optics is still very defective, and though our mile-and-three-quarter telescopes."

"Listen to that, Peer," broke in Mr. Smith, turning to a second scientist. "Optical science defective! Optical science is your specialty. But," he continued, again addressing William Cooley, "failing with Jupiter, are we getting any results from the moon?"

"The case is no better there."

"This time you do not lay the blame on the science of optics. The moon is immeasurably less distant than Mars, yet with Mars our communication is fully established. I presume you will not say that you lack telescopes?"

"Telescopes? O no, the trouble here is about inhabitants!"

"That's it," added Peer.

"So, then, the moon is positively uninhabited?" asked Mr. Smith.

"At least," answered Cooley, "on the face which she presents to us. As for the opposite side, who knows?"

"Ah, the opposite side! You think, then," remarked Mr. Smith, musingly, "that if one could but--"

"Could what?"

"Why, turn the moon about-face."

"Ah, there's something in that," cried the two men at once. And indeed, so confident was their air, they seemed to have no doubt as to the possibility of success in such an undertaking.

"Meanwhile," asked Mr. Smith, after a moment's silence, "have you no news of interest to-day?"

"Indeed we have," answered Cooley. "The elements of Olympus are definitively settled. That great planet gravitates beyond Neptune at the mean distance of 11,400,799,642 miles from the sun, and to traverse its vast orbit takes 1311 years, 294 days, 12 hours, 43 minutes, 9 seconds."

"Why didn't you tell me that sooner?" cried Mr. Smith. "Now inform the reporters of this straightaway. You know how eager is the curiosity of the public with regard to these astronomical questions. That news must go into to-day's issue."

Then, the two men bowing to him, Mr. Smith passed into the next hall, an enormous gallery upward of 3200 feet in length, devoted to atmospheric advertising. Every one has noticed those enormous advertisements reflected from the clouds, so large that they may be seen by the populations of whole cities or even of entire countries. This, too, is one of Mr. Fritz Napoleon Smith's ideas, and in the Earth Chronicle building a thousand projectors are constantly engaged in displaying upon the clouds these mammoth advertisements.

When Mr. Smith to-day entered the sky-advertising department, he found the operators sitting with folded arms at their motionless projectors, and inquired as to the cause of their inaction. In response, the man addressed simply pointed to the sky, which was of a pure blue. "Yes," muttered Mr. Smith, "a cloudless sky! That's too bad, but what's to be done? Shall we produce rain? That we might do, but is it of any use? What we need is clouds, not rain. Go," said he, addressing the head engineer, "go see Mr. Samuel Mark, of the meteorological division of the scientific department, and tell him for me to go to work in earnest on the question of artificial clouds. It will never do for us to be always thus at the mercy of cloudless skies!"

Mr. Smith's daily tour through the several departments of his newspaper is now finished. Next, from the advertisement hall he passes to the reception chamber, where the ambassadors accredited to the American government are awaiting him, desirous of having a word of counsel or advice from the all-powerful editor. A discussion was going on when he entered. "Your Excellency will pardon me," the French Ambassador was saying to the Russian, "but I see nothing in the map of Europe that requires change. 'The North for the Slavs?' Why, yes, of course; but the South for the Matins. Our common frontier, the Rhine, it seems to me, serves very well. Besides, my government, as you must know, will firmly oppose every movement, not only against Paris, our capital, or our two
great prefectures, Rome and Madrid, but also against the kingdom of Jerusalem, the dominion of Saint Peter, of which France means to be the trusty defender."

"Well said!" exclaimed Mr. Smith. "How is it," he asked, turning to the Russian ambassador, "that you Russians are not content with your vast empire, the most extensive in the world, stretching from the banks of the Rhine to the Celestial Mountains and the Kara-Korum, whose shores are washed by the Frozen Ocean, the Atlantic, the Mediterranean, and the Indian Ocean? Then, what is the use of threats? Is war possible in view of modern inventions—asphyxiating shells capable of being projected a distance of 60 miles, an electric spark of 90 miles, that can at one stroke annihilate a battalion; to say nothing of the plague, the cholera, the yellow fever, that the belligerents might spread among their antagonists mutually, and which would in a few days destroy the greatest armies?"

"True," answered the Russian; "but can we do all that we wish? As for us Russians, pressed on our eastern frontier by the Chinese, we must at any cost put forth our strength for an effort toward the west."

"O, is that all? In that case," said Mr. Smith, "the thing can be arranged. I will speak to the Secretary of State about it. The attention of the Chinese government shall be called to the matter. This is not the first time that the Chinese have bothered us."

"Under these conditions, of course—" And the Russian ambassador declared himself satisfied.

"Ah, Sir John, what can I do for you?" asked Mr. Smith as he turned to the representative of the people of Great Britain, who till now had remained silent.

"A great deal," was the reply. "If the Earth Chronicle would but open a campaign on our behalf—"

"And for what object?"

"Simply for the annulment of the Act of Congress annexing to the United States the British islands."

Though, by a just turn-about of things here below, Great Britain has become a colony of the United States, the English are not yet reconciled to the situation. At regular intervals they are ever addressing to the American government vain complaints.

"A campaign against the annexation that has been an accomplished fact for 150 years!" exclaimed Mr. Smith. "How can your people suppose that I would do anything so unpatriotic?"

"We at home think that your people must now be sated. The Monroe doctrine is fully applied; the whole of America belongs to the Americans. What more do you want? Besides, we will pay for what we ask."

"Indeed!" answered Mr. Smith, without manifesting the slightest irritation. "Well, you English will ever be the same. No, no, Sir John, do not count on me for help. Give up our fairest province, Britain? Why not ask France generously to renounce possession of Africa, that magnificent colony the complete conquest of which cost her the labor of 800 years? You will be well received!"

"You decline! All is over then!" murmured the British agent sadly. "The United Kingdom falls to the share of the Americans; the Indies to that of—"

"The Russians," said Mr. Smith, completing the sentence.

"Australia—"

"Has an independent government."

"Then nothing at all remains for us!" sighed Sir John, downcast.

"Nothing?" asked Mr. Smith, laughing. "Well, now, there's Gibraltar!"

With this sally, the audience ended. The clock was striking twelve, the hour of breakfast. Mr. Smith returns to his chamber. Where the bed stood in the morning a table all spread comes up through the floor. For Mr. Smith, being above all a practical man; has reduced the problem of existence to its simplest terms. For him, instead of the endless suites of apartments of the olden time, one room fitted with ingenious mechanical contrivances is enough. Here he sleeps, takes his meals, in short, lives.

He seats himself. In the mirror of the phonotelephote is seen the same chamber at Paris which appeared in it this morning. A table furnished forth is likewise in readiness here, for notwithstanding the difference of hours, Mr. Smith and his wife have arranged to take their meals simultaneously. It is delightful thus to take breakfast _tête-a-tête_ with one who is 3000 miles or so away. Just now, Mrs. Smith's chamber has no occupant.

"She is late! Woman's punctuality! Progress everywhere except there!" muttered Mr. Smith as he turned the tap for the first dish. For like all wealthy folk in our day, Mr. Smith has done away with the domestic kitchen and is a subscriber to the Grand Alimentation Company, which sends through a great network of tubes to subscribers' residences all sorts of dishes, as a varied assortment is always in readiness. A subscription costs money, to be sure, but the _cuisine_ is of the best, and the system has this advantage, that it, does away with the pestering race of the _cordons-bleus_. Mr. Smith received and ate, all alone, the _hors-d'oeuvre, entrées, rôti_ and _legumes_ that constituted the repast. He was just finishing the dessert when Mrs. Smith appeared in the mirror of the telephote.

"Why, where have you been?" asked Mr. Smith through the telephone.
"What! You are already at the dessert? Then I am late," she exclaimed, with a winsome naïveté. "Where have I been, you ask? Why, at my dress-maker's. The hats are just lovely this season! I suppose I forgot to note the time, and so am a little late."

"Yes, a little," growled Mr. Smith; "so little that I have already quite finished breakfast. Excuse me if I leave you now, but I must be going."

"O certainly, my dear; good-by till evening."

Smith stepped into his air-coach, which was in waiting for him at a window. "Where do you wish to go, sir?"

"Let me see; I have three hours," Mr. Smith mused. "Jack, take me to my accumulator works at Niagara."

For Mr. Smith has obtained a lease of the great falls of Niagara. For ages the energy developed by the falls went unutilized. Smith, applying Jackson's invention, now collects this energy, and lets or sells it. His visit to the works took more time than he had anticipated. It was four o'clock when he returned home, just in time for the daily audience which he grants to callers.

One readily understands how a man situated as Smith is must be beset with requests of all kinds. Now it is an inventor needing capital; again it is some visionary who comes to advocate a brilliant scheme which must surely yield millions of profit. A choice has to be made between these projects, rejecting the worthless, examining the questionable ones, accepting the meritorious. To this work Mr. Smith devotes every day two full hours.

The callers were fewer to-day than usual--only twelve of them. Of these, eight had only impracticable schemes to propose. In fact, one of them wanted to revive painting, an art fallen into desuetude owing to the progress made in color-photography. Another, a physician, boasted that he had discovered a cure for nasal catarrh! These impracticables were dismissed in short order. Of the four projects favorably received, the first was that of a young man whose broad forehead betokened his intellectual power.

"Sir, I am a chemist," he began, "and as such I come to you."

"Well!"

"Once the elementary bodies," said the young chemist, "were held to be sixty-two in number; a hundred years ago they were reduced to ten; now only three remain irresolvable, as you are aware."

"Yes, yes."

"Well, sir, these also I will show to be composite. In a few months, a few weeks, I shall have succeeded in solving the problem. Indeed, it may take only a few days."

"And then?"

"Then, sir, I shall simply have determined the absolute. All I want is money enough to carry my research to a successful issue."

"Very well," said Mr. Smith. "And what will be the practical outcome of your discovery?"

"The practical outcome? Why, that we shall be able to produce easily all bodies whatever--stone, wood, metal, fibers--"

"And flesh and blood?" queried Mr. Smith, interrupting him. "Do you pretend that you expect to manufacture a human being out and out?"

"Why not?"

Mr. Smith advanced $100,000 to the young chemist, and engaged his services for the Earth Chronicle laboratory.

The second of the four successful applicants, starting from experiments made so long ago as the nineteenth century and again and again repeated, had conceived the idea of removing an entire city all at once from one place to another. His special project had to do with the city of Granton, situated, as everybody knows, some fifteen miles inland. He proposes to transport the city on rails and to change it into a watering-place. The profit, of course, would be enormous. Mr. Smith, captivated by the scheme, bought a half-interest in it.

"As you are aware, sir," began applicant No. 3, "by the aid of our solar and terrestrial accumulators and transformers, we are able to make all the seasons the same. I propose to do something better still. Transform into heat a portion of the surplus energy at our disposal; send this heat to the poles; then the polar regions, relieved of their snow-cap, will become a vast territory available for man's use. What think you of the scheme?"

"Leave your plans with me, and come back in a week. I will have them examined in the meantime."

Finally, the fourth announced the early solution of a weighty scientific problem. Everyone will remember the bold experiment made a hundred years ago by Dr. Nathaniel Faithburn. The doctor, being a firm believer in human hibernation--in other words, in the possibility of our suspending our vital functions and of calling them into action again after a time--resolved to subject the theory to a practical test. To this end, having first made his last will and pointed out the proper method of awakening him; having also directed that his sleep was to continue a hundred years to a day from the date of his apparent death, he unhesitatingly put the theory to the proof in his own person.

Reduced to the condition of a mummy, Dr. Faithburn was coffined and laid in a tomb. Time went on. September
25th, 2889, being the day set for his resurrection, it was proposed to Mr. Smith that he should permit the second part of the experiment to be performed at his residence this evening.

"Agreed. Be here at ten o'clock," answered Mr. Smith; and with that the day's audience was closed.

Left to himself, feeling tired, he lay down on an extension chair. Then, touching a knob, he established communication with the Central Concert Hall, whence our greatest maestros send out to subscribers their delightful successions of accords determined by recondite algebraic formulas. Night was approaching. Entranced by the harmony, forgetful of the hour, Smith did not notice that it was growing dark. It was quite dark when he was aroused by the sound of a door opening. "Who is there?" he asked, touching a commutator.

Suddenly, in consequence of the vibrations produced, the air became luminous.

"Ah! you, Doctor?"
"Yes," was the reply. "How are you?"
"I am feeling well."
"Good! Let me see your tongue. All right! Your pulse. Regular! And your appetite?"
"Only passably good."
"Yes, the stomach. There's the rub. You are over-worked. If your stomach is out of repair, it must be mended. That requires study. We must think about it."

"In the meantime," said Mr. Smith, "you will dine with me."

As in the morning, the table rose out of the floor. Again, as in the morning, the _potage, rôti, ragoûts_, and _legumes_ were supplied through the food-pipes. Toward the close of the meal, phonotelephotic communication was made with Paris. Smith saw his wife, seated alone at the dinner-table, looking anything but pleased at her loneliness.

"Pardon me, my dear, for having left you alone," he said through the telephone. "I was with Dr. Wilkins."

"Ah, the good doctor!" remarked Mrs. Smith, her countenance lighting up.

"Yes. But, pray, when are you coming home?"
"This evening."
"Very well. Do you come by tube or by air-train?"
"Oh, by tube."
"Yes; and at what hour will you arrive?"
"About eleven, I suppose."
"Eleven by Centropolis time, you mean?"
"Yes."

"Good-by, then, for a little while," said Mr. Smith as he severed communication with Paris.

Dinner over, Dr. Wilkins wished to depart. "I shall expect you at ten," said Mr. Smith. "To-day, it seems, is the day for the return to life of the famous Dr. Faithburn. You did not think of it, I suppose. The awakening is to take place here in my house. You must come and see. I shall depend on your being here."

"I will come back," answered Dr. Wilkins.

Left alone, Mr. Smith busied himself with examining his accounts—a task of vast magnitude, having to do with transactions which involve a daily expenditure of upward of $800,000. Fortunately, indeed, the stupendous progress of mechanic art in modern times makes it comparatively easy. Thanks to the Piano Electro-Reckoner, the most complex calculations can be made in a few seconds. In two hours Mr. Smith completed his task. Just in time. Scarcely had he turned over the last page when Dr. Wilkins arrived. After him came the body of Dr. Faithburn, escorted by a numerous company of men of science. They commenced work at once. The casket being laid down in the middle of the room, the telephote was got in readiness. The outer world, already notified, was anxiously expectant, for the whole world could be eye-witnesses of the performance, a reporter meanwhile, like the chorus in the ancient drama, explaining it all _viva voce_ through the telephone.

"They are opening the casket," he explained. "Now they are taking Faithburn out of it— a veritable mummy, yellow, hard, and dry. Strike the body and it resounds like a block of wood. They are now applying heat; now electricity. No result. These experiments are suspended for a moment while Dr. Wilkins makes an examination of the body. Dr. Wilkins, rising, declares the man to be dead. 'Dead!' exclaims every one present. 'Yes,' answers Dr. Wilkins, 'dead!' 'And how long has he been dead?' Dr. Wilkins makes another examination. 'A hundred years,' he replies."

The case stood just as the reporter said. Faithburn was dead, quite certainly dead! "Here is a method that needs improvement," remarked Mr. Smith to Dr. Wilkins, as the scientific committee on hibernation bore the casket out. "So much for that experiment. But if poor Faithburn is dead, at least he is sleeping," he continued. "I wish I could get some sleep. I am tired out, Doctor, quite tired out! Do you not think that a bath would refresh me?"

"Certainly. But you must wrap yourself up well before you go out into the hall-way. You must not expose
yourself to cold."

"Hall-way? Why, Doctor, as you well know, everything is done by machinery here. It is not for me to go to the bath; the bath will come to me. Just look!" and he pressed a button. After a few seconds a faint rumbling was heard, which grew louder and louder. Suddenly the door opened, and the tub appeared.

Such, for this year of grace 2889, is the history of one day in the life of the editor of the Earth Chronicle. And the history of that one day is the history of 365 days every year, except leap-years, and then of 366 days--for as yet no means has been found of increasing the length of the terrestrial year.

JULES VERNE.
