In the mean time the doctor assured himself of the presence of a sufficient quantity of gas in the mixing-tank to feed the cylinder, if necessary, without there being any need of resorting for some time to the Buntzen battery. He then took out the two perfectly-isolated conducting-wires, which served for the decomposition of the water, and, searching in his travelling-sack, brought forth two pieces of charcoal, cut down to a sharp point, and fixed one at the end of each wire.

His two friends looked on, without knowing what he was about, but they kept perfectly silent. When the doctor had finished, he stood up erect in the car, and, taking the two pieces of charcoal, one in each hand, drew their points nearly together.

In a twinkling, an intense and dazzling light was produced, with an insupportable glow between the two pointed ends of charcoal, and a huge jet of electric radiance literally broke the darkness of the night.

"Oh!" ejaculated the astonished friends.

"Not a word!" cautioned the doctor.

CHAPTER TWENTY-SECOND.

The Jet of Light.--The Missionary.--The Rescue in a Ray of Electricity.--A Lazarist Priest.--But little Hope.--The Doctor's Care.--A Life of Self-Denial.--Passing a Volcano.

Dr. Ferguson darted his powerful electric jet toward various points of space, and caused it to rest on a spot from which shouts of terror were heard. His companions fixed their gaze eagerly on the place.

The baobab, over which the balloon was hanging almost motionless, stood in the centre of a clearing, where, between fields of Indian-corn and sugar-cane, were seen some fifty low, conical huts, around which swarmed a numerous tribe.

A hundred feet below the balloon stood a large post, or stake, and at its foot lay a human being—a young man of thirty years or more, with long black hair, half naked, wasted and wan, bleeding, covered with wounds, his head
bowed over upon his breast, as Christ's was, when He hung upon the cross.

The hair, cut shorter on the top of his skull, still indicated the place of a half-effaced tonsure.

"A missionary! a priest!" exclaimed Joe.

"Poor, unfortunate man!" said Kennedy.

"We must save him, Dick!" responded the doctor; "we must save him!"

The crowd of blacks, when they saw the balloon over their heads, like a huge comet with a train of dazzling light, were seized with a terror that may be readily imagined. Upon hearing their cries, the prisoner raised his head. His eyes gleamed with sudden hope, and, without too thoroughly comprehending what was taking place, he stretched out his hands to his unexpected deliverers.

"He is alive!" exclaimed Ferguson. "God be praised! The savages have got a fine scare, and we shall save him! Are you ready, friends?"

"Ready, doctor, at the word."

"Joe, shut off the cylinder!"

The doctor's order was executed. An almost imperceptible breath of air impelled the balloon directly over the prisoner, at the same time that it gently lowered with the contraction of the gas. For about ten minutes it remained floating in the midst of luminous waves, for Ferguson continued to flash right down upon the throng his glowing sheaf of rays, which, here and there, marked out swift and vivid sheets of light. The tribe, under the influence of an indescribable terror, disappeared little by little in the huts, and there was complete solitude around the stake. The doctor had, therefore, been right in counting upon the fantastic appearance of the balloon throwing out rays, as vivid as the sun's, through this intense gloom.

The car was approaching the ground; but a few of the savages, more audacious than the rest, guessing that their victim was about to escape from their clutches, came back with loud yells, and Kennedy seized his rifle. The doctor, however, besought him not to fire.

The priest, on his knees, for he had not the strength to stand erect, was not even fastened to the stake, his weakness rendering that precaution superfluous. At the instant when the car was close to the ground, the brawny Scot, laying aside his rifle, and seizing the priest around the waist, lifted him into the car, while, at the same moment, Joe tossed over the two hundred pounds of ballast.

The doctor had expected to ascend rapidly, but, contrary to his calculations, the balloon, after going up some three or four feet, remained perfectly motionless.

"What holds us?" he asked, with an accent of terror.

Some of the savages were running toward them, uttering ferocious cries.

"Ah, ha!" said Joe, "one of those cursed blacks is hanging to the car!"

"Dick! Dick!" cried the doctor, "the water-tank!"

Kennedy caught his friend's idea on the instant, and, snatching up with desperate strength one of the water-tanks weighing about one hundred pounds, he tossed it overboard. The balloon, thus suddenly lightened, made a leap of three hundred feet into the air, amid the howlings of the tribe whose prisoner thus escaped them in a blaze of dazzling light.

"Hurrah!" shouted the doctor's comrades.

Suddenly, the balloon took a fresh leap, which carried it up to an elevation of a thousand feet.

"What's that?" said Kennedy, who had nearly lost his balance.

"Oh! nothing; only that black villain leaving us!" replied the doctor, tranquilly, and Joe, leaning over, saw the savage that had clung to the car whirling over and over, with his arms outstretched in the air, and presently dashed to pieces on the ground. The doctor then separated his electric wires, and every thing was again buried in profound obscurity. It was now one o'clock in the morning.

The Frenchman, who had swooned away, at length opened his eyes.

"You are saved!" were the doctor's first words.

"Saved!" he with a sad smile replied in English, "saved from a cruel death! My brethren, I thank you, but my days are numbered, nay, even my hours, and I have but little longer to live."

With this, the missionary, again yielding to exhaustion, relapsed into his fainting-fit.

"He is dying!" said Kennedy.

"No," replied the doctor, bending over him, "but he is very weak; so let us lay him under the awning."

And they did gently deposit on their blankets that poor, wasted body, covered with scars and wounds, still bleeding where fire and steel had, in twenty places, left their agonizing marks. The doctor, taking an old handkerchief, quickly prepared a little lint, which he spread over the wounds, after having washed them. These rapid attentions were bestowed with the celerity and skill of a practised surgeon, and, when they were complete, the doctor, taking a cordial from his medicine-chest, poured a few drops upon his patient's lips.
The latter feebly pressed his kind hands, and scarcely had the strength to say, "Thank you! thank you!"

The doctor comprehended that he must be left perfectly quiet; so he closed the folds of the awning and resumed the guidance of the balloon.

The latter, after taking into account the weight of the new passenger, had been lightened of one hundred and eighty pounds, and therefore kept aloft without the aid of the cylinder. At the first dawn of day, a current drove it gently toward the west-northwest. The doctor went in under the awning for a moment or two, to look at his still sleeping patient.

"May Heaven spare the life of our new companion! Have you any hope?" said the Scot.

"Yes, Dick, with care, in this pure, fresh atmosphere."

"How that man has suffered!" said Joe, with feeling. "He did bolder things than we've done, in venturing all alone among those savage tribes!"

"That cannot be questioned," assented the hunter.

During the entire day the doctor would not allow the sleep of his patient to be disturbed. It was really a long stupor, broken only by an occasional murmur of pain that continued to disquiet and agitate the doctor greatly.

Toward evening the balloon remained stationary in the midst of the gloom, and during the night, while Kennedy and Joe relieved each other in carefully tending the sick man, Ferguson kept watch over the safety of all.

By the morning of the next day, the balloon had moved, but very slightly, to the westward. The dawn came up pure and magnificent. The sick man was able to call his friends with a stronger voice. They raised the curtains of the awning, and he inhaled with delight the keen morning air.

"How do you feel to-day?" asked the doctor.

"Better, perhaps," he replied. "But you, my friends, I have not seen you yet, excepting in a dream! I can, indeed, scarcely recall what has occurred. Who are you --that your names may not be forgotten in my dying prayers?"

"We are English travellers," replied Ferguson. "We are trying to cross Africa in a balloon, and, on our way, we have had the good fortune to rescue you."

"Science has its heroes," said the missionary.

"But religion its martyrs!" rejoined the Scot.

"Are you a missionary?" asked the doctor.

"I am a priest of the Lazarist mission. Heaven sent you to me--Heaven be praised! The sacrifice of my life had been accomplished! But you come from Europe; tell me about Europe, about France! I have been without news for the last five years!"

"Five years! alone! and among these savages!" exclaimed Kennedy with amazement.

"They are souls to redeem! ignorant and barbarous brethren, whom religion alone can instruct and civilize."

Dr. Ferguson, yielding to the priest's request, talked to him long and fully about France. He listened eagerly, and his eyes filled with tears. He seized Kennedy's and Joe's hands by turns in his own, which were burning with fever. The doctor prepared him some tea, and he drank it with satisfaction. After that, he had strength enough to raise himself up a little, and smiled with pleasure at seeing himself borne along through so pure a sky.

"You are daring travellers!" he said, "and you will succeed in your bold enterprise. You will again behold your relatives, your friends, your country--you--"

At this moment, the weakness of the young missionary became so extreme that they had to lay him again on the bed, where a prostration, lasting for several hours, held him like a dead man under the eye of Dr. Ferguson. The latter could not suppress his emotion, for he felt that this life now in his charge was ebbing away. Were they then so soon to lose him whom they had snatched from an agonizing death? The doctor again washed and dressed the young martyr's frightful wounds, and had to sacrifice nearly his whole stock of water to refresh his burning limbs. He surrounded him with the tenderest and most intelligent care, until, at length, the sick man revived, little by little, in his arms, and recovered his consciousness if not his strength.

The doctor was able to gather something of his history from his broken murmurs.

"Speak in your native language," he said to the sufferer; "I understand it, and it will fatigue you less."

The missionary was a poor young man from the village of Aradon, in Brittany, in the Morbihan country. His earliest instincts had drawn him toward an ecclesiastical career, but to this life of self-sacrifice he was also desirous of joining a life of danger, by entering the mission of the order of priesthood of which St. Vincent de Paul was the founder, and, at twenty, he quit his country for the inhospitable shores of Africa. From the sea-coast, overcoming obstacles, little by little, braving all privations, pushing onward, afoot, and praying, he had advanced to the very centre of those tribes that dwell among the tributary streams of the Upper Nile. For two years his faith was spurned, his zeal denied recognition, his charities taken in ill part, and he remained a prisoner to one of the cruelest tribes of the Nyamburra, the object of every species of maltreatment. But still he went on teaching, instructing, and praying. The tribe having been dispersed and he left for dead, in one of those combats which are so frequent between the
tribes, instead of retracing his steps, he persisted in his evangelical mission. His most tranquil time was when he was taken for a madman. Meanwhile, he had made himself familiar with the idioms of the country, and he catechised in them. At length, during two more long years, he traversed these barbarous regions, impelled by that superhuman energy that comes from God. For a year past he had been residing with that tribe of the Nyam-Nyams known as the Barafri, one of the wildest and most ferocious of them all. The chief having died a few days before our travellers appeared, his sudden death was attributed to the missionary, and the tribe resolved to immolate him. His sufferings had already continued for the space of forty hours, and, as the doctor had supposed, he was to have perished in the blaze of the noonday sun. When he heard the sound of fire-arms, nature got the best of him, and he had cried out, "Help! help!" He then thought that he must have been dreaming, when a voice, that seemed to come from the sky, had uttered words of consolation.

"I have no regrets," he said, "for the life that is passing away from me; my life belongs to God!"

"Hope still!" said the doctor; "we are near you, and we will save you now, as we saved you from the tortures of the stake."

"I do not ask so much of Heaven," said the priest, with resignation. "Blessed be God for having vouchsafed to me the joy before I die of having pressed your friendly hands, and having heard, once more, the language of my country!"

The missionary here grew weak again, and the whole day went by between hope and fear, Kennedy deeply moved, and Joe drawing his hand over his eyes more than once when he thought that no one saw him.

The balloon made little progress, and the wind seemed as though unwilling to jostle its precious burden.

Toward evening, Joe discovered a great light in the west. Under more elevated latitudes, it might have been mistaken for an immense aurora borealis, for the sky appeared on fire. The doctor very attentively examined the phenomenon.

"It is, perhaps, only a volcano in full activity," said he.

"But the wind is carrying us directly over it," replied Kennedy.

"Very well, we shall cross it then at a safe height!" said the doctor.

Three hours later, the Victoria was right among the mountains. Her exact position was twenty-four degrees fifteen minutes east longitude, and four degrees forty-two minutes north latitude, and four degrees forty-two minutes north latitude. In front of her a volcanic crater was pouring forth torrents of melted lava, and hurling masses of rock to an enormous height. There were jets, too, of liquid fire that fell back in dazzling cascades--a superb but dangerous spectacle, for the wind with unswerving certainty was carrying the balloon directly toward this blazing atmosphere.

This obstacle, which could not be turned, had to be crossed, so the cylinder was put to its utmost power, and the balloon rose to the height of six thousand feet, leaving between it and the volcano a space of more than three hundred fathoms.

From his bed of suffering, the dying missionary could contemplate that fiery crater from which a thousand jets of dazzling flame were that moment escaping.

"How grand it is!" said he, "and how infinite is the power of God even in its most terrible manifestations!"

This overflow of blazing lava wrapped the sides of the mountain with a veritable drapery of flame; the lower half of the balloon glowed redly in the upper night; a torrid heat ascended to the car, and Dr. Ferguson made all possible haste to escape from this perilous situation.

By ten o'clock the volcano could be seen only as a red point on the horizon, and the balloon tranquilly pursued her course in a less elevated zone of the atmosphere.

CHAPTER TWENTY-THIRD.

A magnificent night overspread the earth, and the missionary lay quietly asleep in utter exhaustion.

"He'll not get over it!" sighed Joe. "Poor young fellow--scarcely thirty years of age!"

"He'll die in our arms. His breathing, which was so feeble before, is growing weaker still, and I can do nothing to save him," said the doctor, despairingly.

"The infamous scoundrels!" exclaimed Joe, grinding his teeth, in one of those fits of rage that came over him at long intervals; "and to think that, in spite of all, this good man could find words only to pity them, to excuse, to pardon them!"

"Heaven has given him a lovely night, Joe--his last on earth, perhaps! He will suffer but little more after this, and his dying will be only a peaceful falling asleep."
The dying man uttered some broken words, and the doctor at once went to him. His breathing became difficult, and he asked for air. The curtains were drawn entirely back, and he inhaled with rapture the light breezes of that clear, beautiful night. The stars sent him their trembling rays, and the moon wrapped him in the white winding-sheet of its effulgence.

"My friends," said he, in an enfeebled voice, "I am going. May God requite you, and bring you to your safe harbor! May he pay for me the debt of gratitude that I owe to you!"

"You must still hope," replied Kennedy. "This is but a passing fit of weakness. You will not die. How could any one die on this beautiful summer night?"

"Death is at hand," replied the missionary, "I know it! Let me look it in the face! Death, the commencement of things eternal, is but the end of earthly cares. Place me upon my knees, my brethren, I beseech you!"

Kennedy lifted him up, and it was distressing to see his weakened limbs bend under him.

"My God! my God!" exclaimed the dying apostle, "have pity on me!"

His countenance shone. Far above that earth on which he had known no joys; in the midst of that night which sent to him its softest radiance; on the way to that heaven toward which he uplifted his spirit, as though in a miraculous assumption, he seemed already to live and breathe in the new existence.

His last gesture was a supreme blessing on his new friends of only one day. Then he fell back into the arms of Kennedy, whose countenance was bathed in hot tears.

"Dead!" said the doctor, bending over him, "dead!" And with one common accord, the three friends knelt together in silent prayer.

"To-morrow," resumed the doctor, "we shall bury him in the African soil which he has besprinkled with his blood."

During the rest of the night the body was watched, turn by turn, by the three travellers, and not a word disturbed the solemn silence. Each of them was weeping.

The next day the wind came from the south, and the balloon moved slowly over a vast plateau of mountains: there, were extinct craters; here, barren ravines; not a drop of water on those parched crests; piles of broken rocks; huge stony masses scattered hither and thither, and, interspersed with whitish marl, all indicated the most complete sterility.

Toward noon, the doctor, for the purpose of burying the body, decided to descend into a ravine, in the midst of some plutonic rocks of primitive formation. The surrounding mountains would shelter him, and enable him to bring his car to the ground, for there was no tree in sight to which he could make it fast.

But, as he had explained to Kennedy, it was now impossible for him to descend, except by releasing a quantity of gas proportionate to his loss of ballast at the time when he had rescued the missionary. He therefore opened the valve of the outside balloon. The hydrogen escaped, and the Victoria quietly descended into the ravine.

As soon as the car touched the ground, the doctor shut the valve. Joe leaped out, holding on the while to the rim of the car with one hand, and with the other gathering up a quantity of stones equal to his own weight. He could then use both hands, and had soon heaped into the car more than five hundred pounds of stones, which enabled both the doctor and Kennedy, in their turn, to get out. Thus the Victoria found herself balanced, and her ascensional force insufficient to raise her.

Moreover, it was not necessary to gather many of these stones, for the blocks were extremely heavy, so much so, indeed, that the doctor's attention was attracted by the circumstance. The soil, in fact, was bestrewn with quartz and porphyritic rocks.

"This is a singular discovery!" said the doctor, mentally.

In the mean while, Kennedy and Joe had strolled away a few paces, looking up a proper spot for the grave. The heat was extreme in this ravine, shut in as it was like a sort of furnace. The noonday sun poured down its rays perpendicularly into it.

The first thing to be done was to clear the surface of the fragments of rock that encumbered it, and then a quite deep grave had to be dug, so that the wild animals should not be able to disinter the corpse.

The body of the martyred missionary was then solemnly placed in it. The earth was thrown in over his remains, and above it masses of rock were deposited, in rude resemblance to a tomb.

The doctor, however, remained motionless, and lost in his reflections. He did not even heed the call of his companions, nor did he return with them to seek a shelter from the heat of the day.

"What are you thinking about, doctor?" asked Kennedy.

"About a singular freak of Nature, a curious effect of chance. Do you know, now, in what kind of soil that man of self-denial, that poor one in spirit, has just been buried?"

"No! what do you mean, doctor?"

"That priest, who took the oath of perpetual poverty, now reposes in a gold-mine!"
"A gold-mine!" exclaimed Kennedy and Joe in one breath.
"Yes, a gold-mine," said the doctor, quietly. "Those blocks which you are trampling under foot, like worthless stones, contain gold-ore of great purity."
"Impossible! impossible!" repeated Joe.
"You would not have to look long among those fissures of slaty schist without finding peptites of considerable value."

Joe at once rushed like a crazy man among the scattered fragments, and Kennedy was not long in following his example.

"Keep cool, Joe," said his master.
"Why, doctor, you speak of the thing quite at your ease."
"What! a philosopher of your mettle--"
"Ah, master, no philosophy holds good in this case!"
"Come! come! Let us reflect a little. What good would all this wealth do you? We cannot carry any of it away with us."
"We can't take any of it with us, indeed?"
"It's rather too heavy for our car! I even hesitated to tell you any thing about it, for fear of exciting your regret!"
"What!" said Joe, again, "abandon these treasures --a fortune for us!--really for us--our own--leave it behind!"
"Take care, my friend! Would you yield to the thirst for gold? Has not this dead man whom you have just helped to bury, taught you the vanity of human affairs?"
"All that is true," replied Joe, "but gold! Mr. Kennedy, won't you help to gather up a trifle of all these millions?"
"What could we do with them, Joe?" said the hunter, unable to repress a smile. "We did not come hither in search of fortune, and we cannot take one home with us."
"The millions are rather heavy, you know," resumed the doctor, "and cannot very easily be put into one's pocket."
"But, at least," said Joe, driven to his last defences, "couldn't we take some of that ore for ballast, instead of sand?"
"Very good! I consent," said the doctor, "but you must not make too many wry faces when we come to throw some thousands of crowns' worth overboard."
"Thousands of crowns!" echoed Joe; "is it possible that there is so much gold in them, and that all this is the same?"
"Yes, my friend, this is a reservoir in which Nature has been heaping up her wealth for centuries! There is enough here to enrich whole nations! An Australia and a California both together in the midst of the wilderness!"
"And the whole of it is to remain useless!"
"Perhaps! but at all events, here's what I'll do to console you."
"That would be rather difficult to do!" said Joe, with a contrite air.
"Listen! I will take the exact bearings of this spot, and give them to you, so that, upon your return to England, you can tell our countrymen about it, and let them have a share, if you think that so much gold would make them happy."
"Ah! master, I give up; I see that you are right, and that there is nothing else to be done. Let us fill our car with the precious mineral, and what remains at the end of the trip will be so much made."

And Joe went to work. He did so, too, with all his might, and soon had collected more than a thousand pieces of quartz, which contained gold enclosed as though in an extremely hard crystal casket.

The doctor watched him with a smile; and, while Joe went on, he took the bearings, and found that the missionary's grave lay in twenty-two degrees twenty-three minutes east longitude, and four degrees fifty-five minutes north latitude.

Then, casting one glance at the swelling of the soil, beneath which the body of the poor Frenchman reposed, he went back to his car.

He would have erected a plain, rude cross over the tomb, left solitary thus in the midst of the African deserts, but not a tree was to be seen in the environs.
"God will recognize it!" said Kennedy.

An anxiety of another sort now began to steal over the doctor's mind. He would have given much of the gold before him for a little water--for he had to replace what had been thrown overboard when the negro was carried up into the air. But it was impossible to find it in these arid regions; and this reflection gave him great uneasiness. He had to feed his cylinder continually; and he even began to find that he had not enough to quench the thirst of his party. Therefore he determined to lose no opportunity of replenishing his supply.

Upon getting back to the car, he found it burdened with the quartz-blocks that Joe's greed had heaped in it. He
got in, however, without saying anything. Kennedy took his customary place, and Joe followed, but not without casting a covetous glance at the treasures in the ravine.

The doctor rekindled the light in the cylinder; the spiral became heated; the current of hydrogen came in a few minutes, and the gas dilated; but the balloon did not stir an inch.

Joe looked on uneasily, but kept silent.

"Joe!" said the doctor.

Joe made no reply.

"Joe! Don't you hear me?"

Joe made a sign that he heard; but he would not understand.

"Do me the kindness to throw out some of that quartz!"

"But, doctor, you gave me leave--"

"I gave you leave to replace the ballast; that was all!"

"But--"

"Do you want to stay forever in this desert?"

Joe cast a despairing look at Kennedy; but the hunter put on the air of a man who could do nothing in the matter.

"Well, Joe?"

"Then your cylinder don't work," said the obstinate fellow.

"My cylinder? It is lit, as you perceive. But the balloon will not rise until you have thrown off a little ballast."

Joe scratched his ear, picked up a piece of quartz, the smallest in the lot, weighed and reweighed it, and tossed it up and down in his hand. It was a fragment of about three or four pounds. At last he threw it out.

But the balloon did not budge.

"Humph!" said he; "we're not going up yet."

"Not yet," said the doctor. "Keep on throwing."

Kennedy laughed. Joe now threw out some ten pounds, but the balloon stood still.

Joe got very pale.

"Poor fellow!" said the doctor. "Mr. Kennedy, you and I weigh, unless I am mistaken, about four hundred pounds--so that you'll have to get rid of at least that weight, since it was put in here to make up for us."

"Throw away four hundred pounds!" said Joe, piteously.

"And some more with it, or we can't rise. Come, courage, Joe!"

The brave fellow, heaving deep sighs, began at last to lighten the balloon; but, from time to time, he would stop, and ask:

"Are you going up?"

"No, not yet," was the invariable response.

"It moves!" said he, at last.

"Keep on!" replied the doctor.

"It's going up; I'm sure."

"Keep on yet," said Kennedy.

And Joe, picking up one more block, desperately tossed it out of the car. The balloon rose a hundred feet or so, and, aided by the cylinder, soon passed above the surrounding summits.

"Now, Joe," resumed the doctor, "there still remains a handsome fortune for you; and, if we can only keep the rest of this with us until the end of our trip, there you are--rich for the balance of your days!"

Joe made no answer, but stretched himself out luxuriously on his heap of quartz.

"See, my dear Dick!" the doctor went on. "Just see the power of this metal over the cleverest lad in the world! What passions, what greed, what crimes, the knowledge of such a mine as that would cause! It is sad to think of it!"

By evening the balloon had made ninety miles to the westward, and was, in a direct line, fourteen hundred miles from Zanzibar.

CHAPTER TWENTY-FOURTH.

The Wind dies away.--The Vicinity of the Desert.--The Mistake in the Water-Supply.--The Nights of the Equator.--Dr. Ferguson's Anxieties.--The Situation flatly stated.--Energetic Replies of Kennedy and Joe.--One Night more.

The balloon, having been made fast to a solitary tree, almost completely dried up by the aridity of the region in which it stood, passed the night in perfect quietness; and the travellers were enabled to enjoy a little of the repose which they so greatly needed. The emotions of the day had left sad impressions on their minds.

Toward morning, the sky had resumed its brilliant purity and its heat. The balloon ascended, and, after several
ineffectual attempts, fell into a current that, although not rapid, bore them toward the northwest.

"We are not making progress," said the doctor. "If I am not mistaken, we have accomplished nearly half of our journey in ten days; but, at the rate at which we are going, it would take months to end it; and that is all the more vexatious, that we are threatened with a lack of water."

"But we'll find some," said Joe. "It is not to be thought of that we shouldn't discover some river, some stream, or pond, in all this vast extent of country."

"I hope so." Kennedy asked this question only to tease Joe; and he did so the more willingly because he had, for a moment, shared the poor lad's hallucinations; but, not finding any thing in them, he had fallen back into the attitude of a strong-minded looker-on, and turned the affair off with a laugh.

Joe cast a mournful glance at him; but the doctor made no reply. He was thinking, not without secret terror, probably, of the vast solitudes of Sahara--for there whole weeks sometimes pass without the caravans meeting with a single spring of water. Occupied with these thoughts, he scrutinized every depression of the soil with the closest attention.

These anxieties, and the incidents recently occurring, had not been without their effect upon the spirits of our three travellers. They conversed less, and were more wrapt in their own thoughts.

Joe, clever lad as he was, seemed no longer the same person since his gaze had plunged into that ocean of gold. He kept entirely silent, and gazed incessantly upon the stony fragments heaped up in the car--worthless to-day, but of inestimable value to-morrow.

The appearance of this part of Africa was, moreover, quite calculated to inspire alarm: the desert was gradually expanding around them; not another village was to be seen--not even a collection of a few huts; and vegetation also was disappearing. Barely a few dwarf plants could now be noticed, like those on the wild heaths of Scotland; then came the first tract of grayish sand and flint, with here and there a lentisk tree and brambles. In the midst of this sterility, the rudimental carcass of the Globe appeared in ridges of sharply-jutting rock. These symptoms of a totally dry and barren region greatly disquieted Dr. Ferguson.

It seemed as though no caravan had ever braved this desert expanse, or it would have left visible traces of its encampments, or the whitened bones of men and animals. But nothing of the kind was to be seen, and the aeronauts felt that, ere long, an immensity of sand would cover the whole of this desolate region.

However, there was no going back; they must go forward; and, indeed, the doctor asked for nothing better; he would even have welcomed a tempest to carry him beyond this country. But, there was not a cloud in the sky. At the close of the day, the balloon had not made thirty miles.

If there had been no lack of water! But, there remained only three gallons in all! The doctor put aside one gallon, destined to quench the burning thirst that a heat of ninety degrees rendered intolerable. Two gallons only then remained to supply the cylinder. Hence, they could produce no more than four hundred and eighty cubic feet of gas; yet the cylinder consumed about nine cubic feet per hour. Consequently, they could not keep on longer than fifty-four hours--and all this was a mathematical calculation!

"Fifty-four hours!" said the doctor to his companions. "Therefore, as I am determined not to travel by night, for fear of passing some stream or pool, we have but three days and a half of journeying during which we must find water, at all hazards. I have thought it my duty to make you aware of the real state of the case, as I have retained only one gallon for drinking, and we shall have to put ourselves on the shortest allowance."

"Put us on short allowance, then, doctor," responded Kennedy, "but we must not despair. We have three days left, you say?"

"Yes, my dear Dick!"

"Well, as grieving over the matter won't help us, in three days there will be time enough to decide upon what is to be done; in the meanwhile, let us redouble our vigilance!"

At their evening meal, the water was strictly measured out, and the brandy was increased in quantity in the punch they drank. But they had to be careful with the spirits, the latter being more likely to produce than to quench thirst.

The car rested, during the night, upon an immense plateau, in which there was a deep hollow; its height was scarcely eight hundred feet above the level of the sea. This circumstance gave the doctor some hope, since it recalled to his mind the conjectures of geographers concerning the existence of a vast stretch of water in the centre of Africa. But, if such a lake really existed, the point was to reach it, and not a sign of change was visible in the motionless sky.

To the tranquil night and its starry magnificence succeeded the unchanging daylight and the blazing rays of the sun; and, from the earliest dawn, the temperature became scorching. At five o'clock in the morning, the doctor gave
the signal for departure, and, for a considerable time, the balloon remained immovable in the leaden atmosphere.

The doctor might have escaped this intense heat by rising into a higher range, but, in order to do so, he would have had to consume a large quantity of water, a thing that had now become impossible. He contented himself, therefore, with keeping the balloon at one hundred feet from the ground, and, at that elevation, a feeble current drove it toward the western horizon.

The breakfast consisted of a little dried meat and pemmican. By noon, the Victoria had advanced only a few miles.

"We cannot go any faster," said the doctor; "we no longer command--we have to obey."

"Ah! doctor, here is one of those occasions when a propeller would not be a thing to be despised."

"Undoubtedly so, Dick, provided it would not require an expenditure of water to put it in motion, for, in that case, the situation would be precisely the same; moreover, up to this time, nothing practical of the sort has been invented. Balloons are still at that point where ships were before the invention of steam. It took six thousand years to invent propellers and screws; so we have time enough yet."

"Confounded heat!" said Joe, wiping away the perspiration that was streaming from his forehead.

"If we had water, this heat would be of service to us, for it dilates the hydrogen in the balloon, and diminishes the amount required in the spiral, although it is true that, if we were not short of the useful liquid, we should not have to economize it. Ah! that rascally savage who cost us the tank!*"* The water-tank had been thrown overboard when the native clung to the car.

"You don't regret, though, what you did, doctor?"

"No, Dick, since it was in our power to save that unfortunate missionary from a horrible death. But, the hundred pounds of water that we threw overboard would be very useful to us now; it would be thirteen or fourteen days more of progress secured, or quite enough to carry us over this desert."

"We've made at least half the journey, haven't we?" asked Joe.

"In distance, yes; but in duration, no, should the wind leave us; and it, even now, has a tendency to die away altogether."

"Come, sir," said Joe, again, "we must not complain; we've got along pretty well, thus far, and whatever happens to me, I can't get desperate. We'll find water; mind, I tell you so."

The soil, however, ran lower from mile to mile; the undulations of the gold-bearing mountains they had left died away into the plain, like the last throes of exhausted Nature. Scanty grass took the place of the fine trees of the east; only a few belts of half-scorched herbage still contended against the invasion of the sand, and the huge rocks, that had rolled down from the distant summits, crushed in their fall, had scattered in sharp-edged pebbles which soon again became coarse sand, and finally impalpable dust.

"Here, at last, is Africa, such as you pictured it to yourself, Joe! Was I not right in saying, 'Wait a little?' eh?"

"Well, master, it's all natural, at least--heat and dust. It would be foolish to look for any thing else in such a country. Do you see," he added, laughing, "I had no confidence, for my part, in your forests and your prairies; they were out of reason. What was the use of coming so far to find scenery just like England? Here's the first time that I believe in Africa, and I'm not sorry to get a taste of it."

Toward evening, the doctor calculated that the balloon had not made twenty miles during that whole burning day, and a heated gloom closed in upon it, as soon as the sun had disappeared behind the horizon, which was traced against the sky with all the precision of a straight line.

The next day was Thursday, the 1st of May, but the days followed each other with desperate monotony. Each morning was like the one that had preceded it; noon poured down the same exhaustless rays, and night condensed in its shadow the scattered heat which the ensuing day would again bequeath to the succeeding night. The wind, now scarcely observable, was rather a gasp than a breath, and the morning could almost be foreseen when even that gasp would cease.

The doctor reacted against the gloominess of the situation and retained all the coolness and self-possession of a disciplined heart. With his glass he scrutinized every quarter of the horizon; he saw the last rising ground gradually melting to the dead level, and the last vegetation disappearing, while, before him, stretched the immensity of the desert.

The responsibility resting upon him pressed sorely, but he did not allow his disquiet to appear. Those two men, Dick and Joe, friends of his, both of them, he had induced to come with him almost by the force alone of friendship and of duty. Had he done well in that? Was it not like attempting to tread forbidden paths? Was he not, in this trip, trying to pass the borders of the impossible? Had not the Almighty reserved for later ages the knowledge of this inhospitable continent?

All these thoughts, of the kind that arise in hours of discouragement, succeeded each other and multiplied in his mind, and, by an irresistible association of ideas, the doctor allowed himself to be carried beyond the bounds of
logic and of reason. After having established in his own mind what he should NOT have done, the next question was, what he should do, then. Would it be impossible to retrace his steps? Were there not currents higher up that would waft him to less arid regions? Well informed with regard to the countries over which he had passed, he was utterly ignorant of those to come, and thus his conscience speaking aloud to him, he resolved, in his turn, to speak frankly to his two companions. He thereupon laid the whole state of the case plainly before them; he showed them what had been done, and what there was yet to do; at the worst, they could return, or attempt it, at least.--What did they think about it?

"I have no other opinion than that of my excellent master," said Joe; "what he may have to suffer, I can suffer, and that better than he can, perhaps. Where he goes, there I'll go!"

"And you, Kennedy?"

"I, doctor, I'm not the man to despair; no one was less ignorant than I of the perils of the enterprise, but I did not want to see them, from the moment that you determined to brave them. Under present circumstances, my opinion is, that we should persevere--go clear to the end. Besides, to return looks to me quite as perilous as the other course. So onward, then! you may count upon us!"

"Thanks, my gallant friends!" replied the doctor, with much real feeling, "I expected such devotion as this; but I needed these encouraging words. Yet, once again, thank you, from the bottom of my heart!"

And, with this, the three friends warmly grasped each other by the hand.

"Now, hear me!" said the doctor. "According to my solar observations, we are not more than three hundred miles from the Gulf of Guinea; the desert, therefore, cannot extend indefinitely, since the coast is inhabited, and the country has been explored for some distance back into the interior. If needs be, we can direct our course to that quarter, and it seems out of the question that we should not come across some oasis, or some well, where we could replenish our stock of water. But, what we want now, is the wind, for without it we are held here suspended in the air at a dead calm.

"Let us wait with resignation," said the hunter.

But, each of the party, in his turn, vainly scanned the space around him during that long wearisome day. Nothing could be seen to form the basis of a hope. The very last inequalities of the soil disappeared with the setting sun, whose horizontal rays stretched in long lines of fire over the flat immensity. It was the Desert!

Our aeronauts had scarcely gone a distance of fifteen miles, having expended, as on the preceding day, one hundred and thirty-five cubic feet of gas to feed the cylinder, and two pints of water out of the remaining eight had been sacrificed to the demands of intense thirst.

The night passed quietly--too quietly, indeed, but the doctor did not sleep!

CHAPTER TWENTY-FIFTH.

A Little Philosophy.--A Cloud on the Horizon.--In the Midst of a Fog.--The Strange Balloon.--An Exact View of the Victoria.--The Palm-Trees.--Traces of a Caravan.--The Well in the Midst of the Desert.

On the morrow, there was the same purity of sky, the same stillness of the atmosphere. The balloon rose to an elevation of five hundred feet, but it had scarcely changed its position to the westward in any perceptible degree.

"We are right in the open desert," said the doctor. "Look at that vast reach of sand! What a strange spectacle! What a singular arrangement of nature! Why should there be, in one place, such extreme luxuriance of vegetation yonder, and here, this extreme aridity, and that in the same latitude, and under the same rays of the sun?"

"The why concerns me but little," answered Kennedy, "the reason interests me less than the fact. The thing is so; that's the important part of it!"

"Oh, it is well to philosophize a little, Dick; it does no harm."

"Let us philosophize, then, if you will; we have time enough before us; we are hardly moving; the wind is afraid to blow; it sleeps."

"That will not last forever," put in Joe; "I think I see some banks of clouds in the east."

"Joe's right!" said the doctor, after he had taken a look.

"Good!" said Kennedy; "now for our clouds, with a fine rain, and a fresh wind to dash it into our faces!"

"Well, we'll see, Dick, we'll see!"

"But this is Friday, master, and I'm afraid of Fridays!"

"Well, I hope that this very day you'll get over those notions."

"I hope so, master, too. Whew!" he added, mopping his face, "heat's a good thing, especially in winter, but in summer it don't do to take too much of it."

"Don't you fear the effect of the sun's heat on our balloon?" asked Kennedy, addressing the doctor.

"No! the gutta-percha coating resists much higher temperatures than even this. With my spiral I have subjected it
inside to as much as one hundred and fifty-eight degrees sometimes, and the covering does not appear to have suffered."

"A cloud! a real cloud!" shouted Joe at this moment, for that piercing eyesight of his beat all the glasses.

And, in fact, a thick bank of vapor, now quite distinct, could be seen slowly emerging above the horizon. It appeared to be very deep, and, as it were, puffed out. It was, in reality, a conglomeration of smaller clouds. The latter invariably retained their original formation, and from this circumstance the doctor concluded that there was no current of air in their collected mass.

This compact body of vapor had appeared about eight o'clock in the morning, and, by eleven, it had already reached the height of the sun's disk. The latter then disappeared entirely behind the murky veil, and the lower belt of cloud, at the same moment, lifted above the line of the horizon, which was again disclosed in a full blaze of daylight.

"It's only an isolated cloud," remarked the doctor. "It won't do to count much upon that."

"Look, Dick, its shape is just the same as when we saw it this morning!"

"Then, doctor, there's to be neither rain nor wind, at least for us!"

"I fear so; the cloud keeps at a great height."

"Well, doctor, suppose we were to go in pursuit of this cloud, since it refuses to burst upon us?"

"I fancy that to do so wouldn't help us much; it would be a consumption of gas, and, consequently, of water, to little purpose; but, in our situation, we must not leave anything untried; therefore, let us ascend!"

And with this, the doctor put on a full head of flame from the cylinder, and the dilation of the hydrogen, occasioned by such sudden and intense heat, sent the balloon rapidly aloft.

About fifteen hundred feet from the ground, it encountered an opaque mass of cloud, and entered a dense fog, suspended at that elevation; but it did not meet with the least breath of wind. This fog seemed even destitute of humidity, and the articles brought in contact with it were scarcely dampened in the slightest degree. The balloon, completely enveloped in the vapor, gained a little increase of speed, perhaps, and that was all.

The doctor gloomily recognized what trifling success he had obtained from his manoeuvre, and was relapsing into deep meditation, when he heard Joe exclaim, in tones of most intense astonishment:

"Ah! by all that's beautiful!"

"What's the matter, Joe?"

"Doctor! Mr. Kennedy! Here's something curious!"

"What is it, then?"

"We are not alone, up here! There are rogues about! They've stolen our invention!"

"Has he gone crazy?" asked Kennedy.

Joe stood there, perfectly motionless, the very picture of amazement.

"Can the hot sun have really affected the poor fellow's brain?" said the doctor, turning toward him.

"Will you tell me?--"

"Look!" said Joe, pointing to a certain quarter of the sky.

"By St. James!" exclaimed Kennedy, in turn, "why, who would have believed it? Look, look! doctor!"

"I see it!" said the doctor, very quietly.

"Another balloon! and other passengers, like ourselves!"

And, sure enough, there was another balloon about two hundred paces from them, floating in the air with its car and its aeronauts. It was following exactly the same route as the Victoria.

"Well," said the doctor, "nothing remains for us but to make signals; take the flag, Kennedy, and show them our colors."

It seemed that the travellers by the other balloon had just the same idea, at the same moment, for the same kind of flag repeated precisely the same salute with a hand that moved in just the same manner.

"What does that mean?" asked Kennedy.

"They are apes," said Joe, "imitating us."

"It means," said the doctor, laughing, "that it is you, Dick, yourself, making that signal to yourself; or, in other words, that we see ourselves in the second balloon, which is no other than the Victoria."

"As to that, master, with all respect to you," said Joe, "you'll never make me believe it."

"Climb up on the edge of the car, Joe; wave your arms, and then you'll see."

Joe obeyed, and all his gestures were instantaneously and exactly repeated.

"It is merely the effect of the MIRAGE," said the doctor, "and nothing else--a simple optical phenomenon due to the unequal refraction of light by different layers of the atmosphere, and that is all."

"It's wonderful," said Joe, who could not make up his mind to surrender, but went on repeating his gesticulations.

"What a curious sight! Do you know," said Kennedy, "that it's a real pleasure to have a view of our noble balloon
in that style? She's a beauty, isn't she?-- and how stately her movements as she sweeps along!"

"You may explain the matter as you like," continued Joe, "it's a strange thing, anyhow!"

But ere long this picture began to fade away; the clouds rose higher, leaving the balloon, which made no further attempt to follow them, and in about an hour they disappeared in the open sky.

The wind, which had been scarcely perceptible, seemed still to diminish, and the doctor in perfect desperation descended toward the ground, and all three of the travellers, whom the incident just recorded had, for a few moments, diverted from their anxieties, relapsed into gloomy meditation, sweltering the while beneath the scorching heat.

About four o'clock, Joe descried some object standing out against the vast background of sand, and soon was able to declare positively that there were two palm-trees at no great distance.

"Palm-trees!" exclaimed Ferguson; "why, then there's a spring--a well!"

He took up his glass and satisfied himself that Joe's eyes had not been mistaken.

"At length!" he said, over and over again, "water! water! and we are saved; for if we do move slowly, still we move, and we shall arrive at last!"

"Good, master! but suppose we were to drink a mouthful in the mean time, for this air is stifling?"

"Let us drink then, my boy!"

No one waited to be coaxed. A whole pint was swallowed then and there, reducing the total remaining supply to three pints and a half.

"Ah! that does one good!" said Joe; "wasn't it fine? Barclay and Perkins never turned out ale equal to that!"

"See the advantage of being put on short allowance!" moralized the doctor.

"It is not great, after all," retorted Kennedy; "and if I were never again to have the pleasure of drinking water, I should agree on condition that I should never be deprived of it."

At six o'clock the balloon was floating over the palm-trees.

They were two shrivelled, stunted, dried-up specimens of trees--two ghosts of palms--without foliage, and more dead than alive. Ferguson examined them with terror.

At their feet could be seen the half-worn stones of a spring, but these stones, pulverized by the baking heat of the sun, seemed to be nothing now but impalpable dust. There was not the slightest sign of moisture. The doctor's heart shrunk within him, and he was about to communicate his thoughts to his companions, when their exclamations attracted his attention. As far as the eye could reach to the eastward, extended a long line of whitened bones; pieces of skeletons surrounded the fountain; a caravan had evidently made its way to that point, marking its progress by its bleaching remains; the weaker had fallen one by one upon the sand; the stronger, having at length reached this spring for which they panted, had there found a horrible death.

Our travellers looked at each other and turned pale.

"Let us not alight!" said Kennedy, "let us fly from this hideous spectacle! There's not a drop of water here!"

"No, Dick, as well pass the night here as elsewhere; let us have a clear conscience in the matter. We'll dig down to the very bottom of the well. There has been a spring here, and perhaps there's something left in it!"

The Victoria touched the ground; Joe and Kennedy put into the car a quantity of sand equal to their weight, and leaped out. They then hastened to the well, and penetrated to the interior by a flight of steps that was now nothing but dust. The spring appeared to have been dry for years. They dug down into a parched and powdery sand--the very dryest of all sand, indeed--there was not one trace of moisture!

The doctor saw them come up to the surface of the desert, saturated with perspiration, worn out, covered with fine dust, exhausted, discouraged and despairing.

He then comprehended that their search had been fruitless. He had expected as much, and he kept silent, for he felt that, from this moment forth, he must have courage and energy enough for three.

Joe brought up with him some pieces of a leathern bottle that had grown hard and horn-like with age, and angrily flung them away among the bleaching bones of the caravan.

At supper, not a word was spoken by our travellers, and they even ate without appetite. Yet they had not, up to this moment, endured the real agonies of thirst, and were in no desponding mood, excepting for the future.

CHAPTER TWENTY-SIXTH.

One Hundred and Thirteen Degrees.--The Doctor's Reflections.--A Desperate Search.--The Cylinder goes out.--One Hundred and Twenty-two Degrees.-- Contemplation of the Desert.--A Night Walk.--Solitude.--Debility.--Joe's Prospects.--He gives himself One Day more.

The distance made by the balloon during the preceding day did not exceed ten miles, and, to keep it afloat, one hundred and sixty-two cubic feet of gas had been consumed.
On Saturday morning the doctor again gave the signal for departure. "The cylinder can work only six hours longer; and, in that time we shall not have found either a well or a spring of water, God alone knows what will become of us!"

"Not much wind this morning, master," said Joe; "but it will come up, perhaps," he added, suddenly remarking the doctor's ill-concealed depression.

Vain hope! The atmosphere was in a dead calm—one of those calms which hold vessels captive in tropical seas. The heat had become intolerable; and the thermometer, in the shade under the awning, indicated one hundred and thirteen degrees.

Joe and Kennedy, reclining at full length near each other, tried, if not in slumber, at least in torpor, to forget their situation, for their forced inactivity gave them periods of leisure far from pleasant. That man is to be pitied the most who cannot wean himself from gloomy reflections by actual work, or some practical pursuit. But here there was nothing to look after, nothing to undertake, and they had to submit to the situation, without having it in their power to ameliorate it.

The pangs of thirst began to be severely felt; brandy, far from appeasing this imperious necessity, augmented it, and richly merited the name of "tiger's milk" applied to it by the African natives. Scarcely two pints of water remained, and that was heated. Each of the party devoured the few precious drops with his gaze, yet neither of them dared to moisten his lips with them. Two pints of water in the midst of the desert!

Then it was that Dr. Ferguson, buried in meditation, asked himself whether he had acted with prudence. Would he not have done better to have kept the water that he had decomposed in pure loss, in order to sustain him in the air? He had gained a little distance, to be sure; but was he any nearer to his journey's end? What difference did sixty miles to the rear make in this region, when there was no water to be had where they were? The wind, should it rise, would blow there as it did here, only less strongly at this point, if it came from the east. But hope urged him onward. And yet those two gallons of water, expended in vain, would have sufficed for nine days' halt in the desert. And what changes might not have occurred in nine days! Perhaps, too, while retaining the water, he might have ascended by throwing out ballast, at the cost merely of discharging some gas, when he had again to descend. But the gas in his balloon was his blood, his very life!

A thousand one such reflections whirled in succession through his brain; and, resting his head between his hands, he sat there for hours without raising it.

"We must make one final effort," he said, at last, about ten o'clock in the morning. "We must endeavor, just once more, to find an atmospheric current to bear us away from here, and, to that end, must risk our last resources."

Therefore, while his companions slept, the doctor raised the hydrogen in the balloon to an elevated temperature, and the huge globe, filling out by the dilation of the gas, rose straight up in the perpendicular rays of the sun. The doctor searched vainly for a breath of wind, from the height of one hundred feet to that of five miles; his starting-point remained fatally right below him, and absolute calm seemed to reign, up to the extreme limits of the breathing atmosphere.

At length the feeding-supply of water gave out; the cylinder was extinguished for lack of gas; the Buntzen battery ceased to work, and the balloon, shrinking together, gently descended to the sand, in the very place that the car had hollowed out there.

It was noon; and solar observations gave nineteen degrees thirty-five minutes east longitude, and six degrees fifty-one minutes north latitude, or nearly five hundred miles from Lake Tchad, and more than four hundred miles from the western coast of Africa.

On the balloon taking ground, Kennedy and Joe awoke from their stupor.

"We have halted," said the Scot.

"We had to do so," replied the doctor, gravely.

His companions understood him. The level of the soil at that point corresponded with the level of the sea, and, consequently, the balloon remained in perfect equilibrium, and absolutely motionless.

The weight of the three travellers was replaced with an equivalent quantity of sand, and they got out of the car. Each was absorbed in his own thoughts; and for many hours neither of them spoke. Joe prepared their evening meal, which consisted of biscuit and pemmican, and was hardly tasted by either of the party. A mouthful of scalding water from their little store completed this gloomy repast.

During the night none of them kept awake; yet none could be precisely said to have slept. On the morrow there remained only half a pint of water, and this the doctor put away, all three having resolved not to touch it until the last extremity.

It was not long, however, before Joe exclaimed:

"I'm choking, and the heat is getting worse! I'm not surprised at that, though," he added, consulting the thermometer; "one hundred and forty degrees!"
"The sand scorches me," said the hunter, "as though it had just come out of a furnace; and not a cloud in this sky of fire. It's enough to drive one mad!"

"Let us not despair," responded the doctor. "In this latitude these intense heats are invariably followed by storms, and the latter come with the suddenness of lightning. Notwithstanding this disheartening clearness of the sky, great atmospheric changes may take place in less than an hour."

"But," asked Kennedy, "is there any sign whatever of that?"

"Well," replied the doctor, "I think that there is some slight symptom of a fall in the barometer."

"May Heaven hearken to you, Samuel! for here we are pinned to the ground, like a bird with broken wings."

"With this difference, however, my dear Dick, that our wings are unhurt, and I hope that we shall be able to use them again."

"Ah! wind! wind!" exclaimed Joe; "enough to carry us to a stream or a well, and we'll be all right. We have provisions enough, and, with water, we could wait a month without suffering; but thirst is a cruel thing!"

It was not thirst alone, but the unchanging sight of the desert, that fatigued the mind. There was not a variation in the surface of the soil, not a hillock of sand, not a pebble, to relieve the gaze. This unbroken level discouraged the beholder, and gave him that kind of malady called the "desert-sickness." The impassible monotonity of the arid blue sky, and the vast yellow expanse of the desert-sand, at length produced a sensation of terror. In this inflamed atmosphere the heat appeared to vibrate as it does above a blazing hearth, while the mind grew desperate in contemplating the limitless calm, and could see no reason why the thing should ever end, since immensity is a species of eternity.

Thus, at last, our hapless travellers, deprived of water in this torrid heat, began to feel symptoms of mental disorder. Their eyes swelled in their sockets, and their gaze became confused.

When night came on, the doctor determined to combat this alarming tendency by rapid walking. His idea was to pace the sandy plain for a few hours, not in search of any thing, but simply for exercise.

"Come along!" he said to his companions; "believe me, it will do you good."

"Out of the question!" said Kennedy; "I could not walk a step."

"And I," said Joe, "would rather sleep!"

"But sleep, or even rest, would be dangerous to you, my friends; you must react against this tendency to stupor. Come with me!"

But the doctor could do nothing with them, and, therefore, set off alone, amid the starry clearness of the night. The first few steps he took were painful, for they were the steps of an enfeebled man quite out of practice in walking. However, he quickly saw that the exercise would be beneficial to him, and pushed on several miles to the westward. Once in rapid motion, he felt his spirits greatly cheered, when, suddenly, a vertigo came over him; he seemed to be poised on the edge of an abyss; his knees bent under him; the vast solitude struck terror to his heart; he found himself the minute mathematical point, the centre of an infinite circumference, that is to say--a nothing! The balloon had disappeared entirely in the deepening gloom. The doctor, cool, impassible, reckless explorer that he was, felt himself at last seized with a nameless dread. He strove to retrace his steps, but in vain. He called aloud. Not even an echo replied, and his voice died out in the empty vastness of surrounding space, like a pebble cast into a bottomless gulf; then, down he sank, fainting, on the sand, alone, amid the eternal silence of the desert.

At midnight he came to, in the arms of his faithful follower, Joe. The latter, uneasy at his master's prolonged absence, had set out after him, easily tracing him by the clear imprint of his feet in the sand, and had found him lying in a swoon.

"What has been the matter, sir?" was the first inquiry.

"Nothing, Joe, nothing! Only a touch of weakness, that's all. It's over now." "Oh! it won't amount to any thing, sir, I'm sure of that; but get up on your feet, if you can. There! lean upon me, and let us get back to the balloon."

And the doctor, leaning on Joe's arm, returned along the track by which he had come.

"You were too bold, sir; it won't do to run such risks. You might have been robbed," he added, laughing. "But, sir, come now, let us talk seriously."

"Speak! I am listening to you."

"We must positively make up our minds to do something. Our present situation cannot last more than a few days longer, and if we get no wind, we are lost."

The doctor made no reply.

"Well, then, one of us must sacrifice himself for the good of all, and it is most natural that it should fall to me to do so."

"What have you to propose? What is your plan?"

"A very simple one! It is to take provisions enough, and to walk right on until I come to some place, as I must
do, sooner or later. In the mean time, if Heaven sends you a good wind, you need not wait, but can start again. For my part, if I come to a village, I'll work my way through with a few Arabic words that you can write for me on a slip of paper, and I'll bring you help or lose my hide. What do you think of my plan?"

"It is absolute folly, Joe, but worthy of your noble heart. The thing is impossible. You will not leave us."

"But, sir, we must do something, and this plan can't do you any harm, for, I say again, you need not wait; and then, after all, I may succeed."

"No, Joe, no! We will not separate. That would only be adding sorrow to trouble. It was written that matters should be as they are; and it is very probably written that it shall be quite otherwise by-and-by. Let us wait, then, with resignation."

"So be it, master; but take notice of one thing: I give you a day longer, and I'll not wait after that. To-day is Sunday; we might say Monday, as it is one o'clock in the morning, and if we don't get off by Tuesday, I'll run the risk. I've made up my mind to that!"

The doctor made no answer, and in a few minutes they got back to the car, where he took his place beside Kennedy, who lay there plunged in silence so complete that it could not be considered sleep.

CHAPTER TWENTY-SEVENTH.

Terrific Heat.--Hallucinations.--The Last Drops of Water.--Nights of Despair.--An Attempt at Suicide.--The Simoom.--The Oasis.--The Lion and Lioness.

The doctor's first care, on the morrow, was to consult the barometer. He found that the mercury had scarcely undergone any perceptible depression.

"Nothing!" he murmured, "nothing!"

He got out of the car and scrutinized the weather; there was only the same heat, the same cloudless sky, the same merciless drought.

"Must we, then, give up to despair?" he exclaimed, in agony.

Joe did not open his lips. He was buried in his own thoughts, and planning the expedition he had proposed.

Kennedy got up, feeling very ill, and a prey to nervous agitation. He was suffering horribly with thirst, and his swollen tongue and lips could hardly articulate a syllable.

There still remained a few drops of water. Each of them knew this, and each was thinking of it, and felt himself drawn toward them; but neither of the three dared to take a step.

Those three men, friends and companions as they were, fixed their haggard eyes upon each other with an instinct of ferocious longing, which was most plainly revealed in the hardy Scot, whose vigorous constitution yielded the soonest to these unnatural privations.

Throughout the day he was delirious, pacing up and down, uttering hoarse cries, gnawing his clinched fists, and ready to open his veins and drink his own hot blood.

"Ah!" he cried, "land of thirst! Well might you be called the land of despair!"

At length he sank down in utter prostration, and his friends heard no other sound from him than the hissing of his breath between his parched and swollen lips.

Toward evening, Joe had his turn of delirium. The vast expanse of sand appeared to him an immense pond, full of clear and limpid water; and, more than once, he dashed himself upon the scorching waste to drink long draughts, and rose again with his mouth clogged with hot dust.

"Curses on it!" he yelled, in his madness, "it's nothing but salt water!"

Then, while Ferguson and Kennedy lay there motionless, the resistless longing came over him to drain the last few drops of water that had been kept in reserve. The natural instinct proved too strong. He dragged himself toward the car, on his knees; he glared at the bottle containing the precious fluid; he gave one wild, eager glance, seized the treasured store, and bore it to his lips.

At that instant he heard a heart-rending cry close beside him--"Water! water!"

It was Kennedy, who had crawled up close to him, and was begging there, upon his knees, and weeping piteously.

Joe, himself in tears, gave the poor wretch the bottle, and Kennedy drained the last drop with savage haste.

"Thanks!" he murmured hoarsely, but Joe did not hear him, for both alike had dropped fainting on the sand.

What took place during that fearful night neither of them knew, but, on Tuesday morning, under those showers of heat which the sun poured down upon them, the unfortunate men felt their limbs gradually drying up, and when Joe attempted to rise he found it impossible.

He looked around him. In the car, the doctor, completely overwhelmed, sat with his arms folded on his breast, gazing with idiotic fixedness upon some imaginary point in space. Kennedy was frightful to behold. He was rolling
his head from right to left like a wild beast in a cage.

All at once, his eyes rested on the butt of his rifle, which jutted above the rim of the car.

"Ah!" he screamed, raising himself with a superhuman effort.

Desperate, mad, he snatched at the weapon, and turned the barrel toward his mouth.

"Kennedy!" shouted Joe, throwing himself upon his friend.

"Let go! hands off!" moaned the Scot, in a hoarse, grating voice--and then the two struggled desperately for the rifle.

"Let go, or I'll kill you!" repeated Kennedy. But Joe clung to him only the more fiercely, and they had been contending thus without the doctor seeing them for many seconds, when, suddenly the rifle went off. At the sound of its discharge, the doctor rose up erect, like a spectre, and glared around him.

But all at once his glance grew more animated; he extended his hand toward the horizon, and in a voice no longer human shrieked:

"There! there--off there!"

There was such fearful force in the cry that Kennedy and Joe released each other, and both looked where the doctor pointed.

The plain was agitated like the sea shaken by the fury of a tempest; billows of sand went tossing over each other amid blinding clouds of dust; an immense pillar was seen whirling toward them through the air from the southeast, with terrific velocity; the sun was disappearing behind an opaque veil of cloud whose enormous barrier extended clear to the horizon, while the grains of fine sand went gliding together with all the supple ease of liquid particles, and the rising dust-tide gained more and more with every second.

Ferguson's eyes gleamed with a ray of energetic hope.

"The simoom!" he exclaimed.

"The simoom!" repeated Joe, without exactly knowing what it meant.

"So much the better!" said Kennedy, with the bitterness of despair. "So much the better--we shall die!"

"So much the better!" echoed the doctor, "for we shall live!" and, so saying, he began rapidly to throw out the sand that encumbered the car.

At length his companions understood him, and took their places at his side.

"And now, Joe," said the doctor, "throw out some fifty pounds of your ore, there!"

Joe no longer hesitated, although he still felt a fleeting pang of regret. The balloon at once began to ascend.

"It was high time!" said the doctor.

The simoom, in fact, came rushing on like a thunderbolt, and a moment later the balloon would have been crushed, torn to atoms, annihilated. The awful whirlwind was almost upon it, and it was already pelted with showers of sand driven like hail by the storm.

"Out with more ballast!" shouted the doctor.

"There!" responded Joe, tossing over a huge fragment of quartz.

With this, the Victoria rose swiftly above the range of the whirling column, but, caught in the vast displacement of the atmosphere thereby occasioned, it was borne along with incalculable rapidity away above this foaming sea.

The three travellers did not speak. They gazed, and hoped, and even felt refreshed by the breath of the tempest.

About three o'clock, the whirlwind ceased; the sand, falling again upon the desert, formed numberless little hillocks, and the sky resumed its former tranquillity.

The balloon, which had again lost its momentum, was floating in sight of an oasis, a sort of islet studded with green trees, thrown up upon the surface of this sandy ocean.

"Water! we'll find water there!" said the doctor.

And, instantly, opening the upper valve, he let some hydrogen escape, and slowly descended, taking the ground at about two hundred feet from the edge of the oasis.

In four hours the travellers had swept over a distance of two hundred and forty miles!

The car was at once ballasted, and Kennedy, closely followed by Joe, leaped out.

"Take your guns with you!" said the doctor; "take your guns, and be careful!"

Dick grasped his rifle, and Joe took one of the fowling-pieces. They then rapidly made for the trees, and disappeared under the fresh verdure, which announced the presence of abundant springs. As they hurried on, they had not taken notice of certain large footprints and fresh tracks of some living creature marked here and there in the damp soil.

Suddenly, a dull roar was heard not twenty paces from them.

"The roar of a lion!" said Joe.

"Good for that!" said the excited hunter; "we'll fight him. A man feels strong when only a fight's in question."

"But be careful, Mr. Kennedy; be careful! The lives of all depend upon the life of one."
But Kennedy no longer heard him; he was pushing on, his eye blazing; his rifle cocked; fearful to behold in his daring rashness. There, under a palm-tree, stood an enormous black-maned lion, crouching for a spring on his antagonist. Scarcely had he caught a glimpse of the hunter, when he bounded through the air; but he had not touched the ground ere a bullet pierced his heart, and he fell to the earth dead.

"Hurrah! hurrah!" shouted Joe, with wild exultation.

Kennedy rushed toward the well, slid down the dampened steps, and flung himself at full length by the side of a fresh spring, in which he plunged his parched lips. Joe followed suit, and for some minutes nothing was heard but the sound they made with their mouths, drinking more like maddened beasts than men.

"Take care, Mr. Kennedy," said Joe at last; "let us not overdo the thing!" and he panted for breath.

But Kennedy, without a word, drank on. He even plunged his hands, and then his head, into the delicious tide—he fairly revelled in its coolness.

"But the doctor?" said Joe; "our friend, Dr. Ferguson?"

That one word recalled Kennedy to himself, and, hastily filling a flask that he had brought with him, he started on a run up the steps of the well.

But what was his amazement when he saw an opaque body of enormous dimensions blocking up the passage! Joe, who was close upon Kennedy's heels, recoiled with him.

"We are blocked in—entrapped!"

"Impossible! What does that mean?--"

Dick had no time to finish; a terrific roar made him only too quickly aware what foe confronted him.

"Another lion!" exclaimed Joe.

"A lioness, rather," said Kennedy. "Ah! ferocious brute!" he added, "I'll settle you in a moment more!" and swiftly reloaded his rifle.

In another instant he fired, but the animal had disappeared.

"Onward!" shouted Kennedy.

"No!" interposed the other, "that shot did not kill her; her body would have rolled down the steps; she's up there, ready to spring upon the first of us who appears, and he would be a lost man!"

"But what are we to do? We must get out of this, and the doctor is expecting us."

"Let us decoy the animal. Take my piece, and give me your rifle."

"What is your plan?"

"You'll see."

And Joe, taking off his linen jacket, hung it on the end of the rifle, and thrust it above the top of the steps. The lioness flung herself furiously upon it. Kennedy was on the alert for her, and his bullet broke her shoulder. The lioness, with a frightful howl of agony, rolled down the steps, overturning Joe in her fall. The poor fellow imagined that he could already feel the enormous paws of the savage beast in his flesh, when a second detonation resounded in the narrow passage, and Dr. Ferguson appeared at the opening above with his gun in hand, and still smoking from the discharge.

Joe leaped to his feet, clambered over the body of the dead lioness, and handed up the flask full of sparkling water to his master.

To carry it to his lips, and to half empty it at a draught, was the work of an instant, and the three travellers offered up thanks from the depths of their hearts to that Providence who had so miraculously saved them.

CHAPTER TWENTY-EIGHTH.

An Evening of Delight.--Joe's Culinary Performance.--A Dissertation on Raw Meat.--The Narrative of James Bruce.--Camping out.--Joe's Dreams.--The Barometer begins to fall.--The Barometer rises again.--Preparations for Departure.--The Tempest.

The evening was lovely, and our three friends enjoyed it in the cool shade of the mimosas, after a substantial repast, at which the tea and the punch were dealt out with no niggardly hand.

Kennedy had traversed the little domain in all directions. He had ransacked every thicket and satisfied himself that the balloon party were the only living creatures in this terrestrial paradise; so they stretched themselves upon their blankets and passed a peaceful night that brought them forgetfulness of their past sufferings.

On the morrow, May 7th, the sun shone with all his splendor, but his rays could not penetrate the dense screen of the palm-tree foliage, and as there was no lack of provisions, the doctor resolved to remain where he was while waiting for a favorable wind.

Joe had conveyed his portable kitchen to the oasis, and proceeded to indulge in any number of culinary combinations, using water all the time with the most profuse extravagance.
"What a strange succession of annoyances and enjoyments!" moralized Kennedy. "Such abundance as this after such privations; such luxury after such want! Ah! I nearly went mad!"

"My dear Dick," replied the doctor, "had it not been for Joe, you would not be sitting here, to-day, discoursing on the instability of human affairs."

"Whole-hearted friend!" said Kennedy, extending his hand to Joe.

"There's no occasion for all that," responded the latter; "but you can take your revenge some time, Mr. Kennedy, always hoping though that you may never have occasion to do the same for me!"

"It's a poor constitution this of ours to succumb to so little," philosophized Dr. Ferguson.

"So little water, you mean, doctor," interposed Joe; "that element must be very necessary to life."

"Undoubtedly, and persons deprived of food hold out longer than those deprived of water."

"I believe it. Besides, when needs must, one can eat any thing he comes across, even his fellow-creatures, although that must be a kind of food that's pretty hard to digest."

"The savages don't boggle much about it!" said Kennedy.

"Yes; but then they are savages, and accustomed to devouring raw meat; it's something that I'd find very disgusting, for my part."

"It is disgusting enough," said the doctor, "that's a fact; and so much so, indeed, that nobody believed the narratives of the earliest travellers in Africa who brought back word that many tribes on that continent subsisted upon raw meat, and people generally refused to credit the statement. It was under such circumstances that a very singular adventure befell James Bruce."

"Tell it to us, doctor; we've time enough to hear it," said Joe, stretching himself voluptuously on the cool greensward.

"By all means.--James Bruce was a Scotchman, of Stirlingshire, who, between 1768 and 1772, traversed all Abyssinia, as far as Lake Tyana, in search of the sources of the Nile. He afterward returned to England, but did not publish an account of his journeys until 1790. His statements were received with extreme incredulity, and such may be the reception accorded to our own. The manners and customs of the Abyssinians seemed so different from those of the English, that no one would credit the description of them. Among other details, Bruce had put forward the assertion that the tribes of Eastern Africa fed upon raw flesh, and this set everybody against him. He might say so as much as he pleased; there was no one likely to go and see! One day, in a parlor at Edinburgh, a Scotch gentleman took up the subject in his presence, as it had become the topic of daily pleasantry, and, in reference to the eating of raw flesh, said that the thing was neither possible nor true. Bruce made no reply, but went out and returned a few minutes later with a raw steak, seasoned with pepper and salt, in the African style."

"'Sir,' said he to the Scotchman, 'in doubting my statements, you have grossly affronted me; in believing the thing to be impossible, you have been egregiously mistaken; and, in proof thereof, you will now eat this beef-steak raw, or you will give me instant satisfaction!' The Scotchman had a wholesome dread of the brawny traveller, and DID eat the steak, although not without a good many wry faces. Thereupon, with the utmost coolness, James Bruce added: 'Even admitting, sir, that the thing were untrue, you will, at least, no longer maintain that it is impossible.'"

"Well put in!" said Joe, "and if the Scotchman found it lie heavy on his stomach, he got no more than he deserved. If, on our return to England, they dare to doubt what we say about our travels--"

"Well, Joe, what would you do?"

"Why, I'll make the doubters swallow the pieces of the balloon, without either salt or pepper!"

All burst out laughing at Joe's queer notions, and thus the day slipped by in pleasant chat. With returning strength, hope had revived, and with hope came the courage to do and to dare. The past was obliterated in the presence of the future with providential rapidity.

Joe would have been willing to remain forever in this enchanting asylum; it was the realm he had pictured in his dreams; he felt himself at home; his master had to give him his exact location, and it was with the gravest air imaginable that he wrote down on his tablets fifteen degrees forty-three minutes east longitude, and eight degrees thirty-two minutes north latitude.

Kennedy had but one regret, to wit, that he could not hunt in that miniature forest, because, according to his ideas, there was a slight deficiency of ferocious wild beasts in it.

"But, my dear Dick," said the doctor, "haven't you rather a short memory? How about the lion and the lioness?"

"Oh, that!" he ejaculated with the contempt of a thorough-bred sportsman for game already killed. "But the fact is, that finding them here would lead one to suppose that we can't be far from a more fertile country."

"It don't prove much, Dick, for those animals, when goaded by hunger or thirst, will travel long distances, and I think that, to-night, we had better keep a more vigilant lookout, and light fires, besides."

"What, in such heat as this?" said Joe. "Well, if it's necessary, we'll have to do it, but I do think it a real pity to burn this pretty grove that has been such a comfort to us!"
"Oh! above all things, we must take the utmost care not to set it on fire," replied the doctor, "so that others in the same strait as ourselves may some day find shelter here in the middle of the desert."

"I'll be very careful, indeed, doctor; but do you think that this oasis is known?"

"Undoubtedly; it is a halting-place for the caravans that frequent the centre of Africa, and a visit from one of them might be any thing but pleasant to you, Joe."

"Why, are there any more of those rascally Nyam-Nyams around here?"

"Certainly; that is the general name of all the neighboring tribes, and, under the same climates, the same races are likely to have similar manners and customs."

"Pah!" said Joe, "but, after all, it's natural enough. If savages had the ways of gentlemen, where would be the difference? By George, these fine fellows wouldn't have to be coaxed long to eat the Scotchman's raw steak, nor the Scotchman either, into the bargain!"

With this very sensible observation, Joe began to get ready his firewood for the night, making just as little of it as possible. Fortunately, these precautions were superfluous; and each of the party, in his turn, dropped off into the soundest slumber.

On the next day the weather still showed no sign of change, but kept provokingly and obstinately fair. The balloon remained motionless, without any oscillation to betray a breath of wind.

The doctor began to get uneasy again. If their stay in the desert were to be prolonged like this, their provisions would give out. After nearly perishing for want of water, they would, at last, have to starve to death!

But he took fresh courage as he saw the mercury fall considerably in the barometer, and noticed evident signs of an early change in the atmosphere. He therefore resolved to make all his preparations for a start, so as to avail himself of the first opportunity. The feeding-tank and the water-tank were both completely filled.

Then he had to reestablish the equilibrium of the balloon, and Joe was obliged to part with another considerable portion of his precious quartz. With restored health, his ambitious notions had come back to him, and he made more than one wry face before obeying his master; but the latter convinced him that he could not carry so considerable a weight with him through the air, and gave him his choice between the water and the gold. Joe hesitated no longer, but flung out the requisite quantity of his much-prized ore upon the sand.

"The next people who come this way," he remarked, "will be rather surprised to find a fortune in such a place."

"And suppose some learned traveller should come across these specimens, eh?" suggested Kennedy.

"You may be certain, Dick, that they would take him by surprise, and that he would publish his astonishment in several folios; so that some day we shall hear of a wonderful deposit of gold-bearing quartz in the midst of the African sands!"

"And Joe there, will be the cause of it all!"

This idea of mystifying some learned sage tickled Joe hugely, and made him laugh.

During the rest of the day the doctor vainly kept on the watch for a change of weather. The temperature rose, and, had it not been for the shade of the oasis, would have been insupportable. The thermometer marked a hundred and forty-nine degrees in the sun, and a veritable rain of fire filled the air. This was the most intense heat that they had yet noted.

Joe arranged their bivouac for that evening, as he had done for the previous night; and during the watches kept by the doctor and Kennedy there was no fresh incident.

But, toward three o'clock in the morning, while Joe was on guard, the temperature suddenly fell; the sky became overcast with clouds, and the darkness increased.

"Turn out!" cried Joe, arousing his companions. "Turn out! Here's the wind!"

"At last!" exclaimed the doctor, eying the heavens. "But it is a storm! The balloon! Let us hasten to the balloon!"

It was high time for them to reach it. The Victoria was bending to the force of the hurricane, and dragging along the car, the latter grazing the sand. Had any portion of the ballast been accidentally thrown out, the balloon would have been swept away, and all hope of recovering it have been forever lost.

But fleet-footed Joe put forth his utmost speed, and checked the car, while the balloon beat upon the sand, at the risk of being torn to pieces. The doctor, followed by Kennedy, leaped in, and lit his cylinder, while his companions threw out the superfluous ballast.

The travellers took one last look at the trees of the oasis bowing to the force of the hurricane, and soon, catching the wind at two hundred feet above the ground, disappeared in the gloom.

CHAPTER TWENTY-NINTH.

Signs of Vegetation.--The Fantastic Notion of a French Author.--A Magnificent Country.--The Kingdom of Adamova.--The Explorations of Speke and Burton connected with those of Dr. Barth.--The Atlantika Mountains.--
The River Benoue.--The City of Yola.--The Bagele.--Mount Mendif.

From the moment of their departure, the travellers moved with great velocity. They longed to leave behind them the desert, which had so nearly been fatal to them.

About a quarter-past nine in the morning, they caught a glimpse of some signs of vegetation: herbage floating on that sea of sand, and announcing, as the weeds upon the ocean did to Christopher Columbus, the nearness of the shore--green shoots peeping up timidly between pebbles that were, in their turn, to be the rocks of that vast expanse. Hills, but of trifling height, were seen in wavy lines upon the horizon. Their profile, muffled by the heavy mist, was defined but vaguely. The monotony, however, was beginning to disappear.

The doctor hailed with joy the new country thus disclosed, and, like a seaman on lookout at the mast-head, he was ready to shout aloud:

"Land, ho! land!"

An hour later the continent spread broadly before their gaze, still wild in aspect, but less flat, less denuded, and with a few trees standing out against the gray sky.

"We are in a civilized country at last!" said the hunter.

"Civilized? Well, that's one way of speaking; but there are no people to be seen yet."

"It will not be long before we see them," said Ferguson, "at our present rate of travel."

"Are we still in the negro country, doctor?"

"Yes, and on our way to the country of the Arabs."

"What! real Arabs, sir, with their camels?"

"No, not many camels; they are scarce, if not altogether unknown, in these regions. We must go a few degrees farther north to see them."

"What a pity!"

"And why, Joe?"

"Because, if the wind fell contrary, they might be of use to us."

"How so?"

"Well, sir, it's just a notion that's got into my head: we might hitch them to the car, and make them tow us along. What do you say to that, doctor?"

"Poor Joe! Another person had that idea in advance of you. It was used by a very gifted French author-- M. Mery--in a romance, it is true. He has his travellers drawn along in a balloon by a team of camels; then a lion comes up, devours the camels, swallows the tow-rope, and hauls the balloon in their stead; and so on through the story. You see that the whole thing is the top-flower of fancy, but has nothing in common with our style of locomotion."

Joe, a little cut down at learning that his idea had been used already, cudgelled his wits to imagine what animal could have devoured the lion; but he could not guess it, and so quietly went on scanning the appearance of the country.

A lake of medium extent stretched away before him, surrounded by an amphitheatre of hills, which yet could not be dignified with the name of mountains. There were winding valleys, numerous and fertile, with their tangled thickets of the most various trees. The African oil-tree rose above the mass, with leaves fifteen feet in length upon its stalk, the latter studded with sharp thorns; the bombax, or silk-cotton-tree, filled the wind, as it swept by, with the fine down of its seeds; the pungent odors of the pendanus, the "kenda" of the Arabs, perfumed the air up to the height where the Victoria was sailing; the papaw-tree, with its palm-shaped leaves; the sterculier, which produces the Soudan-nut; the baobab, and the banana-tree, completed the luxuriant flora of these inter-tropical regions.

"The country is superb!" said the doctor.

"Here are some animals," added Joe. "Men are not far away."

"Oh, what magnificent elephants!" exclaimed Kennedy. "Is there no way to get a little shooting?"

"How could we manage to halt in a current as strong as this? No, Dick; you must taste a little of the torture of Tantalus just now. You shall make up for it afterward."

And, in truth, there was enough to excite the fancy of a sportsman. Dick's heart fairly leaped in his breast as he grasped the butt of his Purdy.

The fauna of the region were as striking as its flora. The wild-ox revelled in dense herbage that often concealed his whole body; gray, black, and yellow elephants of the most gigantic size burst headlong, like a living hurricane, through the forests, breaking, rending, tearing down, devastating every thing in their path; upon the woody slopes of the hills trickled cascades and springs flowing northward; there, too, the hippopotami bathed their huge forms, splashing and snorting as they frolicked in the water, and lamantines, twelve feet long, with bodies like seals, stretched themselves along the banks, turning up toward the sun their rounded teats swollen with milk.

It was a whole menagerie of rare and curious beasts in a wondrous hot-house, where numberless birds with plumage of a thousand hues gleamed and fluttered in the sunshine.
By this prodigality of Nature, the doctor recognized the splendid kingdom of Adamova.

"We are now beginning to trench upon the realm of modern discovery. I have taken up the lost scent of preceding travellers. It is a happy chance, my friends, for we shall be enabled to link the toils of Captains Burton and Speke with the explorations of Dr. Barth. We have left the Englishmen behind us, and now have caught up with the Hamburger. It will not be long, either, before we arrive at the extreme point attained by that daring explorer."

"It seems to me that there is a vast extent of country between the two explored routes," remarked Kennedy; "at least, if I am to judge by the distance that we have made."

"It is easy to determine: take the map and see what is the longitude of the southern point of Lake Ukereoue, reached by Speke."

"It is near the thirty-seventh degree."

"And the city of Yola, which we shall sight this evening, and to which Barth penetrated, what is its position?"

"It is about in the twelfth degree of east longitude."

"Then there are twenty-five degrees, or, counting sixty miles to each, about fifteen hundred miles in all."

"A nice little walk," said Joe, "for people who have to go on foot."

"It will be accomplished, however. Livingstone and Moffat are pushing on up this line toward the interior. Nyassa, which they have discovered, is not far from Lake Tanganayika, seen by Burton. Ere the close of the century these regions will, undoubtedly, be explored. But," added the doctor, consulting his compass, "I regret that the wind is carrying us so far to the westward. I wanted to get to the north."

After twelve hours of progress, the Victoria found herself on the confines of Nigritia. The first inhabitants of this region, the Chouas Arabs, were feeding their wandering flocks. The immense summits of the Atlantika Mountains seen above the horizon--mountains that no European foot had yet scaled, and whose height is computed to be ten thousand feet! Their western slope determines the flow of all the waters in this region of Africa toward the ocean. They are the Mountains of the Moon to this part of the continent.

At length a real river greeted the gaze of our travellers, and, by the enormous ant-hills seen in its vicinity, the doctor recognized the Benoue, one of the great tributaries of the Niger, the one which the natives have called "The Fountain of the Waters."

"This river," said the doctor to his companions, "will, one day, be the natural channel of communication with the interior of Nigritia. Under the command of one of our brave captains, the steamer Pleiad has already ascended as far as the town of Yola. You see that we are not in an unknown country."

Numerous slaves were engaged in the labors of the field, cultivating sorgho, a kind of millet which forms the chief basis of their diet; and the most stupid expressions of astonishment ensued as the Victoria sped past like a meteor. That evening the balloon halted about forty miles from Yola, and ahead of it, but in the distance, rose the two sharp cones of Mount Mendif.

The doctor threw out his anchors and made fast to the top of a high tree; but a very violent wind beat upon the balloon with such force as to throw it over on its side, thus rendering the position of the car sometimes extremely dangerous. Ferguson did not close his all night, and he was repeatedly on the point of cutting the anchor-rope and scudding away before the gale. At length, however, the storm abated, and the oscillations of the balloon ceased to be alarming.

On the morrow the wind was more moderate, but it carried our travellers away from the city of Yola, which recently rebuilt by the Fouillans, excited Ferguson's curiosity. However, he had to make up his mind to being borne farther to the northward and even a little to the east.

Kennedy proposed to halt in this fine hunting-country, and Joe declared that the need of fresh meat was beginning to be felt; but the savage customs of the country, the attitude of the population, and some shots fired at the Victoria, admonished the doctor to continue his journey. They were then crossing a region that was the scene of massacres and burnings, and where warlike conflicts between the barbarian sultans, contending for their power amid the most atrocious carnage, never cease.

Numerous and populous villages of long low huts stretched away between broad pasture-fields whose dense herbage was besprinkled with violet-colored blossoms. The huts, looking like huge beehives, were sheltered behind bristling palisades. The wild hill-sides and hollows frequently reminded the beholder of the glens in the Highlands of Scotland, as Kennedy more than once remarked.

In spite of all he could do, the doctor bore directly to the northeast, toward Mount Mendif, which was lost in the midst of environing clouds. The lofty summits of these mountains separate the valley of the Niger from the basin of Lake Tchad.

Soon afterward was seen the Bagele, with its eighteen villages clinging to its flanks like a whole brood of children to their mother's bosom--a magnificent spectacle for the beholder whose gaze commanded and took in the entire picture at one view. Even the ravines were seen to be covered with fields of rice and of arachides.
By three o’clock the Victoria was directly in front of Mount Mendif. It had been impossible to avoid it; the only thing to be done was to cross it. The doctor, by means of a temperature increased to one hundred and eighty degrees, gave the balloon a fresh ascensional force of nearly sixteen hundred pounds, and it went up to an elevation of more than eight thousand feet, the greatest height attained during the journey. The temperature of the atmosphere was so much cooler at that point that the aeronauts had to resort to their blankets and thick coverings.

Ferguson was in haste to descend; the covering of the balloon gave indications of bursting, but in the meanwhile he had time to satisfy himself of the volcanic origin of the mountain, whose extinct craters are now but deep abysses. Immense accumulations of bird-guano gave the sides of Mount Mendif the appearance of calcareous rocks, and there was enough of the deposit there to manure all the lands in the United Kingdom.

At five o’clock the Victoria, sheltered from the south winds, went gently gliding along the slopes of the mountain, and stopped in a wide clearing remote from any habitation. The instant it touched the soil, all needful precautions were taken to hold it there firmly; and Kennedy, fowling-piece in hand, sallied out upon the sloping plain. Ere long, he returned with half a dozen wild ducks and a kind of snipe, which Joe served up in his best style. The meal was heartily relished, and the night was passed in undisturbed and refreshing slumber.

CHAPTER THIRTIETH.

Mosfeia.—The Sheik.—Denham, Clapperton, and Oudney.—Vogel.—The Capital of Loggoum.—Toole.—Becalmed above Kernak.—The Governor and his Court.—The Attack.—The Incendiary Pigeons.

On the next day, May 11th, the Victoria resumed her adventurous journey. Her passengers had the same confidence in her that a good seaman has in his ship.

In terrific hurricanes, in tropical heats, when making dangerous departures, and descents still more dangerous, it had, at all times and in all places, come out safely. It might almost have been said that Ferguson managed it with a wave of the hand; and hence, without knowing in advance, where the point of arrival would be, the doctor had no fears concerning the successful issue of his journey. However, in this country of barbarians and fanatics, prudence obliged him to take the strictest precautions. He therefore counselled his companions to have their eyes wide open for every thing and at all hours.

The wind drifted a little more to the northward, and, toward nine o’clock, they sighted the larger city of Mosfeia, built upon an eminence which was itself enclosed between two lofty mountains. Its position was impregnable, a narrow road running between a marsh and a thick wood being the only channel of approach to it.

At the moment of which we write, a sheik, accompanied by a mounted escort, and clad in a garb of brilliant colors, preceded by couriers and trumpeters, who put aside the boughs of the trees as he rode up, was making his grand entry into the place.

The doctor lowered the balloon in order to get a better look at this cavalcade of natives; but, as the balloon grew larger to their eyes, they began to show symptoms of intense affright, and at length made off in different directions as fast as their legs and those of their horses could carry them.

The sheik alone did not budge an inch. He merely grasped his long musket, cocked it, and proudly waited in silence. The doctor came on to within a hundred and fifty feet of him, and then, with his roundest and fullest voice, saluted him courteously in the Arabic tongue.

But, upon hearing these words falling, as it seemed, from the sky, the sheik dismounted and prostrated himself in the dust of the highway, where the doctor had to leave him, finding it impossible to divert him from his adoration.

"Unquestionably," Ferguson remarked, "those people take us for supernatural beings. When Europeans came among them for the first time, they were mistaken for creatures of a higher race. When this sheik comes to speak of to-day's meeting, he will not fail to embellish the circumstance with all the resources of an Arab imagination. You may, therefore, judge what an account their legends will give of us some day."

"Not such a desirable thing, after all," said the Scot, "in the point of view that affects civilization; it would be better to pass for mere men. That would give these negro races a superior idea of European power."

"Very good, my dear Dick; but what can we do about it? You might sit all day explaining the mechanism of a balloon to the savants of this country, and yet they would not comprehend you, but would persist in ascribing it to supernatural aid."

"Doctor, you spoke of the first time Europeans visited these regions. Who were the visitors?" inquired Joe.

"My dear fellow, we are now upon the very track of Major Denham. It was at this very city of Mosfeia that he was received by the Sultan of Mandara; he had quitted the Bornou country; he accompanied the sheik in an expedition against the Fellatahs; he assisted in the attack on the city, which, with its arrows alone, bravely resisted the bullets of the Arabs, and put the sheik's troops to flight. All this was but a pretext for murders, raids, and pillage. The major was completely plundered and stripped, and had it not been for his horse, under whose stomach he clung
with the skill of an Indian rider, and was borne with a headlong gallop from his barbarous pursuers, he never could have made his way back to Kouka, the capital of Bornou."

"Who was this Major Denham?"

"A fearless Englishman, who, between 1822 and 1824, commanded an expedition into the Bornou country, in company with Captain Clapperton and Dr. Oudney. They set out from Tripoli in the month of March, reached Mbourouzouk, the capital of Fez, and, following the route which at a later period Dr. Barth was to pursue on his way back to Europe, they arrived, on the 16th of February, 1823, at Kouka, near Lake Chad. Denham made several explorations in Bornou, in Mandara, and to the eastern shores of the lake. In the mean time, on the 15th of December, 1823, Captain Clapperton and Dr. Oudney had pushed their way through the Soudan country as far as Sackatooh, and Oudney died of fatigue and exhaustion in the town of Murmur."

"This part of Africa has, therefore, paid a heavy tribute of victims to the cause of science," said Kennedy.

"Yes, this country is fatal to travellers. We are moving directly toward the kingdom of Baghirmi, which Vogel traversed in 1856, so as to reach the Wadai country, where he disappeared. This young man, at the age of twenty-three, had been sent to cooperate with Dr. Barth. They met on the 1st of December, 1854, and thereupon commenced his explorations of the country. Toward 1856, he announced, in the last letters received from him, his intention to reconnoitre the kingdom of Wadai, which no European had yet penetrated. It appears that he got as far as Wara, the capital, where, according to some accounts, he was made prisoner, and, according to others, was put to death for having attempted to ascend a sacred mountain in the environs. But, we must not too lightly admit the death of travellers, since that does away with the necessity of going in search of them. For instance, how often was the death of Dr. Barth reported, to his own great annoyance! It is, therefore, very possible that Vogel may still be held as a prisoner by the Sultan of Wadai, in the hope of obtaining a good ransom for him.

"Baron de Neimans was about starting for the Wadai country when he died at Cairo, in 1855; and we now know that De Heuglin has set out on Vogel's track with the expedition sent from Leipsic, so that we shall soon be accurately informed as to the fate of that young and interesting explorer."

* Since the doctor's departure, letters written from El'Obeid by Mr. Muntzinger, the newly-appointed head of the expedition, unfortunately place the death of Vogel beyond a doubt.

Mosfeia had disappeared from the horizon long ere this, and the Mandara country was developing to the gaze of our aeronauts its astonishing fertility, with its forests of acacias, its locust-trees covered with red flowers, and the herbaceous plants of its fields of cotton and indigo trees. The river Shari, which eighty miles farther on rolled its impetuous waters into Lake Chad, was quite distinctly seen.

The doctor got his companions to trace its course upon the maps drawn by Dr. Barth.

"You perceive," said he, "that the labors of this savant have been conducted with great precision; we are moving directly toward the Loggoum region, and perhaps toward Kernak, its capital. It was there that poor Toole died, at the age of scarcely twenty-two. He was a young Englishman, an ensign in the 80th regiment, who, a few weeks before, had joined Major Denham in Africa, and it was not long ere he there met his death. Ah! this vast country might well be called the graveyard of European travellers."

Some boats, fifty feet long, were descending the current of the Shari. The Victoria, then one thousand feet above the soil, hardly attracted the attention of the natives; but the wind, which until then had been blowing with a certain degree of strength, was falling off.

"Is it possible that we are to be caught in another dead calm?" sighed the doctor.

"Well, we've no lack of water, nor the desert to fear, anyhow, master," said Joe.

"No; but there are races here still more to be dreaded."

"Why!" said Joe, again, "there's something like a town."

"That is Kernak. The last puffs of the breeze are wafting us to it, and, if we choose, we can take an exact plan of the place."

"Shall we not go nearer to it?" asked Kennedy.

"Nothing easier, Dick! We are right over it. Allow me to turn the stopcock of the cylinder, and we'll not be long in descending."

Half an hour later the balloon hung motionless about two hundred feet from the ground.

"Here we are!" said the doctor, "nearer to Kernak than a man would be to London, if he were perched in the cupola of St. Paul's. So we can take a survey at our ease."

"What is that tick-tacking sound that we hear on all sides?"

Joe looked attentively, and at length discovered that the noise they heard was produced by a number of weavers beating cloth stretched in the open air, on large trunks of trees.

The capital of Loggoum could then be seen in its entire extent, like an unrolled chart. It is really a city with straight rows of houses and quite wide streets. In the midst of a large open space there was a slave-market, attended
by a great crowd of customers, for the Mandara women, who have extremely small hands and feet, are in excellent request, and can be sold at lucrative rates.

At the sight of the Victoria, the scene so often produced occurred again. At first there were outcries, and then followed general stupefaction; business was abandoned; work was flung aside, and all noise ceased. The aeronauts remained as they were, completely motionless, and lost not a detail of the populous city. They even went down to within sixty feet of the ground.

Hereupon the Governor of Loggoum came out from his residence, displaying his green standard, and accompanied by his musicians, who blew on hoarse buffalo-horns, as though they would split their cheeks or any thing else, excepting their own lungs. The crowd at once gathered around him. In the mean while Dr. Ferguson tried to make himself heard, but in vain.

This population looked like proud and intelligent people, with their high foreheads, their almost aquiline noses, and their curling hair; but the presence of the Victoria troubled them greatly. Horsemen could be seen galloping in all directions, and it soon became evident that the governor's troops were assembling to oppose so extraordinary a foe. Joe wore himself out waving handkerchiefs of every color and shape to them; but his exertions were all to no purpose.

However, the sheik, surrounded by his court, proclaimed silence, and pronounced a discourse, of which the doctor could not understand a word. It was Arabic, mixed with Baghirmi. He could make out enough, however, by the universal language of gestures, to be aware that he was receiving a very polite invitation to depart. Indeed, he would have asked for nothing better, but for lack of wind, the thing had become impossible. His noncompliance, therefore, exasperated the governor, whose courtiers and attendants set up a furious howl to enforce immediate obedience on the part of the aerial monster.

They were odd-looking fellows those courtiers, with their five or six shirts swathed around their bodies! They had enormous stomachs, some of which actually seemed to be artificial. The doctor surprised his companions by informing them that this was the way to pay court to the sultan. The rotundity of the stomach indicated the ambition of its possessor. These corpulent gentry gesticulated and bawled at the top of their voices--one of them particularly distinguishing himself above the rest--to such an extent, indeed, that he must have been a prime minister--at least, if the disturbance he made was any criterion of his rank. The common rabble of dusky denizens united their howlings with the uproar of the court, repeating their gesticulations like so many monkeys, and thereby producing a single and instantaneous movement of ten thousand arms at one time.

To these means of intimidation, which were presently deemed insufficient, were added others still more formidable. Soldiers, armed with bows and arrows, were drawn up in line of battle; but by this time the balloon was expanding, and rising quietly beyond their reach. Upon this the governor seized a musket and aimed it at the balloon; but, Kennedy, who was watching him, shattered the uplifted weapon in the sheik's grasp.

At this unexpected blow there was a general rout. Every mother's son of them scampered for his dwelling with the utmost celerity, and stayed there, so that the streets of the town were absolutely deserted for the remainder of that day.

Night came, and not a breath of wind was stirring. The aeronauts had to make up their minds to remain motionless at the distance of but three hundred feet above the ground. Not a fire or light shone in the deep gloom, and around reigned the silence of death; but the doctor only redoubled his vigilance, as this apparent quiet might conceal some snare.

And he had reason to be watchful. About midnight, the whole city seemed to be in a blaze. Hundreds of streaks of flame crossed each other, and shot to and fro in the air like rockets, forming a regular network of fire.

"That's really curious!" said the doctor, somewhat puzzled to make out what it meant.

"By all that's glorious!" shouted Kennedy, "it looks as if the fire were ascending and coming up toward us!"

And, sure enough, with an accompaniment of musket-shots, yelling, and din of every description, the mass of fire was, indeed, mounting toward the Victoria. Joe got ready to throw out ballast, and Ferguson was not long at guessing the truth. Thousands of pigeons, their tails garnished with combustibles, had been set loose and driven toward the Victoria; and now, in their terror, they were flying high up, zigzagging the atmosphere with lines of fire. Kennedy was preparing to discharge all his batteries into the middle of the ascending multitude, but what could he have done against such a numberless army? The pigeons were already whisking around the car; they were even surrounding the balloon, the sides of which, reflecting their illumination, looked as though enveloped with a network of fire.

The doctor dared hesitate no longer; and, throwing out a fragment of quartz, he kept himself beyond the reach of these dangerous assailants; and, for two hours afterward, he could see them wandering hither and thither through the darkness of the night, until, little by little, their light diminished, and they, one by one, died out.

"Now we may sleep in quiet," said the doctor.
"Not badly got up for barbarians," mused friend Joe, speaking his thoughts aloud.
"Oh, they employ these pigeons frequently, to set fire to the thatch of hostile villages; but this time the village mounted higher than they could go."
"Why, positively, a balloon need fear no enemies!"
"Yes, indeed, it may!" objected Ferguson.
"What are they, then, doctor?"
"They are the careless people in the car! So, my friends, let us have vigilance in all places and at all times."

CHAPTER THIRTY-FIRST.
Departure in the Night-time.--All Three.--Kennedy's Instincts.--Precautions.--The Course of the Shari River.--Lake Tchad.--The Water of the Lake.--The Hippopotamus.--One Bullet thrown away.
About three o'clock in the morning, Joe, who was then on watch, at length saw the city move away from beneath his feet. The Victoria was once again in motion, and both the doctor and Kennedy awoke.
The former consulted his compass, and saw, with satisfaction, that the wind was carrying them toward the northwest.
"We are in luck!" said he; "every thing works in our favor: we shall discover Lake Tchad this very day."
"Is it a broad sheet of water?" asked Kennedy.
"Somewhat, Dick. At its greatest length and breadth, it measures about one hundred and twenty miles."
"It will spice our trip with a little variety to sail over a spacious sheet of water."
"After all, though, I don't see that we have much to complain of on that score. Our trip has been very much varied, indeed; and, moreover, we are getting on under the best possible conditions."
"Unquestionably so; excepting those privations on the desert, we have encountered no serious danger."
"It is not to be denied that our noble balloon has behaved wonderfully well. To-day is May 12th, and we started on the 18th of April. That makes twenty-five days of journeying. In ten days more we shall have reached our destination."
"Where is that?"
"I do not know. But what does that signify?"
"You are right again, Samuel! Let us intrust to Providence the care of guiding us and of keeping us in good health as we are now. We don't look much as though we had been crossing the most pestilential country in the world!"
"We had an opportunity of getting up in life, and that's what we have done!"
"Hurrah for trips in the air!" cried Joe. "Here we are at the end of twenty-five days in good condition, well fed, and well rested. We've had too much rest in fact, for my legs begin to feel rusty, and I wouldn't be vexed a bit to stretch them with a run of thirty miles or so!"
"You can do that, Joe, in the streets of London, but in fine we set out three together, like Denham, Clapperton, and Overweg; like Barth, Richardson, and Vogel, and, more fortunate than our predecessors here, we are three in number still. But it is most important for us not to separate. If, while one of us was on the ground, the Victoria should have to ascend in order to escape some sudden danger, who knows whether we should ever see each other again? Therefore it is that I say again to Kennedy frankly that I do not like his going off alone to hunt."
"But still, Samuel, you will permit me to indulge that fancy a little. There is no harm in renewing our stock of provisions. Besides, before our departure, you held out to me the prospect of some superb hunting, and thus far I have done but little in the line of the Andersons and Cummings."
"But, my dear Dick, your memory fails you, or your modesty makes you forget your own exploits. It really seems to me that, without mentioning small game, you have already an antelope, an elephant, and two lions on your conscience."
"But what's all that to an African sportsman who sees all the animals in creation strutting along under the muzzle of his rifle? There! there! look at that troop of giraffes!"
"Those giraffes," roared Joe; "why, they're not as big as my fist."
"Because we are a thousand feet above them; but close to them you would discover that they are three times as tall as you are!"
"And what do you say to yon herd of gazelles, and those ostriches, that run with the speed of the wind?" resumed Kennedy.
"Those ostriches?" remonstrated Joe, again; "those are chickens, and the greatest kind of chickens!"
"Come, doctor, can't we get down nearer to them?" pleaded Kennedy.
"We can get closer to them, Dick, but we must not land. And what good will it do you to strike down those poor
animals when they can be of no use to you? Now, if the question were to destroy a lion, a tiger, a cat, a hyena, I
could understand it; but to deprive an antelope or a gazelle of life, to no other purpose than the gratification of your
instincts as a sportsman, seems hardly worth the trouble. But, after all, my friend, we are going to keep at about one
hundred feet only from the soil, and, should you see any ferocious wild beast, oblige us by sending a ball through its
heart!"

The Victoria descended gradually, but still keeping at a safe height, for, in a barbarous, yet very populous
country, it was necessary to keep on the watch for unexpected perils.

The travellers were then directly following the course of the Shari. The charming banks of this river were hidden
beneath the foliage of trees of various dyes; lianas and climbing plants wound in and out on all sides and formed the
most curious combinations of color. Crocodiles were seen basking in the broad blaze of the sun or plunging beneath
the waters with the agility of lizards, and in their gambols they sported about among the many green islands that
intercept the current of the stream.

It was thus, in the midst of rich and verdant landscapes that our travellers passed over the district of Maffatay,
and about nine o'clock in the morning reached the southern shore of Lake Tchad.

There it was at last, outstretched before them, that Caspian Sea of Africa, the existence of which was so long
consigned to the realms of fable—that interior expanse of water to which only Denham's and Barth's expeditions had
been able to force their way.

The doctor strove in vain to fix its precise configuration upon paper. It had already changed greatly since 1847.
In fact, the chart of Lake Tchad is very difficult to trace with exactitude, for it is surrounded by muddy and almost
impassable morasses, in which Barth thought that he was doomed to perish. From year to year these marshes,
covered with reeds and papyrus fifteen feet high, become the lake itself. Frequently, too, the villages on its shores
are half submerged, as was the case with Ngornou in 1856, and now the hippopotamus and the alligator frisk and
dive where the dwellings of Bornou once stood.

The sun shot his dazzling rays over this placid sheet of water, and toward the north the two elements merged into
one and the same horizon.

The doctor was desirous of determining the character of the water, which was long believed to be salt. There was
no danger in descending close to the lake, and the car was soon skimming its surface like a bird at the distance of
only five feet.

Joe plunged a bottle into the lake and drew it up half filled. The water was then tasted and found to be but little
fit for drinking, with a certain carbonate-of-soda flavor.

While the doctor was jotting down the result of this experiment, the loud report of a gun was heard close beside
him. Kennedy had not been able to resist the temptation of firing at a huge hippopotamus. The latter, who had been
basking quietly, disappeared at the sound of the explosion, but did not seem to be otherwise incommoded by
Kennedy's conical bullet.

"You'd have done better if you had harpooned him," said Joe.

"But how?"

"With one of our anchors. It would have been a hook just big enough for such a rousing beast as that!"

"Humph!" ejaculated Kennedy, "Joe really has an idea this time—"

"Which I beg of you not to put into execution," interposed the doctor. "The animal would very quickly have
dragged us where we could not have done much to help ourselves, and where we have no business to be."

"Especially now since we've settled the question as to what kind of water there is in Lake Tchad. Is that sort of
fish good to eat, Dr. Ferguson?"

"That fish, as you call it, Joe, is really a mammiferous animal of the pachydermal species. Its flesh is said to be
excellent and is an article of important trade between the tribes living along the borders of the lake."

"Then I'm sorry that Mr. Kennedy's shot didn't do more damage."

"The animal is vulnerable only in the stomach and between the thighs. Dick's ball hasn't even marked him; but
should the ground strike me as favorable, we shall halt at the northern end of the lake, where Kennedy will find
himself in the midst of a whole menagerie, and can make up for lost time."

"Well," said Joe. "I hope then that Mr. Kennedy will hunt the hippopotamus a little; I'd like to taste the meat of
that queer-looking beast. It doesn't look exactly natural to get away into the centre of Africa, to feed on snipe and
partridge, just as if we were in England."

CHAPTER THIRTY-SECOND.
The Capital of Bornou.--The Islands of the Biddiomahs.--The Condors.--The Doctor's Anxieties.--His
Precautions.--An Attack in Mid-air.--The Balloon Covering tom.--The Fall.--Sublime Self-Sacrifice.--The Northern
Coast of the Lake.

Since its arrival at Lake Tchad, the balloon had struck a current that edged it farther to the westward. A few clouds tempered the heat of the day, and, besides, a little air could be felt over this vast expanse of water; but about one o’clock, the Victoria, having slanted across this part of the lake, again advanced over the land for a space of seven or eight miles.

The doctor, who was somewhat vexed at first at this turn of his course, no longer thought of complaining when he caught sight of the city of Kouka, the capital of Bornou. He saw it for a moment, encircled by its walls of white clay, and a few rudely-constructed mosques rising clumsily above that conglomeration of houses that look like playing-dice, which form most Arab towns. In the court-yards of the private dwellings, and on the public squares, grew palms and caoutchouc-trees topped with a dome of foliage more than one hundred feet in breadth. Joe called attention to the fact that these immense parasols were in proper accordance with the intense heat of the sun, and made thereon some pious reflections which it were needless to repeat.

Kouka really consists of two distinct towns, separated by the "Dendal," a large boulevard three hundred yards wide, at that hour crowded with horsemen and foot passengers. On one side, the rich quarter stands squarely with its airy and lofty houses, laid out in regular order; on the other, is huddled together the poor quarter, a miserable collection of low hovels of a conical shape, in which a poverty-stricken multitude vegetate rather than live, since Kouka is neither a trading nor a commercial city.

Kennedy thought it looked something like Edinburgh, were that city extended on a plain, with its two distinct boroughs.

But our travellers had scarcely the time to catch even this glimpse of it, for, with the fickleness that characterizes the air-currents of this region, a contrary wind suddenly swept them some forty miles over the surface of Lake Tchad.

Then then were regaled with a new spectacle. They could count the numerous islets of the lake, inhabited by the Biddiomahs, a race of bloodthirsty and formidable pirates, who are as greatly feared when neighbors as are the Touaregs of Sahara.

These estimable people were in readiness to receive the Victoria bravely with stones and arrows, but the balloon quickly passed their islands, fluttering over them, from one to the other with butterfly motion, like a gigantic beetle.

At this moment, Joe, who was scanning the horizon, said to Kennedy:

"There, sir, as you are always thinking of good sport, yonder is just the thing for you!"

"What is it, Joe?"

"This time, the doctor will not disapprove of your shooting."

"But what is it?"

"Don't you see that flock of big birds making for us?"

"Birds?" exclaimed the doctor, snatching his spyglass.

"I see them," replied Kennedy; "there are at least a dozen of them."

"Fourteen, exactly!" said Joe.

"Heaven grant that they may be of a kind sufficiently noxious for the doctor to let me peg away at them!"

"I should not object, but I would much rather see those birds at a distance from us!"

"Why, are you afraid of those fowls?"

"They are condors, and of the largest size. Should they attack us--"

"Well, if they do, we'll defend ourselves. We have a whole arsenal at our disposal. I don't think those birds are so very formidable."

"Who can tell?" was the doctor's only remark.

Ten minutes later, the flock had come within gunshot, and were making the air ring with their hoarse cries. They came right toward the Victoria, more irritated than frightened by her presence.

"How they scream! What a noise!" said Joe.

"Perhaps they don't like to see anybody poaching in their country up in the air, or daring to fly like themselves!"

"Well, now, to tell the truth, when I take a good look at them, they are an ugly, ferocious set, and I should think them dangerous enough if they were armed with Purdy-Moore rifles," admitted Kennedy.

"They have no need of such weapons," said Ferguson, looking very grave.

The condors flew around them in wide circles, their flight growing gradually closer and closer to the balloon. They swept through the air in rapid, fantastic curves, occasionally precipitating themselves headlong with the speed of a bullet, and then breaking their line of projection by an abrupt and daring angle.

The doctor, much disquieted, resolved to ascend so as to escape this dangerous proximity. He therefore dilated the hydrogen in his balloon, and it rapidly rose.

But the condors mounted with him, apparently determined not to part company.
"They seem to mean mischief!" said the hunter, cocking his rifle. 
And, in fact, they were swooping nearer, and more than one came within fifty feet of them, as if defying the fire-arms.
"By George, I'm itching to let them have it!" exclaimed Kennedy.
"No, Dick; not now! Don't exasperate them needlessly. That would only be exciting them to attack us!"
"But I could soon settle those fellows!"
"You may think so, Dick. But you are wrong!"
"Why, we have a bullet for each of them!"
"And suppose that they were to attack the upper part of the balloon, what would you do? How would you get at them? Just imagine yourself in the presence of a troop of lions on the plain, or a school of sharks in the open ocean! For travellers in the air, this situation is just as dangerous."
"Are you speaking seriously, doctor?"
"Very seriously, Dick."
"Let us wait, then!"
"Wait! Hold yourself in readiness in case of an attack, but do not fire without my orders."

The birds then collected at a short distance, yet to near that their naked necks, entirely bare of feathers, could be plainly seen, as they stretched them out with the effort of their cries, while their gristy crests, garnished with a comb and gills of deep violet, stood erect with rage. They were of the very largest size, their bodies being more than three feet in length, and the lower surface of their white wings glittering in the sunlight. They might well have been considered winged sharks, so striking was their resemblance to those ferocious rangers of the deep.
"They are following us!" said the doctor, as he saw them ascending with him, "and, mount as we may, they can fly still higher!"

"Well, what are we to do?" asked Kennedy.

The doctor made no answer.
"Listen, Samuel!" said the sportsman. "There are fourteen of those birds; we have seventeen shots at our disposal if we discharge all our weapons. Have we not the means, then, to destroy them or disperse them? I will give a good account of some of them!"
"I have no doubt of your skill, Dick; I look upon all as dead that may come within range of your rifle, but I repeat that, if they attack the upper part of the balloon, you could not get a sight at them. They would tear the silk covering that sustains us, and we are three thousand feet up in the air!"

At this moment, one of the ferocious birds darted right at the balloon, with outstretched beak and claws, ready to rend it with either or both.
"Fire! fire at once!" cried the doctor.

He had scarcely ceased, ere the huge creature, stricken dead, dropped headlong, turning over and over in space as he fell.
Kennedy had already grasped one of the two-barrelled fowling-pieces and Joe was taking aim with another.
Frightened by the report, the condors drew back for a moment, but they almost instantly returned to the charge with extreme fury. Kennedy severed the head of one from its body with his first shot, and Joe broke the wing of another.
"Only eleven left," said he.
Thereupon the birds changed their tactics, and by common consent soared above the balloon. Kennedy glanced at Ferguson. The latter, in spite of his imperturbability, grew pale. Then ensued a moment of terrifying silence. In the next they heard a harsh tearing noise, as of something rending the silk, and the car seemed to sink from beneath the feet of our three aeronauts.
"We are lost!" exclaimed Ferguson, glancing at the barometer, which was now swiftly rising.
"Over with the ballast!" he shouted, "over with it!"
And in a few seconds the last lumps of quartz had disappeared.
"We are still falling! Empty the water-tanks! Do you hear me, Joe? We are pitching into the lake!"

Joe obeyed. The doctor leaned over and looked out. The lake seemed to come up toward him like a rising tide. Every object around grew rapidly in size while they were looking at it. The car was not two hundred feet from the surface of Lake Tchad.
"The provisions! the provisions!" cried the doctor.
And the box containing them was launched into space.
Their descent became less rapid, but the luckless aeronauts were still falling, and into the lake.
"Throw out something--something more!" cried the doctor.
"There is nothing more to throw!" was Kennedy's despairing response.
"Yes, there is!" called Joe, and with a wave of the hand he disappeared like a flash, over the edge of the car.

"Joe! Joe!" exclaimed the doctor, horror-stricken.

The Victoria thus relieved resumed her ascending motion, mounted a thousand feet into the air, and the wind, burying itself in the disinflated covering, bore them away toward the northern part of the lake.

"Lost!" exclaimed the sportsman, with a gesture of despair.

"Lost to save us!" responded Ferguson.

And these men, intrepid as they were, felt the large tears streaming down their cheeks. They leaned over with the vain hope of seeing some trace of their heroic companion, but they were already far away from him.

"What course shall we pursue?" asked Kennedy.

"Alight as soon as possible, Dick, and then wait."

After a sweep of some sixty miles the Victoria halted on a desert shore, on the north of the lake. The anchors caught in a low tree and the sportsman fastened it securely. Night came, but neither Ferguson nor Kennedy could find one moment's sleep.

CHAPTER THIRTY-THIRD.

Conjectures.--Reestablishment of the Victoria's Equilibrium.--Dr. Ferguson's New Calculations.--Kennedy's Hunt.--A Complete Exploration of Lake Tchad.--Tangalia.--The Return.--Lari.

On the morrow, the 13th of May, our travellers, for the first time, reconnoitred the part of the coast on which they had landed. It was a sort of island of solid ground in the midst of an immense marsh. Around this fragment of terra firma grew reeds as lofty as trees are in Europe, and stretching away out of sight.

These impenetrable swamps gave security to the position of the balloon. It was necessary to watch only the borders of the lake. The vast stretch of water broadened away from the spot, especially toward the east, and nothing could be seen on the horizon, neither mainland nor islands.

The two friends had not yet ventured to speak of their recent companion. Kennedy first imparted his conjectures to the doctor.

"Perhaps Joe is not lost after all," he said. "He was a skilful lad, and had few equals as a swimmer. He would find no difficulty in swimming across the Firth of Forth at Edinburgh. We shall see him again--but how and where I know not. Let us omit nothing on our part to give him the chance of rejoining us."

"May God grant it as you say, Dick!" replied the doctor, with much emotion. "We shall do everything in the world to find our lost friend again. Let us, in the first place, see where we are. But, above all things, let us rid the Victoria of this outside covering, which is of no further use. That will relieve us of six hundred and fifty pounds, a weight not to be despised--and the end is worth the trouble!"

The doctor and Kennedy went to work at once, but they encountered great difficulty. They had to tear the strong silk away piece by piece, and then cut it in narrow strips so as to extricate it from the meshes of the network. The tear made by the beaks of the condors was found to be several feet in length.

This operation took at least four hours, but at length the inner balloon once completely extricated did not appear to have suffered in the least degree. The Victoria was thus diminished in size by one fifth, and this difference was sufficiently noticeable to excite Kennedy's surprise.

"Will it be large enough?" he asked.

"Have no fears on that score, I will reestablish the equilibrium, and should our poor Joe return we shall find a way to start off with him again on our old route."

"At the moment of our fall, unless I am mistaken, we were not far from an island."

"Yes, I recollect it," said the doctor, "but that island, like all the islands on Lake Tchad, is, no doubt, inhabited by a gang of pirates and murderers. They certainly witnessed our misfortune, and should Joe fall into their hands, what will become of him unless protected by their superstitions?"

"Oh, he's just the lad to get safely out of the scrape, I repeat. I have great confidence in his shrewdness and skill."

"I hope so. Now, Dick, you may go and hunt in the neighborhood, but don't get far away whatever you do. It has become a pressing necessity for us to renew our stock of provisions, since we had to sacrifice nearly all the old lot."

"Very good, doctor, I shall not be long absent."

Hereupon, Kennedy took a double-barrelled fowling-piece, and strode through the long grass toward a thicket not far off, where the frequent sound of shooting soon let the doctor know that the sportsman was making a good use of his time.

Meanwhile Ferguson was engaged in calculating the relative weight of the articles still left in the car, and in establishing the equipoise of the second balloon. He found that there were still left some thirty pounds of pemmican,
a supply of tea and coffee, about a gallon and a half of brandy, and one empty water-tank. All the dried meat had disappeared.

The doctor was aware that, by the loss of the hydrogen in the first balloon, the ascensional force at his disposal was now reduced to about nine hundred pounds. He therefore had to count upon this difference in order to rearrange his equilibrium. The new balloon measured sixty-seven thousand cubic feet, and contained thirty-three thousand four hundred and eighty feet of gas. The dilating apparatus appeared to be in good condition, and neither the battery nor the spiral had been injured.

The ascensional force of the new balloon was then about three thousand pounds, and, in adding together the weight of the apparatus, of the passengers, of the stock of water, of the car and its accessories, and putting aboard fifty gallons of water, and one hundred pounds of fresh meat, the doctor got a total weight of twenty-eight hundred and thirty pounds. He could then take with him one hundred and seventy pounds of ballast, for unforeseen emergencies, and the balloon would be in exact balance with the surrounding atmosphere.

His arrangements were completed accordingly, and he made up for Joe's weight with a surplus of ballast. He spent the whole day in these preparations, and the latter were finished when Kennedy returned. The hunter had been successful, and brought back a regular cargo of geese, wild-duck, snipe, teal, and plover. He went to work at once to draw and smoke the game. Each piece, suspended on a small, thin skewer, was hung over a fire of green wood. When they seemed in good order, Kennedy, who was perfectly at home in the business, packed them away in the car.

On the morrow, the hunter was to complete his supplies.

Evening surprised our travellers in the midst of this work. Their supper consisted of pemmican, biscuit, and tea; and fatigue, after having given them appetite, brought them sleep. Each of them strained eyes and ears into the gloom during his watch, sometimes fancying that they heard the voice of poor Joe; but, alas! the voice that they so longed to hear, was far away.

"At the first streak of day, the doctor aroused Kennedy.
"I have been long and carefully considering what should be done," said he, "to find our companion."
"Whatever your plan may be, doctor, it will suit me. Speak!"
"Above all things, it is important that Joe should hear from us in some way."
"Undoubtedly. Suppose the brave fellow should take it into his head that we have abandoned him?"
"He! He knows us too well for that. Such a thought would never come into his mind. But he must be informed as to where we are."
"How can that be managed?"
"We shall get into our car and be off again through the air."
"But, should the wind bear us away?"

"Happily, it will not. See, Dick! it is carrying us back to the lake; and this circumstance, which would have been vexatious yesterday, is fortunate now. Our efforts, then, will be limited to keeping ourselves above that vast sheet of water throughout the day. Joe cannot fail to see us, and his eyes will be constantly on the lookout in that direction. Perhaps he will even manage to let us know the place of his retreat."
"If he be alone and at liberty, he certainly will."
"And if a prisoner," resumed the doctor, "it not being the practice of the natives to confine their captives, he will see us, and comprehend the object of our researches."
"But, at last," put in Kennedy--"for we must anticipate every thing--should we find no trace--if he should have left no mark to follow him by, what are we to do?"

"We shall endeavor to regain the northern part of the lake, keeping ourselves as much in sight as possible. There we'll wait; we'll explore the banks; we'll search the water's edge, for Joe will assuredly try to reach the shore; and we will not leave the country without having done every thing to find him."
"Let us set out, then!" said the hunter.

The doctor hereupon took the exact bearings of the patch of solid land they were about to leave, and arrived at the conclusion that it lay on the north shore of Lake Tchad, between the village of Lari and the village of Ingemini, both visited by Major Denham. During this time Kennedy was completing his stock of fresh meat. Although the neighboring marshes showed traces of the rhinoceros, the lamantiné (or manatee), and the hippopotamus, he had no opportunity to see a single specimen of those animals.

At seven in the morning, but not without great difficulty --which to Joe would have been nothing--the balloon's anchor was detached from its hold, the gas dilated, and the new Victoria rose two hundred feet into the air. It seemed to hesitate at first, and went spinning around, like a top; but at last a brisk current caught it, and it advanced over the lake, and was soon borne away at a speed of twenty miles per hour.

The doctor continued to keep at a height of from two hundred to five hundred feet. Kennedy frequently
discharged his rifle; and, when passing over islands, the aeronauts approached them even imprudently, scrutinizing
the thickets, the bushes, the underbrush—in fine, every spot where a mass of shade or jutting rock could have
afforded a retreat to their companion. They swooped down close to the long pirogues that navigated the lake; and the
wild fishermen, terrified at the sight of the balloon, would plunge into the water and regain their islands with every
symptom of undisguised affright.

"We can see nothing," said Kennedy, after two hours of search.
"Let us wait a little longer, Dick, and not lose heart. We cannot be far away from the scene of our accident."

By eleven o'clock the balloon had gone ninety miles. It then fell in with a new current, which, blowing almost at
right angles to the other, drove them eastward about sixty miles. It next floated over a very large and populous
island, which the doctor took to be Farram, on which the capital of the Biddiomahs is situated. Ferguson expected at
every moment to see Joe spring up out of some thicket, flying for his life, and calling for help. Were he free, they
could pick him up without trouble; were he a prisoner, they could rescue him by repeating the manoeuvre they had
practised to save the missionary, and he would soon be with his friends again; but nothing was seen, not a sound was
heard. The case seemed desperate.

About half-past two o'clock, the Victoria hove in sight of Tangalia, a village situated on the eastern shore of
Lake Tchad, where it marks the extreme point attained by Denham at the period of his exploration.

The doctor became uneasy at this persistent setting of the wind in that direction, for he felt that he was being
thrown back to the eastward, toward the centre of Africa, and the interminable deserts of that region.

"We must absolutely come to a halt," said he, "and even alight. For Joe's sake, particularly, we ought to go back
to the lake; but, to begin with, let us endeavor to find an opposite current."

During more than an hour he searched at different altitudes: the balloon always came back toward the mainland.
But at length, at the height of a thousand feet, a very violent breeze swept to the northwestward.

It was out of the question that Joe should have been detained on one of the islands of the lake; for, in such case
he would certainly have found means to make his presence there known. Perhaps he had been dragged to the
mainland. The doctor was reasoning thus to himself, when he again came in sight of the northern shore of Lake
Tchad.

As for supposing that Joe had been drowned, that was not to be believed for a moment. One horrible thought
 glanced across the minds of both Kennedy and the doctor: caymans swarm in these waters! But neither one nor the
other had the courage to distinctly communicate this impression. However, it came up to them so forcibly at last that
the doctor said, without further preface:

"Crocodiles are found only on the shores of the islands or of the lake, and Joe will have skill enough to avoid
them. Besides, they are not very dangerous; and the Africans bathe with impunity, and quite fearless of their
attacks."

Kennedy made no reply. He preferred keeping quiet to discussing this terrible possibility.

The doctor made out the town of Lari about five o'clock in the evening. The inhabitants were at work gathering
in their cotton-crop in front of their huts, constructed of woven reeds, and standing in the midst of clean and neatly-
kept enclosures. This collection of about fifty habitations occupied a slight depression of the soil, in a valley
extending between two low mountains. The force of the wind carried the doctor farther onward than he wanted to
go; but it changed a second time, and bore him back exactly to his starting-point, on the sort of enclosed island
where he had passed the preceding night. The anchor, instead of catching the branches of the tree, took hold in the
masses of reeds mixed with the thick mud of the marshes, which offered considerable resistance.

The doctor had much difficulty in restraining the balloon; but at length the wind died away with the setting in of
nightfall; and the two friends kept watch together in an almost desperate state of mind.

CHAPTER THIRTY-FOURTH.
The Hurricane.--A Forced Departure.--Loss of an Anchor.--Melancholy Reflections.--The Resolution adopted.--
The Sand-Storm.--The Buried Caravan.--A Contrary yet Favorable Wind.--The Return southward.--Kennedy at his
Post.

At three o'clock in the morning the wind was raging. It beat down with such violence that the Victoria could not
stay near the ground without danger. It was thrown almost flat over upon its side, and the reeds chafed the silk so
roughly that it seemed as though they would tear it.

"We must be off, Dick," said the doctor; "we cannot remain in this situation."

"But, doctor, what of Joe?"

"I am not likely to abandon him. No, indeed! and should the hurricane carry me a thousand miles to the
northward, I will return! But here we are endangering the safety of all."
"Must we go without him?" asked the Scot, with an accent of profound grief.

"And do you think, then," rejoined Ferguson, "that my heart does not bleed like your own? Am I not merely obeying an imperious necessity?"

"I am entirely at your orders," replied the hunter; "let us start!"

But their departure was surrounded with unusual difficulty. The anchor, which had caught very deeply, resisted all their efforts to disengage it; while the balloon, drawing in the opposite direction, increased its tension. Kennedy could not get it free. Besides, in his present position, the manoeuvre had become a very perilous one, for the Victoria threatened to break away before he should be able to get into the car again.

The doctor, unwilling to run such a risk, made his friend get into his place, and resigned himself to the alternative of cutting the anchor-rope. The Victoria made one bound of three hundred feet into the air, and took her route directly northward.

Ferguson had no other choice than to scud before the storm. He folded his arms, and soon became absorbed in his own melancholy reflections.

After a few moments of profound silence, he turned to Kennedy, who sat there no less taciturn.

"We have, perhaps, been tempting Providence," said he; "it does not belong to man to undertake such a journey!" --and a sigh of grief escaped him as he spoke.

"It is but a few days," replied the sportsman, "since we were congratulating ourselves upon having escaped so many dangers! All three of us were shaking hands!"

"Poor Joe! kindly and excellent disposition! brave and candid heart! Dazzled for a moment by his sudden discovery of wealth, he willingly sacrificed his treasures! And now, he is far from us; and the wind is carrying us still farther away with resistless speed!"

"Come, doctor, admitting that he may have found refuge among the lake tribes, can he not do as the travellers who visited them before us, did;--like Denham, like Barth? Both of those men got back to their own country."

"Ah! my dear Dick! Joe doesn't know one word of the language; he is alone, and without resources. The travellers of whom you speak did not attempt to go forward without sending many presents in advance of them to the chiefs, and surrounded by an escort armed and trained for these expeditions. Yet, they could not avoid sufferings of the worst description! What, then, can you expect the fate of our companion to be? It is horrible to think of, and this is one of the worst calamities that it has ever been my lot to endure!"

"But, we'll come back again, doctor!"

"Come back, Dick? Yes, if we have to abandon the balloon! if we should be forced to return to Lake Tchad on foot, and put ourselves in communication with the Sultan of Bornou! The Arabs cannot have retained a disagreeable remembrance of the first Europeans."

"I will follow you, doctor," replied the hunter, with emphasis. "You may count upon me! We would rather give up the idea of prosecuting this journey than not return. Joe forgot himself for our sake; we will sacrifice ourselves for his!"

This resolve revived some hope in the hearts of these two men; they felt strong in the same inspiration. Ferguson forthwith set every thing at work to get into a contrary current, that might bring him back again to Lake Tchad; but this was impracticable at that moment, and even to alight was out of the question on ground completely bare of trees, and with such a hurricane blowing.

The Victoria thus passed over the country of the Tibbous, crossed the Belad el Djerid, a desert of briers that forms the border of the Soudan, and advanced into the desert of sand streaked with the long tracks of the many caravans that pass and repass there. The last line of vegetation was speedily lost in the dim southern horizon, not far from the principal oasis in this part of Africa, whose fifty wells are shaded by magnificent trees; but it was impossible to stop. An Arab encampment, tents of striped stuff, some camels, stretching out their viper-like heads and necks along the sand, gave life to this solitude, but the Victoria sped by like a shooting-star, and in this way traversed a distance of sixty miles in three hours, without Ferguson being able to check or guide her course.

"We cannot halt, we cannot alight!" said the doctor; "not a tree, not an inequality of the ground! Are we then to be driven clear across Sahara? Surely, Heaven is indeed against us!"

He was uttering these words with a sort of despairing rage, when suddenly he saw the desert sands rising aloft in the midst of a dense cloud of dust, and go whirling through the air, impelled by opposing currents.

Amid this tornado, an entire caravan, disorganized, broken, and overthrown, was disappearing beneath an avalanche of sand. The camels, flung pell-mell together, were uttering dull and pitiful groans; cries and howls of despair were heard issuing from that dusty and stifling cloud, and, from time to time, a parti-colored garment cut the chaos of the scene with its vivid hues, and the moaning and shrieking sounded over all, a terrible accompaniment to this spectacle of destruction.

Ere long the sand had accumulated in compact masses; and there, where so recently stretched a level plain as far
as the eye could see, rose now a ridgy line of hillocks, still moving from beneath--the vast tomb of an entire caravan!

The doctor and Kennedy, pallid with emotion, sat transfixed by this fearful spectacle. They could no longer manage their balloon, which went whirling round and round in contending currents, and refused to obey the different dilations of the gas. Caught in these eddies of the atmosphere, it spun about with a rapidity that made their heads reel, while the car oscillated and swung to and fro violently at the same time. The instruments suspended under the awning clattered together as though they would be dashed to pieces; the pipes of the spiral bent to and fro, threatening to break at every instant; and the water-tanks jostled and jarred with tremendous din. Although but two feet apart, our aeronauts could not hear each other speak, but with firmly-clinched hands they clung convulsively to the cordage, and endeavored to steady themselves against the fury of the tempest.

Kennedy, with his hair blown wildly about his face, looked on without speaking; but the doctor had regained all his daring in the midst of this deadly peril, and not a sign of his emotion was betrayed in his countenance, even when, after a last violent twirl, the Victoria stopped suddenly in the midst of a most unlooked-for calm; the north wind had abruptly got the upper hand, and now drove her back with equal rapidity over the route she had traversed in the morning.

"Whither are we going now?" cried Kennedy.

"Let us leave that to Providence, my dear Dick; I was wrong in doubting it. It knows better than we, and here we are, returning to places that we had expected never to see again!"

The surface of the country, which had looked so flat and level when they were coming, now seemed tossed and uneven, like the ocean-billows after a storm; a long succession of hillocks, that had scarcely settled to their places yet, indented the desert; the wind blew furiously, and the balloon fairly flew through the atmosphere.

The direction taken by our aeronauts differed somewhat from that of the morning, and thus about nine o'clock, instead of finding themselves again near the borders of Lake Tchad, they saw the desert still stretching away before them.

Kennedy remarked the circumstance.

"It matters little," replied the doctor, "the important point is to return southward; we shall come across the towns of Bornou, Woudie, or Kouka, and I should not hesitate to halt there."

"If you are satisfied, I am content," replied the Scot, "but Heaven grant that we may not be reduced to cross the desert, as those unfortunate Arabs had to do! What we saw was frightful!"

"It often happens, Dick; these trips across the desert are far more perilous than those across the ocean. The desert has all the dangers of the sea, including the risk of being swallowed up, and added thereto are unendurable fatigues and privations."

"I think the wind shows some symptoms of moderating; the sand-dust is less dense; the undulations of the surface are diminishing, and the sky is growing clearer."

"So much the better! We must now reconnoitre attentively with our glasses, and take care not to omit a single point."

"I will look out for that, doctor, and not a tree shall be seen without my informing you of it."

And, SUITING THE ACTION TO THE WORD, Kennedy took his station, spy-glass in hand, at the forward part of the car.

CHAPTER THIRTY-FIFTH.

What happened to Joe.--The Island of the Biddiomahs.--The Adoration shown him.--The Island that sank.--The Shores of the Lake.--The Tree of the Serpents.--The Foot-Tramp.--Terrible Suffering.--Mosquitoes and Ants.--Hunger.--The Victoria seen.--She disappears.--The Swamp.--One Last Despairing Cry.

What had become of Joe, while his master was thus vainly seeking for him? When he had dashed headlong into the lake, his first movement on coming to the surface was to raise his eyes and look upward. He saw the Victoria already risen far above the water, still rapidly ascending and growing smaller and smaller. It was soon caught in a rapid current and disappeared to the northward. His master--both his friends were saved!

"How lucky it was," thought he, "that I had that idea to throw myself out into the lake! Mr. Kennedy would soon have jumped at it, and he would not have hesitated to do as I did, for nothing's more natural than for one man to give himself up to save two others. That's mathematics!"

Satisfied on this point, Joe began to think of himself. He was in the middle of a vast lake, surrounded by tribes unknown to him, and probably ferocious. All the greater reason why he should get out of the scrape by depending only on himself. And so he gave himself no farther concern about it.

Before the attack by the birds of prey, which, according to him, had behaved like real condors, he had noticed an island on the horizon, and determining to reach it, if possible, he put forth all his knowledge and skill in the art of
swimming, after having relieved himself of the most troublesome part of his clothing. The idea of a stretch of five or six miles by no means disconcerted him; and therefore, so long as he was in the open lake, he thought only of striking out straight ahead and manfully.

In about an hour and a half the distance between him and the island had greatly diminished.

But as he approached the land, a thought, at first fleeting and then tenacious, arose in his mind. He knew that the shores of the lake were frequented by huge alligators, and was well aware of the voracity of those monsters.

Now, no matter how much he was inclined to find every thing in this world quite natural, the worthy fellow was no little disturbed by this reflection. He feared greatly lest white flesh like his might be particularly acceptable to the dreaded brutes, and advanced only with extreme precaution, his eyes on the alert on both sides and all around him. At length, he was not more than one hundred yards from a bank, covered with green trees, when a puff of air strongly impregnated with a musky odor reached him.

"There!" said he to himself, "just what I expected. The crocodile isn't far off!"

With this he dived swiftly, but not sufficiently so to avoid coming into contact with an enormous body, the scaly surface of which scratched him as he passed. He thought himself lost and swam with desperate energy. Then he rose again to the top of the water, took breath and dived once more. Thus passed a few minutes of unspeakable anguish, which all his philosophy could not overcome, for he thought, all the while, that he heard behind him the sound of those huge jaws ready to snap him up forever. In this state of mind he was striking out under the water as noiselessly as possible when he felt himself seized by the arm and then by the waist.

Poor Joe! he gave one last thought to his master; and began to struggle with all the energy of despair, feeling himself the while drawn along, but not toward the bottom of the lake, as is the habit of the crocodile when about to devour its prey, but toward the surface.

So soon as he could get breath and look around him, he saw that he was between two natives as black as ebony, who held him, with a firm gripe, and uttered strange cries.

"Ha!" said Joe, "blacks instead of crocodiles! Well, I prefer it as it is; but how in the mischief dare these fellows go in bathing in such places?"

Joe was not aware that the inhabitants of the islands of Lake Tchad, like many other negro tribes, plunge with impunity into sheets of water infested with crocodiles and caymans, and without troubling their heads about them. The amphibious denizens of this lake enjoy the well-deserved reputation of being quite inoffensive.

But had not Joe escaped one peril only to fall into another? That was a question which he left events to decide; and, since he could not do otherwise, he allowed himself to be conducted to the shore without manifesting any alarm.

"Evidently," thought he, "these chaps saw the Victoria skimming the waters of the lake, like a monster of the air. They were the distant witnesses of my tumble, and they can't fail to have some respect for a man that fell from the sky! Let them have their own way, then."

Joe was at this stage of his meditations, when he was landed amid a yelling crowd of both sexes, and all ages and sizes, but not of all colors. In fine, he was surrounded by a tribe of Biddiomahs as black as jet. Nor had he to blush for the scantiness of his costume, for he saw that he was in "undress" in the highest style of that country.

But before he had time to form an exact idea of the situation, there was no mistaking the agitation of which he instantly became the object, and this soon enabled him to pluck up courage, although the adventure of Kazah did come back rather vividly to his memory.

"I foresee that they are going to make a god of me again," thought he, "some son of the moon most likely. Well, one trade's as good as another when a man has no choice. The main thing is to gain time. Should the Victoria pass this way again, I'll take advantage of my new position to treat my worshippers here to a miracle when I go sailing up into the sky!"

While Joe's thoughts were running thus, the throng pressed around him. They prostrated themselves before him; they howled; they felt him; they became even annoyingly familiar; but at the same time they had the consideration to offer him a superb banquet consisting of sour milk and rice pounded in honey. The worthy fellow, making the best of every thing, took one of the heartiest luncheons he ever ate in his life, and gave his new adorers an exalted idea of how the gods tuck away their food upon grand occasions.

When evening came, the sorcerers of the island took him respectfully by the hand, and conducted him to a sort of house surrounded with talismans; but, as he was entering it, Joe cast an uneasy look at the heaps of human bones that lay scattered around this sanctuary. But he had still more time to think about them when he found himself at last shut up in the cabin.

During the evening and through a part of the night, he heard festive chantings, the reverberations of a kind of drum, and a clatter of old iron, which were very sweet, no doubt, to African ears. Then there were howling choruses, accompanied by endless dances by gangs of natives who circled round and round the sacred hut with contortions and
grimaces.

Joe could catch the sound of this deafening orchestra, through the mud and reeds of which his cabin was built; and perhaps under other circumstances he might have been amused by these strange ceremonies; but his mind was soon disturbed by quite different and less agreeable reflections. Even looking at the bright side of things, he found it both stupid and sad to be left alone in the midst of this savage country and among these wild tribes. Few travellers who had penetrated to these regions had ever again seen their native land. Moreover, could he trust to the worship of which he saw himself the object? He had good reason to believe in the vanity of human greatness; and he asked himself whether, in this country, adoration did not sometimes go to the length of eating the object adored!

But, notwithstanding this rather perplexing prospect, after some hours of meditation, fatigue got the better of his gloomy thoughts, and Joe fell into a profound slumber, which would have lasted no doubt until sunrise, had not a very unexpected sensation of dampness awakened the sleeper. Ere long this dampness became water, and that water gained so rapidly that it had soon mounted to Joe's waist.

"What can this be?" said he; "a flood! a water-spout! or a new torture invented by these blacks? Faith, though, I'm not going to wait here till it's up to my neck!"

And, so saying, he burst through the frail wall with a jog of his powerful shoulder, and found himself--where? --in the open lake! Island there was none. It had sunk during the night. In its place, the watery immensity of Lake Tchad!

"A poor country for the land-owners!" said Joe, once more vigorously resorting to his skill in the art of natation.

One of those phenomena, which are by no means unusual on Lake Tchad, had liberated our brave Joe. More than one island, that previously seemed to have the solidity of rock, has been submerged in this way; and the people living along the shores of the mainland have had to pick up the unfortunate survivors of these terrible catastrophes.

Joe knew nothing about this peculiarity of the region, but he was none the less ready to profit by it. He caught sight of a boat drifting about, without occupants, and was soon aboard of it. He found it to be but the trunk of a tree rudely hollowed out; but there were a couple of paddles in it, and Joe, availing himself of a rapid current, allowed his craft to float along.

"But let us see where we are," he said. "The polar-star there, that does its work honorably in pointing out the direction due north to everybody else, will, most likely, do me that service."

He discovered, with satisfaction, that the current was taking him toward the northern shore of the lake, and he allowed himself to glide with it. About two o'clock in the morning he disembarked upon a promontory covered with prickly reeds, that proved very provoking and inconvenient even to a philosopher like him; but a tree grew there expressly to offer him a bed among its branches, and Joe climbed up into it for greater security, and there, without sleeping much, however, awaited the dawn of day.

When morning had come with that suddenness which is peculiar to the equatorial regions, Joe cast a glance at the tree which had sheltered him during the last few hours, and beheld a sight that chilled the marrow in his bones. The branches of the tree were literally covered with snakes and chameleons! The foliage actually was hidden beneath their coils, so that the beholder might have fancied that he saw before him a new kind of tree that bore reptiles for its leaves and fruit. And all this horrible living mass writhed and twisted in the first rays of the morning sun! Joe experienced a keen sensation or terror mingled with disgust, as he looked at it, and he leaped precipitately from the tree amid the hissings of these new and unwelcome bedfellows.

"Now, there's something that I would never have believed!" said he.

He was not aware that Dr. Vogel's last letters had made known this singular feature of the shores of Lake Tchad, where reptiles are more numerous than in any other part of the world. But after what he had just seen, Joe determined to be more circumspect for the future; and, taking his bearings by the sun, he set off afoot toward the northeast, avoiding with the utmost care cabins, huts, hovels, and dens of every description, that might serve in any manner as a shelter for human beings.

How often his gaze was turned upward to the sky! He hoped to catch a glimpse, each time, of the Victoria; and, although he looked vainly during all that long, fatiguing day of sore foot-travel, his confident reliance on his master remained undiminished. Great energy of character was needed to enable him thus to sustain the situation with philosophy. Hunger conspired with fatigue to crush him, for a man's system is not greatly restored and fortified by a diet of roots, the pith of plants, such as the Mele, or the fruit of the doum palm-tree; and yet, according to his own calculations, Joe was enabled to push on about twenty miles to the westward.

His body bore in scores of places the marks of the thorns with which the lake-reeds, the acacias, the mimosas, and other wild shrubbery through which he had to force his way, were thickly studded; and his torn and bleeding feet rendered walking both painful and difficult. But at length he managed to react against all these sufferings; and when evening came again, he resolved to pass the night on the shores of Lake Tchad.

There he had to endure the bites of myriads of insects --gnats, mosquitoes, ants half an inch long, literally
covered the ground; and, in less than two hours, Joe had not a rag remaining of the garments that had covered him, the insects having devoured them! It was a terrible night, that did not yield our exhausted traveller an hour of sleep. During all this time the wild-boars and native buffaloes, reenforced by the ajoub--a very dangerous species of lamantin--carried on their ferocious revels in the bushes and under the waters of the lake, filling the night with a hideous concert. Joe dared scarcely breathe. Even his courage and coolness had hard work to bear up against so terrible a situation.

At length, day came again, and Joe sprang to his feet precipitately; but judge of the loathing he felt when he saw what species of creature had shared his couch--a toad!--but a toad five inches in length, a monstrous, repulsive specimen of vermin that sat there staring at him with huge round eyes. Joe felt his stomach revolt at the sight, and, regaining a little strength from the intensity of his repugnance, he rushed at the top of his speed and plunged into the lake. This sudden bath somewhat allayed the pangs of the itching that tortured his whole body; and, chewing a few leaves, he set forth resolutely, again feeling an obstinate resolution in the act, for which he could hardly account even to his own mind. He no longer seemed to have entire control of his own acts, and, nevertheless, he felt within him a strength superior to despair.

However, he began now to suffer terribly from hunger. His stomach, less resigned than he was, rebelled, and he was obliged to fasten a tendril of wild-vine tightly about his waist. Fortunately, he could quench his thirst at any moment, and, in recalling the sufferings he had undergone in the desert, he experienced comparative relief in his exemption from that other distressing want.

"What can have become of the Victoria?" he wondered. "The wind blows from the north, and she should be carried back by it toward the lake. No doubt the doctor has gone to work to right her balance, but yesterday would have given him time enough for that, so that may be to-day--but I must act just as if I was never to see him again. After all, if I only get to one of the large towns on the lake, I'll find myself no worse off than the travellers my master used to talk about. Why shouldn't I work my way out of the scrape as well as they did? Some of them got back home again. Come, then! the deuce! Cheer up, my boy!"

Thus talking to himself and walking on rapidly, Joe came right upon a horde of natives in the very depths of the forest, but he halted in time and was not seen by them. The negroes were busy poisoning arrows with the juice of the euphorbium--a piece of work deemed a great affair among these savage tribes, and carried on with a sort of ceremonial solemnity.

Joe, entirely motionless and even holding his breath, was keeping himself concealed in a thicket, when, happening to raise his eyes, he saw through an opening in the foliage the welcome apparition of the balloon--the Victoria herself--moving toward the lake, at a height of only about one hundred feet above him. But he could not make himself heard; he dared not, could not make his friends even see him!

Tears came to his eyes, not of grief but of thankfulness; his master was then seeking him; his master had not left him to perish! He would have to wait for the departure of the blacks; then he could quit his hiding-place and run toward the borders of Lake Tchad!

But by this time the Victoria was disappearing in the distant sky. Joe still determined to wait for her; she would come back again, undoubtedly. She did, indeed, return, but farther to the eastward. Joe ran, gesticulated, shouted--but all in vain! A strong breeze was sweeping the balloon away with a speed that deprived him of all hope.

For the first time, energy and confidence abandoned the heart of the unfortunate man. He saw that he was lost. He thought his master gone beyond all prospect of return. He dared no longer think; he would no longer reflect!

Like a crazy man, his feet bleeding, his body cut and torn, he walked on during all that day and a part of the next night. He even dragged himself along, sometimes on his knees, sometimes with his hands. He saw the moment nigh when all his strength would fail, and nothing would be left to him but to sink upon the ground and die.

Thus working his way along, he at length found himself close to a marsh, or what he knew would soon become a marsh, for night had set in some hours before, and he fell by a sudden misstep into a thick, clinging mire. In spite of all his efforts, in spite of his desperate struggles, he felt himself sinking gradually in the swampy ooze, and in a few minutes he was buried to his waist.

"Here, then, at last, is death!" he thought, in agony, "and what a death!"

He now began to struggle again, like a madman; but his efforts only served to bury him deeper in the tomb that the poor doomed lad was hollowing for himself; not a log of wood or a branch to buoy him up; not a reed to which he might cling! He felt that all was over! His eyes convulsively closed!

"Master! master!--Help!" were his last words; but his voice, despairing, unaided, half stifled already by the rising mire, died away feebly on the night.

CHAPTER THIRTY-SIXTH.
A Throng of People on the Horizon.—A Troop of Arabs.—The Pursuit. —It is He.—Fall from Horseback.—The Strangled Arab.—A Ball from Kennedy.—Adroit Manoeuvres.—Caught up flying.—Joe saved at last.

From the moment when Kennedy resumed his post of observation in the front of the car, he had not ceased to watch the horizon with his utmost attention.

After the lapse of some time he turned toward the doctor and said:

"If I am not greatly mistaken I can see, off yonder in the distance, a throng of men or animals moving. It is impossible to make them out yet, but I observe that they are in violent motion, for they are raising a great cloud of dust."

"May it not be another contrary breeze?" said the doctor, "another whirlwind coming to drive us back northward again?" and while speaking he stood up to examine the horizon.

"I think not, Samuel; it is a troop of gazelles or of wild oxen."

"Perhaps so, Dick; but yon throng is some nine or ten miles from us at least, and on my part, even with the glass, I can make nothing of it!"

"At all events I shall not lose sight of it. There is something remarkable about it that excites my curiosity. Sometimes it looks like a body of cavalry manoeuvring. Ah! I was not mistaken. It is, indeed, a squadron of horsemen. Look—look there!"

The doctor eyed the group with great attention, and, after a moment's pause, remarked:

"I believe that you are right. It is a detachment of Arabs or Tibbous, and they are galloping in the same direction with us, as though in flight, but we are going faster than they, and we are rapidly gaining on them. In half an hour we shall be near enough to see them and know what they are."

Kennedy had again lifted his glass and was attentively scrutinizing them. Meanwhile the crowd of horsemen was becoming more distinctly visible, and a few were seen to detach themselves from the main body.

"It is some hunting manoeuvre, evidently," said Kennedy. "Those fellows seem to be in pursuit of something. I would like to know what they are about."

"Patience, Dick! In a little while we shall overtake them, if they continue on the same route. We are going at the rate of twenty miles per hour, and no horse can keep up with that."

Kennedy again raised his glass, and a few minutes later he exclaimed:

"They are Arabs, galloping at the top of their speed; I can make them out distinctly. They are about fifty in number. I can see their bournouses puffed out by the wind. It is some cavalry exercise that they are going through. Their chief is a hundred paces ahead of them and they are rushing after him at headlong speed."

"Whoever they may be, Dick, they are not to be feared, and then, if necessary, we can go higher."

"Wait, doctor—wait a little!"

"It's curious," said Kennedy again, after a brief pause, "but there's something going on that I can't exactly explain. By the efforts they make, and the irregularity of their line, I should fancy that those Arabs are pursuing some one, instead of following."

"Are you certain of that, Dick?"

"Oh! yes, it's clear enough now. I am right! It is a pursuit—a hunt—but a man-hunt! That is not their chief riding ahead of them, but a fugitive."

"A fugitive!" exclaimed the doctor, growing more and more interested.

"Yes!"

"Don't lose sight of him, and let us wait!"

Three or four miles more were quickly gained upon these horsemen, who nevertheless were dashing onward with incredible speed.

"Doctor! doctor!" shouted Kennedy in an agitated voice.

"What is the matter, Dick?"

"Is it an illusion? Can it be possible?"

"What do you mean?"

"Wait!" and so saying, the Scot wiped the sights of his spy-glass carefully, and looked through it again intently.

"Well?" questioned the doctor.

"It is he, doctor!"

"He!" exclaimed Ferguson with emotion.

"It is he! no other!" and it was needless to pronounce the name.

"Yes! it is he! on horseback, and only a hundred paces in advance of his enemies! He is pursued!"

"It is Joe—Joe himself!" cried the doctor, turning pale.

"He cannot see us in his flight!"

"He will see us, though!" said the doctor, lowering the flame of his blow-pipe.
"But how?"
"In five minutes we shall be within fifty feet of the ground, and in fifteen we shall be right over him!"
"We must let him know it by firing a gun!"
"No! he can't turn back to come this way. He's headed off!"
"What shall we do, then?"
"We must wait."
"Wait?--and these Arabs!"
"We shall overtake them. We'll pass them. We are not more than two miles from them, and provided that Joe's horse holds out!"
"Great God!" exclaimed Kennedy, suddenly.
"What is the matter?"
Kennedy had uttered a cry of despair as he saw Joe fling himself to the ground. His horse, evidently exhausted, had just fallen headlong.
"He sees us!" cried the doctor, "and he motions to us, as he gets upon his feet!"
"But the Arabs will overtake him! What is he waiting for? Ah! the brave lad! Huzza!" shouted the sportsman, who could no longer restrain his feelings.
Joe, who had immediately sprung up after his fall, just as one of the swiftest horsemen rushed upon him, bounded like a panther, avoided his assailant by leaping to one side, jumped up behind him on the crupper, seized the Arab by the throat, and, strangling him with his sinewy hands and fingers of steel, flung him on the sand, and continued his headlong flight.
A tremendous howl was heard from the Arabs, but, completely engrossed by the pursuit, they had not taken notice of the balloon, which was now but five hundred paces behind them, and only about thirty feet from the ground. On their part, they were not twenty lengths of their horses from the fugitive.
One of them was very perceptibly gaining on Joe, and was about to pierce him with his lance, when Kennedy, with fixed eye and steady hand, stopped him short with a ball, that hurled him to the earth.
Joe did not even turn his head at the report. Some of the horsemen reined in their barbs, and fell on their faces in the dust as they caught sight of the Victoria; the rest continued their pursuit.
"But what is Joe about?" said Kennedy; "he don't stop!"
"He's doing better than that, Dick! I understand him! He's keeping on in the same direction as the balloon. He relies upon our intelligence. Ah! the noble fellow! We'll carry him off in the very teeth of those Arab rascals! We are not more than two hundred paces from him!"
"What are we to do?" asked Kennedy.
"Lay aside your rifle, Dick."
And the Scot obeyed the request at once.
"Do you think that you can hold one hundred and fifty pounds of ballast in your arms?"
"Ay, more than that!"
"No! That will be enough!"
And the doctor proceeded to pile up bags of sand in Kennedy's arms.
"Hold yourself in readiness in the back part of the car, and be prepared to throw out that ballast at a single effort. But, for your life, don't do so until I give the word!"
"Be easy on that point."
"Otherwise, we should miss Joe, and he would be lost."
"Count upon me!"
The Victoria at that moment almost commanded the troop of horsemen who were still desperately urging their steeds at Joe's heels. The doctor, standing in the front of the car, held the ladder clear, ready to throw it at any moment. Meanwhile, Joe had still maintained the distance between himself and his pursuers--say about fifty feet. The Victoria was now ahead of the party.
"Attention!" exclaimed the doctor to Kennedy.
"I'm ready!"
"Joe, look out for yourself!" shouted the doctor in his sonorous, ringing voice, as he flung out the ladder, the lowest ratlines of which tossed up the dust of the road.
As the doctor shouted, Joe had turned his head, but without checking his horse. The ladder dropped close to him, and at the instant he grasped it the doctor again shouted to Kennedy:
"Throw ballast!"
"It's done!"
And the Victoria, lightened by a weight greater than Joe's, shot up one hundred and fifty feet into the air.
Joe clung with all his strength to the ladder during the wide oscillations that it had to describe, and then making an indescribable gesture to the Arabs, and climbing with the agility of a monkey, he sprang up to his companions, who received him with open arms.

The Arabs uttered a scream of astonishment and rage. The fugitive had been snatched from them on the wing, and the Victoria was rapidly speeding far beyond their reach.

"Master! Kennedy!" ejaculated Joe, and overwhelmed, at last, with fatigue and emotion, the poor fellow fainted away, while Kennedy, almost beside himself, kept exclaiming:

"Saved--saved!"

"Saved indeed!" murmured the doctor, who had recovered all his phlegmatic coolness.

Joe was almost naked. His bleeding arms, his body covered with cuts and bruises, told what his sufferings had been. The doctor quietly dressed his wounds, and laid him comfortably under the awning.

Joe soon returned to consciousness, and asked for a glass of brandy, which the doctor did not see fit to refuse, as the faithful fellow had to be indulged.

After he had swallowed the stimulant, Joe grasped the hands of his two friends and announced that he was ready to relate what had happened to him.

But they would not allow him to talk at that time, and he sank back into a profound sleep, of which he seemed to have the greatest possible need.

The Victoria was then taking an oblique line to the westward. Driven by a tempestuous wind, it again approached the borders of the thorny desert, which the travellers descried over the tops of palm-trees, bent and broken by the storm; and, after having made a run of two hundred miles since rescuing Joe, it passed the tenth degree of east longitude about nightfall.

CHAPTER THIRTY-SEVENTH.
The Western Route.--Joe wakes up.--His Obstinacy.--End of Joe's Narrative.--Tagelei.--Kennedy's Anxieties.--The Route to the North.--A Night near Aghades.

During the night the wind lulled as though reposing after the boisterousness of the day, and the Victoria remained quietly at the top of the tall sycamore. The doctor and Kennedy kept watch by turns, and Joe availed himself of the chance to sleep most sturdily for twenty-four hours at a stretch.

"That's the remedy he needs," said Dr. Ferguson. "Nature will take charge of his care."

With the dawn the wind sprang up again in quite strong, and moreover capricious gusts. It shifted abruptly from south to north, but finally the Victoria was carried away by it toward the west.

The doctor, map in hand, recognized the kingdom of Damerghou, an undulating region of great fertility, in which the huts that compose the villages are constructed of long reeds interwoven with branches of the asclepia. The grain-mills were seen raised in the cultivated fields, upon small scaffoldings or platforms, to keep them out of the reach of the mice and the huge ants of that country.

They soon passed the town of Zinder, recognized by its spacious place of execution, in the centre of which stands the "tree of death." At its foot the executioner stands waiting, and whoever passes beneath its shadow is immediately hung!

Upon consulting his compass, Kennedy could not refrain from saying:

"Look! we are again moving northward."

"No matter; if it only takes us to Timbuctoo, we shall not complain. Never was a finer voyage accomplished under better circumstances!"

"Nor in better health," said Joe, at that instant thrusting his jolly countenance from between the curtains of the awning.

"There he is! there's our gallant friend--our preserver!" exclaimed Kennedy, cordially.""How goes it, Joe?"

"Oh! why, naturally enough, Mr. Kennedy, very naturally! I never felt better in my life! Nothing sets a man up like a little pleasure-trip with a bath in Lake Tchad to start on--eh, doctor?"

"Brave fellow!" said Ferguson, pressing Joe's hand, "what terrible anxiety you caused us!"

"Humph! and you, sir? Do you think that I felt easy in my mind about you, gentlemen? You gave me a fine fright, let me tell you!"

"We shall never agree in the world, Joe, if you take things in that style."

"I see that his tumble hasn't changed him a bit," added Kennedy.

"Your devotion and self-forgetfulness were sublime, my brave lad, and they saved us, for the Victoria was falling into the lake, and, once there, nobody could have extricated her."

"But, if my devotion, as you are pleased to call my summerset, saved you, did it not save me too, for here we are,
all three of us, in first-rate health? Consequently we have nothing to squabble about in the whole affair."

"Oh! we can never come to a settlement with that youth," said the sportsman.

"The best way to settle it," replied Joe, "is to say nothing more about the matter. What's done is done. Good or bad, we can't take it back."

"You obstinate fellow!" said the doctor, laughing; "you can't refuse, though, to tell us your adventures, at all events."

"Not if you think it worth while. But, in the first place, I'm going to cook this fat goose to a turn, for I see that Mr. Kennedy has not wasted his time."

"All right, Joe!"

"Well, let us see then how this African game will sit on a European stomach!"

The goose was soon roasted by the flame of the blow-pipe, and not long afterward was comfortably stowed away. Joe took his own good share, like a man who had eaten nothing for several days. After the tea and the punch, he acquainted his friends with his recent adventures. He spoke with some emotion, even while looking at things with his usual philosophy. The doctor could not refrain from frequently pressing his hand when he saw his worthy servant more considerate of his master's safety than of his own, and, in relation to the sinking of the island of the Biddiomahs, he explained to him the frequency of this phenomenon upon Lake Tchad.

At length Joe, continuing his recital, arrived at the point where, sinking in the swamp, he had uttered a last cry of despair.

"I thought I was gone," said he, "and as you came right into my mind, I made a hard fight for it. How, I couldn't tell you--but I'd made up my mind that I wouldn't go under without knowing why. Just then, I saw--two or three feet from me--what do you think? the end of a rope that had been fresh cut; so I took leave to make another jerk, and, by hook or by crook, I got to the rope. When I pulled, it didn't give; so I pulled again and hauled away and there I was on dry ground! At the end of the rope, I found an anchor! Ah, master, I've a right to call that the anchor of safety, anyhow, if you have no objection. I knew it again! It was the anchor of the Victoria! You had grounded there! So I followed the direction of the rope and that gave me your direction, and, after trying hard a few times more, I got out of the swamp. I had got my strength back with my spunk, and I walked on part of the night away from the lake, until I got to the edge of a very big wood. There I saw a fenced-in place, where some horses were grazing, without thinking of any harm. Now, there are times when everybody knows how to ride a horse, are there not, doctor? So I didn't spend much time thinking about it, but jumped right on the back of one of those innocent animals and away we went galloping north as fast as our legs could carry us. I needn't tell you about the towns that I didn't see nor the villages that I took good care to go around. No! I crossed the ploughed fields; I leaped the hedges; I scrambled over the fences; I dug my heels into my nag; I thrashed him; I fairly lifted the poor fellow off his feet! At last I got to the end of the tilled land. Good! There was the desert. 'That suits me!' said I, 'for I can see better ahead of me and farther too.' I was hoping all the time to see the balloon tacking about and waiting for me. But not a bit of it; and so, in about three hours, I go plump, like a fool, into a camp of Arabs! Whew! what a hunt that was! You see, Mr. Kennedy, a hunter don't know what a real hunt is until he's been hunted himself! Still I advise him not to try it if he can keep out of it! My horse was so tired, he was ready to drop off his legs; they were close on me; I threw myself to the ground; then I jumped up again behind an Arab! I didn't mean the fellow any harm, and I hope he has no grudge against me for choking him, but I saw you--and you know the rest. The Victoria came on at my heels, and you caught me up flying, as a circus-rider does a ring. Wasn't I right in counting on you? Now, doctor, you see how simple all that was! Nothing more natural in the world! I'm ready to begin over again, if it would be of any service to you. And besides, master, as I said a while ago, it's not worth mentioning."

"My noble, gallant Joe!" said the doctor, with great feeling. "Heart of gold! we were not astray in trusting to your intelligence and skill."

"Poh! doctor, one has only just to follow things along as they happen, and he can always work his way out of a scrape! The safest plan, you see, is to take matters as they come."

While Joe was telling his experience, the balloon had rapidly passed over a long reach of country, and Kennedy soon pointed out on the horizon a collection of structures that looked like a town. The doctor glanced at his map and recognized the place as the large village of Tagelei, in the Damergou country.

"Here," said he, "we come upon Dr. Barth's route. It was at this place that he parted from his companions, Richardson and Overweg; the first was to follow the Zinder route, and the second that of Maradi; and you may remember that, of these three travellers, Barth was the only one who ever returned to Europe."

"Then," said Kennedy, following out on the map the direction of the Victoria, "we are going due north."

"Due north, Dick."

"And don't that give you a little uneasiness?"

"Why should it?"
"Because that line leads to Tripoli, and over the Great Desert."
"Oh, we shall not go so far as that, my friend--at least, I hope not."
"But where do you expect to halt?"
"Come, Dick, don't you feel some curiosity to see Timbuctoo?"
"Timbuctoo?"
"Certainly," said Joe; "nobody nowadays can think of making the trip to Africa without going to see Timbuctoo."
"You will be only the fifth or sixth European who has ever set eyes on that mysterious city."
"Ho, then, for Timbuctoo!"
"Well, then, let us try to get as far as between the seventeenth and eighteenth degrees of north latitude, and there we will seek a favorable wind to carry us westward."
"Good!" said the hunter. "But have we still far to go to the northward?"
"One hundred and fifty miles at least."
"In that case," said Kennedy, "I'll turn in and sleep a bit."
"Sleep, sir; sleep!" urged Joe. "And you, doctor, do the same yourself: you must have need of rest, for I made you keep watch a little out of time."

The sportsman stretched himself under the awning; but Ferguson, who was not easily conquered by fatigue, remained at his post.

In about three hours the Victoria was crossing with extreme rapidity an expanse of stony country, with ranges of lofty, naked mountains of granitic formation at the base. A few isolated peaks attained the height of even four thousand feet. Giraffes, antelopes, and ostriches were seen running and bounding with marvellous agility in the midst of forests of acacias, mimosas, souahs, and date-trees. After the barrenness of the desert, vegetation was now resuming its empire. This was the country of the Kailouas, who veil their faces with a bandage of cotton, like their dangerous neighbors, the Touaregs.

At ten o'clock in the evening, after a splendid trip of two hundred and fifty miles, the Victoria halted over an important town. The moonlight revealed glimpses of one district half in ruins; and some pinnacles of mosques and minarets shot up here and there, glistening in the silvery rays. The doctor took a stellar observation, and discovered that he was in the latitude of Aghades.

This city, once the seat of an immense trade, was already falling into ruin when Dr. Barth visited it.

The Victoria, not being seen in the obscurity of night, descended about two miles above Aghades, in a field of millet. The night was calm, and began to break into dawn about three o'clock A.M.; while a light wind coaxed the balloon westward, and even a little toward the south.

Dr. Ferguson hastened to avail himself of such good fortune, and rapidly ascending resumed his aerial journey amid a long wake of golden morning sunshine.

CHAPTER THIRTY-EIGHTH.

The 17th of May passed tranquilly, without any remarkable incident; the desert gained upon them once more; a moderate wind bore the Victoria toward the southwest, and she never swerved to the right or to the left, but her shadow traced a perfectly straight line on the sand.

Before starting, the doctor had prudently renewed his stock of water, having feared that he should not be able to touch ground in these regions, infested as they are by the Aouelim-Minian Touaregs. The plateau, at an elevation of eighteen hundred feet above the level of the sea, sloped down toward the south. Our travellers, having crossed the Aghades route at Murzouk--a route often pressed by the feet of camels--arrived at that evening, in the sixteenth degree of north latitude, and four degrees fifty-five minutes east longitude, after having passed over one hundred and eighty miles of a long and monotonous day's journey.

During the day Joe dressed the last pieces of game, which had been only hastily prepared, and he served up for supper a mess of snipe, that were greatly relished. The wind continuing good, the doctor resolved to keep on during the night, the moon, still nearly at the full, illumining it with her radiance. The Victoria ascended to a height of five hundred feet, and, during her nocturnal trip of about sixty miles, the gentle slumbers of an infant would not have been disturbed by her motion.

On Sunday morning, the direction of the wind again changed, and it bore to the northwestward. A few crows were seen sweeping through the air, and, off on the horizon, a flock of vultures which, fortunately, however, kept at a distance.
The sight of these birds led Joe to compliment his master on the idea of having two balloons.

"Where would we be," said he, "with only one balloon? The second balloon is like the life-boat to a ship; in case of wreck we could always take to it and escape."

"You are right, friend Joe," said the doctor, "only that my life-boat gives me some uneasiness. It is not so good as the main craft."

"What do you mean by that, doctor?" asked Kennedy.

"I mean to say that the new Victoria is not so good as the old one. Whether it be that the stuff it is made of is too much worn, or that the heat of the spiral has melted the gutta-percha, I can observe a certain loss of gas. It don't amount to much thus far, but still it is noticeable. We have a tendency to sink, and, in order to keep our elevation, I am compelled to give greater dilation to the hydrogen."

"The deuce!" exclaimed Kennedy with concern; "I see no remedy for that."

"There is none, Dick, and that is why we must hasten our progress, and even avoid night halts."

"Are we still far from the coast?" asked Joe.

"Which coast, my boy? How are we to know whither chance will carry us? All that I can say is, that Timbuctoo is still about four hundred miles to the westward."

"And how long will it take us to get there?"

"Should the wind not carry us too far out of the way, I hope to reach that city by Tuesday evening."

"Then," remarked Joe, pointing to a long file of animals and men winding across the open desert, "we shall arrive there sooner than that caravan."

Ferguson and Kennedy leaned over and saw an immense cavalcade. There were at least one hundred and fifty camels of the kind that, for twelve muckals of gold, or about twenty-five dollars, go from Timbuctoo to Tafilet with a load of five hundred pounds upon their backs. Each animal had dangling to its tail a bag to receive its excrement, the only fuel on which the caravans can depend when crossing the desert.

These Touareg camels are of the very best race. They can go from three to seven days without drinking, and for two without eating. Their speed surpasses that of the horse, and they obey with intelligence the voice of the khabir, or guide of the caravan. They are known in the country under the name of mehari.

Such were the details given by the doctor while his companions continued to gaze upon that multitude of men, women, and children, advancing on foot and with difficulty over a waste of sand half in motion, and scarcely kept in its place by scanty nettles, withered grass, and stunted bushes that grew upon it. The wind obliterated the marks of their feet almost instantly.

Joe inquired how the Arabs managed to guide themselves across the desert, and come to the few wells scattered far between throughout this vast solitude.

"The Arabs," replied Dr. Ferguson, "are endowed by nature with a wonderful instinct in finding their way. Where a European would be at a loss, they never hesitate for a moment. An insignificant fragment of rock, a pebble, a tuft of grass, a different shade of color in the sand, suffice to guide them with accuracy. During the night they go by the polar star. They never travel more than two miles per hour, and always rest during the noonday heat. You may judge from that how long it takes them to cross Sahara, a desert more than nine hundred miles in breadth."

But the Victoria had already disappeared from the astonished gaze of the Arabs, who must have envied her rapidity. That evening she passed two degrees twenty minutes east longitude, and during the night left another degree behind her.

On Monday the weather changed completely. Rain began to fall with extreme violence, and not only had the balloon to resist the power of this deluge, but also the increase of weight which it caused by wetting the whole machine, car and all. This continuous shower accounted for the swamps and marshes that formed the sole surface of the country. Vegetation reappeared, however, along with the mimosas, the baobabs, and the tamarind-trees.

Such was the Sonray country, with its villages topped with roofs turned over like Armenian caps. There were few mountains, and only such hills as were enough to form the ravines and pools where the pintadoes and snipes went sailing and diving through. Here and there, an impetuous torrent cut the roads, and had to be crossed by the natives on long vines stretched from tree to tree. The forests gave place to jungles, which alligators, hippopotami, and the rhinoceroses, made their haunts.

"It will not be long before we see the Niger," said the doctor. "The face of the country always changes in the vicinity of large rivers. These moving highways, as they are sometimes correctly called, have first brought vegetation with them, as they will at last bring civilization. Thus, in its course of twenty-five hundred miles, the Niger has scattered along its banks the most important cities of Africa."

"By-the-way," put in Joe, "that reminds me of what was said by an admirer of the goodness of Providence, who praised the foresight with which it had generally caused rivers to flow close to large cities!"

At noon the Victoria was passing over a petty town, a mere assemblage of miserable huts, which once was Goa,
a great capital.

"It was there," said the doctor, "that Barth crossed the Niger, on his return from Timbuctoo. This is the river so famous in antiquity, the rival of the Nile, to which pagan superstition ascribed a celestial origin. Like the Nile, it has engaged the attention of geographers in all ages; and like it, also, its exploration has cost the lives of many victims; yes, even more of them than perished on account of the other."

The Niger flowed broadly between its banks, and its waters rolled southward with some violence of current; but our travellers, borne swiftly by as they were, could scarcely catch a glimpse of its curious outline.

"I wanted to talk to you about this river," said Dr. Ferguson, "and it is already far from us. Under the names of Dhiouleba, Mayo, Egghireou, Quorra, and other titles besides, it traverses an immense extent of country, and almost competes in length with the Nile. These appellations signify simply 'the River,' according to the dialects of the countries through which it passes."

"Did Dr. Barth follow this route?" asked Kennedy.

"No, Dick: in quitting Lake Tchad, he passed through the different towns of Bornou, and intersected the Niger at Say, four degrees below Goa; then he penetrated to the bosom of those unexplored countries which the Niger embraces in its elbow; and, after eight months of fresh fatigues, he arrived at Timbuctoo; all of which we may do in about three days with as swift a wind as this."

"Have the sources of the Niger been discovered?" asked Joe.

"Long since," replied the doctor. "The exploration of the Niger and its tributaries was the object of several expeditions, the principal of which I shall mention: Between 1749 and 1758, Adamson made a reconnaissance of the river, and visited Gorea; from 1785 to 1788, Golberry and Geoffroy travelled across the deserts of Senegambia, and ascended as far as the country of the Moors, who assassinated Saugnier, Brisson, Adam, Riley, Cochelet, and so many other unfortunate men. Then came the illustrious Mungo Park, the friend of Sir Walter Scott, and, like him, a Scotchman by birth. Sent out in 1795 by the African Society of London, he got as far as Bambarra, saw the Niger, travelled five hundred miles with a slave-merchant, reconnoitred the Gambia River, and returned to England in 1797. He again set out, on the 30th of January, 1805, with his brother-in-law Anderson, Scott, the designer, and a gang of workmen; he reached Gorea, there added a detachment of thirty-five soldiers to his party, and saw the Niger again on the 19th of August. But, by that time, in consequence of fatigue, privations, ill-usage, the inclemencies of the weather, and the unhealthiness of the country, only eleven persons remained alive of the forty Europeans in the party. On the 16th of November, the last letters from Mungo Park reached his wife; and, a year later a trader from that country gave information that, having got as far as Boussa, on the Niger, on the 23d of December, the unfortunate traveller's boat was upset by the cataracts in that part of the river, and he was murdered by the natives."

"And his dreadful fate did not check the efforts of others to explore that river?"

"On the contrary, Dick. Since then, there were two objects in view: namely, to recover the lost man's papers, as well as to pursue the exploration. In 1816, an expedition was organized, in which Major Grey took part. It arrived in Senegal, penetrated to the Fonta-Jallon, visited the Foullah and Mandingo populations, and returned to England without further results. In 1822, Major Laing explored all the western part of Africa near to the British possessions; and he it was who got so far as the sources of the Niger; and, according to his documents, the spring in which that immense river takes its rise is not two feet broad.

"Easy to jump over," said Joe.

"How's that? Easy you think, eh?" retorted the doctor. "If we are to believe tradition, whoever attempts to pass that spring, by leaping over it, is immediately swallowed up; and whoever tries to draw water from it, feels himself repulsed by an invisible hand."

"I suppose a man has a right not to believe a word of that!" persisted Joe.

"Oh, by all means!--Five years later, it was Major Laing's destiny to force his way across the desert of Sahara, penetrate to Timbuctoo, and perish a few miles above it, by strangling, at the hands of the Ouelad-shiman, who wanted to compel him to turn Mussulman."

"Still another victim!" said the sportsman.

"It was then that a brave young man, with his own feeble resources, undertook and accomplished the most astonishing of modern journeys--I mean the Frenchman Rene Caillie, who, after sundry attempts in 1819 and 1824, set out again on the 19th of April, 1827, from Rio Nunez. On the 3d of August he arrived at Time, so thoroughly exhausted and ill that he could not resume his journey until six months later, in January, 1828. He then joined a caravan, and, protected by his Oriental dress, reached the Niger on the 10th of March, penetrated to the city of Jenne, embarked on the river, and descended it, as far as Timbuctoo, where he arrived on the 30th of April. In 1760, another Frenchman, Imbert by name, and, in 1810, an Englishman, Robert Adams, had seen this curious place; but Rene Caillie was to be the first European who could bring back any authentic data concerning it. On the 4th of May he quitted this 'Queen of the desert;' on the 9th, he surveyed the very spot where Major Laing had been murdered; on
the 19th, he arrived at El-Arouan, and left that commercial town to brave a thousand dangers in crossing the vast solitudes comprised between the Soudan and the northern regions of Africa. At length he entered Tangiers, and on the 28th of September sailed for Toulon. In nineteen months, notwithstanding one hundred and eighty days' sickness, he had traversed Africa from west to north. Ah! had Callie been born in England, he would have been honored as the most intrepid traveller of modern times, as was the case with Mungo Park. But in France he was not appreciated according to his worth."

"He was a sturdy fellow!" said Kennedy, "but what became of him?"

"He died at the age of thirty-nine, from the consequences of his long fatigues. They thought they had done enough in decreeing him the prize of the Geographical Society in 1828; the highest honors would have been paid to him in England.

"While he was accomplishing this remarkable journey, an Englishman had conceived a similar enterprise and was trying to push it through with equal courage, if not with equal good fortune. This was Captain Clapperton, the companion of Denham. In 1829 he reentered Africa by the western coast of the Gulf of Benin; he then followed in the track of Mungo Park and of Laing, recovered at Boussa the documents relative to the death of the former, and arrived on the 20th of August at Sackatoo, where he was seized and held as a prisoner, until he expired in the arms of his faithful attendant Richard Lander."

"And what became of this Lander?" asked Joe, deeply interested.

"He succeeded in regaining the coast and returned to London, bringing with him the captain's papers, and an exact narrative of his own journey. He then offered his services to the government to complete the reconnoissance of the Niger. He took with him his brother John, the second child of a poor couple in Cornwall, and, together, these men, between 1829 and 1831, redescended the river from Boussa to its mouth, describing it village by village, mile by mile."

"So both the brothers escaped the common fate?" queried Kennedy.

"Yes, on this expedition, at least; but in 1833 Richard undertook a third trip to the Niger, and perished by a bullet, near the mouth of the river. You see, then, my friends, that the country over which we are now passing has witnessed some noble instances of self-sacrifice which, unfortunately, have only too often had death for their reward."

CHAPTER THIRTY-NINTH.

During this dull Monday, Dr. Ferguson diverted his thoughts by giving his companions a thousand details concerning the country they were crossing. The doctor's sole anxiety arose from the obstinate northeast wind which continued to blow furiously, and bore them away from the latitude of Timbuctoo.

The Niger, after running northward as far as that city, sweeps around, like an immense water-jet from some fountain, and falls into the Atlantic in a broad sheaf. In the elbow thus formed the country is of varied character, sometimes luxuriantly fertile, and sometimes extremely bare; fields of maize succeeded by wide spaces covered with broom-corn and uncultivated plains. All kinds of aquatic birds--pelicans, wild-duck, kingfishers, and the rest--were seen in numerous flocks hovering about the borders of the pools and torrents.

From time to time there appeared an encampment of Touaregs, the men sheltered under their leather tents, while their women were busied with the domestic toil outside, milking their camels and smoking their huge-bowed pipes.

By eight o'clock in the evening the Victoria had advanced more than two hundred miles to the westward, and our aeronauts became the spectators of a magnificent scene.

A mass of moonbeams forcing their way through an opening in the clouds, and gliding between the long lines of falling rain, descended in a golden shower on the ridges of the Hombori Mountains. Nothing could be more weird than the appearance of these seemingly basaltic summits; they stood out in fantastic profile against the sombre sky, and the beholder might have fancied them to be the legendary ruins of some vast city of the middle ages, such as the icebergs of the polar seas sometimes mimic them in nights of gloom.

"An admirable landscape for the 'Mysteries of Udolpho!'" exclaimed the doctor. "Ann Radcliffe could not have depicted you mountains in a more appalling aspect."

"Faith!" said Joe, "I wouldn't like to be strolling alone in the evening through this country of ghosts. Do you see now, master, if it wasn't so heavy, I'd like to carry that whole landscape home to Scotland! It would do for the borders of Loch Lomond, and tourists would rush there in crowds."

"Our balloon is hardly large enough to admit of that little experiment--but I think our direction is changing.
Bravo!—the elves and fairies of the place are quite obliging. See, they've sent us a nice little southeast breeze, that will put us on the right track again."

In fact, the Victoria was resuming a more northerly route, and on the morning of the 20th she was passing over an inextricable network of channels, torrents, and streams, in fine, the whole complicated tangle of the Niger's tributaries. Many of these channels, covered with a thick growth of herbage, resembled luxuriant meadow-lands. There the doctor recognized the route followed by the explorer Barth when he launched upon the river to descend to Timbuctoo. Eight hundred fathoms broad at this point, the Niger flowed between banks richly grown with cruciferous plants and tamarind-trees. Herds of agile gazelles were seen skipping about, their curling horns mingling with the tall herbage, within which the alligator, half concealed, lay silently in wait for them with watchful eyes.

Long files of camels and asses laden with merchandise from Jenne were winding in under the noble trees. Ere long, an amphitheatre of low-built houses was discovered at a turn of the river, their roofs and terraces heaped up with hay and straw gathered from the neighboring districts.

"There's Kabra!" exclaimed the doctor, joyously; "there is the harbor of Timbuctoo, and the city is not five miles from here!"

"Then, sir, you are satisfied?" half queried Joe.
"Delighted, my boy!"
"Very good; then every thing's for the best!"

In fact, about two o'clock, the Queen of the Desert, mysterious Timbuctoo, which once, like Athens and Rome, had her schools of learned men, and her professorships of philosophy, stretched away before the gaze of our travellers.

Ferguson followed the most minute details upon the chart traced by Barth himself, and was enabled to recognize its perfect accuracy.

The city forms an immense triangle marked out upon a vast plain of white sand, its acute angle directed toward the north and piercing a corner of the desert. In the environs there was almost nothing, hardly even a few grasses, with some dwarf mimosas and stunted bushes.

As for the appearance of Timbuctoo, the reader has but to imagine a collection of billiard-balls and thimbles—such is the bird's-eye view! The streets, which are quite narrow, are lined with houses only one story in height, built of bricks dried in the sun, and huts of straw and reeds, the former square, the latter conical. Upon the terraces were seen some of the male inhabitants, carelessly lounging at full length in flowing apparel of bright colors, and lance or musket in hand; but no women were visible at that hour of the day.

"Yet they are said to be handsome," remarked the doctor. "You see the three towers of the three mosques that are the only ones left standing of a great number— the city has indeed fallen from its ancient splendor! At the top of the triangle rises the Mosque of Sankore, with its ranges of galleries resting on arcades of sufficiently pure design. Farther on, and near to the Sane-Gungu quarter, is the Mosque of Sidi-Yahia and some two-story houses. But do not look for either palaces or monuments: the sheik is a mere son of traffic, and his royal palace is a counting-house."

"It seems to me that I can see half-ruined ramparts," said Kennedy.

"They were destroyed by the Fouillanes in 1826; the city was one-third larger then, for Timbuctoo, an object generally coveted by all the tribes, since the eleventh century, has belonged in succession to the Touaregs, the Sonrayans, the Moroccans, and the Fouillanes; and this great centre of civilization, where a sage like Ahmed-Baba owned, in the sixteenth century, a library of sixteen hundred manuscripts, is now nothing but a mere half-way house for the trade of Central Africa."

The city, indeed, seemed abandoned to supreme neglect; it betrayed that indifference which seems epidemic to cities that are passing away. Huge heaps of rubbish encumbered the suburbs, and, with the hill on which the marketplace stood, formed the only inequalities of the ground.

When the Victoria passed, there was some slight show of movement; drums were beaten; but the last learned man still lingering in the place had hardly time to notice the new phenomenon, for our travellers, driven onward by the wind of the desert, resumed the winding course of the river, and, ere long, Timbuctoo was nothing more than one of the fleeting reminiscences of their journey.

"And now," said the doctor, "Heaven may waft us whither it pleases!"
"Provided only that we go westward," added Kennedy.
"Bah!" said Joe; "I wouldn't be afraid if it was to go back to Zanzibar by the same road, or to cross the ocean to America."
"We would first have to be able to do that, Joe!"
"And what's wanting, doctor?"
"Gas, my boy; the ascending force of the balloon is evidently growing weaker, and we shall need all our management to make it carry us to the sea-coast. I shall even have to throw over some ballast. We are too heavy."
"That's what comes of doing nothing, doctor; when a man lies stretched out all day long in his hammock, he gets fat and heavy. It's a lazybones trip, this of ours, master, and when we get back every body will find us big and stout."

"Just like Joe," said Kennedy; "just the ideas for him: but wait a bit! Can you tell what we may have to go through yet? We are still far from the end of our trip. Where do you expect to strike the African coast, doctor?"

"I should find it hard to answer you, Kennedy. We are at the mercy of very variable winds; but I should think myself fortunate were we to strike it between Sierra Leone and Portendick. There is a stretch of country in that quarter where we should meet with friends."

"And it would be a pleasure to press their hands; but, are we going in the desirable direction?"

"Not any too well, Dick; not any too well! Look at the needle of the compass; we are bearing southward, and ascending the Niger toward its sources."

"A fine chance to discover them," said Joe, "if they were not known already. Now, couldn't we just find others for it, on a pinch?"

"Not exactly, Joe; but don't be alarmed: I hardly expect to go so far as that."

At nightfall the doctor threw out the last bags of sand. The Victoria rose higher, and the blow-pipe, although working at full blast, could scarcely keep her up. At that time she was sixty miles to the southward of Timbuctoo, and in the morning the aeronauts awoke over the banks of the Niger, not far from Lake Debo.

CHAPTER FORTIETH.

Dr. Ferguson's Anxieties.--Persistent Movement southward.--A Cloud of Grasshoppers.--A View of Jenne.--A View of Sego.--Change of the Wind.--Joe's Regrets.

The flow of the river was, at that point, divided by large islands into narrow branches, with a very rapid current. Upon one among them stood some shepherds' huts, but it had become impossible to take an exact observation of them, because the speed of the balloon was constantly increasing. Unfortunately, it turned still more toward the south, and in a few moments crossed Lake Debo.

Dr. Ferguson, forcing the dilation of his aerial craft to the utmost, sought for other currents of air at different heights, but in vain; and he soon gave up the attempt, which was only augmenting the waste of gas by pressing it against the well-worn tissue of the balloon.

He made no remark, but he began to feel very anxious. This persistence of the wind to head him off toward the southern part of Africa was defeating his calculations, and he no longer knew upon whom or upon what to depend. Should he not reach the English or French territories, what was to become of him in the midst of the barbarous tribes that infest the coasts of Guinea? How should he there get to a ship to take him back to England? And the actual direction of the wind was driving him along to the kingdom of Dahomey, among the most savage races, and into the power of a ruler who was in the habit of sacrificing thousands of human victims at his public orgies. There he would be lost!

On the other hand, the balloon was visibly wearing out, and the doctor felt it failing him. However, as the weather was clearing up a little, he hoped that the cessation of the rain would bring about a change in the atmospheric currents.

It was therefore a disagreeable reminder of the actual situation when Joe said aloud:

"There! the rain's going to pour down harder than ever; and this time it will be the deluge itself, if we're to judge by yon cloud that's coming up!"

"What! another cloud?" asked Ferguson.

"Yes, and a famous one," replied Kennedy.

"I never saw the like of it," added Joe.

"I breathe freely again!" said the doctor, laying down his spy-glass. "That's not a cloud!"

"Not a cloud?" queried Joe, with surprise.

"No; it is a swarm."

"Eh?"

"A swarm of grasshoppers!"

"That? Grasshoppers!"

"Myriads of grasshoppers, that are going to sweep over this country like a water-spout; and woe to it! for, should these insects alight, it will be laid waste."

"That would be a sight worth beholding!"

"Wait a little, Joe. In ten minutes that cloud will have arrived where we are, and you can then judge by the aid of your own eyes."

The doctor was right. The cloud, thick, opaque, and several miles in extent, came on with a deafening noise,
casting its immense shadow over the fields. It was composed of numberless legions of that species of grasshopper called crickets. About a hundred paces from the balloon, they settled down upon a tract full of foliage and verdure. Fifteen minutes later, the mass resumed its flight, and our travellers could, even at a distance, see the trees and the bushes entirely stripped, and the fields as bare as though they had been swept with the scythe. One would have thought that a sudden winter had just descended upon the earth and struck the region with the most complete sterility.

"Well, Joe, what do you think of that?"

"Well, doctor, it's very curious, but quite natural. What one grasshopper does on a small scale, thousands do on a grand scale."

"It's a terrible shower," said the hunter; "more so than hail itself in the devastation it causes."

"It is impossible to prevent it," replied Ferguson. "Sometimes the inhabitants have had the idea to burn the forests, and even the standing crops, in order to arrest the progress of these insects; but the first ranks plunging into the flames would extinguish them beneath their mass, and the rest of the swarm would then pass irresistibly onward. Fortunately, in these regions, there is some sort of compensation for their ravages, since the natives gather these insects in great numbers and greedily eat them."

"They are the prawns of the air," said Joe, who added that he was sorry that he had never had the chance to taste them--just for information's sake!

The country became more marshy toward evening; the forests dwindled to isolated clumps of trees; and on the borders of the river could be seen plantations of tobacco, and swampy meadow-lands fat with forage. At last the city of Jenne, on a large island, came in sight, with the two towers of its clay-built mosque, and the putrid odor of the millions of swallows' nests accumulated in its walls. The tops of some baobabs, mimosas, and date-trees peeped up between the houses; and, even at night, the activity of the place seemed very great. Jenne is, in fact, quite a commercial city: it supplies all the wants of Timbuctoo. Its boats on the river, and its caravans along the shaded roads, bear thither the various products of its industry.

"Were it not that to do so would prolong our journey," said the doctor, "I should like to alight at this place. There must be more than one Arab there who has travelled in England and France, and to whom our style of locomotion is not altogether new. But it would not be prudent."

"Let us put off the visit until our next trip," said Joe, laughing.

"Besides, my friends, unless I am mistaken, the wind has a slight tendency to veer a little more to the eastward, and we must not lose such an opportunity."

The doctor threw overboard some articles that were no longer of use--some empty bottles, and a case that had contained preserved-meat--and thereby managed to keep the balloon in a belt of the atmosphere more favorable to his plans. At four o'clock in the morning the first rays of the sun lighted up Sego, the capital of Bambarra, which could be recognized at once by the four towns that compose it, by its Saracenic mosques, and by the incessant going and coming of the flat-bottomed boats that convey its inhabitants from one quarter to the other. But the travellers were not more seen than they saw. They sped rapidly and directly to the northwest, and the doctor's anxiety gradually subsided.

"Two more days in this direction, and at this rate of speed, and we'll reach the Senegal River."

"And we'll be in a friendly country?" asked the hunter.

"Not altogether; but, if the worst came to the worst, and the balloon were to fail us, we might make our way to the French settlements. But, let it hold out only for a few hundred miles, and we shall arrive without fatigue, alarm, or danger, at the western coast."

"And the thing will be over!" added Joe. "Heigh-ho! so much the worse. If it wasn't for the pleasure of telling about it, I would never want to set foot on the ground again! Do you think anybody will believe our story, doctor?"

"Who can tell, Joe? One thing, however, will be undeniable: a thousand witnesses saw us start on one side of the African Continent, and a thousand more will see us arrive on the other."

"And, in that case, it seems to me that it would be hard to say that we had not crossed it," added Kennedy.

"Ah, doctor!" said Joe again, with a deep sigh, "I'll think more than once of my lumps of solid gold-ore! There was something that would have given WEIGHT to our narrative! At a grain of gold per head, I could have got together a nice crowd to listen to me, and even to admire me!"

CHAPTER FORTY-FIRST.
The Approaches to Senegal.--The Balloon sinks lower and lower.--They keep throwing out, throwing out.--The Marabout Al-Hadji.--Messrs. Pascal, Vincent, and Lambert.--A Rival of Mohammed.--The Difficult Mountains.--Kennedy's Weapons.--One of Joe's Manoeuvres.--A Halt over a Forest.
On the 27th of May, at nine o'clock in the morning, the country presented an entirely different aspect. The slopes, extending far away, changed to hills that gave evidence of mountains soon to follow. They would have to cross the chain which separates the basin of the Niger from the basin of the Senegal, and determines the course of the water-shed, whether to the Gulf of Guinea on the one hand, or to the bay of Cape Verde on the other.

As far as Senegal, this part of Africa is marked down as dangerous. Dr. Ferguson knew it through the recitals of his predecessors. They had suffered a thousand privations and been exposed to a thousand dangers in the midst of these barbarous negro tribes. It was this fatal climate that had devoured most of the companions of Mungo Park. Ferguson, therefore, was more than ever decided not to set foot in this inhospitable region.

But he had not enjoyed one moment of repose. The Victoria was descending very perceptibly, so much so that he had to throw overboard a number more of useless articles, especially when there was a mountain-top to pass. Things went on thus for more than one hundred and twenty miles; they were worn out with ascending and falling again; the balloon, like another rock of Sisyphus, kept continually sinking back toward the ground. The rotundity of the covering, which was now but little inflated, was collapsing already. It assumed an elongated shape, and the wind hollowed large cavities in the silken surface.

Kennedy could not help observing this.

"Is there a crack or a tear in the balloon?" he asked.

"No, but the gutta percha has evidently softened or melted in the heat, and the hydrogen is escaping through the silk."

"How can we prevent that?"

"It is impossible. Let us lighten her. That is the only help. So let us throw out every thing we can spare."

"But what shall it be?" said the hunter, looking at the car, which was already quite bare.

"Well, let us get rid of the awning, for its weight is quite considerable."

Joe, who was interested in this order, climbed up on the circle which kept together the cordage of the network, and from that place easily managed to detach the heavy curtains of the awning and throw them overboard.

"There's something that will gladden the hearts of a whole tribe of blacks," said he; "there's enough to dress a thousand of them, for they're not very extravagant with cloth."

The balloon had risen a little, but it soon became evident that it was again approaching the ground.

"Let us alight," suggested Kennedy, "and see what can be done with the covering of the balloon."

"I tell you, again, Dick, that we have no means of repairing it."

"Then what shall we do?"

"We'll have to sacrifice every thing not absolutely indispensable; I am anxious, at all hazards, to avoid a detention in these regions. The forests over the tops of which we are skimming are any thing but safe."

"What! are there lions in them, or hyenas?" asked Joe, with an expression of sovereign contempt.

"Worse than that, my boy! There are men, and some of the most cruel, too, in all Africa."

"How is that known?"

"By the statements of travellers who have been here before us. Then the French settlers, who occupy the colony of Senegal, necessarily have relations with the surrounding tribes. Under the administration of Colonel Faidherbe, reconnoissances have been pushed far up into the country. Officers such as Messrs. Pascal, Vincent, and Lambert, have brought back precious documents from their expeditions. They have explored these countries formed by the elbow of the Senegal in places where war and pillage have left nothing but ruins."

"What, then, took place?"

"I will tell you. In 1854 a Marabout of the Senegalese Fouta, Al-Hadji by name, declaring himself to be inspired like Mohammed, stirred up all the tribes to war against the infidels--that is to say, against the Europeans. He carried destruction and desolation over the regions between the Senegal River and its tributary, the Fateme. Three hordes of fanatics led on by him scour ed the country, sparing neither a village nor a hut in their pillaging, massacring career. He advanced in person on the town of Sego, which was a long time threatened. In 1857 he worked up farther to the northward, and invested the fortification of Medina, built by the French on the bank of the river. This stronghold was defended by Paul Holl, who, for several months, without provisions or ammunition, held out until Colonel Faidherbe came to his relief. Al-Hadji and his bands then repassed the Senegal, and reappeared in the Kaarta, continuing their rapine and murder. --Well, here below us is the very country in which he has found refuge with his hordes of banditti; and I assure you that it would not be a good thing to fall into his hands."
"What is that?"
"We shall have mountains to pass, and that will be difficult to do, since I cannot augment the ascensional force
of the balloon, even with the greatest possible heat that I can produce."
"Well, wait a bit," said Kennedy, "and we shall see!"
"The poor Victoria!" sighed Joe; "I had got fond of her as the sailor does of his ship, and I'll not give her up so
easily. She may not be what she was at the start—granted; but we shouldn't say a word against her. She has done us
good service, and it would break my heart to desert her."
"Be at your ease, Joe; if we leave her, it will be in spite of ourselves. She'll serve us until she's completely worn
out, and I ask of her only twenty-four hours more!"
"Ah, she's getting used up! She grows thinner and thinner," said Joe, dolefully, while he eyed her. "Poor
balloon!"
"Unless I am deceived," said Kennedy, "there on the horizon are the mountains of which you were speaking,
doctor."
"Yes, there they are, indeed!" exclaimed the doctor, after having examined them through his spy-glass, "and they
look very high. We shall have some trouble in crossing them."
"Can we not avoid them?"
"I am afraid not, Dick. See what an immense space they occupy—nearly one-half of the horizon!"
"They even seem to shut us in," added Joe. "They are gaining on both our right and our left."
"We must then pass over them."
These obstacles, which threatened such imminent peril, seemed to approach with extreme rapidity, or, to speak
more accurately, the wind, which was very fresh, was hurrying the balloon toward the sharp peaks. So rise it must,
or be dashed to pieces.
"Let us empty our tank of water," said the doctor, "and keep only enough for one day."
"There it goes," shouted Joe.
"Does the balloon rise at all?" asked Kennedy.
"A little—some fifty feet," replied the doctor, who kept his eyes fixed on the barometer. "But that is not enough."
In truth the lofty peaks were starting up so swiftly before the travellers that they seemed to be rushing down
upon them. The balloon was far from rising above them. She lacked an elevation of more than five hundred feet
more.
The stock of water for the cylinder was also thrown overboard and only a few pints were retained, but still all
this was not enough.
"We must pass them though!" urged the doctor.
"Let us throw out the tanks—we have emptied them." said Kennedy.
"Over with them!"
"There they go!" panted Joe. "But it's hard to see ourselves dropping off this way by piecemeal."
"Now, for your part, Joe, make no attempt to sacrifice yourself as you did the other day! Whatever happens,
swear to me that you will not leave us!"
"Have no fears, my master, we shall not be separated."
The Victoria had ascended some hundred and twenty feet, but the crest of the mountain still towered above it. It
was an almost perpendicular ridge that ended in a regular wall rising abruptly in a straight line. It still rose more than
two hundred feet over the aeronauts.
"In ten minutes," said the doctor to himself, "our car will be dashed against those rocks unless we succeed in
passing them!"
"Well, doctor?" queried Joe.
"Keep nothing but our pemmican, and throw out all the heavy meat."
Thereupon the balloon was again lightened by some fifty pounds, and it rose very perceptibly, but that was of
little consequence, unless it got above the line of the mountain-tops. The situation was terrifying. The Victoria was
rushing on with great rapidity. They could feel that she would be dashed to pieces—that the shock would be fearful.
The doctor glanced around him in the car. It was nearly empty.
"If needs be, Dick, hold yourself in readiness to throw over your fire-arms!"
"Sacrifice my fire-arms?" repeated the sportsman, with intense feeling.
"My friend, I ask it; it will be absolutely necessary!"
"Samuel! Doctor!"
"Your guns, and your stock of powder and ball might cost us our lives."
"We are close to it!" cried Joe.
Sixty feet! The mountain still overtopped the balloon by sixty feet.
Joe took the blankets and other coverings and tossed them out; then, without a word to Kennedy, he threw over several bags of bullets and lead.

The balloon went up still higher; it surmounted the dangerous ridge, and the rays of the sun shone upon its uppermost extremity; but the car was still below the level of certain broken masses of rock, against which it would inevitably be dashed.

“Kennedy! Kennedy! throw out your fire-arms, or we are lost!” shouted the doctor.

“Wait, sir; wait one moment!” they heard Joe exclaim, and, looking around, they saw Joe disappear over the edge of the balloon.

“Joe! Joe!” cried Kennedy.

“Wretched man!” was the doctor’s agonized expression.

The flat top of the mountain may have had about twenty feet in breadth at this point, and, on the other side, the slope presented a less declivity. The car just touched the level of this plane, which happened to be quite even, and it glided over a soil composed of sharp pebbles that grated as it passed.

“We’re over it! we’re over it! we’re clear!” cried out an exulting voice that made Ferguson’s heart leap to his throat.

The daring fellow was there, grasping the lower rim of the car, and running afoot over the top of the mountain, thus lightening the balloon of his whole weight. He had to hold on with all his strength, too, for it was likely to escape his grasp at any moment.

When he had reached the opposite declivity, and the abyss was before him, Joe, by a vigorous effort, hoisted himself from the ground, and, clambering up by the cordage, rejoined his friends.

“That was all!” he coolly ejaculated.

“My brave Joe! my friend!” said the doctor, with deep emotion.

“Oh! what I did,” laughed the other, “was not for you; it was to save Mr. Kennedy’s rifle. I owed him that good turn for the affair with the Arab! I like to pay my debts, and now we are even,” added he, handing to the sportsman his favorite weapon. “I’d feel very badly to see you deprived of it.”

Kennedy heartily shook the brave fellow’s hand, without being able to utter a word.

The Victoria had nothing to do now but to descend. That was easy enough, so that she was soon at a height of only two hundred feet from the ground, and was then in equilibrium. The surface seemed very much broken as though by a convulsion of nature. It presented numerous inequalities, which would have been very difficult to avoid during the night with a balloon that could no longer be controlled. Evening was coming on rapidly, and, notwithstanding his repugnance, the doctor had to make up his mind to halt until morning.

“We’ll now look for a favorable stopping-place,” said he.

“Ah!” replied Kennedy, “you have made up your mind, then, at last?”

“Yes, I have for a long time been thinking over a plan which we’ll try to put into execution; it is only six o’clock in the evening, and we shall have time enough. Throw out your anchors, Joe!”

Joe immediately obeyed, and the two anchors dangled below the balloon.

“I see large forests ahead of us,” said the doctor; “we are going to sweep along their tops, and we shall grapple to some tree, for nothing would make me think of passing the night below, on the ground.”

“But can we not descend?” asked Kennedy.

“To what purpose? I repeat that it would be dangerous for us to separate, and, besides, I claim your help for a difficult piece of work.”

The Victoria, which was skimming along the tops of immense forests, soon came to a sharp halt. Her anchors had caught, and, the wind falling as dusk came on, she remained motionlessly suspended above a vast field of verdure, formed by the tops of a forest of sycamores.

CHAPTER FORTY-SECOND.

A Struggle of Generosity.--The Last Sacrifice.--The Dilating Apparatus.--Joe’s Adroitness.--Midnight.--The Doctor’s Watch.--Kennedy’s Watch.--The Latter falls asleep at his Post.--The Fire.--The Howlings of the Natives.--Out of Range.

Doctor Ferguson’s first care was to take his bearings by stellar observation, and he discovered that he was scarcely twenty-five miles from Senegal.

“All that we can manage to do, my friends,” said he, after having pointed his map, “is to cross the river; but, as there is neither bridge nor boat, we must, at all hazards, cross it with the balloon, and, in order to do that, we must still lighten up.”

“But I don’t exactly see how we can do that?” replied Kennedy, anxious about his fire-arms, “unless one of us
makes up his mind to sacrifice himself for the rest,—that is, to stay behind, and, in my turn, I claim that honor."
"You, indeed!" remonstrated Joe; "ain't I used to—"
"The question now is, not to throw ourselves out of the car, but simply to reach the coast of Africa on foot. I am a first-rate walker, a good sportsman, and—"
"I'll never consent to it!" insisted Joe.
"Your generous rivalry is useless, my brave friends," said Ferguson; "I trust that we shall not come to any such extremity: besides, if we did, instead of separating, we should keep together, so as to make our way across the country in company."
"That's the talk," said Joe; "a little tramp won't do us any harm."
"But before we try that," resumed the doctor, "we must employ a last means of lightening the balloon."
"What will that be? I should like to see it," said Kennedy, incredulously.
"We must get rid of the cylinder-chests, the spiral, and the Buntzen battery. Nine hundred pounds make a rather heavy load to carry through the air."
"But then, Samuel, how will you dilate your gas?"
"I shall not do so at all. We'll have to get along without it."
"But—"
"Listen, my friends: I have calculated very exactly the amount of ascensional force left to us, and it is sufficient to carry us every one with the few objects that remain. We shall make in all a weight of hardly five hundred pounds, including the two anchors which I desire to keep."
"Dear doctor, you know more about the matter than we do; you are the sole judge of the situation. Tell us what we ought to do, and we will do it."
"I am at your orders, master," added Joe.
"I repeat, my friends, that however serious the decision may appear, we must sacrifice our apparatus."
"Let it go, then!" said Kennedy, promptly.
"To work!" said Joe.

It was no easy job. The apparatus had to be taken down piece by piece. First, they took out the mixing reservoir, then the one belonging to the cylinder, and lastly the tank in which the decomposition of the water was effected. The united strength of all three travellers was required to detach these reservoirs from the bottom of the car in which they had been so firmly secured; but Kennedy was so strong, Joe so adroit, and the doctor so ingenious, that they finally succeeded. The different pieces were thrown out, one after the other, and they disappeared below, making huge gaps in the foliage of the sycamores.
"The black fellows will be mightily astonished," said Joe, "at finding things like those in the woods; they'll make idols of them!"

The next thing to be looked after was the displacement of the pipes that were fastened in the balloon and connected with the spiral. Joe succeeded in cutting the caoutchouc jointings above the car, but when he came to the pipes he found it more difficult to disengage them, because they were held by their upper extremity and fastened by wires to the very circle of the valve.
Then it was that Joe showed wonderful adroitness. In his naked feet, so as not to scratch the covering, he succeeded by the aid of the network, and in spite of the oscillations of the balloon, in climbing to the upper extremity, and after a thousand difficulties, in holding on with one hand to that slippery surface, while he detached the outside screws that secured the pipes in their place. These were then easily taken out, and drawn away by the lower end, which was hermetically sealed by means of a strong ligature.

The Victoria, relieved of this considerable weight, rose upright in the air and tugged strongly at the anchor-rope. About midnight this work ended without accident, but at the cost of most severe exertion, and the trio partook of a luncheon of pemmican and cold punch, as the doctor had no more fire to place at Joe's disposal.
Besides, the latter and Kennedy were dropping off their feet with fatigue.
"Lie down, my friends, and get some rest," said the doctor. "I'll take the first watch; at two o'clock I'll waken Kennedy; at four, Kennedy will waken Joe, and at six we'll start; and may Heaven have us in its keeping for this last day of the trip!"

Without waiting to be coaxed, the doctor's two companions stretched themselves at the bottom of the car and dropped into profound slumber on the instant.

The night was calm. A few clouds broke against the last quarter of the moon, whose uncertain rays scarcely pierced the darkness. Ferguson, resting his elbows on the rim of the car, gazed attentively around him. He watched with close attention the dark screen of foliage that spread beneath him, hiding the ground from his view. The least noise aroused his suspicions, and he questioned even the slightest rustling of the leaves.
He was in that mood which solitude makes more keenly felt, and during which vague terrors mount to the brain.
At the close of such a journey, after having surmounted so many obstacles, and at the moment of touching the goal, one's fears are more vivid, one's emotions keener. The point of arrival seems to fly farther from our gaze.

Moreover, the present situation had nothing very consolatory about it. They were in the midst of a barbarous country, and dependent upon a vehicle that might fail them at any moment. The doctor no longer counted implicitly on his balloon; the time had gone by when he manoevred it boldly because he felt sure of it.

Under the influence of these impressions, the doctor, from time to time, thought that he heard vague sounds in the vast forests around him; he even fancied that he saw a swift gleam of fire shining between the trees. He looked sharply and turned his night-glass toward the spot; but there was nothing to be seen, and the profoundest silence appeared to return.

He had, no doubt, been under the dominion of a mere hallucination. He continued to listen, but without hearing the slightest noise. When his watch had expired, he woke Kennedy, and, enjoining upon him to observe the extremest vigilance, took his place beside Joe, and fell sound asleep.

Kennedy, while still rubbing his eyes, which he could scarcely keep open, calmly lit his pipe. He then ensconced himself in a corner, and began to smoke vigorously by way of keeping awake.

The most absolute silence reigned around him; a light wind shook the tree-tops and gently rocked the car, inviting the hunter to taste the sleep that stole over him in spite of himself. He strove hard to resist it, and repeatedly opened his eyes to plunge into the outer darkness one of those looks that see nothing; but at last, yielding to fatigue, he sank back and slumbered.

How long he had been buried in this stupor he knew not, but he was suddenly aroused from it by a strange, unexpected crackling sound.

He rubbed his eyes and sprang to his feet. An intense glare half-blinded him and heated his cheek--the forest was in flames!

"Fire! fire!" he shouted, scarcely comprehending what had happened.

His two companions started up in alarm.

"What's the matter?" was the doctor's immediate exclamation.

"Fire!" said Joe. "But who could--"

At this moment loud yells were heard under the foliage, which was now illuminated as brightly as the day.

"Ah! the savages!" cried Joe again; "they have set fire to the forest so as to be the more certain of burning us up."

"The Talabas! Al-Hadji's marabouts, no doubt," said the doctor.

A circle of fire hemmed the Victoria in; the crackling of the dry wood mingled with the hissing and sputtering of the green branches; the clambering vines, the foliage, all the living part of this vegetation, writhed in the destructive element. The eye took in nothing but one vast ocean of flame; the large trees stood forth in black relief in this huge furnace, their branches covered with glowing coals, while the whole blazing mass, the entire conflagration, was reflected on the clouds, and the travellers could fancy themselves enveloped in a hollow globe of fire.

"Let us escape to the ground!" shouted Kennedy, "it is our only chance of safety!"

But Ferguson checked him with a firm grasp, and, dashing at the anchor-rope, severed it with one well-directed blow of his hatchet. Meanwhile, the flames, leaping up at the balloon, already quivered on its illuminated sides; but the Victoria, released from her fastenings, spun upward a thousand feet into the air. Frightful yells resounded through the forest, along with the report of fire-arms, while the balloon, caught in a current of air that rose with the dawn of day, was borne to the westward.

It was now four o'clock in the morning.

CHAPTER FORTY-THIRD.

The Talabas.--The Pursuit.--A Devastated Country.--The Wind begins to fall.--The Victoria sinks.--The last of the Provisions.--The Leaps of the Balloon.--A Defence with Fire-arms.--The Wind freshens.--The Senegal River.--The Cataracts of Gouina.--The Hot Air.--The Passage of the River.

"Had we not taken the precaution to lighten the balloon yesterday evening, we should have been lost beyond redemption," said the doctor, after a long silence.

"See what's gained by doing things at the right time!" replied Joe. "One gets out of scrapes then, and nothing is more natural."

"We are not out of danger yet," said the doctor.

"What do you still apprehend?" queried Kennedy. "The balloon can't descend without your permission, and even were it to do so--"

"Were it to do so, Dick? Look!"

They had just passed the borders of the forest, and the three friends could see some thirty mounted men clad in
broad pantaloons and the floating bournouses. They were armed, some with lances, and others with long muskets, and they were following, on their quick, fiery little steeds, the direction of the balloon, which was moving at only moderate speed.

When they caught sight of the aeronauts, they uttered savage cries, and brandished their weapons. Anger and menace could be read upon their swarthy faces, made more ferocious by thin but bristling beards. Meanwhile they galloped along without difficulty over the low levels and gentle declivities that lead down to the Senegal.

"It is, indeed, they!" said the doctor; "the cruel Talabas! the ferocious marabouts of Al-Hadji! I would rather find myself in the middle of the forest encircled by wild beasts than fall into the hands of these banditti."

"They haven't a very obliging look!" assented Kennedy; "and they are rough, stalwart fellows."

"Happily those brutes can't fly," remarked Joe; "and that's something."

"See," said Ferguson, "those villages in ruins, those huts burned down--that is their work! Where vast stretches of cultivated land were once seen, they have brought barrenness and devastation."

"At all events, however," interposed Kennedy, "they can't overtake us; and, if we succeed in putting the river between us and them, we are safe."

"Perfectly, Dick," replied Ferguson; "but we must not fall to the ground!" and, as he said this, he glanced at the barometer.

"In any case, Joe," added Kennedy, "it would do us no harm to look to our fire-arms."

"No harm in the world, Mr. Dick! We are lucky that we didn't scatter them along the road."

"My rifle!" said the sportsman. "I hope that I shall never be separated from it!"

And so saying, Kennedy loaded the pet piece with the greatest care, for he had plenty of powder and ball remaining.

"At what height are we?" he asked the doctor.

"About seven hundred and fifty feet; but we no longer have the power of seeking favorable currents, either going up or coming down. We are at the mercy of the balloon!"

"That is vexatious!" rejoined Kennedy. "The wind is poor; but if we had come across a hurricane like some of those we met before, these vile brigands would have been out of sight long ago."

"The rascals follow us at their leisure," said Joe. "They're only at a short gallop. Quite a nice little ride!"

"If we were within range," sighed the sportsman, "I should amuse myself with dismounting a few of them."

"Exactly," said the doctor; "but then they would have you within range also, and our balloon would offer only too plain a target to the bullets from their long guns; and, if they were to make a hole in it, I leave you to judge what our situation would be!"

The pursuit of the Talabas continued all morning; and by eleven o'clock the aeronauts had made scarcely fifteen miles to the westward.

The doctor was anxiously watching for the least cloud on the horizon. He feared, above all things, a change in the atmosphere. Should he be thrown back toward the Niger, what would become of him? Besides, he remarked that the balloon tended to fall considerably. Since the start, he had already lost more than three hundred feet, and the Senegal must be about a dozen miles distant. At his present rate of speed, he could count upon travelling only three hours longer.

At this moment his attention was attracted by fresh cries. The Talabas appeared to be much excited, and were spurring their horses.

The doctor consulted his barometer, and at once discovered the cause of these symptoms.

"Are we descending?" asked Kennedy.

"Yes!" replied the doctor.

"The mischief!" thought Joe.

In the lapse of fifteen minutes the Victoria was only one hundred and fifty feet above the ground; but the wind was much stronger than before.

The Talabas checked their horses, and soon a volley of musketry pealed out on the air.

"Too far, you fools!" bawled Joe. "I think it would be well to keep those scamps at a distance."

And, as he spoke, he aimed at one of the horsemen who was farthest to the front, and fired. The Talaba fell headlong, and, his companions halting for a moment, the balloon gained upon them.

"They are prudent!" said Kennedy.

"Because they think that they are certain to take us," replied the doctor; "and, they will succeed if we descend much farther. We must, absolutely, get higher into the air."

"What can we throw out?" asked Joe.

"All that remains of our stock of pemmican; that will be thirty pounds less weight to carry."

"Out it goes, sir!" said Joe, obeying orders.
The car, which was now almost touching the ground, rose again, amid the cries of the Talabas; but, half an hour later, the balloon was again falling rapidly, because the gas was escaping through the pores of the covering.

Ere long the car was once more grazing the soil, and Al-Hadji’s black riders rushed toward it; but, as frequently happens in like cases, the balloon had scarcely touched the surface ere it rebounded, and only came down again a mile away.

"So we shall not escape!" said Kennedy, between his teeth.

"Throw out our reserved store of brandy, Joe," cried the doctor; "our instruments, and everything that has any weight, even to our last anchor, because go they must!"

Joe flung out the barometers and thermometers, but all that amounted to little; and the balloon, which had risen for an instant, fell again toward the ground.

The Talabas flew toward it, and at length were not more than two hundred paces away.

"Throw out the two fowling-pieces!" shouted Ferguson.

"Not without discharging them, at least," responded the sportsman; and four shots in quick succession struck the thick of the advancing group of horsemen. Four Talabas fell, amid the frantic howls and imprecations of their comrades.

The Victoria ascended once more, and made some enormous leaps, like a huge gum-elastic ball, bounding and rebounding through the air. A strange sight it was to see these unfortunate men endeavoring to escape by those huge aerial strides, and seeming, like the giant Antaeus, to receive fresh strength every time they touched the earth. But this situation had to terminate. It was now nearly noon; the Victoria was getting empty and exhausted, and assuming a more and more elongated form every instant. Its outer covering was becoming flaccid, and floated loosely in the air, and the folds of the silk rustled and grated on each other.

"Heaven abandons us!" said Kennedy; "we have to fall!"

Joe made no answer. He kept looking intently at his master.

"No!" said the latter; "we have more than one hundred and fifty pounds yet to throw out."

"What can it be, then?" said Kennedy, thinking that the doctor must be going mad.

"The car!" was his reply; "we can cling to the network. There we can hang on in the meshes until we reach the river. Quick! quick!"

And these daring men did not hesitate a moment to avail themselves of this last desperate means of escape. They clutched the network, as the doctor directed, and Joe, holding on by one hand, with the other cut the cords that suspended the car; and the latter dropped to the ground just as the balloon was sinking for the last time.

"Hurrah! hurrah!" shouted the brave fellow exultingly, as the Victoria, once more relieved, shot up again to a height of three hundred feet.

The Talabas spurred their horses, which now came tearing on at a furious gallop; but the balloon, falling in with a much more favorable wind, shot ahead of them, and was rapidly carried toward a hill that stretched across the horizon to the westward. This was a circumstance favorable to the aeronauts, because they could rise over the hill, while Al-Hadji’s horde had to diverge to the northward in order to pass this obstacle.

The three friends still clung to the network. They had been able to fasten it under their feet, where it had formed a sort of swinging pocket.

Suddenly, after they had crossed the hill, the doctor exclaimed: "The river! the river! the Senegal, my friends!"

And about two miles ahead of them, there was indeed the river rolling along its broad mass of water, while the farther bank, which was low and fertile, offered a sure refuge, and a place favorable for a descent.

"Another quarter of an hour," said Ferguson, "and we are saved!"

But it was not to happen thus; the empty balloon descended slowly upon a tract almost entirely bare of vegetation. It was made up of long slopes and stony plains, a few bushes and some coarse grass, scorched by the sun.

The Victoria touched the ground several times, and rose again, but her rebound was diminishing in height and length. At the last one, it caught by the upper part of the network in the lofty branches of a baobab, the only tree that stood there, solitary and alone, in the midst of the waste.

"It’s all over," said Kennedy.

"And at a hundred paces only from the river!" groaned Joe.

The three hapless aeronauts descended to the ground, and the doctor drew his companions toward the Senegal.

At this point the river sent forth a prolonged roaring; and when Ferguson reached its bank, he recognized the falls of Gouina. But not a boat, not a living creature was to be seen. With a breadth of two thousand feet, the Senegal precipitates itself for a height of one hundred and fifty, with a thundering reverberation. It ran, where they saw it, from east to west, and the line of rocks that barred its course extended from north to south. In the midst of the falls, rocks of strange forms started up like huge ante-diluvian animals, petrified there amid the waters.
The impossibility of crossing this gulf was self-evident, and Kennedy could not restrain a gesture of despair.

But Dr. Ferguson, with an energetic accent of undaunted daring, exclaimed—

"All is not over!"

"I knew it," said Joe, with that confidence in his master which nothing could ever shake.

The sight of the dried-up grass had inspired the doctor with a bold idea. It was the last chance of escape. He led his friends quickly back to where they had left the covering of the balloon.

"We have at least an hour's start of those banditti," said he; "let us lose no time, my friends; gather a quantity of this dried grass; I want a hundred pounds of it, at least."

"For what purpose?" asked Kennedy, surprised.

"I have no more gas; well, I'll cross the river with hot air!"

"Ah, doctor," exclaimed Kennedy, "you are, indeed, a great man!"

Joe and Kennedy at once went to work, and soon had an immense pile of dried grass heaped up near the baobab.

In the mean time, the doctor had enlarged the orifice of the balloon by cutting it open at the lower end. He then was very careful to expel the last remnant of hydrogen through the valve, after which he heaped up a quantity of grass under the balloon, and set fire to it.

It takes but a little while to inflate a balloon with hot air. A head of one hundred and eighty degrees is sufficient to diminish the weight of the air it contains to the extent of one-half, by rarefying it. Thus, the Victoria quickly began to assume a more rounded form. There was no lack of grass; the fire was kept in full blast by the doctor's assiduous efforts, and the balloon grew fuller every instant.

It was then a quarter to four o'clock.

At this moment the band of Talabas reappeared about two miles to the northward, and the three friends could hear their cries, and the clatter of their horses galloping at full speed.

"In twenty minutes they will be here!" said Kennedy.

"More grass! more grass, Joe! In ten minutes we shall have her full of hot air."

"Here it is, doctor!"

The Victoria was now two-thirds inflated.

"Come, my friends, let us take hold of the network, as we did before."

"All right!" they answered together.

In about ten minutes a few jerking motions by the balloon indicated that it was disposed to start again. The Talabas were approaching. They were hardly five hundred paces away.

"Hold on fast!" cried Ferguson.

"Have no fear, master—have no fear!"

And the doctor, with his foot pushed another heap of grass upon the fire.

With this the balloon, now completely inflated by the increased temperature, moved away, sweeping the branches of the baobab in her flight.

"We're off!" shouted Joe.

A volley of musketry responded to his exclamation. A bullet even ploughed his shoulder; but Kennedy, leaning over, and discharging his rifle with one hand, brought another of the enemy to the ground.

Cries of fury exceeding all description hailed the departure of the balloon, which had at once ascended nearly eight hundred feet. A swift current caught and swept it along with the most alarming oscillations, while the intrepid doctor and his friends saw the gulf of the cataracts yawning below them.

Ten minutes later, and without having exchanged a word, they descended gradually toward the other bank of the river.

There, astonished, speechless, terrified, stood a group of men clad in the French uniform. Judge of their amazement when they saw the balloon rise from the right bank of the river. They had well-nigh taken it for some celestial phenomenon, but their officers, a lieutenant of marines and a naval ensign, having seen mention made of Dr. Ferguson's daring expedition, in the European papers, quickly explained the real state of the case.

The balloon, losing its inflation little by little, settled with the daring travellers still clinging to its network; but it was doubtful whether it would reach the land. At once some of the brave Frenchmen rushed into the water and caught the three aeronauts in their arms just as the Victoria fell at the distance of a few fathoms from the left bank of the Senegal.

"Dr. Ferguson!" exclaimed the lieutenant.

"The same, sir," replied the doctor, quietly, "and his two friends."

The Frenchmen escorted our travellers from the river, while the balloon, half-empty, and borne away by a swift current, sped on, to plunge, like a huge bubble, headlong with the waters of the Senegal, into the cataracts of Gouina.
"The poor Victoria!" was Joe's farewell remark.

The doctor could not restrain a tear, and extending his hands his two friends wrung them silently with that deep emotion which requires no spoken words.

CHAPTER FORTY-FOURTH.

The expedition upon the bank of the river had been sent by the governor of Senegal. It consisted of two officers, Messrs. Dufraisse, lieutenant of marines, and Rodamel, naval ensign, and with these were a sergeant and seven soldiers. For two days they had been engaged in reconnoitring the most favorable situation for a post at Gouina, when they became witnesses of Dr. Ferguson's arrival.

The warm greetings and felicitations of which our travellers were the recipients may be imagined. The Frenchmen, and they alone, having had ocular proof of the accomplishment of the daring project, naturally became Dr. Ferguson's witnesses. Hence the doctor at once asked them to give their official testimony of his arrival at the cataracts of Gouina.

"You would have no objection to signing a certificate of the fact, would you?" he inquired of Lieutenant Dufraisse.

"At your orders!" the latter instantly replied.

The Englishmen were escorted to a provisional post established on the bank of the river, where they found the most assiduous attention, and every thing to supply their wants. And there the following certificate was drawn up in the terms in which it appears to-day, in the archives of the Royal Geographical Society of London:

"We, the undersigned, do hereby declare that, on the day herein mentioned, we witnessed the arrival of Dr. Ferguson and his two companions, Richard Kennedy and Joseph Wilson, clinging to the cordage and network of a balloon, and that the said balloon fell at a distance of a few paces from us into the river, and being swept away by the current was lost in the cataracts of Gouina. In testimony whereof, we have hereunto set our hands and seals beside those of the persons hereinaabove named, for the information of all whom it may concern.

"Done at the Cataracts of Gouina, on the 24th of May, 1862. "(Signed), "SAMUEL FERGUSON "RICHARD KENNEDY, "JOSEPH WILSON, "DUFRAISSE, Lieutenant of Marines, "RODAMEL, Naval Ensign, "DUFAYS, Sergeant, "FLIPPEAU, MAYOR, } "PELISSIER, LOROIS, } Privates." RASCAGNET, GUIL- } LON, LEBEL, }"

Here ended the astonishing journey of Dr. Ferguson and his brave companions, as vouched for by undeniable testimony; and they found themselves among friends in the midst of most hospitable tribes, whose relations with the French settlements are frequent and amicable.

They had arrived at Senegal on Saturday, the 24th of May, and on the 27th of the same month they reached the post of Medina, situated a little farther to the north, but on the river.

There the French officers received them with open arms, and lavished upon them all the resources of their hospitality. Thus aided, the doctor and his friends were enabled to embark almost immediately on the small steamer called the Basilic, which ran down to the mouth of the river.

Two weeks later, on the 10th of June, they arrived at Saint Louis, where the governor gave them a magnificent reception, and they recovered completely from their excitement and fatigue.

Besides, Joe said to every one who chose to listen:

That was a stupid trip of ours, after all, and I wouldn't advise any body who is greedy for excitement to undertake it. It gets very tiresome at the last, and if it hadn't been for the adventures on Lake Tchad and at the Senegal River, I do believe that we'd have died of yawnig."

An English frigate was just about to sail, and the three travellers procured passage on board of her. On the 25th of June they arrived at Portsmouth, and on the next day at London.

We will not describe the reception they got from the Royal Geographical Society, nor the intense curiosity and consideration of which they became the objects. Kennedy set off, at once, for Edinburgh, with his famous rifle, for he was in haste to relieve the anxiety of his faithful old housekeeper.

The doctor and his devoted Joe remained the same men that we have known them, excepting that one change took place at their own suggestion.

They ceased to be master and servant, in order to become bosom friends.

The journals of all Europe were untiring in their praises of the bold explorers, and the Daily Telegraph struck off an edition of three hundred and seventy-seven thousand copies on the day when it published a sketch of the trip.

Doctor Ferguson, at a public meeting of the Royal Geographical Society, gave a recital of his journey through the air, and obtained for himself and his companions the golden medal set apart to reward the most remarkable
exploring expedition of the year 1862.

The first result of Dr. Ferguson's expedition was to establish, in the most precise manner, the facts and geographical surveys reported by Messrs. Barth, Burton, Speke, and others. Thanks to the still more recent expeditions of Messrs. Speke and Grant, De Heuglin and Muntzinger, who have been ascending to the sources of the Nile, and penetrating to the centre of Africa, we shall be enabled ere long to verify, in turn, the discoveries of Dr. Ferguson in that vast region comprised between the fourteenth and thirty-third degrees of east longitude.

GODFREY MORGAN
A CALIFORNIAN MYSTERY
BY
JULES VERNE

CHAPTER I.
IN WHICH THE READER HAS THE OPPORTUNITY OF BUYING AN ISLAND IN THE PACIFIC OCEAN.

"An island to sell, for cash, to the highest bidder!" said Dean Felporg, the auctioneer, standing behind his rostrum in the room where the conditions of the singular sale were being noisily discussed.

"Island for sale! island for sale!" repeated in shrill tones again and again Gingrass, the crier, who was threading his way in and out of the excited crowd closely packed inside the largest saloon in the auction mart at No. 10, Sacramento Street.

The crowd consisted not only of a goodly number of Americans from the States of Utah, Oregon, and California, but also of a few Frenchmen, who form quite a sixth of the population.

Mexicans were there enveloped in their sarapes; Chinamen in their large-sleeved tunics, pointed shoes, and conical hats; one or two Kanucks from the coast; and even a sprinkling of Black Feet, Grosventres, or Flatheads, from the banks of the Trinity river.

The scene is in San Francisco, the capital of California, but not at the period when the placer-mining fever was raging--from 1849 to 1852. San Francisco was no longer what it had been then, a caravanserai, a terminus, an _inn_, where for a night there slept the busy men who were hastening to the gold-fields west of the Sierra Nevada. At the end of some twenty years the old unknown Yerba-Buena had given place to a town unique of its kind, peopled by 100,000 inhabitants, built under the shelter of a couple of hills, away from the shore, but stretching off to the farthest heights in the background--a city in short which has dethroned Lima, Santiago, Valparaiso, and every other rival, and which the Americans have made the queen of the Pacific, the "glory of the western coast!"

It was the 15th of May, and the weather was still cold. In California, subject as it is to the direct action of the polar currents, the first weeks of this month are somewhat similar to the last weeks of March in Central Europe. But the cold was hardly noticeable in the thick of the auction crowd. The bell with its incessant clangour had brought together an enormous throng, and quite a summer temperature caused the drops of perspiration to glisten on the foreheads of the spectators which the cold outside would have soon solidified.

Do not imagine that all these folks had come to the auction-room with the intention of buying. I might say that all of them had but come to see. Who was going to be mad enough, even if he were rich enough, to purchase an isle of the Pacific, which the government had in some eccentric moment decided to sell? Would the reserve price ever be reached? Could anybody be found to work up the bidding? If not, it would scarcely be the fault of the public crier, who tried his best to tempt buyers by his shoutings and gestures, and the flowery metaphors of his harangue. People laughed at him, but they did not seem much influenced by him.

"An island! an isle to sell!" repeated Gingrass.

"But not to buy!" answered an Irishman, whose pocket did not hold enough to pay for a single pebble.

"An island which at the valuation will not fetch six dollars an acre!" said the auctioneer.

"And which won't pay an eighth per cent.!" replied a big farmer, who was well acquainted with agricultural speculations.

"An isle which measures quite sixty-four miles round and has an area of two hundred and twenty-five thousand acres!"

"Is it solid on its foundation?" asked a Mexican, an old customer at the liquor-bars, whose personal solidity
seemed rather doubtful at the moment.

"An isle with forests still virgin!" repeated the crier, "with prairies, hills, watercourses--"

"Warranted?" asked a Frenchman, who seemed rather inclined to nibble.

"Yes! warranted!" added Felporg, much too old at his trade to be moved by the chaff of the public.

"For two years?"

"To the end of the world!"

"Beyond that?"

"A freehold island!" repeated the crier, "an island without a single noxious animal, no wild beasts, no reptiles!--"

"No birds?" added a wag.

"No insects?" inquired another.

"An island for the highest bidder!" said Dean Felporg, beginning again. "Come, gentlemen, come! Have a little courage in your pockets! Who wants an island in perfect state of repair, never been used, an island in the Pacific, that ocean of oceans? The valuation is a mere nothing! It is put at eleven hundred thousand dollars, is there any one will bid? Who speaks first? You, sir?--you, over there nodding your head like a porcelain mandarin? Here is an island! a really good island! Who says an island?"

"Pass it round!" said a voice as if they were dealing with a picture or a vase.

And the room shouted with laughter, but not a half-dollar was bid.

However, if the lot could not be passed round, the map of the island was at the public disposal. The whereabouts of the portion of the globe under consideration could be accurately ascertained. There was neither surprise nor disappointment to be feared in that respect. Situation, orientation, outline, altitudes, levels, hydrography, climatology, lines of communication, all these were easily to be verified in advance. People were not buying a pig in a poke, and most undoubtedly there could be no mistake as to the nature of the goods on sale. Moreover, the innumerable journals of the United States, especially those of California, with their dailies, bi-weeklies, weeklies, bi-monthlies, monthlies, their reviews, magazines, bulletins, &c., had been for several months directing constant attention to the island whose sale by auction had been authorized by Act of Congress.

The island was Spencer Island, which lies in the west-south-west of the Bay of San Francisco, about 460 miles from the Californian coast, in 32° 15' north latitude, and 145° 18' west longitude, reckoning from Greenwich. It would be impossible to imagine a more isolated position, quite out of the way of all maritime or commercial traffic, although Spencer Island was relatively, not very far off, and situated practically in American waters. But thereabouts the regular currents diverging to the north and south have formed a kind of lake of calms, which is sometimes known as the "Whirlpool of Fleurieu."

It is in the centre of this enormous eddy, which has hardly an appreciable movement, that Spencer Island is situated. And so it is sighted by very few ships. The main routes of the Pacific, which join the new to the old continent, and lead away to China or Japan, run in a more southerly direction. Sailing-vessels would meet with endless calms in the Whirlpool of Fleurieu; and steamers, which always take the shortest road, would gain no advantage by crossing it. Hence ships of neither class know anything of Spencer Island, which rises above the waters like the isolated summit of one of the submarine mountains of the Pacific. Truly, for a man wishing to flee from the noise of the world, seeking quiet in solitude, what could be better than this island, lost within a few hundred miles of the coast? For a voluntary Robinson Crusoe, it would be the very ideal of its kind! Only of course he must pay for it.

And now, why did the United States desire to part with the island? Was it for some whim? No! A great nation cannot act on caprice in any matter, however simple. The truth was this: situated as it was, Spencer Island had for a long time been known as a station perfectly useless. There could be no practical result from settling there. In a military point of view it was of no importance, for it only commanded an absolutely deserted portion of the Pacific. In a commercial point of view there was a similar want of importance, for the products would not pay the freight either inwards or outwards. For a criminal colony it was too far from the coast. And to occupy it in any way, would be a very expensive undertaking. So it had remained deserted from time immemorial, and Congress, composed of "eminently practical" men, had resolved to put it up for sale--on one condition only, and that was, that its purchaser should be a free American citizen. There was no intention of giving away the island for nothing, and so the reserve price had been fixed at $1,100,000. This amount for a financial society dealing with such matters was a mere bagatelle, if the transaction could offer any advantages; but as we need hardly repeat, it offered none, and competent men attached no more value to this detached portion of the United States, than to one of the islands lost beneath the glaciers of the Pole.

In one sense, however, the amount was considerable. A man must be rich to pay for this hobby, for in any case it would not return him a halfpenny per cent. He would even have to be immensely rich for the transaction was to be a "cash" one, and even in the United States it is as yet rare to find citizens with $1,100,000 in their pockets, who
would care to throw them into the water without hope of return.

And Congress had decided not to sell the island under the price. Eleven hundred thousand dollars, not a cent less, or Spencer Island would remain the property of the Union.

It was hardly likely that any one would be mad enough to buy it on the terms.

Besides, it was expressly reserved that the proprietor, if one offered, should not become king of Spencer Island, but president of a republic. He would gain no right to have subjects, but only fellow-citizens, who could elect him for a fixed time, and would be free from re-electing him indefinitely. Under any circumstances he was forbidden to play at monarchy. The Union could never tolerate the foundation of a kingdom, no matter how small, in American waters.

This reservation was enough to keep off many an ambitious millionaire, many an aged nabob, who might like to compete with the kings of the Sandwich, the Marquesas, and the other archipelagoes of the Pacific.

In short, for one reason or other, nobody presented himself. Time was getting on, the crier was out of breath in his efforts to secure a buyer, the auctioneer orated without obtaining a single specimen of those nods which his estimable fraternity are so quick to discover; and the reserve price was not even mentioned.

However, if the hammer was not wearied with oscillating above the rostrum, the crowd was not wearied with waiting around it. The joking continued to increase, and the chaff never ceased for a moment. One individual offered two dollars for the island, costs included. Another said that a man ought to be paid that for taking it.

And all the time the crier was heard with,--

"An island to sell! an island for sale!"

And there was no one to buy it.

"Will you guarantee that there are flats there?" said Stumpy, the grocer of Merchant Street, alluding to the deposits so famous in alluvial gold-mining.

"No," answered the auctioneer, "but it is not impossible that there are, and the State abandons all its rights over the gold lands."

"Haven't you got a volcano?" asked Oakhurst, the bar-keeper of Montgomery Street.

"No volcanoes," replied Dean Felporg, "if there were, we could not sell at this price!"

An immense shout of laughter followed.

"An island to sell! an island for sale!" yelled Gingrass, whose lungs tired themselves out to no purpose.

"Only a dollar! only a half-dollar! only a cent above the reserve!" said the auctioneer for the last time, "and I will knock it down! Once! Twice!"

Perfect silence.

"If nobody bids we must put the lot back! Once! Twice!"

"Twelve hundred thousand dollars!"

The four words rang through the room like four shots from a revolver.

The crowd, suddenly speechless, turned towards the bold man who had dared to bid.

It was William W. Kolderup, of San Francisco.

CHAPTER II.

HOW WILLIAM W. KOLDERUP, OF SAN FRANCISCO, WAS AT LOGGERHEADS WITH J. R. TASKINAR, OF STOCKTON.

A man extraordinarily rich, who counted dollars by the million as other men do by the thousand; such was William W. Kolderup.

People said he was richer than the Duke of Westminster, whose income is some $4,000,000 a year, and who can spend his $10,000 a day, or seven dollars every minute; richer than Senator Jones, of Nevada, who has $35,000,000 in the funds; richer than Mr. Mackay himself, whose annual $13,750,000 give him $1560 per hour, or half-a-dollar to spend every second of his life.

I do not mention such minor millionaires as the Rothschilds, the Vanderbilts, the Dukes of Northumberland, or the Stewarts, nor the directors of the powerful bank of California, and other opulent personages of the old and new worlds whom William W. Kolderup would have been able to comfortably pension. He could, without inconvenience, have given away a million just as you and I might give away a shilling.

It was in developing the early placer-mining enterprises in California that our worthy speculator had laid the solid foundations of his incalculable fortune. He was the principal associate of Captain Sutter, the Swiss, in the localities, where, in 1848, the first traces were discovered. Since then, luck and shrewdness combined had helped him on, and he had interested himself in all the great enterprises of both worlds. He threw himself boldly into commercial and industrial speculations. His inexhaustible funds were the life of hundreds of factories, his ships were
on every sea. His wealth increased not in arithmetical but in geometrical progression. People spoke of him as one of those few "milliardaires" who never know how much they are worth. In reality he knew almost to a dollar, but he never boasted of it.

At this very moment when we introduce him to our readers with all the consideration such a many-sided man merits, William W. Kolderup had 2000 branch offices scattered over the globe, 80,000 employés in America, Europe, and Australia, 300,000 correspondents, a fleet of 500 ships which continually ploughed the ocean for his profit, and he was spending not less than a million a year in bill-stamps and postages. In short, he was the honour and glory of opulent Frisco--the nickname familiarly given by the Americans to the Californian capital.

A bid from William W. Kolderup could not but be a serious one. And when the crowd in the auction room had recognized who it was that by $100,000 had capped the reserve price of Spencer Island, there was an irresistible sensation, the chaffing ceased instantly, jokes gave place to interjections of admiration, and cheers resounded through the saloon. Then a deep silence succeeded to the hubbub, eyes grew bigger, and ears opened wider. For our part had we been there we would have had to hold our breath that we might lose nothing of the exciting scene which would follow should any one dare to bid against William W. Kolderup.

But was it probable? Was it even possible?

No! And at the outset it was only necessary to look at William W. Kolderup to feel convinced that he could never yield on a question where his financial gallantry was at stake.

He was a big, powerful man, with huge head, large shoulders, well-built limbs, firmly knit, and tough as iron. His quiet but resolute look was not willingly cast downwards, his grey hair, brushed up in front, was as abundant as if he were still young. The straight lines of his nose formed a geometrically-drawn right-angled triangle. No moustache; his beard cut in Yankee fashion bedecked his chin, and the two upper points met at the opening of the lips and ran up to the temples in pepper-and-salt whiskers; teeth of snowy whiteness were symmetrically placed on the borders of a clean-cut mouth. The head of one of those true kings of men who rise in the tempest and face the storm. No hurricane could bend that head, so solid was the neck which supported it. In these battles of the bidders each of its nods meant an additional hundred thousand dollars.

There was no one to dispute with him.

"Twelve hundred thousand dollars--twelve hundred thousand!" said the auctioneer, with that peculiar accent which men of his vocation find most effective.

"Going at twelve hundred thousand dollars!" repeated Gingrass the crier.

"You could safely bid more than that," said Oakhurst, the bar-keeper; "William Kolderup will never give in."

"He knows no one will chance it," answered the grocer from Merchant Street.

Repeated cries of "Hush!" told the two worthy tradesmen to be quiet. All wished to hear. All hearts palpitated. Dare any one raise his voice in answer to the voice of William W. Kolderup? He, magnificent to look upon, never moved. There he remained as calm as if the matter had no interest for him. But--and this those near to him noticed--his eyes were like revolvers loaded with dollars, ready to fire.

"Nobody speaks?" asked Dean Felporg.

Nobody spoke.

"Once! Twice!"

"Once! Twice!" repeated Gingrass, quite accustomed to this little dialogue with his chief.

"Going!"

"Going!"

"For twelve--hundred--thousand--dollars--Spencer--Island--com--plete!"

"For twelve--hundred--thousand--dollars!"

"That is so? No mistake?"

"No withdrawal?"

"For twelve hundred thousand dollars, Spencer Island!"

The waistcoats rose and fell convulsively. Could it be possible that at the last second a higher bid would come? Felporg with his right hand stretched on the table was shaking his ivory hammer--one rap, two raps, and the deed would be done.

The public could not have been more absorbed in the face of a summary application of the law of Justice Lynch! The hammer slowly fell, almost touched the table, rose again, hovered an instant like a sword which pauses ere the drawer cleaves the victim in twain; then it flashed swiftly downwards.

But before the sharp rap could be given, a voice was heard giving utterance to these four words,--

"Thirteen--hundred--thousand--dollars!"

There was a preliminary "Ah!" of general stupefaction, then a second "Ah!" of not less general satisfaction. Another bidder had presented himself! There was going to be a fight after all!
But who was the reckless individual who had dared to come to dollar strokes with William W. Kolderup of San Francisco?

It was J. R. Taskinar, of Stockton.

J. R. Taskinar was rich, but he was more than proportionately fat. He weighed 490 lbs. If he had only run second in the last fat-man show at Chicago, it was because he had not been allowed time to finish his dinner, and had lost about a dozen pounds.

This colossus, who had had to have special chairs made for his portly person to rest upon, lived at Stockton, on the San Joachim. Stockton is one of the most important cities in California, one of the dépôt centres for the mines of the south, the rival of Sacramento the centre for the mines of the north. There the ships embark the largest quantity of Californian corn.

Not only had the development of the mines and speculations in wheat furnished J. R. Taskinar with the occasion of gaining an enormous fortune, but petroleum, like another Pactolus, had run through his treasury. Besides, he was a great gambler, a lucky gambler, and he had found "poker" most prodigal of its favours to him.

But if he was a Croesus, he was also a rascal; and no one would have addressed him as "honourable," although the title in those parts is so much in vogue. After all, he was a good war-horse, and perhaps more was put on his back than was justly his due. One thing was certain, and that was that on many an occasion he had not hesitated to use his "Derringer"--the Californian revolver.

Now J. R. Taskinar particularly detested William W. Kolderup. He envied him for his wealth, his position, and his reputation. He despised him as a fat man despises a lean one. It was not the first time that the merchant of Stockton had endeavoured to do the merchant of San Francisco out of some business or other, good or bad, simply owing to a feeling of rivalry. William W. Kolderup thoroughly knew his man, and on all occasions treated him with scorn enough to drive him to distraction.

The last success which J. R. Taskinar could not forgive his opponent was that gained in the struggle over the state elections. Notwithstanding his efforts, his threats, and his libels, not to mention the millions of dollars squandered by his electoral courtiers, it was William W. Kolderup who sat in his seat in the Legislative Council of Sacramento.

J. R. Taskinar had learnt--how, I cannot tell--that it was the intention of William W. Kolderup to acquire possession of Spencer Island. This island seemed doubtless as useless to him as it did to his rival. No matter. Here was another chance for fighting, and perhaps for conquering. J. R. Taskinar would not allow it to escape him.

And that is why J. R. Taskinar had come to the auction room among the curious crowd who could not be aware of his designs, why at all points he had prepared his batteries, why before opening fire, he had waited till his opponent had covered the reserve, and why when William W. Kolderup had made his bid of--

"Twelve hundred thousand dollars!"

J. R. Taskinar at the moment when William W. Kolderup thought he had definitely secured the island, woke up with the words shouted in stentorian tones,--

"Thirteen hundred thousand dollars!"

Everybody as we have seen turned to look at him.

"Fat Taskinar!"

The name passed from mouth to mouth. Yes. Fat Taskinar! He was known well enough! His corpulence had been the theme of many an article in the journals of the Union.

I am not quite sure which mathematician it was who had demonstrated by transcendental calculations, that so great was his mass that it actually influenced that of our satellite and in an appreciable manner disturbed the elements of the lunar orbit.

But it was not J. R. Taskinar's physical composition which interested the spectators in the room. It was something far different which excited them; it was that he had entered into direct public rivalry with William W. Kolderup. It was a fight of heroes, dollar versus dollar, which had opened, and I do not know which of the two coffers would turn out to be best lined. Enormously rich were both these mortal enemies! After the first sensation, which was rapidly suppressed, renewed silence fell on the assembly. You could have heard a spider weaving his web.

It was the voice of Dean Felporg which broke the spell.

"For thirteen hundred thousand dollars, Spencer Island!" exclaimed he, drawing himself up so as to better command the circle of bidders.

William W. Kolderup had turned towards J. R. Taskinar. The bystanders moved back, so as to allow the adversaries to behold each other. The man of Stockton and the man of San Francisco were face to face, mutually staring, at their ease. Truth compels me to state that they made the most of the opportunity. Never would one of them consent to lower his eyes before those of his rival.
"Fourteen hundred thousand dollars," said William W. Kolderup.
"Fifteen hundred thousand!" retorted J. R. Taskinar.
"Sixteen hundred thousand!"
"Seventeen hundred thousand!"

Have you ever heard the story of the two mechanics of Glasgow, who tried which should raise the other highest up the factory chimney at the risk of a catastrophe? The only difference was that here the chimney was of ingots of gold.

Each time after the capping bid of J. R. Taskinar, William W. Kolderup took a few moments to reflect before he bid again. On the contrary Taskinar burst out like a bomb, and did not seem to require a second to think.
"Seventeen hundred thousand dollars!" repeated the auctioneer. "Now, gentlemen, that is a mere nothing! It is giving it away!"

And one can well believe that, carried away by the jargon of his profession, he was about to add,--
"The frame alone is worth more than that!" When--
"Seventeen hundred thousand dollars!" howled Gingrass, the crier.
"Eighteen hundred thousand!" replied William W. Kolderup.
"Nineteen hundred thousand!" retorted J. R. Taskinar.
"'Two millions!"' quoth William W. Kolderup, and so quickly that this time he evidently had not taken the trouble to think. His face was a little pale when these last words escaped his lips, but his whole attitude was that of a man who did not intend to give in.

J. R. Taskinar was simply on fire. His enormous face was like one of those gigantic railway bull's-eyes which, screened by the red, signal the stoppage of the train. But it was highly probable that his rival would disregard the block, and decline to shut off steam.

This J. R. Taskinar felt. The blood mounted to his brows, and seemed apoplextically congested there. He wriggled his fat fingers, covered with diamonds of great price, along the huge gold chain attached to his chronometer. He glared at his adversary, and then shutting his eyes so as to open them with a more spiteful expression a moment afterwards.

"Two million, four hundred thousand dollars!" he remarked, hoping by this tremendous leap to completely rout his rival.
"Two million, seven hundred thousand!" replied William W. Kolderup in a peculiarly calm voice.
"Two million, nine hundred thousand!"
"Three millions!"

Yes! William W. Kolderup, of San Francisco, said three millions of dollars!

Applause rang through the room, hushed, however, at the voice of the auctioneer, who repeated the bid, and whose oscillating hammer threatened to fall in spite of himself by the involuntary movement of his muscles. It seemed as though Dean Felporg, surfeited with the surprises of public auction sales, would be unable to contain himself any longer.

All glances were turned on J. R. Taskinar. That voluminous personage was sensible of this, but still more was he sensible of the weight of these three millions of dollars, which seemed to crush him. He would have spoken, doubtless to bid higher--but he could not. He would have liked to nod his head--he could do so no more.

After a long pause, however, his voice was heard; feeble it is true, but sufficiently audible.
"Three millions, five hundred thousand!"

"Four millions," was the answer of William W. Kolderup.

It was the last blow of the bludgeon. J. R. Taskinar succumbed. The hammer gave a hard rap on the marble table and--

Spencer Island fell for four millions of dollars to William W. Kolderup, of San Francisco.
"I will be avenged!" muttered J. R. Taskinar, and throwing a glance of hatred at his conqueror, he returned to the Occidental Hotel.

But "hip, hip, hurrah," three times thrice, smote the ears of William W. Kolderup, then cheers followed him to Montgomery Street, and such was the delirious enthusiasm of the Americans that they even forgot to favour him with the customary bars of "Yankee Doodle."

CHAPTER III.

THE CONVERSATION OF PHINA HOLLaney AND GODFREY MORGAN, WITH A PIANO ACCOMPANIMENT.

William W. Kolderup had returned to his mansion in Montgomery Street. This thoroughfare is the Regent Street,
the Broadway, the Boulevard des Italiens of San Francisco. Throughout its length, the great artery which crosses the
city parallel with its quays is astir with life and movement; trams there are innumerable; carriages with horses,
carriages with mules; men bent on business, hurrying to and fro over its stone pavements, past shops thronged with
customers; men bent on pleasure, crowding the doors of the "bars," where at all hours are dispensed the Californian's
drinks.

There is no need for us to describe the mansion of a Frisco nabob. With so many millions, there was
proportionate luxury. More comfort than taste. Less of the artistic than the practical. One cannot have everything.

So the reader must be contented to know that there was a magnificent reception-room, and in this reception-
room a piano, whose chords were permeating the mansion's warm atmosphere when the opulent Kolderup walked in.

"Good!" he said. "She and he are there! A word to my cashier, and then we can have a little chat."

And he stepped towards his office to arrange the little matter of Spencer Island, and then dismiss it from his
mind. He had only to realize a few certificates in his portfolio and the acquisition was settled for. Half-a-dozen lines
to his broker--no more. Then William W. Kolderup devoted himself to another "combination" which was much
more to his taste.

Yes! she and he were in the drawing-room--she, in front of the piano; he, half reclining on the sofa, listening
vaguely to the pearly arpeggios which escaped from the fingers of the charmer.

"Are you listening?" she said.
"Of course."
"Yes! but do you understand it?"
"Do I understand it, Phina! Never have you played those 'Auld Robin Gray' variations more superbly."
"But it is not 'Auld Robin Gray,' Godfrey: it is 'Happy Moments.'"
"Oh! ah! yes! I remember!" answered Godfrey, in a tone of indifference which it was difficult to mistake. The
lady raised her two hands, held them suspended for an instant above the keys as if they were about to grasp another
chord, and then with a half-turn on her music-stool she remained for a moment looking at the too tranquil Godfrey,
whose eyes did their best to avoid hers.

Phina Hollaney was the goddaughter of William W. Kolderup. An orphan, he had educated her, and given her
the right to consider herself his daughter, and to love him as her father. She wanted for nothing. She was young,
"handsome in her way" as people say, but undoubtedly fascinating, a blonde of sixteen with the ideas of a woman
much older, as one could read in the crystal of her blue-black eyes. Of course, we must compare her to a lily, for all
beauties are compared to lilies in the best American society. She was then a lily, but a lily grafted into an eglantine.
She certainly had plenty of spirit, but she had also plenty of practical common-sense, a somewhat selfish
demeanour, and but little sympathy with the illusions and dreams so characteristic of her sex and age.

Her dreams were when she was asleep, not when she was awake. She was not asleep now, and had no intention
of being so.

"Godfrey?" she continued.
"Phina?" answered the young man.
"Where are you now?"
"Near you--in this room--"
"Not near me, Godfrey! Not in this room! But far far away, over the seas, is it not so?"

And mechanically Phina's hand sought the key-board and rippled along a series of sinking sevenths, which spoke
of a plaintive sadness, unintelligible perhaps to the nephew of William W. Kolderup.

For such was this young man, such was the relationship he bore towards the master of the house. The son of a
sister of this buyer of islands, fatherless and motherless for a good many years, Godfrey Morgan, like Phina, had
been brought up in the house of his uncle, in whom the fever of business had still left a place for the idea of
marrying these two to each other.

Godfrey was in his twenty-third year. His education now finished, had left him with absolutely nothing to do. He
had graduated at the University, but had found it of little use. For him life opened out but paths of ease; go where he
would, to the right or the left, whichever way he went, fortune would not fail him.

Godfrey was of good presence, gentlemanly, elegant--never tying his cravat in a ring, nor starring his fingers, his
wrists or his shirt-front with those jewelled gimcracks so dear to his fellow-citizens.

I shall surprise no one in saying that Godfrey Morgan was going to marry Phina Hollaney. Was he likely to do
otherwise? All the proprieties were in favour of it. Besides, William W. Kolderup desired the marriage. The two
people whom he loved most in this world were sure of a fortune from him, without taking into consideration
whether Phina cared for Godfrey, or Godfrey cared for Phina. It would also simplify the bookkeeping of the
commercial house. Ever since their births an account had been opened for the boy, another for the girl. It would then
be only necessary to rule these off and transfer the balances to a joint account for the young couple. The worthy merchant hoped that this would soon be done, and the balances struck without error or omission.

But it is precisely that there had been an omission and perhaps an error that we are about to show. An error, because at the outset Godfrey felt that he was not yet old enough for the serious undertaking of marriage; an omission, because he had not been consulted on the subject.

In fact, when he had finished his studies Godfrey had displayed a quite premature indifference to the world, in which he wanted for nothing, in which he had no wish remaining ungratified, and nothing whatever to do. The thought of travelling round the world was always present to him. Of the old and new continents he knew but one spot--San Francisco, where he was born, and which he had never left except in a dream. What harm was there in a young man making the tour of the globe twice or thrice--especially if he were an American? Would it do him any good? Would he learn anything in the different adventures he would meet with in a voyage of any length? If he were not already satiated with a life of adventure, how could he be answered? Finally, how many millions of leagues of observation and instruction were indispensable for the completion of the young man's education?

Things had reached this pass; for a year or more Godfrey had been immersed in books of voyages of recent date, and had passionately devoured them. He had discovered the Celestial Empire with Marco Polo, America with Columbus, the Pacific with Cook, the South Pole with Dumont d'Urville. He had conceived the idea of going where these illustrious travellers had been without him. In truth, he would not have considered an exploring expedition of several years to cost him too dear at the price of a few attacks of Malay pirates, several ocean collisions, and a shipwreck or two on a desert island where he could live the life of a Selkirk or a Robinson Crusoe! A Crusoe! To become a Crusoe! What young imagination has not dreamt of this in reading as Godfrey had often, too often done, the adventures of the imaginary heroes of Daniel de Foe and De Wyss?

Yes! The nephew of William W. Kolderup was in this state when his uncle was thinking of binding him in the chains of marriage. To travel in this way with Phina, then become Mrs. Morgan, would be clearly impossible! He must go alone or leave it alone. Besides, once his fancy had passed away, would not she be better disposed to sign the settlements? Was it for the good of his wife that he had not been to China or Japan, not even to Europe? Decidedly not.

And hence it was that Godfrey was now absent in the presence of Phina, indifferent when she spoke to him, deaf when she played the airs which used to please him; and Phina, like a thoughtful, serious girl, soon noticed this.

To say that she did not feel a little annoyance mingled with some chagrin, is to do her a gratuitous injustice. But accustomed to look things in the face, she had reasoned thus,--

"If we must part, it had better be before marriage than afterwards!"

And thus it was that she had spoken to Godfrey in these significant words.

"No! You are not near me at this moment--you are beyond the seas!"

Godfrey had risen. He had walked a few steps without noticing Phina, and unconsciously his index finger touched one of the keys of the piano. A loud C# of the octave below the staff, a note dismal enough, answered for him.

Phina had understood him, and without more discussion was about to bring matters to a crisis, when the door of the room opened.

William W. Kolderup appeared, seemingly a little preoccupied as usual. Here was the merchant who had just finished one negotiation and was about to begin another.

"Well," said he, "there is nothing more now than for us to fix the date."

"The date?" answered Godfrey, with a start. "What date, if you please, uncle?"

"The date of your wedding!" said William W. Kolderup. "Not the date of mine, I suppose!"

"Perhaps that is more urgent?" said Phina.

"Hey?--what?" exclaimed the uncle--"what does that matter? We are only talking of current affairs, are we not?"

"Godfather Will," answered the lady. "It is not of a wedding that we are going to fix the date to-day, but of a departure."

"A departure!"

"Yes, the departure of Godfrey," continued Phina, "of Godfrey who, before he gets married, wants to see a little of the world!"

"You want to go away--you?" said William W. Kolderup, stepping towards the young man and raising his arms as if he were afraid that this "rascal of a nephew" would escape him.

"Yes; I do, uncle," said Godfrey gallantly.

"And for how long?"

"For eighteen months, or two years, or more, if--"

"If--"
"If you will let me, and Phina will wait for me."
"Wait for you! An intended who intends until he gets away!" exclaimed William W. Kolderup.
"You must let Godfrey go," pleaded Phina; "I have thought it carefully over. I am young, but really Godfrey is younger. Travel will age him, and I do not think it will change his taste! He wishes to travel, let him travel! The need of repose will come to him afterwards, and he will find me when he returns."
"What!" exclaimed William W. Kolderup, "you consent to give your bird his liberty?"
"Yes, for the two years he asks."
"And you will wait for him?"
"Uncle Will, if I could not wait for him I could not love him!" and so saying Phina returned to the piano, and whether she willed it or no, her fingers softly played a portion of the then fashionable "Départ du Fiancé," which was very appropriate under the circumstances. But Phina, without perceiving it perhaps, was playing in "A minor," whereas it was written in "A major," and all the sentiment of the melody was transformed, and its plaintiveness chimed in well with her hidden feelings.

But Godfrey stood embarrassed, and said not a word. His uncle took him by the head and turning it to the light looked fixedly at him for a moment or two. In this way he questioned him without having to speak, and Godfrey was able to reply without having occasion to utter a syllable.

And the lamentations of the "Départ du Fiancé" continued their sorrowful theme, and then William W. Kolderup, having made the turn of the room, returned to Godfrey, who stood like a criminal before the judge. Then raising his voice,--
"You are serious," he asked.
"Quite serious!" interrupted Phina, while Godfrey contented himself with making a sign of affirmation.
"You want to try travelling before you marry Phina! Well! You shall try it, my nephew!"
He made two or three steps and stopping with crossed arms before Godfrey, asked,--
"Where do you want to go to?"
" Everywhere."
"And when do you want to start?"
"When you please, Uncle Will."
"All right," replied William W. Kolderup, fixing a curious look on his nephew.
Then he muttered between his teeth,--
"The sooner the better."

At these last words came a sudden interruption from Phina. The little finger of her left hand touched a G#, and the fourth had, instead of falling on the key-note, rested on the "sensible," like Ralph in the "Huguenots," when he leaves at the end of his duet with Valentine.
Perhaps Phina's heart was nearly full, she had made up her mind to say nothing.

It was then that William W. Kolderup, without noticing Godfrey, approached the piano.
"Phina," said he gravely, "you should never remain on the 'sensible'!"
And with the tip of his large finger he dropped vertically on to one of the keys and an "A natural" resounded through the room.

CHAPTER IV.
IN WHICH T. ARTELETT, OTHERWISE TARTLET, IS DULY INTRODUCED TO THE READER.
If T. Artelett had been a Parisian, his compatriots would not have failed to nickname him Tartlet, but as he had already received this title we do not hesitate to describe him by it. If Tartlet was not a Frenchman he ought to have been one.
In his "Itinéraire de Paris à Jérusalem," Chateaubriand tells of a little man "powdered and frizzed in the old-fashioned style, with a coat of apple green, a waistcoat of drouget, shirt-frill and cuffs of muslin, who scraped a violin and made the Iroquois dance 'Madeleine Friquet.'"

The Californians are not Iroquois, far from it; but Tartlet was none the less professor of dancing and deportment in the capital of their state. If they did not pay him for his lessons, as they had his predecessor in beaver-skins and bear-hams, they did so in dollars. If in speaking of his pupils he did not talk of the "bucks and their squaws," it was because his pupils were highly civilized, and because in his opinion he had contributed considerably to their civilization.

Tartlet was a bachelor, and aged about forty-five at the time we introduce him to our readers. But for a dozen years or so his marriage with a lady of somewhat mature age had been expected to take place.
Under present circumstances it is perhaps advisable to give "two or three lines" concerning his age, appearance,
and position in life. He would have responded to such a request we imagine as follows, and thus we can dispense with drawing his portrait from a moral and physical point of view.

"He was born on the 17th July, 1835, at a quarter-past three in the morning.
"His height is five feet, two inches, three lines.
"His girth is exactly two feet, three inches.
"His weight, increased by some six pounds during the last year, is one hundred and fifty one pounds, two ounces.
"He has an oblong head.
"His hair, very thin above the forehead, is grey chestnut, his forehead is high, his face oval, his complexion fresh coloured.
"His eyes--sight excellent--a greyish brown, eyelashes and eyebrows clear chestnut, eyes themselves somewhat sunk in their orbits beneath the arches of the brows.
"His nose is of medium size, and has a slight indentation towards the end of the left nostril.
"His cheeks and temples are flat and hairless.
"His ears are large and flat.
"His mouth, of middling size, is absolutely free from bad teeth.
"His lips, thin and slightly pinched, are covered with a heavy moustache and imperial, his chin is round and also shaded with a many-tinted beard.
"A small mole ornaments his plump neck--in the nape.
"Finally, when he is in the bath it can be seen that his skin is white and smooth.
"His life is calm and regular. Without being robust, thanks to his great temperance, he has kept his health uninjured since his birth. His lungs are rather irritable, and hence he has not contracted the bad habit of smoking. He drinks neither spirits, coffee, liqueurs, nor neat wine. In a word, all that could prejudicially affect his nervous system is vigorously excluded from his table. Light beer, and weak wine and water are the only beverages he can take without danger. It is on account of his carefulness that he has never had to consult a doctor since his life began.
"His gesture is prompt, his walk quick, his character frank and open. His thoughtfulness for others is extreme, and it is on account of this that in the fear of making his wife unhappy, he has never entered into matrimony."

Such would have been the report furnished by Tartlet, but desirable as he might be to a lady of a certain age, the projected union had hitherto failed. The professor remained a bachelor, and continued to give lessons in dancing and deportment.

It was in this capacity that he entered the mansion of William W. Kolderup. As time rolled on his pupils gradually abandoned him, and he ended by becoming one wheel more in the machinery of the wealthy establishment.

After all, he was a brave man, in spite of his eccentricities. Everybody liked him. He liked Godfrey, he liked Phina, and they liked him. He had only one ambition in the world, and that was to teach them all the secrets of his art, to make them in fact, as far as deportment was concerned, two highly accomplished individuals.

Now, what would you think? It was he, this Professor Tartlet, whom William W. Kolderup had chosen as his nephew's companion during the projected voyage. Yes! He had reason to believe that Tartlet had not a little contributed to imbue Godfrey with this roaming mania, so as to perfect himself by a tour round the world. William W. Kolderup had resolved that they should go together. On the morrow, the 16th of April, he sent for the professor to his office.

The request of the nabob was an order for Tartlet. The professor left his room, with his pocket violin--generally known as a kit--so as to be ready for all emergencies. He mounted the great staircase of the mansion with his feet academically placed as was fitting for a dancing-master; knocked at the door of the room, entered--his body half inclined, his elbows rounded, his mouth on the grin—and waited in the third position, after having crossed his feet one before the other, at half their length, his ankles touching and his toes turned out. Any one but Professor Tartlet placed in this sort of unstable equilibrium would have tottered on his base, but the professor preserved an absolute perpendicularly.

"Mr. Tartlet," said William W. Kolderup, "I have sent for you to tell you some news which I imagine will rather surprise you."
"As you think best!" answered the professor.
"My nephew's marriage is put off for a year or eighteen months, and Godfrey, at his own request, is going to visit the different countries of the old and new world."
"Sir," answered Tartlet, "my pupil, Godfrey, will do honour to the country of his birth, and—"
"And, to the professor of deportment who has initiated him into etiquette," interrupted the merchant, in a tone of which the guileless Tartlet failed to perceive the irony.
And, in fact, thinking it the correct thing to execute an "assemblée," he first moved one foot and then the other, by a sort of semi-circular side slide, and then with a light and graceful bend of the knee, he bowed to William W. Kolderup.

"I thought," continued the latter, "that you might feel a little regret at separating from your pupil?"

"The regret will be extreme," answered Tartlet, "but should it be necessary--"

"It is not necessary," answered William W. Kolderup, knitting his bushy eyebrows.

"Ah!" replied Tartlet.

Slightly troubled, he made a graceful movement to the rear, so as to pass from the third to the fourth position; but he left the breadth of a foot between his feet, without perhaps being conscious of what he was doing.

"Yes!" added the merchant in a peremptory tone, which admitted not of the ghost of a reply; "I have thought it would really be cruel to separate a professor and a pupil so well made to understand each other!"

"Assuredly!--the journey?" answered Tartlet, who did not seem to want to understand.

"Yes! Assuredly!" replied William W. Kolderup; "not only will his travels bring out the talents of my nephew, but the talents of the professor to whom he owes so correct a bearing."

Never had the thought occurred to this great baby that one day he would leave San Francisco, California, America, to roam the seas. Such an idea had never entered the brain of a man more absorbed in choreography than geography, and who was still ignorant of the suburbs of the capital beyond ten miles radius. And now this was offered to him. He was to understand that _nolens volens_ he was to expatriate himself, he himself was to experience with all their costs and inconveniences the very adventures he had recommended to his pupil! Here, decidedly, was something to trouble a brain much more solid than his, and the unfortunate Tartlet for the first time in his life felt an involuntary yielding in the muscles of his limbs, suppled as they were by thirty-five years' exercise.

"Perhaps," said he, trying to recall to his lips the stereotyped smile of the dancer which had left him for an instant,--"perhaps--am I not--"

"You will go!" answered William W. Kolderup like a a man with whom discussion was useless.

To refuse was impossible. Tartlet did not even think of such a thing. What was he in the house? A thing, a parcel, a package to be sent to every corner of the world. But the projected expedition troubled him not a little.

"And when am I to start?" demanded he, trying to get back into an academical position.

"In a month."

"And on what raging ocean has Mr. Kolderup decided that his vessel should bear his nephew and me?"

"The Pacific, at first."

"And on what point of the terrestrial globe shall I first set foot?"

"On the soil of New Zealand," answered William W. Kolderup; "I have remarked that the New Zealanders always stick their elbows out! Now you can teach them to turn them in!"

And thus was Professor Tartlet selected as the travelling-companion of Godfrey Morgan.

A nod from the merchant gave him to understand that the audience had terminated. He retired, considerably agitated, and the performance of the special graces which he usually displayed in this difficult act left a good deal to be desired. In fact, for the first time in his life, Professor Tartlet, forgetting in his preoccupation the most elementary principles of his art, went out with his toes turned in!

CHAPTER V.

IN WHICH THEY PREPARE TO GO, AND AT THE END OF WHICH THEY GO FOR GOOD.

Before the long voyage together through life, which men call marriage, Godfrey then was to make the tour of the world--a journey sometimes even more dangerous. But he reckoned on returning improved in every respect; he left a lad, he would return a man. He would have seen, noted, compared. His curiosity would be satisfied. There would only remain for him to settle down quietly, and live happily at home with his wife, whom no temptation would take him from. Was he wrong or right? Was he to learn a valuable lesson? The future will show.

In short, Godfrey was enchanted.

Phina, anxious without appearing to be so, was resigned to this apprenticeship.

Professor Tartlet, generally so firm on his limbs, had lost all his dancing equilibrium. He had lost all his usual self-possession, and tried in vain to recover it; he even tottered on the carpet of his room as if he were already on the floor of a cabin, rolling and pitching on the ocean.

As for William W. Kolderup, since he had arrived at a decision, he had become very uncommunicative, especially to his nephew. The closed lips, and eyes half hidden beneath their lids, showed that there was some fixed idea in the head where generally floated the highest commercial speculations.

"Ah! you want to travel," muttered he every now and then; "travel instead of marrying and staying at home!
Well, you shall travel."

Preparations were immediately begun.

In the first place, the itinerary had to be projected, discussed, and settled.

Was Godfrey to go south, or east, or west? That had to be decided in the first place.

If he went southwards, the Panama, California and British Columbia Company, or the Southampton and Rio Janeiro Company would have to take him to Europe.

If he went eastwards, the Union Pacific Railway would take him in a few days to New York, and then the Cunard, Inman, White Star, Hamburg-American, or French-Transatlantic Companies would land him on the shores of the old world.

If he went westwards, the Golden Age Steam Transoceanic would render it easy for him to reach Melbourne, and then he could get to the Isthmus of Suez by the boats of the Peninsular and Oriental Company.

The means of transport were abundant, and thanks to their mathematical agreement the round of the world was but a simple pleasure tour.

But it was not thus that the nephew and heir of the nabob of Frisco was to travel.

No! William W. Kolderup possessed for the requirements of his business quite a fleet of steam and sailing-vessels. He had decided that one of these ships should be "put at the disposal" of Godfrey Morgan, as if he were a prince of the blood, travelling for his pleasure—at the expense of his father's subjects.

By his orders the _Dream_, a substantial steamer of 600 tons and 200 horse-power, was got ready. It was to be commanded by Captain Turcott, a tough old salt, who had already sailed in every latitude in every sea. A thorough sailor, this friend of tornadoes, cyclones, and typhoons, had already spent of his fifty years of life, forty at sea. To bring to in a hurricane was quite child's play to this mariner, who was never disconcerted, except by land-sickness when he was in port. His incessantly unsteady existence on a vessel's deck had endowed him with the habit of constantly balancing himself to the right or the left, or behind or in front, as though he had the rolling and pitching variety of St. Vitus's dance.

A mate, an engineer, four stokers, a dozen seamen, eighteen men in all, formed the crew of the _Dream_. And if the ship was contented to get quietly through eight miles an hour, she possessed a great many excellent nautical qualities. If she was not swift enough to race the waves when the sea was high, the waves could not race over her, and that was an advantage which quite compensated for the mediocrity of her speed, particularly when there was no hurry. The _Dream_ was brigantine rigged, and in a favourable wind, with her 400 square yards of canvas, her steaming rate could be considerably increased.

It should be borne in mind all through that the voyage of the _Dream_ was carefully planned, and would be punctually performed. William W. Kolderup was too practical a man not to put to some purpose a journey of 15,000 or 16,000 leagues across all the oceans of the globe. His ship was to go without cargo, undoubtedly, but it was easy to get her down to her right trim by means of water ballast, and even to sink her to her deck, if it proved necessary.

The _Dream_ was instructed to communicate with the different branch establishments of the wealthy merchant. She was to go from one market to another.

Captain Turcott, never fear, would not find it difficult to pay the expenses of the voyage! Godfrey Morgan's whim would not cost the avuncular purse a single dollar! That is the way they do business in the best commercial houses!

All this was decided at long, very secret interviews between William W. Kolderup and Captain Turcott. But it appeared that the regulation of this matter, simple as it seemed, could not be managed alone, for the captain paid numerous visits to the merchant's office. When he came away, it would be noticed that his face bore a curious expression, that his hair stood on end as if he had been ruffling it up with fevered hands, and that all his body rolled and pitched more than usual. High words were constantly heard, proving that the interviews were stormy. Captain Turcott, with his plain speaking, knew how to withstand William W. Kolderup, who loved and esteemed him enough to permit him to contradict him.

And now all was arranged. Who had given in? William W. Kolderup or Turcott? I dare not say, for I do not even know the subject of their discussion. However, I rather think it must have been the captain.

Anyhow, after eight days of interviewing, the merchant and the captain were in accord, but Turcott did not cease to grumble between his teeth.

"May five hundred thousand Davy Joneses drag me to the bottom if ever I had a job like this before!"

However, the _Dream_ fitted out rapidly, and her captain neglected nothing which would enable him to put to sea in the first fortnight in June. She had been into dock, and the hull had been gone over with composition, whose brilliant red contrasted vividly with the black of her upper works.

A great number of vessels of all kinds and nationalities came into the port of San Francisco. In a good many years the old quays of the town, built straight along the shore, would have been insufficient for the embarkation and
disembarkation of their cargoes, if engineers had not devised subsidiary wharves. Piles of red deal were driven into
the water, and many square miles of planks were laid on them and formed huge platforms. A good deal of the bay
was thus taken up, but the bay is enormous. There were also regular landing-stages, with numberless cranes and
crabs, at which steamers from both oceans, steamboats from the Californian rivers, clippers from all countries, and
coasters from the American seaboard were ranged in proper order, so as not to interfere one with the other.

It was at one of these artificial quays, at the extremity of Mission Wharf Street, that the _Dream_ had been
securely moored after she had come out of dock.

Nothing was neglected, and the steamer would start under the most favourable conditions. Provisioning, outfit,
all were minutely studied. The rigging was perfect, the boilers had been tested and the screw was an excellent one. A
steam launch was even carried, to facilitate communication with the shore, and this would probably be of great
service during the voyage.

Everything was ready on the 10th of June. They had only to put to sea. The men shipped by Captain Turcott to
work the sails or drive the engine were a picked crew, and it would have been difficult to find a better one. Quite a
stock of live animals, agouties, sheep, goats, poultry, &c., were stowed between decks, the material wants of the
travellers were likewise provided for by numerous cases of preserved meats of the best brands.

The route the _Dream_ was to follow had doubtless been the subject of the long conferences which William W.
Kolderup had had with his captain. All knew that they were first bound for Auckland, in New Zealand, unless want
of coal necessitated by the persistence of contrary winds obliged them to refill perhaps at one of the islands of the
Pacific or some Chinese port.

All this detail mattered little to Godfrey once he was on the sea, and still less to Tartlet, whose troubled spirit
exaggerated from day to day the dangers of navigation. There was only one formality to be gone through—the
formality of being photographed.

An engaged man could not decently start on a long voyage round the world without taking with him the image of
her he loved, and in return leaving his own image behind him.

Godfrey in tourist costume accordingly handed himself over to Messrs Stephenson and Co., photographers of
Montgomery Street, and Phina, in her walking-dress, confided in like manner to the sun the task of fixing her
charming but somewhat sorrowing features on the plate of those able operators.

It is also the custom to travel together, and so Phina's portrait had its allotted place in Godfrey's cabin, and
Godfrey's portrait its special position in Phina's room. As for Tartlet, who had no betrothed and who was not
thinking of having one at present, he thought it better to confide his image to sensitised paper. But although great
was the talent of the photographers they failed to present him with a satisfactory proof. The negative was a confused
fog in which it was impossible to recognize the celebrated professor of dancing and deportment.

This was because the patient could not keep himself still, in spite of all that was said about the invariable rule in
studios devoted to operations of this nature.

They tried other means, even the instantaneous process. Impossible. Tartlet pitched and rolled in anticipation as
violently as the captain of the _Dream_.

The idea of obtaining a picture of the features of this remarkable man had thus to be abandoned. Irreparable
would be the misfortune if--but far from us be the thought!--if in imagining he was leaving the new world for the old
world Tartlet had left the new world for the other world from which nobody returns.

On the 9th of June all was ready. The _Dream_ was complete. Her papers, bills of lading, charter-party,
assurance policy, were all in order, and two days before the ship-broker had sent on the last signatures.

On that day a grand farewell breakfast was given at the mansion in Montgomery Street. They drank to the happy
voyage of Godfrey and his safe return.

Godfrey was rather agitated, and he did not strive to hide it. Phina showed herself much the most composed. As
for Tartlet he drowned his apprehensions in several glasses of champagne, whose influence was perceptible up to the
moment of departure. He even forgot his kit, which was brought to him as they were casting off the last hawser of
the _Dream_.

The last adieux were said on board, the last handshakings took place on the poop, then the engine gave two or
three turns of the screw and the steamer was under way.

"Good-bye, Phina!"
"Good-bye, Godfrey!"
"May Heaven protect you!" said the uncle.
"And above all may it bring us back!" murmured Professor Tartlet.
"And never forget, Godfrey," added William W. Kolderup, "the device which the _Dream_ bears on her stern,
'Confide, recte agens.'"
"Never, Uncle Will! Good-bye, Phina!"
"Good-bye, Godfrey!"

The steamer moved off, handkerchiefs were shaken as long as she remained in sight from the quay, and even after. Soon the bay of San Francisco, the largest in the world, was crossed, the _Dream_ passed the narrow throat of the Golden Gate and then her prow cleft the waters of the Pacific Ocean. It was as though the Gates of Gold had closed upon her.

CHAPTER VI.
IN WHICH THE READER MAKES THE ACQUAINTANCE OF A NEW PERSONAGE.
The voyage had begun. There had not been much difficulty so far, it must be admitted.
Professor Tartlet, with incontestable logic, often repeated,--
"Any voyage can begin! But where and how it finishes is the important point."
The cabin occupied by Godfrey was below the poop of the _Dream_ and opened on to the dining-saloon. Our young traveller was lodged there as comfortably as possible. He had given Phina's photograph the best place on the best lighted panel of his room. A cot to sleep on, a lavatory for toilet purposes, some chests of drawers for his clothes and his linen, a table to work at, an armchair to sit upon, what could a young man in his twenty-second year want more? Under such circumstances he might have gone twenty-two times round the world! Was he not at the age of that practical philosophy which consists in good health and good humour? Ah! young people, travel if you can, and if you cannot--travel all the same!

Tartlet was not in a good humour. His cabin, near that of his pupil, seemed to him too narrow, his bed too hard, the six square yards which he occupied quite insufficient for his steps and strides. Would not the traveller in him absorb the professor of dancing and deportment? No! It was in the blood, and when Tartlet reached the hour of his last sleep his feet would be found placed in a horizontal line with the heels one against the other, in the first position.

Meals were taken in common. Godfrey and Tartlet sat opposite to each other, the captain and mate occupying each end of the rolling table. This alarming appellation, the "rolling table," is enough to warn us that the professor's place would too often be vacant.

At the start, in the lovely month of June, there was a beautiful breeze from the north-east, and Captain Turcott was able to set his canvas so as to increase his speed. The _Dream_ thus balanced hardly rolled at all, and as the waves followed her, her pitching was but slight. This mode of progressing was not such as to affect the looks of the passengers and give them pinched noses, hollow eyes, livid foreheads, or colourless cheeks. It was supportable.

They steered south-west over a splendid sea, hardly lifting in the least, and the American coast soon disappeared below the horizon.

For two days nothing occurred worthy of mention. The _Dream_ made good progress. The commencement of the voyage promised well--so that Captain Turcott seemed occasionally to feel an anxiety which he tried in vain to hide. Each day as the sun crossed the meridian he carefully took his observations. But it could be noticed that immediately afterwards he retired with the mate into his cabin, and then they remained in secret conclave as if they were discussing some grave eventuality. This performance passed probably unnoticed by Godfrey, who understood nothing about the details of navigation, but the boatswain and the crew seemed somewhat astonished at it, particularly as for two or three times during the first week, when there was not the least necessity for the manoeuvre, the course of the _Dream_ at night was completely altered, and resumed again in the morning. In a sailing-ship this might be intelligible; but in a steamer, which could keep on the great circle line and only use canvas when the wind was favourable, it was somewhat extraordinary.

During the morning of the 12th of June a very unexpected incident occurred on board.
Captain Turcott, the mate, and Godfrey, were sitting down to breakfast when an unusual noise was heard on deck. Almost immediately afterwards the boatswain opened the door and appeared on the threshold.
"Captain!" he said.
"What's up?" asked Turcott, sailor as he was, always on the alert.
"Here's a--Chinee!" said the boatswain.
"A Chinese!"
"Yes! a genuine Chinese we have just found by chance at the bottom of the hold!"
"At the bottom of the hold!" exclaimed Turcott. "Well, by all the--somethings--of Sacramento, just send him to the bottom of the sea!"
"All right!" answered the boatswain.
And that excellent man with all the contempt of a Californian for a son of the Celestial Empire, taking the order as quite a natural one, would have had not the slightest compunction in executing it.
However, Captain Turcott rose from his chair, and followed by Godfrey and the mate, left the saloon and walked
towards the forecastle of the _Dream_.

There stood a Chinaman, tightly handcuffed, and held by two or three sailors, who were by no means sparing of their nudges and knocks. He was a man of from five-and-thirty to forty, with intelligent features, well built, of lithe figure, but a little emaciated, owing to his sojourn for sixteen hours at the bottom of a badly ventilated hold.

Captain Turcott made a sign to his men to leave the unhappy intruder alone.

"Who are you?" he asked.

"A son of the sun."

"And what is your name?"

"Seng Vou," answered the Chinese, whose name in the Celestial language signifies "he who does not live."

"And what are you doing on board here?"

"I am out for a sail!" coolly answered Seng Vou, "but am doing you as little harm as I can."

"Really! as little harm!--and you stowed yourself away in the hold when we started?"

"Just so, captain."

"So that we might take you for nothing from America to China, on the other side of the Pacific?"

"If you will have it so."

"And if I don't wish to have it so, you yellow-skinned nigger. If I will have it that you have to swim to China."

"I will try," said the Chinaman with a smile, "but I shall probably sink on the road!"

"Well, John," exclaimed Captain Turcott, "I am going to show you how to save your passage-money."

And Captain Turcott, much more angry than circumstances necessitated, was perhaps about to put his threat into execution, when Godfrey intervened.

"Captain," he said, "one more Chinee on board the _Dream_ is one Chinee less in California, where there are too many."

"A great deal too many!" answered Captain Turcott.

"Yes, too many. Well, if this poor beggar wishes to relieve San Francisco of his presence, he ought to be pitied! Bah! we can throw him on shore at Shanghai, and there needn't be any fuss about it!"

In saying that there were too many Chinese in California Godfrey held the same language as every true Californian. The emigration of the sons of the Celestial Empire--there are 300,000,000 in China as against 30,000,000 of Americans in the United States--has become dangerous to the provinces of the Far West; and the legislators of these States of California, Lower California, Oregon, Nevada, Utah, and even Congress itself, are much concerned at this new epidemic of invasion, to which the Yankees have given the name of the "yellow-plague."

At this period there were more than 50,000 Chinese, in the State of California alone. These people, very industrious at gold-washing, very patient, living on a pinch of rice, a mouthful of tea, and a whiff of opium, did an immense deal to bring down the price of manual labour, to the detriment of the native workmen. They had to submit to special laws, contrary to the American constitution--laws which regulated their immigration, and withheld from them the right of naturalization, owing to the fear that they would end by obtaining a majority in the Congress. Generally ill-treated, much as Indians or negroes, so as to justify the title of "pests" which was applied to them, they herded together in a sort of ghetto, where they carefully kept up the manners and customs of the Celestial Empire.

In the Californian capital, it is in the Sacramento Street district, decked with their banners and lanterns, that this foreign race has taken up its abode. There they can be met in thousands, trotting along in their wide-sleeved blouses, conical hats, and turned-up shoes. Here, for the most part, they live as grocers, gardeners, or laundresses--unless they are working as cooks or belong to one of those dramatic troupes which perform Chinese pieces in the French theatre at San Francisco.

And--there is no reason why we should conceal the fact--Seng Vou happened to form part of one of these troupes, in which he filled the rôle of "comic lead," if such a description can apply to any Chinese artiste. As a matter of fact they are so serious, even in their fun, that the Californian romancer, Bret Harte, has told us that he never saw a genuine Chinaman laugh, and has even confessed that he is unable to say whether one of the national pieces he witnessed was a tragedy or a farce.

In short, Seng Vou was a comedian. The season had ended, crowned with success--perhaps out of proportion to the gold pieces he had amassed--he wished to return to his country otherwise than as a corpse, for Chinamen always like to get buried at home and there are special steamers who carry dead Celestials and nothing else. At all risks, therefore, he had secretly slipped on board the _Dream_.

Loaded with provisions, did he hope to get through, incognito, a passage of several weeks, and then to land on the coast of China without being seen?

It is just possible. At any rate, the case was hardly one for a death penalty.

So Godfrey had good reason to interfere in favour of the intruder, and Captain Turcott, who pretended to be
angrier than he really was, gave up the idea of sending Seng Vou overboard to battle with the waves of the Pacific.

Seng Vou, however, did not return to his hiding-place in the hold, though he was rather an incubus on board. Phlegmatic, methodic, and by no means communicative, he carefully avoided the seamen, who had always some prank to play off on him, and he kept to his own provisions. He was thin enough in all conscience, and his additional weight but imperceptibly added to the cost of navigating the _Dream_. If Seng Vou got a free passage it was obvious that his carriage did not cost William W. Kolderup very much.

His presence on board put into Captain Turcott's head an idea which his mate probably was the only one to understand thoroughly.
"He will bother us a bit--this confounded Chinee!--after all, so much the worse for him."
"What ever made him stow himself away on board the _Dream_?" answered the mate.
"To get to Shanghai!" replied Captain Turcott. "Bless John and all John's sons too!"

CHAPTER VII.
IN WHICH IT WILL BE SEEN THAT WILLIAM W. KOLDERUP WAS PROBABLY RIGHT IN INSURING HIS SHIP.

During the following days, the 13th, 14th, and 15th of June, the barometer slowly fell, without an attempt to rise in the slightest degree, and the weather became variable, hovering between rain and wind or storm. The breeze strengthened considerably, and changed to south-westerly. It was a head-wind for the _Dream_, and the waves had now increased enormously, and lifted her forward. The sails were all furled, and she had to depend on her screw alone; under half steam, however, so as to avoid excessive labouring.

Godfrey bore the trial of the ship's motion without even losing his good-humour for a moment. Evidently he was fond of the sea.

But Tartlet was not fond of the sea, and it served him out. It was pitiful to see the unfortunate professor of deportment deporting himself no longer, the professor of dancing dancing contrary to every rule of his art. Remain in his cabin, with the seas shaking the ship from stem to stern, he could not.

"Air! air!" he gasped.

And so he never left the deck. A roll sent him rolling from one side to the other, a pitch sent him pitching from one end to the other. He clung to the rails, he clutched the ropes, he assumed every attitude that is absolutely condemned by the principles of the modern choregraphic art. Ah! why could he not raise himself into the air by some balloon-like movement, and escape the eccentricities of that moving plane? A dancer of his ancestors had said that he only consented to set foot to the ground so as not to humiliate his companions, but Tartlet would willingly never have come down at all on the deck, whose perpetual agitation threatened to hurl him into the abyss.

What an idea it was for the rich William W. Kolderup to send him here.
"Is this bad weather likely to last?" asked he of Captain Turcott twenty times a day.
"Dunno! barometer is not very promising!" was the invariable answer of the captain, knitting his brows.
"Shall we soon get there?"
"Soon, Mr. Tartlet? Hum! soon!"
"And they call this the Pacific Ocean!" repeated the unfortunate man, between a couple of shocks and oscillations.

It should be stated that, not only did Professor Tartlet suffer from sea-sickness, but also that fear had seized him as he watched the great seething waves breaking into foam level with the bulwarks of the _Dream_, and heard the valves, lifted by the violent beats, letting the steam off through the waste-pipes, as he felt the steamer tossing like a cork on the mountains of water.

"No," said he with a lifeless look at his pupil, "it is not impossible for us to capsize."
"Take it quietly, Tartlet," replied Godfrey. "A ship was made to float! There are reasons for all this."
"I tell you there are none."

And, thinking thus, the professor had put on his life-belt. He wore it night and day, tightly buckled round his waist. He would not have taken it off for untold gold. Every time the sea gave him a moment's respite he would replenish it with another puff. In fact, he never blew it out enough to please him.

We must make some indulgence for the terrors of Tartlet. To those unaccustomed to the sea, its rolling is of a nature to cause some alarm, and we know that this passenger-in-spite-of-himself had not even till then risked his safety on the peaceable waters of the Bay of San Francisco; so that we can forgive his being ill on board a ship in a stiffish breeze, and his feeling terrified at the playfulness of the waves.

The weather became worse and worse, and threatened the _Dream_ with a gale, which, had she been near the
shore, would have been announced to her by the semaphores.

During the day the ship was dreadfully knocked about, though running at half steam so as not to damage her engines. Her screw was continually immersing and emerging in the violent oscillations of her liquid bed. Hence, powerful strokes from its wings in the deeper water, or fearful tremors as it rose and ran wild, causing heavy thunderings beneath the stern, and furious gallopings of the pistons which the engineer could master but with difficulty.

One observation Godfrey made, of which at first he could not discover the cause. This was, that during the night the shocks experienced by the steamer were infinitely less violent than during the day. Was he then to conclude that the wind then fell, and that a calm set in after sundown?

This was so remarkable that, on the night between the 21st and 22nd of June, he endeavoured to find out some explanation of it. The day had been particularly stormy, the wind had freshened, and it did not appear at all likely that the sea would fall at night, lashed so capriciously as it had been for so many hours.

Towards midnight then Godfrey dressed, and, wrapping himself up warmly, went on deck.

The men on watch were forward, Captain Turcott was on the bridge.

The force of the wind had certainly not diminished. The shock of the waves, which should have dashed on the bows of the _Dream_, was, however, very much less violent. But in raising his eyes towards the top of the funnel, with its black canopy of smoke, Godfrey saw that the smoke, instead of floating from the bow aft, was, on the contrary, floating from aft forwards, and following the same direction as the ship.

"Has the wind changed?" he said to himself.

And extremely glad at the circumstance he mounted the bridge. Stepping up to Turcott,--

"Captain!" he said.

The latter, enveloped in his oilskins, had not heard him approach, and at first could not conceal a movement of annoyance in seeing him close to him.

"You, Mr. Godfrey, you--on the bridge?"

"Yes, I, captain. I came to ask--"

"What?" answered Captain Turcott sharply.

"If the wind has not changed?"

"No, Mr. Godfrey, no. And, unfortunately, I think it will turn to a storm!"

"But we now have the wind behind us!"

"Wind behind us--yes--wind behind us!" replied the captain, visibly disconcerted at the observation. "But it is not my fault."

"What do you mean?"

"I mean that in order not to endanger the vessel's safety I have had to put her about and run before the storm."

"That will cause us a most lamentable delay!" said Godfrey.

"Very much so," answered Captain Turcott, "but when day breaks, if the sea falls a little, I shall resume our westerly route. I should recommend you, Mr. Godfrey, to get back to your cabin. Take my advice, try and sleep while we are running before the wind. You will be less knocked about."

Godfrey made a sign of affirmation; turning a last anxious glance at the low clouds which were chasing each other with extreme swiftness, he left the bridge, returned to his cabin, and soon resumed his interrupted slumbers.

Properly speaking, they were not regular waves on which the sea rose and fell, but only lengthened undulations which gently rocked the steamer.

Undulations or waves, it is true, it was all one to Professor Tartlet, as unwell when it was "too mild," as when it was "too rough." There he was, half crouching on the deck, with his mouth open like a carp fainted out of water.

The mate on the poop, his telescope at his eye, was looking towards the north-east.

Godfrey approached him.

"Well, sir," said he gaily, "to-day is a little better than yesterday."
"Yes, Mr. Godfrey," replied the mate, "we are now in smooth water."

"And the _Dream_ is on the right road!"

"Not yet."

"Not yet? and why?"

"Because we have evidently drifted north-eastwards during this last spell, and we must find out our position exactly."

"But there is a good sun and a horizon perfectly clear."

"At noon in taking its height we shall get a good observation, and then the captain will give us our course."

"Where is the captain?" asked Godfrey.

"He has gone off."

"Gone off?"

"Yes! our look-outs saw from the whiteness of the sea that there were some breakers away to the east; breakers which are not shown on the chart. So the steam launch was got out, and with the boatswain and three men, Captain Turcott has gone off to explore."

"How long ago?"

"About an hour and a half!"

"Ah!" said Godfrey, "I am sorry he did not tell me. I should like to have gone too."

"You were asleep, Mr. Godfrey," replied the mate, "and the captain did not like to wake you."

"I am sorry; but tell me, which way did the launch go?"

"Over there," answered the mate, "over the starboard bow, north-eastwards."

"And can you see it with the telescope?"

"No, she is too far off."

"But will she be long before she comes back?"

"She won’t be long, for the captain is going to take the sights himself, and to do that he must be back before noon."

At this Godfrey went and sat on the forecastle, having sent some one for his glasses. He was anxious to watch the return of the launch. Captain Turcott’s reconnaissance did not cause him any surprise. It was natural that the _Dream_ should not be run into danger on a part of the sea where breakers had been reported.

Two hours passed. It was not until half-past ten that a light line of smoke began to rise on the horizon. It was evidently the steam launch which, having finished the reconnaissance, was making for the ship.

It amused Godfrey to follow her in the field of his glasses. He saw her little by little reveal herself in clearer outline, he saw her grow on the surface of the sea, and then give definite shape to her smoke wreath, as it mingled with a few curls of steam on the clear depth of the horizon.

She was an excellent little vessel, of immense speed, and as she came along at full steam, she was soon visible to the naked eye. Towards eleven o’clock, the wash from her bow as she tore through the waves was perfectly distinct, and behind her the long furrow of foam gradually growing wider and fainter like the tail of a comet.

At a quarter-past eleven, Captain Turcott hailed and boarded the _Dream_.

"Well, captain, what news?" asked Godfrey, shaking his hand.

"Ah! Good morning, Mr. Godfrey!"

"And the breakers?"

"Only show!" answered Captain Turcott. "We saw nothing suspicious, our men must have been deceived, but I am rather surprised at that, all the same."

"We are going ahead then?" said Godfrey.

"Yes, we are going on now, but I must first take an observation."

"Shall we get the launch on board?" asked the mate.

"No," answered the captain, "we may want it again. Leave it in tow!"

The captain’s orders were executed, and the launch, still under steam, dropped round to the stern of the _Dream_.

Three-quarters of an hour afterwards, Captain Turcott, with his sextant in his hand, took the sun’s altitude, and having made his observation, he gave the course. That done, having given a last look at the horizon, he called the mate, and taking him into his cabin, the two remained there in a long consultation.

The day was a very fine one. The sails had been furled, and the _Dream_ steamed rapidly without their help. The wind was very slight, and with the speed given by the screw there would not have been enough to fill them.

Godfrey was thoroughly happy. This sailing over a beautiful sea, under a beautiful sky, could anything be more cheering, could anything give more impulse to thought, more satisfaction to the mind? And it is scarcely to be wondered at that Professor Tartlet also began to recover himself a little. The state of the sea did not inspire him with immediate inquietude, and his physical being showed a little reaction. He tried to eat, but without taste or appetite.
Godfrey would have had him take off the life-belt which encircled his waist, but this he absolutely refused to do. Was there not a chance of this conglomeration of wood and iron, which men call a vessel, gaping asunder at any moment.

The evening came, a thick mist spread over the sky, without descending to the level of the sea. The night was to be much darker than would have been thought from the magnificent daytime.

There was no rock to fear in these parts, for Captain Turcott had just fixed his exact position on the charts; but collisions are always possible, and they are much more frequent on foggy nights.

The lamps were carefully put into place as soon as the sun set. The white one was run up the mast, and the green light to the right and the red one to the left gleamed in the shrouds. If the _Dream_ was run down, at the least it would not be her fault—had was one consolation. To founder even when one is in order is to founder nevertheless, and if any one on board made this observation it was of course Professor Tartlet. However, the worthy man, always on the roll and the pitch, had regained his cabin, Godfrey his; the one with the assurance, the other in the hope that he would pass a good night, for the _Dream_ scarcely moved on the crest of the lengthened waves.

Captain Turcott, having handed over the watch to the mate, also came under the poop to take a few hours' rest. All was in order. The steamer could go ahead in perfect safety, although it did not seem as though the thick fog would lift.

In about twenty minutes Godfrey was asleep, and the sleepless Tartlet, who had gone to bed with his clothes on as usual, only betrayed himself by distant sighs. All at once—at about one in the morning—Godfrey was awakened by a dreadful clamour.

He jumped out of bed, slipped on his clothes, his trousers, his waistcoat and his sea-boots.

Almost immediately a fearful cry was heard on deck, "We are sinking! we are sinking!"

In an instant Godfrey was out of his cabin and in the saloon. There he cannoned against an inert mass which he did not recognize. It was Professor Tartlet.

The whole crew were on deck, hurrying about at the orders of the mate and captain. "A collision?" asked Godfrey.

"I don't know, I don't know—this beastly fog—" answered the mate; "but we are sinking!"

"Sinking?" exclaimed Godfrey.

And in fact the _Dream_, which had doubtless struck on a rock was sensibly foundering. The water was creeping up to the level of the deck. The engine fires were probably already out below.

"To the sea! to the sea, Mr. Morgan!" exclaimed the captain. "There is not a moment to lose! You can see the ship settling down! It will draw you down in the eddy!"

"And Tartlet?"

"I'll look after him!—We are only half a cable from the shore!"

"But you?"

"My duty compels me to remain here to the last, and I remain!" said the captain. "But get off! get off!"

Godfrey still hesitated to cast himself into the waves, but the water was already up to the level of the deck.

Captain Turcott knowing that Godfrey swam like a fish, seized him by the shoulders, and did him the service of throwing him overboard.

It was time! Had it not been for the darkness, there would doubtless have been seen a deep raging vortex in the place once occupied by the _Dream_.

But Godfrey, in a few strokes in the calm water, was able to get swiftly clear of the whirlpool, which would have dragged him down like a maelstrom.

All this was the work of a minute. A few minutes afterwards, amid shouts of despair, the lights on board went out one after the other. Doubt existed no more; the _Dream_ had sunk head downwards!

As for Godfrey he had been able to reach a large lofty rock away from the surf. There, shouting vainly in the darkness, hearing no voice in reply to his own, not knowing if he should find himself on an isolated rock or at the extremity of a line of reefs, and perhaps the sole survivor of the catastrophe, he waited for the dawn.

CHAPTER VIII.

WHICH LEADS GODFREY TO BITTER REFLECTIONS ON THE MANIA FOR TRAVELLING.

Three long hours had still to pass before the sun reappeared above the horizon. These were such hours that they might rather be called centuries.

The trial was a rough one to begin with, but, we repeat, Godfrey had not come out for a simple promenade. He himself put it very well when he said he had left behind him quite a lifetime of happiness and repose, which he
would never find again in his search for adventures. He tried his utmost therefore to rise to the situation.

He was, temporarily, under shelter. The sea after all could not drive him off the rock which lay anchored alone amid the spray of the surf. Was there any fear of the incoming tide soon reaching him? No, for on reflection he concluded that the wreck had taken place at the highest tide of the new moon.

But was the rock isolated? Did it command a line of breakers scattered on this portion of the sea? What was this coast which Captain Turcott had thought he saw in the darkness? To which continent did it belong? It was only too certain that the _Dream_ had been driven out of her route during the storm of the preceding days. The position of the ship could not have been exactly fixed. How could there be a doubt of this when the captain had two hours before affirmed that his charts bore no indication of breakers in these parts! He had even done better and had gone himself to reconnoitre these imaginary reefs which his look-outs had reported they had seen in the east.

It nevertheless had been only too true, and Captain Turcott's reconnaissance would have certainly prevented the catastrophe if it had only been pushed far enough. But what was the good of returning to the past?

The important question in face of what had happened—a question of life or death—was for Godfrey to know if he was near to some land. In what part of the Pacific there would be time later on to determine. Before everything he must think as soon as the day came of how to leave the rock, which in its biggest part could not measure more than twenty yards square. But people do not leave one place except to go to another. And if this other did not exist, if the captain had been deceived in the fog, if around the breakers there stretched a boundless sea, if at the extreme point of view the sky and the water seemed to meet all round the horizon?

The thoughts of the young man were thus concentrated on this point. All his powers of vision did he employ to discover through the black night if any confused mass, any heap of rocks or cliffs, would reveal the neighbourhood of land to the eastward of the reef.

Godfrey saw nothing. Not a smell of earth reached his nose, not a sensation of light reached his eyes, not a sound reached his ears. Not a bird traversed the darkness. It seemed that around him there was nothing but a vast desert of water.

Godfrey did not hide from himself that the chances were a thousand to one that he was lost. He no longer thought of making the tour of the world, but of facing death, and calmly and bravely his thoughts rose to that Providence which can do all things for the feeblest of its creatures, though the creatures can do nothing of themselves. And so Godfrey had to wait for the day to resign himself to his fate, if safety was impossible; and, on the contrary, to try everything, if there was any chance of life.

Calmed by the very gravity of his reflections, Godfrey had seated himself on the rock. He had stripped off some of his clothes which had been saturated by the sea-water, his woollen waistcoat and his heavy boots, so as to be ready to jump into the sea if necessary.

However, was it possible that no one had survived the wreck? What! not one of the men of the _Dream_ carried to shore? Had they all been sucked in by the terrible whirlpool which the ship had drawn round herself as she sank? The last to whom Godfrey had spoken was Captain Turcott, resolved not to quit his ship while one of his sailors was still there! It was the captain himself who had hurled him into the sea at the moment the _Dream_ was disappearing.

But the others, the unfortunate Tartlet, and the unhappy Chinese, surprised without doubt, and swallowed up, the one in the poop, the other in the depths of the hold, what had become of them? Of all those on board the _Dream_, was he the only one saved? And had the steam launch remained at the stern of the steamer? Could not a few passengers or sailors have saved themselves therein, and found time to flee from the wreck? But was it not rather to be feared that the launch had been dragged down by the ship under several fathoms of water?

Godfrey then said to himself, that if in this dark night he could not see, he could at least make himself heard. There was nothing to prevent his shouting and hailing in the deep silence. Perhaps the voice of one of his companions would respond to his.

Over and over again then did he call, giving forth a prolonged shout which should have been heard for a considerable distance round. Not a cry answered to his.

He began again, many times, turning successively to every point of the horizon.

Absolute silence.

"Alone! alone!" he murmured.

Not only had no cry answered to his, but no echo had sent him back the sound of his own voice. Had he been near a cliff, not far from a group of rocks, such as generally border the shore, it was certain that his shouts, repelled by the obstacles, would have returned to him. Either eastwards of the reef, therefore, stretched a low-lying shore ill-adapted for the production of an echo, or there was no land in his vicinity, the bed of breakers on which he had found refuge was isolated.

Three hours were passed in these anxieties. Godfrey, quite chilled, walked about the top of the rock, trying to battle with the cold. At last a few pale beams of light tinged the clouds in the zenith. It was the reflection of the first
colouring of the horizon.

Godfrey turned to this side—the only one towards which there could be land—to see if any cliff outlined itself in
the shadow. With its early rays the rising sun might disclose its features more distinctly.

But nothing appeared through the misty dawn. A light fog was rising over the sea, which did not even admit of
his discovering the extent of the breakers.

[Illustration: Nothing appeared through the mist. _page 82._]

He had, therefore, to satisfy himself with illusions. If Godfrey were really cast on an isolated rock in the Pacific,
it was death to him after a brief delay, death by hunger, by thirst, or if necessary, death at the bottom of the sea as a
last resource!

However, he kept constantly looking, and it seemed as though the intensity of his gaze increased enormously, for
all his will was concentrated therein.

At length the morning mist began to fade away. Godfrey saw the rocks which formed the reef successively
defined in relief on the sea, like a troop of marine monsters. It was a long and irregular assemblage of dark boulders,
strangely worn, of all sizes and forms, whose direction was almost west and east. The enormous block on the top of
which Godfrey found himself emerged from the sea on the western edge of the bank scarcely thirty fathoms from the
spot where the _Dream_ had gone down. The sea hereabouts appeared to be very deep, for of the steamer nothing
was to be seen, not even the ends of her masts. Perhaps by some under-current she had been drawn away from the
reefs.

A glance was enough for Godfrey to take in this state of affairs. There was no safety on that side. All his
attention was directed towards the other side of the breakers, which the lifting fog was gradually disclosing. The sea,
now that the tide had retired, allowed the rocks to stand out very distinctly. They could be seen to lengthen as there
humid bases widened. Here were vast intervals of water, there a few shallow pools. If they joined on to any coast, it
would not be difficult to reach it.

Up to the present, however, there was no sign of any shore. Nothing yet indicated the proximity of dry land,
even in this direction.

The fog continued to lift, and the field of view persistently watched by Godfrey continued to grow. Its wreaths
had now rolled off for about half a mile or so. Already a few sandy flats appeared among the rocks, carpeted with
their slimy sea-weed.

Did not this sand indicate more or less the presence of a beach, and if the beach existed, could there be a doubt
but what it belonged to the coast of a more important land? At length a long profile of low hills, buttressed with
huge granitic rocks, became clearly outlined and seemed to shut in the horizon on the east. The sun had drunk up all
the morning vapours, and his disc broke forth in all its glory.

"Land! land!" exclaimed Godfrey.

And he stretched his hands towards the shore-line, as he knelt on the reef and offered his thanks to Heaven.

It was really land. The breakers only formed a projecting ridge, something like the southern cape of a bay, which
curved round for about two miles or more. The bottom of the curve seemed to be a level beach, bordered by trifling
hills, contoured here and there with lines of vegetation, but of no great size.

From the place which Godfrey occupied, his view was able to grasp the whole of this side.

Borders north and south by two unequal promontories, it stretched away for, at the most, five or six miles. It
was possible, however, that it formed part of a large district. Whatever it was, it offered at the least temporary safety.
Godfrey, at the sight, could not conceive a doubt but that he had not been thrown on to a solitary reef, and that this
morsel of ground would satisfy his earliest wants.

"To land! to land!" he said to himself.

But before he left the reef, he gave a look round for the last time. His eyes again interrogated the sea away up to
the horizon. Would some raft appear on the surface of the waves, some fragment of the _Dream_, some survivor,
perhaps?

Nothing. The launch even was not there, and had probably been dragged into the common abyss.

Then the idea occurred to Godfrey that among the breakers some of his companions might have found a refuge,
and were, like him, waiting for the day to try and reach the shore.

There was nobody, neither on the rocks, nor on the beach! The reef was as deserted as the ocean!

But in default of survivors, had not the sea thrown up some of the corpses? Could not Godfrey find among the
rocks, along to the utmost boundary of the surf, the inanimate bodies of some of his companions?

No! Nothing along the whole length of the breakers, which the last ripples of the ebb had now left bare.

Godfrey was alone! He could only count on himself to battle with the dangers of every sort which environed
him!

Before this reality, however, Godfrey, let it be said to his credit, did not quail. But as before everything it was
best for him to ascertain the nature of the ground from which he was separated by so short a distance, he left the
summit of the rock and began to approach the shore.

When the interval which separated the rocks was too great to be cleared at a bound, he got down into the water,
and sometimes walking and sometimes swimming he easily gained the one next in order. When there was but a yard
or two between, he jumped from one rock to the other. His progress over these slimy stones, carpeted with glistening
sea-weeds, was not easy, and it was long. Nearly a quarter of a mile had thus to be traversed.

But Godfrey was active and handy, and at length he set foot on the land where there probably awaited him, if not
early death, at least a miserable life worse than death. Hunger, thirst, cold, and nakedness, and perils of all kinds;
without a weapon of defence, without a gun to shoot with, without a change of clothes--such the extremities to
which he was reduced.

How imprudent he had been! He had been desirous of knowing if he was capable of making his way in the world
under difficult circumstances! He had put himself to the proof! He had envied the lot of a Crusoe! Well, he would
see if the lot were an enviable one!

And then there returned to his mind the thought of his happy existence, that easy life in San Francisco, in the
midst of a rich and loving family, which he had abandoned to throw himself into adventures. He thought of his
Uncle Will, of his betrothed Phina, of his friends who would doubtless never see him again.

As he called up these remembrances his heart swelled, and in spite of his resolution a tear rose to his eyes.

And again, if he was not alone, if some other survivor of the shipwreck had managed, like him, to reach the
shore, and even in default of the captain or the mate, this proved to be Professor Tartlet, how little he could depend
on that frivolous being, and how slightly improved the chances of the future appeared! At this point, however, he
still had hope. If he had found no trace among the breakers, would he meet with any on the beach?

Who else but he had already touched the shore, seeking a companion who was seeking him?

Godfrey took another long look from north to south. He did not notice a single human being. Evidently this
portion of the earth was uninhabited. In any case there was no sign, not a trace of smoke in the air, not a vestige.

"Let us get on!" said Godfrey to himself.

And he walked along the beach towards the north, before venturing to climb the sand dunes, which would allow
him to reconnoitre the country over a larger extent.

The silence was absolute. The sand had received no other footprint. A few sea-birds, gulls or guillemots, were
skimming along the edge of the rocks, the only living things in the solitude.

Godfrey continued his walk for a quarter of an hour. At last he was about to turn on to the talus of the most
elevated of the dunes, dotted with rushes and brushwood, when he suddenly stopped.

A shapeless object, extraordinarily distended, something like the corpse of a sea monster, thrown there,
doubtless, by the late storm, was lying about thirty paces off on the edge of the reef.

Godfrey hastened to run towards it.

The nearer he approached the more rapidly did his heart beat. In truth, in this stranded animal he seemed to
recognize a human form.

Godfrey was not ten paces away from it, when he stopped as if rooted to the soil, and exclaimed,--
"Tartlet!"

It was the professor of dancing and deportment.

Godfrey rushed towards his companion, who perhaps still breathed.

A moment afterwards he saw that it was the life-belt which produced this extraordinary distension, and gave the
aspect of a monster of the sea to the unfortunate professor.

But although Tartlet was motionless, was he dead? Perhaps this natatory clothing had kept him above water,
while the surf had borne him to shore?

Godfrey set to work. He knelt down by Tartlet; he unloosed the life-belt and rubbed him vigorously. He noticed
at last a light breath on the half-opened lips! He put his hand on his heart! The heart still beat.

Godfrey spoke to him.

Tartlet shook his head, then he gave utterance to a hoarse exclamation, followed by incoherent words.

Godfrey shook him violently.

Tartlet then opened his eyes, passed his left hand over his brow, lifted his right hand and assured himself that his
precious kit and bow, which he tightly held, had not abandoned him.

"Tartlet! My dear Tartlet!" shouted Godfrey, lightly raising his head.

The head with his mass of tumbled hair gave an affirmative nod.

"It is I! I! Godfrey!"

"Godfrey?" asked the professor.

And then he turned over, and rose on to his knees, and looked about, and smiled, and rose to his feet! He had
discovered that at last he was on a solid base! He had gathered that he was no longer on the ship's deck, exposed to all the uncertainties of its pitches and its rolls! The sea had ceased to carry him! He stood on firm ground!

And then Professor Tartlet recovered the aplomb which he had lost since his departure; his feet placed themselves naturally, with their toes turned out, in the regulation position; his left hand seized his kit, his right hand grasped his bow.

Then, while the strings, vigorously attacked, gave forth a humid sound of melancholy sonorousness, these words escaped his smiling lips,--

"In place, miss!"

The good man was thinking of Phina.

CHAPTER IX.
IN WHICH IT IS SHOWN THAT CRUSOECS DO NOT HAVE EVERYTHING AS THEY WISH.

That done, the professor and his pupil rushed into one another's arms.

"My dear Godfrey!" exclaimed Tartlet.

"My good Tartlet!" replied Godfrey.

"At last we are arrived in port!" observed the professor in the tone of a man who had had enough of navigation and its accidents.

He called it arriving in port!

Godfrey had no desire to contradict him.

"Take off your life-belt," he said. "It suffocates you and hampers your movements."

"Do you think I can do so without inconvenience?" asked Tartlet.

"Without any inconvenience," answered Godfrey. "Now put up your fiddle, and let us take a look round."

"Come on," replied the professor; "but if you don't mind, Godfrey, let us go to the first restaurant we see. I am dying of hunger, and a dozen sandwiches washed down with a glass or two of wine will soon set me on my legs again."

"Yes! to the first restaurant!" answered Godfrey, nodding his head; "and even to the last, if the first does not suit us."

"And," continued Tartlet, "we can ask some fellow as we go along the road to the telegraph office so as to send a message off to your Uncle Kolderup. That excellent man will hardly refuse to send on some necessary cash for us to get back to Montgomery Street, for I have not got a cent with me!"

"Agreed, to the first telegraph office," answered Godfrey, "or if there isn't one in this country, to the first post office. Come on, Tartlet."

The professor took off his swimming apparatus, and passed it over his shoulder like a hunting-horn, and then both stepped out for the edge of the dunes which bordered the shore.

What more particularly interested Godfrey, whom the encounter with Tartlet had imbued with some hope, was to see if they too were the only survivors of the _Dream_.

A quarter of an hour after the explorers had left the edge of the reef they had climbed a dune about sixty or eighty feet high, and stood on its crest. Thence they looked on a large extent of coast, and examined the horizon in the east, which till then had been hidden by the hills on the shore.

Two or three miles away in that direction a second line of hills formed the background, and beyond them nothing was seen of the horizon.

Towards the north the coast trended off to a point, but it could not be seen if there was a corresponding cape behind. On the south a creek ran some distance into the shore, and on this side it looked as though the ocean closed the view. Whence this land in the Pacific was probably a peninsula, and the isthmus which joined it to the continent would have to be sought for towards the north or north-east.

The country, however, far from being barren, was hidden beneath an agreeable mantle of verdure; long prairies, amid which meandered many limpid streams, and high and thick forests, whose trees rose above one another to the very backbone of hills. It was a charming landscape.

But of houses forming town, village, or hamlet, not one was in sight! Of buildings grouped and arranged as a farm of any sort, not a sign! Of smoke in the sky, betraying some dwelling hidden among the trees, not a trace. Not a steeple above the branches, not a windmill on an isolated hill. Not even in default of houses a cabin, a hut, an ajoupa, or a wigwam? No! nothing. If human beings inhabited this unknown land, they must live like troglodytes, below, and not above the ground. Not a road was visible, not a footpath, not even a track. It seemed that the foot of man had never trod either a rock of the beach or a blade of the grass on the prairies.

"I don't see the town," remarked Tartlet, who, however, remained on tiptoe.
"That is perhaps because it is not in this part of the province!" answered Godfrey.
"But a village?"
"There's nothing here."
"Where are we then?"
"I know nothing about it."
"What! You don't know! But Godfrey, we had better make haste and find out."
"Who is to tell us?"
"What will become of us then?" exclaimed Tartlet, rounding his arms and lifting them to the sky.
"Become a couple of Crusoes!"

At this answer the professor gave a bound such as no clown had ever equalled.

Crusoes! They! A Crusoe! He! Descendants of that Selkirk who had lived for long years on the island of Juan Fernandez! Imitators of the imaginary heroes of Daniel Defoe and De Wyss whose adventures they had so often read! Abandoned, far from their relatives, their friends; separated from their fellow-men by thousands of miles, destined to defend their lives perhaps against wild beasts, perhaps against savages who would land there, wretches without resources, suffering from hunger, suffering from thirst, without weapons, without tools, almost without clothes, left to themselves. No, it was impossible!

"Don't say such things, Godfrey," exclaimed Tartlet. "No! Don't joke about such things! The mere supposition will kill me! You are laughing at me, are you not?"

"Yes, my gallant Tartlet," answered Godfrey. "Reassure yourself. But in the first place, let us think about matters that are pressing."

In fact, they had to try and find some cavern, a grotto or hole, in which to pass the night, and then to collect some edible mollusks so as to satisfy the cravings of their stomachs.

Godfrey and Tartlet then commenced to descend the talus of the dunes in the direction of the reef. Godfrey showed himself very ardent in his researches, and Tartlet considerably stupefied by his shipwreck experiences. The first looked before him, behind him, and all around him; the second hardly saw ten paces in front of him.

"If there are no inhabitants on this land, are there any animals?" asked Godfrey.

He meant to say domestic animals, such as furred and feathered game, not wild animals which abound in tropical regions, and with which they were not likely to have to do.

Several flocks of birds were visible on the shore, bitterns, curlews, bernicle geese, and teal, which hovered and chirped and filled the air with their flutterings and cries, doubtless protesting against the invasion of their domain.

Godfrey was justified in concluding that where there were birds there were nests, and where there were nests there were eggs. The birds congregated here in such numbers, because rocks provided them with thousands of cavities for their dwelling-places. In the distance a few herons and some flocks of snipe indicated the neighbourhood of a marsh.

Birds then were not wanting, the only difficulty was to get at them without fire-arms. The best thing to do now was to make use of them in the egg state, and consume them under that elementary but nourishing form.

But if the dinner was there, how were they to cook it? How were they to set about lighting a fire? An important question, the solution of which was postponed.

Godfrey and Tartlet returned straight towards the reef, over which some sea-birds were circling. An agreeable surprise there awaited them.

Among the indigenous fowl which ran along the sand of the beach and pecked about among the sea-weed and under the tufts of aquatic plants, was it a dozen hens and two or three cocks of the American breed that they beheld? No! There was no mistake, for at their approach did not a resounding cock-a-doodle-do-oo-oo rend the air like the sound of a trumpet?

And farther off, what were those quadrupeds which were gliding in and out of the rocks, and making their way towards the first slopes of the hills, or grubbing beneath some of the green shrubs? Godfrey could not be mistaken. There were a dozen agouties, five or six sheep, and as many goats, who were quietly browsing on the first vegetation on the very edge of the prairie.

"Look there, Tartlet!" he exclaimed.

And the professor looked, but saw nothing, so much was he absorbed with the thought of this unexpected situation.

A thought flashed across the mind of Godfrey, and it was correct: it was that these hens, agouties, goats, and sheep had belonged to the _Dream_. At the moment she went down, the fowls had easily been able to reach the reef and then the beach. As for the quadrupeds, they could easily have swum ashore.

"And so," remarked Godfrey, "what none of our unfortunate companions have been able to do, these simple animals, guided by their instinct, have done! And of all those on board the _Dream_, none have been saved but a
"few beasts!"
"Including ourselves!" answered Tartlet naively.
As far as he was concerned, he had come ashore unconsciously, very much like one of the animals. It mattered little. It was a very fortunate thing for the two shipwrecked men that a certain number of these animals had reached the shore. They would collect them, fold them, and with the special fecundity of their species, if their stay on this land was a lengthy one, it would be easy to have quite a flock of quadrupeds, and a yard full of poultry.

But on this occasion, Godfrey wished to keep to such alimentary resources as the coast could furnish, either in eggs or shell-fish. Professor Tartlet and he set to work to forage among the interstices of the stones, and beneath the carpet of sea-weeds, and not without success. They soon collected quite a notable quantity of mussels and periwinkles, which they could eat raw. A few dozen eggs of the bernicle geese were also found among the higher rocks which shut in the bay on the north. They had enough to satisfy a good many; and, hunger pressing, Godfrey and Tartlet hardly thought of making difficulties about their first repast.

"And the fire?" said the professor.
"Yes! The fire!" said Godfrey.
It was the most serious of questions, and it led to an inventory being made of the contents of their pockets. Those of the professor were empty or nearly so. They contained a few spare strings for his kit, and a piece of rosin for his bow. How would you get a light from that, I should like to know? Godfrey was hardly better provided. However, it was with extreme satisfaction that he discovered in his pocket an excellent knife, whose leather case had kept it from the sea-water. This knife, with blade, gimlet, hook, and saw, was a valuable instrument under the circumstances. But besides this tool, Godfrey and his companion had only their two hands; and as the hands of the professor had never been used except in playing his fiddle, and making his gestures, Godfrey concluded that he would have to trust to his own.

He thought, however, of utilizing those of Tartlet for procuring a fire by means of rubbing two sticks of wood rapidly together. A few eggs cooked in the embers would be greatly appreciated at their second meal at noon.

While Godfrey then was occupied in robbing the nests in spite of the proprietors, who tried to defend their progeny in the shell, the professor went off to collect some pieces of wood which had been dried by the sun at the foot of the dunes. These were taken behind a rock sheltered from the wind from the sea. Tartlet then chose two very dry pieces, with the intention of gradually obtaining sufficient heat by rubbing them vigorously and continuously together. What simple Polynesian savages commonly did, why should not the professor, so much their superior in his own opinion, be able to do?

Behold him then, rubbing and rubbing, in a way to dislocate the muscles of his arm and shoulder. He worked himself into quite a rage, poor man! But whether it was that the wood was not right, or its dryness was not sufficient, or the professor held it wrongly, or had not got the peculiar turn of hand necessary for operations of this kind, if he did not get much heat out of the wood, he succeeded in getting a good deal out of himself. In short, it was his own forehead alone which smoked under the vapours of his own perspiration.

When Godfrey returned with his collection of eggs, he found Tartlet in a rage, in a state to which his choregraphic exercises had never doubtless provoked him.
"Doesn't it do?" he asked.
"No, Godfrey, it does not do," replied the professor. "And I begin to think that these inventions of the savages are only imaginations to deceive the world."
"No," answered Godfrey. "But in that, as in all things, you must know how to do it."
"These eggs, then?"
"There is another way. If you attach one of these eggs to the end of a string and whirl it round rapidly, and suddenly arrest the movement of rotation, the movement may perhaps transform itself into heat, and then--"
"And then the egg will be cooked?"
"Yes, if the rotation has been swift enough and the stoppage sudden enough. But how do you produce the stoppage without breaking the egg? Now, there is a simpler way, dear Tartlet. Behold!"

And carefully taking one of the eggs of the bernicle goose, he broke the shell at its end, and adroitly swallowed the inside without any further formalities.

Tartlet could not make up his mind to imitate him, and contented himself with the shell-fish.
It now remained to look for a grotto or some shelter in which to pass the night.
"It is an unheard-of thing," observed the professor, "that Crusoes cannot at the least find a cavern, which, later on, they can make their home!"
"Let us look," said Godfrey.
It was unheard of. We must avow, however, that on this occasion the tradition was broken. In vain did they search along the rocky shore on the southern part of the bay. Not a cavern, not a grotto, not a hole was there that
would serve as a shelter. They had to give up the idea. Godfrey resolved to reconnoitre up to the first trees in the background beyond the sandy coast.

Tartlet and he then remounted the first line of sandhills and crossed the verdant prairies which they had seen a few hours before.

A very odd circumstance, and a very fortunate one at the time, that the other survivors of the wreck voluntarily followed them. Evidently, cocks and hens, and sheep, goats and agouties, driven by instinct, had resolved to go with them. Doubtless they felt too lonely on the beach, which did not yield sufficient food.

Three-quarters of an hour later Godfrey and Tartlet—they had scarcely spoken during the exploration—arrived at the outskirt of the trees. Not a trace was there of habitation or inhabitant. Complete solitude. It might even be doubted if this part of the country had ever been trodden by human feet.

In this place were a few handsome trees, in isolated groups, and others more crowded about a quarter of a mile in the rear formed a veritable forest of different species.

Godfrey looked out for some old trunk, hollowed by age, which could offer a shelter among its branches, but his researches were in vain, although he continued them till night was falling.

Hunger made itself sharply felt, and the two contented themselves with mussels, of which they had thoughtfully brought an ample supply from the beach. Then, quite tired out, they lay down at the foot of a tree, and trusting to Providence, slept through the night.

CHAPTER X.
IN WHICH GODFREY DOES WHAT ANY OTHER SHIPWRECKED MAN WOULD HAVE DONE UNDER THE CIRCUMSTANCES.

The night passed without incident. The two men, quite knocked up with excitement and fatigue, had slept as peacefully as if they had been in the most comfortable room in the mansion in Montgomery Street.

On the morrow, the 27th of June, at the first rays of the rising sun, the crow of the cock awakened them.

Godfrey immediately recognized where he was, but Tartlet had to rub his eyes and stretch his arms for some time before he did so.

"Is breakfast this morning to resemble dinner yesterday?" was his first observation.
"I am afraid so," answered Godfrey. "But I hope we shall dine better this evening."

The professor could not restrain a significant grimace. Where were the tea and sandwiches which had hitherto been brought to him when he awoke? How could he wait till breakfast-time, the bell for which would perhaps never sound, without this preparatory repast?

But it was necessary to make a start. Godfrey felt the responsibility which rested on him, on him alone, for he could in no way depend on his companion. In that empty box which served the professor for a cranium there could be born no practical idea; Godfrey would have to think, contrive, and decide for both.

His first thought was for Phina, his betrothed, whom he had so stupidly refused to make his wife; his second for his Uncle Will, whom he had so imprudently left, and then turning to Tartlet,—

"To vary our ordinary," he said, "here are some shell-fish and half a dozen eggs."

"And nothing to cook them with!"

"Nothing!" said Godfrey. "But if the food itself was missing, what would you say then, Tartlet?"

"I should say that nothing was not enough," said Tartlet dryly.

Nevertheless, they had to be content with this repast.

The very natural idea occurred to Godfrey to push forward the reconnaissance commenced the previous evening. Above it was necessary to know as soon as possible in what part of the Pacific Ocean the _Dream_ had been lost, so as to discover some inhabited place on the shore, where they could either arrange the way of returning home or await the passing of some ship.

Godfrey observed that if he could cross the second line of hills, whose picturesque outline was visible beyond the first, that he might perhaps be able to do this. He reckoned that they could get there in an hour or two, and it was to this urgent exploration that he resolved to devote the first hours of the day. He looked round him. The cocks and hens were beginning to peck about among the high vegetation. Agouties, goats, sheep, went and came on the skirt of the forest.

Godfrey did not care to drag all this flock of poultry and quadrupeds about with him. But to keep them more safely in this place, it would be necessary to leave Tartlet in charge of them.

Tartlet agreed to remain alone, and for several hours to act as shepherd of the flock.

He made but one observation,—

"If you lose yourself, Godfrey?"
"Have no fear of that," answered the young man, "I have only this forest to cross, and as you will not leave its edge I am certain to find you again."

"Don't forget the telegram to your Uncle Will, and ask him for a good many hundred dollars."

"The telegram--or the letter! It is all one!" answered Godfrey, who so long as he had not fixed on the position of this land was content to leave Tartlet to his illusions.

Then having shaken hands with the professor, he plunged beneath the trees, whose thick branches scarcely allowed the sun's rays to penetrate. It was their direction, however, which was to guide our young explorer towards the high hill whose curtain hid from his view the whole of the eastern horizon.

Footpath there was none. The ground, however, was not free from all imprint. Godfrey in certain places remarked the tracks of animals. On two or three occasions he even believed he saw some rapid ruminants moving off, either elans, deer, or wapiti, but he recognized no trace of ferocious animals such as tigers or jaguars, whose absence, however, was no cause for regret.

The first floor of the forest, that is to say all that portion of the trees comprised between the first fork and the branches, afforded an asylum to a great number of birds--wild pigeons by the hundred beneath the trees, ospreys, grouse, aracaris with beaks like a lobster's claw, and higher, hovering above the glades, two or three of those lammergeiers whose eye resembles a cockade. But none of the birds were of such special kinds that he could therefrom make out the latitude of this continent.

So it was with the trees of this forest. Almost the same species as those in that part of the United States which comprises Lower California, the Bay of Monterey, and New Mexico.

Arbutus-trees, large-flowered cornels, maples, birches, oaks, four or five varieties of magnolias and sea-pines, such as are met with in South Carolina, then in the centre of vast clearances, olive-trees, chestnuts, and small shrubs. Tufts of tamarinds, myrtles, and mastic-trees, such as are produced in the temperate zone. Generally, there was enough space between the trees to allow him to pass without being obliged to call on fire or the axe. The sea breeze circulated amid the higher branches, and here and there great patches of light shone on the ground.

And so Godfrey went along striking an oblique line beneath these large trees. To take any precautions never occurred to him. The desire to reach the heights which bordered the forest on the east entirely absorbed him. He sought among the foliage for the direction of the solar rays so as to march straight on his goal. He did not even see the guide-birds, so named because they fly before the steps of the traveller, stopping, returning, and darting on ahead as if they were showing the way. Nothing could distract him.

His state of mind was intelligible. Before an hour had elapsed his fate would be settled! Before an hour he would know if it were possible to reach some inhabited portion of the continent.

Already Godfrey, reasoning on what had been the route followed and the way made by the _Dream_ during a navigation of seventeen days, had concluded that it could only be on the Japanese or Chinese coast that the ship had gone down.

Besides the position of the sun, always in the south, rendered it quite certain that the _Dream_ had not crossed the line.

Two hours after he had started Godfrey reckoned the distance he had travelled at about five miles, considering several circuits which he had had to make owing to the density of the forest. The second group of hills could not be far away.

Already the trees were getting farther apart from each other, forming isolated groups, and the rays of light penetrated more easily through the lofty branches. The ground began slightly to slope, and then abruptly to rise.

Although he was somewhat fatigued, Godfrey had enough will not to slacken his pace. He would doubtless have run had it not been for the steepness of the earlier ascents.

He had soon got high enough to overlook the general mass of the verdant dome which stretched away behind him, and whence several heads of trees here and there emerged.

But Godfrey did not dream of looking back. His eyes never quitted the line of the denuded ridge, which showed itself about 400 or 500 feet before and above him. That was the barrier which all the time hid him from the eastern horizon.

A tiny cone, obliquely truncated, overlooked this rugged line and joined on with its gentle slope to the sinuous crest of the hills.

"There! there!" said Godfrey, "that is the point I must reach! The top of that cone! And from there what shall I see?--A town?--A village?--A desert?"

Highly excited, Godfrey mounted the hill, keeping his elbows at his chest to restrain the beating of his heart. His panting tired him, but he had not the patience to stop so as to recover himself. Were he to have fallen half fainting on the summit of the cone which shot up about 100 feet above his head, he would not have lost a minute in hastening towards it.
A few minutes more and he would be there. The ascent seemed to him steep enough on his side, an angle perhaps of thirty or thirty-five degrees. He helped himself up with hands and feet; he seized on the tufts of slender herbs on the hill-side, and on a few meagre shrubs, masticis and myrtles, which stretched away up to the top.

A last effort was made! His head rose above the platform of the cone, and then, lying on his stomach, his eyes gazed at the eastern horizon.

It was the sea which formed it. Twenty miles off it united with the line of the sky!

He turned round.

Still sea--west of him, south of him, north of him! The immense ocean surrounding him on all sides!

"An island!"

As he uttered the word Godfrey felt his heart shrink. The thought had not occurred to him that he was on an island. And yet such was the case! The terrestrial chain which should have attached him to the continent was abruptly broken. He felt as though he had been a sleeping man in a drifted boat, who awoke with neither oar nor sail to help him back to shore.

But Godfrey was soon himself again. His part was taken, to accept the situation. If the chances of safety did not come from without, it was for him to contrive them.

He set to work at first then as exactly as possible to ascertain the disposition of this island which his view embraced over its whole length. He estimated that it ought to measure about sixty miles round, being, as far as he could see, about twenty miles long from south to north, and twelve miles wide from east to west.

Its central part was screened by the green depths of forest which extended up to the ridge dominated by the cone, whose slope died away on the shore.

All the rest was prairie, with clumps of trees, or beach with rocks, whose outer ring was capriciously tapered off in the form of capes and promontories. A few creeks cut out the coast, but could only afford refuge for two or three fishing-boats.

The bay at the bottom of which the _Dream_ lay shipwrecked was the only one of any size, and that extended over some seven or eight miles. An open roadstead, no vessel would have found it a safe shelter, at least unless the wind was blowing from the east.

But what was this island? To what geographical group did it belong? Did it form part of an archipelago, or was it alone in this portion of the Pacific?

In any case, no other island, large or small, high or low, appeared within the range of vision.

Godfrey rose and gazed round the horizon. Nothing was to be seen along the circular line where sea and sky ran into each other. If, then, there existed to windward or to leeward any island or coast of a continent, it could only be at a considerable distance.

Godfrey called up all his geographical reminiscences, in order to discover what island of the Pacific this could be. In reasoning it out he came to this conclusion.

The _Dream_ for seventeen days had steered very nearly south-west. Now with a speed of from 150 to 180 miles every four-and-twenty hours, she ought to have covered nearly fifty degrees. Now it was obvious that she had not crossed the equator.

The situation of the island, or of the group to which it belonged, would therefore have to be looked for in that part of the ocean comprised between the 160th and 170th degrees of west longitude.

In this portion of the Pacific it seemed to Godfrey that the map showed no other archipelago than that of the Sandwich Islands, but outside this archipelago were there not any isolated islands whose names escaped him and which were dotted here and there over the sea up to the coast of the Celestial Empire?

It was not of much consequence. There existed no means of his going in search of another spot on the ocean which might prove more hospitable.

"Well," said Godfrey to himself, "if I don't know the name of this island, I'll call it Phina Island, in memory of her I ought never to have left to run about the world, and perhaps the name will bring us some luck."

Godfrey then occupied himself in trying to ascertain if the island was inhabited in the part which he had not yet been able to visit.

From the top of the cone he saw nothing which betrayed the presence of aborigines, neither habitations on the prairie nor houses on the skirt of the trees, not even a fisherman's hut on the shore.

But if the island was deserted, the sea which surrounded it was none the less so, for not a ship showed itself within the limits of what, from the height of the cone, was a considerable circuit.

Godfrey having finished his exploration had now only to get down to the foot of the hill and retake the road through the forest so as to rejoin Tartlet. But before he did so his eyes were attracted by a sort of cluster of trees of huge stature, which rose on the boundary of the prairie towards the north. It was a gigantic group, it exceeded by a
head all those which Godfrey had previously seen.

"Perhaps," he said, "it would be better to take up our quarters over there, more especially as if I am not mistaken I can see a stream which should rise in the central chain and flow across the prairie."

This was to be looked into on the morrow.

Towards the south the aspect of the island was slightly different. Forests and prairies rapidly gave place to the yellow carpet of the beach, and in places the shore was bounded with picturesque rocks.

But what was Godfrey's surprise, when he thought he saw a light smoke, which rose in the air beyond this rocky barrier.

"Are there any of our companions?" he exclaimed. "But no, it is not possible! Why should they have got so far from the bay since yesterday, and round so many miles of reef? Is it a village of fishermen, or the encampment of some indigenous tribe?"

Godfrey watched it with the closest attention. Was this gentle vapour which the breeze softly blew towards the west a smoke? Could he be mistaken? Anyhow it quickly vanished, a few minutes afterwards nothing could be seen of it.

It was a false hope.

Godfrey took a last look in its direction, and then seeing nothing, glided down the slope, and again plunged beneath the trees.

An hour later he had traversed the forest and found himself on its skirt.

There Tartlet awaited him with his two-footed and four-footed flock. And how was the obstinate professor occupying himself? In the same way. A bit of wood was in his right hand another piece in his left, and he still continued his efforts to set them alight. He rubbed and rubbed with a constancy worthy of a better fate.

"Well," he shouted as he perceived Godfrey some distance off--"and the telegraph office?"

"It is not open!" answered Godfrey, who dared not yet tell him anything of the situation.

"And the post?"

"It is shut! But let us have something to eat!--I am dying with hunger! We can talk presently."

And this morning Godfrey and his companion had again to content themselves with a too meagre repast of raw eggs and shell-fish.

"Wholesome diet!" repeated Godfrey to Tartlet, who was hardly of that opinion and picked his food with considerable care.

CHAPTER XI.

IN WHICH THE QUESTION OF LODGING IS SOLVED AS WELL AS IT COULD BE.

The day was already far advanced. Godfrey resolved to defer till the morrow the task of proceeding to a new abode. But to the pressing questions which the professor propounded on the results of his exploration he ended by replying that it was an island, Phina Island, on which they both had been cast, and that they must think of the means of living before dreaming of the means of departing.

"An island!" exclaimed Tartlet.

"Yes! It is an island!"

"Which the sea surrounds?"

"Naturally."

"But what is it?"

"I have told you, Phina Island, and you understand why I gave it that name."

"No, I do not understand!" answered Tartlet, making a grimace; "and I don't see the resemblance! Miss Phina is surrounded by land, not water!"

After this melancholy reflection, he prepared to pass the night with as little discomfort as possible. Godfrey went off to the reef to get a new stock of eggs and mollusks, with which he had to be contented, and then, tired out, he came back to the tree and soon fell asleep, while Tartlet, whose philosophy would not allow him to accept such a state of affairs, gave himself over to the bitterest meditations. On the morrow, the 28th of June, they were both afoot before the cock had interrupted their slumbers.

To begin with, a hasty breakfast, the same as the day before. Only water from a little brook was advantageously replaced by a little milk given by one of the goats.

Ah! worthy Tartlet! Where were the "mint julep," the "port wine sangaree," the "sherry cobbler," the "sherry cocktail," which he hardly drank, but which were served him at all hours in the bars and taverns of San Francisco? How he envied the poultry, the agouties, and the sheep, who cheerfully quenched their thirst without the addition of such saccharine or alcoholic mixtures to their water from the stream! To these animals no fire was necessary to cook
their food; roots and herbs and seeds sufficed, and their breakfast was always served to the minute on their tablecloth of green.

"Let us make a start," said Godfrey.

And behold the two on their way, followed by a procession of domestic animals, who refused to be left behind. Godfrey's idea was to explore, in the north of the island, that portion of the coast on which he had noticed the group of gigantic trees in his view from the cone. But to get there he resolved to keep along the shore. The surf might perhaps have cast up some fragment of the wreck. Perhaps they might find on the beach some of their companions in the _Dream_ to which they could give Christian burial. As for finding any one of them living, it was hardly to be hoped for, after a lapse of six-and-thirty hours.

The first line of hills was surmounted, and Godfrey and his companion reached the beginning of the reef, which looked as deserted as it had when they had left it. There they renewed their stock of eggs and mollusks, in case they should fail to find even such meagre resources away to the north. Then, following the fringe of sea-weed left by the last tide, they again ascended the dunes, and took a good look round.

Nothing! always nothing!

We must certainly say that if misfortune had made Crusoes of these survivors of the _Dream_, it had shown itself much more rigorous towards them than towards their predecessors, who always had some portion of the vessel left to them, and who, after bringing away crowds of objects of necessity had been able to utilize the timbers of the wreck. Victuals for a considerable period, clothes, tools, weapons, had always been left them with which to satisfy the elementary exigencies of existence. But here there was nothing of all this! In the middle of that dark night the ship had disappeared in the depths of the sea, without leaving on the reefs the slightest traces of its wreck! It had not been possible to save a thing from her--not even a lucifer-match--and to tell the truth, the want of that match was the most serious of all wants.

I know well, good people comfortably installed in your easy-chairs before a comfortable hearth at which is blazing brightly a fire of wood or coals, that you will be apt to say,--

"But nothing was more easy than for them to get a fire! There are a thousand ways of doing that! Two pebbles! A little dry moss! A little burnt rag,"--and how do you burn the rag? "The blade of a knife would do for a steel, or two bits of wood rubbed briskly together in Polynesian fashion!"

Well, try it!

It was about this that Godfrey was thinking as he walked, and this it was that occupied his thoughts more than anything else. Perhaps he too, poking his coke fire and reading his travellers' tales, had thought the same as you good people! But now he had to put matters to the test, and he saw with considerable disquietude the want of a fire, that indispensable element which nothing could replace.

He kept on ahead, then, lost in thought, followed by Tartlet, who by his shouts and gestures, kept together the flock of sheep, agouties, goats, and poultry.

Suddenly his look was attracted by the bright colours of a cluster of small apples which hung from the branches of certain shrubs, growing in hundreds at the foot of the dunes. He immediately recognized them as "manzanillas," which serve as food to the Indians in certain parts of California.

"At last," he exclaimed, "there is something which will be a change from our eggs and mussels."

"What? Do you eat those things?" said Tartlet with his customary grimace.

"You shall soon see!" answered Godfrey.

And he set to work to gather the manzanillas, and eat them greedily.

They were only wild apples, but even their acidity did not prevent them from being agreeable. The professor made little delay in imitating his companion, and did not show himself particularly discontented at the work. Godfrey thought, and with reason, that from these fruits there could be made a fermented liquor which would be preferable to the water.

The march was resumed. Soon the end of the sand dunes died away in a prairie traversed by a small stream. This was the one Godfrey had seen from the top of the cone. The large trees appeared further on, and after a journey of about nine miles the two explorers, tired enough by their four hours' walk, reached them a few minutes after noon.

The site was well worth the trouble of looking at, of visiting, and, doubtless, occupying.

On the edge of a vast prairie, dotted with manzanilla bushes and other shrubs, there rose a score of gigantic trees which could have even borne comparison with the same species in the forests of California. They were arranged in a semi-circle. The carpet of verdure, which stretched at their feet, after bordering the stream for some hundreds of feet, gave place to a long beach, covered with rocks, and shingle, and sea-weed, which ran out into the water in a narrowing point to the north.

These "big trees," as they are commonly called in Western America, belong to the genus _Sequoia_, and are conifers of the fir family. If you ask the English for their distinguishing name, you will be told "Wellingtonias," if
you ask the Americans they will reply "Washingtonias." But whether they recall the memory of the phlegmatic victor of Waterloo, or of the illustrious founder of the American Republic, they are the hugest products known of the Californian and Nevadan floras. In certain districts in these states there are entire forests of these trees, such as the groups at Mariposa and Calaveras, some of the trees of which measure from sixty to eighty feet in circumference, and some 300 feet in height. One of them, at the entrance of the Yosemite Valley, is quite 100 feet round. When living--for it is now prostrate--its first branches could have overtopped Strasburg Cathedral, or, in other words, were above eighty feet from the ground.

Besides this tree there are "The Mother of the Forest," "The Beauty of the Forest," "The Hut of the Pioneer," "The Two Sentinels," "General Grant," "Miss Emma," "Miss Mary," "Brigham Young and his Wife," "The Three Graces," "The Bear," &c., &c.; all of them veritable vegetable phenomena. One of the trees has been sawn across at its base, and on it there has been built a ball-room, in which a quadrille of eight or ten couples can be danced with ease.

But the giant of giants, in a forest which is the property of the state, about fifteen miles from Murphy, is "The Father of the Forest," an old sequoia, 4000 years old, which rises 452 feet from the ground, higher than the cross of St. Peter's, at Rome, higher than the great pyramid of Ghizeh, higher than the iron bell-turret which now caps one of the towers of Rouen Cathedral, and which ought to be looked upon as the highest monument in the world.

It was a group of some twenty of these colossi that nature had planted on this point of the island, at the epoch, probably, when Solomon was building that temple at Jerusalem which has never risen from its ruins. The largest was, perhaps, 300 feet high, the smallest nearly 200.

Some of them, hollowed out by age, had enormous arches through their bases, beneath which a troop of horsemen could have ridden with ease.

Godfrey was struck with admiration in the presence of these natural phenomena, as they are not generally found at altitudes of less than from 5000 to 6000 feet above the level of the sea. He even thought that the view alone was worth the journey. Nothing he had seen was comparable to these columns of clear brown, which outlined themselves almost without sensible diminution of their diameters to their lowest fork. The cylindrical trunks rising from 80 to 100 feet above the earth, ramified into such thick branches that they themselves looked like tree-stems of huge dimensions bearing quite a forest in the air.

One of these specimens of _Sequoia gigantea_--one of the biggest in the group--more particularly attracted Godfrey's attention.

Gazing at its base it displayed an opening of from four to five feet in width, and ten feet high, which gave entrance to its interior. The giant's heart had disappeared, the alburnum had been dissipated into soft whitish dust; but if the tree did not depend so much on its powerful roots as on its solid bark, it could still keep its position for centuries.

"In default of a cavern or a grotto," said Godfrey, "here is a ready-made dwelling. A wooden house, a tower, such as there is in no inhabited land. Here we can be sheltered and shut in. Come along, Tartlet! come!"

And the young man, catching hold of his companion, dragged him inside the sequoia.

The base was covered with a bed of vegetable dust, and in diameter could not be less than twenty feet.

As for the height to which its vault extended, the gloom prevented even an estimate. For not a ray of light found its way through the bark wall. Neither cleft nor fault was there through which the wind or rain could come. Our two Crusoes would therein find themselves in a position to brave with impunity the inclemency of the weather. No cave could be firmer, or drier, or compacter. In truth it would have been difficult to have anywhere found a better.

"Eh, Tartlet, what do you think of our natural house?" asked Godfrey.

"Yes, but the chimney?" answered Tartlet.

"Before we talk about the chimney," replied Godfrey, "let us wait till we have got the fire!"

This was only logical.

Godfrey went to reconnoitre the neighbourhood. As we have said, the prairie extended to this enormous mass of sequoias which formed its edge. The small stream meandering through the grassy carpet gave a healthy freshness to its borders, and thereon grew shrubs of different kinds; myrtles, mastic bushes, and among others a quantity of manzanillas, which gave promise of a large crop of their wild apples.

Farther off, on ground that grew gradually higher, were scattered several clumps of trees, made up of oaks and beeches, sycamores and nettle-trees, but trees of great stature as they were, they seemed but simple underwood by the side of the "mammoths," whose huge shadows the sun was throwing even into the sea. Across the prairie lay minor lines of bushes, and vegetable clumps and verdant thickets, which Godfrey resolved to investigate on the following day.

If the site pleased him, it did not displease the domestic animals. Agouties, goats, and sheep had soon taken possession of this domain, which offered them roots to nibble at, and grass to browse on far beyond their needs. As
for the fowls they were greedily pecking away at the seeds and worms in the banks of the rivulet. Animal life was already manifesting itself in such goings and comings, such flights and gambols, such bleatings and gruntings and cluckings as had doubtless never been heard of in these parts before.

Then Godfrey returned to the clump of sequoias, and made a more attentive examination of the tree in which he had chosen to take up his abode. It appeared to him that it would be difficult, if not impossible, to climb into the first branches, at least by the exterior; for the trunk presented no protuberances. Inside it the ascent might be easier, if the tree were hollow up to the fork.

In case of danger it would be advisable to seek refuge among the thick boughs borne by the enormous trunk. But this matter could be looked into later on.

When he had finished his inquiries the sun was low on horizon, and it seemed best to put off till to-morrow the preparations for their definitely taking up their abode.

But, after a meal with dessert composed of wild apples, what could they do better than pass the night on a bed of the vegetable dust which covered the ground inside the sequoia?

And this, under the keeping of Providence, was what was done, but not until after Godfrey, in remembrance of his uncle, William W. Kolderup, had given to the giant the name of “Will Tree,” just as its prototypes in the forests of California and the neighbouring states bear the names of the great citizens of the American Republic.

CHAPTER XII.
WHICH ENDS WITH A THUNDER-BOLT.

It must be acknowledged that Godfrey was in a fair way to become a new man in this completely novel position to one so frivolous, so light-minded, and so thoughtless. He had hitherto only had to allow himself to live. Never had care for the morrow disquieted his rest. In the opulent mansion in Montgomery Street, where he slept his ten hours without a break, not the fall of a rose leaf had ever troubled his slumbers.

It was so no longer. On this unknown land he found himself thoroughly shut off from the rest of the world, left entirely to his own resources, obliged to face the necessities of life under conditions in which a man even much more practical might have been in great difficulty. Doubtless when it was found that the _Dream_ did not return, a search for him would be made. But what were these two? Less than a needle in a hayrick or a sand-grain on the sea-bottom! The incalculable fortune of Uncle Kolderup could not do everything.

When Godfrey had found his fairly acceptable shelter, his sleep in it was by no means undisturbed. His brain travelled as it had never done before. Ideas of all kinds were associated together: those of the past which he bitterly regretted, those of the present of which he sought the realization, those of the future which disquieted him more than all!

But in these rough trials, the reason and, in consequence, the reasoning which naturally flows from it, were little by little freed from the limbo in which they had hitherto slept. Godfrey was resolved to strive against his ill-luck, and to do all he could to get out of his difficulties. If he escaped, the lesson would certainly not be lost on him for the future.

At daybreak he was astir, with the intention of proceeding to a more complete installation. The question of food, above all that of fire, which was connected with it, occupied the first place; then there were tools or arms to make, clothes to procure, unless they were anxious of soon appearing attired in Polynesian costume.

Tartlet still slumbered. You could not see him in the shadow, but you could hear him. That poor man, spared from the wreck, remained as frivolous at forty-five as his pupil had formerly been. He was a gain in no sense. He even might be considered an incubus, for he had to be cared for in all ways. But he was a companion! He was worth more in that than the most intelligent dog, although he was probably of less use! He was a creature able to talk—although only at random; to converse—if the matter were never serious; to complain—and this he did most frequently! As it was, Godfrey was able to hear a human voice. That was worth more than the parrot's in Robinson Crusoe! Even with a Tartlet he would not be alone, and nothing was so disheartening as the thought of absolute solitude.

"Crusoe before Friday, Crusoe after Friday; what a difference!" thought he.

However, on this morning, that of June 29th, Godfrey was not sorry to be alone, so as to put into execution his project of exploring the group of sequoias. Perhaps he would be fortunate enough to discover some fruit, some edible root, which he could bring back—to the extreme satisfaction of the professor. And so he left Tartlet to his dreams, and set out.

A light fog still shrouded the shore and the sea, but already it had commenced to lift in the north and east under the influence of the solar rays, which little by little were condensing it. The day promised to be fine. Godfrey, after having cut himself a substantial walking-stick, went for two miles along that part of the beach which he did not
know, and whose return formed the outstretched point of Phina Island.

There he made a first meal of shell-fish, mussels, clams, and especially some capital little oysters which he found in great abundance.

"If it comes to the worst," he said to himself, "we need never die of hunger! Here are thousands of dozens of oysters to satisfy the calls of the most imperious stomach! If Tartlet complains, it is because he does not like mollusks! Well, he will have to like them!"

Decidedly, if the oyster did not absolutely replace bread and meat, it furnished an aliment in no whit less nutritive and in a condition capable of being absorbed in large quantities. But as this mollusk is of very easy digestion, it is somewhat dangerous in its use, to say nothing of its abuse.

This breakfast ended, Godfrey again seized his stick, and struck off obliquely towards the south-east, so as to walk up the right bank of the stream. In this direction, he would cross the prairie up to the groups of trees observed the night before beyond the long lines of shrubs and underwood, which he wished to carefully examine.

Godfrey then advanced in this direction for about two miles. He followed the bank of the stream, carpeted with short herbage and smooth as velvet. Flocks of aquatic birds noisily flew round this being, who, new to them, had come to trouble their domain. Fish of many kinds were seen darting about in the limpid waters of the brook, here abouts some four or five yards wide.

It was evident that there would be no difficulty in catching these fish, but how to cook them? Always this insoluble question!

Fortunately, when Godfrey reached the first line of shrubs he recognized two sorts of fruits or roots. One sort had to pass through the fiery trial before being eaten, the other was edible in its natural state. Of these two vegetables the American Indians make constant use.

The first was a shrub of the kind called "camas," which thrives even in lands unfit for culture. With these onion-like roots, should it not be found preferable to treat them as potatoes, there is made a sort of flour very rich and glutinous. But either way, they have to be subjected to a certain cooking, or drying.

The other bush produces a species of bulb of oblong form, bearing the indigenous name of "yamph," and if it possesses less nutritive principles than the camas, it is much the better for one thing,—it can be eaten raw.

Godfrey, highly pleased at his discovery, at once satisfied his hunger on a few of these excellent roots, and not forgetting Tartlet's breakfast, collected a large bundle, and throwing it over his shoulder, retook the road to Will Tree.

That he was well received on his arrival with the crop of yamphs need not be insisted on. The professor greedily regaled himself, and his pupil had to caution him to be moderate.

"Ah!" he said. "We have got some roots to-day. Who knows whether we shall have any to-morrow?"

"Without any doubt," replied Godfrey, "to-morrow and the day after, and always. There is only the trouble of going and fetching them."

"Well, Godfrey, and the camas?"

"Of the camas we will make flour and bread when we have got a fire."

"Fire!" exclaimed the professor, shaking his head. "Fire! And how shall we make it?"

"I don't know yet, but somehow or other we will get at it."

"May Heaven hear you, my dear Godfrey! And when I think that there are so many fellows in this world who have only got to rub a bit of wood on the sole of their boot to get it, it annoys me! No! Never would I have believed that ill-luck would have reduced me to this state! You need not take three steps down Montgomery Street, before you will meet with a gentleman, cigar in mouth, who thinks it a pleasure to give you a light, and here--"

"Here we are not in San Francisco, Tartlet, nor in Montgomery Street, and I think it would be wiser for us not to reckon on the kindness of those we meet!"

"But, why is cooking necessary for bread and meat? Why did not nature make us so that we might live upon nothing?"

"That will come, perhaps!" answered Godfrey with a good-humoured smile.

"Do you think so?"

"I think that our scientists are probably working out the subject."

"Is it possible! And how do they start on their research as to this new mode of alimentation?"

"On this line of reasoning," answered Godfrey, "as the functions of digestion and respiration are connected, the endeavour is to substitute one for the other. Hence the day when chemistry has made the almonds necessary for the food of man capable of assimilation by respiration, the problem will be solved. There is nothing wanted beyond rendering the air nutritious. You will breathe your dinner instead of eating it, that is all!"

"Ah! Is it not a pity that this precious discovery is not yet made!" exclaimed the professor. "How cheerfully would I breathe half a dozen sandwiches and a silverside of beef, just to give me an appetite!"
And Tartlet plunged into a semi-sensuous reverie, in which he beheld succulent atmospheric dinners, and at them unconsciously opened his mouth and breathed his lungs full, oblivious that he had scarcely the wherewithal to feed upon in the ordinary way.

Godfrey roused him from his meditation, and brought him back to the present. He was anxious to proceed to a more complete installation in the interior of Will Tree.

The first thing to do was to clean up their future dwelling-place. It was at the outset necessary to bring out several bushels of that vegetable dust which covered the ground and in which they sank almost up to their knees. Two hours' work hardly sufficed to complete this troublesome task, but at length the chamber was clear of the pulverulent bed, which rose in clouds at the slightest movement.

The ground was hard and firm, as if floored with joists, the large roots of the sequoia ramifying over its surface. It was uneven but solid. Two corners were selected for the beds and of these several bundles of herbage, thoroughly dried in the sun, were to form the materials. As for other furniture, benches, stools, or tables, it was not impossible to make the most indispensable things, for Godfrey had a capital knife, with its saw and gimlet. The companions would have to keep inside during rough weather, and they could eat and work there. Daylight did not fail them, for it streamed through the opening. Later on, if it became necessary to close this aperture for greater safety, Godfrey could try and pierce one or two embrasures in the bark of the sequoia to serve as windows.

As for discovering to what height the opening ran up into the trunk, Godfrey could not do so without a light. All that he could do was to find out with the aid of a pole ten or twelve feet long, held above his head, that he could not touch the top.

The question, however, was not an urgent one. It would be solved eventually.

The day passed in these labours, which were not ended at sunset. Godfrey and Tartlet, tired as they were, found their novel bed-clothes formed of the dried herbage, of which they had an ample supply, most excellent; but they had to drive away the poultry who would willingly have roosted in the interior of Will Tree. Then occurred to Godfrey the idea of constructing a poultry-house in some other sequoia, as to keep them out of the common room, he was building up a hurdle of brushwood. Fortunately neither the sheep nor the agouties, nor the goats experienced the like temptation. These animals remained quietly outside, and had no fancy to get through the insufficient barrier.

The following days were employed in different jobs, in fitting up the house or bringing in food; eggs and shell-fish were collected, yamph roots and manzanilla apples were brought in, and oysters, for which each morning they went to the bank or the shore. All this took time, and the hours passed away quickly.

The "dinner things" consisted now of large bivalve shells, which served for dishes or plates. It is true that for the kind of food to which the hosts of Will Tree were reduced, others were not needed.

There was also the washing of the linen in the clear water of the stream, which occupied the leisure of Tartlet. It was to him that this task fell; but he only had to see to the two shirts, two handkerchiefs, and two pairs of socks, which composed the entire wardrobe of both.

While this operation was in progress, Godfrey and Tartlet had to wear only waistcoat and trousers, but in the blazing sun of that latitude the clothes quickly dried. And so matters went on without either rain or wind till July 3rd. Already they had begun to be fairly comfortable in their new home, considering the condition in which they had been cast on the island.

However, it was advisable not to neglect the chances of safety which might come from without. Each day Godfrey examined the whole sector of sea which extended from the east to the north-west beyond the promontory. This part of the Pacific was always deserted. Not a vessel, not a fishing-boat, not a ribbon of smoke detaching itself from the horizon, proclaimed the passage of a steamer. It seemed that Phina Island was situated out of the way of all the itineraries of commerce. All they could do was to wait, trusting in the Almighty who never abandons the weak.

Meanwhile, when their immediate necessities allowed them leisure, Godfrey, incited by Tartlet, returned to that important and vexed question of the fire.

He tried at first to replace amadou, which he so unfortunately lacked, by another and analogous material. It was possible that some of the varieties of mushrooms which grew in the crevices of the old trees, after having been subjected to prolonged drying, might be transformed into a combustible substance.

Many of these mushrooms were collected and exposed to the direct action of the sun, until they were reduced to powder. Then with the back of his knife, Godfrey endeavoured to strike some sparks off with a flint, so that they might fall on this substance. It was useless. The spongy stuff would not catch fire. Godfrey then tried to use that fine vegetable dust, dried during so many centuries, which he had found in the interior of Will Tree. The result was equally discouraging.

In desperation he then, by means of his knife and flint, strove to secure the ignition of a sort of sponge which grew under the rocks. He fares no better. The particle of steel, lighted by the impact of the silex, fell on to the
substance, but went out immediately. Godfrey and Tartlet were in despair. To do without fire was impossible. Of their fruits and mollusks they were getting tired, and their stomachs began to revolt at such food. They eyed, the professor especially, the sheep, agouties, and fowls which went and came round Will Tree. The pangs of hunger seized them as they gazed. With their eyes they ate the living meat!

No! It could not go on like this!

But an unexpected circumstance, a providential one if you will, came to their aid.

In the night of the 3rd of July the weather, which had been on the change for a day or so, grew stormy, after an oppressive heat which the sea-breeze had been powerless to temper.

Godfrey and Tartlet at about one o'clock in the morning were awakened by heavy claps of thunder, and most vivid flashes of lightning. It did not rain as yet, but it soon promised to do so, and then regular cataracts would be precipitated from the cloudy zone, owing to the rapid condensation of the vapour.

Godfrey got up and went out so as to observe the state of the sky.

There seemed quite a conflagration above the domes of the giant trees and the foliage appeared on fire against the sky, like the fine network of a Chinese shadow.

Suddenly, in the midst of the general uproar, a vivid flash illuminated the atmosphere. The thunder-clap followed immediately, and Will Tree was permeated from top to bottom with the electric force.

Godfrey, staggered by the return shock, stood in the midst of a rain of fire which showered around him. The lightning had ignited the dry branches above him. They were incandescent particles of carbon which crackled at his feet.

Godfrey with a shout awoke his companion.

"Fire! Fire!"

"Fire!" answered Tartlet. "Blessed be Heaven which sends it to us!"

Instantly they possessed themselves of the flaming twigs, of which some still burned, while others had been consumed in the flames. Hurriedly, at the same time, did they heap together a quantity of dead wood such as was never wanting at the foot of the sequoia, whose trunk had not been touched by the lightning.

Then they returned into their gloomy habitation as the rain, pouring down in sheets, extinguished the fire which threatened to devour the upper branches of Will Tree.

CHAPTER XIII.

IN WHICH GODFREY AGAIN SEES A SLIGHT SMOKE OVER ANOTHER PART OF THE ISLAND.

That was a storm which came just when it was wanted! Godfrey and Tartlet had not, like Prometheus, to venture into space to bring down the celestial fire! "It was," said Tartlet, "as if the sky had been obliging enough to send it down to them on a lightning flash."

With them now remained the task of keeping it!

"No! we must not let it go out!" Godfrey had said.

"Not until the wood fails us to feed it!" had responded Tartlet, whose satisfaction showed itself in little cries of joy.

"Yes! but who will keep it in?"

"I! I will! I will watch it day and night, if necessary," replied Tartlet, brandishing a flaming bough.

And he did so till the sun rose.

Dry wood, as we have said, abounded beneath the sequoias. Until the dawn Godfrey and the professor, after heaping up a considerable stock, did not spare to feed the fire. By the foot of one of the large trees in a narrow space between the roots the flames leapt up, crackling clearly and joyously. Tartlet exhausted his lungs blowing away at it, although his doing so was perfectly useless. In this performance he assumed the most characteristic attitudes in following the greyish smoke whose wreaths were lost in the foliage above.

But it was not that they might admire it that they had so longingly asked for this indispensable fire, not to warm themselves at it. It was destined for a much more interesting use. There was to be an end of their miserable meals of raw mollusks and yamph roots, whose nutritive elements boiling water and simple cooking in the ashes had never developed. It was in this way that Godfrey and Tartlet employed it during the morning.

"We could eat a fowl or two!" exclaimed Tartlet, whose jaws moved in anticipation. "Not to mention an agouti ham, a leg of mutton, a quarter of goat, some of the game on the prairie, without counting two or three freshwater fish and a sea fish or so."

"Not so fast," answered Godfrey, whom the declaration of this modest bill of fare had put in good humour. "We need not risk indigestion to satisfy a fast! We must look after our reserves, Tartlet! Take a couple of fowls--one apiece--and if we want bread, I hope that our cansa roots can be so prepared as to replace it with advantage!"
cost the lives of two innocent hens, who, plucked, trussed, and dressed by the professor, were stuck on a stick, and
soon roasted before the crackling flames.

Meanwhile, Godfrey was getting the camas roots in a state to figure creditably at the first genuine breakfast on
Phina Island. To render them edible it was only necessary to follow the Indian method, which the Californians were
well acquainted with.

This was what Godfrey did.

A few flat stones selected from the beach were thrown in the fire so as to get intensely hot. Tartlet seemed to
think it a great shame to use such a good fire “to cook stones with,” but as it did not hinder the preparation of his
fowls in any way he had no other complaint to make.

While the stones were getting warm Godfrey selected a piece of ground about a yard square from which he tore
up the grass; then with his hands armed with large scallop shells he dug the soil to the depth of about ten inches.
That done he laid at the bottom of the cavity a fire of dry wood, which he so arranged as to communicate to the earth
heaped up at its bottom some considerable heat.

When all the wood had been consumed and the cinders taken away, the camas roots, previously cleaned and
scraped, were strewn in the hole, a thin layer of sods thrown over them and the glowing stones placed on the top, so
as to serve as the basis of a new fire which was lighted on their surface.

In fact, it was a kind of oven which had been prepared; and in a very short time—about half an hour or so—the
operation was at an end.

Beneath the double layer of stones and sods lay the roots cooked by this violent heating. On crushing them there
was obtainable a flour well fitted for making into bread, but, even eaten as they were, they proved much like
potatoes of highly nutritive quality.

It was thus that this time the roots were served and we leave our readers to imagine what a breakfast our two
friends made on the chickens which they devoured to the very bones, and on the excellent camas roots, of which
they had no need to be sparing. The field was not far off where they grew in abundance. They could be picked up in
hundreds by simply stooping down for them.

The repast over, Godfrey set to work to prepare some of the flour, which keeps for any length of time, and which
could be transformed into bread for their daily wants.

The day was passed in different occupations. The fire was kept up with great care. Particularly was the fuel
heaped on for the night; and Tartlet, nevertheless, arose on many occasions to sweep the ashes together and provoke
a more active combustion. Having done this, he would go to bed again, to get up as soon as the fire burnt low, and
thus he occupied himself till the day broke. The night passed without incident, the cracklings of the fire and the crow
of the cock awoke Godfrey and his companion, who had ended his performances by falling off to sleep.

At first Godfrey was surprised at feeling a current of air coming down from above in the interior of Will Tree.
He was thus led to think that the sequoia was hollow up to the junction of the lower branches where there was an
opening which they would have to stop up if they wished to be snug and sheltered.

“But it is very singular!” said Godfrey to himself.

“How was it that during the preceding nights I did not feel this current of air? Could it have been the lightning?”

And to get an answer to this question, the idea occurred to him to examine the trunk of the sequoia from the out
side.

When he had done so, he understood what had happened during the storm.

The track of the lightning was visible on the tree, which had had a long strip of its bark torn off from the fork
down to the roots.

Had the electric spark found its way into the interior of the sequoia in place of keeping to the outside, Godfrey
and his companion would have been struck. Most decidedly they had had a narrow escape.

“It is not a good thing to take refuge under trees during a storm,” said Godfrey. "That is all very well for people
who can do otherwise. But what way have we to avoid the danger who live inside the tree? We must see!"

Then examining the sequoia from the point where the long lightning trace began--"It is evident," said he, "that
where the flash struck the tree has been cracked. But since the air penetrates by this orifice the tree must be hollow
along its whole length and only lives in its bark? Now that is what I ought to see about!"

And Godfrey went to look for a resinous piece of wood that might do for a torch.

A bundle of pine twigs furnished him with the torch he needed, as from them exuded a resin which, once
inflamed, gave forth a brilliant light.

Godfrey then entered the cavity which served him for his house. To darkness immediately succeeded light, and it
was easy to see the state of the interior of Will Tree. A sort of vault of irregular formation stretched across in a
ceiling some fifteen feet above the ground. Lifting his torch Godfrey distinctly saw that into this there opened a
narrow passage whose further development was lost in the shadow. The tree was evidently hollow throughout its
length; but perhaps some portion of the albumen still remained intact. In that case, by the help of the outgrowths it would be possible if not easy to get up to the fork.

Godfrey, who was thinking of the future, resolved to know without delay if this were so.

He had two ends in view; one, to securely close the opening by which the rain and wind found admission, and so render Will Tree almost habitable; the other, to see if in case of danger, or an attack from animals or savages, the upper branches of the tree would not afford a convenient refuge.

He could but try. If he encountered any insurmountable obstacle in the narrow passage, Godfrey could be got down again.

After firmly sticking his torch between two of the roots below, behold him then commencing to raise himself on to the first interior knots of the bark. He was lithe, strong, and accustomed to gymnastics like all young Americans. It was only sport to him. Soon he had reached in this uneven tube a part much narrower, in which, with the aid of his back and knees, he could work his way upwards like a chimney-sweep. All he feared was that the hole would not continue large enough for him to get up.

However, he kept on, and each time he reached a projection he would stop and take breath.

Three minutes after leaving the ground, Godfrey had mounted about sixty feet, and consequently could only have about twenty feet further to go.

In fact, he already felt the air blowing more strongly on his face. He inhaled it greedily, for the atmosphere inside the sequoia was not, strictly speaking, particularly fresh.

After resting a minute, and shaking off the fine dust which he had rubbed on to him off the wall, Godfrey started again up the long tunnel, which gradually narrowed.

But at this moment his attention was attracted by a peculiar noise, which appeared to him somewhat suspicious. There was a sound as of scratching, up the tree. Almost immediately a sort of hissing was heard.

Godfrey stopped.

"What is that?" he asked. "Some animal taken refuge in the sequoia? Was it a snake? No! We have not yet seen one on the island! Perhaps it is a bird that wants to get out!"

Godfrey was not mistaken; and as he continued to mount, a cawing, followed by a rapid flapping of wings, showed him that it was some bird ensconced in the tree whose sleep he was doubtless disturbing.

Many a "frrr-frrr!" which he gave out with the whole power of his lungs, soon determined the intruder to clear off.

It proved to be a kind of jackdaw, of huge stature, which scuttled out of the opening, and disappeared into the summit of Will Tree.

A few seconds afterwards, Godfrey's head appeared through the same opening, and he soon found himself quite at his ease, installed on a fork of the tree where the lower branches gave off, at about eighty feet from the ground.

There, as has been said, the enormous stem of the sequoia supported quite a forest. The capricious network of its upper boughs presented the aspect of a wood crowded with trees, which no gap rendered passable.

However, Godfrey managed, not without difficulty, to get along from one branch to another, so as to gain little by little the upper story of this vegetable phenomenon.

A number of birds with many a cry flew off at his approach, and hastened to take refuge in the neighbouring members of the group, above which Will Tree towered by more than a head.

Godfrey continued to climb as well as he could, and did not stop until the ends of the higher branches began to bend beneath his weight.

A huge horizon of water surrounded Phina Island, which lay unrolled like a relief-map at his feet. Greedily his eyes examined that portion of the sea. It was still deserted. He had to conclude once more, that the island lay away from the trade routes of the Pacific.

Godfrey uttered a heavy sigh; then his look fell on the narrow domain on which fate had condemned him to live, doubtless for long, perhaps for ever.

But what was his surprise when he saw, this time away to the north, a smoke similar to that which he had already thought he had seen in the south. He watched it with the keenest attention.

[A illustration: There was the column of smoke. _page 152._]

A very light vapour, calm and pure, greyish blue at its tip, rose straight in the air.

"No! I am not mistaken!" exclaimed Godfrey. "There is a smoke, and therefore a fire which produces it! And that fire could not have been lighted except by--By whom?"

Godfrey then with extreme precision took the bearings of the spot in question.

The smoke was rising in the north-east of the island, amid the high rocks which bordered the beach. There was no mistake about that. It was less than five miles from Will Tree. Striking straight to the north-east across the prairie, and then following the shore, he could not fail to find the rocks above which the vapour rose.
With beating heart Godfrey made his way down the scaffolding of branches until he reached the fork. There he stopped an instant to clear off the moss and leaves which clung to him, and that done he slid down the opening, which he enlarged as much as possible, and rapidly gained the ground. A word to Tartlet not to be uneasy at his absence, and Godfrey hastened off in the north-easterly direction so as to reach the shore.

It was a two hours' walk across the verdant prairie, through clumps of scattered trees, or hedges of spiny shrubs, and then along the beach. At length the last chain of rocks was reached.

But the smoke which Godfrey had seen from the top of the tree he searched for in vain when he had reached the ground. As he had taken the bearings of the spot with great care, he came towards it without any mistake.

There Godfrey began his search. He carefully explored every nook and corner of this part of the shore. He called. No one answered to his shout. No human being appeared on the beach. Not a rock gave him a trace of a newly lighted fire--nor of a fire now extinct, which could have been fed by sea herbs and dry algæ thrown up by the tide.

"But it is impossible that I should have been mistaken!" repeated Godfrey to himself. "I am sure it was smoke that I saw! And besides!--"

As Godfrey could not admit that he had been the dupe of a delusion, he began to think that there must exist some well of heated water, or kind of intermittent geyser, which he could not exactly find, but which had given forth the vapour.

There was nothing to show that in the island there were not many of such natural wells, and the apparition of the column of smoke could be easily explained by so simple a geological phenomenon.

Godfrey left the shore and returned towards Will Tree, observing the country as he went along a little more carefully than he had done as he came. A few ruminants showed themselves, amongst others some wapiti, but they dashed past with such speed that it was impossible to get near them.

In about four hours Godfrey got back. Just before he reached the tree he heard the shrill "twang! squeak!" of the kit, and soon found himself face to face with Professor Tartlet, who, in the attitude of a vestal, was watching the sacred fire confided to his keeping.

CHAPTER XIV.
WHEREIN GODFREY FINDS SOME WRECKAGE, TO WHICH HE AND HIS COMPANION GIVE A HEARTY WELCOME.

To put up with what you cannot avoid is a philosophical principle, that may not perhaps lead you to the accomplishment of great deeds, but is assuredly eminently practical. On this principle Godfrey had resolved to act for the future. If he had to live in this island, the wisest thing for him to do was to live there as comfortably as possible until an opportunity offered for him to leave it.

And so, without delay, he set to work to get the interior of Will Tree into some order. Cleanliness was of the first importance. The beds of dried grass were frequently renewed. The plates and dishes were only scallop shells, it is true, but no American kitchen could show cleaner ones. It should be said to his praise that Professor Tartlet was a capital washer. With the help of his knife Godfrey, by flattening out a large piece of bark, and sticking four uprights into the ground, had contrived a table in the middle of the room. Some large stumps served for stools. The comrades were no longer reduced to eating on their knees, when the weather prevented their dining in the open air.

There was still the question of clothing, which was of great interest to them, and they did the best they could. In that climate, and under that latitude, there was no reason why they should not go about half naked; but, at length, trousers, waistcoat, and linen shirt were all worn out. How could they replace them? Were the sheep and the goats to provide them with skins for clothing, after furnishing them with flesh for food? It looked like it. Meanwhile, Godfrey had the few garments he possessed frequently washed. It was on Tartlet, transformed into a laundress, that this task fell, and he acquitted himself of it to the general satisfaction.

Godfrey busied himself specially in providing food, and in arranging matters generally. He was, in fact, the caterer. Collecting the edible roots and the manzanilla fruit occupied him some hours every day; and so did fishing with plaited rushes, sometimes in the waters of the stream, and sometimes in the hollows of the rocks on the beach when the tide had gone out. The means were primitive, no doubt, but from time to time a fine crustacean or a succulent fish figured on the table of Will Tree, to say nothing of the mollusks, which were easily caught by hand.

But we must confess that the pot--of all the pieces in the battery of the cook undoubtedly the most essential--the simple iron pot, was wanting. Its absence could not but be deeply felt. Godfrey knew not how to replace the vulgar pipkin, whose use is universal. No hash, no stew, no boiled meat, no fish, nothing but roasts and grills. No soup appeared at the beginning of a meal. Constantly and bitterly did Tartlet complain--but how to satisfy the poor man?

Godfrey was busied with other cares. In visiting the different trees of the group he had found a second sequoia of
great height, of which the lower part, hollowed out by the weather, was very rugged and uneven.

Here he devised his poultry-house, and in it the fowls took up their abode. The hens soon became accustomed to their home, and settled themselves to set on eggs placed in the dried grass, and chickens began to multiply. Every evening the broods were driven in and shut up, so as to keep them from birds of prey, who, aloft in the branches, watched their easy victims, and would, if they could, have ended by destroying them.

As for the agoutis, the sheep, and the goats, it would have been useless then to have looked out a stable or a shelter for them. When the bad weather came, there would be time enough to see to that. Meanwhile they prospered on the luxuriant pasturage of the prairie, with its abundance of sainfoin and edible roots, of which the porcine representatives showed genuine appreciation. A few kids had been dropped since the arrival in the island, and as much milk as possible was left to the goats with which to nourish their little ones.

From all this it resulted that the surroundings of Will Tree were quite lively. The well-fed domestic animals came during the warm hours of the day to find there a refuge from the heat of the sun. No fear was there of their wandering abroad, or of their falling a prey to wild beasts, of which Phina Island seemed to contain not a single specimen.

And so things went on, with a present fairly comfortable perhaps, but a future very disquieting, when an unexpected incident occurred which bettered the position considerably.

It was on the 29th of July.

Godfrey was strolling in the morning along that part of the shore which formed the beach of the large bight to which he had given the name of Dream Bay. He was exploring it to see if it was as rich in shell-fish as the coast on the north. Perhaps he still hoped that he might yet come across some of the wreck, of which it seemed to him so strange that the tide had as yet brought in not a single fragment.

On this occasion he had advanced to the northern point which terminated in a sandy spit, when his attention was attracted by a rock of curious shape, rising near the last group of algæ and sea-weeds.

A strange presentiment made him hasten his steps. What was his surprise, and his joy, when he saw that what he had taken for a rock was a box, half buried in the sand.

Was it one of the packages of the _Dream_? Had it been here ever since the wreck? Was it not rather all that remained of another and more recent catastrophe? It was difficult to say. In any case no matter whence it came or what it held, the box was a valuable prize.

Godfrey examined it outwardly. There was no trace of an address not even a name, not even one of those huge initials cut out of thin sheet metal which ornament the boxes of the Americans. Perhaps he would find inside it some paper which would indicate the origin, or nationality, or name of the proprietor? Any how it was apparently hermetically sealed, and there was hope that its contents had not been spoiled by their sojourn in the sea-water. It was a very strong wooden box, covered with thick leather, with copper corner plates at the angles, and large straps all over it.

Impatient as he was to view the contents of the box, Godfrey did not think of damaging it, but of opening it after destroying the lock; as to transporting it from the bottom of Dream Bay to Will Tree, its weight forbade it, and he never gave that a thought.

"Well," said Godfrey to himself, "we must empty it where it is, and make as many journeys as may be necessary to take away all that is inside."

It was about four miles from the end of the promontory to the group of sequoias. It would therefore take some time to do this, and occasion considerable fatigue. Time did not press, however. As for the fatigue, it was hardly worth thinking about.

What did the box contain? Before returning to Will Tree, Godfrey had a try at opening it.

He began by unbuckling the straps, and once they were off he very carefully lifted the leather shield which protected the lock. But how was he to force it?

"Well," said Godfrey to himself, "we must empty it where it is, and make as many journeys as may be necessary to take away all that is inside."

It was a difficult job. Godfrey had no lever with which to bring his strength to bear. He had to guard against the risk of breaking his knife, and so he looked about for a heavy stone with which he could start the staple.

The beach was strewn with lumps of hard silex in every form which could do for a hammer.

Godfrey picked out one as thick as his wrist, and with it he gave a tremendous whack on the plate of copper.

To his extreme surprise the bolt shot through the staple immediately gave way.

Either the staple was broken by the blow, or the lock was not turned.

Godfrey's heart beat high as he stooped to lift up the box lid.

It rose unchecked, and in truth had Godfrey had to get it to pieces he would not have done so without trouble. The trunk was a regular strong-box. The interior was lined with sheet zinc, so that the sea-water had failed to penetrate. The objects it contained, however delicate they might be, would be found in a perfect state of preservation.
And what objects! As he took them out Godfrey could not restrain exclamations of joy! Most assuredly the box must have belonged to some highly practical traveller, who had reckoned on getting into a country where he would have to trust to his own resources.

In the first place there was linen—shirts, tablecloths, sheets, counterpanes; then clothes—woollen jerseys, woollen socks, cotton socks, cloth trousers, velveteen trousers, knitted waistcoats, waistcoats of good heavy stuffs; then two pairs of strong boots, and hunting-shoes and felt hats.

Then came a few kitchen and toilet utensils; and an iron pot—the famous pot which was wanted so badly—a kettle, a coffee-pot, a tea-pot, some spoons, some forks, some knives, a looking-glass, and brushes of all kinds, and, what was by no means to be despised, three cans, containing about fifteen pints of brandy and tafia, and several pounds of tea and coffee.

Then, in the third place, came some tools—an auger, a gimlet, a handsaw, an assortment of nails and brads, a spade, a shovel, a pickaxe, a hatchet, an adze, &c., &c.

In the fourth place, there were some weapons, two hunting-knives in their leather sheaths, a carbine and two muskets, three six-shooter revolvers, a dozen pounds of powder, many thousand caps, and an important stock of lead and bullets, all the arms seeming to be of English make. There was also a small medicine-chest, a telescope, a compass, and a chronometer. There were also a few English books, several quires of blank paper, pencils, pens, and ink, an almanac, a Bible with a New York imprint, and a "Complete Cook's Manual."

Verily this is an inventory of what under the circumstances was an inestimable prize.

Godfrey could not contain himself for joy. Had he expressly ordered the trousseau for the use of shipwrecked folks in difficulties, he could not have made it more complete.

Abundant thanks were due for it to Providence. And Providence had the thanks, and from an overflowing heart.

Godfrey indulged himself in the pleasure of spreading out all his treasure on the beach. Every object was looked over, but not a scrap of paper was there in the box to indicate to whom it belonged, or the ship on which it had been embarked.

Around, the sea showed no signs of a recent wreck.

Nothing was there on the rocks, nothing on the sands. The box must have been brought in by the flood, after being afloat for perhaps many days. In fact, its size in proportion to its weight had assured for it sufficient buoyancy.

The two inhabitants of Phina Island would for some time be kept provided in a large measure with the material wants of life, tools, arms, instruments, utensils, clothes—due to the luckiest of chances.

Godfrey did not dream of taking all the things to Will Tree at once. Their transport would necessitate several journeys but he would have to make haste for fear of bad weather.

Godfrey then put back most of the things in the box. A gun, a revolver, a certain quantity of powder and lead, a hunting-knife, the telescope, and the iron pot, he took as his first load.

The box was carefully closed and strapped up, and with a rapid step Godfrey strode back along the shore.

Ah! What a reception he had from Tartlet, an hour later! And the delight of the Professor when his pupil ran over the list of their new riches! The pot—above everything—threw him into transports of joy, culminating in a series of "hornpipes" and "cellar-flaps," wound up by a triumphant "six-eight breakdown."

It was only noon as yet. Godfrey wished after the meal to get back at once to Dream Bay. He would never rest until the whole was in safety at Will Tree.

Tartlet made no objection, and declared himself ready to start. It was no longer necessary to watch the fire. With the powder they could always get a light. But the Professor was desirous that during their absence the soup which he was thinking about might be kept gently on the simmer. The wonderful pot was soon filled with water from the stream, a whole quarter of a goat was thrown in, accompanied by a dozen yamph roots, to take the place of vegetables, and then a pinch or two of salt found in the crevices of the rocks gave seasoning to the mixture.

"It must skim itself," exclaimed Tartlet, who seemed highly satisfied at his performance.

And off they started for Dream Bay by the shortest road. The box had not been disturbed. Godfrey opened it with care. Amid a storm of admiring exclamations from Tartlet, he began to pick out the things.

In this first journey Godfrey and his companion, transformed into beasts of burden, carried away to Will Tree the arms, the ammunition, and a part of the wearing apparel.

Then they rested from their fatigue beside the table, on which there smoked the stewed agouti, which they pronounced most excellent. As for the meat, to listen to the Professor it would have been difficult even to imagine anything more exquisite! Oh! the marvellous effect of privation!

On the 30th, the next day, Godfrey and Tartlet set forth at dawn, and in three other journeys succeeded in emptying and carrying away all that the box contained. Before the evening, tools, weapons, instruments, utensils, were all brought, arranged, and stowed away in Will Tree.

On the 1st of August, the box itself, dragged along the beach not without difficulty, found a place in the tree, and
was transformed into a linen-closet.

Tartlet, with the fickleness of his mind, now looked upon the future through none but rosy glasses. We can hardly feel astonished then that on this day, with his kit in his hand, he went out to find his pupil, and said to him in all seriousness, as if he were in the drawing-room of Kolderup's mansion,—

"Well, Godfrey, my boy, don't you think it is time to resume our dancing lessons?"

CHAPTER XV.

IN WHICH THERE HAPPENS WHAT HAPPENS AT LEAST ONCE IN THE LIFE OF EVERY CRUSOE, REAL OR IMAGINARY.

And now the future looked less gloomy. But if Tartlet saw in the possession of the instruments, the tools, and the weapons only the means of making their life of isolation a little more agreeable, Godfrey was already thinking of how to escape from Phina Island. Could he not now construct a vessel strong enough to enable them to reach if not some neighbouring land, at least some ship passing within sight of the island?

Meanwhile the weeks which followed were principally spent in carrying out not these ideas, but those of Tartlet. The wardrobe at Will Tree was now replenished, but it was decided to use it with all the discretion which the uncertainty of the future required. Never to wear any of the clothes unless necessity compelled him to do so, was the rule to which the professor was forced to submit.

"What is the good of that?" grumbled he. "It is a great deal too stingy, my dear Godfrey! Are we savages, that we should go about half naked?"

"I beg your pardon, Tartlet," replied Godfrey; "we are savages, and nothing else."

"As you please; but you will see that we shall leave the island before we have worn the clothes!"

"I know nothing about it, Tartlet, and it is better to have than to want."

"But on Sunday now, surely on Sunday, we might dress up a little?"

"Very well, on Sundays then, and perhaps on public holidays," answered Godfrey, who did not wish to anger his frivolous companion; "but as to day is Monday we shall have to wait a whole week before we come out in our best."

We need hardly mention that from the moment he arrived on the island Godfrey had not omitted to mark each day as it passed. By the aid of the calendar he found in the box he was able to verify that the day was really Monday. Each performed his daily task according to his ability. It was no longer necessary for them to keep watch by day and night over a fire which they had now the means of relighting.

Tartlet therefore abandoned, not without regret, a task which suited him so well. Henceforward he took charge of the provisioning with yamph and camas roots—of that in short which formed the daily bread of the establishment, so that the professor went every day and collected them, up to the lines of shrubs with which the prairie was bordered behind Will Tree. It was one or two miles to walk, but he accustomed himself to it. Between whiles he occupied his time in collecting oysters or other mollusks, of which they consumed a great quantity.

Godfrey reserved for himself the care of the domestic animals and the poultry. The butchering trade was hardly to his taste, but he soon overcame his repugnance. Thanks to him, boiled meats appeared frequently on the table, followed by an occasional joint of roast meat to afford a sufficiently varied bill of fare. Game abounded in the woods of Phina Island, and Godfrey proposed to begin his shooting when other more pressing cares allowed him time. He thought of making good use of the guns, powder, and bullets in his arsenal, but he in the first place wished to complete his preparations. His tools enabled him to make several benches inside and outside Will Tree. The stools were cut out roughly with the axe, the table made a little less roughly became more worthy of the dishes and dinner things with which Professor Tartlet adored it. The beds were arranged in wooden boxes and their litter of dry grass assumed a more inviting aspect. If mattresses and palliasses were still wanting, counterpanes at least were not. The various cooking utensils stood no longer on the ground, but had their places on planks fixed along the walls. Stores, linen, and clothes were carefully put away in cavities hollowed out in the bark of the sequoia. From strong pegs were suspended the arms and instruments, forming quite a trophy on the walls.

Godfrey was also desirous of putting a door to the house, so that the other living creatures—the domestic animals—should not come during the night and trouble their sleep. As he could not cut out boards with his only saw, the handsaw, he used large and thick pieces of bark, which he got off very easily. With these he made a door sufficiently massive to close the opening into Will Tree, at the same time he made two little windows, one opposite to the other, so as to let light and air into the room. Shutters allowed him to close them at night, but from the morning to the evening it was no longer necessary to take refuge in flaring resinous torches which filled the dwelling with smoke. What Godfrey would think of to yield them light during the long nights of winter he had as yet no idea. He might take to making candles with the mutton fat, or he might be contented with resinous torches more carefully prepared. We shall see.
Another of his anxieties was how to construct a chimney in Will Tree. While the fine weather lasted, the fire outside among the roots of the sequoia sufficed for all the wants of the kitchen, but when the bad weather came and the rain fell in torrents, and they would have to battle with the cold, whose extreme rigour during a certain time they reasonably feared, they would have to have a fire inside their house, and the smoke from it must have some vent. This important question therefore had to be settled.

One very useful work which Godfrey undertook was to put both banks of the river in communication with each other on the skirt of the sequoia-trees.

He managed, after some difficulty, to drive a few stakes into the river-bed, and on them he fixed a staging of planks, which served for a bridge. They could thus get away to the northern shore without crossing the ford, which led them a couple of miles out of their road.

But if Godfrey took all these precautions so as to make existence a little more possible on this lone isle of the Pacific, in case he and his companion were destined to live on it for some time, or perhaps live on it for ever, he had no intention of neglecting in any way the chances of rescue.

Phina Island was not on the routes taken by the ships--that was only too evident. It offered no port of call, nor means of revictualling. There was nothing to encourage ships to take notice of it. At the same time it was not impossible that a war-ship or a merchant-vessel might come in sight. It was advisable therefore to find some way of attracting attention, and showing that the island was inhabited.

With this object Godfrey erected a flagstaff at the end of the cape which ran out to the north, and for a flag he sacrificed a piece of one of the cloths found in the trunk. As he thought that the white colour would only be visible in a strong light, he tried to stain his flag with the berries of a sort of shrub which grew at the foot of the dunes. He obtained a very vivid red, which he could not make indelible owing to his having no mordant, but he could easily re-dye the cloth when the wind or rain had faded it.

These varied employments occupied him up to the 15th of August. For many weeks the sky had been constantly clear, with the exception of two or three storms of extreme violence which had brought down a large quantity of water, to be greedily drunk in by the soil.

About this time Godfrey began his shooting expeditions. But if he was skilful enough in the use of the gun, he could not reckon on Tartlet, who had yet to fire his first shot.

Many days of the week did Godfrey devote to the pursuit of fur and feather, which, without being abundant, were yet plentiful enough for the requirements of Will Tree.

A few partridges, some of the red-legged variety, and a few snipes, came as a welcome variation of the bill of fare. Two or three antelopes fell to the prowess of the young stalker; and although he had had nothing to do with their capture, the professor gave them a no less welcome than he did when they appeared as haunches and cutlets.

But while he was out shooting, Godfrey did not forget to take a more complete survey of the island. He penetrated the depths of the dense forests which occupied the central districts. He ascended the river to its source. He again mounted the summit of the cone, and redescended by the talus on the eastern shore, which he had not, up to then, visited.

"After all these explorations," repeated Godfrey to himself, "there can be no doubt that Phina Island has no dangerous animals, neither wild beasts, snakes, nor saurians! I have not caught sight of one! Assuredly if there had been any, the report of the gun would have woke them up! It is fortunate, indeed. If it were to become necessary to fortify Will Tree against their attacks, I do not know how we should get on!"

Then passing on to quite a natural deduction--

"It must also be concluded," continued he, "that the island is not inhabited at all. Either natives or people shipwrecked here would have appeared before now at the sound of the gun! There is, however, that inexplicable smoke which I twice thought I saw."

The fact is, that Godfrey had never been able to trace any fire. As for the hot water springs to which he attributed the origin of the vapour he had noticed, Phina Island being in no way volcanic did not appear to contain any, and he had to content himself with thinking that he had twice been the victim of an illusion.

Besides, this apparition of the smoke or the vapour was not repeated. When Godfrey the second time ascended the central cone, as also when he again climbed up into Will Tree, he saw nothing to attract his attention. He ended by forgetting the circumstance altogether.

Many weeks passed in different occupations about the tree, and many shooting excursions were undertaken. With every day their mode of life improved.

Every Sunday, as had been agreed, Tartlet donned his best clothes. On that day he did nothing but walk about under the big trees, and indulge in an occasional tune on the kit. Many were the glissades he performed, giving lessons to himself, as his pupil had positively refused to continue his course.

"What is the good of it?" was Godfrey's answer to the entreaties of the professor. "Can you imagine Robinson
Crusoe taking lessons in dancing and deportment?"

"And why not?" asked Tartlet seriously. "Why should Robinson Crusoe dispense with deportment? Not for the
good of others, but of himself, he should acquire refined manners."

To which Godfrey made no reply. And as he never came for his lesson, the professor became professor
"emeritus."

The 13th of September was noted for one of the greatest and cruellest deceptions to which, on a desert island, the
unfortunate survivors of a shipwreck could be subjected.

Godfrey had never again seen that inexplicable and undiscoverable smoke on the island; but on this day, about
three o'clock in the afternoon, his attention was attracted by a long line of vapour, about the origin of which he could
not be deceived.

He had gone for a walk to the end of Flag Point--the name which he had given to the cape on which he had
erected his flagstaff. While he was looking through his glass he saw above the horizon a smoke driven by the west
wind towards the island.

Godfrey's heart beat high.

"A ship!" he exclaimed.

But would this ship, this steamer, pass in sight of Phina Island? And if it passed, would it come near enough for
the signal thereon to be seen on board?

Or would not rather the semi-visible smoke disappear with the vessel towards the north-west or south-west of the
horizon?

For two hours Godfrey was a prey to alternating emotions more easy to indicate than to describe.

The smoke got bigger and bigger. It increased when the steamer re-stoked her fires, and diminished almost to
vanishing-point as the fuel was consumed. Continually did the vessel visibly approach. About four o'clock her hull
had come up on the line between the sky and the sea.

She was a large steamer, bearing north-east. Godfrey easily made that out. If that direction was maintained, she
would inevitably approach Phina Island.

Godfrey had at first thought of running back to Will Tree to inform Tartlet. What was the use of doing so? The
sight of one man making signals could do as much good as that of two. He remained there, his glass at his eye,
losing not a single movement of the ship.

The steamer kept on her course towards the coast, her bow steered straight for the cape. By five o'clock the
horizon-line was already above her hull, and her rig was visible. Godfrey could even recognize the colours at her
gaff.

She carried the United States' ensign.

"But if I can see their flag, cannot they see mine? The wind keeps it out, so that they could easily see my flag
with their glasses. Shall I make signals, by raising it and lowering it a few times, so as to show that I want to enter
into communication with them? Yes! I have not an instant to lose."

It was a good idea. Godfrey ran to the end of Flag Point, and began to haul his flag up and down, as if he were
saluting. Then he left it half-mast high, so as to show, in the way usual with seafaring people, that he required help
and succour.

The steamer still approached to within three miles of the shore, but her flag remained immovable at the peak,
and replied not to that on Flag Point. Godfrey felt his heart sink. He would not be noticed! It was half-past six, and
the sun was about to set!

The steamer was now about two miles from the cape, which she was rapidly nearing. At this moment the sun
disappeared below the horizon. With the first shadows of night, all hope of being seen had to be given up.

Godfrey again, with no more success, began to raise and lower his flag. There was no reply.

He then fired his gun two or three times, but the distance was still great, and the wind did not set in that
direction! No report would be heard on board!

The night gradually came on; soon the steamer's hull grew invisible. Doubtless in another hour she would have
passed Phina Island.

Godfrey, not knowing what to do, thought of setting fire to a group of resinous trees which grew at the back of
Flag Point. He lighted a heap of dry leaves with some gunpowder, and then set light to the group of pines, which
flared up like an enormous torch.

But no fire on the ship answered to the one on the land, and Godfrey returned sadly to Will Tree, feeling perhaps
more desolate than he had ever felt till then.

CHAPTER XVI.
IN WHICH SOMETHING HAPPENS WHICH CANNOT FAIL TO SURPRISE THE READER.

To Godfrey the blow was serious. Would this unexpected chance which had just escaped him ever offer again? Could he hope so? No! The indifference of the steamer as she passed in sight of the island, without even taking a look at it, was obviously shared in by all the vessels venturing in this deserted portion of the Pacific. Why should they put into port more than she had done? The island did not possess a single harbour.

Godfrey passed a sorrowful night. Every now and then jumping up as if he heard a cannon out at sea, he would ask himself if the steamer had not caught sight of the huge fire which still burnt on the coast, and if she were not endeavouring to answer the signal by a gun-shot?

Godfrey listened. It was only an illusion of his over-excited brain. When the day came, he had come to look upon the apparition of the ship as but a dream, which had commenced about three o'clock on the previous afternoon.

But no! He was only too certain that a ship had been in sight of Phina Island, maybe within two miles of it, and certainly she had not put in.

Of this deception Godfrey said not a word to Tartlet. What was the good of talking about it? Besides, his frivolous mind could not see more than twenty-four hours ahead. He was no longer thinking of the chances of escaping from the island which might offer. He no longer imagined that the future had great things in store for them. San Francisco was fading out of his recollection. He had no sweetheart waiting for him, no Uncle Will to return to. If at this end of the world he could only commence a course of lessons on dancing, his happiness would be complete--were it only with one pupil.

If the professor dreamt not of immediate danger, such as to compromise his safety in this island--bare, as it was, of wild beasts and savages--he was wrong. This very day his optimism was to be put to a rude test.

About four o'clock in the afternoon Tartlet had gone, according to his custom, to collect some oysters and mussels, on that part of the shore behind Flag Point, when Godfrey saw him coming back as fast as his legs could carry him to Will Tree. His hair stood on end round his temples. He looked like a man in flight, who dared not turn his head to the right or to the left.

"What is the matter?" shouted Godfrey, not without alarm, running to meet his companion.

"There! there!" answered Tartlet, pointing with his finger towards the narrow strip of sea visible to the north between the trees.

"A canoe!"

"Yes! Savages! Quite a fleet of savages! Cannibals, perhaps!"

Godfrey looked in the direction pointed out.

It was not a fleet, as the distracted Tartlet had said; but he was only mistaken about the quantity.

In fact, there was a small vessel gliding through the water, now very calm, about half-a-mile from the coast, so as to double Flag Point.

"But what is it?" asked Godfrey, whose first movement was to run to the edge of the sequoias.

"A canoe!"

"A canoe?"

"Yes! Savages! Quite a fleet of savages! Cannibals, perhaps!"

Godfrey looked in the direction pointed out.

It was not a fleet, as the distracted Tartlet had said; but he was only mistaken about the quantity.

In fact, there was a small vessel gliding through the water, now very calm, about half-a-mile from the coast, so as to double Flag Point.

"And why should they be cannibals?" asked Godfrey, turning towards the professor.

"Because in Crusoe Islands," answered Tartlet, "there are always cannibals, who arrive sooner or later."

"Is it not a boat from some merchant-ship?"

"From a ship?"

"Yes. From a steamer which passed here yesterday afternoon, in sight of our island?"

"And you said nothing to me about it!" exclaimed Tartlet, lifting his hands to the sky.

"What good should I have done?" asked Godfrey. "Besides, I thought that the vessel had disappeared! But that boat might belong to her! Let us go and see!"

Godfrey ran rapidly back to Will Tree, and, seizing his glass, returned to the edge of the trees.

He then examined with extreme attention the little vessel, which would ere then have perceived the flag on Flag Point as it fluttered in the breeze.

The glass fell from his hands.

"Savages! Yes! They are really savages!" he exclaimed.

Tartlet felt his knees knock together, and a tremor of fright ran through his body.

It was a vessel manned by savages which Godfrey saw approaching the island. Built like a Polynesian canoe, she carried a large sail of woven bamboo; an outrigger on the weather side kept her from capsizing as she heeled down to the wind.

Godfrey easily distinguished the build of the vessel. She was a proa, and this would indicate that Phina Island was not far from Malaysia. But they were not Malays on board; they were half-naked blacks, and there were about a dozen of them.
The danger of being found was thus great. Godfrey regretted that he had hoisted the flag, which had not been seen by the ship, but would be by these black fellows. To take it down now would be too late.

It was, in truth, very unfortunate. The savages had probably come to the island thinking it was uninhabited, as indeed it had been before the wreck of the _Dream_. But there was the flag, indicating the presence of human beings on the coast! How were they to escape them if they landed?

Godfrey knew not what to do. Anyhow his immediate care must be to watch if they set foot on the island. He could think of other things afterwards.

With his glass at his eye he followed the proa; he saw it turn the point of the promontory, then run along the shore and then approach the mouth of the small stream, which, two miles up, flowed past Will Tree.

If the savages intended to paddle up the river, they would soon reach the group of sequoias--and nothing could hinder them. Godfrey and Tartlet ran rapidly back to their dwelling. They first of all set about guarding themselves against surprise, and giving themselves time to prepare their defence.

At least that is what Godfrey thought of. The ideas of the professor took quite a different turn.

"Ah!" he exclaimed. "It is destiny! This is as it was written? We could not escape it! You cannot be a Crusoe without a canoe coming to your island, without cannibals appearing one day or another! Here we have been for only three months, and there they are already! Assuredly, neither Defoe, nor De Wyss exaggerated matters! You can make yourself a Crusoe, if you like!"

Worthy Tartlet, folks do not make themselves Crusoes, they become Crusoes, and you are not sure that you are wise in comparing your position with that of the heroes of the two English and Swiss romances!

The precautions taken by Godfrey as soon as he returned to Will Tree were as follows. The fire burning among the roots of the sequoia was extinguished, and the embers scattered broadcast, so as to leave no trace; cocks, hens, and chickens were already in their house for the night, and the entrance was hidden with shrubs and twigs as much as possible; the other animals, the goats, agoutis, and sheep, were driven on to the prairie, but it was unlucky that there was no stable to shut them up in; all the instruments and tools were taken into the tree. Nothing was left outside that could indicate the presence or the passage of human beings.

Then the door was closely shut, after Godfrey and Tartlet had gone in. The door made of the sequoia bark was indistinguishable from the bark of the trunk, and might perhaps escape the eyes of the savages, who would not look at it very closely. It was the same with the two windows, in which the lower boards were shut. Then all light was extinguished in the dwelling, and our friends remained in total darkness. How long that night was! Godfrey and Tartlet heard the slightest sounds outside. The creaking of a dry branch, even a puff of wind, made them start. They thought they heard some one walking under the trees. It seemed that they were prowling round Will Tree. Then Godfrey climbed up to one of the windows, opened one of the boards, and anxiously peered into the gloom.

Nothing!

However, Godfrey at last heard footsteps on the ground. His ear could not deceive him this time. He still looked, but could only see one of the goats come for shelter beneath the trees.

Had any of the savages happened to discover the house hidden in the enormous sequoia, Godfrey had made up his mind what to do: he would drag up Tartlet with him by the chimney inside, and take refuge in the higher branches, where he would be better able to resist. With guns and revolvers in his possession, and ammunition in abundance, he would there have some chance against a dozen savages devoid of fire-arms.

If in the event of their being armed with bows and arrows they attacked from below, it was not likely that they would have the best of it against fire-arms aimed from above. If on the other hand they forced the door of the dwelling and tried to reach the branches from the inside, they would find it very difficult to get there, owing to the narrow opening, which the besieged could easily defend.

Godfrey said nothing about this to Tartlet. The poor man had been almost out of his mind with fright since he had seen the proa. The thought that he might be obliged to take refuge in the upper part of a tree, as if in an eagle's nest, would not have soothed him in the least. If it became necessary, Godfrey decided to drag him up before he had time to think about it.

The night passed amid these alternations of fear and hope. No attack occurred. The savages had not yet come to the sequoia group. Perhaps they would wait for the day before venturing to cross the island.

"That is probably what they will do," said Godfrey, "since our flag shows that it is inhabited! But there are only a dozen of them, and they will have to be cautious! How are they to know that they have only to deal with a couple of shipwrecked men? No! They will risk nothing except by daylight--at least, if they are going to stop."

"Supposing they go away when the daylight comes?" answered Tartlet.

"Go away? Why should they have come to Phina Island for one night?"

"I do not know," replied the professor, who in his terror could only explain the arrival of the blacks by supposing that they had come to feed on human flesh.
"Anyhow," continued Godfrey; "to-morrow morning, if they have not come to Will Tree, we will go out and reconnoitre."
"We?"
"Yes! we! Nothing would be more imprudent than for us to separate! Who knows whether we may not have to run to the forest in the centre of the island and hide there for some days--until the departure of the proa! No! We will keep together, Tartlet!"
"Hush!" said the professor in a low voice; "I think I hear something outside."
Godfrey climbed up again to the window, and got down again almost immediately.
"No!" he said. "Nothing suspicious! It is only our cattle coming back to the wood."
"Hunted perhaps!" exclaimed Tartlet.
"They seem very quiet then," replied Godfrey; "I fancy they have only come in search of shelter against the morning dew."
"Ah!" murmured Tartlet in so piteous a tone that Godfrey could hardly help laughing, "these things could not happen at your uncle's place in Montgomery Street!"
"Day will soon break," said Godfrey, after a pause. "In an hour's time, if the savages have not appeared, we will leave Will Tree and reconnoitre towards the north of the island. You are able to carry a gun, Tartlet?"
"Carry? Yes!"
"And to fire it in a stated direction?"
"I do not know! I have never tried such a thing, and you may be sure, Godfrey, that my bullet will not go--"
"Who knows if the report alone might not frighten the savages?"
An hour later, it was light enough to see beyond the sequoias.
Godfrey then cautiously reopened the shutters.
From that looking to the south he saw nothing extraordinary. The domestic animals wandered peacefully under the trees, and did not appear in the least alarmed. The survey completed, Godfrey carefully shut this window. Through the opening to the north there was a view up to the shore. Two miles off even the end of Flag Point could be seen; but the mouth of the river at the place where the savages had landed the evening before was not visible. Godfrey at first looked around without using his glass, so as to examine the environs of Will Tree on this side of Phina Island.
All was quite peaceful.
Godfrey then taking his glass swept round the coast to the promontory at Flag Point. Perhaps, as Tartlet had said, though it was difficult to find the reason, the savages had embarked, after a night spent on shore, without attempting to see if the island were inhabited.

CHAPTER XVII.
IN WHICH PROFESSOR TARTLET'S GUN REALLY DOES MARVELS.
But Godfrey suddenly uttered an exclamation which made the professor jump. There could be no doubt that the savages knew the island was inhabited, for the flag hitherto hoisted at the extremity of the cape had been carried away by them and no longer floated on the mast at Flag Point. The moment had then come to put the project into execution, to reconnoitre if the savages were still in the island, and to see what they were doing.
"Let us go," said he to his companion.
"Go! But--" answered Tartlet.
"Would you rather stay here?"
"With you, Godfrey--yes!"
"No--alone!"
"Alone! Never!"
"Come along then!"
Tartlet, thoroughly understanding that Godfrey would not alter his decision, resolved to accompany him. He had not courage enough to stay behind at Will Tree.
Before starting, Godfrey assured himself that the fire-arms were ready for action. The two guns were loaded, and one passed into the hands of the professor, who seemed as much embarrassed with it as might have been a savage of Pomotou. He also hung one of the hunting-knives to his belt, to which he had already attached his cartridge-pouch. The thought had occurred to him to also take his fiddle, imagining perhaps that they would be sensible to the charm of its squeaking, of which all the talent of a virtuoso could not conceal the harshness.
Godfrey had some trouble in getting him to abandon this idea, which was as ridiculous as it was impracticable.
It was now six o'clock in the morning. The summits of the sequoias were glowing in the first rays of the sun.
Godfrey opened the door; he stepped outside; he scanned the group of trees.

Complete solitude.
The animals had returned to the prairie. There they were, tranquilly browsing, about a quarter of a mile away. Nothing about them denoted the least uneasiness.

Godfrey made a sign to Tartlet to join him. The professor, as clumsy as could be in his fighting harness, followed—not without some hesitation.

Then Godfrey shut the door, and saw that it was well hidden in the bark of the sequoia. Then, having thrown at the foot of the tree a bundle of twigs, which he weighted with a few large stones, he set out towards the river, whose banks he intended to descend, if necessary, to its mouth. Tartlet followed him not without giving before each of his steps an uneasy stare completely round him up to the very limits of the horizon; but the fear of being left alone impelled him to advance.

Arrived at the edge of the group of trees, Godfrey stopped.

Taking his glasses from their case, he scanned with extreme attention all that part of the coast between the Flag Point promontory and the north-east angle of the island.

Not a living being showed itself, not a single smoke wreath was rising in the air.

The end of the cape was equally deserted, but they would there doubtless find numberless footprints freshly made. As for the mast, Godfrey had not been deceived. If the staff still rose above the last rock on the cape, it was bereft of its flag. Evidently the savages after coming to the place had gone off with the red cloth which had excited their covetousness, and had regained their boat at the mouth of the river.

Godfrey then turned off so as to examine the western shore.

It was nothing but a vast desert from Flag Point right away beyond the curve of Dream Bay.

No boat of any kind appeared on the surface of the sea. If the savages had taken to their proa, it only could be concluded that they were hugging the coast sheltered by the rocks, and so closely that they could not be seen.

However, Godfrey could not and would not remain in doubt. He was determined to ascertain, yes or no, if the proa had definitely left the island.

To do this it was necessary to visit the spot where the savages had landed the night before, that is to say, the narrow creek at the mouth of the river.

This he immediately attempted.

The borders of the small watercourse were shaded by occasional clumps of trees encircled by shrubs, for a distance of about two miles. Beyond that for some five or six hundred yards down to the sea the river ran between naked banks. This state of affairs enabled him to approach close to the landing-place without being perceived. It might be, however, that the savages had ascended the stream, and to be prepared for this eventuality the advance had to be made with extreme caution.

Godfrey, however thought, not without reason, that, at this early hour the savages, fatigued by their long voyage, would not have quitted their anchorage. Perhaps they were still sleeping either in their canoe or on land; in which case it would be seen if they could not be surprised.

This idea was acted upon at once. It was important that they should get on quickly. In such circumstances the advantage is generally gained at the outset. The fire-arms were again examined, the revolvers were carefully looked at, and then Godfrey and Tartlet commenced the descent of the left bank of the river in Indian file. All around was quiet. Flocks of birds flew from one bank to the other, pursuing each other among the higher branches without showing any uneasiness.

Godfrey went first, but it can easily be believed that his companion found the attempt to cover step rather tiring. Moving from one tree to another they advanced towards the shore without risk of discovery. Here the clumps of bushes hid them from the opposite bank, there even their heads disappeared amid the luxurious vegetation. But no matter where they were, an arrow from a bow or a stone from a sling might at any moment reach them. And so they had to be constantly on their guard.

However, in spite of the recommendations which were addressed to him, Tartlet, tripping against an occasional stump, had two or three falls which might have complicated matters. Godfrey was beginning to regret having brought such a clumsy assistant. Indeed, the poor man could not be much help to him. Doubtless he would have been worth more left behind at Will Tree; or, if he would not consent to that, hidden away in some nook in the forest. But it was too late. An hour after he had left the sequoia group, Godfrey and his companion had come a mile-only a mile—for the path was not easy beneath the high vegetation and between the luxuriant shrubs. Neither one nor the other of our friends had seen anything suspicious.

Hereabouts the trees thinned out for about a hundred yards or less, the river ran between naked banks, the country round was barer.

Godfrey stopped. He carefully observed the prairie to the right and left of the stream.
Still there was nothing to disquiet him, nothing to indicate the approach of savages. It is true that as they could not but believe the island inhabited, they would not advance without precaution, in fact they would be as careful in ascending the little river as Godfrey was in descending it. It was to be supposed therefore that if they were prowling about the neighbourhood, they would also profit by the shelter of the trees or the high bushes of mastics and myrtles which formed such an excellent screen.

It was a curious though very natural circumstance that, the farther they advanced, Tartlet, perceiving no enemy, little by little lost his terror, and began to speak with scorn of "those cannibal laughing-stocks." Godfrey, on the contrary, became more anxious, and it was with greater precaution than ever that he crossed the open space and regained the shadow of the trees. Another hour led them to the place where the banks, beginning to feel the effects of the sea's vicinity, were only bordered with stunted shrubs, or sparse grasses.

Under these circumstances it was difficult to keep hidden or rather impossible to proceed without crawling along the ground.

This is what Godfrey did, and also what he advised Tartlet to do.

"There are not any savages! There are not any cannibals! They have all gone!" said the professor.

"There are!" answered Godfrey quickly, in a low voice, "They ought to be here! Down Tartlet, get down! Be ready to fire, but don't do so till I tell you."

Godfrey had said these words in such a tone of authority that the professor, feeling his limbs give way under him, had no difficulty in at once assuming the required position.

And he did well!

In fact, it was not without reason that Godfrey had spoken as he had.

From the spot which they then occupied, they could see neither the shore, nor the place where the river entered the sea. A small spur of hills shut out the view about a hundred yards ahead, but above this near horizon a dense smoke was rising straight in the air.

Godfrey, stretched at full length in the grass, with his finger on the trigger of his musket, kept looking towards the coast.

"This smoke," he said, "is it not of the same kind that I have already seen twice before? Should I conclude that savages have previously landed on the north and south of the island, and that the smoke came from fires lighted by them? But no! That is not possible, for I found no cinders, nor traces of a fireplace, nor embers! Ah! this time I'll know the reason of it."

And by a clever reptilian movement, which Tartlet imitated as well as he could, he managed, without showing his head above the grass, to reach the bend of the river.

Thence he could command, at his ease, every part of the bank through which the river ran.

An exclamation could not but escape him! His hand touched the professor's shoulder to prevent any movement of his! Useless to go further! Godfrey saw what he had come to see!

A large fire of wood was lighted on the beach, among the lower rocks, and from it a canopy of smoke rose slowly to the sky. Around the fire, feeding it with fresh armfuls of wood, of which they had made a heap, went and came the savages who had landed the evening before. Their canoe was moored to a large stone, and, lifted by the rising tide, oscillated on the ripples of the shore.

Godfrey could distinguish all that was passing on the sands without using his glasses. He was not more than two hundred yards from the fire, and he could even hear it crackling. He immediately perceived that he need fear no surprise from the rear, for all the blacks he had counted in the proa were in the group.

Ten out of the twelve were occupied in looking after the fire and sticking stakes in the ground with the evident intention of rigging up a spit in the Polynesian manner. An eleventh, who appeared to be the chief, was walking along the beach, and constantly turning his glances towards the interior of the island, as if he were afraid of an attack.

Godfrey recognized as a piece of finery on his shoulders the red stuff of his flag.

The twelfth savage was stretched on the ground, tied tightly to a post.

Godfrey recognized at once the fate in store for the wretched man. The spit was for him! The fire was to roast him at! Tartlet had not been mistaken, when, the previous evening, he had spoken of these folks as cannibals!

It must be admitted that neither was he mistaken in saying that the adventures of Crusoes, real or imaginary, were all copied one from the other!

Most certainly Godfrey and he did then find themselves in the same position as the hero of Daniel Defoe when the savages landed on his island. They were to assist, without doubt, at the same scene of cannibalism.

Godfrey decided to act as this hero did! He would not permit the massacre of the prisoner for which the stomachs of the cannibals were waiting! He was well armed. His two muskets--four shots--his two revolvers--a dozen shots--could easily settle these eleven rascals, whom the mere report of one of the fire-arms might perhaps be
sufficient to scatter. Having taken his decision he coolly waited for the moment to interfere like a thunder-clap. He had not long to wait!

Twenty minutes had barely elapsed, when the chief approached the fire. Then by a gesture he pointed out the prisoner to the savages who were expecting his orders.

Godfrey rose. Tartlet, without knowing why, followed the example. He did not even comprehend where his companion was going, for he had said nothing to him of his plans.

Godfrey imagined, evidently, that at sight of him the savages would make some movement, perhaps to rush to their boat, perhaps to rush at him.

They did nothing. It did not even seem as though they saw him; but at this moment the chief made a significant gesture. Three of his companions went towards the prisoner, unloosed him, and forced him near the fire.

He was still a young man, who, feeling that his last hour had come, resisted with all his might.

Assuredly, if he could, he would sell his life dearly. He began by throwing off the savages who held him, but he was soon knocked down, and the thief, seizing a sort of stone axe, jumped forward to beat in his head.

Godfrey uttered a cry, followed by a report. A bullet whistled through the air, and it seemed as though the chief were mortally wounded, for he fell on the ground.

At the report, the savages, surprised as though they had never heard the sound of fire-arms, stopped. At the sight of Godfrey those who held the prisoner instantly released him.

Immediately the poor fellow arose, and ran towards the place where he perceived his unexpected liberator.

At this moment a second report was heard.

It was Tartlet, who, without looking—for the excellent man kept his eyes shut—had just fired, and the stock of the musket on his right shoulder delivered the hardest knock which had ever been received by the professor of dancing and deportment.

But—what a chance it was!—a second savage fell close to his chief.

The rout at once began. Perhaps the savages thought they had to do with a numerous troop of natives whom they could not resist. Perhaps they were simply terrified at the sight of the two white men who seemed to keep the lightning in their pockets. There they were, seizing the two who were wounded, carrying them off, rushing to the proa, driving it by their paddles out of the little creek, hoisting their sail, steering before the wind, making for the Flag Point promontory, and doubling it in hot haste.

Godfrey had no thought of pursuing them. What was the good of killing them? They had saved the victim. They had put them to flight, that was the important point. This had been done in such a way that the cannibals would never dare to return to Phina Island.

All was then for the best. They had only to rejoice in their victory, in which Tartlet did not hesitate to claim the greatest share.

Meanwhile the prisoner had come to his rescuer. For an instant he stopped, with the fear inspired in him by superior beings, but almost immediately he resumed his course. When he arrived before the two whites, he bowed to the ground; then catching hold of Godfrey's foot, he placed it on his head in sign of servitude.

One would almost have thought that this Polynesian savage had also read Robinson Crusoe!

CHAPTER XVIII.
WHICH TREATS OF THE MORAL AND PHYSICAL EDUCATION OF A SIMPLE NATIVE OF THE PACIFIC.

Godfrey at once raised the poor fellow, who lay prostrate before him. He looked in his face.

He was a man of thirty-five or more, wearing only a rag round his loins. In his features, as in the shape of his head, there could be recognized the type of the African negro. It was not possible to confound him with the debased wretches of the Polynesian islands, who, with their depressed crania and elongated arms, approach so strangely to the monkey.

Now, as he was a negro from Soudan or Abyssinia who had fallen into the hands of the natives of an archipelago of the Pacific, it might be that he could speak English or one or two words of the European languages which Godfrey understood. But it was soon apparent that the unhappy man only used an idiom that was absolutely incomprehensible—probably the language of the aborigines among whom he had doubtless arrived when very young. In fact, Godfrey had immediately interrogated him in English, and had obtained no reply. He then made him understand by signs, not without difficulty, that he would like to know his name.

After many fruitless essays, the negro, who had a very intelligent and even honest face, replied to the demand which was made of him in a single word,—
"Carefinotu."
"Carefinotu!" exclaimed Tartlet. "Do you hear the name? I propose that we call him 'Wednesday,' for to-day is Wednesday, and that is what they always do in these Crusoe islands! Is he to be allowed to call himself Carefinotu?"

"If that is his name," said Godfrey; "why should he not keep it?"

And at the moment he felt a hand placed on his chest, while all the black's physiognomy seemed to ask him what his name was.

"Godfrey!" answered he.

The black endeavoured to say the word, but although Godfrey repeated it several times, he could not succeed in pronouncing it in an intelligible fashion. Then he turned towards the professor, as if to know his name.

"Tartlet," was the reply of that individual in a most amiable tone.

"Tartlet!" repeated Carefinotu.

And it seemed as though this assemblage of syllables was more agreeable to his vocal chords, for he pronounced it distinctly.

The professor appeared to be extremely flattered. In truth he had reason to be.

Then Godfrey, wishing to put the intelligence of the black to some profit, tried to make him understand that he wished to know the name of the island. He pointed with his hand to the woods and prairies and hills, and then the shore which bound them, and then the horizon of the sea, and he interrogated him with a look.

Carefinotu did not at first understand what was meant, and imitating the gesture of Godfrey he also turned and ran his eyes over the space.

"Arneka," said he at length.

"Arneka?" replied Godfrey, striking the soil with his foot so as to accentuate his demand.

"Arneka!" repeated the negro.

This told Godfrey nothing, neither the geographical name borne by the island, nor its position in the Pacific. He could not remember such a name; it was probably a native one, little known to geographers.

However, Carefinotu did not cease from looking at the two white men, not without some stupor, going from one to the other as if he wished to fix in his mind the differences which characterized them. The smile on his mouth disclosed abundant teeth of magnificent whiteness which Tartlet did not examine without a certain reserve.

"If those teeth," he said, "have never eaten human flesh may my fiddle burst up in my hand."

"Anyhow, Tartlet," answered Godfrey; "our new companion no longer looks like the poor beggar they were going to cook and feed on! That is the main point!"

What particularly attracted the attention of Carefinotu were the weapons carried by Godfrey and Tartlet—as much the musket in the hand as the revolver in the belt.

Godfrey easily understood this sentiment of curiosity. It was evident that the savage had never seen a fire-arm. He said to himself that this was one of those iron tubes which had launched the thunder-bolt that had delivered him? There could be no doubt of it.

Godfrey, wishing to give him, not without reason, a high idea of the power of the whites, loaded his gun, and then, showing to Carefinotu a red-legged partridge that was flying across the prairie about a hundred yards away, he shouldered it quickly, and fired. The bird fell.

At the report the black gave a prodigious leap, which Tartlet could not but admire from a choreographic point of view. Then repressing his fear, and seeing the bird with broken wing running through the grass, he started off and swift as a greyhound ran towards it, and with many a caper, half of joy, half of stupefaction, brought it back to his master.

Tartlet then thought of displaying to Carefinotu that the Great Spirit had also favoured him with the power of the lightning; and perceiving a kingfisher tranquilly seated on an old stump near the river was bringing the stock up to his cheek, when Godfrey stopped him with—

"No! Don't fire, Tartlet!"

"Why not?"

"Suppose that by some mishap you were not to hit the bird, think how we would fall in the estimation of the nigger!"

"And why should I not hit him?" replied Tartlet with some acerbity. "Did I not, during the battle, at more than a hundred paces, the very first time I handled a gun, hit one of the cannibals full in the chest?"

"You touched him evidently," said Godfrey; "for he fell. But take my advice, Tartlet, and in the common interest do not tempt fortune twice!"

The professor, slightly annoyed, allowed himself to be convinced; he threw the gun on to his shoulder with a swagger, and both our heroes, followed by Carefinotu, returned to Will Tree.

There the new guest of Phina Island met with quite a surprise in the habitation so happily contrived in the lower part of the sequoia. First he had to be shown, by using them while he looked on, the use of the tools, instruments,
and utensils. It was obvious that Carefinotu belonged to, or had lived amongst savages in the lowest rank of the human scale, for fire itself seemed to be unknown to him. He could not understand why the pot did not take fire when they put it on the blazing wood; he would have hurried away from it, to the great displeasure of Tartlet, who was watching the different phases of the cooking of the soup. At a mirror, which was held out to him, he betrayed consummate astonishment; he turned round, and turned it round to see if he himself were not behind it.

"The fellow is hardly a monkey!" exclaimed the professor with a disdainful grimace.

"No, Tartlet," answered Godfrey; "he is more than a monkey, for his looks behind the mirror show good reasoning power."

"Well, I will admit that he is not a monkey," said Tartlet, shaking his head as if only half convinced; "but we shall see if such a being can be of any good to us."

"I am sure he will be!" replied Godfrey.

In any case Carefinotu showed himself quite at home with the food placed before him. He first tore it apart, and then tasted it; and then I believe that the whole breakfast of which they partook the--agouti soup, the partridge killed by Godfrey, and the shoulder of mutton with camas and yamph roots--would hardly have sufficed to calm the hunger which devoured him.

"The poor fellow has got a good appetite!" said Godfrey.

"Yes," responded Tartlet; "and we shall have to keep a watch on his cannibal instinct."

"Well, Tartlet! We shall make him get over the taste of human flesh if he ever had it!"

"I would not swear that," replied the professor. "It appears that once they have acquired this taste--"

While they were talking, Carefinotu was listening with extreme attention. His eyes sparkled with intelligence. One could see that he understood what was being said in his presence. He then spoke with extreme volubility, but it was only a succession of onomatopoeias devoid of sense, of harsh interjections with _a_ and _ou_ predominant, as in the majority of Polynesian idioms.

Whatever the negro was, he was a new companion; he might become a devoted servant, which the most unexpected chance had sent to the hosts of Will Tree.

He was powerful, adroit, active; no work came amiss to him. He showed a real aptitude to imitate what he saw being done. It was in this way that Godfrey proceeded with his education. The care of the domestic animals, the collection of the roots and fruits, the cutting up of the sheep or agouties, which were to serve for food for the day, the fabrication of a sort of cider they extracted from the wild manzanilla apples,—he acquitted himself well in all these tasks, after having seen them done.

Whatever Tartlet thought, Godfrey felt no distrust in the savage, and never seemed to regret having come across him. What disquieted him was the possible return of the cannibals who now knew the situation of Phina Island.

From the first, a bed had been reserved for Carefinotu in the room at Will Tree, but generally, unless it was raining, he preferred to sleep outside in some hole in the tree, as though he were on guard over the house.

During the fortnight which followed his arrival on the island, Carefinotu many times accompanied Godfrey on his shooting excursions. His surprise was always extreme when he saw the game fall hit at such a distance; but in his character of retriever, he showed a dash and daring which no obstacles, hedge or bush, or stream, could stop.

Gradually, Godfrey became greatly attached to this negro. There was only one part of his progress in which Carefinotu showed refractoriness; that was in learning the English language. Do what he might he could not be prevailed upon to pronounce the most ordinary words which Godfrey, and particularly Professor Tartlet tried to teach him.

So the time passed. But if the present was fairly supportable, thanks to a happy accident, if no immediate danger menaced them, Godfrey could not help asking himself, if they were ever to leave this island, by what means they were to rejoin their country! Not a day passed but he thought of Uncle Will and his betrothed. It was not without secret apprehension that he saw the bad season approaching, which would put between his friends and him a barrier still more impassable.

On the 27th of September a circumstance occurred deserving of note.

If it gave more work to Godfrey and his two companions, it at least assured them of an abundant reserve of food.

Godfrey and Carefinotu were busied in collecting the mollusks, at the extreme end of Dream Bay, when they perceived out at sea an innumerable quantity of small moving islets which the rising tide was bringing gently to shore. It was a sort of floating archipelago, on the surface of which there walked, or flew, a few of those sea-birds, with great expanse of wing, known as sea-hawks.

What then were these masses which floated landwards, rising and falling with the undulations of the waves?

Godfrey did not know what to think, when Carefinotu threw himself down on his stomach, and then drawing his head back into his shoulders, folded beneath him his arms and legs, and began to imitate the movements of an animal crawling slowly along the ground.
Godfrey looked at him without understanding these extraordinary gymnastics. Then suddenly--
"Turtles!" he exclaimed.
Carefinotu was right. There was quite a square mile of myriads of turtles, swimming on the surface of the water.
About a hundred fathoms from the shore the greater part of them dived and disappeared, and the sea-hawks, finding their footing gone, flew up into the air in large spirals. But luckily about a hundred of the amphibians came on to the beach.
Godfrey and the negro had quickly run down in front of these creatures, each of which measured at the least from three to four feet in diameter. Now the only way of preventing turtles from regaining the sea is to turn them on their backs; and it was in this rough work that Godfrey and Carefinotu employed themselves, not without great fatigue.

The following days were spent in collecting the booty. The flesh of the turtle, which is excellent either fresh or preserved, could perhaps be kept for a time in both forms. In preparation for the winter, Godfrey had the greater part salted in such a way as to serve for the needs of each day. But for some time the table was supplied with turtle soup, on which Tartlet was not the only one to regale himself.

Barring this incident, the monotony of existence was in no way ruffled. Every day the same hours were devoted to the same work. Would not the life become still more depressing when the winter season would oblige Godfrey and his companions to shut themselves up in Will Tree? Godfrey could not think of it without anxiety. But what could he do?
Meanwhile, he continued the exploration of the island, and all the time not occupied with more pressing tasks he spent in roaming about with his gun. Generally Carefinotu accompanied him, Tartlet remaining behind at the dwelling. Decidedly he was no hunter, although his first shot had been a master-stroke!

Now on one of these occasions an unexpected incident happened, of a nature to gravely compromise the future safety of the inmates of Will Tree.
Godfrey and the black had gone out hunting in the central forest, at the foot of the hill which formed the principal ridge of Phina Island. Since the morning they had seen nothing pass but two or three antelopes through the high underwood, but at too great a distance for them to fire with any chance of hitting them.

As Godfrey was not in search of game for dinner, and did not seek to destroy for destruction's sake, he resigned himself to return empty-handed. If he regretted doing so it was not so much for the meat of the antelope, as for the skin, of which he intended to make good use.

It was about three o'clock in the afternoon. He and his companion after lunch were no more fortunate than before. They were preparing to return to Will Tree for dinner, when, just as they cleared the edge of the wood, Carefinotu made a bound; then precipitating himself on Godfrey, he seized him by the shoulders, and dragged him along with such vigour that resistance was impossible.

After going about twenty yards they stopped. Godfrey took breath, and, turning towards Carefinotu, interrogated him with a look.

The black, exceedingly frightened, stretched out his hand towards an animal which was standing motionless about fifty yards off.

It was a grizzly bear, whose paws held the trunk of a tree, and who was swaying his big head up and down, as if he were going to rush at the two hunters.

Immediately, without pausing to think, Godfrey loaded his gun, and fired before Carefinotu could hinder him.

Was the enormous plantigrade hit by the bullet? Probably. Was he killed? They could not be sure, but his paws unclasped, and he rolled at the foot of the tree. Delay was dangerous. A struggle with so formidable an animal might have the worst results. In the forests of California the pursuit of the grizzly is fraught with the greatest danger, even to professional hunters of the beast.

And so the black seized Godfrey by the arms to drag him away in the direction of Will Tree, and Godfrey, understanding that he could not be too cautious, made no resistance.

CHAPTER XIX.
IN WHICH THE SITUATION ALREADY GRAVELY COMPROMISED BECOMES MORE AND MORE COMPLICATED.

The presence of a formidable wild beast in Phina Island was, it must be confessed, calculated to make our friends think the worst of the ill-fortune which had fallen on them.

Godfrey--perhaps he was wrong--did not consider that he ought to hide from Tartlet what had passed.

"A bear!" screamed the professor, looking round him with a bewildered glare as if the environs of Will Tree were being assailed by a herd of wild beasts. "Why, a bear? Up to now we had not even got a bear in our island! If
there is one there may be many, and even numbers of other ferocious beasts—jaguars, panthers, tigers, hyænas, lions!"

Tartlet already beheld Phina Island given over to quite a menagerie escaped from their cages.

Godfrey answered that there was no need for him to exaggerate. He had seen one bear, that was certain. Why one of these animals had never been seen before in his wanderings on the island he could not explain, and it was indeed inexplicable. But to conclude from this that wild animals of all kinds were prowling in the woods and prairies was to go too far. Nevertheless, they would have to be cautious and never go out unarmed.

Unhappy Tartlet! From this day there commenced for him an existence of anxieties, emotions, alarms, and irrational terrors which gave him nostalgia for his native land in a most acute form.

"No!" repeated he. "No! If there are animals—I have had enough of it, and I want to get off!"

He had not the power.

Godfrey and his companions then had henceforth to be on their guard. An attack might take place not only on the shore side or the prairie side, but even in the group of sequoias. This is why serious measures were taken to put the habitation in a state to repel a sudden attack. The door was strengthened, so as to resist the clutches of a wild beast. As for the domestic animals Godfrey would have built a stable to shut them up in at least at night, but it was not easy to do so. He contented himself at present with making a sort of enclosure of branches not far from Will Tree, which would keep them as in a fold. But the enclosure was not solid enough nor high enough to hinder a bear or hyæna from upsetting it or getting over it.

Notwithstanding the remonstrances made to him, Carefinotu persisted in watching outside during the night, and Godfrey hoped thus to receive warning of a direct attack.

Decidedly Carefinotu endangered his life in thus constituting himself the guardian of Will Tree; but he had understood that he could thus be of service to his liberators, and he persisted, in spite of all Godfrey said to him, in watching as usual over the general safety.

A week passed without any of these formidable visitors appearing in the neighbourhood. Godfrey did not go very far from the dwelling, unless there was a necessity for his doing so. While the sheep and goats grazed on the neighbouring prairie, they were never allowed out of sight. Generally Carefinotu acted as shepherd. He did not take a gun, for he did not seem to understand the management of fire-arms, but one of the hunting-knives hung from his belt, and he carried an axe in his right hand. Thus armed the active negro would not have hesitated to throw himself before a tiger or any animal of the worst description.

However, as neither a bear nor any of his congers had appeared since the last encounter Godfrey began to gather confidence. He gradually resumed his hunting expeditions, but without pushing far into the interior of the island. Frequently the black accompanied him; Tartlet, safe in Will Tree, would not risk himself in the open, not even if he had the chance of giving a dancing lesson. Sometimes Godfrey would go alone, and then the professor had a companion to whose instruction he obstinately devoted himself.

Yes! Tartlet had at first thought of teaching Carefinotu the most ordinary words in the English language, but he had to give this up, as the negro seemed to lack the necessary phonetic apparatus for that kind of pronunciation. "Then," had Tartlet said, "if I cannot be his professor, I will be his pupil!"

And he it was who attempted to learn the idiom spoken by Carefinotu. Godfrey had warned him that the accomplishment would be of little use. Tartlet was not dissuaded. He tried to get Carefinotu to name the objects he pointed at with his hand. In truth Tartlet must have got on excellently, for at the end of fifteen days he actually knew fifteen words! He knew that Carefinotu said "birsi" for fire, "aradore" for the sky, "mervira" for the sea, "doura" for a tree, &c. He was as proud of this as if he had taken the first prize for Polynesian at some examination!

It was then with a feeling of gratitude that he wished to make some recognition of what had been done for him, and instead of torturing the negro with English words, he resolved on teaching him deportment and the true principles of European choreography.

At this Godfrey could not restrain his peals of laughter. After all it would pass the time away, and on Sunday, when there was nothing else to do, he willingly assisted at the course of lectures delivered by the celebrated Professor Tartlet of San Francisco. Indeed, we ought to have seen them! The unhappy Carefinotu perspired profusely as he went through the elementary exercises. He was docile and willing, nevertheless; but like all his fellows, his shoulders did not set back, nor did his chest throw out, nor did his knees or his feet point apart! To make a Vestris or a Saint Leon of a savage of this sort!

The professor pursued his task in quite a fury. Carefinotu, tortured as he was, showed no lack of zeal. What he suffered, even to get his feet into the first position can be imagined! And when he passed to the second and then to the third, it was still more agonizing.

"But look at me, you blockhead!" exclaimed Tartlet, who added example to precept. "Put your feet out! Further out! The heel of one to the heel of the other! Open your knees, you duffer! Put back your shoulders, you idiot! Stick
But you ask what is impossible!" said Godfrey.
"Nothing is impossible to an intelligent man!" was Tartlet's invariable response.
"But his build won't allow of it."
"Well, his build must allow of it! He will have to do it sooner or later, for the savage must at least know how to
present himself properly in a drawing-room!"
"But, Tartlet, he will never have the opportunity of appearing in a drawing-room!"
"Ah! How do you know that, Godfrey?" replied the professor, drawing himself up. "Do you know what the
future may bring forth?"
This was the last word in all discussions with Tartlet. And then the professor taking his kit would with the bow
extract from it some squeaky little air to the delight of Carefinotu. It required but this to excite him. Oblivious of
choregraphic rules, what leaps, what contortions, what capers!

And Tartlet, in a reverie, as he saw this child of Polynesia so demean himself, inquired if these steps, perhaps a
little too characteristic, were not natural to the human being, although outside all the principles of his art.

But we must leave the professor of dancing and deportment to his philosophical meditations, and return to
questions at once more practical and pressing.

During his last excursions into the plain, either by himself or with Carefinotu, Godfrey had seen no wild animal.
He had even come upon no traces of such. The river to which they would come to drink bore no footprint on its
banks. During the night there were no howlings nor suspicious noises. Besides the domestic animals continued to
give no signs of uneasiness.

"This is singular," said Godfrey several times; "but I was not mistaken! Carefinotu certainly was not! It was
really a bear that he showed me! It was really a bear that I shot! Supposing I killed him, was he the last
representative of the plantigrades on the island?"

It was quite inexplicable! Besides, if Godfrey had killed this bear, he would have found the body where he had
shot it. Now they searched for it in vain! Were they to believe then that the animal mortally wounded had died far
off in some den. It was possible after all, but then at this place, at the foot of this tree, there would have been traces
of blood, and there were none.

"Whatever it is," thought Godfrey, "it does not much matter; and we must keep on our guard."

With the first days of November it could be said that the wet season had commenced in this unknown latitude.
Cold rains fell for many hours. Later on probably they would experience those interminable showers which do not
cease for weeks at a time, and are characteristic of the rainy period of winter in these latitudes.

Godfrey had then to contrive a fireplace in the interior of Will Tree--an indispensable fireplace that would serve
as well to warm the dwelling during the winter months as to cook their food in shelter from the rain and tempest.
The hearth could at any time be placed in a corner of the chamber between big stones, some placed on the
ground and others built up round them; but the question was how to get the smoke out, for to leave it to escape by
the long chimney, which ran down the centre of the sequoia, proved impracticable.

Godfrey thought of using as a pipe some of those long stout bamboos which grew on certain parts of the river
banks. It should be said that on this occasion he was greatly assisted by Carefinotu. The negro, not without effort,
understood what Godfrey required. He it was who accompanied him for a couple of miles from Will Tree to select
the larger bamboos, he it was who helped him build his hearth. The stones were placed on the ground opposite to the
door; the bamboos, emptied of their pith and bored through at the knots, afforded, when joined one to another, a tube
of sufficient length, which ran out through an apertured made for it in the sequoia bark, and would serve every
purpose, provided it did not catch fire. Godfrey soon had the satisfaction of seeing a good fire burning without
filling the interior of Will Tree with smoke.

He was quite right in hastening on these preparations, for from the 3rd to the 10th of November the rain never
ceased pouring down. It would have been impossible to keep a fire going in the open air. During these miserable
days they had to keep indoors and did not venture out except when the flocks and poultry urgently required them to
do so. Under these circumstances the reserve of camas roots began to fail; and these were what took the place of
bread, and of which the want would be immediately felt.

Godfrey then one day, the 10th of November, informed Tartlet that as soon as the weather began to mend a little
he and Carefinotu would go out and collect some. Tartlet, who was never in a hurry to run a couple of miles across a
soaking prairie, decided to remain at home during Godfrey's absence.

In the evening the sky began to clear of the heavy clouds which the west wind had been accumulating since the
commencement of the month, the rain gradually ceased, the sun gave forth a few crepuscular rays. It was to be
hoped that the morning would yield a lull in the storm, of which it was advisable to make the most.

"To-morrow," said Godfrey, "I will go out, and Carefinotu will go with me."
"Agreed!" answered Tartlet.

The evening came, and when supper was finished and the sky, cleared of clouds, permitted a few brilliant stars to appear, the black wished to take up his accustomed place outside, which he had had to abandon during the preceding rainy nights. Godfrey tried to make him understand that he had better remain indoors, that there was no necessity to keep a watch as no wild animal had been noticed; but Carefinotu was obstinate. He therefore had to have his way.

The morning was as Godfrey had foreseen, no rain had fallen since the previous evening, and when he stepped forth from Will Tree, the first rays of the sun were lightly gilding the thick dome of the sequoias.

Carefinotu was at his post, where he had passed the night. He was waiting. Immediately, well armed and provided with large sacks, the two bid farewell to Tartlet, and started for the river, which they intended ascending along the left bank up to the camas bushes.

An hour afterwards they arrived there without meeting with any unpleasant adventure.

The roots were rapidly torn up and a large quantity obtained, so as to fill the sacks. This took three hours, so that it was about eleven o'clock in the morning when Godfrey and his companion set out on their return to Will Tree.

Walking close together, keeping a sharp look-out, for they could not talk to each other, they had reached a bend in the small river where there were a few large trees, grown like a natural cradle across the stream, when Godfrey suddenly stopped.

This time it was he who showed to Carefinotu a motionless animal at the foot of a tree whose eyes were gleaming with a singular light.

"A tiger!" he exclaimed.

He was not mistaken. It was really a tiger of large stature resting on its hind legs with its forepaws on the trunk of a tree, and ready to spring.

In a moment Godfrey had dropped his sack of roots. The loaded gun passed into his right hand; he cocked it, presented it, aimed it, and fired.

"Hurrah! hurrah!" he exclaimed.

This time there was no room for doubt; the tiger, struck by the bullet, had bounded backwards. But perhaps he was not mortally wounded, perhaps rendered still more furious by his wound he would spring on to them!

Godfrey held his gun pointed, and threatened the animal with his second barrel.

But before Godfrey could stop him, Carefinotu had rushed at the place where the tiger disappeared, his hunting-knife in his hand.

Godfrey shouted for him to stop, to come back! It was in vain. The black, resolved even at the risk of his life to finish the animal which perhaps was only wounded, did not or would not hear.

Godfrey rushed after him.

When he reached the bank, he saw Carefinotu struggling with the tiger, holding him by the throat, and at last stabbing him to the heart with a powerful blow.

The tiger then rolled into the river, of which the waters, swollen by the rains, carried it away with the quickness of a torrent. The corpse, which floated only for an instant, was swiftly borne off towards the sea.

A bear! A tiger! There could be no doubt that the island did contain formidable beasts of prey!

Godfrey, after rejoining Carefinotu, found that in the struggle the black had only received a few scratches. Then, deeply anxious about the future, he retook the road to Will Tree.

CHAPTER XX.

IN WHICH TARTLET REITERATES IN EVERY KEY THAT HE WOULD RATHER BE OFF.

When Tartlet learnt that there were not only bears in the island, but tigers too, his lamentations again arose. Now he would never dare to go out! The wild beasts would end by discovering the road to Will Tree! There was no longer any safety anywhere! In his alarm the professor wanted for his protection quite a fortification! Yes! Stone walls with scarpes and counterscarps, curtains and bastions, and ramparts, for what was the use of a shelter under a group of sequoias? Above all things, he would at all risks, like to be off.

"So would I," answered Godfrey quietly.

In fact, the conditions under which the castaways on Phina Island had lived up to now were no longer the same. To struggle to the end, to struggle for the necessaries of life, they had been able, thanks to fortunate circumstances. Against the bad season, against winter and its menaces, they knew how to act, but to have to defend themselves against wild animals, whose attack was possible every minute, was another thing altogether; and in fact they could not do it.

The situation, already complicated, had become very serious, for it had become intolerable.
"But," repeated Godfrey to himself, without cessation, "how is it that for four months we did not see a single
beast of prey in the island, and why during the last fortnight have we had to encounter a bear and a tiger? What shall
we say to that?"

The fact might be inexplicable, but it was none the less real.

Godfrey, whose coolness and courage increased, as difficulties grew, was not cast down. If dangerous animals
menaced their little colony, it was better to put themselves on guard against their attacks, and that without delay.

But what was to be done?

It was at the outset decided that excursions into the woods or to the sea-shore should be rarer, and that they
should never go out unless well armed, and only when it was absolutely necessary for their wants.

"We have been lucky enough in our two encounters!" said Godfrey frequently; "but there may come a time when
we may not shoot so straight! So there is no necessity for us to run into danger!"

At the same time they had not only to settle about the excursions, but to protect Will Tree--not only the dwelling,
but the annexes, the poultry roost, and the fold for the animals, where the wild beasts could easily cause irreparable
disaster.

Godfrey thought then, if not of fortifying Will Tree according to the famous plans of Tartlet, at least of
connecting the four or five large sequoias which surrounded it.

If he could devise a high and strong palisade from one tree to another, they would be in comparative security at
any rate from a surprise.

It was practicable--Godfrey concluded so after an examination of the ground--but it would cost a good deal of
labour. To reduce this as much as possible, he thought of erecting the palisade around a perimeter of only some three
hundred feet. We can judge from this the number of trees he had to select, cut down, carry, and trim until the
enclosure was complete.

Godfrey did not quail before his task. He imparted his projects to Tartlet, who approved them, and promised his
active co-operation; but what was more important, he made his plans understood to Carefinotu, who was always
ready to come to his assistance.

They set to work without delay.

There was at a bend in the stream, about a mile from Will Tree, a small wood of stone pines of medium height,
whose trunks, in default of beams and planks, without wanting to be squared, would, by being placed close together,
form a solid palisade.

It was to this wood that, at dawn on the 12th of November, Godfrey and his two companions repaired. Though
well armed they advanced with great care.

"You can have too much of this sort of thing," murmured Tartlet, whom these new difficulties had rendered still
more discontented, "I would rather be off!"

But Godfrey did not take the trouble to reply to him.

On this occasion his tastes were not being consulted, his intelligence even was not being appealed to. It was the
assistance of his arms that the common interest demanded. In short, he had to resign himself to his vocation of beast
of burden.

No unpleasant accident happened in the mile which separated the wood from Will Tree. In vain they had
carefully beaten the underwood, and swept the horizon all around them. The domestic animals they had left out at
pasture gave no sign of alarm. The birds continued their frolics with no more anxiety than usual.

Work immediately began. Godfrey, very properly did not want to begin carrying until all the trees he wanted had
been felled. They could work at them in greater safety on the spot.

Carefinotu was of great service during this toilsome task. He had become very clever in the use of the axe and
saw. His strength even allowed him to continue at work when Godfrey was obliged to rest for a minute or so, and
when Tartlet, with bruised hands and aching limbs, had not even strength left to lift his fiddle.

However, although the unfortunate professor of dancing and deportment had been transformed into a wood-
cutter, Godfrey had reserved for him the least fatiguing part, that is, the clearing off of the smaller branches. In spite
of this, if Tartlet had only been paid half a dollar a day, he would have stolen four-fifths of his salary!

For six days, from the 12th to the 17th of November, these labours continued. Our friends went off in the
morning at dawn, they took their food with them, and they did not return to Will Tree until evening. The sky was not
very clear. Heavy clouds frequently accumulated over it. It was harvest weather, with alternating showers and
sunshine; and during the showers the wood-cutters would take shelter under the trees, and resume their task when
the rain had ceased.

On the 18th all the trees, topped and cleared of branches, were lying on the ground, ready for transport to Will
Tree.

During this time no wild beast had appeared in the neighbourhood of the river. The question was, were there any
more in the island, or had the bear and the tiger been—a most improbable event—the last of their species?

Whatever it was, Godfrey had no intention of abandoning his project of the solid palisade so as to be prepared against a surprise from savages, or bears, or tigers. Besides, the worst was over, and there only remained to take the wood where it was wanted.

We say "the worst was over," though the carriage promised to be somewhat laborious. If it were not so, it was because Godfrey had had a very practical idea, which materially lightened the task; this was to make use of the current of the river, which the flood occasioned by the recent rains had rendered very rapid, to transport the wood. Small rafts could be formed, and they would quietly float down to the sequoias, where a bar, formed by the small bridge, would stop them. From thence to Will Tree was only about fifty-five paces.

If any of them showed particular satisfaction at this mode of procedure, it was Tartlet.

On the 18th the first rafts were formed, and they arrived at the barrier without accident. In less than three days on the evening of the 25th, the palisade had been all sent down to its destination.

On the morrow, the first trunks, sunk two feet in the soil, began to rise in such a manner as to connect the principal sequoias which surrounded Will Tree. A capping of strong flexible branches, pointed by the axe, assured the solidity of the wall.

Godfrey saw the work progress with extreme satisfaction, and delayed not until it was finished.

"Once the palisade is done," he said to Tartlet, "we shall be really at home."

"We shall not be really at home," replied the professor drily, "until we are in Montgomery Street, with your Uncle Kolderup."

There was no disputing this opinion.

On the 26th of November the palisade was three parts done. It comprised among the sequoias attached one to another that in which the poultry had established themselves, and Godfrey's intention was to build a stable inside it.

In three or four days the fence was finished. There only remained to fit in a solid door, which would assure the closure of Will Tree.

But on the morning of the 27th of November the work was interrupted by an event which we had better explain with some detail, for it was one of those unaccountable things peculiar to Phina Island.

About eight o'clock, Carefinotu had climbed up to the fork of the sequoia, so as to more carefully close the hole by which the cold and rain penetrated, when he uttered a singular cry.

Godfrey, who was at work at the palisade, raised his head and saw the black, with expressive gestures, motioning to him to join him without delay.

Godfrey, thinking Carefinotu would not have disturbed him unless he had serious reason, took his glasses with him and climbed up the interior passage, and passing through the hole, seated himself astride of one of the main branches.

Carefinotu, pointing with his arm towards the rounded angle which Phina Island made to the north-east, showed a column of smoke rising in the air like a long plume.

"Again!" exclaimed Godfrey.

And putting his glasses in the direction, he assured himself that this time there was no possible error, that it must escape from some important fire, which he could distinctly see must be about five miles off.

Godfrey turned towards the black.

Carefinotu expressed his surprise, by his looks, his exclamations, in fact by his whole attitude. Assuredly he was no less astounded than Godfrey at this apparition.

Besides, in the offing, there was no ship, not a vessel native or other, nothing which showed that a landing had recently been made on the shore.

"Ah! This time I will find out the fire which produces that smoke!" exclaimed Godfrey.

And pointing to the north-east angle of the island, and then to the foot of the tree, he gesticulated to Carefinotu that he wished to reach the place without losing an instant.

Carefinotu understood him. He even gave him to understand that he approved of the idea.

"Yes," said Godfrey to himself, "if there is a human being there, we must know who he is and whence he comes! We must know why he hides himself! It will be for the safety of all!"

A moment afterwards Carefinotu and he descended to the foot of Will Tree. Then Godfrey, informing Tartlet of what had passed and what he was going to do, proposed for him to accompany them to the north coast.

A dozen miles to traverse in one day was not a very tempting suggestion to a man who regarded his legs as the most precious part of his body, and only designed for noble exercises. And so he replied that he would prefer to remain at Will Tree.

"Very well, we will go alone," answered Godfrey, "but do not expect us until the evening."

So saying, and Carefinotu and he carrying some provisions for lunch on the road, they set out, after taking leave
of the professor, whose private opinion it was that they would find nothing, and that all their fatigue would be useless.

Godfrey took his musket and revolver; the black the axe and the hunting-knife which had become his favourite weapon. They crossed the plank bridge to the right bank of the river, and then struck off across the prairie to the point on the shore where the smoke had been seen rising amongst the rocks.

It was rather more easterly than the place which Godfrey had uselessly visited on his second exploration.

They progressed rapidly, not without a sharp look-out that the wood was clear and that the bushes and underwood did not hide some animal whose attack might be formidable.

Nothing disquieting occurred.

At noon, after having had some food, without, however, stopping for an instant, they reached the first line of rocks which bordered the beach. The smoke, still visible, was rising about a quarter of a mile ahead. They had only to keep straight on to reach their goal.

Nothing disquieting occurred.

They hastened their steps, but took precautions so as to surprise, and not be surprised.

Two minutes afterwards the smoke disappeared, as if the fire had been suddenly extinguished.

But Godfrey had noted with exactness the spot whence it arose. It was at the point of a strangely formed rock, a sort of truncated pyramid, easily recognizable. Showing this to his companion, he kept straight on.

The quarter of a mile was soon traversed, then the last line was climbed, and Godfrey and Carefinotu gained the beach about fifty paces from the rock.

They ran up to it. Nobody! But this time half-smouldering embers and half-burnt wood proved clearly that the fire had been alight on the spot.

"There has been some one here!" exclaimed Godfrey. "Some one not a moment ago! We must find out who!"

He shouted. No response! Carefinotu gave a terrible yell. No one appeared!

Behold them then hunting amongst the neighbouring rocks, searching a cavern, a grotto, which might serve as a refuge for a shipwrecked man, an aboriginal, a savage--

It was in vain that they ransacked the slightest recesses of the shore. There was neither ancient nor recent camp in existence, not even the traces of the passage of a man.

"But," repeated Godfrey, "it was not smoke from a warm spring this time! It was from a fire of wood and grass, and that fire could not light itself."

Vain was their search. Then about two o'clock Godfrey and Carefinotu, as weary as they were disconcerted at their fruitless endeavours, retook their road to Will Tree.

There was nothing astonishing in Godfrey being deep in thought. It seemed to him that the island was now under the empire of some occult power. The reappearance of this fire, the presence of wild animals, did not all this denote some extraordinary complication?

And was there not cause for his being confirmed in this idea when an hour after he had regained the prairie, he heard a singular noise, a sort of hard jingling.

Carefinotu pushed him aside at the same instant as a serpent glided beneath the herbage, and was about to strike at him.

"Snakes, now. Snakes in the island, after the bears and the tigers!" he exclaimed.

Yes! It was one of those reptiles well-known by the noise they make, a rattlesnake of the most venomous species: a giant of the Crotalus family!

Carefinotu threw himself between Godfrey and the reptile, which hurried off under a thick bush.

But the negro pursued it and smashed in its head with a blow of the axe. When Godfrey rejoined him, the two halves of the reptile were writhing on the blood-stained soil.

Then other serpents, not less dangerous, appeared in great abundance on this part of the prairie which was separated by the stream from Will Tree.

Was it then a sudden invasion of reptiles? Was Phina Island going to become the rival of ancient Tenos, whose formidable ophidians rendered it famous in antiquity, and which gave its name to the viper?

"Come on! come on!" exclaimed Godfrey, motioning to Carefinotu to quicken the pace.

He was uneasy. Strange presentiments agitated him without his being able to control them.

Under their influence, fearing some approaching misfortune, he had hastened his return to Will Tree.

But matters became serious when he reached the planks across the river.

Screams of terror resounded from beneath the sequoias--cries for help in a tone of agony which it was impossible to mistake!

"It is Tartlet!" exclaimed Godfrey. "The unfortunate man has been attacked! Quick! quick!"

Once over the bridge, about twenty paces further on, Tartlet was perceived running as fast as his legs could carry him.
An enormous crocodile had come out of the river and was pursuing him with its jaws wide open. The poor man, distracted, mad with fright, instead of turning to the right or the left, was keeping in a straight line, and so running the risk of being caught. Suddenly he stumbled. He fell. He was lost.

Godfrey halted. In the presence of this imminent danger his coolness never forsook him for an instant. He brought his gun to his shoulder, and aimed at the crocodile. The well-aimed bullet struck the monster, and it made a bound to one side and fell motionless on the ground.

Carefinotu rushed towards Tartlet and lifted him up. Tartlet had escaped with a fright! But what a fright!

It was six o'clock in the evening.

A moment afterwards Godfrey and his two companions had reached Will Tree.

How bitter were their reflections during their evening repast! What long sleepless hours were in store for the inhabitants of Phina Island, on whom misfortunes were now crowding.

As for the professor, in his anguish he could only repeat the words which expressed the whole of his thoughts, "I had much rather be off!"

CHAPTER XXI.

WHICH ENDS WITH QUITE A SURPRISING REFLECTION BY THE NEGRO CAREFINOTU.

The winter season, so severe in these latitudes, had come at last. The first frosts had already been felt, and there was every promise of rigorous weather. Godfrey was to be congratulated on having established his fireplace in the tree. It need scarcely be said that the work at the palisade had been completed, and that a sufficiently solid door now assured the closure of the fence.

During the six weeks which followed, that is to say, until the middle of December, there had been a good many wretched days on which it was impossible to venture forth. At the outset there came terrible squalls. They shook the group of sequoias to their very roots. They strewed the ground with broken branches, and so furnished an ample reserve for the fire.

Then it was that the inhabitants of Will Tree clothed themselves as warmly as they could. The woollen stuffs found in the box were used during the few excursions necessary for revictualling, until the weather became so bad that even these were forbidden. All hunting was at an end, and the snow fell in such quantity that Godfrey could have believed himself in the inhospitable latitudes of the Arctic Ocean.

It is well known that Northern America, swept by the Polar winds, with no obstacle to check them, is one of the coldest countries on the globe. The winter there lasts until the month of April. Exceptional precautions have to be taken against it. It was the coming of the winter as it did which gave rise to the thought that Phina Island was situated in a higher latitude than Godfrey had supposed.

Hence the necessity of making the interior of Will Tree as comfortable as possible. But the suffering from rain and cold was cruel. The reserves of provisions were unfortunately insufficient, the preserved turtle flesh gradually disappeared. Frequently there had to be sacrificed some of the sheep or goats or agouties, whose numbers had but slightly increased since their arrival in the island.

With these new trials, what sad thoughts haunted Godfrey!

It happened also that for a fortnight he fell into a violent fever. Without the tiny medicine-chest which afforded the necessary drugs for his treatment, he might never have recovered. Tartlet was ill-suited to attend to the petty cares that were necessary during the continuance of the malady. It was to Carefinotu that he mainly owed his return to health.

But what remembrances and what regrets! Who but himself could he blame for having got into a situation of which he could not even see the end? How many times in his delirium did he call Phina, whom he never should see again, and his Uncle Will, from whom he beheld himself separated for ever! Ah! he had to alter his opinion of this Crusoe life which his boyish imagination had made his ideal! Now he was contending with reality! He could no longer even hope to return to the domestic hearth.

So passed this miserable December, at the end of which Godfrey began to recover his strength.

As for Tartlet, by special grace, doubtless, he was always well. But what incessant lamentations! What endless jeremiads! As the grotto of Calypso after the departure of Ulysses, Will Tree "resounded no more to his song"--that of his fiddle--for the cold had frozen the strings!

It should be said too that one of the gravest anxieties of Godfrey was not only the re-appearance of dangerous animals, but the fear of the savages returning in great numbers to Phina Island, the situation of which was known to them. Against such an invasion the palisade was but an insufficient barrier. All things considered, the refuge offered by the high branches of the sequoia appeared much safer, and the rendering the access less difficult was taken in hand. It would always be easy to defend the narrow orifice by which the top of the trunk was reached.
With the aid of Carefinotu Godfrey began to cut regular ledges on each side, like the steps of a staircase, and these, connected by a long cord of vegetable fibre, permitted of rapid ascent up the interior.

"Well," said Godfrey, when the work was done, "that gives us a town house below and a country house above!"

"I had rather have a cellar, if it was in Montgomery Street!" answered Tartlet.

Christmas arrived. Christmas kept in such style throughout the United States of America! The New Year's Day, full of memories of childhood, rainy, snowy, cold, and gloomy, began the new year under the most melancholy auspices.

It was six months since the survivors of the _Dream_ had remained without communication with the rest of the world.

The commencement of the year was not very cheering. It made Godfrey and his companions anticipate that they would still have many trials to encounter.

The snow never ceased falling until January 18th. The flocks had to be let out to pasture to get what feed they could. At the close of the day, a very cold damp night enveloped the island, and the space shaded by the sequoias was plunged in profound obscurity.

Tartlet and Carefinotu, stretched on their beds inside Will Tree, were trying in vain to sleep. Godfrey, by the struggling light of a torch, was turning over the pages of his Bible.

About ten o'clock a distant noise, which came nearer and nearer, was heard outside away towards the north. There could be no mistake. It was the wild beasts prowling in the neighbourhood, and, alarming to relate, the howling of the tiger and of the hyæna, and the roaring of the panther and the lion were this time blended in one formidable concert.

Godfrey, Tartlet, and the negro sat up, each a prey to indescribable anguish. If at this unaccountable invasion of ferocious animals Carefinotu shared the alarm of his companions, his astonishment was quite equal to his fright.

During two mortal hours all three kept on the alert. The howlings sounded at times close by; then they suddenly ceased, as if the beasts, not knowing the country, were roaming about all over it. Perhaps then Will Tree would escape an attack!

"It doesn't matter if it does," thought Godfrey. "If we do not destroy these animals to the very last one, there will be no safety for us in the island!"

A little after midnight the roaring began again in full strength at a moderate distance away. Impossible now to doubt but that the howling army was approaching Will Tree!

Yes! It was only too certain! But whence came these wild animals? They could not have recently landed on Phina Island! They must have been there then before Godfrey's arrival! But how was it that all of them had remained hidden during his walks and hunting excursions, as well across the centre as in the most out-of-the-way parts to the south? For Godfrey had never found a trace of them. Where was the mysterious den which vomited forth lions, hyænas, panthers, tigers? Amongst all the unaccountable things up to now this was indeed the most unaccountable.

Carefinotu could not believe what he heard. We have said that his astonishment was extreme. By the light of the fire which illuminated the interior of Will Tree there could be seen on his black face the strangest of grimaces.

Tartlet in the corner, groaned and lamented, and moaned again. He would have asked Godfrey all about it, but Godfrey was not in the humour to reply. He had a presentiment of a very great danger, he was seeking for a way to retreat from it.

Once or twice Carefinotu and he went out to the centre of the palisade. They wished to see that the door was firmly and strongly shut.

Suddenly an avalanche of animals appeared with a huge tumult along the front of Will Tree.

It was only the goats and sheep and agouties. Terrified at the howling of the wild beasts, and scenting their approach, they had fled from their pasturage to take shelter behind the palisade.

"We must open the door!" exclaimed Godfrey.

Carefinotu nodded his head. He did not want to know the language to understand what Godfrey meant.

The door was opened, and the frightened flock rushed into the enclosure.

But at that instant there appeared through the opening a gleaming of eyes in the depths of the darkness which the shadow of the sequoias rendered still more profound.

There was no time to close the enclosure!

To jump at Godfrey, seize him in spite of himself, push him into the dwelling and slam the door, was done by Carefinotu like a flash of lightning.

New roarings indicated that three or four wild beasts had just cleared the palisade.

Then these horrible roarings were mingled with quite a concert of bleatings and groanings of terror. The domestic flock were taken as in a trap and delivered over to the clutches of the assailants.

Godfrey and Carefinotu, who had climbed up to the two small windows in the bark of the sequoia, endeavoured
to see what was passing in the gloom.

Evidently the wild animals--tigers or lions, panthers or hyænas, they did not know which yet--had thrown themselves on the flock and begun their slaughter.

At this moment, Tartlet, in a paroxysm of blind terror, seized one of the muskets, and would have taken a chance shot out of one of the windows.

Godfrey stopped him.

"No!" said he. "In this darkness our shots will be lost, and we must not waste our ammunition! Wait for daylight!"

He was right. The bullets would just as likely have struck the domestic as the wild animals--more likely in fact, for the former were the most numerous. To save them was now impossible. Once they were sacrificed, the wild beasts, thoroughly gorged, might quit the enclosure before sunrise. They would then see how to act to guard against a fresh invasion.

It was most important too, during the dark night, to avoid as much as possible revealing to these animals the presence of human beings, whom they might prefer to the flock. Perhaps they would thus avoid a direct attack against Will Tree.

As Tartlet was incapable of understanding either this reasoning or any other, Godfrey contented himself with depriving him of his weapon. The professor then went and threw himself on his bed and freely anathematized all travels and travellers and maniacs who could not remain quietly at their own firesides.

Both his companions resumed their observations at the windows.

Thence they beheld, without the power of interference, the horrible massacre which was taking place in the gloom. The cries of the sheep and the goats gradually diminished as the slaughter of the animals was consummated, although the greater part had escaped outside, where death, none the less certain, awaited them. This loss was irreparable for the little colony; but Godfrey was not then anxious about the future. The present was disquieting enough to occupy all his thoughts.

There was nothing they could do, nothing they could try, to hinder this work of destruction.

Godfrey and Carefinotu kept constant watch, and now they seemed to see new shadows coming up and passing into the palisade, while a fresh sound of footsteps struck on their ears.

Evidently certain belated beasts, attracted by the odour of the blood which impregnated the air, had traced the scent up to Will Tree.

They ran to and fro, they rushed round and round the tree and gave forth their hoarse and angry growls. Some of the shadows jumped on the ground like enormous cats. The slaughtered flock had not been sufficient to satisfy their rage.

Neither Godfrey nor his companions moved. In keeping completely motionless they might avoid a direct attack.

An unlucky shot suddenly revealed their presence and exposed them to the greatest danger.

Tartlet, a prey to a veritable hallucination, had risen. He had seized a revolver; and this time, before Godfrey and Carefinotu could hinder him, and not knowing himself what he did, but believing that he saw a tiger standing before him, he had fired! The bullet passed through the door of Will Tree.

"Fool!" exclaimed Godfrey, throwing himself on Tartlet, while the negro seized the weapon.

It was too late. The alarm was given, and growlings still more violent resounded without. Formidable talons were heard tearing the bark of the sequoia. Terrible blows shook the door, which was too feeble to resist such an assault.

"We must defend ourselves!" shouted Godfrey.

And, with his gun in his hand and his cartridge-pouch round his waist, he took his post at one of the windows.

To his great surprise, Carefinotu had done the same! Yes! the black, seizing the second musket--a weapon which he had never before handled--had filled his pockets with cartridges and taken his place at the second window.

Then the reports of the guns began to echo from the embrasures. By the flashes, Godfrey on the one side, and Carefinotu on the other, beheld the foes they had to deal with.

There, in the enclosure, roaring with rage, howling at the reports, rolling beneath the bullets which struck many of them, leapt of lions and tigers, and hyænas and panthers, at least a score. To their roarings and growlings which reverberated from afar, there echoed back those of other ferocious beasts running up to join them. Already the now distant roaring could be heard as they approached the environs of Will Tree. It was as though quite a menagerie of wild animals had been suddenly set free on the island!

[Illustration: Of lions and tigers quite a score. _page 252_]
grief told them that the animal had been hit.

A quarter of an hour elapsed, and then came a respite. Had the wild beasts given up the attack which had cost the lives of so many amongst them? Were they waiting for the day to recommence the attempt under more favourable conditions?

Whatever might be the reason, neither Godfrey nor Carefinotu desired to leave his post. The black had shown himself no less ready with the gun than Godfrey. If that was due only to the instinct of imitation, it must be admitted that it was indeed surprising.

About two o'clock in the morning there came a new alarm—more furious than before. The danger was imminent, the position in the interior of Will Tree was becoming untenable. New growlings resounded round the foot of the sequoia. Neither Godfrey nor Carefinotu, on account of the situation of the windows, which were cut straight through, could see the assailants, nor, in consequence, could they fire with any chance of success.

It was now the door which the beasts attacked, and it was only too evident that it would be beaten in by their weight or torn down by their claws.

Godfrey and the black had descended to the ground. The door was already shaking beneath the blows from without. They could feel the heated breath making its way in through the cracks in the bark.

Godfrey and Carefinotu attempted to prop back the door with the stakes which kept up the beds, but these proved quite useless.

It was obvious that in a little while it would be driven in, for the beasts were mad with rage—particularly as no shots could reach them.

Godfrey was powerless. If he and his companions were inside Will Tree when the assailants broke in, their weapons would be useless to protect them.

Godfrey had crossed his arms. He saw the boards of the door open little by little. He could do nothing. In a moment of hesitation, he passed his hand across his forehead, as if in despair. But soon recovering his self-possession, he shouted,—

"Up we go! Up! All of us!"

And he pointed to the narrow passage which led up to the fork inside Will Tree.

Carefinotu and he, taking their muskets and revolvers, supplied themselves with cartridges.

And now he turned to make Tartlet follow them into these heights where he had never ventured before.

Tartlet was no longer there. He had started up while his companions were firing.
"Up!" repeated Godfrey.

It was a last retreat, where they would assuredly be sheltered from the wild beasts. If any tiger or panther attempted to come up into the branches of the sequoia, it would be easy to defend the hole through which he would have to pass.

Godfrey and Carefinotu had scarcely ascended thirty feet, when the roaring was heard in the interior of Will Tree. A few moments more and they would have been surprised. The door had just fallen in. They both hurried along, and at last reached the upper end of the hole.

A scream of terror welcomed them. It was Tartlet, who imagined he saw a panther or tiger! The unfortunate professor was clasping a branch, frightened almost out of his life lest he should fall.

Carefinotu went to him, and compelled him to lean against an upright bough, to which he firmly secured him with his belt.

Then, while Godfrey selected a place whence he could command the opening, Carefinotu went to another spot whence he could deliver a cross fire.

And they waited.

Under these circumstances it certainly looked as though the besieged were safe from attack.

Godfrey endeavoured to discover what was passing beneath them; but the night was still too dark. Then he tried to hear; and the growlings, which never ceased, showed that the assailants had no thought of abandoning the place.

Suddenly, towards four o'clock in the morning, a great light appeared at the foot of the tree. At once it shot out through the door and windows. At the same time a thick smoke spread forth from the upper opening and lost itself in the higher branches.

"What is that now?" exclaimed Godfrey.

It was easily explained. The wild beasts, in ravaging the interior of Will Tree, had scattered the remains of the fire. The fire had spread to the things in the room. The flame had caught the bark, which had dried and become combustible. The gigantic sequoia was ablaze below.

The position was now more terrible than it had ever been. By the light of the flames, which illuminated the space beneath the grove, they could see the wild beasts leaping round the foot of Will Tree.

At the same instant, a fearful explosion occurred. The sequoia, violently wrenched, trembled from its roots to its
It was the reserve of gunpowder which had exploded inside Will Tree, and the air, violently expelled from the opening, rushed forth like the gas from a discharging cannon.

Godfrey and Carefinotu were almost torn from their resting-places. Had Tartlet not been lashed to the branch, he would assuredly have been hurled to the ground.

The wild beasts, terrified at the explosion, and more or less wounded, had taken to flight.

But at the same time the conflagration, fed by the sudden combustion of the powder, had considerably extended. It swiftly grew in dimensions as it crept up the enormous stem.

Large tongues of flame lapped the interior, and the highest soon reached the fork, and the dead wood snapped and crackled like shots from a revolver. A huge glare lighted up, not only the group of giant trees, but even the whole of the coast from Flag Point to the southern cape of Dream Bay.

Soon the fire had reached the lower branches of the sequoia, and threatened to invade the spot where Godfrey and his companions had taken refuge. Were they then to be devoured by the flames, with which they could not battle, or had they but the last resource of throwing themselves to the ground to escape being burnt alive? In either case they must die!

Godfrey sought about for some means of escape. He saw none!

Already the lower branches were ablaze and a dense smoke was struggling with the first gleams of dawn which were rising in the east.

At this moment there was a horrible crash of rending and breaking. The sequoia, burnt to the very roots, cracked violently—it toppled over—it fell!

But as it fell the stem met the stems of the trees which environed it; their powerful branches were mingled with its own, and so it remained obliquely cradled at an angle of about forty-five degrees from the ground.

At the moment that the sequoia fell, Godfrey and his companions believed themselves lost!

"Nineteenth of January!" exclaimed a voice, which Godfrey, in spite of his astonishment, immediately recognized.

It was Carefinotu! Yes, Carefinotu had just pronounced these words, and in that English language which up to then he had seemed unable to speak or to understand!

"What did you say?" asked Godfrey, as he followed him along the branches.

"I said, Mr. Morgan," answered Carefinotu, "that to-day your Uncle Will ought to reach us, and that if he doesn't turn up we are done for!"

CHAPTER XXII.

WHICH CONCLUDES BY EXPLAINING WHAT UP TO NOW HAD APPEARED INEXPLICABLE.

At that instant, and before Godfrey could reply, the report of fire-arms was heard not far from Will Tree.

At the same time one of those rain storms, regular cataracts in their fury, fell in a torrential shower just as the flames devouring the lower branches were threatening to seize upon the trees against which Will Tree was resting.

What was Godfrey to think after this series of inexplicable events? Carefinotu speaking English like a cockney, calling him by his name, announcing the early arrival of Uncle Will, and then the sudden report of the fire-arms?

He asked himself if he had gone mad; but he had no time for insoluble questions, for below him—hardly five minutes after the first sound of the guns—a body of sailors appeared hurrying through the trees.

Godfrey and Carefinotu slipped down along the stem, the interior of which was still burning.

But the moment that Godfrey touched the ground, he heard himself spoken to, and by two voices which even in his trouble it was impossible for him not to recognize.

"Nephew Godfrey, I have the honour to salute you!"

"Godfrey! Dear Godfrey!"

"Uncle Will! Phina! You!" exclaimed Godfrey, astounded.

Three seconds afterwards he was in somebody's arms, and was clasping that somebody in his own.

At the same time two sailors, at the order of Captain Turcott who was in command, climbed up along the sequoia to set Tartlet free, and, with all due respect, pluck him from the branch as if he were a fruit.

And then the questions, the answers, the explanations which passed!

"Uncle Will! You?"

"Yes! me!"

"And how did you discover Phina Island?"

"Phina Island!" answered William W. Kolderup. "You should say Spencer Island! Well, it wasn't very difficult. I bought it six months ago!"
"Spencer Island!"
"And you gave my name to it, you dear Godfrey!" said the young lady.
"The new name is a good one, and we will keep to it," answered the uncle; "but for geographers this is Spencer Island, only three days' journey from San Francisco, on which I thought it would be a good plan for you to serve your apprenticeship to the Crusoe business!"
"Oh! Uncle! Uncle Will! What is it you say?" exclaimed Godfrey. "Well, if you are in earnest, I can only answer that I deserved it! But then, Uncle Will, the wreck of the _Dream_?"
"Sham!" replied William W. Kolderup, who had never seemed in such a good humour before. "The _Dream_ was quietly sunk by means of her water ballast, according to the instructions I had given Turcott. You thought she sank for good, but when the captain saw that you and Tartlet had got safely to land he brought her up and steamed away. Three days later he got back to San Francisco, and he it is who has brought us to Spencer Island on the date we fixed!"
"Then none of the crew perished in the wreck?"
"None--unless it was the unhappy Chinaman who hid himself away on board and could not be found!"
"But the canoe?"
"Sham! The canoe was of my own make."
"But the savages?"
"Sham! The savages whom luckily you did not shoot!"
"But Carefinotu?"
"Sham! Carefinotu was my faithful Jup Brass, who played his part of Friday marvellously well, as I see."
"Yes," answered Godfrey. "He twice saved my life--once from a bear, once from a tiger--"
"The bear was sham! the tiger was sham!" laughed William W. Kolderup. "Both of them were stuffed with straw, and landed before you saw them with Jup Brass and his companions!"
"But he moved his head and his paws!"
"By means of a spring which Jup Brass had fixed during the night a few hours before the meetings which were prepared for you."
"What! all of them?" repeated Godfrey, a little ashamed at having been taken in by these artifices.
"Yes! Things were going too smoothly in your island, and we had to get up a little excitement!"
"Then," answered Godfrey, who had begun to laugh, "if you wished to make matters unpleasant for us, why did you send us the box which contained everything we wanted?"
And as he said so he looked towards Phina, who cast down her eyes and turned away her head.
"Oh! indeed!--a box! but then Phina must have had an accomplice--"
And Uncle Will turned towards Captain Turcott, who laughingly answered,--
"What could I do, Mr. Kolderup? I can sometimes resist you--but Miss Phina--it was too difficult! And four months ago, when you sent me to look round the island, I landed the box from my boat--"
"Dearest Phina!" said Godfrey, seizing the young lady's hand.
"Turcott, you promised to keep the secret!" said Phina with a blush.
And Uncle William W. Kolderup, shaking his big head, tried in vain to hide that he was touched.
But if Godfrey could not restrain his smiles as he listened to the explanations of Uncle Will, Professor Tartlet did not laugh in the least! He was excessively mortified at what he heard! To have been the object of such a mystification, he, a professor of dancing and deportment! And so advancing with much dignity he observed,--
"Mr. William Kolderup will hardly assert, I imagine, that the enormous crocodile, of which I was nearly the unhappy victim, was made of pasteboard and wound up with a spring?"
"A crocodile?" replied the uncle.
"Yes, Mr. Kolderup," said Carefinotu, to whom we had better return his proper name of Jup Brass. "Yes, a real live crocodile, which went for Mr. Tartlet, and which I did not have in my collection!"
Godfrey then related what had happened, the sudden appearance of the wild beasts in such numbers, real lions, real tigers, real panthers, and then the invasion of the snakes, of which during four months they had not seen a single specimen in the island!
William W. Kolderup at this was quite disconcerted. He knew nothing about it. Spencer Island--it had been known for a long time--never had any wild beasts, did not possess even a single noxious animal; it was so stated in the deeds of sale.
Neither did he understand what Godfrey told him of the attempts he had made to discover the origin of the smoke which had appeared at different points on the island. And he seemed very much troubled to find that all had not passed on the island according to his instructions, and that the programme had been seriously interfered with.
As for Tartlet, he was not the sort of man to be humbugged. For his part he would admit nothing, neither the sham shipwreck, nor the sham savages, nor the sham animals, and above all he would never give up the glory which he had gained in shooting with the first shot from his gun the chief of the Polynesian tribe—one of the servants of the Kolderup establishment, who turned out to be as well as he was.

All was described, all was explained, except the serious matter of the real wild beasts and the unknown smoke. Uncle Will became very thoughtful about this. But, like a practical man, he put off, by an effort of the will, the solution of the problems, and addressing his nephew,—

"Godfrey," said he, "you have always been so fond of islands, that I am sure it will please you to hear that this is yours—wholly yours! I make you a present of it! You can do what you like with it! I never dreamt of bringing you away by force; and I would not take you away from it! Be then a Crusoe for the rest of your life, if your heart tells you so—"

"I!" answered Godfrey. "I! All my life!"

Phina stepped forward.
"Godfrey," she asked, "would you like to remain on your island?"
"I would rather die!" he exclaimed.

But immediately he added, as he took the young lady's hand,—

"Well, yes, I will remain; but on three conditions. The first is, you stay with me, dearest Phina; the second is, that Uncle Will lives with us; and the third is, that the chaplain of the _Dream_ marries us this very day!"

"There is no chaplain on board the _Dream_. Godfrey!" replied Uncle Will. "You know that very well. But I think there is still one left in San Francisco, and that we can find some worthy minister to perform the service! I believe I read your thoughts when I say that before to-morrow we shall put to sea again!"

Then Phina and Uncle Will asked Godfrey to do the honours of his island. Behold them then walking under the group of sequoias, along the stream up to the little bridge.

Alas! of the habitation at Will Tree nothing remained. The fire had completely devoured the dwelling in the base of the tree! Without the arrival of William W. Kolderup, what with the approaching winter, the destruction of their stores, and the genuine wild beasts in the island, our Crusoes would have deserved to be pitied.

"Uncle Will!" said Godfrey. "If I gave the island the name of Phina, let me add that I gave our dwelling the name of Will Tree!"

"Well," answered the uncle, "we will take away some of the seed, and plant it in my garden at 'Frisco!"

During the walk they noticed some wild animals in the distance; but they dared not attack so formidable a party as the sailors of the _Dream_. But none the less was their presence absolutely incomprehensible.

Then they returned on board, not without Tartlet asking permission to bring off "his crocodile"—a permission which was granted.

That evening the party were united in the saloon of the _Dream_. and there was quite a cheerful dinner to celebrate the end of the adventures of Godfrey Morgan and his marriage with Phina Hollaney.

On the morrow, the 20th of January, the _Dream_ set sail under the command of Captain Turcott. At eight o'clock in the morning Godfrey, not without emotion, saw the horizon in the west wipe out, as if it were a shadow, the island on which he had been to school for six months—a school of which he never forgot the lessons.

The passage was rapid; the sea magnificent; the wind favourable. This time the _Dream_ went straight to her destination! There was no one to be mystified! She made no tackings without number as on the first voyage! She did not lose during the night what she had gained during the day!

And so on the 23rd of January, after passing at noon through the Golden Gate, she entered the vast bay of San Francisco, and came alongside the wharf in Merchant Street.

And what did they then see?
They saw issue from the hold a man who, having swum to the _Dream_ during the night while she was anchored at Phina Island, had succeeded in stowing himself away for the second time!
And who was this man?
It was the Chinaman, Seng Vou, who had made the passage back as he had made the passage out!
Seng Vou advanced towards William W. Kolderup.

"I hope Mr. Kolderup will pardon me," said he very politely. "When I took my passage in the _Dream_, I thought she was going direct to Shanghai, and then I should have reached my country, but I leave her now, and return to San Francisco."

Every one, astounded at the apparition, knew not what to answer, and laughingly gazed at the intruder.
"But," said William W. Kolderup at last, "you have not remained six months in the hold, I suppose?"
"No!" answered Seng Vou.
"Where have you been, then?"
"On the island!"
"You!" exclaimed Godfrey.
"Yes."
"Then the smoke?"
"A man must have a fire!"
"And you did not attempt to come to us, to share our living?"
"A Chinaman likes to live alone," quietly replied Seng Vou. "He is sufficient for himself, and he wants no one!"
And thereupon this eccentric individual bowed to William W. Kolderup, landed, and disappeared.
"That is the stuff they make real Crusoes of!" observed Uncle Will. "Look at him and see if you are like him! It does not matter, the English race would do no good by absorbing fellows of that stamp!"
"Good!" said Godfrey, "the smoke is explained by the presence of Seng Vou; but the beasts?"
"And my crocodile!" added Tartlet; "I should like some one to explain my crocodile!"
William W. Kolderup seemed much embarrassed, and feeling in turn quite mystified, passed his hand over his forehead as if to clear the clouds away.
"We shall know later on," he said. "Everything is found by him who knows how to seek!"
A few days afterwards there was celebrated with great pomp the wedding of the nephew and pupil of William W. Kolderup. That the young couple were made much of by all the friends of the wealthy merchant can easily be imagined.
At the ceremony Tartlet was perfect in bearing, in everything, and the pupil did honour to the celebrated professor of dancing and deportment.
Now Tartlet had an idea. Not being able to mount his crocodile on a scarf-pin--and much he regretted it--he resolved to have it stuffed. The animal prepared in this fashion--hung from the ceiling, with the jaws half open, and the paws outspread--would make a fine ornament for his room. The crocodile was consequently sent to a famous taxidermist, and he brought it back to Tartlet a few days afterwards. Every one came to admire the monster who had almost made a meal of Tartlet.
"You know, Mr. Kolderup, where the animal came from?" said the celebrated taxidermist, presenting his bill.
"No, I do not," answered Uncle Will.
"But it had a label underneath its carapace."
"A label!" exclaimed Godfrey.
"Here it is," said the celebrated taxidermist.
And he held out a piece of leather on which, in indelible ink, were written these words,—

"From Hagenbeck, Hamburg, "To J. R. Taskinar, Stockton, U.S.A."—

When William W. Kolderup had read these words he burst into a shout of laughter. He understood all.
It was his enemy, J. R. Taskinar, his conquered competitor, who, to be revenged, had bought a cargo of wild beasts, reptiles, and other objectionable creatures from a well-known purveyor to the menageries of both hemispheres, and had landed them at night in several voyages to Spencer Island. It had cost him a good deal, no doubt, to do so; but he had succeeded in infesting the property of his rival, as the English did Martinique, if we are to believe the legend, before it was handed over to France.
There was thus no more to explain of the remarkable occurrences on Phina Island.
"Well done!" exclaimed William W. Kolderup. "I could not have done better myself!"
"But with those terrible creatures," said Phina, "Spencer Island—"
"Phina Island—" interrupted Godfrey.
"Phina Island," continued the bride, with a smile, "is quite uninhabitable."
"Bah!" answered Uncle Will; "we can wait till the last lion has eaten up the last tiger!"
"And then, dearest Phina," said Godfrey, "you will not be afraid to pass a season there with me?"
"With you, my dear husband, I fear nothing from anywhere," answered Phina, "and as you have not had your voyage round the world—"
"We will have it together," said Godfrey, "and if an unlucky chance should ever make me a real Crusoe—"
"You will ever have near you the most devoted of Crusoe-esses!"

THE END.
CHAPTER I
THE "FORWARD"

"To-morrow, at low tide, the brig _Forward_, Captain K. Z----, Richard Shandon mate, will start from New Prince's Docks for an unknown destination."

The foregoing might have been read in the _Liverpool Herald_ of April 5th, 1860. The departure of a brig is an event of little importance for the most commercial port in England. Who would notice it in the midst of vessels of all sorts of tonnage and nationality that six miles of docks can hardly contain? However, from daybreak on the 6th of April a considerable crowd covered the wharfs of New Prince's Docks--the innumerable companies of sailors of the town seemed to have met there. Workmen from the neighbouring wharfs had left their work, merchants their dark counting-houses, tradesmen their shops. The different-coloured omnibuses that ran along the exterior wall of the docks brought cargoes of spectators at every moment; the town seemed to have but one pre-occupation, and that was to see the _Forward_ go out.

The _Forward_ was a vessel of a hundred and seventy tons, charged with a screw and steam-engine of a hundred and twenty horse-power. It might easily have been confounded with the other brigs in the port. But though it offered nothing curious to the eyes of the public, connoisseurs remarked certain peculiarities in it that a sailor cannot mistake. On board the _Nautilus_, anchored at a little distance, a group of sailors were hazarding a thousand conjectures about the destination of the _Forward_.

"I don't know what to think about its masting," said one; "it isn't usual for steamboats to have so much sail."

"That ship," said a quartermaster with a big red face--"that ship will have to depend more on her masts than her engine, and the topsails are the biggest because the others will be often useless. I haven't got the slightest doubt that the _Forward_ is destined for the Arctic or Antarctic seas, where the icebergs stop the wind more than is good for a brave and solid ship."

"You must be right, Mr. Cornhill," said a third sailor. "Have you noticed her stern, how straight it falls into the sea?"

"Yes," said the quartermaster, "and it is furnished with a steel cutter as sharp as a razor and capable of cutting a three-decker in two if the _Forward_ were thrown across her at top speed."

"That's certain," said a Mersey pilot; "for that 'ere vessel runs her fourteen knots an hour with her screw. It was marvellous to see her cutting the tide when she made her trial trip. I believe you, she's a quick un."

"The canvas isn't intricate either," answered Mr. Cornhill; "it goes straight before the wind, and can be managed by hand. That ship is going to try the Polar seas, or my name isn't what it is. There's something else--do you see the wide helm-port that the head of her helm goes through?"

"It's there, sure enough," answered one; "but what does that prove?"

"That proves, my boys," said Mr. Cornhill with disdainful satisfaction, "that you don't know how to put two and two together and make it four; it proves that they want to be able to take off the helm when they like, and you know it's a manoeuvre that's often necessary when you have ice to deal with."

"That's certain," answered the crew of the _Nautilus_.

"Besides," said one of them, "the way she's loaded confirms Mr. Cornhill's opinion. Clifton told me. The _Forward_ is victualled and carries coal enough for five or six years. Coals and victuals are all its cargo, with a stock of woollen garments and sealskins."

"Then," said the quartermaster, "there is no more doubt on the matter; but you, who know Clifton, didn't he tell you anything about her destination?"

"He couldn't tell me; he doesn't know; the crew was engaged without knowing. He'll only know where he's going when he gets there."

"I shouldn't wonder if they were going to the devil," said an unbeliever: "it looks like it."

"And such pay," said Clifton's friend, getting warm--"five times more than the ordinary pay. If it hadn't been for that, Richard Shandon wouldn't have found a soul to go with him. A ship with a queer shape, going nobody knows where, and looking more like not coming back than anything else, it wouldn't have suited this child."

"Whether it would have suited you or not," answered Cornhill, "you couldn't have been one of the crew of the _Forward_."

"And why, pray?"

"Because you don't fulfil the required conditions. I read that all married men were excluded, and you are in the category, so you needn't talk. Even the very name of the ship is a bold one. The _Forward_--where is it to be forwarded to? Besides, nobody knows who the captain is."
"Yes, they do," said a simple-faced young sailor.

"Why, you don't mean to say that you think Shandon is the captain of the _Forward_?" said Cornhill.

"But----" answered the young sailor--

"Why, Shandon is commander, and nothing else; he's a brave and bold sailor, an experienced whaler, and a jolly fellow worthy in every respect to be the captain, but he isn't any more captain than you or I. As to who is going to command after God on board he doesn't know any more than we do. When the moment has come the true captain will appear, no one knows how nor where, for Richard Shandon has not said and hasn't been allowed to say to what quarter of the globe he is going to direct his ship."

"But, Mr. Cornhill," continued the young sailor, "I assure you that there is someone on board who was announced in the letter, and that Mr. Shandon was offered the place of second to."

"What!" said Cornhill, frowning, "do you mean to maintain that the _Forward_ has a captain on board?"

"Yes, Mr. Cornhill."

"Where did you get your precious information from?"

"From Johnson, the boatswain."

"From Johnson?"

"Yes, sir."

"Johnson told you so?"

"He not only told me so, but he showed me the captain."

"He showed him to you!" said Cornhill, stupefied. "And who is it, pray?"

"A dog."

"What do you mean by a dog?"

"A dog on four legs."

Stupefaction reigned amongst the crew of the _Nautilus_. Under any other circumstances they would have burst out laughing. A dog captain of a vessel of a hundred and seventy tons burden! It was enough to make them laugh. But really the _Forward_ was such an extraordinary ship that they felt it might be no laughing matter, and they must be sure before they denied it. Besides, Cornhill himself didn't laugh.

"So Johnson showed you the new sort of captain, did he?" added he, addressing the young sailor, "and you saw him?"

"Yes, sir, as plainly as I see you now."

"Well, and what do you think about it?" asked the sailors of the quartermaster.

"I don't think anything," he answered shortly. "I don't think anything, except that the _Forward_ is a ship belonging to the devil, or madmen fit for nothing but Bedlam."

The sailors continued silently watching the _Forward_, whose preparations for departure were drawing to an end; there was not one of them who pretended that Johnson had only been laughing at the young sailor. The history of the dog had already made the round of the town, and amongst the crowd of spectators many a one looked out for the dog-captain and believed him to be a supernatural animal. Besides, the _Forward_ had been attracting public attention for some months past. Everything about her was marvellous; her peculiar shape, the mystery which surrounded her, the incognito kept by the captain, the way Richard Shandon had received the proposition to direct her, the careful selection of the crew, her unknown destination, suspected only by a few--all about her was strange.

To a thinker, dreamer, or philosopher nothing is more affecting than the departure of a ship; his imagination plays round the sails, sees her struggles with the sea and the wind in the adventurous journey which does not always end in port; when in addition to the ordinary incidents of departure there are extraordinary ones, even minds little given to credulity let their imagination run wild.

So it was with the _Forward_, and though the generality of people could not make the knowing remarks of Quartermaster Cornhill, it did not prevent the ship forming the subject of Liverpool gossip for three long months. The ship had been put in dock at Birkenhead, on the opposite side of the Mersey. The builders, Scott and Co., amongst the first in England, had received an estimate and detailed plan from Richard Shandon; it informed them of the exact tonnage, dimensions, and store room that the brig was to have. They saw by the details given that they had to do with a consummate seaman. As Shandon had considerable funds at his disposal, the work advanced rapidly, according to the recommendation of the owner. The brig was constructed of a solidity to withstand all tests; it was evident that she was destined to resist enormous pressure, for her ribs were built of teak-wood, a sort of Indian oak, remarkable for its extreme hardness, and were, besides, plated with iron. Sailors asked why the hull of a vessel made so evidently for resistance was not built of sheet-iron like other steamboats, and were told it was because the mysterious engineer had his own reasons for what he did.

Little by little the brig grew on the stocks, and her qualities of strength and delicacy struck connoisseurs. As the sailors of the _Nautilus_ had remarked, her stern formed a right angle with her keel; her steel prow, cast in the
workshop of R. Hawthorn, of Newcastle, shone in the sun and gave a peculiar look to the brig, though otherwise she had nothing particularly warlike about her. However, a 16-pounder cannon was installed on the forecastle; it was mounted on a pivot, so that it might easily be turned in any direction; but neither the cannon nor the stern, steel-clad as they were, succeeded in looking warlike.

On the 5th of February, 1860, this strange vessel was launched in the midst of an immense concourse of spectators, and the trial trip was perfectly successful. But if the brig was neither a man-of-war, a merchant vessel, nor a pleasure yacht--for a pleasure trip is not made with six years' provisions in the hold--what was it? Was it a vessel destined for another Franklin expedition? It could not be, because in 1859, the preceding year, Captain McClintock had returned from the Arctic seas, bringing the certain proof of the loss of the unfortunate expedition.

Was the _Forward_ going to attempt the famous North-West passage? What would be the use? Captain McClure had discovered it in 1853, and his lieutenant, Creswell, was the first who had the honour of rounding the American continent from Behring's Straits to Davis's Straits. Still it was certain to competent judges that the _Forward_ was prepared to face the ice regions. Was it going to the South Pole, farther than the whaler Weddell or Captain James Ross? But, if so, what for?

The day after the brig was floated her engine was sent from Hawthorn's foundry at Newcastle. It was of a hundred and twenty horse-power, with oscillating cylinders, taking up little room; its power was considerable for a hundred-and-seventy-ton brig, with so much sail, too, and of such fleetness. Her trial trips had left no doubt on that subject, and even the boatswain, Johnson, had thought right to express his opinion to Clifton's friend--

"When the _Forward_ uses her engine and sails at the same time, her sails will make her go the quickest."

Clifton's friend did not understand him, but he thought anything possible of a ship commanded by a dog. After the engine was installed on board, the stowage of provisions began. This was no slight work, for the vessel was to carry enough for six years. They consisted of dry and salted meat, smoked fish, biscuit, and flour; mountains of tea and coffee were thrown down the shafts in perfect avalanches. Richard Shandon presided over the management of this precious cargo like a man who knows what he is about; all was stowed away, ticketed, and numbered in perfect order; a very large provision of the Indian preparation called pemmican, which contains many nutritive elements in a small volume, was also embarked. The nature of the provisions left no doubt about the length of the cruise, and the sight of the barrels of lime-juice, lime-drops, packets of mustard, grains of sorrel and _cochlearia_, all antiscorbutic, confirmed the opinion on the destination of the brig for the ice regions; their influence is so necessary in Polar navigation. Shandon had doubtless received particular instructions about this part of the cargo, which, along with the medicine-chest, he attended to particularly.

Although arms were not numerous on board, the powder-magazine overflowed. The one cannon could not pretend to use the contents. That gave people more to think about. There were also gigantic saws and powerful instruments, such as levers, leaden maces, handsaws, enormous axes, etc., without counting a considerable quantity of blasting cylinders, enough to blow up the Liverpool Customs—all that was strange, not to say fearful, without mentioning rockets, signals, powder-chests, and beacons of a thousand different sorts. The numerous spectators on the wharfs of Prince's Docks admired likewise a long mahogany whaler, a tin _pirogue_ covered with gutta-percha, and a certain quantity of halkett-boats, a sort of indiarubber cloaks that can be transformed into canoes by blowing in their lining. Expectation was on the _qui vive_, for the _Forward_ was going out with the tide.

CHAPTER II
AN UNEXPECTED LETTER

The letter received by Richard Shandon, eight months before, ran as follows:--

"ABERDEEN,
"August 2nd, 1859.
"To Mr. Richard Shandon,
"Liverpool.

"SIR,—I beg to advise you that the sum of sixteen thousand pounds sterling has been placed in the hands of Messrs. Marcuart and Co., bankers, of Liverpool. I join herewith a series of cheques, signed by me, which will allow you to draw upon the said Messrs. Marcuart for the above-mentioned sum. You do not know me, but that is of no consequence. I know you: that is sufficient. I offer you the place of second on board the brig _Forward_ for a voyage that may be long and perilous. If you agree to my conditions you will receive a salary of 500 pounds, and all through the voyage it will be augmented one-tenth at the end of each year. The _Forward_ is not yet in existence. You must have it built so as to be ready for sea at the beginning of April, 1860, at the latest. Herewith is a detailed plan and estimate. You will take care that it is scrupulously followed. The ship is to be built by Messrs. Scott and Co., who will settle with you. I particularly recommend you the choice of the _Forward's_ crew; it will be composed
of a captain, myself, of a second, you, of a third officer, a boatswain, two engineers, an ice pilot, eight sailors, and
two others, eighteen men in all, comprising Dr. Clawbonny, of this town, who will introduce himself to you when
necessary. The _Forward’s_ crew must be composed of Englishmen without incumbrance; they should be all
bachelors and sober—for no spirits, nor even beer, will be allowed on board—ready to undertake anything, and to
bear with anything. You will give the preference to men of a sanguine constitution, as they carry a greater amount
of animal heat. Offer them five times the usual pay, with an increase of one-tenth for each year of service. At the end of
the voyage five hundred pounds will be placed at the disposition of each, and two thousand at yours. These funds
will be placed with Messrs. Marcuart and Co. The voyage will be long and difficult, but honourable, so you need not
hesitate to accept my conditions. Be good enough to send your answer to K. Z., Poste Restante, Goteborg, Sweden.

"P.S.--On the 15th of February next you will receive a large Danish dog, with hanging lips, and tawny coat with
black stripes. You will take it on board and have it fed with oaten bread, mixed with tallow grease. You will
acknowledge the reception of the said dog to me under the same initials as above, Poste Restante, Leghorn, Italy.

"The captain of the _Forward_ will introduce himself to you when necessary. When you are ready to start you
will receive further instructions.

"THE CAPTAIN OF THE 'FORWARD,'

"K. Z."

CHAPTER III

DR. CLAWBONNY

Richard Shandon was a good sailor; he had been commander of whalers in the Arctic seas for many years, and
had a wide reputation for skill. He might well be astonished at such a letter, and so he was, but astonished like a man
used to astonishments. He fulfilled, too, all the required conditions: he had no wife, children, or relations; he was as
free as a man could be. Having no one to consult, he went straight to Messrs. Marcuart's bank.

"If the money is there," he said to himself, "I'll undertake the rest."

He was received by the firm with all the attention due to a man with sixteen thousand pounds in their safes. Sure
of that fact, Shandon asked for a sheet of letter-paper, and sent his acceptance in a large sailor's hand to the address
indicated. The same day he put himself in communication with the Birkenhead shipbuilders, and twenty-four hours
later the keel of the _Forward_ lay on the stocks in the dockyard.

Richard Shandon was a bachelor of forty, robust, energetic, and brave, three sailor-like qualities, giving their
possessor confidence, vigour, and _sang-froid_. He was reputed jealous and hard to be pleased, so he was more
feared than loved by his sailors. But this reputation did not increase the difficulty of finding a crew, for he was
known to be a clever commander. He was afraid that the mystery of the enterprise would embarrass his movements,
and he said to himself, "The best thing I can do is to say nothing at all; there are sea-dogs who will want to know the
why and the wherefore of the business, and as I know nothing myself, I can't tell them. K. Z. is a queer fish, but after
all he knows me, and has confidence in me; that's enough. As to the ship, she will be a handsome lass, and my name
isn't Richard Shandon if she is not destined for the Frozen Seas. But I shall keep that to myself and my officers."

Upon which Richard Shandon set about recruiting his crew upon the conditions of family and health exacted by
the captain. He knew a brave fellow and capital sailor, named James Wall. Wall was about thirty, and had made
more than one trip to the North Seas. Shandon offered him the post of third officer, and he accepted blindly; all he
cared for was to sail, as he was devoted to his profession. Shandon told him and Johnson (whom he engaged as
boatswain) all he knew about the business.

"Just as soon go there as anywhere else," answered Wall. "If it's to seek the North-West passage, many have
been and come back."

"Been, yes; but come back I don't answer for," said Johnson; "but that's no reason for not going."

"Besides, if we are not mistaken in our conjectures," said Shandon, "the voyage will be undertaken under good
conditions. The _Forward's_ a bonny lass, with a good engine, and will stand wear and tear. Eighteen men are all the
crew we want."

"Eighteen men?" said Johnson. "That's just the number that the American, Kane, had on board when he made his
famous voyage towards the North Pole."

"It's a singular fact that there's always some private individual trying to cross the sea from Davis's Straits to
Behring's Straits. The Franklin expeditions have already cost England more than seven hundred and sixty thousand
pounds without producing any practical result. Who the devil means to risk his fortune in such an enterprise?"

"We are reasoning now on a simple hypothesis," said Shandon. "I don't know if we are really going to the
Northern or Southern Seas. Perhaps we are going on a voyage of discovery. We shall know more when Dr.
Clawbonny comes; I daresay he will tell us all about it."
"There's nothing for it but to wait," answered Johnson; "I'll go and hunt up some solid subjects, captain; and as to their animal heat, I guarantee beforehand you can trust me for that."

Johnson was a valuable acquisition; he understood the navigation of these high latitudes. He was quartermaster on board the _Phoenix_, one of the vessels of the Franklin expedition of 1853. He was witness of the death of the French lieutenant Bellot, whom he had accompanied in his expedition across the ice. Johnson knew the maritime population of Liverpool, and started at once on his recruiting expedition. Shandon, Wall, and he did their work so well that the crew was complete in the beginning of December. It had been a difficult task; many, tempted by the high pay, felt frightened at the risk, and more than one enlisted boldly who came afterwards to take back his word and enlistment money, dissuaded by his friends from undertaking such an enterprise. All of them tried to pierce the mystery, and worried Shandon with questions; he sent them to Johnson.

"I can't tell you what I don't know," he answered invariably; "you'll be in good company, that's all I can tell you. You can take it or leave it alone."

And the greater number took it. "I have only to choose," added the boatswain; "such salary has never been heard of in the memory of sailors, and then the certainty of finding a handsome capital when we come back. Only think: it's tempting enough."

"The fact is," answered the sailor, "it is tempting; enough to live on till the end of one's days."

"I don't hide from you," continued Johnson, "that the cruise will be long, painful, and perilous; that is formally stated in our instructions, and you ought to know what you undertake; you will very likely be required to attempt all that it is possible for human beings to do, and perhaps more. If you are the least bit frightened, if you don't think you may just as well finish yonder as here, you'd better not enlist, but give way to a bolder man."

"But, Mr. Johnson," continued the sailor, for the want of something better to say, "at least you know the captain?"

"The captain is Richard Shandon till another comes."

Richard Shandon, in his secret heart, hoped that the command would remain with him, and that at the last moment he should receive precise instructions as to the destination of the _Forward_. He did all he could to spread the report in his conversations with his officers, or when following the construction of the brig as it grew in the Birkenhead dockyard, looking like the ribs of a whale turned upside down. Shandon and Johnson kept strictly to their instructions touching the health of the sailors who were to form the crew; they all looked hale and hearty, and had enough heat in their bodies to suffice for the engine of the _Forward_; their supple limbs, their clear and florid complexions were fit to react against the action of intense cold. They were confident and resolute men, energetically and solidly constituted. Of course they were not all equally vigorous; Shandon had even hesitated about taking some of them, such as the sailors Gripper and Garry, and the harpooner Simpson, because they looked rather thin; but, on the whole, their build was good; they were a warm-hearted lot, and their engagement was signed.

All the crew belonged to the same sect of the Protestant religion; during these long campaigns prayer in common and the reading of the Bible have a good influence over the men and sustain them in the hour of discouragement; it was therefore important that they should be all of the same way of thinking. Shandon knew by experience the utility of these practices, and their influence on the mind of the crew; they are always employed on board ships that are intended to winter in the Polar Seas. The crew once got together, Shandon and his two officers set about the provisions; they strictly followed the instructions of the captain; these instructions were clear, precise, and detailed, and the least articles were put down with their quality and quantity. Thanks to the cheques at the commander's disposition, every article was paid for at once with a discount of 8 per cent, which Richard carefully placed to the credit of K. Z.

Crew, provisions, and cargo were ready by January, 1860; the _Forward_ began to look shipshape, and Shandon went daily to Birkenhead. On the morning of the 23rd of January he was, as usual, on board one of the Mersey ferry-boats with a helm at either end to prevent having to turn it; there was a thick fog, and the sailors of the river were obliged to direct their course by means of the compass, though the passage lasts scarcely ten minutes. But the thickness of the fog did not prevent Shandon seeing a man of short stature, rather fat, with an intelligent and merry face and an amiable look, who came up to him, took him by the two hands, and shook them with an ardour, a petulance, and a familiarity "quite meridional," as a Frenchman would have said. But if this person did not come from the South, he had got his temperament there; he talked and gesticulated with volubility; his thought must come out or the machine would burst. His eyes, small as those of witty men generally are, his mouth, large and mobile, were safety-pipes which allowed him to give passage to his overflowing thoughts; he talked, and talked, and talked so much and so fast that Shandon couldn't understand a word he said. However, this did not prevent the _Forward_'s mate from recognising the little man he had never seen before; a lightning flash traversed his mind, and when the other paused to take breath, Shandon made haste to get out the words, "Doctor Clawbonny!"

"Himself in person, commander! I've been at least half a quarter of an hour looking for you, asking everybody
everywhere! Just think how impatient I got; five minutes more and I should have lost my head! And so you are the commander Richard? You really exist? You are not a myth? Your hand, your hand! I want to shake it again. It is Richard Shandon's hand, and if there is a commander Shandon, there's a brig _Forward_ to command; and if he commands he will start, and if he starts he'll take Dr. Clawbonny on board."

"Well, yes, doctor, I am Richard Shandon; there is a brig _Forward_, and it will start."

"That's logic," answered the doctor, after taking in a large provision of breathing air--"that's logic. And I am ready to jump for joy at having my dearest wishes gratified. I've wanted to undertake such a voyage. Now with you, commander---"

"I don't----" began Shandon.

"With you," continued Clawbonny, without hearing him, "we are sure to go far and not to draw back for a trifle."

"But----" began Shandon again.

"For you have shown what you are made of, commander; I know your deeds of service. You are a fine sailor!"

"If you will allow me----"

"No, I won't have your bravery, audacity, and skill put an instant in doubt, even by you! The captain who chose you for his mate is a man who knows what he's about, I can tell you."

"But that's nothing to do with it," said Shandon, impatient.

"What is it, then? Don't keep me in suspense another minute."

"You don't give me time to speak. Tell me, if you please, doctor, how it comes that you are to take part in the expedition of the _Forward_."

"Read this letter, this worthy letter, the letter of a brave captain--very laconic, but quite sufficient."

Saying which the doctor held out the following letter to Shandon:--

"INVERNESS,

Jan. 22nd, 1860.

"To Dr. Clawbonny.

"If Dr. Clawbonny wishes to embark on board the _Forward_ for a long cruise, he may introduce himself to the commander, Richard Shandon, who has received orders concerning him.

"THE CAPTAIN OF THE 'FORWARD,'

"K. Z."

"This letter reached me this morning, and here I am, ready to embark."

"But, doctor, do you know where we are going to?"

"I haven't the slightest idea, and I do not care so that it is somewhere. They pretend that I am learned; they are mistaken, commander. I know nothing, and if I have published a few books that don't sell badly, I ought not to have done it; the public is silly for buying them. I know nothing, I tell you. I am only an ignorant man. When I have the offer of completing, or rather of going over again, my knowledge of medicine, surgery, history, geography, botany, mineralogy, conchology, geodesy, chemistry, natural philosophy, mechanics, and hydrography, why I accept, of course."

"Then," said Shandon, disappointed, "you do not know where the _Forward_ is bound for?"

"Yes, I do; it is bound for where there is something to learn, to discover, and to compare--where we shall meet with other customs, other countries, other nations, to study in the exercise of their functions; it is going, in short, where I have never been."

"But I want to know something more definite than that," cried Shandon.

"Well, I have heard that we are bound for the Northern Seas."

"At least," asked Shandon, "you know the captain?"

"Not the least bit in the world! But he is an honest fellow, you may believe me."

The commander and the doctor disembarked at Birkenhead; the former told the doctor all he knew about the situation of things, and the mystery inflamed the imagination of the doctor. The sight of the brig caused him transports of joy. From that day he stopped with Shandon, and went every day to pay a visit to the shell of the _Forward_. Besides, he was specially appointed to overlook the installation of the ship's medicine-chest. For Dr. Clawbonny was a doctor, and a good one, though practising little. At the age of twenty-five he was an ordinary practitioner; at the age of forty he was a _savant_, well known in the town; he was an influential member of all the literary and scientific institutions of Liverpool. His fortune allowed him to distribute counsels which were none the worse for being gratuitous; beloved as a man eminently lovable must always be, he had never wronged any one, not even himself; lively and talkative, he carried his heart in his hand, and put his hand into that of everybody. When it was known in Liverpool that he was going to embark on board the _Forward_ his friends did all they could to dissuade him, and only fixed him more completely in his determination, and when the doctor was determined to do anything no one could prevent him. From that time the suppositions and apprehensions increased, but did not
CHAPTER IV
DOG-CAPTAIN

The day of departure arrived with the 5th of April. The admission of the doctor on board had given the crew more confidence. They knew that where the worthy doctor went they could follow. However, the sailors were still uneasy, and Shandon, fearing that some of them would desert, wished to be off. With the coast out of sight, they would make up their mind to the inevitable.

Dr. Clawbonny's cabin was situated at the end of the poop, and occupied all the stern of the vessel. The captain's and mate's cabins gave upon deck. The captain's remained hermetically closed, after being furnished with different instruments, furniture, travelling garments, books, clothes for changing, and utensils, indicated in a detailed list. According to the wish of the captain, the key of the cabin was sent to Lubeck; he alone could enter his room. This detail vexed Shandon, and took away all chance of the chief command. As to his own cabin, he had perfectly appropriated it to the needs of the presumed voyage, for he thoroughly understood the needs of a Polar expedition. The room of the third officer was placed under the lower deck, which formed a vast sleeping-room for the sailors' use; the men were very comfortably lodged, and would not have found anything like the same convenience on board any other ship; they were cared for like the most priceless cargo: a vast stove occupied all the centre of the common room. Dr. Clawbonny was in his element; he had taken possession of his cabin on the 6th of February, the day after the _Forward_ was launched.

"The happiest of animals," he used to say, "is a snail, for it can make a shell exactly to fit it; I shall try to be an intelligent snail."

And considering that the shell was to be his lodging for a considerable time, the cabin began to look like home; the doctor had a _savant's_ or a child's pleasure in arranging his scientific traps. His books, his herbs, his set of pigeon-holes, his instruments of precision, his chemical apparatus, his collection of thermometers, barometers, hygrometers, rain-gauges, spectacles, compasses, sextants, maps, plans, flasks, powders, bottles for medicine-chest, were all classed in an order that would have shamed the British Museum. The space of six square feet contained incalculable riches: the doctor had only to stretch out his hand without moving to become instantaneously a doctor, a mathematician, an astronomer, a geographer, a botanist, or a conchologist. It must be acknowledged that he was proud of his management and happy in his floating sanctuary, which three of his thinnest friends would have sufficed to fill. His friends came to it in such numbers that even a man as easy-going as the doctor might have said with Socrates, "My house is small, but may it please Heaven never to fill it with friends!"

To complete the description of the _Forward_ it is sufficient to say that the kennel of the large Danish dog was constructed under the window of the mysterious cabin but its savage inhabitant preferred wandering between decks and in the hold; it seemed impossible to tame him, and no one had been able to become his master; during the night he howled lamentably, making the hollows of the ship ring in a sinister fashion. Was it regret for his absent master? Was it the instinct of knowing that he was starting for a perilous voyage? Was it a presentiment of dangers to come? The sailors decided that it was for the latter reason, and more than one pretended to joke who believed seriously that the dog was of a diabolical kind. Pen, who was a brutal man, was going to strike him once, when he fell, unfortunately, against the angle of the capstan, and made a frightful wound in his head. Of course this accident was placed to the account of the fantastic animal. Clifton, the most superstitious of the crew, made the singular observation that when the dog was on the poop he always walked on the windward side, and afterwards, when the brig was out at sea, and altered its tack, the surprising animal changed its direction with the wind the same as the captain of the _Forward_ would have done in his place. Dr. Clawbonny, whose kindness and caresses would have tamed a tiger, tried in vain to win the good graces of the dog; he lost his time and his pains. The animal did not answer to any name ever written in the dog calendar, and the crew ended by calling him Captain, for he appeared perfectly conversant with ship customs; it was evident that it was not his first trip. From such facts it is easy to
understand the boatswain's answer to Clifton's friend, and the credulity of those who heard it; more than one repeated jokingly that he expected one day to see the dog take human shape and command the manoeuvres with a resounding voice.

If Richard Shandon did not feel the same apprehensions he was not without anxiety, and the day before the departure, in the evening of April 5th, he had a conversation on the subject with the doctor, Wall, and Johnson in the poop cabin. These four persons were tasting their tenth grog, and probably their last, for the letter from Aberdeen had ordered that all the crew, from the captain to the stoker, should be teetotallers, and that there should be no wine, beer, nor spirits on board except those given by the doctor's orders. The conversation had been going on about the departure for the last hour. If the instructions of the captain were realised to the end, Shandon would receive his last instructions the next day.

"If the letter," said the commander, "does not tell me the captain's name, it must at least tell me the destination of the brig, or I shall not know where to take her to."

"If I were you," said the impatient doctor, "I should start whether I get a letter or no; they'll know how to send after you, you may depend."

"You are ready for anything, doctor; but if so, to what quarter of the globe should you set sail?"

"To the North Pole, of course; there's not the slightest doubt about that."

"Why should it not be the South Pole?" asked Wall.

"The South Pole is out of the question. No one with any sense would send a brig across the whole of the Atlantic. Just reflect a minute, and you'll see the impossibility."

"The doctor has an answer to everything," said Wall.

"Well, we'll say north," continued Shandon. "But where north? To Spitzbergen or Greenland? Labrador or Hudson's Bay? Although all directions end in insuperable icebergs, I am not less puzzled as to which to take. Have you an answer to that, doctor?"

"No," he answered, vexed at having nothing to say; "but if you don't get a letter what shall you do?"

"I shall do nothing; I shall wait."

"Do you mean to say you won't start?" cried Dr. Clawbonny, agitating his glass in despair.

"Certainly I do."

"And that would be the wisest plan," said Johnson tranquilly, while the doctor began marching round the table, for he could not keep still; "but still, if we wait too long, the consequences may be deplorable; the season is good now if we are really going north, as we ought to profit by the breaking up of the ice to cross Davis's Straits; besides, the crew gets more and more uneasy; the friends and companions of our men do all they can to persuade them to leave the _Forward_, and their influence may be pernicious for us."

"Besides," added Wall, "if one of them deserted they all would, and then I don't know how you would get another crew together."

"But what can I do?" cried Shandon.

"What you said you would do," replied the doctor; "wait and wait till to-morrow before you despair. The captain's promises have all been fulfilled up to now with the greatest regularity, and there's no reason to believe we shan't be made acquainted with our destination when the proper time comes. I haven't the slightest doubt that to-morrow we shall be sailing in the Irish Channel, and I propose we drink a last grog to our pleasant voyage. It begins in an unaccountable fashion, but with sailors like you there are a thousand chances that it will end well."

And all four drank to their safe return.

"Now, commander," continued Johnson, "if you will allow me to advise you, you will prepare everything to start; the crew must think that you know what you are about. If you don't get a letter to-morrow, set sail; do not get up the steam, the wind looks like holding out, and it will be easy enough to sail; let the pilot come on board; go out of the docks with the tide, and anchor below Birkenhead; our men won't be able to communicate with land, and if the devil of a letter comes it will find us as easily there as elsewhere."

"By heavens! you are right, Johnson!" cried the doctor, holding out his hand to the old sailor.

"So be it," answered Shandon.

Then each one entered his cabin, and waited in feverish sleep for the rising of the sun. The next day the first distribution of letters took place in the town, and not one bore the address of the commander, Richard Shandon. Nevertheless, he made his preparations for departure, and the news spread at once all over Liverpool, and, as we have already seen, an extraordinary affluence of spectators crowded the wharfs of New Prince's Docks. Many of them came on board to shake hands for the last time with a comrade, or to try and dissuade a friend, or to take a look at the brig, and to know its destination; they were disappointed at finding the commander more taciturn and reserved than ever. He had his reasons for that.

Ten o'clock struck. Eleven followed. The tide began to go out that day at about one o'clock in the afternoon.
Shandon from the top of the poop was looking at the crowd with uneasy eyes, trying to read the secret of his destiny on one of the faces. But in vain. The sailors of the _Forward_ executed his orders in silence, looking at him all the time, waiting for orders which did not come. Johnson went on preparing for departure. The weather was cloudy and the sea rough; a south-easter blew with violence, but it was easy to get out of the Mersey.

At twelve o'clock nothing had yet been received. Dr. Clawbonny marched up and down in agitation, looking through his telescope, gesticulating, impatient for the sea, as he said. He felt moved, though he struggled against it. Shandon bit his lips till the blood came. Johnson came up to him and said--

"Commander, if we want to profit by the tide, there is no time to be lost; we shall not be clear of the docks for at least an hour."

Shandon looked round him once more and consulted his watch. The twelve o'clock letters had been distributed. In despair he told Johnson to start. The boatswain ordered the deck to be cleared of spectators, and the crowd made a general movement to regain the wharves while the last moorings were unloosed. Amidst the confusion a dog's bark was distinctly heard, and all at once the animal broke through the compact mass, jumped on to the poop, and, as a thousand spectators can testify, dropped a letter at Shandon's feet.

"A letter!" cried Shandon. "He is on board, then?"

"He was, that's certain, but he isn't now," said Johnson, pointing to the deserted deck.

Shandon held the letter without opening it in his astonishment.

"But read it, read it, I say," said the doctor.

Shandon looked at it. The envelope had no postmark or date; it was addressed simply to:

"RICHARD SHANDON,
"Commander on board the brig
"_Forward_."

Shandon opened the letter and read as follows:---

"Sail for Cape Farewell. You will reach it by the 20th of April. If the captain does not appear on board, cross Davis's Straits, and sail up Baffin's Sea to Melville Bay.

"THE CAPTAIN OF THE 'FORWARD',
"K. Z."

Shandon carefully folded this laconic epistle, put it in his pocket, and gave the order for departure. His voice, which rang above the east wind, had something solemn in it.

Soon the _Forward_ had passed the docks, and directed by a Liverpool pilot whose little cutter followed, went down the Mersey with the current. The crowd precipitated itself on to the exterior wharf along the Victoria Docks in order to get a last glimpse of the strange brig. The two topsails, the foresail and the brigantine sail were rapidly set up, and the _Forward_, worthy of its name, after having rounded Birkenhead Point, sailed with extraordinary fleetness into the Irish Sea.

CHAPTER V
OUT AT SEA

The wind was favourable, though it blew in April gales. The _Forward_ cut through the waves, and towards three o'clock crossed the mail steamer between Liverpool and the Isle of Man. The captain hailed from his deck the last adieu that the _Forward_ was destined to hear.

At five o'clock the pilot left the command in the hands of Richard Shandon, the commander of the brig, and regained his cutter, which, turning round, soon disappeared on the south-west. Towards evening the brig doubled the Calf of Man at the southern extremity of the island. During the night the sea was very rough, but the _Forward_ behaved well, left the point of Ayr to the north-west, and directed its course for the Northern Channel. Johnson was right; once out at sea the maritime instinct of the sailors gained the upper hand. Life on board went on with regularity.

The doctor breathed in the sea air with delight; he walked about vigorously in the squalls, and for a _savant_ he was not a bad sailor.

"The sea is splendid," said he to Johnson, coming up on deck after breakfast. "I have made its acquaintance rather late, but I shall make up for lost time."

"You are right, Mr. Clawbonny. I would give all the continents of the world for a corner of the ocean. They pretend that sailors soon get tired of their profession, but I've been forty years on the sea and I love it as much as the first day."

"It is a great pleasure to feel a good ship under one's feet, and if I'm not a bad judge the _Forward_ behaves herself well."
"You judge rightly, doctor," answered Shandon, who had joined the talkers; "she is a good ship, and I acknowledge that a vessel destined for navigation amongst ice has never been better equipped. That reminds me that thirty years ago Captain James Ross, sailing for the North-West passage-----"

"In the _Victory_," added the doctor quickly, "a brig about the same tonnage as ours, with a steam-engine too."

"What! you know about that?"

"Judge if I do," answered the doctor. "Machines were then in their infancy, and the _Victory's_ kept her back; the captain, James Ross, after having vainly repaired it bit by bit, finished by taking it down, and abandoned it at his first winter quarters."

"The devil!" said Shandon. "You know all about it, I see."

"Yes. I've read the works of Parry, Ross, and Franklin, and the reports of McClure, Kennedy, Kane, and McClintock, and I remember something of what I've read. I can tell you, too, that this same McClintock, on board the _Fox_, a screw brig in the style of ours, went easier to his destination than any of the men who preceded him."

"That's perfectly true," answered Shandon; "he was a bold sailor was McClintock; I saw him at work. You may add that, like him, we shall find ourselves in Davis's Straits in April, and if we succeed in passing the ice our voyage will be considerably advanced."

"Unless," added the doctor, "it happens to us like it did to the _Fox_ in 1857, to be caught the very first year by the ice in Baffin's Sea, and have to winter in the midst of the icebergs."

"We must hope for better luck," answered Johnson. "If a ship like the _Forward_ can't take us where we want to go, we must renounce all hope for ever."

"Besides," said the doctor, "if the captain is on board he will know better than we do what must be done. We know nothing as yet; his letter says nothing about what our voyage is for."

"It is a good deal to know which way to go," answered Shandon quickly. "We can do without the captain and his instructions for another month at least. Besides, you know what I think about it."

"A short time ago," said the doctor, "I thought like you that the captain would never appear, and that you would remain commander of the ship; but now---"

"Now what?" replied Shandon in an impatient tone.

"Since the arrival of the second letter I have modified that opinion."

"Why, doctor?"

"Because the letter tells you the route to follow, but leaves you ignorant of the _Forward's_ destination; and we must know where we are going to. How the deuce are you to get a letter now we are out at sea? On the coast of Greenland the service of the post must leave much to wish for. I believe that our gentleman is waiting for us in some Danish settlement--at Holsteinborg or Uppernawik; he has evidently gone there to complete his cargo of sealskins, buy his sledges and dog, and, in short, get together all the tackle wanted for a voyage in the Arctic Seas. I shouldn't be at all surprised to see him come out of his cabin one of these fine mornings and begin commanding the ship in anything but a supernatural way."

"It's possible," answered Shandon drily; "but in the meantime the wind is getting up, and I can't risk my gallant sails in such weather."

Shandon left the doctor and gave the order to reef the topsails.

"He takes it to heart," said the doctor to the boatswain.

"Yes," answered the latter, "and it's a great pity, for you may be right, Mr. Clawbonny."

In the evening of Saturday the _Forward_ doubled the Mull of Galloway, whose lighthouse shone to the north-east; during the night they left the Mull of Cantyre to the north, and Cape Fair, on the coast of Ireland, to the east. Towards three o'clock in the morning, the brig, leaving Rathlin Island on her starboard side, disembogued by the Northern Channel into the ocean. It was Sunday, the 8th of April, and the doctor read some chapters of the Bible to the assembled seamen. The wind then became a perfect hurricane, and tended to throw the brig on to the Irish coast; she pitched, and rolled, and tossed, and if the doctor was not seasick it was because he would not be, for nothing was easier. At noon Cape Malinhead disappeared towards the south; it was the last European ground that these bold sailors were to perceive, and more than one watched it out of sight, destined never to see it again. They were then in 55 degrees 57 minutes latitude and 7 degrees 40 minutes longitude by the Greenwich meridian.

The storm spent itself out about nine o'clock in the evening; the _Forward_, like a good sailor, maintained her route north-west. She showed by her behaviour during the day what her sailing capacities were, and as the Liverpool connoisseurs had remarked, she was above all, a sailing vessel. During the following days the _Forward_ gained the north-west with rapidity; the wind veered round south, and the sea had a tremendous swell on; the brig was then going along under full sail. Some petrels and puffins came sailing over the poop; the doctor skilfully shot one of the latter, and it fell, fortunately, on the deck. The harpooner, Simpson, picked it up and brought it to its owner.

"Nasty game that, Mr. Clawbonny," he said.
"It will make an excellent meal, on the contrary," said the doctor.

"You don't mean to say you are going to eat that thing?"

"And so are you, old fellow," said the doctor, laughing.

"Poh!" replied Simpson, "but it's oily and rancid, like all other sea birds."

"Never mind!" answered the doctor, "I have a peculiar way of cooking that game, and if you recognise it for a sea bird I'll consent never to kill another in my life."

"Do you know how to cook, then?"

"A _savant_ ought to know how to do a little of everything."

"You'd better take care, Simpson," said the boatswain; "the doctor's a clever man, and he'll make you take this puffin for a grouse."

The fact is that the doctor was quite right about his fowl; he took off all the fat, which all lies under the skin, principally on the thighs, and with it disappeared the rancidity and taste of fish which is so disagreeable in a sea bird. Thus prepared the puffin was declared excellent, and Simpson acknowledged it the first.

During the late storm Richard Shandon had been able to judge of the qualities of his crew; he had watched each man narrowly, and knew how much each was to be depended upon.

James Wall was devoted to Richard, understood quickly and executed well, but he might fail in initiative; he placed him in the third rank. Johnson was used to struggle with the sea; he was an old stager in the Arctic Ocean, and had nothing to learn either in audacity or _sang-froid_. The harpooner, Simpson, and the carpenter, Bell, were sure men, faithful to duty and discipline. The ice-master, Foker, was an experienced sailor, and, like Johnson, was capable of rendering important service. Of the other sailors Garry and Bolton seemed to be the best; Bolton was a gay and talkative fellow; Garry was thirty-five, with an energetic face, but rather pale and sad-looking. The three sailors, Clifton, Gripper, and Pen, seemed less ardent and resolute; they easily grumbled. Gripper wanted to break his engagement even before the departure of the _Forward_; a sort of shame kept him on board. If things went on all right, if there were not too many risks to run, no dangers to encounter, these three men might be depended upon; but they must be well fed, for it might be said that they were led by their stomachs. Although warned beforehand, they grumbled at having to be teetotallers; at their meals they regretted the brandy and gin; it did not, however, make them spare the tea and coffee, which was prodigally given out on board. As to the two engineers, Brunton and Plover, and the stoker, Warren, there had been nothing for them to do as yet, and Shandon could not tell anything about their capabilities.

On the 14th of April the _Forward_ got into the grand current of the Gulf Stream, which, after ascending the eastern coast of America to Newfoundland, inclines to the north-east along the coast of Norway. They were then in 57 degrees 37 minutes latitude by 22 degrees 58 minutes longitude, at two hundred miles from the point of Greenland. The weather grew colder, and the thermometer descended to thirty-two degrees, that is to say to freezing point.

The doctor had not yet begun to wear the garments he destined for the Arctic Seas, but he had donned a sailor's dress like the rest; he was a queer sight with his top-boots, in which his legs disappeared, his vast oilcloth hat, his jacket and trousers of the same; when drenched with heavy rains or enormous waves the doctor looked like a sort of sea-animal, and was proud of the comparison.

During two days the sea was extremely rough; the wind veered round to the north-west, and delayed the progress of the _Forward_. From the 14th to the 16th of April the swell was great, but on the Monday there came such a torrent of rain that the sea became calm immediately. Shandon spoke to the doctor about this phenomenon.

"It confirms the curious observations of the whaler Scoresby, who laid it before the Royal Society of Edinburgh, of which I have the honour to be an honorary member. You see that when it rains the waves are not very high, even under the influence of a violent wind, and when the weather is dry the sea is more agitated, even when there is less wind."

"But how is this phenomenon accounted for?"

"Very simply; it is not accounted for at all."

Just then the ice-master, who was keeping watch on the crossbars of the topsails, signalled a floating mass on the starboard, at about fifteen miles distance before the wind.

"An iceberg here!" cried the doctor.

Shandon pointed his telescope in the direction indicated, and confirmed the pilot's announcement.

"That is curious!" said the doctor.

"What! you are astonished at last!" said the commander, laughing.

"I am surprised, but not astonished," answered the doctor, laughing; "for the brig _Ann_ of Poole, from Greenspon'd, was caught in 1813 in perfect ice-fields, in the forty-fourth degree of north latitude, and her captain, Dayerment, counted them by hundreds!"
"I see you can teach us something, even upon that subject."

"Very little," answered Clawbonny modestly; "it is only that ice has been met with in even lower latitudes."

"I knew that already, doctor, for when I was cabinboy on board the war-sloop _Fly_."

"In 1818," continued the doctor, "at the end of March, almost in April, you passed between two large islands of floating ice under the forty-second degree of latitude."

"Well, I declare you astonish me!" cried Shandon.

"But the iceberg doesn't astonish me, as we are two degrees further north."

"You are a well, doctor," answered the commander; "and all we have to do is to be water-buckets."

"You will draw me dry sooner than you think for; and now, Shandon, if we could get a nearer look at this phenomenon, I should be the happiest of doctors."

"Just so, Johnson," said Shandon, calling his boatswain. "It seems to me that the breeze is getting up."

"Yes, commander," answered Johnson; "we are making very little way, and the currents of Davis's Straits will soon be against us."

"You are right, Johnson, and if we wish to be in sight of Cape Farewell on the 20th of April we must put the steam on, or we shall be thrown on the coasts of Labrador. Mr. Wall, will you give orders to light the fires?"

The commander's orders were executed, an hour afterwards the steam was up, the sails were furled, and the screw cutting the waves sent the _Forward_ against the north-west wind.

CHAPTER VI
THE GREAT POLAR CURRENT

A short time after the flights of birds became more and more numerous. Petrels, puffins, and mates, inhabitants of those desolate quarters, signalled the approach of Greenland. The _Forward_ was rapidly nearing the north, leaving to her leeward a long line of black smoke.

On Tuesday the 17th of April, about eleven o'clock in the morning, the ice-master signalled the first sight of the ice-blink; it was about twenty miles to the N.N.W. This glaring white strip was brilliantly lighted up, in spite of the presence of thick clouds in the neighbouring parts of the sky. Experienced people on board could make no mistake about this phenomenon, and declared, from its whiteness, that the blink was owing to a large ice-field, situated at about thirty miles out of sight, and that it proceeded from the reflection of luminous rays. Towards evening the wind turned round to the south, and became favourable; Shandon put on all sail, and for economy's sake caused the fires to be put out. The _Forward_, under her topsails and foresails, glided on towards Cape Farewell.

At three o'clock on the 18th they came across the ice-stream, and a white thick line of a glaring colour cut brilliantly the lines of the sea and sky. It was evidently drifting from the eastern coast of Greenland more than from Davis's Straits, for ice generally keeps to the west coast of Baffin's Sea. An hour afterwards the _Forward_ passed in the midst of isolated portions of the ice-stream, and in the most compact parts, the icebergs, though welded together, obeyed the movements of the swell. The next day the man at the masthead signalled a vessel. It was the _Valkirien_, a Danish corvette, running alongside the _Forward_, and making for the bank of Newfoundland. The current of the Strait began to make itself felt, and Shandon had to put on sail to go up it. At this moment the commander, the doctor, James Wall, and Johnson were assembled on the poop examining the direction and strength of the current. The doctor wanted to know if the current existed also in Baffin's Sea.

"Without the least doubt," answered Shandon, "and the sailing vessels have much trouble to stem it."

"Besides there," added Wall, "you meet with it on the eastern coast of America, as well as on the western coast of Greenland."

"There," said the doctor, "that is what gives very singular reason to the seekers of the North-West passage! That current runs about five miles an hour, and it is a little difficult to suppose that it springs from the bottom of a gulf."

"It is so much the more probable, doctor," replied Shandon, "that if this current runs from north to south we find in Behring's Straits a contrary current which runs from south to north, and which must be the origin of this one."

"According to that," replied the doctor, "we must admit that America is totally unconnected with the Polar lands, and that the waters of the Pacific run round the coasts of America into the Atlantic. On the other hand, the greater elevation of the waters of the Pacific gives reason to the supposition that they fall into the European seas."

"But," sharply replied Shandon, "there must be facts to establish that theory, and if there are any," added he with irony, "our universally well-informed doctor ought to know them."

"Well," replied the above-mentioned, with amiable satisfaction, "if it interests you, I can tell you that whales, wounded in Davis's Straits, are caught some time afterwards in the neighbourhood of Tartary with the European harpoon still in their flanks."

"And unless they have been able to double Cape Horn or the Cape of Good Hope," replied Shandon, "they must
necessarily have rounded the septentrional coasts of America--that's what I call indisputable, doctor."

"However, if you were not convinced, my dear fellow," said the doctor, smiling, "I could still produce other facts, such as drift-wood, of which Davis's Straits are full, larch, aspen, and other tropical trees. Now we know that the Gulf Stream hinders those woods from entering the Straits. If, then, they come out of it they can only get in from Behring's Straits."

"I am convinced, doctor, and I avow that it would be difficult to remain incredulous with you."

"Upon my honour," said Johnson, "there's something that comes just in time to help our discussion. I perceive in the distance a lump of wood of certain dimensions; if the commander permits it we'll haul it in, and ask it the name of its country."

"That's it," said the doctor, "the example after the rule."

Shandon gave the necessary orders; the brig was directed towards the piece of wood signalled, and soon afterwards, not without trouble, the crew hoisted it on deck. It was the trunk of a mahogany tree, gnawed right into the centre by worms, but for which circumstance it would not have floated.

"This is glorious," said the doctor enthusiastically, "for as the currents of the Atlantic could not carry it to Davis's Straits, and as it has not been driven into the Polar basin by the streams of septentrionial America, seeing that this tree grew under the Equator, it is evident that it comes in a straight line from Behring; and look here, you see those sea-worms which have eaten it, they belong to a hot-country species."

"It is evident," replied Wall, "that the people who do not believe in the famous passage are wrong."

"Why, this circumstance alone ought to convince them," said the doctor; "I will just trace you out the itinerary of that mahogany; it has been floated towards the Pacific by some river of the Isthmus of Panama or Guatemala, from whence the current has dragged it along the American coast as far as Behring's Straits, and in spite of everything it was obliged to enter the Polar Seas. It is neither so old nor so soaked that we need fear to assign a recent date to its setting out; it has had the good luck to get clear of the obstacles in that long suite of straits which lead out of Baffin's Bay, and quickly seized by the boreal current came by Davis's Straits to be made prisoner by the _Forward_ to the great joy of Dr. Clawbonny, who asks the commander's permission to keep a sample of it."

"Do so," said Shandon, "but allow me to tell you that you will not be the only proprietor of such a wreck. The Danish governor of the Isle of Disko----"

"On the coast of Greenland," continued the doctor, "possesses a mahogany table made from a trunk fished up under the same circumstances. I know it, but I don't envy him his table, for if it were not for the bother, I should have enough there for a whole bedroom."

During the night, from Wednesday to Thursday, the wind blew with extreme violence, and driftwood was seen more frequently. Nearing the coast offered many dangers at an epoch in which icebergs were so numerous; the commander caused some of the sails to be furled, and the _Forward_ glided away under her foresail and foremast only. The thermometer sank below freezing-point. Shandon distributed suitable clothing to the crew, a woollen jacket and trousers, a flannel shirt, wadmel stockings, the same as those the Norwegian country-people wear, and a pair of perfectly waterproof sea-boots. As to the captain, he contented himself with his natural fur, and appeared little sensible to the change in the temperature; he had, no doubt, gone through more than one trial of this kind, and besides, a Dane had no right to be difficult. He was seen very little, as he kept himself concealed in the darkest parts of the vessel.

Towards evening the coast of Greenland peeped out through an opening in the fog. The doctor, armed with his glass, could distinguish for an instant a line of peaks, ridged with large blocks of ice; but the fog closed rapidly on this vision, like the curtain of a theatre falling in the most interesting moment of the piece.

On the morning of the 20th of April the _Forward_ was in sight of an iceberg a hundred and fifty feet high, stranded there from time immemorial; the thaws had taken no effect on it, and had respected its strange forms. Snow saw it; James Ross took an exact sketch of it in 1829; and in 1851 the French lieutenant Bellot saw it from the deck of the _Prince Albert_. Of course the doctor wished to keep a memento of the celebrated mountain, and made a clever sketch of it. It is not surprising that such masses should be stranded and adhere to the land, for to each foot above water they have two feet below, giving, therefore, to this one about eighty fathoms of depth.

At last, under a temperature which at noon was only 12 degrees, under a snowy and foggy sky, Cape Farewell was perceived. The _Forward_ arrived on the day fixed; if it pleased the unknown captain to come and occupy his position in such diabolical weather he would have no cause to complain.

"There you are, then," said the doctor to himself, "cape so celebrated and so well named! Many have cleared it like we who were destined never to see it again. Is it, then, an eternal adieu said to one's European friends? You have all passed it. Frobisher, Knight, Barlow, Vaughan, Scroggs, Barentz, Hudson, Blösseville, Franklin, Crozier, Bellot, never to come back to your domestic hearth, and that cape has been really for you the cape of adieus."

It was about the year 970 that some navigators left Iceland and discovered Greenland. Sebastian Cabot forced his
way as far as latitude 56 degrees in 1498. Gaspard and Michel Cotreal, in 1500 and 1502, went as far north as 60 degrees; and Martin Frobisher, in 1576, arrived as far as the bay that bears his name. To John Davis belongs the honour of having discovered the Straits in 1585; and two years later, in a third voyage, that bold navigator and great whaler reached the sixty-third parallel, twenty-seven degrees from the Pole.

Barentz in 1596, Weymouth in 1602, James Hall in 1605 and 1607, Hudson, whose name was given to that vast bay which hollows out so profoundly the continent of America, James Poole, in 1611, advanced far into the Strait in search of that North-West passage the discovery of which would have considerably shortened the track of communication between the two worlds. Baffin, in 1616, found the Straits of Lancaster in the sea that bears his own name; he was followed, in 1619, by James Munk, and in 1719 by Knight, Barlow, Vaughan, and Scroggs, of whom no news has ever been heard. In 1776 Lieutenant Pickersgill, sent out to meet Captain Cook, who tried to go up Behring's Straits, reached the sixty-eighth degree; the following year Young, for the same purpose, went as far north as Woman's Island.

Afterwards came Captain James Ross, who, in 1818, rounded the coasts of Baffin's Sea, and corrected the hydrographic errors of his predecessors. Lastly, in 1819 and 1820, the celebrated Parry passed through Lancaster Straits, and penetrated, in spite of unnumbered difficulties, as far as Melville Island, and won the prize of 5,000 pounds promised by Act of Parliament to the English sailors who would reach the hundred and seventeenth meridian by a higher latitude than the seventy-seventh parallel.

In 1826 Beechey touched Chamisso Island; James Ross wintered from 1829 to 1833 in Prince Regent Straits, and amongst other important works discovered the magnetic pole. During this time Franklin, by an overland route, traversed the septentrional coasts of America from the River Mackenzie to Turnagain Point. Captain Back followed in his steps from 1823 to 1835, and these explorations were completed in 1839 by Messrs. Dease and Simpson and Dr. Rae.

Lastly, Sir John Franklin, wishing to discover the North-West passage, left England in 1845 on board the _Erebus_ and the _Terror_; he penetrated into Baffin's Sea, and since his passage across Disko Island no news had been heard of his expedition.

That disappearance determined the numerous investigations which have brought about the discovery of the passage, and the survey of these Polar continents, with such indented coast lines. The most daring English, French, and American sailors made voyages towards these terrible countries, and, thanks to their efforts, the maps of that country, so difficult to make, figured in the list of the Royal Geographical Society of London. The curious history of these countries was thus presented to the doctor's imagination as he leaned on the rail, and followed with his eyes the long track left by the brig. Thoughts of the bold navigators weighed upon his mind, and he fancied he could perceive under the frozen arches of the icebergs the pale ghosts of those who were no more.

CHAPTER VII

DAVIS'S STRAITS

During that day the _Forward_ cut out an easy road amongst the half-broken ice; the wind was good, but the temperature very low; the currents of air blowing across the ice-fields brought with them their penetrating cold. The night required the severest attention; the floating icebergs drew together in that narrow pass; a hundred at once were often counted on the horizon; they broke off from the elevated coasts under the teeth of the grinding waves and the influence of the spring season, in order to go and melt or to be swallowed up in the depths of the ocean. Long rafts of wood, with which it was necessary to escape collision, kept the crew on the alert; the crow's nest was put in its place on the mizenmast; it consisted of a cask, in which the ice-master was partly hidden to protect him from the cold winds while he kept watch over the sea and the icebergs in view, and from which he signalled danger and sometimes gave orders to the crew. The nights were short; the sun had reappeared since the 31st of January in consequence of the refraction, and seemed to get higher and higher above the horizon. But the snow impeded the view, and if it did not cause complete obscurity it rendered navigation laborious.

On the 21st of April Desolation Cape appeared in the midst of thick mists; the crew were tired out with the constant strain on their energies rendered necessary ever since they had got amongst the icebergs; the sailors had not had a minute's rest; it was soon necessary to have recourse to steam to cut a way through the heaped-up blocks. The doctor and Johnson were talking together on the stern, whilst Shandon was snatching a few hours' sleep in his cabin. Clawbonny was getting information from the old sailor, whose numerous voyages had given him an interesting and sensible education. The doctor felt much friendship for him, and the boatswain repaid it with interest.

"You see, Mr. Clawbonny," Johnson used to say, "this country is not like all others; they call it _Green_land, but there are very few weeks in the year when it justifies its name."

"Who knows if in the tenth century this land did not justify its name?" added the doctor. "More than one
revolution of this kind has been produced upon our globe, and I daresay I should astonish you if I were to tell you
that according to Icelandic chronicles two thousand villages flourished upon this continent about eight or nine
hundred years ago."

"You would so much astonish me, Mr. Clawbonny, that I should have some difficulty in believing you, for it is a
miserable country."

"However miserable it may be, it still offers a sufficient retreat to its inhabitants, and even to civilised
Europeans."

"Without doubt! We met men at Disko and Uppernawik who consented to live in such climates; but my ideas
upon the matter were that they lived there by compulsion and not by choice."

"I daresay you are right, though men get accustomed to everything, and the Greenlanders do not appear to me so
unfortunate as the workmen of our large towns; they may be unfortunate, but they are certainly not unhappy. I say
unhappy, but the word does not translate my thought, for if these people have not the comforts of temperate
countries, they are formed for a rude climate, and find pleasures in it which we are not able to conceive."

"I suppose we must think so, as Heaven is just. Many, many voyages have brought me upon these coasts, and my
heart always shrinks at the sight of these wretched solitudes; but they ought to have cheered up these capes,
promontories, and bays with more engaging names, for Farewell Cape and Desolation Cape are not names made to
attract navigators."

"I have also remarked that," replied the doctor, "but these names have a geographical interest that we must not
overlook. They describe the adventures of those who gave them those names. Next to the names of Davis, Baffin,
Hudson, Ross, Parry, Franklin, and Bellot, if I meet with Cape Desolation I soon find Mercy Bay; Cape Providence
is a companion to Port Anxiety; Repulsion Bay brings me back to Cape Eden, and leaving Turnagain Point I take
refuge in Refuge Bay. I have there under my eyes an unceasing succession of perils, misfortunes, obstacles,
successes, despairs, and issues, mixed with great names of my country, and, like a series of old-fashioned medals,
that nomenclature retraces in my mind the whole history of these seas."

"You are quite right, Mr. Clawbonny, and I hope we shall meet with more Success Bays than Despair Capes in
our voyage."

"I hope so too, Johnson; but, I say, is the crew come round a little from its terrors?"

"Yes, a little; but since we got into the Straits they have begun to talk about the fantastic captain; more than one
of them expected to see him appear at the extremity of Greenland; but between you and me, doctor, doesn't it
astonish you a little too?"

"It does indeed, Johnson."

"Do you believe in the captain's existence?"

"Of course I do."

"But what can be his reasons for acting in that manner?"

"If I really must tell you the whole of my thoughts, Johnson, I believe that the captain wished to entice the crew
far enough out to prevent them being able to come back. Now if he had been on board when we started they would
all have wanted to know our destination, and he might have been embarrassed."

"But why so?"

"Suppose he should wish to attempt some superhuman enterprise, and to penetrate where others have never been
able to reach, do you believe if the crew knew it they would ever have enlisted? As it is, having got so far, going
farther becomes a necessity."

"That's very probable, Mr. Clawbonny. I have known more than one intrepid adventurer whose name alone was
a terror, and who would never have found any one to accompany him in his perilous expeditions-----"

"Excepting me," ventured the doctor.

"And me, after you," answered Johnson, "and to follow you; I can venture to affirm that our captain is amongst
the number of such adventurers. No matter, we shall soon see; I suppose the unknown will come as captain on board
from the coast of Uppernawik or Melville Bay, and will tell us at last where it is his good pleasure to conduct the
ship."

"I am of your opinion, Johnson, but the difficulty will be to get as far as Melville Bay. See how the icebergs
encircle us from every point! They scarcely leave a passage for the _Forward_. Just examine that immense plain
over there."

"The whalers call that in our language an ice-field, that is to say a continued surface of ice the limits of which
cannot be perceived."

"And on that side, that broken field, those long pieces of ice more or less joined at their edges?"

"That is a pack; if it was of a circular form we should call it a patch; and, if the form was longer, a stream."

"And there, those floating icebergs?"
"Those are drift-ice; if they were a little higher they would be icebergs or hills; their contact with vessels is dangerous, and must be carefully avoided. Here, look over there: on that ice-field there is a protuberance produced by the pressure of the icebergs; we call that a hummock; if that protuberance was submerged to its base we should call it a calf. It was very necessary to give names to all those forms in order to recognise them."

"It is truly a marvellous spectacle!" exclaimed the doctor, contemplating the wonders of the Boreal Seas; "there is a field for the imagination in such pictures!"

"Yes," answered Johnson, "ice often takes fantastic shapes, and our men are not behindhand in explaining them according to their own notions."

"Isn't that assemblage of ice-blocks admirable? Doesn't it look like a foreign town, an Eastern town, with its minarets and mosques under the pale glare of the moon? Further on there is a long series of Gothic vaults, reminding one of Henry the Seventh's chapel or the Houses of Parliament."

"They would be houses and towns very dangerous to inhabit, and we must not sail too close to them. Some of those minarets yonder totter on their base, and the least of them would crush a vessel like the _Forward_."

"And yet sailors dared to venture into these seas before they had steam at their command! How ever could a sailing vessel be steered amongst these moving rocks?"

"Nevertheless, it has been accomplished, Mr. Clawbonny. When the wind became contrary--and that has happened to me more than once--we quietly anchored to one of those blocks, and we drifted more or less with it and waited for a favourable moment to set sail again. I must acknowledge that such a manner of voyaging required months, whilst with a little good fortune we shall only want a few days."

"It seems to me," said the doctor, "that the temperature has a tendency to get lower."

"That would be a pity," answered Johnson, "for a thaw is necessary to break up these masses and drive them away into the Atlantic; besides, they are more numerous in Davis's Straits, for the sea gets narrower between Capes Walsingham and Holsteinborg; but on the other side of the 67th degree we shall find the seas more navigable during the months of May and June."

"Yes; but first of all we must get to the other side."

"Yes, we must get there, Mr. Clawbonny. In June and July we should have found an open passage, like the whalers do, but our orders were precise; we were to be here in April. I am very much mistaken if our captain has not his reasons for getting us out here so early."

The doctor was right in stating that the temperature was lowering; the thermometer at noon only indicated 6 degrees, and a north-west breeze was getting up, which, although it cleared the sky, assisted the current in precipitating the floating masses of ice into the path of the _Forward_. All of them did not obey the same impulsion, and it was not uncommon to encounter some of the highest masses drifting in an opposite direction, seized at their base by an undercurrent.

It is easy to understand the difficulties of this kind of navigation; the engineers had not a minute's rest; the engines were worked from the deck by means of levers, which opened, stopped, and reversed them according to the orders of the officers on watch. Sometimes the brig had to hasten through an opening in the ice-fields, sometimes to struggle against the swiftness of an iceberg which threatened to close the only practicable issue, or, again, some block, suddenly overturned, compelled the brig to back quickly so as not to be crushed to pieces. This mass of ice, carried along, broken up and amalgamated by the northern current, crushed up the passage, and if seized by the frost would oppose an impassable barrier to the passage of the _Forward_.

Birds were found in innumerable quantities on these coasts, petrels and other sea-birds fluttered about here and there with deafening cries, a great number of big-headed, short-necked sea-gulls were amongst them; they spread out their long wings and braved in their play the snow whipped by the hurricane. This animation of the winged tribe made the landscape more lively.

Numerous pieces of wood were floating to leeway, clashing with noise; a few enormous, bloated-headed sharks approached the vessel, but there was no question of chasing them, although Simpson, the harpooner, was longing to have a hit at them. Towards evening several seals made their appearance, nose above water, swimming between the blocks.

On the 22nd the temperature again lowered; the _Forward_ put on all steam to catch the favourable passes: the wind was decidedly fixed in the north-west; all sails were furled.

During that day, which was Sunday, the sailors had little to do. After the reading of Divine service, which was conducted by Shandon, the crew gave chase to sea-birds, of which they caught a great number. They were suitably prepared according to the doctor's method, and furnished an agreeable increase of provisions to the tables of the officers and crew.

At three o'clock in the afternoon the _Forward_ had attained Thin de Sael, Sukkertop Mountain; the sea was very rough; from time to time a vast and inopportunity fog fell from the grey sky; however, at noon an exact observation
could be taken. The vessel was in 65 degrees 20 minutes latitude by 54 degrees 22 minutes longitude. It was necessary to attain two degrees more in order to meet with freer and more favourable navigation.

During the three following days, the 24th, 25th, and 26th of April, the _Forward_ had a continual struggle with the ice; the working of the machines became very fatiguing. The steam was turned off quickly or got up again at a moment's notice, and escaped whistling from its valves. During the thick mist the nearing of icebergs was only known by dull thundering produced by the avalanches; the brig was instantly veered; it ran the risk of being crushed against the heaps of fresh-water ice, remarkable for its crystal transparency, and as hard as a rock.

Richard Shandon never missed completing his provision of water by embarking several tons of ice every day. The doctor could not accustom himself to the optical delusions that refraction produces on these coasts. An iceberg sometimes appeared to him like a small white lump within reach, when it was at least at ten or twelve miles' distance. He endeavoured to accustom his eyesight to this singular phenomenon, so that he might be able to correct its errors rapidly.

At last the crew were completely worn out by their labours in hauling the vessel alongside of the ice-fields and by keeping it free from the most menacing blocks by the aid of long perches. Nevertheless, the _Forward_ was still held back in the impassable limits of the Polar Circle on Friday, the 27th of April.

CHAPTER VIII
GOSSIP OF THE CREW

However, the _Forward_ managed, by cunningly slipping into narrow passages, to gain a few more minutes north; but instead of avoiding the enemy, it was soon necessary to attack it. The ice-fields, several miles in extent, were getting nearer, and as these moving heaps often represent a pressure of more than ten millions of tons, it was necessary to give a wide berth to their embraces. The ice-saws were at once installed in the interior of the vessel, in such a manner as to facilitate immediate use of them. Part of the crew philosophically accepted their hard work, but the other complained of it, if it did not refuse to obey. At the same time that they assisted in the installation of the instruments, Garry, Bolton, Pen and Gripper exchanged their opinions.

"By Jingo!" said Bolton gaily, "I don't know why the thought strikes me that there's a very jolly tavern in Waterstreet where it's comfortable to be between a glass of gin and a bottle of porter. Can't you imagine it, Gripper?"

"To tell you the truth," quickly answered the questioned sailor, who generally professed to be in a bad temper, "I don't imagine it here."

"It's for the sake of talking, Gripper; it's evident that the snow towns Dr. Clawbonny admires so don't contain the least public where a poor sailor can get a half-pint of brandy."

"That's sure enough, Bolton; and you may as well add that there's nothing worth drinking here. It's a nice idea to deprive men of their grog when they are in the Northern Seas."

"But you know," said Garry, "that the doctor told us it was to prevent us getting the scurvy. It's the only way to make us go far."

"But I don't want to go far, Garry; it's pretty well to have come this far without trying to go where the devil is determined we shan't."

"Well, we shan't go, that's all," replied Pen. "I declare I've almost forgotten the taste of gin."

"But remember what the doctor says," replied Bolton.

"It's all very fine for them to talk. It remains to be seen if it isn't an excuse for being skinny with the drink."

"Pen may be right, after all," said Gripper.

"His nose is too red for that," answered Bolton. "Pen needn't grumble if it loses a little of its colour in the voyage."

"What's my nose got to do with you?" sharply replied the sailor, attacked in the most sensitive place. "My nose doesn't need any of your remarks; take care of your own."

"Now, then, don't get angry, Pen; I didn't know your nose was so touchy. I like a glass of whisky as well as anybody, especially in such a temperature; but if I know it'll do me more harm than good, I go without."

"You go without," said Warren, the stoker; "but everyone don't go without."

"What do you mean, Warren?" asked Garry, looking fixedly at him.

"I mean that for some reason or other there are spirits on board, and I know they don't go without in the stern."

"And how do you know that?" asked Garry.

Warren did not know what to say; he talked for the sake of talking.

"You see Warren don't know anything about it, Garry," said Bolton.

"Well," said Pen, "we'll ask the commander for a ration of gin; we've earned it well and we'll see what he says."

"I wouldn't if I were you," answered Garry.
"Why?" cried Pen and Gripper.
"Because he'll refuse. You knew you weren't to have any when you enlisted; you should have thought of it then."
"Besides," replied Bolton, who took Garry's part because he liked his character, "Richard Shandon isn't master on board; he obeys, like us."
"Who is master if he isn't?"
"The captain."
"Always that unfortunate captain!" exclaimed Pen. "Don't you see that on these ice-banks there's no more a captain than there is a public? It's a polite way of refusing us what we've a right to claim."
"But if there's a captain," replied Bolton, "I'll bet two months' pay we shall see him before long."
"I should like to tell the captain a bit of my mind," said Pen.
"Who's talking about the captain?" said a new-comer. It was Clifton, the sailor, a superstitious and envious man.
"Is anything new known about the captain?" he asked.
"No," they all answered at once.
"Well, I believe we shall find him one fine morning installed in his cabin, and no one will know how he got there."
"Get along, do!" replied Bolton. "Why, Clifton, you imagine that he's a hobgoblin--a sort of wild child of the Highlands."
"Laugh as much as you like, Bolton, you won't change my opinion. Every day as I pass his cabin I look through the keyhole. One of these fine mornings I shall come and tell you what he's like."
"Why, he'll be like everyone else," said Pen, "and if he thinks he'll be able to do what he likes with us, he'll find himself mistaken, that's all!"
"Pen don't know him yet," said Bolton, "and he's beginning to quarrel with him already."
"Who doesn't know him?" said Clifton, looking knowing; "I don't know that he don't!"
"What the devil do you mean?" asked Gripper.
"I know very well what I mean."
"But we don't."
"Well, Pen has quarrelled with him before."
"With the captain?"
"Yes, the dog-captain--it's all one."
The sailors looked at one another, afraid to say anything.
"Man or dog," muttered Pen, "I declare that that animal will have his account one of these days."
"Come, Clifton," asked Bolton seriously, "you don't mean to say that you believe the dog is the real captain?"
"Indeed I do," answered Clifton with conviction. "If you noticed things like I do, you would have noticed what a queer beast it is."
"Well, tell us what you've noticed."
"Haven't you noticed the way he walks on the poop with such an air of authority, looking up at the sails as if he were on watch?"
"That's true enough," added Gripper, "and one evening I actually found him with his paws on the paddle-wheel."
"You don't mean it!" said Bolton.
"And now what do you think he does but go for a walk on the ice-fields, minding neither the bears nor the cold?"
"That's true enough," said Bolton.
"Do you ever see that 'ere animal, like an honest dog, seek men's company, sneak about the kitchen, and set his eyes on Mr. Strong when's he taking something good to the commander? Don't you hear him in the night when he goes away two or three miles from the vessel, howling fit to make your blood run cold, as if it weren't easy enough to feel that sensation in such a temperature as this? Again, have you ever seen him feed? He takes nothing from any one. His food is always untouched and unless a secret hand feeds him on board, I may say that he lives without eating, and if he's not unearthly, I'm a fool!"
"Upon my word," said Bell, the carpenter, who had heard all Clifton's reasoning, "I shouldn't be surprised if such was the case." The other sailors were silenced.
"Well, at any rate, where's the _Forward_ going to?"
"I don't know anything about it," replied Bell. "Richard Shandon will receive the rest of his instructions in due time."
"But from whom?"
"From whom?"
"Yes, how?" asked Bolton, becoming pressing.
"Now then, answer, Bell!" chimed in all the other sailors.
"By whom? how? Why, I don't know," said the carpenter, embarrassed in his turn.
"Why, by the dog-captain," exclaimed Clifton. "He has written once already; why shouldn't he again? If I only knew half of what that 'ere animal knows, I shouldn't be embarrassed at being First Lord of the Admiralty!"
"So then you stick to your opinion that the dog is the captain?"
"Yes."
"Well," said Pen in a hoarse voice, "if that 'ere animal don't want to turn up his toes in a dog's skin, he's only got to make haste and become a man, or I'm hanged if I don't settle him."
"What for?" asked Garry.
"Because I choose," replied Pen brutally; "besides, it's no business of any one."
"Enough talking, my boys," called out Mr. Johnson, interfering just in time, for the conversation was getting hot. "Get on with your work, and set up your saws quicker than that. We must clear the iceberg."
"What! on a Friday?" replied Clifton, shrugging his shoulders. "You'll see she won't get over the Polar circle as easily as you think."

The efforts of the crew were almost powerless during the whole day. The _Forward_ could not separate the ice-fields even by going against them full speed, and they were obliged to anchor for the night. On Saturday the temperature lowered again under the influence of an easterly wind. The weather cleared up, and the eye could sweep over the white plains in the distance, which the reflection of the sun's rays rendered dazzling. At seven in the morning the thermometer marked eight degrees below zero. The doctor was tempted to stay quietly in his cabin, and read the Arctic voyages over again; but, according to his custom, he asked himself what would be the most disagreeable thing he could do, which he settled was to go on deck and assist the men to work in such a temperature. Faithful to the line of conduct he had traced out for himself, he left his well-warmed cabin and came to help in hauling the vessel. His was a pleasant face, in spite of the green spectacles by which he preserved his eyes from the biting of the reflected rays; in his future observations he was always careful in making use of his snow spectacles, in order to avoid ophthalmia, very frequent in these high latitudes.

Towards evening the _Forward_ had made several miles further north, thanks to the activity of the men and Shandon's skill, which made him take advantage of every favourable circumstance; at midnight he had got beyond the sixty-sixth parallel, and the fathom line declared twenty-three fathoms of water; Shandon discovered that he was on the shoal where Her Majesty's ship _Victoria_ struck, and that land was drawing near, thirty miles to the east. But now the heaps of ice, which up till now had been motionless, divided and began to move; icebergs seemed coming from every point of the horizon; the brig was entangled in a series of moving rocks, the crushing force of which it was impossible to resist. Moving became so difficult that Garry, the best helmsman, took the wheel; the mountains had a tendency to close up behind the brig; it then became essential to cut through the floating ice, and prudence as well as duty ordered them to go ahead. Difficulties became greater from the impossibility that Shandon found in establishing the direction of the vessel amongst such changing points, which kept moving without offering one firm perspective. The crew was divided into two tacks, larboard and starboard; each one, armed with a long perch with an iron point, drove back the two threatening blocks. Soon the _Forward_ entered into a pass so narrow, between two high blocks, that the extremity of her yards struck against the walls, hard as rock; by degrees she entangled herself in the midst of a winding valley, filled up with eddies of snow, whilst the floating ice was crashing and splitting with sinister cracklings. But it soon became certain that there was no egress from this gullet. An enormous block, caught in the channel, was driving rapidly on to the _Forward_! It seemed impossible to avoid it, and equally impossible to back out along a road already obstructed.

Shandon and Johnson, standing on the prow, were contemplating the position. Shandon was pointing with his right hand at the direction the helmsman was to take, and with his left was conveying to James Wall, posted near the engineer, his orders for the working of the machine.
"How will this end?" asked the doctor of Johnson.
"As it may please God," replied the boatswain.

The block of ice, at least a hundred feet high, was only about a cable's length from the _Forward_, and threatened to pound her under it.
"Cursed luck!" exclaimed Pen, swearing frightfully.
"Silence!" exclaimed a voice which it was impossible to recognise in the midst of the storm.

The block seemed to be precipitating itself upon the brig; there was a moment of undefinable anguish; the men forsook their poles and flocked to the stern in spite of Shandon's orders.

Suddenly a frightful sound was heard; a genuine waterspout fell upon deck, heaved up by an enormous wave. A cry of terror rang out from the crew whilst Garry, at the helm, held the _Forward_ in a straight line in spite of the frightful incumbrance. When their frightened looks were drawn towards the mountain of ice it had disappeared; the pass was free, and further on a long channel, illuminated by the oblique rays of the sun, allowed the brig to pursue
"Well, Mr. Clawbonny," said Johnson, "can you explain to me the cause of that phenomenon?"

"It is a very simple one," answered the doctor, "and happens very often. When those floating bodies are disengaged from each other by the thaw, they sail away separately, maintaining their balance; but by degrees, as they near the south, where the water is relatively warmer, their base, shaken by the collision with other icebergs, begins to melt and weaken; it then happens that their centre of gravity is displaced, and, naturally, they overturn. Only, if that one had turned over two minutes later, it would have crushed our vessel to pieces."

CHAPTER IX

NEWS

The Polar circle was cleared at last. On the 30th of April, at midday, the _Forward_ passed abreast of Holsteinborg; picturesque mountains rose up on the eastern horizon. The sea appeared almost free from icebergs, and the few there were could easily be avoided. The wind veered round to the south-east, and the brig, under her mizensail, brigantine, topsails, and her topgallant sail, sailed up Baffin's Sea. It had been a particularly calm day, and the crew were able to take a little rest. Numerous birds were swimming and fluttering about round the vessel; amongst others, the doctor observed some _alca-alla_, very much like the teal, with black neck, wings and back, and white breast; they plunged with vivacity, and their immersion often lasted forty seconds.

The day would not have been remarkable if the following fact, however extraordinary it may appear, had not occurred on board. At six o'clock in the morning Richard Shandon, re-entering his cabin after having been relieved, found upon the table a letter with this address:

"To the Commander,

RICHARD SHANDON,

On board the 'FORWARD,'

'Baffin's Sea.'

Shandon could not believe his own eyes, and before reading such a strange epistle he caused the doctor, James Wall and Johnson to be called, and showed them the letter.

"That grows very strange," said Johnson.

"It's delightful!" thought the doctor.

"At last," cried Shandon, "we shall know the secret."

With a quick hand he tore the envelope and read as follows:

"COMMANDER,—The captain of the _Forward_ is pleased with the coolness, skill, and courage that your men, your officers, and yourself have shown on the late occasions, and begs you to give evidence of his gratitude to the crew.

'Have the goodness to take a northerly direction towards Melville Bay, and from thence try and penetrate into Smith's Straits.

'THE CAPTAIN OF THE _Forward_,

'K. Z.

'Monday, April 30th,

'Abreast of Cape Walsingham.'

'Is that all?"' cried the doctor.

'That's all," replied Shandon, and the letter fell from his hands.

'Well," said Wall, "this chimerical captain doesn't even mention coming on board, so I conclude that he never will come."

'But how did this letter get here?" said Johnson.

Shandon was silent.

'Mr. Wall is right," replied the doctor, after picking up the letter and turning it over in every direction; "the captain won't come on board for an excellent reason----"

'And what's that?" asked Shandon quickly.

'Because he is here already," replied the doctor simply.

'Already!" said Shandon. "What do you mean?"

'How do you explain the arrival of this letter if such is not the case?"

Johnson nodded his head in sign of approbation.

'It is not possible!" said Shandon energetically. "I know every man of the crew. We should have to believe, in that case, that the captain has been with us ever since we set sail. It is not possible, I tell you. There isn't one of them that I haven't seen for more than two years in Liverpool; doctor, your supposition is inadmissible."
"Then what do you admit, Shandon?"

"Everything but that! I admit that the captain, or one of his men, has profited by the darkness, the fog, or anything you like, in order to slip on board; we are not very far from land; there are Esquimaux kayaks that pass unperceived between the icebergs; someone may have come on board and left the letter; the fog was intense enough to favour their design."

"And to hinder them from seeing the brig," replied the doctor; "if we were not able to perceive an intruder slip on board, how could _he_ have discovered the _Forward_ in the midst of a fog?"

"That is evident," exclaimed Johnson.

"I come back, then," said the doctor, "to my first hypothesis. What do you think about it, Shandon?"

"I think what you please," replied Shandon fiercely, "with the exception of supposing that this man is on board my vessel."

"Perhaps," added Wall, "there may be amongst the crew a man of his who has received instructions from him."

"That's very likely," added the doctor.

"But which man?" asked Shandon. "I tell you I have known all my men a long time."

"Anyhow," replied Johnson, "if this captain shows himself, let him be man or devil, we'll receive him; but we have another piece of information to draw from this letter."

"What's that?" asked Shandon.

"Why, that we are to direct our path not only towards Melville Bay, but again into Smith's Straits."

"You are right," answered the doctor.

"Smith's Straits?" echoed Shandon mechanically.

"It is evident," replied Johnson, "that the destination of the _Forward_ is not to seek a North-West passage, as we shall leave to our left the only track that leads to it--that is to say, Lancaster Straits; that's what forebodes us difficult navigation in unknown seas."

"Yes, Smith's Straits," replied Shandon, "that's the route the American Kane followed in 1853, and at the price of what dangers! For a long time he was thought to be lost in those dreadful latitudes! However, as we must go, go we must. But where? how far? To the Pole?"

"And why not?" cried the doctor.

The idea of such an insane attempt made the boatswain shrug his shoulders.

"After all," resumed James Wall, "to come back to the captain, if he exists, I see nowhere on the coast of Greenland except Disko or Uppernawik where he can be waiting for us; in a few days we shall know what we may depend upon."

"But," asked the doctor of Shandon, "aren't you going to make known the contents of that letter to the crew?"

"With the commander's permission," replied Johnson, "I should do nothing of the kind."

"And why so?" asked Shandon.

"Because all that mystery tends to discourage the men: they are already very anxious about the fate of our expedition, and if the supernatural side of it is increased it may produce very serious results, and in a critical moment we could not rely upon them. What do you say about it, commander?"

"And you, doctor--what do you think?" asked Shandon.

"I think Johnson's reasoning is just."

"And you, Wall?"

"Unless there's better advice forthcoming, I shall stick to the opinion of these gentlemen."

Shandon reflected seriously during a few minutes, and read the letter over again carefully.

"Gentlemen," said he, "your opinion on this subject is certainly excellent, but I cannot adopt it."

"Why not, Shandon?" asked the doctor.

"Because the instructions of this letter are formal: they command me to give the captain's congratulations to the crew, and up till to-day I have always blindly obeyed his orders in whatever manner they have been transmitted to me, and I cannot----"

"But----" said Johnson, who rightly dreaded the effect of such a communication upon the minds of the sailors.

"My dear Johnson," answered Shandon, "your reasons are excellent, but read--'he begs you to give evidence of his gratitude to the crew.'"

"Act as you think best," replied Johnson, who was besides a very strict observer of discipline. "Are we to muster the crew on deck?"

"Do so," replied Shandon.

The news of a communication having been received from the captain spread like wildfire on deck; the sailors quickly arrived at their post, and the commander read out the contents of the mysterious letter. The reading of it was received in a dead silence; the crew dispersed, a prey to a thousand suppositions. Clifton had heard enough to give
himself up to all the wanderings of his superstitious imagination; he attributed a considerable share in this incident to the dog-captain, and when by chance he met him in his passage he never failed to salute him. "I told you the animal could write," he used to say to the sailors. No one said anything in answer to this observation, and even Bell, the carpenter himself, would not have known what to answer.

Nevertheless it was certain to all that, in default of the captain, his spirit or his shadow watched on board; and henceforward the wisest of the crew abstained from exchanging their opinions about him.

On the 1st of May, at noon, they were in 68 degrees latitude and 56 degrees 32 minutes longitude. The temperature was higher and the thermometer marked twenty-five degrees above zero. The doctor was amusing himself with watching the antics of a white bear and two cubs on the brink of a pack that lengthened out the land. Accompanied by Wall and Simpson, he tried to give chase to them by means of the canoe; but the animal, of a rather warlike disposition, rapidly led away its offspring, and consequently the doctor was compelled to renounce following them up.

Chilly Cape was doubled during the night under the influence of a favourable wind, and soon the high mountains of Disko rose in the horizon. Godhavn Bay, the residence of the Governor-General of the Danish Settlements, was left to the right. Shandon did not consider it worth while to stop, and soon outran the Esquimaux pirogues who were endeavouring to reach his ship.

The Island of Disko is also called Whale Island. It was from this point that on the 12th of July, 1845, Sir John Franklin wrote to the Admiralty for the last time. It was also on that island on the 27th of August, 1859, that Captain McClintock set foot on his return, bringing back, alas! proofs too complete of the loss of the expedition. The coincidence of these two facts were noted by the doctor; that melancholy conjunction was prolific in memories, but soon the heights of Disko disappeared from his view.

There were, at that time, numerous icebergs on the coasts, some of those which the strongest thaws are unable to detach; the continual series of ridges showed themselves under the strangest forms.

The next day, towards three o'clock, they were bearing on to Sanderson Hope to the north-east. Land was left on the starboard at a distance of about fifteen miles; the mountains seemed tinged with a red-coloured bistre. During the evening, several whales of the finners species, which have fins on their backs, came playing about in the midst of the ice-trails, throwing out air and water from their blow-holes. It was during the night between the 3rd and 4th of May that the doctor saw for the first time the sun graze the horizon without dipping his luminous disc into it. Since the 31st of January the days had been getting longer and longer till the sun went down no more. To strangers not accustomed to the persistence of this perpetual light it was a constant subject of astonishment, and even of fatigue; it is almost impossible to understand to what extent obscurity is requisite for the well-being of our eyes. The doctor experienced real pain in getting accustomed to this light, rendered still more acute by the reflection of the sun's rays upon the plains of ice.

On May 5th the _Forward_ headed the seventy-second parallel; two months later they would have met with numerous whalers under these high latitudes, but at present the straits were not sufficiently open to allow them to penetrate into Baffin's Bay. The following day the brig, after having headed Woman's Island, came in sight of Uppernawik, the most northerly settlement that Denmark possesses on these coasts.

CHAPTER X
DANGEROUS NAVIGATION

Shandon, Dr. Clawbonny, Johnson, Foker, and Strong, the cook, went on shore in the small boat. The governor, his wife, and five children, all of the Esquimaux race, came politely to meet the visitors. The doctor knew enough Danish to enable him to establish a very agreeable acquaintance with them; besides, Foker, who was interpreter of the expedition, as well as ice-master, knew about twenty words of the Greenland language, and if not ambitious, twenty words will carry you far. The governor was born on the island, and had never left his native country. He did the honours of the town, which is composed of three wooden huts, for himself and the Lutheran minister, of a school, and magazines stored with the produce of wrecks. The remainder consists of snow-huts, the entrance to which is attained by creeping through a hole.

The greater part of the population came down to greet the _Forward_, and more than one native advanced as far as the middle of the bay in his kayak, fifteen feet long and scarcely two wide. The doctor knew that the word Esquimaux signified raw-fish-eater, and he likewise knew that the name was considered an insult in the country, for which reason he did not fail to address them by the title of Greenlanders, and nevertheless only by the look of their oily sealskin clothing, their boots of the same material, and all their greasy tainted appearance, it was easy to discover their accustomed food. Like all Ichthyophagans, they were half-eaten up with leprosy; and yet, for all that, were in no worse health.
On the 8th of May, at six o'clock in the morning, the _Forward_ under her topsails, foresails, and topgallant, lost sight of the Uppernawik settlement, and the hideous stakes to which were hung seal-guts and deer-paunches. The wind was blowing from the south-east, and the temperature went up to thirty-two degrees. The sun pierced through the fog, and the ice was getting a little loosened under its dissolving action. But the reflection of the white rays produced a sad effect on the eyesight of several of the crew. Wolsten, the gunsmith, Gripper, Clifton, and Bell were struck with snow blindness, a kind of weakness in the eyes very frequent in spring, and which determines, amongst the Esquimaux, numerous cases of blindness. The doctor advised those who were so afflicted and their companions in general to cover their faces with green gauze, and he was the first to put his own prescription into execution.

The dogs bought by Shandon at Uppernawik were of a rather savage nature, but in the end they became accustomed to the ship; the captain did not take the arrival of these new comrades too much to heart, and he seemed to know their habits. Clifton was not the last to remark the fact that the captain must already have been in communication with his Greenland brethren, as on land they were always famished and reduced by incomplete nourishment; they only thought of recruiting themselves by the diet on board.

On the 9th of May the _Forward_ touched within a few cables' length the most westerly of the Baffin Isles. The land offered a very different aspect from that of Uppernawik; immense glaciers were outlined on the tendency to rise, it was easy enough to see that the icebergs and ice-streams were accumulating to the north of the Uppernawik settlement, and the hideous stakes to which were hung seal-guts and deer-paunches. The doctor noticed several rocks in the bay between the islands and the continent, those called Crimson Cliffs; they were covered over with snow as red as carmine, to which Dr. Kane gives a purely vegetable origin. Clawbonny wanted to know their habits. Clifton was not the last to remark the fact that the captain must already have been in communication with his Greenland brethren, as on land they were always famished and reduced by incomplete nourishment; they only thought of recruiting themselves by the diet on board.
the horizon against a greyish sky. On the 10th the _Forward_ left Hingston Bay on the right, near to the seventy-fourth degree of latitude. Several hundred miles westward the Lancaster Channel opened out into the sea.

But afterwards that immense extent of water disappeared under enormous fields of ice, upon which hummocks rose up as regularly as a crystallisation of the same substance. Shandon had the steam put on, and up to the 11th of May the _Forward_ wound amongst the sinuous rocks, leaving the print of a track on the sky, caused by the black smoke from her funnels. But new obstacles were soon encountered; the paths were getting closed up in consequence of the incessant displacement of the floating masses; at every minute a failure of water in front of the _Forward's_ prow became imminent, and if she had been nipped it would have been difficult to extricate her. They all knew it, and thought about it.

On board this vessel, without aim or known destination, foolishly seeking to advance towards the north, some symptoms of hesitation were manifested amongst those men, accustomed to an existence of danger; many, forgetting the advantages offered, regretted having ventured so far, and already a certain demoralisation prevailed in their minds, still more increased by Clifton's fears, and the idle talk of two or three of the leaders, such as Pen, Gripper, Warren, and Wolston.

To the uneasiness of the crew were joined overwhelming fatigues, for on the 12th of May the brig was closed in on every side; her steam was powerless, and it was necessary to force a road through the ice-fields. The working of the saws was very difficult in the floes, which measured from six to seven feet in thickness. When two parallel grooves divided the ice for the length of a hundred feet, they had to break the interior part with hatchets or handspikes; then took place the elongation of the anchors, fixed in a hole by means of a thick auger; afterwards the working of the capstan began, and in this way the vessel was hauled over. The greatest difficulty consisted in driving the smashed pieces under the floes in order to open up a free passage for the ship, and to thrust them away they were compelled to use long iron-spiked poles.

At last, what with the working of the saws, the hauling, the capstan and poles, incessant, dangerous, and forced work, in the midst of fogs or thick snow, the temperature relatively low, ophthalmic suffering and moral uneasiness, all contributed to discourage the crew, and react on the men's imagination. When sailors have an energetic, audacious, and convinced man to do with, who knows what he wants, where he is bound for, and what end he has in view, confidence sustains them in spite of everything. They make one with their chief, feeling strong in his strength, and quiet in his tranquillity; but on the brig it was felt that the commander was not sure of himself, that he hesitated before his unknown end and destination. In spite of his energetic nature, his weakness showed itself in his changing orders, incomplete manoeuvres, stormy reflections, and a thousand details which could not escape the notice of the crew.

Besides, Shandon was not captain of the ship, a sufficient reason for argument about his orders; from argument to a refusal to obey the step is easy. The discontented soon added to their number the first engineer, who up to now had remained a slave to his duty.

On May 16th, six days after the _Forward's_ arrival at the icebergs, Shandon had not gained two miles northward, and the ice threatened to freeze in the brig till the following season. This was becoming dangerous. Towards eight in the evening Shandon and the doctor, accompanied by Garry, went on a voyage of discovery in the midst of the immense plains; they took care not to go too far away from the vessel, as it was difficult to fix any landmarks in those white solitudes, the aspects of which changed constantly.

The refraction produced strange effects; they still astonished the doctor; where he thought he had only one foot to leap he found it was five or six, or the contrary; and in both cases the result was a fall, if not dangerous, at least painful, on the frozen ice as hard as glass.

Shandon and his two companions went in search of a practicable passage. Three miles from the ship they succeeded, not without trouble, in climbing the iceberg, which was perhaps three hundred feet high.

From this point their view extended over that desolated mass which looked like the ruins of a gigantic town with its beaten-down obelisks, its overthrown steeples and palaces turned upside down all in a lump--in fact, a genuine chaos. The sun threw long oblique rays of a light without warmth, as if heat-absorbing substances were placed between it and that gloomy country. The sea seemed to be frozen to the remotest limits of view.

"How shall we get through?" exclaimed the doctor.

"I have not the least idea," replied Shandon; "but we will get through, even if we are obliged to employ powder to blow up those mountains, for I certainly won't let that ice shut me up till next spring."

"Nevertheless, such was the fate of the _Fox_, almost in these same quarters. Never mind," continued the doctor, "we shall get through with a little philosophy. Believe me, that is worth all the engines in the world."

"You must acknowledge," replied Shandon, "that the year doesn't begin under very favourable auspices."

"That is incontestable, and I notice that Baffin's Sea has a tendency to return to the same state in which it was before 1817."
"Then you think, doctor, that the present state of things has not always existed?"

"Yes; from time to time there are vast breakings up which scientific men can scarcely explain; thus, up to 1817 this sea was constantly obstructed, when suddenly an immense cataclysm took place which drove back these icebergs into the ocean, the great part of which were stranded on Newfoundland Bank. From that time Baffin's Bay has been almost free, and has become the haunt of numerous whalers."

"Then, since that epoch, voyages to the north have been easier?"

"Incomparably so; but for the last few years it has been observed that the bay has a tendency to be closed up again, and according to investigations made by navigators, it may probably be so for a long time—a still greater reason for us to go on as far as possible. Just now we look like people who get into unknown galleries, the doors of which are always shut behind them."

"Do you advise me to back out?" asked Shandon, endeavouring to read the answer in the doctor's eyes.

"I! I have never known how to take a step backward, and should we never return, I say 'Go ahead.' However, I should like to make known to you that if we do anything imprudent, we know very well what we are exposed to."

"Well, Garry, what do you think about it?" asked Shandon of the sailor.

"I? Commander, I should go on; I'm of the same opinion as Mr. Clawbonny; but you do as you please; command, and we will obey."

"They don't all speak like you, Garry," replied Shandon. "They aren't all in an obedient humour! Suppose they were to refuse to execute my orders?"

"Commander," replied Garry coldly, "I have given you my advice because you asked me for it; but you are not obliged to act upon it."

Shandon did not reply; he attentively examined the horizon, and descended with his two companions on to the ice-field.

CHAPTER XI
THE DEVIL'S THUMB

During the commander's absence the men had gone through divers works in order to make the ship fit to avoid the pressure of the ice-fields. Pen, Clifton, Gripper, Bolton, and Simpson were occupied in this laborious work; the stoker and the two engineers were even obliged to come to the aid of their comrades, for, from the instant they were not wanted at the engine, they again became sailors, and, as such, they could be employed in all kinds of work on board. But this was not accomplished without a great deal of grumbling.

"I'll tell you what," said Pen, "I've had enough of it, and if in three days the breaking up isn't come, I'll swear to God that I'll chuck up!"

"You'll chuck up?" replied Gripper; "you'd do better to help us to back out. Do you think we are in the humour to winter here till next year?"

"To tell you the truth, it would be a dreary winter," said Plover, "for the ship is exposed from every quarter."

"And who knows," added Brunton, "if even next spring we should find the sea freer than it is now?"

"We aren't talking about next spring," said Pen; "to-day's Thursday; if next Sunday morning the road ain't clear, we'll back out south."

"That's the ticket!" cried Clifton.

"Are you all agreed?" said Pen.

"Yes," answered all his comrades.

"That's right enough," answered Warren, "for if we are obliged to work like this, hauling the ship by the strength of our arms, my advice is to backwater."

"We'll see about that on Sunday," answered Wolsten.

"As soon as I get the order," said Brunton, "I'll soon get my steam up."

"Or we'd manage to get it up ourselves," said Clifton.

"If any of the officers," said Pen, "wants to have the pleasure of wintering here, we'll let him. He can build himself a snow-hut like the Esquimaux."

"Nothing of the kind, Pen," replied Brunton; "we won't leave anybody. You understand that, you others. Besides, I don't think it would be difficult to persuade the commander; he already seems very uncertain, and if we were quietly to propose it----"

"I don't know that," said Plover; "Richard Shandon is a hard, headstrong man, and we should have to sound him carefully."

"When I think," replied Bolton, with a covetous sigh, "that in a month we might be back in Liverpool; we could soon clear the southern ice-line. The pass in Davis's Straits will be open in the beginning of June, and we shall only
have to let ourselves drift into the Atlantic."

"Besides," said the prudent Clifton, "if we bring back the commander with us, acting under his responsibility, our pay and bounty money will be sure; whilst if we return alone it won't be so certain."

"That's certain!" said Plover; "that devil of a Clifton speaks like a book. Let us try to have nothing to explain to the Admiralty; it's much safer to leave no one behind us."

"But if the officers refuse to follow us?" replied Pen, who wished to push his comrades to an extremity.

To such a question they were puzzled to reply.

"We shall see about it when the time comes," replied Bolton; "besides, it would be enough to win Richard Shandon over to our side. We shall have no difficulty about that."

"Anyhow," said Pen, swearing, "there's something I'll leave here if I get an arm eaten in the attempt."

"Ah! you mean the dog," said Plover.

"Yes, the dog; and before long I'll settle his hash!"

"The more so," replied Clifton, coming back to his favourite theme, "that the dog is the cause of all our misfortunes."

"He's cast an evil spell over us," said Plover.

"It's through him we're in an iceberg," said Gripper.

"He's the cause that we've had more ice against us than has ever been seen at this time of year," said Wolsten.

"He's the cause of my bad eyes," said Brunton.

"He's cut off the gin and brandy," added Pen.

"He's the cause of everything," said the assembly, getting excited.

"And he's captain into the bargain!" cried Clifton.

"Well, captain of ill-luck," said Pen, whose unreasonable fury grew stronger at every word; "you wanted to come here, and here you'll stay."

"But how are we to nap him?" said Plover.

"We've a good opportunity," replied Clifton; "the commander isn't on deck, the lieutenant is asleep in his cabin, and the fog's thick enough to stop Johnson seeing us."

"But where's the dog?" cried Pen.

"He's asleep near the coahole," replied Clifton, "and if anybody wants----"

"I'll take charge of him," answered Pen furiously.

"Look out, Pen; he's got teeth that could snap an iron bar in two."

"If he moves I'll cut him open," cried Pen, taking his knife in one hand. He bounced in between decks, followed by Warren, who wanted to help him in his undertaking. They quickly came back, carrying the animal in their arms, strongly muzzled, with his paws bound tightly together. They had taken him by surprise whilst he slept, so that the unfortunate dog could not escape them.

"Hurrah for Pen!" cried Plover.

"What do you mean to do with him now you've got him?" asked Clifton.

"Why, drown him, and if ever he gets over it----" replied Pen, with a fearful smile of satisfaction.

About two hundred steps from the vessel there was a seal-hole, a kind of circular crevice cut out by the teeth of that amphibious animal, hollowed out from underneath, and through which the seal comes up to breathe on to the surface of the ice. To keep this aperture from closing up he has to be very careful because the formation of his jaws would not enable him to bore through the hole again from the outside, and in a moment of danger he would fall a prey to his enemies. Pen and Warren directed their steps towards this crevice, and there, in spite of the dog's energetic efforts, he was unmercifully precipitated into the sea. An enormous lump of ice was then placed over the opening, thus closing all possible issue to the poor animal, walled up in a watery prison.

"Good luck to you, captain," cried the brutal sailor.

Shortly afterwards Pen and Warren returned on deck. Johnson had seen nothing of this performance. The fog thickened round about the ship, and snow began to fall with violence. An hour later, Richard Shandon, the doctor, and Garry rejoined the _Forward_. Shandon had noticed a pass in a north-eastern direction of which he was resolved to take advantage, and gave his orders in consequence. The crew obeyed with a certain activity, not without hinting to Shandon that it was impossible to go further on, and that they only gave him three more days' obedience. During a part of the night and the following day the working of the saws and the hauling were actively kept up; the _Forward_ gained about two miles further north. On the 18th she was in sight of land, and at five or six cable-lengths from a peculiar peak, called from its strange shape the Devil's Thumb.

It was there that the _Prince Albert_ in 1851, and the _Advance_ with Kane, in 1853, were kept prisoners by the ice for several weeks. The odd form of the Devil's Thumb, the dreary deserts in its vicinity, the vast circus of icebergs--some of them more than three hundred feet high--the cracking of the ice, reproduced by the echo in so
sinister a manner, rendered the position of the _Forward_ horribly dreary. Shandon understood the necessity of getting out of it and going further ahead. Twenty-four hours later, according to his estimation, he had been able to clear the fatal coast for about two miles, but this was not enough. Shandon, overwhelmed with fear, and the false situation in which he was placed, lost both courage and energy; in order to obey his instructions and get further north, he had thrown his vessel into an excessively perilous situation. The men were worn out by the hauling; it required more than three hours to hollow out a channel twenty feet long, through ice that was usually from four to five feet thick. The health of the crew threatened to break down. Shandon was astonished at the silence of his men and their unaccustomed obedience, but he feared that it was the calm before the storm. Who can judge, then, of his painful disappointment, surprise, and despair when he perceived that in consequence of an insensible movement of the ice-field the _Forward_ had, during the night from the 18th to the 19th, lost all the advantage she had gained with so much toil? On the Saturday morning they were once more opposite the ever-threatening Devil's Thumb, and in a still more critical position. The icebergs became more numerous, and drifted by in the fog like phantoms. Shandon was in a state of complete demoralisation, for fright had taken possession of the dauntless man and his crew. Shandon had heard the dog's disappearance spoken about, but dared not punish those who were guilty of it. He feared that a rebellion might be the consequence. The weather was fearful during the whole day; the snow rose up in thick whirlpools, wrapping up the _Forward_ in an impenetrable cloak. Sometimes, under the action of the storm, the fog was torn asunder, and displayed towards land, raised up like a spectre, the Devil's Thumb.

The _Forward_ was anchored to an immense block of ice; it was all that could be done; there was nothing more to attempt; the obscurity became denser, and the man at the helm could not see James Wall, who was on duty in the bow. Shandon withdrew to his cabin, a prey to unremitting uneasiness; the doctor was putting his voyage notes in order; one half the crew remained on deck, the other half stayed in the common cabin. At one moment, when the storm increased in fury, the Devil's Thumb seemed to rise up out of all proportion in the midst of the fog.

"Good God!" cried Simpson, drawing back with fright.
"What the devil's that?" said Foker, and exclamations rose up in every direction.
"It is going to smash us!"
"We are lost!"
"Mr. Wall! Mr. Wall!"
"It's all over with us!"
"Commander! Commander!"

These cries were simultaneously uttered by the men on watch. Wall fled to the quarter-deck, and Shandon, followed by the doctor, rushed on deck to look. In the midst of the fog the Devil's Thumb seemed to have suddenly neared the brig, and seemed to have grown in a most fantastic manner. At its summit rose up a second cone, turned upside down and spindled on its point; its enormous mass threatened to crush the ship, as it was oscillating and ready to fall. It was a most fearful sight; every one instinctively drew back, and several sailors, leaping on to the ice, abandoned the ship.

"Let no one move!" cried the commander in a severe voice. "Every one to his post!"
"How now, my friends? There's nothing to be frightened at!" said the doctor. "There's no danger! Look, commander, look ahead, Mr. Wall; it's only an effect of the mirage, nothing else."
"You are quite right, Mr. Clawbonny," answered Johnson; "those fools were frightened at a shadow."

After the doctor had spoken most of the sailors drew near, and their fear changed to admiration at the wonderful phenomenon, which shortly disappeared from sight.

"They call that a mirage?" said Clifton. "Well, you may believe me that the devil has something to do with it."
"That's certain!" replied Gripper.

But when the fog cleared away it disclosed to the eyes of the commander an immense free and unexpected passage; it seemed to run away from the coast, and he therefore determined to seize such a favourable hazard. Men were placed on each side of the creek, hawsers were lowered down to them, and they began to tow the vessel in a northerly direction. During long hours this work was actively executed in silence. Shandon caused the steam to be got up, in order to take advantage of the fortunate discovery of this channel.

"This," said he to Johnson, "is a most providential hazard, and if we can only get a few miles ahead, we shall probably get to the end of our misfortunes."
"Brunton! stir up the fires, and as soon as there's enough pressure let me know. In the meantime our men will pluck up their courage--that will be so much gained. They are in a hurry to run away from the Devil's Thumb; we'll take advantage of their good inclinations!"

All at once the progress of the _Forward_ was abruptly arrested.
"What's up?" cried Shandon. "I say, Wall! have we broken our tow-ropes?"
"Not at all, commander," answered Wall, looking over the side. "Hallo! Here are the men coming back again.
They are climbing the ship's side as if the devil was at their heels."
"What the deuce can it be?" cried Shandon, rushing forward.
"On board! On board!" cried the terrified sailors.

Shandon looked in a northerly direction, and shuddered in spite of himself. A strange animal, with appalling movements, whose foaming tongue emerged from enormous jaws, was leaping about at a cable's length from the ship. In appearance he seemed to be about twenty feet high, with hair like bristles; he was following up the sailors, whilst his formidable tail, ten feet long, was sweeping the snow and throwing it up in thick whirlwinds. The sight of such a monster riveted the most daring to the spot.

"It's a bear!" said one.
"It's the Gevaudan beast!"
"It's the lion of the Apocalypse!"

Shandon ran to his cabin for a gun he always kept loaded. The doctor armed himself, and held himself in readiness to fire upon an animal which, by its dimensions, recalled the antediluvian quadrupeds. He neared the ship in immense leaps; Shandon and the doctor fired at the same time, when, suddenly, the report of their firearms, shaking the atmospheric stratum, produced an unexpected effect. The doctor looked attentively, and burst out laughing.

"It's the refraction!" he exclaimed.
"Only the refraction!" repeated Shandon. But a fearful exclamation from the crew interrupted them.
"The dog!" said Clifton.
"The dog, captain!" repeated all his comrades.
"Himself!" cried Pen; "always that cursed brute."

They were not mistaken--it was the dog. Having got loose from his shackles, he had regained the surface by another crevice. At that instant the refraction, through a phenomenon common to these latitudes, caused him to appear under formidable dimensions, which the shaking of the air had dispersed; but the vexatious effect was none the less produced upon the minds of the sailors, who were very little disposed to admit an explanation of the fact by purely physical reasons. The adventure of the Devil's Thumb, the reappearance of the dog under such fantastic circumstances, gave the finishing touch to their mental faculties, and murmurs broke out on all sides.

CHAPTER XII
CAPTAIN HATTERAS

The _Forward_ under steam, rapidly made its way between the ice-mountains and the icebergs. Johnson was at the wheel. Shandon, with his snow spectacles, was examining the horizon, but his joy was of short duration, for he soon discovered that the passage ended in a circus of mountains. However, he preferred going on, in spite of the difficulty, to going back. The dog followed the brig at a long distance, running along the plain, but if he lagged too far behind a singular whistle could be distinguished, which he immediately obeyed. The first time this whistle was heard the sailors looked round about them; they were alone on deck all together, and no stranger was to be seen; and yet the whistle was again heard from time to time. Clifton was the first alarmed.

"Do you hear?" said he. "Just look how that animal answers when he hears the whistle."
"I can scarcely believe my eyes," answered Gripper.
"It's all over!" cried Pen. "I don't go any further."
"Pen's right!" replied Brunton; "it's tempting God!"
"Tempting the devil!" replied Clifton. "I'd sooner lose my bounty money than go a step further."
"We shall never get back!" said Bolton in despair.

The crew had arrived at the highest pitch of insubordination.
"Not a step further!" cried Wolsten. "Are you all of the same mind?"
"Ay! ay!" answered all the sailors.
"Come on, then," said Bolton; "let's go and find the commander; I'll undertake the talking."

The sailors in a tight group swayed away towards the poop. The _Forward_ at the time was penetrating into a vast circus, which measured perhaps 800 feet in diameter, and with the exception of one entrance--that by which the vessel had come--was entirely closed up.

Shandon said that he had just imprisoned himself; but what was he to do? How were they to retrace their steps? He felt his responsibility, and his hand grasped the telescope. The doctor, with folded arms, kept silent; he was contemplating the walls of ice, the medium altitude of which was over 300 feet. A foggy dome remained suspended above the gulf. It was at this instant that Bolton addressed his speech to the commander.

"Commander!" said he in a trembling voice, "we can't go any further."
"What do you say?" replied Shandon, whose consciousness of disregarded authority made the blood rise to the roots of his hair.

"Commander," replied Bolton, "we say that we've done enough for that invisible captain, and we are decided to go no further ahead."

"You are decided?" cried Shandon. "You talk thus, Bolton? Take care!"

"Your threats are all the same to us," brutally replied Pen; "we won't go an inch further."

Shandon advanced towards the mutineers; at the same time the mate came up and said in a whisper: "Commander, if you wish to get out of here we haven't a minute to lose; there's an iceberg drifting up the pass, and it is very likely to cork up all issue and keep us prisoners."

Shandon examined the situation.

"You will give an account of your conduct later on, you fellows," said he. "Now heave aboard!"

The sailors rushed to their posts, and the _Forward_ quickly veered round; the fires were stuffed with coals; the great question was to outrun the floating mountain. It was a struggle between the brig and the iceberg. The former, in order to get through, was running south; the latter was drifting north, ready to close up every passage.

"Steam up! steam up!" cried Shandon. "Do you hear, Brunton?"

The _Forward_ glided like a bird amidst the struggling icebergs, which her prow sent to the right-about; the brig's hull shivered under the action of the screw, and the manometer indicated a prodigious tension of steam, for it whistled with a deafening noise.

"Load the valves!" cried Shandon, and the engineer obeyed at the risk of blowing up the ship; but his despairing efforts were in vain. The iceberg, caught up by an undercurrent, rapidly approached the pass. The brig was still about three cables' length from it, when the mountain, entering like a corner-stone into the open space, strongly adhered to its neighbours and closed up all issue.

"We are lost!" cried Shandon, who could not retain the imprudent words.

"Lost!" repeated the crew.

"Let them escape who can!" said some.

"Lower the shore boats!" said others.

"To the steward's room!" cried Pen and several of his band, "and if we are to be drowned, let's drown ourselves in gin!"

Disorder among the men was at its height. Shandon felt himself overcome; when he wished to command, he stammered and hesitated. His thought was unable to make way through his words. The doctor was walking about in agitation. Johnson stoically folded his arms and said nothing. All at once a strong, imperious, and energetic voice was heard to pronounce these words:

"Every man to his post and tack about!"

Johnson started, and, hardly knowing what he did, turned the wheel rapidly. He was just in time, for the brig, launched at full speed, was about to crush herself against her prison walls. But while Johnson was instinctively obeying, Shandon, Clawbonny, the crew, and all down to the stoker Warren, who had abandoned his fires, even black Strong, who had left his cooking, were all mustered on deck, and saw emerge from that cabin the only man who was in possession of the key, and that man was Garry, the sailor.

"Sir!" cried Shandon, becoming pale. "Garry--you--by what right do you command here?"

"Dick," called out Garry, reproducing that whistle which had so much surprised the crew. The dog, at the sound of his right name, jumped with one bound on to the poop and lay quietly down at his master's feet. The crew did not say a word. The key which the captain of the _Forward_ alone possessed, the dog sent by him, and who came thus to verify his identity, that commanding accent which it was impossible to mistake--all this acted strongly on the minds of the sailors, and was sufficient to establish Garry's authority.

Besides, Garry was no longer recognisable; he had cut off the long whiskers which had covered his face, which made it look more energetic and imperious than ever; dressed in the clothes of his rank which had been deposited in the cabin, he appeared in the insignia of commander.

Then immediately, with that mobility which characterised them, the crew of the _Forward_ cried out--"Three cheers for the captain!"

"Shandon!" said the latter to his second, "muster the crew; I am going to inspect it!"

Shandon obeyed and gave orders with an altered voice. The captain advanced to meet his officers and men, saying something suitable to each, and treating each according to his past conduct. When he had finished the inspection, he returned on to the poop, and with a calm voice pronounced the following words:

"Officers and sailors, like you, I am English, and my motto is that of Nelson, 'England expects that every man will do his duty.' As an Englishman I am resolved, we are resolved, that no bolder men shall go further than we have been. As an Englishman I will not allow, we will not allow, other people to have the glory of pushing further north
themselves. If ever human foot can step upon the land of the North Pole, it shall be the foot of an Englishman. Here is our country's flag. I have equipped this vessel, and consecrated my fortune to this enterprise, and, if necessary, I shall consecrate to it my life and yours; for I am determined that these colours shall float on the North Pole. Take courage. From this day, for every degree we can gain northwards the sum of a thousand pounds will be awarded to you. There are ninety, for we are now in the seventy-second. Count them. Besides, my name is enough. It means energy and patriotism. I am Captain Hatteras!"
"Captain Hatteras!" exclaimed Shandon, and that name, well known to English sailors, was whispered amongst the crew.

"Now," continued Hatteras, "anchor the brig to the ice, put out the fires, and each of you return to your usual work. Shandon, I wish to hold a council with you relative to affairs on board. Join me with the doctor, Wall, and the boatswain in my cabin. Johnson, disperse the men."

Hatteras, calm and haughty, quietly left the poop. In the meantime Shandon was anchoring the brig.

Who, then, was this Hatteras, and for what reason did his name make such a profound impression upon the crew? John Hatteras was the only son of a London brewer, who died in 1852 worth six millions of money. Still young, he embraced the maritime career in spite of the splendid fortune awaiting him. Not that he felt any vocation for commerce, but the instinct of geographical discoveries was dear to him. He had always dreamt of placing his foot where no mortal foot had yet soiled the ground.

At the age of twenty he was already in possession of the vigorous constitution of a thin and sanguine man; an energetic face, with lines geometrically traced; a high and perpendicular forehead; cold but handsome eyes; thin lips, which set off a mouth from which words rarely issued; a middle stature; solidly-jointed limbs, put in motion by iron muscles; the whole forming a man endowed with a temperament fit for anything. When you saw him you knew he was daring; when you heard him you felt he was coldly determined; his was a character that never drew back, ready to stake the lives of others as well as his own. It was well to think twice before following him in his expeditions.

John Hatteras was proud of being an Englishman. A Frenchman once said to him, with what he thought was refined politeness and amiability:

"If I were not a Frenchman I should like to be an Englishman."

"And if I were not an Englishman," answered Hatteras, "I should like to be an Englishman."

That answer revealed the character of the man. It was a great grief to him that Englishmen had not the monopoly of geographical discoveries, and were, in fact, rather behind other nations in that field.

Christopher Columbus, the discoverer of America, was a Genoese; Vasco da Gama, a Portuguese, discovered India; another Portuguese, Fernando de Andrade, China; and a third, Magellan, the Terra del Fuego. Canada was discovered by Jacques Cartier, a Frenchman; Labrador, Brazil, the Cape of Good Hope, the Azores, Madeira, Newfoundland, Guinea, Congo, Mexico, Cape Blanco, Greenland, Iceland, the South Seas, California, Japan, Cambodia, Peru, Kamtchatka, the Philippines, Spitzbergen, Cape Horn, Behring's Straits, Tasmania, New Zealand, New Britanny, New Holland, Louisiana, Jean Mayen Island, were discovered by Icelanders, Scandinavians, French, Russians, Portuguese, Danes, Spaniards, Genoese, and Dutch, but not one by an Englishman. Captain Hatteras could not reconcile himself to the fact that Englishmen were excluded from the glorious list of navigators who made the great discoveries of the 15th and 16th centuries.

Hatteras consoled himself a little when he turned to more modern times. Then Englishmen had the best of it with Sturt, Burke, Wills, King, and Grey in Australia; with Palliser in America; with Cyril Graham, Waddington, and Cunningham in India; with Burton, Speke, Grant, and Livingstone in Africa.

But for a man like Hatteras this was not enough; from his point of view these bold travellers were _improvers_ rather than _inventors_; and he was determined to do something better, and he would have invented a country if he could, only to have the honour of discovering it. Now he had noticed that, although Englishmen did not form a majority amongst ancient discoverers, and that he had to go back to Cook in 1774 to obtain New Caledonia and the Sandwich Isles, where the unfortunate captain perished in 1778, yet there existed, nevertheless, a corner of the globe where they seemed to have united all their efforts. This corner was precisely the boreal lands and seas of North America. The list of Polar discoveries may be thus written:

Nova Zembla, discovered by Willoughby, in 1553; Weigatz Island, by Barrough, in 1556; the West Coast of Greenland, by Davis, in 1585; Davis's Straits, by Davis, in 1587; Spitzbergen, by Willoughby, in 1596; Hudson's Bay, by Hudson, in 1610; Baffin's Bay, by Baffin, in 1616.

In more modern times, Hearne, Mackenzie, John Ross, Parry, Franklin, Richardson, Beechey, James Ross, Back, Dease, Simpson, Rae, Inglefield, Belcher, Austin, Kellett, Moore, McClure, Kennedy, and McClintock have continually searched those unknown lands.

The limits of the northern coasts of America had been fixed, and the North-West passage almost discovered, but this was not enough; there was something better still to be done, and John Hatteras had twice attempted it by
equipping two ships at his own expense. He wanted to reach the North Pole, and thus crown the series of English
discoveries by one of the most illustrious attempts. To attain the Pole was the aim of his life.

After a few successful cruises in the Southern seas, Hatteras endeavoured for the first time, in 1846, to go north
by Baffin's Sea; but he could not get beyond the seventy-fourth degree of latitude; he was then commanding the
sloop _Halifax_. His crew suffered atrocious torments, and John Hatteras pushed his adventurous rashness so far,
that, afterwards, sailors were little tempted to re-commence similar expeditions under such a chief.

However, in 1850 Hatteras succeeded in enrolling on the schooner _Farewell_ about twenty determined men,
tempted principally by the high prize offered for their audacity. It was upon that occasion that Dr. Clawbonny
entered into correspondence with John Hatteras, whom he did not know, requesting to join the expedition, but
happily for the doctor the post was already filled up. The _Farewell_, following the track taken in 1817 by the
_Neptune_ from Aberdeen, got up to the north of Spitzbergen as far as the seventy-sixth degree of latitude. There
the expedition was compelled to winter. But the sufferings of the crew from the intense cold were so great that not a
single man saw England again, with the exception of Hatteras himself, who was brought back to his own country by
a Danish whaler after a walk of more than two hundred miles across the ice.

The sensation produced by the return of this one man was immense. Who in future would dare to follow Hatteras
in his mad attempts? However, he did not despair of beginning again. His father, the brewer, died, and he became
possessor of a nabob's fortune. Soon after a geographical fact bitterly stirred up John Hatteras. A brig, the
_Advance_, manned by seventeen men, equipped by a merchant named Grinnell, under the command of Dr. Kane,
and sent in search of Sir John Franklin, advanced in 1853 through Baffin's Sea and Smith's Strait, beyond the eighty-
second degree of boreal latitude, much nearer the Pole than any of his predecessors. Now, this vessel was American,
Grinnell was American, and Kane was American. The Englishman's disdain for the Yankee will be easily
understood; in the heart of Hatteras it changed to hatred; he was resolved to outdo his audacious competitor and
reach the Pole itself.

For two years he had been living incognito in Liverpool, passing himself off as a sailor; he recognised in Richard
Shandon the man he wanted; he sent him an offer by an anonymous letter, and one to Dr. Clawbonny at the same
time. The _Forward_ was built, armed, and equipped. Hatteras took great care to conceal his name, for had it been
known he would not have found a single man to accompany him. He was determined not to take the command of the
brig except in a moment of danger, and when his crew had gone too far to draw back. He had in reserve, as we have
seen, such offers of money to make to the men that not one of them would refuse to follow him to the other end of
the world; and, in fact, it was right to the other end of the world that he meant to go. Circumstances had become
critical, and John Hatteras had made himself known. His dog, the faithful Dick, the companion of his voyages, was
the first to recognise him. Luckily for the brave and unfortunately for the timid, it was well and duly established that
John Hatteras was the captain of the _Forward_.

CHAPTER XIII
THE PROJECTS OF HATTERAS

The appearance of this bold personage was appreciated in different ways by the crew; part of them completely
rallied round him, either from love of money or daring; others submitted because they could not help themselves,
reserving their right to protest later on; besides, resistance to such a man seemed, for the present, difficult. Each man
went back to his post. The 20th of May fell on a Sunday, and was consequently a day of rest for the crew. A council
was held by the captain, composed of the officers, Shandon, Wall, Johnson, and the doctor.

"Gentlemen," said the captain in that voice at the same time soft and imperious which characterised him, "you
are aware that I intend to go as far as the Pole. I wish to know your opinion about this enterprise. Shandon, what do
you think about it?"

"It is not for me to think, captain," coldly replied Shandon; "I have only to obey."

Hatteras was not surprised at the answer.

"Richard Shandon," continued he, not less coldly, "I beg you will say what you think about our chance of
success."

"Very well, captain," answered Shandon, "facts are there, and answer for me; attempts of the same kind up till
now have always failed; I hope we shall be more fortunate."

"We shall be. What do you think, gentlemen?"

"As far as I am concerned," replied the doctor, "I consider your plan practicable, as it is certain that some day
navigators will attain the boreal Pole. I don't see why the honour should not fall to our lot."

"There are many things in our favour," answered Hatteras; "our measures are taken in consequence, and we shall
profit by the experience of those who have gone before us. And thereupon, Shandon, accept my thanks for the care
you have taken in fitting out this ship; there are a few evil-disposed fellows amongst the crew that I shall have to
bring to reason, but on the whole I have only praises to give you."

Shandon bowed coldly. His position on the _Forward_, which he thought to command, was a false one. Hatteras
understood this, and did not insist further.

"As to you, gentlemen," he continued, turning to Wall and Johnson, "I could not have secured officers more
distinguished for courage and experience."

"Well, captain, I'm your man," answered Johnson, "and although your enterprise seems to me rather daring, you
may rely upon me till the end."

"And on me too," said James Wall.

"As to you, doctor, I know what you are worth."

"You know more than I do, then," quickly replied the doctor.

"Now, gentlemen," continued Hatteras, "it is well you should learn upon what undeniable facts my pretension to
arrive at the Pole is founded. In 1817 the _Neptune_ got up to the north of Spitzbergen, as far as the eighty-second
degree. In 1826 the celebrated Parry, after his third voyage to the Polar Seas, started also from Spitzbergen Point,
and by the aid of sledge-boats went a hundred and fifty miles northward. In 1852 Captain Inglefield penetrated into
Smith's Inlet as far as seventy-eight degrees thirty-five minutes latitude. All these vessels were English, and
Englishmen, our countrymen, commanded them." Here Hatteras paused. "I ought to add," he continued, with a
constrained look, and as though the words were unable to leave his lips—"I must add that, in 1854, Kane, the
American, commanding the brig _Advance_, went still higher, and that his lieutenant, Morton, going across the ice-
fields, hoisted the United States standard on the other side of the eighty-second degree. This said, I shall not return
to the subject. Now what remains to be known is this, that the captains of the _Neptune_, the _Enterprise_, the
_Isabel_, and the _Advance_ ascertained that proceeding from the highest latitudes there existed a Polar basin
entirely free from ice."

"Free from ice!" exclaimed Shandon, interrupting the captain, "that is impossible!"

You will notice, Shandon," quietly replied Hatteras, whose eye shone for an instant, "that I quote names and
facts as a proof. I may even add that during Captain Parry's station on the border of Wellington Channel, in 1851, his
lieutenant, Stewart, also found himself in the presence of open sea, and this peculiarity was confirmed during Sir
Edward Beecher's wintering in 1853, in Northumberland Bay, in 76 degrees 52 minutes N. latitude, and 99 degrees
20 minutes longitude. The reports are incontestable, and it would be most unjust not to admit them."

"However, captain," continued Shandon, "those reports are so contradictory."

"You are mistaken, Shandon," cried Dr. Clawbonny. "These reports do not contradict any scientific assertion, the
captain will allow me to tell you."

"Go on, doctor," answered Hatteras.

"Well, listen, Shandon; it evidently follows from geographical facts, and from the study of isotherm lines, that
the coldest point of the globe is not at the Pole itself; like the magnetic point, it deviates several degrees from the
Pole. The calculations of Brewster, Bergham, and several other natural philosophers show us that in our hemisphere
there are two cold Poles; one is situated in Asia at 79 degrees 30 minutes N. latitude, and by 120 degrees E.
longitude, and the other in America at 78 degrees N. latitude, and 97 degrees W. longitude. It is with the latter that
we have to do, and you see, Shandon, we have met with it at more than twelve degrees below the Pole. Well, why
should not the Polar Sea be as equally disengaged from ice as the sixty-sixth parallel is in summer—that is to say, the
south of Baffin's Bay?"

"That's what I call well pleaded," replied Johnson. "Mr. Clawbonny speaks upon these matters like a professional
man."

"It appears very probable," chimed in James Wall.

"All guess-work," answered Shandon obstinately.

"Well, Shandon," said Hatteras, "let us take into consideration either case; either the sea is free from ice or it is
not so, and neither of these suppositions can hinder us from attaining the Pole. If the sea is free the _Forward_ will
take us there without trouble; if it is frozen we will attempt the adventure upon our sledges. This, you will allow, is
not impracticable. When once our brig has attained the eighty-third degree we shall only have six hundred miles to
traverse before reaching the Pole."

"And what are six hundred miles?" quickly answered the doctor, "when it is known that a Cossack, Alexis
Markoff, went over the ice sea along the northern coast of the Russian Empire, in sledges drawn by dogs, for the
space of eight hundred miles in twenty-four days?"

"Do you hear that, Shandon?" said Hatteras; "can't Englishmen do as much as a Cossack?"

"Of course they can," cried the impetuous doctor.

"Of course," added the boatswain.
"Well, Shandon?" said the captain.
"I can only repeat what I said before, captain," said Shandon--"I will obey."
"Very good. And now," continued Hatteras, "let us consider our present situation. We are caught by the ice, and it seems to me impossible, for this year at least, to get into Smith's Strait. Well, here, then, this is what I propose."

Hatteras laid open upon the table one of the excellent maps published in 1859 by the order of the Admiralty.
"Be kind enough to follow me. If Smith's Strait is closed up from us, Lancaster Strait, on the west coast of Baffin's Sea, is not. I think we ought to ascend that strait as far as Barrow Strait, and from there sail to Beechey Island; the same track has been gone over a hundred times by sailing vessels; consequently with a screw we can do it easily. Once at Beechey Island we will go north as far as possible, by Wellington Channel, up to the outlet of the creek which joins Wellington's and Queen's Channels, at the very point where the open sea was perceived. It is now only the 20th of May; in a month, if circumstances favour us, we shall have attained that point, and from there we'll drive forward towards the Pole. What do you think about it, gentlemen?"

"It is evidently the only track to follow," replied Johnson.

"Very well, we will take it from to-morrow. I shall let them rest to-day as it is Sunday. Shandon, you will take care that religious service be attended to; it has a beneficial effect on the minds of men, and a sailor above all needs to place confidence in the Almighty."

"It shall be attended to, captain," answered Shandon, who went out with the lieutenant and the boatswain.

"Doctor!" said Hatteras, pointing towards Shandon, "there's a man whose pride is wounded; I can no longer rely upon him."

Early the following day the captain caused the pirogue to be lowered in order to reconnoitre the icebergs in the vicinity, the breadth of which did not exceed 200 yards. He remarked that through a slow pressure of the ice the basin threatened to become narrower. It became urgent, therefore, to make an aperture to prevent the ship being crushed in a vice of the mountains. By the means employed by John Hatteras, it is easy to observe that he was an energetic man.

He first had steps cut out in the walls of ice, and by their means climbed to the summit of an iceberg. From that point he saw that it was easy for him to cut out a road towards the south-west. By his orders a blasting furnace was hollowed nearly in the heart of the mountain. This work, rapidly put into execution, was terminated by noon on Monday. Hatteras could not rely on his eight or ten pound blasting cylinders, which would have had no effect on such masses as those. They were only sufficient to shatter ice-fields. He therefore had a thousand pounds of powder placed in the blasting furnace, of which the diffusive direction was carefully calculated. This mine was provided with a long wick, bound in gutta-percha, the end of which was outside. The gallery conducting to the mine was filled up with snow and lumps of ice, which the cold of the following night made as hard as granite. The temperature, under the influence of an easterly wind, came down to twelve degrees.

At seven the next morning the _Forward_ was held under steam, ready to profit by the smallest issue. Johnson was charged with setting fire to the wick, which, according to calculation, would burn for half an hour before setting fire to the mine. Johnson had, therefore, plenty of time to regain the brig; ten minutes after having executed Hatteras's order he was again at his post. The crew remained on deck, for the weather was dry and bright; it had left off snowing.

Hatteras was on the poop, chronometer in hand, counting the minutes; Shandon and the doctor were with him. At eight thirty-five a dull explosion was heard, much less loud than any one would have supposed. The outline of the mountains was changed all at once as if by an earthquake; thick white smoke rose up to a considerable height in the sky, leaving long crevices in the iceberg, the top part of which fell in pieces all round the _Forward_. But the path was not yet free; large blocks of ice remained suspended above the pass on the adjacent mountains, and there was every reason to fear that they would fall and close up the passage. Hatteras took in the situation at one glance.

"Wolsten!" cried he.
The gunsmith hastened up.
"Yes, captain?" cried he.
"Load the gun in the bow with a triple charge," said Hatteras, "and wad it as hard as possible."
"Are we going to attack the mountain with cannon-balls?" asked the doctor.
"No," answered Hatteras, "that would be useless. No bullet, Wolsten, but a triple charge of powder. Look sharp!"

A few minutes after the gun was loaded.
"What does he mean to do without a bullet?" muttered Shandon between his teeth.
"We shall soon see," answered the doctor.
"Ready, captain!" called out Wolsten.
"All right!" replied Hatteras.
"Brunton!" he called out to the engineer, "a few turns ahead."
Brunton opened the sliders, and the screw being put in movement, the _Forward_ neared the mined mountain.

"Aim at the pass!" cried the captain to the gunsmith. The latter obeyed, and when the brig was only half a cable's length from it, Hatteras called out:

"Fire!"

A formidable report followed his order, and the blocks, shaken by the atmospheric commotion, were suddenly precipitated into the sea; the disturbance amongst the strata of the air had been sufficient to accomplish this.

"All steam on, Brunton! Straight for the pass, Johnson!"

The latter was at the helm; the brig, driven along by her screw, which turned in the foaming waves, dashed into the middle of the then opened pass; it was time, for scarcely had the _Forward_ cleared the opening than her prison closed up again behind her. It was a thrilling moment, and on board there was only one stout and undisturbed heart—that of the captain. The crew, astonished at the manoeuvre, cried out:

"Hurrah for the captain!"

CHAPTER XIV
EXPEDITION IN SEARCH OF FRANKLIN

On Wednesday, the 23rd of May, the _Forward_ had again taken up her adventurous navigation, cleverly tacking amongst the packs and icebergs. Thanks to steam, that obedient force which so many of our Polar sea navigators have had to do without, she appeared to be playing in the midst of the moving rocks. She seemed to recognise the hand of an experienced master, and like a horse under an able rider, she obeyed the thought of her captain. The temperature rose. At six o'clock in the morning the thermometer marked twenty-six degrees, at six in the evening twenty-nine degrees, and at midnight twenty-five degrees; the wind was lightly blowing from the south-east.

On Thursday, towards three in the morning, the _Forward_ was in sight of Possession Bay, on the coast of America. At the entrance to Lancaster Strait, shortly after, the crew caught a glimpse of Burney Cape. A few Esquimaux pulled off towards the vessel, but Hatteras did not take the trouble to wait for them. The Byam-Martin peaks, which overlook Cape Liverpool, were sighted to the left, and soon disappeared in the evening mists, which also prevented any observation being taken from Cape Hay. This cape is so low that it gets confounded with the ice on the coast, a circumstance which often renders the hydrographic determination of the Polar seas extremely difficult.

Puffins, ducks, and white sea-gulls showed up in very great numbers. The _Forward_ was then in latitude 74 degrees 1 minute, and in longitude 77 degrees 15 minutes. The snowy hoods of the two mountains, Catherine and Elizabeth, rose up above the clouds.

On Friday, at six o'clock, Cape Warender was passed on the right side of the strait, and on the left Admiralty Inlet, a bay that has been little explored by navigators, who are generally in a hurry to sail away west. The sea became rather rough, and the waves often swept the deck of the brig, throwing up pieces of ice. The land on the north coast, with its high table lands almost level, and which reverberated the sun's rays, offered a very curious appearance.

Hatteras wanted to run along the north coast, in order to reach Beechey Island and the entrance to Wellington Channel sooner; but continual icebergs compelled him, to his great annoyance, to follow the southern passes. That was why, on the 26th of May, the _Forward_ was abreast of Cape York in a thick fog interspersed with snow; a very high mountain, almost perpendicular, caused it to be recognised. The weather cleared up a little, and the sun, towards noon, appeared for an instant, allowing a tolerably good observation to be taken; 74 degrees 4 minutes latitude and 84 degrees 23 minutes longitude. The _Forward_ was then at the extremity of Lancaster Strait.

Hatteras pointed out to the doctor on his map the route already taken, and the one he meant to follow. The position of the brig at the time was very interesting.

"I should like to have been further north," said he, "but no one can do the impossible; see, this is our exact situation."

And the captain pricked his map at a short distance from Cape York.

"We are in the centre of this four-road way, open to every wind, fenced by the outlets of Lancaster Strait, Barrow Strait, Wellington Channel, and Regent's Passage; it is a point that all navigators in these seas have been obliged to come to."

"Well," replied the doctor, "it must have puzzled them greatly; four cross-roads with no sign-posts to tell them which to take. How did Parry, Ross, and Franklin manage?"

"They did not manage at all, they were managed; they had no choice, I can assure you; sometimes Barrow Strait was closed to one of them, and the next year another found it open; sometimes the vessel was irresistibly drawn towards Regent's Passage, so that we have ended by becoming acquainted with these inextricable seas."
"What a singular country!" said the doctor, examining the map. "It is all in pieces, and they seem to have no logical connection. It seems as if the land in the vicinity of the North Pole had been cut up like this on purpose to make access to it more difficult. Whilst that in the other hemisphere quietly terminates in tapered-out points like those of Cape Horn, the Cape of Good Hope, and the Indian Peninsula. Is it the greater rapidity of the equator which has thus modified matters, whilst the land at the extremities, yet fluid from the creation, has not been able to get condensed or agglomerated together, for want of a sufficiently rapid rotation?"

"That must be the case, for everything on earth is logical, and 'nothing is that errs from law,' and God often allows men to discover His laws; make use of His permission, doctor."

"Unfortunately, I shall not be able to take much advantage of it," said the doctor, "but the wind here is something dreadful," added he, muffling himself up as well as he could.

"Yes, we are quite exposed to the north wind, and it is turning us out of our road."

"Anyhow it ought to drive the ice down south, and level a clear road."

"It ought to do so, doctor, but the wind does not always do what it ought. Look, that ice-bank seems impenetrable. Never mind, we will try to reach Griffith Island, sail round Cornwallis Island, and get into Queen's Channel without going by Wellington Channel. Nevertheless I positively desire to touch at Beechey Island in order to renew my coal provision."

"What do you mean?" asked the astonished doctor.

"I mean that, according to orders from the Admiralty, large provisions have been deposited on that island in order to provide for future expeditions, and although Captain McClintock took some in 1859, I assure you that there will be some left for us."

"By-the-bye," said the doctor, "these parts have been explored for the last fifteen years, and since the day when the proof of the loss of Franklin was acquired, the Admiralty has always kept five or six cruisers in these seas. If I am not mistaken, Griffith Island, which I see there on the map, almost in the middle of the cross-roads, has become a general meeting-place for navigators."

"It is so, doctor; and Franklin's unfortunate expedition resulted in making known these distant countries to us."

"That is true, captain; for since 1845 expeditions have been very numerous. It was not until 1848 that we began to be uneasy about the disappearance of the _Erebus_ and the _Terror_, Franklin's two vessels. It was then that we saw the admiral's old friend, Dr. Richardson, at the age of seventy, go to Canada, and ascend Coppermine River as far as the Polar Sea; and James Ross, commanding the _Enterprise_ and _Investigation_, set out from Uppernawk in 1848 and arrived at Cape York, where we now are. Every day he threw a tub containing papers into the sea, for the purpose of making known his whereabouts. During the mists he caused the cannon to be fired, and had sky-rockets sent up at night along with Bengal lights, and kept under sail continually. He wintered in Port Leopold from 1848 to 1849, where he took possession of a great number of white foxes, and caused brass collars, upon which was engraved the indication of the whereabouts of ships and the store depots, to be riveted on their necks. Afterwards they were dispersed in all directions; in the following spring he began to search the coasts of North Somerset on sledges in the midst of dangers and privations from which almost all his men fell ill or lame. He built up cairns in which he inclosed brass cylinders with the necessary memoranda for rallying the lost expedition. While he was away his lieutenant McClure explored the northern coasts of Barrow Strait, but without result. James Ross had under his orders two officers who, later on, were destined to become celebrities--McClure, who cleared the North-West passage, and McClintock, who discovered the remains of Sir John Franklin."

"Yes; they are now two good and brave English captains. You know the history of these seas well, doctor, and you will benefit us by telling us about it. There is always something to be gained by hearing about such daring attempts."

"Well, to finish all I know about James Ross: he tried to reach Melville Island by a more westerly direction, but he nearly lost his two vessels, for he was caught by the ice and driven back into Baffin's Sea."

"Driven back?" repeated Hatteras, contracting his brows; "forced back in spite of himself?"

"Yes, and without having discovered anything," continued the doctor; "and ever since that year, 1850, English vessels have never ceased to plough these seas, and a reward of twenty thousand pounds was offered to any one who might find the crews of the _Erebus_ and _Terror_. Captains Kellett and Moore had already, in 1848, attempted to get through Behring's Strait. In 1850 and 1851 Captain Austin wintered in Cornwallis Island; Captain Parry, on board the _Assistance_ and the _Resolute_, explored Wellington Channel; John Ross, the venerable hero of the magnetic pole, set out again with his yacht, the _Felix_, in search of his friend; the brig _Prince Albert_ went on a first cruise at the expense of Lady Franklin; and, lastly, two American ships, sent out by Grinnell with Captain Haven, were drifted out of Wellington Channel and thrown back into Lancaster Strait. It was during this year that McClintock, who was then Austin's lieutenant, pushed on as far as Melville Island and Cape Dundas, the extreme points attained by Parry in 1819; it was then that he found traces of Franklin's wintering on Beechey Island in 1845."
"Yes," answered Hatteras, "three of his sailors had been buried there--three men more fortunate than the others!"

The doctor nodded in approval of Hatteras's remark, and continued:

"During 1851 and 1852 the _Prince Albert_ went on a second voyage under the French lieutenant, Bellot; he wintered at Batty Bay, in Prince Regent Strait, explored the south-west of Somerset, and reconnoitred the coast as far as Cape Walker. During that time the _Enterprise_ and the _Investigator_ returned to England and passed under the command of Collinson and McClure for the purpose of rejoining Kellett and Moore in Behring's Straits; whilst Collinson came back to winter at Hong-Kong, McClure made the best of his way onward, and after being obliged to winter three times--from 1850 to '51; from 1851 to '52; and from 1852 to '53--he discovered the North-West passage without learning anything of Franklin's fate. During 1852 and '53 a new expedition composed of three sailing vessels, the _Resolute_, the _Assistance_, the _North Star_, and two steamers, the _Pioneer_ and _Intrepid_, set sail under the command of Sir Edward Belcher, with Captain Kellett under him; Sir Edward visited Wellington Channel, wintered in Northumberland Bay, and went over the coast, whilst Kellett, pushing on to Bridport in Melville Island, explored, without success, that part of the boreal land. It was at this time that news was spread in England that two ships, abandoned in the midst of icebergs, had been descried near the coast of New Scotland. Lady Franklin immediately had prepared the little screw _Isabelle_, and Captain Inglefield, after having steamed up Baffin's Bay as far as Victoria Point on the eightieth parallel, came back to Beechey Island no more successful than his predecessors. At the beginning of 1855, Grinnell, an American, fitted up a fresh expedition, and Captain Kane tried to penetrate to the Pole----"

"But he didn't do it," cried Hatteras violently; "and what he didn't do we will, with God's help!"

"I know, captain," answered the doctor, "and I mention it because this expedition is of necessity connected with the search for Franklin. But it had no result. I was almost forgetting to tell you that the Admiralty, considering Beechey Island as the general rendezvous of expeditions, charged Captain Inglefield, who then commanded the steamer _Phoenix_, to transport provisions there in 1853; Inglefield set out with Lieutenant Bellot, and lost the brave officer who for the second time had devoted his services to England; we can have more precise details upon this catastrophe, as our boatswain, Johnson, was witness to the misfortune."

"Lieutenant Bellot was a brave Frenchman," said Hatteras, "and his memory is honoured in England."

"By that time," continued the doctor, "Belcher's fleet began to come back little by little; not all of it, for Sir Edward had been obliged to abandon the _Assistance_ in 1854, as McClure had done with the _Investigator_ in 1853. In the meantime, Dr. Rae, in a letter dated the 29th of July, 1854, and addressed from Repulse Bay, which he had succeeded in reaching through America, sent word that the Esquimaux of King William's Land were in possession of different objects taken from the wrecks of the _Erebus_ and _Terror_; there was then not the least doubt about the fate of the expedition; the _Phoenix_, the _North Star_, and Collinson's vessel then came back to England, leaving the Arctic Seas completely abandoned by English ships. But if the Government seemed to have lost all hope it was not so with Lady Franklin, and with the remnants of her fortune she fitted out the _Fox_, commanded by McClintock, who set sail in 1857, and wintered in the quarters where you made your apparition; he reached Beechey Island on the 11th of August, 1858, wintered a second time in Bellot's Strait, began his search again in February, 1859, and on the 6th of May found the document which cleared away all doubt about the fate of the _Erebus_ and the _Terror_, and returned to England at the end of the year. That is all that has happened for fifteen years in these fateful countries, and since the return of the _Fox_ not a single vessel has returned to attempt success in the midst of these dangerous seas."

"Well," replied Hatteras, "we will attempt it."

CHAPTER XV
THE "FORWARD" DRIVEN BACK SOUTH

The weather cleared up towards evening, and land was clearly distinguished between Cape Sepping and Cape Clarence, which runs east, then south, and is joined to the coast on the west by a rather low neck of land. The sea at the entrance to Regent Strait was free from ice, with the exception of an impenetrable ice-bank, a little further than Port Leopold, which threatened to stop the _Forward_ in her north-westerly course. Hatteras was greatly vexed, but he did not show it; he was obliged to have recourse to petards in order to force an entrance to Port Leopold; he reached it on Sunday, the 27th of May; the brig was solidly anchored to the enormous icebergs, which were as upright, hard, and solid as rocks.

The captain, followed by the doctor, Johnson, and his dog Dick, immediately leaped upon the ice, and soon reached land. Dick leaped with joy, for since he had recognised the captain he had become more sociable, keeping his grudge against certain men of the crew for whom his master had no more friendship than he. The port was not then blocked up with ice that the east winds generally heaped up there; the earth, intersected with peaks, offered at
their summits graceful undulations of snow. The house and lantern erected by James Ross were still in a tolerable state of preservation; but the provisions seemed to have been ransacked by foxes and bears, the recent traces of which were easily distinguished. Men, too, had something to do with the devastation, for a few remains of Esquimaux huts remained upon the shores of the Bay. The six graves inclosing the remains of the six sailors of the _Enterprise_ and the _Investigator_ were recognisable by a slight swelling of the ground; they had been respected both by men and animals. In placing his foot for the first time on boreal land, the doctor experienced much emotion. It is impossible to imagine the feelings with which the heart is assailed at the sight of the remains of houses, tents, huts, and magazines that Nature so marvellously preserves in those cold countries.

"There is that residence," he said to his companions, "which James Ross himself called the Camp of Refuge; if Franklin's expedition had reached this spot, it would have been saved. There is the engine which was abandoned here, and the stove at which the crew of the _Prince Albert_ warmed themselves in 1851. Things have remained just as they were, and any one would think that Captain Kennedy had only left yesterday. Here is the long boat which sheltered him and his for a few days, for this Kennedy, separated from his ship, was in reality saved by Lieutenant Bellot, who braved the October temperature in order to go to his assistance."

"I knew that brave and worthy officer," said Johnson.

Whilst the doctor was examining with all an antiquarian's enthusiasm the vestiges of previous winterings, Hatters was occupied in piling together the various provisions and articles of fuel, which were only to be found in very small quantities. The following day was employed in transporting them on board. The doctor, without going too far from the ship, surveyed the country, and took sketches of the most remarkable points of view. The temperature rose by degrees, and the heaped-up snow began to melt. The doctor made an almost complete collection of northern birds, such as gulls, divers, eider-down ducks, which are very much like common ducks, with white breasts and backs, blue bellies, the top of the head blue, and the remainder of the plumage white, shaded with green; several of them had already their breasts stripped of that beautiful down with which the male and female line their nests. The doctor also perceived large seals taking breath on the surface of the ice, but could not shoot one. In his excursions he discovered the high water mark, a stone upon which the following signs are engraved:

(E. I.) 1849,

and which indicate the passage of the _Enterprise_ and _Investigator_; he pushed forward as far as Cape Clarence to the spot where John and James Ross, in 1833, waited with so much impatience for the breaking up of the ice. The land was strewn with skulls and bones of animals, and traces of Esquimaux habitations could be still distinguished.

The doctor wanted to raise up a cairn on Port Leopold, and deposit in it a note indicating the passage of the _Forward_, and the aim of the expedition. But Hatters would not hear of it; he did not want to leave traces behind of which a competitor might take advantage. In spite of his good motives the doctor was forced to yield to the captain's will. Shandon blamed the captain's obstinacy, which prevented any ships following the trace of the _Forward_ in case of accident. Hatters would not give way. His lading was finished on Monday night, and he attempted once more to gain the north by breaking open the ice-bank; but after dangerous efforts he was forced to resign himself, and to go down Regent's Channel again; he would not stop at Port Leopold, which, open to-day, might be closed again to-morrow by an unexpected displacement of ice-fields, a very frequent phenomenon in these seas, and which navigators ought particularly to take into consideration.

If Hatters did not allow his uneasiness to be outwardly perceived, it did not prevent him feeling it inwardly. His desire was to push northward, whilst, on the contrary, he found himself constrained to put back southward. Where should he get to in that case? Should he be obliged to put back to Victoria Harbour, in Boothia Gulf, where Sir John Ross wintered in 1833? Would he find Bellot Strait open at that epoch, and could he ascend Peel Strait by rounding North Somerset? Or, again, should he, like his predecessors, find himself captured during several winters, and be compelled to exhaust his strength and provisions? These fears were fermenting in his brain; he must decide one way or other. He heaved about, and struck out south. The width of Prince Regent's Channel is about the same from Port Leopold to Adelaide Bay. The _Forward_, more favoured than the ships which had preceded her, and of which the greater number had required more than a month to descend the channel, even in a more favourable season, made her way rapidly amongst the icebergs; it is true that other ships, with the exception of the _Fox_, had no steam at their disposal, and had to endure the caprices of an uncertain and often foul wind.

In general the crew showed little wish to push on with the enterprising Hatters; the men were only too glad to perceive that the vessel was taking a southerly direction. Hatters would have liked to go on regardless of consequences.

The _Forward_ rushed along under the pressure of her engines, the smoke from which twisted round the shining points of the icebergs; the weather was constantly changing from dry cold to snowy fogs. The brig, which drew little water, sailed along the west coast; Hatters did not wish to miss the entrance to Bellot Strait, as the only outlet to the
Gulf of Boothia on the south was the strait, only partially known to the _Fury_ and the _Hecla_; if he missed the Bellot Strait, he might be shut up without possibility of egress.

In the evening the _Forward_ was in sight of Elwin Bay, known by its high perpendicular rocks; on the Tuesday morning Batty Bay was sighted, where the _Prince Albert_ anchored for its long wintering on the 10th of September, 1851. The doctor swept the whole coast with his telescope. It was from this point that the expeditions radiated that established the geographical configuration of North Somerset. The weather was clear, and the profound ravines by which the bay is surrounded could be clearly distinguished.

The doctor and Johnson were perhaps the only beings on board who took any interest in these deserted countries. Hatteras was always intent upon his maps, and said little; his taciturnity increased as the brig got more and more south; he often mounted the poop, and there with folded arms, and eyes lost in vacancy, he stood for hours. His orders, when he gave any, were curt and rough. Shandon kept a cold silence, and kept himself so much aloof by degrees that at last he had no relations with Hatteras except those exacted by the service; James Wall remained devoted to Shandon, and regulated his conduct accordingly. The remainder of the crew waited for something to turn up, ready to take any advantage in their own interest. There was no longer that unity of thought and communion of ideas on board which are so necessary for the accomplishment of anything great, and this Hatteras knew to his sorrow.

During the day two whales were perceived rushing towards the south; a white bear was also seen, and was shot at without any apparent success. The captain knew the value of an hour under the circumstances, and would not allow the animal to be chased.

On Wednesday morning the extremity of Regent's Channel was passed; the angle on the west coast was followed by a deep curve in the land. By consulting his map the doctor recognised the point of Somerset House, or Fury Point.

"There," said he to his habitual companion—"there is the very spot where the first English ship, sent into these seas in 1815, was lost, during the third of Parry's voyages to the Pole; the _Fury_ was so damaged by the ice on her second wintering, that her crew were obliged to desert her and return to England on board her companion ship the _Hecla_.

"That shows the advantage of having a second ship," answered Johnson. "It is a precaution that Polar navigators ought not to neglect, but Captain Hatteras wasn't the sort of man to trouble himself with another ship."

"Do you think he is imprudent, Johnson?" asked the doctor.

"I? I think nothing, Mr. Clawbonny. Do you see those stakes over there with some rotten tent-rags still hanging to them?"

"Yes; that's where Parry disembarked his provisions from his ship, and, if I remember rightly, the roof of his tent was a topsail."

"Everything must be greatly changed since 1825!"

"Not so much as any one might think. John Ross owed the health and safety of his crew to that fragile habitation in 1829. When the _Prince Albert_ sent an expedition there in 1851, it was still existing; Captain Kennedy had it repaired, nine years ago now. It would be interesting to visit it, but Hatteras isn't in the humour to stop!"

"I daresay he is right, Mr. Clawbonny; if time is money in England, here it is life, and a day's or even an hour's delay might make all the difference."

During the day of Thursday, the 1st of June, the _Forward_ cut across Creswell Bay; from Fury Point the coast rose towards the north in perpendicular rocks three hundred feet high; it began to get lower towards the south; some snow summits looked like neatly-cut tables, whilst others were shaped like pyramids, and had other strange forms.

The weather grew milder during that day, but was not so clear; land was lost to sight, and the thermometer went up to thirty-two degrees; seafowl fluttered about, the flocks of wild ducks were seen flying north; the crew could divest themselves of some of their garments, and the influence of the Arctic summer began to be felt. Towards evening the _Forward_ doubled Cape Garry at a quarter of a mile from the shore, where the soundings gave from ten to twelve fathoms; from thence she kept near the coast as far as Brentford Bay. It was under this latitude that Bellot Strait was to be met with; a strait the existence of which Sir John Ross did not even guess at during his expedition in 1828; his maps indicated an uninterrupted coast-line, whose irregularities he noted with the utmost care; the entrance to the strait must therefore have been blocked up by ice at the time. It was really discovered by Kennedy in April, 1852, and he gave it the name of his lieutenant, Bellot, as "a just tribute," he said, "to the important services rendered to our expedition by the French officer."

CHAPTER XVI
THE MAGNETIC POLE
Hatteras felt his anxiety increase as he neared the strait; the fate of his voyage depended upon it; up till now he had done more than his predecessors, the most fortunate of whom, McClintock, had taken fifteen months to reach this part of the Polar Seas; but it was little or nothing if he did not succeed in clearing Bellot Strait; he could not retrace his steps, and would be blocked up till the following year.

He trusted the care of examining the coast to no one but himself; he mounted the crow's nest and passed several hours there during the morning of Saturday. The crew perfectly understood the ship's position; profound silence reigned on board; the engine slackened steam, and the _Forward_ kept as near land as possible; the coast bristled with icebergs, which the warmest summers do not melt; an experienced eye alone could distinguish an opening between them. Hatteras compared his maps with the land. As the sun showed himself for an instant towards noon, he caused Shandon and Wall to take a pretty exact observation, which was shouted to him. All the crew suffered the tortures of anxiety for half the day, but towards two o'clock these words were shouted from the top of the mizenmast:

"Veer to the west, all steam on."

The brig instantly obeyed; her prow was directed towards the point indicated; the sea foamed under the screws, and the _Forward_, with all speed on, entered between two ice-streams. The road was found, Hatteras descended upon deck, and the ice-master took his place.

"Well, captain," said the doctor, "we are in the famous strait at last."

"Yes," answered Hatteras, lowering his voice; "but getting in isn't everything; we must get out too," and so saying he regained his cabin.

"He's right," said the doctor; "we are here in a sort of mousetrap, with scarcely enough space for working the brig, and if we are forced to winter in the strait!... Well, we shan't be the first that have had to do it, and they got over it, and so shall we."

The doctor was not mistaken. It was in that very place, in a little sheltered harbour called Kennedy Harbour by McClintock himself, that the _Fox_ wintered in 1858. The high granite chain and the steep cliffs of the two banks were clearly discernible.

Bellot Strait is seventeen miles long and a mile wide, and about six or seven fathoms deep. It lies between mountains whose height is estimated at 1,600 feet. It separates North Somerset from Boothia Land.

It is easy to understand that there is not much elbow-room for vessels in such a strait. The _Forward_ advanced slowly, but it did advance; tempests are frequent in the strait, and the brig did not escape them; by Hatteras's order all sails were furled; but, notwithstanding all precautions, the brig was much knocked about; the waves dashed over her, and her smoke fled towards the east with astonishing rapidity; her course was not certain amongst the moving ice; the barometer fell; it was difficult to stop on deck, and most of the men stayed below to avoid useless suffering.

Hatteras, Johnson, and Shandon remained on the poop in spite of the gales of snow and rain; as usual the doctor had asked himself what would be the most disagreeable thing he could do, and answered himself by going on deck at once; it was impossible to hear and difficult to see one another, so that he kept his reflections to himself. Hatteras tried to see through the fog; he calculated that they would be at the mouth of the strait at six o'clock, but when the time came all issue seemed closed up; he was obliged to wait and anchor the brig to an iceberg; but he stopped under pressure all night.

The weather was frightful. The _Forward_ threatened to break her chains at every instant; it was feared that the iceberg to which they were anchored, torn away at its base under the violent west wind, would float away with the brig. The officers were constantly on the look-out and under extreme apprehension; along with the snow there fell a perfect hail of ice torn off from the surface of the icebergs by the strength of the wind; it was like a shower of arrows bristling in the atmosphere. The temperature rose singularly during this terrible night; the thermometer marked fifty-seven degrees, and the doctor, to his great astonishment, thought he saw flashes of lightning in the south, followed by the roar of far-off thunder that seemed to corroborate the testimony of the whaler Scoresby, who observed a similar phenomenon above the sixty-fifth parallel. Captain Parry was also witness to a similar meteorological wonder in 1821.

Towards five o'clock in the morning the weather changed with astonishing rapidity; the temperature went down to freezing point, the wind turned north, and became calmer. The western opening to the strait was in sight, but entirely obstructed. Hatteras looked eagerly at the coast, asking himself if the passage really existed. However, the brig got under way, and glided slowly amongst the ice-streams, whilst the icebergs pressed noisily against her planks, the packs at that epoch were still from six to seven feet thick; they were obliged carefully to avoid their pressure, for if the brig had resisted them she would have run the risk of being lifted up and turned over on her side. At noon, for the first time, they could admire a magnificent solar phenomenon, a halo with two parhelia; the doctor observed it, and took its exact dimensions; the exterior bow was only visible over an extent of thirty degrees on each side of its horizontal diameter; the two images of the sun were remarkably clear; the colours of the luminous bows
proceeded from inside to outside, and were red, yellow, green, and very light blue—in short, white light without any assignable exterior limit. The doctor remembered the ingenious theory of Thomas Young about these meteors; this natural philosopher supposed that certain clouds composed of prisms of ice are suspended in the atmosphere; the rays of the sun that fall on the prisms are decomposed at angles of sixty and ninety degrees. Halos cannot, therefore, exist in a calm atmosphere. The doctor thought this theory very probable. Sailors accustomed to the boreal seas generally consider this phenomenon as the precursor of abundant snow. If their observation was just, the position of the _Forward_ became very difficult. Hatteras, therefore, resolved to go on fast; during the remainder of the day and following night he did not take a minute's rest, sweeping the horizon with his telescope, taking advantage of the least opening, and losing no occasion of getting out of the strait.

But in the morning he was obliged to stop before the insuperable ice-bank. The doctor joined him on the poop. Hatteras went with him apart where they could talk without fear of being overheard.

"We are in for it," began Hatteras; "it is impossible to go any further."
"Is there no means of getting out?" asked the doctor.
"None. All the powder in the _Forward_ would not make us gain half a mile!"
"What shall we do, then?" said the doctor.
"I don't know. This cursed year has been unfavourable from the beginning."
"Well," answered the doctor, "if we must winter here, we must. One place is as good as another."
"But," said Hatteras, lowering his voice, "we must not winter here, especially in the month of June. Wintering is full of physical and moral danger. The crew would be unmanageable during a long inaction in the midst of real suffering. I thought I should be able to stop much nearer the Pole than this!"
"Luck would have it so, or Baffin's Bay wouldn't have been closed."
"It was open enough for that American!" cried Hatteras in a rage.
"Come, Hatteras," said the doctor, interrupting him on purpose, "to-day is only the 5th of June; don't despair; a passage may suddenly open up before us; you know that the ice has a tendency to break up into several blocks, even in the calmest weather, as if a force of repulsion acted upon the different parts of it; we may find the sea free at any minute."
"If that minute comes we shall take advantage of it. It is quite possible that, once out of Bellot Strait, we shall be able to go north by Peel Strait or McClintock Channel, and then----"
"Captain," said James Wall, who had come up while Hatteras was speaking, "the ice nearly carries off our rudder."
"Well," answered Hatteras, "we must risk it. We must be ready day and night. You must do all you can to protect it, Mr. Wall, but I can't have it removed."
"But----" added Wall.
"That is my business," said Hatteras severely, and Wall went back to his post.
"I would give five years of my life," said Hatteras, in a rage, "to be up north. I know no more dangerous passage. To add to the difficulty, the compass is no guide at this distance from the magnetic pole: the needle is constantly shifting its direction."
"I acknowledge," answered the doctor, "that navigation is difficult, but we knew what we had to expect when we began our enterprise, and we ought not to be surprised at it."
"Ah, doctor, my crew is no longer what it was; the officers are spoiling the men. I could make them do what I want by offering them a pecuniary reward, but I am not seconded by my officers, but they shall pay dearly for it!"
"You are exaggerating, Hatteras."
"No, I am not. Do you think the crew is sorry for the obstacles that I meet with? On the contrary, they hope they will make me abandon my projects. They do not complain now, and they won't as long as the _Forward_ is making for the south. The fools! They think they are getting nearer England! But once let me go north and you'll see how they'll change! I swear, though, that no living being will make me deviate from my line of conduct. Only let me find a passage, that's all!"

One of the captain's wishes was fulfilled soon enough. There was a sudden change during the evening; under some influence of the wind, the current, or the temperature, the ice-fields were separated; the _Forward_ went along boldly, breaking up the ice with her steel prow; she sailed along all night, and the next morning about six cleared Bellot Strait. But that was all; the northern passage was completely obstructed—to the great disgust of Hatteras. However, he had sufficient strength of character to hide his disappointment, and as if the only passage open was the one he preferred, he let the _Forward_ sail down Franklin Strait again; not being able to get up Peel Strait, he resolved to go round Prince of Wales's Land to get into McClintock Channel. But he felt he could not deceive Shandon and Wall as to the extent of his disappointment. The day of the 6th of June was uneventful; the sky was full of snow, and the prognostics of the halo were fulfilled.
During thirty-six hours the _Forward_ followed the windings of Boothia Land, unable to approach Prince of Wales's Land; the captain counted upon getting supplies at Beechey Island; he arrived on the Thursday at the extremity of Franklin Strait, where he again found the road to the north blocked up. It was enough to make him despair; he could not even retrace his steps; the icebergs pushed him onwards, and he saw the passages close up behind him as if there never had existed open sea where he had passed an hour before. The _Forward_ was, therefore, not only prevented from going northwards, but could not stop still an instant for fear of being caught, and she fled before the ice as a ship flies before a storm.

On Friday, the 8th of June, they arrived near the shore of Boothia, at the entrance to James Ross Strait, which they were obliged to avoid, as its only issue is on the west, near the American coasts.

Observations taken at noon from this point gave 70 degrees 5 minutes 17 seconds latitude, and 96 degrees 46 minutes 45 seconds longitude; when the doctor heard that he consulted his map, and saw they were at the magnetic pole, at the very place where James Ross, the nephew of Sir John, had fixed it. The land was low near the coast, and at about a mile's distance became slightly elevated, sixty feet only. The _Forward's_ boiler wanted cleaning, and the captain caused the brig to be anchored to an ice-field, and allowed the doctor and the boatswain to land. He himself cared for nothing but his pet project, and stayed in his cabin, consulting his map of the Pole.

The doctor and his companion easily succeeded in reaching land; the doctor took a compass to make experiments with. He wished to try if James Ross's conclusions hold good. He easily discovered the limestone heap raised by Ross; he ran to it; an opening allowed him to see, in the interior, the tin case in which James Ross had placed the official report of his discoveries. No living being seemed to have visited this desolate coast for the last thirty years. In this spot a loadstone needle, suspended as delicately as possible, immediately moved into an almost vertical position under the magnetic influence; if the centre of attraction was not immediately under the needle, it could only be at a trifling distance. The doctor made the experiment carefully, and found that the imperfect instruments of James Ross had given his vertical needle an inclination of 89 degrees 59 minutes, making the real magnetic point at a minute's distance from the spot, but that his own at a little distance gave him an inclination of 90 degrees.

"Here is the exact spot of the world's magnetic pole," said the doctor, rapping the earth.
"Then," said the boatswain, "there's no loadstone mountain, after all."
"Of course not; that mountain was only a credulous hypothesis. As you see, there isn't the least mountain capable of attracting ships, of attracting their iron anchor after anchor and nail after nail, and you see it respects your shoes as much as any other land on the globe."
"Then how do you explain----"
"Nothing is explained, Johnson; we don't know enough for that yet. But it is certain, exact, mathematical, that the magnetic pole is in this very spot!"
"Ah, Mr. Clawbonny! how happy the captain would be to say as much of the boreal pole!"
"He will some day, Johnson, you will see."
"I hope he will," answered the boatswain.
He and the doctor elevated a cairn on the exact spot where the experiment had been made, and returned on board at five o'clock in the evening.

CHAPTER XVII
THE FATE OF SIR JOHN FRANKLIN

The _Forward_ succeeded in cutting straight across James Ross Strait, but not without difficulty; the crew were obliged to work the saws and use petards, and they were worn out with fatigue. Happily the temperature was bearable, and thirty degrees higher than that experienced by James Ross at the same epoch. The thermometer marked thirty-four degrees.

On Saturday they doubled Cape Felix at the northern extremity of King William's Land, one of the middle-sized isles of the northern seas. The crew there experienced a strong and painful sensation, and many a sad look was turned towards the island as they sailed by the coast. This island had been the theatre of the most terrible tragedy of modern times. Some miles to the west the _Erebus_ and the _Terror_ had been lost for ever. The sailors knew about the attempts made to find Admiral Franklin and the results, but they were ignorant of the affecting details of the catastrophe. While the doctor was following the progress of the ship on his map, several of them, Bell, Bolton, and Simpson, approached and entered into conversation with him. Their comrades, animated by curiosity, soon followed them; while the brig flew along with extreme rapidity, and the coast with its bays, capes, and promontories passed before their eyes like a gigantic panorama.

Hatteras was marching up and down the poop with quick steps. The doctor, on the deck, looked round, and saw
herself surrounded by almost the whole crew. He saw how powerful a recital would be in such a situation, and he
continued the conversation begun with Johnson as follows:--

"You know how Franklin began, my friends; he was a cabin-boy like Cook and Nelson; after having employed
his youth in great maritime expeditions, he resolved in 1845 to launch out in search of the North-West passage; he
commanded the _Erebus_ and the _Terror_, two vessels, already famous, that had just made an Antarctic campaign
under James Ross, in 1840. The _Erebus_, equipped by Franklin, carried a crew of seventy men, officers and sailors,
with Fitz-James as captain; Gore and Le Vesconte, lieutenants; Des Voeux, Sargent, and Couch, boatswains; and
Stanley as surgeon. The _Terror_ had sixty-eight men, Captain Crozier; Lieutenants Little, Hodgson, and Irving;
Horesby and Thomas were the boatswains, and Peddie the surgeon. In the names on the map of the capes, straits,
points, and channels, you may read those of these unfortunate men, not one of whom was destined ever again to see
his native land. There were a hundred and thirty-eight men in all! We know that Franklin's last letters were
addressed from Disko Island, and were dated July 12th, 1845. 'I hope,' he said, 'to get under way to-night for
Lancaster Strait.' What happened after his departure from Disko Bay? The captains of two whalers, the _Prince of
Wales_ and the _Enterprise_, perceived the two ships in Melville Bay for the last time, and after that day nothing
was heard of them. However, we can follow Franklin in his westerly course: he passed through Lancaster and
Barrow Straits, and arrived at Beechey Island, where he passed the winter of 1845 and '46."

"But how do you know all this?" asked Bell, the carpenter.

"By three tombs which Austin discovered on that island in 1850. Three of Franklin's sailors were buried there,
and by a document which was found by Lieutenant Hobson, of the _Fox_, which bears the date of April 25th, 1848,
we know that after their wintering the _Erebus_ and the _Terror_ went up Wellington Strait as far as the seventy-
seventh parallel; but instead of continuing their route northwards, which was, probably, not practicable, they
returned south."

"And that was their ruin!" said a grave voice. "Safety lay to the north."

Every one turned round. Hatteras, leaning on the rail of the poop, had just uttered that terrible observation.

"There is not a doubt," continued the doctor, "that Franklin's intention was to get back to the American coast; but
tempests stopped him, and on the 12th September, 1846, the two ships were seized by the ice, at a few miles from
here, to the north-west of Cape Felix; they were dragged along N.N.W. to Victoria Point over there," said the doctor,
pointing to a part of the sea. "Now," he continued, "the ships were not abandoned till the 22nd of April, 1848. What
happened during these nineteen months? What did the poor unfortunate men do? They, doubtless, explored the
surrounding land, attempting any chance of safety, for the admiral was an energetic man, and if he did not succeed--
"

"Very likely his crew betrayed him," added Hatteras.

The sailors dared not raise their eyes; these words pricked their conscience.

"To end my tale, the fatal document informs us also that John Franklin succumbed to fatigue on the 11th of June,
1847. Honour to his memory!" said the doctor, taking off his hat. His audience imitated him in silence.

"What became of the poor fellows for the next ten months after they had lost their chief? They remained on
board their vessels, and only resolved to abandon them in April, 1848; a hundred and five men out of a hundred and
thirty-eight were still living; thirty-three were dead! Then Captain Crozier and Captain Fitz-James raised a cairn on
Victory Point, and there deposited their last document. See, my friends, we are passing the point now! You can still
see the remains of the cairn placed on the extreme point, reached by John Ross in 1831. There is Jane Franklin Cape.
There is Franklin Point. There is Le Vesconte Point. There is Erebus Bay, where the boat made out of the _debris_ of
one of the vessels was found on a sledge. Silver spoons, provisions in abundance, chocolate, tea, and religious
books were found there too. The hundred and five survivors, under Captain Crozier, started for Great Fish River.
Where did they get to? Did they succeed in reaching Hudson's Bay? Did any survive? What became of them after
this last departure?"

"I will tell you what became of them," said John Hatteras in a firm voice. "Yes, they did try to reach Hudson's
Bay, and they split up into several parties! Yes, they did make for the south! A letter from Dr. Rae in 1854 contained
the information that in 1850 the Esquimaux had met on King William's Land a detachment of forty men travelling
on the ice, and dragging a boat, thin, emaciated, worn out by fatigue and suffering! Later on they discovered thirty
corpses on the continent and five on a neighbouring island, some half-buried, some left without burial, some under a
boat turned upside down, others under the remains of a tent; here an officer with his telescope on his shoulder and a
loaded gun at his side, further on a boiler with the remnants of a horrible meal! When the Admiralty received these
tidings it begged the Hudson's Bay Company to send its most experienced agents to the scene. They descended Back
River to its mouth. They visited the islands of Montreal, Maconochie, and Ogle Point. But they discovered nothing.
All the poor wretches had died from misery, suffering, and hunger, whilst trying to prolong their existence by the
dreadful resource of cannibalism. That is what became of them on the southern route. Well! Do you still wish to
march in their footsteps?"

His trembling voice, his passionate gestures and beaming face, produced an indescribable effect. The crew, excited by its emotion before this fatal land, cried out with one voice: "To the north! To the north!"

"Yes, to the north! Safety and glory lie to the north. Heaven is for us! The wind is changing; the pass is free!"

So saying, Hatteras gave orders to turn the vessel; the sailors went to work with alacrity; the ice streams got clear little by little; the _Forward_, with all steam on, made for McClintock Channel. Hatteras was right when he counted upon a more open sea; he followed up the supposed route taken by Franklin, sailing along the western coast of Prince of Wales's Land, then pretty well known, whilst the opposite shore is still unknown. It was evident that the breaking up of the ice had taken place in the eastern locks, for this strait appeared entirely free; the _Forward_ made up for lost time; she fled along so quickly that she passed Osborne Bay on the 14th of June, and the extreme points attained by the expeditions of 1851. Icebergs were still numerous, but the sea did not threaten to quit the keel of the _Forward_.

CHAPTER XVIII
THE NORTHERN ROUTE

The crew seemed to have returned to its habits of discipline and obedience. There was little fatiguing work to do, and they had a good deal of leisure. The temperature kept above freezing point, and it seemed as if the thaw had removed the great obstacles to navigation.

Dick, now sociable and familiar, had made great friends with Dr. Clawbonny. But as in most friendships one friend has to give way to the other, it must be acknowledged it was not the dog. Dick did what he liked with the doctor, who obeyed him as if he were the dog. He was amiable with most of the sailors and officers on board, only by instinct, doubtless, he shunned Shandon's society; he also kept up a grudge against Pen and Foker; he vented his hatred of them by growling at their approach. But they dare not now attack the captain's dog--his "familiar," as Clifton called him. On the whole the crew had plucked up courage again and worked well.

"It seems to me," said James Wall one day to Richard Shandon, "that our men took the captain's speech seriously; they no longer seem to be doubtful of success."

"The more fools they!" answered Shandon. "If they reflected, if they examined the situation, they would see that we are going out of one imprudence into another."

"But," continued Wall, "the sea is open now, and we are getting back into well-known tracks; aren't you exaggerating a bit, Shandon?"

"No, I am not exaggerating; the dislike I feel to Hatteras is not blinding me. Have you seen the coal-holes lately?"

"No," answered Wall.

"Well, then, go and examine them: you will see how much there's left. He ought to have navigated under sail, and have kept the engine for currents and contrary winds; he ought only to have used his coal where he was obliged; who can tell where we shall be kept, and for how many years? But Hatteras only thinks about getting north. Whether the wind is contrary or not, he goes along at full steam, and if things go on as they are doing now, we shall soon be in a pretty pickle."

"If what you say is true, it is very serious."

"Yes, it is, because of the wintering. What shall we do without coal in a country where even the thermometer freezes?"

"But, if I am not mistaken, the captain counts upon renewing his stock of coal at Beechey Island. It appears there is a large provision there."

"And suppose we can't reach Beechey Island, what will become of us then?"

"You are right, Shandon; Hatteras seems to me very imprudent; but why don't you expostulate with him on the subject?"

"No," said Shandon, with ill-concealed bitterness, "I won't say a word. It is nothing to do with me now. I shall wait to see what turns up; I shall obey orders, and not give my opinion where it isn't wanted."

"Allow me to tell you that you are in the wrong, Shandon; you have as much interest in setting yourself against the captain's imprudence as we have."

"He wouldn't listen to me if I were to speak; do you think he would?"

Wall dared not answer in the affirmative, and he added--

"But perhaps he would listen to the crew."

"The crew!" answered Shandon, shrugging his shoulders; "you don't know the crew. The men know they are nearing the 72nd parallel, and that they will earn a thousand pounds for every degree above that."
"The captain knew what he was doing when he offered them that."
"Of course he did, and for the present he can do what he likes with them."
"What do you mean?"
"I mean that while they have nothing to do, and there is an open sea, they will go on right enough; but wait till difficulty and danger come, and you will see how much they'll think about the money!"
"Then you don't think Hatteras will succeed?"
"No, he will not; to succeed in such an enterprise there must be a good understanding between him and his officers, and that does not exist. Hatteras is a madman; all his past career proves it. Well, we shall see; perhaps circumstances will force them to give the command to a less adventurous captain."
"Still," said Wall, shaking his head, "he will always have on his side----"
"Dr. Clawbonny, a man who only cares for science, and Johnson, a sailor who only cares to obey, and perhaps two more men like Bell, the carpenter; four at the most, and we are eighteen on board! No, Wall, Hatteras has not got the confidence of his men, and he knows it, so he bribes them; he profited cleverly by the Franklin affair, but that won't last, I tell you, and if he doesn't reach Beechey Island he's a lost man!"
"Suppose the crew should take it into its head----"
"Don't tell the crew what I think," answered Shandon quickly; "the men will soon see for themselves. Besides, just now we must go north. Who knows if Hatteras won't find that way will bring us back sooner? At the end of McClintock Channel lies Melville Bay, and from thence go the straits that lead to Baffin's Bay. Hatteras must take care! The way to the east is easier than the road to the north!"

Hatteras was not mistaken in his opinion that Shandon would betray him if he could. Besides, Shandon was right in attributing the contentment of the men to the hope of gain. Clifton had counted exactly how much each man would have. Without reckoning the captain and the doctor, who would not expect a share in the bounty-money, there remained sixteen men to divide it amongst. If ever they succeeded in reaching the Pole, each man would have 1,125 pounds—that is to say, a fortune. It would cost the captain 18,000 pounds, but he could afford it. The thoughts of the money inflamed the minds of the crew, and they were now as anxious to go north as before they had been eager to turn south. The _Forward_ during the day of June 16th passed Cape Aworth. Mount Rawlinson raised its white peaks towards the sky; the snow and fog made it appear colossal, as they exaggerated its distance; the temperature still kept some degrees above freezing point; improvised cascades and cataracts showed themselves on the sides of the mountains, and avalanches roared down with the noise of artillery discharges. The glaciers, spread out in long white sheets, projected an immense reverberation into space. Boreal nature, in its struggle with the frost, presented a splendid spectacle. The brig went very near the coast; on some sheltered rocks rare heaths were to be seen, the pink flowers lifting their heads timidly out of the snows, and some meagre lichens of a reddish colour and the shoots of a dwarf willow.

At last, on the 19th of June, at the famous seventy-third parallel, they doubled Cape Minto, which forms one of the extremities of Ommaney Bay; the brig entered Melville Bay, surnamed by Bolton Money Bay; the merry sailors joked about the name, and made Dr. Clawbonny laugh heartily. Notwithstanding a strong breeze from the northeast, the _Forward_ made considerable progress, and on the 23rd of June she passed the 74th degree of latitude. She was in the midst of Melville Bay, one of the most considerable seas in these regions. This sea was crossed for the first time by Captain Parry in his great expedition of 1819, and it was then that his crew earned the prize of 5,000 pounds promised by Act of Parliament. Clifton remarked that there were two degrees from the 72nd to the 74th; that already placed 125 pounds to his credit. But they told him that a fortune was not worth much there, and that it was of no use being rich if he could not drink his riches, and he had better wait till he could roll under a Liverpool table before he rejoiced and rubbed his hands.

CHAPTER XIX
A WHALE IN SIGHT

Melville Bay, though easily navigable, was not free from ice; ice-fields lay as far as the utmost limits of the horizon; a few icebergs appeared here and there, but they were immovable, as if anchored in the midst of the frozen fields. The _Forward_, with all steam on, followed the wide passes where it was easy to work her. The wind changed frequently from one point of the compass to another. The variability of the wind in the Arctic Seas is a remarkable fact; sometimes a dead calm is followed in a few minutes by a violent tempest, as the _Forward_ found to her cost on the 23rd of June in the midst of the immense bay. The more constant winds blow from off the ice-bank on to the open sea, and are intensely cold. On that day the thermometer fell several degrees; the wind veered round to the south, and violent gusts, sweeping over the ice-fields, brought a thick snow along with them. Hatteras immediately caused the sails that helped the screw to be furled, but not quickly enough to prevent his little foresail
being carried away in the twinkling of an eye. Hatteras worked his ship with the greatest composure, and did not
leave the deck during the tempest; he was obliged to fly before the weather and to turn westward. The wind raised
up enormous waves, in the midst of which blocks of ice balanced themselves; these blocks were of all sizes and
shapes, and had been struck off the surrounding ice-fields; the brig was tossed about like a child's plaything, and
morsels of the packs were thrown over her hull; at one instant she was lying perpendicularly along the side of a
liquid mountain; her steel prow concentrated the light, and shone like a melting metal bar; at another she was down
an abyss, plunging her head into whirlwinds of snow, whilst her screws, out of the water, turned in space with a
sinister noise, striking the air with their paddles. Rain mixed with the snow and fell in torrents.

The doctor could not miss such an occasion of getting wet to the skin; he remained on deck, a prey to that
emotional admiration which a scientific man must necessarily feel during such a spectacle. His nearest neighbour
could not have heard him speak, so he said nothing and watched; but whilst watching he was witness to an odd
phenomenon, peculiar to hyperborean regions. The tempest was confined to a restricted area, and only extended for
about three or four miles; the wind that passes over ice-fields loses much of its strength and cannot carry its violence
far out; the doctor perceived from time to time, through an opening in the tempest, a calm sky and a quiet sea
beyond some ice-fields. The _Forward_ would therefore only have to take advantage of some channels left by the
ice to find a peaceful navigation again, but she ran the risk of being thrown on to one of the moving banks which
followed the movement of the swell. However, in a few hours Hatteras succeeded in getting his ship into a calm sea,
whilst the violence of the hurricane spent itself at a few cables' length from the _Forward_. Melville Bay no longer
presented the same aspect; under the influence of the winds and the waves a great number of icebergs, detached
from the coast, floated northward, running against one another in every direction. There were several hundreds of
them, but the bay is very wide, and the brig easily avoided them. The spectacle of these floating masses was
magnificent; they seemed to be having a grand race for it on the open sea. The doctor was getting quite excited with
watching them, when the harpooner, Simpson, came up and made him look at the changing tints in the sea; they
varied from a deep blue to olive green; long stripes stretched north and south in such decided lines that the eye could
follow each shade out of sight. Sometimes a transparent sheet of water would follow a perfectly opaque sheet.

"Well, Mr. Clawbonny, what do you think of that?" said Simpson.

"I am of the same opinion as the whaler Scoresby on the nature of the different coloured waters; blue water has
no animalculae, and green water is full of them. Scoresby has made several experiments on this subject, and I think
he is right."

"Well, sir, I know something else about the colours in the sea, and if I were a whaler I should be precious glad to
see them."

"But I don't see any whales," answered the doctor.

"You won't be long before you do, though, I can tell you. A whaler is lucky when he meets with those green
stripes under this latitude."

"Why?" asked the doctor, who always liked to get information from anybody who understood what they were
talking about.

"Because whales are always found in great quantities in green water."

"What's the reason of that?"

"Because they find plenty of food in them."

"Are you sure of that?"

"I've seen it a hundred times, at least, in Baffin Sea; why shouldn't it be the same in Melville Bay? Besides, look
there, Mr. Clawbonny," added Simpson, leaning over the barricading.

"Why any one would think it was the wake of a ship!"

"It is an oily substance that the whale leaves behind. The animal can't be far off!"

The atmosphere was impregnated with a strong oily odour, and the doctor attentively watched the surface of the
water. The prediction of the harpooner was soon accomplished. Foker called out from the masthead--

"A whale alee!"

All looks turned to the direction indicated. A small spout was perceived coming up out of the sea about a mile
from the brig.

"There she spouts!" cried Simpson, who knew what that meant.

"She has disappeared!" answered the doctor.

"Oh, we could find her again easily enough if necessary!" said Simpson, with an accent of regret. To his great
astonishment, and although no one dared ask for it, Hatteras gave orders to man the whaler. Johnson went aft to the
stem, while Simpson, harpoon in hand, stood in the bow. They could not prevent the doctor joining the expedition.
The sea was pretty calm. The whaler soon got off, and in ten minutes was a mile from the brig. The whale had taken
in another provision of air, and had plunged again; but she soon returned to the surface and spouted out that mixture
of gas and mucus that escapes from her air-holes.

"There! There!" said Simpson, pointing to a spot about eight hundred yards from the boat. It was soon alongside the animal, and as they had seen her from the brig too, she came nearer, keeping little steam on. The enormous cetacean disappeared and reappeared as the waves rose and fell, showing its black back like a rock in open sea. Whales do not swim quickly unless they are pursued, and this one only rocked itself in the waves. The boat silently approached along the green water; its opacity prevented the animal seeing the enemy. It is always an agitating spectacle when a fragile boat attacks one of these monsters; this one was about 130 feet long, and it is not rare, between the 72nd and the 80th degree, to meet with whales more than 180 feet long. Ancient writers have described animals more than 700 feet long, but they drew upon their imagination for their facts. The boat soon neared the whale; on a sign from Simpson the men rested on their oars, and brandishing his harpoon, the experienced sailor threw it with all his strength; it went deep into the thick covering of fat. The wounded whale struck the sea with its tail and plunged. The four oars were immediately raised perpendicularly; the cord fastened to the harpoon, and attached to the bow, rolled rapidly out and dragged the boat along, steered cleverly by Johnson.

The whale got away from the brig and made for the moving icebergs; she kept on for more than half-an-hour; they were obliged to wet the cord fastened to the harpoon to prevent it catching fire by rubbing against the boat. When the whale seemed to be going along a little more slowly, the cord was pulled in little by little and rolled up; the whale soon reappeared on the surface of the sea, which she beat with her formidable tail: veritable waterspouts fell in a violent rain on to the boat. It was getting nearer. Simpson had seized a long lance, and was preparing to give close battle to the animal, when all at once the whale glided into a pass between two mountainous icebergs. The pursuit then became really dangerous.

"The devil!" said Johnson.
"Go ahead," cried Simpson; "we've got her!"
"But we can't follow her into the icebergs!" said Johnson, steering steadily.
"Yes we can!" cried Simpson.
"No, no!" cried some of the sailors.
"Yes, yes!" said others.

During the discussion the whale had got between two floating mountains which the swell was bringing close together. The boat was being dragged into this dangerous part when Johnson rushed to the fore, an axe in his hand, and cut the cord. He was just in time; the two mountains came together with a tremendous crash, crushing the unfortunate animal.

"The whale's lost!" cried Simpson.
"But we are saved!" answered Johnson.
"Well," said the doctor, who had not moved, "that was worth seeing!"

The crushing force of these ice-mountains is enormous. The whale was victim to an accident that often happens in these seas. Scoresby relates that in the course of a single summer thirty whales perished in the same way in Baffin's Sea; he saw a three-master flattened in a minute between two immense walls of ice. Other vessels were split through, as if with a lance, by pointed icicles a hundred feet long, meeting through the planks. A few minutes afterwards the boat hailed the brig, and was soon in its accustomed place on deck.

"It is a lesson for those who are imprudent enough to adventure into the channels amongst the ice!" said Shandon in a loud voice.

CHAPTER XX
BEECHEY ISLAND

On the 25th of June the _Forward_ arrived in sight of Cape Dundas at the north-western extremity of Prince of Wales's Land. There the difficulty of navigating amongst the ice grew greater. The sea is narrower there, and the line made by Crozier, Young, Day, Lowther, and Garret Islands, like a chain of forts before a roadstead, forced the ice-streams to accumulate in this strait. The brig took from the 25th to the 30th of June to make as much way as she would have done in one day under any other circumstances; she stopped, retraced her steps, waiting for a favourable occasion so as not to miss Beechey Island, using a great deal of coal, as the fires were only moderated when she had to halt, but were never put out, so that she might be under pressure day and night. Hatteras knew the extent of his coal provision as well as Shandon, but as he was certain of getting his provision renewed at Beechey Island he would not lose a minute for the sake of economy; he had been much delayed by his forced march southward, and although he had taken the precaution of leaving England before the month of April, he did not find himself more advanced than preceding expeditions had been at the same epoch. On the 30th they sighted Cape Walker at the north-eastern extremity of Prince of Wales's Land; it was the extreme point that Kennedy and Bellot perceived on
the 3rd of May, 1852, after an excursion across the whole of North Somerset. Before that, in 1851, Captain Ommaney, of the Austin expedition, had the good luck to revictual his detachments there. This cape is very high, and remarkable for its reddish-brown colour; from there, when the weather is clear, the view stretches as far as the entrance to Wellington Channel. Towards evening they saw Cape Bellot, separated from Cape Walker by McLeon Bay. Cape Bellot was so named in the presence of the young French officer, for whom the English expedition gave three cheers. At this spot the coast is made of yellow limestone, presenting a very rugged outline; it is defended by enormous icebergs which the north winds pile up there in a most imposing way. It was soon lost to sight by the _Forward_ as she opened a passage amongst the ice to get to Beechey Island through Barrow Strait. Hatteras resolved to go straight on, and, so as not to be drifted further than the island, scarcely quitted his post during the following days; he often went to the masthead to look out for the most advantageous channels. All that pluck, skill, and genius could do he did while they were crossing the strait. Fortune did not favour him, for the sea is generally more open at this epoch. But at last, by dint of sparing neither his steam, his crew, nor himself, he attained his end.

On the 3rd of July, at 11 o’clock in the morning, the ice-master signalled land to the north. After taking an observation Hatteras recognised Beechey Island, that general meeting-place of Arctic navigators. Almost all ships that adventure in these seas stop there. Franklin wintered there for the first time before getting into Wellington Strait, and Creswell, with Lieutenant McClure, after having cleared 170 miles on the ice, rejoined the _Phoenix_ and returned to England. The last ship which anchored at Beechey Island before the _Forward_ was the _Fox_; McClintock revictualled there the 11th of August, 1858, and repaired the habitations and magazines; only two years had elapsed since then, and Hatteras knew all these details. The boatswain's heart beat with emotion at the sight of this island; when he had visited it he was quartermaster on board the _Phoenix_; Hatteras questioned him about the coast line, the facilities for anchoring, how far they could go inland, &c.; the weather was magnificent, and the temperature kept at 57 degrees.

"Well, Johnson," said the captain, "do you know where you are?"
"Yes, sir, that is Beechey Island; only you must let us get further north--the coast is more easy of access."
"But where are the habitations and the magazines?" said Hatteras.
"Oh, you can't see them till you land; they are sheltered behind those little hills you see yonder."
"And is that where you transported a considerable quantity of provisions?"
"Yes, sir; the Admiralty sent us here in 1853, under the command of Captain Inglefield, with the steamer _Phoenix_ and a transport ship, the _Breadalbane_, loaded with provisions; we brought enough with us to revictual a whole expedition."

"But the commander of the _Fox_ took a lot of them in 1858," said Hatteras.
"That doesn't matter, sir; there'll be plenty left for you; the cold preserves them wonderfully, and we shall find them as fresh and in as good a state of preservation as the first day."
"What I want is coal," said Hatteras; "I have enough provisions for several years."
"We left more than a thousand tons there, so you can make your mind easy."
"Are we getting near?" said Hatteras, who, telescope in hand, was watching the coast.
"You see that point?" continued Johnson. "We have doubled it shall we be very near where we drop anchor. It was from that place that we started for England with Lieutenant Creswell and the twelve invalids from the _Investigator_. We were fortunate enough to bring back McClure's lieutenant, but the officer Bellot, who accompanied us on board the _Phoenix_, never saw his country again! It is a painful thing to think about. But, captain, I think we ought to drop anchor here."

"Very well," answered Hatteras, and he gave his orders in consequence. The _Forward_ was in a little bay naturally sheltered on the north, east, and south, and at about a cable's length from the coast.

"Mr. Wall," said Hatteras, "have the long boat got ready to transport the coal on board. I shall land in the pirogue with the doctor and the boatswain. Will you accompany us, Mr. Shandon?"

"As you please," answered Shandon.

A few minutes later the doctor, armed as a sportsman and a _savant_, took his place in the pirogue along with his companions; in ten minutes they landed on a low and rocky coast.

"Lead the way, Johnson," said Hatteras. "You know it, I suppose?"
"Perfectly, sir; only there's a monument here that I did not expect to find!"
"That!" cried the doctor; "I know what it is; let us go up to it; the stone itself will tell us."

The four men advanced, and the doctor said, after taking off his hat--
"This, my friends, is a monument in memory of Franklin and his companions."

Lady Franklin had, in 1855, confided a black marble tablet to Doctor Kane, and in 1858 she gave a second to McClintock to be raised on Beechey Island. McClintock accomplished this duty religiously, and placed the stone near a funeral monument erected to the memory of Bellot by Sir John Barrow.
The tablet bore the following inscription:

"TO THE MEMORY OF FRANKLIN, CROZIER, FITZ-JAMES, AND ALL THEIR VALIANT BRETHREN OFFICERS AND FAITHFUL COMPANIONS who suffered for the cause of science and for their country's glory.

"This stone is erected near the place where they passed their first Arctic winter, and from whence they departed to conquer obstacles or to die.

"It perpetuates the regret of their countrymen and friends who admire them, and the anguish, conquered by Faith, of her who lost in the chief of the expedition the most devoted and most affectionate of husbands.

"It is thus that He led them to the supreme haven where all men take their rest.

"1855."

This stone, on a forlorn coast of these far-off regions, appealed mournfully to the heart; the doctor, in presence of these touching regrets, felt his eyes fill with tears. At the very same place which Franklin and his companions passed full of energy and hope, there only remained a block of marble in remembrance! And notwithstanding this sombre warning of destiny, the _Forward_ was going to follow in the track of the _Erebus_ and the _Terror_.

Hatteras was the first to rouse himself from the perilous contemplation, and quickly climbed a rather steep hill, almost entirely bare of snow.

"Captain," said Johnson, following him, "we shall see the magazines from here."

Shandon and the doctor joined them on the summit. But from there the eye contemplated the vast plains, on which there remained no vestige of a habitation.

"That is singular!" cried the boatswain.

"Well, and where are the magazines?" said Hatteras quickly.

"I don't know--I don't see----" stammered Johnson.

"You have mistaken the way," said the doctor.

"It seemed to me that this was the very place," continued Johnson.

"Well," said Hatteras, impatiently "where are we to go now?"

"We had better go down, for I may be mistaken. I may have forgotten the exact locality in seven years!"

"Especially when the country is so uniformly monotonous!" added the doctor.

"And yet----" murmured Johnson.

Shandon had not spoken a word. After walking for a few minutes, Johnson stopped.

"But no," he cried, "I am not mistaken!"

"Well?" said Hatteras, looking round him.

"Do you see that swell of the ground?" asked the boatswain, pointing to a sort of mound with three distinct swells on it.

"What do you conclude from that?" asked the doctor.

"Those are the three graves of Franklin's sailors. I am sure now that I am not mistaken; the habitations ought to be about a hundred feet from here, and if they are not, they----"

He dared not finish his sentence; Hatteras had rushed forward, a prey to violent despair. There, where the wished-for stores on which he had counted ought to have been, there ruin, pillage and destruction had been before him. Who had done it? Animals would only have attacked the provisions, and there did not remain a single rag from the tent, a piece of wood or iron, and, more terrible still, not a fragment of coal! It was evident that the Esquimaux had learnt the value of these objects from their frequent relations with Europeans; since the departure of the _Fox_ they had fetched everything away, and had not left a trace even of their passage. A slight coating of snow covered the ground. Hatteras was confounded. The doctor looked and shook his head. Shandon still said nothing, but an attentive observer would have noticed his lips curl with a cruel smile. At this moment the men sent by Lieutenant Wall came up; they soon saw the state of affairs. Shandon advanced towards the captain, and said:

"Mr. Hatteras, we need not despair; happily we are near the entrance to Barrow Strait, which will take us back to Baffin's Sea!"

"Mr. Shandon," answered Hatteras, "happily we are near the entrance to Wellington Strait, and that will take us north!"

"But how shall we get along, captain?"

"With the sails, sir. We have two months' firing left, and that is enough for our wintering."

"But allow me to tell you----" added Shandon.

"I will allow you to follow me on board my ship, sir," answered Hatteras, and turning his back on his second, he returned to the brig and shut himself up in his cabin. For the next two days the wind was contrary, and the captain did not show up on deck. The doctor profited by the forced sojourn to go over Beechey Island; he gathered some plants, which the temperature, relatively high, allowed to grow here and there on the rocks that the snow had left, some heaths, a few lichens, a sort of yellow ranunculus, a sort of plant something like sorrel, with wider leaves and
more veins, and some pretty vigorous saxifrages. He found the fauna of this country much richer than the flora; he perceived long flocks of geese and cranes going northward, partridges, eider ducks of a bluish black, sandpipers, a sort of wading bird of the scolopax class, northern divers, plungers with very long bodies, numerous ptarmites, a sort of bird very good to eat, dovekies with black bodies, wings spotted with white, feet and beak red as coral; noisy bands of kittywakes and fat loons with white breasts, represented the ornithology of the island. The doctor was fortunate enough to kill a few grey hares, which had not yet put on their white winter fur, and a blue fox which Dick ran down skilfully. Some bears, evidently accustomed to dread the presence of men, would not allow themselves to be got at, and the seals were extremely timid, doubtless for the same reason as their enemies the bears. The class of articulated animals was represented by a single mosquito, which the doctor caught to his great delight, though not till it had stung him. As a conchologist he was less favoured, and only found a sort of mussel and some bivalve shells.

CHAPTER XXI
THE DEATH OF BELLOT

The temperature during the days of the 3rd and 4th of July kept up to 57 degrees; this was the highest thermometric point observed during the campaign. But on Thursday, the 5th, the wind turned to the south-east, and was accompanied by violent snow-storms. The thermometer fell during the preceding night to 23 degrees. Hatteras took no notice of the murmurs of the crew, and gave orders to get under way. For the last thirteen days, from Cape Dundas, the _Forward_ had not been able to gain one more degree north, so the party represented by Clifton was no longer satisfied, but wished like Hatteras to get into Wellington Channel, and worked away with a will. The brig had some difficulty in getting under sail; but Hatteras having set his mizensail, his topsails, and his gallantsails during the night, advanced boldly in the midst of fields of ice which the current was drifting south. The crew were tired out with this winding navigation, which kept them constantly at work at the sails. Wellington Channel is not very wide; it is bounded by North Devon on the east and Cornwallis Island on the west; this island was long believed to be a peninsula. It was Sir John Franklin who first sailed round it in 1846, starting west, and coming back to the same point to the north of the channel. The exploration of Wellington Channel was made in 1851 by Captain Penny in the whalers _Lady Franklin_ and _Sophia_; one of his lieutenants, Stewart, reached Cape Beecher in latitude 76 degrees 20 minutes, and discovered the open sea--that open sea which was Hatteras's dream!

"What Stewart found I shall find," said he to the doctor; "then I shall be able to set sail to the Pole."

"But aren't you afraid that your crew----"

"My crew!" said Hatteras severely. Then in a low tone--"Poor fellows!" murmured he, to the great astonishment of the doctor. It was the first expression of feeling he had heard the captain deliver.

"No," he repeated with energy, "they must follow me! They shall follow me!"

However, although the _Forward_ had nothing to fear from the collision of the ice-streams, which were still pretty far apart, they made very little progress northward, for contrary winds often forced them to stop. They passed Capes Spencer and Innis slowly, and on Tuesday, the 10th, cleared 75 degrees to the great delight of Clifton. The _Forward_ was then at the very place where the American ships, the _Rescue_ and the _Advance_, encountered such terrible dangers. Doctor Kane formed part of this expedition; towards the end of September, 1850, these ships got caught in an ice-bank, and were forcibly driven into Lancaster Strait. It was Shandon who related this catastrophe to James Wall before some of the brig's crew.

"The _Advance_ and the _Rescue_," he said to them, "were so knocked about by the ice, that they were obliged to leave off fires on board; but that did not prevent the temperature sinking 18 degrees below zero. During the whole winter the unfortunate crews were kept prisoners in the ice-bank, ready to abandon their ships at any moment; for three weeks they did not even change their clothes. They floated along in that dreadful situation for more than a thousand miles, when at last they were thrown into the middle of Baffin's Sea."

The effect of this speech upon a crew already badly disposed can be well imagined. During this conversation Johnson was talking to the doctor about an event that had taken place in those very quarters; he asked the doctor to tell him when the brig was in latitude 75 degrees 30 minutes, and when they passed it he cried:

"Yes, it was just there!" in saying which tears filled his eyes.

"You mean that Lieutenant Bellot died there?" said the doctor.

"Yes, Mr. Clawbonny. He was as good and brave a fellow as ever lived! It was upon this very North Devon coast! It was to be, I suppose, but if Captain Pullen had returned on board sooner it would not have happened."

"What do you mean, Johnson?"

"Listen to me, Mr. Clawbonny, and you will see on what a slight thread existence often hangs. You know that Lieutenant Bellot went his first campaign in search of Franklin in 1850?"
"Yes, on the _Prince Albert._"

"Well, when he got back to France he obtained permission to embark on board the _Phoenix_ under Captain Inglefield; I was a sailor on board. We came with the _Breadalbane_ to transport provisions to Beechey Island!"

"Those provisions we, unfortunately, did not find. Well?"

"We reached Beechey Island in the beginning of August; on the 10th Captain Inglefield left the _Phoenix_ to rejoin Captain Pullen, who had been separated from his ship, the _North Star_, for a month. When he came back he thought of sending his Admiralty despatches to Sir Edward Belcher, who was wintering in Wellington Channel. A little while after the departure of our captain, Captain Pullen got back to his ship. Why did he not arrive before the departure of Captain Inglefield? Lieutenant Bellot, fearing that our captain would be long away, and knowing that the Admiralty despatches ought to be sent at once, offered to take them himself. He left the command of the two ships to Captain Pullen, and set out on the 12th of August with a sledge and an indiarubber boat. He took the boatswain of the _North Star_ (Harvey) with him, and three sailors, Madden, David Hook, and me. We supposed that Sir Edward Belcher was to be found in the neighbourhood of Beecher Cape, to the north of the channel; we made for it with our sledge along the eastern coast. The first day we encamped about three miles from Cape Innis; the next day we stopped on a block of ice about three miles from Cape Bowden. As land lay at about three miles' distance, Lieutenant Bellot resolved to go and encamp there during the night, which was as light as the day; he tried to get to it in his indiarubber canoe; he was twice repulsed by a violent breeze from the south-east; Harvey and Madden attempted the passage in their turn, and were more fortunate; they took a cord with them, and established a communication between the coast and the sledge; three objects were transported by means of the cord, but at the fourth attempt we felt our block of ice move; Mr. Bellot called out to his companions to drop the cord, and we were dragged to a great distance from the coast. The wind blew from the south-east, and it was snowing; but we were not in much danger, and the lieutenant might have come back as we did."

Here Johnson stopped an instant to take a glance at the fatal coast, and continued:

"After our companions were lost to sight we tried to shelter ourselves under the tent of our sledge, but in vain; then, with our knives, we began to cut out a house in the ice. Mr. Bellot helped us for half an hour, and talked to us about the danger of our situation. I told him I was not afraid. 'By God's help,' he answered, 'we shall not lose a hair of our heads.' I asked him what o'clock it was, and he answered, 'About a quarter-past six.' It was a quarter-past six in the morning of Thursday, August 18th. Then Mr. Bellot tied up his books, and said he would go and see how the ice floated; he had only been gone four minutes when I went round the block of ice to look for him; I saw his stick on the opposite side of a crevice, about five fathoms wide, where the ice was broken, but I could not see him anywhere. I called out, but no one answered. The wind was blowing great guns. I looked all round the block of ice, but found no trace of the poor lieutenant."

"What do you think had become of him?" said the doctor, much moved.

"I think that when Mr. Bellot got out of shelter the wind blew him into the crevice, and, as his greatcoat was buttoned up he could not swim. Oh! Mr. Clawbonny, I never was more grieved in my life! I could not believe it! He was a victim to duty, for it was in order to obey Captain Pullen's instructions that he tried to get to land. He was a good fellow, everybody liked him; even the Esquimaux, when they learnt his fate from Captain Inglefield on his return from Pound Bay, cried while they wept, as I am doing now, 'Poor Bellot! poor Bellot!'"

"But you and your companion, Johnson," said the doctor, "how did you manage to reach land?"

"Oh! we stayed twenty-four hours more on the block of ice, without food or firing; but at last we met with an ice-field; we jumped on to it, and with the help of an oar we fastened ourselves to an iceberg that we could guide like a raft, and we got to land, but without our brave officer."

By the time Johnson had finished his story the _Forward_ had passed the fatal coast, and Johnson lost sight of the place of the painful catastrophe. The next day they left Griffin Bay to the starboard, and, two days after, Capes Grinnell and Helpmann; at last, on the 14th of July, they doubled Osborn Point, and on the 15th the brig anchored in Baring Bay, at the extremity of the channel. Navigation had not been very difficult; Hatteras met with a sea almost as free as that of which Belcher profited to go and winter with the _Pioneer_ and the _Assistance_ as far north as 77 degrees. It was in 1852 and 1853, during his first wintering, for he passed the winter of 1853 to 1854 in Baring Bay, where the _Forward_ was now at anchor. He suffered so much that he was obliged to leave the _Assistance_ in the midst of the ice. Shandon told all these details to the already discontented sailors. Did Hatteras know how he was betrayed by his first officer? It is impossible to say; if he did, he said nothing about it.

At the top of Baring Bay there is a narrow channel which puts Wellington and Queen's Channel into communication with each other. There the rafts of ice lie closely packed. Hatteras tried, in vain, to clear the passes to the north of Hamilton Island; the wind was contrary; five precious days were lost in useless efforts. The temperature still lowered, and, on the 19th of July, fell to 26 degrees; it got higher the following day; but this foretaste of winter made Hatteras afraid of waiting any longer. The wind seemed to be going to keep in the west, and to stop the
progress of the ship. However, he was in a hurry to gain the point where Stewart had met with the open sea. On the 19th he resolved to get into the Channel at any price; the wind blew right on the brig, which might, with her screw, have stood against it, had not Hatteras been obliged to economise his fuel; on the other hand, the Channel was too wide to allow the men to haul the brig along. Hatteras, not considering the men's fatigue, resolved to have recourse to means often employed by whalers under similar circumstances. The men took it in turns to row, so as to push the brig on against the wind. The _Forward_ advanced slowly up the Channel. The men were worn out and murmured loudly. They went on in that manner till the 23rd of July, when they reached Baring Island in Queen's Channel. The wind was still against them. The doctor thought the health of the men much shaken, and perceived the first symptoms of scurvy amongst them; he did all he could to prevent the spread of the wretched malady, and distributed lime-juice to the men.

Hatteras saw that he could no longer count upon his crew; reasoning and kindness were ineffectual, so he resolved to employ severity for the future; he suspected Shandon and Wall, though they dare not speak out openly. Hatteras had the doctor, Johnson, Bell, and Simpson for him; they were devoted to him body and soul; amongst the undecided were Foker, Bolton, Wolsten the gunsmith, and Brunton the first engineer; and they might turn against the captain at any moment; as to Pen, Gripper, Clifton, and Warren, they were in open revolt; they wished to persuade their comrades to force the captain to return to England. Hatteras soon saw that he could not continue to work his ship with such a crew. He remained twenty-four hours at Baring Island without taking a step forward. The weather grew cooler still, for winter begins to be felt in July in these high latitudes. On the 24th the thermometer fell to 22 degrees. Young ice formed during the night, and if snow fell it would soon be thick enough to bear the weight of a man. The sea began already to have that dirty colour which precedes the formation of the first crystals. Hatteras could not mistake these alarming symptoms; if the channels got blocked up, he should be obliged to winter there at a great distance from the point he had undertaken the voyage in order to reach, without having caught a glimpse of that open sea which his predecessors made out was so near. He resolved, then, to gain several degrees further north, at whatever cost; seeing that he could not employ oars without the rowers were willing, nor sail in a contrary wind, he gave orders to put steam on again.

CHAPTER XXII
BEGINNING OF REVOLT

At this unexpected command, the surprise was great on board the _Forward_.

"Light the fires!" exclaimed some.

"What with?" asked others.

"When we've only two months' coal in the hold!" said Pen.

"What shall we warm ourselves with in the winter?" asked Clifton.

"We shall be obliged to burn the brig down to her water-line," answered Gripper.

"And stuff the stove with the masts," added Warren. Shandon looked at Wall. The stupefied engineers hesitated to go down to the machine-room.

"Did you hear me?" cried the captain in an irritated tone.

Brunton made for the hatchway, but before going down he stopped.

"Don't go, Brunton!" called out a voice.

"Who spoke?" cried Hatteras.

"I did," said Pen, advancing towards the captain.

"And what did you say?" asked Hatteras.

"I say," answered Pen with an oath--"I say, we've had enough of it, and we won't go any further. You shan't kill us with hunger and work in the winter, and they shan't light the fires!"

"Mr. Shandon," answered Hatteras calmly, "have that man put in irons!"

"But, captain," replied Shandon, "what the man says----"

"If you repeat what the man says," answered Hatteras, "I'll have you shut up in your cabin and guarded! Seize that man! Do you hear?" Johnson, Bell, and Simpson advanced towards the sailor, who was in a terrible passion.

"The first who touches me----" he said, brandishing a handspike. Hatteras approached him.

"Pen," said he tranquilly, "if you move, I shall blow out your brains!" So speaking, he cocked a pistol and aimed it at the sailor. A murmur was heard.

"Not a word, men," said Hatteras, "or that man falls dead!" Johnson and Bell disarmed Pen, who no longer made any resistance, and placed him in the hold.

"Go, Brunton," said Hatteras. The engineer, followed by Plover and Warren, went down to his post. Hatteras returned to the poop.
"That Pen is a wretched fellow!" said the doctor.
"No man has ever been nearer death!" answered the captain, simply.

The steam was soon got up, the anchors were weighed, and the _Forward_ veered away east, cutting the young ice with her steel prow. Between Baring Island and Beecher Point there are a considerable quantity of islands in the midst of ice-fields; the streams crowd together in the little channels which cut up this part of the sea; they had a tendency to agglomerate under the relatively low temperature; hummocks were formed here and there, and these masses, already more compact, denser, and closer together, would soon form an impenetrable mass. The _Forward_ made its way with great difficulty amidst the snowstorms. However, with the mobility that characterises the climate of these regions, the sun appeared from time to time, the temperature went up several degrees, obstacles melted as if by magic, and a fine sheet of water lay where icebergs bristled all the passes. The horizon glowed with those magnificent orange shades which rest the eye, tired with the eternal white of the snow.

On the 26th of July the _Forward_ passed Dundas Island, and veered afterwards more to the north; but there Hatteras found himself opposite an ice-bank eight or nine feet high, formed of little icebergs detached from the coast; he was obliged to turn west. The uninterrupted cracking of the ice, added to the noise of the steamer, was like sighs or groans. At last the brig found a channel, and advanced painfully along it; often an enormous iceberg hindered her course for hours; the fog hindered the pilot's look-out; as long as he can see for a mile in front of him, he can easily avoid obstacles; but in the midst of the fog it was often impossible to see a cable's length, and the swell was very strong. Sometimes the clouds looked smooth and white as though they were reflections of the ice-banks; but there were entire days when the yellow rays of the sun could not pierce the tenacious fog. Birds were still very numerous, and their cries were deafening; seals, lying idle on the floating ice, raised their heads, very little frightened, and moved their long necks as the brig passed. Pieces from the ship's sheathing were often rubbed off in her contact with the ice. At last, after six days of slow navigation, Point Beecher was sighted to the north on the 1st of August. Hatteras passed the last few hours at his masthead; the open sea that Stewart had perceived on May 30th, 1851, about latitude 76 degrees 20 minutes, could not be far off; but as far as the eye could reach, Hatteras saw no indication of it. He came down without saying a word.

"Do you believe in an open sea?" asked Shandon of the lieutenant.
"I am beginning not to," answered Wall.

"Wasn't I right to say the pretended discovery was purely imagination? But they would not believe me, and even you were against me, Wall."

"We shall believe in you for the future, Shandon."

"Yes," said he, "when it's too late," and so saying he went back to his cabin, where he had stopped almost ever since his dispute with the captain. The wind veered round south towards evening; Hatteras ordered the brig to be put under sail and the fires to be put out; the crew had to work very hard for the next few days; they were more than a week getting to Barrow Point. The _Forward_ had only made thirty miles in ten days. There the wind turned north again, and the screw was set to work; Hatteras still hoped to find an open sea beyond the 77th parallel, as Sir Edward Belcher had done. Ought he to treat these accounts as apocryphal? or had the winter come upon him earlier? On the 15th of August Mount Percy raised its peak, covered with eternal snow, through the mist. The next day the sun set for the first time, ending thus the long series of days with twenty-four hours in them. The men had ended by getting accustomed to the continual daylight, but it had never made any difference to the animals; the Greenland dogs went to their rest at their accustomed hour, and Dick slept as regularly every evening as though darkness had covered the sky. Still, during the nights which followed the 15th of August, darkness was never profound; although the sun set, he still gave sufficient light by refraction. On the 19th of August, after a pretty good observation, they sighted Cape Franklin on the east coast and Cape Lady Franklin on the west coast; the gratitude of the English people had given these names to the two opposite points—probably the last reached by Franklin: the name of the devoted wife, opposite to that of her husband, is a touching emblem of the sympathy which always united them.

The doctor, by following Johnson's advice, accustomed himself to support the low temperature; he almost always stayed on deck braving the cold, the wind, and the snow. He got rather thinner, but his constitution did not suffer. Besides, he expected to be much worse off, and joyfully prepared for the approaching winter.

"Look at those birds," he said to Johnson one day; "they are emigrating south in flocks! They are shrieking out their good-byes!"

"Yes, Mr. Clawbonny, some instinct tells them they must go, and they set out."
"There's more than one amongst us who would like to imitate them, I think."

"They are cowards, Mr. Clawbonny; those animals have no provisions as we have, and are obliged to seek their food where it is to be found. But sailors, with a good ship under their feet, ought to go to the world's end."

"You hope that Hatteras will succeed, then?"

"He certainly will, Mr. Clawbonny."
"I am of the same opinion as you, Johnson, and if he only wanted one faithful companion----"

"He'll have two!"

"Yes, Johnson," answered the doctor, shaking hands with the brave sailor.

Prince Albert Land, which the _Forward_ was then coasting, bears also the name of Grinnell Land, and though Hatteras, from his hatred to the Yankees, would never call it by its American name, it is the one it generally goes by. It owes its double appellation to the following circumstances: At the same time that Penny, an Englishman, gave it the name of Prince Albert, Lieutenant Haven, commander of the _Rescue_, called it Grinnell Land in honour of the American merchant who had fitted out the expedition from New York at his own expense. Whilst the brig was coasting it, she experienced a series of unheard-of difficulties, navigating sometimes under sail, sometimes by steam. On the 18th of August they sighted Britannia Mountain, scarcely visible through the mist, and the _Forward_ weighed anchor the next day in Northumberland Bay. She was hemmed in on all sides.

CHAPTER XXIII
ATTACKED BY ICEBERGS

Hatteras, after seeing to the anchoring of his ship, re-entered his cabin and examined his map attentively. He found himself in latitude 76 degrees 57 minutes and longitude 99 degrees 20 minutes—that is to say, at only three minutes from the 77th parallel. It was at this very spot that Sir Edward Belcher passed his first winter with the _Pioneer_ and the _Assistance_. It was thence that he organised his sledge and boat excursions. He discovered Table Isle, North Cornwall, Victoria Archipelago, and Belcher Channel. He reached the 78th parallel, and saw that the coast was depressed on the south-east. It seemed to go down to Jones's Strait, the entrance to which lies in Baffin's Bay. But to the north-west, on the contrary, says his report, an open sea lay as far as the eye could reach.

Hatteras considered attentively the white part of the map, which represented the Polar basin free from ice.

"After such testimony as that of Stewart, Penny, and Belcher, I can't have a doubt about it," he said to himself. "They saw it with their own eyes. But if the winter has already frozen it! But no; they made their discoveries at intervals of several years. It exists, and I shall find it! I shall see it."

Hatteras went on to the poop. An intense fog enveloped the _Forward_; the masthead could scarcely be distinguished from the deck. However, Hatteras called down the ice-master from his crow's nest, and took his place. He wished to profit by the shortest clear interval to examine the north-western horizon. Shandon did not let the occasion slip for saying to the lieutenant:

"Well, Wall, where is the open sea?"

"You were right, Shandon, and we have only six weeks' coal in the hold."

"Perhaps the doctor will find us some scientific fuel to warm us in the place of coal," answered Shandon. "I have heard say you can turn fire to ice; perhaps he'll turn ice to fire." And he entered his cabin, shrugging his shoulders. The next day was the 20th of August, and the fog cleared away for several minutes. They saw Hatteras look eagerly at the horizon, and then come down without speaking; but it was easy to see that his hopes had again been crushed. The _Forward_ weighed anchor, and took up her uncertain march northward. As the _Forward_ began to be weather-worn, the masts were unreved, for they could no longer rely on the variable wind, and the sails were nearly useless in the winding channels. Large white marks appeared here and there on the sea like oil spots; they presaged an approaching frost; as soon as the breeze dropped the sea began to freeze immediately; but as soon as the wind got up again, the young ice was broken up and dispersed. Towards evening the thermometer went down to 17 degrees.

When the brig came to a closed-up pass she acted as a battering ram, and ran at full steam against the obstacle, which she sunk. Sometimes they thought she was stopped for good; but an unexpected movement of the streams opened her a new passage, and she took advantage of it boldly. When the brig stopped, the steam which escaped from the safety-pipes was condensed by the cold air and fell in snow on to the deck. Another impediment came in the way; the ice-blocks sometimes got entangled in the paddles, and they were so hard that all the strength of the machine was not sufficient to break them; it was then necessary to back the engine and send men to clear the screws with their handspikes. All this delayed the brig; it lasted thirteen days. The _Forward_ dragged herself painfully along Penny Strait; the crew grumbled, but obeyed: the men saw now that it was impossible to go back. Keeping north was less dangerous than retreating south. They were obliged to think about wintering. The sailors talked together about their present position, and one day they mentioned it to Richard Shandon, who, they knew, was on their side. The second officer forgot his duty as an officer, and allowed them to discuss the authority of the captain before him.

"You say, then, Mr. Shandon, that we can't go back now?" said Gripper.

"No, it's too late now," answered Shandon.

"Then we must think about wintering," said another sailor.
"It's the only thing we can do. They wouldn't believe me."

"Another time," said Pen, who had been released, "we shall believe you."

"But as I am not the master----" replied Shandon.

"Who says you mayn't be?" answered Pen. "John Hatteras may go as far as he likes, but we aren't obliged to follow him."

"You all know what became of the crew that did follow him in his first cruise to Baffin's Sea?" said Gripper.

"And the cruise of the _Farewell_ under him that got lost in the Spitzbergen seas!" said Clifton.

"He was the only man that came back," continued Gripper.

"He and his dog," answered Clifton.

"We won't die for his pleasure," added Pen.

"Nor lose the bounty we've been at so much trouble to earn," cried Clifton. "When we've passed the 78th degree-and we aren't far off it, I know—that will make just the 375 pounds each."

"But," answered Gripper, "shan't we lose it if we go back without the captain?"

"Not if we prove that we were obliged to," answered Clifton.

"But it's the captain----"

"You never mind, Gripper," answered Pen; "we'll have a captain and a good one—that Mr. Shandon knows. When one commander goes mad, folks have done with him, and they take another; don't they, Mr. Shandon?"

Shandon answered evasively that they could reckon upon him, but that they must wait to see what turned up. Difficulties were getting thick round Hatteras, but he was as firm, calm, energetic, and confident as ever. After all, he had done in five months what other navigators had taken two or three years to do! He should be obliged to winter now, but there was nothing to frighten brave sailors in that. Sir John Ross and McClure had passed three successive winters in the Arctic regions. What they had done he could do too!

"If I had only been able to get up Smith Strait at the north of Baffin's Sea, I should be at the Pole by now!" he said to the doctor regretfully.

"Never mind, captain!" answered the doctor, "we shall get at it by the 99th meridian instead of by the 75th; if all roads lead to Rome, it's more certain still that all meridians lead to the Pole."

On the 31st of August the thermometer marked 13 degrees. The end of the navigable season was approaching; the _Forward_ left Exmouth Island to the starboard, and three days after passed Table Island in the middle of Belcher Channel. At an earlier period it would perhaps have been possible to regain Baffin's Sea by this channel, but it was not to be dreamt of then; this arm of the sea was entirely barricaded by ice; ice-fields extended as far as the eye could reach, and would do so for eight months longer. Happily they could still gain a few minutes further north on the condition of breaking up the ice with huge clubs and petards. Now the temperature was so low, any wind, even a contrary one, was welcome, for in a calm the sea froze in a single night. The _Forward_ could not winter in her present situation, exposed to winds, icebergs, and the drift from the channel; a shelter was the first thing to find; Hatteras hoped to gain the coast of New Cornwall, and to find above Albert Point a bay of refuge sufficiently sheltered. He therefore pursued his course northward with perseverance. But on the 8th an impenetrable ice-bank lay in front of him, and the temperature was at 10 degrees. Hatteras did all he could to force a passage, continually risking his ship and getting out of danger by force of skill. He could be accused of imprudence, want of reflection, folly, blindness, but he was a good sailor, and one of the best! The situation of the _Forward_ became really dangerous; the sea closed up behind her, and in a few hours the ice got so hard that the men could run along it and tow the ship in all security.

Hatteras found he could not get round the obstacle, so he resolved to attack it in front; he used his strongest blasting cylinders of eight to ten pounds of powder; they began by making a hole in the thick of the ice, and filled it with snow, taking care to place the cylinder in a horizontal position, so that a greater portion of the ice might be submitted to the explosion; lastly, they lighted the wick, which was protected by a gutta-percha tube. They worked at the blasting, as they could not saw, for the saws stuck immediately in the ice. Hatteras hoped to pass the next day. But during the night a violent wind raged, and the sea rose under her crust of ice as if shaken by some submarine commotion, and the terrified voice of the pilot was heard crying:

"Look out aft!"

Hatteras turned to the direction indicated, and what he saw by the dim twilight was frightful. A high iceberg, driven back north, was rushing on to the ship with the rapidity of an avalanche.

"All hands on deck!" cried the captain.

The rolling mountain was hardly half a mile off; the blocks of ice were driven about like so many huge grains of sand; the tempest raged with fury.

"There, Mr. Clawbonny," said Johnson to the doctor, "we are in something like danger now."

"Yes," answered the doctor tranquilly, "it looks frightful enough."
"It's an assault we shall have to repulse," replied the boatswain.

"It looks like a troop of antediluvian animals, those that were supposed to inhabit the Pole. They are trying which shall get here first!"

"Well," added Johnson, "I hope we shan't get one of their spikes into us!"

"It's a siege--let's run to the ramparts!"

And they made haste aft, where the crew, armed with poles, bars of iron, and handspikes, were getting ready to repulse the formidable enemy. The avalanche came nearer, and got bigger by the addition of the blocks of ice which it caught in its passage; Hatteras gave orders to fire the cannon in the bow to break the threatening line. But it arrived and rushed on to the brig; a great crackling noise was heard, and as it struck on the brig's starboard a part of her barricading was broken. Hatteras gave his men orders to keep steady and prepare for the ice. It came along in blocks; some of them weighing several hundredweight came over the ship's side; the smaller ones, thrown up as high as the topsails, fell in little spikes, breaking the shrouds and cutting the rigging. The ship was boarded by these innumerable enemies, which in a block would have crushed a hundred ships like the _Forward_. Some of the sailors were badly wounded whilst trying to keep off the ice, and Bolton had his left shoulder torn open. The noise was deafening. Dick barked with rage at this new kind of enemy. The obscurity of the night came to add to the horror of the situation, but did not hide the threatening blocks, their white surface reflected the last gleams of light. Hatteras's orders were heard in the midst of the crew's strange struggle with the icebergs. The ship giving way to the tremendous pressure, bent to the larboard, and the extremity of her mainyard leaned like a buttress against the iceberg and threatened to break her mast.

Hatteras saw the danger; it was a terrible moment; the brig threatened to turn completely over, and the masting might be carried away. An enormous block, as big as the steamer itself, came up alongside her hull; it rose higher and higher on the waves; it was already above the poop; it fell over the _Forward_. All was lost; it was now upright, higher than the gallant yards, and it shook on its foundation. A cry of terror escaped the crew. Everyone fled to starboard. But at this moment the steamer was lifted completely up, and for a little while she seemed to be suspended in the air, and fell again on to the ice-blocks; then she rolled over till her planks cracked again. After a minute, which appeared a century, she found herself again in her natural element, having been turned over the ice-bank that blocked her passage by the rising of the sea.

"She's cleared the ice-bank!" shouted Johnson, who had rushed to the fore of the brig.

"Thank God!" answered Hatteras.

The brig was now in the midst of a pond of ice, which hemmed her in on every side, and though her keel was in the water, she could not move; she was immovable, but the ice-field moved for her.

"We are drifting, captain!" cried Johnson.

"We must drift," answered Hatteras; "we can't help ourselves."

When daylight came, it was seen that the brig was drifting rapidly northward, along with a submarine current. The floating mass carried the _Forward_ along with it. In case of accident, when the brig might be thrown on her side, or crushed by the pressure of the ice, Hatteras had a quantity of provisions brought up on deck, along with materials for encamping, the clothes and blankets of the crew. Taking example from Captain McClure under similar circumstances, he caused the brig to be surrounded by a belt of hammocks, filled with air, so as to shield her from the thick of the damage; the ice soon accumulated under a temperature of 7 degrees, and the ship was surrounded by a wall of ice, above which her masts only were to be seen. They navigated thus for seven days; Point Albert, the western extremity of New Cornwall, was sighted on the 10th of September, but soon disappeared; from thence the ice-field drifted east. Where would it take them to? Where should they stop? Who could tell? The crew waited, and the men folded their arms. At last, on the 15th of September, about three o'clock in the afternoon, the ice-field, stopped, probably, by collision with another field, gave a violent shake to the brig, and stood still. Hatteras found himself out of sight of land in latitude 78 degrees 15 minutes and longitude 95 degrees 35 minutes in the midst of the unknown sea, where geographers have placed the Frozen Pole.

CHAPTER XXIV
PREPARATIONS FOR WINTERING

The southern hemisphere is colder in parallel latitudes than the northern hemisphere; but the temperature of the new continent is still 15 degrees below that of the other parts of the world; and in America the countries known under the name of the Frozen Pole are the most formidable. The average temperature of the year is 2 degrees below zero. Scientific men, and Dr. Clawbonny amongst them, explain the fact in the following way. According to them, the prevailing winds of the northern regions of America blow from the south-west; they come from the Pacific Ocean with an equal and bearable temperature; but in order to reach the Arctic Seas they have to cross the immense
American territory, covered with snow, they get cold by contact with it, and then cover the hyperborean regions with
their frigid violence. Hatters found himself at the Frozen Pole beyond the countries seen by his predecessors; he,
therefore, expected a terrible winter on a ship lost in the midst of the ice with a crew nearly in revolt. He resolved to
face these dangers with his accustomed energy. He began by taking, with the help of Johnson's experience, all the
measures necessary for wintering. According to his calculations he had been dragged two hundred and fifty miles
beyond New Cornwall, the last country discovered; he was clasped in an ice-field as securely as in a bed of granite,
and no power on earth could extricate him.

There no longer existed a drop of water in the vast seas over which the Arctic winter reigned. Ice-fields extended
as far as the eye could reach, bristling with icebergs, and the _Forward_ was sheltered by three of the highest on
three points of the compass; the south-east wind alone could reach her. If instead of icebergs there had been rocks,
verdure instead of snow, and the sea in its liquid state again, the brig would have been safely anchored in a pretty
bay sheltered from the worst winds. But in such a latitude it was a miserable state of things. They were obliged to
fasten the brig by means of her anchors, notwithstanding her immovability; they were obliged to prepare for the
submarine currents and the breaking up of the ice. When Johnson heard where they were, he took the greatest
precautions in getting everything ready for wintering.

"It's the captain's usual luck," said he to the doctor; "we've got nipped in the most disagreeable point of the
whole glove! Never mind; we'll get out of it!"

As to the doctor, he was delighted at the situation. He would not have changed it for any other! A winter at the
Frozen Pole seemed to him desirable. The crew were set to work at the sails, which were not taken down, and put
into the hold, as the first people who wintered in these regions had thought prudent; they were folded up in their
cases, and the ice soon made them an impervious envelope. The crow's nest, too, remained in its place, serving as a
nautical observatory; the rigging alone was taken away. It became necessary to cut away the part of the field that
surrounded the brig, which began to suffer from the pressure. It was a long and painful work. In a few days the keel
was cleared, and on examination was found to have suffered little, thanks to the solidity of its construction, only its
copper plating was almost all torn off. When the ship was once liberated she rose at least nine inches; the crew then
bevelled the ice in the shape of the keel, and the field formed again under the brig, and offered sufficient opposition
to pressure from without. The doctor helped in all this work; he used the ice-knife skilfully; he incited the sailors by
his happy disposition. He instructed himself and others, and was delighted to find the ice under the ship.

"It's a very good precaution!" said he.

"We couldn't do without it, Mr. Clawbonny," said Johnson. "Now we can raise a snow-wall as high as the
gunwale, and if we like we can make it ten feet thick, for we've plenty of materials."

"That's an excellent idea," answered the doctor. "Snow is a bad conductor of heat; it reflects it instead of
absorbing it, and the heat of the interior does not escape."

"That's true," said Johnson. "We shall raise a fortification against the cold, and against animals too, if they take it
into their heads to pay us a visit; when the work is done it will answer, I can tell you. We shall make two flights of
steps in the snow, one from the ship and the other from outside; when once we've cut out the steps we shall pour
water over them, and it will make them as hard as rock. We shall have a royal staircase."

"It's a good thing that cold makes ice and snow, and so gives us the means of protecting ourselves against it. I
don't know what we should do if it did not."

A roofing of tarred cloth was spread over the deck and descended to the sides of the brig. It was thus sheltered
from all outside impression, and made a capital promenade; it was covered with two feet and a-half of snow, which
was beaten down till it became very hard, and above that they put a layer of sand, completely macadamising it.

"With a few trees I should imagine myself in Hyde Park," said the doctor, "or in one of the hanging gardens of
Babylon."

They made a hole at a short distance from the brig; it was round, like a well; they broke the ice every morning.
This well was useful in case of fire or for the frequent baths ordered to keep the crew in health. In order to spare
their fuel, they drew the water from a greater depth by means of an apparatus invented by a Frenchman, Francois
Arago. Generally, when a ship is wintering, all the objects which encumber her are placed in magazines on the coast,
but it was impossible to do this in the midst of an ice-field. Every precaution was taken against cold and damp; men
have been known to resist the cold and succumb to damp; therefore both had to be guarded against. The _Forward_
had been built expressly for these regions, and the common room was wisely arranged. They had made war on the
corners, where damp takes refuge at first. If it had been quite circular it would have done better, but warmed by a
vast stove and well ventilated, it was very comfortable; the walls were lined with buckskins and not with woollen
materials, for wool condenses the vapours and impregnates the atmosphere with damp. The partitions were taken
down in the poop, and the officers had a large comfortable room, warmed by a stove. Both this room and that of the
crew had a sort of antechamber, which prevented all direct communication with the exterior, and prevented the heat
going out; it also made the crew pass more gradually from one temperature to another. They left their snow-covered garments in these antechambers, and scraped their feet on scrapers put there on purpose to prevent any unhealthy element getting in.

Canvas hose let in the air necessary to make the stoves draw; other hose served for escape-pipes for the steam. Two condensers were fixed in the two rooms; they gathered the vapour instead of letting it escape, and were emptied twice a week; sometimes they contained several bushels of ice. By means of the air-pipes the fires could be easily regulated, and it was found that very little fuel was necessary to keep up a temperature of 50 degrees in the rooms. But Hatteras saw with grief that he had only enough coal left for two months' firing. A drying-room was prepared for the garments that were obliged to be washed, as they could not be hung in the air or they would have been frozen and spoiled. The delicate parts of the machine were taken to pieces carefully, and the room where they were placed was closed up hermetically. The rules for life on board were drawn up by Hatteras and hung up in the common room. The men got up at six in the morning, and their hammocks were exposed to the air three times a week; the floors of the two rooms were rubbed with warm sand every morning; boiling tea was served out at every meal, and the food varied as much as possible, according to the different days of the week; it consisted of bread, flour, beef suet and raisins for puddings, sugar, cocoa, tea, rice, lemon-juice, preserved meat, salted beef and pork, pickled cabbage and other vegetables; the kitchen was outside the common rooms, and the men were thus deprived of its heat, but cooking is a constant source of evaporation and humidity.

The health of men depends a great deal on the food they eat; under these high latitudes it is of great importance to consume as much animal food as possible. The doctor presided at the drawing up of the bill of fare.

"We must take example from the Esquimaux," said he; "they have received their lessons from nature, and are our teachers here; although Arabians and Africans can live on a few dates and a handful of rice, it is very different here, where we must eat a great deal and often. The Esquimaux absorb as much as ten and fifteen pounds of oil in a day. If you do not like oil, you must have recourse to things rich in sugar and fat. In a word, you want carbon in the stove inside you as much as the stove there wants coal."

Every man was forced to take a bath in the half-frozen water condensed from the fire. The doctor set the example; he did it at first as we do all disagreeable things that we feel obliged to do, but he soon began to take extreme pleasure in it. When the men had to go out either to hunt or work they had to take great care not to get frost-bitten; and if by accident it happened, they made haste to rub the part attacked with snow to bring back the circulation of the blood. Besides being carefully clothed in wool from head to foot, the men wore hoods of buckskin and sealskin trousers, through which it is impossible for the wind to penetrate. All these preparations took about three weeks, and the 10th of October came round without anything remarkable happening.

CHAPTER XXV
AN OLD FOX

That day the thermometer went down to 3 degrees below zero. The weather was pretty calm, and the cold without breeze was bearable. Hatteras profited by the clearness of the atmosphere to reconnoitre the surrounding plains; he climbed one of the highest icebergs to the north, and could see nothing, as far as his telescope would let him, but ice-fields and icebergs. No land anywhere, but the image of chaos in its saddest aspect. He came back on board trying to calculate the probable duration of his captivity. The hunters, and amongst them the doctor, James Wall, Simpson, Johnson, and Bell, did not fail to supply the ship with fresh meat. Birds had disappeared; they were gone to less rigorous southern climates. The ptarmigans, a sort of partridge, alone stay the winter in these latitudes; they are easily killed, and their great number promised an abundant supply of game. There were plenty of hares, foxes, wolves, ermine, and bears; there were enough for any sportsman, English, French, or Norwegian; but they were difficult to get at, and difficult to distinguish on the white plains from the whiteness of their fur; when the intense cold comes their fur changes colour, and white is their winter colour. The doctor found that this change of fur is not caused by the change of temperature, for it takes place in the month of October, and is simply a precaution of Providence to guard them from the rigour of a boreal winter.

Seals were abundant in all their varieties, and were particularly sought after by the hunters for the sake, not only of their skins, but their fat, which is very warming; besides which, the liver of these animals makes excellent fuel: hundreds of them were to be seen, and two or three miles to the north of the brig the ice was literally perforated all over with the holes these enormous amphibians make; only they smelt the hunters from afar, and many were wounded that escaped by plunging under the ice. However, on the 19th, Simpson managed to catch one at about a hundred yards from the ship; he had taken the precaution to block up its hole of refuge so that it was at the mercy of the hunters. It took several bullets to kill the animal, which measured nine feet in length; its bulldog head, the sixteen teeth in its jaws, its large pectoral fins in the shape of pinions, and its little tail, furnished with another pair of
fins, made it a good specimen of the family of dog-hound fish. The doctor, wishing to preserve the head for his natural history collection, and its skin for his future use, had them prepared by a rapid and inexpensive process. He plunged the body of the animal into the hole in the ice, and thousands of little prawns soon ate off all the flesh; in half a day the work was accomplished, and the most skilful of the honourable corporation of Liverpool tanners could not have succeeded better.

As soon as the sun had passed the autumnal equinox—that is to say, on the 23rd of September—winter may be said to begin in the Arctic regions. The sun disappears entirely on the 23rd of October, lighting up with its oblique rays the summits of the frozen mountains. The doctor wished him a traveler's farewell; he was not going to see him again till February. But obscurity is not complete during this long absence of the sun; the moon comes each month to take its place as well as she can; starlight is very bright, and there is besides frequent aurora borealis, and a refraction peculiar to the snowy horizons; besides, the sun at the very moment of his greatest austral declination, the 21st of December, is still only 13 degrees from the Polar horizon, so that there is twilight for a few hours; only fogs, mists, and snowstorms often plunge these regions into complete obscurity. However, at this epoch the weather was pretty favourable; the partridges and the hares were the only animals that had a right to complain, for the sportsmen did not give them a moment's peace; they set several fox-traps, but the suspicious animals did not let themselves be caught so easily; they would often come and eat the snare by scratching out the snow from under the trap; the doctor wished them at the devil, as he could not get them himself. On the 25th of October the thermometer marked more than 4 degrees below zero. A violent tempest set in; the air was thick with snow, which prevented a ray of light reaching the _Forward_. During several hours they were very uneasy about Bell and Simpson, who had gone too far whilst hunting; they did not reach the ship till the next day, after having lain for a whole day in their buckskins, whilst the tempest swept the air about them, and buried them under five feet of snow. They were nearly frozen, and the doctor had some trouble to restore their circulation.

The tempest lasted a week without interruption. It was impossible to stir out. In a single day the temperature varied fifteen and twenty degrees. During their forced idleness each one lived to himself; some slept, others smoked, or talked in whispers, stopping when they saw the doctor or Johnson approach; there was no moral union between the men; they only met for evening prayers, and on Sunday for Divine service. Clifton had counted that once the 78th parallel cleared, his share in the bounty would amount to 375 pounds; he thought that enough, and his ambition did not go beyond. The others were of the same opinion, and only thought of enjoying the fortune acquired at such a price. Hatteras was hardly ever seen. He neither took part in the hunting nor other excursions. He felt no interest in the meteorological phenomena which excited the doctor's admiration. He lived for one idea; it was comprehended in three words—the North Pole. He was constantly looking forward to the moment when the _Forward_ once more free, would begin her adventurous voyage again.

In short, it was a melancholy life; the brig, made for movement, seemed quite out of place as a stationary dwelling; her original form could not be distinguished amidst the ice and snow that covered her, and she was anything but a lively spectacle. During these unoccupied hours the doctor put his travelling notes in order—the notes from which this history is taken; he was never idle, and the evenness of his humour remained the same, only he was very glad to see the tempest clearing off so as to allow him to set off hunting once more. On the 3rd of November, at six in the morning, with a temperature at 5 degrees below zero, he started, accompanied by Johnson and Bell; the plains of ice were level; the snow, which covered the ground thickly, solidified by the frost, made the ground good for walking; a dry and keen cold lightened the atmosphere; the moon shone in all her splendour, and threw an astonishing light on all the asperities of the field; their footsteps left marks on the snow, and the moon lighted up their edges, so that they looked like a luminous track behind the hunters whose shadows fell on the ice with astonishing outlines.

The doctor had taken his friend Dick with him; he preferred him to the Greenland dogs to run down the game for a good reason; the latter do not seem to have the scent of their brethren of more temperate climates. Dick ran on and often pointed out the track of a bear, but in spite of his skill the hunters had not even killed a hare after two hours' walking.

"Do you think the game has gone south too?" asked the doctor, halting at the foot of a hummock.

"It looks like it, Mr. Clawbonny," answered the carpenter.

"I don't think so," answered Johnson; "hares, foxes, and bears are accustomed to the climate; I believe the late tempest is the cause of their disappearance; but with the south winds they'll soon come back. Ah! if you said reindeers or musk-oxen it would be a different thing."

"But it appears those, too, are found in troops in Melville Island," replied the doctor; "that is much further south, I grant you; when Parry wintered there he always had as much game as he wanted."

"We are not so well off," said Bell; "if we could only get plenty of bear's flesh I should not complain."

"Bears are very difficult to get at," answered the doctor; "it seems to me they want civilising."
"Bell talks about the bear's flesh, but we want its fat more than its flesh or its skin," said Johnson.

"You are right, Johnson; you are always thinking about the fuel."

"How can I help thinking about it? I know if we are ever so careful of it we've only enough left for three weeks."

"Yes," replied the doctor, "that is our greatest danger, for we are only at the beginning of November, and February is the coldest month of the year in the Frozen Zone; however, if we can't get bear's grease we can rely on that of the seals."

"Not for long, Mr. Clawbonny," answered Johnson. "They'll soon desert us too; either through cold or fright, they'll soon leave off coming on to the surface of the ice."

"Then we must get at the bears," said the doctor; "they are the most useful animals in these countries: they furnish food, clothes, light, and fuel. Do you hear, Dick?" continued he, caressing his friend; "we must have a bear, so look out."

Dick, who was smelling the ice as the doctor spoke, started off all at once, quick as an arrow. He barked loudly, and, notwithstanding his distance, the sportsmen heard him distinctly. The extreme distance to which sound is carried in these low temperatures is astonishing; it is only equalled by the brilliancy of the constellations in the boreal sky.

The sportsmen, guided by Dick's barking, rushed on his traces; they had to run about a mile, and arrived quite out of breath, for the lungs are rapidly suffocated in such an atmosphere. Dick was pointing at about fifty paces from an enormous mass at the top of a mound of ice.

"We've got him," said the doctor, taking aim.

"And a fine one," added Bell, imitating the doctor.

"It's a queer bear," said Johnson, waiting to fire after his two companions.

Dick barked furiously. Bell advanced to within twenty feet and fired, but the animal did not seem to be touched.

Johnson advanced in his turn, and after taking a careful aim, pulled the trigger.

"What," cried the doctor, "not touched yet? Why, it's that cursed refraction. The bear is at least a thousand paces off."

The three sportsmen ran rapidly towards the animal, whom the firing had not disturbed; he seemed to be enormous, and without calculating the dangers of the attack, they began to rejoice in their conquest. Arrived within reasonable distance they fired again; the bear, mortally wounded, gave a great jump and fell at the foot of the mound. Dick threw himself upon it.

"That bear wasn't difficult to kill," said the doctor.

"Only three shots," added Bell in a tone of disdain, "and he's down."

"It's very singular," said Johnson.

"Unless we arrived at the very moment when it was dying of old age," said the doctor, laughing.

So speaking, the sportsmen reached the foot of the mound, and, to their great stupefaction, they found Dick with his fangs in the body of a white fox.

"Well, I never!" cried Bell.

"We kill a bear and a fox falls," added the doctor.

Johnson did not know what to say.

"Why!" said the doctor, with a roar of laughter, "it's the refraction again!"

"What do you mean, Mr. Clawbonny?" asked the carpenter.

"Why, it deceived us about the size as it did about the distance. It made us see a bear in a fox's skin."

"Well," answered Johnson, "now we've got him, we'll eat him."

Johnson was going to lift the fox on to his shoulders, when he cried like Bell--"Well, I never!"

"What is it?" asked the doctor.

"Look, Mr. Clawbonny--look what the animal's got on its neck; it's a collar, sure enough."

"A collar?" echoed the doctor, leaning over the animal. A half worn-out collar encircled the fox's neck, and the doctor thought he saw something engraved on it; he took it off and examined it.

"That bear is more than twelve years old, my friends," said the doctor, "it's one of James Ross's foxes, and the collar has been round its neck ever since 1848."

"Is it possible?" cried Bell.

"There isn't a doubt about it, and I'm sorry we've shot the poor animal. During his wintering James Ross took a lot of white foxes in his traps, and had brass collars put round their necks on which were engraved the whereabouts of his ships, the _Enterprise_ and the _Investigator_, and the store magazines. He hoped one of them might fall into the hands of some of the men belonging to Franklin's expedition. The poor animal might have saved the lives of the ship's crews, and it has fallen under our balls."

"Well, we won't eat him," said Johnson, "especially as he's twelve years old. Anyway, we'll keep his skin for
curiosity sake." So saying he lifted the animal on his shoulders, and they made their way to the ship, guided by the stars; still their expedition was not quite fruitless: they bagged several brace of ptarmigans. An hour before they reached the _Forward_, a phenomenon occurred which excited the astonishment of the doctor; it was a very rain of shooting stars; they could be counted by thousands, like rockets in a display of fireworks. They paled the light of the moon, and the admirable spectacle lasted several hours. A like meteor was observed at Greenland by the Moravian brothers in 1799. The doctor passed the whole night watching it, till it ceased, at seven in the morning, amidst the profound silence of the atmosphere.

CHAPTER XXVI
THE LAST LUMP OF COAL

It seemed certain that no bears were to be had; several seals were killed during the days of the 4th, 5th, and 6th of November; then the wind changed, and the thermometer went up several degrees; but the snow-drifts began again with great violence. It became impossible to leave the vessel, and the greatest precaution was needed to keep out the damp. At the end of the week there were several bushels of ice in the condensers. The weather changed again on the 15th of November, and the thermometer, under the influence of certain atmospherical conditions, went down to 24 degrees below zero. It was the lowest temperature observed till then. This cold would have been bearable in a quiet atmosphere, but there was a strong wind which seemed to fill the atmosphere with sharp blades. The doctor was vexed at being kept prisoner, for the ground was covered with snow, made hard by the wind, and was easy to walk upon; he wanted to attempt some long excursion.

It is very difficult to work when it is so cold, because of the shortness of breath it causes. A man can only do a quarter of his accustomed work; iron implements become impossible to touch; if one is taken up without precaution, it causes a pain as bad as a burn, and pieces of skin are left on it. The crew, confined to the ship, were obliged to walk for two hours on the covered deck, where they were allowed to smoke, which was not allowed in the common room. There, directly the fire got low, the ice invaded the walls and the joins in the flooring; every bolt, nail, or metal plate became immediately covered with a layer of ice. The doctor was amazed at the instantaneity of the phenomenon. The breath of the men condensed in the air, and passing quickly from a fluid to a solid state, fell round them in snow. At a few feet only from the stoves the cold was intense, and the men stood near the fire in a compact group. The doctor advised them to accustom their skin to the temperature, which would certainly get worse, and he himself set the example; but most of them were too idle or too benumbed to follow his advice, and preferred remaining in the unhealthy heat. However, according to the doctor, there was no danger in the abrupt changes of temperature in going from the warm room into the cold. It is only dangerous for people in perspiration; but the doctor's lessons were thrown away on the greater part of the crew.

As to Hatteras, he did not seem to feel the influence of the temperature. He walked silently about at his ordinary pace. Had the cold no empire over his strong constitution, or did he possess in a supreme degree the natural heat he wished his sailors to have? Was he so armed in his one idea as to be insensible to exterior impressions? His men were profoundly astonished at seeing him facing the 24 degrees below zero; he left the ship for hours, and came back without his face betraying the slightest mark of cold.

"He is a strange man," said the doctor to Johnson; "he even astonishes me. He is one of the most powerful natures I have ever studied in my life."

"The fact is," answered Johnson, "that he comes and goes in the open air without clothing himself more warmly than in the month of June."

"Oh! the question of clothes is not of much consequence," replied the doctor; "it is of no use clothing people who do not produce heat naturally. It is the same as if we tried to warm a piece of ice by wrapping it up in a blanket! Hatteras does not want that; he is constituted so, and I should not be surprised if being by his side were as good as being beside a stove."

Johnson had the job of clearing the water-hole the next day, and remarked that the ice was more than ten feet thick. The doctor could observe magnificent aurora borealis almost every night; from four till eight p.m. the sky became slightly coloured in the north; then this colouring took the regular form of a pale yellow border, whose extremities seemed to buttress on to the ice-field. Little by little the brilliant zone rose in the sky, following the magnetic meridian, and appeared striated with blackish bands; jets of some luminous matter, augmenting and diminishing, shot out lengthways; the meteor, arrived at its zenith, was often composed of several bows, bathed in floods of red, yellow, or green light. It was a dazzling spectacle. Soon the different curves all joined in one point, and formed boreal crowns of a heavenly richness. At last the bows joined, the splendid aurora faded, the intense rays melted into pale, vague, undetermined shades, and the marvellous phenomenon, feeble, and almost extinguished, fainted insensibly into the dark southern clouds. Nothing can equal the wonders of such a spectacle under the high
latitudes less than eight degrees from the Pole; the aurora borealis perceived in temperate regions gives no idea of them—not even a feeble one; it seems as if Providence wished to reserve its most astonishing marvels for these climates.

During the duration of the moon several images of her are seen in the sky, increasing her brilliancy; often simple lunar halos surround her, and she shines from the centre of her luminous circle with a splendid intensity.

On the 26th of November there was a high tide, and the water escaped with violence from the water-hole; the thick layer of ice was shaken by the rising of the sea, and sinister crackings announced the submarine struggle; happily the ship kept firm in her bed, and her chains only were disturbed. Hatteras had had them fastened in anticipation of the event. The following days were still colder; there was a penetrating fog, and the wind scattered the piled-up snow; it became difficult to see whether the whirlwinds began in the air or on the ice-fields; confusion reigned.

The crew were occupied in different works on board, the principal of which consisted in preparing the grease and oil produced by the seals; they had become blocks of ice, which had to be broken with axes into little bits, and ten barrels were thus preserved.

All sorts of vessels were useless, and the liquid they contained would only have broken them when the temperature changed. On the 28th the thermometer went down to 32 degrees below zero; there was only coal enough left for ten days, and everyone looked forward to its disappearance with dread. Hatteras had the poop stove put out for economy’s sake, and from that time Shandon, the doctor, and he stayed in the common room. Hatteras was thus brought into closer contact with the men, who threw ferocious and stupefied looks at him. He heard their reproaches, their recriminations, and even their threats, and he could not punish them. But he seemed to be deaf to everything. He did not claim the place nearest the fire, but stopped in a corner, his arms folded, never speaking.

In spite of the doctor’s recommendations, Pen and his friends refused to take the least exercise; they passed whole days leaning against the stove or lying under the blankets of their hammocks. Their health soon began to suffer; they could not bear up against the fatal influence of the climate, and the terrible scurvy made its appearance on board. The doctor had, however, begun, some time ago, to distribute limejuice and lime pastilles every morning; but these preservatives, generally so efficacious, had very little effect on the malady, which soon presented the most horrible symptoms. The sight of the poor fellows, whose nerves and muscles contracted with pain, was pitiable. Their legs swelled in an extraordinary fashion, and were covered with large blackish blue spots; their bloody gums and ulcerated lips only gave passage to inarticulate sounds; the vitiated blood no longer went to the extremities.

Clifton was the first attacked; then Gripper, Brunton, and Strong took to their hammocks. Those that the malady still spared could not lose sight of their sufferings; they were obliged to stay there, and it was soon transformed into a hospital, for out of eighteen sailors of the _Forward_, thirteen were attacked in a few days. Pen seemed destined to escape contagion; his vigorous nature preserved him from it. Shandon felt the first symptoms, but they did not go further, and exercise kept the two in pretty good health.

The doctor nursed the invalids with the greatest care, and it made him miserable to see the sufferings he could not alleviate. He did all he could to keep his companions in good spirits; he talked to them, read to them, and told them tales, which his astonishing memory made it easy for him to do. He was often interrupted by the complaints and groans of the invalids, and he stopped his talk to become once more the attentive and devoted doctor. His health kept up well; he did not get thinner, and he used to say that it was a good thing for him that he was dressed like a seal or a whale, who, thanks to its thick layer of fat, easily supports the Arctic atmosphere. Hatteras felt nothing, either physically or morally. Even the sufferings of his crew did not seem to touch him. Perhaps it was because he would not let his face betray his emotions; but an attentive observer would have remarked that a man’s heart beat beneath the iron envelope. The doctor analysed him, studied him, but did not succeed in classifying so strange an organisation, a temperament so supernatural. The thermometer lowered again; the walk on deck was deserted; the Esquimaux dogs alone frequented it, howling lamentably.

There was always one man on guard near the stove to keep up the fire; it was important not to let it go out. As soon as the fire got lower, the cold glided into the room; ice covered the walls, and the humidity, rapidly condensed, fell in snow on the unfortunate inhabitants of the brig. It was in the midst of these unutterable tortures that the 8th of December was reached. That morning the doctor went as usual to consult the exterior thermometer. He found the mercury completely frozen.

“Forty-four degrees below zero!” he cried with terror. And that day they threw the last lump of coal into the stove.

CHAPTER XXVII
CHRISTMAS
There was then a movement of despair. The thought of death, and death from cold, appeared in all its horror; the last piece of coal burnt away as quickly as the rest, and the temperature of the room lowered sensibly. But Johnson went to fetch some lumps of the new fuel which the marine animals had furnished him with, and he stuffed it into the stove; he added some oakum, impregnated with frozen oil, and soon obtained enough heat. The smell of the grease was abominable, but how could they get rid of it? They were obliged to get used to it. Johnson agreed that his expedient left much to wish for, and would have no success in a Liverpool house.

"However," added he, "the smell may have one good result."

"What's that?" asked the carpenter.

"It will attract the bears; they are very fond of the stink."

"And what do we want with bears?" added Bell.

"You know, Bell, we can't depend on the seals; they've disappeared for a good while to come; if the bears don't come to be turned into fuel too, I don't know what will become of us."

"There would be only one thing left; but I don't see how----"

"The captain would never consent; but perhaps we shall be obliged."

Johnson shook his head sadly, and fell into a silent reverie, which Bell did not interrupt. He knew that their stock of grease would not last more than a week with the strictest economy.

The boatswain was not mistaken. Several bears, attracted by the fetid exhalations, were signalled to the windward; the healthy men gave chase to them, but they were extraordinarily quick, and did not allow themselves to be approached, and the most skilful shots could not touch them. The ship's crew was seriously menaced with death from cold; it was impossible to resist such a temperature more than forty-eight hours, and every one feared the end of the fuel. The dreaded moment arrived at three o'clock p.m. on the 20th of December. The fire went out; the sailors looked at each other with haggard eyes. Hatteras remained immovable in his corner. The doctor as usual marched up and down in agitation; he was at his wits' end. The temperature of the room fell suddenly to 7 degrees below zero.

But if the doctor did not know what to do, some of the others did. Shandon, calm and resolute, and Pen with anger in his eyes, and two or three of their comrades, who could still walk, went up to Hatteras.

"Captain!" said Shandon.

Hatteras, absorbed in thought, did not hear him.

"Captain!" repeated Shandon, touching his hand.

Hatteras drew himself up.

"What is it?" he said.

"Our fire is out!"

"What then?" answered Hatteras.

"If you mean to kill us with cold, you had better say so," said Shandon ironically.

"I mean," said Hatteras gravely, "to require every man to do his duty to the end."

"There's something higher than duty, captain--there's the right to one's own preservation. I repeat that the fire is out, and if it is not relighted, not one of us will be alive in two days."

"I have no fuel," answered Hatteras, with a hollow voice.

"Very well," cried Pen violently, "if you have no fuel, we must take it where we can!"

Hatteras grew pale with anger.

"Where?" said he.

"On board," answered the sailor insolently.

"On board!" echoed the captain, his fists closed, his eyes sparkling.

He had seized an axe, and he now raised it over Pen's head.

"Wretch!" he cried.

The doctor rushed between the captain and Pen; the axe fell to the ground, its sharp edge sinking into the flooring. Johnson, Bell, and Simpson were grouped round Hatteras, and appeared determined to give him their support. But lamentable and plaintive voices came from the beds.

"Some fire! Give us some fire!" cried the poor fellows.

Hatteras made an effort, and said calmly:

"If we destroy the brig, how shall we get back to England?"

"We might burn some of the rigging and the gunwale, sir," said Johnson.

"Besides, we should still have the boats left," answered Shandon; "and we could build a smaller vessel with the remains of the old one!"

"Never!" answered Hatteras.

"But----" began several sailors, raising their voices.

"We have a great quantity of spirits of wine," answered Hatteras; "burn that to the last drop."
"Ah, we didn't think of that!" said Johnson, with affected cheerfulness, and by the help of large wicks steeped in spirits he succeeded in raising the temperature a few degrees.

During the days that followed this melancholy scene the wind went round to the south, and the thermometer went up. Some of the men could leave the vessel during the least damp part of the day; but ophthalmia and scurvy kept the greater number on board; besides, neither fishing nor hunting was practicable. But it was only a short respite from the dreadful cold, and on the 25th, after an unexpected change in the wind, the mercury again froze; they were then obliged to have recourse to the spirits of wine thermometer, which never freezes. The doctor found, to his horror, that it marked 66 degrees below zero; men had never been able to support such a temperature. The ice spread itself in long tarnished mirrors on the floor; a thick fog invaded the common room; the damp fell in thick snow; they could no longer see one another; the extremities became blue as the heat of the body left them; a circle of iron seemed to be clasping their heads, and made them nearly delirious. A still more fearful symptom was that their tongues could no longer articulate a word.

From the day they had threatened to burn his ship, Hatteras paced the deck for hours. He was guarding his treasures; the wood of the ship was his own flesh, and whoever cut a piece off cut one of his limbs. He was armed, and mounted guard, insensible to the cold, the snow, and the ice, which stiffened his garments and enveloped him in granite armour. His faithful Dick accompanied him, and seemed to understand why he was there.

However, on Christmas Day he went down to the common room. The doctor, taking advantage of what energy he had left, went straight to him, and said--

"Hatteras, we shall all die if we get no fuel."
"Never!" said Hatteras, knowing what was coming.
"We must," said the doctor gently.
"Never!" repeated Hatteras with more emphasis still. "I will never consent! They can disobey me if they like!"

Johnson and Bell took advantage of the half-permission, and rushed on deck. Hatteras heard the wood crack under the axe. He wept. What a Christmas Day for Englishmen was that on board the _Forward_! The thought of the great difference between their position and that of the happy English families who rejoiced in their roast beef, plum pudding, and mince pies added another pang to the miseries of the unfortunate crew. However, the fire put a little hope and confidence into the men; the boiling of coffee and tea did them good, and the next week passed less miserably, ending the dreadful year 1860; its early winter had defeated all Hatteras's plans.

On the 1st of January, 1861, the doctor made a discovery. It was not quite so cold, and he had resumed his interrupted studies; he was reading Sir Edward Belcher's account of his expedition to the Polar Seas; all at once a passage struck him; he read it again and again. It was where Sir Edward Belcher relates that after reaching the extremity of Queen's Channel he had discovered important traces of the passage and residence of men. "They were," said he, "very superior habitations to those which might be attributed to the wandering Esquimaux. The walls had foundations, the floors of the interior had been covered with a thick layer of fine gravel, and were paved. Reindeer, seal, and walrus bones were seen in great quantities. We found some coal._" At the last words the doctor was struck with an idea; he carried the book to Hatteras and showed him the passage.

"They could not have found coal on this deserted coast," said Hatteras; "it is not possible!"
"Why should we doubt what Belcher says? He would not have recorded such a fact unless he had been certain and had seen it with his own eyes."
"And what then, doctor?"
"We aren't a hundred miles from the coast where Belcher saw the coal, and what is a hundred miles' excursion? Nothing. Longer ones than that have often been made across the ice."
"We will go," said Hatteras.

Johnson was immediately told of their resolution, of which he strongly approved; he told his companions about it: some were glad, others indifferent.

"Coal on these coasts!" said Wall, stretched on his bed of pain.
"Let them go," answered Shandon mysteriously.

But before Hatteras began his preparations for the journey, he wished to be exactly certain of the _Forward_'s position. He was obliged to be mathematically accurate as to her whereabouts, because of finding her again. His task was very difficult; he went upon deck and took at different moments several lunar distances and the meridian heights of the principal stars. These observations were hard to make, for the glass and mirrors of the instrument were covered with ice from Hatteras's breath; he burnt his eyelashes more than once by touching the brass of the glasses. However, he obtained exact bases for his calculations, and came down to make them in the room. When his work was over, he raised his head in astonishment, took his map, pricked it, and looked at the doctor.

"What is it?" asked the latter.
"In what latitude were we at the beginning of our wintering?"
"We were in latitude 78 degrees 15 minutes, by longitude 95 degrees 35 minutes; exactly at the Frozen Pole."

"Well," said Hatteras, in a low tone, "our ice-field has been drifting! We are two degrees farther north and farther west, and three hundred miles at least from your store of coal!"

"And those poor fellows don't know," said the doctor.

"Hush!" said Hatteras, putting his finger on his lips.

CHAPTER XXVIII
PREPARATIONS FOR DEPARTURE

Hatteras would not inform his crew of their situation, for if they had known that they had been dragged farther north they would very likely have given themselves up to the madness of despair. The captain had hidden his own emotions at his discovery. It was his first happy moment during the long months passed in struggling with the elements. He was a hundred and fifty miles farther north, scarcely eight degrees from the Pole! But he hid his delight so profoundly that even the doctor did not suspect it; he wondered at seeing an unwonted brilliancy in the captain's eyes; but that was all, and he never once thought of the reason.

The _Forward_, by getting nearer the Pole, had got farther away from the coal repository observed by Sir Edward Belcher; instead of one hundred, it lay at two hundred and fifty miles farther south. However, after a short discussion about it between Hatteras and Clawbonny, the journey was persisted in. If Belcher had written the truth—and there was no reason for doubting his veracity—they should find things exactly in the same state as he had left them, for no new expedition had gone to these extreme continents since 1853. There were few or no Esquimaux to be met with in that latitude. They could not be disappointed on the coast of New Cornwall as they had been on Beechey Island. The low temperature preserves the objects abandoned to its influence for any length of time. All probabilities were therefore in favour of this excursion across the ice. It was calculated that the expedition would take, at the most, forty days, and Johnson's preparations were made in consequence.

The sledge was his first care; it was in the Greenland style, thirty-five inches wide and twenty-four feet long. The Esquimaux often make them more than fifty feet long. This one was made of long planks, bent up front and back, and kept bent like a bow by two thick cords; the form thus given to it gave it increased resistance to shocks; it ran easily on the ice, but when the snow was soft on the ground it was put upon a frame; to make it glide more easily it was rubbed, Esquimaux fashion, with sulphur and snow. Six dogs drew it; notwithstanding their leanness these animals did not appear to suffer from the cold; their buckskin harness was in good condition, and they could draw a weight of two thousand pounds without fatigue. The materials for encampment consisted of a tent, should the construction of a snow-house be impossible, a large piece of mackintosh to spread over the snow, to prevent it melting in contact with the human body, and lastly, several blankets and buffalo-skins. They took the halkett boat too.

The provisions consisted of five cases of pemmican, weighing about four hundred and fifty pounds; they counted one pound of pemmican for each man and each dog; there were seven dogs including Dick, and four men. They also took twelve gallons of spirits of wine—that is to say, about one hundred fifty pounds weight—a sufficient quantity of tea and biscuit, a portable kitchen with plenty of wicks, oakum, powder, ammunition, and two double-barrelled guns. They also used Captain Parry's invention of indiarubber belts, in which the warmth of the body and the movement of walking keeps coffee, tea, and water in a liquid state. Johnson was very careful about the snow-shoes; they are a sort of wooden patten, fastened on with leather straps; when the ground was quite hard and frozen they could be replaced by buckskin moccasins; each traveller had two pairs of both.

These preparations were important, for any detail omitted might occasion the loss of an expedition; they took four whole days. Each day at noon Hatteras took care to set the position of his ship; they had ceased to drift; he was obliged to be certain in order to get back. He next set about choosing the men he should take with him; some of them were not fit either to take or leave, but the captain decided to take none but sure companions, as the common safety depended upon the success of the excursion. Shandon was, therefore, excluded, which he did not seem to regret. James Wall was ill in bed. The state of the sick got no worse, however, and as the only thing to do for them was to rub them with lime-juice, and give them doses of it, the doctor was not obliged to stop, and he made one of the travellers. Johnson very much wished to accompany the captain in his perilous enterprise, but Hatteras took him aside, and said, in an affectionate tone:

"Johnson, I have confidence in you alone. You are the only officer in whose hands I can leave my ship. I must know that you are there to overlook Shandon and the others. They are kept prisoners here by the winter, but I believe them capable of anything. You will be furnished with my formal instructions, which, in case of need, will give you the command. You will take my place entirely. Our absence will last four or five weeks at the most. I shall not be anxious, knowing you are where I cannot be. You must have wood, Johnson, I know, but, as far as possible, spare
my poor ship. Do you understand me, Johnson?"

"Yes, sir," answered the old sailor, "I'll stop if you wish."

"Thank you," said Hatteras, shaking his boatswain's hand; "and if we don't come back, wait for the next breaking-up time, and try to push forward towards the Pole. But if the others won't go, don't mind us, and take the _Forward_ back to England."

"Are those your last commands, captain?"

"Yes, my express commands," answered Hatteras.

"Very well, sir, they shall be carried out," said Johnson simply.

The doctor regretted his friend, but he thought Hatteras had acted wisely in leaving him. Their other two travelling companions were Bell the carpenter and Simpson. The former was in good health, brave and devoted, and was the right man to render service during the encampments on the snow; Simpson was not so sure, but he accepted a share in the expedition, and his hunting and fishing capabilities might be of the greatest use. The expedition consisted, therefore, of four men, Hatteras, Clawbonny, Bell, and Simpson, and seven dogs. The provisions had been calculated in consequence. During the first days of January the temperature kept at an average of 33 degrees below zero. Hatteras was very anxious for the weather to change; he often consulted the barometer, but it is of little use in such high latitudes. A clear sky in these regions does not always bring cold, and the snow does not make the temperature rise; the barometer is uncertain; it goes down with the north and east winds; low, it brought fine weather; high, snow or rain. Its indications could not, therefore, be relied upon.

At last, on January 5th, the mercury rose to 18 degrees below zero, and Hatteras resolved to start the next day; he could not bear to see his ship burnt piece by piece before his eyes; all the poop had gone into the stove. On the 6th, then, in the midst of whirlwinds of snow, the order for departure was given. The doctor gave his last orders about the sick; Bell and Simpson shook hands silently with their companions. Hatteras wished to say his good-byes aloud, but he saw himself surrounded by evil looks and thought he saw Shandon smile ironically. He was silent, and perhaps hesitated for an instant about leaving the _Forward_, but it was too late to turn back; the loaded sledge, with the dogs harnessed to it, awaited him on the ice-field. Bell started the first; the others followed.

Johnson accompanied the travellers for a quarter of a mile, then Hatteras begged him to return on board, and the old sailor went back after making a long farewell gesture. At that moment Hatteras turned a last look towards the brig, and saw the extremity of her masts disappear in the dark clouds of the sky.

CHAPTER XXIX
ACROSS THE ICE

The little troop descended towards the south-east. Simpson drove the sledge. Dick helped him with zeal, and did not seem astonished at the new occupation of his companions. Hatteras and the doctor walked behind, whilst Bell went on in front, sounding the ice with his iron-tipped stick. The rising of the thermometer indicated approaching snow; it soon fell in thick flakes, and made the journey difficult for the travellers; it made them deviate from the straight line, and obliged them to walk slower; but, on an average, they made three miles an hour. The surface of the ice was unequal, and the sledge was often in danger of being overturned, but by great care it was kept upright.

Hatteras and his companions were clothed in skins more useful than elegant. Their heads and faces were covered with hoods, their mouths, eyes, and noses alone coming into contact with the air. If they had not been exposed the breath would have frozen their coverings, and they would have been obliged to take them off with the help of an axe—an awkward way of undressing. The interminable plain kept on with fatiguing monotony; icebergs of uniform aspect and hummocks whose irregularity ended by seeming always the same; blocks cast in the same mould, and icebergs between which tortuous valleys wound. The travellers spoke little, and marched on, compass in hand. It is painful to open one's mouth in such an atmosphere; sharp icicles form immediately between one's lips, and the breath is not warm enough to melt them. Bell's steps were marked in the soft ground, and they followed them attentively, certain of being able to go where he had been before.

Numerous traces of bears and foxes crossed their path, but not an animal was seen that day. It would have been dangerous and useless to hunt them, as the sledge was sufficiently freighted. Generally in this sort of excursion travellers leave provision-stores along their route; they place them in hiding-places of snow, out of reach of animals; unload during the journey, and take up the provisions on their return. But Hatteras could not venture to do this on moveable ice-fields, and the uncertainty of the route made the return the same way exceedingly problematic. At noon Hatteras caused his little troop to halt under shelter of an ice-wall. Their breakfast consisted of pemmican and boiling tea; the latter beverage comforted the cold wayfarers. They set out again after an hour's rest. The first day they walked about twenty miles, and in the evening both men and dogs were exhausted. However, notwithstanding their fatigue, they were obliged to construct a snow-house in which to pass the night. It took about an hour and a half
to build. Bell showed himself very skilful. The ice-blocks were cut out and placed above one another in the form of a dome; a large block at the top made the vault. Snow served for mortar and filled up the chinks. It soon hardened and made a single block of the entire structure. It was reached by a narrow opening, through which the doctor squeezed himself painfully, and the others followed him. The supper was rapidly prepared with spirits of wine. The interior temperature of the snow-house was bearable, as the wind which raged outside could not penetrate. When their repast, which was always the same, was over, they began to think of sleep. A mackintosh was spread over the floor and kept them from the damp. Their stockings and shoes were dried by the portable grate, and then three of the travellers wrapped themselves up in their blankets, leaving the fourth to keep watch; he watched over the common safety, and prevented the opening getting blocked up, for if it did they would be buried alive.

Dick shared the snow-house; the other dogs remained outside, and after their supper they squatted down in the snow, which made them a blanket. The men were tired out with their day's walk, and soon slept. The doctor took his turn on guard at three o'clock in the morning. There was a tempest during the night, the gusts of which thickened the walls of the snow-house. The next day, at six o'clock, they set out again on their monotonous march. The temperature lowered several degrees, and hardened the ground so that walking was easier. They often met with mounds or cairns something like the Esquimaux hiding-places. The doctor had one demolished, and found nothing but a block of ice.

"What did you expect, Clawbonny?" said Hatteras. "Are we not the first men who have set foot here?"
"It's very likely we are, but who knows?" answered the doctor.
"I do not want to lose my time in useless search," continued the captain; "I want to be quick back to my ship, even if we don't find the fuel."
"I believe we are certain of doing that," said the doctor.
"I often wish I had not left the _Forward_," said Hatteras; "a captain's place is on board."
"Johnson is there."
"Yes; but--well, we must make haste, that's all."

The procession marched along rapidly; Simpson excited the dogs by calling to them; in consequence of a phosphorescent phenomenon they seemed to be running on a ground in flames, and the sledges seemed to raise a dust of sparks. The doctor went on in front to examine the state of the snow, but all at once he disappeared. Bell, who was nearest to him, ran up.

"Well, Mr. Clawbonny," he called out in anxiety, "where are you?"
"Doctor!" called the captain.
"Here, in a hole," answered a reassuring voice; "throw me a cord, and I shall soon be on the surface of the globe again."

They threw a cord to the doctor, who was at the bottom of a hole about ten feet deep; he fastened it round his waist, and his companions hauled him up with difficulty.

"Are you hurt?" asked Hatteras.
"Not a bit," answered the doctor, shaking his kind face, all covered with snow.
"But how did you tumble down there?"
"Oh, it was the refraction's fault," he answered laughing. "I thought I was stepping across about a foot's distance, and I fell into a hole ten feet deep! I never shall get used to it. It will teach us to sound every step before we advance. Ears hear and eyes see all topsy-turvy in this enchanted spot."
"Can you go on?" asked the captain.
"Oh, yes; the little fall has done me more good than harm."

In the evening the travellers had marched twenty-five miles; they were worn out, but it did not prevent the doctor climbing up an iceberg while the snow-house was being built. The full moon shone with extraordinary brilliancy in the clearest sky; the stars were singularly bright; from the top of the iceberg the view stretched over an immense plain, bristling with icebergs; they were of all sizes and shapes, and made the field look like a vast cemetery, in which twenty generations slept the sleep of death. Notwithstanding the cold, the doctor remained a long time in contemplation of the spectacle, and his companions had much trouble to get him away; but they were obliged to think of rest; the snow-hut was ready; the four companions burrowed into it like moles, and soon slept the sleep of the just.

The next day and the following ones passed without any particular incident; the journey was easy or difficult according to the weather; when it was cold and clear they wore their moccasins and advanced rapidly, when damp and penetrating, their snow-shoes, and made little way. They reached thus the 15th of January; the moon was in her last quarter, and was only visible for a short time; the sun, though still hidden below the horizon, gave six hours of a sort of twilight, not sufficient to see the way by; they were obliged to stake it out according to the direction given by the compass. Bell led the way; Hatteras marched in a straight line behind him; then Simpson and the doctor, taking it
in turns, so as only to see Hatteras, and keep in a straight line. But notwithstanding all their precautions, they
deviated sometimes thirty or forty degrees; they were then obliged to stake it out again. On Sunday, the 15th of
January, Hatteras considered he had made a hundred miles to the south; the morning was consecrated to the mending
of different articles of clothing and encampment; divine service was not forgotten. They set out again at noon; the
temperature was cold, the thermometer marked only 32 degrees below zero in a very clear atmosphere.

All at once, without warning of any kind, a vapour rose from the ground in a complete state of congelation,
reaching a height of about ninety feet, and remaining stationary; they could not see a foot before them; it clung to
their clothing, and bristled it with ice. Our travellers, surprized by the frost-rime, had all the same idea--that of
getting near one another. They called out, "Bell!" "Simpson!" "This way, doctor!" "Where are you, captain?" But no
answers were heard; the vapour did not conduct sound. They all fired as a sign of rallying. But if the sound of the
voice appeared too weak, the detonation of the firearms was too strong, for it was echoed in all directions, and
produced a confused rumble without appreciable direction. Each acted then according to his instincts. Hatteras
stopped, folded his arms, and waited. Simpson contented himself with stopping his sledge. Bell retraced his steps,
feeling the traces with his hands. The doctor ran hither and thither, bumping against the icebergs, falling down,
getting up, and losing himself more and more. At the end of five minutes he said:

"I can't go on like this! What a queer climate! It changes too suddenly, and the icicles are cutting my face.
Captain! I say, captain!"

But he obtained no answer; he discharged his gun, and notwithstanding his thick gloves, burnt his hand with the
trigger. During this operation he thought he saw a confused mass moving at a few steps from him.

"At last!" said he. "Hatteras! Bell! Simpson! Is it you? Answer, do!"

A hollow growl was the only answer.

"Whatever is that?" thought the doctor. The mass approached, and its outline was more distinctly seen. "Why, it's
a bear!" thought the terrified doctor. It was a bear, lost too in the frost-rime, passing within a few steps of the men of
whose existence it was ignorant. The doctor saw its enormous paws beating the air, and did not like the situation. He
jumped back and the mass disappeared like a phantom. The doctor felt the ground rising under his feet; climbing on
all-fours he got to the top of a block, then another, feeling the end with his stick. "It's an iceberg!" he said to himself:
"if I get to the top I shall be saved." So saying he climbed to a height of about eighty feet; his head was higher than
the frozen fog, of which he could clearly see the top. As he looked round he saw the heads of his three companions
emerging from the dense fluid.

"Hatteras!"
"Doctor!"
"Bell!"
"Simpson!"

The four names were all shouted at the same time; the sky, lightened by a magnificent halo, threw pale rays
which coloured the frost-rime like clouds, and the summits of the icebergs seemed to emerge from liquid silver. The
travellers found themselves circumscribed by a circle less than a hundred feet in diameter. Thanks to the purity of
the upper layers of air, they could hear each other distinctly, and could talk from the top of their icebergs. After the
first shots they had all thought the best thing they could do was to climb.

"The sledge!" cried the captain.
"It's eighty feet below us," answered Simpson.
"In what condition?"
"In good condition."
"What about the bear?" asked the doctor.
"What bear?" asked Bell.
"The bear that nearly broke my head," answered the doctor.
"If there is a bear we must go down," said Hatteras.
"If we do we shall get lost again," said the doctor.
"And our dogs?" said Hatteras.

At this moment Dick's bark was heard through the fog.

"That's Dick," said Hatteras; "there's something up; I shall go down."

Growls and barks were heard in a fearful chorus. In the fog it sounded like an immense humming in a wadded
room. Some struggle was evidently going on.

"Dick! Dick!" cried the captain, re-entering the frost-rime.

"Wait a minute, Hatteras; I believe the fog is clearing off," called out the doctor. So it was, but lowering like the
waters of a pond that is being emptied; it seemed to enter the ground from whence it sprang; the shining summits of
the icebergs grew above it; others, submerged till then, came out like new islands; by an optical illusion the
travellers seemed to be mounting with their icebergs above the fog. Soon the top of the sledge appeared, then the dogs, then about thirty other animals, then enormous moving masses, and Dick jumping about in and out of the fog.

"Foxes!" cried Bell.

"Bears!" shouted the doctor. "Five!"

"Our dogs! Our provisions!" cried Simpson. A band of foxes and bears had attacked the sledge, and were making havoc with the provisions. The instinct of pillage made them agree; the dogs barked furiously, but the herd took no notice, and the scene of destruction was lamentable.

"Fire!" cried the captain, discharging his gun. His companions imitated him. Upon hearing the quadruple detonation the bears raised their heads, and with a comical growl gave the signal for departure; they went faster than a horse could gallop, and, followed by the herd of foxes, soon disappeared amongst the northern icebergs.

CHAPTER XXX
THE CAIRN
The frost-rime had lasted about three-quarters of an hour; quite long enough for the bears and foxes to make away with a considerable quantity of provisions which they attacked all the more greedily, arriving, as they did, when the animals were perishing with hunger from the long winter. They had torn open the covering of the sledge with their enormous paws; the cases of pemmican were open, and half-empty; the biscuit-bags pillaged, the provisions of tea spilt over the snow, a barrel of spirits of wine broken up, and its precious contents run out; the camping materials lying all about. The wild animals had done their work.

"The devils have done for us!" said Bell.

"What shall we do now?" said Simpson.

"Let us first see how much we've lost," said the doctor; "we can talk after."

Hatteras said nothing, but began picking up the scattered objects. They picked up all the pemmican and biscuit that was still eatable. The loss of so much spirits of wine was deplorable, as without it it was impossible to get any hot drinks—no tea nor coffee.

The doctor made an inventory of the provisions that were left, and found that the animals had eaten two hundred pounds of pemmican and a hundred and fifty pounds of biscuit; if the travellers continued their journey they would be obliged to put themselves on half-rations. They deliberated about what was to be done under the circumstances. Should they return to the brig and begin their expedition again? But how could they resolve to lose the hundred and fifty miles already cleared? and coming back without the fuel, how would they be received by the crew? and which of them would begin the excursion again? It was evident that the best thing to do was to go on, even at the price of the worst privations. The doctor, Hatteras, and Bell were for going on, but Simpson wanted to go back; his health had severely suffered from the fatigues of the journey, and he grew visibly weaker; but at last, seeing he was alone in his opinion, he took his place at the head of the sledge, and the little caravan continued its route. During the three following days, from the 15th to the 17th of January, the monotonous incidents of the journey took place again. They went on more slowly; the travellers were soon tired; their legs ached with fatigue, and the dogs drew with difficulty. Their insufficient food told upon them. The weather changed with its usual quickness, going suddenly from intense cold to damp and penetrating fogs.

On the 18th of January the aspect of the ice-field changed all at once. A great number of peaks, like pyramids, ending in a sharp point at a great elevation, showed themselves on the horizon. The soil in certain places was seen through the layer of snow; it seemed to consist of schist and quartz, with some appearance of calcareous rock. At last the travellers had reached _terra firma_, and, according to their estimation, the continent must be New Cornwall. The doctor was delighted to tread on solid ground once more; the travellers had only a hundred more miles to go before reaching Belcher Cape; but the trouble of walking increased on this rocky soil, full of inequalities, crevices, and precipices; they were obliged to plunge into the interior of the land and climb the high cliffs on the coast, across narrow gorges, in which the snow was piled up to a height of thirty or forty feet. The travellers soon had cause to regret the levels they had left, on which the sledge rolled so easily. Now they were obliged to drag it with all their strength. The dogs were worn out, and had to be helped; the men harnessed themselves along with them, and wore themselves out too. They were often obliged to unload the provisions in order to get over a steep hill, whose frozen surface gave no hold. Some passages ten feet long took hours to clear. During the first day they only made about five miles on that land, so well named Cornwall. The next day the sledge attained the upper part of the cliffs; the travellers were too exhausted to construct their snow-house, and were obliged to pass the night under the tent, enveloped in their buffalo-skins, and drying their stockings by placing them on their chests. The consequences of such a state of things may be readily imagined; during the night the thermometer went down to 44 degrees below zero, and the mercury froze.
The health of Simpson became alarming; an obstinate cold, violent rheumatism, and intolerable pain forced him to lie down on the sledge, which he could no longer guide. Bell took his place; he was not well, but was obliged not to give in. The doctor also felt the influence of his terrible winter excursion, but he did not utter a complaint; he marched on in front, leaning on his stick; he lighted the way; he helped in everything. Hatteras, impassive, impenetrable, insensible, in as good health as the first day, with his iron constitution, followed the sledge in silence. On the 20th of January the weather was so bad that the least effort caused immediate prostration; but the difficulties of the ground became so great that Hatteras and Bell harnessed themselves along with the dogs; the front of the sledge was broken by an unexpected shock, and they were forced to stop and mend it. Such delays occurred several times a day. The travellers were journeying along a deep ravine up to their waists in snow, and perspiring, notwithstanding the violent cold. No one spoke. All at once Bell looked at the doctor in alarm, picked up a handful of snow, and began to rub his companion's face with all his might.

"What the deuce, Bell?" said the doctor, struggling.
But Bell went on rubbing.

"Are you mad? You've filled my eyes, nose, and mouth with snow. What is it?"
"Why," answered Bell, "if you've got a nose left, you owe it to me."

"A nose?" said the doctor, putting his hand to his face.

"Yes, Mr. Clawbonny, you were quite frostbitten; your nose was quite white when I looked at you, and without my bit of rubbing you would be minus nose."

"Thanks, Bell," said the doctor; "I'll do the same for you in case of need."

"I hope you will, Mr. Clawbonny, and I only wish we had nothing worse to look forward to!"

"You mean Simpson! Poor fellow, he is suffering dreadfully!"

"Do you fear for him?" asked Hatteras quickly.

"Yes, captain," answered the doctor.

"What do you fear?"

"A violent attack of scurvy. His legs swell already, and his gums are attacked; the poor fellow is lying under his blankets on the sledge, and every shock increases his pain. I pity him, but I can't do anything for him!"

"Poor Simpson!" said Bell.

"Perhaps we had better stop a day or two," said the doctor.

"Stop!" cried Hatteras, "when the lives of eighteen men depend upon our return! You know we have only enough provisions left for twenty days."

Neither the doctor nor Bell could answer that, and the sledge went on its way. In the evening they stopped at the foot of an ice-hill, out of which Bell soon cut a cavern; the travellers took refuge in it, and the doctor passed the night in nursing Simpson; he was a prey to the scurvy, and constant groans issued from his terrified lips.

"Ah, Mr. Clawbonny, I shall never get over it. I wish I was dead already."

"Take courage, my poor fellow!" answered the doctor, with pity in his tone, and he answered Simpson's complaints by incessant attention. Though half-dead with fatigue, he employed a part of the night in making the sick man a soothing draught, and rubbed him with lime-juice. Unfortunately it had little effect, and did not prevent the terrible malady spreading. The next day they were obliged to lift the poor fellow on to the sledge, although he begged and prayed them to leave him to die in peace, and begin their painful march again.

The freezing mists wet the three men to the skin; the snow and sleet beat in their faces; they did the work of beasts of burden, and had not even sufficient food. Dick ran hither and thither, discovering by instinct the best route to follow. During the morning of the 23rd of January, when it was nearly dark, for the new moon had not yet made her appearance, Dick ran on first; he was lost to sight for several hours. Hatteras became anxious, as there were many bear-marks on the ground; he was considering what had better be done, when a loud barking was heard in front. The little procession moved on quicker, and soon came upon the faithful animal in the depth of a ravine. Dick was set as if he had been petrified in front of a sort of cairn, made of limestone, and covered with a cement of ice.

"This time," said the doctor, disengaging himself from the traces, "it's really a cairn; we can't be mistaken."

"What does it matter to us?" said Hatteras.

"Why, if it is a cairn, it may inclose something that would be useful to us--some provisions perhaps."

"As if Europeans had ever been here!" said Hatteras, shrugging his shoulders.

"But if not Europeans, it may be that the Esquimaux have hidden some product of their hunting here. They are accustomed to doing it, I think."

"Well, look if you like, Clawbonny, but I don't think it is worth your while."

Clawbonny and Bell, armed with their pickaxes made for the cairn. Dick kept on barking furiously. The cairn was soon demolished, and the doctor took out a damp paper. Hatteras took the document and read:

"Altam... _Porpoise_, Dec... 13th, 1860, 12.. degrees long... 8.. degrees 35 minutes lat..."
"The _Porpoise_!" said the doctor.

"I don't know any ship of that name frequenting these seas," said Hatteras.

"It is evident," continued the doctor, "that some sailors, or perhaps some shipwrecked fellows, have passed here within the last two months."

"That's certain," said Bell.

"What shall we do?" asked the doctor.

"Continue our route," said Hatteras coldly. "I don't know anything about the _Porpoise_, but I do know that the _Forward_ is waiting for our return."

CHAPTER XXXI
THE DEATH OF SIMPSON

The travellers went on their weary way, each thinking of the discovery they had just made. Hatteras frowned with uneasiness.

"What can the _Porpoise_ be?" he asked himself. "Is it a ship? and if so, what was it doing so near the Pole?"

At this thought he shivered, but not from the cold. The doctor and Bell only thought of the result their discovery might have for others or for themselves. But the difficulties and obstacles in their way soon made them oblivious to everything but their own preservation.

Simpson's condition grew worse; the doctor saw that death was near. He could do nothing, and was suffering cruelly on his own account from a painful ophthalmia which might bring on blindness if neglected. The twilight gave them enough light to hurt the eyes when reflected by the snow; it was difficult to guard against the reflection, for the spectacle-glasses got covered with a layer of opaque ice which obstructed the view, and when so much care was necessary for the dangers of the route, it was important to see clearly; however, the doctor and Bell took it in turns to cover their eyes or to guide the sledge. The soil was volcanic, and by its inequalities made it very difficult to draw the sledge, the frame of which was getting worn out. Another difficulty was the effect of the uniform brilliancy of the snow; the ground seemed to fall beneath the feet of the travellers, and they experienced the same sensation as that of the rolling of a ship; they could not get accustomed to it, and it made them sleepy, and they often walked on half in a dream. Then some unexpected shock, fall, or obstacle would wake them up from their inertia, which afterwards took possession of them again.

On the 25th of January they began to descend, and their dangers increased. The least slip might send them down a precipice, and there they would have been infallibly lost. Towards evening an extremely violent tempest swept the snow-clad summits; they were obliged to lie down on the ground, and the temperature was so low that they were in danger of being frozen to death. Bell, with the help of Hatteras, built a snow-house, in which the poor fellows took shelter; there they partook of a little pemmican and warm tea; there were only a few gallons of spirits of wine left, and they were obliged to use them to quench their thirst, as they could not take snow in its natural state; it must be melted. In temperate countries, where the temperature scarcely falls below freezing point, it is not injurious; but above the Polar circle it gets so cold that it cannot be touched more than a red-hot iron; there is such a difference of temperature that its absorption produces suffocation. The Esquimaux would rather suffer the greatest torments than slake their thirst with snow.

The doctor took his turn to watch at three o'clock in the morning, when the tempest was at its height; he was leaning in a corner of the snow-house, when a lamentable groan from Simpson drew his attention; he rose to go to him, and struck his head against the roof; without thinking of the accident he began to rub Simpson's swollen limbs; after about a quarter of an hour he got up again, and bumped his head again, although he was kneeling then.

"That's very queer," he said to himself.

He lifted his hand above his head, and felt that the roof was lowering.

"Good God!" he cried; "Hatteras! Bell!"

His cries awoke his companions, who got up quickly, and bumped themselves too; the darkness was thick.

"The roof is falling in!" cried the doctor.

They all rushed out, dragging Simpson with them; they had no sooner left their dangerous retreat, than it fell in with a great noise. The poor fellows were obliged to take refuge under the tent covering, which was soon covered with a thick layer of snow, which, as a bad conductor, prevented the travellers being frozen alive. The tempest continued all through the night. When Bell harnessed the dogs the next morning he found that some of them had begun to eat their leather harness, and that two of them were very ill, and could not go much further. However, the caravan set out again; there only remained sixty miles to go. On the 26th, Bell, who went on in front, called out suddenly to his companions. They ran up to him, and he pointed to a gun leaning against an iceberg.

"A gun!" cried the doctor.
Hatteras took it; it was loaded and in good condition.

"The men from the _Porpoise_ can't be far off," said the doctor.

Hatteras remarked that the gun was of American manufacture, and his hands crisped the frozen barrel. He gave orders to continue the march, and they kept on down the mountain slope. Simpson seemed deprived of all feeling; he had no longer the strength to complain. The tempest kept on, and the sledge proceeded more and more slowly; they scarcely made a few miles in twenty-four hours, and in spite of the strictest economy, the provisions rapidly diminished; but as long as they had enough for the return journey, Hatteras kept on.

On the 27th they found a sextant half-buried in the snow, then a leather bottle; the latter contained brandy, or rather a lump of ice, with a ball of snow in the middle, which represented the spirit; it could not be used. It was evident that they were following in the steps of some poor shipwrecked fellows who, like them, had taken the only practicable route. The doctor looked carefully round for other cairns, but in vain. Sad thoughts came into his mind; he could not help thinking that it would be a good thing not to meet with their predecessors; what could he and his companions do for them? They wanted help themselves; their clothes were in rags, and they had not enough to eat. If their predecessors were numerous they would all die of hunger. Hatteras seemed to wish to avoid them, and could he be blamed? But these men might be their fellow-countrymen, and, however slight might be the chance of saving them, ought they not to try it? He asked Bell what he thought about it, but the poor fellow's heart was hardened by his own suffering, and he did not answer. Clawbonny dared not question Hatteras, so he left it to Providence.

In the evening of the 27th, Simpson appeared to be at the last extremity; his limbs were already stiff and frozen; his difficult breathing formed a sort of mist round his head, and convulsive movements announced that his last hour was come. The expression of his face was terrible, desperate, and he threw looks of powerless anger towards the captain. He accused him silently, and Hatteras avoided him and became more taciturn and wrapped up in himself than ever. The following night was frightful; the tempest redoubled in violence; the tent was thrown down three times, and the snowdrifts buried the poor fellows, blinded them, froze them, and wounded them with the sharp icicles struck off the surrounding icebergs. The dogs howled lamentably. Simpson lay exposed to the cruel atmosphere. Bell succeeded in getting up the tent again, which, though it did not protect them from the cold, kept out the snow. But a more violent gust blew it down a fourth time, and dragged it along in its fury.

"Oh, we can't bear it any longer!" cried Bell.

"Courage, man, courage!" answered the doctor, clinging to him in order to prevent themselves rolling down a ravine. Simpson's death-rattle was heard. All at once, with a last effort, he raised himself up and shook his fist at Hatteras, who was looking at him fixedly, then gave a fearful cry, and fell back dead in the midst of his unfinished threat.

"He is dead!" cried the doctor.

"Dead!" repeated Bell.

Hatteras advanced towards the corpse, but was driven back by a gust of wind.

Poor Simpson was the first victim to the murderous climate, the first to pay with his life the unreasonable obstinacy of the captain. The dead man had called Hatteras an assassin, but he did not bend beneath the accusation. A single tear escaped from his eyes and froze on his pale cheek. The doctor and Bell looked at him with a sort of terror. Leaning on his stick, he looked like the genius of the North, upright in the midst of the whirlwind, and frightful in his immobility.

He remained standing thus till the first dawn of twilight, bold, tenacious, indomitable, and seemed to defy the tempest that roared round him.

CHAPTER XXXII
THE RETURN

The wind went down about six in the morning, and turning suddenly north cleared the clouds from the sky; the thermometer marked 33 degrees below zero. The first rays of the sun reached the horizon which they would gild a few days later. Hatteras came up to his two dejected companions, and said to them, in a low, sad voice:

"We are still more than sixty miles from the spot indicated by Sir Edward Belcher. We have just enough provisions to allow us to get back to the brig. If we go on any further we shall meet with certain death, and that will do good to no one. We had better retrace our steps."

"That is a sensible resolution, Hatteras," answered the doctor; "I would have followed you as far as you led us, but our health gets daily weaker; we can scarcely put one foot before the other; we ought to go back."

"Is that your opinion too, Bell?" asked Hatteras.

"Yes, captain," answered the carpenter.

"Very well," said Hatteras; "we will take two days' rest. We want it. The sledge wants mending. I think we had
better build ourselves a snow-house, and try to regain a little strength."

After this was settled, our three men set to work with vigour. Bell took the necessary precautions to assure the solidity of the construction, and they soon had a good shelter at the bottom of the ravine where the last halt had taken place. It had cost Hatteras a great effort to interrupt his journey. All their trouble and pain lost! A useless excursion, which one man had paid for with his life. What would become of the crew now that all hope of coal was over? What would Shandon think? Notwithstanding all these painful thoughts, he felt it impossible to go on any further. They began their preparations for the return journey at once. The sledge was mended; it had now only two hundred pounds weight to carry. They mended their clothes, worn-out, torn, soaked with snow, and hardened by the frost; new moccasins and snow-shoes replaced those that were worn out. This work took the whole day of the 29th and the morning of the 30th; the three travellers rested and comforted themselves as well as they could.

During the thirty-six hours passed in the snow-house and on the icebergs of the ravine, the doctor had noticed that Dick's conduct was very strange; he crept smelling about a sort of rising in the ground made by several layers of ice; he kept wagging his tail with impatience, and trying to draw the attention of his master to the spot. The doctor thought that the dog's uneasiness might be caused by the presence of Simpson's body, which he and his companions had not yet had time to bury. He resolved to put it off no longer, especially as they intended starting early the next morning. Bell and the doctor took their pickaxes and directed their steps towards the lowest part of the ravine; the mound indicated by Dick seemed to be a good spot to place the corpse in; they were obliged to bury it deep to keep it from the bears. They began by removing the layer of soft snow, and then attacked the ice. At the third blow of his pickaxe the doctor broke some hard obstacle; he took out the pieces and saw that it was a glass bottle; Bell discovered a small biscuit-sack with a few crumbs at the bottom.

"Whatever does this mean?" said the doctor.
"I can't think," answered Bell, suspending his work.
They called Hatteras, who came immediately. Dick barked loudly, and began scratching at the ice.
"Perhaps we have found a provision-store," said the doctor.
"It is possible," said Bell.
"Go on," said Hatteras.

Some remains of food were drawn out, and a case a quarter full of pemmican.
"If it is a hiding-place," said Hatteras, "the bears have been before us. See, the provisions are not intact."
"I am afraid so," answered the doctor; "for--"
He was interrupted by a cry from Bell, who had come upon a man's leg, stiffened and frozen.
"A corpse," cried the doctor.
"It is a tomb," answered Hatteras.

When the corpse was disinterred it turned out to be that of a sailor, about thirty years old, perfectly preserved. He wore the clothes of an Arctic navigator. The doctor could not tell how long he had been dead. But after this corpse, Bell discovered a second, that of a man of fifty, bearing the mark of the suffering that had killed him on his face.
"These are not buried bodies," cried the doctor, "the poor fellows were surprised by death just as we find them."
"You are right, Mr. Clawbonny," answered Bell.
"Go on! go on!" said Hatteras.

Bell obeyed tremblingly; for who knew how many human bodies the mound contained?
"These men have been the victims of the same accident that almost happened to us," said the doctor. "Their snow-house tumbled in. Let us see if any one of them is still alive."

The place was soon cleared, and Bell dug out a third body, that of a man of forty, who had not the cadaverous look of the others. The doctor examined him and thought he recognised some symptoms of existence.
"He is alive!" he cried.

Bell and he carried the body into the snow-house whilst Hatteras, unmoved, contemplated their late habitation. The doctor stripped the resuscitated man and found no trace of a wound on him. He and Bell rubbed him vigorously with oakum steeped in spirits of wine, and they saw signs of returning consciousness; but the unfortunate man was in a state of complete prostration, and could not speak a word. His tongue stuck to his palate as if frozen. The doctor searched his pockets, but they were empty. He left Bell to continue the friction, and rejoined Hatteras. The captain had been down into the depths of the snow-house, and had searched about carefully. He came up holding a half-burnt fragment of a letter. These words were on it:

... tamont... orpoise... w York.
"Altamont!" cried the doctor, of the ship _Porpoise_, of New York.
"An American," said Hatteras.
"I'll save him," said the doctor, "and then we shall know all about it."

He went back to Altamont whilst Hatteras remained pensive. Thanks to his attentions, the doctor succeeded in
recalling the unfortunate man to life, but not to feeling; he neither saw, heard, nor spoke, but he lived. The next day Hatteras said to the doctor:

"We must start at once."
"Yes. The sledge is not loaded; we'll put the poor fellow on it and take him to the brig."
"Very well; but we must bury these bodies first."

The two unknown sailors were placed under the ruins of the snow-house again, and Simpson's corpse took Altamont's place. The three travellers buried their companion, and at seven o'clock in the morning they set out again. Two of the Greenland dogs were dead, and Dick offered himself in their place. He pulled with energy.

During the next twenty days the travellers experienced the same incidents as before. But as it was in the month of February they did not meet with the same difficulty from the ice. It was horribly cold, but there was not much wind. The sun reappeared for the first time on the 31st of January, and every day he stopped longer above the horizon. Bell and the doctor were almost blinded and half-lame; the carpenter was obliged to walk upon crutches. Altamont still lived, but he was in a state of complete insensibility. The doctor took great care of him, although he wanted attention himself; he was getting ill with fatigue. Hatteras thought of nothing but his ship. What state should he find it in?

On the 24th of February he stopped all of a sudden. A red light appeared about 300 paces in front, and a column of black smoke went up to the sky.

"Look at that smoke! my ship is burning," said he with a beating heart.
"We are three miles off yet," said Bell; "it can't be the _Forward_."
"Yes it is," said the doctor; "the mirage makes it seem nearer."

The three men, leaving the sledge to the care of Dick, ran on, and in an hour's time were in sight of the ship. She was burning in the midst of the ice, which melted around her. A hundred steps farther a man met them, wringing his hands before the _Forward_ in flames. It was Johnson. Hatteras ran to him.

"My ship! My ship!" cried he.
"Is that you, captain? Oh, don't come any nearer," said Johnson.
"What is it?" said Hatteras.
"The wretches left forty-eight hours ago, after setting fire to the ship."
"Curse them!" cried Hatteras.

A loud explosion was then heard; the ground trembled; the icebergs fell upon the ice-field; a column of smoke went up into the clouds, and the _Forward_ blew up. The doctor and Bell reached Hatteras, who out of the depths of despair cried:

"The cowards have fled! The strong will succeed! Johnson and Bell, you are courageous. Doctor, you have science. I have faith. To the North Pole! To the North Pole!"

His companions heard these energetic words, and they did them good; but it was a terrible situation for these four men, alone, under the 80th degree of latitude, in the midst of the Polar Regions!

END OF PART I OF THE ADVENTURES OF CAPTAIN HATTERAS

THE FIELD OF ICE
BY JULES VERNE

CHAPTER I.
THE DOCTOR'S INVENTORY.

It was a bold project of Hatteras to push his way to the North Pole, and gain for his country the honour and glory of its discovery. But he had done all that lay in human power now, and, after having struggled for nine months against currents and tempests, shattering icebergs and breaking through almost insurmountable barriers, amid the cold of an unprecedented winter, after having outdistanced all his predecessors and accomplished half his task, he suddenly saw all his hopes blasted. The treachery, or rather the despondency, of his worn-out crew, and the criminal folly of one or two leading spirits among them had left him and his little band of men in a terrible situation—helpless in an icy desert, two thousand five hundred miles away from their native land, and without even a ship to shelter them.

However, the courage of Hatteras was still undaunted. The three men which were left him were the best on board his brig, and while they remained he might venture to hope.

After the cheerful, manly words of the captain, the Doctor felt the best thing to be done was to look their prospects fairly in the face, and know the exact state of things. Accordingly, leaving his companions, he stole away
alone down to the scene of the explosion.

Of the Forward, the brig that had been so carefully built and had become so dear, not a vestige remained. Shapeless blackened fragments, twisted bars of iron,

[Illustration: ]
cable ends still smouldering, and here and there in the distance spiral wreaths of smoke, met his eye on all sides. His cabin and all his precious treasures were gone, his books, and instruments, and collections reduced to ashes. As he stood thinking mournfully of his irreparable loss, he was joined by Johnson, who grasped his offered hand in speechless sorrow.

"What’s to become of us?" asked the Doctor.
"Who can tell!" was the old sailor’s reply.
"Anyhow," said Clawbonny, "do not let us despair! Let us be men!"
"Yes, Mr. Clawbonny, you are right. Now is the time to show our mettle. We are in a bad plight, and how to get out of it, that is the question."
"Poor old brig!" exclaimed the Doctor. "I had grown so attached to her. I loved her as one loves a house where he has spent a life-time."
"Ay! it’s strange what a hold those planks and beams get on a fellow’s heart."
"And the long-boat—is that burnt?" asked the Doctor.
"No, Mr. Clawbonny. Shandon and his gang have carried it off."
"And the pirogue?"
"Shivered into a thousand pieces? Stop. Do you see those bits of sheet-iron? That is all that remains of it."
"Then we have nothing but the Halkett-boat?"
"Yes, we have that still, thanks to your idea of taking it with you."
"That isn’t much," said the Doctor.
"Oh, those base traitors!" exclaimed Johnson. "Heaven punish them as they deserve!"
"Johnson," returned the Doctor, gently, "we must not forget how sorely they have been tried. Only the best remain good in the evil day; few can stand trouble. Let us pity our fellow-sufferers, and not curse them."

For the next few minutes both were silent, and then Johnson asked what had become of the sledge.

"We left it about a mile off," was the reply.
"In charge of Simpson?"
"No, Simpson is dead, poor fellow!"
"Simpson dead!"
"Yes, his strength gave way entirely, and he first sank."
"Poor Simpson! And yet who knows if he isn’t rather to be envied?"
"But, for the dead man we have left behind, we have brought back a dying one."
"A dying man?"
"Yes, Captain Altamont."
And in a few words he informed Johnson of their discovery.
"An American!" said Johnson, as the recital was ended.
"Yes, everything goes to prove that. But I wonder what the Porpoise was, and what brought her in these seas?"
"She rushed on to her ruin like the rest of foolhardy adventurers; but, tell me, did you find the coal?"
The Doctor shook his head sadly.
"No coal! not a vestige! No, we did not even get as far as the place mentioned by Sir Edward Belcher."
"Then we have no fuel whatever?" said the old sailor.
"No."
"And no provisions?"
"No."
"And no ship to make our way back to England?"

It required courage indeed to face these gloomy realities, but, after a moment’s silence, Johnson said again—

"Well, at any rate we know exactly how we stand. The first thing to be done now is to make a hut, for we can’t stay long exposed to this temperature."
"Yes, we’ll soon manage that with Bell’s help," replied the Doctor. "Then we must go and find the sledge, and bring back the American, and have a consultation with Hatteras."
"Poor captain," said Johnson, always forgetting his own troubles, "how he must feel it!"

Clawbonny and Bell found Hatteras standing motionless, his arms folded in his usual fashion. He seemed gazing into space, but his face had recovered its calm, self-possessed expression. His faithful dog stood beside him, like his master, apparently insensible to the biting cold, though the temperature was 32 degrees below zero.
Bell lay on the ice in an almost inanimate condition. Johnson had to take vigorous measures to rouse him, but at last, by dint of shaking and rubbing him with snow, he succeeded.

"Come, Bell," he cried, "don't give way like this. Exert yourself, my man; we must have a talk about our situation, and we need a place to put our heads in. Come and help me, Bell. You haven't forgotten how to make a snow hut, have you? There is an iceberg all ready to hand; we've only got to hollow it out. Let's set to work; we shall find that is the best remedy for us."

Bell tried to shake off his torpor and help his comrade, while Mr. Clawbonny undertook to go and fetch the sledge and the dogs.

"Will you go with him, captain?" asked Johnson.

"No, my friend," said Hatteras, in a gentle tone, "if the Doctor will kindly undertake the task. Before the day ends I must come to some resolution, and I need to be alone to think. Go. Do meantime whatever you think best. I will deal with the future."

Johnson went back to the Doctor, and said—

"It's very strange, but the captain seems quite to have got over his anger. I never heard him speak so gently before."

"So much the better," said Clawbonny. "Believe me, Johnson, that man can save us yet."

And drawing his hood as closely round his head as possible, the Doctor seized his iron-tipped staff, and set out without further delay.

Johnson and Bell commenced operations immediately. They had simply to dig a hole in the heart of a great block of ice; but it was not easy work, owing to the extreme hardness of the material. However, this very hardness guaranteed the solidity of the dwelling, and the further their labours advanced the more they became sheltered.

Hatteras alternately paced up and down, and stood motionless, evidently shrinking from any approach to the scene of explosion.

In about an hour the Doctor returned, bringing with him Altamont lying on the sledge, wrapped up in the folds of the tent. The poor dogs were so exhausted from starvation that they could scarcely draw it along, and they had begun to gnaw their harness. It was, indeed, high time for feasts and men to take food and rest.

While the hut was being still further dug out, the Doctor went foraging about, and had the good fortune to find a little stove, almost undamaged by the explosion. He soon restored it to working trim, and, by the time the hut was completed, had filled it with wood and got it lighted. Before long it was roaring, and diffusing a genial warmth on all sides. The American was brought in and laid on blankets, and the four Englishmen seated themselves round the fire to enjoy their scanty meal of biscuit and hot tea, the last remains of the provisions on the sledge. Not a word was spoken by Hatteras, and the others respected his silence.

When the meal was over, the Doctor rose and went out, making a sign to Johnson to follow.

"Come, Johnson," he said, "we will take an inventory of all we have left. We must know exactly how we are off, and our treasures are scattered in all directions; so we had better begin, and pick them up as fast as possible, for the snow may fall at any moment, and then it would be quite useless to look for anything."

"Don't let us lose a minute, then," replied Johnson. "Fire and food—those are our chief wants."

"Very well, you take one side and I'll take the other, and we'll search from the centre to the circumference."

This task occupied two hours, and all they discovered was a little salt meat, about 50 lbs. of pemmican, three sacks of biscuits, a small stock of chocolate, five or six pints of brandy, and about 2 lbs. of coffee, picked up bean by bean off the ice.

Neither blankets, nor hammocks, nor clothing—all had been consumed in the devouring flame.

This slender store of provisions would hardly last three weeks, and they had wood enough to supply the stove for about the same time.

When the meal was over, the Doctor rose and went out, making a sign to Johnson to follow.

"Come, Johnson," he said, "we will take an inventory of all we have left. We must know exactly how we are off, and our treasures are scattered in all directions; so we had better begin, and pick them up as fast as possible, for the snow may fall at any moment, and then it would be quite useless to look for anything."

"Don't let us lose a minute, then," replied Johnson. "Fire and food—those are our chief wants."

"Very well, you take one side and I'll take the other, and we'll search from the centre to the circumference."

This task occupied two hours, and all they discovered was a little salt meat, about 50 lbs. of pemmican, three sacks of biscuits, a small stock of chocolate, five or six pints of brandy, and about 2 lbs. of coffee, picked up bean by bean off the ice.

Neither blankets, nor hammocks, nor clothing—all had been consumed in the devouring flame.

This slender store of provisions would hardly last three weeks, and they had wood enough to supply the stove for about the same time.

Now that the inventory was made, the next business was to fetch the sledge. The tired-out dogs were harnessed sorely against their will, and before long returned bringing the few but precious treasures found among the débris of the brig.—P.9]

Now that the inventory was made, the next business was to fetch the sledge. The tired-out dogs were harnessed sorely against their will, and before long returned bringing the few but precious treasures found among the débris of the brig. These were safely deposited in the hut, and then Johnson and Clawbonny, half-frozen with their work, resumed their places beside their companions in misfortune.

CHAPTER II.
FIRST WORDS OF ALTAMONT.
About eight o'clock in the evening, the grey snow clouds cleared away for a little, and the stars shone out brilliantly in the sky.

Hatteras seized the opportunity and went out silently to take the altitude of some of the principal constellations.
He wished to ascertain if the ice-field was still drifting.

In half an hour he returned and sat down in a corner of the hut, where he remained without stirring all night, motionless as if asleep, but in reality buried in deepest thought.

The next day the snow fell heavily, and the Doctor congratulated himself on his wise forethought, when he saw the white sheet lying three feet thick over the scene of the explosion, completely obliterating all traces of the Forward.

It was impossible to venture outside in such weather, but the stove drew capitally, and made the hut quite comfortable, or at any rate it seemed so to the weary, worn out adventurers.

The American was in less pain, and was evidently gradually coming back to life. He opened his eyes, but could not yet speak, for his lips were so affected by the scurvy that articulation was impossible, but he could hear and understand all that was said to him. On learning what had passed, and the circumstances of his discovery, he expressed his thanks by gestures, and the Doctor was too wise to let him know how brief his respite from death would prove. In three weeks at most every vestige of food would be gone.

About noon Hatteras roused himself, and going up to his friends, said—

"We must make up our minds what to do, but I must request Johnson to tell me first all the particulars of the mutiny on the brig, and how this final act of baseness came about."

"What good will that do?" said the Doctor. "The fact is certain, and it is no use thinking over it."

"I differ from your opinion," rejoined Hatteras. "Let me hear the whole affair from Johnson, and then I will banish it from my thoughts."

"Well," said the boatswain, "this was how it happened. I did all in my power to prevent, but——"

"I am sure of that, Johnson; and what’s more, I have no doubt the ringleaders had been hatching their plans for some time."

"That’s my belief too," said the Doctor.

Illustration: Johnson's Story. —P.11

"And so it is mine," resumed Johnson; "for almost immediately after your departure Shandon, supported by the others, took the command of the ship.

I could not resist him, and from that moment everybody did pretty much as they pleased. Shandon made no attempt to restrain them: it was his policy to make them believe that their privations and toils were at an end. Economy was entirely disregarded. A blazing fire was kept up in the stove, and the men were allowed to eat and drink at discretion; not only tea and coffee was at their disposal, but all the spirits on board, and on men who had been so long deprived of ardent liquors, you may guess the result. They went on in this manner from the 7th to the 15th of January."

"And this was Shandon’s doing?" asked Hatteras.

"Yes, captain."

"Never mention his name to me again! Go on, Johnson."

"It was about the 24th or 25th of January, that they resolved to abandon the ship. Their plan was to reach the west coast of Baffin’s Bay, and from thence to embark in the boat and follow the track of the whalers, or to get to some of the Greenland settlements on the eastern side. Provisions were abundant, and the sick men were so excited by the hope of return that they were almost well. They began their preparations for departure by making a sledge which they were to draw themselves, as they had no dogs. This was not ready till the 15th of February, and I was always hoping for your arrival, though I half dreaded it too, for you could have done nothing with the men, and they would have massacred you rather than remain on board. I tried my influence on each one separately, remonstrating and reasoning with them, and pointing out the dangers they would encounter, and also the cowardice of leaving you, but it was a mere waste of words; not even the best among them would listen to me. Shandon was impatient to be off, and fixed the 22nd of February for starting. The sledge and the boat were packed as closely as possible with provisions and spirits, and heaps of wood, to obtain which they had hewed the brig down to her water-line. The last day the men ran riot. They completely sacked the ship, and in a drunken paroxysm Pen and two or three others set it on fire. I fought and struggled against them, but they threw me down and assailed me with blows, and then the wretches, headed by Shandon, went off towards the east and were soon out of sight. I found myself alone on the burning ship, and what could I do? The fire-hole was completely blocked up with ice. I had not a single drop of water! For two days the Forward struggled with the flames, and you know the rest."

A long silence followed the gloomy recital, broken at length by Hatteras, who said—

"Johnson, I thank you; you did all you could to save my ship, but single-handed you could not resist. Again I thank you, and now let the subject be dropped. Let us unite efforts for our common salvation. There are four of us, four companions, four friends, and all our lives are equally precious. Let each give his opinion on the best course for us to pursue."
"You ask us then, Hatteras," said the Doctor, "we are all devoted to you, and our words come from our hearts. But will you not state your own views first?"

"That would be little use," said Hatteras, sadly; "my opinion might appear interested; let me hear all yours first."

"Captain," said Johnson, "before pronouncing on such an important matter, I wish to ask you a question."

"Ask it, then, Johnson."

"You went out yesterday to ascertain our exact position; well, is the field drifting or stationary?"

"Perfectly stationary. It had not moved since the last reckoning was made. I find we are just where we were before we left, in 80° 15' lat. and 97° 35' long."

"And what distance are we from the nearest sea to the west?"

"About six hundred miles."

"And that sea is——?"

"Smith's Sound," was the reply.

"The same that we could not get through last April?"

"The same."

"Well, captain, now we know our actual situation, we are in a better position to determine our course of action."

"Speak your minds, then," said Hatteras, again burying his head in his hands.

"What do you say, Bell?" asked the Doctor.

"It strikes me the case doesn't need long thinking over," said the carpenter. "We must get back at once without losing a single day or even a single hour, either to the south or west, and make our way to the nearest coast, even if we are two months doing it!"

"We have only food for three weeks," replied Hatteras, without raising his head.

"Very well," said Johnson, "we must make the journey in three weeks, since it is our last chance. Even if we can only crawl on our knees before we get to our destination, we must be there in twenty-five days."

"This part of the Arctic Continent is unexplored. We may have to encounter difficulties. Mountains and glaciers may bar our progress," objected Hatteras.

"I don't see that's any sufficient reason for not attempting it. We shall have to endure sufferings, no doubt, and perhaps many. We shall have to limit ourselves to the barest quantities of food, unless our guns should procure us anything."

"There is only about half a pound of powder left," said Hatteras.

"Come now, Hatteras, I know the full weight of your objections, and I am not deluding myself with vain hopes. But I think I can read your motive. Have you any practical suggestion to offer?"

"No," said Hatteras, after a little hesitation.

"You don't doubt our courage," continued the Doctor. "We would follow you to the last—you know that. But must we not, meantime, give up all hope of reaching the Pole? Your plans have been defeated by treachery. Natural difficulties you might have overcome, but you have been outmatched by perfidy and human weakness. You have done all that man could do, and you would have succeeded I am certain; but situated as we are now, are you not obliged to relinquish your projects for the present, and is not a return to England even positively necessary before you could continue them?"

"Well, captain?" asked Johnson after waiting a considerable time for Hatteras to reply.

"Think yourselves quite certain then of reaching the Sound, exhausted though you are, and almost without food?"

"No," replied the Doctor, "but there is one thing certain, the Sound won't come to us, we must go to it. We may chance to find some Esquimaux tribes further south."

"Besides, isn't there the chance of falling in with some ship that is wintering here?" asked Johnson.

"Even supposing the Sound is blocked up, couldn't we get across to some Greenland or Danish settlement? At any rate, Hatteras, we can get nothing by remaining here. The route to England is towards the south, not the north."

"Yes," said Bell, "Mr. Clawbonny is right. We must start, and start at once. We have been forgetting our country too long already."

"Is this your advice, Johnson?" asked Hatteras again.

"Yes, captain."

"And yours, Doctor?"

"Yes, Hatteras."

Hatteras remained silent, but his face, in spite of himself, betrayed his inward agitation. The issue of his whole life hung on the decision he had to make, for he felt that to return to England was to lose all! He could not venture on a fourth expedition.
The Doctor finding he did not reply, added—

"I ought also to have said, that there is not a moment to lose. The sledge must be loaded with the provisions at once, and as much wood as possible. I must confess six hundred miles is a long journey, but we can, or rather we must make twenty miles a day, which will bring us to the coast about the 26th of March."

"But cannot we wait a few days yet?" said Hatteras.

"What are you hoping for?" asked Johnson.

"I don't know. Who can tell the future? It is necessary, too, that you should get your strength a little recruited. You might sink down on the road with fatigue, without even a snow hut to shelter you."

"But think of the terrible death that awaits us here," replied the carpenter.

"My friends," said Hatteras, in almost supplicating tones; "you are despairing too soon. I should propose that we should seek our deliverance towards the north, but you would refuse to follow me, and yet why should there not be Esquimaux tribes round about the Pole as well as towards the south? The open sea, of the existence of which we are certified, must wash the shores of continents. Nature is logical in all her doings. Consequently vegetation must be found there when the earth is no longer ice-bound. Is there not a promised land awaiting us in the north from which you would flee?"

Hatteras became animated as he spoke, and Doctor Clawbonny's excitable nature was so wrought upon that his decision began to waver. He was on the point of yielding, when Johnson, with his wiser head and calmer temperament, recalled him to reason and duty by calling out—

"Come, Bell, let us be off to the sledge."

"All right," said Bell, and the two had risen to leave the hut, when Hatteras exclaimed—

"Oh, Johnson! You! You! Well, go! I shall stay, I shall stay!"

"Captain!" said Johnson, stopping in spite of himself.

"I shall stay, I tell you. Go! Leave me like the rest! Come, Duk, you and I will stay together."

The faithful dog barked as if he understood, and settled himself down beside his master. Johnson looked at the Doctor, who seemed at a loss to know what to do, but finally decided that the best way, meantime, was to calm Hatteras, even at the sacrifice of a day. He was just about to try the force of his eloquence in this direction, when he felt a light touch on his arm, and turning round saw Altamont who had crawled out of bed and managed to get on his knees. He was trying to speak, but his swollen lips could scarcely make a sound. Hatteras went towards him, and watched his efforts to articulate so attentively that in a few minutes he made out a word that sounded like Porpoise, and stooping over him he asked—

"Is it the Porpoise?"

Altamont made a sign in the affirmative, and Hatteras went on with his queries, now that he had found a clue.

"In these seas?"

The affirmative gesture was repeated.

"Is she in the north?"

"Yes."

"Do you know her position?"

"Yes."

"Exactly?"

"Yes."

For a minute or so, nothing more was said, and the onlookers waited with palpitating hearts.

Then Hatteras spoke again and said—

"Listen to me. We must know the exact position of your vessel. I will count the degrees aloud, and you; will stop me when I come to the right one."

The American assented by a motion of the head, and Hatteras began—

"We'll take the longitude first. 105°, No? 106°, 107°? It is to the west, I suppose?"

"Yes," replied Altamont.

"Let us go on, then: 109°, 110°, 112°, 114°, 116°, 118°, 120°."

"Yes," interrupted the sick man.

[Illustration: ]

"120° of longitude, and how many minutes? I will count."

Hatteras began at number one, and when he got to fifteen, Altamont made a sign to stop.

"Very good," said Hatteras; "now for the latitude. Are you listening? 80°, 81°, 82°, 83°."

Again the sign to stop was made.

"Now for the minutes: 5', 10', 15', 20', 25', 30', 35'."

Altamont stopped him once more, and smiled feebly.
"You say, then, that the Porpoise is in longitude 120° 15', and latitude 83° 35'?"

"Yes," sighed the American, and fell back motionless in the Doctor's arms, completely overpowered by the effort he had made.

"Friends!" exclaimed Hatteras; "you see I was right. Our salvation lies indeed in the north, always in the north. We shall be saved!"

But the joyous, exulting words had hardly escaped his lips before a sudden thought made his countenance change. The serpent of jealousy had stung him, for this stranger was an American, and he had reached three degrees nearer the Pole than the ill-fated Forward.

CHAPTER III.

A SEVENTEEN DAYS' MARCH.

These first words of Altamont had completely changed the whole aspect of affairs, but his communication was still incomplete, and, after giving him a little time to rest, the Doctor undertook the task of conversing again with him, putting his questions in such a form that a movement of the head or eyes would be a sufficient answer.

He soon ascertained that the Porpoise was a three-mast American ship, from New York, wrecked on the ice, with provisions and combustibles in abundance still on board, and that, though she had been thrown on her side, she had not gone to pieces, and there was every chance of saving her cargo.

Altamont and his crew had left her two months previously, taking the long boat with them on a sledge. They intended to get to Smith's Sound, and reach some whaler that would take them back to America; but one after another succumbed to fatigue and illness, till at last Altamont and two men were all that remained out of thirty; and truly he had survived by a providential miracle, while his two companions already lay beside him in the sleep of death.

Hatteras wished to know why the Porpoise had come so far north, and learned in reply that she had been irresistibly driven there by the ice. But his anxious fears were not satisfied with this explanation, and he asked further what was the purpose of his voyage. Altamont said he wanted to make the north-west passage, and this appeared to content the jealous Englishman, for he made no more reference to the subject. "Well," said the Doctor, "it strikes me that, instead of trying to get to Baffin's Bay, our best plan would be to go in search of the Porpoise, for here lies a ship a full third of the distance nearer, and, more than that, stocked with everything necessary for winter quarters."

"I see no other course open to us," replied Bell.

"And the sooner we go the better," added Johnson, "for the time we allow ourselves must depend on our provisions."

"You are right, Johnson," returned the Doctor. "If we start to-morrow, we must reach the Porpoise by the 15th of March, unless we mean to die of starvation. What do you say, Hatteras?"

"Let us make preparations immediately, but perhaps the route may be longer than we suppose."

"How can that be, captain? The man seems quite sure of the position of his ship," said the Doctor.

"But suppose the ice-field should have drifted like ours?"

Here Altamont, who was listening attentively, made a sign that he wished to speak, and, after much difficulty, he succeeded in telling the Doctor that the Porpoise had struck on rocks near the coast, and that it was impossible for her to move.

This was reassuring information, though it cut off all hope of returning to Europe, unless Bell could construct a smaller ship out of the wreck.

[Illustration: ]

No time was lost in getting ready to start. The sledge was the principal thing, as it needed thorough repair. There was plenty of wood, and, profiting by the experience they had recently had of this mode of transit, several improvements were made by Bell.

Inside, a sort of couch was laid for the American, and covered over with the tent. The small stock of provisions did not add much to the weight, but, to make up the deficiency, as much wood was piled up on it as it could hold.

The Doctor did the packing, and made an exact calculation of how long their stores would last. He found that, by allowing three-quarter rations to each man and full rations to the dogs, they might hold out for three weeks.

Towards seven in the evening, they felt so worn out that they were obliged to give up work for the night; but, before lying down to sleep, they heaped up the wood in the stove, and made a roaring fire, determined to allow themselves this parting luxury. As they gathered round it, basking in the unaccustomed heat, and enjoying their hot coffee and biscuits and pemmican, they became quite cheerful, and forgot all their sufferings.

About seven in the morning they set to work again and by three in the afternoon everything was ready.

It was almost dark, for, though the sun had reappeared above the horizon since the 31st of January, his light was
feeble and of short duration. Happily the moon would rise about half-past six, and her soft beams would give
sufficient light to show the road.

The parting moment came. Altamont was overjoyed at the idea of starting, though the jolting would necessarily
increase his sufferings, for the Doctor would find on board the medicines he required for his cure.

They lifted him on to the sledge, and laid him as comfortably as possible, and then harnessed the dogs, including
Duk. One final look towards the icy bed where the Forward had been, and the little party set out for the Porpoise.
Bell was scout, as before; the Doctor and Johnson took each a side of the sledge, and lent a helping hand when
necessary; while Hatteras walked behind to keep all in the right track.

They got on pretty quickly, for the weather was good, and the ice smooth and hard, allowing the sledge to glide
easily along, yet the temperature was so low that men and dogs were soon panting, and had often to stop and take
breath. About seven the moon shone out, and irradiated the whole horizon. Far as the eye could see, there was
nothing visible but a wide-stretching level plain of ice, without a solitary hummock or patch to relieve the
uniformity.

Illustration: ]

As the Doctor remarked to his companion, it looked like some vast, monotonous desert.
"Ay! Mr. Clawbonny, it is a desert, but we shan’t die of thirst in it at any rate."
"That’s a comfort, certainly, but I’ll tell you one thing: it proves, Johnson, we must be a great distance from any
coast. The nearer the coast, the more numerous the icebergs in general, and you see there is not one in sight."
"The horizon is rather misty, though."
"So it is, but ever since we started, we have been on this same interminable ice-field."
"Do you know, Mr. Clawbonny, that smooth as this ice is, we are going over most dangerous ground?
Fathomless abysses lie beneath our feet."
"That’s true enough, but they won’t engulp us. This white sheet over them is pretty tough, I can tell you. It is
always getting thicker too; for in these latitudes, it snows nine days out of ten even in April and May; ay, and in June
as well. The ice here, in some parts, cannot be less than between thirty and forty feet thick."
"That sounds reassuring, at all events." said Johnson.
"Yes, we’re not like the skaters on the Serpentine—always in danger of falling through. This ice is strong
enough to bear the weight of the Custom House in Liverpool, or the Houses of Parliament in Westminster."
"Can they reckon pretty nearly what ice will bear, Mr. Clawbonny?" asked the old sailor, always eager for
information.
"What can’t be reckoned now-a-days? Yes, ice two inches thick will bear a man; three and a half inches, a man
on horse-back; five inches, an eight pounder; eight inches, field artillery; and ten inches, a whole army."
"It is difficult to conceive of such a power of resistance, but you were speaking of the incessant snow just now,
and I cannot help wondering where it comes from, for the water all round is frozen, and what makes the clouds?"
"That’s a natural enough question, but my notion is that nearly all the snow or rain that we get here comes from
the temperate zones. I fancy each of those snowflakes was originally a drop of water in some river, caught up by
evaporation into the air, and wafted over here in the shape of clouds; so that it is not impossible that when we
quench our thirst with the melted snow, we are actually drinking from the very rivers of our own native land."

Just at this moment the conversation was interrupted by Hatteras, who called out that they were getting out of the
straight line. The increasing mist made it difficult to keep together, and at last, about eight o’clock, they determined
to come to a halt, as they had gone fifteen miles. The tent was put up and the stove lighted, and after their usual
supper they lay down and slept comfortably till morning.

The calm atmosphere was highly favourable, for though the cold became intense, and the mercury was always
frozen in the thermometer, they found no difficulty in continuing their route, confirming the truth of Parry’s
assertion that any man suitably clad may walk abroad with impunity in the lowest temperature, provided there is no
wind; while, on the other hand, the least breeze would make the skin smart acutely, and bring on violent headache,
which would soon end in death.

On the 5th of March a peculiar phenomenon occurred. The sky was perfectly clear and glittering with stars,
when suddenly snow began to fall thick and fast, though there was not a cloud in the heavens and through the white
flakes the constellations could be seen shining. This curious display lasted two hours, and ceased before the Doctor
could arrive at any satisfactory conclusion as to its cause.

The moon had ended her last quarter, and complete darkness prevailed now for seventeen hours out of the
twenty-four. The travellers had to fasten themselves together with a long rope to avoid getting separated, and it was
all but impossible to pursue the right course. Moreover, the brave fellows, in spite of their iron will, began to show
signs of fatigue. Halts became more frequent, and yet every hour was precious, for the provisions were rapidly
coming to an end.
Hatteras hardly knew what to think as day after day went on without apparent result, and he asked himself sometimes whether the Porpoise had any actual existence except in Altamont’s fevered brain, and more than once the idea even came into his head that perhaps national hatred might have induced the American to drag them along with himself to certain death.

He told the Doctor his suppositions, who rejected them absolutely, and laid them down to the score of the unhappy rivalry that had arisen already between the two captains.

On the 14th of March, after sixteen days’ march the little party found themselves only yet in the 82º latitude. Their strength was exhausted, and they had a hundred miles more to go. To increase their sufferings, rations had to be still further reduced. Each man must be content with a fourth part to allow the dogs their full quantity.

Unfortunately they could not rely at all on their guns, for only seven charges of powder were left, and six balls. They had fired at several hares and foxes on the road already, but unsuccessfully.

However, on the 15th, the Doctor was fortunate enough to surprise a seal basking on the ice, and, after several shots, the animal was captured and killed.

Johnson soon had it skinned and cut in pieces, but it was so lean that it was worthless as food, unless its captors would drink the oil like the Esquimaux.

The Doctor was bold enough to make the attempt, but failed in spite of himself.

Next day several icebergs and hummocks were noticed on the horizon. Was this a sign that land was near, or was it some ice-field that had broken up? It was difficult to know what to surmise.

On arriving at the first of these hummocks, the travellers set to work to make a cave in it where they could rest more comfortably than in the tent, and after three hours’ persevering toil, were able to light their stove and lie down beside it to stretch their weary limbs.

CHAPTER IV.

THE LAST CHARGE OF POWDER

Johnson was obliged to take the dogs inside the hut, for they would have been soon frozen outside in such dry weather. Had it been snowing they would have been safe enough, for the snow served as a covering, and kept in the natural heat of the animals.

The old sailor, who made a first-rate dog-driver, tried his beasts with the oily flesh of the seal; and found, to his joyful surprise, that they ate it greedily. The Doctor said he was not astonished at this, as in North America the horses were chiefly fed on fish; and he thought that what would satisfy an herbivorous horse might surely content an omnivorous dog.

The whole party were soon buried in deep sleep, for they were fairly overcome with fatigue. Johnson awoke his companions early next morning, and the march was resumed in haste. Their lives depended now on their speed, for provisions would only hold out three days longer.

The sky was magnificent; the atmosphere extremely clear, and the temperature very low. The sun rose in the form of a long ellipse, owing to refraction, which made his horizontal diameter appear twice the length of his vertical.

The Doctor, gun in hand, wandered away from the others, braving the solitude and the cold in the hope of discovering game. He had only sufficient powder left to load three times, and he had just three balls. That was little enough should he encounter a bear, for it often takes ten or twelve shots to have any effect on these enormous animals.

But the brave Doctor would have been satisfied with humbler game. A few hares or foxes would be a welcome addition to their scanty food; but all that day, if even he chanced to see one, either he was too far away, or he was deceived by refraction, and took a wrong aim. He came back to his companions at night with crestfallen looks, having wasted one ball and one charge of powder.

Next day the route appeared more difficult, and the weary men could hardly drag themselves along. The dogs had devoured even the entrails of the seal, and began to gnaw their traces.

A few foxes passed in the distance, and the Doctor lost another ball in attempting to shoot them.

They were forced to come to a halt early in the evening, though the road was illumined by a splendid Aurora Borealis; for they could not put one foot before the other.

Their last meal, on the Sunday evening, was a very sad one—if no providential help came, their doom was sealed.

Johnson set a few traps before going to sleep, though he had no baits to put inside them. He was very disappointed to find them all empty in the morning, and was returning gloomily to the hut, when he perceived a bear of huge dimensions. The old sailor took it into his head that Heaven had sent this beast specially for him to kill; and
without waking his comrades, he seized the Doctor’s gun, and was soon in pursuit of his prey. On reaching the right
distance, he took aim; but, just as his finger touched the trigger, he felt his arm tremble. His thick gloves hampered
him, and, flinging them hastily off, he took up the gun with a firmer grasp. But what a cry of agony escaped him!
The skin of his fingers stuck to the gun as if it had been red-hot, and he was forced to let it drop. The sudden fall made it go off, and the last ball was discharged in the air.

The Doctor ran out at the noise of the report, and understood all at a glance. He saw the animal walking quietly
off, and poor Johnson forgetting his sufferings in his despair.

[illustration: ]

"I am a regular milksop!" he exclaimed, “a cry-baby, that can’t stand the least pain! And at my age, too!"
"Come, Johnson; go in at once, or you will be frost-bitten. Look at your hands—they are white already! Come, come this minute."
"I am not worth troubling about, Mr. Clawbonny," said the old boatswain. “Never mind me!"
"But you must come in, you obstinate fellow. Come, now, I tell you; it will be too late presently."
At last he succeeded in dragging the poor fellow into the tent, where he made him plunge his hands into a
bowl of water, which the heat of the stove kept in a liquid state, though still cold. Johnson’s hands had hardly
touched it before it froze immediately.
"You see it was high time you came in; I should have been forced to amputate soon," said the Doctor.
Thanks to his endeavours, all danger was over in about an hour, but he was advised to keep his hands at a good
distance from the stove for some time still.

That morning they had no breakfast. Pemmican and salt beef were both done. Not a crumb of biscuit remained.
They were obliged to content themselves with half a cup of hot coffee, and start off again.
They scarcely went three miles before they were compelled to give up for the day. They had no supper but
coffee, and the dogs were so ravenous that they were almost devouring each other.
Johnson fancied he could see the bear following them in the distance, but he made no remark to his companions.
Sleep forsook the unfortunate men, and their eyes grew wild and haggard.

Tuesday morning came, and it was thirty-four hours since they had tasted a morsel of food. Yet these brave,
stout-hearted men continued their march, sustained by their superhuman energy of purpose. They pushed the sledge
themselves, for the dogs could no longer draw it.
At the end of two hours, they sank exhausted. Hatteras urged them to make a fresh attempt, but his entreaties and
supplications were powerless; they could not do impossibilities.
[illustration: ]

"Well, at any rate," he said, "I won’t die of cold if I must of hunger." He set to work to hew out
a hut in an iceberg, aided by Johnson, and really they looked like men digging their own tomb.
It was hard labour, but at length the task was accomplished. The little house was ready, and the miserable men
took up their abode in it.

In the evening, while the others lay motionless, a sort of hallucination came over Johnson, and he began raving
about bears.
The Doctor roused himself from his torpor, and asked the old man what he meant, and what bear he was talking
about.

"The bear that is following us," replied Johnson.
"A bear following us?"
"Yes, for the last two days!"
"For the last two days! You have seen him?"
"Yes, about a mile to leeward."
"And you never told me, Johnson!"
"What was the good!"
"True enough," said the Doctor; "we have not a single bail to send after him!"
"No, not even a bit of iron!"

The Doctor was silent for a minute, as if thinking. Then he said—
"Are you quite certain the animal is following us?"
"Yes, Mr. Clawbonny, he is reckoning on a good feed of human flesh!"
"Johnson!" exclaimed the Doctor, grieved at the despairing mood of his companion.
"He is sure enough of his meal!" continued the
"You have no ball!"
"I’ll make one."
"You have no lead!"

"No, but I have mercury."

So saying, he took the thermometer, which stood at 50° above zero, and went outside and laid it on a block of ice. Then he came in again, and said, "Tomorrow! Go to sleep, and wait till the sun rises."

With the first streak of dawn next day, the Doctor and Johnson rushed out to look at the thermometer. All the mercury had frozen into a compact cylindrical mass. The Doctor broke the tube and took it out. Here was a hard piece of metal ready for use.

"It is wonderful, Mr. Clawbonny; you ought to be a proud man."

"Not at all, my friend, I am only gifted with a good memory, and I have read a great deal."

"How did that help you?"

"Why, I just happened to recollect a fact related by Captain Ross in his voyages. He states that they pierced a plank, an inch thick, with a bullet made of mercury. Oil would even have suited my purpose, for, he adds, that a ball of frozen almond oil splits through a post without breaking in pieces."

"It is quite incredible!"

"But it is a fact, Johnson. Well, come now, this bit of metal may save our lives. We'll leave it exposed to the air a little while, and go and have a look for the bear."

Just then Hatteras made his appearance, and the Doctor told him his project, and showed him the mercury.

The captain grasped his hand silently, and the three hunters went off in quest of their game.

The weather was very clear, and Hatteras, who was a little ahead of the others, speedily discovered the bear about three hundred yards distant, sitting on his hind quarters sniffing the air, evidently scenting the intruders on his domains.

"There he is!" he exclaimed.

"Hush!" cried the Doctor.

But the enormous quadruped, even when he perceived his antagonists, never stirred, and displayed neither fear nor anger. It would not be easy to get near him, however, and Hatteras said—

"Friends, this is no idle sport, our very existence is at stake; we must act prudently."

"Yes," replied the Doctor, "for we have but the one shot to depend upon. We must not miss, for if Away they went, while the old boatswain slipped behind a hummock, which completely hid him from the bear, who continued still in the same place and in the same position.

CHAPTER V.

THE SEAL AND THE BEAR.

"You know, Doctor," said Hatteras, as they returned to the hut, "the polar bears subsist almost entirely on seals. They'll lie in wait for them beside the crevasses for whole days, ready to strangle them the moment their heads appear above the surface. It is not likely, then, that a bear will be frightened of a seal."

"I think I see what you are after, but it is dangerous."

"Yes, but there is more chance of success than in trying any other plan, so I mean to risk it. I am going to dress myself in the seal's skin, and creep along the ice. Come, don't let us lose time. Load the gun and give it me."

The Doctor soon joined the old boatswain behind the hummock, and told him what they had been doing. The bear was still there, but moving restlessly about, as if he felt the approach of danger.

In a quarter of an hour or so the seal made his appearance on the ice. He had gone a good way round, so as to come on the bear by surprise, and every movement was so perfect an imitation of a seal, that even the Doctor would have been deceived if he had not known it was Hatteras.

"It is capital!" said Johnson, in a low voice. The bear had instantly caught sight of the supposed seal, for he gathered himself up, preparing to make a spring as the animal came nearer, apparently seeking to return to his native element, and unaware of the enemy's proximity. Bruin went to work with extreme prudence, though his eyes glared with greedy desire to clutch the coveted prey, for he had probably been fasting a month, if not two. He allowed his victim to get within ten paces of him, and then sprang forward with a tremendous bound, but stopped short,
stupefied and frightened, within three steps of Hatteras, who started up that moment, and, throwing off his disguise, knelt on one knee, and aimed straight at the bear’s heart. He fired, and the huge monster rolled back on the ice.

"Forward! Forward!" shouted the Doctor, hurrying towards Hatteras, for the bear had reared on his hind legs, and was striking the air with one paw and tearing up the snow to stanch his wound with the other.

Hatteras never moved, but waited, knife in hand. He had aimed well, and fired with a sure and steady aim. Before either of his companions came up he had plunged the knife in the animal’s throat, and made an end of him, for he fell down at once to rise no more.

"Hurrah! Bravo!" shouted Johnson and the Doctor, but Hatteras was as cool and unexcited as possible, and stood with folded arms gazing at his prostrate foe.

"It is my turn now," said Johnson. "It is a good thing the bear is killed, but if we leave him out here much longer, he will get as hard as a stone, and we shall be able to do nothing with him."

He began forthwith to strip the skin off, and a fine business it was, for the enormous quadruped was almost as large as an ox. It measured nearly nine feet long, and four round, and the great tusks in his jaws were three inches long.

On cutting the carcase open, Johnson found nothing but water in the stomach. The beast had evidently had no food for a long time, yet it was very fat, and weighed fifteen hundred pounds. The hunters were so famished that they had hardly patience to carry home the flesh to be cooked, and it needed all the Doctor’s persuasion to prevent them eating it raw.

On entering the hut, each man with a load on his back, Clawbonny was struck with the coldness that pervaded the atmosphere. On going up to the stove he found the fire black out. The exciting business of the morning had made Johnson neglect his accustomed duty of replenishing the stove.

The Doctor tried to blow the embers into a flame, but finding he could not even get a red spark, he went out to the sledge to fetch tinder, and get the steel from Johnson.

The old sailor put his hand into his pocket, but was surprised to find the steel missing. He felt in the other pockets, but it was not there. Then he went into the hut again, and shook the blanket he had slept in all night, but his search was still unsuccessful.

He went back to his companions and said—
"Are you sure, Doctor, you haven’t the steel?"
"Quite, Johnson."
"And you haven’t it either, captain?"
"Not I!" replied Hatteras.
"It has always been in your keeping," said the Doctor.
"Well, I have not got it now!" exclaimed Johnson, turning pale.
"Not got the steel!" repeated the Doctor, shuddering involuntarily at the bare idea of its loss, for it was all the means they had of procuring a fire.

"Look again, Johnson," he said.

The boatswain hurried to the only remaining place he could think of, the hummock where he had stood to watch the bear. But the missing treasure was nowhere to be found, and the old sailor returned in despair.

Hatteras looked at him, but no word of reproach escaped his lips. He only said—
"This is a serious business, Doctor."
"It is, indeed!" said Clawbonny.
"We have not even an instrument, some glass that we might take the lens out of, and use like a burning glass."
"No, and it is a great pity, for the sun’s rays are quite strong enough just now to light our tinder."
"Well," said Hatteras, "we must just appease our hunger with the raw meat, and set off again as soon as we can, to try to discover the ship."
"Yes!" replied Clawbonny, speaking to himself, absorbed in his own reflections. "Yes, that might do at a pinch! Why not? We might try."

"What are you dreaming about?" asked Hatteras.
"An idea has just occurred to me."
"An idea come into your head, Doctor," exclaimed Johnson; "then we are saved!"
"Will it succeed? that’s the question."
"What’s your project?" said Hatteras.
"We want a lens; well, let us make one."
"How?" asked Johnson.
"With a piece of ice."
"What? Do you think that would do?"
"Why not? All that is needed is to collect the sun's rays into one common focus, and ice will serve that purpose
as well as the finest crystal."
"Is it possible?" said Johnson.
"Yes, only I should like fresh water ice, it is harder and more transparent than the other."
"There it is to your hand, if I am not much mistaken," said Johnson, pointing to a hummock close by.
[Illustration: ]
"I fancy that is fresh water, from the dark look of it, and the green tinge."
"You are right. Bring your hatchet, Johnson."

A good-sized piece was soon cut off, about a foot in diameter, and the Doctor set to work. He began by chopping
it into rough shape with the hatchet; then he operated upon it more carefully with his knife, making as smooth a
surface as possible, and finished the polishing process with his fingers, rubbing away until he had obtained as
transparent a lens as if it had been made of magnificent crystal.

The sun was shining brilliantly enough for the Doctor's experiment. The tinder was fetched, and held beneath
the lens so as to catch the rays in full power. In a few seconds it took fire, to Johnson's rapturous delight.

He danced about like an idiot, almost beside himself with joy, and shouted, "Hurrah! hurrah!" while Clawbonny
hurried back into the hut and rekindled the fire. The stove was soon roaring, and it was not many minutes before the
savoury odour of broiled bear-steaks roused Bell from his torpor.

What a feast this meal was to the poor starving men may be imagined. The Doctor, however, counselled
moderation in eating, and set the example himself.

"This is a glad day for us," he said, "and we have no fear of wanting food all the rest of our journey. Still we
must not forget we have further to go yet, and I think the sooner we start the better."

"We cannot be far off now," said Altamont, who could almost articulate perfectly again; "we must be within
forty-eight hours' march of the Porpoise."

"I hope we'll find something there to make a fire with," said the Doctor, smiling. "My lens does well enough at
present; but it needs the sun, and there are plenty of days when he does not make his appearance here, within less
than four degrees of the pole."

"Less than four degrees!" repeated Altamont, with a sigh; "yes, my ship went further than any other has ever
ventured."

"It is time we started," said Hatteras, abruptly.

"Yes," replied the Doctor, glancing uneasily at the two captains.

The dogs were speedily harnessed to the sledge, and the march resumed. [Illustration: ]

But the American made only evasive replies, and Clawbonny whispered in old Johnson's ear—

"Two men we've got that need looking after."

"You are right," said Johnson.

"Hatteras never says a word to this American, and I must say the man has not shown himself very grateful. I am
here, fortunately."

"Mr. Clawbonny," said Johnson, "now this Yankee has come back to life again, I must confess I don't much like
the expression of his face."

"I am much mistaken if he does not suspect the projects of Hatteras."

"Do you think his own were similar?"

"Who knows? These Americans, Johnson, are bold, daring fellows. It is likely enough an American would try to
do as much as an Englishman."

"Then you think that Altamont—"

"I think nothing about it, but his ship is certainly on the road to the North Pole."

"But didn't Altamont say that he had been caught among the ice, and dragged there irresistibly?"

"He said so, but I fancied there was a peculiar smile on his lips while he spoke."

"Hang it! It would be a bad job, Mr. Clawbonny, if any feeling of rivalry came between two men of their stamp."

"Heaven forfend! for it might involve the most serious consequences, Johnson."

"I hope Altamont will remember he owes his life to us?"

"But do we not owe ours to him now? I grant, without us, he would not be alive at this moment, but without him
and his ship, what would become of us?"

"Well, Mr. Clawbonny, you are here to keep things straight anyhow, and that is a blessing."

"I hope I may manage it, Johnson."

The journey proceeded without any fresh incident, but on the Saturday morning the travellers found themselves
in a region of quite an altered character. Instead of the wide smooth plain of ice that had hitherto stretched before
them, overturned icebergs and broken hummocks covered the horizon; while the frequent blocks of fresh-water ice
showed that some coast was near.

Next day, after a hearty breakfast off the bear’s paws, the little party continued their route; but the road became
tolosome and fatiguing. Altamont lay watching the horizon with feverish anxiety—an anxiety shared by all his
companions, for, according to the last reckoning made by Hatteras, they were now exactly in latitude 83° 35" and
longitude 120° 15", and the question of life or death would be decided before the day was over.

At last, about two o’clock in the afternoon, Altamont started up with a shout that arrested the whole party, and
pointing to a white mass that no eye but his could have distinguished from the surrounding icebergs, exclaimed in a
loud, ringing voice, "The Porpoise."

CHAPTER VI.

THE PORPOISE

It was the 24th of March, and Palm Sunday, a bright, joyous day in many a town and village of the Old World,
but in this desolate region what mournful silence prevailed! No willow branches here with their silvery blossom —
not even a single withered leaf to be seen — not a blade of grass!

Yet this was a glad day to the travellers, for it promised them speedy deliverance from the death that had seemed
so inevitable.

They hastened onward, the dogs put forth renewed energy, and Duk barked his loudest, till, before long, they
arrived at the ship. The Porpoise was completely buried under the snow. All her masts and rigging had been
destroyed in the shipwreck, and she was lying on a bed of rocks so entirely on her side that her hull was uppermost.

They had to knock away fifteen feet of ice before they could even catch a glimpse of her, and it was not without
great difficulty that they managed to get on board, and made the welcome discovery that the provision stores had not
been visited by any four-footed marauders. It was quite evident, however, that the ship was not habitable.

"Never mind!" said Hatteras, "we must build a snow-house, and make ourselves comfortable on land."

"Yes, but we need not hurry over it," said the Doctor; "let us do it well while we’re about it, and for a time we
can make shift on board; for we must build a substantial house, that will protect us from the bears as well as the
cold. I’ll undertake to be the architect, and you shall see what a first-rate job I’ll make of it."

"I don’t doubt your talents, Mr. Clawbonny," replied Johnson; "but, meantime, let us see about taking up our
abode here, and making an inventory of the stores we find. There does not seem a boat visible of any description,
and I fear these timbers are in too bad a condition to build a new ship out of them."

"I don’t know that," returned Clawbonny, "time and thought do wonders; but our first business is to build a
house, and not a ship; one thing at a time, I propose."

"And quite right too," said Hatteras; "so we’ll go ashore again."

They returned to the sledge, to communicate the result of their investigation to Bell and Altamont; and about
four in the afternoon the five men installed themselves as well as they could on the wreck. Bell had managed to
make a tolerably level floor with planks and spars; the stiffened cushions and hammocks were placed round the
stove to thaw, and were soon fit for use. Altamont, with the Doctor’s assistance, got on board without much trouble,
and a sigh of satisfaction escaped him as if he felt himself once more at home—a sigh which to Johnson’s ear boded
no good.

The rest of the day was given to repose, and they wound up with a good supper off the remains of the bear,
backed by a plentiful supply of biscuit and hot tea.

[Illustration: The poor fellows felt like colonists safely arrived at their destination—P.57]

It was late next morning before Hatteras and his companions woke, for their minds were not burdened now with
any solicitudes about the morrow, and they might sleep as long as they pleased. The poor fellows felt like colonists
safely arrived at their destination, who had forgotten all the sufferings of the voyage, and thought only of the new
life that lay before them.

"Well, it is something at all events," said the Doctor, rousing himself and stretching his arms, "for a fellow not to
need to ask where he is going to find his next bed and breakfast."

"Let us see what there is on board before we say much," said Johnson.

The Porpoise has been thoroughly equipped and provisioned for a long voyage, and, on making an inventory of
what stores remained, they found 6150 lbs. of flour, fat, and raisins; 2000 lbs. of salt beef and pork, 1500 lbs. of
pemmican; 700 lbs. of sugar, and the same of chocolate; a chest and a half of tea, weighing 96 lbs.; 500 lbs. of rice;
several barrels of preserved fruits and vegetables; a quantity of lime-juice, with all sorts of medicines, and 300
gallons of rum and brandy. There was also a large supply of gunpowder, ball, and shot, and coal and wood in
abundance.

Altogether, there was enough to last those five men for more than two years, and all fear of death from starvation
or cold was at an end.

"Well, Hatteras, we’re sure of enough to live on now," said the Doctor, "and there is nothing to hinder us reaching the Pole."

"The Pole!" echoed Hatteras.

"Yes, why not? Can’t we push our way overland in the summer months?"

"We might overland; but how could we cross water?"

"Perhaps we may be able to build a boat out of some of the ship’s planks."

"Out of an American ship!" exclaimed the captain, contemptuously.

Clawbonny was prudent enough to make no reply, and presently changed the conversation by saying—

"Well, now we have seen what we have to depend upon, we must begin our house and store-rooms. We have materials enough at hand; and, Bell, I hope you are going to distinguish yourself," he added.

"I am ready, Mr. Clawbonny," replied Bell; "and, as for material, there is enough for a town here with houses and streets."

"We don’t require that; we’ll content ourselves with imitating the Hudson's Bay Company. They entrench themselves in fortresses against the Indians and wild beasts. That’s all we need—a house one side and stores the other, with a wall and two bastions. I must try to make a plan."

"Ah! Doctor, if you undertake it," said Johnson, "I am sure you’ll make a good thing of it."

"Well, the first part of the business is to go and choose the ground. Will you come with us Hatteras?"

"I’ll trust all that to you, Doctor," replied the captain. "I’m going to look along the coast."

Altamont was too feeble yet to take part in any work, so he remained on the ship, while the others commenced to explore the unknown continent.

On examining the coast, they found that the Porpoise was in a sort of bay bristling with dangerous rocks, and that to the west, far as the eye could reach, the sea extended, entirely frozen now, though if Belcher and Penny were to be believed, open during the summer months. Towards the north, a promontory stretched out into the sea, and about three miles away was an island of moderate size. The roadstead thus formed would have afforded safe anchorage to ships, but for the difficulty of entering it. A considerable distance inland there was a solitary mountain, about 3000 feet high, by the Doctor’s reckoning; and half-way up the steep rocky cliffs that rose from the shore, they noticed a circular plateau, open on three sides to the bay and sheltered on the fourth by a precipitous wall, 120 feet high.

This seemed to the Doctor the very place for this house, from its naturally fortified situation. By cutting steps in the ice, they managed to climb up and examine it more closely.

[Illustration: ]

They were soon convinced they could not have a better foundation, and resolved to commence operations forthwith, by removing the hard snow more than ten feet deep, which covered the ground, as both dwelling and storehouses must have a solid foundation.

This preparatory work occupied the whole of Monday, Tuesday, and Wednesday. At last they came to hard granite close in grain, and containing garnets and felspar crystals, which flew out with every stroke of the pickaxe.

[Illustration: ]

The dimensions and plan of the snow-house were then settled by the Doctor. It was to be divided into three rooms, as all they needed was a bed-room, sitting-room and kitchen. The sitting-room was to be in the middle, the kitchen to the left, and the bed-room to the right.

For five days they toiled unremittingly. There was plenty of material, and the walls required to be thick enough to resist summer thaws. Already the house began to present an imposing appearance. There were four windows in front, made of splendid sheets of ice, in Esquimaux fashion, through which the light came softly in as if through frosted glass.

Outside there was a long covered passage between the two windows of the sitting-room. This was the entrance hall, and it was shut in by a strong door taken from the cabin of the Porpoise. The Doctor was highly delighted with his performance when all was finished, for though it would have been difficult to say to what style of architecture it belonged, it was strong, and that was the chief thing.

The next business was to move in all the furniture of the Porpoise. The beds were brought first and laid down round the large stove in the sleeping room; then came chairs, tables, arm-chairs, cupboards, and benches for the sitting-room, and finally the ship furnaces and cooking utensils for the kitchen. Sails spread on the ground did duty for carpets, and also served for inner doors.

[Illustration: ]

The walls of the house were over five feet thick, and the windows resembled port-holes for cannon. Every part was as solid as possible, and what more was wanted? Yet if the Doctor could have had his way, he would have made
all manner of ornamental additions, in humble imitation of the Ice Palace built in St. Petersburgh in January, 1740,
of which he had read an account. He amused his companions after work in the evening by describing its grandeur,
the cannons in front, and statues of exquisite beauty, and the wonderful elephant that spouted water out of his trunk
by day and flaming naphtha by night—all cut out of ice. He also depicted the interior, with tables, and toilette tables,
mIRRORS, CANDELABRA, TAPPERS, BEDS, MATTRESSES, PILLOWS, CURTAINS, TIME-PIECES, CHAIRS, PLAYING-CARDS, WARDROBES,
completely fitted up—in fact, everything in the way of furniture that could be mentioned, and the whole entirely
composed of ice.

It was on Easter Sunday, the 31st of March, when the travellers installed themselves in their new abode and after
holding divine service in the sitting-room, they devoted the remainder of the day to rest.

Next morning they set about building the storehouses and powder magazine. This took a whole week longer,
including the time spent in unloading the vessel, which was a task of considerable difficulty, as the temperature was
so low, that they could not work for many hours at a time. At length on the 8th of April, provisions, fuel, and
ammunition were all safe on terra firma, and deposited in their respective places. A sort of kennel was constructed a
little distance from the house for the Greenland dogs, which the Doctor dignified by the name of "Dog Palace." Duk
shared his master's quarters.

All that now remained to be done was to put a parapet right round the plateau by way of fortification.

By the 15th this was also completed, and the snow-house might bid defiance to a whole tribe of Esquimaux, or
any other hostile invaders, if indeed any human beings whatever were to be found on this unknown continent, for
Hatteras, who had minutely examined the bay and the surrounding coast, had not been able to discover the least
vestiges of the huts that are generally met with on shores frequented by Greenland tribes. The shipwrecked sailors of
the Porpoise and Forward seemed to be the first whose feet had ever trod this lone region.

CHAPTER VII.
AN IMPORTANT DISCUSSION.

While all these preparations for winter were going on Altamont was fast regaining strength. His vigorous
constitution triumphed, and he was even able to lend a helping hand in the unlading of the ship. He was a true type
of the American, a shrewd, intelligent man, full of energy and resolution, enterprising, bold, and ready for anything.
He was a native of New York, he informed his companions, and had been a sailor from his boyhood.

The Porpoise had been equipped and sent out by a company of wealthy merchants belonging to the States, at the
head of which was the famous Grinnell.

There were many points of resemblance between Altamont and Hatteras, but no affinities. Indeed, any similarity
that there was between them, tended rather to create discord than to make the men friends. With a greater show of
frankness, he was in reality far more deep and crafty than Hatteras. He was more free and easy, but not so true-
hearted, and somehow his apparent openness did not inspire such confidence as the Englishman's gloomy reserve.

The Doctor was in constant dread of a collision between the rival captains, and yet one must command
inevitably, and which should it be! Hatteras had the men, but Altamont had the ship, and it was hard to say whose
was the better right.

It required all the Doctor's tact to keep things smooth, for the simplest conversation threatened to lead to strife.

At last, in spite of all his endeavours, an outbreak occurred on the occasion of a grand banquet by way of "house-
warming," when the new habitation was completed.

This banquet was Dr Clawbonny's idea. He was head-cook, and distinguished himself by the concoction of a
wonderful pudding, which would positively have done no dishonour to the cuisine of the Lord Chancellor of
England.

Bell most opportunely chanced to shoot a white hare and several ptarmigans, which made an agreeable variety
from the pemmican and salt meat.

Clawbonny was master of the ceremonies, and brought in his pudding, adorning himself with the insignia of his
office—a big apron, and a knife dangling at his belt.

As Altamont did not conform to the teetotal régime of his English companions, gin and brandy were set on the
table after dinner, and the others, by the Doctor's orders, joined him in a glass for once, that the festive occasion
might be duly honoured. When the different toasts were being drunk, one was given to the United States, to which
Hatteras made no response.

This important business over, the Doctor introduced an interesting subject of conversation by saying—

"My friends, it is not enough to have come thus far in spite of so many difficulties; we have something more yet
to do. I propose we should bestow a name on this continent, where we have found friendly shelter and rest, and not
only on the continent, but on the several bays, peaks, and promontories that we meet with. This has been invariably
done by navigators and is a most necessary proceeding."

"Quite right," said Johnson, "when once a place is named, it takes away the feeling of being castaways on an
unknown shore."

"Yes," added Bell, "and we might be going on some expedition and obliged to separate, or go out hunting, and it
would make it much easier to find one another if each locality had a definite name."

[ Illustration: ]

"Very well; then," said the Doctor, "since we are all agreed, let us go steadily to work."

Hatteras had taken no part in the conversation as yet, but seeing all eyes fixed on him, he rose at last, and said—
"If no one objects, I think the most suitable name we can give our house is that of its skilful architect, the best
man among us. Let us call it ‘Doctor’s House.’"

"Just the thing!" said Bell.

"First rate!" exclaimed Johnson, "‘Doctor’s House!’"

"We cannot do better," chimed in Altamont. "Hurrah for Doctor Clawbonny."

Three hearty cheers were given, in which Duk joined lustily, barking his loudest.

"It is agreed then," said Hatteras, "that this house is to be called ‘Doctor’s House.’"

The Doctor, almost overcome by his feelings, modestly protested against the honour; but he was obliged to yield
to the wishes of his friends, and the new habitation was formally named "Doctor’s House."

"Now, then," said the Doctor, "let us go onto name the most important of our discoveries."

"There is that immense sea which surrounds us, unfurrowed as yet by a single ship."

"A single ship!" repeated Altamont. "I think you have forgotten the Porpoise, and yet she certainly did not get
here overland."

"Well, it would not be difficult to believe she had," replied Hatteras, "to see on what she lies at present."

"True, enough, Hatteras," said Altamont, in a piqued tone; "but, after all, is not that better than being blown to
atoms like the Forward?"

Hatteras was about to make some sharp retort, but Clawbonny interposed.

"It is not a question of ships, my friends," he said, "but of a fresh sea."

"It is no new sea," returned Altamont; "it is in every Polar chart, and has a name already. It is called the Arctic
Ocean, and I think it would be very inconvenient to alter its designation. Should we find out by and by, that, instead
of being an ocean it is only a strait or gulf, it will be time enough to alter it then."

"So be it," said Hatteras.

"Very well, that is an understood thing, then," said the Doctor, almost regretting that he had started a discussion
so pregnant with national rivalries.

"Let us proceed with the continent where we find ourselves at present," resumed Hatteras. "I am not aware that
any name whatever has been affixed to it, even in the most recent charts."

He looked at Altamont as he spoke, who met his gaze steadily, and said—

"Possibly you may be mistaken again, Hatteras."

"Mistaken! What! This unknown continent, this virgin soil——"

"Has already a name," replied Altamont, coolly.

Hatteras was silent, but his lip quivered.

"And what name has it, then?" asked the Doctor, rather astonished at Altamont’s affirmation.

"My dear Clawbonny," replied the American, "it is the custom, not to say the right, of every navigator to christen
the soil on which he is the first to set foot. It appears to me, therefore, that it is my privilege and duty on this
occasion to exercise my prerogative, and——"

"But, sir," interrupted Johnson, rather nettled at his sang froid.

"It would be a difficult matter to prove that the Porpoise did not come here, even supposing she reached this
coast by land," continued Altamont, without noticing Johnson’s protest. "The fact is indisputable," he added looking
at Hatteras.

[ Illustration: "I dispute the claim," said the Englishman, restraining himself by a powerful effort.—P.72]

"I dispute the claim," said the Englishman, restraining himself by a powerful effort. "To name a country, you
must first discover it, I suppose, and that you certainly did not do. Besides, but for us, where would you have been,
sir, at this moment, pray? Lying twenty feet deep under the snow."

"And without me, sir," retorted Altamont, hotly, "without me and my ship, where would you all be at this
moment? Dead, from cold and hunger."

"Come, come, friends," said the Doctor, "don’t get to words, all that can be easily settled. Listen to me."

"Mr. Hatteras," said Altamont, "is welcome to name whatever territories he may discover, should he succeed in
discovering any; but this continent belongs to me. I should not even consent to its having two names like Grinnell’s
Land, which is also called Prince Albert’s Land, because it was discovered almost simultaneously by an Englishman and an American. This is quite another matter; my right of priority is incontestable. No ship before mine ever touched this shore, no foot before mine ever trod this soil. I have given it a name, and that name it shall keep."

"And what is that name?" inquired the Doctor.

"New America," replied Altamont.

Hatteras trembled with suppressed passion, but by a violent effort restrained himself.

"Can you prove to me," said Altamont, "that an Englishman has set foot here before an American?"

Johnson and Bell said nothing, though quite as much offended as the captain by Altamont’s imperious tone. They felt that reply was impossible.

For a few minutes there was an awkward silence, which the Doctor broke by saying—

"My friends, the highest human law is justice. It includes all others. Let us be just, then, and don’t let any bad feeling get in among us. The priority of Altamont seems to me indisputable. We will take our revenge by and by, and England will get her full share in our future discoveries. Let the name New America stand for the continent itself, but I suppose Altamont has not yet disposed of all the bays, and capes, and headlands it contains, and I imagine there will be nothing to prevent us calling this bay Victoria Bay?"

"Nothing whatever, provided that yonder cape is called Cape Washington," replied Altamont.

"You might choose a name, sir," exclaimed Hatteras, almost beside himself with passion, "that is less offensive to an Englishman."

"But not one which sounds so sweet to an American," retorted Altamont, proudly.

"Come, come," said the Doctor, "no discussion on that subject. An American has a perfect right to be proud of his great countryman! Let us honour genius wherever it is met with; and since Altamont has made his choice, let us take our turn next; let the captain——"

"Doctor!" interrupted Hatteras, "I have no wish that my name should figure anywhere on this continent, seeing that it belongs to America."

"Is this your unalterable determination?" asked Clawbonny.

"It is."

The Doctor did not insist further.

"Very well, we’ll have it to ourselves then," he continued, turning to Johnson and Bell. "We’ll leave our traces behind us. I propose that the island we see out there, about three miles away from the shore, should be called Isle Johnson, in honour of our boatswain,"

"Oh, Mr. Clawbonny," began Johnson, in no little confusion.

"And that mountain that we discovered in the west we will call Bell Mount, if our carpenter is willing."

"It is doing me too much honour," replied Bell.

"It is simple justice," returned the Doctor.

"Nothing could be better," said Altamont.

"Now then, all we have to do is to christen our fort," said the Doctor, "about that there will be no discussion, I hope, for it is neither to our gracious sovereign Queen Victoria, nor to Washington, that we owe our safety and shelter here, but to God, who brought about our meeting, and by so doing saved us all. Let our little fort be called Fort Providence."

"Your remarks are just," said Altamont; "no name could be more suitable."

"Fort Providence," added Johnson, "sounds well too. In our future excursions, then, we shall go by Cape Washington to Victoria Bay, and from thence to Fort Providence, where we shall find food and rest at Doctor’s House!"

"The business is settled then so far," resumed the Doctor. "As our discoveries multiply we shall have other names to give; but I trust, friends, we shall have no disputes about them, for placed as we are, we need all the help and love we can give each other. Let us be strong by being united. Who knows what dangers yet we may have to brave, and what sufferings to endure before we see our native land once more. Let us be one in heart though five in number, and let us lay aside all feelings of rivalry. Such feelings are bad enough at all times, but among us they would be doubly wrong. You understand me, Altamont, and you, Hatteras?"

Neither of the captains replied, but the Doctor took no notice of their silence, and went on to speak of other things. Sundry expeditions were planned to forage for fresh food. It would soon be spring, and hares and partridges, foxes and bears would re-appear. So it was determined that part of every day should be spent in hunting and exploring this unknown continent of New America.

[Illustration: Clambering up the steep, rocky wall, against which the Doctor’s House leaned, he succeeded, though with considerable difficulty, in reaching the top.—P.77]

CHAPTER VIII.
AN EXCURSION TO THE NORTH OF VICTORIA BAY

Next morning Clawbonny was out by dawn of day. Clambering up the steep, rocky wall, against which the Doctor’s House leaned, he succeeded, though with considerable difficulty, in reaching the top, which he found terminated abruptly in a sort of truncated cone. From this elevation there was an extensive view over a vast tract of country, which was all disordered and convulsed as if it had undergone some volcanic commotion. Sea and land, as far as it was possible to distinguish one from the other, were covered with a sheet of ice.

A new project struck the Doctor’s mind, which was soon matured and ripe for execution. He lost no time in going back to the snow house, and consulting over it with his companions.

"I have got an idea," he said; "I think of constructing a lighthouse on the top of that cone above our heads."

"A lighthouse!" they all exclaimed.

"Yes, a lighthouse. It would be a double advantage. It would be a beacon to guide us in distant excursions, and also serve to illumine our plateau in the long dreary winter months."

"There is no doubt," replied Altamont, "of its utility; but how would you contrive to make it?"

"With one of the lanterns out of the Porpoise."

"All right; but how will you feed your lamp? With seal oil?"

"No, seal oil would not give nearly sufficient light. It would scarcely be visible through the fog."

"Are you going to try to make gas out of our coal then?"

"No, not that either, for gas would not be strong enough; and, worse still, it would waste our combustibles."

"Well," replied Altamont; "I’m at a loss to see how you—"

"Oh, I’m prepared for everything after the mercury bullet, and the ice lens, and Fort Providence. I believe Mr. Clawbonny can do anything," exclaimed Johnson.

"Come, Clawbonny, tell us what your light is to be, then," said Altamont.

"That’s soon told," replied Clawbonny. "I mean to have an electric light."

"An electric light?"

"Yes, why not? Haven’t you a galvanic battery on board your ship?"

"Yes."

"Well, there will be no difficulty then in producing an electric light, and that will cost nothing, and be far brighter."

"First-rate?" said Johnson; "let us set to work at once."

"By all means. There is plenty of material. In an hour we can raise a pillar of ice ten feet high, and that is quite enough.

Away went the Doctor, followed by his companions, and the column was soon erected and crowned with a ship lantern. The conducting wires were properly adjusted within it, and the pile with which they communicated fixed up in the sitting-room, where the warmth of the stove would protect it from the action of the frost.

As soon as it grew dark the experiment was made, and proved a complete success. An intense brilliant light streamed from the lantern and illumined the entire plateau and the plains beneath.

Johnson could not help clapping his hands, half beside himself with delight.

"Well, I declare, Mr. Clawbonny," he exclaimed, "you’re our sun now."

"One must be a little of everything, you know," was Clawbonny’s modest reply.

It was too cold, however, even to stand admiring more than a minute, and the whole party were glad enough to get indoors again, and tuck themselves up in their warm blankets.

A regular course of life commenced now, though uncertain weather and frequent changes of temperature made it sometimes impracticable to venture outside the hut at all, and it was not till the Saturday after the installation, that a day came that was favourable enough for a hunting excursion; when Bell, and Altamont, and the Doctor determined to take advantage of it, and try to replenish their stock of provisions.

They started very early in the morning, each armed with a double-barrelled gun and plenty of powder and shot, a hatchet, and a snow knife.

[ Illustration: ]

The weather was cloudy, but Clawbonny put the galvanic battery in action before he left, and the bright rays of the electric light did duty for the glorious orb of day, and in truth was no bad substitute, for the light was equal to three thousand candles, or three hundred gas burners.

It was intensely cold, but dry, and there was little or no wind. The hunters set off in the direction of Cape Washington, and the hard snow so favoured their march, that in three hours they had gone fifteen miles, Duk jumping and barking beside them all the way. They kept as close to the coast as possible, but found no trace of human habitation and indeed scarcely a sign of animal life. A few snow birds, however, darting to and fro announced the approach of spring and the return of the animal creation. The sea was still entirely frozen over, but it
was evident from the open breathing holes in the ice, that the seals had been quite recently on the surface. In one part the holes were so numerous, that the Doctor said to his companions that he had no doubt that when summer came, they would be seen there in hundreds, and would be easily captured, for on unfrequented shores they were not so difficult of approach. But once frighten them and they all vanish as if by enchantment, and never return to the spot again. "Inexperienced hunters," he said, "have often lost a whole shoal by attacking them, en masse, with noisy shouts instead of singly and silently."

"Is it for the oil or skin that they are mostly hunted?"

"Europeans hunt them for the skin, but the Esquimaux eat them. They live on seals, and nothing is so delicious to them as a piece of the flesh, dipped in the blood and oil. After all, cooking has a good deal to do with it, and I'll bet you something I could dress you cutlets you would not turn up your nose at, unless for their black appearance."

"We'll set you to work on it," said Bell, "and I'll eat as much as you like to please you."

"My good Bell, you mean to say to please yourself, but your voracity would never equal the Green-landers', for they devour from ten to fifteen pounds of meat a day."

"Fifteen pounds!" said Bell. "What stomachs!"

"Arctic stomachs," replied the Doctor, "are prodigious; they can expand at will, and, I may add, contract at will; so that they can endure starvation quite as well as abundance. When an Esquimaux sits down to dinner he is quite thin, and by the time he has finished, he is so corpulent you would hardly recognize him. But then we must remember that one meal sometimes has to last a whole day."

"This voracity must be peculiar to the inhabitants of cold countries," said Altamont.

"I think it is," replied the Doctor. "In the Arctic regions people must eat enormously: it is not only one of the conditions of strength, but of existence. The Hudson's Bay Company always reckoned on this account 8 lbs. of meat to each man a day, or 12 lbs. of fish, or 2 lbs. of pemmican."

"Invigorating regimen, certainly!" said Bell.

"Not so much as you imagine, my friend. An Indian who guzzles like that can't do a whit better day's work than an Englishman, who has his pound of beef and pint of beer."

"Things are best as they are, then, Mr. Clawbonny."

"No doubt of it; and yet an Esquimaux meal may well astonish us. In Sir John Ross's narrative, he states his surprise at the appetites of his guides. He tells us that two of them—just two mind—devoured a quarter of a buffalo in one morning. They cut the meat in long narrow strips, and the mode of eating was either for the one to bite off as much as his mouth could hold, and then pass it on to the other, or to leave the long ribbons of meat dangling from the mouth and devour them gradually like boa-constrictors, lying at full length on the ground."

[ Illustration: ]

"Faugh!" exclaimed Bell, "what disgusting brutes!"

"Every man has his own fashion of dining," remarked the philosophical American.

"Happily," said the Doctor.

"Well, if eating is such an imperative necessity in these latitudes, it quite accounts for all the journals of Arctic travellers being so full of eating and drinking."

"You are right," returned the Doctor. "I have been struck by the same fact; but I think it arises not only from the necessity of full diet, but from the extreme difficulty sometimes in procuring it. The thought of food is always uppermost in the mind, and naturally finds mention in the narrative."

"And yet," said Altamont, "if my memory serves me right, in the coldest parts of Norway the peasants do not seem to need such substantial fare. Milk diet is their staple food, with eggs, and bread made of the bark of the birch-tree; a little salmon occasionally, but never meat; and still they are fine hardy fellows."

"It is an affair of organization out of my power to explain," replied Clawbonny; "but I have no doubt that if these same Norwegians were transplanted to Greenland, they would learn to eat like the Esquimaux by the second or third generation. Even if we ourselves were to remain in this blessed country long, we should be as bad as the Esquimaux, even if we escaped becoming regular gluttons."

"I declare, Mr. Clawbonny, you make me feel hungry talking so much about eating," exclaimed Bell.

"Not I!" said Altamont. "It rather sickens me, and makes me loathe the sight of a seal. But, stop, I do believe we are going to have the chance of a dinner off one, for I am much mistaken if that's not something alive lying on those lumps of ice yonder!"

"It is a walrus!" exclaimed the Doctor. "Be quiet, and let us get up to him."

Clawbonny was right, it was a walrus of huge dimensions, disporting himself not more than two hundred yards away. The hunters separated, going in different directions, so as to surround the animal and cut off all retreat. They crept along cautiously behind the hummocks, and managed to get within a few paces of him unperceived, when they fired simultaneously.
The walrus rolled over, but speedily got up again, and tried to make his escape, but Altamont fell upon him with his hatchet, and cut off his dorsal fins. He made a desperate resistance, but was overpowered by his enemies, and soon lay dead, reddening the ice-field with his blood.

It was a fine animal, measuring more than fifteen feet in length, and would have been worth a good deal for the oil; but the hunters contented themselves with cutting off the most savoury parts, and left the rest to the ravens, which had just begun to make their appearance.

Night was drawing on, and it was time to think of returning to Fort Providence. The moon had not yet risen, but the sky was serene and cloudless, and already glittering with stars—magnificent stars.

"Come," said the Doctor, "let us be off, for it is getting late. Our hunting has not been very successful; but still, if a man has found something for his supper, he need not grumble. Let us go the shortest road, however, and get quickly home without losing our way. The stars will guide us."

They resolved to try a more direct route back by going further inland, and avoiding the windings of the coast; but, after some hours’ walking, they found themselves no nearer Doctor’s House, and it was evident that they must have lost their way. The question was raised whether to construct a hut and rest till morning, or proceed; but Clawbonny insisted on going on, as Hatteras and Johnson would be so uneasy.

"Duk will guide us," he said; "he won’t go wrong. His instinct can dispense with star and compass. Just let us keep close behind him."

They did well to trust to Duk, for very speedily a faint light appeared in the horizon almost like a star glimmering through the mist, which hung low above the ground.

"There’s our lighthouse!" exclaimed the Doctor.

"Do you think it is, Mr. Clawbonny?" said Bell.

"I’m certain of it! Come on faster." The light became stronger the nearer they approached, and soon they were walking in a bright luminous track, leaving their long shadows behind them on the spotless snow. —P.87

Quickening their steps, they hastened forward, and in another half hour they were climbing the ascent to Fort Providence.

CHAPTER IX.
COLD AND HEAT.

Hatteras and Johnson had been getting somewhat uneasy at the prolonged absence of their companions, and were delighted to see them back safe and sound. The hunters were no less glad to find themselves once more in a warm shelter, for the temperature had fallen considerably as night drew on, and the thermometer outside was 73° below zero.

The poor hunters were half frozen, and so worn out that they could hardly drag their limbs along; but the stoves were roaring and crackling cheerily, and the big kitchen fire waiting to cook such game as might be brought in. Clawbonny donned his official apron again, and soon had his seal cutlets dressed and smoking on the table. By nine o’clock the whole party were enjoying a good supper, and Bell couldn’t help exclaiming—

"Well, even at the risk of being taken for an Esquimaux, I must confess eating is the most important business if one has to winter in these regions. A good meal isn’t to be sneezed at."

They all had their mouths crammed too full to speak, but the Doctor signified his agreement with Bell’s views by an approving nod.

The cutlets were pronounced first-rate, and it seemed as if they were, for they were all eaten, to the very last morsel.

For dessert they had coffee, which the Doctor brewed himself in a French coffee-pot over spirits-of-wine. He never allowed anybody but himself to concoct this precious beverage; for he made a point of serving it boiling hot, always declaring it was not fit to drink unless it burnt his tongue. This evening he took it so scalding that Altamont exclaimed—

"You’ll skin your throat!"

"Not a bit of it," was the Doctor’s reply.

"Then your palate must be copper-sheathed," said Johnson.

"Not at all, friends. I advise you to copy my example. Many persons, and I am one, can drink coffee at a temperature of 131°."

"131°?" said Altamont; "why, that is hotter than the hand could bear!"

"Of course it is, Altamont, for the hand could not bear more than 122°, but the palate and tongue are less
"You surprise me."

"Well, I will convince you it is fact," returned Clawbonny, and taking up a thermometer, he plunged it into the steaming coffee. He waited till the mercury rose as high as 131° and then withdrew it, and swallowed the liquid with evident gusto.

Bell tried to follow his example, but burnt his mouth severely.

"You are not used to it," said the Doctor, coolly.

"Can you tell us, Clawbonny," asked Altamont, "what is the highest temperature that the human body can bear."

"Yes, several curious experiments have been made in that respect. I remember reading of some servant girls, in the town of Rochefoucauld, in France, who could stay ten minutes in a baker's large oven when the temperature was 300°, while potatoes and meat were cooking all round them.

"What girls!" exclaimed Altamont.

"Well, there is another case, where eight of our own countrymen—Fordyce, Banks, Solander, Blagdin, Home, Nooth, Lord Seaforth, and Captain Phillips—went into one as hot as 200°, where eggs and beef were frizzling."

"And they were Englishmen!" said Bell, with a touch of national pride.

"Oh, the Americans could have done better than that," said Altamont.

"They would have roasted," returned the Doctor, laughing. "At all events they have never tried it, so I shall stand up for my countrymen. There is one more instance I recollect, and really it is so incredible, that it would be impossible to believe it, if it were not attested by unimpeachable evidence. The Duke of Ragusa and [Illustration: ] Dr. Jung, a Frenchman and an Austrian, saw a Turk plunge into a bath at 170°."

"But that is not so astonishing as those servant girls, or our own countrymen," said Johnson.

"I beg your pardon," replied Clawbonny; "there is a great difference between plunging into hot air and hot water. Hot air produces perspiration, which protects the skin, but boiling water scalds. The maximum heat of baths is 107°, so that this Turk must have been an extraordinary fellow to endure such temperature."

"What is the mean temperature, Mr. Clawbonny, of animated beings?" asked Johnson.

"That varies with the species," replied the Doctor. "Birds have the highest, especially the duck and the hen. The mammalia come next, and human beings. The temperature of Englishmen averages 101°."

"I am sure Mr. Altamont is going to claim a higher rate for his countrymen," said Johnson, smiling.

"Well, sure enough, we've some precious hot ones among us, but as I never have put a thermometer down their throats to ascertain, I can't give you statistics.

"There is no sensible difference," said the Doctor, "between men of different races when they are placed under the same conditions, whatever their food may be. I may almost say their temperature would be the same at the Equator as the Pole."

"Then the heat of our bodies is the same here as in England," replied Altamont.

"Just about it. The other species of mammalia are generally hotter than human beings. The horse, the hare, the elephant, the porpoise, and the tiger are nearly the same; but the cat, the squirrel, the rat, the panther, the sheep, the ox, the dog, the monkey, and the goat, are as high as 103°; and the pig is 104°."

"Rather humiliating to us," put in Altamont.

"Then come the amphibia and the fish," resumed the Doctor, "whose temperature varies with that of the water. The serpent has a temperature of 86°, the frog 70°, and the shark several degrees less. Insects appear to have the temperature of air and water."

[Illustration: ]

"All this is very well," interrupted Hatteras, who had hitherto taken no part in the conversation, "and we are obliged to the Doctor for his scientific information; but we are really talking as if we were going to brave the heat of the torrid zone. I think it would be far more seasonable to speak of cold, if the Doctor could tell us what is the lowest temperature on record."

"I can enlighten you on that too," replied the Doctor. "There are a great number of memorable winters, which appear to have come at intervals of about forty-one years. In 1364, the Rhone was frozen over as far as Arles; in 1408, the Danube was frozen throughout its entire extent, and the wolves crossed the Cattigut on firm ground; in 1509, the Adriatic and the Mediterranean were frozen at Venice and Marseilles, and the Baltic on the 10th of April; in 1608, all the cattle died in England from the cold; in 1789, the Thames was frozen as far as Gravesend; and the frightful winter of 1813 will long be remembered in France. The earliest and longest ever known in the present century was in 1829. So much for Europe."

"But here, within the Polar circle, what is the lowest degree?" asked Altamont.
"My word!" said the Doctor. "I think we have experienced the lowest ourselves, for one day the thermometer was 72° below zero, and, if my memory serves me right, the lowest temperature mentioned hitherto by Arctic voyagers has been 61° at Melville Island, 65° at Port Felix, and 70° at Fort Reliance."

"Yes," said Hatteras, "it was the unusual severity of the winter that barred our progress, for it came on just at the worst time possible."

"You were stopped, you say?" asked Altamont, looking fixedly at the captain.

"Yes, in our voyage west," the Doctor hastened to reply.

"Then the maximum and minimum temperatures," said Altamont, resuming the conversation, "are about 200° apart. So you see, my friends, we may make ourselves easy."

"But if the sun were suddenly extinguished," suggested Johnson, "would not the earth’s temperature be far lower?"

"There is no fear of such a catastrophe; but, even should it happen, the temperature would be scarcely any different."

[illustration: ]

"That’s curious."

"It is; but Fourrier, a learned Frenchman, has proved the fact incontestably. If it were not the case, the difference between day and night would be far greater, as also the degree of cold at the Poles. But now I think, friends, we should be the better of a few hours’ sleep. Who has charge of the stove?"

"It is my turn to-night," said Bell.

"Well, pray keep up a good fire, for it is a perishing night."

"Trust me for that," said Bell. "But do look out, the sky is all in a blaze."

"Ay! it is a magnificent aurora," replied the Doctor, going up to the window. "How beautiful! I never tire gazing at it."

No more he ever did, though his companions had become so used to such displays that they hardly noticed them now. He soon followed the example of the others, however, and lay down on his bed beside the fire, leaving Bell to mount guard.

CHAPTER X.
WINTER PLEASURES

It is a dreary affair to live at the Pole, for there is no going out for many long months, and nothing to break the weary monotony.

The day after the hunting excursion was dark and snowy, and Clawbonny could find no occupation except polishing up the ice walls of the hut as they became damp with the heat inside, and emptying out the snow which drifted into the long passage leading to the inner door. The "Snow-House" stood out well, defying storm and tempest, and the snow only seemed to increase the thickness of the walls.

The storehouses, too, did not give way the least; but though they were only a few yards off, it was found necessary to lay in enough provisions for the day, as very often the weather made it almost impossible to venture that short distance.

The unloading of the Porpoise turned out to have been a wise precaution, for she was slowly but surely being crashed to pieces by the silent, irresistible pressure around her. Still the Doctor was always hoping enough planks might be sufficiently sound to construct a small vessel to convey them back to England, but the right time to build had not come.

[illustration: ]

The five men were consequently compelled to spend the greater part of the day in complete idleness. Hatteras lolled on his bed absorbed in thought. Altamont smoked or dozed, and the Doctor took care not to disturb either of them, for he was in perpetual fear of a quarrel between them.

At meal times he always led the conversation away from irritating topics and sought, as far as possible, to instruct and interest all parties. Whenever he was not engaged with the preparation of his notes, he gave them dissertations on history, geography, or meteorology, handling his subject in an easy, though philosophical manner, drawing lessons from the most trivial incidents. His inexhaustible memory was never at a loss for fact or illustration when his good humour and geniality made him the life and soul of the little company. He was implicitly trusted by all, even by Hatteras, who cherished a deep affection for him.

Yet no man felt the compulsory confinement more painfully than Clawbonny. He longed ardently for the breaking up of the frost to resume his excursions though he dreaded the rivalry that might ensue between the two captains.

Yet things must come to a crisis soon or late, and meantime he resolved to use his best endeavors to bring both
parties to a better mind, but to reconcile an American and an Englishman was no easy task. He and Johnson had
many a talk on the subject, for the old sailor’s views quite coincided with his own as to the difficult complications
which awaited them in the future.

However, the bad weather continued, and leaving Fort Providence, even for an hour, was out of the question.
Day and night they were pent up in these glittering ice-walls, and time hung heavily on their hands, at least on all
but the Doctor’s, and he always managed to find some occupation for himself.

[Illustration: ]

"I declare," said Altamont, one evening; "life like this is not worth having. We might as well be some of those
reptiles that sleep all the winter. But I suppose there is no help for it."

"I am afraid not," said the Doctor; "unfortunately we are too few in number to get up any amusement."

"Then you think if there were more of us, we should find more to do?"

"Of course: when whole ships’ crews have wintered here, they have managed to while away the time famously."

"Well, I must say I should like to know how. It would need a vast amount of ingenuity to extract anything
amusing out of our circumstances. I suppose they did not play at charades?"

"No, but they introduced the press and the theatre."

"What? They had a newspaper?" exclaimed the American.

"They acted a comedy?" said Bell.

"That they did," said the Doctor. "When Parry wintered at Melville Island, he started both amusements among
his men, and they met with great success."

"Well, I must confess, I should like to have been there," returned Johnson; "for it must have been rather curious
work."

"Curious and amusing too, my good Johnson. Lieutenant Beechey was the theatre manager, and Captain Sabina
chief editor of the newspaper called ‘The Winter Chronicle, or the Gazette of Northern Georgia.’ "

"Good titles," said Altamont.

"The newspaper appeared daily from the 1st of November, 1819, to the 20th of March, 1820. It reported the
different excursions, and hunting parties, and accidents, and adventures, and published amusing stories. No doubt
the articles were not up to the ‘Spectator’ or the ‘Daily Telegraph,’ but the readers were neither critical nor blasé,
and found great pleasure in their perusal."

[Illustration: ]

"My word!" said Altamont. "I should like to read some of the articles."

"Would you? Well, you shall judge for yourself."

"What! can you repeat them from memory?"

"No; but you had Parry’s Voyages on board the Porpoise, and I can read you his own narrative if you like."

This proposition was so eagerly welcomed that the Doctor fetched the book forthwith, and soon found the
passage in question.

"Here is a letter," he said, "addressed to the editor."

"Your proposition to establish a journal has been received by us with the greatest satisfaction. I am convinced
that, under your direction, it will be a great source of amusement, and go a long way to lighten our hundred days of
darkness."

"The interest I take in the matter myself has led me to study the effect of your announcement on my comrades,
and I can testify, to use reporter’s language, that the thing has produced an immense sensation.

"The day after your prospectus appeared, there was an unusual and unprecedented demand for ink among us,
and our green tablecloth was deluged with snippings and parings of quill-pens, to the injury of one of our servants,
who got a piece driven right under his nail. I know for a fact that Sergeant Martin had no less than nine pen-knives
to sharpen."

"It was quite a novel sight to see all the writing-desks brought out, which had not made their appearance for a
couple of months, and judging by the reams of paper visible, more than one visit must have been made to the depths
of the hold."

"I must not forget to tell you, that I believe attempts will be made to slip into your box sundry articles which
are not altogether original, as they have been published already. I can declare that, no later than last night, I saw an
author bending over his desk, holding a volume of the "Spectator" open with one hand, and thawing the frozen ink in
his pen at the lamp with the other. I need not warn you to be on your guard against such tricks, for it would never do
for us to have articles in our "Winter Chronicle" which our great-grandfathers read over their breakfast-tables a
century ago."

"Well, well," said Altamont, "there is a good deal of clever humour in that writer. He must have been a sharp
fellow."
"You’re right. Here is an amusing catalogue of Arctic tribulations:—

‘To go out in the morning for a walk, and the moment you put your foot outside the ship, find yourself immersed in the cook’s water-hole.

‘To go out hunting, and fall in with a splendid reindeer, take aim, and find your gun has gone off with a flash in the pan, owing to damp powder.

‘To set out on a march with a good supply of soft new bread in your pocket, and discover, when you want to eat, that it has frozen so hard that you would break your teeth if you attempted to bite it through.

‘To rush from the table when it is reported that a wolf is in sight, and on coming back to find the cat has eaten your dinner.

‘To be returning quietly home from a walk, absorbed in profitable meditation, and suddenly find yourself in the embrace of a bear.’

“We might supplement this list ourselves,” said the Doctor, “to almost any amount, for there is a sort of pleasure in enumerating troubles when one has got the better of them.”

“I declare,” said Altamont, “this ‘Winter Journal’ is an amusing affair. I wish we could subscribe to it.”

“Suppose we start one,” said Johnson.

“For us five!” exclaimed Clawbonny; “we might do for editors, but there would not be readers enough.”

“No, nor spectators enough, if we tried to get up a comedy,” added Altamont.

“Tell us some more about Captain Parry’s theatre,” said Johnson; “did they play new pieces?”

“Certainly. At first two volumes on board the ‘Hecla’ were gone through, but as there was a performance once a fortnight, this repertoire was soon exhausted. Then they had to improvise fresh plays; Parry himself composed one which had immense success. It was called ‘The North-West Passage, or the End of the Voyage.’ ”

“A famous title,” said Altamont; “but I must confess, if I had chosen such a subject, I should have been at a loss for the dénouement.”

“You are right,” said Bell; “who can say what the end will be?”

“What does that matter?” replied Mr. Clawbonny. “Why should we trouble about the last act, while the first ones are going on well. Leave all that to Providence, friends; let us each play our own rôle as perfectly as we can, and since the dénouement belongs to the Great Author of all things, we will trust his skill. He will manage our affairs for us, never fear.”

“Well, we’d better go and dream about it,” said Johnson, “for it’s getting late, and it is time we went to bed,” said Johnson.

“You’re in a great hurry, old fellow,” replied the Doctor.

“Why would you sit up, Mr. Clawbonny? I am so comfortable in my bed, and then I always have such good dreams. I dream invariably of hot countries, so that I might almost say, half my life is spent in the tropics, and half at the North Pole.”

“You’re a happy man, Johnson,” said Altamont, “to be blessed with such a fortunate organization.”

“Indeed I am,” replied Johnson.

“Well, come, after that it would be positive cruelty to keep our good friend pining here,” said the Doctor, “his tropical sun awaits him, so let’s all go to bed.”

CHAPTER XI

TRACES OF BEARS

On the 26th of April during the night there was a sudden change in the weather. The thermometer fell several degrees, and the inmates of Doctor’s House could hardly keep themselves warm even in their beds. Altamont had charge of the stove, and he found it needed careful replenishing to preserve the temperature at 50° above zero.

This increase of cold betokened the cessation of the stormy weather, and the Doctor hailed it gladly as the harbinger of his favourite hunting and exploring expeditions.

He rose early next morning, and climbed up to the top of the cone. The wind had shifted north, the air was clear, and the snow firm and smooth to the tread.

Before long the five companions had left Doctor’s House, and were busily engaged in clearing the heavy masses of snow off the roof and sides, for the house was no longer distinguishable from the plateau, as the snow had drifted to a depth of full fifteen feet. It took two hours to remove the frozen snow, and restore the architectural form of the dwelling. At length the granite foundations appeared, and the storehouses and powder magazines were once more accessible.

[Illustration: ]

But as, in so uncertain a climate, a storm might cut off their supplies any day, they wisely resolved to provide for any such emergency by carrying over a good stock of provisions to the kitchen; and then Clawbonny, Altamont, and Bell started off with their guns in search of game, for the want of fresh food began to be urgently felt.
The three companions went across the east side of the cone, right down into the centre of the far-stretching, snow-covered plain beneath, but they did not need to go far, for numerous traces of animals appeared on all sides within a circle of two miles round Fort Providence.

After gazing attentively at these traces for some minutes, the hunters looked at each other silently, and then the Doctor exclaimed:

"Well, these are plain enough, I think!"
"Ay, only too plain," added Bell, "bears have been here!"
"First rate game!" said Altamont. "There’s only one fault about it."
"And what is that?" asked Bell.
"What do you mean?"
"I mean this—there are distinct traces of five bears, and five bears are rather too much for five men."
"Are you sure there are five?" said Clawbonny.
"Look and see for yourself. Here is one footprint, and there is another quite different. These claws are far wider apart than those; and see here, again, that paw belongs to a much smaller bear. I tell you, if you look carefully, you will see the marks of all five different bears distinctly."
"You’re right," said Bell, after a close inspection.
"If that’s the case, then," said the Doctor, "we must take care what we’re about, and not be foolhardy, for these animals are starving after the severe winter, and they might be extremely dangerous to encounter and, since we are sure of their number——"
"And of their intentions, too," put in Altamont.
"You think they have discovered our presence here?"
"No doubt of it, unless we have got into a bear-pass, but then, why should these footprints be in a circle round our fort? Look, these animals have come from the south-east, and stopped at this place, and commenced to reconnoitre the coast."

[Illustration: ]

"You’re right," said the Doctor, "and, what’s more, it is certain that they have been here last night."
"And other nights before that," replied Altamont.
"I don’t think so," rejoined Clawbonny. "It is more likely that they waited till the cessation of the tempest, and were on their way down to the bay, intending to catch seals, when they scented us."
"Well, we can easily find out if they come tonight," said Altamont.
"How?"
"By effacing all the marks in a given place, and if to-morrow, we find fresh ones, it will be evident that Fort Providence is the goal for which the bears are bound."

[Illustration: ]

"Very good, at any rate we shall know, then, what we have to expect."

The three hunters set to work, and scraped the snow over till all the footprints were obliterated for a considerable distance.

"It is singular, though," said Bell, "that bears could scent us all that way off; we have not been burning anything fat which might have attracted them."

"Oh!" replied the Doctor, "bears are endowed with a wonderfully keen sense of smell, and a piercing sight; and, more than that, they are extremely intelligent, almost more so than any other animal. They have smelt something unusual; and, besides, who can tell whether they have not even found their way as far as our plateau during the tempest?"

"But then, why did they stop here last night?" asked Altamont.
"Well, that’s a question I can’t answer, but there is no doubt they will continue narrowing their circles, till they reach Fort Providence."

"We shall soon see," said Altamont.
"And, meantime, we had best go on," added the Doctor, "and keep a sharp look out."

But not a sign of anything living was visible, and after a time they returned to the snow-house.

Hatteras and Johnson were informed how matters stood, and it was resolved to maintain a vigilant watch. Night came, but nothing disturbed its calm splendour—nothing was heard to indicate approaching danger.

Next morning at early dawn, Hatteras and his companions, well armed, went out to reconnoitre the state of the snow. They found the same identical footmarks, but somewhat nearer. Evidently the enemy was bent on the siege of Fort Providence.

"But where can the bears be?" said Bell.
"Behind the icebergs watching us," replied the Doctor. "Don’t let us expose ourselves imprudently."
"What about going hunting, then?" asked Altamont.

"We must put it off for a day or two, I think, and rub out the marks again, and see if they are renewed to-morrow."

The Doctor’s advice was followed, and they entrenched themselves for the present in the fort. The lighthouse was taken down, as it was not of actual use meantime, and might help to attract the bears. Each took it in turn to keep watch on the upper plateau.

The day passed without a sign of the enemy’s existence, and next morning, when they hurried eagerly out to examine the snow, judge their astonishment to find it wholly untouched!

"Capital!" exclaimed Altamont. "The bears are put off the scent; they have no perseverance, and have grown tired waiting for us. They are off, and a good riddance. Now let us start for a day’s hunting."

"Softly, softly," said the Doctor; "I’m not so sure they have gone. I think we had better wait one day more. It is evident the bears have not been here last night, at least on this side; but still—"

"Well, let us go right round the plateau, and see how things stand," said the impatient Altamont.

"All right," said Clawbonny. "Come along."

Away they went, but it was impossible to scrutinize carefully a track of two miles, and no trace of the enemy was discoverable.

"Now, then, can’t we go hunting?" said Altamont.

"Wait till to-morrow," urged the Doctor again.

His friend was very unwilling to delay, but yielded the point at last, and returned to the fort.

As on the preceding night, each man took his hour’s watch on the upper plateau. When it came to Altamont’s turn, and he had gone out to relieve Bell, Hatteras called his old companions round him. The Doctor left his desk and Johnson his cooking, and hastened to their captain’s side, supposing he wanted to talk over their perilous situation; but Hatteras never gave it a thought.

"My friends," he said, "let us take advantage of the American’s absence to speak of business. There are things which cannot concern him, and with which I do not choose him to meddle."

Johnson and Clawbonny looked at each other, wondering what the captain was driving at.

"I wish," he continued, "to talk with you about our plans for the future."

"All right! talk away while we are alone," said the Doctor.

"In a month, or six weeks at the outside, the time for making distant excursions will come again. Have you thought of what we had better undertake in summer?"

"Have you, captain?" asked Johnson.

"Have I? I may say that not an hour of my life passes without revolving in my mind my one cherished purpose. I suppose not a man among you intends to retrace his steps?"

No one replied, and Hatteras went on to say—

"For my own part, even if I must go alone, I will push on to the North Pole. Never were men so near it before, for we are not more than 360 miles distant at most, and I will not lose such an opportunity without making every attempt to reach it, even though it be an impossibility. What are your views, Doctor?"

"Your own, Hatteras."

"And yours, Johnson?"

"Like the Doctor’s."

"And yours, Bell?"

"Captain," replied the carpenter, "it is true we have neither wives nor children waiting us in England, but, after all, it is one’s country—one’s native land! Have you no thoughts of returning home?"

"We can return after we have discovered the Pole quite as well as before, and even better. Our difficulties will not increase, for as we near the Pole we get away from the point of greatest cold. We have fuel and provisions enough. There is nothing to stop us, and we should be culpable, in my opinion, if we allowed ourselves to abandon the project."

"Very well, captain, I’ll go along with you."

"That’s right; I never doubted you," said Hatteras. "We shall succeed, and England will have all the glory."

"But there is an American among us!" said Johnson.

Hatteras could not repress an impatient exclamation.

"I know it!" he said, in a stern voice.

"We cannot leave him behind," added the Doctor.

"No, we can’t," repeated Hatteras, almost mechanically.

"And he will be sure to go too."
"Yes, he will go too; but who will command?"
"You, captain."
"And if you all obey my orders, will the Yankee refuse?"
"I shouldn't think so; but suppose he should, what can be done?"
"He and I must fight it out, then."
The three Englishmen looked at Hatteras, but said nothing. Then the Doctor asked how they were to go.
"By the coast, as far as possible," was the reply.
"But what if we find open water, as is likely enough?"
"Well, we'll go across it."
"But we have no boat."
Hatteras did not answer, and looked embarrassed.
"Perhaps," suggested Bell, "we might make a ship out of some of the planks of the Porpoise."
"Never!" exclaimed Hatteras, vehemently.
"Never!" said Johnson.
The Doctor shook his head. He understood the feeling of the captain.
"Never!" reiterated Hatteras. "A boat made out of an American ship would be an American!"
"But, captain——" began Johnson.
The Doctor made a sign to the old boatswain not to press the subject further, and resolved in his own mind to
reserve the question for discussion at a more opportune moment. He managed to turn the conversation to other
matters, till it abruptly terminated by the entrance of Altamont.

This ended the day, and the night passed quietly without the least disturbance. The bears had evidently
disappeared.

CHAPTER XII
IMPRISONED IN DOCTOR’S HOUSE

The first business next day was to arrange for a hunt. It was settled that Altamont, Bell, and Hatteras should form
the party, while Clawbonny should go and explore as far as Isle Johnson, and make some hydrographic notes and
Johnson should remain behind to keep house.

The three hunters soon completed their preparations. They armed themselves each with a double barreled
revolver and a rifle, and took plenty of powder and shot. Each man also carried in his belt his indispensable snow
knife and hatchet, and a small supply of pemmican in case night should surprise them before their return.

Thus equipped, they could go far, and might count on a good supply of game.

At eight o'clock they started, accompanied by Duk, who frisked and gambolled with delight. They went up the
hill to the east, across the cone, and down into the plain below.

The Doctor next took his departure, after agreeing with Johnson on a signal of alarm in case of danger.

The old boatswain was left alone, but he had plenty to do. He began by unfastening the Greenland dogs, and
letting them out for a run after their long, wearisome confinement. Then he attended to divers housekeeping matters.
He had to replenish the stock of combustibles and provisions, to arrange the store-houses, to mend several broken
utensils, to repair the rents in coverlets, and get new shoes ready for summer excursions. There was no lack of work,
and the old sailor's nimble clever fingers could do anything.

While his hands were busy, his mind was occupied with the conversation of the preceding evening. He thought
with regret over the captain's obstinacy, and yet he felt that there was something grand and even heroic in his
determination that neither an American nor an American ship should first touch the Pole.

The hunters had been gone about an hour when Johnson suddenly heard the report of a gun.
"Capital!" he exclaimed. "They have found something, and pretty quickly too, for me to hear their guns so
distinctly. The atmosphere must be very clear."

A second and a third shot followed.
"Bravo!" again exclaimed the boatswain; "they must have fallen in luck's way!"

But when three more shots came in rapid succession, the old man turned pale, and a horrible thought crossed his
mind, which made him rush out and climb hastily to the top of the cone. He shuddered at the sight which met his
eyes. The three hunters, followed by Duk, were tearing home at full speed, followed by the five huge bears! Their
six balls had evidently taken no effect, and the terrible monsters were close on their heels. Hatteras, who brought up
the rear, could only manage to keep off his pursuers by flinging down one article after another—first his cap, then
his hatchet, and, finally, his gun. He knew that the inquisitive bears would stop and examine every object, sniffing
all round it, and this gave him a little time, otherwise he could not have escaped, for these animals outstrip the
fleetest horse, and one monster was so near that Hatteras had to brandish his knife vigorously, to ward off a
tremendous blow of his paw.

At last, though panting and out of breath, the three men reached Johnson safely, and slid down the rock with him
into the snow-house. The bears stopped short on the upper plateau, and Hatteras and his companions lost no time in
barring and barricading them out.

"Here we are at last!" exclaimed Hatteras; "we can defend ourselves better now. It is five against five."

"Four!" said Johnson in a frightened voice.

"How?"

"The Doctor!" replied Johnson, pointing to the empty sitting-room.

"Well, he is in Isle Johnson."

"A bad job for him," said Bell.

"But we can't leave him to his fate, in this fashion," said Altamont.

"No, let's be off to find him at once," replied Hatteras.

He opened the door, but soon shut it, narrowly escaping a bear's hug.

"They are there!" he exclaimed.

"All?" asked Bell.

"The whole pack."

Altamont rushed to the windows, and began to fill up the deep embrasure with blocks of ice, which he broke off
the walls of the house.

His companions followed his example silently. Not a sound was heard but the low, deep growl of Duk.

To tell the simple truth, however, it was not their own danger that occupied their thoughts, but their absent
friend, the Doctor's. It was for him they trembled, not for themselves. Poor Clawbonny, so good and devoted as he
had been to every member of the little colony! This was the first time they had been separated from him. Extreme
peril, and most likely a frightful death awaited him, for he might return unsuspectingly to Fort Providence, and find
himself in the power of these ferocious animals.

"And yet," said Johnson, "unless I am much mistaken, he must be on guard. Your repeated shots cannot but have
warned him. He must surely be aware that something unusual has happened."

"But suppose he was too far away to hear them," replied Altamont, "or has not understood the cause of them? It
is ten chances to one but he'll come quickly back, never imagining the danger. The bears are screened from sight by
the crag completely."

"We must get rid of them before he comes," said Hatteras.

"But how?" asked Bell.

Altamont resolved to try a port-hole through which he might fire on his assailants. He had soon scooped out a hole in the wall, but his gun was hardly
pushed through, when it was seized with irresistible force, and wrested from his grasp before he could even fire.

"Confound it!" he exclaimed, "we're no match for them."

And he hastened to stop up the breach as fast as possible.

This state of things had lasted upwards of an hour, and there seemed no prospect of a termination. The question
of a sortie began now to be seriously discussed. There was little chance of success, as the bears could not be attacked
separately, but Hatteras and his companions had grown so impatient, and it must be confessed were also so much
ashamed of being kept in prison by beasts, that they would even have dared the risk if the captain had not suddenly
thought of a new mode of defence.

He took Johnson's furnace-poker, and thrust it into the stove while he made an opening in the snow wall, or
rather a partial opening, for he left a thin sheet of ice on the outer side. As soon as the poker was red hot, he said to
his comrades who stood eagerly watching him, wondering what he was going to do—

"This red-hot bar will keep off the bears when they try to get hold of it, and we shall be able easily to fire across
it without letting them snatch away our guns."

"A good idea," said Bell, posting himself beside Altamont.
Hatteras withdrew the poker, and instantly plunged it in the wall. The melting snow made a loud hissing noise, and two bears ran and made a snatch at the glowing bar; but they fell back with a terrible howl, and at the same moment four shots resounded, one after the other.

"Hit!" exclaimed Altamont.
"Hit!" echoed Bell.
"Let us repeat the dose," said Hatteras, carefully stopping up the opening meantime.
The poker was again thrust into the fire, and in a few minutes was ready for Hatteras to recommence operations. Altamont and Bell reloaded their guns, and took their places; but this time the poker would not pass through.
"Confound the beasts!" exclaimed the impetuous American.
"What’s the matter?" asked Johnson.
"What’s the matter? Why, those plaguey animals are piling up block after block, intending to bury us alive!"
"Impossible!"
"Look for yourself; the poker can’t get through. I declare it is getting absurd now."
It was worse than absurd, it was alarming. Things grew worse. It was evident that the bears meant to stifle their prey, for the sagacious animals were heaping up huge masses, which would make escape impossible.
"It is too bad," said old Johnson, with a mortified look. "One might put up with men, but bears!"
Illustration: ]
Two hours elapsed without bringing any relief to the prisoners; to go out was impossible, and the thick walls excluded all sound. Altamont walked impatiently up and down full of exasperation and excitement at finding himself worsted for once. Hatteras could think of nothing but the Doctor, and of the serious peril which threatened him.
Illustration: ]
"Oh, if Mr. Clawbonny were only here!" said Johnson.
"What could he do?" asked Altamont.
"Oh, he’d manage to get us out somehow."
"How, pray?" said the American, crossly.
"If I knew that I should not need him. However, I know what his advice just now would be."
"What?"
"To take some food; that can’t hurt us. What do you say, Mr. Altamont?"
"Oh, let’s eat, by all means, if that will please you, though we’re in a ridiculous, not to say humiliating, plight."
"I’ll bet you we’ll find a way out after dinner."
No one replied, but they seated themselves round the table.
Illustration: ]
Johnson, trained in Clawbonny’s school, tried to be brave and unconcerned about the danger, but he could scarcely manage it. His jokes stuck in his throat. Moreover, the whole party began to feel uncomfortable. The atmosphere was getting dense, for every opening was hermetically sealed. The stoves would hardly draw, and it was evident would soon go out altogether for want of oxygen.
Hatteras was the first to see their fresh danger, and he made no attempt to hide it from his companions.
"If that is the case," said Altamont, "we must get out at all risks."
"Yes," replied Hatteras; "but let us wait till night. We will make a hole in the roof, and let in a provision of air, and then one of us can fire out of it on the bears."
"It is the only thing we can do, I suppose," said Altamont.
So it was agreed; but waiting was hard work, and Altamont could not refrain from giving vent to his impatience by thundering maldictions on the bears, and abusing the ill fate which had placed them in such an awkward and humiliating predicament. "It was beasts versus men," he said, "and certainly the men cut a pretty figure."

CHAPTER XIII.
THE MINE.
Night drew on, and the lamp in the sitting-room already began to burn dim for want of oxygen.
At eight o’clock the final arrangements were completed, and all that remained to do was to make an opening in the roof.
They had been working away at this for some minutes, and Bell was showing himself quite an adept in the business, when Johnson, who had been keeping watch in the sleeping room, came hurriedly in to his companions, pulling such a long face, that the captain asked immediately what was the matter?
"Nothing exactly," said the old sailor, "and yet——"
"Come, out with it!" exclaimed Altamont.
"Hush! don’t you hear a peculiar noise?"
"Where?"
"Here, on this side, on the wall of the room."
Bell stopped working, and listened attentively like the rest. Johnson was right; a noise there certainly was on the side wall, as if some one were cutting the ice.
"Don't you hear it?" repeated Johnson.
"Hear it? Yes, plain enough," replied Altamont.
"Is it the bears?" asked Bell.
"Most assuredly."
"Well; they have changed their tactics," said old Johnson, "and given up the idea of suffocating us."
"Or may be they suppose we are suffocated by now," suggested the American, getting furious at his invisible enemies.
"They are going to attack us," said Bell.
"Well, what of it?" returned Hatteras.
"We shall have a hand-to-hand struggle, that’s all."
"And so much the better," added Altamont; "that’s far more to my taste; I have had enough of invisible foes—let me see my antagonist, and then I can fight him."
"Ay," said Johnson; "but not with guns. They would be useless here."
"With knife and hatchet then," returned the American.
The noise increased, and it was evident that the point of attack was the angle of the wall formed by its junction with the cliff.
"They are hardly six feet off now," said the boatswain.
"Right, Johnson!" replied Altamont; "but we have time enough to be ready for them."
And seizing a hatchet, he placed himself in fighting attitude, planting his right foot firmly forward and throwing himself back.
Hatteras and the others followed his example, and Johnson took care to load a gun in case of necessity.
Every minute the sound came nearer, till at last only a thin coating separated them from their assailants.
Presently this gave way with a loud crack, and a huge dark mass rolled over into the room.
Altamont had already swung his hatchet to strike, when he was arrested by a well-known voice, exclaiming—
"For Heaven’s sake, stop!"
"The Doctor! the Doctor!" cried Johnson.
And the Doctor it actually was who had tumbled in among them in such undignified fashion.
"How do ye do, good friends?" he said, picking himself smartly up.
His companions stood stupefied for a moment, but joy soon loosened their tongues, and each rushed eagerly forward to welcome his old comrade with a loving embrace. Hatteras was for once fairly overcome with emotion, and positively hugged him like a child.
"And is it really you, Mr. Clawbonny?" said Johnson.
"Myself and nobody else, my old fellow. I assure you I have been far more uneasy about you than you could have been about me."
"But how did you know we had been attacked by a troop of bears?" asked Altamont. "What we were most afraid of was that you would come quickly back to Fort Providence, never dreaming of danger."
"Oh, I saw it all. Your repeated shots gave me the alarm. When you commenced firing I was beside the wreck of the Porpoise, but I climbed up a hummock, and discovered five bears close on your heels. Oh, how anxious I was for you! But when I saw you disappear down the cliff, while the bears stood hesitating on the edge, as if uncertain what to do, I felt sure that you had managed to get safely inside the house and barricade it. I crept cautiously nearer, sometimes going on all-fours, sometimes slipping between great blocks of ice, till I came at last quite close to our fort, and then I found the bears working away like beavers. They were prowling about the snow, and dragging enormous blocks of ice towards the house, piling them up like a wall, evidently intending to bury you alive. It is a lucky thing they did not take it into their heads to dash down the blocks from the summit of the cone, for you must have been crushed inevitably."
"But what danger you were in, Mr. Clawbonny," said Bell. "Any moment they might have turned round and attacked you."
"They never thought of it even. Johnson’s Greenland dogs came in sight several times, but they did not take the trouble to go after them. No, they imagined themselves sure of a more savoury supper!"
"Thanks for the compliment!" said Altamont, laughing.
"Oh, there is nothing to be proud of. When I saw what the bears were up to, I determined to get back to you by
some means or other. I waited till night, but as soon as it got dark I glided noiselessly along towards the powder-magazine. I had my reasons for choosing that point from which to work my way hither, and I speedily commenced operations with my snow-knife. A famous tool it is. For three mortal hours I have been hacking and heaving away, but here I am at last tired enough and starving, but still safe here."

"To share our fate!" said Altamont.
"No, to save you all; but, for any sake, give me a biscuit and a bit of meat, for I feel sinking for want of food."
A substantial meal was soon before him, but the vivacious little man could talk all the while he was eating, and was quite ready to answer any questions.
"Did you say to save us?" asked Bell.
"Most assuredly!" was the reply.
"Well, certainly, if you found your way in, we can find our way out by the same road."
"A likely story, and leave the field clear for the whole pack to come in and find out our stores. Pretty havoc they would make!"
"No, we must stay here," said Hatteras.
"Of course we must," replied Clawbonny, "but we'll get rid of the bears for all that."
"I told you so," said Johnson, rubbing his hands. "I knew nothing was hopeless if Mr. Clawbonny was here; he has always some expedient in his wise head."
"My poor head is very empty, I fear, but by dint of rummaging perhaps I——"
"Doctor," interrupted Altamont, "I suppose there is no fear of the bears getting in by the passage you have made?"
"No, I took care to stop up the opening thoroughly, and now we can reach the powder-magazine without letting them see us."
"All right; and now will you let us have your plan of getting rid of these comical assailants?"
[Illustration: ]
"My plan is quite simple, and part of the work is done already."
"What do you mean?"
"You shall see. But I am forgetting that I brought a companion with me."
"What do you say?" said Johnson.
"I have a companion to introduce to you," replied the Doctor, going out again into the passage, and bringing back a dead fox, newly killed.
"I shot it this morning," he continued, "and never did fox come more opportunely."
"What on earth do you mean?" asked Altamont.
"I mean to blow up the bears en masse with 100 lbs of powder."
"But where is the powder?" exclaimed his friend.
"In the magazine. This passage will lead to it. I made it purposely."
"And where is the mine to be?" inquired Altamont.
"At the furthest point from the house and stores."
"And how will you manage to entice the bears there, all to one spot?"
"I'll undertake that business; but we have talked enough, let us set to work. We have a hundred feet more to add to our passage to-night, and that is no easy matter, but as there are five of us, we can take turns at it. Bell will begin, and we will lie down and sleep meantime."
"Well, really," said Johnson, "the more I think of it, the more feasible seems the Doctor's plan."
"It is a sure one, anyway," said Clawbonny.
"So sure that I can feel the bear's fur already on my shoulder. Well, come, let's begin then."
Away he went into the gloomy passage, followed by Bell, and in a few moments they had reached the powder-magazine, and stood among the well-arranged barrels. The Doctor pointed out to his companion the exact spot where he began excavating, and then left him to his task, at which he laboured diligently for about an hour, when Altamont came to relieve him. All the snow he had dug out was taken to the kitchen and melted, to prevent its taking up room.
The captain succeeded Altamont, and was followed by Johnson. In ten hours—that is to say, about eight in the morning—the gallery was entirely open.
[Illustration: ]
With the first streak of day, the Doctor was up to reconnoitre the position of the enemy. The patient animals were still occupying their old position, prowling up and down and growling. The house had already almost disappeared beneath the piled-up blocks of ice, but even while he gazed a council of war seemed being held, which evidently resulted in the determination to alter the plan of action, for suddenly all the five bears began vigorously to
pull down these same heaped-up blocks.

"What are they about?" asked Hatteras, who was standing beside him.

"Well, they look to me to be bent on demolishing their own work, and getting right down to us as fast as possible; but wait a bit, my gentlemen, we'll demolish you first. However, we have not a minute to lose."

Hastening away to the mine, he had the chamber where the powder was to be lodged enlarged the whole breadth and height of the sloping rock against which the wall leaned, till the upper part was about a foot thick, and had to be propped up to prevent its falling in. A strong stake was fixed firmly on the granite foundation, on the top of which the dead fox was fastened. A rope was attached to the lower part of the stake, sufficiently long to reach the powder stores.

"This is the bait," he said, pointing to the dead fox, "and here is the mine," he added, rolling in a keg of powder containing about 100 lbs.

"But, Doctor," said Hatteras, "won't that blow us up too, as well as the bears?"

"No, we shall be too far from the scene of explosion. Besides, our house is solid, and we can soon repair the walls even if they should get a bit shaken."

"And how do you propose to manage?" asked Altamont.

"See! By hauling in this rope we lower the post which props up the roof, and make it give way, and bring up the dead fox to light, and I think you will agree with me that the bears are so famished with their long fasting, that they won't lose much time in rushing towards their unexpected meal. Well, just at that very moment, I shall set fire to the mine, and blow up both the guests and the meal."

"Capital! Capital!" shouted Johnson, who had been listening with intense interest.

[Illustration: ]

Hatteras said nothing, for he had such absolute confidence in his friend that he wanted no further explanation. But Altamont must know the why and wherefore of everything.

"But Doctor," he said, "can you reckon on your match so exactly that you can be quite sure it will fire the mine at the right moment?"

"I don't need to reckon at all; that's a difficulty easily got over."

"Then you have a match a hundred feet long?"

"No."

"You are simply going to lay a train of powder."

"No, that might miss fire."

"Well, there is no way then but for one of us to devote his life to the others, and go and light the powder himself."

"I'm ready," said Johnson, eagerly, "ready and willing."

"Quite useless my brave fellow," replied the Doctor, holding out his hand. "All our lives are precious, and they will be all spared, thank God!"

"Well, I give it up!" said the American. "I'll make no more guesses."

"I should like to know what is the good of learning physics," said the Doctor, smiling, "if they can't help a man at a pinch like this. Haven't we an electric battery, and long enough lines attached to it to serve our purpose? We can fire our mine whenever we please in an instant, and without the slightest danger."

"Hurrah!" exclaimed Johnson.

"Hurrah!" echoed the others, without heeding whether the enemy heard them or not.

The Doctor's idea was immediately carried out, and the connecting lines uncoiled and laid down from the house to the chamber of the mine, one end of each remaining attached to the electric pile, and the other inserted into the keg of powder.

By nine o'clock everything was ready. It was high time, for the bears were furiously engaged in the work of demolition. Johnson was stationed in the powder-magazine, in charge of the cord which held the bait.

"Now," said Clawbonny to his companions, "load your guns, in case our assailants are not killed. Stand beside Johnson, and the moment the explosion is over rush out."

[Illustration: ]

"All right," said Altamont.

"And now we have done all we can to help ourselves. So may Heaven help us!"

Hatteras, Altamont, and Bell repaired to the powder-magazine, while the Doctor remained alone beside the pile. Soon he heard Johnson's voice in the distance calling out "Ready."

"All right," was the reply.

Johnson pulled his rope vigorously, and then rushed to the loop-hole to see the effect. The thin shell of ice had given way, and the body of the fox lay among the ruins. The bears were somewhat scared at first, but the next
minute had eagerly rushed to seize the booty.

"Fire!" called out Johnson, and at once the electric spark was sent along the lines right into the keg of powder. A formidable explosion ensued; the house was shaken as if by an earthquake, and the walls cracked asunder. Hatteras, Alamont, and Bell hurried out with the guns, but they might spare their shot, for four of the bears lay dead, and the fifth, half roasted, though alive, was scampering away in terror as fast as his legs could carry him.

"Hurrah! Three cheers for Clawbonny," they shouted and overwhelmed the Doctor with plaudits and thanks.

CHAPTER XIV.
AN ARCTIC SPRING.

The prisoners were free, and their joy found vent in the noisiest demonstrations. They employed the rest of the day in repairing the house, which had suffered greatly by the explosion. They cleared away the blocks piled up by the animals, and filled up the rents in the walls, working with might and main, enlivened by the many songs of old Johnson.

Next morning there was a singular rise in the temperature, the thermometer going up to 15° above zero. This comparative heat lasted several days. In sheltered spots the glass rose as high as 31°, and symptoms of a thaw appeared.

The ice began to crack here and there, and jets of salt water were thrown up, like fountains in an English park. A few days later, the rain fell in torrents.

Thick vapour rose from the snow, giving promise of the speedy disappearance of these immense masses. The sun’s pale disc became deeper in colour, and remained longer above the horizon. The night was scarcely longer than three hours.

Other tokens of spring’s approach were manifest of equal significance, the birds were returning in flocks, and the air resounded with their deafening cries. Hares were seen on the shores of the bay, and mice in such abundance that their burrows completely honeycombed the ground.

The Doctor drew the attention of his companions to the fact, that almost all these animals were beginning to lose their white winter dress, and would soon put on summer attire, while nature was already providing mosses, and poppies, and saxifrags, and short grass for their sustenance. A new world lay beneath that melting snow.

But with these inoffensive animals came back their natural enemies. Foxes and wolves arrived in search of their prey, and dismal howls broke the silence of the short night.

Arctic wolves closely resemble dogs, and their barking would deceive the most practised ears; even the canine race themselves have been deceived by it. Indeed, it seems as if the wily animals employed this ruse to attract the dogs, and make them their prey. Several navigators have mentioned the fact, and the Doctor’s own experience confirmed it. Johnson took care not to let his Greenlanders loose; of Duk there was little fear; nothing could take him in.

For about a fortnight hunting was the principal occupation. There was an abundant supply of fresh meat to be had. They shot partridges, ptarmigans, and snow ortolans, which are delicious eating. The hunters never went far from Fort Providence, for game was so plentiful that it seemed waiting their guns, and the whole bay presented an animated appearance.

The thaw, meanwhile, was making rapid progress. The thermometer stood steadily at 32° above zero, and the water ran down the mountain sides in cataracts, and dashed in torrents through the ravines.

The Doctor lost no time in clearing about an acre of ground, in which he sowed the seeds of anti-scorbutic plants. He just had the pleasure of seeing tiny little green leaves begin to sprout, when the cold returned in full force.

In a single night, the thermometer lost nearly 40°; it went down to 8° below zero. Everything was frozen—birds, quadrupeds, amphibia disappeared as if by magic; seal-holes reclosed, and the ice once more became hard as granite.

The change was most striking; it occurred on the 18th of May, during the night. The Doctor was rather disappointed at having all his work to do again, but Hatteras bore the grievance most unphilosophically, as it interfered with all his plans of speedy departure.

"Do you think we shall have a long spell of this weather, Mr. Clawbonny?" asked Johnson.

"No, my friend, I don’t; it is a last blow from the cold. You see these are his dominions, and he won’t be driven out without making some resistance."

"He can defend himself pretty well," said Bell, rubbing his face.

"Yes; but I ought to have waited, and not have wasted my seed like an ignoramus; and all the more as I could, if necessary, have made them sprout by the kitchen stoves."
"But do you mean to say," asked Altamont, "that you might have anticipated the sudden change?"

"Of course, and without being a wizard. I ought to have put my seed under the protection of Saint Paucratius and the other two saints, whose fête days fall this month."

"Absurd! Pray tell me what they have to do with it? What influence can they possibly have on the temperature?"

"An immense one, if we are to believe horticulturists, who call them the patron saints of the frost."

"And for what reason?"

"Because generally there is a periodical frost in the month of May, and it is coldest from the 11th to the 13th. That is the fact."

"And how is it explained?"

"In two ways. Some say that a larger number of asteroids come between the earth and the sun at this time of year, and others that the mere melting of the snow necessarily absorbs a large amount of heat, and accounts for the low temperature. Both theories are plausible enough, but the fact remains whichever we accept, and I ought to have remembered it."

The Doctor was right, for the cold lasted till the end of the month, and put an end to all their hunting expeditions. The old monotonous life in-doors recommenced, and was unmarked by any incident except a serious illness which suddenly attacked Bell. This was violent quinsy, but, under the Doctor’s skilful treatment, it was soon cured. Ice was the only remedy he employed, administered in small pieces, and in twenty-four hours Bell was himself again.

During this compulsory leisure, Clawbonny determined to have a talk with the captain on an important subject—the building of a sloop out of the planks of the Porpoise.

The Doctor hardly knew how to begin, as Hatteras had declared so vehemently that he would never consent to use a morsel of American wood; yet it was high time he were brought to reason, as June was at hand, the only season for distant expeditions, and they could not start without a ship.

He thought over it a long while, and at last drew the captain aside, and said in the kindest, gentlest way—

"Hatteras, do you believe I’m your friend?"

"Most certainly I do," replied the captain, earnestly; "my best, indeed my only friend."

"And if I give you a piece of advice without your asking, will you consider my motive is perfectly disinterested?"

"Yes, for I know you have never been actuated by self-interest. But what are you driving at?"

"Wait, Hatteras, I have one thing more to ask. Do you look on me as a true-hearted Englishman like yourself, anxious for his country’s glory?"

Hatteras looked surprised, but simply said—

"I do."

"You desire to reach the North Pole," the Doctor went on; "and I understand and share your ambition, but to achieve your object you must employ the right means."

"Well, and have I not sacrificed everything for it?"

"No, Hatteras, you have not sacrificed your personal antipathies. Even at this very moment I know you are in the mood to refuse the indispensable conditions of reaching the pole."

"Ah! it is the boat you want to talk about, and that man——"

"Hatteras, let us discuss the question calmly, and examine the case on all sides. The coast on which we find ourselves at present may terminate abruptly; we have no proof that it stretches right away to the pole; indeed, if your present information prove correct, we ought to come to an open sea during the summer months. Well, supposing we reach this Arctic Ocean and find it free from ice and easy to navigate, what shall we do if we have no ship?"

Hatteras made no reply.

"Tell me, now, would you like to find yourself only a few miles from the pole and not be able to get to it?"

Hatteras made no reply. "No," continued Clawbonny; "the real truth is, it is not the sloop you care about: it is the man."

"Yes, Doctor, yes," replied the captain. "It is this American I detest; I hate him with a thorough English hatred. Fate has thrown him in my path."
"To save you!"
"To ruin me. He seems to defy me, and speaks as if he were lord and master. He thinks he has my destiny in his hands, and knows all my projects. Didn't we see the man in his true colours when we were giving names to the different coasts? Has he ever avowed his object in coming so far north? You will never get out of my head that this man is not the leader of some expedition sent out by the American government."
"Well, Hatteras, suppose it is so, does it follow that this expedition is to search for the North Pole? May it not be to find the North-West Passage? But anyway, Altamont is in complete ignorance of our object, for neither Johnson, nor Bell, nor myself, have ever breathed a word to him about it, and I am sure you have not."
"Well, let him always remain so."
"He must be told in the end, for we can't leave him here alone."
"Why not? Can't he stay here in Fort Providence?"
"He would never consent to that, Hatteras; and, moreover, to leave a man in that way, and not know whether we might find him safe when we came back, would be worse than imprudent: it would be inhuman. Altamont will come with us; he must come. But we need not disclose our projects; let us tell him nothing, but simply build a sloop for the ostensible purpose of making a survey of the coast."
Hatteras could not bring himself to consent, but said—
"And suppose the man won't allow his ship to be cut up?"
"In that case, you must take the law in your own hands, and build a vessel in spite of him."
"I wish to goodness he would refuse, then!"
"He must be asked before he can refuse. I'll undertake the asking," said Clawbonny.
He kept his word, for that very same night, at supper, he managed to turn the conversation towards the subject of making excursions during summer for hydrographical purposes.
"You will join us, I suppose, Altamont," he said.
"Of course," replied the American. "We must know how far New America extends."
Hatteras looked fixedly at his rival, but said nothing.
"And for that purpose," continued Altamont, "we had better build a little ship out of the remains of the Porpoise. It is the best possible use we can make of her."
"You hear, Bell," said the Doctor, eagerly. "We'll all set to work to-morrow morning."
[Illustration: The carpenter began his task immediately.—P.154]
CHAPTER XV.
THE NORTH-WEST PASSAGE.
Next morning, Altamont Bell and the Doctor repaired to the Porpoise. There was no lack of wood, for, shattered as the old "three-master" had been by the icebergs, she could still supply the principal parts of a new ship, and the carpenter began his task immediately.
In the end of May, the temperature again rose, and spring returned for good and all. Rain fell copiously, and before long the melting snow was running down every little slope in falls and cascades.
Hatteras could not contain his delight at these signs of a general thaw among the ice-fields, for an open sea would bring him liberty. At last he might hope to ascertain for himself whether his predecessors were correct in their assertions about a polar basin.
This was a frequent topic of thought and conversation with him, and one evening when he was going over all the old familiar arguments in support of his theory, Altamont took up the subject, and declared his opinion that the polar basin extended west as well as east. But it was impossible for the American and Englishman, to talk long about anything without coming to words, so intensely national were both. Dr. Kane was the first bone of contention on this occasion, for the jealous Englishman was unwilling to grant his rival the glory of being a discoverer, alleging his belief that though the brave adventurer had gone far north, it was by mere chance he had made a discovery.
[Illustration: ]
"Chance!" interrupted Altamont, hotly. "Do you mean to assert that it is not to Kane's energy and science that we owe his great discovery?"
"I mean to say that Dr. Kane's name is not worth mentioning in a country made illustrious by such names as Parry, and Franklin, and Ross, and Belcher, and Penny; in a country where the seas opened the North-West Passage to an Englishman—McClure!"
"McClure!" exclaimed the American. "Well, if ever chance favoured anyone it was that McClure. Do you pretend to deny it?"
"I do," said Hatteras, becoming quite excited. "It was his courage and perseverance in remaining four whole winters among the ice."
"I believe that, don't I?" said Altamont, sneeringly. "He was caught among the bergs and could not get away; but
didn’t he after all abandon his ship, the Investigator, and try to get back home? Besides, putting the man aside, what is the value of his discovery? I maintain that the North-West Passage is still undiscovered, for not a single ship to this day has ever sailed from Behring’s Straits to Baffin’s Bay!"

The fact was indisputable, but Hatteras started to his feet, and said—

"I will not permit the honour of an English captain to be attacked in my presence any longer!"

"You will not permit!" echoed Altamont, also springing erect. "But these are facts, and it is out of your power to destroy them!"

"Sir!" shouted Hatteras, pale with rage.

"My friends!" interposed the Doctor; "pray be calm. This is a scientific point we are discussing."

But Hatteras was deaf to reason now, and said angrily—

"I’ll tell you the facts, sir."

"And I’ll tell you," retorted the irate American.

"Gentlemen," said Clawbonny, in a firm tone; "allow me to speak, for I know the facts of the case as well as and perhaps better than you, and I can state them impartially."

[Illustration: ]

"Yes, yes!" cried Bell and Johnson, who had been anxiously watching the strife.

"Well, go on," said Altamont, finding himself in the minority, while Hatteras simply made a sign of acquiescence, and resumed his seat.

The Doctor brought a chart and spread it out on the table, that his auditors might follow his narration intelligibly, and be able to judge the merits of McClure for themselves.

"It was in 1848," he said, "that two vessels, the Herald and the Plover, were sent out in search of Franklin, but their efforts proving ineffectual, two others were despatched to assist them—the Investigator, in command of McClure, and the Enterprise, in command of Captain Collison. The Investigator arrived first in Behring’s Straits, and without waiting for her consort, set out with the declared purpose to find Franklin or the North-West Passage. The gallant young officer hoped to push north as far as Melville Sound, but just at the extremity of the Strait, he was stopped by an insurmountable barrier of ice, and forced to winter there. During the long, dreary months, however, he and his officers undertook a journey over the ice-field, to make sure of its communicating with Melville Sound."

"Yes, but he did not get through," said Altamont.

"Stop a bit," replied Clawbonny; "as soon as a thaw set in, McClure renewed his attempt to bring his ship into Melville Sound, and had succeeded in getting within twenty miles, when contrary winds set in, and dragged her south with irresistible violence. This decided the captain to alter his course. He determined to go in a westerly direction; but after a fearful struggle with icebergs, he stuck fast in the first of the series of straits

[Illustration: ]

which end in Baffin’s Bay, and was obliged to winter in Mercy Bay. His provisions would only hold out eighteen months longer, but he would not give up. He set out on a sledge, and reached Melville Island, hoping to fall in with some ship or other, but all he found in Winter Harbour was a cairn, which contained a document, stating that Captain Austin’s lieutenant, McClintock, had been there the preceding year. McClure replaced this document by another, which stated his intention of returning to England by the North-West Passage he had discovered, by Lancaster Sound and Baffin’s Bay, and that in the event of his not being heard of, he might be looked for north or west of Melville Island. Then he went back to Mercy Bay with undaunted courage, to pass a third winter. By the beginning of March his stock of provisions was so reduced in consequence of the utter scarcity of game through the severity of the season, that McClure resolved to send half his men to England, either by Baffin’s Bay or by McKenzie River and Hudson’s Bay. The other half would manage to work the vessel to Europe. He kept all his best sailors, and selected for departure only those to whom a fourth winter would have been fatal. Everything was arranged for their leaving, and the day fixed, when McClure, who was out walking with Lieutenant Craswell, observed a man running towards them, flinging up his arms and gesticulating frantically, and on getting nearer recognized him as Lieutenant Prim, officer on board the Herald, one of the ships he had parted with in Behring’s Straits two years before.

Captain Kellett, the Commander, had reached Winter Harbour, and finding McClure’s document in the cairn, had dispatched his lieutenant in search of him. McClure accompanied him back, and arranged with the captain to send him his batch of invalids. Lieutenant Craswell took charge of these and conveyed them safely to Winter Harbour. Leaving them there he went across the ice four hundred and seventy miles, and arrived at Isle Beechy, where, a few days afterwards, he took passage with twelve men on board the Phoenix, and reached London safely on the 7th of October, 1853, having traversed the whole extent between Behring’s Straits and Cape Farewell."

"Well, if arriving on one side and leaving at the other is not going through, I don’t know what is!" said Hatteras.

"Yes, but he went four hundred and seventy miles over ice-fields," objected Altamont.
"What of that?"
"Everything; that is the gist of the whole argument. It was not the Investigator that went through."
"No," replied Clawbonny, "for, at the close of the fourth winter, McClure was obliged to leave her among the ice."
"Well, in maritime expeditions the vessel has to get through, and not the man; and if ever the Northwest Passage is practicable, it will be for ships and not sledges. If a ship cannot go, a sloop must."
"A sloop!" exclaimed Hatteras, discovering a hidden meaning in the words.
"Altamont," said the Doctor, "your distinction is simply puerile, and in that respect we all consider that you are in the wrong."
"You may easily do that," returned the American. "It is four against one, but that will not prevent me from holding my own opinion."
"Keep it and welcome, but keep it to yourself, if you please, for the future," exclaimed Hatteras.
"And pray what right have you to speak to me like this, sir?" shouted Altamont, in a fury.
"My right as captain," returned Hatteras, equally angry.
"Am I to submit to your orders, then?"
"Most assuredly, and woe to you if——"

The Doctor did not allow him to proceed, for he really feared the two antagonists might come to blows.—P.162

The Doctor did not allow him to proceed, for he really feared the two antagonists might come to blows. Bell and Johnson seconded his endeavours to make peace, and, after a few conciliatory words, Altamont turned on his heel, and walked carelessly away, whistling "Yankee Doodle." Hatteras went outside, and paced up and down with rapid strides. In about an hour he came back, and retired to bed without saying another word.

CHAPTER XVI.
ARCTIC ARCADIA

On the 29th of May, for the first time, the sun never set. His glowing disc just touched the boundary line of the horizon, and rose again immediately. The period was now entered when the day lasts twenty-four hours.

Next morning there was a magnificent halo; the monarch of day appeared surrounded by a luminous circle, radiant with all the prismatic colours. This phenomenon never lost its charm, for the Doctor, however frequently it occurred, and he always noted carefully down all particulars respecting it.

Before long the feathered tribes began to return, filling the air with their discordant cries. Flocks of bustards and Canadian geese from Florida or Arkansas came flying north with marvellous rapidity, bringing spring beneath their wings. The Doctor shot several, and among them one or two cranes and a solitary stork.

The snow was now fast melting, and the ice-fields were covered with "slush." All round the bay large pools had formed, between which the soil appeared as if some product of spring.

The Doctor recommenced his sowing, for he had plenty of seed; but he was surprised to find sorrel growing already between the half-dried stones, and even pale sickly heaths, trying to show their delicate pink blossoms.

At last it began to be really hot weather. On the 15th of June, the thermometer stood at 57° above zero. The Doctor scarcely believed his eyes, but it was a positive fact, and it was soon confirmed by the changed appearance of the country.

The three hunters, accompanied by Duk, set out on Monday, the 17th of June, at six in the morning, each man armed with a double-barrelled gun, a hatchet and snow-knife, and provisions for several days.
It was a fine bright morning, and by ten o’clock they had gone twelve miles; but not a living thing had crossed
their path, and the hunt threatened to turn out a mere excursion.

However, they went on in hope, after a good breakfast and half-an-hour’s rest.

The ground was getting gradually lower, and presented a peculiar appearance from the snow, which lay here and
there in ridges unmelted. At a distance it looked like the sea when a strong wind is lashing up the waves, and
cresting them with a white foam.

[Illustration: ]

Before long they reached a sort of glen, at the bottom of which was a winding river. It was almost completely
thawed, and already the banks were clothed with a species of vegetation, as if the sun had done his best to fertilise
the soil.

"I tell you what," said the Doctor, "a few enterprising colonists might make a fine settlement here. With a little
industry and perseverance wonders might be done in this country. Ah! if I am not much mistaken, it has some four-
footed inhabitants already. Those frisky little fellows know the best spots to choose."

"Hares! I declare. That’s jolly!" said Altamont, loading his gun.

[Illustration: ]

"Stop!" cried the Doctor; "stop, you furious hunter. Let the poor little things alone; they are not thinking of
running away. Look, they are actually coming to us, I do believe!"

He was right, for presently three or four young hares, gambolling away among the fresh moss and tiny heaths,
came running about their legs so fearlessly and trustfully, that even Altamont was disarmed. They

[Illustration: It was a strange and touching spectacle to see the pretty creatures—they flew on Clawbonny’s
shoulders, etc.—P.169]
rubbed against the Doctor’s knees, and let him stroke them till the kind-hearted man could not help saying to
Altamont—

"Why give shot to those who come for caresses? The death of these little beasts could do us no good."

"You say what’s true, Clawbonny. Let them live!" replied Hatteras.

[Illustration: ]

"And these ptarmigans too, I suppose, and these long-legged plovers," added Altamont, as a whole covey of
birds flew down among the hunters, never suspecting their danger. Duk could not tell what to make of it, and stood
stupefied.

It was a strange and touching spectacle to see the pretty creatures; they flew on Clawbonny’s shoulders, and lay
down at his feet as if inviting friendly caresses, and doing their utmost to welcome the strangers. The whole glen
echoed with their joyous cries as they darted to and fro from all parts. The good Doctor seemed some mighty
enchanter.

The hunters had continued their course along the banks of the river, when a sudden bend in the valley revealed a
herd of deer, eight or ten in number, peacefully browsing on some lichens that lay half-buried in the snow. They
were charming creatures, so graceful and gentle, male and female, both adorned with noble antlers, wide-spreading
and deeply-notched. Their skin had already lost its winter whiteness, and began to assume the brown tint of
summer. Strange to say, they appeared not a whit more afraid than the birds or hares.

The three men were now right in the centre of the herd, but not one made the least movement to run away. This
time the worthy Doctor had far more difficulty in restraining Altamont’s impatience, for the mere sight of such
magnificent animals roused his hunting instincts, and he became quite excited; while Hatteras, on the contrary,
seemed really touched to see the splendid creatures rubbing their heads so affectionately and trustfully against
the good Clawbonny, the friend of every living thing.

"But, I say," exclaimed Altamont, "didn’t we come out expressly to hunt?"

"To hunt the musk-ox, and nothing else," replied Clawbonny. "Besides, we shouldn’t know what to do with this
game, even if we killed it; we have provisions enough. Let us for once enjoy the sight of men and animals in perfect
amity."

"It proves no human beings have been here before," said Hatteras.

"True, and that proves something more, these animals are not of American origin."

"How do you make that out?" said Altamont.

"Why, if they had been born in North America they would have known how to treat that mammiferous biped
called man, and would have fled at the first glimpse of us. No, they are from the north, most likely from the
untrodden wilds of Asia, so Altamont, you have no right to claim them as fellow-countrymen."

[Illustration: ]

"Oh! a hunter doesn’t examine his game so closely as all that. Everything is grist that comes to his mill."

"All right. Calm yourself, my brave Nimrod! For my own part, I would rather never fire another shot than make
one of these beautiful creatures afraid of me. See, even Duk fraternizes with them. Believe me, it is well to be kind
where we can. Kindness is power."

"Well, well, so be it," said Altamont, not at all understanding such scruples. "But I should like to see what you
would do if you had no weapon but kindness among a pack of bears or wolves! You wouldn’t make much of it."

"I make no pretensions to charm wild beasts. I don’t believe much in Orpheus and his enchantments. Besides,
bears and wolves would not come to us like these hares, and partridges, and deer."

"Why not? They have never seen human beings either."

"No but they are savage by nature," said Clawbonny, "and ferocity, like wickedness, engenders suspicion. This is
true of men as well as animals."

They spent the whole day in the glen, which the Doctor christened "Arctic Arcadia," and when evening came
they lay down to rest in the hollow of a rock, which seemed as if expressly prepared for their accommodation.

CHAPTER XVII.
ALTAMONT’S REVENGE.

Next morning, as the fine weather still continued, the hunters determined to have another search for the musk ox.
It was only fair to give Altamont a chance, with the distinct understanding that he should have the right of firing,
however fascinating the game they might meet. Besides, the flesh of the musk ox, though a little too highly
impregnated with the smell, is savoury food, and the hunters would gladly carry back a few pounds of it to Fort
Providence.

During the first part of the day, nothing occurred worth mentioning, but they noticed a considerable change in
the aspect of the country, and appearances seemed to indicate that they were approaching a hilly region. This New
America was evidently either a continent or an island of considerable extent.

Duk was running far ahead of his party when he stopped suddenly short, and began sniffing the ground as if he
had caught scent of game. Next minute he rushed forward again with extreme rapidity, and was speedily out of
sight. But loud distinct barking convinced the hunters that the faithful fellow had at last discovered the desired
object.

They hurried onwards, and after an hour and a half’s quick walking, found him standing in front of two
formidable looking animals, and barking furiously. The Doctor recognized them at once as belonging to the musk
ox, or Ovibos genus, as naturalists call it, by the very wide horns touching each other at their base, by the absence of
muzzle, by the narrow square chanfrin resembling that of a sheep, and by the very short tail. Their hair was long and
thickly matted, and mixed with fine brown, silky wool.

[Illustration: ]

These singular-looking quadrupeds were not the least afraid of Duk, though extremely surprised; but at the first
glimpse of the hunters they took flight, and it was no easy task to go after them, for half an hour’s swift running
brought them no nearer, and made the whole party so out of breath, that they were forced to come to a halt.

"Confound the beasts!" said Altamont.

"Yes, Altamont, I’ll make them over to you," replied Clawbonny; "they are true Americans, and they don’t
appear to have a very favourable idea of their fellow countrymen."

[Illustration: ]

"That proves our hunting prowess," rejoined Altamont.

Meantime the oxen finding themselves no longer pursued, had stopped short. Further pursuit was evidently
useless. If they were to be captured at all they must be surrounded, and the plateau which they first happened to have
reached, was very favourable for the purpose. Leaving Duk to worry them, they went down by the neighbouring
ravines; and got to the one end of the plateau, where Altamont and the Doctor hid themselves behind projecting
rocks, while Hatteras went on to the other end, intending to startle the animals by his sudden appearance, and drive
them back towards his companions.

"I suppose you have no objection this time to bestow a few bullets on these gentry?" said Altamont.

"Oh, no, it is ‘a fair field now and no favour,’" returned Clawbonny.

The oxen had begun to shake themselves impatiently at Duk, trying to kick him off, when Hatteras started up
right in front of them, shouting and chasing them back. This was the signal for Altamont and the Doctor to rush
forward and fire, but at the sight of two assailants, the terrified animals wheeled round and attacked Hatteras. He met
their onset with a firm, steady foot, and fired straight at their heads. But both his balls were powerless, and only
served still further to madden the enraged beasts. They rushed upon the unfortunate man like furies, and threw him
on the ground in an instant.

"He is a dead man!" exclaimed the Doctor, in despairing accents.

A tremendous struggle was going on in Altamont’s breast at the sight of his prostrate foe, and though his first
impulse was to hasten to his help, he stopped short, battling with himself and his prejudices. But his hesitation
scarcely lasted half a second, his better self conquered, and exclaiming,

"No, it would be cowardly!" he rushed forward with Clawbonny.

Hatteras full well understood how his rival felt, but would rather have died than have begged his intervention. However, he had hardly time to think about it, before Altamont was at his side.

He could not have held out much longer, for it was impossible to ward off the blows of horns and hoofs of two such powerful antagonists, and in a few minutes more he must have been torn to pieces. But suddenly two shots resounded, and Hatteras felt the balls graze his head.

[Ilustration: Dealt him such a tremendous blow on the head with his hatchet, that the skull was completely split open.—P.177]

"Courage!" shouted Altamont, flinging away his discharged weapon, and throwing himself right in front of the raging animals. One of them, shot to the heart, fell dead as he reached the spot, while the other dashed madly on Hatteras, and was about to gore the unfortunate captain with his horns, when Altamont plunged his snow knife far into the beast’s wide open jaws with one hand, with the other dealt him such a tremendous blow on the head with his hatchet, that the skull was completely split open.

It was done so quickly that it seemed like a flash of lightning, and all was over. The second ox lay dead, and Clawbonny shouted "Hurrah! hurrah!" Hatteras was saved.

He owed his life to the man he hated the most. What a storm of conflicting passions this must have roused in his soul! But where was the emotion he could not master?

However, his action was prompt, whatever his feeling might be. Without a moment’s hesitancy, he went up to his rival, and said in a grave voice—

"Altamont, you have saved my life!"
"You saved mine," replied the American.

There was a moment’s silence, and then Altamont added—

"We’re quits, Hatteras."

"No, Altamont," said the captain; "when the Doctor dragged you out of your icy tomb, I did not know who you were; but you saved me at the peril of your own life, knowing quite well who I was."
"Why, you are a fellow-creature at any rate, and whatever faults an American may have, he is no coward."
"No, indeed," said the Doctor. "He is a man, every inch as much as yourself, Hatteras."
"And like me, he shall have part in the glory that awaits us."
"The glory of reaching the North Pole?" asked Altamont.
"Yes," replied Hatteras, proudly.
"I guessed right, then," said Altamont.
"And you have actually dared to conceive such a project? Oh! it is grand; I tell you it is sublime even to think of it?"

"But tell me," said Hatteras in a hurried manner; "you were not bound for the Pole then yourself?"

Altamont hesitated.
"Come, speak out, man," urged the Doctor.
"Well, to tell the truth, I was not, and the truth is better than self-love. No, I had no such grand purpose in view. I was trying to clear the North-West Passage, and that was all."

"Altamont," said Hatteras, holding out his hand; "be our companion to glory, come with us and find the North Pole."

The two men clasped hands in a warm, hearty grasp, and the bond of friendship between them was sealed.

When they turned to look for the Doctor they found him in tears.

"Ah! friends," he said, wiping his eyes; "you have made me so happy, it is almost more than I can bear’ You have sacrificed this miserable nationality for the sake of the common cause. You have said, ‘What does it matter if only the Pole is discovered, whether it is by an Englishman or an American?’ Why should we brag of being American or English, when we can boast that we are men?"

The good little man was beside himself with joy He hugged the reconciled enemies to his bosom, and cemented their friendship by his own affection to both.

At last he grew calm after at least a twentieth embrace, and said—

"It is time I went to work now. Since I am no hunter, I must use my talents in another direction"

And he began to cut up the oxen so skilfully, that he seemed like a surgeon making a delicate autopsy.

His two companions looked on smiling. In a few minutes the adroit operator had cut off more than a hundred pounds of flesh. This he divided into three parts. Each man took one, and they retraced their steps to Fort Providence.

At ten o’clock they arrived at Doctor’s House, where Johnson and Bell had a good supper prepared for them.
But before sitting down to enjoy it, the Doctor exclaimed in a jubilant tone, and pointing to his two companions—

"My dear old Johnson, I took out an American and an Englishman with me, didn’t I?"

"Yes, Mr. Clawbonny."

"Well, I bring back two brothers."

This was joyous news to the sailors, and they shook hands warmly with Altamont; while the Doctor recounted all that had passed, and how the American captain had saved the English captain’s life. That night no five happier men could have been found than those that lay sleeping in the little snow house.

CHAPTER XVIII.

FINAL PREPARATIONS

Next day the weather changed, the cold returned. Snow, and rain, and tempest came in quick succession for several days.

Bell had completed the sloop, and done his work well, for the little vessel was admirably adapted for the purpose contemplated, being high at the sides and partly decked so as to be able to stand a heavy sea, and yet light enough to be drawn on the sledge without overburdening the dogs.

At last a change of the greatest importance took place. The ice began to tremble in the centre of the bay, and the highest masses became loosened at their base ready to form icebergs, and drift away before the first gale; but Hatteras would not wait for the ice-fields to break up before he started. Since the journey must be made on land, he did not care whether the sea was open or not; and the day of departure was fixed for the 25th of June—Johnson and Bell undertaking the necessary repairs of the sledge.

On the 20th, finding there was space enough between the broken ice to allow the sloop to get through, it was determined to take her a trial trip to Cape Washington.

The sea was not quite open but it would have been impossible to go across on foot.

This short sail of six hours sufficiently tested the powers of the sloop, and proved her excellent qualities. In coming back they witnessed a curious sight; it was the chase of a seal by a gigantic bear. Mr. Bruin was too busily engaged to notice the vessel, or he would have pursued; he was intently watching beside a seal hole with the patience of a true hunter, or rather angler, for he was certainly fishing just then. He watched in absolute silence, without stirring or giving the least sign of life.

But all of a sudden there was a slight disturbance on the surface of the water in the hole, which announced the coming up of the amphibious animal to breathe. Instantly the bear lay flat on his belly with his two paws stretched round the opening.

Next minute up came the seal, but his head no sooner appeared above the water than the bear’s paws closed about him like a vice, and dragged him right out. The poor seal struggled desperately, but could not free himself from the iron grasp of his enemy, who hugged him closer and closer till suffocation was complete. Then he carried him off to his den as if the weight were nothing, leaping lightly from pack to pack till he gained terra firma safely.

On the 22nd of June, Hatteras began to load the sledge. They put in 200 lbs. of salt meat, three cases of vegetables and preserved meat, besides lime-juice, and flour, and medicines. They also took 200 lbs. of powder and a stock of fire-arms. Including the sloop and the Halkett-boat, there was about 1500 lbs. weight, a heavy load for four dogs, and all the more as they would have to drag it every day, instead of only four days successively, like the dogs employed by the Esquimaux, who always keep a relay for their sledges. However, the distance to the Pole was not 150 miles at the outside, and they did not intend to go more than twelve miles a day, as they could do it comfortably in a month. Even if land failed them, they could always fall back on the sloop, and finish the journey without fatigue to men or dogs.

All the party were in excellent health, though they had lost flesh a little; but, by attending to the Doctor’s wise counsels, they had weathered the winter without being attacked by any of the maladies incident to the climate.

On Sunday, the 23rd, all was ready, and it was resolved to devote the entire day to rest.

The dwellers on Fort Providence could not see the last day dawn without some emotion. It cost them a pang to
leave the snow-hut which had served them in such good stead, and this hospitable shore where they had passed the
winter. Take it altogether, they had spent very happy hours there, and the Doctor made a touching reference to the
subject as they sat round the table at the evening meal, and did not forget to thank God for his manifest protection.

They retired early to rest, for they needed to be up betimes. So passed the last night in Fort Providence.

CHAPTER XIX.

MARCH TO THE NORTH

Next day at early dawn, Hatteras gave the signal for departure. The well-fed and well-rested dogs were
harnessed to the sledge. They had been having a good time of it all the winter, and might be expected to do good
service during the summer.

It was six in the morning when the expedition started. After following the windings of the bay and going past
Cape Washington, they struck into the direct route for the north, and by seven o’clock had lost sight of the
lighthouse and Fort Providence.

During the first two days they made twenty miles in twelve hours, devoting the remainder of the time to rest and
meals. The tent was quite sufficient protection during sleep.

The temperature began to rise. In many places the snow melted entirely away, and great patches of water
appeared; here and there complete ponds, which a little stretch of imagination might easily convert into lakes. The
travellers were often up to their knees, but they only laughed over it; and, indeed, the Doctor was rather glad of such
unexpected baths.

"But for all that," he said, "the water has no business to wet us here. It is an element which has no right to this
country, except in a solid or vaporous state. Ice or vapour is all very well, but water— never!"

Hunting was not forgotten during the march, for fresh meat was a necessity. Altamont and Bell kept their guns
loaded, and shot ptarmigans, guillemots, geese, and a few young hares; but, by degrees, birds and animals had been
changing from trustfulness to fear, and had become so shy and difficult to approach, that very often, but for Duk, the
hunters would have wasted their powder.

Hatteras advised them not to go more than a mile away, as there was not a day, nor even an hour, to lose, for
three months of fine weather was the utmost they
could count upon. Besides, the sledge was often coming to difficult places, when each man was needed to lend a
helping hand.

On the third day they came to a lake, several acres in extent, and still entirely frozen over. The sun’s rays had
little access to it, owing to its situation, and the ice was so strong that it must have dated from some remote winter. It
was strong enough to bear both the travellers and their sledge, and was covered with dry snow.

From this point the country became gradually lower, from which the Doctor concluded that it did not extend to
the Pole, but that most probably this New America was an island.

Up to this time the expedition had been attended with no fatigue. The travellers had only suffered from the
intense glare of the sun on the snow, which threatened them with snow-blindness. At another time of the year they
might have avoided this by walking during the night, but at present there was no night at all. Happily the snow was
beginning to melt, and the brilliancy would diminish as the process of dissolution advanced.

On the 28th of June the thermometer rose to 45°, and the rain fell in torrents. Hatteras and his companions,
however, marched stoically on, and even hailed the downpour with delight, knowing that it would hasten the
disappearance of the snow.

As they went along, the Doctor often picked up stones, both round ones and flat pebbles, as if worn away by the
tide. He thought from this they must be near the Polar Basin, and yet far as the eye could reach was one interminable
plain.

There was not a trace of houses, or huts, or cairns visible. It was evident that the Greenlanders had not pushed
their way so far north, and yet the famished tribes would have found their account in coming, for the country
abounded in game. Bears were frequently seen, and numerous herds of musk-oxen and deer.

On the 29th, Bell killed a fox and Altamont a musk-ox. These supplies of fresh food were very acceptable, and
even the Doctor surveyed, with considerable satisfaction, the haunches of meat they managed to procure from time
to time.

"Don’t let us stint ourselves," he used to say on these occasions; "food is no unimportant matter in expeditions
like ours."
    "Especially," said Johnson, "when a meal depends on a lucky shot."
    "You’re right, Johnson; a man does not think so much about dinner when he knows the soup-pot is simmering by
the kitchen-fire."
    On the 30th, they came to a district which seemed
    [Illustration: ]
to have been upturned by some volcanic convulsion, so covered was it with cones and sharp lofty peaks.
    A strong breeze from the south-east was blowing, which soon increased to a hurricane, sweeping over the rocks
covered with snow and the huge masses, of ice, which took the forms of icebergs and hummocks, though on dry
land.
    The tempest was followed by damp, warm weather, which caused a regular thaw.
    On all sides nothing could be heard but the noise of cracking ice and falling avalanches.
    The travellers had to be very careful in avoiding hills, and even in speaking aloud, for the slightest agitation in
the air might have caused a catastrophe. Indeed, the suddenness is the peculiar feature in Arctic
    [Illustration: ]
avalanches, distinguishing them from those of Switzerland and Norway. Often the dislodgment of a block of ice
is instantaneous, and not even a cannon-ball or thunderbolt could be more rapid in its descent. The loosening, the
fall, and the crash happen almost simultaneously.
    Happily, however, no accident befell any of the party, and three days afterwards they came to smooth, level
ground again.
    [Illustration: ]
    But here a new phenomenon met their gaze—a phenomenon which was long a subject of patient inquiry among
the learned of both hemispheres. They came to a long chain of low hills which seemed to extend for miles, and were
all covered on the eastern side with bright red snow.
    It is easy to imagine the surprise and half-terrified exclamations of the little company at the sight of this long red
curtain; but the Doctor hastened to reassure them, or rather to instruct them, as to the nature of this peculiar snow.
He told them that this same red substance had been found in Switzerland, in the heart of the Alps, and that the colour
proceeded solely from the presence of certain corpuscles, about the nature of which for a long time chemists could
not agree. They could not decide whether these corpuscles were of animal or vegetable origin, but at last it was
settled that they belonged to the family of fungi, being a sort of microscopic champignon of the species Uredo.
    Turning the snow over with his iron-tipped staff, the Doctor found that the colouring matter measured nine feet
deep. He pointed this out to his companions, that they might have some idea of the enormous number of these tiny
mushrooms in a layer extending so many miles.
    This phenomenon was none the less strange for being explained, for red is a colour seldom seen in nature over
any considerable area. The reflection of the sun’s rays upon it produced the most peculiar effect, lighting up men,
and animals, and rocks with a fiery glow, as if proceeding from some flame within. When the snow melted it looked
like blood, as the red particles do not decompose. It seemed to the travellers as if rivulets of blood were running
among their feet.
    [Illustration: ]
    The Doctor filled several bottles with this precious substance to examine at leisure, as he had only had a glimpse
of the Crimson Cliffs in Baffin’s Bay.
    [Illustration: ]
    This Field of Blood, as he called it, took three hours to get over, and then the country resumed its usual aspect.
    [Illustration: At Bell’s suggestion torches were contrived.—P.199]
CHAPTER XX.
FOOTPRINTS IN THE SNOW.
    On the fourth of July there was such an exceedingly dense fog, that it was very difficult to keep the straight
course for the north. No misadventure, however, befell the party during the darkness, except the loss of Bell’s snow-
shoes. At Bell’s suggestion, which fired the Doctor’s inventive genius, torches were contrived, made of tow steeped
in spirits-of-wine and fastened on the end of a stick, and these served somewhat to help them on, though they made
but small progress; for, on the sixth, after the fog had cleared off, the Doctor took their bearings, and found that they
had only been marching at the rate of eight miles a day.
    Determined to make up for lost time, they rose next morning very early and started off, Bell and Altamont as
usual going ahead of the rest and acting as scouts. Johnson and the others kept beside the sledge, and were soon
nearly two miles behind the guides; but the weather was so dry and clear that all their movements could be distinctly
observed.
"What now? " said Clawbonny, as he saw them make a sudden halt, and stoop down as if examining the ground.
"I was just wondering what they are about, myself," replied old Johnson.
"Perhaps they have come on the tracks of animals," suggested Hatteras.
"No," said Clawbonny, "it can’t be that."
[Illustration: ]
"Why not?"
"Because Duk would bark."
"Well, it is quite evident they are examining some sort of marks."
"Let’s get on, then," said Hatteras; and, urging forward the dogs, they rejoined their companions in about twenty
minutes, and shared their surprise at finding unmistakable fresh footprints of human beings in the snow, as plain as
if only made the preceding day.
"They are Esquimaux footprints," said Hatteras.
"Do you think so?" asked Altamont.
"There is no doubt of it."
"But what do you make of this, then?" returned Altamont, pointing to another footprint repeated in
[Illustration: ]
several places. "Do you believe for a minute that was made by an Esquimaux?"
It was incontestably the print of a European boot—nails, sole, and heel clearly stamped in the snow. There was
no room for doubt, and Hatteras exclaimed in amazement—
"Europeans here!"
"Evidently," said Johnson.
"And yet it is so improbable that we must take a second look before pronouncing an opinion," said Clawbonny.

But the longer he looked, the more apparent became the fact. Hatteras was chagrined beyond measure. A
European here, so near the Pole!
The footprints extended for about a quarter of a mile, and then diverged to the west. Should the travellers follow
them further?
"No," said Hatteras, "let us go on."
He was interrupted by an exclamation from the Doctor, who had just picked up an object that gave still more
convincing proof of European origin. It was part of a pocket spy-glass!
"Well, if we still had any doubts about the footmarks, this settles the case at once, at any rate," said Clawbonny.
"Forward!" exclaimed Hatteras so energetically, that instinctively each one obeyed, and the march was resumed
forthwith.
The day wore away, but no further sign of the presence of suspected rivals was discovered, and they prepared to
encamp for the night.
The tent was pitched in a ravine for shelter, as the sky was dark and threatening, and a violent north wind was
blowing.
"I’m afraid we’ll have a bad night," said Johnson.
"A pretty noisy one, I expect," replied the Doctor, "but not cold. We had better take every precaution, and fasten
down our tent with good big stones."
"You are right, Mr. Clawbonny. If the hurricane swept away our tent, I don’t know where we should find it
again."
[Illustration: ]
The tent held fast, but sleep was impossible, for the tempest was let loose and raged with tremendous violence.
"It seems to me," said the Doctor, during a brief lull in the deafening roar," as if I could hear the sound of
collisions between icebergs and ice-fields. If we were near the sea, I could really believe there was a general break-
up in the ice."
"I can’t explain the noises any other way," said Johnson.
"Can we have reached the coast, I wonder?" asked Hatteras.
"It is not impossible," replied Clawbonny. "Listen! Do you hear that crash? That is certainly the sound of
icebergs falling. We cannot be very far from the ocean."
"Well, if it turn out to be so, I shall push right on over the ice-fields."
"Oh, they’ll be all broken up after such a storm as this. We shall see what to-morrow, brings; but all I can say is,
if any poor fellows are wandering about in a night like this, I pity them.
The storm lasted for ten hours, and the weary travellers anxiously watched for the morning. About daybreak its
fury seemed to have spent itself, and Hatteras, accompanied by Bell and Altamont, ventured to leave the tent. They
climbed a hill about three hundred feet high, which commanded a wide view. But what a metamorphosed region met
their gaze! All the ice had completely vanished, the storm had chased away the winter, and stripped the soil everywhere of its snow covering.

But Hatteras scarcely bestowed a glance on surrounding objects; his eager gaze was bent on the northern horizon, which appeared shrouded in black mist.

"That may very likely be caused by the ocean," suggested Clawbonny.

"You are right. The sea must be there," was the reply.

"That tints is what we call the blink of open water," said Johnson.

"Come on, then, to the sledge at once, and let us get to this unknown ocean," exclaimed Hatteras.

Their few preparations were soon made, and the march resumed. Three hours afterwards they arrived at the coast, and shouted simultaneously, "The sea! the sea!"

"Ay, and open sea!" added Hatteras.

And so it was. The storm had opened wide the Polar Basin, and the loosened packs were drifting in all directions. The icebergs had weighed anchor, and were sailing out into the open sea.

This new ocean stretched far away out of sight, and not a single island or continent was visible.

On the east and west the coast formed two capes or headlands, which sloped gently down to the sea. In the centre, a projecting rock formed a small natural bay, sheltered on three sides, into which a wide river fell, bearing in its bosom the melted snows of winter.

After a careful survey of the coast, Hatteras determined to launch the sloop that very day, and to unpack the sledge, and get everything on board. The tent was soon put up, and a comfortable repast prepared. This important business despatched, work commenced; and all hands were so expeditious and willing, that by five o'clock nothing more remained to be done. The sloop lay rocking gracefully in the little bay, and all the cargo was on board except the tent, and what was required for the night’s encampment.

The sight of the sloop suggested to Clawbonny the propriety of giving Altamont’s name to the little bay. His proposition to that effect met with unanimous approval, and the port was forthwith dignified by the title of Altamont Harbour.

According to the Doctor’s calculations the travellers were now only 9° distant from the Pole. They had gone over two hundred miles from Victoria Bay to Altamont Harbour, and were in latitude 87° 5’ and longitude 118° 35’.

CHAPTER XXI.

THE OPEN SEA.

Next morning by eight o’clock all the remaining effects were on board, and the preparations for departure completed. But before starting the Doctor thought he would like to take a last look at the country and see if any further traces of the presence of strangers could be discovered, for the mysterious footmarks they had met with were never out of his thoughts. He climbed to the top of a height which commanded a view of the whole southern horizon, and took out his pocket telescope. But what was his astonishment, to find he could see nothing through it, not even neighbouring objects. He rubbed his eyes and looked again, but with no better result. Then he began to examine the telescope, the object glass was gone!

The object glass! This explained the whole mystery, foot-prints and all; and with a shout of surprise he hurried down the hill to impart his discovery to the wondering companions, who came running towards him, startled by his loud exclamation, and full of anxiety at his precipitate descent.

"Well, what is the matter now?" said Johnson.

The Doctor could hardly speak, he was so out of breath. At last he managed to gasp out—

"The tracks, footmarks, strangers."

"What?" said Hatteras, "strangers here?"

"No, no, the object glass; the object glass out of my telescope."

And he held out his spy-glass for them to look at.

"Ah! I see," said Altamont; "it is wanting."

"Yes."

"But then the footmarks?"

"They were ours, friends, just ours," exclaimed the Doctor. "We had lost ourselves in the fog, and been wandering in a circle."

"But the boot-marks," objected Hatteras.

"Bell’s. He walked about a whole day after he had lost his snow shoes."
"So I did," said Bell.

The mistake was so evident, that they all laughed heartily, except Hatteras, though no one was more glad than he at the discovery.

A quarter of an hour afterwards the little sloop sailed out of Altamont Harbour, and commenced her voyage of discovery. The wind was favourable, but there was little of it, and the weather was positively warm.

The sloop was none the worse for the sledge journey. She was in first-rate trim, and easily managed. Johnson steered, the Doctor, Bell, and the American leaned back against the cargo, and Hatteras stood at the prow, his fixed, eager gaze bent steadily on that mysterious point towards which he felt drawn with irresistible power, like the magnetic needle to the Pole. He wished to be the first to descry any shore that might come in sight, and he had every right to the honour.

The water of this Polar Sea presented some peculiar features worth mentioning. In colour it was a faint ultramarine blue, and possessed such wonderful transparency that one seemed to gaze down into fathomless depths. These depths were lighted up, no doubt, by some electrical phenomenon, and so many varieties of living creatures were visible that the vessel seemed to be sailing over a vast aquarium.

Innumerable flocks of birds were flying over the surface of this marvellous ocean, darkening the sky like thick heavy storm-clouds. Water-fowl of every description were among them, from the albatross to the penguin, and all of gigantic proportions. Their cries were absolutely deafening, and some of them had such immense, wide-spreading wings, that they covered the sloop completely as they flew over. The Doctor thought himself a good naturalist, but he found his science greatly at fault, for many a species here was wholly unknown to any ornithological society.

The good little man was equally nonplussed when he looked at the water, for he saw the most wonderful meduse, some so large that they looked like little islands floating about among Brobdignagian sea-weeds. And below the surface, what a spectacle met the eye! Myriads of fish of every species; young manati at play with each other; narwhals with their one strong weapon of defence, like the horn of a unicorn, chasing the timid seals; whales of every tribe, spouting out columns of water and mucilage, and filling the air with a peculiar whizzing noise; dolphins, seals, and walruses; sea-dogs and sea-horses, sea-bears and sea-elephants, quietly browsing on submarine pastures; and the Doctor could gaze at them all as easily and clearly as if they were in glass tanks in the Zoological Gardens.

There was a strange supernatural purity about the atmosphere. It seemed charged to overflowing with oxygen, and had a marvellous power of exhilaration, producing an almost intoxicating effect on the brain.

Towards evening, Hatteras and his companions lost sight of the coast. Night came on, though the sun remained just above the horizon; but it had the same influence on animated nature as in temperate zones. Birds, fish, and all the cetacea disappeared and perfect silence prevailed.

Since the departure from Altamont Harbour, the sloop had made one degree further north. The next day brought no signs of land; there was not even a speck on the horizon. The wind was still favourable, and the sea pretty calm. The birds and fishes returned as numerously as on the preceding day, and the Doctor leaning over the side of the vessel, could see the whales and the dolphins, and all the rest of the monsters of the deep.—P.214]  

The good little man was equally nonplussed when he looked at the water, for he saw the most wonderful medusæ, some so large that they looked like little islands floating about among Brobdignagian sea-weeds. And below the surface, what a spectacle met the eye! There was a strange supernatural purity about the atmosphere. It seemed charged to overflowing with oxygen, and had a marvellous power of exhilaration, producing an almost intoxicating effect on the brain.

Towards evening, Hatteras and his companions lost sight of the coast. Night came on, though the sun remained just above the horizon; but it had the same influence on animated nature as in temperate zones. Birds, fish, and all the cetacea disappeared and perfect silence prevailed.

Since the departure from Altamont Harbour, the sloop had made one degree further north. The next day brought no signs of land; there was not even a speck on the horizon. The wind was still favourable, and the sea pretty calm. The birds and fishes returned as numerously as on the preceding day, and the Doctor leaning over the side of the vessel, could see the whales and the dolphins, and all the rest of the monsters of the deep, gradually coming up from the clear depths below. On the surface, far as the eye could reach, nothing was visible except a solitary iceberg here and there, and a few scattered floes.

Indeed, but little ice was met with anywhere. The sloop was ten degrees above the point of greatest cold, and consequently in the same temperature as Baffin’s Bay and Disko. It was therefore not astonishing that the sea should be open in these summer months.

This is a fact of great practical value, for if ever the whalers can penetrate north as far as the Polar basin, they may be sure of an immediate cargo, as this part of the ocean seems the general reservoir of whales and seals, and every marine species.

The day wore on, but still nothing appeared on the horizon. Hatteras never left the prow of the ship, but stood, glass in hand, eagerly gazing into the distance with anxious, questioning eyes, and seeking to discover, in the colour of the water, the shape of the waves, and the breath of the wind, indications of approaching land.

CHAPTER XXII.
GETTING NEAR THE POLE.
Hour after hour passed away, and still Hatteras persevered in his weary watch, though his hopes appeared doomed to disappointment.

At length, about six in the evening, a dim, hazy, shapeless sort of mist seemed to rise far away between sea and
sky. It was not a cloud, for it was constantly vanishing, and then reappearing next minute.

Hatteras was the first to notice this peculiar phenomenon; but after an hour’s scrutiny through his telescope, he could make nothing of it.

All at once, however, some sure indication met his eye, and stretching out his arm to the horizon, he shouted, in a clear ringing voice——

"Land! land!"

His words produced an electrical effect on his companions, and every man rushed to his side.

"I see it, I see it," said Clawbonny.

"Yes, yes, so do I! " exclaimed Johnson.

"It is a cloud," said Altamont.

"Land! land!" repeated Hatteras, in tones of absolute conviction.

Even while he spoke the appearance vanished, and when it returned again the Doctor fancied he caught a gleam of light about the smoke for an instant.

[Illustration: "It is a volcano!" he exclaimed.—P.217]

"It is a volcano!" he exclaimed.

"A volcano?" repeated Altamont.

"Undoubtedly."

[ Illustration: ]

"In so high a latitude?"

"Why not? Is not Iceland a volcanic island—indeed, almost made of volcanoes, one might say?"

"Well, has not our famous countryman, James Ross, affirmed the existence of two active volcanoes, the Erebus and the Terror, on the Southern Continent, in longitude 170° and latitude 78°? Why, then, should not volcanoes be found near the North Pole?"

"It is possible, certainly," replied Altamont.

"Ah, now I see it distinctly," exclaimed the Doctor. "It is a volcano!"

"Let us make right for it then," said Hatteras.

[ Illustration: ]

It was impossible longer to doubt the proximity of the coast. In twenty-four hours, probably, the bold navigators might hope to set foot on its untrodden soil. But strange as it was, now that they were so near the goal of their voyage, no one showed the joy which might have been expected. Each man sat silent, absorbed in his own thoughts, wondering what sort of place this Pole must be. The birds seemed to shun it, for though it was evening, they were all flying towards the south with outspread wings. Was it, then, so inhospitable, that not so much as a sea-gull or a ptarmigan could find a shelter? The fish, too, even the large cetacea, were hastening away through the transparent waters. What could cause this feeling either of repulsion or terror?

At last sleep overcame the tired men, and one after another dropped off, leaving Hatteras to keep watch.

He took the helm, and tried his best not to close his eyes, for he grudged losing precious time; but the slow motion of the vessel rocked him into a state of such irresistible somnolence that, in spite of himself, he was soon, like his companions, locked fast in deep slumber. He began to dream, and imagination brought back all the scenes of his past life. He dreamt of his ship, the Forward, and of the traitors that had burnt it. He began to remember, and he forgot his actual situation. Then the scene changed, and he saw himself at the Pole unfurling the Union Jack!

While memory and fancy were thus busied, an enormous cloud of an olive tinge had begun to darken sea and sky. A hurricane was at hand. The first blast of the tempest roused the captain and his companions, and they were on their feet in an instant, ready to meet it. The sea had risen tremendously, and the ship was tossing violently up and down on the billows. Hatteras took the helm again, and kept a firm hold of it, while Johnson and Bell baled out the water which was constantly dashing over the ship.

It was a difficult matter to preserve the right course, for the thick fog made it impossible to see more than a few yards off.

This sudden tempest might well seem to such excited men, a stern prohibition against further approach to the Pole; but it needed but a glance at their resolute faces to know that they would neither yield to winds nor waves, but go right on to the end.

[ Illustration: ]

For a whole day the struggle lasted, death threatening them each moment; but about six in the evening, just as the fury of the waves seemed at its highest pitch, there came a sudden calm. The wind was stilled as if miraculously,
and the sea became smooth as glass.

Then came a most extraordinary inexplicable phenomenon.

The fog, without dispersing, became strangely luminous, and the sloop sailed along in a zone of electric light. Mast, sail, and rigging appeared pencilled in black against the phosphorescent sky with wondrous distinctness. The men were bathed in light, and their faces shone with a fiery glow.

"The volcano!" exclaimed Hatteras.

"Is it possible?" said Bell.

"No, no!" replied Clawbonny. "We should be suffocated with its flames so near."

"Perhaps it is the reflection," suggested Altamont.

"Not that much even, for then we must be near land, and in that case we should hear the noise of the eruption."

"What is it, then?" asked the captain.

"It is a cosmical phenomenon," replied the Doctor, "seldom met hitherto. If we go on, we shall soon get out of our luminous sphere and be back in the darkness and tempest again."

"Well, let's go on, come what may," said Hatteras.

The Doctor was right. Gradually the fog began to lose its light, and then its transparency, and the howling wind was heard not far off. A few minutes more, and the little vessel was caught in a violent squall, and swept back into the cyclone.

But the hurricane had fortunately turned a point towards the south, and left the vessel free to run before the wind straight towards the Pole. There was imminent danger of her sinking, for she sped along at frenzied speed, and any sudden collision with rock or iceberg must have inevitably dashed her to pieces.

But not a man on board counselled prudence. They were intoxicated with the danger, and no speed could be quick enough to satisfy their longing impatience to reach the unknown.

At last they began evidently to near the coast. Strange symptoms were manifest in the air; the fog suddenly rent like a curtain torn by the wind; and for an instant, like a flash of lightning, an immense column of flame was seen on the horizon.

"The volcano! the volcano!" was the simultaneous exclamation.

But the words had hardly passed their lips before the fantastic vision had vanished. The wind suddenly changed to south-east, and drove the ship back again from the land.

"Confound it!" said Hatteras; "we weren’t three miles from the coast."

However, resistance was impossible. All that could be done was to keep tacking; but every few minutes the little sloop would be thrown on her side, though she righted herself again immediately obedient to the helm.

As Hatteras stood with dishevelled hair, grasping the helm as if welded to his hand, he seemed the animating soul of the ship.

All at once, a fearful sight met his gaze.

Scarcely twenty yards in front was a great block of ice coming right towards them, mounting and falling on the stormy billows, ready to overturn at any moment and crush them in its descent.

But this was not the only danger that threatened the bold navigators. The iceberg was packed with white bears, huddling close together, and evidently beside themselves with terror.

The iceberg made frightful lurches, sometimes inclining at such a sharp angle that the animals rolled pell-mell over each other and set up a low growling, which mingled with the roar of the elements and made a terrible concert.

For a quarter of an hour, which seemed a whole century, the sloop sailed on in this formidable company, sometimes a few yards distant and sometimes near enough to touch. The Greenland dogs trembled for fear, but Duk was quite imperturbable. At last the iceberg lost ground, and got driven by the wind further and further away till it disappeared in the fog, only at intervals betraying its presence by the ominous growls of its equipage.

[Illustration: Mast and sail were torn off, and went flying away through the darkness like some large white bird. —P.224]

The storm now burst forth with redoubled fury. The little barque was lifted bodily out of the water, and whirled round and round with the most frightful rapidity. Mast and sail were torn off, and went flying away through the darkness like some large white bird. A whirlpool began to form among the waves, drawing down the ship gradually by its irresistible suction.

[Instruction: ]

Deeper and deeper she sank, whizzing round at such tremendous speed that to the poor fellows on board, the water seemed motionless. All five men stood erect, gazing at each other in speechless terror. But suddenly the ship rose perpendicularly, her prow went above the edge of the vortex, and getting out of the centre of attraction by her own velocity, she escaped at a tangent from the circumference, and was thrown far beyond, swift as a ball from a cannon’s mouth.
Altamont, the Doctor, Johnson, and Bell were pitched flat on the planks. When they got up, Hatteras had disappeared!

It was two o’clock in the morning.

CHAPTER XXIII.

THE ENGLISH FLAG

For a few seconds they seemed stupefied, and then a cry of "Hatteras!" broke from every lip.

On all sides, nothing was visible but the tempestuous ocean. Duk barked desperately, and Bell could hardly keep him from leaping into the waves.

"Take the helm, Altamont," said the Doctor, "and let us try our utmost to find our poor captain."

Johnson and Bell seized the oars, and rowed about for more than an hour; but their search was vain—Hatteras was lost!

Lost! and so near the Pole, just as he had caught sight of the goal!

The Doctor called, and shouted, and fired signals, and Duk made piteous lamentations; but there was no response. Clawbonny could bear up no longer; he buried his head in his hands, and fairly wept aloud.

At such a distance from the coast, it was impossible Hatteras could reach it alive, without an oar or even so much as a spar to help him; if ever he touched the haven of his desire, it would be as a swollen, mutilated corpse!

Longer search was useless, and nothing remained but to resume the route north. The tempest was dying out, and about five in the morning on the 11th of July, the wind fell, and the sea gradually became calm. The sky recovered its polar clearness, and less than three miles away the land appeared in all its grandeur.

The new continent was only an island, or rather a volcano, fixed like a lighthouse on the North Pole of the world.

[Illustration: Two men in a boat observing a volcano in the distance.]

The mountain was in full activity, pouring out a mass of burning stones and glowing rock. At every fresh eruption there was a convulsive heaving within, as if some mighty giant were respiring, and the masses ejected were thrown up high into the air amidst jets of bright flame, streams of lava rolling down the sides in impetuous torrents.

In one part, serpents of fire seemed writhing and wriggling amongst smoking rocks, and in another the glowing liquid fell in cascades, in the midst of purple vapour, into a river of fire below, formed of a thousand igneous streams, which emptied itself into the sea, the waters hissing and seething like a boiling cauldron.

Apparently there was only one crater to the volcano, out of which the columns of fire issued, streaked with forked lightning. Electricity seemed to have something to do with this magnificent panorama.

Above the panting flames waved an immense plume-shaped cloud of smoke, red at its base and black at its summit. It rose with incomparable majesty, and unrolled in thick volumes.

The sky was ash-colour to a great height, and it was evident that the darkness that had prevailed while the tempest lasted, which had seemed quite inexplicable to the Doctor, was owing to the columns of cinders overspreading the sun like a thick curtain. He remembered a similar phenomenon which occurred in the Barbadoes, where the whole island was plunged in profound obscurity by the mass of cinders ejected from the crater of Isle St. Vincent.

This enormous ignivomous rock in the middle of the sea was six thousand feet high, just about the altitude of Hecla.

It seemed to rise gradually out of the water as the boat got nearer. There was no trace of vegetation, indeed there was no shore; the rock ran straight down to the sea.

"Can we land?" said the Doctor.

"The wind is carrying us right to it," said Altamont. "But I don’t see an inch of land to set our foot upon."

"It seems so at this distance," said Johnson; "but we shall be sure to find some place to run in our boat at, and that is all we want."

"Let us go on, then," said Clawbonny, dejectedly.

He had no heart now for anything. The North Pole was indeed before his eyes, but not the man who had discovered it.

As they got nearer the island, which was not more than eight or ten miles in circumference, the navigators noticed a tiny fiord, just large enough to harbour their boat, and made towards it immediately. They feared their captain’s dead body would meet their eyes on the coast, and yet it seemed difficult for a corpse to lie on it, for there was no shore, and the sea broke on steep rocks, which were covered with cinders above watermark.

At last the little sloop glided gently into the narrow opening between two sandbanks just visible above the water, where she would be safe from the violence of the breakers; but before she could be moored, Duk began howling and barking again in the most piteous manner, as if calling on the cruel sea and stony rocks to yield up his lost master. The Doctor tried to calm him by caresses, but in vain. The faithful beast, as if he would represent the captain, sprang...
on shore with a tremendous bound, sending a cloud of cinders after him.

"Duk! Duk!" called Clawbonny.

But Duk had already disappeared.

[Illustration: ]

After the sloop was made fast, they all got out and went after him. Altamont was just going to climb to the top of a pile of stones, when the Doctor exclaimed, "Listen!"

Duk was barking vehemently some distance off, but his bark seemed full of grief rather than fury.

"Has he come on the track of some animal, do you think? " asked Johnson.

"No, no!" said Clawbonny, shuddering. "His bark is too sorrowful; it is the dog's tear. He has found the body of Hatteras."

They all four rushed forward, in spite of the blinding cinder-dust, and came to the far-end of a fiord, where they discovered the dog barking round a corpse wrapped in the British flag!

"Hatteras! Hatteras!" cried the Doctor, throwing himself on the body of his friend. But next minute he started up with an indescribable cry, and shouted, "Alive! alive!"

"Yes!" said a feeble voice; "yes, alive at the North Pole, on Queen's Island."

"Hurrah for England!" shouted all with one accord.

"And for America!" added Clawbonny, holding out one hand to Hatteras and the other to Altamont.

Duk was not behind with his hurrah, which was worth quite as much as the others.

For a few minutes the joy of recovery of their captain filled all their hearts, and the poor fellows could not restrain their tears.

The Doctor found, on examination, that he was not seriously hurt. The wind threw him on the coast where landing was perilous work, but, after being driven back more than once into the sea, the hardy sailor had managed to scramble on to a rock, and gradually to hoist himself above the waves.

Then he must have become insensible, for he remembered nothing more except rolling himself in his flag. He only awoke to consciousness with the loud barking and caresses of his faithful Duk.

After a little, Hatteras was able to stand up supported by the Doctor, and tried to get back to the sloop.

He kept exclaiming, "The Pole! the North Pole!"

"You are happy now?" said his friend.

"Yes, happy! And are not you? Isn't it joy to find yourself here! The ground we tread is round the Pole! The air we breathe is the air that blows round the Pole! The sea we have crossed is the sea which washes the Pole! Oh! the North Pole! the North Pole!"

He had become quite delirious with excitement, and fever burned in his veins. His eyes shone with unnatural brilliancy, and his brain seemed on fire. Perfect rest was what he most needed, for the Doctor found it impossible to quiet him.

A place of encampment must therefore be fixed upon immediately.

[Illustration: Altamont speedily discovered a grotto composed of rocks.—P.234]

Altamont speedily discovered a grotto composed of rocks, which had so fallen as to form a sort of cave. Johnson and Bell carried in provisions, and gave the dogs their liberty.

About eleven o'clock, breakfast, or rather dinner, was ready, consisting of pemmican, salt meat, and smoking-hot tea and coffee.

But Hatteras would do nothing till the exact position of the island was ascertained; so the Doctor and Altamont set to work with their instruments, and found that the exact latitude of the grotto was 89° 59' 15". The longitude was of little importance, for all the meridians blended a few hundred feet higher.

The 90° of lat. was then only about three quarters of a mile off, or just about the summit of the volcano.

When the result was communicated to Hatteras, he desired that a formal document might be drawn up to attest the fact, and two copies made, one of which should be deposited on a cairn on the island.

Clawbonny was the scribe, and indited the following document, a copy of which is now among the archives of the Royal Geographical Society of London:

"On this 11th day of July, 1861, in North latitude 89° 59' 15" was discovered Queen's Island at the North Pole, by Captain Hatteras, Commander of the brig Forward of Liverpool, who signs this, as also all his companions.

"Whoever may find this document is requested to forward it to the Admiralty.

"(Signed) JOHN HATTERAS, Commander
of the Forward
"DR. CLAWBONNY
"ALTAMONT, Commander of the Porpoise
"JOHNSON, Boatswain"
"BELL, Carpenter."

"And now, friends, come to table," said the Doctor, merrily.

Coming to table was just squatting on the ground.

"But who," said Clawbonny, "would not give all the tables and dining-rooms in the world to dine at 89° 59’ and 15° N. lat.?"

It was an exciting occasion this first meal at the Pole! What neither ancients nor moderns, neither Europeans, nor Americans, nor Asiatics had been able to accomplish was now achieved, and all past sufferings and perils were forgotten in the glow of success.

"But, after all," said Johnson, after toasts to Hatteras and the North Pole had been enthusiastically drunk, "what is there so very special about the North Pole? Will you tell me, Mr. Clawbonny?"

"Just this, my good Johnson. It is the only point of the globe that is motionless; all the other points are revolving with extreme rapidity."

"But I don’t see that we are any more motionless here than at Liverpool."

"Because in both cases you are a party concerned, both in the motion and the rest; but the fact is certain."

Clawbonny then went on to describe the diurnal and annual motions of the earth—the one round its own axis, the extremities of which are the poles, which is accomplished in twenty-four hours, and the other round the sun, which takes a whole year.

Bell and Johnson listened half incredulously, and 

[caption: Illustration: ]

couldn’t see why the earth could not have been allowed to keep still, till Altamont informed them that they would then have had neither day nor night, nor spring, summer, autumn, and winter.

"Ay, and worse still," said Clawbonny, "if the motion chanced to be interrupted, we should fall right into the sun in sixty-four and a half days."

"What! take sixty-four and a half days, to fall?" exclaimed Johnson.

"Yes, we are ninety-five millions of miles off. But when I say the Pole is motionless, it is not strictly true; it is only so in comparison with the rest of the globe, for it has a certain movement of its own, and completes a circle in about twenty-six thousand years. This comes from the precession of the equinoxes."

A long and learned talk was started on this subject between Altamont and the Doctor, simplified, however, as much as possible for the benefit of Bell and Johnson.

Hatteras took no part in it, and even when they went on to speculate about the earth’s centre, and discussed several of the theories that had been advanced respecting it, he seemed not to hear; it was evident his thoughts were far away.

Among other opinions put forth was one in our own days, which greatly excited Altamont’s surprise. It was held that there was an immense opening at the poles which led into the heart of the earth, and that it was out of the opening that the light of the Aurora Borealis streamed. This was gravely stated, and Captain Synness, a countryman of our own, actually proposed that Sir Humphrey Davy, Humboldt, and Arago should undertake an expedition through it, but they refused."

"And quite right too," said Altamont.

"So say I; but you see, my friends, what absurdities imagination has conjured up about these regions, and how, sooner or later, the simple reality comes to light."

CHAPTER XXIV.

MOUNT HATTERAS.

After this conversation they all made themselves as comfortable as they could, and lay down to sleep.

All, except Hatteras; and why could this extraordinary man not sleep like the others?

Was not the purpose of his life attained now? Had he not realized his most daring project? Why could he not rest? Indeed, might not one have supposed that, after the strain his nervous system had undergone, he would long for rest?

But no, he grew more and more excited, and it was not the thought of returning that so affected him. Was he bent on going farther still? Had his passion for travel no limits? Was the world too small for him now he had circumnavigated it.

Whatever might be the cause, he could not sleep; yet this first night at the Pole was clear and calm. The isle was absolutely uninhabited—not a bird was to be seen in this burning atmosphere, not an animal on these scoriae-covered rocks, not a fish in these seething waters. Next morning, when Altamont, and the others awoke, Hatteras was gone. Feeling uneasy at his absence, they hurried out of the grotto in search of him.

[Caption: Illustration: There he was standing on a rock, gazing fixedly at the top of the mountain.—P.242]

There he was standing on a rock, gazing fixedly at the top of the mountain. His instruments were in his hand,
and he was evidently calculating the exact longitude and latitude.

The Doctor went towards him and spoke, but it was long before he could rouse him from his absorbing contemplations. At last the captain seemed to understand, and Clawbonny said, while he examined him with a keen scrutinizing glance—

"Let us go round the island. Here we are, all ready for our last excursion."

"The last!" repeated Hatteras, as if in a dream. "Yes!, the last truly, but," he added, with more animation, "the most wonderful."

He pressed both hands on his brow as he spoke, as if to calm the inward tumult.

Just then Altamont and the others came up, and their appearance seemed to dispel the hallucinations under which he was labouring.

"My friends," he said, in a voice full of emotion, "thanks for your courage, thanks for your perseverance, thanks for your superhuman efforts, through which we are permitted to set our feet on this soil."

"Captain," said Johnson, "we have only obeyed orders to you alone belongs the honour."

"No, no!" exclaimed Hatteras, with a violent outburst of emotion, "to all of you as much as to me! To Altamont as much as any of us, as much as the Doctor himself! Oh, let my heart break in your hands, it cannot contain its joy and gratitude any longer."

He grasped the hands of his brave companions as he spoke, and paced up and down as if he had lost all self-control.

"We have only done our duty as Englishmen," said Bell.

"And as friends," added Clawbonny.

"Yes, but all did not do it," replied Hatteras "some gave way. However, we must pardon them—pardon both the traitors and those who were led away by them. Poor fellows! I forgive them. You hear me, Doctor?"

"Yes," replied Clawbonny, beginning to be seriously uneasy at his friend's excitement.

"I have no wish, therefore," continued the captain, "that they should lose the little fortune they came so far to seek. No, the original agreement is to remain unaltered, and they shall be rich—if they ever see England again."

It would have been difficult not to have been touched by the pathetic tone of voice in which Hatteras said this.

"But, captain," interrupted Johnson, trying to joke, "one would think you were making your will!"

"Perhaps I am," said Hatteras, gravely.

"And yet you have a long bright career of glory before you!"

"Who knows?" was the reply.

No one answered, and the Doctor did not dare to guess his meaning; but Hatteras soon made them understand it, for presently he said, in a hurried, agitated manner, as if he could scarcely command himself—

"Friends, listen to me. We have done much already, but much yet remains to be done."

His companions heard him with profound astonishment.

"Yes," he resumed, "we are close to the Pole, but we are not on it."

"How do you make that out," said Altamont.

"Yes," replied Hatteras, with vehemence, "I said an Englishman should plant his foot on the Pole of the world! I said it, and an Englishman shall."

"What!" cried Clawbonny.

"We are still 45° from the unknown point," resumed Hatteras, with increasing animation, "and to that point I shall go."

"But it is on the summit of the volcano," said the Doctor.

"I shall go."

"It is an inaccessible cone!"

"I shall go."

"But it is a yawning fiery crater!"

"I shall go."

The tone of absolute determination in which Hatteras pronounced these words it is impossible to describe.

His friends were stupefied, and gazed in terror at the blazing mountain.

At last the Doctor recovered himself, and began to urge and entreat Hatteras to renounce his project. He tried every means his heart dictated, from humble supplications to friendly threats; but he could gain nothing—a sort of frenzy had come over the captain, an absolute monomania about the Pole.

Nothing but violent measures would keep him back from destruction, but the Doctor was unwilling to employ these unless driven to extremity.

He trusted, moreover, that physical impossibilities, insuperable obstacles would bar his further progress, and meantime finding all protestations were useless, he simply said—
"Very well, since you are bent on it, we’ll go too."
"Yes," replied Hatteras, "half-way up the mountain, but not a step beyond. You know you have to carry back to England the duplicate of the document in the cairn——"
"Yes; but——"
"It is settled," said Hatteras, in an imperious tone; "and since the prayers of a friend will not suffice, the captain commands."

The Doctor did not insist longer, and a few minutes after the little band set out, accompanied by Duk.

It was about eight o’clock when they commenced their difficult ascent; the sky was splendid, and the thermometer stood at 52°.

Hatteras and his dog went first, closely followed by the others.

"I am afraid," said Johnson to the Doctor.
"No, no, there’s nothing to be afraid of; we are here."

This singular little island appeared to be of recent formation, and was evidently the product of successive volcanic eruptions. The rocks were all lying loose on the top of each other, and it was a marvel how they preserved their equilibrium. Strictly speaking, the mountain was only a heap of stones thrown down from a height, and the mass of rocks which composed the island had evidently come out of the bowels of the earth.

The earth, indeed, may be compared to a vast cauldron of spherical form, in which, under the influence of a central fire, immense quantities of vapours are generated, which would explode the globe but for the safety-valves outside.

These safety-valves are volcanoes, when one closes another opens; and at the Poles where the crust of the earth is thinner, owing to its being flattened, it is not surprising that a volcano should be suddenly formed by the upheaving of some part of the ocean-bed.

The Doctor, while following Hatteras, was closely following all the peculiarities of the island, and he was further confirmed in his opinion as to its recent formation by the absence of water. Had it existed for centuries, the thermal springs would have flowed from its bosom.

As they got higher, the ascent became more and more difficult, for the flanks of the mountain were almost perpendicular, and it required the utmost care to keep them from falling. Clouds of scoræ and ashes would whirl round them repeatedly, threatening them with asphyxia, or torrents of lava would bar their passage. In parts where these torrents ran horizontally, the outside had become hardened; while underneath was the boiling lava, and every step the travellers took had first to be tested with the iron-tipped staff to avoid being suddenly plunged into the scalding liquid.

At intervals large fragments of red-hot rock were thrown up from the crater, and burst in the air like bomb-shells, scattering the debris to enormous distances in all directions.

Hatteras, however, climbed up the steepest ascents with surprising agility, disdaining the help of his staff.

He arrived before long at a circular rock, a sort of plateau about ten feet wide. A river of boiling lava surrounded it, except in one part, where it forked away to a higher rock, leaving a narrow passage, through which Hatteras fearlessly passed.

Here he stopped, and his companions managed to rejoin him. He seemed to be measuring with his eye the distance he had yet to get over. Horizontally, he was not more than two hundred yards from the top of the crater, but vertically he had nearly three times that distance to traverse.

The ascent had occupied three hours already. Hatteras showed no signs of fatigue, while the others were almost spent.

The summit of the volcano appeared inaccessible, and the Doctor determined at any price to prevent Hatteras from attempting to proceed. He tried gentle means first, but the captain’s excitement was fast becoming delirium. During their ascent, symptoms of insanity had become more and more marked, and no one could be surprised who knew anything of his previous history.

"Hatteras," said the Doctor, "it is enough! we cannot go further!"
"Stop, then," he replied, in a strangely altered voice; "I am going higher."
"No, it is useless; you are at the Pole already."
"No, no! higher, higher!"
"My friend, do you know who is speaking to you? It is I, Doctor Clawbonny."
"Higher, higher!" repeated the madman.
"Very well, we shall not allow it—that is all."

He had hardly uttered the words before Hatteras, by a superhuman effort, sprang over the boiling lava, and was beyond the reach of his companions.

A cry of horror burst from every lip, for they thought the poor captain must have perished in that fiery gulf; but
there he was safe on the other side, accompanied by his faithful Duk, who would not leave him.

He speedily disappeared behind a curtain of smoke, and they heard his voice growing fainter in the distance, shouting—

"To the north! to the north! to the top of Mount Hatteras! Remember Mount Hatteras!"

All pursuit of him was out of the question; it was impossible to leap across the fiery torrent, and equally impossible to get round it. Altamont, indeed, was mad enough to make an attempt, and would certainly have lost his life if the others had not held him back by main force.

"Hatteras! Hatteras!" shouted the Doctor, but no response was heard save the faint bark of Duk.

At intervals, however, a glimpse of him could be caught through the clouds of smoke and showers of ashes. Sometimes his head, sometimes his arm appeared; then he was out of sight again, and a few minutes later was seen higher up clinging to the rocks. His size constantly decreased with the fantastic rapidity of objects rising upwards in the air. In half-an-hour he was only half his size.

The air was full of the deep rumbling noise of the volcano, and the mountain shook and trembled. From time to time a loud fail was heard behind, and the travellers would see some enormous rock rebounding from the heights to engulf itself in the polar basin below.

[Illustration: Hatteras did not even turn once to look back, but marched straight on, carrying his country’s flag attached to his staff.—P.249]

Hatteras did not even turn once to look back, but marched straight on, carrying his country’s flag attached to his staff. His terrified friends watched every movement, and saw him gradually decrease to microscopic dimensions, while Duk looked no larger than a big rat.

Then came a moment of intense anxiety, for the wind beat down on them an immense sheet of flame, and they could see nothing but the red glare. A cry of agony escaped the Doctor; but an instant afterwards Hatteras reappeared, waving his flag.

For a whole hour this fearful spectacle went on—an hour of battle with unsteady loose rocks and quagmires of ashes, where the foolhardy climber sank up to his waist. Sometimes they saw him hoist himself up by leaning knees and loins against the rocks in narrow, intricate winding paths, and sometimes he would be hanging on by both hands to some sharp crag, swinging to and fro like a withered tuft.

[Illustration: ]

At last he reached the summit of the mountain, the mouth of the crater. Here the Doctor hoped the infatuated man would stop, at any rate, and would, perhaps, recover his senses, and expose himself to no more danger than the descent involved.

Once more he shouted—

"Hatteras! Hatteras!"

There was such a pathos of entreaty in his tone that Altamont felt moved to his inmost soul.

"I’ll save him yet!" he exclaimed; and before Clawbonny could hinder him, he had cleared with a bound the torrent of fire, and was out of sight among the rocks.

Meantime, Hatteras had mounted a rock which overhung the crater, and stood waving his flag amidst showers of stones which rained down on him. Duk was by his side; but the poor beast was growing dizzy in such close proximity to the abyss.

Hatteras balanced his staff in one hand, and with the other sought to find the precise mathematical point where all the meridians of the globe meet, the point on which it was his sublime purpose to plant his foot.

All at once the rock gave way, and he disappeared. A cry of horror broke from his companions, and rang to the top of the mountain. Clawbonny thought his friend had perished, and lay buried for ever in the depths of the volcano. A second—only a second, though it seemed an age—elapsed, and there was Altamont and the dog holding the ill-fated Hatteras! Man and dog had caught him at the very moment when he disappeared in the abyss.

Hatteras was saved! Saved in spite of himself; and half-an-hour later he lay unconscious in the arms of his despairing companions.

When he came to himself, the Doctor looked at him in speechless anguish, for there was no glance of recognition in his eye. It was the eye of a blind man, who gazes without seeing.

"Good heavens!" exclaimed Johnson; "he is blind!"

"No," replied Clawbonny, "no! My poor friends, we have only saved the body of Hatteras; his soul is left behind on the top of the volcano. His reason is gone!"

"Insane!" exclaimed Johnson and Altamont, in consternation.

"Insane!" replied the Doctor, and the big tears ran down his cheeks.

CHAPTER XXV.

RETURN SOUTH.
Three hours after this sad dénouement of the adventures of Captain Hatteras, the whole party were back once more in the grotto.

Clawbonny was asked his opinion as to what was best to be done.
"Well, friends," he said, "we cannot stay longer in this island; the sea is open, and we have enough provisions. We ought to start at once, and get back without the least delay to Fort Providence, where we must winter."
"That is my opinion, too," said Altamont. "The wind is favourable, so to-morrow we will get to sea."

The day passed in profound dejection. The insanity of the captain was a bad omen and when they began to talk over the return voyage, their hearts failed them for fear. They missed the intrepid spirit of their leader.

However, like brave men, they prepared to battle anew with the elements and with themselves, if ever they felt inclined to give way.

Next morning they made all ready to sail, and brought the tent and all its belongings on board.

But before leaving these rocks, never to return, the Doctor carrying out the intentions of Hatteras, had a cairn erected on the very spot where the poor fellow had jumped ashore. It was made of great blocks placed one on the top of the other, so as to be a landmark perfectly visible while the eruptions of the volcano left it undisturbed. On one of the side stones, Bell chiselled the simple inscription—

JOHN HATTERAS.

The duplicate of the document attesting the discovery of the North Pole was enclosed in a tinned iron cylinder, and deposited in the cairn, to remain as a silent witness among those desert rocks.

This done, the four men and the captain, a poor body without a soul, set out on the return voyage, accompanied by the faithful Duk, who had become sad and downcast. A new sail was manufactured out of the tent, and about ten o’clock, the little sloop sailed out before the wind.

She made a quick passage, finding abundance of open water. It was certainly easier to get away from the Pole than to get to it.

But Hatteras knew nothing that was passing around him. He lay full length in the boat, perfectly silent, with lifeless eye and folded arms, and Duk lying at his feet. Clawbonny frequently addressed him, but could elicit no reply.

On the 15th they sighted Altamont Harbour, but as the sea was open all along the coast, they determined to go round to Victoria Bay by water, instead of crossing New America in the sledge.

The voyage was easy and rapid. In a week they accomplished what had taken a fortnight in the sledge, and on the 23rd they cast anchor in Victoria Bay.

As soon as the sloop was made fast, they all hastened to Fort Providence. But what a scene of devastation met their eyes! Doctor’s House, stores, powder-magazine, fortifications, all had melted away, and the provisions had been ransacked by devouring animals.

The navigators had almost come to the end of their supplies, and had been reckoning on replenishing their stores at Fort Providence. The impossibility of wintering there now was evident, and they decided to get to Baffin’s Bay by the shortest route.

"We have no alternative," said Clawbonny; "Baffin’s Bay is not more than six hundred miles distant. We can sail as long as there is water enough under our sloop, and get to Jones’ Sound, and then on to the Danish settlements."

"Yes," said Altamont; "let us collect what food remains, and be off at once."

After a thorough search, a few cases of pemmican were found scattered here and there, and two barrels of preserved meat, altogether enough for six weeks, and a good supply of powder. It was soon collected and brought on board, and the remainder of the day was employed in caulking the sloop and putting her in good trim.

Next morning they put out once more to sea. The voyage presented no great difficulties, the drift-ice being easily avoided; but still the Doctor thought it advisable, in case of possible delays, to limit the rations to one-half. This was no great hardship, as there was not much work for anyone to do, and all were in perfect health.

Besides, they found a little shooting, and brought down ducks, and geese, and guillemots, or sea turtledoves. Water they were able to supply themselves with in abundance, from the fresh-water icebergs they constantly fell in with as they kept near the coast, not daring to venture out to the open sea in so frail a barque.

At that time of the year, the thermometer was already constantly below freezing point. The frequent rains changed to snow, and the weather became gloomy. Each day the sun dipped lower below the horizon, and on the 30th, for a few minutes, he was out of sight altogether.

However, the little sloop sailed steadily on without stopping an instant. They knew what fatigues and obstacles a land journey involved, if they should be forced to adopt it, and no time was to be lost, for soon the open water would harden to firm ground; already the young ice had begun to form. In these high latitudes there is neither spring nor autumn; winter follows close on the heels of summer.
On the 31st the first stars glimmered overhead, and from that time forwards there was continual fog, which considerably impeded navigation.

The Doctor became very uneasy at these multiplied indications of approaching winter. He knew the difficulties Sir John Ross had to contend with after he left his ship to try and reach Baffin’s Bay, and how, after all, he was compelled to return and pass a fourth winter on board. It was bad enough with shelter and food and fuel, but if any such calamity befell the survivors of the Forward, if they were obliged to stop or return, they were lost.

The Doctor said nothing of his anxieties to his companions, but only urged them to get as far east as possible.

At last, after thirty days’ tolerably quick sailing, and after battling for forty-eight hours against the increasing drift ice, and risking the frail sloop a hundred times, the navigators saw themselves blocked in on all sides. Further progress was impossible, for the sea was frozen in every direction, and the thermometer was only 15° above zero.

Altamont made a reckoning with scrupulous precision, and found they were in 77°15’ latitude, and 85° 2’ longitude.

"This is our exact position then," said the Doctor. "We are in South Lincoln, just at Cape Eden, and are entering Jones’ Sound. With a little more good luck, we should have found open water right to Baffin’s Bay. But we must not grumble. If my poor Hatters had found as navigable a sea at first, he would have soon reached the Pole. His men would not have deserted him, and his brain would not have given way under the pressure of terrible trial."

"I suppose, then," said Altamont, "our only course is to leave the sloop, and get by sledge to the east coast of Lincoln."

"Yes; but I think we should go through Jones’ Sound, and get to South Devon instead of crossing Lincoln."

"Why?"

"Because the nearer we get to Lancaster Sound, the more chance we have of meeting whalers."

"You are right; but I question whether the ice is firm enough to make it practicable."

"We’ll try," replied Clawbonny.

The little vessel was unloaded, and the sledge put together again. All the parts were in good condition, so the next day the dogs were harnessed, and they started off along the coast to reach the ice-field; but Altamont’s opinion proved right. They could not get through Jones’ Sound, and were obliged to follow the coast to Lincoln.

At last, on the 24th, they set foot on North Devon.

"Now," said Clawbonny, "we have only to cross this, and get to Cape Warender at the entrance to Lancaster Sound."

But the weather became frightful, and very cold. The snow-storms and tempests returned with winter violence, and the travellers felt too weak to contend with them. Their stock of provisions was almost exhausted, and rations had to be reduced now to a third, that the dogs might have food enough to keep them in working condition.

The nature of the ground added greatly to the fatigue. North Devon is extremely wild and rugged, and the path across the Trauter mountains is through difficult gorges. The whole party—men, and dogs, and sledge alike—were frequently forced to stop, for they could not struggle on against the fury of the elements. More than once despair crept over the brave little band, hardy as they were, and used to Polar sufferings. Though scarcely aware of it themselves, they were completely worn out, physically and mentally.

It was not till the 30th of August that they emerged from these wild mountains into a plain, which seemed to have been upturned and convulsed by volcanic action at some distant period.

Here it was absolutely necessary to take a few days’ rest, for the travellers could not drag one foot after the other, and two of the dogs had died from exhaustion. None of the party felt equal to put up the tent, so they took shelter behind an iceberg.

Provisions were now so reduced, that, notwithstanding their scanty rations, there was only enough left for one week. Starvation stared the poor fellows in the face.

Altamont, who had displayed great unselfishness and devotion to the others, roused his sinking energies, and determined to go out and find food for his comrades.

He took his gun, called Duk, and went off almost unnoticed by the rest.

He had been absent about an hour, and only once during that time had they heard the report of his gun; and now he was coming back empty-handed, but running as if terrified.

"What is the matter?" asked the Doctor.

"Down there, under the snow!" said Altamont, speaking as if scared, and pointing in a particular direction.

"What?"

"A whole party of men!"

"Alive?"
"Dead—frozen—and even—"
He did not finish the sentence, but a look of unspeakable horror came over his face.

The Doctor and the others were so roused by this incident, that they managed to get up and drag themselves after Altamont towards the place he indicated.

They soon arrived, at a narrow part at the bottom of a ravine, and what a spectacle met their gaze! Dead bodies, already stiff, lay half-buried in a winding-sheet of snow. A leg visible here, an arm there, and yonder shrunken hands and rigid faces, stamped with the expression of rage and despair.

The Doctor stooped down to look at them more closely, but instantly started back pale and agitated, while Duk barked ominously.

"Horrible, horrible!" he said.
"What is it?" asked Johnson.
"Don't you recognize them?"
"What do you mean?"
"Look and see!"

It was evident this ravine had been but recently the scene of a fearful straggle with cold, and despair, and starvation, for by certain horrible remains it was manifest that the poor wretches had been feeding on human flesh, perhaps while still warm and palpitating; and among them the Doctor recognized Shandon, Pen, and the ill-fated crew of the Forward! Their strength had failed; provisions had come to an end; their boat had been broken, perhaps by an avalanche or engulfed in some abyss, and they could not take advantage of the open sea; or perhaps they had lost their way in wandering over these unknown continents. Moreover, men who set out under the excitement of a revolt were not likely to remain long united. The leader of a rebellion has but a doubtful power, and no doubt Shandon’s authority had been soon cast off.

Be that as it might, it was evident the crew had come through agonies of suffering and despair before this last terrible catastrophe, but the secret of their miseries is buried with them beneath the polar snows.

"Come away! come away!" said the Doctor, dragging his companions from the scene. Horror gave them momentary strength, and they resumed their march without stopping a minute longer.

CHAPTER XXVI.
CONCLUSION.

It would be useless to enumerate all the misfortunes which befell the survivors of the expedition. Even the men themselves were never able to give any detailed narrative of the events which occurred during the week subsequent to the horrible discovery related in the last chapter. However, on the 9th of September, by superhuman exertions, they arrived at last at Cape Horsburg, the extreme point of North Devon.

They were absolutely starving. For forty-eight hours they had tasted nothing, and their last meal had been off the flesh of their last Esquimaux dog. Bell could go no further, and Johnson felt himself dying.

They were on the shore of Baffin’s Bay, now half-frozen over; that is to say, on the road to Europe, and three miles off the waves were dashing noiselessly on the sharp edges of the ice-field.

Here they must wait their chance of a whaler appearing; and for how long?

But Heaven pitied the poor fellows, for the very next day Altamont distinctly perceived a sail on the horizon. Every one knows the torturing suspense that follows such an appearance, and the agonizing dread lest it should prove a false hope. The vessel seems alternately to approach and recede, and too often just at the very moment when the poor castaways think they are saved, the sail begins to disappear, and is soon out of sight.

[Illustration: Two hours later, after unheard-of exertions, the survivors of the Forward were picked up by the Hans Christian.—P.266]

The Doctor and his companions went through all these experiences. They had succeeded in reaching the western boundary of the ice-field by carrying and pushing each other along, and they watched the ship gradually fade away from view without observing them, in spite of their loud cries for help.

Just then a happy inspiration came to the Doctor. His fertile genius, which had served him many a time in such good stead, supplied him with one last idea!

A floe driven by the current struck against the icefield, and Clawbonny exclaimed, pointing to it—
"This floe!"

His companions could not understand what he meant.
"Let us embark on it! let us embark on it!"
"Oh! Mr. Clawbonny, Mr. Clawbonny," said Johnson, pressing his hand.

Bell, assisted by Altamont, hurried to the sledge, and brought back one of the poles, which he stuck fast on the ice like a mast, and fastened it with ropes. The tent was torn up to furnish a sail, and as soon as the frail raft was ready the poor fellows jumped upon it, and sailed out to the open sea.
Two hours later, after unheard-of exertions, the survivors of the Forward were picked up by the Hans Christian, a Danish whaler, on her way to Davis’ Straits. They were more like spectres than human beings, and the sight of their sufferings was enough. It told its own tale; but the captain received them with such hearty sympathy, and lavished on them such care and kindness, that he succeeded in keeping them alive.

Ten days afterwards, Clawbonny, Johnson, Bell, Altamont, and Captain Hatteras landed at Korsam, in Zealand, an island belonging to Denmark. They took the steamer to Kiel, and from there proceeded by Altona and Hamburg to London, where they arrived on the 13th of the same month, scarcely recovered after their long sufferings.

The first care of Clawbonny was to request the Royal Geographical Society to receive a communication from him. He was accordingly admitted to the next séance, and one can imagine the astonishment of the learned assembly and the enthusiastic applause produced by the reading of Hatteras’ document.

The English have a passion for geographical discovery, from the lord to the cockney, from the merchant down to the dock labourer, and the news of this grand discovery speedily flashed along the telegraph wires, throughout the length and breadth of the kingdom. Hatteras was lauded as a martyr by all the newspapers, and every Englishman felt proud of him.

The Doctor and his companions had the honour of being presented to the Queen by the Lord Chancellor, and they were feted and "lionized" in all quarters.

The Government confirmed the names of "Queen’s Island," "Mount Hatteras," and "Altamont Harbour."

Altamont would not part from his companions in misery and glory, but followed them to Liverpool, where they were joyously welcomed back, after being so long supposed dead and buried beneath the eternal snows.

But Dr. Clawbonny would never allow that any honour was due to himself. He claimed all the merit of the discovery for his unfortunate captain, and in the narrative of his voyage, published the next year under the auspices of the Royal Geographical Society, he places John Hatteras on a level with the most illustrious navigators, and makes him the compeer of all the brave, daring men who have sacrificed themselves for the progress of science.

The insanity of this poor victim of a sublime passion was of a mild type, and he lived quietly at Sten Cottage, a private asylum near Liverpool, where the Doctor himself had placed him. He never spoke, and understood nothing that was said to him; reason and speech had fled together. The only tie that connected him with the outside world was his friendship for Duk, who was allowed to remain with him.

For a considerable time the captain had been in the habit of walking in the garden for hours, accompanied by his faithful dog, who watched him with sad, wistful eyes, but his promenade was always in one direction in a particular part of the garden. When he got to the end of this path, he would stop and begin to walk backwards. If anyone stopped him he would point with his finger towards a certain part of the sky, but let anyone attempt to turn him round, and he became angry, while Duk, as if sharing his master’s sentiments, would bark furiously.

The Doctor, who often visited his afflicted friend, noticed this strange proceeding one day, and soon understood the reason of it. He saw how it was that he paced so constantly in a given direction, as if under the influence of some magnetic force.

This was the secret: John Hatteras invariably walked towards the North.

The End.

CHAPTER I THE SHARK

ON the 26th of July, 1864, a magnificent yacht was steaming along the North Channel at full speed, with a strong breeze blowing from the N. E. The Union Jack was flying at the mizzen-mast, and a blue standard bearing the initials E. G., embroidered in gold, and surmounted by a ducal coronet, floated from the topgallant head of the main-mast. The name of the yacht was the DUNCAN, and the owner was Lord Glenarvan, one of the sixteen Scotch peers who sit in the Upper House, and the most distinguished member of the Royal Thames Yacht Club, so famous throughout the United Kingdom.

Lord Edward Glenarvan was on board with his young wife, Lady Helena, and one of his cousins, Major McNabbs.

The DUNCAN was newly built, and had been making a trial trip a few miles outside the Firth of Clyde. She was
returning to Glasgow, and the Isle of Arran already loomed in the distance, when the sailor on watch caught sight of
an enormous fish sporting in the wake of the ship. Lord Edward, who was immediately apprised of the fact, came up
on the poop a few minutes after with his cousin, and asked John Mangles, the captain, what sort of an animal he
thought it was.

"Well, since your Lordship asks my opinion," said Mangles, "I think it is a shark, and a fine large one too."

"A shark on these shores!"

"There is nothing at all improbable in that," returned the captain. "This fish belongs to a species that is found in
all latitudes and in all seas. It is the 'balance-fish,' or hammer-headed shark, if I am not much mistaken. But if your
Lordship has no objections, and it would give the smallest pleasure to Lady Helena to see a novelty in the way of
fishing, we'll soon haul up the monster and find out what it really is."

"What do you say, McNabbs? Shall we try to catch it?" asked Lord Glenarvan.

"If you like; it's all one to me," was his cousin's cool reply.

"The more of those terrible creatures that are killed the better, at all events," said John Mangles, "so let's seize
the chance, and it will not only give us a little diversion, but be doing a good action."

"Very well, set to work, then," said Glenarvan.

Lady Helena soon joined her husband on deck, quite charmed at the prospect of such exciting sport. The sea was
splendid, and every movement of the shark was distinctly visible. In obedience to the captain's orders, the sailors
threw a strong rope over the starboard side of the yacht, with a big hook at the end of it, concealed in a thick lump of
bacon. The bait took at once, though the shark was full fifty yards distant. He began to make rapidly for the yacht,
beating the waves violently with his fins, and keeping his tail in a perfectly straight line. As he got nearer, his great
projecting eyes could be seen inflamed with greed, and his gaping jaws with their quadruple row of teeth. His head
was large, and shaped like a double hammer at the end of a handle. John Mangles was right. This was evidently a
balance-fish-- the most voracious of all the SQUALIDAE species.

The passengers and sailors on the yacht were watching all the animal's movements with the liveliest interest. He
soon came within reach of the bait, turned over on his back to make a good dart at it, and in a second bacon and
contents had disappeared. He had hooked himself now, as the tremendous jerk he gave the cable proved, and the
sailors began to haul in the monster by means of tackle attached to the mainyard. He struggled desperately, but his
captors were prepared for his violence, and had a long rope ready with a slip knot, which caught his tail and
rendered him powerless at once. In a few minutes more he was hoisted up over the side of the yacht and thrown on
the deck. A man came forward immediately, hatchet in hand, and approaching him cautiously, with one powerful
stroke cut off his tail.

This ended the business, for there was no longer any fear of the shark. But, though the sailors' vengeance was
satisfied, their curiosity was not; they knew the brute had no very delicate appetite, and the contents of his stomach
might be worth investigation. This is the common practice on all ships when a shark is captured, but Lady Glenarvan
deprecated to be present at such a disgusting exploration, and withdrew to the cabin again. The fish was still breathing;
it measured ten feet in length, and weighed more than six hundred pounds. This was nothing extraordinary, for
though the hammer-headed shark is not classed among the most gigantic of the species, it is always reckoned among
the most formidable.

The huge brute was soon ripped up in a very unceremonious fashion. The hook had fixed right in the stomach,
which was found to be absolutely empty, and the disappointed sailors were just going to throw the remains
overboard, when the boatswain's attention was attracted by some large object sticking fast in one of the viscera.

"I say! what's this?" he exclaimed.

"That!" replied one of the sailors, "why, it's a piece of rock the beast swallowed by way of ballast."

"It's just a bottle, neither more nor less, that the fellow has got in his inside, and couldn't digest," said another of
the crew.

"Hold your tongues, all of you!" said Tom Austin, the mate of the DUNCAN. "Don't you see the animal has
been such an invertebrate tippler that he has not only drunk the wine, but swallowed the bottle?"

"What!" said Lord Glenarvan. "Do you mean to say it is a bottle that the shark has got in his stomach."

"Ay, it is a bottle, most certainly," replied the boatswain, "but not just from the cellar."

"Well, Tom, be careful how you take it out," said Lord Glenarvan, "for bottles found in the sea often contain
precious documents."

"Do you think this does?" said Major McNabbs, incredulously.

"It possibly may, at any rate."

"Oh! I'm not saying it doesn't. There may perhaps be some secret in it," returned the Major.

"That's just what we're to see," said his cousin. "Well, Tom."

"Here it is," said the mate, holding up a shapeless lump he had managed to pull out, though with some difficulty.
"Get the filthy thing washed then, and bring it to the cabin."

Tom obeyed, and in a few minutes brought in the bottle and laid it on the table, at which Lord Glenarvan and the Major were sitting ready with the captain, and, of course Lady Helena, for women, they say, are always a little curious. Everything is an event at sea. For a moment they all sat silent, gazing at this frail relic, wondering if it told the tale of sad disaster, or brought some trifling message from a frolic-loving sailor, who had flung it into the sea to amuse himself when he had nothing better to do.

However, the only way to know was to examine the bottle, and Glenarvan set to work without further delay, so carefully and minutely, that he might have been taken for a coroner making an inquest.

He commenced by a close inspection of the outside. The neck was long and slender, and round the thick rim there was still an end of wire hanging, though eaten away with rust. The sides were very thick, and strong enough to bear great pressure. It was evidently of Champagne origin, and the Major said immediately, "That's one of our Clicquot's bottles."

Nobody contradicted him, as he was supposed to know; but Lady Helena exclaimed, "What does it matter about the bottle, if we don't know where it comes from?"

"We shall know that, too, presently, and we may affirm this much already-- it comes from a long way off. Look at those petrifactions all over it, these different substances almost turned to mineral, we might say, through the action of the salt water! This waif had been tossing about in the ocean a long time before the shark swallowed it."

"I quite agree with you," said McNabbs. "I dare say this frail concern has made a long voyage, protected by this strong covering."

"But I want to know where from?" said Lady Glenarvan.

"Wait a little, dear Helena, wait; we must have patience with bottles; but if I am not much mistaken, this one will answer all our questions," replied her husband, beginning to scrape away the hard substances round the neck. Soon the cork made its appearance, but much damaged by the water.

"That's vexing," said Lord Edward, "for if papers are inside, they'll be in a pretty state!"

"It's to be feared they will," said the Major.

"But it is a lucky thing the shark swallowed them, I must say," added Glenarvan, "for the bottle would have sunk to the bottom before long with such a cork as this."

"That's true enough," replied John Mangles, "and yet it would have been better to have fished them up in the open sea. Then we might have found out the road they had come by taking the exact latitude and longitude, and studying the atmospheric and submarine currents; but with such a postman as a shark, that goes against wind and tide, there's no clew whatever to the starting-point."

"We shall see," said Glenarvan, gently taking out the cork. A strong odor of salt water pervaded the whole saloon, and Lady Helena asked impatiently: "Well, what is there?"

"I was right!" exclaimed Glenarvan. "I see papers inside. But I fear it will be impossible to remove them," he added, "for they appear to have rotted with the damp, and are sticking to the sides of the bottle."

"Break it," said the Major.

"I would rather preserve the whole if I could."

"No doubt you would," said Lady Helena; "but the contents are more valuable than the bottle, and we had better sacrifice the one than the other."

"If your Lordship would simply break off the neck, I think we might easily withdraw the papers," suggested John Mangles.

"Try it, Edward, try it," said Lady Helena.

Lord Glenarvan was very unwilling, but he found there was no alternative; the precious bottle must be broken. They had to get a hammer before this could be done, for the stony material had acquired the hardness of granite. A few sharp strokes, however, soon shivered it to fragments, many of which had pieces of paper sticking to them. These were carefully removed by Lord Glenarvan, and separated and spread out on the table before the eager gaze of his wife and friends.

CHAPTER II THE THREE DOCUMENTS

All that could be discovered, however, on these pieces of paper was a few words here and there, the remainder of the lines being almost completely obliterated by the action of the water. Lord Glenarvan examined them attentively for a few minutes, turning them over on all sides, holding them up to the light, and trying to decipher the least scrap of writing, while the others looked on with anxious eyes. At last he said: "There are three distinct documents here, apparently copies of the same document in three different languages. Here is one in English, one in French, and one in German."

"But can you make any sense out of them?" asked Lady Helena.

"That's hard to say, my dear Helena, the words are quite incomplete."

"But I want to know where from?" said Lady Glenarvan.

"Wait a little, dear Helena, wait; we must have patience with bottles; but if I am not much mistaken, this one will answer all our questions," replied her husband, beginning to scrape away the hard substances round the neck. Soon the cork made its appearance, but much damaged by the water.

"That's vexing," said Lord Edward, "for if papers are inside, they'll be in a pretty state!"

"It's to be feared they will," said the Major.

"But it is a lucky thing the shark swallowed them, I must say," added Glenarvan, "for the bottle would have sunk to the bottom before long with such a cork as this."

"That's true enough," replied John Mangles, "and yet it would have been better to have fished them up in the open sea. Then we might have found out the road they had come by taking the exact latitude and longitude, and studying the atmospheric and submarine currents; but with such a postman as a shark, that goes against wind and tide, there's no clew whatever to the starting-point."

"We shall see," said Glenarvan, gently taking out the cork. A strong odor of salt water pervaded the whole saloon, and Lady Helena asked impatiently: "Well, what is there?"

"I was right!" exclaimed Glenarvan. "I see papers inside. But I fear it will be impossible to remove them," he added, "for they appear to have rotted with the damp, and are sticking to the sides of the bottle."

"Break it," said the Major.

"I would rather preserve the whole if I could."

"No doubt you would," said Lady Helena; "but the contents are more valuable than the bottle, and we had better sacrifice the one than the other."

"If your Lordship would simply break off the neck, I think we might easily withdraw the papers," suggested John Mangles.

"Try it, Edward, try it," said Lady Helena.

Lord Glenarvan was very unwilling, but he found there was no alternative; the precious bottle must be broken. They had to get a hammer before this could be done, for the stony material had acquired the hardness of granite. A few sharp strokes, however, soon shivered it to fragments, many of which had pieces of paper sticking to them. These were carefully removed by Lord Glenarvan, and separated and spread out on the table before the eager gaze of his wife and friends.

CHAPTER II THE THREE DOCUMENTS

All that could be discovered, however, on these pieces of paper was a few words here and there, the remainder of the lines being almost completely obliterated by the action of the water. Lord Glenarvan examined them attentively for a few minutes, turning them over on all sides, holding them up to the light, and trying to decipher the least scrap of writing, while the others looked on with anxious eyes. At last he said: "There are three distinct documents here, apparently copies of the same document in three different languages. Here is one in English, one in French, and one in German."

"But can you make any sense out of them?" asked Lady Helena.

"That's hard to say, my dear Helena, the words are quite incomplete."
"Perhaps the one may supplement the other," suggested Major McNabbs.

"Very likely they will," said the captain. "It is impossible that the very same words should have been effaced in each document, and by putting the scraps together we might gather some intelligible meaning out of them."

"That's what we will do," rejoined Lord Glenarvan; "but let us proceed methodically. Here is the English document first."

All that remained of it was the following:

62 _Bri gow sink stra aland skipp Gr that monit of long and ssistance lost_

"There's not much to be made out of that," said the Major, looking disappointed.

"No, but it is good English anyhow," returned the captain.

"There's no doubt of it," said Glenarvan. "The words SINK, ALAND, LOST are entire; SKIPP is evidently part of the word SKIPPER, and that's what they call ship captains often in England. There seems a Mr. Gr. mentioned, and that most likely is the captain of the shipwrecked vessel."

"Well, come, we have made out a good deal already," said Lady Helena.

"Yes, but unfortunately there are whole lines wanting," said the Major, "and we have neither the name of the ship nor the place where she was shipwrecked."

"We'll get that by and by," said Edward.

"Oh, yes; there is no doubt of it," replied the Major, who always echoed his neighbor's opinion. "But how?"

"By comparing one document with the other."

"Let us try them," said his wife.

The second piece of paper was even more destroyed than the first; only a few scattered words remained here and there.

It ran as follows:

7 Juni Glas zwei atrosen graus bringt ihnen

"This is written in German," said John Mangles the moment he looked at it.

"And you understand that language, don't you?" asked Lord Glenarvan.

"Perfectly."

"Come, then, tell us the meaning of these words."

The captain examined the document carefully, and said:

"Well, here's the date of the occurrence first: 7 Juni means June 7; and if we put that before the figures 62 we have in the other document, it gives us the exact date, 7th of June, 1862."

"Capital!" exclaimed Lady Helena. "Go on, John!"

"On the same line," resumed the young captain, "there is the syllable GLAS and if we add that to the GOW we found in the English paper, we get the whole word GLASGOW at once. The documents evidently refer to some ship that sailed out of the port of Glasgow." "That is my opinion, too," said the Major.

"The second line is completely effaced," continued the Captain; "but here are two important words on the third. There is ZWEI, which means TWO, and ATROSEN or MATROSEN, the German for SAILORS."

"Then I suppose it is about a captain and two sailors," said Lady Helena.

"It seems so," replied Lord Glenarvan.

"I must confess, your Lordship, that the next word puzzles me. I can make nothing of it. Perhaps the third document may throw some light on it. The last two words are plain enough. BRINGT IHNEN means BRING THEM; and, if you recollect, in the English paper we had SSISTANCE, so by putting the parts together, it reads thus, I think: 'BRING THEM ASSISTANCE.'"

"Yes, that must be it," replied Lord Glenarvan. "But where are the poor fellows? We have not the slightest indication of the place, meantime, nor of where the catastrophe happened."

"Perhaps the French copy will be more explicit," suggested Lady Helena.

"Here it is, then," said Lord Glenarvan, "and that is in a language we all know."

The words it contained were these:

troi ats tannia gonie austral abor contin pr cruel indi jete ongit et 37 degrees 11" LAT

"There are figures!" exclaimed Lady Helena. "Look!"

"Let us go steadily to work," said Lord Glenarvan, "and begin at the beginning. I think we can make out from the incomplete words in the first line that a three-mast vessel is in question, and there is little doubt about the name; we get that from the fragments of the other papers; it is the BRITANNIA. As to the next two words, GONIE and AUSTRAL, it is only AUSTRAL that has any meaning to us."

"But that is a valuable scrap of information," said John Mangles. "The shipwreck occurred in the southern hemisphere."

"That's a wide world," said the Major.
"Well, we'll go on," resumed Glenarvan. "Here is the word ABOR; that is clearly the root of the verb ABORDER. The poor men have landed somewhere; but where? CONTIN--does that mean continent? CRUEL!"

"CRUEL!" interrupted John Mangles. "I see now what GRAUS is part of in the second document. It is GRAUSAM, the word in German for CRUEL!"

"Let's go on," said Lord Glenarvan, becoming quite excited over his task, as the incomplete words began to fill up and develop their meaning. "INDI--is it India where they have been shipwrecked? And what can this word ONGIT be part of? Ah! I see--it is LONGITUDE; and here is the latitude, 37 degrees 11". That is the precise indication at last, then!"

"But we haven't the longitude," objected McNabbs.

"But we can't get everything, my dear Major; and it is something at all events, to have the exact latitude. The French document is decidedly the most complete of the three; but it is plain enough that each is the literal translation of the other, for they all contain exactly the same number of lines. What we have to do now is to put together all the words we have found, and translate them into one language, and try to ascertain their most probable and logical sense."

"Well, what language shall we choose?" asked the Major.

"I think we had better keep to the French, since that was the most complete document of the three."

"Your Lordship is right," said John Mangles, "and besides, we're all familiar with the language."

"Very well, then, I'll set to work."

In a few minutes he had written as follows:

7 Juin 1862 trois-mats Britannia Glasgow sombre gonie austral a terre deux matelots capitaine Gr abor contin pr cruel indi jete ce document de longitude et 37 degrees 11" de latitude Portez-leur secours perdus.

[7th of June, 1862 three-mast BRITANNIA Glasgow] foundered gonie southern on the coast two sailors Gr Captain landed contin pr cruel indi thrown this document in longitude and 37 degrees 11" latitude Bring them assistance lost

Just at that moment one of the sailors came to inform the captain that they were about entering the Firth of Clyde, and to ask what were his orders.

"What are your Lordship's intentions?" said John Mangles, addressing Lord Glenarvan.

"To get to Dunbarton as quickly as possible, John; and Lady Helena will return to Malcolm Castle, while I go on to London and lay this document before the Admiralty."

The sailor received orders accordingly, and went out to deliver them to the mate.

"Now, friends," said Lord Glenarvan, "let us go on with our investigations, for we are on the track of a great catastrophe, and the lives of several human beings depend on our sagacity. We must give our whole minds to the solution of this enigma."

"First of all, there are three very distinct things to be considered in this document--the things we know, the things we may conjecture, the things we do not know.""

"What are those we know? We know that on the 7th of June a three-mast vessel, the BRITANNIA of Glasgow, foundered; that two sailors and the captain threw this document into the sea in 37 degrees 11" latitude, and they entreat help."

"Exactly so," said the Major.

"What are those now we may conjecture?" continued Glenarvan. "That the shipwreck occurred in the southern seas; and here I would draw your attention at once to the incomplete word GONIE. Doesn't the name of the country strike you even in the mere mention of it?"

"Patagonia!" exclaimed Lady Helena.

"Undoubtedly."

"But is Patagonia crossed by the 37th parallel?" asked the Major.

"That is easily ascertained," said the captain, opening a map of South America. "Yes, it is; Patagonia just touches the 37th parallel. It cuts through Araucania, goes along over the Pampas to the north, and loses itself in the Atlantic."

"Well, let us proceed then with our conjectures. The two sailors and the captain LAND--land where? CONTIN--on a continent; on a continent, mark you, not an island. What becomes of them? There are two letters here providentially which give a clew to their fate--PR, that must mean prisoners, and CRUEL INDIAN is evidently the meaning of the next two words. These unfortunate men are captives in the hands of cruel Indians. Don't you see it? Don't the words seem to come of themselves, and fill up the blanks? Isn't the document quite clear now? Isn't the sense self-evident?"

Glenarvan spoke in a tone of absolute conviction, and his enthusiastic confidence appeared contagious, for the others all exclaimed, too, "Yes, it is evident, quite evident!"

After an instant, Lord Edward said again, "To my own mind the hypothesis is so plausible, that I have no doubt
whatever the event occurred on the coast of Patagonia, but still I will have inquiries made in Glasgow, as to the
destination of the BRITANNIA, and we shall know if it is possible she could have been wrecked on those shores."
"Oh, there's no need to send so far to find out that," said John Mangles. "I have the _Mercantile and Shipping
Gazette_ here, and we'll see the name on the list, and all about it."
"Do look at once, then," said Lord Glenarvan.

The file of papers for the year 1862 was soon brought, and John began to turn over the leaves rapidly, running
down each page with his eye in search of the name required. But his quest was not long, for in a few minutes he
called out: "I've got it! 'May 30, 1862, Peru-Callao, with cargo for Glasgow, the BRITANNIA, Captain Grant.'"
"Grant!" exclaimed Lord Glenarvan. "That is the adventurous Scotchman that attempted to found a new Scotland
on the shores of the Pacific."
"Yes," rejoined John Mangles, "it is the very man. He sailed from Glasgow in the BRITANNIA in 1861, and has
not been heard of since."
"There isn't a doubt of it, not a shadow of doubt," repeated Lord Glenarvan. "It is just that same Captain Grant.
The BRITANNIA left Callao on the 30th of May, and on the 7th of June, a week afterward, she is lost on the coast
of Patagonia. The few broken disjointed words we find in these documents tell us the whole story. You see, friends,
our conjectures hit the mark very well; we know all now except one thing, and that is the longitude."
"That is not needed now, we know the country. With the latitude alone, I would engage to go right to the place
where the wreck happened."
"Then have we really all the particulars now?" asked Lady Helena.
"All, dear Helena; I can fill up every one of these blanks the sea has made in the document as easily as if Captain
Grant were dictating to me."

And he took up the pen, and dashed off the following lines immediately: "On the 7th of June, 1862, the three-
mast vessel, BRITANNIA, of Glasgow, has sunk on the coast of Patagonia, in the southern hemisphere. Making for
the shore, two sailors and Captain Grant are about to land on the continent, where they will be taken prisoners by
cruel Indians. They have thrown this document into the sea, in longitude and latitude 37 degrees 11'. Bring them
assistance, or they are lost."
"Capital! capital! dear Edward," said Lady Helena. "If those poor creatures ever see their native land again, it is
you they will have to thank for it."
"And they will see it again," returned Lord Glenarvan; "the statement is too explicit, and clear, and certain for
England to hesitate about going to the aid of her three sons cast away on a desert coast. What she has done for
Franklin and so many others, she will do to-day for these poor shipwrecked fellows of the BRITANNIA."
"Most likely the unfortunate men have families who mourn their loss. Perhaps this ill-fated Captain Grant had a
wife and children," suggested Lady Helena.
"Very true, my dear, and I'll not forget to let them know that there is still hope. But now, friends, we had better
go up on deck, as the boat must be getting near the harbor."

A carriage and post-horses waited there, in readiness to convey Lady Helena and Major McNabbs to Malcolm
Castle, and Lord Glenarvan bade adieu to his young wife, and jumped into the express train for Glasgow.

But before starting he confided an important missive to a swifter agent than himself, and a few minutes
afterward it flashed along the electric wire to London, to appear next day in the _Times and Morning Chronicle_ in
the following words: "For information respecting the fate of the three-mast vessel BRITANNIA, of Glasgow,
Captain Grant, apply to Lord Glenarvan, Malcolm Castle, Luss, Dumbartonshire, Scotland."

CHAPTER III THE CAPTAIN'S CHILDREN

LORD GLENARVAN'S fortune was enormous, and he spent it entirely in doing good. His kindheartedness was
even greater than his generosity, for the one knew no bounds, while the other, of necessity, had its limits. As Lord of
Luss and "laird" of Malcolm, he represented his county in the House of Lords; but, with his Jacobite ideas, he did
d not care much for the favor of the House of Hanover, and he was looked upon coldly by the State party in England,
because of the tenacity with which he clung to the traditions of his forefathers, and his energetic resistance to the
political encroachments of Southerners. And yet he was not a man behind the times, and there was nothing little or
narrow-minded about him; but while always keeping open his ancestral county to progress, he was a true Scotchman
at heart, and it was for the honor of Scotland that he competed in the yacht races of the Royal Thames Yacht Club.

Edward Glenarvan was thirty-two years of age. He was tall in person, and had rather stern features; but there was
an exceeding sweetness in his look, and a stamp of Highland poetry about his whole bearing. He was known to be
brave to excess, and full of daring and chivalry— a Fer-gus of the nineteenth century; but his goodness excelled
every other quality, and he was more charitable than St. Martin himself, for he would have given the whole of his
cloak to any of the poor Highlanders.

He had scarcely been married three months, and his bride was Miss Helena Tuffnell, the daughter of William
Tuffnell, the great traveler, one of the many victims of geographical science and of the passion for discovery. Miss Helena did not belong to a noble family, but she was Scotch, and that was better than all nobility in the eyes of Lord Glenarvan; and she was, moreover, a charming, high-souled, religious young woman.

Lord Glenarvan did not forget that his wife was the daughter of a great traveler, and he thought it likely that she would inherit her father's predilections. He had the DUNCAN built expressly that he might take his bride to the most beautiful lands in the world, and complete their honeymoon by sailing up the Mediterranean, and through the clustering islands of the Archipelago.

However, Lord Glenarvan had gone now to London. The lives of the shipwrecked men were at stake, and Lady Helena was too much concerned herself about them to grudge her husband's temporary absence. A telegram next day gave hope of his speedy return, but in the evening a letter apprised her of the difficulties his proposition had met with, and the morning after brought another, in which he openly expressed his dissatisfaction with the Admiralty.

Lady Helena began to get anxious as the day wore on. In the evening, when she was sitting alone in her room, Mr. Halbert, the house steward, came in and asked if she would see a young girl and boy that wanted to speak to Lord Glenarvan.

"Some of the country people?" asked Lady Helena.

"No, madame," replied the steward, "I do not know them at all. They came by rail to Balloch, and walked the rest of the way to Luss."

"Tell them to come up, Halbert."

In a few minutes a girl and boy were shown in. They were evidently brother and sister, for the resemblance was unmistakable. The girl was about sixteen years of age; her tired pretty face, and sorrowful eyes, and resigned but courageous look, as well as her neat though poor attire, made a favorable impression. The boy she held by the hand was about twelve, but his face expressed such determination, that he appeared quite his sister's protector.

The girl seemed too shy to utter a word at first, but Lady Helena quickly relieved her embarrassment by saying, with an encouraging smile: "You wish to speak to me, I think?"

"No," replied the boy, in a decided tone; "not to you, but to Lord Glenarvan."

V. IV Verne

"Excuse him, ma'am," said the girl, with a look at her brother.

"Lord Glenarvan is not at the castle just now," returned Lady Helena; "but I am his wife, and if I can do anything for you--"

"You are Lady Glenarvan?" interrupted the girl.

"I am."

"The wife of Lord Glenarvan, of Malcolm Castle, that put an announcement in the TIMES about the shipwreck of the BRITANNIA?"

"Yes, yes," said Lady Helena, eagerly; "and you?"

"I am Miss Grant, ma'am, and this is my brother."

"Miss Grant, Miss Grant!" exclaimed Lady Helena, drawing the young girl toward her, and taking both her hands and kissing the boy's rosy cheeks.

"What is it you know, ma'am, about the shipwreck? Tell me, is my father living? Shall we ever see him again? Oh, tell me," said the girl, earnestly.

"My dear child," replied Lady Helena. "Heaven forbid that I should answer you lightly such a question; I would not delude you with vain hopes."

"Oh, tell me all, tell me all, ma'am. I'm proof against sorrow. I can bear to hear anything."

"My poor child, there is but a faint hope; but with the help of almighty Heaven it is just possible you may one day see your father once more."

The girl burst into tears, and Robert seized Lady Glenarvan's hand and covered it with kisses.

As soon as they grew calmer they asked a complete string of questions, and Lady Helena recounted the whole story of the document, telling them that their father had been wrecked on the coast of Patagonia, and that he and two sailors, the sole survivors, appeared to have reached the shore, and had written an appeal for help in three languages and committed it to the care of the waves.

During the recital, Robert Grant was devouring the speaker with his eyes, and hanging on her lips. His childish imagination evidently retraced all the scenes of his father's shipwreck. He saw him on the deck of the BRITANNIA, and then struggling with the billows, then clinging to the rocks, and lying at length exhausted on the beach.

More than once he cried out, "Oh, papa! my poor papa!" and pressed close to his sister.

Miss Grant sat silent and motionless, with clasped hands, and all she said when the narration ended, was: "Oh, ma'am, the paper, please!"

"I have not it now, my dear child," replied Lady Helena.
"You haven't it?"

"No. Lord Glenarvan was obliged to take it to London, for the sake of your father; but I have told you all it contained, word for word, and how we managed to make out the complete sense from the fragments of words left—all except the longitude, unfortunately."

"We can do without that," said the boy.

"Yes, Mr. Robert," rejoined Lady Helena, smiling at the child's decided tone. "And so you see, Miss Grant, you know the smallest details now just as well as I do."

"Yes, ma'am, but I should like to have seen my father's writing."

"Well, to-morrow, perhaps, to-morrow, Lord Glenarvan will be back. My husband determined to lay the document before the Lords of the Admiralty, to induce them to send out a ship immediately in search of Captain Grant."

"Is it possible, ma'am," exclaimed the girl, "that you have done that for us?"

"Yes, my dear Miss Grant, and I am expecting Lord Glenarvan back every minute now."

"Oh, ma'am! Heaven bless you and Lord Glenarvan," said the young girl, fervently, overcome with grateful emotion.

"My dear girl, we deserve no thanks; anyone in our place would have done the same. I only trust the hopes we are leading you to entertain may be realized, but till my husband returns, you will remain at the Castle."

"Oh, no, ma'am. I could not abuse the sympathy you show to strangers."

"Strangers, dear child!" interrupted Lady Helena; "you and your brother are not strangers in this house, and I should like Lord Glenarvan to be able on his arrival to tell the children of Captain Grant himself, what is going to be done to rescue their father."

It was impossible to refuse an invitation given with such heart, and Miss Grant and her brother consented to stay till Lord Glenarvan returned.

CHAPTER IV LADY GLENARVAN'S PROPOSAL

LADY HELENA thought it best to say nothing to the children about the fears Lord Glenarvan had expressed in his letters respecting the decisions of the Lords of the Admiralty with regard to the document. Nor did she mention the probable captivity of Captain Grant among the Indians of South America. Why sadden the poor children, and damp their newly cherished hopes? It would not in the least alter the actual state of the case; so not a word was said, and after answering all Miss Grant's questions, Lady Helena began to interrogate in her turn, asking her about her past life and her present circumstances.

It was a touching, simple story she heard in reply, and one which increased her sympathy for the young girl.

Mary and Robert were the captain's only children. Harry Grant lost his wife when Robert was born, and during his long voyages he left his little ones in charge of his cousin, a good old lady. Captain Grant was a fearless sailor. He not only thoroughly understood navigation, but commerce also—a two-fold qualification eminently useful to skippers in the merchant service. He lived in Dundee, in Perthshire, Scotland. His father, a minister of St. Katrine's Church, had given him a thorough education, as he believed that could never hurt anybody.

Harry's voyages were prosperous from the first, and a few years after Robert was born, he found himself possessed of a considerable fortune.

It was then that he projected the grand scheme which made him popular in Scotland. Like Glenarvan, and a few noble families in the Lowlands, he had no heart for the union with England. In his eyes the interests of his country were not identified with those of the Anglo-Saxons, and to give scope for personal development, he resolved to found an immense Scotch colony on one of the ocean continents. Possibly he might have thought that some day they would achieve their independence, as the United States did—an example doubtless to be followed eventually by Australia and India. But whatever might be his secret motives, such was his dream of colonization. But, as is easily understood, the Government opposed his plans, and put difficulties enough in his way to have killed an ordinary man. But Harry would not be beaten. He appealed to the patriotism of his countrymen, placed his fortune at the service of the cause, built a ship, and manned it with a picked crew, and leaving his children to the care of his old cousin set off to explore the great islands of the Pacific. This was in 1861, and for twelve months, or up to May, 1862, letters were regularly received from him, but no tidings whatever had come since his departure from Callao, in June, and the name of the BRITANNIA never appeared in the Shipping List.

Just at this juncture the old cousin died, and Harry Grant's two children were left alone in the world.

Mary Grant was then only fourteen, but she resolved to face her situation bravely, and to devote herself entirely to her little brother, who was still a mere child. By dint of close economy, combined with tact and prudence, she managed to support and educate him, working day and night, denying herself everything, that she might give him all he needed, watching over him and caring for him like a mother.

The two children were living in this touching manner in Dundee, struggling patiently and courageously with
their poverty. Mary thought only of her brother, and indulged in dreams of a prosperous future for him. She had long given up all hope of the BRITANNIA, and was fully persuaded that her father was dead. What, then, was her emotion when she accidentally saw the notice in the TIMES!

She never hesitated for an instant as to the course she should adopt, but determined to go to Dumbartonshire immediately, to learn the best and worst. Even if she were to be told that her father's lifeless body had been found on a distant shore, or in the bottom of some abandoned ship, it would be a relief from incessant doubt and torturing suspense.

She told her brother about the advertisement, and the two children started off together that same day for Perth, where they took the train, and arrived in the evening at Malcolm Castle.

Such was Mary Grant's sorrowful story, and she recounted it in so simple and unaffected a manner, that it was evident she never thought her conduct had been that of a heroine through those long trying years. But Lady Helena thought it for her, and more than once she put her arms round both the children, and could not restrain her tears.

As for Robert, he seemed to have heard these particulars for the first time. All the while his sister was speaking, he gazed at her with wide-open eyes, only knowing now how much she had done and suffered for him; and, as she ended, he flung himself on her neck, and exclaimed, "Oh, mamma! My dear little mamma!"

It was quite dark by this time, and Lady Helena made the children go to bed, for she knew they must be tired after their journey. They were soon both sound asleep, dreaming of happy days.

After they had retired. Lady Helena sent for Major McNabbs, and told him the incidents of the evening.

"That Mary Grant must be a brave girl," said the Major.

"I only hope my husband will succeed, for the poor children's sake," said his cousin. "It would be terrible for them if he did not."

"He will be sure to succeed, or the Lords of the Admiralty must have hearts harder than Portland stone."

But, notwithstanding McNabbs's assurance, Lady Helena passed the night in great anxiety, and could not close her eyes.

Mary Grant and her brother were up very early next morning, and were walking about in the courtyard when they heard the sound of a carriage approaching. It was Lord Glenarvan; and, almost immediately, Lady Helena and the Major came out to meet him.

Lady Helena flew toward her husband the moment he alighted; but he embraced her silently, and looked gloomy and disappointed-- indeed, even furious.

"Well, Edward?" she said; "tell me."

"Well, Helena, dear; those people have no heart!"

"They have refused?"

"Yes. They have refused me a ship! They talked of the millions that had been wasted in search for Franklin, and declared the document was obscure and unintelligible. And, then, they said it was two years now since they were cast away, and there was little chance of finding them. Besides, they would have it that the Indians, who made them prisoners, would have dragged them into the interior, and it was impossible, they said, to hunt all through Patagonia for three men--three Scotchmen; that the search would be vain and perilous, and cost more lives than it saved. In short, they assigned all the reasons that people invent who have made up their minds to refuse. The truth is, they remembered Captain Grant's projects, and that is the secret of the whole affair. So the poor fellow is lost for ever."

"My father! my poor father!" cried Mary Grant, throwing herself on her knees before Lord Glenarvan, who exclaimed in amazement:

"Your father? What? Is this Miss--"

"Yes, Edward," said Lady Helena; "this is Miss Mary Grant and her brother, the two children condemned to orphanage by the cruel Admiralty!"

"Oh! Miss Grant," said Lord Glenarvan, raising the young girl, "if I had known of your presence--"

He said no more, and there was a painful silence in the courtyard, broken only by sobs. No one spoke, but the very attitude of both servants and masters spoke their indignation at the conduct of the English Government.

At last the Major said, addressing Lord Glenarvan: "Then you have no hope whatever?"

"None," was the reply.

"Very well, then," exclaimed little Robert, "I'll go and speak to those people myself, and we'll see if they--" He did not complete his sentence, for his sister stopped him; but his clenched fists showed his intentions were the reverse of pacific.

"No, Robert," said Mary Grant, "we will thank this noble lord and lady for what they have done for us, and never cease to think of them with gratitude; and then we'll both go together."

"Mary!" said Lady Helena, in a tone of surprise.

"Go where?" asked Lord Glenarvan.
"I am going to throw myself at the Queen's feet, and we shall see if she will turn a deaf ear to the prayers of two children, who implore their father's life."

Lord Glenarvan shook his head; not that he doubted the kind heart of her Majesty, but he knew Mary would never gain access to her. Supplicants but too rarely reach the steps of a throne; it seems as if royal palaces had the same inscription on their doors that the English have on their ships: _Passengers are requested not to speak to the man at the wheel_.

Lady Glenarvan understood what was passing in her husband's mind, and she felt the young girl's attempt would be useless, and only plunge the poor children in deeper despair. Suddenly, a grand, generous purpose fired her soul, and she called out: "Mary Grant! wait, my child, and listen to what I'm going to say."

Mary had just taken her brother by the hand, and turned to go away; but she stepped back at Lady Helena's bidding.

The young wife went up to her husband, and said, with tears in her eyes, though her voice was firm, and her face beamed with animation: "Edward, when Captain Grant wrote that letter and threw it into the sea, he committed it to the care of God. God has sent it to us--to us! Undoubtedly God intends us to undertake the rescue of these poor men."

"What do you mean, Helena?"

"I mean this, that we ought to think ourselves fortunate if we can begin our married life with a good action. Well, you know, Edward, that to please me you planned a pleasure trip; but what could give us such genuine pleasure, or be so useful, as to save those unfortunate fellows, cast off by their country?"

"Helena!" exclaimed Lord Glenarvan.

"Yes, Edward, you understand me. The DUNCAN is a good strong ship, she can venture in the Southern Seas, or go round the world if necessary. Let us go, Edward; let us start off and search for Captain Grant!"

Lord Glenarvan made no reply to this bold proposition, but smiled, and, holding out his arms, drew his wife into a close, fond embrace. Mary and Robert seized her hands, and covered them with kisses; and the servants who thronged the courtyard, and had been witnesses of this touching scene, shouted with one voice, "Hurrah for the Lady of Luss. Three cheers for Lord and Lady Glenarvan!"

CHAPTER V THE DEPARTURE OF THE "DUNCAN"

We have said already that Lady Helena was a brave, generous woman, and what she had just done proved it indubitably. Her husband had good reason to be proud of such a wife, one who could understand and enter into all his views. The idea of going to Captain Grant's rescue had occurred to him in London when his request was refused, and he would have anticipated Lady Helena, only he could not bear the thought of parting from her. But now that she herself proposed to go, all hesitation was at an end. The servants of the Castle had hailed the project with loud acclamations--for it was to save their brothers--Scotchmen, like themselves--and Lord Glenarvan cordially joined his cheers with theirs, for the Lady of Luss.

The departure once resolved upon, there was not an hour to be lost. A telegram was dispatched to John Mangles the very same day, conveying Lord Glenarvan's orders to take the DUNCAN immediately to Glasgow, and to make preparations for a voyage to the Southern Seas, and possibly round the world, for Lady Helena was right in her opinion that the yacht might safely attempt the circumnavigation of the globe, if necessary.

The DUNCAN was a steam yacht of the finest description. She was 210 tons burden--much larger than any of the first vessels that touched the shores of the New World, for the largest of the four ships that sailed with Columbus was only 70 tons. She had two masts and all the sails and rigging of an ordinary clipper, which would enable her to take advantage of every favorable wind, though her chief reliance was on her mechanical power. The engine, which was constructed on a new system, was a high-pressure one, of 160-horse power, and put in motion a double screw. This gave the yacht such swiftness that during her trial trip in the Firth of Clyde, she made seventeen miles an hour, a higher speed than any vessel had yet attained. No alterations were consequently needed in the DUNCAN herself; John Mangles had only to attend to her interior arrangements.

His first care was to enlarge the bunkers to carry as much coal as possible, for it is difficult to get fresh supplies _en route_. He had to do the same with the store-rooms, and managed so well that he succeeded in laying in provisions enough for two years. There was abundance of money at his command, and enough remained to buy a cannon, on a pivot carriage, which he mounted on the forecastle. There was no knowing what might happen, and it is always well to be able to send a good round bullet flying four miles off.

John Mangles understood his business. Though he was only the captain of a pleasure yacht, he was one of the best skippers in Glasgow. He was thirty years of age, and his countenance expressed both courage and goodness, if the features were somewhat coarse. He had been brought up at the castle by the Glenarvan family, and had turned out a capital sailor, having already given proof, in some of his long voyages, of his skill and energy and _sang-froid_. When Lord Glenarvan offered him the command of the DUNCAN, he accepted it with right good will, for he
loved the master of Malcolm Castle, like a brother, and had hitherto vainly sought some opportunity of showing his
devotion.

Tom Austin, the mate, was an old sailor, worthy of all confidence. The crew, consisting of twenty-five men,
including the captain and chief officer, were all from Dumbartonshire, experienced sailors, and all belonging to the
Glenarvan estate; in fact, it was a regular clan, and they did not forget to carry with them the traditional bagpipes.
Lord Glenarvan had in them a band of trusty fellows, skilled in their calling, devoted to himself, full of courage, and
as practiced in handling fire-arms as in the maneuvering of a ship; a valiant little troop, ready to follow him any
where, even in the most dangerous expeditions. When the crew heard whither they were bound, they could not
restrain their enthusiasm, and the rocks of Dumbarton rang again with their joyous outbursts of cheers.

But while John Mangles made the stowage and provisioning of the yacht his chief business, he did not forget to
fit up the rooms of Lord and Lady Glenarvan for a long voyage. He had also to get cabins ready for the children of
Captain Grant, as Lady Helena could not refuse Mary's request to accompany her.

As for young Robert, he would have smuggled himself in somewhere in the hold of the DUNCAN rather than be
left behind. He would willingly have gone as cabin-boy, like Nelson. It was impossible to resist a little fellow like
that, and, indeed, no one tried. He would not even go as a passenger, but must serve in some capacity, as cabin-boy,
apprentice or sailor, he did not care which, so he was put in charge of John Mangles, to be properly trained for his
vocation.

"And I hope he won't spare me the 'cat-o-nine-tails' if I don't do properly," said Robert.

"Rest easy on that score, my boy," said Lord Glenarvan, gravely; he did not add, that this mode of punishment
was forbidden on board the DUNCAN, and moreover, was quite unnecessary.

To complete the roll of passengers, we must name Major McNabbs. The Major was about fifty years of age, with
a calm face and regular features—a man who did whatever he was told, of an excellent, indeed, a perfect temper;
modest, silent, peaceable, and amiable, agreeing with everybody on every subject, never discussing, never disputing,
ever getting angry. He wouldn't move a step quicker, or slower, whether he walked upstairs to bed or mounted a
breach. Nothing could excite him, nothing could disturb him, not even a cannon ball, and no doubt he will die
without ever having known even a passing feeling of irritation.

This man was endowed in an eminent degree, not only with ordinary animal courage, that physical bravery of
the battle-field, which is solely due to muscular energy, but he had what is far nobler—moral courage, firmness of
soul. If he had any fault it was his being so intensely Scotch from top to toe, a Caledonian of the Caledonians, an
obstinate stickler for all the ancient customs of his country. This was the reason he would never serve in England,
and he gained his rank of Major in the 42nd regiment, the Highland Black Watch, composed entirely of Scotch
noblemen.

As a cousin of Glenarvan, he lived in Malcolm Castle, and as a major he went as a matter of course with the
DUNCAN.

Such, then, was the PERSONNEL of this yacht, so unexpectedly called to make one of the most wonderful
voyages of modern times. From the hour she reached the steamboat quay at Glasgow, she completely monopolized
the public attention. A considerable crowd visited her every day, and the DUNCAN was the one topic of interest and
conversation, to the great vexation of the different captains in the port, among others of Captain Burton, in command
of the SCOTIA, a magnificent steamer lying close beside her, and bound for Calcutta. Considering her size, the
SCOTIA might justly look upon the DUNCAN as a mere fly-boat, and yet this pleasure yacht of Lord Glenarvan
was quite the center of attraction, and the excitement about her daily increased.

The DUNCAN was to sail out with the tide at three o'clock on the morning of the 25th of August. But before
starting, a touching ceremony was witnessed by the good people of Glasgow. At eight o'clock the night before, Lord
Glenarvan and his friends, and the entire crew, from the stokers to the captain, all who were to take part in this self-
sacrificing voyage, left the yacht and repaired to St. Mungo's, the ancient cathedral of the city. This venerable
edifice, so marvelously described by Walter Scott, remains intact amid the ruins made by the Reformation; and it
was there, beneath its lofty arches, in the grand nave, in the presence of an immense crowd, and surrounded by	ombs as thickly set as in a cemetery, that they all assembled to implore the blessing of Heaven on their expedition,
and to put themselves under the protection of Providence. The Rev. Mr. Morton conducted the service, and when he
had ended and pronounced the benediction, a young girl's voice broke the solemn silence that followed. It was Mary
Grant who poured out her heart to God in prayer for her benefactors, while grateful happy tears streamed down her
cheeks, and almost choked her utterance. The vast assembly dispersed under the influence of deep emotion, and at
ten o'clock the passengers and crew returned on board the vessel.

CHAPTER VI AN UNEXPECTED PASSENGER

THE ladies passed the whole of the first day of the voyage in their berths, for there was a heavy swell in the sea,
and toward evening the wind blew pretty fresh, and the DUNCAN tossed and pitched considerably.
But the morning after, the wind changed, and the captain ordered the men to put up the foresail, and brigantine and foretopsail, which greatly lessened the rolling of the vessel. Lady Helena and Mary Grant were able to come on deck at daybreak, where they found Lord Glenarvan, Major McNabb and the captain.

"And how do you stand the sea, Miss Mary?" said Lord Glenarvan.

"Pretty well, my Lord. I am not very much inconvenienced by it. Besides I shall get used to it."

"And our young Robert!"

"Oh, as for Robert," said the captain, "whenever he is not poking about down below in the engine-room, he is perched somewhere aloft among the rigging. A youngster like that laughs at sea-sickness. Why, look at him this very moment! Do you see him?"

The captain pointed toward the foremast, and sure enough there was Robert, hanging on the yards of the topgallant mast, a hundred feet above in the air. Mary involuntarily gave a start, but the captain said:

"Oh, don't be afraid, Miss Mary; he is all right, take my word for it; I'll have a capital sailor to present to Captain Grant before long, for we'll find the worthy captain, depend upon it."

"Heaven grant it, Mr. John," replied the young girl.

"My dear child," said Lord Glenarvan, "there is something so providential in the whole affair, that we have every reason to hope. We are not going, we are led; we are not searching, we are guided. And then see all the brave men that have enlisted in the service of the good cause. We shall not only succeed in our enterprise, but there will be little difficulty in it. I promised Lady Helena a pleasure trip, and I am much mistaken if I don't keep my word."

"Edward," said his wife, "you are the best of men."

"Not at all," was the reply; "but I have the best of crews and the best of ships. You don't admire the DUNCAN, I suppose, Miss Mary?"

"On the contrary, my Lord, I do admire her, and I'm a connoisseur in ships," returned the young girl.

"Indeed!"

"Yes. I have played all my life on my father's ships. He should have made me a sailor, for I dare say, at a push, I could reef a sail or plait a gasket easily enough."

"Do you say so, miss?" exclaimed John Mangles.

"If you talk like that you and John will be great friends, for he can't think any calling is equal to that of a seaman; he can't fancy any other, even for a woman. Isn't it true, John?"

"Quite so," said the captain, "and yet, your Lordship, I must confess that Miss Grant is more in her place on the poop than reefing a topsail. But for all that, I am quite flattered by her remarks."

"And especially when she admires the DUNCAN," replied Glenarvan.

"Well, really," said Lady Glenarvan, "you are so proud of your yacht that you make me wish to look all over it; and I should like to go down and see how our brave men are lodged."

"Their quarters are first-rate," replied John, "they are as comfortable as if they were at home."

"And they really are at home, my dear Helena," said Lord Glenarvan. "This yacht is a portion of our old Caledonia, a fragment of Dumbartonshire, making a voyage by special favor, so that in a manner we are still in our own country. The DUNCAN is Malcolm Castle, and the ocean is Loch Lomond."

"Very well, dear Edward, do the honors of the Castle then."

"At your service, madam; but let me tell Olbinett first."

The steward of the yacht was an excellent _maitre d'hôtel_, and might have been French for his airs of importance, but for all that he discharged his functions with zeal and intelligence.

"Olbinett," said his master, as he appeared in answer to his summons, "we are going to have a turn before breakfast. I hope we shall find it ready when we come back."

He said this just as if it had been a walk to Tarbert or Loch Katrine they were going, and the steward bowed with perfect gravity in reply.

"Are you coming with us, Major?" asked Lady Helena.

"If you command me," replied McNabb.

"Oh!" said Lord Glenarvan; "the Major is absorbed in his cigar; "you mustn't tear him from it. He is an inveterate smoker, Miss Mary, I can tell you. He is always smoking, even while he sleeps."

The Major gave an assenting nod, and Lord Glenarvan and his party went below.

McNabb remained alone, talking to himself, as was his habit, and was soon enveloped in still thicker clouds of smoke. He stood motionless, watching the track of the yacht. After some minutes of this silent contemplation he turned round, and suddenly found himself face to face with a new comer. Certainly, if any thing could have surprised him, this RENCONTRE would, for he had never seen the stranger in his life before.

He was a tall, thin, withered-looking man, about forty years of age, and resembled a long nail with a big head. His head was large and massive, his forehead high, his chin very marked. His eyes were concealed by enormous
round spectacles, and in his look was that peculiar indecision which is common to nyctalopes, or people who have a peculiar construction of the eye, which makes the sight imperfect in the day and better at night. It was evident from his physiognomy that he was a lively, intelligent man; he had not the crabbed expression of those grave individuals who never laugh on principle, and cover their emptiness with a mask of seriousness. He looked far from that. His careless, good-humored air, and easy, unceremonious manners, showed plainly that he knew how to take men and things on their bright side. But though he had not yet opened his mouth, he gave one the impression of being a great talker, and moreover, one of those absent folks who neither see though they are looking, nor hear though they are listening. He wore a traveling cap, and strong, low, yellow boots with leather gaiters. His pantaloons and jacket were of brown velvet, and their innumerable pockets were stuffed with note-books, memorandum-books, account-books, pocket-books, and a thousand other things equally cumbersome and useless, not to mention a telescope in addition, which he carried in a shoulder-belt.

The stranger’s excitement was a strong contrast to the Major’s placidity. He walked round McNabbs, looking at him and questioning him with his eyes without eliciting one remark from the imperturbable Scotchman, or awakening his curiosity in the least, to know where he came from, and where he was going, and how he had got on board the DUNCAN.

Finding all his efforts baffled by the Major’s indifference, the mysterious passenger seized his telescope, drew it out to its fullest extent, about four feet, and began gazing at the horizon, standing motionless with his legs wide apart. His examination lasted some few minutes, and then he lowered the glass, set it up on deck, and leaned on it as if it had been a walking-stick. Of course, his weight shut up the instrument immediately by pushing the different parts one into the other, and so suddenly, that he fell full length on deck, and lay sprawling at the foot of the mainmast.

Any one else but the Major would have smiled, at least, at such a ludicrous sight; but McNabbs never moved a muscle of his face.

This was too much for the stranger, and he called out, with an unmistakably foreign accent:

"Steward!"

He waited a minute, but nobody appeared, and he called again, still louder, "Steward!"

Mr. Olbinett chanced to be passing that minute on his way from the galley, and what was his astonishment at hearing himself addressed like this by a lanky individual of whom he had no knowledge whatever.

"Where can he have come from? Who is he?" he thought to himself. "He can not possibly be one of Lord Glenarvan’s friends?"

However, he went up on the poop, and approached the unknown personage, who accosted him with the inquiry, "Are you the steward of this vessel?"

"Yes, sir," replied Olbinett; "but I have not the honor of--"

"I am the passenger in cabin Number 6."

"Number 6!" repeated the steward.

"Certainly; and your name, what is it?"

"Olbinett."

"Well, Olbinett, my friend, we must think of breakfast, and that pretty quickly. It is thirty-six hours since I have had anything to eat, or rather thirty-six hours that I have been asleep--pardonable enough in a man who came all the way, without stopping, from Paris to Glasgow. What is the breakfast hour?"

"Nine o’clock," replied Olbinett, mechanically.

The stranger tried to pull out his watch to see the time; but it was not till he had rummaged through the ninth pocket that he found it.

"Ah, well," he said, "it is only eight o’clock at present. Fetch me a glass of sherry and a biscuit while I am waiting, for I am actually falling through sheer inanition."

Olbinett heard him without understanding what he meant for the voluble stranger kept on talking incessantly, flying from one subject to another.

"The captain? Isn’t the captain up yet? And the chief officer? What is he doing? Is he asleep still? It is fine weather, fortunately, and the wind is favorable, and the ship goes all alone."

Just at that moment John Mangles appeared at the top of the stairs.

"Here is the captain!" said Olbinett.

"Ah! delighted, Captain Burton, delighted to make your acquaintance," exclaimed the unknown.

John Mangles stood stupefied, as much at seeing the stranger on board as at hearing himself called "Captain Burton."

But the new comer went on in the most affable manner.

"Allow me to shake hands with you, sir; and if I did not do so yesterday evening, it was only because I did not
wish to be troublesome when you were starting. But to-day, captain, it gives me great pleasure to begin my intercourse with you."

John Mangles opened his eyes as wide as possible, and stood staring at Olbinett and the stranger alternately.

But without waiting for a reply, the rattling fellow continued:
"Now the introduction is made, my dear captain, we are old friends. Let’s have a little talk, and tell me how you like the SCOTIA?"

"What do you mean by the SCOTIA?" put in John Mangles at last.

"By the SCOTIA? Why, the ship we’re on, of course—a good ship that has been commended to me, not only for its physical qualities, but also for the moral qualities of its commander, the brave Captain Burton. You will be some relation of the famous African traveler of that name. A daring man he was, sir. I offer you my congratulations."

"Sir," interrupted John. "I am not only no relation of Burton the great traveler, but I am not even Captain Burton."

V. IV Verne

"Ah, is that so? It is Mr. Burdness, the chief officer, that I am talking to at present."

"Mr. Burdness!" repeated John Mangles, beginning to suspect how the matter stood. Only he asked himself whether the man was mad, or some heedless rattle pate? He was beginning to explain the case in a categorical manner, when Lord Glenarvan and his party came up on the poop. The stranger caught sight of them directly, and exclaimed:

"Ah! the passengers, the passengers! I hope you are going to introduce me to them, Mr. Burdness!"

But he could not wait for any one's intervention, and going up to them with perfect ease and grace, said, bowing to Miss Grant, "Madame;" then to Lady Helena, with another bow, "Miss;" and to Lord Glenarvan, "Sir."

Here John Mangles interrupted him, and said, "Lord Glenarvan."

"My Lord," continued the unknown, "I beg pardon for presenting myself to you, but at sea it is well to relax the strict rules of etiquette a little. I hope we shall soon become acquainted with each other, and that the company of these ladies will make our voyage in the SCOTIA appear as short as agreeable."

Lady Helena and Miss Grant were too astonished to be able to utter a single word. The presence of this intruder on the poop of the DUNCAN was perfectly inexplicable.

Lord Glenarvan was more collected, and said, "Sir, to whom have I the honor of speaking?"

"To Jacques Eliacin Francois Marie Paganel, Secretary of the Geographical Society of Paris, Corresponding Member of the Societies of Berlin, Bombay, Darmstadt, Leipsic, London, St. Petersburg, Vienna, and New York; Honorary Member of the Royal Geographical and Ethnographical Institute of the East Indies; who, after having spent twenty years of his life in geographical work in the study, wishes to see active service, and is on his way to India to gain for the science what information he can by following up the footsteps of great travelers."

CHAPTER VII JACQUES PAGANEL IS UNDECEIVED

THE Secretary of the Geographical Society was evidently an amiable personage, for all this was said in a most charming manner. Lord Glenarvan knew quite well who he was now, for he had often heard Paganel spoken of, and was aware of his merits. His geographical works, his papers on modern discoveries, inserted in the reports of the Society, and his world-wide correspondence, gave him a most distinguished place among the LITERATI of France.

Lord Glenarvan could not but welcome such a guest, and shook hands cordially.

"And now that our introductions are over," he added, "you will allow me, Monsieur Paganel, to ask you a question?"

"Twenty, my Lord," replied Paganel; "it will always be a pleasure to converse with you."

"Was it last evening that you came on board this vessel?"

"Yes, my Lord, about 8 o’clock. I jumped into a cab at the Caledonian Railway, and from the cab into the SCOTIA, where I had booked my cabin before I left Paris. It was a dark night, and I saw no one on board, so I found cabin No. 6, and went to my berth immediately, for I had heard that the best way to prevent sea-sickness is to go to bed as soon as you start, and not to stir for the first few days; and, moreover, I had been traveling for thirty hours. So I tucked myself in, and slept conscientiously, I assure you, for thirty-six hours."

Paganel's listeners understood the whole mystery, now, of his presence on the DUNCAN. The French traveler had mistaken his vessel, and gone on board while the crew were attending the service at St. Mungo's. All was explained. But what would the learned geographer say, when he heard the name and destination of the ship, in which he had taken passage?

"Then it is Calcutta, M. Paganel, that you have chosen as your point of departure on your travels?"

"Yes, my Lord, to see India has been a cherished purpose with me all my life. It will be the realization of my fondest dreams, to find myself in the country of elephants and Thugs."

"Then it would be by no means a matter of indifference to you, to visit another country instead."
"No, my Lord; indeed it would be very disagreeable, for I have letters from Lord Somerset, the Governor-General, and also a commission to execute for the Geographical Society."

"Ah, you have a commission."

"Yes, I have to attempt a curious and important journey, the plan of which has been drawn up by my learned friend and colleague, M. Vivien de Saint Martin. I am to pursue the track of the Schlaginweit Brothers; and Colonels Waugh and Webb, and Hodgson; and Huc and Gabet, the missionaries; and Moorecroft and M. Jules Remy, and so many celebrated travelers. I mean to try and succeed where Krick, the missionary so unfortunately failed in 1846; in a word, I want to follow the course of the river Yarou-Dzangbo-Tchou, which waters Thibet for a distance of 1500 kilometres, flowing along the northern base of the Himalayas, and to find out at last whether this river does not join itself to the Brahmapoutre in the northeast of As-sam. The gold medal, my Lord, is promised to the traveler who will succeed in ascertaining a fact which is one of the greatest DESIDERATA to the geography of India."

Paganel was magnificent. He spoke with superb animation, soaring away on the wings of imagination. It would have been as impossible to stop him as to stop the Rhine at the Falls of Schaffhausen.

"Monsieur Jacques Paganel," said Lord Glenarvan, after a brief pause, "that would certainly be a grand achievement, and you would confer a great boon on science, but I should not like to allow you to be laboring under a mistake any longer, and I must tell you, therefore, that for the present at least, you must give up the pleasure of a visit to India."

"Give it up. And why?"

"Because you are turning your back on the Indian peninsula."

"What! Captain Burton."

"I am not Captain Burton," said John Mangles.

"But the SCOTIA."

"This vessel is not the SCOTIA."

It would be impossible to depict the astonishment of Paganel. He stared first at one and then at another in the utmost bewilderment.

Lord Glenarvan was perfectly grave, and Lady Helena and Mary showed their sympathy for his vexation by their looks. As for John Mangles, he could not suppress a smile; but the Major appeared as unconcerned as usual. At last the poor fellow shrugged his shoulders, pushed down his spectacles over his nose and said:

"You are joking."

But just at that very moment his eye fell on the wheel of the ship, and he saw the two words on it: Duncan. Glasgow.

"The DUNCAN! the DUNCAN!" he exclaimed, with a cry of despair, and forthwith rushed down the stairs, and away to his cabin.

As soon as the unfortunate SAVANT had disappeared, every one, except the Major, broke out into such peals of laughter that the sound reached the ears of the sailors in the forecastle. To mistake a railway or to take the train to Edinburgh when you want to go to Dumbarton might happen; but to mistake a ship and be sailing for Chili when you meant to go to India--that is a blunder indeed!

"However," said Lord Glenarvan, "I am not much astonished at it in Paganel. He is quite famous for such misadventures. One day he published a celebrated map of America, and put Japan in it! But for all that, he is distinguished for his learning, and he is one of the best geographers in France."

"But what shall we do with the poor gentleman?" said Lady Helena; "we can't take him to Patagonia."

"Why not?" replied McNabbs, gravely. "We are not responsible for his heedless mistakes. Suppose he were in a railway train, would they stop it for him?"

"No, but he would get out at the first station."

"Well, that is just what he can do here, too, if he likes; he can disembark at the first place where we touch."

While they were talking, Paganel came up again on the poop, looking very woebegone and crestfallen. He had been making inquiry about his luggage, to assure himself that it was all on board, and kept repeating incessantly the unlucky words, "The DUNCAN! the DUNCAN!"

He could find no others in his vocabulary. He paced restlessly up and down; sometimes stopping to examine the sails, or gaze inquiringly over the wide ocean, at the far horizon. At length he accosted Lord Glenarvan once more, and said--

"And this DUNCAN--where is she going?"

"To America, Monsieur Paganel," was the reply.

"And to what particular part?"

"To Concepcion."

"To Chili! to Chili!" cried the unfortunate geographer. "And my mission to India. But what will M. de Quatre-
fages, the President of the Central Commission, say? And M. d' Avezac? And M. Cortanbert? And M. Vivien de Saint Martin? How shall I show my face at the SEANCES of the Society?"

"Come, Monsieur Paganel, don't despair. It can all be managed; you will only have to put up with a little delay, which is relatively of not much importance. The Yarou-Dzangbo-Tchou will wait for you still in the mountains of Thibet. We shall soon put in at Madeira, and you will get a ship there to take you back to Europe."

"Thanks, my Lord. I suppose I must resign myself to it; but people will say it is a most extraordinary adventure, and it is only to me such things happen. And then, too, there is a cabin taken for me on board the SCOTIA."

"Oh, as to the SCOTIA, you'll have to give that up meantime."

"But the DUNCAN is a pleasure yacht, is it not?" began Paganel again, after a fresh examination of the vessel.

"Yes, sir," said John Mangles, "and belongs to Lord Glenarvan."

"Who begs you will draw freely on his hospitality," said Lord Glenarvan.

"A thousand thanks, my Lord! I deeply feel your courtesy, but allow me to make one observation: India is a fine country, and can offer many a surprising marvel to travelers. These ladies, I suppose, have never seen it. Well now, the man at the helm has only to give a turn at the wheel, and the DUNCAN will sail as easily to Calcutta as to Concepcion; and since it is only a pleasure trip that you are--"

His proposal was met by such grave, disapproving shakes of the head, that he stopped short before the sentence was completed; and Lady Helena said:

"Monsieur Paganel, if we were only on a pleasure trip, I should reply, 'Let us all go to India together,' and I am sure Lord Glenarvan would not object; but the DUNCAN is going to bring back shipwrecked mariners who were cast away on the shores of Patagonia, and we could not alter such a destination."

The Frenchman was soon put in possession of all the circumstances of the case. He was no unmoved auditor, and when he heard of Lady Helena's generous proposition, he could not help saying,

"Madame, permit me to express my admiration of your conduct throughout--my unreserved admiration. Let your yacht continue her course. I should reproach myself were I to cause a single day's delay."

"Will you join us in our search, then?" asked Lady Helena.

"It is impossible, madame. I must fulfill my mission. I shall disembark at the first place you touch at, wherever it may be."

"That will be Madeira," said John Mangles.

"Madeira be it then. I shall only be 180 leagues from Lisbon, and I shall wait there for some means of transport."

"Very well, Monsieur Paganel, it shall be as you wish; and, for my own part, I am very glad to be able to offer you, meantime, a few days' hospitality. I only hope you will not find our company too dull."

"Oh, my Lord," exclaimed Paganel, "I am but too happy to have made a mistake which has turned out so agreeably. Still, it is a very ridiculous plight for a man to be in, to find himself sailing to America when he set out to go to the East Indies!"

But in spite of this melancholy reflection, the Frenchman submitted gracefully to the compulsory delay. He made himself amiable and merry, and even diverting, and enchanted the ladies with his good humor. Before the end of the day he was friends with everybody. At his request, the famous document was brought out. He studied it carefully and minutely for a long time, and finally declared his opinion that no other interpretation of it was possible. Mary Grant and her brother inspired him with the most lively interest. He gave them great hope; indeed, the young girl could not help smiling at his sanguine prediction of success, and this odd way of foreseeing future events. But for his mission he would have made one of the search party for Captain Grant, undoubtedly.

As for Lady Helena, when he heard that she was a daughter of William Tuffnell, there was a perfect explosion of admiring epithets. He had known her father, and what letters had passed between them when William Tuffnell was a corresponding member of the Society! It was he himself that had introduced him and M. Malte Brun. What a rencontre this was, and what a pleasure to travel with the daughter of Tuffnell.

He wound up by asking permission to kiss her, which Lady Helena granted, though it was, perhaps, a little improper.

CHAPTER VIII THE GEOGRAPHER'S RESOLUTION

MEANTIME the yacht, favored by the currents from the north of Africa, was making rapid progress toward the equator. On the 30th of August they sighted the Madeira group of islands, and Glenarvan, true to his promise, offered to put in there, and land his new guest.

But Paganel said:

"My dear Lord, I won't stand on ceremony with you. Tell me, did you intend to stop at Madeira before I came on board?"

"No," replied Glenarvan.

"Well, then, allow me to profit by my unlucky mistake. Madeira is an island too well known to be of much
interest now to a geographer. Every thing about this group has been said and written already. Besides, it is completely going down as far as wine growing is concerned. Just imagine no vines to speak of being in Madeira! In 1813, 22,000 pipes of wine were made there, and in 1845 the number fell to 2,669. It is a grievous spectacle! If it is all the same to you, we might go on to the Canary Isles instead."

"Certainly. It will not the least interfere with our route."

"I know it will not, my dear Lord. In the Canary Islands, you see, there are three groups to study, besides the Peak of Teneriffe, which I always wished to visit. This is an opportunity, and I should like to avail myself of it, and make the ascent of the famous mountain while I am waiting for a ship to take me back to Europe."

"As you please, my dear Paganel," said Lord Glenarvan, though he could not help smiling; and no wonder, for these islands are scarcely 250 miles from Madeira, a trifling distance for such a quick sailor as the DUNCAN.

Next day, about 2 P. M., John Mangles and Paganel were walking on the poop. The Frenchman was assailing his companion with all sorts of questions about Chili, when all at once the captain interrupted him, and pointing toward the southern horizon, said:

"Monsieur Paganel?"

"Yes, my dear Captain."

"Be so good as to look in this direction. Don't you see anything?"

"Nothing."

"You're not looking in the right place. It is not on the horizon, but above it in the clouds."

"In the clouds? I might well not see."

"There, there, by the upper end of the bowsprit."

"I see nothing."

"Then you don't want to see. Anyway, though we are forty miles off, yet I tell you the Peak of Teneriffe is quite visible yonder above the horizon."

But whether Paganel could not or would not see it then, two hours later he was forced to yield to ocular evidence or own himself blind.

"You do see it at last, then," said John Mangles.

"Yes, yes, distinctly," replied Paganel, adding in a disdainful tone, "and that's what they call the Peak of Teneriffe!"

"That's the Peak."

"It doesn't look much of a height."

"It is 11,000 feet, though, above the level of the sea."

"That is not equal to Mont Blanc."

"Likely enough, but when you come to ascend it, probably you'll think it high enough."

"Oh, ascend it! ascend it, my dear captain! What would be the good after Humboldt and Bonplan? That Humboldt was a great genius. He made the ascent of this mountain, and has given a description of it which leaves nothing unsaid. He tells us that it comprises five different zones—the zone of the vines, the zone of the laurels, the zone of the pines, the zone of the Alpine heaths, and, lastly, the zone of sterility. He set his foot on the very summit, and found that there was not even room enough to sit down. The view from the summit was very extensive, stretching over an area equal to Spain. Then he went right down into the volcano, and examined the extinct crater. What could I do, I should like you to tell me, after that great man?"

"Well, certainly, there isn't much left to glean. That is vexing, too, for you would find it dull work waiting for a vessel in the Peak of Teneriffe."

"But, I say, Mangles, my dear fellow, are there no ports in the Cape Verde Islands that we might touch at?"

"Oh, yes, nothing would be easier than putting you off at Villa Praya."

"And then I should have one advantage, which is by no means inconsiderable—I should find fellow-countrymen at Senegal, and that is not far away from those islands. I am quite aware that the group is said to be devoid of much interest, and wild, and unhealthy; but everything is curious in the eyes of a geographer. Seeing is a science. There are people who do not know how to use their eyes, and who travel about with as much intelligence as a shell-fish. But that's not in my line, I assure you."

"Please yourself, Monsieur Paganel. I have no doubt geographical science will be a gainer by your sojourn in the Cape Verde Islands. We must go in there anyhow for coal, so your disembarkation will not occasion the least delay."

The captain gave immediate orders for the yacht to continue her route, steering to the west of the Canary group, and leaving Teneriffe on her larboard. She made rapid progress, and passed the Tropic of Cancer on the second of September at 5 A. M.

The weather now began to change, and the atmosphere became damp and heavy. It was the rainy season, "_le tempo das aguas,_" as the Spanish call it, a trying season to travelers, but useful to the inhabitants of the African
Islands, who lack trees and consequently water. The rough weather prevented the passengers from going on deck, but did not make the conversation any less animated in the saloon.

On the 3d of September Paganel began to collect his luggage to go on shore. The DUNCAN was already steaming among the Islands. She passed Sal, a complete tomb of sand lying barren and desolate, and went on among the vast coral reefs and athwart the Isle of St. Jacques, with its long chain of basaltic mountains, till she entered the port of Villa Praya and anchored in eight fathoms of water before the town. The weather was frightful, and the surf excessively violent, though the bay was sheltered from the sea winds. The rain fell in such torrents that the town was scarcely visible through it. It rose on a plain in the form of a terrace, buttressed on volcanic rocks three hundred feet high. The appearance of the island through the thick veil of rain was mournful in the extreme.

Lady Helena could not go on shore as she had purposed; indeed, even coaling was a difficult business, and the passengers had to content themselves below the poop as best they might. Naturally enough, the main topic of conversation was the weather. Everybody had something to say about it except the Major, who surveyed the universal deluge with the utmost indifference. Paganel walked up and down shaking his head.

"It is clear enough, Paganel," said Lord Glenarvan, "that the elements are against you."

"I'll be even with them for all that," replied the Frenchman.

"You could not face rain like that, Monsieur Paganel," said Lady Helena.

"Oh, quite well, madam, as far as I myself am concerned. It is for my luggage and instruments that I am afraid. Everything will be ruined."

"The disembarking is the worst part of the business. Once at Villa Praya you might manage to find pretty good quarters. They wouldn't be over clean, and you might find the monkeys and pigs not always the most agreeable companions. But travelers are not too particular, and, moreover, in seven or eight months you would get a ship, I dare say, to take you back to Europe."

"Seven or eight months!" exclaimed Paganel.

"At least. The Cape Verde Islands are not much frequented by ships during the rainy season. But you can employ your time usefully. This archipelago is still but little known."

"You can go up the large rivers," suggested Lady Helena.

"There are none, madam."

"Well, then, the small ones."

"There are none, madam."

"The running brooks, then."

"There are no brooks, either."

"You can console yourself with the forests if that's the case," put in the Major.

"You can't make forests without trees, and there are no trees."

"A charming country!" said the Major.

"Comfort yourself, my dear Paganel, you'll have the mountains at any rate," said Glenarvan.

"Oh, they are neither lofty nor interesting, my Lord, and, beside, they have been described already."

"Already!" said Lord Glenarvan.

"Yes, that is always my luck. At the Canary Islands, I saw myself anticipated by Humboldt, and here by M. Charles Sainte-Claire Deville, a geologist."

"Impossible!"

"It is too true," replied Paganel, in a doleful voice. "Monsieur Deville was on board the government corvette, La Decidee, when she touched at the Cape Verde Islands, and he explored the most interesting of the group, and went to the top of the volcano in Isle Fogo. What is left for me to do after him?"

"It is really a great pity," said Helena. "What will become of you, Monsieur Paganel?"

Paganel remained silent.

"You would certainly have done much better to have landed at Madeira, even though there had been no wine," said Glenarvan.

Still the learned secretary was silent.

"I should wait," said the Major, just as if he had said, "I should not wait."

Paganel spoke again at length, and said:

"My dear Glenarvan, where do you mean to touch next?"

"At Concepcion."

"Plague it! That is a long way out of the road to India."

"Not it! From the moment you pass Cape Horn, you are getting nearer to it."

"I doubt it much."

"Beside," resumed Lord Glenarvan, with perfect gravity, "when people are going to the Indies it doesn't matter
much whether it is to the East or West."

"What! it does not matter much?"

"Without taking into account the fact that the inhabitants of the Pampas in Patagonia are as much Indians as the
natives of the Punjaub."

"Well done, my Lord. That's a reason that would never have entered my head!"

"And then, my dear Paganel, you can gain the gold medal anyway. There is as much to be done, and sought, and
investigated, and discovered in the Cordilleras as in the mountains of Thibet."

"But the course of the Yarou-Dzangbo-Tchou--what about that?"

"Go up the Rio Colorado instead. It is a river but little known, and its course on the map is marked out too much
according to the fancy of geographers."

"I know it is, my dear Lord; they have made grave mistakes. Oh, I make no question that the Geographical
Society would have sent me to Patagonia as soon as to India, if I had sent in a request to that effect. But I never
thought of it."

"Just like you."

"Come, Monsieur Paganel, will you go with us?" asked Lady Helena, in her most winning tone.

"Madam, my mission?"

"We shall pass through the Straits of Magellan, I must tell you," said Lord Glenarvan.

"My Lord, you are a tempter."

"Let me add, that we shall visit Port Famine."

"Port Famine!" exclaimed the Frenchman, besieged on all sides. "That famous port in French annals!"

"Think, too, Monsieur Paganel, that by taking part in our enterprise, you will be linking France with Scotland."

"Undoubtedly."

"A geographer would be of much use to our expedition, and what can be nobler than to bring science to the
service of humanity?"

"That's well said, madam."

"Take my advice, then, and yield to chance, or rather providence. Follow our example. It was providence that
sent us the document, and we set out in consequence. The same providence brought you on board the DUNCAN.
Don't leave her."

"Shall I say yes, my good friends? Come, now, tell me, you want me very much to stay, don't you?" said
Paganel.

"And you're dying to stay, now, aren't you, Paganel?" returned Glenarvan.

"That's about it," confessed the learned geographer; "but I was afraid it would be inconsiderate."

CHAPTER IX THROUGH THE STRAITS OF MAGELLAN

THE joy on board was universal when Paganel's resolution was made known.

Little Robert flung himself on his neck in such tumultuous delight that he nearly threw the worthy secretary
down, and made him say, "Rude _petit bonhomme_. I'll teach him geography."

Robert bade fair to be an accomplished gentleman some day, for John Mangles was to make a sailor of him, and
the Major was to teach him _sang-froid_, and Glenarvan and Lady Helena were to instil into him courage and
goodness and generosity, while Mary was to inspire him with gratitude toward such instructors.

The DUNCAN soon finished taking in coal, and turned her back on the dismal region. She fell in before long
with the current from the coast of Brazil, and on the 7th of September entered the Southern hemisphere.

So far, then, the voyage had been made without difficulty. Everybody was full of hope, for in this search for
Captain Grant, each day seemed to increase the probability of finding him. The captain was among the most
confident on board, but his confidence mainly arose from the longing desire he had to see Miss Mary happy. He was
smitten with quite a peculiar interest for this young girl, and managed to conceal his sentiments so well that
everyone on board saw it except himself and Mary Grant.

As for the learned geographer, he was probably the happiest man in all the southern hemisphere. He spent the
whole day in studying maps, which were spread out on the saloon table, to the great annoyance of M. Olbinett, who
could never get the cloth laid for meals, without disputes on the subject. But all the passengers took his part except
the Major, who was perfectly indifferent about geographical questions, especially at dinner-time. Paganel also came
across a regular cargo of old books in the chief officer's chest. They were in a very damaged condition, but among
them he raked out a few Spanish volumes, and determined forthwith to set to work to master the language of Cer-
vantes, as no one on board understood it, and it would be helpful in their search along the Chilian coast. Thanks to
his taste for languages, he did not despair of being able to speak the language fluently when they arrived at
Concepcion. He studied it furiously, and kept constantly muttering heterogeneous syllables.

He spent his leisure hours in teaching young Robert, and instructed him in the history of the country they were
so rapidly approaching.

On the 25th of September, the yacht arrived off the Straits of Magellan, and entered them without delay. This route is generally preferred by steamers on their way to the Pacific Ocean. The exact length of the straits is 372 miles. Ships of the largest tonnage find, throughout, sufficient depth of water, even close to the shore, and there is a good bottom everywhere, and abundance of fresh water, and rivers abounding in fish, and forests in game, and plenty of safe and accessible harbors; in fact a thousand things which are lacking in Strait Lemaire and Cape Horn, with its terrible rocks, incessantly visited by hurricane and tempest.

For the first three or four hours—that is to say, for about sixty to eighty miles, as far as Cape Gregory—the coast on either side was low and sandy. Jacques Paganel would not lose a single point of view, nor a single detail of the straits. It would scarcely take thirty-six hours to go through them, and the moving panorama on both sides, seen in all the clearness and glory of the light of a southern sun, was well worth the trouble of looking at and admiring. On the Terra del Fuego side, a few wretched-looking creatures were wandering about on the rocks, but on the other side not a solitary inhabitant was visible.

Paganel was so vexed at not being able to catch a glimpse of any Patagonians, that his companions were quite amused at him. He would insist that Patagonia without Patagonians was not Patagonia at all.

But Glenarvan replied:
"Patience, my worthy geographer. We shall see the Patagonians yet."
"I am not sure of it."
"But there is such a people, anyhow," said Lady Helena.
"I doubt it much, madam, since I don't see them."
"But surely the very name Patagonia, which means 'great feet' in Spanish, would not have been given to imaginary beings." "Oh, the name is nothing," said Paganel, who was arguing simply for the sake of arguing. "And besides, to speak the truth, we are not sure if that is their name."
"What an idea!" exclaimed Glenarvan. "Did you know that, Major?"
"No," replied McNabbs, "and wouldn't give a Scotch pound-note for the information."
"You shall hear it, however, Major Indifferent. Though Magellan called the natives Patagonians, the Fuegians called them Tiremenen, the Chilians Caucalhues, the colonists of Carmen Tehuelches, the Araucans Huiliches; Bougainville gives them the name of Chauha, and Falkner that of Tehuelhets. The name they give themselves is Inaken. Now, tell me then, how would you recognize them? Indeed, is it likely that a people with so many names has any actual existence?"
"That's a queer argument, certainly," said Lady Helena.
"Well, let us admit it," said her husband, "but our friend Paganel must own that even if there are doubts about the name of the race there is none about their size."
"Indeed, I will never own anything so outrageous as that," replied Paganel.
"They are tall," said Glenarvan.
"I don't know that."
"Are they little, then?" asked Lady Helena.
"No one can affirm that they are."
"About the average, then?" said McNabbs.
"I don't know that either."
"That's going a little too far," said Glenarvan. "Travelers who have seen them tell us."
"Travelers who have seen them," interrupted Paganel, "don't agree at all in their accounts. Magellan said that his head scarcely reached to their waist."
"Well, then, that proves."
"Yes, but Drake declares that the English are taller than the tallest Patagonian?"
"Oh, the English—that may be," replied the Major, disdainfully, "but we are talking of the Scotch."
"Cavendish assures us that they are tall and robust," continued Paganel. "Hawkins makes out they are giants. Lemaire and Shouten declare that they are eleven feet high."
"These are all credible witnesses," said Glenarvan.
"Yes, quite as much as Wood, Narborough, and Falkner, who say they are of medium stature. Again, Byron, Giraudais, Bougainville, Wallis, and Carteret, declared that the Patagonians are six feet six inches tall."
"But what is the truth, then, among all these contradictions?" asked Lady Helena.
"Just this, madame; the Patagonians have short legs, and a large bust; or by way of a joke we might say that these natives are six feet high when they are sitting, and only five when they are standing."
"Bravo! my dear geographer," said Glenarvan. "That is very well put."
"Unless the race has no existence, that would reconcile all statements," returned Paganel. "But here is one
consolation, at all events: the Straits of Magellan are very magnificent, even without Patagonians."

Just at this moment the DUNCAN was rounding the peninsula of Brunswick between splendid panoramas.

Seventy miles after doubling Cape Gregory, she left on her starboard the penitentiary of Punta Arena. The church steeple and the Chilian flag gleamed for an instant among the trees, and then the strait wound on between huge granitic masses which had an imposing effect. Cloud-capped mountains appeared, their heads white with eternal snows, and their feet hid in immense forests. Toward the southwest, Mount Tarn rose 6,500 feet high. Night came.

V. IV Verne on after a long lingering twilight, the light insensibly melting away into soft shades. These brilliant constellations began to bestud the sky, and the Southern Cross shone out. There were numerous bays along the shore, easy of access, but the yacht did not drop anchor in any; she continued her course fearlessly through the luminous darkness. Presently ruins came in sight, crumbling buildings, which the night invested with grandeur, the sad remains of a deserted settlement, whose name will be an eternal protest against these fertile shores and forests full of game. The DUNCAN was passing Fort Famine.

It was in that very spot that Sarmiento, a Spaniard, came in 1581, with four hundred emigrants, to establish a colony. He founded the city of St. Philip, but the extreme severity of winter decimated the inhabitants, and those who had struggled through the cold died subsequently of starvation. Cavendish the Corsair discovered the last survivor dying of hunger in the ruins.

A WEEK after they had doubled the Cape Pilares, the DUNCAN steamed into the bay of Talcahuano, a magnificent estuary, twelve miles long and nine broad. The weather was splendid. From November to March the sky is always cloudless, and a constant south wind prevails, as the coast is sheltered by the mountain range of the Andes. In obedience to Lord Glenarvan's order, John Mangles had sailed as near the archipelago of Chiloe as possible, and examined all the creeks and windings of the coast, hoping to discover some traces of the shipwreck. A broken spar, or any fragment of the vessel, would have put them in the right track; but nothing whatever was visible, and the yacht continued her route, till she dropped anchor at the port of Talcahuano, forty-two days from the time she had sailed out of the fogs of the Clyde.

Lord Glenarvan had a boat lowered immediately, and went on shore, accompanied by Paganel. The learned geographer gladly availed himself of the opportunity of making use of the language he had been studying so conscientiously, but to his great amazement, found he could not make himself understood by the people. "It is the accent I've not got," he said.

"Let us go to the Custom-house," replied Glenarvan.

They were informed on arriving there, by means of a few English words, aided by expressive gestures, that the British Consul lived at Concepcion, an hour's ride distant. Glenarvan found no difficulty in procuring two fleet horses, and he and Paganel were soon within the walls of the great city, due to the enterprising genius of Valdivia, the valiant comrade of the Pizarros.

How it was shorn of its ancient splendor! Often pillaged by the natives, burned in 1819, it lay in desolation and ruins, its walls still blackened by the flames, scarcely numbering 8,000 inhabitants, and already eclipsed by Talcahuano. The grass was growing in the streets, beneath the lazy feet of the citizens, and all trade and business, indeed any description of activity, was impossible. The notes of the mandolin resounded from every balcony, and languishing songs floated on the breeze. Concepcion, the ancient city of brave men, had become a village of women and children. Lord Glenarvan felt no great desire to inquire into the causes of this decay, though Paganel tried to draw him into a discussion on the subject. He would not delay an instant, but went straight on to the house of Mr. Bentic, her Majesty's Consul, who received them very courteously, and, on learning their errand, undertook to make inquiries all along the coast.

But to the question whether a three-mast vessel, called the BRITANNIA, had gone ashore either on the Chilian
or Araucanian coast, he gave a decided negative. No report of such an event had been made to him, or any of the
other consuls. Glenarvan, however, would not allow himself to be disheartened; he went back to Talcahuano, and
spared neither pains nor expense to make a thorough investigation of the whole seaboard. But it was all in vain. The
most minute inquiries were fruitless, and Lord Glenarvan returned to the yacht to report his ill success. Mary Grant
and her brother could not restrain their grief. Lady Helena did her best to comfort them by loving caresses, while
Jacques Paganel took up the document and began studying it again. He had been poring over it for more than an
hour when Glenarvan interrupted him and said:

"Paganel! I appeal to your sagacity. Have we made an erroneous interpretation of the document? Is there
anything illogical about the meaning?"

Paganel was silent, absorbed in reflection.

"Have we mistaken the place where the catastrophe occurred?" continued Glenarvan. "Does not the name
Patagonia seem apparent even to the least clear-sighted individual?"

Paganel was still silent.

"Besides," said Glenarvan, "does not the word INDIEN prove we are right?"

"Perfectly so," replied McNabbs.

"And is it not evident, then, that at the moment of writing the words, the shipwrecked men were expecting to be
made prisoners by the Indians?"

"I take exception to that, my Lord," said Paganel; "and even if your other conclusions are right, this, at least,
seemed to me irrational."

"What do you mean?" asked Lady Helena, while all eyes were fixed on the geographer.

"I mean this," replied Paganel, "that Captain Grant is _now a prisoner among the Indians_, and I further add that
the document states it unmistakably."

"Explain yourself, sir," said Mary Grant.

"Nothing is plainer, dear Mary. Instead of reading the document _seront prisonniers_, read _sont prisonniers_,
and the whole thing is clear."

"But that is impossible," replied Lord Glenarvan.

"Impossible! and why, my noble friend?" asked Paganel, smiling.

"Because the bottle could only have been thrown into the sea just when the vessel went to pieces on the rocks,
and consequently the latitude and longitude given refer to the actual place of the shipwreck."

"There is no proof of that," replied Paganel, "and I see nothing to preclude the supposition that the poor fellows
were dragged into the interior by the Indians, and sought to make known the place of their captivity by means of this
bottle."

"Except this fact, my dear Paganel, that there was no sea, and therefore they could not have flung the bottle into
it."

"Unless they flung it into rivers which ran into the sea," returned Paganel.

This reply was so unexpected, and yet so admissible, that it made them all completely silent for a minute, though
their beaming eyes betrayed the rekindling of hope in their hearts. Lady Helena was the first to speak.

"What an idea!" she exclaimed.

"And what a good idea," was Paganel's naive rejoinder to her exclamation.

"What would you advise, then?" said Glenarvan.

"My advice is to follow the 37th parallel from the point where it touches the American continent to where it dips
into the Atlantic, without deviating from it half a degree, and possibly in some part of its course we shall fall in with
the shipwrecked party."

"There is a poor chance of that," said the Major.

"Poor as it is," returned Paganel, "we ought not to lose it. If I am right in my conjecture, that the bottle has been
carried into the sea on the bosom of some river, we cannot fail to find the track of the prisoners. You can easily
convince yourselves of this by looking at this map of the country."

He unrolled a map of Chili and the Argentine provinces as he spoke, and spread it out on the table.

"Just follow me for a moment," he said, "across the American continent. Let us make a stride across the narrow
strip of Chili, and over the Cordilleras of the Andes, and get into the heart of the Pampas. Shall we find any lack of
rivers and streams and currents? No, for here are the Rio Negro and Rio Colorado, and their tributaries intersected
by the 37th parallel, and any of them might have carried the bottle on its waters. Then, perhaps, in the midst of a
tribe in some Indian settlement on the shores of these almost unknown rivers, those whom I may call my friends
await some providential intervention. Ought we to disappoint their hopes? Do you not all agree with me that it is our
duty to go along the line my finger is pointing out at this moment on the map, and if after all we find I have been
mistaken, still to keep straight on and follow the 37th parallel till we find those we seek, if even we go right round
the world?"

His generous enthusiasm so touched his auditors that, involuntarily, they rose to their feet and grasped his hands, while Robert exclaimed as he devoured the map with his eyes:

"Yes, my father is there!"

"And where he is," replied Glenarvan, "we'll manage to go, my boy, and find him. Nothing can be more logical than Paganel's theory, and we must follow the course he points out without the least hesitation. Captain Grant may have fallen into the hands of a numerous tribe, or his captors may be but a handful. In the latter case we shall carry him off at once, but in the event of the former, after we have reconnoitered the situation, we must go back to the DUNCAN on the eastern coast and get to Buenos Ayres, where we can soon organize a detachment of men, with Major McNabbs at their head, strong enough to tackle all the Indians in the Argentine provinces."

"That's capital, my Lord," said John Mangles, "and I may add, that there is no danger whatever crossing the continent."

"Monsieur Paganel," asked Lady Helena, "you have no fear then that if the poor fellows have fallen into the hands of the Indians their lives at least have been spared."

"What a question? Why, madam, the Indians are not anthropophagi! Far from it. One of my own countrymen, M. Guinnard, associated with me in the Geographical Society, was three years a prisoner among the Indians in the Pampas. He had to endure sufferings and ill-treatment, but came off victorious at last. A European is a useful being in these countries. The Indians know his value, and take care of him as if he were some costly animal."

"There is not the least room then for hesitation," said Lord Glenarvan. "Go we must, and as soon as possible. What route must we take?"

"One that is both easy and agreeable," replied Paganel. "Rather mountainous at first, and then sloping gently down the eastern side of the Andes into a smooth plain, turfed and graveled quite like a garden."

"Let us see the map?" said the Major.

"Here it is, my dear McNabbs. We shall go through the capital of Araucania, and cut the Cordilleras by the pass of Antuco, leaving the volcano on the south, and gliding gently down the mountain sides, past the Neuquem and the Rio Colorado on to the Pampas, till we reach the Sierra Tapalquen, from whence we shall see the frontier of the province of Buenos Ayres. These we shall pass by, and cross over the Sierra Tandil, pursuing our search to the very shores of the Atlantic, as far as Point Medano."

Paganel went through this programme of the expedition without so much as a glance at the map. He was so posted up in the travels of Frezier, Molina, Humboldt, Miers, and Orbigny, that he had the geographical nomenclature at his fingers' ends, and could trust implicitly to his never-failing memory.

"You see then, friend," he added, "that it is a straight course. In thirty days we shall have gone over it, and gained the eastern side before the DUNCAN, however little she may be delayed by the westerly winds."

"Then the DUNCAN is to cruise between Corrientes and Cape Saint Antonie," said John Mangles.

"Just so."

"And how is the expedition to be organized?" asked Glenarvan.

"As simply as possible. All there is to be done is to reconnoiter the situation of Captain Grant and not to come to gunshot with the Indians. I think that Lord Glenarvan, our natural leader; the Major, who would not yield his place to anybody; and your humble servant, Jacques Paganel."

"And me," interrupted Robert.

"Robert, Robert!" exclaimed Mary.

"And why not?" returned Paganel. "Travels form the youthful mind. Yes, Robert, we four and three of the sailors."

"And does your Lordship mean to pass me by?" said John Mangles, addressing his master.

"My dear John," replied Glenarvan, "we leave passengers on board, those dearer to us than life, and who is to watch over them but the devoted captain?"

"Then we can't accompany you?" said Lady Helena, while a shade of sadness beclouded her eyes.

"My dear Helena, the journey will so soon be accomplished that it will be but a brief separation, and--"

"Yes, dear, I understand, it is all right; and I do hope you may succeed."

"Besides, you can hardly call it a journey," added Paganel.

"What is it, then?"

"It is just making a flying passage across the continent, the way a good man goes through the world, doing all the good he can. _Transire beneficiendo_—that is our motto."

This ended the discussion, if a conversation can be so called, where all who take part in it are of the same opinion. Preparations commenced the same day, but as secretly as possible to prevent the Indians getting scent of it.

The day of departure was fixed for the 14th of October. The sailors were all so eager to join the expedition that
Glenarvan found the only way to prevent jealousy among them was to draw lots who should go. This was accordingly done, and fortune favored the chief officer, Tom Austin, Wilson, a strong, jovial young fellow, and Mulrady, so good a boxer that he might have entered the lists with Tom Sayers himself.

Glenarvan displayed the greatest activity about the preparations, for he was anxious to be ready by the appointed day. John Mangles was equally busy in coaling the vessel, that she might weigh anchor at the same time. There was quite a rivalry between Glenarvan and the young captain about getting first to the Argentine coast.

Both were ready on the 14th. The whole search party assembled in the saloon to bid farewell to those who remained behind. The DUNCAN was just about to get under way, and already the vibration of the screw began to agitate the limpid waters of Talcahuano. Glenarvan, Paganel, McNabbs, Robert Grant, Tom Austin, Wilson, and Mulrady, stood armed with carbines and Colt's revolvers. Guides and mules awaited them at the landing stairs of the harbor.

"It is time," said Lord Glenarvan at last.
"Go then, dear Edward," said Lady Helena, restraining her emotion.

Lord Glenarvan clasped her closely to his breast for an instant, and then turned away, while Robert flung his arms round Mary's neck.

"And now, friends," said Paganel, "let's have one good hearty shake of the hand all round, to last us till we get to the shores of the Atlantic."

This was not much to ask, but he certainly got strong enough grips to go some way towards satisfying his desire.

All went on deck now, and the seven explorers left the vessel. They were soon on the quay, and as the yacht turned round to pursue her course, she came so near where they stood, that Lady Helena could exchange farewells once more.

"God help you!" she called out.
"Heaven will help us, madam," shouted Paganel, in reply, "for you may be sure we'll help ourselves."
"Go on," sung out the captain to his engineer.

At the same moment Lord Glenarvan gave the signal to start, and away went the mules along the coast, while the DUNCAN steamed out at full speed toward the broad ocean.

CHAPTER XI TRAVELING IN CHILI

THE native troops organized by Lord Glenarvan consisted of three men and a boy. The captain of the muleteers was an Englishman, who had become naturalized through twenty years' residence in the country. He made a livelihood by letting out mules to travelers, and leading them over the difficult passes of the Cordilleras, after which he gave them in charge of a BAQUEANO, or Argentine guide, to whom the route through the Pampas was perfectly familiar. This Englishman had not so far forgotten his mother tongue among mules and Indians that he could not converse with his countrymen, and a lucky thing it was for them, as Lord Glenarvan found it far easier to give orders than to see them executed, Paganel was still unsuccessful in making himself understood.

The CATAPEZ, as he was called in Chilian, had two natives called PEONS, and a boy about twelve years of age under him. The PEONS took care of the baggage mules, and the boy led the MADRINA, a young mare adorned with rattle and bells, which walked in front, followed by ten mules. The travelers rode seven of these, and the CATAPEZ another. The remaining two carried provisions and a few bales of goods, intended to secure the goodwill of the Caciques of the plain. The PEONS walked, according to their usual habit.

Every arrangement had been made to insure safety and speed, for crossing the Andes is something more than an ordinary journey. It could not be accomplished without the help of the hardy mules of the far-famed Argentine breed. Those reared in the country are much superior to their progenitors. They are not particular about their food, and only drink once a day, and they can go with ease ten leagues in eight hours.

There are no inns along this road from one ocean to another. The only viands on which travelers can regale themselves are dried meat, rice seasoned with pimento, and such game as may be shot en route. The torrents provide them with water in the mountains, and the rivulets in the plains, which they improve by the addition of a few drops of rum, and each man carries a supply of this in a bullock's horn, called CHIFFLE. They have to be careful, however, not to indulge too freely in alcoholic drinks, as the climate itself has a peculiarly exhilarating effect on the nervous system. As for bedding, it is all contained in the saddle used by the natives, called RECADO. This saddle is made of sheepskins, tanned on one side and woolly on the other, fastened by gorgeous embroidered straps. Wrapped in these warm coverings a traveler may sleep soundly, and brave exposure to the damp nights.

Glenarvan, an experienced traveler, who knew how to adapt himself to the customs of other countries,adopted the Chilian costume for himself and his whole party. Paganel and Robert, both alike children, though of different growth, were wild with delight as they inserted their heads in the national PONCHO, an immense plaid with a hole in center, and their legs in high leather boots. The mules were richly caparisoned, with the Arab bit in their mouths, and long reins of plaited leather, which served as a whip; the headstall of the bridle was decorated with metal.
ornaments, and the ALFORJAS, double sacks of gay colored linen, containing the day's provisions. Paganel, DI
STRAIT as usual, was flung several times before he succeeded in bestriding his good steed, but once in the saddle, his inseparable telescope on his shoulder-belt, he held on well enough, keeping his feet fast in the stirrups, and trusting entirely to the sagacity of his beast. As for Robert, his first attempt at mounting was successful, and proved that he had the making in him of an excellent horseman.

The weather was splendid when they started, the sky a deep cloudless blue, and yet the atmosphere so tempered by the sea breezes as to prevent any feeling of oppressive heat. They marched rapidly along the winding shore of the bay of Talcahuano, in order to gain the extremity of the parallel, thirty miles south. No one spoke much the first day, for the smoke of the DUNCAN was still visible on the horizon, and the pain of parting too keenly felt. Paganel talked to himself in Spanish, asking and answering questions.

The CATAPEZ, moreover, was a taciturn man naturally, and had not been rendered loquacious by his calling. He hardly spoke to his PEONS. They understood their duties perfectly. If one of the mules stopped, they urged it on with a guttural cry, and if that proved unavailing, a good-sized pebble, thrown with unerring aim, soon cured the animal's obstinacy. If a strap got loose, or a rein fell, a PEON came forward instantly, and throwing off his poncho, flung it over his beast's head till the accident was repaired and the march resumed.

The custom of the muleteers is to start immediately after breakfast, about eight o'clock, and not to stop till they camp for the night, about 4 P. M. Glenarvan fell in with the practice, and the first halt was just as they arrived at Arauco, situated at the very extremity of the bay. To find the extremity of the 37th degree of latitude, they would have required to proceed as far as the Bay of Carnero, twenty miles further. But the agents of Glenarvan had already scoured that part of the coast, and to repeat the exploration would have been useless. It was, therefore, decided that Arauco should be the point of departure, and they should keep on from there toward the east in a straight line.

Since the weather was so favorable, and the whole party, even Robert, were in perfect health, and altogether the journey had commenced under such favorable auspices, it was deemed advisable to push forward as quickly as possible. Accordingly, the next day they marched 35 miles or more, and encamped at nightfall on the banks of Rio Biobio. The country still presented the same fertile aspect, and abounded in flowers, but animals of any sort only came in sight occasionally, and there were no birds visible, except a solitary heron or owl, and a thrush or grebe, flying from the falcon. Human beings there were none, not a native appeared; not even one of the GUASSOS, the degenerate offspring of Indians and Spaniards, dashed across the plain like a shadow, his flying steed dripping with blood from the cruel thrusts inflicted by the gigantic spurs of his master's naked feet. It was absolutely impossible to make inquiries when there was no one to address, and Lord Glenarvan came to the conclusion that Captain Grant must have been dragged right over the Andes into the Pampas, and that it would be useless to search for him elsewhere. The only thing to be done was to wait patiently and press forward with all the speed in their power.

On the 17th they set out in the usual line of march, a line which it was hard work for Robert to keep, his ardor constantly compelled him to get ahead of the MADRINA, to the great despair of his mule. Nothing but a sharp recall from Glenarvan kept the boy in proper order.

The country now became more diversified, and the rising ground indicated their approach to a mountainous district. Rivers were more numerous, and came rushing noisily down the slopes. Paganel consulted his maps, and when he found any of those streams not marked, which often happened, all the fire of a geographer burned in his veins, and he would exclaim, with a charming air of vexation:

"A river which hasn't a name is like having no civil standing. It has no existence in the eye of geographical law."

He christened them forthwith, without the least hesitation, and marked them down on the map, qualifying them with the most high-sounding adjectives he could find in the Spanish language.

"What a language!" he said. "How full and sonorous it is! It is like the metal church bells are made of--composed of seventy-eight parts of copper and twenty-two of tin."

"But, I say, do you make any progress in it?" asked Glenarvan.

"Most certainly, my dear Lord. Ah, if it wasn't the accent, that wretched accent!"

And for want of better work, Paganel whiled away the time along the road by practising the difficulties in pronunciation, repeating all the break-jaw words he could, though still making geographical observations. Any question about the country that Glenarvan might ask the CATAPEZ was sure to be answered by the learned Frenchman before he could reply, to the great astonishment of the guide, who gazed at him in bewilderment.

About two o'clock that same day they came to a cross road, and naturally enough Glenarvan inquired the name of it.

"It is the route from Yumbel to Los Angeles," said Paganel.

Glenarvan looked at the CATAPEZ, who replied:

"Quite right."

And then, turning toward the geographer, he added:
"You have traveled in these parts before, sir?"
"Oh, yes," said Paganel, quite gravely.
"On a mule?"
"No, in an easy chair."
The CATAPEZ could not make him out, but shrugged his shoulders and resumed his post at the head of the party.
At five in the evening they stopped in a gorge of no great depth, some miles above the little town of Loja, and encamped for the night at the foot of the Sierras, the first steppes of the great Cordilleras.
CHAPTER XII ELEVEN THOUSAND FEET ALOFT
NOTHING of importance had occurred hitherto in the passage through Chili; but all the obstacles and difficulties incident to a mountain journey were about to crowd on the travelers now.
One important question had first to be settled. Which pass would take them over the Andes, and yet not be out of their fixed route?
On questioning the CATAPEZ on the subject, he replied:
"There are only two practicable passes that I know of in this part of the Cordilleras."
"The pass of Arica is one undoubtedly discovered by Valdivia Mendoza," said Paganel.
"Just so."
"And that of Villarica is the other."
"Precisely."
"Well, my good fellow, both these passes have only one fault; they take us too far out of our route, either north or south."
"Have you no other to propose?" asked the Major.
"Certainly," replied Paganel. "There is the pass of Antuco, on the slope of the volcano, in latitude, 37 degrees 30', or, in other words, only half a degree out of our way."
"That would do, but are you acquainted with this pass of Antuco, CATAPEZ?" said Glenarvan.
"Yes, your Lordship, I have been through it, but I did not mention it, as no one goes that way but the Indian shepherds with the herds of cattle."
"Oh, very well; if mares and sheep and oxen can go that way, we can, so let's start at once."
The signal for departure was given immediately, and they struck into the heart of the valley of Las Lejas, between great masses of chalk crystal. From this point the pass began to be difficult, and even dangerous. The angles of the declivities widened and the ledges narrowed, and frightful precipices met their gaze. The mules went cautiously along, keeping their heads near the ground, as if scenting the track. They marched in file. Sometimes at a sudden bend of the road, the MADRINA would disappear, and the little caravan had to guide themselves by the distant tinkle of her bell. Often some capricious winding would bring the column in two parallel lines, and the CATAPEZ could speak to his PEONS across a crevasse not two fathoms wide, though two hundred deep, which made between them an inseparable gulf.
Glenarvan followed his guide step by step. He saw that his perplexity was increasing as the way became more difficult, but did not dare to interrogate him, rightly enough, perhaps, thinking that both mules and muleteers were very much governed by instinct, and it was best to trust to them.
For about an hour longer the CATAPEZ kept wandering about almost at haphazard, though always getting higher up the mountains. At last he was obliged to stop short. They were in a narrow valley, one of those gorges called by the Indians "quebrads," and on reaching the end, a wall of porphyry rose perpendicularly before them, and barred further passage. The CATAPEZ, after vain attempts at finding an opening, dismounted, crossed his arms, and waited. Glenarvan went up to him and asked if he had lost his way.
"No, your Lordship," was the reply.
"But you are not in the pass of Antuco."
"We are."
"You are sure you are not mistaken?"
"I am not mistaken. See! there are the remains of a fire left by the Indians, and there are the marks of the mares and the sheep."
"They must have gone on then."
"Yes, but no more will go; the last earthquake has made the route impassable."
"To mules," said the Major, "but not to men."
"Ah, that's your concern; I have done all I could. My mules and myself are at your service to try the other passes of the Cordilleras."
"And that would delay us?"
"Three days at least."

Glenarvan listened silently. He saw the CATAPEZ was right. His mules could not go farther. When he talked of returning, however, Glenarvan appealed to his companions and said:

"Will you go on in spite of all the difficulty?"

"We will follow your Lordship," replied Tom Austin.

"And even precede you," added Paganel. "What is it after all? We have only to cross the top of the mountain chain, and once over, nothing can be easier of descent than the slopes we shall find there. When we get below, we shall find BAQUEANOS, Argentine shepherds, who will guide us through the Pampas, and swift horses accustomed to gallop over the plains. Let's go forward then, I say, and without a moment's hesitation."

"Forward!" they all exclaimed. "You will not go with us, then?" said Glenarvan to the CATAPEZ.

"I am the muleteer," was the reply.

"As you please," said Glenarvan.

"We can do without him," said Paganel. "On the other side we shall get back into the road to Antuco, and I'm quite sure I'll lead you to the foot of the mountain as straight as the best guide in the Cordilleras."

Accordingly, Glenarvan settled accounts with the CATAPEZ, and bade farewell to him and his PEONS and mules. The arms and instruments, and a small stock of provisions were divided among the seven travelers, and it was unanimously agreed that the ascent should recommence at once, and, if necessary, should continue part of the night. There was a very steep winding path on the left, which the mules never would have attempted. It was toilsome work, but after two hours' exertion, and a great deal of roundabout climbing, the little party found themselves once more in the pass of Antuco.

They were not far now from the highest peak of the Cordilleras, but there was not the slightest trace of any beaten path. The entire region had been overturned by recent shocks of earthquake, and all they could do was to keep on climbing higher and higher. Paganel was rather disconcerted at finding no way out to the other side of the chain, and laid his account with having to undergo great fatigue before the topmost peaks of the Andes could be reached, for their mean height is between eleven and twelve thousand six hundred feet. Fortunately the weather was calm and the sky clear, in addition to the season being favorable, but in Winter, from May to October, such an ascent would have been impracticable. The intense cold quickly kills travelers, and those who even manage to hold out against it fall victims to the violence of the TEMPORALES, a sort of hurricane peculiar to those regions, which yearly fills the abysses of the Cordilleras with dead bodies.

They went on toiling steadily upward all night, hoisting themselves up to almost inaccessible plateaux, and leaping over broad, deep crevasses. They had no ropes, but arms linked in arms supplied the lack, and shoulders served for ladders. The strength of Mulrady and the dexterity of Wilson were taxed heavily now. These two brave Scots multiplied themselves, so to speak. Many a time, but for their devotion and courage the small band could not have gone on. Glenarvan never lost sight of young Robert, for his age and vivacity made him imprudent. Paganel was a true Frenchman in his impetuous ardor, and hurried furiously along. The Major, on the contrary, only went as quick as was necessary, neither more nor less, climbing without the least apparent exertion. Perhaps he hardly knew, indeed, that he was climbing at all, or perhaps he fancied he was descending.

The whole aspect of the region had now completely changed. Huge blocks of glittering ice, of a bluish tint on some of the declivities, stood up on all sides, reflecting the early light of morn. The ascent became very perilous. They were obliged to reconnoiter carefully before making a single step, on account of the crevasses. Wilson took the lead, and tried the ground with his feet. His companions followed exactly in his footprints, lowering their voices to a whisper, as the least sound would disturb the currents of air, and might cause the fall of the masses of snow suspended in the air seven or eight hundred feet above their heads.

They had come now to the region of shrubs and bushes, which, higher still, gave place to grasses and cacti. At 11,000 feet all trace of vegetation had disappeared. They had only stopped once, to rest and snatch a hurried meal to V. IV Verne recruit their strength. With superhuman courage, the ascent was then resumed amid increasing dangers and difficulties. They were forced to bstride sharp peaks and leap over chasms so deep that they did not dare to look down them. In many places wooden crosses marked the scene of some great catastrophes.

About two o'clock they came to an immense barren plain, without a sign of vegetation. The air was dry and the sky unclouded blue. At this elevation rain is unknown, and vapors only condense into snow or hail. Here and there peaks of porphyry or basalt pierced through the white winding-sheet like the bones of a skeleton; and at intervals fragments of quartz or gneiss, loosened by the action of the air, fell down with a faint, dull sound, which in a denser atmosphere would have been almost imperceptible.

However, in spite of their courage, the strength of the little band was giving way. Glenarvan regretted they had gone so far into the interior of the mountain when he saw how exhausted his men had become. Young Robert held out manfully, but he could not go much farther.
At three o'clock Glenarvan stopped and said:
"We must rest."
He knew if he did not himself propose it, no one else would.
"Rest?" rejoined Paganel; "we have no place of shelter."
"It is absolutely necessary, however, if it were only for Robert."
"No, no," said the courageous lad; "I can still walk; don't stop."
"You shall be carried, my boy; but we must get to the other side of the Cordilleras, cost what it may. There we
may perhaps find some hut to cover us. All I ask is a two hours' longer march."
"Are you all of the same opinion?" said Glenarvan.
"Yes," was the unanimous reply: and Mulrady added, "I'll carry the boy."
The march eastward was forthwith resumed. They had a frightful height to climb yet to gain the topmost peaks.
The rarefaction of the atmosphere produced that painful oppression known by the name of PUNA. Drops of blood
stood on the gums and lips, and respiration became hurried and difficult. However strong the will of these brave men
might be, the time came at last when their physical powers failed, and vertigo, that terrible malady in the mountains,
destroyed not only their bodily strength but their moral energy. Falls became frequent, and those who fell could not
rise again, but dragged themselves along on their knees.

But just as exhaustion was about to make short work of any further ascent, and Glenarvan's heart began to sink
as he thought of the snow lying far as the eye could reach, and of the intense cold, and saw the shadow of night fast
overspreading the desolate peaks, and knew they had not a roof to shelter them, suddenly the Major stopped and
said, in a calm voice, "A hut!"

CHAPTER XIII A SUDDEN DESCENT
ANYONE else but McNabbs might have passed the hut a hundred times, and gone all round it, and even over it
without suspecting its existence. It was covered with snow, and scarcely distinguishable from the surrounding rocks;
but Wilson and Mulrady succeeded in digging it out and clearing the opening after half an hour's hard work, to the
great joy of the whole party, who eagerly took possession of it.
They found it was a CASUCHA, constructed by the Indians, made of ADOBES, a species of bricks baked in the
sun. Its form was that of a cube, 12 feet on each side, and it stood on a block of basalt. A stone stair led up to the
door, the only opening; and narrow as this door was, the hurricane, and snow, and hail found their way in when the
TEMPORALES were unchained in the mountains.
Ten people could easily find room in it, and though the walls might be none too water-tight in the rainy season,
at this time of the year, at any rate, it was sufficient protection against the intense cold, which, according to the
thermometer, was ten degrees below zero. Besides, there was a sort of fireplace in it, with a chimney of bricks, badly
enough put together, certainly, but still it allowed of a fire being lighted.
"This will shelter us, at any rate," said Glenarvan, "even if it is not very comfortable. Providence has led us to it,
and we can only be thankful."
"Why, it is a perfect palace, I call it," said Paganel; "we only want flunkeys and courtiers. We shall do capital
here."
"Especially when there is a good fire blazing on the hearth, for we are quite as cold as we are hungry. For my
part, I would rather see a good faggot just now than a slice of venison."
"Well, Tom, we'll try and get some combustible or other," said Paganel.
"Combustibles on the top of the Cordilleras!" exclaimed Mulrady, in a dubious tone.
"Since there is a chimney in the CASUCHA," said the Major, "the probability is that we shall find something to
burn in it."
"Our friend McNabbs is right," said Glenarvan. "Get everything in readiness for supper, and I'll go out and turn
woodcutter."
"Wilson and I will go with you," said Paganel.
"Do you want me?" asked Robert, getting up.
"No, my brave boy, rest yourself. You'll be a man, when others are only children at your age," replied
Glenarvan.

On reaching the little mound of porphyry, Glenarvan and his two companions left the CASUCHA. In spite of the
perfect calmness of the atmosphere, the cold was stinging. Paganel consulted his barometer, and found that the
depression of the mercury corresponded to an elevation of 11,000 feet, only 910 meters lower than Mont Blanc. But
if these mountains had presented the difficulties of the giant of the Swiss Alps, not one of the travelers could have
crossed the great chain of the New World.
On reaching a little mound of porphyry, Glenarvan and Paganel stopped to gaze about them and scan the horizon
on all sides. They were now on the summit of the Nevadas of the Cordilleras, and could see over an area of forty
miles. The valley of the Colorado was already sunk in shadow, and night was fast drawing her mantle over the eastern slopes of the Andes. The western side was illumined by the rays of the setting sun, and peaks and glaciers flashed back his golden beams with dazzling radiance. On the south the view was magnificent. Across the wild valley of the Torbido, about two miles distant, rose the volcano of Antuco. The mountain roared like some enormous monster, and vomited red smoke, mingled with torrents of sooty flame. The surrounding peaks appeared on fire. Showers of red-hot stones, clouds of reddish vapor and rockets of lava, all combined, presented the appearance of glowing sparkling streams. The splendor of the spectacle increased every instant as night deepened, and the whole sky became lighted up with a dazzling reflection of the blazing crater, while the sun, gradually becoming shorn of his sunset glories, disappeared like a star lost in the distant darkness of the horizon.

Paganel and Glenarvan would have remained long enough gazing at the sublime struggle between the fires of earth and heaven, if the more practical Wilson had not reminded them of the business on hand. There was no wood to be found, however, but fortunately the rocks were covered with a poor, dry species of lichen. Of this they made an ample provision, as well as of a plant called LLARETTA, the root of which burns tolerably well. This precious combustible was carried back to the CASUCHA and heaped up on the hearth. It was a difficult matter to kindle it, though, and still more to keep it alight. The air was so rarefied that there was scarcely oxygen enough in it to support combustion. At least, this was the reason assigned by the Major.

"By way of compensation, however," he added, "water will boil at less than 100 degrees heat. It will come to the point of ebullition before 99 degrees."

McNabbs was right, as the thermometer proved, for it was plunged into the kettle when the water boiled, and the mercury only rose to 99 degrees. Coffee was soon ready, and eagerly gulped down by everybody. The dry meat certainly seemed poor fare, and Paganel couldn't help saying:

"I tell you what, some grilled llama wouldn't be bad with this, would it? They say that the llama is substitute for the ox and the sheep, and I should like to know if it is, in an alimentary respect."

"What!" replied the Major. "You're not content with your supper, most learned Paganel."

"Enchanted with it, my brave Major; still I must confess I should not say no to a dish of llama."

"You are a Sybarite."

"I plead guilty to the charge. But come, now, though you call me that, you wouldn't sulk at a beefsteak yourself, would you?"

"Probably not."

"And if you were asked to lie in wait for a llama, notwithstanding the cold and the darkness, you would do it without the least hesitation?"

"Of course; and if it will give you the slightest pleasure--"

His companions had hardly time to thank him for his obliging good nature, when distant and prolonged howls broke on their ear, plainly not proceeding from one or two solitary animals, but from a whole troop, and one, moreover, that was rapidly approaching.

Providence had sent them a supper, as well as led them to a hut. This was the geographer's conclusion; but Glenarvan damped his joy somewhat by remarking that the quadrupeds of the Cordilleras are never met with in such a high latitude.

"Then where can these animals come from?" asked Tom Austin. "Don't you hear them getting nearer!"

"Impossible," returned Paganel. "That is regular howling."

"Let us go out and see," said Glenarvan.

"Yes, and be ready for hunting," replied McNabbs, arming himself with his carbine.

They all rushed forthwith out of the CASUCHA. Night had completely set in, dark and starry. The moon, now in her last quarter, had not yet risen. The peaks on the north and east had disappeared from view, and nothing was visible save the fantastic SILHOUETTE of some towering rocks here and there. The howls, and clearly the howls of terrified animals, were redoubled. They proceeded from that part of the Cordilleras which lay in darkness. What could be going on there? Suddenly a furious avalanche came down, an avalanche of living animals mad with fear. The whole plateau seemed to tremble. There were hundreds, perhaps thousands, of these animals, and in spite of the rarefied atmosphere, their noise was deafening. Were they wild beasts from the Pampas, or herds of llamas and vicunas? Glenarvan, McNabbs, Robert, Austin, and the two sailors, had just time to throw themselves flat on the ground before they swept past like a whirlwind, only a few paces distant. Paganel, who had remained standing, to take advantage of his peculiar powers of sight, was knocked down in a twinkling. At the same moment the report of firearms was heard. The Major had fired, and it seemed to him that an animal had fallen close by, and that the whole herd, yelling louder than ever, had rushed down and disappeared among the declivities lighted up by the reflection of the volcano.
"Ah, I've got them," said a voice, the voice of Paganel.
"Got what?" asked Glenarvan.
"My spectacles," was the reply. "One might expect to lose that much in such a tumult as this."
"You are not wounded, I hope?"
"No, only knocked down; but by what?"
"By this," replied the Major, holding up the animal he had killed.
They all hastened eagerly into the hut, to examine McNabbs' prize by the light of the fire.
It was a pretty creature, like a small camel without a hump. The head was small and the body flattened, the legs were long and slender, the skin fine, and the hair the color of _cafe au lait_.
Paganel had scarcely looked at it before he exclaimed, "A guanaco!"
"What sort of an animal is that?" asked Glenarvan.
"One you can eat."
"And it is good savory meat, I assure you; a dish of Olympus! I knew we should have fresh meat for supper, and such meat! But who is going to cut up the beast?"
"I will," said Wilson.
"Well, I'll undertake to cook it," said Paganel.
"Can you cook, then, Monsieur Paganel?" asked Robert.
"I should think so, my boy. I'm a Frenchman, and in every Frenchman there is a cook."
Five minutes afterward Paganel began to grill large slices of venison on the embers made by the use of the LLARETTAS, and in about ten minutes a dish was ready, which he served up to his companions by the tempting name of guanaco cutlets. No one stood on ceremony, but fell to with a hearty good will.
To the absolute stupefaction of the geographer, however, the first mouthful was greeted with a general grimace, and such exclamations as--"Tough!" "It is horrible." "It is not eatable."
The poor SAVANT was obliged to own that his cutlets could not be relished, even by hungry men. They began to banter him about his "Olympian dish," and indulge in jokes at his expense; but all he cared about was to find out how it happened that the flesh of the guanaco, which was certainly good and eatable food, had turned out so badly in his hands. At last light broke in on him, and he called out:
"I see through it now! Yes, I see through it. I have found out the secret now."
"The meat was too long kept, was it?" asked McNabbs, quietly.
"No, but the meat had walked too much. How could I have forgotten that?"
"What do you mean?" asked Tom Austin.
"I mean this: the guanaco is only good for eating when it is killed in a state of rest. If it has been long hunted, and gone over much ground before it is captured, it is no longer eatable. I can affirm the fact by the mere taste, that this animal has come a great distance, and consequently the whole herd has."
"You are certain of this?" asked Glenarvan.
"Absolutely certain."
"But what could have frightened the creatures so, and driven them from their haunts, when they ought to have been quietly sleeping?"
"That's a question, my dear Glenarvan, I could not possibly answer. Take my advice, and let us go to sleep without troubling our heads about it. I say, Major, shall we go to sleep?"
"Yes, we'll go to sleep, Paganel."
Each one, thereupon, wrapped himself up in his poncho, and the fire was made up for the night.
Loud snores in every tune and key soon resounded from all sides of the hut, the deep bass contribution of Paganel completing the harmony.
But Glenarvan could not sleep. Secret uneasiness kept him in a continual state of wakefulness. His thoughts reverted involuntarily to those frightened animals flying in one common direction, impelled by one common terror. They could not be pursued by wild beasts, for at such an elevation there were almost none to be met with, and of hunters still fewer. What terror then could have driven them among the precipices of the Andes? Glenarvan felt a presentiment of approaching danger.
But gradually he fell into a half-drowsy state, and his apprehensions were lulled. Hope took the place of fear. He saw himself on the morrow on the plains of the Andes, where the search would actually commence, and perhaps success was close at hand. He thought of Captain Grant and his two sailors, and their deliverance from cruel bondage. As these visions passed rapidly through his mind, every now and then he was roused by the crackling of the fire, or sparks flying out, or some little jet of flame would suddenly flare up and illumine the faces of his slumbering companions.
Then his presentiments returned in greater strength than before, and he listened anxiously to the sounds outside.
the hut.

At certain intervals he fancied he could hear rumbling noises in the distance, dull and threatening like the mutterings of thunder before a storm. There surely must be a storm raging down below at the foot of the mountains. He got up and went out to see.

The moon was rising. The atmosphere was pure and calm. Not a cloud visible either above or below. Here and there was a passing reflection from the flames of Antuco, but neither storm nor lightning, and myriads of bright stars studded the zenith. Still the rumbling noises continued. They seemed to meet together and cross the chain of the Andes. Glenarvan returned to the CASUCHA more uneasy than ever, questioning within himself as to the connection between these sounds and the flight of the guanacos. He looked at his watch and found the time was about two in the morning. As he had no certainty, however, of any immediate danger, he did not wake his companions, who were sleeping soundly after their fatigue, and after a little dozed off himself, and slumbered heavily for some hours.

All of a sudden a violent crash made him start to his feet. A deafening noise fell on his ear like the roar of artillery. He felt the ground giving way beneath him, and the CASUCHA rocked to and fro, and opened.

He shouted to his companions, but they were already awake, and tumbling pell-mell over each other. They were being rapidly dragged down a steep declivity. Day dawned and revealed a terrible scene. The form of the mountains changed in an instant. Cones were cut off. Tottering peaks disappeared as if some trap had opened at their base. Owing to a peculiar phenomenon of the Cordilleras, an enormous mass, many miles in extent, had been displaced entirely, and was speeding down toward the plain.

"An earthquake!" exclaimed Paganel. He was not mistaken. It was one of those cataclysms frequent in Chili, and in this very region where Copiapo had been twice destroyed, and Santiago four times laid in ruins in fourteen years. This region of the globe is so underlaid with volcanic fires and the volcanoes of recent origin are such insufficient safety valves for the subterranean vapors, that shocks are of frequent occurrence, and are called by the people TREMBLORES.

The plateau to which the seven men were clinging, holding on by tufts of lichen, and giddy and terrified in the extreme, was rushing down the declivity with the swiftness of an express, at the rate of fifty miles an hour. Not a cry was possible, nor an attempt to get off or stop. They could not even have heard themselves speak. The internal rumblings, the crash of the avalanches, the fall of masses of granite and basalt, and the whirlwind of pulverized snow, made all communication impossible. Sometimes they went perfectly smoothly along without jolts or jerks, and sometimes on the contrary, the plateau would reel and roll like a ship in a storm, coasting past abysses in which fragments of the mountain were falling, tearing up trees by the roots, and leveling, as if with the keen edge of an immense scythe, every projection of the declivity.

How long this indescribable descent would last, no one could calculate, nor what it would end in ultimately. None of the party knew whether the rest were still alive, whether one or another were not already lying in the depths of some abyss. Almost breathless with the swift motion, frozen with the cold air, which pierced them through, and blinded with the whirling snow, they gasped for breath, and became exhausted and nearly inanimate, only retaining their hold of the rocks by a powerful instinct of self-preservation. Suddenly a tremendous shock pitched them right off, and sent them rolling to the very foot of the mountain. The plateau had stopped.

For some minutes no one stirred. At last one of the party picked himself up, and stood on his feet, stunned by the shock, but still firm on his legs. This was the Major. He shook off the blinding snow and looked around him. His companions lay in a close circle like the shots from a gun that has just been discharged, piled one on top of another.

The Major counted them. All were there except one—that one was Robert Grant.

CHAPTER XIV PROVIDENTIALLY RESCUED

THE eastern side of the Cordilleras of the Andes consists of a succession of lengthened declivities, which slope down almost insensibly to the plain. The soil is carpeted with rich herbage, and adorned with magnificent trees, among which, in great numbers, were apple-trees, planted at the time of the conquest, and golden with fruit. There were literally, perfect forests of these. This district was, in fact, just a corner of fertile Normandy.

The sudden transition from a desert to an oasis, from snowy peaks to verdant plains, from Winter to Summer, can not fail to strike the traveler's eye.

The ground, moreover, had recovered its immobility. The trembling had ceased, though there was little doubt the forces below the surface were carrying on their devastating work further on, for shocks of earthquake are always occurring in some part or other of the Andes. This time the shock had been one of extreme violence. The outline of the mountains was wholly altered, and the Pampas guides would have sought vainly for the accustomed landmarks.

A magnificent day had dawned. The sun was just rising from his ocean bed, and his bright rays streamed already over the Argentine plains, and ran across to the Atlantic. It was about eight o'clock.

Lord Glenarvan and his companions were gradually restored to animation by the Major's efforts. They had been
completely stunned, but had sustained no injury whatever. The descent of the Cordilleras was accomplished; and as Dame Nature had conveyed them at her own expense, they could only have praised her method of locomotion if one of their number, and that one the feeblest and youngest, the child of the party, had not been missing at the roll call.

The brave boy was beloved by everybody. Paganel was particularly attached to him, and so was the Major, with all his apparent coldness. As for Glenarvan, he was in absolute despair when he heard of his disappearance, and pictured to himself the child lying in some deep abyss, wildly crying for succor.

"We must go and look for him, and look till we find him," he exclaimed, almost unable to keep back his tears. "We cannot leave him to his fate. Every valley and precipice and abyss must be searched through and through. I will have a rope fastened round my waist, and go down myself. I insist upon it; you understand; I insist upon it. Heaven grant Robert may be still alive! If we lose the boy, how could we ever dare to meet the father? What right have we to save the captain at the cost of his son's life?"

Glenarvan's companions heard him in silence. He sought to read hope in their eyes, but they did not venture to meet his gaze.

At last he said, "Well, you hear what I say, but you make no response. Do you mean to tell me that you have no hope--not the slightest?"

Again there was silence, till McNabbs asked: "Which of you can recollect when Robert disappeared?"

No one could say.

"Well, then," resumed the Major, "you know this at any rate. Who was the child beside during our descent of the Cordilleras?"

"Beside me," replied Wilson.

"Very well. Up to what moment did you see him beside you? Try if you can remember."

"All that I can recollect is that Robert Grant was still by my side, holding fast by a tuft of lichen, less than two minutes before the shock which finished our descent."

"Less than two minutes? Mind what you are saying; I dare say a minute seemed a very long time to you. Are you sure you are not making a mistake?"

"I don't think I am. No; it was just about two minutes, as I tell you."

"Very well, then; and was Robert on your right or left?"

"On my left. I remember that his poncho brushed past my face."

"And with regard to us, how were you placed?"

"On the left also."

"Then Robert must have disappeared on this side," said the Major, turning toward the mountain and pointing toward the right: "and I should judge," he added, "considering the time that has elapsed, that the spot where he fell is about two miles up. Between that height and the ground is where we must search, dividing the different zones among us, and it is there we shall find him."

Not another word was spoken. The six men commenced their explorations, keeping constantly to the line they had made in their descent, examining closely every fissure, and going into the very depths of the abysses, choked up though they partly were with fragments of the plateau; and more than one came out again with garments torn to rags, and feet and hands bleeding. For many long hours these brave fellows continued their search without dreaming of taking rest. But all in vain. The child had not only met his death on the mountain, but found a grave which some enormous rock had sealed forever.

About one o'clock, Glenarvan and his companions met again in the valley. Glenarvan was completely crushed with grief. He scarcely spoke. The only words that escaped his lips amid his sighs were, "I shall not go away! I shall not go away!"

No one of the party but could enter into his feeling, and respect it.

"Let us wait," said Paganel to the Major and Tom Austin. "We will take a little rest, and recruit our strength. We need it anyway, either to prolong our search or continue our route."

"Yes; and, as Edward wishes it, we will rest. He has still hope, but what is it he hopes?"

"Who knows!" said Tom Austin.

"Poor Robert!" replied Paganel, brushing away a tear.

The valley was thickly wooded, and the Major had no difficulty in finding a suitable place of encampment. He chose a clump of tall carob trees, under which they arranged their few belongings--few indeed, for all they had were sundry wraps and fire-arms, and a little dried meat and rice. Not far off there was a RIO, which supplied them with water, though it was still somewhat muddy after the disturbance of the avalanche. Mulrady soon had a fire lighted on the grass, and a warm refreshing beverage to offer his master. But Glenarvan refused to touch it, and lay stretched on
his poncho in a state of absolute prostration.

So the day passed, and night came on, calm and peaceful as the preceding had been. While his companions were lying motionless, though wide awake, Glenarvan betook himself once more to the slopes of the Cordilleras, listening intently in hope that some cry for help would fall upon his ear. He ventured far up in spite of his being alone, straining his ear with painful eagerness to catch the faintest sound, and calling aloud in an agony of despair.

But he heard nothing save the beatings of his own heart, though he wandered all night on the mountain. Sometimes the Major followed him, and sometimes Paganel, ready to lend a helping hand among the slippery peaks and dangerous precipices among which he was dragged by his rash and useless imprudence. All his efforts were in vain, however, and to his repeated cries of "Robert, Robert!" echo was the only response.

Day dawned, and it now became a matter of necessity to go and bring back the poor Lord from the distant plateau, even against his will. His despair was terrible. Who could dare to speak of quitting this fatal valley? Yet provisions were done, and Argentine guides and horses were not far off to lead them to the Pampas. To go back would be more difficult than to go forward. Besides, the Atlantic Ocean was the appointed meeting place with the DUNCAN. These were strong reasons against any long delay; indeed it was best for all parties to continue the route as soon as possible.

McNabbs undertook the task of rousing Lord Glenarvan from his grief. For a long time his cousin seemed not to hear him. At last he shook his head, and said, almost inaudibly:
"Did you say we must start?"
"Yes, we must start."
"Wait one hour longer."
"Yes, we'll wait another," replied the Major.

The hour slipped away, and again Glenarvan begged for longer grace. To hear his imploring tones, one might have thought him a criminal begging a respite. So the day passed on till it was almost noon. McNabbs hesitated now no longer, but, acting on the advice of the rest, told his cousin that start they must, for all their lives depended on prompt action.

"Yes, yes!" replied Glenarvan. "Let us start, let us start!"

But he spoke without looking at McNabbs. His gaze was fixed intently on a certain dark speck in the heavens. Suddenly he exclaimed, extending his arm, and keeping it motionless, as if petrified:
"There! there! Look! look!"

All eyes turned immediately in the direction indicated so imperiously. The dark speck was increasing visibly. It was evidently some bird hovering above them.

"A condor," said Paganel.

"Yes, a condor," replied Glenarvan. "Who knows? He is coming down-- he is gradually getting lower! Let us wait."

Paganel was not mistaken, it was assuredly a condor. This magnificent bird is the king of the Southern Andes, and was formerly worshiped by the Incas. It attains an extraordinary development in those regions. Its strength is prodigious. It has frequently driven oxen over the edge of precipices down into the depths of abysses. It seizes sheep, and kids, and young calves, browsing on the plains, and carries them off to inaccessible heights. It hovers in the air far beyond the utmost limits of human sight, and its powers of vision are so great that it can discern the smallest objects on the earth beneath.

What had this condor discovered then? Could it be the corpse of Robert Grant? "Who knows?" repeated Glenarvan, keeping his eye immovably fixed on the bird. The enormous creature was fast approaching, sometimes hovering for awhile with outspread wings, and sometimes falling with the swiftness of inert bodies in space. Presently he began to wheel round in wide circles. They could see him distinctly. He measured more than fifteen feet, and his powerful wings bore him along with scarcely the slightest effort, for it is the prerogative of large birds to fly with calm majesty, while insects have to beat their wings a thousand times a second.

The Major and Wilson had seized their carbines, but Glenarvan stopped them by a gesture. The condor was encircling in his flight a sort of inaccessible plateau about a quarter of a mile up the side of the mountain. He wheeled round and round with dazzling rapidity, opening and shutting his formidable claws, and shaking his cartilaginous carbuncle, or comb.

"It is there, there!" exclaimed Glenarvan.

A sudden thought flashed across his mind, and with a terrible cry, he called out, "Fire! fire! Oh, suppose Robert were still alive! That bird."

But it was too late. The condor had dropped out of sight behind the crags. Only a second passed, a second that seemed an age, and the enormous bird reappeared, carrying a heavy load and flying at a slow rate.

A cry of horror rose on all sides. It was a human body the condor had in his claws, dangling in the air, and
apparently lifeless-- it was Robert Grant. The bird had seized him by his clothes, and had him hanging already at least one hundred and fifty feet in the air. He had caught sight of the travelers, and was flapping his wings violently, endeavoring to escape with his heavy prey.

"Oh! would that Robert were dashed to pieces against the rocks, rather than be a--"

He did not finish his sentence, but seizing Wilson's carbine, took aim at the condor. His arm was too trembling, however, to keep the weapon steady.

"Let me do it," said the Major. And with a calm eye, and sure hands and motionless body, he aimed at the bird, now three hundred feet above him in the air.

But before he had pulled the trigger the report of a gun resounded from the bottom of the valley. A white smoke rose from between two masses of basalt, and the condor, shot in the head, gradually turned over and began to fall, supported by his great wings spread out like a parachute. He had not let go his prey, but gently sank down with it on the ground, about ten paces from the stream.

"We've got him, we've got him," shouted Glenarvan; and without waiting to see where the shot so providentially came from, he rushed toward the condor, followed by his companions.

When they reached the spot the bird was dead, and the body of Robert was quite concealed beneath his mighty wings. Glenarvan flung himself on the corpse, and dragging it from the condor's grasp, placed it flat on the grass, and knelt down and put his ear to the heart.

But a wilder cry of joy never broke from human lips, than Glenarvan uttered the next moment, as he started to his feet and exclaimed:

"He is alive! He is still alive!"

The boy's clothes were stripped off in an instant, and his face bathed with cold water. He moved slightly, opened his eyes, looked round and murmured, "Oh, my Lord! Is it you!" he said; "my father!"

Glenarvan could not reply. He was speechless with emotion, and kneeling down by the side of the child so miraculously saved, burst into tears.

CHAPTER XV THALCAVE

ROBERT had no sooner escaped one terrible danger than he ran the risk of another scarcely less formidable. He was almost torn to pieces by his friends, for the brave fellows were so overjoyed at the sight of him, that in spite of his weak state, none of them would be satisfied without V. IV Verne giving him a hug. However, it seemed as if good rough hugging did not hurt sick people; at any rate it did not hurt Robert, but quite the contrary.

But the first joy of deliverance over, the next thought was who was the deliverer? Of course it was the Major who suggested looking for him, and he was not far off, for about fifty paces from the RIO a man of very tall stature was seen standing motionless on the lowest crags at the foot of the mountain. A long gun was lying at his feet.

He had broad shoulders, and long hair bound together with leather thongs. He was over six feet in height. His bronzed face was red between the eyes and mouth, black by the lower eyelids, and white on the forehead. He wore the costume of the Patagonians on the frontiers, consisting of a splendid cloak, ornamented with scarlet arabesques, made of the skins of the guanaco, sewed together with ostrich tendons, and with the silky wool turned up on the edge. Under this mantle was a garment of fox-skin, fastened round the waist, and coming down to a point in front. A little bag hung from his belt, containing colors for painting his face. His boots were pieces of ox hide, fastened round the ankles by straps, across.

This Patagonian had a splendid face, indicating real intelligence, notwithstanding the medley of colors by which it was disfigured. His waiting attitude was full of dignity; indeed, to see him standing grave and motionless on his pedestal of rocks, one might have taken him for a statue of _sang-froid_.

As soon as the Major perceived him, he pointed him out to Glenarvan, who ran toward him immediately. The Patagonian came two steps forward to meet him, and Glenarvan caught hold of his hand and pressed it in his own. It was impossible to mistake the meaning of the action, for the noble face of the Scotch lord so beamed with gratitude that no words were needed. The stranger bowed slightly in return, and said a few words that neither Glenarvan nor the Major could understand.

The Patagonian surveyed them attentively for a few minutes, and spoke again in another language. But this second idiom was no more intelligible than the first. Certain words, however, caught Glenarvan's ear as sounding like Spanish, a few sentences of which he could speak.

"ESPAÑOL?" he asked.

The Patagonian nodded in reply, a movement of the head which has an affirmative significance among all nations.

"That's good!" said the Major. "Our friend Paganel will be the very man for him. It is lucky for us that he took it into his head to learn Spanish."
Paganel was called forthwith. He came at once, and saluted the stranger with all the grace of a Frenchman. But his compliments were lost on the Patagonian, for he did not understand a single syllable. However, on being told how things stood, he began in Spanish, and opening his mouth as wide as he could, the better to articulate, said:

"_Vos sois um homen de bem_." (You are a brave man.)
The native listened, but made no reply.
"He doesn't understand," said the geographer.
"Perhaps you haven't the right accent," suggested the Major.
"That's just it! Confound the accent!"

Once more Paganel repeated his compliment, but with no better success.
"I'll change the phrase," he said; and in slow, deliberate tones he went on, "_Sam duvida um Patagao_." (A Patagonian, undoubtedly).
No response still.
"DIZEIME!" said Paganel (Answer me).
But no answer came.
"_Vos compriendes_?" (Do you understand?) shouted Paganel, at the very top of his voice, as if he would burst his throat.
Evidently the Indian did not understand, for he replied in Spanish,
"_No comprendo_." (I do not understand).

It was Paganel's turn now to be amazed. He pushed his spectacles right down over his nose, as if greatly irritated, and said,
"I'll be hanged if I can make out one word of his infernal patois. It is Araucanian, that's certain!"
"Not a bit of it!" said Glenarvan. "It was Spanish he spoke."
And addressing the Patagonian, he repeated the word, "ESPANOL?" (Spanish?).
"_Si, si_." (yes, yes) replied the Indian.

Paganel's surprise became absolute stupefaction. The Major and his cousin exchanged sly glances, and McNabbs said, mischievously, with a look of fun on his face, "Ah, ah, my worthy friend; is this another of your misadventures? You seem to have quite a monopoly of them."
"What!" said Paganel, pricking up his ear.
"Yes, it's clear enough the man speaks Spanish."
"He!"
"Yes, he certainly speaks Spanish. Perhaps it is some other language you have been studying all this time instead of--"

But Paganel would not allow him to proceed. He shrugged his shoulders, and said stiffly,
"You go a little too far, Major."
"Well, how is it that you don't understand him then?"
"Why, of course, because the man speaks badly," replied the learned geographer, getting impatient.
"He speaks badly; that is to say, because you can't understand him," returned the Major coolly.
"Come, come, McNabbs," put in Glenarvan, "your supposition is quite inadmissible. However DISTRAIT our friend Paganel is, it is hardly likely he would study one language for another."
"Well, Edward--or rather you, my good Paganel--explain it then."
"I explain nothing. I give proof. Here is the book I use daily, to practice myself in the difficulties of the Spanish language. Examine it for yourself, Major,” he said, handing him a volume in a very ragged condition, which he had brought up, after a long rummage, from the depths of one of his numerous pockets. "Now you can see whether I am imposing on you," he continued, indignantly.
"And what's the name of this book?" asked the Major, as he took it from his hand.
"The LUSIADES, an admirable epic, which--"
"The LUSIADES!" exclaimed Glenarvan.
"Yes, my friend, the LUSIADES of the great Camoens, neither more nor less."
"Camoens!" repeated Glenarvan; "but Paganel, my unfortunate fellow, Camoens was a Portuguese! It is Portuguese you have been learning for the last six weeks!"
"Camoens! LUISADES! Portuguese!" Paganel could not say more. He looked vexed, while his companions, who had all gathered round, broke out in a furious burst of laughter.

The Indian never moved a muscle of his face. He quietly awaited the explanation of this incomprehensible mirth.
"Fool, idiot, that I am!" at last uttered Paganel. "Is it really a fact? You are not joking with me? It is what I have actually been doing? Why, it is a second confusion of tongues, like Babel. Ah me! alack-a-day! my friends, what is
to become of me? To start for India and arrive at Chili! To learn Spanish and talk Portuguese! Why, if I go on like this, some day I shall be throwing myself out of the window instead of my cigar!"

To hear Paganel bemoan his misadventures and see his comical discomfiture, would have upset anyone's gravity. Besides, he set the example himself, and said:

"Laugh away, my friends, laugh as loud as you like; you can't laugh at me half as much as I laugh at myself!"

"But, I say," said the Major, after a minute, "this doesn't alter the fact that we have no interpreter."

"Oh, don't distress yourself about that," replied Paganel, "Portuguese and Spanish are so much alike that I made a mistake; but this very resemblance will be a great help toward rectifying it. In a very short time I shall be able to thank the Patagonian in the language he speaks so well."

Paganel was right. He soon managed to exchange a few words with the stranger, and found out even that his name was Thalcave, a word that signified in Araucanian, "The Thunderer." This surname had, no doubt, come from his skill in handling fire-arms.

But what rejoiced Glenarvan most was to learn that he was a guide by occupation, and, moreover, a guide across the Pampas. To his mind, the meeting with him was so providential, that he could not doubt now of the success of their enterprise. The deliverance of Captain Grant seemed an accomplished fact.

When the party went back to Robert, the boy held out his arms to the Patagonian, who silently laid his hand on his head, and proceeded to examine him with the greatest care, gently feeling each of his aching limbs. Then he went down to the RIO, and gathered a few handfuls of wild celery, which grew on the banks, with which he rubbed the child's body all over. He handled him with the most exquisite delicacy, and his treatment so revived the lad's strength, that it was soon evident that a few hours' rest would set him all right.

It was accordingly decided that they should encamp for the rest of the day and the ensuing night. Two grave questions, moreover, had to be settled: where to get food, and means of transport. Provisions and mules were both lacking. Happily, they had Thalcave, however, a practised guide, and one of the most intelligent of his class. He undertook to find all that was needed, and offered to take him to a TOLDERIA of Indians, not further than four miles off at most, where he could get supplies of all he wanted. This proposition was partly made by gestures, and partly by a few Spanish words which Paganel managed to make out. His offer was accepted, and Glenarvan and his learned friend started off with him at once.

They walked at a good pace for an hour and a half, and had to make great strides to keep up with the giant Thalcave. The road lay through a beautiful fertile region, abounding in rich pasturages; where a hundred thousand cattle might have fed comfortably. Large ponds, connected by an inextricable labyrinth of RIROS, amply watered these plains and produced their greenness. Swans with black heads were disporting in the water, disputing possession with the numerous intruders which gamboled over the LLANOS. The feathered tribes were of most brilliant plumage, and of marvelous variety and deafening noise. The isacus, a graceful sort of dove with gray feathers streaked with white, and the yellow cardinals, were flitting about in the trees like moving flowers; while overhead pigeons, sparrows, chingolos, bulgueros, and mongitas, were flying swiftly along, rending the air with their piercing cries.

Paganel's admiration increased with every step, and he had nearly exhausted his vocabulary of adjectives by his loud exclamations, to the astonishment of the Patagonian, to whom the birds, and the swans, and the prairies were every day things. The learned geographer was so lost in delight, that he seemed hardly to have started before they came in sight of the Indian camp, or TOLDERIA, situated in the heart of a valley.

About thirty nomadic Indians were living there in rude cabins made of branches, pasturing immense herds of milch cows, sheep, oxen, and horses. They went from one prairie to another, always finding a well-spread table for their four-footed guests.

These nomads were a hybrid type of Araucans, Pehu-enches, and Aucas. They were Ando-Peruvians, of an olive tint, of medium stature and massive form, with a low forehead, almost circular face, thin lips, high cheekbones, effeminate features, and cold expression. As a whole, they are about the least interesting of the Indians. However, it was their herds Glenarvan wanted, not themselves. As long as he could get beef and horses, he cared for nothing else.

Thalcave did the bargaining. It did not take long. In exchange for seven ready saddled horses of the Argentine breed, 100 pounds of CHARQUI, or dried meat, several measures of rice, and leather bottles for water, the Indians agreed to take twenty ounces of gold as they could not get wine or rum, which they would have preferred, though they were perfectly acquainted with the value of gold. Glenarvan wished to purchase an eighth horse for the Patagonian, but he gave him to understand that it would be useless.

They got back to the camp in less than half an hour, and were hailed with acclamations by the whole party or rather the provisions and horses were. They were all hungry, and ate heartily of the welcome viands. Robert took a little food with the rest. He was fast recovering strength. The close of the day was spent in complete repose and
pleasant talk about the dear absent ones.

Paganel never quitted the Indian's side. It was not that he was so glad to see a real Patagonian, by whom he
looked a perfect pigmy--a Patagonian who might have almost rivaled the Emperor Maximii, and that Congo negro
seen by the learned Van der Brock, both eight feet high; but he caught up Spanish phrases from the Indian and
studied the language without a book this time, gesticulating at a great rate all the grand sonorous words that fell on
his ear.

"If I don't catch the accent," he said to the Major, "it won't be my fault; but who would have said to me that it
was a Patagonian who would teach me Spanish one day?"

CHAPTER XVI THE NEWS OF THE LOST CAPTAIN

NEXT day, the 22d of October, at eight o'clock in the morning, Thalcave gave the signal for departure. Between
the 22d and 42d degrees the Argentine soil slopes eastward, and all the travelers had to do was to follow the slope
right down to the sea.

Glenarvan had supposed Thalcave's refusal of a horse was that he preferred walking, as some guides do, but he
was mistaken, for just as they were ready, the Patagonian gave a peculiar whistle, and immediately a magnificent
steed of the pure Argentine breed came bounding out of a grove close by, at his master's call. Both in form and color
the animal was of perfect beauty. The Major, who was a thorough judge of all the good points of a horse, was loud
in admiration of this sample of the Pampas breed, and considered that, in many respects, he greatly resembled an
English hunter. This splendid creature was called "Thaouka," a word in Patagonia which means bird, and he well
deserved the name.

Thalcave was a consummate horseman, and to see him on his prancing steed was a sight worth looking at. The
saddle was adapted to the two hunting weapons in common use on the Argentine plains—the BOLAS and the LAZO.
The BOLAS consists of three balls fastened together by a strap of leather, attached to the front of the RECADO. The
Indians fling them often at the distance of a hundred feet from the animal or enemy of which they are in pursuit, and
with such precision that they catch round their legs and throw them down in an instant. It is a formidable weapon in
their hands, and one they handle with surprising skill. The LAZO is always retained in the hand. It is simply a rope,
thirty feet long, made of tightly twisted leather, with a slip knot at the end, which passes through an iron ring. This
noose was thrown by the right hand, while the left keeps fast hold of the rope, the other end of which is fastened to
the saddle. A long carbine, in the shoulder belt completed the accouterments of the Patagonian.

He took his place at the head of the party, quite unconscious of the admiration he was exciting, and they set off,
going alternately at a gallop and walking pace, for the "trot" seemed altogether unknown to them. Robert proved to
be a bold rider, and completely reassured Glenarvan as to his ability to keep his seat.

The Pampas commenced at the very foot of the Cordilleras. They may be divided into three parts. The first
extends from the chain of the Andes, and stretches over an extent of 250 miles covered with stunted trees and
bushes; the second 450 miles is clothed with magnificent herbage, and stops about 180 miles from Buenos Ayres;
from this point to the sea, the foot of the traveler treads over immense prairies of lucerne and thistles, which
constitute the third division of the Pampas.

On issuing from the gorges of the Cordilleras, Glenarvan and his band came first to plains of sand, called
MEDANOS, lying in ridges like waves of the sea, and so extremely fine that the least breath of wind agitated the
light particles, and sent them flying in clouds, which rose and fell like water-spouts. It was a spectacle which caused
both pleasure and pain, for nothing could be more curious than to see the said water-spouts wandering over the
plain, coming in contact and mingling with each other, and falling and rising in wild confusion; but, on the other
hand, nothing could be more disagreeable than the dust which was thrown off by these innumerable MEDANOS,
which was so impalpable that close one's eyes as they might, it found its way through the lids.

This phenomenon lasted the greater part of the day. The travelers made good progress, however, and about four
o'clock the Cordilleras lay full forty miles behind them, the dark outlines being already almost lost in the evening
mists. They were all somewhat fatigued with the journey, and glad enough to halt for the night on the banks of the
Neuquem, called Ramid, or Comoe by certain geographers, a troubled, turbulent rapid flowing between high red
banks.

No incident of any importance occurred that night or the following day. They rode well and fast, finding the
ground firm, and the temperature bearable. Toward noon, however, the sun's rays were extremely scorching, and
when evening came, a bar of clouds streaked the southwest horizon—a sure sign of a change in the weather. The
Patagonian pointed it out to the geographer, who replied:

"Yes, I know;" and turning to his companions, added, "see, a change of weather is coming! We are going to have
a taste of PAMPERO."

And he went on to explain that this PAMPERO is very common in the Argentine plains. It is an extremely dry
wind which blows from the southwest. Thalcave was not mistaken, for the PAMPERO blew violently all night, and
was sufficiently trying to poor fellows only sheltered by their ponchos. The horses lay down on the ground, and the men stretched themselves beside them in a close group. Glenarvan was afraid they would be delayed by the continuance of the hurricane, but Paganel was able to reassure him on that score, after consulting his barometer.

"The PAMPERO generally brings a tempest which lasts three days, and may be always foretold by the depression of the mercury," he said. "But when the barometer rises, on the contrary, which is the case now, all we need expect is a few violent blasts. So you can make your mind easy, my good friend; by sunrise the sky will be quite clear again."

"And I am one; and what's more, you are welcome to turn over my leaves whenever you like."

The book was right. At one o'clock the wind suddenly lulled, and the weary men fell asleep and woke at daybreak, refreshed and invigorated.

It was the 20th of October, and the tenth day since they had left Talcahuano. They were still ninety miles from the point where the Rio Colorado crosses the thirty-seventh parallel, that is to say, about two days' journey. Glenarvan kept a sharp lookout for the appearance of any Indians, intending to question them, through Thalcave, about Captain Grant, as Paganel could not speak to him well enough for this. But the track they were following was one little frequented by the natives, for the ordinary routes across the Pampas lie further north. If by chance some nomadic horseman came in sight far away, he was off again like a dart, not caring to enter into conversation with strangers. To a solitary individual, a little troop of eight men, all mounted and well armed, wore a suspicious aspect, so that any intercourse either with honest men or even banditti, was almost impossible.

Glenarvan was regretting this exceedingly, when he unexpectedly met with a singular justification of his rendering of the eventful document.

In pursuing the course the travelers had laid down for themselves, they had several times crossed the routes over the plains in common use, but had struck into none of them. Hitherto Thalcave had made no remark about this. He understood quite well, however, that they were not bound for any particular town, or village, or settlement. Every morning they set out in a straight line toward the rising sun, and went on without the least deviation. Moreover, it must have struck Thalcave that instead of being the guide he was guided; yet, with true Indian reserve, he maintained absolute silence. But on reaching a particular point, he checked his horse suddenly, and said to Paganel:

"The Carmen route."

"Yes, my good Patagonian," replied Paganel in his best Spanish; "the route from Carmen to Mendoza."

"We are not going to take it?"

"No," replied Paganel.

"Where are we going then?"

"Always to the east."

"That's going nowhere."

"Who knows?"

Thalcave was silent, and gazed at the geographer with an air of profound surprise. He had no suspicion that Paganel was joking, for an Indian is always grave.

"You are not going to Carmen, then?" he added, after a moment's pause.

"No."

"Nor to Mendoza?"

"No, nor to Mendoza."

Just then Glenarvan came up to ask the reason of the stoppage, and what he and Thalcave were discussing.

"He wanted to know whether we were going to Carmen or Mendoza, and was very much surprised at my negative reply to both questions."

"Well, certainly, it must seem strange to him."

"I think so. He says we are going nowhere."

"Well, Paganel, I wonder if it is possible to make him understand the object of our expedition, and what our motive is for always going east."

"That would be a difficult matter, for an Indian knows nothing about degrees, and the finding of the document would appear to him a mere fantastic story."

"Is it the story he would not understand, or the storyteller?" said McNabbs, quietly

"Ah, McNabbs, I see you have small faith in my Spanish yet."

"Well, try it, my good friend."

"So I will."

And turning round to the Patagonian he began his narrative, breaking down frequently for the want of a word, and the difficulty of making certain details intelligible to a half-civilized Indian. It was quite a sight to see the
learned geographer. He gesticulated and articulated, and so worked himself up over it, that the big drops of sweat fell in a cascade down his forehead on to his chest. When his tongue failed, his arms were called to aid. Paganel got down on the ground and traced a geographical map on the sand, showing where the lines of latitude and longitude cross and where the two oceans were, along which the Carmen route led. Thalcave looked on composedly, without giving any indication of comprehending or not comprehending.

The lesson had lasted half an hour, when the geographer left off, wiped his streaming face, and waited for the Patagonian to speak.

"Does he understand?" said Glenarvan.

"That remains to be seen; but if he doesn't, I give it up," replied Paganel.

Thalcave neither stirred nor spoke. His eyes remained fixed on the lines drawn on the sand, now becoming fast effaced by the wind.

"Well?" said Paganel to him at length.

The Patagonian seemed not to hear. Paganel fancied he could detect an ironical smile already on the lips of the Major, and determined to carry the day, was about to recommence his geographical illustrations, when the Indian stopped him by a gesture, and said:

"You are in search of a prisoner?"

"Yes," replied Paganel.

"And just on this line between the setting and rising sun?" added Thalcave, speaking in Indian fashion of the route from west to east.

"Yes, yes, that's it."

"And it's your God," continued the guide, "that has sent you the secret of this prisoner on the waves."

"God himself."

"His will be accomplished then," replied the native almost solemnly. "We will march east, and if it needs be, to the sun."

Paganel, triumphing in his pupil, immediately translated his replies to his companions, and exclaimed:

"What an intelligent race! All my explanations would have been lost on nineteen in every twenty of the peasants in my own country."

Glenarvan requested him to ask the Patagonian if he had heard of any foreigners who had fallen into the hands of the Indians of the Pampas.

Paganel did so, and waited an answer.

"Perhaps I have."

The reply was no sooner translated than the Patagonian found himself surrounded by the seven men questioning him with eager glances. Paganel was so excited, he could hardly find words, and he gazed at the grave Indian as if he could read the reply on his lips.

Each word spoken by Thalcave was instantly translated, so that the whole party seemed to hear him speak in their mother tongue.

"And what about the prisoner?" asked Paganel.

"He was a foreigner."

"You have seen him?"

"No; but I have heard the Indian speak of him. He is brave; he has the heart of a bull."

"The heart of a bull!" said Paganel. "Ah, this magnificent Patagonian language. You understand him, my friends, he means a courageous man."

"My father!" exclaimed Robert Grant, and, turning to Paganel, he asked what the Spanish was for, "Is it my father."

"_Es mio padre_," replied the geographer.

Immediately taking Thalcave's hands in his own, the boy said, in a soft tone:

"_Es mio padre_."

"_Suo padre_," replied the Patagonian, his face lighting up.

He took the child in his arms, lifted him up on his horse, and gazed at him with peculiar sympathy. His intelligent face was full of quiet feeling.

But Paganel had not completed his interrogations. "This prisoner, who was he? What was he doing? When had Thalcave heard of him?" All these questions poured upon him at once.

He had not long to wait for an answer, and learned that the European was a slave in one of the tribes that roamed the country between the Colorado and the Rio Negro.

"But where was the last place he was in?"

"With the Cacique Calfoucoura."
"In the line we have been following?"
"Yes."
"And who is this Cacique?"
"The chief of the Poyuches Indians, a man with two tongues and two hearts."
"That's to say false in speech and false in action," said Paganel, after he had translated this beautiful figure of the Patagonian language.
"And can we deliver our friend?" he added.
"You may if he is still in the hands of the Indians."
"And when did you last hear of him?"
"A long while ago; the sun has brought two summers since then to the Pampas."

The joy of Glenarvan can not be described. This reply agreed perfectly with the date of the document. But one question still remained for him to put to Thalcave.
"You spoke of a prisoner," he said; "but were there not three?"
"I don't know," said Thalcave.
"And you know nothing of his present situation?"
"Nothing."

This ended the conversation. It was quite possible that the three men had become separated long ago; but still this much was certain, that the Indians had spoken of a European that was in their power; and the date of the captivity, and even the descriptive phrase about the captive, evidently pointed to Harry Grant.

CHAPTER XVII A SERIOUS NECESSITY

THE Argentine Pampas extend from the thirty-fourth to the fortieth degree of southern latitude. The word PAMPA, of Araucanian origin, signifies _grass plain_, and justly applies to the whole region. The mimosas growing on the western part, and the substantial herbage on the eastern, give those plains a peculiar appearance. The soil is composed of sand and red or yellow clay, and this is covered by a layer of earth, in which the vegetation takes root. The geologist would find rich treasures in the tertiary strata here, for it is full of antediluvian remains--enormous bones, which the Indians attribute to some gigantic race that lived in a past age.

The horses went on at a good pace through the thick PAJA-BRAVA, the grass of the Pampas, _par excellence_, so high and thick that the Indians find shelter in it from storms. At certain distances, but increasingly seldom, there were wet, marshy spots, almost entirely under water, where the willows grew, and a plant called the _Gygnerium argenteum_. Here the horses drank their fill greedily, as if bent on quenching their thirst for past, present and future.

Thalcave went first to beat the bushes and frighten away the cholinas, a most dangerous species of viper, the bite of which kills an ox in less than an hour.

For two days they plodded steadily across this arid and deserted plain. The dry heat became severe. There were not only no RIOS, but even the ponds dug out by the Indians were dried up. As the drought seemed to increase with every mile, Paganel asked Thalcave when he expected to come to water.
"At Lake Salinas," replied the Indian.
"And when shall we get there?"
"To-morrow evening."

When the Argentines travel in the Pampas they generally dig wells, and find water a few feet below the surface. But the travelers could not fall back on this resource, not having the necessary implements. They were therefore obliged to husband the small provision of water they had still left, and deal it out in rations, so that if no one had enough to satisfy his thirst no one felt it too painful.

They halted at evening after a course of thirty miles and eagerly looked forward to a good night's rest to compensate for the fatigue of day. But their slumbers were invaded by a swarm of mosquitoes, which allowed them no peace. Their presence indicated a change of wind which shifted to the north. A south or southwest wind generally puts to flight these little pests.

Even these petty ills of life could not ruffle the Major's equanimity; but Paganel, on the contrary, was perfectly exasperated by such trifling annoyances. He abused the poor mosquitoes desperately, and deplored the lack of some acid lotion which would have eased the pain of their stings. The Major did his best to console him by reminding him of the fact that they had only to do with one species of insect, among the 300,000 naturalists reckon. He would listen to nothing, and got up in a very bad temper.

He was quite willing to start at daybreak, however, for they had to get to Lake Salinas before sundown. The horses were tired out and dying for water, and though their riders had stinted themselves for their sakes, still their ration was very insufficient. The drought was constantly increasing, and the heat none the less for the wind being north, this wind being the simoom of the Pampas.

There was a brief interruption this day to the monotony of the journey. Mulrady, who was in front of the others,
rode hastily back to report the approach of a troop of Indians. The news was received with very different feelings by Glenarvan and Thalcave. The Scotchman was glad of the chance of gleaning some information about his shipwrecked countryman, while the Patagonian hardly cared to encounter the nomadic Indians of the prairie, knowing their bandit propensities. He rather sought to avoid them, and gave orders to his party to have their arms in readiness for any trouble.

Presently the nomads came in sight, and the Patagonian was reassured at finding they were only ten in number. They came within a hundred yards of them, and stopped. This was near enough to observe them distinctly. They were fine specimens of the native races, which had been almost entirely swept away in 1833 by General Rosas, tall in stature, with arched forehead and olive complexion. They were dressed in guanaco skins, and carried lances twenty feet long, knives, slings, bolas, and lassos, and, by their dexterity in the management of their horses, showed themselves to be accomplished riders.

They appeared to have stopped for the purpose of holding a council with each other, for they shouted and gesticulated at a great rate. Glenarvan determined to go up to them; but he had no sooner moved forward than the whole band wheeled round, and disappeared with incredible speed. It would have been useless for the travelers to attempt to overtake them with such wornout horses.

"The cowards!" exclaimed Paganel.
"They scampered off too quick for honest folks," said McNabbs.
"Who are these Indians, Thalcave?" asked Paganel.
"Gauchos."
"The Gauchos!" cried Paganel; and, turning to his companions, he added, "we need not have been so much on our guard; there was nothing to fear."
"How is that?" asked McNabbs.
"Because the Gauchos are inoffensive peasants."
"You believe that, Paganel?"
"Certainly I do. They took us for robbers, and fled in terror."
"I rather think they did not dare to attack us," replied Glenarvan, much vexed at not being able to enter into some sort of communication with those Indians, whatever they were.
"That's my opinion too," said the Major, "for if I am not mistaken, instead of being harmless, the Gauchos are formidable out-and-out bandits."
"The idea!" exclaimed Paganel.

And forthwith commenced a lively discussion of this ethnological thesis—so lively that the Major became excited, and, quite contrary to his usual suavity, said bluntly:
"I believe you are wrong, Paganel."
"Wrong?" replied Paganel.
"Yes. Thalcave took them for robbers, and he knows what he is talking about."
"Well, Thalcave was mistaken this time," retorted Paganel, somewhat sharply. "The Gauchos are agriculturists and shepherds, and nothing else, as I have stated in a pamphlet on the natives of the Pampas, written by me, which has attracted some notice."

V. IV Verne

[illustration omitted] [page intentionally blank]
"Well, well, you have committed an error, that's all, Monsieur Paganel."
"What, Monsieur McNabbs! you tell me I have committed an error?"
"An inadvertence, if you like, which you can put among the ERRATA in the next edition."
Paganel, highly incensed at his geographical knowledge being brought in question, and even jested about, allowed his ill-humor to get the better of him, and said:
"Know, sir, that my books have no need of such ERRATA."
"Indeed! Well, on this occasion they have, at any rate," retorted McNabbs, quite as obstinate as his opponent.
"Sir, I think you are very annoying to-day."
"And I think you are very crabbed."

Glenarvan thought it was high time to interfere, for the discussion was getting too hot, so he said:
"Come, now, there is no doubt one of you is very teasing and the other is very crabbed, and I must say I am surprised at both of you."

The Patagonian, without understanding the cause, could see that the two friends were quarreling. He began to smile, and said quietly:
"It's the north wind."
"The north wind," exclaimed Paganel; "what's the north wind to do with it?"
"Ah, it is just that," said Glenarvan. "It's the north wind that has put you in a bad temper. I have heard that, in South America, the wind greatly irritates the nervous system."

"By St. Patrick, Edward you are right," said the Major, laughing heartily.

But Paganel, in a towering rage, would not give up the contest, and turned upon Glenarvan, whose intervention in this jesting manner he resented.

"And so, my Lord, my nervous system is irritated?" he said.

"Yes, Paganel, it is the north wind--a wind which causes many a crime in the Pampas, as the TRAMONTANE does in the Campagna of Rome."

" Crimes!" returned the geographer. "Do I look like a man that would commit crimes?"

"That's not exactly what I said."

"Tell me at once that I want to assassinate you?"

"Well, I am really afraid," replied Glenarvan, bursting into an uncontrollable fit of laughter, in which all others joined.

Paganel said no more, but went off in front alone, and came back in a few minutes quite himself, as if he had completely forgotten his grievance.

At eight o'clock in the evening, Thalcave, who was considerably in advance of the rest, descried in the distance the much-desired lake, and in less than a quarter of an hour they reached its banks; but a grievous disappointment awaited them--the lake was dried up.

CHAPTER XVIII IN SEARCH OF WATER

LAKE SALINAS ends the string of lagoons connected with the Sierras Ventana and Guamini. Numerous expeditions were formerly made there from Buenos Ayres, to collect the salt deposited on its banks, as the waters contain great quantities of chloride of sodium.

But when Thalcave spoke of the lake as supplying drinkable water he was thinking of the RIOS of fresh water which run into it. Those streams, however, were all dried up also; the burning sun had drunk up everything liquid, and the consternation of the travelers may be imagined at the discovery.

Some action must be taken immediately, however; for what little water still remained was almost bad, and could not quench thirst. Hunger and fatigue were forgotten in the face of this imperious necessity. A sort of leather tent, called a ROUKAH, which had been left by the natives, afforded the party a temporary resting-place, and the weary horses stretched themselves along the muddy banks, and tried to browse on the marine plants and dry reeds they found there--nauseous to the taste as they must have been.

As soon as the whole party were ensconced in the ROUKAH, Paganel asked Thalcave what he thought was best to be done. A rapid conversation followed, a few words of which were intelligible to Glenarvan. Thalcave spoke calmly, but the lively Frenchman gesticulated enough for both. After a little, Thalcave sat silent and folded his arms.

"What does he say?" asked Glenarvan. "I fancied he was advising us to separate."

"Yes, into two parties. Those of us whose horses are so done out with fatigue and thirst that they can scarcely drag one leg after the other, are to continue the route as they best can, while the others, whose steeds are fresher, are to push on in advance toward the river Guamini, which throws itself into Lake San Lucas about thirty-one miles off. If there should be water enough in the river, they are to wait on the banks till their companions reach them; but should it be dried up, they will hasten back and spare them a useless journey."

"And what will we do then?" asked Austin.

"Then we shall have to make up our minds to go seventy-two miles south, as far as the commencement of the Sierra Ventana, where rivers abound."

"It is wise counsel, and we will act upon it without loss of time. My horse is in tolerable good trim, and I volunteer to accompany Thalcave."

"Oh, my Lord, take me," said Robert, as if it were a question of some pleasure party.

"But would you be able for it, my boy?"

"Oh, I have a fine beast, which just wants to have a gallop. Please, my Lord, to take me."

"Come, then, my boy," said Glenarvan, delighted not to leave Robert behind. "If we three don't manage to find out fresh water somewhere," he added, "we must be very stupid."

"Well, well, and what about me?" said Paganel.

"Oh, my dear Paganel, you must stay with the reserve corps," replied the Major. "You are too well acquainted with the 37th parallel and the river Guamini and the whole Pampas for us to let you go. Neither Mulrady, nor Wilson, nor myself would be able to rejoin Thalcave at the given rendezvous, but we will put ourselves under the banner of the brave Jacques Paganel with perfect confidence."

"I resign myself," said the geographer, much flattered at having supreme command.

"But mind, Paganel, no distractions," added the Major. "Don't you take us to the wrong place--to the borders of
the Pacific, for instance."

"Oh, you insufferable Major; it would serve you right," replied Paganel, laughing. "But how will you manage to understand what Thalcave says, Glenarvan?" he continued.

"I suppose," replied Glenarvan, "the Patagonian and I won't have much to talk about; besides, I know a few Spanish words, and, at a pinch, I should not fear either making him understand me, or my understanding him."

"Go, then, my worthy friend," said Paganel.

"We'll have supper first," rejoined Glenarvan, "and then sleep, if we can, till it is starting time."

The supper was not very reviving without drink of any kind, and they tried to make up for the lack of it by a good sleep. But Paganel dreamed of water all night, of torrents and cascades, and rivers and ponds, and streams and brooks—in fact, he had a complete nightmare.

Next morning, at six o'clock, the horses of Thalcave, Glenarvan and Robert were got ready. Their last ration of water was given them, and drunk with more avidity than satisfaction, for it was filthy, disgusting stuff. The three travelers then jumped into their saddles, and set off, shouting "_Au revoir!_" to their companions.

"Don't come back whatever you do," called Paganel after them.

The _Desertio de las Salinas_, which they had to traverse, is a dry plain, covered with stunted trees not above ten feet high, and small mimosas, which the Indians call _curra-mammel_; and _JUMES_, a bushy shrub, rich in soda. Here and there large spaces were covered with salt, which sparkled in the sunlight with astonishing brilliancy. These might easily have been taken for sheets of ice, had not the intense heat forbidden the illusion; and the contrast these dazzling white sheets presented to the dry, burned-up ground gave the desert a most peculiar character. Eighty miles south, on the contrary, the Sierra Ventana, toward which the travelers might possibly have to betake themselves should the Guamini disappoint their hopes, the landscape was totally different. There the fertility is splendid; the pasturage is incomparable. Unfortunately, to reach them would necessitate a march of one hundred and thirty miles south; and this was why Thalcave thought it best to go first to Guamini, as it was not only much nearer, but also on the direct line of route.

The three horses went forward might and main, as if instinctively knowing whither they were bound. Thaouka especially displayed a courage that neither fatigue nor hunger could damp. He bounded like a bird over the dried-up CANADAS and the bushes of CURRA-MAMMEL, his loud, joyous neighing seeming to bode success to the search. The horses of Glenarvan and Robert, though not so light-footed, felt the spur of his example, and followed him bravely. Thalcave inspired his companions as much as Thaouka did his four-footed brethren. He sat motionless in the saddle, but often turned his head to look at Robert, and ever and anon gave him a shout of encouragement and approval, as he saw how well he rode. Certainly the boy deserved praise, for he was fast becoming an excellent cavalier.

"Bravo! Robert," said Glenarvan. "Thalcave is evidently congratulating you, my boy, and paying you compliments."

"What for, my Lord?"

"For your good horsemanship."

"I can hold firm on, that's all," replied Robert blushing with pleasure at such an encomium.

"That is the principal thing, Robert; but you are too modest. I tell you that some day you will turn out an accomplished horseman."

"What would papa say to that?" said Robert, laughing. "He wants me to be a sailor."

"The one won't hinder the other. If all cavaliers wouldn't make good sailors, there is no reason why all sailors should not make good horsemen. To keep one's footing on the yards must teach a man to hold on firm; and as to managing the reins, and making a horse go through all sorts of movements, that's easily acquired. Indeed, it comes naturally."

"Poor father," said Robert; "how he will thank you for saving his life."

"You love him very much, Robert?"

"Yes, my Lord, dearly. He was so good to me and my sister. We were his only thought: and whenever he came home from his voyages, we were sure of some SOUVENIR from all the places he had been to; and, better still, of loving words and caresses. Ah! if you knew him you would love him, too. Mary is most like him. He has a soft voice, like hers. That's strange for a sailor, isn't it?"

"Yes, Robert, very strange."

"I see him still," the boy went on, as if speaking to himself. "Good, brave papa. He put me to sleep on his knee, crooning an old Scotch ballad about the lochs of our country. The time sometimes comes back to me, but very confused like. So it does to Mary, too. Ah, my Lord, how we loved him. Well, I do think one needs to be little to love one's father like that."

"Yes, and to be grown up, my child, to venerate him," replied Glenarvan, deeply touched by the boy's genuine
affection.

During this conversation the horses had been slackening speed, and were only walking now.

"You will find him?" said Robert again, after a few minutes' silence.

"Yes, we'll find him," was Glenarvan's reply, "Thalcave has set us on the track, and I have great confidence in him."

"Thalcave is a brave Indian, isn't he?" said the boy.

"That indeed he is."

"Do you know something, my Lord?"

"What is it, and then I will tell you?"

"That all the people you have with you are brave. Lady Helena, whom I love so, and the Major, with his calm manner, and Captain Mangles, and Monsieur Paganel, and all the sailors on the DUNCAN. How courageous and devoted they are."

"Yes, my boy, I know that," replied Glenarvan.

"And do you know that you are the best of all."

"No, most certainly I don't know that."

"Well, it is time you did, my Lord," said the boy, seizing his lordship's hand, and covering it with kisses.

Glenarvan shook his head, but said no more, as a gesture from Thalcave made them spur on their horses and hurry forward.

But it was soon evident that, with the exception of Thaouka, the wearied animals could not go quicker than a walking pace. At noon they were obliged to let them rest for an hour. They could not go on at all, and refused to eat the ALFAFARES, a poor, burnt-up sort of lucerne that grew there.

Glenarvan began to be uneasy. Tokens of sterility were not the least on the decrease, and the want of water might involve serious calamities. Thalcave said nothing, thinking probably, that it would be time enough to despair if the Guamini should be dried up—if, indeed, the heart of an Indian can ever despair.

Spur and whip had both to be employed to induce the poor animals to resume the route, and then they only crept along, for their strength was gone.

Thaouka, indeed, could have galloped swiftly enough, and reached the RIO in a few hours, but Thalcave would not leave his companions behind, alone in the midst of a desert.

It was hard work, however, to get the animal to consent to walk quietly. He kicked, and reared, and neighed violently, and was subdued at last more by his master's voice than hand. Thalcave positively talked to the beast, and Thaouka understood perfectly, though unable to reply, for, after a great deal of arguing, the noble creature yielded, though he still champed the bit.

Thalcave did not understand Thaouka, it turned out, though Thaouka understood him. The intelligent animal felt humidity in the atmosphere and drank it in with frenzy, moving and making a noise with his tongue, as if taking deep draughts of some cool refreshing liquid. The Patagonian could not mistake him now—water was not far off.

The two other horses seemed to catch their comrade's meaning, and, inspired by his example, made a last effort, and galloped forward after the Indian.

About three o'clock a white line appeared in a dip of the road, and seemed to tremble in the sunlight.

"Water!" exclaimed Glenarvan.

"Yes, yes! it is water!" shouted Robert.

They were right; and the horses knew it too, for there was no need now to urge them on; they tore over the ground as if mad, and in a few minutes had reached the river, and plunged in up to their chests.

Their masters had to go on too, whether they would or not but they were so rejoiced at being able to quench their thirst, that this compulsory bath was no grievance.

"Oh, how delicious this is!" exclaimed Robert, taking a deep draught.

"Drink moderately, my boy," said Glenarvan; but he did not set the example.

Thalcave drank very quietly, without hurrying himself, taking small gulps, but "as long as a lazo," as the Patagonians say. He seemed as if he were never going to leave off, and really there was some danger of his swallowing up the whole river.

At last Glenarvan said:

"Well, our friends won't be disappointed this time; they will be sure of finding clear, cool water when they get here-- that is to say, if Thalcave leaves any for them."

"But couldn't we go to meet them? It would spare them several hours' suffering and anxiety."

"You're right my boy; but how could we carry them this water? The leather bottles were left with Wilson. No; it is better for us to wait for them as we agreed. They can't be here till about the middle of the night, so the best thing we can do is to get a good bed and a good supper ready for them."
Thalcave had not waited for Glenarvan's proposition to prepare an encampment. He had been fortunate enough to discover on the banks of the _rio a ramada_, a sort of enclosure, which had served as a fold for flocks, and was shut in on three sides. A more suitable place could not be found for their night's lodging, provided they had no fear of sleeping in the open air beneath the star-lit heavens; and none of Thalcave's companions had much solicitude on that score. Accordingly they took possession at once, and stretched themselves at full length on the ground in the bright sunshine, to dry their dripping garments.

"Well, now we've secured a lodging, we must think of supper," said Glenarvan. "Our friends must not have reason to complain of the couriers they sent to precede them; and if I am not much mistaken, they will be very satisfied. It strikes me that an hour's shooting won't be lost time. Are you ready, Robert?"

"Yes, my Lord," replied the boy, standing up, gun in hand.

Why Glenarvan proposed this was, that the banks of the Guamini seemed to be the general rendezvous of all the game in the surrounding plains. A sort of partridge peculiar to the Pampas, called TINAMOUS; black wood-hens; a species of plover, called TERU-TERU; yellow rays, and waterfowl with magnificent green plumage, rose in coveys. No quadrupeds, however, were visible, but Thalcave pointed to the long grass and thick brushwood, and gave his friends to understand they were lying there in concealment.

Disdaining the feathered tribes when more substantial game was at hand, the hunters' first shots were fired into the underwood. Instantly there rose by the hundred roebucks and guanacos, like those that had swept over them that terrible night on the Cordilleras, but the timid creatures were so frightened that they were all out of gunshot in a twinkling. The hunters were obliged to content themselves with humbler game, though in an alimentary point of view nothing better could be wished. A dozen of red partridges and rays were speedily brought down, and Glenarvan also managed very cleverly to kill a TAY-TETRE, or peccary, a pachydermatous animal, the flesh of which is excellent eating.

In less than half an hour the hunters had all the game they required. Robert had killed a curious animal belonging to the order EDENTATA, an armadillo, a sort of tatou, covered with a hard bony shell, in movable pieces, and measuring a foot and a half long. It was very fat and would make an excellent dish, the Patagonian said. Robert was very proud of his success.

Thalcave did his part by capturing a NANDOU, a species of ostrich, remarkable for its extreme swiftness.

There could be no entrapping such an animal, and the Indian did not attempt it. He urged Thaouka to a gallop, and made a direct attack, knowing that if the first aim missed the NANDOU would soon tire out horse and rider by involving them in an inextricable labyrinth of windings. The moment, therefore, that Thalcave got to a right distance, he flung his BOLAS with such a powerful hand, and so skillfully, that he caught the bird round the legs and paralyzed his efforts at once. In a few seconds it lay flat on the ground.

The Indian had not made his capture for the mere pleasure and glory of such a novel chase. The flesh of the NANDOU is highly esteemed, and Thalcave felt bound to contribute his share of the common repast.

They returned to the RAMADA, bringing back the string of partridges, the ostrich, the peccary, and the armadillo. The ostrich and the peccary were prepared for cooking by divesting them of their tough skins, and cutting them up into thin slices. As to the armadillo, he carries his cooking apparatus with him, and all that had to be done was to place him in his own shell over the glowing embers.

The substantial dishes were reserved for the night-comers, and the three hunters contented themselves with devouring the partridges, and washed down their meal with clear, fresh water, which was pronounced superior to all the porter in the world, even to the famous Highland USQUEBAUGH, or whisky.

The horses had not been overlooked. A large quantity of dry fodder was discovered lying heaped up in the RAMADA, and this supplied them amply with both food and bedding.

When all was ready the three companions wrapped themselves in the ponchos, and stretched themselves on an eiderdown of ALFAFARES, the usual bed of hunters on the Pampas.

CHAPTER XIX THE RED WOLVES

NIGHT came, but the orb of night was invisible to the inhabitants of the earth, for she was just in her first quarter. The dim light of the stars was all that illumined the plain. The waters of the Guamini ran silently, like a sheet of oil over a surface of marble. Birds, quadrupeds, and reptiles were resting motionless after the fatigues of the day, and the silence of the desert brooded over the far-spreading Pampas.

Glenarvan, Robert, and Thalcave, had followed the common example, and lay in profound slumber on their soft couch of lucerne. The worn-out horses had stretched themselves full length on the ground, except Thaouka, who slept standing, true to his high blood, proud in repose as in action, and ready to start at his master's call. Absolute silence reigned within the inclosure, over which the dying embers of the fire shed a fitful light.

However, the Indian's sleep did not last long; for about ten o'clock he woke, sat up, and turned his ear toward the plain, listening intently, with half-closed eyes. An uneasy look began to depict itself on his usually impassive face.
Had he caught scent of some party of Indian marauders, or of jaguars, water tigers, and other terrible animals that haunt the neighborhood of rivers? Apparently it was the latter, for he threw a rapid glance on the combustible materials heaped up in the inclosure, and the expression of anxiety on his countenance seemed to deepen. This was not surprising, as the whole pile of ALFAFARES would soon burn out and could only ward off the attacks of wild beasts for a brief interval.

There was nothing to be done in the circumstances but wait; and wait he did, in a half-recumbent posture, his head leaning on his hands, and his elbows on his knees, like a man roused suddenly from his night's sleep.

A whole hour passed, and anyone except Thalcave would have lain down again on his couch, reassured by the silence round him. But where a stranger would have suspected nothing, the sharpened senses of the Indian detected the approach of danger.

As he was thus watching and listening, Thaouka gave a low neigh, and stretched his nostrils toward the entrance of the RAMADA.

This startled the Patagonian, and made him rise to his feet at once.

"Thaouka scents an enemy," he said to himself, going toward the opening, to make careful survey of the plains.

Silence still prevailed, but not tranquillity; for Thalcave caught a glimpse of shadows moving noiselessly over the tufts of CURRA-MAMMEL. Here and there luminous spots appeared, dying out and rekindling constantly, in all directions, like fantastic lights dancing over the surface of an immense lagoon. An inexperienced eye might have mistaken them for fireflies, which shine at night in many parts of the Pampas; but Thalcave was not deceived; he knew the enemies he had to deal with, and lost no time in loading his carbine and taking up his post in front of the fence.

He did not wait long, for a strange cry—a confused sound of barking and howling—broke over the Pampas, followed next instant by the report of the carbine, which made the uproar a hundred times worse.

Glenarvan and Robert woke in alarm, and started to their feet instantly.

"What is it?" exclaimed Robert.

"Is it the Indians?" asked Glenarvan.

"No," replied Thalcave, "the AGUARAS."

"AGUARAS?" said Robert, looking inquiringly at Glenarvan.

"Yes," replied Glenarvan, "the red wolves of the Pampas."

They seized their weapons at once, and stationed themselves beside the Patagonian, who pointed toward the plain from whence the yelling resounded.

Robert drew back involuntarily.

"You are not afraid of wolves, my boy?" said Glenarvan.

"No, my Lord," said the lad in a firm tone, "and moreover, beside you I am afraid of nothing."

"So much the better. These AGUARAS are not very formidable either; and if it were not for their number I should not give them a thought."

"Never mind; we are all well armed; let them come."

"We'll certainly give them a warm reception," rejoined Glenarvan.

His Lordship only spoke thus to reassure the child, for a secret terror filled him at the sight of this legion of bloodthirsty animals let loose on them at midnight.

There might possibly be some hundreds, and what could three men do, even armed to the teeth, against such a multitude?

As soon as Thalcave said the word AGUARA, Glenarvan knew that he meant the red wolf, for this is the name given to it by the Pampas Indians. This voracious animal, called by naturalists the _Canis jubatus_, is in shape like a large dog, and has the head of a fox. Its fur is a reddish-cinnamon color, and there is a black mane all down the back. It is a strong, nimble animal, generally inhabiting marshy places, and pursuing aquatic animals by swimming, prowling about by night and sleeping during the day. Its attacks are particularly dreaded at the ESTANCIAS, or sheep stations, as it often commits considerable ravages, carrying off the finest of the flock. Singly, the AGUARA is not much to be feared; but they generally go in immense packs, and one had better have to deal with a jaguar or cougar than with them.

Both from the noise of the howling and the multitude of shadows leaping about, Glenarvan had a pretty good idea of the number of the wolves, and he knew they had scented a good meal of human flesh or horse flesh, and none of them would go back to their dens without a share. It was certainly a very alarming situation to be in.

The assailants were gradually drawing closer. The horses displayed signs of the liveliest terror, with the exception of Thaouka, who stamped his foot, and tried to break loose and get out. His master could only calm him by keeping up a low, continuous whistle.

Glenarvan and Robert had posted themselves so as to defend the opening of the RAMADA. They were just
going to fire into the nearest ranks of the wolves when Thalcave lowered their weapons.
"What does Thalcave mean?" asked Robert.
"He forbids our firing."
"And why?"
"Perhaps he thinks it is not the right time."
But this was not the Indian's reason, and so Glenarvan saw when he lifted the powder-flask, showed him it was nearly empty.
"What's wrong?" asked Robert.
"We must husband our ammunition," was the reply. "To-day's shooting has cost us dear, and we are short of powder and shot. We can't fire more than twenty times."
The boy made no reply, and Glenarvan asked him if he was frightened.
"No, my Lord," he said.
"That's right," returned Glenarvan.
A fresh report resounded that instant. Thalcave had made short work of one assailant more audacious than the rest, and the infuriated pack had retreated to within a hundred steps of the inclosure.
On a sign from the Indian Glenarvan took his place, while Thalcave went back into the inclosure and gathered up all the dried grass and ALFAFARES, and, indeed, all the combustibles he could rake together, and made a pile of them at the entrance. Into this he flung one of the still-glowing embers, and soon the bright flames shot up into the dark night. Glenarvan could now get a good glimpse of his antagonists, and saw that it was impossible to exaggerate their numbers or their fury. The barrier of fire just raised by Thalcave had redoubled their anger, though it had cut off their approach. Several of them, however, urged on by the hindmost ranks, pushed forward into the very flames, and burned their paws for their pains.
From time to time another shot had to be fired, notwithstanding the fire, to keep off the howling pack, and in the course of an hour fifteen dead animals lay stretched on the prairie.
The situation of the besieged was, relatively speaking, less dangerous now. As long as the powder lasted and the barrier of fire burned on, there was no fear of being overmastered. But what was to be done afterward, when both means of defense failed at once?
Glenarvan's heart swelled as he looked at Robert. He forgot himself in thinking of this poor child, as he saw him showing a courage so far above his years. Robert was pale, but he kept his gun steady, and stood with firm foot ready to meet the attacks of the infuriated wolves.
However, after Glenarvan had calmly surveyed the actual state of affairs, he determined to bring things to a crisis.
"In an hour's time," he said, "we shall neither have powder nor fire. It will never do to wait till then before we settle what to do."
Accordingly, he went up to Thalcave, and tried to talk to him by the help of the few Spanish words his memory could muster, though their conversation was often interrupted by one or the other having to fire a shot.
It was no easy task for the two men to understand each other, but, most fortunately, Glenarvan knew a great deal of the peculiarities of the red wolf; otherwise he could never have interpreted the Indian's words and gestures.
As it was, fully a quarter of an hour elapsed before he could get any answer from Thalcave to tell Robert in reply to his inquiry.
"What does he say?"
"He says that at any price we must hold out till daybreak. The AGUARA only prowls about at night, and goes back to his lair with the first streak of dawn. It is a cowardly beast, that loves the darkness and dreads the light—an owl on four feet."
"Very well, let us defend ourselves, then, till morning."
"Yes, my boy, and with knife-thrusts, when gun and shots fail."
Already Thalcave had set the example, for whenever a wolf came too near the burning pile, the long arm of the Patagonian dashed through the flames and came out again reddened with blood.
But very soon this means of defense would be at an end. About two o'clock, Thalcave flung his last armful of combustibles into the fire, and barely enough powder remained to load a gun five times.
Glenarvan threw a sorrowful glance round him. He thought of the lad standing there, and of his companions and those left behind, whom he loved so dearly.
Robert was silent. Perhaps the danger seemed less imminent to his imagination. But Glenarvan thought for him, and pictured to himself the horrible fate that seemed to await him inevitably. Quite overcome by his emotion, he took the child in his arms, and straining him convulsively to his heart, pressed his lips on his forehead, while tears he could not restrain streamed down his cheeks.
Robert looked up into his face with a smile, and said, "I am not frightened."
"No, my child, no! and you are right. In two hours daybreak will come, and we shall be saved. Bravo, Thalcave! my brave Patagonian! Bravo!" he added as the Indian that moment leveled two enormous beasts who endeavored to leap across the barrier of flames.

But the fire was fast dying out, and the DENOUEMENT of the terrible drama was approaching. The flames got lower and lower. Once more the shadows of night fell on the prairie, and the glaring eyes of the wolves glowed like phosphorescent balls in the darkness. A few minutes longer, and the whole pack would be in the inclosure.

Thalcave loaded his carbine for the last time, killed one more enormous monster, and then folded his arms. His head sank on his chest, and he appeared buried in deep thought. Was he planning some daring, impossible, mad attempt to repulse the infuriated horde? Glenarvan did not venture to ask.

At this very moment the wolves began to change their tactics. The deafening howls suddenly ceased: they seemed to be going away. Gloomy silence spread over the prairie, and made Robert exclaim:
"They're gone!"

But Thalcave, guessing his meaning, shook his head. He knew they would never relinquish their sure prey till daybreak made them hasten back to their dens.

Still, their plan of attack had evidently been altered. They no longer attempted to force the entrance, but their new maneuvers only heightened the danger.

They had gone round the RAMADA, as by common consent, and were trying to get in on the opposite side.
The next minute they heard their claws attacking the moldering wood, and already formidable paws and hungry, savage jaws had found their way through the palings. The terrified horses broke loose from their halters and ran about the inclosure, mad with fear.

Glenarvan put his arms round the young lad, and resolved to defend him as long as his life held out. Possibly he might have made a useless attempt at flight when his eye fell on Thalcave.

The Indian had been stalking about the RAMADA like a stag, when he suddenly stopped short, and going up to his horse, who was trembling with impatience, began to saddle him with the most scrupulous care, without forgetting a single strap or buckle. He seemed no longer to disturb himself in the least about the wolves outside, though their yells had redoubled in intensity. A dark suspicion crossed Glenarvan's mind as he watched him.
"He is going to desert us," he exclaimed at last, as he saw him seize the reins, as if preparing to mount.
"He! never!" replied Robert. Instead of deserting them, the truth was that the Indian was going to try and save his friends by sacrificing himself.

Thaouka was ready, and stood champing his bit. He reared up, and his splendid eyes flashed fire; he understood his master.

But just as the Patagonian caught hold of the horse's mane, Glenarvan seized his arm with a convulsive grip, and said, pointing to the open prairie.
"You are going away?"
V. IV Verne
"Yes," replied the Indian, understanding his gesture. Then he said a few words in Spanish, which meant: "Thaouka; good horse; quick; will draw all the wolves away after him."
"Oh, Thalcave," exclaimed Glenarvan.
"Quick, quick!" replied the Indian, while Glenarvan said, in a broken, agitated voice to Robert:
"Robert, my child, do you hear him? He wants to sacrifice himself for us. He wants to rush away over the Pampas, and turn off the wolves from us by attracting them to himself."
"Friend Thalcave," returned Robert, throwing himself at the feet of the Patagonian, "friend Thalcave, don't leave us!"

"No," said Glenarvan, "he shall not leave us."
And turning toward the Indian, he said, pointing to the frightened horses, "Let us go together."
"No," replied Thalcave, catching his meaning. "Bad beasts; frightened; Thaouka, good horse."
"Be it so then!" returned Glenarvan. "Thalcave will not leave you, Robert. He teaches me what I must do. It is for me to go, and for him to stay by you."
Then seizing Thaouka's bridle, he said, "I am going, Thalcave, not you."
"No," replied the Patagonian quietly.
"I am," exclaimed Glenarvan, snatching the bridle out of his hands. "I, myself! Save this boy, Thalcave! I commit him to you."

Glenarvan was so excited that he mixed up English words with his Spanish. But what mattered the language at such a terrible moment. A gesture was enough. The two men understood each other.

However, Thalcave would not give in, and though every instant's delay but increased the danger, the discussion
Neither Glenarvan nor Thalcave appeared inclined to yield. The Indian had dragged his companion towards the entrance of the RAMADA, and showed him the prairie, making him understand that now was the time when it was clear from the wolves; but that not a moment was to be lost, for should this maneuver not succeed, it would only render the situation of those left behind more desperate. and that he knew his horse well enough to be able to trust his wonderful lightness and swiftness to save them all. But Glenarvan was blind and obstinate, and determined to sacrifice himself at all hazards, when suddenly he felt himself violently pushed back. Thaouka pranced up, and reared himself bolt upright on his hind legs, and made a bound over the barrier of fire, while a clear, young voice called out:

"God save you, my lord."

But before either Thalcave or Glenarvan could get more than a glimpse of the boy, holding on fast by Thaouka's mane, he was out of sight.

But even Thalcave did not catch the words, for his voice was drowned in the frightful uproar made by the wolves, who had dashed off at a tremendous speed on the track of the horse.

Thalcave and Glenarvan rushed out of the RAMADA. Already the plain had recovered its tranquillity, and all that could be seen of the red wolves was a moving line far away in the distant darkness.

Glenarvan sank prostrate on the ground, and clasped his hands despairingly. He looked at Thalcave, who smiled with his accustomed calmness, and said:

"Thaouka, good horse. Brave boy. He will save himself!"

"And suppose he falls?" said Glenarvan.

"He'll not fall."

But notwithstanding Thalcave's assurances, poor Glenarvan spent the rest of the night in torturing anxiety. He seemed quite insensible now to the danger they had escaped through the departure of the wolves, and would have hastened immediately after Robert if the Indian had not kept him back by making him understand the impossibility of their horses overtaking Thaouka; and also that boy and horse had outdistanced the wolves long since, and that it would be useless going to look for them till daylight.

At four o'clock morning began to dawn. A pale glimmer appeared in the horizon, and pearly drops of dew lay thick on the plain and on the tall grass, already stirred by the breath of day.

The time for starting had arrived.

"Now!" cried Thalcave, "come."

Glenarvan made no reply, but took Robert's horse and sprung into the saddle. Next minute both men were galloping at full speed toward the west, in the line in which their companions ought to be advancing. They dashed along at a prodigious rate for a full hour, dreading every minute to come across the mangled corpse of Robert. Glenarvan had torn the flanks of his horse with his spurs in his mad haste, when at last gun-shots were heard in the distance at regular intervals, as if fired as a signal.

"There they are!" exclaimed Glenarvan; and both he and the Indian urged on their steeds to a still quicker pace, till in a few minutes more they came up to the little detachment conducted by Paganel. A cry broke from Glenarvan's lips, for Robert was there, alive and well, still mounted on the superb Thaouka, who neighed loudly with delight at the sight of his master.

"Oh, my child, my child!" cried Glenarvan, with indescribable tenderness in his tone.

Both he and Robert leaped to the ground, and flung themselves into each other's arms. Then the Indian hugged the brave boy in his arms.

"He is alive, he is alive," repeated Glenarvan again and again.

"Yes," replied Robert; "and thanks to Thaouka."

This great recognition of his favorite's services was wholly unexpected by the Indian, who was talking to him that minute, caressing and speaking to him, as if human blood flowed in the veins of the proud creature. Then turning to Paganel, he pointed to Robert, and said, "A brave!" and employing the Indian metaphor, he added, "his spurs did not tremble!"

But Glenarvan put his arms round the boy and said, "Why wouldn't you let me or Thalcave run the risk of this last chance of deliverance, my son?"

"My lord," replied the boy in tones of gratitude, "wasn't it my place to do it? Thalcave has saved my life already, and you-- you are going to save my father."

CHAPTER XX STRANGE SIGNS

AFTER the first joy of the meeting was over, Paganel and his party, except perhaps the Major, were only conscious of one feeling-- they were dying of thirst. Most fortunately for them, the Guamini ran not far off, and
about seven in the morning the little troop reached the inclosure on its banks. The precincts were strewed with the
dead wolves, and judging from their numbers, it was evident how violent the attack must have been, and how
desperate the resistance.

As soon as the travelers had drunk their fill, they began to demolish the breakfast prepared in the RAMADA,
and did ample justice to the extraordinary viands. The NANDOU fillets were pronounced first-rate, and the
armadillo was delicious.

"To eat moderately," said Paganel, "would be positive ingratitude to Providence. We must eat immoderately."
And so they did, but were none the worse for it. The water of the Guamini greatly aided digestion apparently.

Glenarvan, however, was not going to imitate Hannibal at Capua, and at ten o'clock next morning gave the signal
for starting. The leathern bottles were filled with water, and the day's march commenced. The horses were so well
rested that they were quite fresh again, and kept up a canter almost constantly. The country was not so parched up
now, and consequently less sterile, but still a desert. No incident occurred of any importance during the 2d and 3d of
November, and in the evening they reached the boundary of the Pampas, and camped for the night on the frontiers of
the province of Buenos Ayres. Two-thirds of their journey was now accomplished. It was twenty-two days since
they left the Bay of Talcahuano, and they had gone 450 miles.

Next morning they crossed the conventional line which separates the Argentine plains from the region of the
Pampas. It was here that Thalcave hoped to meet the Caciques, in whose hands, he had no doubt, Harry Grant and
his men were prisoners.

From the time of leaving the Guamini, there was marked change in the temperature, to the great relief of the
travelers. It was much cooler, thanks to the violent and cold winds from Patagonia, which constantly agitate the
atmospheric waves. Horses and men were glad enough of this, after what they had suffered from the heat and
drought, and they felt animated with fresh ardor and confidence. But contrary to what Thalcave had said, the whole
district appeared uninhabited, or rather abandoned.

Their route often led past or went right through small lagoons, sometimes of fresh water, sometimes of brackish.
On the banks and bushes about these, king-wrens were hopping about and larks singing joyously in concert with the
tangaras, the rivals in color of the brilliant humming birds. On the thorny bushes the nests of the ANNUBIS swung
to and fro in the breeze like an Indian hammock; and on the shore magnificent flamingos stalked in regular order
like soldiers marching, and spread out their flaming red wings. Their nests were seen in groups of thousands,
forming a complete town, about a foot high, and resembling a truncated cone in shape. The flamingos did not disturb
themselves in the least at the approach of the travelers, but this did not suit Paganel.

"I have been very desirous a long time," he said to the Major, "to see a flamingo flying."
"All right," replied McNabbs.
"Now while I have the opportunity, I should like to make the most of it," continued Paganel.
"Very well; do it, Paganel."
"Come with me, then, Major, and you too Robert. I want witnesses."
And all three went off towards the flamingos, leaving the others to go on in advance.

As soon as they were near enough, Paganel fired, only loading his gun, however, with powder, for he would not
shed even the blood of a bird uselessly. The shot made the whole assemblage fly away _en masse_, while Paganel
watched them attentively through his spectacles.

"Well, did you see them fly?" he asked the Major.
"Certainly I did," was the reply. "I could not help seeing them, unless I had been blind."
"Well and did you think they resembled feathered arrows when they were flying?"
"Not in the least."
"Not a bit," added Robert.
"I was sure of it," said the geographer, with a satisfied air; "and yet the very proudest of modest men, my
illustrious countryman, Chateaubriand, made the inaccurate comparison. Oh, Robert, comparison is the most
dangerous figure in rhetoric that I know. Mind you avoid it all your life, and only employ it in a last extremity."
"Are you satisfied with your experiment?" asked McNabbs.
"Delighted."
"And so am I. But we had better push on now, for your illustrious Chateaubriand has put us more than a mile
behind."

On rejoining their companions, they found Glenarvan busily engaged in conversation with the Indian, though
apparently unable to make him understand. Thalcave's gaze was fixed intently on the horizon, and his face wore a
puzzled expression.
The moment Paganel came in sight, Glenarvan called out:
"Come along, friend Paganel. Thalcave and I can't understand each other at all."
After a few minutes' talk with the Patagonian, the interpreter turned to Glenarvan and said:

"Thalcave is quite astonished at the fact, and certainly it is very strange that there are no Indians, nor even traces of any to be seen in these plains, for they are generally thick with companies of them, either driving along cattle stolen from the ESTANCIAS, or going to the Andes to sell their zorillo cloths and plaited leather whips."

"And what does Thalcave think is the reason?"

"He does not know; he is amazed and that's all."

"But what description of Indians did he reckon on meeting in this part of the Pampas?"

"Just the very ones who had the foreign prisoners in their hands, the natives under the rule of the Caciques Calfoucoura, Catriel, or Yanchetruz."

"Who are these Caciques?"

"Chiefs that were all powerful thirty years ago, before they were driven beyond the sierras. Since then they have been reduced to subjection as much as Indians can be, and they scour the plains of the Pampas and the province of Buenos Ayres. I quite share Thalcave's surprise at not discovering any traces of them in regions which they usually infest as SALTEADORES, or bandits."

"And what must we do then?"

"I'll go and ask him," replied Paganel.

After a brief colloquy he returned and said:

"This is his advice, and very sensible it is, I think. He says we had better continue our route to the east as far as Fort Independence, and if we don't get news of Captain Grant there we shall hear, at any rate, what has become of the Indians of the Argentine plains."

"Is Fort Independence far away?" asked Glenarvan.

"No, it is in the Sierra Tandil, a distance of about sixty miles."

"And when shall we arrive?"

"The day after to-morrow, in the evening."

Glenarvan was considerably disconcerted by this circumstance. Not to find an Indian where in general there were only too many, was so unusual that there must be some grave cause for it; but worse still if Harry Grant were a prisoner in the hands of any of those tribes, had been dragged away with them to the north or south? Glenarvan felt that, cost what it might, they must not lose his track, and therefore decided to follow the advice of Thalcave, and go to the village of Tandil. They would find some one there to speak to, at all events.

About four o'clock in the evening a hill, which seemed a mountain in so flat a country, was sighted in the distance. This was Sierra Tapalquem, at the foot of which the travelers camped that night.

The passage in the morning over this sierra, was accomplished without the slightest difficulty; after having crossed the Cordillera of the Andes, it was easy work to ascend the gentle heights of such a sierra as this. The horses scarcely slackened their speed. At noon they passed the deserted fort of Tapalquem, the first of the chain of forts which defend the southern frontiers from Indian marauders. But to the increasing surprise of Thalcave, they did not come across even the shadow of an Indian. About the middle of the day, however, three flying horsemen, well mounted and well armed came in sight, gazed at them for an instant, and then sped away with inconceivable rapidity. Glenarvan was furious.

"Gauchos," said the Patagonian, designating them by the name which had caused such a fiery discussion between the Major and Paganel.

"Ah! the Gauchos," replied McNabbs. "Well, Paganel, the north wind is not blowing to-day. What do you think of those fellows yonder?"

"I think they look like regular bandits."

"And how far is it from looking to being, my good geographer?"

"Only just a step, my dear Major."

Paganel's admission was received with a general laugh, which did not in the least disconcert him. He went on talking about the Indians however, and made this curious observation:

"I have read somewhere," he said, "that about the Arabs there is a peculiar expression of ferocity in the mouth, while the eyes have a kindly look. Now, in these American savages it is quite the reverse, for the eye has a particularly villainous aspect."

No physiognomist by profession could have better characterized the Indian race.

But desolate as the country appeared, Thalcave was on his guard against surprises, and gave orders to his party to form themselves in a close platoon. It was a useless precaution, however; for that same evening, they camped for the night in an immense TOLDERIA, which they not only found perfectly empty, but which the Patagonian declared, after he had examined it all round, must have been uninhabited for a long time.

Next day, the first ESTANCIAS of the Sierra Tandil came in sight. The ESTANCIAS are large cattle stations for
breeding cattle; but Thalcave resolved not to stop at any of them, but to go straight on to Fort Independence. They passed several farms fortified by battlements and surrounded by a deep moat, the principal building being encircled by a terrace, from which the inhabitants could fire down on the marauders in the plain. Glenarvan might, perhaps, have got some information at these houses, but it was the surest plan to go straight on to the village of Tandil. Accordingly they went on without stopping, fording the Río of Los Huasos and also the Chapaleofu, a few miles further on. Soon they were treading the grassy slopes of the first ridges of the Sierra Tandil, and an hour afterward the village appeared in the depths of a narrow gorge, and above it towered the lofty battlements of Fort Independence.

CHAPTER XXI A FALSE TRAIL

THE Sierra Tandil rises a thousand feet above the level of the sea. It is a primordial chain--that is to say, anterior to all organic and metamorphic creation. It is formed of a semi-circular ridge of gneiss hills, covered with fine short grass. The district of Tandil, to which it has given its name, includes all the south of the Province of Buenos Ayres, and terminates in a river which conveys north all the Ríos that take their rise on its slopes.

After making a short ascent up the sierra, they reached the postern gate, so carelessly guarded by an Argentine sentinel, that they passed through without difficulty, a circumstance which betokened extreme negligence or extreme security.

A few minutes afterward the Commandant appeared in person. He was a vigorous man about fifty years of age, of military aspect, with grayish hair, and an imperious eye, as far as one could see through the clouds of tobacco smoke which escaped from his short pipe. His walk reminded Paganel instantly of the old subalterns in his own country.

Thalcave was spokesman, and addressing the officer, presented Lord Glenarvan and his companions. While he was speaking, the Commandant kept staring fixedly at Paganel in rather an embarrassing manner. The geographer could not understand what he meant by it, and was just about to interrogate him, when the Commandant came forward, and seizing both his hands in the most free-and-easy fashion, said in a joyous voice, in the mother tongue of the geographer:

"A Frenchman!"

"Yes, a Frenchman," replied Paganel.

"Ah! delightful! Welcome, welcome. I am a Frenchman too," he added, shaking Paganel's hand with such vigor as to be almost alarming.

"Is he a friend of yours, Paganel?" asked the Major.

"Yes," said Paganel, somewhat proudly. "One has friends in every division of the globe."

After he had succeeded in disengaging his hand, though not without difficulty, from the living vise in which it was held, a lively conversation ensued. Glenarvan would fain have put in a word about the business on hand, but the Commandant related his entire history, and was not in a mood to stop till he had done. It was evident that the worthy man must have left his native country many years back, for his mother tongue had grown unfamiliar, and if he had not forgotten the words he certainly did not remember how to put them together. He spoke more like a negro belonging to a French colony.

The fact was that the Governor of Fort Independence was a French sergeant, an old comrade of Parachapee. He had never left the fort since it had been built in 1828; and, strange to say, he commanded it with the consent of the Argentine Government. He was a man about fifty years of age, a Basque by birth, and his name was Manuel Ipharaguerre, so that he was almost a Spaniard. A year after his arrival in the country he was naturalized, took service in the Argentine army, and married an Indian girl, who was then nursing twin babies six months old--two boys, be it understood, for the good wife of the Commandant would have never thought of presenting her husband with girls. Manuel could not conceive of any state but a military one, and he hoped in due time, with the help of God, to offer the republic a whole company of young soldiers.

"You saw them. Charming! good soldiers are Jose, Juan, and Miquele! Pepe, seven year old; Pepe can handle a gun."

Pepe, hearing himself complimented, brought his two little feet together, and presented arms with perfect grace.

"He'll get on!" added the sergeant. "He'll be colonel-major or brigadier-general some day."

Sergeant Manuel seemed so enchanted that it would have been useless to express a contrary opinion, either to the profession of arms or the probable future of his children. He was happy, and as Goethe says, "Nothing that makes us happy is an illusion."

All this talk took up a quarter of an hour, to the great astonishment of Thalcave. The Indian could not understand how so many words could come out of one throat. No one interrupted the Sergeant, but all things come to an end, and at last he was silent, but not till he had made his guests enter his dwelling, and be presented to Madame Ipharaguerre. Then, and not till then, did he ask his guests what had procured him the honor of their visit. Now or
never was the moment to explain, and Paganel, seizing the chance at once, began an account of their journey across
the Pampas, and ended by inquiring the reason of the Indians having deserted the country.
"Ah! there was no one!" replied the Sergeant, shrugging his shoulders--"really no one, and us, too, our arms
crossed! Nothing to do!"
"But why?"
"War."
"War?"
"Yes, civil war between the Paraguayans and Buenos Ayriens," replied the Sergeant.
"Well?"
"Well, Indians all in the north, in the rear of General Flores. Indian pillagers find pillage there."
"But where are the Caciques?"
"Caciques are with them."
"What! Catriel?"
"There is no Catriel."
"And Calfoucoura?"
"There is no Calfoucoura."
"And is there no Yanchetruz?"
"No; no Yanchetruz."

The reply was interpreted by Thalcave, who shook his head and gave an approving look. The Patagonian was
either unaware of, or had forgotten that civil war was decimating the two parts of the republic--a war which
ultimately required the intervention of Brazil. The Indians have everything to gain by these intestine strifes, and can
not lose such fine opportunities of plunder. There was no doubt the Sergeant was right in assigning war then as the
cause of the forsaken appearance of the plains.

But this circumstance upset all Glenarvan's projects, for if Harry Grant was a prisoner in the hands of the
Caciques, he must have been dragged north with them. How and where should they ever find him if that were the
case? Should they attempt a perilous and almost useless journey to the northern border of the Pampas? It was a
serious question which would need to be well talked over.

However, there was one inquiry more to make to the Sergeant; and it was the Major who thought of it, for all the
others looked at each other in silence.
"Had the Sergeant heard whether any Europeans were prisoners in the hands of the Caciques?"
Manuel looked thoughtful for a few minutes, like a man trying to ransack his memory. At last he said:
"Yes."
"Ah!" said Glenarvan, catching at the fresh hope.
They all eagerly crowded round the Sergeant, exclaiming,
"Tell us, tell us."
"It was some years ago," replied Manuel. "Yes; all I heard was that some Europeans were prisoners, but I never
saw them."
"You are making a mistake," said Glenarvan. "It can't be some years ago; the date of the shipwreck is explicitly
given. The BRITANNIA was wrecked in June, 1862. It is scarcely two years ago."
"Oh, more than that, my Lord."
"Impossible!" said Paganel.
"Oh, but it must be. It was when Pepe was born. There were two prisoners."
"No, three!" said Glenarvan.
"Two!" replied the Sergeant, in a positive tone.
"Two?" echoed Glenarvan, much surprised. "Two Englishmen?"
"No, no. Who is talking of Englishmen? No; a Frenchman and an Italian."
"An Italian who was massacred by the Poyuches?" exclaimed Paganel.
"Yes; and I heard afterward that the Frenchman was saved."
"Saved!" exclaimed young Robert, his very life hanging on the lips of the Sergeant.
Yes; delivered out of the hands of the Indians."
Paganel struck his forehead with an air of desperation, and said at last,
"Ah! I understand. It is all clear now; everything is explained."
"But what is it?" asked Glenarvan, with as much impatience.
"My friends," replied Paganel, taking both Robert's hands in his own, "we must resign ourselves to a sad
disaster. We have been on a wrong track. The prisoner mentioned is not the captain at all, but one of my own
countrymen; and his companion, who was assassinated by the Poyuches, was Marco Vazello. The Frenchman was
dragged along by the cruel Indians several times as far as the shores of the Colorado, but managed at length to make his escape, and return to Colorado. Instead of following the track of Harry Grant, we have fallen on that of young Guinnard."

This announcement was heard with profound silence. The mistake was palpable. The details given by the Sergeant, the nationality of the prisoner, the murder of his companions, his escape from the hands of the Indians, all evidenced the fact. Glenarvan looked at Thalcave with a crestfallen face, and the Indian, turning to the Sergeant, asked whether he had never heard of three English captives.

"Never," replied Manuel. "They would have known of them at Tandil, I am sure. No, it cannot be."

After this, there was nothing further to do at Fort Independence but to shake hands with the Commandant, and thank him and take leave.

Glenarvan was in despair at this complete overthrow of his hopes, and Robert walked silently beside him, with his eyes full of tears. Glenarvan could not find a word of comfort to say to him. Paganel gesticulated and talked away to himself. The Major never opened his mouth, nor Thalcave, whose _amour propre_, as an Indian, seemed quite wounded by having allowed himself to go on a wrong scent. No one, however, would have thought of reproaching him for an error so pardonable.

They went back to the FONDA, and had supper; but it was a gloomy party that surrounded the table. It was not that any one of them regretted the fatigue they had so heedlessly endured or the dangers they had run, but they felt their hope of success was gone, for there was no chance of coming across Captain Grant between the Sierra Tandil and the sea, as Sergeant Manuel must have heard if any prisoners had fallen into the hands of the Indians on the coast of the Atlantic. Any event of this nature would have attracted the notice of the Indian traders who traffic between Tandil and Carmen, at the mouth of the Rio Negro. The best thing to do now was to get to the DUNCAN as quick as possible at the appointed rendezvous.

Paganel asked Glenarvan, however, to let him have the document again, on the faith of which they had set out on so bootless a search. He read it over and over, as if trying to extract some new meaning out of it.

"Yet nothing can be clearer," said Glenarvan; "it gives the date of the shipwreck, and the manner, and the place of the captivity in the most categorical manner."

"That it does not--no, it does not!" exclaimed Paganel, striking the table with his fist. "Since Harry Grant is not in the Pampas, he is not in America; but where he is the document must say, and it shall say, my friends, or my name is not Jacques Paganel any longer."

CHAPTER XXII THE FLOOD

A DISTANCE of 150 miles separates Fort Independence from the shores of the Atlantic. Unless unexpected and certainly improbable delays should occur, in four days Glenarvan would rejoin the DUNCAN. But to return on board without Captain Grant, and after having so completely failed in his search, was what he could not bring himself to do. Consequently, when next day came, he gave no orders for departure; the Major took it upon himself to have the horses saddled, and make all preparations. Thanks to his activity, next morning at eight o'clock the little troop was descending the grassy slopes of the Sierra.

Glenarvan, with Robert at his side, galloped along without saying a word. His bold, determined nature made it impossible to take failure quietly. His heart throbbed as if it would burst, and his head was burning. Paganel, excited by the difficulty, was turning over and over the words of the document, and trying to discover some new meaning. Thalcave was perfectly silent, and left Thaouka to lead the way. The Major, always confident, remained firm at his post, like a man on whom discouragement takes no hold. Tom Austin and his two sailors shared the dejection of their master. A timid rabbit happened to run across their path, and the superstitious men looked at each other in dismay.

"Yes, in the Highlands," repeated Mulrady.
"What's bad in the Highlands is not better here," returned Wilson sententiously.

Toward noon they had crossed the Sierra, and descended into the undulating plains which extend to the sea. Limpid RIOS intersected these plains, and lost themselves among the tall grasses. The ground had once more become a dead level, the last mountains of the Pampas were passed, and a long carpet of verdure unrolled itself over the monotonous prairie beneath the horses' tread.

Hitherto the weather had been fine, but to-day the sky presented anything but a reassuring appearance. The heavy vapors, generated by the high temperature of the preceding days, hung in thick clouds, which ere long would empty themselves in torrents of rain. Moreover, the vicinity of the Atlantic, and the prevailing west wind, made the climate of this district particularly damp. This was evident by the fertility and abundance of the pasture and its dark color. However, the clouds remained unbroken for the present, and in the evening, after a brisk gallop of forty miles, the horses stopped on the brink of deep CANADAS, immense natural trenches filled with water. No shelter was
near, and ponchos had to serve both for tents and coverlets as each man lay down and fell asleep beneath the threatening sky.

Next day the presence of water became still more sensibly felt; it seemed to exude from every pore of the ground. Soon large ponds, some just beginning to form, and some already deep, lay across the route to the east. As long as they had only to deal with lagoons, circumscribed pieces of water unencumbered with aquatic plants, the horses could get through well enough, but when they encountered moving sloughs called PENTANOS, it was harder work. Tall grass blocked them up, and they were involved in the peril before they were aware.

These bogs had already proved fatal to more than one living thing, for Robert, who had got a good bit ahead of the party, came rushing back at full gallop, calling out:

"Monsieur Paganel, Monsieur Paganel, a forest of horns."

"What!" exclaimed the geographer; "you have found a forest of horns?"

"Yes, yes, or at any rate a coppice."

"A coppice!" replied Paganel, shrugging his shoulders. "My boy, you are dreaming."

"I am not dreaming, and you will see for yourself. Well, this is a strange country. They sow horns, and they sprout up like wheat. I wish I could get some of the seed."

"The boy is really speaking seriously," said the Major.

"Yes, Mr. Major, and you will soon see I am right."

The boy had not been mistaken, for presently they found themselves in front of an immense field of horns, regularly planted and stretching far out of sight. It was a complete copse, low and close packed, but a strange sort.

"Well," said Robert.

"This is peculiar certainly," said Paganel, and he turned round to question Thalcave on the subject.

"The horns come out of the ground," replied the Indian, "but the oxen are down below."

"What!" exclaimed Paganel; "do you mean to say that a whole herd was caught in that mud and buried alive?"

"Yes," said the Patagonian.

And so it was. An immense herd had been suffocated side by side in this enormous bog, and this was not the first occurrence of the kind which had taken place in the Argentine plains.

An hour afterward and the field of horns lay two miles behind.

Thalcave was somewhat anxiously observing a state of things which appeared to him unusual. He frequently stopped and raised himself on his stirrups and looked

V. IV Verne around. His great height gave him a commanding view of the whole horizon; but after a keen rapid survey, he quickly resumed his seat and went on. About a mile further he stopped again, and leaving the straight route, made a circuit of some miles north and south, and then returned and fell back in his place at the head of the troop, without saying a syllable as to what he hoped or feared. This strange behavior, several times repeated, made Glenarvan very uneasy, and quite puzzled Paganel. At last, at Glenarvan's request, he asked the Indian about it.

Thalcave replied that he was astonished to see the plains so saturated with water. Never, to his knowledge, since he had followed the calling of guide, had he found the ground in this soaking condition. Even in the rainy season, the Argentine plains had always been passable.

"But what is the cause of this increasing humidity?" said Paganel.

"I do not know, and what if I did?"

"Could it be owing to the RIOS of the Sierra being swollen to overflowing by the heavy rains?"

"Sometimes they are."

"And is it the case now?"

"Perhaps."

Paganel was obliged to be content with this unsatisfactory reply, and went back to Glenarvan to report the result of his conversation.

"And what does Thalcave advise us to do?" said Glenarvan.

Paganel went back to the guide and asked him.

"Go on fast," was the reply.

This was easier said than done. The horses soon tired of treading over ground that gave way at every step. It sank each moment more and more, till it seemed half under water.

They quickened their pace, but could not go fast enough to escape the water, which rolled in great sheets at their feet. Before two hours the cataracts of the sky opened and deluged the plain in true tropical torrents of rain. Never was there a finer occasion for displaying philosophic equanimity. There was no shelter, and nothing for it but to bear it stolidly. The ponchos were streaming like the overflowing gutter-spouts on the roof of a house, and the unfortunate horsemen had to submit to a double bath, for their horses dashed up the water to their waists at every step.
In this drenching, shivering state, and worn out with fatigue, they came toward evening to a miserable RANCHO, which could only have been called a shelter by people not very fastidious, and certainly only travelers in extremity would even have entered it; but Glenarvan and his companions had no choice, and were glad enough to burrow in this wretched hovel, though it would have been despised by even a poor Indian of the Pampas. A miserable fire of grass was kindled, which gave out more smoke than heat, and was very difficult to keep alight, as the torrents of rain which dashed against the ruined cabin outside found their way within and fell down in large drops from the roof. Twenty times over the fire would have been extinguished if Mulrady and Wilson had not kept off the water.

The supper was a dull meal, and neither appetizing nor reviving. Only the Major seemed to eat with any relish. The impassive McNabbs was superior to all circumstances. Paganel, Frenchman as he was, tried to joke, but the attempt was a failure.

"My jests are damp," he said, "they miss fire."

The only consolation in such circumstances was to sleep, and accordingly each one lay down and endeavored to find in slumber a temporary forgetfulness of his discomforts and his fatigues. The night was stormy, and the planks of the rancho cracked before the blast as if every instant they would give way. The poor horses outside, exposed to all the inclemency of the weather, were making piteous moans, and their masters were suffering quite as much inside the ruined RANCHO. However, sleep overpowered them at length. Robert was the first to close his eyes and lean his head against Glenarvan's shoulder, and soon all the rest were soundly sleeping too under the guardian eye of Heaven.

The night passed safely, and no one stirred till Thaouka woke them by tapping vigorously against the RANCHO with his hoof. He knew it was time to start, and at a push could give the signal as well as his master. They owed the faithful creature too much to disobey him, and set off immediately.

The rain had abated, but floods of water still covered the ground. Paganel, on consulting his map, came to the conclusion that the RIOS Grande and Vivarota, into which the water from the plains generally runs, must have been united in one large bed several miles in extent.

Extreme haste was imperative, for all their lives depended on it. Should the inundation increase, where could they find refuge? Not a single elevated point was visible on the whole circle of the horizon, and on such level plains water would sweep along with fearful rapidity.

The horses were spurred on to the utmost, and Thaouka led the way, bounding over the water as if it had been his natural element. Certainly he might justly have been called a sea-horse--better than many of the amphibious animals who bear that name.

All of a sudden, about ten in the morning, Thaouka betrayed symptoms of violent agitation. He kept turning round toward the south, neighing continually, and snorting with wide open nostrils. He reared violently, and Thalcave had some difficulty in keeping his seat. The foam from his mouth was tinged with blood from the action of the bit, pulled tightly by his master's strong hand, and yet the fiery animal would not be still. Had he been free, his master knew he would have fled away to the north as fast as his legs would have carried him.

"What is the matter with Thaouka?" asked Paganel. "Is he bitten by the leeches? They are very voracious in the Argentine streams."

"No," replied the Indian.

"Is he frightened at something, then?"

"Yes, he scents danger."

"What danger?"

"I don't know."

But, though no danger was apparent to the eye, the ear could catch the sound of a murmuring noise beyond the limits of the horizon, like the coming in of the tide. Soon a confused sound was heard of bellowing and neighing and bleating, and about a mile to the south immense flocks appeared, rushing and tumbling over each other in the greatest disorder, as they hurried pell-mell along with inconceivable rapidity. They raised such a whirlwind of water in their course that it was impossible to distinguish them clearly. A hundred whales of the largest size could hardly have dashed up the ocean waves more violently.

"_Anda, anda!_" (quick, quick), shouted Thalcave, in a voice like thunder.

"What is it, then?" asked Paganel.

"The rising," replied Thalcave.

"He means an inundation," exclaimed Paganel, flying with the others after Thalcave, who had spurred on his horse toward the north.

It was high time, for about five miles south an immense towering wave was seen advancing over the plain, and changing the whole country into an ocean. The tall grass disappeared before it as if cut down by a scythe, and
clumps of mimosas were torn up and drifted about like floating islands.

The wave was speeding on with the rapidity of a racehorse, and the travelers fled before it like a cloud before a storm-wind. They looked in vain for some harbor of refuge, and the terrified horses galloped so wildly along that the riders could hardly keep their saddles.

"Anda, anda!" shouted Thalcave, and again they spurred on the poor animals till the blood ran from their lacerated sides. They stumbled every now and then over great cracks in the ground, or got entangled in the hidden grass below the water. They fell, and were pulled up only to fall again and again, and be pulled up again and again. The level of the waters was sensibly rising, and less than two miles off the gigantic wave reared its crested head.

For a quarter of an hour this supreme struggle with the most terrible of elements lasted. The fugitives could not tell how far they had gone, but, judging by the speed, the distance must have been considerable. The poor horses, however, were breast-high in water now, and could only advance with extreme difficulty. Glenarvan and Paganel, and, indeed, the whole party, gave themselves up for lost, as the horses were fast getting out of their depth, and six feet of water would be enough to drown them.

It would be impossible to tell the anguish of mind these eight men endured; they felt their own impotence in the presence of these cataclysms of nature so far beyond all human power. Their salvation did not lie in their own hands.

Five minutes afterward, and the horses were swimming; the current alone carried them along with tremendous force, and with a swiftness equal to their fastest gallop; they must have gone fully twenty miles an hour.

All hope of delivery seemed impossible, when the Major suddenly called out:

"A tree!"

"A tree?" exclaimed Glenarvan.

"Yes, there, there!" replied Thalcave, pointing with his finger to a species of gigantic walnut-tree, which raised its solitary head above the waters.

His companions needed no urging forward now; this tree, so opportunely discovered, they must reach at all hazards. The horses very likely might not be able to get to it, but, at all events, the men would, the current bearing them right down to it.

Just at that moment Tom Austin's horse gave a smothered neigh and disappeared. His master, freeing his feet from the stirrups, began to swim vigorously.

"Hang on to my saddle," called Glenarvan.

"Thanks, your honor, but I have good stout arms."

"Robert, how is your horse going?" asked his Lordship, turning to young Grant.

"Famously, my Lord, he swims like a fish."

"Lookout!" shouted the Major, in a stentorian voice.

The warning was scarcely spoken before the enormous billow, a monstrous wave forty feet high, broke over the fugitives with a fearful noise. Men and animals all disappeared in a whirl of foam; a liquid mass, weighing several millions of tons, engulfed them in its seething waters.

When it had rolled on, the men reappeared on the surface, and counted each other rapidly; but all the horses, except Thaouka, who still bore his master, had gone down forever.

"Courage, courage," repeated Glenarvan, supporting Paganel with one arm, and swimming with the other.

"I can manage, I can manage," said the worthy savant. "I am even not sorry--"

But no one ever knew what he was not sorry about, for the poor man was obliged to swallow down the rest of his sentence with half a pint of muddy water. The Major advanced quietly, making regular strokes, worthy of a master swimmer. The sailors took to the water like porpoises, while Robert clung to Thaouka's mane, and was carried along with him. The noble animal swam superbly, instinctively making for the tree in a straight line.

The tree was only twenty fathoms off, and in a few minutes was safely reached by the whole party; but for this refuge they must all have perished in the flood.

The water had risen to the top of the trunk, just to where the parent branches fork out. It was consequently, quite easy to clamber up to it. Thalcave climbed up first, and got off his horse to hoist up Robert and help the others. His powerful arms had soon placed all the exhausted swimmers in a place of security.

But, meantime, Thaouka was being rapidly carried away by the current. He turned his intelligent face toward his master, and, shaking his long mane, neighed as if to summon him to his rescue.

"Are you going to forsake him, Thalcave?" asked Paganel.

"I!" replied the Indian, and forthwith he plunged down into the tumultuous waters, and came up again ten fathoms off. A few instants afterward his arms were round Thaouka's neck, and master and steed were drifting together toward the misty horizon of the north.

CHAPTER XXIII A SINGULAR ABODE

THE tree on which Glenarvan and his companions had just found refuge, resembled a walnut-tree, having the
same glossy foliage and rounded form. In reality, however, it was the OMBU, which grows solitarily on the Argentine plains. The enormous and twisted trunk of this tree is planted firmly in the soil, not only by its great roots, but still more by its vigorous shoots, which fasten it down in the most tenacious manner. This was how it stood proof against the shock of the mighty billow.

This OMBU measured in height a hundred feet, and covered with its shadow a circumference of one hundred and twenty yards. All this scaffolding rested on three great boughs which sprang from the trunk. Two of these rose almost perpendicularly, and supported the immense parasol of foliage, the branches of which were so crossed and intertwined and entangled, as if by the hand of a basket-maker, that they formed an impenetrable shade. The third arm, on the contrary, stretched right out in a horizontal position above the roaring waters, into which the lower leaves dipped. There was no want of room in the interior of this gigantic tree, for there were great gaps in the foliage, perfect glades, with air in abundance, and freshness everywhere. To see the innumerable branches rising to the clouds, and the creepers running from bough to bough, and attaching them together while the sunlight glinted here and there among the leaves, one might have called it a complete forest instead of a solitary tree sheltering them all.

On the arrival of the fugitives a myriad of the feathered tribes fled away into the topmost branches, protesting by their outcries against this flagrant usurpation of their domicile. These birds, who themselves had taken refuge in the solitary OMBU, were in hundreds, comprising blackbirds, starlings, isacas, HILGUEROS, and especially the pica-flor, humming-birds of most resplendent colors. When they flew away it seemed as though a gust of wind had blown all the flowers off the tree.

Such was the asylum offered to the little band of Glenarvan. Young Grant and the agile Wilson were scarcely perched on the tree before they had climbed to the upper branches and put their heads through the leafy dome to get a view of the vast horizon. The ocean made by the inundation surrounded them on all sides, and, far as the eye could reach, seemed to have no limits. Not a single tree was visible on the liquid plain; the OMBU stood alone amid the rolling waters, and trembled before them. In the distance, drifting from south to north, carried along by the impetuous torrent, they saw trees torn up by the roots, twisted branches, roofs torn off, destroyed RANCHOS, planks of sheds stolen by the deluge from ESTANCIAS, carcasses of drowned animals, blood-stained skins, and on a shaky tree a complete family of jaguars, howling and clutching hold of their frail raft. Still farther away, a black spot almost invisible, already caught Wilson's eye. It was Thalcave and his faithful Thaouka.

"Thalcave, Thalcave!" shouted Robert, stretching out his hands toward the courageous Patagonian.

"He will save himself, Mr. Robert," replied Wilson; "we must go down to his Lordship."

Next minute they had descended the three stages of boughs, and landed safely on the top of the trunk, where they found Glenarvan, Paganel, the Major, Austin, and Mulrady, sitting either astride or in some position they found more comfortable. Wilson gave an account of their investigations aloft, and all shared his opinion with respect to Thalcave. The only question was whether it was Thalcave who would save Thaouka, or Thaouka save Thalcave.

Their own situation meantime was much more alarming than his. No doubt the tree would be able to resist the current, but the waters might rise higher and higher, till the topmost branches were covered, for the depression of the soil made this part of the plain a deep reservoir. Glenarvan's first care, consequently, was to make notches by which to ascertain the progress of the inundation. For the present it was stationary, having apparently reached its height. This was reassuring.

"And now what are we going to do?" said Glenarvan.

"Make our nest, of course!" replied Paganel

"Make our nest!" exclaimed Robert.

"Certainly, my boy, and live the life of birds, since we can't that of fishes."

"All very well, but who will fill our bills for us?" said Glenarvan.

"I will," said the Major.

All eyes turned toward him immediately, and there he sat in a natural arm-chair, formed of two elastic boughs, holding out his ALFORJAS damp, but still intact.

"Oh, McNabbs, that's just like you," exclaimed Glenarvan, "you think of everything even under circumstances which would drive all out of your head."

"Since it was settled we were not going to be drowned, I had no intention of starvimg of hunger."

"I should have thought of it, too," said Paganel, "but I am so DISTRAIT."

"And what is in the ALFORJAS?" asked Tom Austin.

"Food enough to last seven men for two days," replied McNabbs.

"And I hope the inundation will have gone down in twenty-four hours," said Glenarvan.

"Or that we shall have found some way of regaining _terra firma_," added Paganel.

"Our first business, then, now is to breakfast," said Glenarvan.
"I suppose you mean after we have made ourselves dry," observed the Major.

"And where's the fire?" asked Wilson.

"We must make it," returned Paganel.

"Where?"

"On the top of the trunk, of course."

"And what with?"

"With the dead wood we cut off the tree."

"But how will you kindle it?" asked Glenarvan. "Our tinder is just like wet sponge."

"We can dispense with it," replied Paganel. "We only want a little dry moss and a ray of sunshine, and the lens of my telescope, and you'll see what a fire I'll get to dry myself by. Who will go and cut wood in the forest?"

"I will," said Robert.

And off he scampered like a young cat into the depths of the foliage, followed by his friend Wilson. Paganel set to work to find dry moss, and had soon gathered sufficient. This he laid on a bed of damp leaves, just where the large branches began to fork out, forming a natural hearth, where there was little fear of conflagration.

Robert and Wilson speedily reappeared, each with an armful of dry wood, which they threw on the moss. By the help of the lens it was easily kindled, for the sun was blazing overhead. In order to ensure a proper draught, Paganel stood over the hearth with his long legs straddled out in the Arab manner. Then stooping down and raising himself with a rapid motion, he made a violent current of air with his poncho, which made the wood take fire, and soon a bright flame roared in the improvised brasier. After drying themselves, each in his own fashion, and hanging their ponchos on the tree, where they were swung to and fro in the breeze, they breakfasted, carefully however rationing out the provisions, for the morrow had to be thought of; the immense basin might not empty so soon as Glenarvan expected, and, anyway, the supply was very limited. The OMBU produced no fruit, though fortunately, it would likely abound in fresh eggs, thanks to the numerous nests stowed away among the leaves, not to speak of their feathered proprietors. These resources were by no means to be despised.

The next business was to install themselves as comfortably as they could, in prospect of a long stay.

"As the kitchen and dining-room are on the ground floor," said Paganel, "we must sleep on the first floor. The house is large, and as the rent is not dear, we must not cramp ourselves for room. I can see up yonder natural cradles, in which once safely tucked up we shall sleep as if we were in the best beds in the world. We have nothing to fear. Besides, we will watch, and we are numerous enough to repulse a fleet of Indians and other wild animals."

"We only want fire-arms."

"I have my revolvers," said Glenarvan.

"And I have mine," replied Robert.

"But what's the good of them?" said Tom Austin, "unless Monsieur Paganel can find out some way of making powder."

"We don't need it," replied McNabbs, exhibiting a powder flask in a perfect state of preservation.

"Where did you get it from, Major," asked Paganel.

"From Thalcave. He thought it might be useful to us, and gave it to me before he plunged into the water to save Thaouka."

"Generous, brave Indian!" exclaimed Glenarvan.

"Yes," replied Tom Austin, "if all the Patagonians are cut after the same pattern, I must compliment Patagonia."

"I protest against leaving out the horse," said Paganel. "He is part and parcel of the Patagonian, and I'm much mistaken if we don't see them again, the one on the other's back."

"What distance are we from the Atlantic?" asked the Major.

"About forty miles at the outside," replied Paganel; "and now, friends, since this is Liberty Hall, I beg to take leave of you. I am going to choose an observatory for myself up there, and by the help of my telescope, let you know how things are going on in the world."

Forthwith the geographer set off, hoisting himself up very cleverly from bough to bough, till he disappeared beyond the thick foliage. His companions began to arrange the night quarters, and prepare their beds. But this was neither a long nor difficult task, and very soon they resumed their seats round the fire to have a talk.

As usual their theme was Captain Grant. In three days, should the water subside, they would be on board the DUNCAN once more. But Harry Grant and his two sailors, those poor shipwrecked fellows, would not be with them. Indeed, it even seemed after this ill success and this useless journey across America, that all chance of finding them was gone forever. Where could they commence a fresh quest? What grief Lady Helena and Mary Grant would feel on hearing there was no further hope.

"Poor sister!" said Robert. "It is all up with us."

For the first time Glenarvan could not find any comfort to give him. What could he say to the lad?
Had they not searched exactly where the document stated?

"And yet," he said, "this thirty-seventh degree of latitude is not a mere figure, and that it applies to the shipwreck or captivity of Harry Grant, is no mere guess or supposition. We read it with our own eyes."

"All very true, your Honor," replied Tom Austin, "and yet our search has been unsuccessful."

"It is both a provoking and hopeless business," replied Glenarvan.

"Provoking enough, certainly," said the Major, "but not hopeless. It is precisely because we have an uncon-testable figure, provided for us, that we should follow it up to the end."

"What do you mean?" asked Glenarvan. "What more can we do?"

"A very logical and simple thing, my dear Edward. When we go on board the DUNCAN, turn her beak head to the east, and go right along the thirty-seventh parallel till we come back to our starting point if necessary."

"Do you suppose that I have not thought of that, Mr. McNabbs?" replied Glenarvan. "Yes, a hundred times. But what chance is there of success? To leave the American continent, wouldn't it be to go away from the very spot indicated by Harry Grant, from this very Patagonia so distinctly named in the document?"

"And would you recommence your search in the Pampas, when you have the certainty that the shipwreck of the BRITANNIA neither occurred on the coasts of the Pacific nor the Atlantic?"

Glenarvan was silent.

"And however small the chance of finding Harry Grant by following up the given parallel, ought we not to try?"

"I don't say no," replied Glenarvan.

"And are you not of my opinion, good friends," added the Major, addressing the sailors.

"Entirely," said Tom Austin, while Mulrady and Wilson gave an assenting nod.

"Listen to me, friends," said Glenarvan after a few minutes' reflection; "and remember, Robert, this is a grave discussion. I will do my utmost to find Captain Grant; I am pledged to it, and will devote my whole life to the task if needs be. All Scotland would unite with me to save so devoted a son as he has been to her. I too quite think with you that we must follow the thirty-seventh parallel round the globe if necessary, however slight our chance of finding him. But that is not the question we have to settle. There is one much more important than that is--should we from this time, and all together, give up our search on the American continent?"

No one made any reply. Each one seemed afraid to pronounce the word.

"Well?" resumed Glenarvan, addressing himself especially to the Major.

"My dear Edward," replied McNabbs, "it would be incurring too great a responsibility for me to reply _hic et nunc_. It is a question which requires reflection. I must know first, through which countries the thirty-seventh parallel of southern latitude passes?"

"That's Paganel's business; he will tell you that," said Glenarvan.

"Let's ask him, then," replied the Major.

But the learned geographer was nowhere to be seen. He was hidden among the thick leafage of the OMBU, and they must call out if they wanted him.

"Paganel, Paganel!" shouted Glenarvan.

"Here," replied a voice that seemed to come from the clouds.

"Where are you?"

"In my tower."

"What are you doing there?"

"Examining the wide horizon."

"Could you come down for a minute?"

"Do you want me?"

"Yes."

"What for?"

"To know what countries the thirty-seventh parallel passes through."

"That's easily said. I need not disturb myself to come down for that."

"Very well, tell us now."

"Listen, then. After leaving America the thirty-seventh parallel crosses the Atlantic Ocean."

"And then?"

"It encounters Isle Tristan d'Acunha."

"Yes."

"It goes on two degrees below the Cape of Good Hope."

"And afterwards?"

"Runs across the Indian Ocean, and just touches Isle St. Pierre, in the Amsterdam group."

"Go on."
"It cuts Australia by the province of Victoria."
"And then."
"After leaving Australia in--"
This last sentence was not completed. Was the geographer hesitating, or didn't he know what to say?
No; but a terrible cry resounded from the top of the tree. Glenarvan and his friends turned pale and looked at
each other. What fresh catastrophe had happened now? Had the unfortunate Paganel slipped his footing?
Already Wilson and Mulrady had rushed to his rescue when his long body appeared tumbling down from branch
to branch.
But was he living or dead, for his hands made no attempt to seize anything to stop himself. A few minutes more,
and he would have fallen into the roaring waters had not the Major's strong arm barred his passage.
"Much obliged, McNabbs," said Paganel.
"How's this? What is the matter with you? What came over you? Another of your absent fits."
"Yes, yes," replied Paganel, in a voice almost inarticulate with emotion. "Yes, but this was something
extraordinary."
"What was it?"
"I said we had made a mistake. We are making it still, and have been all along."
"Explain yourself."
"Glenarvan, Major, Robert, my friends," exclaimed Paganel, "all you that hear me, we are looking for Captain
Grant where he is not to be found."
"What do you say?" exclaimed Glenarvan.
"Not only where he is not now, but where he has never been."
CHAPTER XXIV PAGANEL'S DISCLOSURE
PROFOUND astonishment greeted these unexpected words of the learned geographer. What could he mean?
Had he lost his sense? He spoke with such conviction, however, that all eyes turned toward Glenarvan, for Paganel's
affirmation was a direct answer to his question, but Glenarvan shook his head, and said nothing, though evidently he
was not inclined to favor his friend's views.
"Yes," began Paganel again, as soon as he had recovered himself a little; "yes, we have gone a wrong track, and
read on the document what was never there."
"Explain yourself, Paganel," said the Major, "and more calmly if you can."
"The thing is very simple, Major. Like you, I was in error; like you, I had rushed at a false interpretation, until
about an instant ago, on the top of the tree, when I was answering your questions, just as I pronounced the word
'Australia,' a sudden flash came across my mind, and the document became clear as day."
"What!" exclaimed Glenarvan, "you mean to say that Harry Grant--"
"I mean to say," replied Paganel, "that the word AUSTRAL that occurs in the document is not a complete word,
as we have supposed up till now, but just the root of the word AUSTRALIE."
"Well, that would be strange," said the Major.
"Strange!" repeated Glenarvan, shrugging his shoulders; "it is simply impossible."
"Impossible!" returned Paganel. "That is a word we don't allow in France."
"What!" continued Glenarvan, in a tone of the most profound incredulity, "you dare to contend, with the
document in your hand, that the shipwreck of the BRITANNIA happened on the shores of Australia."
"I am sure of it," replied Paganel.
"My conscience," exclaimed Glenarvan, "I must say I am surprised at such a declaration from the Secretary of a
Geographical Society!"
"And why so?" said Paganel, touched in his weak point.
"Because, if you allow the word AUSTRALIE! you must also allow the word INDIENS, and Indians are never
seen there."
Paganel was not the least surprised at this rejoinder. Doubtless he expected it, for he began to smile, and said:
"My dear Glenarvan, don't triumph over me too fast. I am going to floor you completely, and never was an
Englishman more thoroughly defeated than you will be. It will be the revenge for Cressy and Agincourt."
"I wish nothing better. Take your revenge, Paganel."
"Listen, then. In the text of the document, there is neither mention of the Indians nor of Patagonia! The
incomplete word INDI does not mean INDIENS, but of course, INDIGENES, aborigines! Now, do you admit that
there are aborigines in Australia?"
"Bravo, Paganel!" said the Major.
"Well, do you agree to my interpretation, my dear Lord?" asked the geographer again.
"Yes," replied Glenarvan, "if you will prove to me that the fragment of a word GONIE, does not refer to the
country of the Patagonians."

"Certainly it does not. It has nothing to do with Patagonia," said Paganel. "Read it any way you please except that."

"How?"

"Cosmogonie, theogonie, agonie_."

"AGONIE," said the Major.

"I don't care which," returned Paganel. "The word is quite unimportant; I will not even try to find out its meaning. The main point is that AUSTRAL means AUSTRALIE, and we must have gone blindly on a wrong track not to have discovered the explanation at the very beginning, it was so evident. If I had found the document myself, and my judgment had not been misled by your interpretation, I should never have read it differently."

A burst of hurrahs, and congratulations, and compliments followed Paganel's words. Austin and the sailors, and the Major and Robert, most all overjoyed at this fresh hope, applauded him heartily; while even Glenarvan, whose eyes were gradually getting open, was almost prepared to give in.

"I only want to know one thing more, my dear Paganel," he said, "and then I must bow to your perspicacity."

"What is it?"

"How will you group the words together according to your new interpretation? How will the document read?"

"Easily enough answered. Here is the document," replied Paganel, taking out the precious paper he had been studying so conscientiously for the last few days.

For a few minutes there was complete silence, while the worthy SAVANT took time to collect his thoughts before complying with his lordship's request. Then putting his finger on the words, and emphasizing some of them, he began as follows:

"Le 7 juin 1862 le trois-mats Britannia de Glasgow a sombre apres _, put, if you please, ', deux jours, trois jours_, or ', une longue agonie_, it doesn't signify, it is quite a matter of indifference,--' sur les cotes de l'Australie. Se dirigeant a terre, deux matelots et le Capitaine Grant vont essayer d'aborder _, or ', ont aborde le continent ou ils seront_, or ', sont prisonniers de cruels indigenes. Ils ont jete ce documents_, etc. Is that clear?"

"Clear enough," replied Glenarvan, "if the word continent can be applied to Australia, which is only an island."

"Make yourself easy about that, my dear Glenarvan; the best geographers have agreed to call the island the Australian Continent."

"Then all I have now to say is, my friends," said Glenarvan, "away to Australia, and may Heaven help us!"

"To Australia!" echoed his companions, with one voice.

"I tell you what, Paganel," added Glenarvan, "your being on board the DUNCAN is a perfect providence."

"All right. Look on me as a messenger of providence, and let us drop the subject."

So the conversation ended—a conversation which great results were to follow; it completely changed the moral condition of the travelers; it gave the clew of the labyrinth in which they had thought themselves hopelessly entangled, and, amid their ruined projects, inspired them with fresh hope. They could now quit the American Continent without the least hesitation, and already their thoughts had flown to the Australias. In going on board the DUNCAN again they would not bring despair with them, and Lady Helena and Mary Grant would not have to mourn the irrevocable loss of Captain Grant. This thought so filled them with joy that they forgot all the dangers of their actual situation, and only regretted that they could not start immediately.

It was about four o'clock in the afternoon, and they determined to have supper at six. Paganel wished to get up a splendid spread in honor of the occasion, but as the materials were very scanty, he proposed to Robert to go and hunt in the neighboring forest. Robert clapped his hands at the idea, so they took Thalcave's powder flask, cleaned the revolvers and loaded them with small shot, and set off.

"Don't go too far," said the Major, gravely, to the two hunters.

After their departure, Glenarvan and McNabbs went down to examine the state of the water by looking at the notches they had made on the tree, and Wilson and Mulrady replenished the fire.

No sign of decrease appeared on the surface of the immense lake, yet the flood seemed to have reached its maximum height; but the violence with which it rushed from the south to north proved that the equilibrium of the Argentine rivers was not restored. Before getting lower the liquid mass must remain stationary, as in the case with the ocean before the ebb tide commences.

While Glenarvan and his cousin were making these observations, the report of firearms resounded frequently above their heads, and the jubilant outcries of the two sportsmen—for Paganel was every whit as much a child as Robert. They were having a fine time of it among the thick leaves, judging by the peals of laughter which rang out in the boy's clear treble voice and Paganel's deep bass. The chase was evidently successful, and wonders in culinary art might be expected. Wilson had a good idea to begin with, which he had skilfully carried out; for when Glenarvan
came back to the brasier, he found that the brave fellow had actually managed to catch, with only a pin and a piece of string, several dozen small fish, as delicate as smelts, called MOJARRAS, which were all jumping about in a fold of his poncho, ready to be converted into an exquisite dish.

At the same moment the hunters reappeared. Paganel was carefully carrying some black swallows’ eggs, and a string of sparrows, which he meant to serve up later under the name of field larks. Robert had been clever enough to bring down several brace of HILGUEROS, small green and yellow birds, which are excellent eating, and greatly in demand in the Montevideo market. Paganel, who knew fifty ways of dressing eggs, was obliged for this once to be content with simply hardening them on the hot embers. But notwithstanding this, the viands at the meal were both dainty and varied. The dried beef, hard eggs, grilled MOJARRAS, sparrows, and roast HILGUEROS, made one of those gala feasts the memory of which is imperishable.

The conversation was very animated. Many compliments were paid Paganel on his twofold talents as hunter and cook, which the SAVANT accepted with the modesty which characterizes true merit. Then he turned the conversation on the peculiarities of the OMBU, under whose canopy they had found shelter, and whose depths he declared were immense.

"Robert and I," he added, jestingly, "thought ourselves hunting in the open forest. I was afraid, for the minute, we should lose ourselves, for I could not find the road. The sun was sinking below the horizon; I sought vainly for footmarks; I began to feel the sharp pangs of hunger, and the gloomy depths of the forest resounded already with the roar of wild beasts. No, not that; there are no wild beasts here, I am sorry to say."

"What!" exclaimed Glenarvan, "you are sorry there are no wild beasts?"

"Certainly I am."

"And yet we should have every reason to dread their ferocity."

"Their ferocity is non-existent, scientifically speaking," replied the learned geographer.

"Now come, Paganel," said the Major, "you'll never make me admit the utility of wild beasts. What good are they?"

"Why, Major," exclaimed Paganel, "for purposes of classification into orders, and families, and species, and subspecies."

"A mighty advantage, certainly!" replied McNabbs, "I could dispense with all that. If I had been one of Noah’s companions at the time of the deluge, I should most assuredly have hindered the imprudent patriarch from putting in pairs of lions, and tigers, and panthers, and bears, and such animals, for they are as malevolent as they are useless."

"You would have done that?" asked Paganel.

"Yes, I would."

"Well, you would have done wrong in a zoological point of view," returned Paganel.

"But not in a humanitarian one," rejoined the Major.

"It is shocking!" replied Paganel. "Why, for my part, on the contrary, I should have taken special care to preserve megatheriums and pterodactyles, and all the antediluvian species of which we are unfortunately deprived by his neglect."

"And I say," returned McNabbs, "that Noah did a very good thing when he abandoned them to their fate--that is, if they lived in his day."

"And I say he did a very bad thing," retorted Paganel, "and he has justly merited the malediction of SAVANTS to the end of time!"

The rest of the party could not help laughing at hearing the two friends disputing over old Noah. Contrary to all his principles, the Major, who all his life had never disputed with anyone, was always sparring with Paganel. The geographer seemed to have a peculiarly exciting effect on him.

Glenarvan, as usual, always the peacemaker, interfered in the debate, and said:

"Whether the loss of ferocious animals is to be regretted or not, in a scientific point of view, there is no help for it now; we must be content to do without them. Paganel can hardly expect to meet with wild beasts in this aerial forest."

"Why not?" asked the geographer.

"Wild beasts on a tree!" exclaimed Tom Austin.

"Yes, undoubtedly. The American tiger, the jaguar, takes refuge in the trees, when the chase gets too hot for him. It is quite possible that one of these animals, surprised by the inundation, might have climbed up into this OMBU, and be hiding now among its thick foliage."

"You haven’t met any of them, at any rate, I suppose?" said the Major.

"No," replied Paganel, "though we hunted all through the wood. It is vexing, for it would have been a splendid chase. A jaguar is a bloodthirsty, ferocious creature. He can twist the neck of a horse with a single stroke of his paw. When he has once tasted human flesh he scents it greedily. He likes to eat an Indian best, and next to him a negro,
then a mulatto, and last of all a white man,"

"I am delighted to hear we come number four," said McNabbs.

"That only proves you are insipid," retorted Paganel, with an air of disdain.

"I am delighted to be insipid," was the Major's reply.

"Well, it is humiliating enough," said the intractable Paganel. "The white man proclaimed himself chief of the human race; but Mr. Jaguar is of a different opinion it seems."

"Be that as it may, my brave Paganel, seeing there are neither Indians, nor negroes, nor mulattoes among us, I am quite rejoiced at the absence of your beloved jaguars. Our situation is not so particularly agreeable."

"What! not agreeable!" exclaimed Paganel, jumping at the word as likely to give a new turn to the conversation.

"You are complaining of your lot, Glenarvan."

"I should think so, indeed," replied Glenarvan. "Do you find these uncomfortable hard branches very luxurious?"

"I have never been more comfortable, even in my study. We live like the birds, we sing and fly about. I begin to believe men were intended to live on trees."

"But they want wings," suggested the Major.

"They'll make them some day."

"And till then," put in Glenarvan, "with your leave, I prefer the gravel of a park, or the floor of a house, or the deck of a ship, to this aerial dwelling."

"We must take things as they come, Glenarvan," returned Paganel. "If good, so much the better; if bad, never mind. Ah, I see you are wishing you had all the comforts of Malcolm Castle."

"No, but--"

"I am quite certain Robert is perfectly happy," interrupted Paganel, eager to insure one partisan at least.

"Yes, that I am!" exclaimed Robert, in a joyous tone.

"At his age it is quite natural," replied Glenarvan.

"And at mine, too," returned the geographer. "The fewer one's comforts, the fewer one's needs; and the fewer one's needs, the greater one's happiness."

"Now, now," said the Major, "here is Paganel running a tilt against riches and gilt ceilings."

"No, McNabbs," replied the SAVANT, "I'm not; but if you like, I'll tell you a little Arabian story that comes into my mind, very APROPOS this minute."

"Oh, do, do," said Robert.

"And what is your story to prove, Paganel?" inquired the Major.

"Much what all stories prove, my brave comrade."

"Not much then," rejoined McNabbs. "But go on, Scheherazade, and tell us the story."

"There was once," said Paganel, "a son of the great Haroun-al-Raschid, who was unhappy, and went to consult an old Dervish. The old sage told him that happiness was a difficult thing to find in this world. 'However,' he added, 'I know an infallible means of procuring your happiness.' 'What is it?' asked the young Prince. 'It is to put the shirt of a happy man on your shoulders.' Whereupon the Prince embraced the old man, and set out at once to search for his talisman. He visited all the capital cities in the world. He tried on the shirts of kings, and emperors, and princes and nobles; but all in vain: he could not find a man among them that was happy. Then he put on the shirts of artists, and warriors, and merchants; but these were no better. By this time he had traveled a long way, without finding what he sought. At last he began to despair of success, and began sorrowfully to retrace his steps back to his father's palace, when one day he heard an honest peasant singing so merrily as he drove the plow, that he thought, 'Surely this man is happy, if there is such a thing as happiness on earth.' Forthwith he accosted him, and said, 'Are you happy?' 'Yes,' was the reply. 'There is nothing you desire?' 'Nothing.' 'You would not change your lot for that of a king?' 'Never!' 'Well, then, sell me your shirt.' 'My shirt! I haven't one!'''

CHAPTER XXV BETWEEN FIRE AND WATER

BEFORE turning into 'their nest,' as Paganel had called it, he, and Robert, and Glenarvan climbed up into the observatory to have one more inspection of the liquid plain. It was about nine o'clock; the sun had just sunk behind the glowing mists of the western horizon.

The eastern horizon was gradually assuming a most stormy aspect. A thick dark bar of cloud was rising higher and higher, and by degrees extinguishing the stars. Before long half the sky was overspread. Evidently motive power lay in the cloud itself, for there was not a breath of wind. Absolute calm reigned in the atmosphere; not a leaf stirred on the tree, not a ripple disturbed the surface of the water. There seemed to be scarcely any air even, as though some vast pneumatic machine had rarefied it. The entire atmosphere was charged to the utmost with electricity, the presence of which sent a thrill through the whole nervous system of all animated beings.

"We are going to have a storm," said Paganel.

"You're not afraid of thunder, are you, Robert?" asked Glenarvan.
"No, my Lord!" exclaimed Robert. "Well, my boy, so much the better, for a storm is not far off."
"And a violent one, too," added Paganel, "if I may judge by the look of things."
"It is not the storm I care about," said Glenarvan, "so much as the torrents of rain that will accompany it. We shall be soaked to the skin. Whatever you may say, Paganel, a nest won't do for a man, and you will learn that soon, to your cost."
"With the help of philosophy, it will," replied Paganel.
"Philosophy! that won't keep you from getting drenched."
"No, but it will warm you."
"Well," said Glenarvan, "we had better go down to our friends, and advise them to wrap themselves up in their philosophy and their ponchos as tightly as possible, and above all, to lay in a stock of patience, for we shall need it before very long."

Glenarvan gave a last glance at the angry sky. The clouds now covered it entirely; only a dim streak of light shone faintly in the west. A dark shadow lay on the water, and it could hardly be distinguished from the thick vapors above it. There was no sensation of light or sound. All was darkness and silence around.

"Let us go down," said Glenarvan; "the thunder will soon burst over us."

On returning to the bottom of the tree, they found themselves, to their great surprise, in a sort of dim twilight, produced by myriads of luminous specks which appeared buzzing confusedly over the surface of the water.

"It is phosphorescence, I suppose," said Glenarvan.

"No, but phosphorescent insects, positive glow-worms, living diamonds, which the ladies of Buenos Ayres convert into magnificent ornaments."

"What!" exclaimed Robert, "those sparks flying about are insects!"

"Yes, my boy."

Robert caught one in his hand, and found Paganel was right. It was a kind of large drone, an inch long, and the Indians call it "tucu-tucu." This curious specimen of the COLEOPTERA sheds its radiance from two spots in the front of its breast-plate, and the light is sufficient to read by. Holding his watch close to the insect, Paganel saw distinctly that the time was 10 P. M.

On rejoining the Major and his three sailors, Glenarvan warned them of the approaching storm, and advised them to secure themselves in their beds of branches as firmly as possible, for there was no doubt that after the first clap of thunder the wind would become unchained, and the OMBU would be violently shaken. Though they could not defend themselves from the waters above, they might at least keep out of the rushing current beneath.

They wished one another "good-night," though hardly daring to hope for it, and then each one rolled himself in his poncho and lay down to sleep.

But the approach of the great phenomena of nature excites vague uneasiness in the heart of every sentient being, even in the most strong-minded. The whole party in the OMBU felt agitated and oppressed, and not one of them could close his eyes. The first peal of thunder found them wide awake. It occurred about 11 P. M., and sounded like a distant rolling. Glenarvan ventured to creep out of the sheltering foliage, and made his way to the extremity of the horizontal branch to take a look round.

The deep blackness of the night was already scarified with sharp bright lines, which were reflected back by the water with unerring exactness. The clouds had rent in many parts, but noislessly, like some soft cotton material. After attentively observing both the zenith and horizon, Glenarvan went back to the center of the trunk.

"Well, Glenarvan, what's your report?" asked Paganel.

"I say it is beginning in good earnest, and if it goes on so we shall have a terrible storm."

"So much the better," replied the enthusiastic Paganel; "I should like a grand exhibition, since we can't run away."

"That's another of your theories," said the Major.

"And one of my best, McNabbs. I am of Glenarvan's opinion, that the storm will be superb. Just a minute ago, when I was trying to sleep, several facts occurred to my memory, that make me hope it will, for we are in the region of great electrical tempests. For instance, I have read somewhere, that in 1793, in this very province of Buenos Ayres, lightning struck thirty-seven times during one single storm. My colleague, M. Martin de Mouussy, counted fifty-five minutes of uninterrupted rolling."

"Watch in hand?" asked the Major.

"Watch in hand. Only one thing makes me uneasy," added Paganel, "if it is any use to be uneasy, and that is, that the culminating point of this plain, is just this very OMBU where we are. A lightning conductor would be very serviceable to us at present. For it is this tree especially, among all that grow in the Pampas, that the thunder has a particular affection for. Besides, I need not tell you, friend, that learned men tell us never to take refuge under trees during a storm."
"Most seasonable advice, certainly, in our circumstances," said the Major.
"I must confess, Paganel," replied Glenarvan, "that you might have chosen a better time for this reassuring information."
"Bah!" replied Paganel, "all times are good for getting information. Ha! now it's beginning."
Louder peals of thunder interrupted this inopportune conversation, the violence increasing with the noise till the whole atmosphere seemed to vibrate with rapid oscillations.
The incessant flashes of lightning took various forms. Some darted down perpendicularly from the sky five or six times in the same place in succession. Others would have excited the interest of a SAVANT to the highest degree, for though Arago, in his curious statistics, only cites two examples of forked lightning, it was visible here hundreds of times. Some of the flashes branched out in a thousand different directions, making coralliform zigzags, and threw out wonderful jets of arborescent light.

Soon the whole sky from east to north seemed supported by a phosphoric band of intense brilliancy. This kept increasing by degrees till it overspread the entire horizon, kindling the clouds which were faithfully mirrored in the waters as if they were masses of combustible material, beneath, and presented the appearance of an immense globe of fire, the center of which was the OMBU.

Glenarvan and his companions gazed silently at this terrifying spectacle. They could not make their voices heard, but the sheets of white light which enwrapped them every now and then, revealed the face of one and another, sometimes the calm features of the Major, sometimes the eager, curious glance of Paganel, or the energetic face of Glenarvan, and at others, the scared eyes of the terrified Robert, and the careless looks of the sailors, investing them with a weird, spectral aspect.

However, as yet, no rain had fallen, and the wind had not risen in the least. But this state of things was of short duration; before long the cataracts of the sky burst forth, and came down in vertical streams. As the large drops fell splashing into the lake, fiery sparks seemed to fly out from the illuminated surface.

Was the rain the FINALE of the storm? If so, Glenarvan and his companions would escape scot free, except for a few vigorous douche baths. No. At the very height of this struggle of the electric forces of the atmosphere, a large ball of fire appeared suddenly at the extremity of the horizontal parent branch, as thick as a man's wrist, and surrounded with black smoke. This ball, after turning round and round for a few seconds, burst like a bombshell, and with so much noise that the explosion was distinctly audible above the general FRACAS. A sulphurous smoke filled the air, and complete silence reigned till the voice of Tom Austin was heard shouting:

"The tree is on fire."

Tom was right. In a moment, as if some fireworks were being ignited, the flame ran along the west side of the OMBU; the dead wood and nests of dried grass, and the whole sap, which was of a spongy texture, supplied food for its devouring activity.

The wind had risen now and fanned the flame. It was time to flee, and Glenarvan and his party hurried away to the eastern side of their refuge, which was meantime untouched by the fire. They were all silent, troubled, and terrified, as they watched branch after branch shrivel, and crack, and writhe in the flame like living serpents, and then drop into the swollen torrent, still red and gleaming, as it was borne swiftly along on the rapid current. The flames sometimes rose to a prodigious height, and seemed almost lost in the atmosphere, and sometimes, beaten down by the hurricane, closely enveloped the OMBU like a robe of Nessus. Terror seized the entire group. They were almost suffocated with smoke, and scorched with the unbearable heat, for the conflagration had already reached the lower branches on their side of the OMBU. To extinguish it or check its progress was impossible; and they saw themselves irrevocably condemned to a torturing death, like the victims of Hindoo divinities.

At last, their situation was absolutely intolerable. Of the two deaths staring them in the face, they had better choose the less cruel.

"To the water!" exclaimed Glenarvan.

Wilson, who was nearest the flames, had already plunged into the lake, but next minute he screamed out in the most violent terror:

"Help! Help!"

Austin rushed toward him, and with the assistance of the Major, dragged him up again on the tree.

"What's the matter?" they asked.

"Alligators! alligators!" replied Wilson.

The whole foot of the tree appeared to be surrounded by these formidable animals of the Saurian order. By the glare of the flames, they were immediately recognized by Paganel, as the ferocious species peculiar to America, called CAIMANS in the Spanish territories. About ten of them were there, lashing the water with their powerful tails, and attacking the OMBU with the long teeth of their lower jaw.

At this sight the unfortunate men gave themselves up to be lost. A frightful death was in store for them, since
they must either be devoured by the fire or by the caimans. Even the Major said, in a calm voice:

"This is the beginning of the end, now."

There are circumstances in which men are powerless, when the unchained elements can only be combated by other elements. Glenarvan gazed with haggard looks at the fire and water leagued against him, hardly knowing what deliverance to implore from Heaven.

The violence of the storm had abated, but it had developed in the atmosphere a considerable quantity of vapors, to which electricity was about to communicate immense force. An enormous water-spout was gradually forming in the south-- a cone of thick mists, but with the point at the bottom, and base at the top, linking together the turbulent water and the angry clouds. This meteor soon began to move forward, turning over and over on itself with dizzy rapidity, and sweeping up into its center a column of water from the lake, while its gyratory motions made all the surrounding currents of air rush toward it.

A few seconds more, and the gigantic water-spout threw itself on the OMBU, and caught it up in its whirl. The tree shook to its roots. Glenarvan could fancy the caimans' teeth were tearing it up from the soil; for as he and his companions held on, each clinging firmly to the other, they felt the towering OMBU give way, and the next minute it fell right over with a terrible hissing noise, as the flaming branches touched the foaming water.

It was the work of an instant. Already the water-spout had passed, to carry on its destructive work elsewhere. It seemed to empty the lake in its passage, by continually drawing up the water into itself.

The OMBU now began to drift rapidly along, impelled by wind and current. All the caimans had taken their departure, except one that was crawling over the upturned roots, and coming toward the poor refugees with wide open jaws. But Mulrady, seizing hold of a branch that was half-burned off, struck the monster such a tremendous blow, that it fell back into the torrent and disappeared, lashing the water with its formidable tail.

Glenarvan and his companions being thus delivered from the voracious SAURIANS, stationed themselves on the branches windward of the conflagration, while the OMBU sailed along like a blazing fire-ship through the dark night, the flames spreading themselves round like sails before the breath of the hurricane.

CHAPTER XXVI THE RETURN ON BOARD

FOR two hours the OMBU navigated the immense lake without reaching _terra firma_. The flames which were devouring it had gradually died out. The chief danger of their frightful passage was thus removed, and the Major went the length of saying, that he should not be surprised if they were saved after all.

The direction of the current remained unchanged, always running from southwest to northeast. Profound darkness had again set in, only illumined here and there by a parting flash of lightning. The storm was nearly over. The rain had given place to light mists, which a breath of wind dispersed, and the heavy masses of cloud had separated, and now streaked the sky in long bands.

The OMBU was borne onward so rapidly by the impetuous torrent, that anyone might have supposed some powerful locomotive engine was hidden in its trunk. It seemed likely enough they might continue drifting in this way for days. About three o'clock in the morning, however, the Major noticed that the roots were beginning to graze the ground occasionally, and by sounding the depth of the water with a long branch, Tom Austin found that they were getting on rising ground. Twenty minutes afterward, the OMBU stopped short with a violent jolt.

"Land! land!" shouted Paganel, in a ringing tone.

The extremity of the calcined bough had struck some hillock, and never were sailors more glad; the rock to them was the port.

Already Robert and Wilson had leaped on to the solid plateau with a loud, joyful hurrah! when a well-known whistle was heard. The gallop of a horse resounded over the plain, and the tall form of Thalcave emerged from the dark night, the flames spreading themselves round like sails before the breath of the hurricane.

"Thalcave! Thalcave!" they all cried with one voice.

"Amigos!" replied the Patagonian, who had been waiting for the travelers here in the same place where the current had landed himself.

As he spoke he lifted up Robert in his arms, and hugged him to his breast, never imagining that Paganel was hanging on to him. A general and hearty hand-shaking followed, and everyone rejoiced at seeing their faithful guide again. Then the Patagonian led the way into the HANGAR of a deserted ESTANCIA, where there was a good, blazing fire to warm them, and a substantial meal of fine, juicy slices of venison soon broiling, of which they did not leave a crumb. When their minds had calmed down a little, and they were able to reflect on the dangers they had come through from flood, and fire, and alligators, they could scarcely believe they had escaped.

Thalcave, in a few words, gave Paganel an account of himself since they parted, entirely ascribing his deliverance to his intrepid horse. Then Paganel tried to make him understand their new interpretation of the document, and the consequent hopes they were indulging. Whether the Indian actually understood his ingenious hypothesis was a question; but he saw that they were glad and confident, and that was enough for him.
As can easily be imagined, after their compulsory rest on the OMBU, the travelers were up betimes and ready to start. At eight o'clock they set off. No means of transport being procurable so far south, they were compelled to walk. However, it was not more than forty miles now that they had to go, and Thaouka would not refuse to give a lift occasionally to a tired pedestrian, or even to a couple at a pinch. In thirty-six hours they might reach the shores of the Atlantic.

The low-lying tract of marshy ground, still under water, soon lay behind them, as Thalcave led them upward to the higher plains. Here the Argentine territory resumed its monotonous aspect. A few clumps of trees, planted by European hands, might chance to be visible among the pasturage, but quite as rarely as in Tandil and Tapalquem Sierras. The native trees are only found on the edge of long prairies and about Cape Corrientes.

Next day, though still fifteen miles distant, the proximity of the ocean was sensibly felt. The VIRAZON, a peculiar wind, which blows regularly half of the day and night, bent down the heads of the tall grasses. Thinly planted woods rose to view, and small tree-like mimosa-s, bushes of acacia, and tufts of CURRA-MANTEL. Here and there, shining like pieces of broken glass, were salinous lagoons, which increased the difficulty of the journey as the travelers had to wind round them to get past. They pushed on as quickly as possible, hoping to reach Lake Salado, on the shores of the ocean, the same day; and at 8 P. M., when they found themselves in front of the sand hills two hundred feet high, which skirt the coast, they were all tolerably tired. But when the long murmur of the distant ocean fell on their ears, the exhausted men forgot their fatigue, and ran up the sandhills with surprising agility. But it was getting quite dark already, and their eager gaze could discover no traces of the DUNCAN on the gloomy expanse of water that met their sight.

"But she is there, for all that," exclaimed Glenarvan, "waiting for us, and running alongside."

"We shall see her to-morrow," replied McNabbs.

Tom Austin hailed the invisible yacht, but there was no response. The wind was very high and the sea rough. The clouds were scudding along from the west, and the spray of the waves dashed up even to the sand-hills. It was little wonder, then, if the man on the look-out could neither hear nor make himself heard, supposing the DUNCAN were there. There was no shelter on the coast for her, neither bay nor cove, nor port; not so much as a creek. The shore was composed of sand-banks which ran out into the sea, and were more dangerous to approach than rocky shoals. The sand-banks irritate the waves, and make the sea so particularly rough, that in heavy weather vessels that run aground there are invariably dashed to pieces.

Though, then, the DUNCAN would keep far away from such a coast, John Mangles is a prudent captain to get near. Tom Austin, however, was of the opinion that she would be able to keep five miles out.

The Major advised his impatient relative to restrain himself to circumstances. Since there was no means of dissipating the darkness, what was the use of straining his eyes by vainly endeavoring to pierce through it.

He set to work immediately to prepare the night's encampment beneath the shelter of the sand-hills; the last provisions supplied the last meal, and afterward, each, following the Major's example, scooped out a hole in the sand, which made a comfortable enough bed, and then covered himself with the soft material up to his chin, and fell into a heavy sleep.

But Glenarvan kept watch. There was still a stiff breeze of wind, and the ocean had not recovered its equilibrium after the recent storm. The waves, at all times tumultuous, now broke over the sand-banks with a noise like thunder. Glenarvan could not rest, knowing the DUNCAN was so near him. As to supposing she had not arrived at the appointed rendezvous, that was out of the question. Glenarvan had left the Bay of Talcahuano on the 14th of October, and arrived on the shores of the Atlantic on the 12th of November. He had taken thirty days to cross Chili, the Cordilleras, the Pampas, and the Argentine plains, giving the DUNCAN ample time to double Cape Horn, and arrive on the opposite side. For such a fast runner there were no impediments. Certainly the storm had been very violent, and its fury must have been terrible on such a vast battlefield as the Atlantic, but the yacht was a good ship, and the captain was a good sailor. He was bound to be there, and he would be there.

These reflections, however, did not calm Glenarvan. When the heart and the reason are struggling, it is generally the heart that wins the mastery. The laird of Malcolm Castle felt the presence of loved ones about him in the darkness as he wandered up and down the lonely strand. He gazed, and listened, and even fancied he caught occasional glimpses of a faint light.

"I am not mistaken," he said to himself; "I saw a ship's light, one of the lights on the DUNCAN! Oh! why can't I see in the dark?"

All at once the thought rushed across him that Paganel said he was a nyctalope, and could see at night. He must go and wake him.

The learned geographer was sleeping as sound as a mole. A strong arm pulled him up out of the sand and made him call out:

"Who goes there?"
"It is I, Paganel."
"Who?"
"Glenarvan. Come, I need your eyes."
"My eyes," replied Paganel, rubbing them vigorously.
"Yes, I need your eyes to make out the DUNCAN in this darkness, so come."
"Confound the nyctalopia!" said Paganel, inwardly, though delighted to be of any service to his friend.

He got up and shook his stiffened limbs, and stretching and yawning as most people do when roused from sleep, followed Glenarvan to the beach.

Glenarvan begged him to examine the distant horizon across the sea, which he did most conscientiously for some minutes.
"Well, do you see nothing?" asked Glenarvan.
"Not a thing. Even a cat couldn't see two steps before her."

V. IV Verne
"Look for a red light or a green one--her larboard or starboard light."
"I see neither a red nor a green light, all is pitch dark," replied Paganel, his eyes involuntarily beginning to close.

For half an hour he followed his impatient friend, mechanically letting his head frequently drop on his chest, and raising it again with a start. At last he neither answered nor spoke, and he reeled about like a drunken man. Glenarvan looked at him, and found he was sound asleep!

Without attempting to wake him, he took his arm, led him back to his hole, and buried him again comfortably.

At dawn next morning, all the slumberers started to their feet and rushed to the shore, shouting "Hurrah, hurrah!" as Lord Glenarvan's loud cry, "The DUNCAN, the DUNCAN!" broke upon his ear.

There she was, five miles out, her courses carefully reefed, and her steam half up. Her smoke was lost in the morning mist. The sea was so violent that a vessel of her tonnage could not have ventured safely nearer the sand-banks.

Glenarvan, by the aid of Paganel's telescope, closely observed the movements of the yacht. It was evident that John Mangles had not perceived his passengers, for he continued his course as before.

But at this very moment Thalcave fired his carbine in the direction of the yacht. They listened and looked, but no signal of recognition was returned. A second and a third time the Indian fired, awakening the echoes among the sand-hills.

At last a white smoke was seen issuing from the side of the yacht.
"They see us!" exclaimed Glenarvan. "That's the cannon of the DUNCAN."

A few seconds, and the heavy boom of the cannon came across the water and died away on the shore. The sails were instantly altered, and the steam got up, so as to get as near the coast as possible.

Presently, through the glass, they saw a boat lowered.
"Lady Helena will not be able to come," said Tom Austin. "It is too rough."

"Nor John Mangles," added McNabbs; "he cannot leave the ship."

"My sister, my sister!" cried Robert, stretching out his arms toward the yacht, which was now rolling violently.
"Oh, how I wish I could get on board!" said Glenarvan.
"Patience, Edward! you will be there in a couple of hours," replied the Major.

Two hours! But it was impossible for a boat--a six-oared one--to come and go in a shorter space of time.

Glenarvan went back to Thalcave, who stood beside Thaouka, with his arms crossed, looking quietly at the troubled waves.

Glenarvan took his hand, and pointing to the yacht, said: "Come!"
The Indian gently shook his head.
"Come, friend," repeated Glenarvan.

"No," said Thalcave, gently. "Here is Thaouka, and there-- the Pampas," he added, embracing with a passionate gesture the wide-stretching prairies.

Glenarvan understood his refusal. He knew that the Indian would never forsake the prairie, where the bones of his fathers were whitening, and he knew the religious attachment of these sons of the desert for their native land. He did not urge Thalcave longer, therefore, but simply pressed his hand. Nor could he find it in his heart to insist, when the Indian, smiling as usual, would not accept the price of his services, pushing back the money, and saying:
"For the sake of friendship."

Glenarvan could not reply; but he wished at least, to leave the brave fellow some souvenir of his European friends. What was there to give, however? Arms, horses, everything had been destroyed in the unfortunate inundation, and his friends were no richer than himself.

He was quite at a loss how to show his recognition of the disinterestedness of this noble guide, when a happy
thought struck him. He had an exquisite portrait of Lady Helena in his pocket, a CHEF-D'OEUVRE of Lawrence. This he drew out, and offered to Thalcave, simply saying:

"My wife."
The Indian gazed at it with a softened eye, and said:

"Good and beautiful."

Then Robert, and Paganel, and the Major, and the rest, exchanged touching farewells with the faithful Patagonian. Thalcave embraced them each, and pressed them to his broad chest. Paganel made him accept a map of South America and the two oceans, which he had often seen the Indian looking at with interest. It was the most precious thing the geographer possessed. As for Robert, he had only caresses to bestow, and these he lavished on his friend, not forgetting to give a share to Thaouka.

The boat from the DUNCAN was now fast approaching, and in another minute had glided into a narrow channel between the sand-banks, and run ashore.

"My wife?" were Glenarvan's first words.

"My sister?" said Robert.

"Lady Helena and Miss Grant are waiting for you on board," replied the coxswain; "but lose no time your honor, we have not a minute, for the tide is beginning to ebb already."

The last kindly adieux were spoken, and Thalcave accompanied his friends to the boat, which had been pushed back into the water. Just as Robert was going to step in, the Indian took him in his arms, and gazed tenderly into his face. Then he said:

"Now go. You are a man."

"Good-by, good-by, friend!" said Glenarvan, once more.

"Shall we never see each other again?" Paganel called out.

"_Quien sabe? _" (Who knows?) replied Thalcave, lifting his arms toward heaven.

These were the Indian's last words, dying away on the breeze, as the boat receded gradually from the shore. For a long time, his dark, motionless SILHOUETTE stood out against the sky, through the white, dashing spray of the waves. Then by degrees his tall form began to diminish in size, till at last his friends of a day lost sight of him altogether.

An hour afterward Robert was the first to leap on board the DUNCAN. He flung his arms round Mary's neck, amid the loud, joyous hurrahs of the crew on the yacht.

Thus the journey across South America was accomplished, the given line of march being scrupulously adhered to throughout.

Neither mountains nor rivers had made the travelers change their course; and though they had not had to encounter any ill-will from men, their generous intrepidity had been often enough roughly put to the proof by the fury of the unchained elements.

END OF BOOK ONE
principal incidents of the expedition, and especially of the new interpretation of the document, due to the sagacity of Jacques Paganel. His Lordship also spoke in the most eulogistic terms of Robert, of whom Mary might well be proud. His courage and devotion, and the dangers he had run, were all shown up in strong relief by his patron, till the modest boy did not know which way to look, and was obliged to hide his burning cheeks in his sister's arms.

"No need to blush, Robert," said John Mangles. "Your conduct has been worthy of your name." And he leaned over the boy and pressed his lips on his cheek, still wet with Mary's tears.

The Major and Paganel, it need hardly be said, came in for their due share of welcome, and Lady Helena only regretted she could not shake hands with the brave and generous Thalcave. McNabbs soon slipped away to his cabin, and began to shave himself as coolly and composedly as possible; while Paganel flew here and there, like a bee sipping the sweets of compliments and smiles. He wanted to embrace everyone on board the yacht, and beginning with Lady Helena and Mary Grant, wound up with M. Olbinett, the steward, who could only acknowledge so polite an attention by announcing that breakfast was ready.

"Breakfast!" exclaimed Paganel.

"Yes, Monsieur Paganel."

"A real breakfast, on a real table, with a cloth and napkins?"

"Certainly, Monsieur Paganel."

"And we shall neither have CHARQUI, nor hard eggs, nor fillets of ostrich?"

"Oh, Monsieur," said Olbinett in an aggrieved tone.

"I don't want to hurt your feelings, my friend," said the geographer smiling. "But for a month that has been our usual bill of fare, and when we dined we stretched ourselves full length on the ground, unless we sat astride on the trees. Consequently, the meal you have just announced seemed to me like a dream, or fiction, or chimera."

"Well, Monsieur Paganel, come along and let us prove its reality," said Lady Helena, who could not help laughing.

"Take my arm," replied the gallant geographer.

"Has his Lordship any orders to give me about the DUNCAN?" asked John Mangles.

"After breakfast, John," replied Glenarvan, "we'll discuss the program of our new expedition _en famille_."

M. Olbinett's breakfast seemed quite a FETE to the hungry guests. It was pronounced excellent, and even superior to the festivities of the Pampas. Paganel was helped twice to each dish, through "absence of mind," he said. This unlucky word reminded Lady Helena of the amiable Frenchman's propensity, and made her ask if he had ever fallen into his old habits while they were away. The Major and Glenarvan exchanged smiling glances, and Paganel burst out laughing, and protested on his honor that he would never be caught tripping again once more during the whole voyage. After this prelude, he gave an amusing recital of his disastrous mistake in learning Spanish, and his profound study of Camoens. "After all," he added, "it's an ill wind that blows nobody good, and I don't regret the mistake."

"Why not, my worthy friend?" asked the Major.

"Because I not only know Spanish, but Portuguese. I can speak two languages instead of one."

"Upon my word, I never thought of that," said McNabbs. "My compliments, Paganel—my sincere compliments."

But Paganel was too busily engaged with his knife and fork to lose a single mouthful, though he did his best to eat and talk at the same time. He was so much taken up with his plate, however, that one little fact quite escaped his observation, though Glenarvan noticed it at once. This was, that John Mangles had grown particularly attentive to Mary Grant. A significant glance from Lady Helena told him, moreover, how affairs stood, and inspired him with affectionate sympathy for the young lovers; but nothing of this was apparent in his manner to John, for his next question was what sort of a voyage he had made.

"We could not have had a better; but I must apprise your Lordship that I did not go through the Straits of Magellan again."

"What! you doubled Cape Horn, and I was not there!" exclaimed Paganel.

"Hang yourself!" said the Major.

"Selfish fellow! you advise me to do that because you want my rope," retorted the geographer.

"Well, you see, my dear Paganel, unless you have the gift of ubiquity you can't be in two places at once. While you were scouring the pampas you could not be doubling Cape Horn."

"That doesn't prevent my regretting it," replied Paganel.

Here the subject dropped, and John continued his account of his voyage. On arriving at Cape Pilares he had found the winds dead against him, and therefore made for the south, coasting along the Desolation Isle, and after going as far as the sixty-seventh degree southern latitude, had doubled Cape Horn, passed by Terra del Fuego and the Straits of Lemaire, keeping close to the Patagonian shore. At Cape Corrientes they encountered the terrible storm which had handled the travelers across the pampas so roughly, but the yacht had borne it bravely, and for the last
three days had stood right out to sea, till the welcome signal-gun of the expedition was heard announcing the arrival of the anxiously-looked-for party. "It was only justice," the captain added, "that he should mention the intrepid bearing of Lady Helena and Mary Grant throughout the whole hurricane. They had not shown the least fear, unless for their friends, who might possibly be exposed to the fury of the tempest."

After John Mangles had finished his narrative, Glenarvan turned to Mary and said; "My dear Miss Mary, the captain has been doing homage to your noble qualities, and I am glad to think you are not unhappy on board his ship."

"How could I be?" replied Mary naively, looking at Lady Helena, and at the young captain too, likely enough. "Oh, my sister is very fond of you, Mr. John, and so am I," exclaimed Robert.

"And so am I of you, my dear boy," returned the captain, a little abashed by Robert's innocent avowal, which had kindled a faint blush on Mary's cheek. Then he managed to turn the conversation to safer topics by saying: "And now that your Lordship has heard all about the doings of the DUNCAN, perhaps you will give us some details of your own journey, and tell us more about the exploits of our young hero."

Nothing could be more agreeable than such a recital to Lady Helena and Mary Grant; and accordingly Lord Glenarvan hastened to satisfy their curiosity--going over incident by incident, the entire march from one ocean to another, the pass of the Andes, the earthquake, the disappearance of Robert, his capture by the condor, Thalcave's providential shot, the episode of the red wolves, the devotion of the young lad, Sergeant Manuel, the inundations, the caimans, the waterspout, the night on the Atlantic shore-- all these details, amusing or terrible, excited by turns laughter and horror in the listeners. Often and often Robert came in for caresses from his sister and Lady Helena. Never was a boy so much embraced, or by such enthusiastic friends.

"And now, friends," added Lord Glenarvan, when he had finished his narrative, "we must think of the present. The past is gone, but the future is ours. Let us come back to Captain Harry Grant."

As soon as breakfast was over they all went into Lord Glenarvan's private cabin and seated themselves round a table covered with charts and plans, to talk over the matter fully.

"My dear Helena," said Lord Glenarvan, "I told you, when we came on board a little while ago, that though we had not brought back Captain Grant, our hope of finding him was stronger than ever. The result of our journey across America is this: We have reached the conviction, or rather absolute certainty, that the shipwreck never occurred on the shores of the Atlantic nor Pacific. The natural inference is that, as far as regards Patagonia, our interpretation of the document was erroneous. Most fortunately, our friend Paganel, in a happy moment of inspiration, discovered the mistake. He has proved clearly that we have been on the wrong track, and so explained the document that all doubt whatever is removed from our minds. However, as the document is in French, I will ask Paganel to go over it for your benefit."

The learned geographer, thus called upon, executed his task in the most convincing manner, descanting on the syllables GONIE and INDI, and extracting AUSTRALIA out of AUSTRAL. He pointed out that Captain Grant, on leaving the coast of Peru to return to Europe, might have been carried away with his disabled ship by the southern currents of the Pacific right to the shores of Australia, and his hypotheses were so ingenious and his deductions so subtle that even the matter-of-fact John Mangles, a difficult judge, and most unlikely to be led away by any flights of imagination, was completely satisfied.

At the conclusion of Paganel's dissertation, Glenarvan announced that the DUNCAN would sail immediately for Australia.

But before the decisive orders were given, McNabbs asked for a few minutes' hearing.

"Say away, McNabbs," replied Glenarvan.

"I have no intention of weakening the arguments of my friend Paganel, and still less of refuting them. I consider them wise and weighty, and deserving our attention, and think them justly entitled to form the basis of our future researches. But still I should like them to be submitted to a final examination, in order to make their worth incontestable and uncontested."

"Go on, Major," said Paganel; "I am ready to answer all your questions."

"They are simple enough, as you will see. Five months ago, when we left the Clyde, we had studied these same documents, and their interpretation then appeared quite plain. No other coast but the western coast of Patagonia could possibly, we thought, have been the scene of the shipwreck. We had not even the shadow of a doubt on the subject."

"That's true," replied Glenarvan.

"A little later," continued the Major, "when a providential fit of absence of mind came over Paganel, and brought him on board the yacht, the documents were submitted to him and he approved our plan of search most unreservedly."

"I do not deny it," said Paganel.
"And yet we were mistaken," resumed the Major.

"Yes, we were mistaken," returned Paganel; "but it is only human to make a mistake, while to persist in it, a man must be a fool."

"Stop, Paganel, don't excite yourself; I don't mean to say that we should prolong our search in America."

"What is it, then, that you want?" asked Glenarvan.

"A confession, nothing more. A confession that Australia now as evidently appears to be the theater of the shipwreck of the BRITANNIA as America did before."

"We confess it willingly," replied Paganel.

"Very well, then, since that is the case, my advice is not to let your imagination rely on successive and contradictory evidence. Who knows whether after Australia some other country may not appear with equal certainty to be the place, and we may have to recommence our search?"

Glenarvan and Paganel looked at each other silently, struck by the justice of these remarks.

"I should like you, therefore," continued the Major, "before we actually start for Australia, to make one more examination of the documents. Here they are, and here are the charts. Let us take up each point in succession through which the 37th parallel passes, and see if we come across any other country which would agree with the precise indications of the document."

"Nothing can be more easily and quickly done," replied Paganel; "for countries are not very numerous in this latitude, happily."

"Well, look," said the Major, displaying an English planisphere on the plan of Mercator's Chart, and presenting the appearance of a terrestrial globe.

He placed it before Lady Helena, and then they all stood round, so as to be able to follow the argument of Paganel.

"As I have said already," resumed the learned geographer, "after having crossed South America, the 37th degree of latitude cuts the islands of Tristan d'Acunha. Now I maintain that none of the words of the document could relate to these islands."

The documents were examined with the most minute care, and the conclusion unanimously reached was that these islands were entirely out of the question.

"Let us go on then," resumed Paganel. "After leaving the Atlantic, we pass two degrees below the Cape of Good Hope, and into the Indian Ocean. Only one group of islands is found on this route, the Amsterdam Isles. Now, then, we must examine these as we did the Tristan d'Acunha group."

After a close survey, the Amsterdam Isles were rejected in their turn. Not a single word, or part of a word, French, English or German, could apply to this group in the Indian Ocean.

"Now we come to Australia," continued Paganel.

"The 37th parallel touches this continent at Cape Bernouilli, and leaves it at Twofold Bay. You will agree with me that, without straining the text, the English word STRA and the French one AUSTRAL may relate to Australia. The thing is too plain to need proof."

The conclusion of Paganel met with unanimous approval; every probability was in his favor.

"And where is the next point?" asked McNabbs.

"That is easily answered. After leaving Twofold Bay, we cross an arm of the sea which extends to New Zealand. Here I must call your attention to the fact that the French word CONTIN means a continent, irrefragably. Captain Grant could not, then, have found refuge in New Zealand, which is only an island. However that may be though, examine and compare, and go over and over each word, and see if, by any possibility, they can be made to fit this new country."

"In no way whatever," replied John Mangles, after a minute investigation of the documents and the planisphere.

"No," chimed in all the rest, and even the Major himself, "it cannot apply to New Zealand."

"Now," went on Paganel, "in all this immense space between this large island and the American coast, there is only one solitary barren little island crossed by the 37th parallel."

"And what is its name," asked the Major.

"Here it is, marked in the map. It is Maria Theresa--a name of which there is not a single trace in either of the three documents."

"Not the slightest," said Glenarvan.

"I leave you, then, my friends, to decide whether all these probabilities, not to say certainties, are not in favor of the Australian continent."

"Evidently," replied the captain and all the others.

"Well, then, John," said Glenarvan, "the next question is, have you provisions and coal enough?"

"Yes, your honor, I took in an ample store at Talcahuano, and, besides, we can easily replenish our stock of coal
at Cape Town."
"Well, then, give orders."
"Let me make one more observation," interrupted McNabbs.
"Go on then."
"Whatever likelihood of success Australia may offer us, wouldn't it be advisable to stop a day or two at the
Tristan d'Acunha Isles and the Amsterdam? They lie in our route, and would not take us the least out of the way.
Then we should be able to ascertain if the BRITANNIA had left any traces of her shipwreck there?"
"Incredulous Major!" exclaimed Paganel, "he still sticks to his idea."
"I stick to this any way, that I don't want to have to retrace our steps, supposing that Australia should disappoint
our sanguine hopes."
"It seems to me a good precaution," replied Glenarvan.
"And I'm not the one to dissuade you from it," returned Paganel; "quite the contrary."
"Steer straight for Tristan d'Acunha."
"Immediately, your Honor," replied the captain, going on deck, while Robert and Mary Grant overwhelmed Lord
Glenarvan with their grateful thanks.
Shortly after, the DUNCAN had left the American coast, and was running eastward, her sharp keel rapidly
cutting her way through the waves of the Atlantic Ocean.

CHAPTER II TRISTAN D'ACUNHA AND THE ISLE OF AMSTERDAM

IF the yacht had followed the line of the equator, the 196 degrees which separate Australia from America, or,
more correctly, Cape Bernouilli from Cape Corrientes, would have been equal to 11,760 geographical miles; but
along the 37th parallel these same degrees, owing to the form of the earth, only represent 9,480 miles. From the
American coast to Tristan d'Acunha is reckoned 2,100 miles-- a distance which John Mangles hoped to clear in ten
days, if east winds did not retard the motion of the yacht. But he was not long uneasy on that score, for toward
evening the breeze sensibly lulled and then changed altogether, giving the DUNCAN a fair field on a calm sea for
displaying her incomparable qualities as a sailor.

The passengers had fallen back into their ordinary ship life, and it hardly seemed as if they really could have
been absent a whole month. Instead of the Pacific, the Atlantic stretched itself out before them, and there was
scarcely a shade of difference in the waves of the two oceans. The elements, after having handled them so roughly,
seemed now disposed to favor them to the utmost. The sea was tranquil, and the wind kept in the right quarter, so
that the yacht could spread all her canvas, and lend its aid, if needed to the indefatigable steam stored up in the
boiler.
Under such conditions, the voyage was safely and rapidly accomplished. Their confidence increased as they
found themselves nearer the Australian coast. They began to talk of Captain Grant as if the yacht were going to take
him on board at a given port. His cabin was got ready, and berths for the men. This cabin was next to the famous
_number six_, which Paganel had taken possession of instead of the one he had booked on the SCOTIA. It had been
till now occupied by M. Olbinett, who vacated it for the expected guest. Mary took great delight in arranging it with
her own hands, and adorning it for the reception of the loved inmate.
The learned geographer kept himself closely shut up. He was working away from morning till night at a work
entitled "Sublime Impressions of a Geographer in the Argentine Pampas," and they could hear him repeating elegant
periods aloud before committing them to the white pages of his day-book; and more than once, unfaithful to Clio,
the muse of history, he invoked in his transports the divine Calliope, the muse of epic poetry.

Paganel made no secret of it either. The chaste daughters of Apollo willingly left the slopes of Helicon and
Parnassus at his call. Lady Helena paid him sincere compliments on his mythological visitants, and so did the Major,
though he could not forbear adding:
"But mind no fits of absence of mind, my dear Paganel; and if you take a fancy to learn Australian, don't go and
study it in a Chinese grammar."

Things went on perfectly smoothly on board. Lady Helena and Lord Glenarvan found leisure to watch John
Mangles' growing attachment to Mary Grant. There was nothing to be said against it, and, indeed, since John
remained silent, it was best to take no notice of it.

V. IV Verne
"What will Captain Grant think?" Lord Glenarvan asked his wife one day.
"He'll think John is worthy of Mary, my dear Edward, and he'll think right."
Meanwhile, the yacht was making rapid progress. Five days after losing sight of Cape Corrientes, on the 16th of
November, they fell in with fine westerly breezes, and the DUNCAN might almost have dispensed with her screw
altogether, for she flew over the water like a bird, spreading all her sails to catch the breeze, as if she were running a
race with the Royal Thames Club yachts.
Next day, the ocean appeared covered with immense seaweeds, looking like a great pond choked up with the DEBRIS of trees and plants torn off the neighboring continents. Commander Murray had specially pointed them out to the attention of navigators. The DUNCAN appeared to glide over a long prairie, which Paganel justly compared to the Pampas, and her speed slackened a little.

Twenty-four hours after, at break of day, the man on the look-out was heard calling out, "Land ahead!"

"In what direction?" asked Tom Austin, who was on watch.

"Leeeward!" was the reply.

This exciting cry brought everyone speedily on deck. Soon a telescope made its appearance, followed by Jacques Paganel. The learned geographer pointed the instrument in the direction indicated, but could see nothing that resembled land.

"Look in the clouds," said John Mangles.

"Ah, now I do see a sort of peak, but very indistinctly."

"It is Tristan d'Acunha," replied John Mangles.

"Then, if my memory serves me right, we must be eighty miles from it, for the peak of Tristan, seven thousand feet high, is visible at that distance."

"That's it, precisely."

Some hours later, the sharp, lofty crags of the group of islands stood out clearly on the horizon. The conical peak of Tristan looked black against the bright sky, which seemed all ablaze with the splendor of the rising sun. Soon the principal island stood out from the rocky mass, at the summit of a triangle inclining toward the northeast.

Tristan d'Acunha is situated in 37 degrees 8' of southern latitude, and 10 degrees 44' of longitude west of the meridian at Greenwich. Inaccessible Island is eighteen miles to the southwest and Nightingale Island is ten miles to the southeast, and this completes the little solitary group of islets in the Atlantic Ocean. Toward noon, the two principal landmarks, by which the group is recognized were sighted, and at 3 P. M. the DUNCAN entered Falmouth Bay in Tristan d'Acunha.

Several whaling vessels were lying quietly at anchor there, for the coast abounds in seals and other marine animals.

John Mangle's first care was to find good anchorage, and then all the passengers, both ladies and gentlemen, got into the long boat and were rowed ashore. They stepped out on a beach covered with fine black sand, the impalpable DEBRIS of the calcined rocks of the island.

Tristan d'Acunha is the capital of the group, and consists of a little village, lying in the heart of the bay, and watered by a noisy, rapid stream. It contained about fifty houses, tolerably clean, and disposed with geometrical regularity. Behind this miniature town there lay 1,500 hectares of meadow land, bounded by an embankment of lava. Above this embankment, the conical peak rose 7,000 feet high.

Lord Glenarvan was received by a governor supplied from the English colony at the Cape. He inquired at once respecting Harry Grant and the BRITANNIA, and found the names entirely unknown. The Tristan d'Acunha Isles are out of the route of ships, and consequently little frequented. Since the wreck of the _Blendon Hall_ in 1821, on the rocks of Inaccessible Island, two vessels have stranded on the chief island—the PRIMANGUET in 1845, and the three-mast American, PHILADELPHIA, in 1857. These three events comprise the whole catalogue of maritime disasters in the annals of the Acunhas.

Lord Glenarvan did not expect to glean any information, and only asked by the way of duty. He even sent the boats to make the circuit of the island, the entire extent of which was not more than seventeen miles at most.

In the interim the passengers walked about the village. The population does not exceed 150 inhabitants, and consists of English and Americans, married to negroes and Cape Hottentots, who might bear away the palm for ugliness. The children of these heterogeneous households are very disagreeable compounds of Saxon stiffness and African blackness.

It was nearly nightfall before the party returned to the yacht, chattering and admiring the natural riches displayed on all sides, for even close to the streets of the capital, fields of wheat and maize were waving, and crops of vegetables, imported forty years before; and in the environs of the village, herds of cattle and sheep were feeding.

The boats returned to the DUNCAN about the same time as Lord Glenarvan. They had made the circuit of the entire island in a few hours, but without coming across the least trace of the BRITANNIA. The only result of this voyage of circumnavigation was to strike out the name of Isle Tristan from the program of search.

CHAPTER III CAPE TOWN AND M. VIOT

As John Mangles intended to put in at the Cape of Good Hope for coals, he was obliged to deviate a little from the 37th parallel, and go two degrees north. In less than six days he cleared the thirteen hundred miles which separate the point of Africa from Tristan d'Acunha, and on the 24th of November, at 3 P. M. the Table Mountain was sighted. At eight o'clock they entered the bay, and cast anchor in the port of Cape Town. They sailed away next
morning at daybreak.

Between the Cape and Amsterdam Island there is a distance of 2,900 miles, but with a good sea and favoring breeze, this was only a ten day's voyage. The elements were now no longer at war with the travelers, as on their journey across the Pampas--air and water seemed in league to help them forward.

"Ah! the sea! the sea!" exclaimed Paganel, "it is the field _par excellence_ for the exercise of human energies, and the ship is the true vehicle of civilization. Think, my friends, if the globe had been only an immense continent, the thousandth part of it would still be unknown to us, even in this nineteenth century. See how it is in the interior of great countries. In the steppes of Siberia, in the plains of Central Asia, in the deserts of Africa, in the prairies of America, in the immense wilds of Australia, in the icy solitudes of the Poles, man scarcely dares to venture; the most daring shrinks back, the most courageous succumbs. They cannot penetrate them; the means of transport are insufficient, and the heat and disease, and savage disposition of the natives, are impassable obstacles. Twenty miles of desert separate men more than five hundred miles of ocean."

Paganel spoke with such warmth that even the Major had nothing to say against this panegyric of the ocean. Indeed, if the finding of Harry Grant had involved following a parallel across continents instead of oceans, the enterprise could not have been attempted; but the sea was there ready to carry the travelers from one country to another, and on the 6th of December, at the first streak of day, they saw a fresh mountain apparently emerging from the bosom of the waves.

This was Amsterdam Island, situated in 37 degrees 47 minutes latitude and 77 degrees 24 minutes longitude, the high cone of which in clear weather is visible fifty miles off. At eight o'clock, its form, indistinct though it still was, seemed almost a reproduction of Teneriffe.

"And consequently it must resemble Tristan d'Acunha," observed Glenarvan.

"A very wise conclusion," said Paganel, "according to the geometrographic axiom that two islands resembling a third must have a common likeness. I will only add that, like Tristan d'Acunha, Amsterdam Island is equally rich in seals and Robinsons."

"There are Robinsons everywhere, then?" said Lady Helena.

"Indeed, Madam," replied Paganel, "I know few islands without some tale of the kind appertaining to them, and the romance of your immortal countryman, Daniel Defoe, has been often enough realized before his day."

"Monsieur Paganel," said Mary, "may I ask you a question?"

"Two if you like, my dear young lady, and I promise to answer them."

"Well, then, I want to know if you would be very much frightened at the idea of being cast away alone on a desert island."

"I?" exclaimed Paganel.

"Come now, my good fellow," said the Major, "don't go and tell us that it is your most cherished desire."

"I don't pretend it is that, but still, after all, such an adventure would not be very unpleasant to me. I should begin a new life; I should hunt and fish; I should choose a grotto for my domicile in Winter and a tree in Summer. I should make storehouses for my harvests: in one word, I should colonize my island."

"All by yourself?"

"All by myself if I was obliged. Besides, are we ever obliged? Cannot one find friends among the animals, and choose some tame kid or eloquent parrot or amiable monkey? And if a lucky chance should send one a companion like the faithful Friday, what more is needed? Two friends on a rock, there is happiness. Suppose now, the Major and I--"

"Thank you," replied the Major, interrupting him; "I have no inclination in that line, and should make a very poor Robinson Crusoe."

"My dear Monsieur Paganel," said Lady Helena, "you are letting your imagination run away with you, as usual. But the dream is very different from the reality. You are thinking of an imaginary Robinson's life, thrown on a picked island and treated like a spoiled child by nature. You only see the sunny side."

"What, madam! You don't believe a man could be happy on a desert island?"

"I do not. Man is made for society and not for solitude, and solitude can only engender despair. It is a question of time. At the outset it is quite possible that material wants and the very necessities of existence may engross the poor shipwrecked fellow, just snatched from the waves; but afterward, when he feels himself alone, far from his fellow men, without any hope of seeing country and friends again, what must he think, what must he suffer? His little island is all his world. The whole human race is shut up in himself, and when death comes, which utter loneliness will make terrible, he will be like the last man on the last day of the world. Believe me, Monsieur Paganel, such a man is not to be envied."

Paganel gave in, though regretfully, to the arguments of Lady Helena, and still kept up a discussion on the advantages and disadvantages of Isolation, till the very moment the DUNCAN dropped anchor about a mile off
Amsterdam Island.

This lonely group in the Indian Ocean consists of two distinct islands, thirty-three miles apart, and situated exactly on the meridian of the Indian peninsula. To the north is Amsterdam Island, and to the south St. Paul; but they have been often confounded by geographers and navigators.

At the time of the DUNCAN's visit to the island, the population consisted of three people, a Frenchman and two mulattoes, all three employed by the merchant proprietor. Paganel was delighted to shake hands with a countryman in the person of good old Monsieur Viot. He was far advanced in years, but did the honors of the place with much politeness. It was a happy day for him when these kindly strangers touched at his island, for St. Peter's was only frequented by seal-fishers, and now and then a whaler, the crews of which are usually rough, coarse men.

M. Viot presented his subjects, the two mulattoes. They composed the whole living population of the island, except a few wild boars in the interior and myriads of penguins. The little house where the three solitary men lived was in the heart of a natural bay on the southeast, formed by the crumbling away of a portion of the mountain.

Twice over in the early part of the century, Amsterdam Island became the country of deserted sailors, providentially saved from misery and death; but since these events no vessel had been lost on its coast. Had any shipwreck occurred, some fragments must have been thrown on the sandy shore, and any poor sufferers from it would have found their way to M. Viot's fishing-huts. The old man had been long on the island, and had never been called upon to exercise such hospitality. Of the BRITANNIA and Captain Grant he knew nothing, but he was certain that the disaster had not happened on Amsterdam Island, nor on the islet called St. Paul, for whalers and fishing-vessels went there constantly, and must have heard of it.

Glenarvan was neither surprised nor vexed at the reply; indeed, his object in asking was rather to establish the fact that Captain Grant had not been there than that he had. This done, they were ready to proceed on their voyage next day.

They rambled about the island till evening, as its appearance was very inviting. Its FAUNA and FLORA, however, were poor in the extreme. The only specimens of quadrupeds, birds, fish and cetacea were a few wild boars, stormy petrels, albatrosses, perch and seals. Here and there thermal springs and chalybeate waters escaped from the black lava, and thin dark vapors rose above the volcanic soil. Some of these springs were very hot. John Mangles held his thermometer in one of them, and found the temperature was 176 degrees Fahrenheit. Fish caught in the sea a few yards off, cooked in five minutes in these all but boiling waters, a fact which made Paganel resolve not to attempt to bathe in them.

Toward evening, after a long promenade, Glenarvan and his party bade adieu to the good old M. Viot, and returned to the yacht, wishing him all the happiness possible on his desert island, and receiving in return the old man's blessing on their expedition.

CHAPTER IV A WAGER AND HOW DECIDED

On the 7th of December, at three A. M., the DUNCAN lay puffing out her smoke in the little harbor ready to start, and a few minutes afterward the anchor was lifted, and the screw set in motion. By eight o'clock, when the passengers came on deck, the Amsterdam Island had almost disappeared from view behind the mists of the horizon. This was the last halting-place on the route, and nothing now was between them and the Australian coast but three thousand miles' distance. Should the west wind continue but a dozen days longer, and the sea remain favorable, the yacht would have reached the end of her voyage.

Mary Grant and her brother could not gaze without emotion at the waves through which the DUNCAN was speeding her course, when they thought that these very same waves must have dashed against the prow of the BRITANNIA but a few days before her shipwreck. Here, perhaps, Captain Grant, with a disabled ship and diminished crew, had struggled against the tremendous hurricanes of the Indian Ocean, and felt himself driven toward the coast with irresistible force. The Captain pointed out to Mary the different currents on the ship's chart, and explained to her their constant direction. Among others there was one running straight to the Australian continent, and its action is equally felt in the Atlantic and Pacific. It was doubtless against this that the BRITANNIA, dismasted and rudderless, had been unable to contend, and consequently been dashed against the coast, and broken in pieces.

A difficulty about this, however, presented itself. The last intelligence of Captain Grant was from Callao on the 30th of May, 1862, as appeared in the _Mercantile and Shipping Gazette_. "How then was it possible that on the 7th of June, only eight days after leaving the shores of Peru, that the BRITANNIA could have found herself in the Indian Ocean? But to this, Paganel, who was consulted on the subject, found a very plausible solution.

It was one evening, about six days after their leaving Amsterdam Island, when they were all chatting together on the poop, that the above-named difficulty was stated by Glenarvan. Paganel made no reply, but went and fetched the document. After perusing it, he still remained silent, simply shrugging his shoulders, as if ashamed of troubling himself about such a trifle.
"Come, my good friend," said Glenarvan, "at least give us an answer."
"No," replied Paganel, "I'll merely ask a question for Captain John to answer."
"And what is it, Monsieur Paganel?" said John Mangles.
"Could a quick ship make the distance in a month over that part of the Pacific Ocean which lies between America and Australia?"
"Yes, by making two hundred miles in twenty-four hours."
"Would that be an extraordinary rate of speed?"
"Not at all; sailing clippers often go faster."
"Well, then, instead of '7 June' on this document, suppose that one figure has been destroyed by the sea-water, and read '17 June' or '27 June,' and all is explained."
"That's to say," replied Lady Helena, "that between the 31st of May and the 27th of June--"
"Captain Grant could have crossed the Pacific and found himself in the Indian Ocean.
Paganel's theory met with universal acceptance.
"That's one more point cleared up," said Glenarvan. "Thanks to our friend, all that remains to be done now is to get to Australia, and look out for traces of the wreck on the western coast."
"Or the eastern?" said John Mangles.
"Indeed, John, you may be right, for there is nothing in the document to indicate which shore was the scene of the catastrophe, and both points of the continent crossed by the 37th parallel, must, therefore, be explored."
"Then, my Lord, it is doubtful, after all," said Mary.
"Oh no, Miss Mary," John Mangles hastened to reply, seeing the young girl's apprehension. "His Lordship will please to consider that if Captain Grant had gained the shore on the east of Australia, he would almost immediately have found refuge and assistance. The whole of that coast is English, we might say, peopled with colonists. The crew of the BRITANNIA could not have gone ten miles without meeting a fellow-countryman."
"I am quite of your opinion, Captain John," said Paganel. "On the eastern coast Harry Grant would not only have found an English colony easily, but he would certainly have met with some means of transport back to Europe."
"And he would not have found the same resources on the side we are making for?" asked Lady Helena.
"No, madam," replied Paganel; "it is a desert coast, with no communication between it and Melbourne or Adelaide. If the BRITANNIA was wrecked on those rocky shores, she was as much cut off from all chance of help as if she had been lost on the inhospitable shores of Africa."
"But what has become of my father there, then, all these two years?" asked Mary Grant.
"My dear Mary," replied Paganel, "you have not the least doubt, have you, that Captain Grant reached the Australian continent after his shipwreck?"
"No, Monsieur Paganel."
"Well, granting that, what became of him? The suppositions we might make are not numerous. They are confined to three. Either Harry Grant and his companions have found their way to the English colonies, or they have fallen into the hands of the natives, or they are lost in the immense wilds of Australia."
"Go on, Paganel," said Lord Glenarvan, as the learned Frenchman made a pause.
"The first hypothesis I reject, then, to begin with, for Harry Grant could not have reached the English colonies, or long ago he would have been back with his children in the good town of Dundee."
"Poor father," murmured Mary, "away from us for two whole years."
"Hush, Mary," said Robert, "Monsieur Paganel will tell us."
"Alas! my boy, I cannot. All that I affirm is, that Captain Grant is in the hands of the natives."
"But these natives," said Lady Helena, hastily, "are they--"
"Reassure yourself, madam," said Paganel, divining her thoughts. "The aborigines of Australia are low enough in the scale of human intelligence, and most degraded and uncivilized, but they are mild and gentle in disposition, and not sanguinary like their New Zealand neighbors. Though they may be prisoners, their lives have never been threatened, you may be sure. All travelers are unanimous in declaring that the Australian natives abhor shedding blood, and many a time they have found in them faithful allies in repelling the attacks of evil-disposed convicts far more cruelly inclined."
"You hear what Monsieur Paganel tells us, Mary," said Lady Helena turning to the young girl. "If your father is in the hands of the natives, which seems probable from the document, we shall find him."
"And what if he is lost in that immense country?" asked Mary.
"Well, we'll find him still," exclaimed Paganel, in a confident tone. "Won't we, friends?"
"Most certainly," replied Glenarvan; and anxious to give a less gloomy turn to the conversation, he added--
"But I won't admit the supposition of his being lost, not for an instant."
"Neither will I," said Paganel.
"Is Australia a big place?" inquired Robert.

"Australia, my boy, is about as large as four-fifths of Europe. It has somewhere about 775,000 HECTARES."

"So much as that?" said the Major.

"Yes, McNabbs, almost to a yard's breadth. Don't you think now it has a right to be called a continent?"

"I do, certainly."

"I may add," continued the SAVANT, "that there are but few accounts of travelers being lost in this immense country. Indeed, I believe Leichardt is the only one of whose fate we are ignorant, and some time before my departure I learned from the Geographical Society that McDintyre had strong hopes of having discovered traces of him."

"The whole of Australia, then, is not yet explored?" asked Lady Helena.

"No, madam, but very little of it. This continent is not much better known than the interior of Africa, and yet it is from no lack of enterprising travelers. From 1606 to 1862, more than fifty have been engaged in exploring along the coast and in the interior."

"Oh, fifty!" exclaimed McNabbs incredulously.

"No, no," objected the Major; "that is going too far."

"And I might go farther, McNabbs," replied the geographer, impatient of contradiction.

"Yes, McNabbs, quite that number."

"Farther still, Paganel."

"If you doubt me, I can give you the names."

"Oh, oh," said the Major, coolly. "That's just like you SAVANTS. You stick at nothing."

"Major, will you bet your Purdy-Moore rifle against my telescope?"

"Why not, Paganel, if it would give you any pleasure."

"Done, Major!" exclaimed Paganel. "You may say good-by to your rifle, for it will never shoot another chamois or fox unless I lend it to you, which I shall always be happy to do, by the by."

"And whenever you require the use of your telescope, Paganel, I shall be equally obliging," replied the Major, gravely.

"Let us begin, then; and ladies and gentlemen, you shall be our jury. Robert, you must keep count."

This was agreed upon, and Paganel forthwith commenced.

"Mnemosyne! Goddess of Memory, chaste mother of the Muses!" he exclaimed, "inspire thy faithful servant and fervent worshiper! Two hundred and fifty-eight years ago, my friends, Australia was unknown. Strong suspicions were entertained of the existence of a great southern continent. In the library of your British Museum, Glenarvan, there are two charts, the date of which is 1550, which mention a country south of Asia, called by the Portuguese Great Java. But these charts are not sufficiently authentic. In the seventeenth century, in 1606, Quiros, a Spanish navigator, discovered a country which he named Australia de Espiritu Santo. Some authors imagine that this was the New Hebrides group, and not Australia. I am not going to discuss the question, however. Count Quiros, Robert, and let us pass on to another."

"ONE," said Robert.

"In that same year, Louis Vas de Torres, the second in command of the fleet of Quiros, pushed further south. But it is to Theodore Hertogt, a Dutchman, that the honor of the great discovery belongs. He touched the western coast of Australia in 25 degrees latitude, and called it Eendracht, after his vessel. From this time navigators increased. In 1618, Zeachen discovered the northern parts of the coast, and called them Amheim and Diemen. In 1618, Jan Edels went along the western coast, and christened it by his own name. In 1622, Leuwin went down as far as the cape which became his namesake. And so Paganel continued with name after name until his hearers cried for mercy.

"Stop, Paganel," said Glenarvan, laughing heartily, "don't quite crush poor McNabbs. Be generous; he owns he is vanquished."

"And what about the rifle?" asked the geographer, triumphantly.

"It is yours, Paganel," replied the Major, "and I am very sorry for it; but your memory might gain an armory by such feats."

"It is certainly impossible to be better acquainted with Australia; not the least name, not even the most trifling fact—"

"As to the most trifling fact, I don't know about that," said the Major, shaking his head.

"What do you mean, McNabbs?" exclaimed Paganel.

"Simply that perhaps all the incidents connected with the discovery of Australia may not be known to you."

"Just fancy," retorted Paganel, throwing back his head proudly.

"Come now. If I name one fact you don't know, will you give me back my rifle?" said McNabbs.

"On the spot, Major."
"Very well, it's a bargain, then."
"Yes, a bargain; that's settled."
"All right. Well now, Paganel, do you know how it is that Australia does not belong to France?"
"But it seems to me--"
"Or, at any rate, do you know what's the reason the English give?" asked the Major.
"No," replied Paganel, with an air of vexation.
"Just because Captain Baudin, who was by no means a timid man, was so afraid in 1802, of the croaking of the Australian frogs, that he raised his anchor with all possible speed, and quit the coast, never to return."
"What!" exclaimed Paganel. "Do they actually give that version of it in England? But it is just a bad joke."
"Bad enough, certainly, but still it is history in the United Kingdom."
"It's an insult!" exclaimed the patriotic geographer; "and they relate that gravely?"
"I must own it is the case," replied Glenarvan, amidst a general outburst of laughter. "Do you mean to say you have never heard of it before?"
"Never! But I protest against it. Besides, the English call us 'frog-eaters.' Now, in general, people are not afraid of what they eat."
"It is said, though, for all that," replied McNabbs. So the Major kept his famous rifle after all.

CHAPTER V THE STORM ON THE INDIAN OCEAN
Two days after this conversation, John Mangles announced that the DUNCAN was in longitude 113 degrees 37 minutes, and the passengers found on consulting the chart that consequently Cape Bernouilli could not be more than five degrees off. They must be sailing then in that part of the Indian Ocean which washed the Australian continent, and in four days might hope to see Cape Bernouilli appear on the horizon.

Hitherto the yacht had been favored by a strong westerly breeze, but now there were evident signs that a calm was impending, and on the 13th of December the wind fell entirely; as the sailors say, there was not enough to fill a cap.

There was no saying how long this state of the atmosphere might last. But for the powerful propeller the yacht would have been obliged to lie motionless as a log. The young captain was very much annoyed, however, at the prospect of emptying his coal-bunkers, for he had covered his ship with canvas, intending to take advantage of the slightest breeze.

"After all, though," said Glenarvan, with whom he was talking over the subject, "it is better to have no wind than a contrary one."

"Your Lordship is right," replied John Mangles; "but the fact is these sudden calms bring change of weather, and this is why I dread them. We are close on the trade winds, and if we get them ever so little in our teeth, it will delay us greatly."

"Well, John, what if it does? It will only make our voyage a little longer."
"Yes, if it does not bring a storm with it."
"Do you mean to say you think we are going to have bad weather?" replied Glenarvan, examining the sky, which from horizon to zenith seemed absolutely cloudless.

"I do," returned the captain. "I may say so to your Lordship, but I should not like to alarm Lady Glenarvan or Miss Grant."

"You are acting wisely; but what makes you uneasy?"

"Sure indications of a storm. Don't trust, my Lord, to the appearance of the sky. Nothing is more deceitful. For the last two days the barometer has been falling in a most ominous manner, and is now at 27 degrees. This is a warning I dare not neglect, for there is nothing I dread more than storms in the Southern Seas; I have had a taste of them already. The vapors which become condensed in the immense glaciers at the South Pole produce a current of air of extreme violence. This causes a struggle between the polar and equatorial winds, which results in cyclones, tornadoes, and all those multiplied varieties of tempest against which a ship is no match."

"Well, John," said Glenarvan, "the DUNCAN is a good ship, and her captain is a brave sailor. Let the storm come, we'll meet it!"

John Mangles remained on deck the whole night, for though as yet the sky was still unclouded, he had such faith in his weather-glass, that he took every precaution that prudence could suggest. About 11 P. M. the sky began to darken in the south, and the crew were called up, and all the sails hauled in, except the foresail, brigantine, top-sail, and jib-boom. At midnight the wind freshened, and before long the cracking of the masts, and the rattling of the cordage, and groaning of the timbers, awakened the passengers, who speedily made their appearance on deck-- at least Paganel, Glenarvan, the Major and Robert.

"Is it the hurricane?" asked Glenarvan quietly.
"Not yet," replied the captain; "but it is close at hand."
And he went on giving his orders to the men, and doing his best to make ready for the storm, standing, like an officer commanding a breach, with his face to the wind, and his gaze fixed on the troubled sky. The glass had fallen to 26 degrees, and the hand pointed to tempest.

It was one o'clock in the morning when Lady Helena and Miss Grant ventured upstairs on deck. But they no sooner made their appearance than the captain hurried toward them, and begged them to go below again immediately. The waves were already beginning to dash over the side of the ship, and the sea might any moment sweep right over her from stem to stern. The noise of the warring elements was so great that his words were scarcely audible, but Lady Helena took advantage of a sudden lull to ask if there was any danger.

"None whatever," replied John Mangles; "but you cannot remain on deck, madam, no more can Miss Mary."

The ladies could not disobey an order that seemed almost an entreaty, and they returned to their cabin. At the same moment the wind redoubled its fury, making the masts bend beneath the weight of the sails, and completely lifting up the yacht.

"Haul up the foresail!" shouted the captain. "Lower the topsail and jib-boom!"

Glenarvan and his companions stood silently gazing at the struggle between their good ship and the waves, lost in wondering and half-terrified admiration at the spectacle.

Just then, a dull hissing was heard above the noise of the elements. The steam was escaping violently, not by the funnel, but from the safety-valves of the boiler; the alarm whistle sounded unnaturally loud, and the yacht made a frightful pitch, overturning Wilson, who was at the wheel, by an unexpected blow from the tiller. The DUNCAN no longer obeyed the helm.

"What is the matter?" cried the captain, rushing on the bridge.

"The ship is heeling over on her side," replied Wilson.

"The engine! the engine!" shouted the engineer.

Away rushed John to the engine-room. A cloud of steam filled the room. The pistons were motionless in their cylinders, and they were apparently powerless, and the engine-driver, fearing for his boilers, was letting off the steam.

"What's wrong?" asked the captain.

"The propeller is bent or entangled," was the reply. "It's not acting at all."

"Can't you extricate it?"

"It is impossible."

An accident like this could not be remedied, and John's only resource was to fall back on his sails, and seek to make an auxiliary of his most powerful enemy, the wind. He went up again on deck, and after explaining in a few words to Lord Glenarvan how things stood, begged him to retire to his cabin, with the rest of the passengers. But Glenarvan wished to remain above.

"But we might be a help."

"Go in, my Lord, go in. I must indeed insist on it. There are times when I must be master on board, and retire you must."

Their situation must indeed be desperate for John Mangles to speak in such authoritative language. Glenarvan was wise enough to understand this, and felt he must set an example in obedience. He therefore quitted the deck immediately with his three companions, and rejoined the ladies, who were anxiously watching the DENOUEMENT of this war with the elements.

"He's an energetic fellow, this brave John of mine!" said Lord Glenarvan, as he entered the saloon.

"That he is," replied Paganel. "He reminds me of your great Shakespeare's boatswain in the 'Tempest,' who says to the king on board: 'Hence! What care these roarers for the name of king? To cabin! Silence! Trouble us not.'"

However, John Mangles did not lose a second in extricating his ship from the peril in which she was placed by the condition of her screw propeller. He resolved to rely on the mainsail for keeping in the right route as far as possible, and to brace the yards obliquely, so as not to present a direct front to the storm. The yacht turned about like a swift horse that feels the spur, and presented a broadside to the billows. The only question was, how long would she hold out with so little sail, and what sail could resist such violence for any length of time. The great advantage of keeping up the mainsail was that it presented to the waves only the most solid portions of the yacht, and kept her in the right course. Still it involved some peril, for the vessel might get engulfed between the waves, and not be able to raise herself. But Mangles felt there was no alternative, and all he could do was to keep the crew ready to alter the sail at any moment, and stay in the shrouds himself watching the tempest.

The remainder of the night was spent in this manner, and it was hoped that morning would bring a calm. But this
was a delusive hope. At 8 A.M., the wind had increased to a hurricane.

John said nothing, but he trembled for his ship, and those on board. The DUNCAN made a frightful plunge forward, and for an instant the men thought she would never rise again. Already they had seized their hatchets to cut away the shrouds from the mainmast, but the next minute the sails were torn away by the tempest, and had flown off like gigantic albatrosses.

The yacht had risen once more, but she found herself at the mercy of the waves entirely now, with nothing to steady or direct her, and was so fearfully pitched and tossed about that every moment the captain expected the masts would break short off. John had no resource but to put up a forestaysail, and run before the gale. But this was no easy task. Twenty times over he had all his work to begin again, and it was 3 P.M. before his attempt succeeded. A mere shred of canvas though it was, it was enough to drive the DUNCAN forward with inconceivable rapidity to the northeast, of course in the same direction as the hurricane. Swiftness was their only chance of safety. Sometimes she would get in advance of the waves which carried her along, and cutting through them with her sharp prow, bury herself in their depths. At others, she would keep pace with them, and make such enormous leaps that there was imminent danger of her being pitched over on her side, and then again, every now and then the storm-driven sea would out-distance the yacht, and the angry billows would sweep over the deck from stem to stern with tremendous violence.

In this alarming situation and amid dreadful alternations of hope and despair, the 12th of December passed away, and the ensuing night, John Mangles never left his post, not even to take food. Though his impassive face betrayed no symptoms of fear, he was tortured with anxiety, and his steady gaze was fixed on the north, as if trying to pierce through the thick mists that enshrouded it.

There was, indeed, great cause for fear. The DUNCAN was out of her course, and rushing toward the Australian coast with a speed which nothing could lessen. To John Mangles it seemed as if a thunderbolt were driving them along. Every instant he expected the yacht would dash against some rock, for he reckoned the coast could not be more than twelve miles off, and better far be in mid ocean exposed to all its fury than too near land.

John Mangles went to find Glenarvan, and had a private talk with him about their situation, telling him frankly the true state of affairs, stating the case with all the coolness of a sailor prepared for anything and everything and he wound up by saying he might, perhaps, be obliged to cast the yacht on shore.

"To save the lives of those on board, my Lord," he added.

"Do it then, John," replied Lord Glenarvan.

"And Lady Helena, Miss Grant?"

"I will tell them at the last moment when all hope of keeping out at sea is over. You will let me know?"

"I will, my Lord."

Glenarvan rejoined his companions, who felt they were in imminent danger, though no word was spoken on the subject. Both ladies displayed great courage, fully equal to any of the party. Paganel descanted in the most inopportune manner about the direction of atmospheric currents, making interesting comparisons, between tornadoes, cyclones, and rectilinear tempests. The Major calmly awaited the end with the fatalism of a Mussulman.

About eleven o'clock, the hurricane appeared to decrease slightly. The damp mist began to clear away, and a sudden gleam of light revealed a low-lying shore about six miles distant. They were driving right down on it. Enormous breakers fifty feet high were dashing over it, and the fact of their height showed John there must be solid ground before they could make such a rebound.

"Those are sand-banks," he said to Austin.

"I think they are," replied the mate.

"We are in God's hands," said John. "If we cannot find any opening for the yacht, and if she doesn't find the way in herself, we are lost."

"The tide is high at present, it is just possible we may ride over those sand-banks."

"But just see those breakers. What ship could stand them. Let us invoke divine aid, Austin!"

Meanwhile the DUNCAN was speeding on at a frightful rate. Soon she was within two miles of the sand-banks, which were still veiled from time to time in thick mist. But John fancied he could see beyond the breakers a quiet basin, where the DUNCAN would be in comparative safety. But how could she reach it?

All the passengers were summoned on deck, for now that the hour of shipwreck was at hand, the captain did not wish anyone to be shut up in his cabin.

"John!" said Glenarvan in a low voice to the captain, "I will try to save my wife or perish with her. I put Miss Grant in your charge."

"Yes, my Lord," replied John Mangles, raising Glenarvan's hand to his moistened eyes.

The yacht was only a few cables' lengths from the sandbanks. The tide was high, and no doubt there was abundance of water to float the ship over the dangerous bar; but these terrific breakers alternately lifting her up and
then leaving her almost dry, would infallibly make her graze the sand-banks.

Was there no means of calming this angry sea? A last expedient struck the captain. "The oil, my lads!" he exclaimed. "Bring the oil here!"

The crew caught at the idea immediately; this was a plan that had been successfully tried already. The fury of the waves had been allayed before this time by covering them with a sheet of oil. Its effect is immediate, but very temporary. The moment after a ship has passed over the smooth surface, the sea redoubles its violence, and woe to the bark that follows. The casks of seal-oil were forthwith hauled up, for danger seemed to have given the men double strength. A few hatchet blows soon knocked in the heads, and they were then hung over the larboard and starboard.

"Be ready!" shouted John, looking out for a favorable moment.

In twenty seconds the yacht reached the bar. Now was the time. "Pour out!" cried the captain, "and God prosper it!"

The barrels were turned upside down, and instantly a sheet of oil covered the whole surface of the water. The billows fell as if by magic, the whole foaming sea seemed leveled, and the DUNCAN flew over its tranquil bosom into a quiet basin beyond the formidable bar; but almost the same minute the ocean burst forth again with all its fury, and the towering breakers dashed over the bar with increased violence.

CHAPTER VI A HOSPITABLE COLONIST

The captain's first care was to anchor his vessel securely. He found excellent moorage in five fathoms' depth of water, with a solid bottom of hard granite, which afforded a firm hold. There was no danger now of either being driven away or stranded at low water. After so many hours of danger, the DUNCAN found herself in a sort of creek, sheltered by a high circular point from the winds outside in the open sea.

Lord Glenarvan grasped John Mangles' hand, and simply said: "Thank you, John."

This was all, but John felt it ample recompense. Glenarvan kept to himself the secret of his anxiety, and neither Lady Helena, nor Mary, nor Robert suspected the grave perils they had just escaped.

One important fact had to be ascertained. On what part of the coast had the tempest thrown them? How far must they go to regain the parallel. At what distance S. W. was Cape Bernouilli? This was soon determined by taking the position of the ship, and it was found that she had scarcely deviated two degrees from the route. They were in longitude 36 degrees 12 minutes, and latitude 32 degrees 67 minutes, at Cape Catastrophe, three hundred miles from Cape Bernouilli. The nearest port was Adelaide, the Capital of Southern Australia.

Could the DUNCAN be repaired there? This was the question. The extent of the injuries must first be ascertained, and in order to do this he ordered some of the men to dive below the stern. Their report was that one of the branches of the screw was bent, and had got jammed against the stern post, which of course prevented all possibility of rotation. This was a serious damage, so serious as to require more skilful workmen than could be found in Adelaide.

After mature reflection, Lord Glenarvan and John Mangles came to the determination to sail round the Australian coast, stopping at Cape Bernouilli, and continuing their route south as far as Melbourne, where the DUNCAN could speedily be put right. This effected, they would proceed to cruise along the eastern coast to complete their search for the BRITANNIA.

This decision was unanimously approved, and it was agreed that they should start with the first fair wind. They had not to wait long for the same night the hurricane had ceased entirely, and there was only a manageable breeze from the S. W. Preparations for sailing were instantly commenced, and at four o'clock in the morning the crew lifted the anchors, and got under way with fresh canvas outspread, and a wind blowing right for the Australian shores.

Two hours afterward Cape Catastrophe was out of sight. In the evening they doubled Cape Borda, and came alongside Kangaroo Island. This is the largest of the Australian islands, and a great hiding place for runaway convicts. Its appearance was enchanting. The stratified rocks on the shore were richly carpeted with verdure, and innumerable kangaroos were jumping over the woods and plains, just as at the time of its discovery in 1802. Next day, boats were sent ashore to examine the coast minutely, as they were now on the 36th parallel, and between that and the 38th Glenarvan wished to leave no part unexplored.

The boats had hard, rough work of it now, but the men never complained. Glenarvan and his inseparable companion, Paganel, and young Robert generally accompanied them. But all this painstaking exploration came to nothing. Not a trace of the shipwreck could be seen anywhere. The Australian shores revealed no more than the Patagonian. However, it was not time yet to lose hope altogether, for they had not reached the exact point indicated by the document.

On the 20th of December, they arrived off Cape Bernouilli, which terminates Lacepede Bay, and yet not a vestige of the BRITANNIA had been discovered. Still this was not surprising, as it was two years since the occurrence of the catastrophe, and the sea might, and indeed must, have scattered and destroyed whatever fragments
of the brig had remained. Besides, the natives who scent a wreck as the vultures do a dead body, would have pounced upon it and carried off the smaller DEBRIS. There was no doubt whatever Harry Grant and his companions had been made prisoners the moment the waves threw them on the shore, and been dragged away into the interior of the continent.

But if so, what becomes of Paganel's ingenious hypothesis about the document? viz., that it had been thrown into a river and carried by a current into the sea. That was a plausible enough theory in Patagonia, but not in the part of Australia intersected by the 37th parallel. Besides the Patagonian rivers, the Río Colorado and the Río Negro, flow into the sea along deserted solitudes, uninhabited and uninhabitable; while, on the contrary, the principal rivers of Australia--the Murray, the Yarrow, the Torrens, the Darling--all connected with each other, throw themselves into the ocean by well-frequented routes, and their mouths are ports of great activity. What likelihood, consequently, would there be that a fragile bottle would ever find its way along such busy thoroughfares right out into the Indian Ocean?

Paganel himself saw the impossibility of it, and confessed to the Major, who raised a discussion on the subject, that his hypothesis would be altogether illogical in Australia. It was evident that the degrees given related to the place where the BRITANNIA was actually shipwrecked and not the place of captivity, and that the bottle therefore had been thrown into the sea on the western coast of the continent.

However, as Glenarvan justly remarked, this did not alter the fact of Captain Grant's captivity in the least degree, though there was no reason now for prosecuting the search for him along the 37th parallel, more than any other. It followed, consequently, that if no traces of the BRITANNIA were discovered at Cape Bernouilli, the only thing to be done was to return to Europe. Lord Glenarvan would have been unsuccessful, but he would have done his duty courageously and conscientiously.

But the young Grants did not feel disheartened. They had long since said to themselves that the question of their father's deliverance was about to be finally settled. Irrevocably, indeed, they might consider it, for as Paganel had judiciously demonstrated, if the wreck had occurred on the eastern side, the survivors would have found their way back to their own country long since.

"Hope on! Hope on, Mary!" said Lady Helena to the young girl, as they neared the shore; "God's hand will still lead us."

"Yes, Miss Mary," said Captain John. "Man's extremity is God's opportunity. When one way is hedged up another is sure to open."

"God grant it," replied Mary.

Land was quite close now. The cape ran out two miles into the sea, and terminated in a gentle slope, and the boat glided easily into a sort of natural creek between coral banks in a state of formation, which in course of time would be a belt of coral reefs round the southern point of the Australian coast. Even now they were quite sufficiently formidable to destroy the keel of a ship, and the BRITANNIA might likely enough have been dashed to pieces on them.

The passengers landed without the least difficulty on an absolutely desert shore. Cliffs composed of beds of strata made a coast line sixty to eighty feet high, which it would have been difficult to scale without ladders or cramp-irons. John Mangles happened to discover a natural breach about half a mile south. Part of the cliff had been partially beaten down, no doubt, by the sea in some equinoctial gale. Through this opening the whole party passed and reached the top of the cliff by a pretty steep path. Robert climbed like a young cat, and was the first on the summit, to the despair of Paganel, who was quite ashamed to see his long legs, forty years old, out-distanced by a young urchin of twelve. However, he was far ahead of the Major, who gave himself no concern on the subject.

They were all soon assembled on the lofty crags, and from this elevation could command a view of the whole plain below. It appeared entirely uncultivated, and covered with shrubs and bushes. Glenarvan thought it resembled some glens in the lowlands of Scotland, and Paganel fancied it like some barren parts of Brittany. But along the coast the country appeared to be inhabited, and significant signs of industry revealed the presence of civilized men, not savages.

"A mill!" exclaimed Robert.

And, sure enough, in the distance the long sails of a mill appeared, apparently about three miles off.

"It certainly is a windmill," said Paganel, after examining the object in question through his telescope.

"Let us go to it, then," said Glenarvan.

Away they started, and, after walking about half an hour, the country began to assume a new aspect, suddenly changing its sterility for cultivation. Instead of bushes, quick-set hedges met the eye, inclosing recent clearings. Several bullocks and about half a dozen horses were feeding in meadows, surrounded by acacias supplied from the vast plantations of Kangaroo Island. Gradually fields covered with cereals came in sight, whole acres covered with bristling ears of corn, hay-ricks in the shape of large bee-hives, blooming orchards, a fine garden worthy of Horace,
in which the useful and agreeable were blended; then came sheds; commons wisely distributed, and last of all, a plain comfortable dwelling-house, crowned by a joyous-sounding mill, and fanned and shaded by its long sails as they kept constantly moving round.

Just at that moment a pleasant-faced man, about fifty years of age, came out of the house, warned, by the loud barking of four dogs, of the arrival of strangers. He was followed by five handsome strapping lads, his sons, and their mother, a fine tall woman. There was no mistaking the little group. This was a perfect type of the Irish colonist—a man who, weary of the miseries of his country, had come, with his family, to seek fortune and happiness beyond the seas.

Before Glenarvan and his party had time to reach the house and present themselves in due form, they heard the cordial words: "Strangers! welcome to the house of Paddy O'Moore!"

"You are Irish," said Glenarvan, "if I am not mistaken," warmly grasping the outstretched hand of the colonist.

"I was," replied Paddy O'Moore, "but now I am Australian. Come in, gentlemen, whoever you may be, this house is yours."

It was impossible not to accept an invitation given with such grace. Lady Helena and Mary Grant were led in by Mrs. O'Moore, while the gentlemen were assisted by his sturdy sons to disencumber themselves of their fire-arms.

An immense hall, light and airy, occupied the ground floor of the house, which was built of strong planks laid horizontally. A few wooden benches fastened against the gaily-colored walls, about ten stools, two oak chests on tin mugs, a large long table where twenty guests could sit comfortably, composed the furniture, which looked in perfect keeping with the solid house and robust inmates.

The noonday meal was spread; the soup tureen was smoking between roast beef and a leg of mutton, surrounded by large plates of olives, grapes, and oranges. The necessary was there and there was no lack of the superfluous. The host and hostess were so pleasant, and the big table, with its abundant fare, looked so inviting, that it would have been ungracious not to have seated themselves. The farm servants, on equal footing with their master, were already in their places to take their share of the meal. Paddy O'Moore pointed to the seats reserved for the strangers, and said to Glenarvan:

"I was waiting for you."

"Waiting for us!" replied Glenarvan in a tone of surprise.

"I am always waiting for those who come," said the Irishman; and then, in a solemn voice, while the family and domestics reverently stood, he repeated the BENEDICITE.

Dinner followed immediately, during which an animated conversation was kept up on all sides. From Scotch to Irish is but a handbreadth. The Tweed, several fathoms wide, digs a deeper trench between Scotland and England than the twenty leagues of Irish Channel, which separates Old Caledonia from the Emerald Isle. Paddy O'Moore related his history. It was that of all emigrants driven by misfortune from their own country. Many come to seek fortunes who only find trouble and sorrow, and then they throw the blame on chance, and forget the true cause is their own idleness and vice and want of commonsense. Whoever is sober and industrious, honest and economical, gets on.

Such a one had been and was Paddy O'Moore. He left Dundalk, where he was starving, and came with his family to Australia, landed at Adelaide, where, refusing employment as a miner, he got engaged on a farm, and two months afterward commenced clearing ground on his own account.

The whole territory of South Australia is divided into lots, each containing eighty acres, and these are granted to colonists by the government. Any industrious man, by proper cultivation, can not only get a living out of his lot, but lay by pounds 80 a year.

Paddy O'Moore knew this. He profited by his own former experience, and laid by every penny he could till he had saved enough to purchase new lots. His family prospered, and his farm also. The Irish peasant became a landed proprietor, and though his little estate had only been under cultivation for two years, he had five hundred acres cleared by his own hands, and five hundred head of cattle. He was his own master, after having been a serf in Europe, and as independent as one can be in the freest country in the world.

His guests congratulated him heartily as he ended his narration; and Paddy O'Moore no doubt expected confidence for confidence, but he waited in vain. However, he was one of those discreet people who can say, "I tell you who I am, but I don't ask who you are." Glenarvan's great object was to get information about the BRITANNIA, and like a man who goes right to the point, he began at once to interrogate O'Moore as to whether he had heard of the shipwreck.

The reply of the Irishman was not favorable; he had never heard the vessel mentioned. For two years, at least, no ship had been wrecked on that coast, neither above nor below the Cape. Now, the date of the catastrophe was within two years. He could, therefore, declare positively that the survivors of the wreck had not been thrown on that part of the western shore. Now, my Lord," he added, "may I ask what interest you have in making the inquiry?"
This pointed question elicited in reply the whole history of the expedition. Glenarvan related the discovery of the document, and the various attempts that had been made to follow up the precise indications given of the whereabouts of the unfortunate captives; and he concluded his account by expressing his doubt whether they should ever find the Captain after all.

His dispirited tone made a painful impression on the minds of his auditors. Robert and Mary could not keep back their tears, and Paganel had not a word of hope or comfort to give them. John Mangles was grieved to the heart, though he, too, was beginning to yield to the feeling of hopelessness which had crept over the rest, when suddenly the whole party were electrified by hearing a voice exclaim: "My Lord, praise and thank God! if Captain Grant is alive, he is on this Australian continent."

CHAPTER VII THE QUARTERMASTER OF THE "BRITANNIA"

The surprise caused by these words cannot be described. Glenarvan sprang to his feet, and pushing back his seat, exclaimed: "Who spoke?"

"I did," said one of the servants, at the far end of the table.

"You, Ayrton!" replied his master, not less bewildered than Glenarvan.

"Yes, it was I," rejoined Ayrton in a firm tone, though somewhat agitated voice. "A Scotchman like yourself, my Lord, and one of the shipwrecked crew of the BRITANNIA."

The effect of such a declaration may be imagined. Mary Grant fell back, half-fainting, in Lady Helena's arms, overcome by joyful emotion, and Robert, and Mangles, and Paganel started up and toward the man that Paddy O'Moore had addressed as AYRTON. He was a coarse-looking fellow, about forty-five years of age, with very bright eyes, though half-hidden beneath thick, overhanging brows. In spite of extreme leanness there was an air of unusual strength about him. He seemed all bone and nerves, or, to use a Scotch expression, as if he had not wasted time in making fat. He was broad-shouldered and of middle height, and though his features were coarse, his face was so full of intelligence and energy and decision, that he gave one a favorable impression. The interest he excited was still further heightened by the marks of recent suffering imprinted on his countenance. It was evident that he had endured long and severe hardships, and that he had borne them bravely and come off victor.

"You are one of the shipwrecked sailors of the BRITANNIA?" was Glenarvan's first question.

"Yes, my Lord; Captain Grant's quartermaster."

"And saved with him after the shipwreck?"

"No, my Lord, no. I was separated from him at that terrible moment, for I was swept off the deck as the ship struck."

"Then you are not one of the two sailors mentioned in the document?"

"No; I was not aware of the existence of the document. The captain must have thrown it into the sea when I was no longer on board."

"But the captain? What about the captain?"

"I believed he had perished; gone down with all his crew. I imagined myself the sole survivor."

"But you said just now, Captain Grant was living."

"No, I said, 'if the captain is living.'"

"And you added, 'he is on the Australian continent.'"

"And, indeed, he cannot be anywhere else."

"Then you don't know where he is?"

"No, my Lord. I say again, I supposed he was buried beneath the waves, or dashed to pieces against the rocks. It was from you I learned that he was still alive."

"What then do you know?"

"Simply this--if Captain Grant is alive, he is in Australia."

"Where did the shipwreck occur?" asked Major McNabbs.

This should have been the first question, but in the excitement caused by the unexpected incident, Glenarvan cared more to know where the captain was, than where the BRITANNIA had been lost. After the Major's inquiry, however, Glenarvan's examination proceeded more logically, and before long all the details of the event stood out clearly before the minds of the company.

To the question put by the Major, Ayrton replied:

"When I was swept off the forecastle, when I was hauling in the jib-boom, the BRITANNIA was running right on the Australian coast. She was not more than two cables' length from it and consequently she must have struck just there."

"In latitude 37 degrees?" asked John Mangles.

"Yes, in latitude 37 degrees."

"On the west coast?"
"No, on the east coast," was the prompt reply.
"And at what date?"
"It was on the night of the 27th of June, 1862."
"Exactly, just exactly," exclaimed Glenarvan.
"You see, then, my Lord," continued Ayrton, "I might justly say, _If Captain Grant_ is alive, he is on the
Australian continent, and it is useless looking for him anywhere else."
"And we will look for him there, and find him too, and save him," exclaimed Paganel. "Ah, precious document," he added, with perfect NAIVETE, "you must own you have fallen into the hands of uncommonly shrewd people."

But, doubtless, nobody heard his flattering words, for Glenarvan and Lady Helena, and Mary Grant, and Robert,
were too much engrossed with Ayrton to listen to anyone else. They pressed round him and grasped his hands. It
seemed as if this man's presence was the sure pledge of Harry Grant's deliverance. If this sailor had escaped the
perils of the shipwreck, why should not the captain? Ayrton was quite sanguine as to his existence; but on what part
of the continent he was to be found, that he could not say. The replies the man gave to the thousand questions that
assailed him on all sides were remarkably intelligent and exact. All the while he spake, Mary held one of his hands
in hers. This sailor was a companion of her father's, one of the crew of the BRITANNIA. He had lived with Harry
Grant, crossed the seas with him and shared his dangers. Mary could not keep her eyes off his face, rough and
homely though it was, and she wept for joy.

Up to this time no one had ever thought of doubting either the veracity or identity of the quartermaster; but the
Major, and perhaps John Mangles, now began to ask themselves if this Ayrton's word was to be absolutely believed.
There was something suspicious about this unexpected meeting. Certainly the man had mentioned facts and dates
which corresponded, and the minuteness of his details was most striking. Still exactness of details was no positive
proof. Indeed, it has been noticed that a falsehood has sometimes gained ground by being exceedingly particular in
minutiae. McNabbs, therefore, prudently refrained from committing himself by expressing any opinion.

John Mangles, however, was soon convinced when he heard Ayrton speak to the young girl about her father. He
knew Mary and Robert quite well. He had seen them in Glasgow when the ship sailed. He remembered them at the
farewell breakfast given on board the BRITANNIA to the captain's friends, at which Sheriff McIntyre was present.
Robert, then a boy of ten years old, had been given into his charge, and he ran away and tried to climb the rigging.
"Yes, that I did, it is quite right," said Robert.

He went on to mention several other trifling incidents, without attaching the importance to them that John
Mangles did, and when he stopped Mary Grant said, in her soft voice: "Oh, go on, Mr. Ayrton, tell us more about
our father."

The quartermaster did his best to satisfy the poor girl, and Glenarvan did not interrupt him, though a score of
questions far more important crowded into his mind. Lady Helena made him look at Mary's beaming face, and the
words he was about to utter remained unspoken.

Ayrton gave an account of the BRITANNIA'S voyage across the Pacific. Mary knew most of it before, as news
of the ship had come regularly up to the month of May, 1862. In the course of the year Harry Grant had touched at
all the principal ports. He had been to the Hebrides, to New Guinea, New Zealand, and New Caledonia, and had
succeeded in finding an important point on the western coast of Papua, where the establishment of a Scotch colony
seemed to him easy, and its prosperity certain. A good port on the Molucca and Philippine route must attract ships,
especially when the opening of the Suez Canal would have supplanted the Cape route. Harry Grant was one of those
who appreciated the great work of M. De Lesseps, and would not allow political rivalries to interfere with
international interests.

After reconnoitering Papua, the BRITANNIA went to provision herself at Callao, and left that port on the 30th
of May, 1862, to return to Europe by the Indian Ocean and the Cape. Three weeks afterward, his vessel was disabled
by a fearful storm in which they were caught, and obliged to cut away the masts. A leak sprang in the hold, and
could not be stopped. The crew were too exhausted to work the pumps, and for eight days the BRITANNIA was
tossed about in the hurricane like a shuttlecock. She had six feet of water in her hold, and was gradually sinking. The
boats had been all carried away by the tempest; death stared them in the face, when, on the night of the 22d of June,
as Paganel had rightly supposed, they came in sight of the eastern coast of Australia.

The ship soon neared the shore, and presently dashed violently against it. Ayrton was swept off by a wave, and
thrown among the breakers, where he lost consciousness. When he recovered, he found himself in the hands of
natives, who dragged him away into the interior of the country. Since that time he had never heard the
BRITANNIA's name mentioned, and reasonably enough came to the conclusion that she had gone down with all
hands off the dangerous reefs of Twofold Bay.

This ended Ayrton's recital, and more than once sorrowful exclamations were evoked by the story. The Major
could not, in common justice, doubt its authenticity. The sailor was then asked to narrate his own personal history,
which was short and simple enough. He had been carried by a tribe of natives four hundred miles north of the 37th parallel. He spent a miserable existence there— not that he was ill-treated, but the natives themselves lived miserably. He passed two long years of painful slavery among them, but always cherished in his heart the hope of one day regaining his freedom, and watching for the slightest opportunity that might turn up, though he knew that his flight would be attended with innumerable dangers.

At length one night in October, 1864, he managed to escape the vigilance of the natives, and took refuge in the depths of immense forests. For a whole month he subsisted on roots, edible ferns and mimosa gums, wandering through vast solitudes, guiding himself by the sun during the day and by the stars at night. He went on, though often almost despairingly, through bogs and rivers, and across mountains, till he had traversed the whole of the uninhabited part of the continent, where only a few bold travelers have ventured; and at last, in an exhausted and all but dying condition, he reached the hospitable dwelling of Paddy O'Moore, where he said he had found a happy home in exchange for his labor.

"And if Ayrton speaks well of me," said the Irish settler, when the narrative ended, "I have nothing but good to say of him. He is an honest, intelligent fellow and a good

V. IV Verne worker; and as long as he pleases, Paddy O'Moore's house shall be his."

Ayrton thanked him by a gesture, and waited silently for any fresh question that might be put to him, though he thought to himself that he surely must have satisfied all legitimate curiosity. What could remain to be said that he had not said a hundred times already. Glenarvan was just about to open a discussion about their future plan of action, profiting by this rencontre with Ayrton, and by the information he had given them, when Major McNabbs, addressing the sailor said, "You were quartermaster, you say, on the BRITANNIA?"

"Yes," replied Ayrton, without the least hesitation.

But as if conscious that a certain feeling of mistrust, however slight, had prompted the inquiry, he added, "I have my shipping papers with me; I saved them from the wreck."

He left the room immediately to fetch his official document, and, though hardly absent a minute, Paddy O'Moore managed to say, "My Lord, you may trust Ayrton; I vouch for his being an honest man. He has been two months now in my service, and I have never had once to find fault with him. I knew all this story of his shipwreck and his captivity. He is a true man, worthy of your entire confidence."

Glenarvan was on the point of replying that he had never doubted his good faith, when the man came in and brought his engagement written out in due form. It was a paper signed by the shipowners and Captain Grant. Mary recognized her father's writing at once. It was to certify that "Tom Ayrton, able-bodied seaman, was engaged as quartermaster on board the three-mast vessel, the BRITANNIA, Glasgow."

There could not possibly be the least doubt now of Ayrton's identity, for it would have been difficult to account for his possession of the document if he were not the man named in it.

"Now then," said Glenarvan, "I wish to ask everyone's opinion as to what is best to be done. Your advice, Ayrton, will be particularly valuable, and I shall be much obliged if you would let us have it."

"Madam," replied Ayrton, readily enough, "I should re-embark in the DUNCAN, and go right to the scene of the catastrophe. There I should be guided by circumstances, and by any chance indications we might discover."

"Very good," returned Glenarvan; "but we must wait till the DUNCAN is repaired."
"Ah, she has been injured then?" said Ayrton.
"Yes," replied Mangles.
"To any serious extent?"
"No; but such injuries as require more skilful workmanship than we have on board. One of the branches of the screw is twisted, and we cannot get it repaired nearer than Melbourne."
"Well, let the ship go to Melbourne then," said Paganel, "and we will go without her to Twofold Bay."
"And how?" asked Mangles.
"By crossing Australia as we crossed America, keeping along the 37th parallel."
"But the DUNCAN?" repeated Ayrton, as if particularly anxious on that score.
"The DUNCAN can join us, or we can join her, as the case may be. Should we discover Captain Grant in the course of our journey, we can all return together to Melbourne. If we have to go on to the coast, on the contrary, then the DUNCAN can come to us there. Who has any objection to make? Have you, Major?"
"No, not if there is a practicable route across Australia."
"So practicable, that I propose Lady Helena and Miss Grant should accompany us."
"Are you speaking seriously?" asked Glenarvan.
"Perfectly so, my Lord. It is a journey of 350 miles, not more. If we go twelve miles a day it will barely take us a month, just long enough to put the vessel in trim. If we had to cross the continent in a lower latitude, at its wildest part, and traverse immense deserts, where there is no water and where the heat is tropical, and go where the most adventurous travelers have never yet ventured, that would be a different matter. But the 37th parallel cuts only through the province of Victoria, quite an English country, with roads and railways, and well populated almost everywhere. It is a journey you might make, almost, in a chaise, though a wagon would be better. It is a mere trip from London to Edinburgh, nothing more."
"What about wild beasts, though?" asked Glenarvan, anxious to go into all the difficulties of the proposal.
"There are no wild beasts in Australia."
"And how about the savages?"
"There are no savages in this latitude, and if there were, they are not cruel, like the New Zealanders."
"And the convicts?"
"There are no convicts in the southern provinces, only in the eastern colonies. The province of Victoria not only refused to admit them, but passed a law to prevent any ticket-of-leave men from other provinces from entering her territories. This very year the Government threatened to withdraw its subsidy from the Peninsular Company if their vessels continued to take in coal in those western parts of Australia where convicts are admitted. What! Don't you know that, and you an Englishman?"
"In the first place, I beg leave to say I am not an Englishman," replied Glenarvan.
"What M. Paganel says is perfectly correct," said Paddy O'Moore. "Not only the province of Victoria, but also Southern Australia, Queensland, and even Tasmania, have agreed to expel convicts from their territories. Ever since I have been on this farm, I have never heard of one in this Province."
"And I can speak for myself. I have never come across one."
"You see then, friends," went on Jacques Paganel, "there are few if any savages, no ferocious animals, no convicts, and there are not many countries of Europe for which you can say as much. Well, will you go?"
"What do you think, Helena?" asked Glenarvan.
"What we all think, dear Edward," replied Lady Helena, turning toward her companions; "let us be off at once."

CHAPTER VIII PREPARATION FOR THE JOURNEY

GLENARVAN never lost much time between adopting an idea and carrying it out. As soon as he consented to Paganel's proposition, he gave immediate orders to make arrangements for the journey with as little delay as possible. The time of starting was fixed for the 22d of December, the next day but one.

What results might not come out of this journey. The presence of Harry Grant had become an indisputable fact, and the chances of finding him had increased. Not that anyone expected to discover the captain exactly on the 37th parallel, which they intended strictly to follow, but they might come upon his track, and at all events, they were going to the actual spot where the wreck had occurred. That was the principal point.

Besides, if Ayrton consented to join them and act as their guide through the forests of the province of Victoria and right to the eastern coast, they would have a fresh chance of success. Glenarvan was sensible of this, and asked his host whether he would have any great objection to his asking Ayrton to accompany them, for he felt particularly desirous of securing the assistance of Harry Grant's old companion.

Paddy O'Moore consented, though he would regret the loss of his excellent servant.
"Well, then, Ayrton, will you come with us in our search expedition?"
Ayrton did not reply immediately. He even showed signs of hesitation; but at last, after due reflection, said,
"Yes, my Lord, I will go with you, and if I can not take you to Captain Grant, I can at least take you to the very place where his ship struck."
"Thanks, Ayrton."
"One question, my Lord."
"Well?"
"Where will you meet the DUNCAN again?"
"At Melbourne, unless we traverse the whole continent from coast to coast."
"But the captain?"
"The captain will await my instructions in the port of Melbourne."
"You may depend on me then, my Lord."
"I will, Ayrton."

The quartermaster was warmly thanked by the passengers of the DUNCAN, and the children loaded him with caresses. Everyone rejoiced in his decision except the Irishman, who lost in him an intelligent and faithful helper. But Paddy understood the importance Glenarvan attached to the presence of the man, and submitted. The whole party then returned to the ship, after arranging a rendezvous with Ayrton, and ordering him to procure the necessary means of conveyance across the country.

When John Mangles supported the proposition of Paganel, he took for granted that he should accompany the expedition. He began to speak to Glenarvan at once about it, and adduced all sorts of arguments to advance his cause—his devotion to Lady Helena and his Lordship, how useful he could be in organizing the party, and how useless on board the DUNCAN; everything, in fact, but the main reason, and that he had no need to bring forward.

"I'll only ask you one question, John," said Glenarvan. "Have you entire confidence in your chief officer?"
"Absolutely," replied Mangles, "Tom Austin is a good sailor. He will take the ship to her destination, see that the repairs are skillfully executed, and bring her back on the appointed day. Tom is a slave to duty and discipline. Never would he take it upon himself to alter or retard the execution of an order. Your Lordship may rely on him as on myself."

"Very well then, John," replied Glenarvan. "You shall go with us, for it would be advisable," he added, smiling, "that you should be there when we find Mary Grant's father."

"Oh! your Lordship," murmured John, turning pale. He could say no more, but grasped Lord Glenarvan's hand.

Next day, John Mangles and the ship's carpenter, accompanied by sailors carrying provisions, went back to Paddy O'Moore's house to consult the Irishman about the best method of transport. All the family met him, ready to give their best help. Ayrton was there, and gave the benefit of his experience.

On one point both he and Paddy agreed, that the journey should be made in a bullock-wagon by the ladies, and that the gentlemen should ride on horseback. Paddy could furnish both bullocks and vehicle. The vehicle was a cart twenty feet long, covered over by a tilt, and resting on four large wheels without spokes or felloes, or iron tires— in a word, plain wooden discs. The front and hinder part were connected by means of a rude mechanical contrivance, which did not allow of the vehicle turning quickly. There was a pole in front thirty-five feet long, to which the bullocks were to be yoked in couples. These animals were able to draw both with head and neck, as their yoke was fastened on the nape of the neck, and to this a collar was attached by an iron peg. It required great skill to drive such a long, narrow, shaky concern, and to guide such a team by a goad; but Ayrton had served his apprenticeship to it on the Irishman's farm, and Paddy could answer for his com-petency. The role of conductor was therefore assigned to him.

There were no springs to the wagon, and, consequently, it was not likely to be very comfortable; but, such as it was, they had to take it. But if the rough construction could not be altered, John Mangles resolved that the interior should be made as easy as possible. His first care was to divide it into two compartments by a wooden partition. The back one was intended for the provisions and luggage, and M. Olbinett's portable kitchen. The front was set apart especially for the ladies, and, under the carpenter's hands, was to be speedily converted into a comfortable room, covered with a thick carpet, and fitted up with a toilet table and two couches. Thick leather curtains shut in this apartment, and protected the occupants from the chilliness of the nights. In case of necessity, the gentlemen might shelter themselves here, when the violent rains came on, but a tent was to be their usual resting-place when the caravan camped for the night. John Mangles exercised all his ingenuity in furnishing the small space with everything that the two ladies could possibly require, and he succeeded so well, that neither Lady Helena nor Mary had much reason to regret leaving their cozy cabins on board the DUNCAN.

For the rest of the party, the preparations were soon made, for they needed much less. Strong horses were provided for Lord Glenarvan, Paganel, Robert Grant, McNabbs, and John Mangles; also for the two sailors, Wilson and Mulrady, who were to accompany their captain. Ayrton's place was, of course, to be in front of the wagon, and M. Olbinett, who did not much care for equitation, was to make room for himself among the baggage. Horses and
bullocks were grazing in the Irishman's meadows, ready to fetch at a moment's notice.

After all arrangements were made, and the carpenter set to work, John Mangles escorted the Irishman and his family back to the vessel, for Paddy wished to return the visit of Lord Glenarvan. Ayrton thought proper to go too, and about four o'clock the party came over the side of the DUNCAN.

They were received with open arms. Glenarvan would not be outstripped in politeness, and invited his visitors to stop and dine. His hospitality was willingly accepted. Paddy was quite amazed at the splendor of the saloon, and was loud in admiration of the fitting up of the cabins, and the carpets and hangings, as well as of the polished maple-wood of the upper deck. Ayrton's approbation was much less hearty, for he considered it mere costly superfluity.

But when he examined the yacht with a sailor's eye, the quartermaster of the BRITANNIA was as enthusiastic about it as Paddy. He went down into the hold, inspected the screw department and the engine-room, examining the engine thoroughly, and inquired about its power and consumption. He explored the coal-bunkers, the store-room, the powder-store, and armory, in which last he seemed to be particularly attracted by a cannon mounted on the forecastle. Glenarvan saw he had to do with a man who understood such matters, as was evident from his questions. Ayrton concluded his investigations by a survey of the masts and rigging.

"You have a fine vessel, my Lord," he said after his curiosity was satisfied.
"A good one, and that is best," replied Glenarvan.
"And what is her tonnage?"
"Two hundred and ten tons."
"I don't think I am far out," continued Ayrton, "in judging her speed at fifteen knots. I should say she could do that easily."
"Say seventeen," put in John Mangles, "and you've hit the mark."
"Seventeen!" exclaimed the quartermaster. "Why, not a man-of-war--not the best among them, I mean--could chase her!"
"Not one," replied Mangles. "The DUNCAN is a regular racing yacht, and would never let herself be beaten."
"Even at sailing?" asked Ayrton.
"Even at sailing."
"Well, my Lord, and you too, captain," returned Ayrton, "allow a sailor who knows what a ship is worth, to compliment you on yours."
"Stay on board of her, then, Ayrton," said Glenarvan; "it rests with yourself to call it yours."
"I will think of it, my Lord," was all Ayrton's reply.
Just then M. Olbinett came to announce dinner, and his Lordship repaired with his guests to the saloon.
"That Ayrton is an intelligent man," said Paganel to the Major.
"Too intelligent!" muttered McNabbs, who, without any apparent reason, had taken a great dislike to the face and manners of the quartermaster.

During the dinner, Ayrton gave some interesting details about the Australian continent, which he knew perfectly. He asked how many sailors were going to accompany the expedition, and seemed astonished to hear that only two were going. He advised Glenarvan to take all his best men, and even urged him to do it, which advice, by the way, ought to have removed the Major's suspicion.
"But," said Glenarvan, "our journey is not dangerous, is it?"
"Not at all," replied Ayrton, quickly.
"Well then, we'll have all the men we can on board. Hands will be wanted to work the ship, and to help in the repairs. Besides, it is of the utmost importance that she should meet us to the very day, at whatever place may be ultimately selected. Consequently, we must not lessen her crew."
Ayrton said nothing more, as if convinced his Lordship was right.

When evening came, Scotch and Irish separated. Ayrton and Paddy O'Moore and family returned home. Horses and wagons were to be ready the next day, and eight o'clock in the morning was fixed for starting.

Lady Helena and Mary Grant soon made their preparations. They had less to do than Jacques Paganel, for he spent half the night in arranging, and wiping, and rubbing up the lenses of his telescope. Of course, next morning he slept on till the Major's stentorian voice roused him.

The luggage was already conveyed to the farm, thanks to John Mangles, and a boat was waiting to take the passengers. They were soon seated, and the young captain gave his final orders to Tom Austin, his chief officer. He impressed upon him that he was to wait at Melbourne for Lord Glenarvan's commands, and to obey them scrupulously, whatever they might be.

The old sailor told John he might rely on him, and, in the name of the men, begged to offer his Lordship their best wishes for the success of this new expedition.

A storm of hurrahs burst forth from the yacht as the boat rowed off. In ten minutes the shore was reached, and a
quarter of an hour afterward the Irishman's farm. All was ready. Lady Helena was enchanted with her installation. The huge chariot, with its primitive wheels and massive planks, pleased her particularly. The six bullocks, yoked in pairs, had a patriarchal air about them which took her fancy. Ayrtin, goad in hand, stood waiting the orders of this new master.

"My word," said Paganel, "this is a famous vehicle; it beats all the mail-coaches in the world. I don't know a better fashion of traveling than in a mountebank's caravan— a movable house, which goes or stops wherever you please. What can one wish better? The Samaritians understood that, and never traveled in any other way."

"Monsieur Paganel," said Lady Helena, "I hope I shall have the pleasure of seeing you in my SALONS."

"Assuredly, madam, I should count it an honor. Have you fixed the day?"

"I shall be at home every day to my friends," replied Lady Helena; "and you are--"

"The most devoted among them all," interrupted Paganel, gaily.

These mutual compliments were interrupted by the arrival of the seven horses, saddled and ready. They were brought by Paddy's sons, and Lord Glenarvan paid the sum stipulated for his various purchases, adding his cordial thanks, which the worthy Irishman valued at least as much as his golden guineas.

The signal was given to start, and Lady Helena and Mary took their places in the reserved compartment. Ayrtin seated himself in front, and Olbinett scrambled in among the luggage. The rest of the party, well armed with carbines and revolvers, mounted their horses. Ayrtin gave a peculiar cry, and his team set off. The wagon shook and the planks creaked, and the axles grated in the naves of the wheels; and before long the hospitable farm of the Irishman was out of sight.

CHAPTER IX A COUNTRY OF PARADOXES

IT was the 23d of December, 1864, a dull, damp, dreary month in the northern hemisphere; but on the Australian continent it might be called June. The hottest season of the year had already commenced, and the sun's rays were almost tropical, when Lord Glenarvan started on his new expedition.

Most fortunately the 37th parallel did not cross the immense deserts, inaccessible regions, which have cost many martyrs to science already. Glenarvan could never have encountered them. He had only to do with the southern part of Australia—viz., with a narrow portion of the province of Adelaide, with the whole of Victoria, and with the top of the reversed triangle which forms New South Wales.

It is scarcely sixty-two miles from Cape Bernouilli to the frontiers of Victoria. It was not above a two days' march, and Ayrtin reckoned on their sleeping next night at Apsley, the most westerly town of Victoria.

The commencement of a journey is always marked by ardor, both in the horses and the horsemen. This is well enough in the horsemen, but if the horses are to go far, their speed must be moderated and their strength husbanded. It was, therefore, fixed that the average journey every day should not be more than from twenty-five to thirty miles.

Besides, the pace of the horses must be regulated by the slower pace of the bullocks, truly mechanical engines which lose in time what they gain in power. The wagon, with its passengers and provisions, was the very center of the caravan, the moving fortress. The horsemen might act as scouts, but must never be far away from it.

As no special marching order had been agreed upon, everybody was at liberty to follow his inclinations within certain limits. The hunters could scour the plain, amiable folks could talk to the fair occupants of the wagon, and philosophers could philosophize. Paganel, who was all three combined, had to be and was everywhere at once.

The march across Adelaide presented nothing of any particular interest. A succession of low hills rich in dust, a long stretch of what they call in Australia "bush," several prairies covered with a small prickly bush, considered a great dainty by the ovine tribe, embraced many miles. Here and there they noticed a species of sheep peculiar to New Holland— sheep with pig's heads, feeding between the posts of the telegraph line recently made between Adelaide and the coast.

Up to this time there had been a singular resemblance in the country to the monotonous plains of the Argentine Pampas. There was the same grassy flat soil, the same sharply-defined horizon against the sky. McNabb's declared they had never changed countries; but Paganel told him to wait, and he would soon see a difference. And on the faith of this assurance marvelous things were expected by the whole party.

In this fashion, after a march of sixty miles in two days, the caravan reached the parish of Apsley, the first town in the Province of Victoria in the Wimerra district.

The wagon was put up at the Crown Inn. Supper was soon smoking on the table. It consisted solely of mutton served up in various ways.

They all ate heartily, but talked more than they ate, eagerly asking Paganel questions about the wonders of the country they were just beginning to traverse. The amiable geographer needed no pressing, and told them first that this part of it was called Australia Felix.

"Wrongly named!" he continued. "It had better have been called rich, for it is true of countries, as individuals, that riches do not make happiness. Thanks to her gold mines, Australia has been abandoned to wild devastating
adventurers. You will come across them when we reach the gold fields."

"Is not the colony of Victoria of but a recent origin?" asked Lady Glenarvan.

"Yes, madam, it only numbers thirty years of existence. It was on the 6th of June, 1835, on a Tuesday--"

"At a quarter past seven in the evening," put in the Major, who delighted in teasing the Frenchman about his precise dates.

"No, at ten minutes past seven," replied the geographer, gravely, "that Batman and Falckner first began a settlement at Port Phillip, the bay on which the large city of Melbourne now stands. For fifteen years the colony was part of New South Wales, and recognized Sydney as the capital; but in 1851, she was declared independent, and took the name of Victoria."

"And has greatly increased in prosperity since then, I believe," said Glenarvan.

"Judge for yourself, my noble friend," replied Paganel. "Here are the numbers given by the last statistics; and let McNabbs say as he likes, I know nothing more eloquent than statistics."

"Go on," said the Major.

"Well, then, in 1836, the colony of Port Phillip had 224 inhabitants. To-day the province of Victoria numbers 550,000. Seven millions of vines produce annually 121,- 000 gallons of wine. There are 103,000 horses spreading over the plains, and 675,272 horned cattle graze in her wide-stretching pastures."

"Is there not also a certain number of pigs?" inquired McNabbs.

"Yes, Major, 79,625."

"And how many sheep?"

"7,115,943, McNabbs."

"Including the one we are eating at this moment."

"No, without counting that, since it is three parts devoured."

"Bravo, Monsieur Paganel," exclaimed Lady Helena, laughing heartily. "It must be owned you are posted up in geographical questions, and my cousin McNabbs need not try and find you tripping."

"It is my calling, Madam, to know this sort of thing, and to give you the benefit of my information when you please. You may therefore believe me when I tell you that wonderful things are in store for you in this strange country."

"It does not look like it at present," said McNabbs, on purpose to tease Paganel.

"Just wait, impatient Major," was his rejoinder. "You have hardly put your foot on the frontier, when you turn round and abuse it. Well, I say and say again, and will always maintain that this is the most curious country on the earth. Its formation, and nature, and products, and climate, and even its future disappearance have amazed, and are now amazing, and will amaze, all the SAVANTS in the world. Think, my friends, of a continent, the margin of which, instead of the center, rose out of the waves originally like a gigantic ring, which encloses, perhaps, in its center, a sea partly evaporated, the waves of which are drying up daily; where humidity does not exist either in the air or in the soil; where the trees lose their bark every year, instead of their leaves; where the leaves present their sides to the sun and not their face, and consequently give no shade; where the wood is often incombustible, where good-sized stones are dissolved by the rain; where the forests are low and the grasses gigantic; where the animals are strange; where quadrupeds have beaks, like the echidna, or ornithorhynchus, and naturalists have been obliged to create a special order for them, called monotremes; where the kangaroos leap on unequal legs, and sheep have pigs' heads; where foxes fly about from tree to tree; where the swans are black; where rats make nests; where the bowerbird opens her reception-rooms to receive visits from her feathered friends; where the birds astonish the imagination by the variety of their notes and their aptness; where one bird serves for a clock, and another makes a sound like a postillion cracking of a whip, and a third imitates a knife-grinder, and a fourth the motion of a pendulum; where one laughs when the sun rises, and another cries when the sun sets! Oh, strange, illogical country, land of paradoxes and anomalies, if ever there was one on earth--the learned botanist Grimard was right when he said, 'There is that Australia, a sort of parody, or rather a defiance of universal laws in the face of the rest of the world.'"

Paganel's tirade was poured forth in the most impetuous manner, and seemed as if it were never coming to an end. The eloquent secretary of the Geographical Society was no longer master of himself. He went on and on, gesticulating furiously, and brandishing his fork to the imminent danger of his neighbors. But at last his voice was drowned in a thunder of applause, and he managed to stop.

Certainly after such an enumeration of Australian peculiarities, he might have been left in peace but the Major said in the coolest tone possible: "And is that all, Paganel?"

"No, indeed not," rejoined the Frenchman, with renewed vehemence.

"What!" exclaimed Lady Helena; "there are more wonders still in Australia?"

"Yes, Madam, its climate. It is even stranger than its productions."

"Is it possible?" they all said.
"I am not speaking of the hygienic qualities of the climate," continued Paganel, "rich as it is in oxygen and poor in azote. There are no damp winds, because the trade winds blow regularly on the coasts, and most diseases are unknown, from typhus to measles, and chronic affections."

"Still, that is no small advantage," said Glenarvan.

"No doubt; but I am not referring to that, but to one quality it has which is incomparable."

"And what is that?"

"You will never believe me."

"Yes, we will," exclaimed his auditors, their curiosity aroused by this preamble.

"Well, it is--"

"It is what?"

"It is a moral regeneration."

"A moral regeneration?"

"Yes," replied the SAVANT, in a tone of conviction. "Here metals do not get rust on them by exposure to the air, nor men. Here the pure, dry atmosphere whitens everything rapidly, both linen and souls. The virtue of the climate must have been well known in England when they determined to send their criminals here to be reformed."

"What! do you mean to say the climate has really any such influence?" said Lady Helena.

"Yes, Madam, both on animals and men."

"You are not joking, Monsieur Paganel?"

"I am not, Madam. The horses and the cattle here are of incomparable docility. You see it?"

"It is impossible!"

"But it is a fact. And the convicts transported into this reviving, salubrious air, become regenerated in a few years. Philanthropists know this. In Australia all natures grow better."

"But what is to become of you then, Monsieur Paganel, in this privileged country--you who are so good already?" said Lady Helena. "What will you turn out?"

"Excellent, Madam, just excellent, and that's all."

CHAPTER X AN ACCIDENT

THE next day, the 24th of December, they started at daybreak. The heat was already considerable, but not unbearable, and the road was smooth and good, and allowed the cavalcade to make speedy progress. In the evening they camped on the banks of the White Lake, the waters of which are brackish and undrinkable.

Jacques Paganel was obliged to own that the name of this lake was a complete misnomer, for the waters were no more white than the Black Sea is black, or the Red Sea red, or the Yellow River yellow, or the Blue Mountains blue. However, he argued and disputed the point with all the _amour propre_ of a geographer, but his reasoning made no impression.

M. Olbinett prepared the evening meal with his accustomed punctuality, and after this was dispatched, the travelers disposed themselves for the night in the wagon and in the tent, and were soon sleeping soundly, notwithstanding the melancholy howling of the "dingoes," the jackals of Australia.

A magnificent plain, thickly covered with chrysanthemums, stretched out beyond the lake, and Glenarvan and his friends would gladly have explored its beauties when they awoke next morning, but they had to start. As far as the eye could reach, nothing was visible but one stretch of prairie, enameled with flower, in all the freshness and abundance of spring. The blue flowers of the slender-leaved flax, combined with the bright hues of the scarlet acanthus, a flower peculiar to the country.

A few cassowaries were bounding over the plain, but it was impossible to get near them. The Major was fortunate enough, however, to hit one very rare animal with a ball in the leg. This was the jabiru, a species which is fast disappearing, the gigantic crane of the English colonies. This winged creature was five feet high, and his wide, conical, extremely pointed beak, measured eighteen inches in length. The violet and purple tints of his head contrasted vividly with the glossy green of his neck, and the dazzling whiteness of his throat, and the bright red of his long legs. Nature seems to have exhausted in its favor all the primitive colors on her palette.

V. IV Verne

Great admiration was bestowed on this bird, and the Major's spoil would have borne the honors of the day, had not Robert come across an animal a few miles further on, and bravely killed it. It was a shapeless creature, half porcupine, half ant-eater, a sort of unfinished animal belonging to the first stage of creation. A long glutinous extensible tongue hung out of his jaws in search of the ants, which formed its principal food.

"It is an echidna," said Paganel. "Have you ever seen such a creature?"

"It is horrible," replied Glenarvan.

"Horrible enough, but curious, and, what's more, peculiar to Australia. One might search for it in vain in any other part of the world."
Naturally enough, the geographer wished to preserve this interesting specimen of monotremata, and wanted to stow it away in the luggage; but M. Olbinett resented the idea so indignantly, that the SAVANT was obliged to abandon his project.

About four o'clock in the afternoon, John Mangles descried an enormous column of smoke about three miles off, gradually overspreading the whole horizon. What could be the cause of this phenomenon? Paganel was inclined to think it was some description of meteor, and his lively imagination was already in search of an explanation, when Ayrton cut short all his conjectures summarily, by announcing that the cloud of dust was caused by a drove of cattle on the road.

The quartermaster proved right, for as the cloud came nearer, quite a chorus of bleatings and neighings, and bellowings escaped from it, mingled with the loud tones of a human voice, in the shape of cries, and whistles, and vociferations.

Presently a man came out of the cloud. This was the leader-in-chief of the four-footed army. Glenarvan advanced toward him, and friendly relations were speedily established between them. The leader, or to give him his proper designation, the stock-keeper, was part owner of the drove. His name was Sam Machell, and he was on his way from the eastern provinces to Portland Bay.

The drove numbered 12,075 head in all, or 1,000 bullocks, 11,000 sheep, and 75 horses. All these had been bought in the Blue Mountains in a poor, lean condition, and were going to be fatted up on the rich pasture lands of Southern Australia, and sold again at a great profit. Sam Machell expected to get pounds 2 on each bullock, and 10s. on every sheep, which would bring him in pounds 3,750. This was doing good business; but what patience and energy were required to conduct such a restive, stubborn lot to their destination, and what fatigues must have to be endured. Truly the gain was hardly earned.

Sam Machell told his history in a few words, while the drove continued their march among the groves of mimosas. Lady Helena and Mary and the rest of the party seated themselves under the shade of a wide-spreading gum-tree, and listened to his recital.

It was seven months since Sam Machell had started. He had gone at the rate of ten miles a day, and his interminable journey would last three months longer. His assistants in the laborious task comprised twenty dogs and thirty men, five of whom were blacks, and very serviceable in tracking up any strayed beasts. Six wagons made the rear-guard. All the men were armed with stockwhips, the handles of which are eighteen inches long, and the lash nine feet, and they move about among the racks, bringing refractory animals back into order, while the dogs, the light cavalry of the regiment, preserved discipline in the wings.

The travelers were struck with the admirable arrangement of the drove. The different stock were kept apart, for wild sheep and bullocks would not have got on together at all. The bullocks would never have grazed where the sheep had passed along, and consequently they had to go first, divided into two battalions. Five regiments of sheep followed, in charge of twenty men, and last of all came the horses.

Sam Machell drew the attention of his auditors to the fact that the real guides of the drove were neither the men nor the dogs, but the oxen themselves, beasts of superior intelligence, recognized as leaders by their congenitors. They advanced in front with perfect gravity, choosing the best route by instinct, and fully alive to their claim to respect. Indeed, they were obliged to be studied and humored in everything, for the whole drove obeyed them implicitly. If they took it into their heads to stop, it was a matter of necessity to yield to their good pleasure, for not a single animal would move a step till these leaders gave the signal to set off.

Sundry details, added by the stock-keeper, completed the history of this expedition, worthy of being written, if not commended by Xenophon himself. As long as the troop marched over the plains it was well enough, there was little difficulty or fatigue. The animals fed as they went along, and slaked their thirst at the numerous creeks that watered the plains, sleeping at night and making good progress in the day, always obedient and tractable to the dogs. But when they had to go through great forests and groves of eucalyptus and mimosas, the difficulties increased. Platoons, battalions and regiments got all mixed together or scattered, and it was a work of time to collect them again. Should a "leader" unfortunately go astray, he had to be found, cost what it might, on pain of a general disbandment, and the blacks were often long days in quest of him, before their search was successful. During the heavy rains the lazy beasts refused to stir, and when violent storms chanced to occur, the creatures became almost mad with terror, and were seized with a wild, disorderly panic.

However, by dint of energy and ambition, the stock-keeper triumphed over these difficulties, incessantly renewed though they were. He kept steadily on; mile after mile of plains and woods, and mountains, lay behind. But in addition to all his other qualities, there was one higher than all that he specially needed when they came to rivers. This was patience—patience that could stand any trial, and not only could hold out for hours and days, but for weeks. The stock-keeper would be himself forced to wait on the banks of a stream that might have been crossed at once. There was nothing to hinder but the obstinacy of the herd. The bullocks would taste the water and turn back. The
sheep fled in all directions, afraid to brave the liquid element. The stock-keeper hoped when night came he might manage them better, but they still refused to go forward. The rams were dragged in by force, but the sheep would not follow. They tried what thirst would do, by keeping them without drink for several days, but when they were brought to the river again, they simply quenched their thirst, and declined a more intimate acquaintance with the water. The next expedient employed was to carry all the lambs over, hoping the mothers would be drawn after them, moved by their cries. But the lambs might bleat as pitifully as they liked, the mothers never stirred. Sometimes this state of affairs would last a whole month, and the stock-keeper would be driven to his wits' end by his bleating, bellowing, neighing army. Then all of a sudden, one fine day, without rhyme or reason, a detachment would take it into their heads to make a start across, and the only difficulty now was to keep the whole herd from rushing helter-skelter after them. The wildest confusion set in among the ranks, and numbers of the animals were drowned in the passage.

Such was the narrative of Sam Machell. During its recital, a considerable part of the troop had filed past in good order. It was time for him to return to his place at their head, that he might be able to choose the best pasturage. Taking leave of Lord Glenarvan, he sprang on a capital horse of the native breed, that one of his men held waiting for him, and after shaking hands cordially with everybody all round, took his departure. A few minutes later, nothing was visible of the stock-keeper and his troop but a cloud of dust.

The wagon resumed its course in the opposite direction, and did not stop again till they halted for the night at the foot of Mount Talbot.

Paganel made the judicious observation that it was the 25th of December, the Christmas Day so dear to English hearts. But the steward had not forgotten it, and an appetizing meal was soon ready under the tent, for which he deserved and received warm compliments from the guests. Indeed, M. Olbinett had quite excelled himself on this occasion. He produced from his stores such an array of European dishes as is seldom seen in the Australian desert. Reindeer hams, slices of salt beef, smoked salmon, oat cakes, and barley meal scones; tea _ad libitum_, and whisky in abundance, and several bottles of port, composed this astonishing meal. The little party might have thought themselves in the grand dining-hall of Malcolm Castle, in the heart of the Highlands of Scotland.

The next day, at 11 A. M., the wagon reached the banks of the Wimerra on the 143d meridian.

The river, half a mile in width, wound its limpid course between tall rows of gum-trees and acacias. Magnificent specimens of the MYRTACEA, among others, the _metroside-ros speciosa_, fifteen feet high, with long drooping branches, adorned with red flowers. Thousands of birds, the lories, and greenfinches, and gold-winged pigeons, not to speak of the noisy paroquets, flew about in the green branches. Below, on the bosom of the water, were a couple of shy and unapproachable black swans. This _rara avis_ of the Australian rivers soon disappeared among the windings of the Wimerra, which water the charming landscape in the most capricious manner.

The wagon stopped on a grassy bank, the long fringes of which dipped in the rapid current. There was neither raft nor bridge, but cross over they must. Ayrton looked about for a practicable ford. About a quarter of a mile up the water seemed shallower, and it was here they determined to try to pass over. The soundings in different parts showed a depth of three feet only, so that the wagon might safely enough venture.

"I suppose there is no other way of fording the river?" said Glenarvan to the quartermaster.

"No, my Lord; but the passage does not seem dangerous. We shall manage it."

"Shall Lady Glenarvan and Miss Grant get out of the wagon?"

"Not at all. My bullocks are sure-footed, and you may rely on me for keeping them straight."

"Very well, Ayrton; I can trust you."

The horsemen surrounded the ponderous vehicle, and all stepped boldly into the current. Generally, when wagons have to ford rivers, they have empty casks slung all round them, to keep them floating on the water; but they had no such swimming belt with them on this occasion, and they could only depend on the sagacity of the animals and the prudence of Ayrton, who directed the team. The Major and the two sailors were some feet in advance. Glenarvan and John Mangles went at the sides of the wagon, ready to lend any assistance the fair travelers might require, and Paganel and Robert brought up the rear.

All went well till they reached the middle of the Wimerra, but then the hollow deepened, and the water rose to the middle of the wheels. The bullocks were in danger of losing their footing, and dragging with them the oscillating vehicle. Ayrton devoted himself to his task courageously. He jumped into the water, and hanging on by the bullocks' horns, dragged them back into the right course.

Suddenly the wagon made a jolt that it was impossible to prevent; a crack was heard, and the vehicle began to lean over in a most precarious manner. The water now rose to the ladies' feet; the whole concern began to float, though John Mangles and Lord Glenarvan hung on to the side. It was an anxious moment.

Fortunately a vigorous effort drove the wagon toward the opposite shore, and the bank began to slope upward, so that the horses and bullocks were able to regain their footing, and soon the whole party found themselves on the
other side, glad enough, though wet enough too.

The fore part of the wagon, however, was broken by the jolt, and Glenarvan's horse had lost a shoe.

This was an accident that needed to be promptly repaired. They looked at each other hardly knowing what to do, till Ayrton proposed he should go to Black Point Station, twenty miles further north, and bring back a blacksmith with him.

"Yes, go, my good fellow," said Glenarvan. "How long will it take you to get there and back?"

"About fifteen hours," replied Ayrton, "but not longer."

"Start at once, then, and we will camp here, on the banks of the Wimerra, till you return."

CHAPTER XI CRIME OR CALAMITY

IT was not without apprehension that the Major saw Ayrton quit the Wimerra camp to go and look for a blacksmith at the Black Point Station. But he did not breathe a word of his private misgivings, and contented himself with watching the neighborhood of the river; nothing disturbed the repose of those tranquil glades, and after a short night the sun reappeared on the horizon.

As to Glenarvan, his only fear was lest Ayrton should return alone. If they fail to find a workman, the wagon could not resume the journey. This might end in a delay of many days, and Glenarvan, impatient to succeed, could brook no delay, in his eagerness to attain his object.

Ayrton luckily had lost neither his time nor his trouble. He appeared next morning at daybreak, accompanied by a man who gave himself out as the blacksmith from BlackPoint Station. He was a powerful fellow, and tall, but his features were of a low, brutal type, which did not prepossess anyone in his favor. But that was nothing, provided he knew his business. He scarcely spoke, and certainly he did not waste his breath in useless words.

"Is he a good workman?" said John Mangles to the quartermaster.

"I know no more about him than you do, captain," said Ayrton. "But we shall see."

The blacksmith set to work. Evidently that was his trade, as they could plainly see from the way he set about repairing the forepart of the wagon. He worked skilfully and with uncommon energy. The Major observed that the flesh of his wrists was deeply furrowed, showing a ring of extravasated blood. It was the mark of a recent injury, which the sleeve of an old woolen shirt could not conceal. McNabbs questioned the blacksmith about those sores which looked so painful. The man continued his work without answering. Two hours more and the damage the carriage had sustained was made good. As to Glenarvan's horse, it was soon disposed of. The blacksmith had had the forethought to bring the shoes with him. These shoes had a peculiarity which did not escape the Major; it was a trefoil clumsily cut on the back part. McNabbs pointed it out to Ayrton.

"It is the Black-Point brand," said the quartermaster. "That enables them to track any horses that may stray from the station, and prevents their being mixed with other herds."

The horse was soon shod. The blacksmith claimed his wage, and went off without uttering four words.

The horse was soon shod. The blacksmith claimed his wage, and went off without uttering four words.

Half an hour later, the travelers were on the road. Beyond the grove of mimosas was a stretch of sparsely timbered country, which quite deserved its name of "open plain." Some fragments of quartz and ferruginous rock lay among the scrub and the tall grass, where numerous flocks were feeding. Some miles farther the wheels of the wagon plowed deep into the alluvial soil, where irregular creeks murmured in their beds, half hidden among giant reeds. By-and-by they skirted vast salt lakes, rapidly evaporating. The journey was accomplished without trouble, and, indeed, without fatigue.

Lady Helena invited the horsemen of the party to pay her a visit in turns, as her reception-room was but small, and in pleasant converse with this amiable woman they forgot the fatigue of their day's ride.

Lady Helena, seconded by Miss Mary, did the honors of their ambulatory house with perfect grace. John Mangles was not forgotten in these daily invitations, and his somewhat serious conversation was not unpleasing.

The party crossed, in a diagonal direction, the mail-coach road from Crowland to Horsham, which was a very dusty one, and little used by pedestrians.

The spurs of some low hills were skirted at the boundary of Talbot County, and in the evening the travelers reached a point about three miles from Maryborough. The fine rain was falling, which, in any other country, would have soaked the ground; but here the air absorbed the moisture so wonderfully that the camp did not suffer in the least.

Next day, the 29th of December, the march was delayed somewhat by a succession of little hills, resembling a miniature Switzerland. It was a constant repetition of up and down hill, and many a jolt besides, all of which were scarcely pleasant. The travelers walked part of the way, and thought it no hardship.

At eleven o'clock they arrived at Carisbrook, rather an important municipality. Ayrton was for passing outside the town without going through it, in order, he said, to save time. Glenarvan concurred with him, but Paganel, always eager for novelties, was for visiting Carisbrook. They gave him his way, and the wagon went on slowly.

Paganel, as was his custom, took Robert with him. His visit to the town was very short, but it sufficed to give
him an exact idea of Australian towns. There was a bank, a court-house, a market, a church, and a hundred or so of brick houses, all exactly alike. The whole town was laid out in squares, crossed with parallel streets in the English fashion. Nothing could be more simple, nothing less attractive. As the town grows, they lengthen the streets as we lengthen the trousers of a growing child, and thus the original symmetry is undisturbed.

Carisbrook was full of activity, a remarkable feature in these towns of yesterday. It seems in Australia as if towns shot up like trees, owing to the heat of the sun. Men of business were hurrying along the streets; gold buyers were hastening to meet the in-coming escort; the precious metal, guarded by the local police, was coming from the mines at Bendigo and Mount Alexander. All the little world was so absorbed in its own interests, that the strangers passed unobserved amid the laborious inhabitants.

After an hour devoted to visiting Carisbrook, the two visitors rejoined their companions, and crossed a highly cultivated district. Long stretches of prairie, known as the "Low Level Plains," next met their gaze, dotted with countless sheep, and shepherds' huts. And then came a sandy tract, without any transition, but with the abruptness of change so characteristic of Australian scenery. Mount Simpson and Mount Terrengower marked the southern point where the boundary of the Loddon district cuts the 144th meridian.

As yet they had not met with any of the aboriginal tribes living in the savage state. Glenarvan wondered if the Australians were wanting in Australia, as the Indians had been wanting in the Pampas of the Argentine district; but Paganel told him that, in that latitude, the natives frequented chiefly the Murray Plains, about one hundred miles to the eastward.

"We are now approaching the gold district," said he, "in a day or two we shall cross the rich region of Mount Alexander. It was here that the swarm of diggers alighted in 1852; the natives had to fly to the interior. We are in civilized districts without seeing any sign of it; but our road will, before the day is over, cross the railway which connects the Murray with the sea. Well, I must confess, a railway in Australia does seem to me an astonishing thing!"

"And pray, why, Paganel?" said Glenarvan.

"Why? because it jars on one's ideas. Oh! I know you English are so used to colonizing distant possessions. You, who have electric telegraphs and universal exhibitions in New Zealand, you think it is all quite natural. But it dumbfounders the mind of a Frenchman like myself, and confuses all one's notions of Australia!"

"Because you look at the past, and not at the present," said John Mangles.

A loud whistle interrupted the discussion. The party were within a mile of the railway. Quite a number of persons were hastening toward the railway bridge. The people from the neighboring stations left their houses, and the shepherds their flocks, and crowded the approaches to the railway. Every now and then there was a shout, "The railway! the railway!"

Something serious must have occurred to produce such an agitation. Perhaps some terrible accident.

Glenarvan, followed by the rest, urged on his horse. In a few minutes he arrived at Camden Bridge and then he became aware of the cause of such an excitement.

A fearful accident had occurred; not a collision, but a train had gone off the line, and then there had been a fall. The affair recalled the worst disasters of American railways. The river crossed by the railway was full of broken carriages and the engine. Whether the weight of the train had been too much for the bridge, or whether the train had gone off the rails, the fact remained that five carriages out of six fell into the bed of the Loddon, dragged down by the locomotive. The sixth carriage, miraculously preserved by the breaking of the coupling chain, remained on the rails, six feet from the abyss. Below nothing was discernible but a melancholy heap of twisted and blackened axles, shattered wagons, bent rails, charred sleepers; the boiler, burst by the shock, had scattered its plates to enormous distances. From this shapeless mass of ruins flames and black smoke still rose. After the fearful fall came fire, more fearful still! Great tracks of blood, scattered limbs, charred trunks of bodies, showed here and there; none could guess how many victims lay dead and mangled under those ruins.

Glenarvan, Paganel, the Major, Mangles, mixing with the crowd, heard the current talk. Everyone tried to account for the accident, while doing his utmost to save what could be saved.

"The bridge must have broken," said one.

"Not a bit of it. The bridge is whole enough; they must have forgotten to close it to let the train pass. That is all."

It was, in fact, a swing bridge, which opened for the convenience of the boats. Had the guard, by an unpardonable oversight, omitted to close it for the passage of the train, so that the train, coming on at full speed, was precipitated into the Loddon? This hypothesis seemed very admissible; for although one-half of the bridge lay beneath the ruins of the train, the other half, drawn up to the opposite shore, hung, still unharmed, by its chains. No one could doubt that an oversight on the part of the guard had caused the catastrophe.

The accident had occurred in the night, to the express train which left Melbourne at 11:45 in the evening. About a quarter past three in the morning, twenty-five minutes after leaving Castlemaine, it arrived at Camden Bridge,
where the terrible disaster befell. The passengers and guards of the last and only remaining carriage at once tried to obtain help. But the telegraph, whose posts were lying on the ground, could not be worked. It was three hours before the authorities from Castlemaine reached the scene of the accident, and it was six o'clock in the morning when the salvage party was organized, under the direction of Mr. Mitchell, the surveyor-general of the colony, and a detachment of police, commanded by an inspector. The squatters and their "hands" lent their aid, and directed their efforts first to extinguishing the fire which raged in the ruined heap with unconquerable violence. A few unrecognizable bodies lay on the slope of the embankment, but from that blazing mass no living thing could be saved. The fire had done its work too speedily. Of the passengers ten only survived—those in the last carriage. The railway authorities sent a locomotive to bring them back to Castlemaine.

Lord Glenarvan, having introduced himself to the surveyor-general, entered into conversation with him and the inspector of police. The latter was a tall, thin man, im-perturbably cool, and, whatever he may have felt, allowed no trace of it to appear on his features. He contemplated this calamity as a mathematician does a problem; he was seeking to solve it, and to find the unknown; and when Glenarvan observed, "This is a great misfortune," he quietly replied, "Better than that, my Lord."

"Better than that?" cried Glenarvan. "I do not understand you."

"It is better than a misfortune, it is a crime!" he replied, in the same quiet tone.

Glenarvan looked inquiringly at Mr. Mitchell for a solution. "Yes, my Lord," replied the surveyor-general, "our inquiries have resulted in the conclusion that the catastrophe is the result of a crime. The last luggage-van has been robbed. The surviving passengers were attacked by a gang of five or six villains. The bridge was intentionally opened, and not left open by the negligence of the guard; and connecting with this fact the guard's disappearance, we may conclude that the wretched fellow was an accomplice of these ruffians."

The police-officer shook his head at this inference.

"You do not agree with me?" said Mr. Mitchell.

"No, not as to the complicity of the guard."

"Well, but granting that complicity, we may attribute the crime to the natives who haunt the Murray. Without him the blacks could never have opened a swing-bridge; they know nothing of its mechanism."

"Exactly so," said the police-inspector.

"Well," added Mr. Mitchell, "we have the evidence of a boatman whose boat passed Camden Bridge at 10:40 P. M., that the bridge was properly shut after he passed."

"True."

"Well, after that I cannot see any doubt as to the complicity of the guard."

The police-officer shook his head gently, but continuously.

"Then you don't attribute the crime to the natives?"

"Not at all."

"To whom then?"

Just at this moment a noise was heard from about half a mile up the river. A crowd had gathered, and quickly increased. They soon reached the station, and in their midst were two men carrying a corpse. It was the body of the guard, quite cold, stabbed to the heart. The murderers had no doubt hoped, by dragging their victim to a distance, that the police would be put on a wrong scent in their first inquiries. This discovery, at any rate, justified the doubts of the police-inspector. The poor blacks had had no hand in the matter.

"Those who dealt that blow," said he, "were already well used to this little instrument"; and so saying he produced a pair of "darbies," a kind of handcuff made of a double ring of iron secured by a lock. "I shall soon have the pleasure of presenting them with these bracelets as a New Year's gift."

"Then you suspect—"

"Some folks who came out free in Her Majesty's ships."

"What! convicts?" cried Paganel, who recognized the formula employed in the Australian colonies.

"I thought," said Glenarvan, "convicts had no right in the province of Victoria."

"Bah!" said the inspector, "if they have no right, they take it! They escape sometimes, and, if I am not greatly mistaken, this lot have come straight from Perth, and, take my word for it, they will soon be there again."

Mr. Mitchell nodded acquiescence in the words of the police-inspector. At this moment the wagon arrived at the level crossing of the railway. Glenarvan wished to spare the ladies the horrible spectacle at Camden Bridge. He took courteous leave of the surveyor-general, and made a sign to the rest to follow him. "There is no reason," said he, "for delaying our journey."

When they reached the wagon, Glenarvan merely mentioned to Lady Helena that there had been a railway accident, without a hint of the crime that had played so great a part in it; neither did he make mention of the presence of a band of convicts in the neighborhood, reserving that piece of information solely for Ayrton's ear. The little
procession now crossed the railway some two hundred yards below the bridge, and then resumed their eastward course.

CHAPTER XII TOLINE OF THE LACHLAN

ABOUT two miles from the railway, the plain terminated in a range of low hills, and it was not long before the wagon entered a succession of narrow gorges and capricious windings, out of which it emerged into a most charming region, where grand trees, not closely planted, but in scattered groups, were growing with absolutely tropical luxuriance. As the party drove on they stumbled upon a little native boy lying fast asleep beneath the shade of a magnificent banksia. He was dressed in European garb, and seemed about eight years of age. There was no mistaking the characteristic features of his race; the crisped hair, the nearly black skin, the flattened nose, the thick lips, the unusual length of the arms, immediately classed him among the aborigines of the interior. But a degree of intelligence appeared in his face that showed some educational influences must have been at work on his savage, untamed nature.

Lady Helena, whose interest was greatly excited by this spectacle, got out of the wagon, followed by Mary, and presently the whole company surrounded the peaceful little sleeper. "Poor child!" said Mary Grant. "Is he lost, I wonder, in this desert?"

"I suppose," said Lady Helena, "he has come a long way to visit this part. No doubt some he loves are here."

"But he can't be left here," added Robert. "We must--"

His compassionate sentence remained unfinished, for, just at that moment the child turned over in his sleep, and, to the extreme surprise of everybody, there was a large label on his shoulders, on which the following was written:

TOLINE. To be conducted to Echuca. Care of Jeffries Smith, Railway Porter. Prepaid.

"That's the English all over!" exclaimed Paganel. "They send off a child just as they would luggage, and book him like a parcel. I heard it was done, certainly; but I could not believe it before."

"Poor child!" said Lady Helena. "Could he have been in the train that got off the line at Camden Bridge? Perhaps his parents are killed, and he is left alone in the world!"

"I don't think so, madam," replied John Mangles. "That card rather goes to prove he was traveling alone."

"He is waking up!" said Mary.

And so he was. His eyes slowly opened and then closed again, pained by the glare of light. But Lady Helena took his hand, and he jumped up at once and looked about him in bewilderment at the sight of so many strangers. He seemed half frightened at first, but the presence of Lady Helena reassured him. "Do you understand English, my little man?" asked the young lady.

"I understand it and speak it," replied the child in fluent enough English, but with a marked accent. His pronunciation was like a Frenchman's.

"What is your name?" asked Lady Helena.

"Toline," replied the little native.

"Toline!" exclaimed Paganel. "Ah! I think that means 'bark of a tree' in Australian."

Toline nodded, and looked again at the travelers.

"Where do you come from?" inquired Lady Helena.

"From Melbourne, by the railway from Sandhurst."

"Were you in the accident at Camden Bridge?" said Glenarvan.

"Yes, sir," was Toline's reply; "but the God of the Bible protected me."

"Are you traveling alone?"

"Yes, alone; the Reverend Paxton put me in charge of Jeffries Smith; but unfortunately the poor man was killed."

"And you did not know any one else on the train?"

"No one, madam; but God watches over children and never forsakes them."

Toline said this in soft, quiet tones, which went to the heart. When he mentioned the name of God his voice was grave and his eyes beamed with all the fervor that animated his young soul.

This religious enthusiasm at so tender an age was easily explained. The child was one of the aborigines baptized by the English missionaries, and trained by them in all the rigid principles of the Methodist Church. His calm replies, proper behavior, and even his somber garb made him look like a little reverend already.

But where was he going all alone in these solitudes and why had he left Camden Bridge? Lady Helena asked him about this.

"I was returning to my tribe in the Lachlan," he replied. "I wished to see my family again."

"Are they Australians?" inquired John Mangles.

"Yes, Australians of the Lachlan," replied Toline.

"Have you a father and mother?" said Robert Grant.

"Yes, my brother," replied Toline, holding out his hand to little Grant. Robert was so touched by the word
brother that he kissed the black child, and they were friends forthwith.

The whole party were so interested in these replies of the little Australian savage that they all sat round him in a listening group. But the sun had meantime sunk behind the tall trees, and as a few miles would not greatly retard their progress, and the spot they were in would be suitable for a halt, Glenarvan gave orders to prepare their camp for the night at once. Ayrton unfastened the bullocks and turned them out to feed at will. The tent was pitched, and Olbinett got the supper ready. Toline consented, after some difficulty, to share it, though he was hungry enough. He took his seat beside Robert, who chose out all the titbits for his new friend. Toline accepted them with a shy grace that was very charming.

The conversation with him, however, was still kept up, for everyone felt an interest in the child, and wanted to talk to him and hear his history. It was simple enough. He was one of the poor native children confided to the care of charitable societies by the neighboring tribes. The Australian aborigines are gentle and inoffensive, never exhibiting the fierce hatred toward their conquerors which characterizes the New Zealanders, and possibly a few of the races of Northern Australia. They often go to the large towns, such as Adelaide, Sydney and Melbourne, and walk about in very primitive costume. They go to barter their few articles of industry, hunting and fishing implements, weapons, etc., and some of the chiefs, from pecuniary motives, no doubt, willingly leave their children to profit by the advantages of a gratuitous education in English.

V. IV Verne

This was how Toline's parents had acted. They were true Australian savages living in the Lachlan, a vast region lying beyond the Murray. The child had been in Melbourne five years, and during that time had never once seen any of his own people. And yet the imperishable feeling of kindred was still so strong in his heart that he had dared to brave this journey over the wilds to visit his tribe once more, scattered though perchance it might be, and his family, even should he find it decimated.

"And after you have kissed your parents, are you coming back to Melbourne?" asked Lady Glenarvan.

"Yes, Madam," replied Toline, looking at the lady with a loving expression.

"And what are you going to be some day?" she continued.

"I am going to snatch my brothers from misery and ignorance. I am going to teach them, to bring them to know and love God. I am going to be a missionary."

Words like those, spoken with such animation from a child of only eight years, might have provoked a smile in light, scoffing auditors, but they were understood and appreciated by the grave Scotch, who admired the courage of this young disciple, already armed for the battle. Even Paganel was stirred to the depths of his heart, and felt his warmer sympathy awakened for the poor child.

To speak the truth, up to that moment he did not care much for a savage in European attire. He had not come to Australia to see Australians in coats and trousers. He preferred them simply tattooed, and this conventional dress jarred on his preconceived notions. But the child's genuine religious fervor won him over completely. Indeed, the wind-up of the conversation converted the worthy geographer into his best friend.

It was in reply to a question Lady Helena had asked, that Toline said he was studying at the Normal School in Melbourne, and that the principal was the Reverend Mr. Paxton.

"And what do they teach you?" she went on to say.

"They teach me the Bible, and mathematics, and geography."

Paganel pricked up his ears at this, and said, "Indeed, geography!"

"Yes, sir," said Toline; "and I had the first prize for geography before the Christmas holidays."

"You had the first prize for geography, my boy?"

"Yes, sir. Here it is," returned Toline, pulling a book out of his pocket.

It was a bible, 32mo size, and well bound. On the first page was written the words: "Normal School, Melbourne. First Prize for Geography. Toline of the Lachlan."

Paganel was beside himself. An Australian well versed in geography. This was marvelous, and he could not help kissing Toline on both cheeks, just as if he had been the Reverend Mr. Paxton himself, on the day of the distribution of prizes. Paganel need not have been so amazed at this circumstance, however, for it is frequent enough in Australian schools. The little savages are very quick in learning geography. They learn it eagerly, and on the other hand, are perfectly averse to the science of arithmetic.

Toline could not understand this outburst of affection on the part of the Frenchman, and looked so puzzled that Lady Helena thought she had better inform him that Paganel was a celebrated geographer and a distinguished professor on occasion.

"A professor of geography!" cried Toline. "Oh, sir, do question me!"

"Question you? Well, I'd like nothing better. Indeed, I was going to do it without your leave. I should very much like to see how they teach geography in the Normal School of Melbourne."
"And suppose Toline trips you up, Paganel!" said McNabbs.
"What a likely idea!" exclaimed the geographer. "Trip up the Secretary of the Geographical Society of France."
Their examination then commenced, after Paganel had settled his spectacles firmly on his nose, drawn himself up to his full height, and put on a solemn voice becoming to a professor.
"Pupil Toline, stand up."
As Toline was already standing, he could not get any higher, but he waited modestly for the geographer's questions.
"Pupil Toline, what are the five divisions of the globe?"
"Oceanica, Asia, Africa, America, and Europe."
"Perfectly so. Now we'll take Oceanica first; where are we at this moment? What are the principal divisions?"
"Australia, belonging to the English; New Zealand, belonging to the English; Tasmania, belonging to the English. The islands of Chatham, Auckland, Macquarie, Kermadec, Makin, Maraki, are also belonging to the English."
"Very good, and New Caledonia, the Sandwich Islands, the Mendana, the Pomotou?"
"They are islands under the Protectorate of Great Britain."
"What!" cried Paganel, "under the Protectorate of Great Britain. I rather think on the contrary, that France--"
"France," said the child, with an astonished look.
"Well, well," said Paganel; "is that what they teach you in the Melbourne Normal School?"
"Yes, sir. Isn't it right?"
"Oh, yes, yes, perfectly right. All Oceanica belongs to the English. That's an understood thing. Go on."
Paganel's face betrayed both surprise and annoyance, to the great delight of the Major.
"Let us go on to Asia."
"Asia," replied Toline, "is an immense country. Capital--Calcutta. Chief Towns--Bombay, Madras, Calicut, Aden, Malacca, Singapore, Pegu, Colombo. The Laccadive Islands, the Maldives, the Chagos, etc., belonging to the English."
"Very good, and New Caledonia, the Sandwich Islands, the Mendana, the Pomotou?"
"They are islands under the Protectorate of Great Britain."
"Capital!" said Paganel, beginning to enter into this perfectly taught but Anglo-colored fanciful geography. "As to Algeria, Morocco, Egypt--they are all struck out of the Britannic cities."
"Let us pass on, pray, to America."
"It is divided," said Toline, promptly, "into North and South America. The former belongs to the English in Canada, New Brunswick, New Scotland, and the United States, under the government of President Johnson."
"President Johnson," cried Paganel, "the successor of the great and good Lincoln, assassinated by a mad fanatic of the slave party. Capital; nothing could be better. And as to South America, with its Guiana, its archipelago of South Shetland, its Georgia, Jamaica, Trinidad, etc., that belongs to the English, too! Well, I'll not be the one to dispute that point! But, Toline, I should like to know your opinion of Europe, or rather your professor's."
"Europe?" said Toline not at all understanding Paganel's excitement.
"Yes, Europe! Who does Europe belong to?"
"Why, to the English," replied Toline, as if the fact was quite settled.
"I much doubt it," returned Paganel. "But how's that, Toline, for I want to know that?"
"England, Ireland, Scotland, Malta, Jersey and Guern-sey, the Ionian Islands, the Hebrides, the Shetlands, and the Orkneys."
"Yes, yes, my lad; but there are other states you forgot to mention."
"What are they?" replied the child, not the least disconcerted.
"Spain, Russia, Austria, Prussia, France," answered Paganel.
"They are provinces, not states," said Toline.
"Well, that beats all!" exclaimed Paganel, tearing off his spectacles.
"Yes," continued the child. "Spain--capital, Gibraltar."
"Admirable! perfect! sublime! And France, for I am French, and I should like to know to whom I belong."
"France," said Toline, quietly, "is an English province; chief city, Calais."
"Calais!" cried Paganel. "So you think Calais still belongs to the English?"
"Certainly."
"And that it is the capital of France?"
"Yes, sir; and it is there that the Governor, Lord Napo-leon, lives."
This was too much for Paganel's risible faculties. He burst out laughing. Toline did not know what to make of
him. He had done his best to answer every question put to him. But the singularity of the answers were not his
blame; indeed, he never imagined anything singular about them. However, he took it all quietly, and waited for the
professor to recover himself. These peals of laughter were quite incomprehensible to him.

"You see," said Major McNabbs, laughing, "I was right. The pupil could enlighten you after all."

"Most assuredly, friend Major," replied the geographer. "So that's the way they teach geography in Melbourne!
They do it well, these professors in the Normal School! Europe, Asia, Africa, America, Oceanica, the whole world
belongs to the English. My conscience! with such an ingenious education it is no wonder the natives submit. Ah,
well, Toline, my boy, does the moon belong to England, too?"

"She will, some day," replied the young savage, gravely.

This was the climax. Paganel could not stand any more. He was obliged to go away and take his laugh out, for he
was actually exploding with mirth, and he went fully a quarter of a mile from the encampment before his
equilibrium was restored.

Meanwhile, Glenarvan looked up a geography they had brought among their books. It was "Richardson's
Compendium," a work in great repute in England, and more in agreement with modern science than the manual in
use in the Normal School in Melbourne.

"Here, my child," he said to Toline, "take this book and keep it. You have a few wrong ideas about geography,
which it would be well for you to rectify. I will give you this as a keepsake from me."

Toline took the book silently; but, after examining it attentively, he shook his head with an air of incredulity, and
could not even make up his mind to put it in his pocket.

By this time night had closed in; it was 10 P. M. and time to think of rest, if they were to start betimes next day.
Robert offered his friend Toline half his bed, and the little fellow accepted it. Lady Helena and Mary Grant
withdrew to the wagon, and the others lay down in the tent, Paganel's merry peals still mingling with the low, sweet
song of the wild magpie.

But in the morning at six o'clock, when the sunshine wakened the sleepers, they looked in vain for the little
Australian. Toline had disappeared. Was he in haste to get to the Lachlan district? or was he hurt by Paganel's
laughter? No one could say.

But when Lady Helena opened her eyes she discovered a fresh branch of mimosa leaves lying across her, and
Paganel found a book in his vest pocket, which turned out to be "Richardson's Geography."

CHAPTER XIII A WARNING

ON the 2d of January, at sunrise, the travelers forded the Colban and the Caupespe rivers. The half of their
journey was now accomplished. In fifteen days more, should their journey continue to be prosperous, the little party
would reach Twofold Bay.

They were all in good health. All that Paganel said of the hygienic qualities of the climate was realized. There
was little or no humidity, and the heat was quite bearable. Neither horses nor bullocks could complain of it any more
than human beings. The order of the march had been changed in one respect since the affair of Camden Bridge. That
criminal catastrophe on the railway made Ayrton take sundry precautions, which had hitherto been unnecessary. The
hunters never lost sight of the wagon, and whenever they camped, one was always placed on watch. Morning and
evening the firearms were primed afresh. It was certain that a gang of ruffians was prowling about the country, and
though there was no cause for actual fear, it was well to be ready for whatever might happen.

It need hardly be said these precautions were adopted without the knowledge of Lady Helena and Mary Grant, as
Lord Glenarvan did not wish to alarm them.

They were by no means unnecessary, however, for any imprudence or carelessness might have cost the travelers
dear. Others beside Glenarvan were on their guard. In lonely settlements and on stations, the inhabitants and the
squatters prepared carefully against any attack or surprise. Houses are closed at nightfall; the dogs let loose inside
the fences, barked at the slightest sound. Not a single shepherd on horseback gathered his numerous flocks together
at close of day, without having a carbine slung from his saddle.

The outrage at Camden Bridge was the reason for all this, and many a colonist fastened himself in with bolts and
bars now at dusk, who used to sleep with open doors and windows.

The Government itself displayed zeal and prudence, especially in the Post-office department. On this very day,
just as Glenarvan and his party were on their way from Kilmore to Heathcote, the mail dashed by at full speed; but
though the horses were at a gallop, Glenarvan caught sight of the glittering weapons of the mounted police that rode
by its side, as they swept past in a cloud of dust. The travelers might have fancied themselves back in those lawless
times when the discovery of the first gold-fields deluged the Australian continent with the scum of Europe.

A mile beyond the road to Kilmore, the wagon, for the first time since leaving Cape Bernouilli, struck into one
of those forests of gigantic trees which extend over a super-fices of several degrees. A cry of admiration escaped the
travelers at the sight of the eucalyptus trees, two hundred feet high, with tough bark five inches thick. The trunks,
measuring twenty feet round, and furrowed with foamy streaks of an odorous resin, rose one hundred and fifty feet above the soil. Not a branch, not a twig, not a stray shoot, nor even a knot, spoilt the regularity of their outline. They could not have come out smoother from the hands of a turner. They stood like pillars all molded exactly alike, and could be counted by hundreds. At an enormous height they spread out in chaplets of branches, rounded and adorned at their extremity with alternate leaves. At the axe of these leaves solitary flowers drooped down, the calyx of which resembles an inverted urn.

Under this leafy dome, which never lost its greenness, the air circulated freely, and dried up the dampness of the ground. Horses, cattle, and wagon could easily pass between the trees, for they were standing in wide rows, and parceled out like a wood that was being felled. This was neither like the densely-packed woods choked up with brambles, nor the virgin forest barricaded with the trunks of fallen trees, and overgrown with inextricable tangles of creepers, where only iron and fire could open up a track. A grassy carpet at the foot of the trees, and a canopy of verdure above, long perspectives of bold colors, little shade, little freshness at all, a peculiar light, as if the rays came through a thin veil, dappled lights and shades sharply reflected on the ground, made up a whole, and constituted a peculiar spectacle rich in novel effects. The forests of the Oceanic continent do not in the least resemble the forests of the New World; and the Eucalyptus, the “Tara” of the aborigines, belonging to the family of MYRTACEA, the different varieties of which can hardly be enumerated, is the tree _par excellence_ of the Australian flora.

The reason of the shade not being deep, nor the darkness profound, under these domes of verdure, was that these trees presented a curious anomaly in the disposition of the leaves. Instead of presenting their broad surface to the sunlight, only the side is turned. Only the profile of the leaves is seen in this singular foliage. Consequently the sun's rays slant down them to the earth, as if through the open slants of a Venetian blind.

Glenarvan expressed his surprise at this circumstance, and wondered what could be the cause of it. Paganel, who was never at a loss for an answer, immediately replied:

"What astonishes me is not the caprice of nature. She knows what she is about, but botanists don't always know what they are saying. Nature made no mistake in giving this peculiar foliage to the tree, but men have erred in calling them EUCALYPTUS."

"What does the word mean?" asked Mary Grant.

"It comes from a Greek word, meaning I _cover well_. They took care to commit the mistake in Greek, that it might not be so self-evident, for anyone can see that the eucalyptus covers badly."

"I agree with you there," said Glenarvan; "but now tell us, Paganel, how is it that the leaves grow in this fashion?"

"From a purely physical cause, friends," said Paganel, "and one that you will easily understand. In this country where the air is dry and rain seldom falls, and the ground is parched, the trees have no need of wind or sun. Moisture lacking, sap is lacking also. Hence these narrow leaves, which seek to defend themselves against the light, and prevent too great evaporation. This is why they present the profile and not the face to the sun's rays. There is nothing more intelligent than a leaf."

"And nothing more selfish," added the Major. "These only thought of themselves, and not at all of travelers."

Everyone inclined to the opinion of McNabbs except Paganel, who congratulated himself on walking under shadeless trees, though all the time he was wiping the perspiration from his forehead. However, this disposition of foliage was certainly to be regretted, for the journey through the forest was often long and painful, as the traveler had no protection whatever against the sun's fierce rays.

The whole of this day the wagon continued to roll along through interminable rows of eucalyptus, without meeting either quadruped or native. A few cockatoos lived in the tops of the trees, but at such a height they could scarcely be distinguished, and their noisy chatter was changed into an imperceptible murmur. Occasionally a swarm of par-roquets flew along a distant path, and lighted it up for an instant with gay colors; but otherwise, solemn silence reigned in this vast green temple, and the tramp of the horses, a few words exchanged with each other by the riders, the grinding noise of the wheels, and from time to time a cry from Ayrton to stir up his lazy team, were the only sounds which disturbed this immense solitude.

When night came they camped at the foot of some eucalyptus, which bore marks of a comparatively recent fire. They looked like tall factory chimneys, for the flame had completely hollowed them out their whole length. With the thick bark still covering them, they looked none the worse. However, this bad habit of squatters or natives will end in the destruction of these magnificent trees, and they will disappear like the cedars of Lebanon, those world monuments burnt by unlucky camp fires.

Olbinett, acting on Paganel's advice, lighted his fire to prepare supper in one of these tubular trunks. He found it drew capitally, and the smoke was lost in the dark foliage above. The requisite precautions were taken for the night, and Ayrton, Mulrady, Wilson and John Mangles undertook in turn to keep watch until sunrise.

On the 3d of January, all day long, they came to nothing but the same symmetrical avenues of trees; it seemed as
if they never were going to end. However, toward evening the ranks of trees began to thin, and on a little plain a few miles off an assemblage of regular houses.

"Seymour!" cried Paganel; "that is the last town we come to in the province of Victoria."

"Is it an important one?" asked Lady Helena.

"It is a mere village, madam, but on the way to become a municipality."

"Shall we find a respectable hotel there?" asked Glenarvan.

"I hope so," replied Paganel.

"Very well; let us get on to the town, for our fair travelers, with all their courage, will not be sorry, I fancy, to have a good night's rest."

"My dear Edward, Mary and I will accept it gladly, but only on the condition that it will cause no delay, or take us the least out of the road."

"It will do neither," replied Lord Glenarvan. "Besides, our bullocks are fatigued, and we will start to-morrow at daybreak."

It was now nine o'clock; the moon was just beginning to rise, but her rays were only slanting yet, and lost in the mist. It was gradually getting dark when the little party entered the wide streets of Seymour, under Paganel's guidance, who seemed always to know what he had never seen; but his instinct led him right, and he walked straight to Campbell's North British Hotel.

The Major without even leaving the hotel, was soon aware that fear absorbed the inhabitants of the little town. Ten minutes' conversation with Dickson, the loquacious landlord, made him completely acquainted with the actual state of affairs; but he never breathed a word to any one.

When supper was over, though, and Lady Glenarvan, and Mary, and Robert had retired, the Major detained his companions a little, and said, "They have found out the perpetrators of the crime on the Sandhurst railroad."

"And are they arrested?" asked Ayrton, eagerly.

"No," replied McNabbs, without apparently noticing the EMPRESSMENT of the quartermaster--an EMPRESSMENT which, moreover, was reasonable enough under the circumstances.

"So much the worse," replied Ayrton.

"Well," said Glenarvan, "who are the authors of the crime?"

"Read," replied the Major, offering Glenarvan a copy of the _Australian and New Zealand Gazette_, "and you will see that the inspector of the police was not mistaken."

Glenarvan read aloud the following message:

SYDNEY, Jan. 2, 1866.

It will be remembered that on the night of the 29th or 30th of last December there was an accident at Camden Bridge, five miles beyond the station at Castlemaine, on the railway from Melbourne to Sandhurst. The night express, 11.45, dashing along at full speed, was precipitated into the Loddon River.

Camden Bridge had been left open. The numerous robberies committed after the accident, the body of the guard picked up about half a mile from Camden Bridge, proved that this catastrophe was the result of a crime.

Indeed, the coroner's inquest decided that the crime must be attributed to the band of convicts which escaped six months ago from the Penitentiary at Perth, Western Australia, just as they were about to be transferred to Norfolk Island.

The gang numbers twenty-nine men; they are under the command of a certain Ben Joyce, a criminal of the most dangerous class, who arrived in Australia a few months ago, by what ship is not known, and who has hitherto succeeded in evading the hands of justice.

The inhabitants of towns, colonists and squatters at stations, are hereby cautioned to be on their guard, and to communicate to the Surveyor-General any information that may aid his search. J. P. MITCHELL, S. G.

When Glenarvan had finished reading this article, McNabbs turned to the geographer and said, "You see, Paganel, there can be convicts in Australia."

"Escaped convicts, that is evident," replied Paganel, "but not regularly transported criminals. Those fellows have no business here."

"Well, they are here, at any rate," said Glenarvan; "but I don't suppose the fact need materially alter our arrangements. What do you think, John?"

John Mangles did not reply immediately; he hesitated between the sorrow it would cause the two children to give up the search, and the fear of compromising the expedition.

"If Lady Glenarvan, and Miss Grant were not with us," he said, "I should not give myself much concern about these wretches."

Glenarvan understood him and added, "Of course I need not say that it is not a question of giving up our task; but would it perhaps be prudent, for the sake of our companions, to rejoin the DUNCAN at Melbourne, and proceed
with our search for traces of Harry Grant on the eastern side. What do you think of it, McNabbs?"

"Before I give my opinion," replied the Major, "I should like to hear Ayrton's."

At this direct appeal, the quartermaster looked at Glenarvan, and said, "I think we are two hundred miles from Melbourne, and that the danger, if it exists, is as great on the route to the south as on the route to the east. Both are little frequented, and both will serve us. Besides, I do not think that thirty scoundrels can frighten eight well-armed, determined men. My advice, then, is to go forward."

"And good advice too, Ayrton," replied Paganel. "By going on we may come across the traces of Captain Grant. In returning south, on the contrary, we turn our backs to them. I think with you, then, and I don't care a snap for these escaped fellows. A brave man wouldn't care a bit for them!"

Upon this they agreed with the one voice to follow their original programme.

"Just one thing, my Lord," said Ayrton, when they were about to separate.

"Say on, Ayrton."

"Wouldn't it be advisable to send orders to the DUNCAN to be at the coast?"

"What good would that be," replied John Mangles. "When we reach Twofold Bay it will be time enough for that. If any unexpected event should oblige us to go to Melbourne, we might be sorry not to find the DUNCAN there. Besides, her injuries can not be repaired yet. For these reasons, then, I think it would be better to wait."

"All right," said Ayrton, and forbore to press the matter further.

CHAPTER XIV WEALTH IN THE WILDERNESS

ON January 6, at 7 A. M., after a tranquil night passed in longitude 146 degrees 15', the travelers continued their journey across the vast district. They directed their course steadily toward the rising sun, and made a straight line across the plain. Twice over they came upon the traces of squatters going toward the north, and their different footprints became confused, and Glenarvan's horse no longer left on the dust the Blackpoint mark, recognizable by its double shamrock.

The plain was furrowed in some places by fantastic winding creeks surrounded by box, and whose waters were rather temporary than permanent. They originated in the slopes of the Buffalo Ranges, a chain of mountains of moderate height, the undulating line of which was visible on the horizon. It was resolved to camp there the same night. Ayrton goaded on his team, and after a journey of thirty-five miles, the bullocks arrived, somewhat fatigued. The tent was pitched beneath the great trees, and as night had drawn on supper was served as quickly as possible, for all the party cared more for sleeping than eating, after such a day's march.

Paganel who had the first watch did not lie down, but shouldered his rifle and walked up and down before the camp, to keep himself from going to sleep. In spite of the absence of the moon, the night was almost luminous with the light of the southern constellations. The SAVANT amused himself with reading the great book of the firmament, a book which is always open, and full of interest to those who can read it. The profound silence of sleeping nature was only interrupted by the clanking of the hobbles on the horses' feet.

Paganel was engrossed in his astronomical meditations, and thinking more about the celestial than the terrestrial world, when a distant sound aroused him from his reverie. He listened attentively, and to his great amaze, fancied he heard the sounds of a piano. He could not be mistaken, for he distinctly heard chords struck.

"A piano in the wilds!" said Paganel to himself. "I can never believe it is that."

It certainly was very surprising, but Paganel found it easier to believe it was some Australian bird imitating the sounds of a Pleyel or Erard, as others do the sounds of a clock or mill. But at this very moment, the notes of a clear ringing voice rose on the air. The PIANIST was accompanied by singing. Still Paganel was unwilling to be convinced. However, next minute he was forced to admit the fact, for there fell on his ear the sublime strains of Mozart's "Il mio tesoro tanto" from Don Juan.

"Well, now," said the geographer to himself, "let the Australian birds be as queer as they may, and even granting the paroquets are the most musical in the world, they can't sing Mozart!"

He listened to the sublime inspiration of the great master to the end. The effect of this soft melody on the still clear night was indescribable. Paganel remained as if spellbound for a time; the voice ceased and all was silence. When Wilson came to relieve the watch, he found the geographer plunged into a deep reverie. Paganel made no remark, however, to the sailor, but reserved his information for Glenarvan in the morning, and went into the tent to bed.

Next day, they were all aroused from sleep by the sudden loud barking of dogs, Glenarvan got up forthwith. Two magnificent pointers, admirable specimens of English hunting dogs, were bounding in front of the little wood, into which they had retreated at the approach of the travelers, redoubling their clamor.

"There is some station in this desert, then," said Glenarvan, "and hunters too, for these are regular setters."

Paganel was just about to recount his nocturnal experiences, when two young men appeared, mounted on horses of the most perfect breed, true "hunters."
The two gentlemen dressed in elegant hunting costume, stopped at the sight of the little group camping in gipsy fashion. They looked as if they wondered what could bring an armed party there, but when they saw the ladies get out of the wagon, they dismounted instantly, and went toward them hat in hand. Lord Glenarvan came to meet them, and, as a stranger, announced his name and rank.

The gentlemen bowed, and the elder of them said, "My Lord, will not these ladies and yourself and friends honor us by resting a little beneath our roof?"

"Mr.--," began Glenarvan.

"Michael and Sandy Patterson are our names, proprietors of Hottam Station. Our house is scarcely a quarter of a mile distant."

"Gentlemen," replied Glenarvan, "I should not like to abuse such kindly-offered hospitality."

"My Lord," returned Michael Patterson, "by accepting it you will confer a favor on poor exiles, who will be only too happy to do the honors of the wilds."

Glenarvan bowed in token of acquiescence.

"Sir," said Paganel, addressing Michael Patterson, "if it is not an impudent question, may I ask whether it was you that sung an air from the divine Mozart last night?"

"It was, sir," replied the stranger, "and my cousin Sandy accompanied me."

"Well, sir," replied Paganel, holding out his hand to the young man, "receive the sincere compliments of a Frenchman, who is a passionate admirer of this music."

Michael grasped his hand cordially, and then pointing out the road to take, set off, accompanied by the ladies and Lord Glenarvan and his friends, for the station. The horses and the camp were left to the care of Ayrton and the sailors.

Hottam Station was truly a magnificent establishment, kept as scrupulously in order as an English park. Immense meadows, enclosed in gray fences, stretched away out of sight. In these, thousands of bullocks and millions of sheep were grazing, tended by numerous shepherds, and still more numerous dogs. The crack of the stock-whip mingled continually with the barking of the "collies" and the bellowing and bleating of the cattle and sheep.

Toward the east there was a boundary of myalls and gum-trees, beyond which rose Mount Hottam, its imposing peak towering 7,500 feet high. Long avenues of green trees were visible on all sides. Here and there was a thick clump of "grass trees," tall bushes ten feet high, like the dwarf palm, quite lost in their crown of long narrow leaves. The air was balmy and odorous with the perfume of scented laurels, whose white blossoms, now in full bloom, distilled on the breeze the finest aromatic perfume.

To these charming groups of native trees were added transplantations from European climates. The peach, pear, and apple trees were there, the fig, the orange, and even the oak, to the rapturous delight of the travelers, who greeted them with loud hurrahs! But astonished as the travelers were to find themselves walking beneath the shadow of the trees of their own native land, they were still more so at the sight of the birds that flew about in the branches—the "satin bird," with its silky plumage, and the "king-honeysuckers," with their plumage of gold and black velvet.

For the first time, too, they saw here the "Lyre" bird, the tail of which resembles in form the graceful instrument of Orpheus. It flew about among the tree ferns, and when its tail struck the branches, they were almost surprised not to hear the harmonious strains that inspired Amphion to rebuild the walls of Thebes. Paganel had a great desire to play on it.

However, Lord Glenarvan was not satisfied with admiring the fairy-like wonders of this oasis, improvised in the Australian desert. He was listening to the history of the young gentlemen. In England, in the midst of civilized countries, the new comer acquaints his host whence he comes and whither he is going; but here, by a refinement of delicacy, Michael and Sandy Patterson thought it a duty to make themselves known to the strangers who were about to receive their hospitality.

Michael and Sandy Patterson were the sons of London bankers. When they were twenty years of age, the head of their family said, "Here are some thousands, young men. Go to a distant colony; and start some useful settlement there. Learn to know life by labor. If you succeed, so much the better. If you fail, it won't matter much. We shall not regret the money which makes you men."

The two young men obeyed. They chose the colony of Victoria in Australia, as the field for sowing the paternal bank-notes, and had no reason to repent the selection. At the end of three years the establishment was flourishing. In Victoria, New South Wales, and Southern Australia, there are more than three thousand stations, some belonging to squatters who rear cattle, and others to settlers who farm the ground. Till the arrival of the two Pattersons, the largest establishment of this sort was that of Mr. Jamieson, which covered an area of seventy-five miles, with a frontage of about eight miles along the Peron, one of the affluents of the Darling.

Now Hottam Station bore the palm for business and extent. The young men were both squatters and settlers.
They managed their immense property with rare ability and uncommon energy.

The station was far removed from the chief towns in the midst of the unfrequented districts of the Murray. It occupied a long wide space of five leagues in extent, lying between the Buffalo Ranges and Mount Hottam. At the two angles north of this vast quadrilateral, Mount Aberdeen rose on the left, and the peaks of High Barven on the right. Winding, beautiful streams were not wanting, thanks to the creeks and affluents of the Oven's River, which throws itself at the north into the bed of the Murray. Consequently they were equally successful in cattle breeding and farming. Ten thousand acres of ground, admirably cultivated, produced harvests of native productions and exotics, and several millions of animals fattened in the fertile pastures. The products of Hottam Station fetched the very highest price in the markets of Castlemaine and Melbourne.

Michael and Sandy Patterson had just concluded these details of their busy life, when their dwelling came in sight, at the extremity of the avenue of the oaks.

It was a charming house, built of wood and brick, hidden in groves of emerophilis. Nothing at all, however, belonging to a station was visible--neither sheds, nor stables, nor cart-houses. All these out-buildings, a perfect village, comprising more than twenty huts and houses, were about a quarter of a mile off in the heart of a little valley. Electric communication was established between this village and the master's house, which, far removed from all noise, seemed buried in a forest of exotic trees.

At Sandy Patterson's bidding, a sumptuous breakfast was served in less than a quarter of an hour. The wines and viands were of the finest quality; but what pleased the guests most of all in the midst of these refinements of opulence, was the joy of the young squatters in offering them this splendid hospitality.

It was not long before they were told the history of the expedition, and had their liveliest interest awakened for its success. They spoke hopefully to the young Grants, and Michael said: "Harry Grant has evidently fallen into the hands of natives, since he has not turned up at any of the settlements on the coast. He knows his position exactly, as the document proves, and the reason he did not reach some English colony is that he must have been taken prisoner by the savages the moment he landed!"

"That is precisely what befell his quartermaster, Ayrton," said John Mangles.

"But you, gentlemen, then, have never heard the catastrophe of the BRITANNIA, mentioned?" inquired Lady Helena.

"Never, Madam," replied Michael.

"And what treatment, in your opinion, has Captain Grant met with among the natives?"

"The Australians are not cruel, Madam," replied the young squatter, "and Miss Grant may be easy on that score. There have been many instances of the gentleness of their nature, and some Europeans have lived a long time among them without having the least cause to complain of their brutality."

"King, among others, the sole survivor of the Burke expedition," put in Paganel.

"And not only that bold explorer," returned Sandy, "but also an English soldier named Buckley, who deserted at Port Philip in 1803, and who was welcomed by the natives, and lived thirty-three years among them."

"And more recently," added Michael, "one of the last numbers of the AUSTRALASIA informs us that a certain Morrilli has just been restored to his countrymen after sixteen years of slavery. His story is exactly similar to the captain's, for it was at the very time of his shipwreck in the PRUVIENNE, in 1846, that he was made prisoner by the natives, and dragged away into the interior of the continent. I therefore think you have reason to hope still."

The young squatter's words caused great joy to his auditors. They completely corroborated the opinions of Paganel and Ayrton.

Glenarvan could not refuse the request of his amiable hosts, to spend the whole day at the station. It was twelve hours' delay, but also twelve hours' rest, and both horses and bullocks would be the better for the comfortable quarters they would find there. This was accordingly agreed upon, and the young squatters sketched out a programme of the day's amusements, which was adopted eagerly.

At noon, seven vigorous hunters were before the door. An elegant brake was intended for the ladies, in which the coachman could exhibit his skill in driving four-in-hand. The cavalcade set off preceded by huntsmen, and armed with first-rate rifles, followed by a pack of pointers barking joyously as they bounded through the bushes. For four hours the hunting party wandered through the paths and avenues of the park, which was as large as a small German state. The Reuiss-Schleitz, or Saxe-Coburg Gotha, would have gone inside it comfortably. Few people were to be
met in it certainly, but sheep in abundance. As for game, there was a complete preserve awaiting the hunters. The noisy reports of guns were soon heard on all sides. Little Robert did wonders in company with Major McNabbs. The daring boy, in spite of his sister's injunctions, was always in front, and the first to fire. But John Mangles promised to watch over him, and Mary felt less uneasy.

During this BATTUE they killed certain animals peculiar to the country, the very names of which were unknown to Paganel; among others the "wombat" and the "bandicoot." The wombat is an herbivorous animal, which burrows in the ground like a badger. It is as large as a sheep, and the flesh is excellent.

The bandicoot is a species of marsupial animal which could outwit the European fox, and give him lessons in pillaging poultry yards. It was a repulsive-looking animal, a foot and a half long, but, as Paganel chanced to kill it, of course he thought it charming.

"An adorable creature," he called it.

But the most interesting event of the day, by far, was the kangaroo hunt. About four o'clock, the dogs roused a troop of these curious marsupials. The little ones retreated precipitately into the maternal pouch, and all the troop decamped in file. Nothing could be more astonishing than the enormous bounds of the kangaroo. The hind legs of the animal are twice as long as the front ones, and unbend like a spring. At the head of the flying troop was a male five feet high, a magnificent specimen of the _macropus giganteus_, an "old man," as the bushmen say.

For four or five miles the chase was vigorously pursued. The kangaroos showed no signs of weariness, and the dogs, who had reason enough to fear their strong paws and sharp nails, did not care to approach them. But at last, worn out with the race, the troop stopped, and the "old man" leaned against the trunk of a tree, ready to defend himself. One of the pointers, carried away by excitement, went up to him. Next minute the unfortunate beast leaped into the air, and fell down again completely ripped up.

The whole pack, indeed, would have had little chance with these powerful marsupia. They had to dispatch the fellow with rifles. Nothing but balls could bring down the gigantic animal.

Just at this moment, Robert was well nigh the victim of his own imprudence. To make sure of his aim, he had approached too near the kangaroo, and the animal leaped upon him immediately. Robert gave a loud cry and fell. Mary Grant saw it all from the brake, and in an agony of terror, speechless and almost unable even to see, stretched out her arms toward her little brother. No one dared to fire, for fear of wounding the child.

But John Mangles opened his hunting knife, and at the risk of being ripped up himself, sprang at the animal, and plunged it into his heart. The beast dropped forward, and Robert rose unhurt. Next minute he was in his sister's arms.

"Thank you, Mr. John, thank you!" she said, holding out her hand to the young captain.

"I had pledged myself for his safety," was all John said, taking her trembling fingers into his own.

This occurrence ended the sport. The band of marsupia had disappeared after the death of their leader. The hunting party returned home, bringing their game with them. It was then six o'clock. A magnificent dinner was ready. Among other things, there was one dish that was a great success. It was kangaroo-tail soup, prepared in the native manner.

Next morning very early, they took leave of the young squatters, with hearty thanks and a positive promise from them of a visit to Malcolm Castle when they should return to Europe.

Then the wagon began to move away, round the foot of Mount Hottam, and soon the hospitable dwelling disappeared from the sight of the travelers like some brief vision which had come and gone.

For five miles further, the horses were still treading the station lands. It was not till nine o'clock that they had passed the last fence, and entered the almost unknown districts of the province of Victoria.

CHAPTER XV SUSPICIOUS OCCURRENCES

AN immense barrier lay across the route to the southeast. It was the Australian Alps, a vast fortification, the fantastic curtain of which extended 1,500 miles, and pierced the clouds at the height of 4,000 feet.

The cloudy sky only allowed the heat to reach the ground through a close veil of mist. The temperature was just bearable, but the road was toilsome from its uneven character. The extumescences on the plain became more and more marked. Several mounds planted with green young gum trees appeared here and there. Further on these protuberances rising sharply, formed the first steps of the great Alps. From this time their course was a continual ascent, as was soon evident in the strain it made on the bullocks to drag along the cumbrous wagon. Their yoke creaked, they breathed heavily, and the muscles of their houghs were stretched as if they would burst. The planks of the vehicle groaned at the unexpected jolts, which Ayrtan with all his skill could not prevent. The ladies bore their share of discomfort bravely.

John Mangles and his two sailors acted as scouts, and went about a hundred steps in advance. They found out practical paths, or passes, indeed they might be called, for these projections of the ground were like so many rocks, between which the wagon had to steer carefully. It required absolute navigation to find a safe way over the billowy region.
It was a difficult and often perilous task. Many a time Wilson's hatchet was obliged to open a passage through thick tangles of shrubs. The damp argillaceous soil gave way under their feet. The route was indefinitely prolonged owing to the insurmountable obstacles, huge blocks of granite, deep ravines, suspected lagoons, which obliged them to make a thousand detours. When night came they found they had only gone over half a degree. They camped at the foot of the Alps, on the banks of the creek of Cobongra, on the edge of a little plain, covered with little shrubs four feet high, with bright red leaves which gladdened the eye.

"We shall have hard work to get over," said Glenarvan, looking at the chain of mountains, the outlines of which were fast fading away in the deepening darkness. "The very name Alps gives plenty of room for reflection."

"It is not quite so big as it sounds, my dear Glenarvan. Don't suppose you have a whole Switzerland to traverse. In Australia there are the Grampians, the Pyrenees, the Alps, the Blue Mountains, as in Europe and America, but in miniature. This simply implies either that the imagination of geographers is not infinite, or that their vocabulary of proper names is very poor."

"Then these Australian Alps," said Lord Glenarvan, "are--"

"Mere pocket mountains," put in Paganel; "we shall get over them without knowing it."

"Speak for yourself," said the Major. "It would certainly take a very absent man who could cross over a chain of mountains and not know it."

"Absent! But I am not an absent man now. I appeal to the ladies. Since ever I set foot on the Australian continent, have I been once at fault? Can you reproach me with a single blunder?"

"Not one. Monsieur Paganel," said Mary Grant. "You are now the most perfect of men."

"Too perfect," added Lady Helena, laughing; "your blunders suited you admirably."

"Didn't they, Madam? If I have no faults now, I shall soon get like everybody else. I hope then I shall make some outrageous mistake before long, which will give you a good laugh. You see, unless I make mistakes, it seems to me I fail in my vocation."

Next day, the 9th of January, notwithstanding the assurances of the confident geographer, it was not without great difficulty that the little troop made its way through the Alpine pass. They were obliged to go at a venture, and enter the depths of narrow gorges without any certainty of an outlet. Ayrton would doubtless have found himself very much embarrassed if a little inn, a miserable public house, had not suddenly presented itself.

"My goodness!" cried Paganel, "the landlord of this inn won't make his fortune in a place like this. What is the use of it here?"

"To give us the information we want about the route," replied Glenarvan. "Let us go in."

Glenarvan, followed by Ayrton, entered the inn forthwith. The landlord of the "Bush Inn," as it was called, was a coarse man with an ill-tempered face, who must have considered himself his principal customer for the gin, brandy and whisky he had to sell. He seldom saw any one but the squatters and rovers. He answered all the questions put to him in a surly tone. But his replies sufficed to make the route clear to Ayrton, and that was all that was wanted. Glenarvan rewarded him with a handful of silver for his trouble, and was about to leave the tavern, when a placard against the wall arrested his attention.

It was a police notice, and announcing the escape of the convicts from Perth, and offering a reward for the capture of Ben Joyce of pounds 100 sterling.

"He's a fellow that's worth hanging, and no mistake," said Glenarvan to the quartermaster.

"And worth capturing still more. But what a sum to offer! He is not worth it!"

"I don't feel very sure of the innkeeper though, in spite of the notice," said Glenarvan.

"No more do I," replied Ayrton.

They went back to the wagon, toward the point where the route to Lucknow stopped. A narrow path wound away from this which led across the chain in a slanting direction. They had commenced the ascent.

It was hard work. More than once both the ladies and gentlemen had to get down and walk. They were obliged to help to push round the wheels of the heavy vehicle, and to support it frequently in dangerous declivities, to unharness the bullocks when the team could not go well round sharp turnings, prop up the wagon when it threatened to roll back, and more than once Ayrton had to reinforce his bullocks by harnessing the horses, although they were tired out already with dragging themselves along.

Whether it was this prolonged fatigue, or from some other cause altogether, was not known, but one of the horses sank suddenly, without the slightest symptom of illness. It was Mulrady's horse that fell, and on attempting to pull it up, the animal was found to be dead. Ayrton examined it immediately, but was quite at a loss to account for the disaster.

"The beast must have broken some blood vessels," said Glenarvan.

"Evidently," replied Ayrton.

"Take my horse, Mulrady," added Glenarvan. "I will join Lady Helena in the wagon."
Mulrady obeyed, and the little party continued their fatiguing ascent, leaving the carcass of the dead animal to the ravens.

The Australian Alps are of no great thickness, and the base is not more than eight miles wide. Consequently if the pass chosen by Ayrton came out on the eastern side, they might hope to get over the high barrier within forty-eight hours more. The difficulty of the route would then be surmounted, and they would only have to get to the sea.

During the 18th the travelers reached the top-most point of the pass, about 2,000 feet high. They found themselves on an open plateau, with nothing to intercept the view. Toward the north the quiet waters of Lake Omco, all alive with aquatic birds, and beyond this lay the vast plains of the Murray. To the south were the wide spreading plains of Gippsland, with its abundant gold-fields and tall forests. There nature was still mistress of the products and water, and great trees where the woodman's ax was as yet unknown, and the squatters, then five in number, could not struggle against her. It seemed as if this chain of the Alps separated two different countries, one of which had retained its primitive wildness. The sun went down, and a few solitary rays piercing the rosy clouds, lighted up the Murray district, leaving Gippsland in deep shadow, as if night had suddenly fallen on the whole region. The contrast was presented very vividly to the spectators placed between these two countries so divided, and some emotion filled the minds of the travelers, as they contemplated the almost unknown district they were about to traverse right to the frontiers of Victoria.

They camped on the plateau that night, and next day the descent commenced. It was tolerably rapid. A hailstorm of extreme violence assailed the travelers, and obliged them to seek a shelter among the rocks. It was not hail-stones, but regular lumps of ice, as large as one's hand, which fell from the stormy clouds. A waterspout could not have come down with more violence, and sundry big bruises warned Paganel and Robert to retreat. The wagon was riddled in several places, and few coverings would have held out against those sharp icicles, some of which had fastened themselves into the trunks of the trees. It was impossible to go on till this tremendous shower was over, unless the travelers wished to be stoned. It lasted about an hour, and then the march commenced anew over slanting rocks still slippery after the hail.

Toward evening the wagon, very much shaken and disjointed in several parts, but still standing firm on its wooden disks, came down the last slopes of the Alps, among great isolated pines. The passage ended in the plains of Gippsland. The chain of the Alps was safely passed, and the usual arrangements were made for the nightly encampment.

On the 21st, at daybreak, the journey was resumed with an ardor which never relaxed. Everyone was eager to reach the goal--that is to say the Pacific Ocean--at that part where the wreck of the BRITANNIA had occurred. Nothing could be done in the lonely wilds of Gippsland, and Ayrton urged Lord Glenarvan to send orders at once for the DUNCAN to repair to the coast, in order to have at hand all means of research. He thought it would certainly be advisable to take advantage of the Lucknow route to Melbourne. If they waited it would be difficult to find any way of direct communication with the capital.

This advice seemed good, and Paganel recommended that they should act upon it. He also thought that the presence of the yacht would be very useful, and he added, that if the Lucknow road was once passed, it would be impossible to communicate with Melbourne.

Glenarvan was undecided what to do, and perhaps he would have yielded to Ayrton's arguments, if the Major had not combated this decision vigorously. He maintained that the presence of Ayrton was necessary to the expedition, that he would know the country about the coast, and that if any chance should put them on the track of Harry Grant, the quartermaster would be better able to follow it up than any one else, and, finally, that he alone could point out the exact spot where the shipwreck occurred.

McNabbs voted therefore for the continuation of the voyage, without making the least change in their programme. John Mangles was of the same opinion. The young captain said even that orders would reach the DUNCAN more easily from Twofold Bay, than if a message was sent two hundred miles over a wild country.

His counsel prevailed. It was decided that they should wait till they came to Twofold Bay. The Major watched Ayrton narrowly, and noticed his disappointed look. But he said nothing, keeping his observations, as usual, to himself.

The plains which lay at the foot of the Australian Alps were level, but slightly inclined toward the east. Great clumps of mimosas and eucalyptus, and various odorous gum-trees, broke the uniform monotony here and there. The _gastrolobium grandiflorum_ covered the ground, with its bushes covered with gay flowers. Several unimportant creeks, mere streams full of little rushes, and half covered up with orchids, often interrupted the route. They had to ford these. Flocks of bustards and emus fled at the approach of the travelers. Below the shrubs, kangaroos were leaping and springing like dancing jacks. But the hunters of the party were not thinking much of the sport, and the horses little needed any additional fatigue.

Moreover, a sultry heat oppressed the plain. The atmosphere was completely saturated with electricity, and its
influence was felt by men and beasts. They just dragged themselves along, and cared for nothing else. The silence was only interrupted by the cries of Ayrton urging on his burdened team.

From noon to two o'clock they went through a curious forest of ferns, which would have excited the admiration of less weary travelers. These plants in full flower measured thirty feet in height. Horses and riders passed easily beneath their drooping leaves, and sometimes the spurs would clash against the woody stems. Beneath these immovable parasols there was a refreshing coolness which every one appreciated. Jacques Paganel, always demonstrative, gave such deep sighs of satisfaction that the parrots and cockatoos flew out in alarm, making a deafening chorus of noisy chatter.

The geographer was going on with his sighs and jubilations with the utmost coolness, when his companions suddenly saw him reel forward, and he and his horse fell down in a lump. Was it giddiness, or worse still, suffocation, caused by the high temperature? They ran to him, exclaiming: "Paganel! Paganel! what is the matter?"

"Just this. I have no horse, now!" he replied, disengaging his feet from the stirrups.

"What! your horse?"

"Dead like Mulrady's, as if a thunderbolt had struck him."

Glenarvan, John Mangles, and Wilson examined the animal; and found Paganel was right. His horse had been suddenly struck dead.

"That is strange," said John.

"Very strange, truly," muttered the Major.

Glenarvan was greatly disturbed by this fresh accident. He could not get a fresh horse in the desert, and if an epidemic was going to seize their steeds, they would be seriously embarrassed how to proceed.

Before the close of the day, it seemed as if the word epidemic was really going to be justified. A third horse, Wilson's, fell dead, and what was, perhaps equally disastrous, one of the bullocks also. The means of traction and transport were now reduced to three bullocks and four horses.

The situation became grave. The unmounted horsemen might walk, of course, as many squatters had done already; but if they abandoned the wagon, what would the ladies do? Could they go over the one hundred and twenty miles which lay between them and Twofold Bay? John Mangles and Lord Glenarvan examined the surviving horses with great uneasiness, but there was not the slightest symptom of illness or feebleness in them. The animals were in perfect health, and bravely bearing the fatigues of the voyage. This somewhat reassured Glenarvan, and made him hope the malady would strike no more victims. Ayrton agreed with him, but was unable to find the least solution of the mystery.

They went on again, the wagon serving, from time to time, as a house of rest for the pedestrians. In the evening, after a march of only ten miles, the signal to halt was given, and the tent pitched. The night passed without inconvenience beneath a vast mass of bushy ferns, under which enormous bats, properly called flying foxes, were flapping about.

The next day's journey was good; there were no new calamities. The health of the expedition remained satisfactory; horses and cattle did their task cheerily. Lady Helena's drawing-room was very lively, thanks to the number of visitors. M. Olbinett busied himself in passing round refreshments which were very acceptable in such hot weather. Half a barrel of Scotch ale was sent in bodily. Barclay and Co. was declared to be the greatest man in Great Britain, even above Wellington, who could never have manufactured such good beer. This was a Scotch estimate. Jacques Paganel drank largely, and discoursed still more _de omni re scibili_.

A day so well commenced seemed as if it could not but end well; they had gone fifteen good miles, and managed to get over a pretty hilly district where the soil was reddish. There was every reason to hope they might camp that same night on the banks of the Snowy River, an important river which throws itself into the Pacific, south of Victoria.

Already the wheels of the wagon were making deep ruts on the wide plains, covered with blackish alluvium, as it passed on between tufts of luxuriant grass and fresh fields of gastrolobium. As evening came on, a white mist on the horizon marked the course of the Snowy River. Several additional miles were got over, and a forest of tall trees came in sight at a bend of the road, behind a gentle eminence. Ayrton turned his team a little toward the great trunks, lost in shadow, and he had got to the skirts of the wood, about half-a-mile from the river, when the wagon suddenly sank up to the middle of the wheels.

"Stop!" he called out to the horsemen following him.

"What is wrong?" inquired Glenarvan.

"We have stuck in the mud," replied Ayrton.

He tried to stimulate the bullocks to a fresh effort by voice and goad, but the animals were buried half-way up their legs, and could not stir.

"Let us camp here," suggested John Mangles.
"It would certainly be the best place," said Ayrton. "We shall see by daylight to-morrow how to get ourselves out."

Glenarvan acted on their advice, and came to a halt. Night came on rapidly after a brief twilight, but the heat did not withdraw with the light. Stifling vapors filled the air, and occasionally bright flashes of lightning, the reflections of a distant storm, lighted up the sky with a fiery glare. Arrangements were made for the night immediately. They did the best they could with the sunk wagon, and the tent was pitched beneath the shelter of the great trees; and if the rain did not come, they had not much to complain about.

Ayrton succeeded, though with some difficulty, in extricating the three bullocks. These courageous beasts were engulfed up to their flanks. The quartermaster turned them out with the four horses, and allowed no one but himself to see after their pasturage. He always executed his task wisely, and this evening Glenarvan noticed he redoubled his care, for which he took occasion to thank him, the preservation of the team being of supreme importance.

Meantime, the travelers were dispatching a hasty supper. Fatigue and heat destroy appetite, and sleep was needed more than food. Lady Helena and Miss Grant speedily bade the company good-night, and retired. Their companions soon stretched themselves under the tent or outside under the trees, which is no great hardship in this salubrious climate.

Gradually they all fell into a heavy sleep. The darkness deepened owing to a thick current of clouds which overspread the sky. There was not a breath of wind. The silence of night was only interrupted by the cries of the "morepork" in the minor key, like the mournful cuckoos of Europe.

Towards eleven o'clock, after a wretched, heavy, unre-freshing sleep, the Major woke. His half-closed eyes were struck with a faint light running among the great trees. It looked like a white sheet, and glittered like a lake, and McNabbs thought at first it was the commencement of a fire.

He started up, and went toward the wood; but what was his surprise to perceive a purely natural phenomenon! Before him lay an immense bed of mushrooms, which emitted a phosphorescent light. The luminous spores of the cryptograms shone in the darkness with intensity.

The Major, who had no selfishness about him, was going to waken Paganel, that he might see this phenomenon with his own eyes, when something occurred which arrested him. This phosphorescent light illumined the distance half a mile, and McNabbs fancied he saw a shadow pass across the edge of it. Were his eyes deceiving him? Was it some hallucination?

McNabbs lay down on the ground, and, after a close scrutiny, he could distinctly see several men stooping down and lifting themselves up alternately, as if they were looking on the ground for recent marks.

The Major resolved to find out what these fellows were about, and without the least hesitation or so much as arousing his companions, crept along, lying flat on the ground, like a savage on the prairies, completely hidden among the long grass.

CHAPTER XVI A STARTLING DISCOVERY

It was a frightful night. At two A. M. the rain began to fall in torrents from the stormy clouds, and continued till daybreak. The tent became an insufficient shelter. Glenarvan and his companions took refuge in the wagon; they did not sleep, but talked of one thing and another. The Major alone, whose brief absence had not been noticed, contented himself with being a silent listener. There was reason to fear that if the storm lasted longer the Snowy River would overflow its banks, which would be a very unlucky thing for the wagon, stuck fast as it was already in the soft ground. Mulrady, Ayrton and Mangles went several times to ascertain the height of the water, and came back dripping from head to foot.

At last day appeared; the rain ceased, but sunlight could not break through the thick clouds. Large patches of yellowish water—muddy, dirty ponds indeed they were—covered the ground. A hot steam rose from the soaking earth, and saturated the atmosphere with unhealthy humidity.

Glenarvan's first concern was the wagon; this was the main thing in his eyes. They examined the ponderous vehicle, and found it sunk in the mud in a deep hollow in the stiff clay. The forepart had disappeared completely, and the hind part up to the axle. It would be a hard job to get the heavy conveyance out, and would need the united strength of men, bullocks, and horses.

"At any rate, we must make haste," said John Mangles. "If the clay dries, it will make our task still more difficult."

"Let us be quick, then," replied Ayrton.

Glenarvan, his two sailors, John Mangles, and Ayrton went off at once into the wood, where the animals had passed the night. It was a gloomy-looking forest of tall gum-trees; nothing but dead trees, with wide spaces between, which had been barked for ages, or rather skinned like the cork-oak at harvest time. A miserable network of bare branches was seen above two hundred feet high in the air. Not a bird built its nest in these aerial skeletons; not a leaf trembled on the dry branches, which rattled together like bones. To what cataclysm is this phenomenon to be
attributed, so frequent in Australia, entire forests struck dead by some epidemic; no one knows; neither the oldest natives, nor their ancestors who have lain long buried in the groves of the dead, have ever seen them green.

Glenarvan as he went along kept his eye fixed on the gray sky, on which the smallest branch of the gum-trees was sharply defined. Ayrton was astonished not to discover the horses and bullocks where he had left them the preceding night. They could not have wandered far with the hobbles on their legs.

They looked over the wood, but saw no signs of them, and Ayrton returned to the banks of the river, where magnificent mimosas were growing. He gave a cry well known to his team, but there was no reply. The quartermaster seemed uneasy, and his companions looked at him with disappointed faces. An hour had passed in vain endeavors, and Glenarvan was about to go back to the wagon, when a neigh struck on his ear, and immediately after a bellow.

"They are there!" cried John Mangles, slipping between the tall branches of gastrolobium, which grew high enough to hide a whole flock. Glenarvan, Mulrady, and Ayrton darted after him, and speedily shared his stupefaction at the spectacle which met their gaze.

Two bullocks and three horses lay stretched on the ground, struck down like the rest. Their bodies were already cold, and a flock of half-starved looking ravens croaking among the mimosas were watching the unexpected prey. Glenarvan and his party gazed at each other and Wilson could not keep back the oath that rose to his lips.

"What do you mean, Wilson?" said Glenarvan, with difficulty controlling himself. "Ayrton, bring away the bullock and the horse we have left; they will have to serve us now."

"If the wagon were not sunk in the mud," said John Mangles, "these two animals, by making short journeys, would be able to take us to the coast; so we must get the vehicle out, cost what it may."

"We will try, John," replied Glenarvan. "Let us go back now, or they will be uneasy at our long absence."

Ayrton removed the hobbles from the bullock and Mulrady from the horse, and they began to return to the encampment, following the winding margin of the river. In half an hour they rejoined Paganel, and McNabbs, and the ladies, and told them of this fresh disaster.

"Upon my honor, Ayrton," the Major could not help saying, "it is a pity that you hadn't had the shoeing of all our beasts when we forded the Wimerra."

"Why, sir?" asked Ayrton.

"Because out of all our horses only the one your blacksmith had in his hands has escaped the common fate."

"That's true," said John Mangles. "It's strange it happens so."

"A mere chance, and nothing more," replied the quartermaster, looking firmly at the Major.

Major McNabbs bit his lips as if to keep back something.

V. IV Verne he was about to say. Glenarvan and the rest waited for him to speak out his thoughts, but the Major was silent, and went up to the wagon, which Ayrton was examining.

"What was he going to say. Mangles?" asked Glenarvan.

"I don't know," replied the young captain; "but the Major is not at all a man to speak without reason."

"No, John," said Lady Helena. "McNabbs must have suspicions about Ayrton."

"Suspicious!" exclaimed Paganel, shrugged his shoulders.

"And what can they be?" asked Glenarvan. "Does he suppose him capable of having killed our horses and bullocks? And for what purpose? Is not Ayrton's interest identical with our own?"

"You are right, dear Edward," said Lady Helena! "and what is more, the quartermaster has given us incontestable proofs of his devotion ever since the commencement of the journey."

"Certainly he has," replied Mangles; "but still, what could the Major mean? I wish he would speak his mind plainly out."

"Does he suppose him acting in concert with the convicts?" asked Paganel, imprudently.

"What convicts?" said Miss Grant.

"Monsieur Paganel is making a mistake," replied John Mangles, instantly. "He knows very well there are no convicts in the province of Victoria."

"Ah, that is true," returned Paganel, trying to get out of his unlucky speech. "Whatever had I got in my head? Convicts! who ever heard of convicts being in Australia? Besides, they would scarcely have disembarked before they would turn into good, honest men. The climate, you know, Miss Mary, the regenerative climate---"

Here the poor SAVANT stuck fast, unable to get further, like the wagon in the mud. Lady Helena looked at him in surprise, which quite deprived him of his remaining _sang-froid_; but seeing his embarrassment, she took Mary away to the side of the tent, where M. Olbinett was laying out an elaborate breakfast.

"I deserve to be transported myself," said Paganel, woefully.

"I think so," said Glenarvan.

And after this grave reply, which completely overwhelmed the worthy geographer, Glenarvan and John Mangles
They found Ayrton and the two sailors doing their best to get it out of the deep ruts, and the bullock and horse, yoked together, were straining every muscle. Wilson and Mulrady were pushing the wheels, and the quartermaster urging on the team with voice and goad; but the heavy vehicle did not stir, the clay, already dry, held it as firmly as if sealed by some hydraulic cement.

John Mangles had the clay watered to loosen it, but it was of no use. After renewed vigorous efforts, men and animals stopped. Unless the vehicle was taken to pieces, it would be impossible to extricate it from the mud; but they had no tools for the purpose, and could not attempt such a task.

However, Ayrton, who was for conquering this obstacle at all costs, was about to commence afresh, when Glenarvan stopped him by saying: "Enough, Ayrton, enough. We must husband the strength of our remaining horse and bullock. If we are obliged to continue our journey on foot, the one animal can carry the ladies and the other the provisions. They may thus still be of great service to us."

"Very well, my Lord," replied the quartermaster, un-yoking the exhausted beasts.

"Now, friends," added Glenarvan, "let us return to the encampment and deliberately examine our situation, and determine on our course of action."

After a tolerably good breakfast to make up for their bad night, the discussion was opened, and every one of the party was asked to give his opinion. The first point was to ascertain their exact position, and this was referred to Paganel, who informed them, with his customary rigorous accuracy, that the expedition had been stopped on the 37th parallel, in longitude 147 degrees 53 minutes, on the banks of the Snowy River.

"What is the exact longitude of Twofold Bay?" asked Glenarvan.

"One hundred and fifty degrees," replied Paganel; "two degrees seven minutes distant from this, and that is equal to seventy-five miles."

"And Melbourne is?"

"Two hundred miles off at least."

"Very good. Our position being then settled, what is best to do?"

The response was unanimous to get to the coast without delay. Lady Helena and Mary Grant undertook to go five miles a day. The courageous ladies did not shrink, if necessary, from walking the whole distance between the Snowy River and Twofold Bay.

"You are a brave traveling companion, dear Helena," said Lord Glenarvan. "But are we sure of finding at the bay all we want when we get there?"

"Without the least doubt," replied Paganel. "Eden is a municipality which already numbers many years in existence; its port must have frequent communication with Melbourne. I suppose even at Delegete, on the Victoria frontier, thirty-five miles from here, we might revictual our expedition, and find fresh means of transport."

"And the DUNCAN?" asked Ayrton. "Don't you think it advisable to send for her to come to the bay?"

"What do you think, John?" said Glenarvan.

"I don't think your Lordship should be in any hurry about it," replied the young captain, after brief reflection.

"There will be time enough to give orders to Tom Austin, and summon him to the coast."

"That's quite certain," added Paganel.

"You see," said John, "in four or five days we shall reach Eden."

"Four or five days!" repeated Ayrton, shaking his head; "say fifteen or twenty, Captain, if you don't want to repent your mistake when it is too late."

"Fifteen or twenty days to go seventy-five miles?" cried Glenarvan.

"At the least, my Lord. You are going to traverse the most difficult portion of Victoria, a desert, where everything is wanting, the squatters say; plains covered with scrub, where is no beaten track and no stations. You will have to walk hatchet or torch in hand, and, believe me, that's not quick work."

Ayrton had spoken in a firm tone, and Paganel, at whom all the others looked inquiringly, nodded his head in token of his agreement in opinion with the quartermaster.

But John Mangles said, "Well, admitting these difficulties, in fifteen days at most your Lordship can send orders to the DUNCAN."

"I have to add," said Ayrton, "that the principal difficulties are not the obstacles in the road, but the Snowy River has to be crossed, and most probably we must wait till the water goes down."

"Wait!" cried John. "Is there no ford?"

"I think not," replied Ayrton. "This morning I was looking for some practical crossing, but could not find any. It is unusual to meet with such a tumultuous river at this time of the year, and it is a fatality against which I am powerless."

"Is this Snowy River wide?" asked Lady Helena.
"Wide and deep, Madam," replied Ayrton; "a mile wide, with an impetuous current. A good swimmer could not go over without danger."

"Let us build a boat then," said Robert, who never stuck at anything. "We have only to cut down a tree and hollow it out, and get in and be off."

"He's going ahead, this boy of Captain Grant's!" said Paganel.

"And he's right," returned John Mangles. "We shall be forced to come to that, and I think it is useless to waste our time in idle discussion."

"What do you think of it, Ayrton?" asked Glenarvan seriously.

"I think, my Lord, that a month hence, unless some help arrives, we shall find ourselves still on the banks of the Snowy."

"Well, then, have you any better plan to propose?" said John Mangles, somewhat impatiently.

"Yes, that the DUNCAN should leave Melbourne, and go to the east coast."

"Oh, always the same story! And how could her presence at the bay facilitate our means of getting there?"

Ayrton waited an instant before answering, and then said, rather evasively: "I have no wish to obtrude my opinions. What I do is for our common good, and I am ready to start the moment his honor gives the signal." And he crossed his arms and was silent.

"That is no reply, Ayrton," said Glenarvan. "Tell us your plan, and we will discuss it. What is it you propose?"

Ayrton replied in a calm tone of assurance: "I propose that we should not venture beyond the Snowy in our present condition. It is here we must wait till help comes, and this help can only come from the DUNCAN. Let us camp here, where we have provisions, and let one of us take your orders to Tom Austin to go on to Twofold Bay."

This unexpected proposition was greeted with astonishment, and by John Mangles with openly expressed opposition.

"Meantime," continued Ayrton, "either the river will get lower, and allow us to ford it, or we shall have time to make a canoe. This is the plan I submit for your Lordship's approval."

"Well, Ayrton," replied Glenarvan, "your plan is worthy of serious consideration. The worst thing about it is the delay it would cause; but it would save us great fatigue, and perhaps danger. What do you think of it, friends?"

"Speak your mind, McNabbs," said Lady Helena. "Since the beginning of the discussion you have been only a listener, and very sparing of your words."

"Since you ask my advice," said the Major, "I will give it you frankly. I think Ayrton has spoken wisely and well, and I side with him."

Such a reply was hardly looked for, as hitherto the Major had been strongly opposed to Ayrton's project. Ayrton himself was surprised, and gave a hasty glance at the Major. However, Paganel, Lady Helena, and the sailors were all of the same way of thinking; and since McNabbs had come over to his opinion, Glenarvan decided that the quartermaster's plan should be adopted in principle.

"And now, John," he added, "don't you think yourself it would be prudent to encamp here, on the banks of the river Snowy, till we can get some means of conveyance."

"Yes," replied John Mangles, "if our messenger can get across the Snowy when we cannot."

All eyes were turned on the quartermaster, who said, with the air of a man who knew what he was about: "The messenger will not cross the river."

"Indeed!" said John Mangles.

"He will simply go back to the Lucknow Road which leads straight to Melbourne."

"Go two hundred and fifty miles on foot!" cried the young Captain.

"On horseback," replied Ayrton. "There is one horse sound enough at present. It will only be an affair of four days. Allow the DUNCAN two days more to get to the bay and twenty hours to get back to the camp, and in a week the messenger can be back with the entire crew of the vessel."

The Major nodded approvingly as Ayrton spoke, to the profound astonishment of John Mangles; but as every one was in favor of the plan all there was to do was to carry it out as quickly as possible.

"Now, then, friends," said Glenarvan, "we must settle who is to be our messenger. It will be a fatiguing, perilous mission. I would not conceal the fact from you. Who is disposed, then, to sacrifice himself for his companions and carry our instructions to Melbourne?"

Wilson and Mulrady, and also Paganel, John Mangles and Robert instantly offered their services. John particularly insisted that he should be intrusted with the business; but Ayrton, who had been silent till that moment, now said: "With your Honor's permission I will go myself. I am accustomed to all the country round. Many a time I have been across worse parts. I can go through where another would stick. I ask then, for the good of all, that I may be sent to Melbourne. A word from you will accredit me with your chief officer, and in six days I guarantee the DUNCAN shall be in Twofold Bay."
"That's well spoken," replied Glenarvan. "You are a clever, daring fellow, and you will succeed."

It was quite evident the quartermaster was the fittest man for the mission. All the rest withdrew from the competition. John Mangles made this one last objection, that the presence of Ayrton was necessary to discover traces of the BRITANNIA or Harry Grant. But the Major justly observed that the expedition would remain on the banks of the Snowy till the return of Ayrton, that they had no idea of resuming their search without him, and that consequently his absence would not in the least prejudice the Captain's interests.

"Well, go, Ayrton," said Glenarvan. "Be as quick as you can, and come back by Eden to our camp."

A gleam of satisfaction shot across the quartermaster's face. He turned away his head, but not before John Mangles caught the look and instinctively felt his old distrust of Ayrton revive.

The quartermaster made immediate preparations for departure, assisted by the two sailors, one of whom saw to the horse and the other to the provisions. Glenarvan, meantime, wrote his letter for Tom Austin. He ordered his chief officer to repair without delay to Twofold Bay. He introduced the quartermaster to him as a man worthy of all confidence. On arriving at the coast, Tom was to dispatch a detachment of sailors from the yacht under his orders.

Glenarvan was just at this part of his letter, when McNabbs, who was following him with his eyes, asked him in a singular tone, how he wrote Ayrton's name.

"Why, as it is pronounced, of course," replied Glenarvan.

"It is a mistake," replied the Major quietly. "He pronounces it AYRTON, but he writes it _Ben Joyce!_"

CHAPTER XVII THE PLOT UNVEILED

The revelation of Tom Ayrton's name was like a clap of thunder. Ayrton had started up quickly and grasped his revolver. A report was heard, and Glenarvan fell wounded by a ball. Gunshots resounded at the same time outside.

John Mangles and the sailors, after their first surprise, would have seized Ben Joyce; but the bold convict had already disappeared and rejoined his gang scattered among the gum-trees.

The tent was no shelter against the balls. It was necessary to beat a retreat. Glenarvan was slightly wounded, but could stand up.

"To the wagon--to the wagon!" cried John Mangles, dragging Lady Helena and Mary Grant along, who were soon in safety behind the thick curtains.

John and the Major, and Paganel and the sailors seized their carbines in readiness to repulse the convicts. Glenarvan and Robert went in beside the ladies, while Olbinett rushed to the common defense.

These events occurred with the rapidity of lightning. John Mangles watched the skirts of the wood attentively. The reports had ceased suddenly on the arrival of Ben Joyce; profound silence had succeeded the noisy fusillade. A few wreaths of white smoke were still curling over the tops of the gum trees. The tall tufts of gastrolobium were motionless. All signs of attack had disappeared.

The Major and John Mangles examined the wood closely as far as the great trees; the place was abandoned. Numerous footmarks were there and several half-burned caps were lying smoking on the ground. The Major, like a prudent man, extinguished these carefully, for a spark would be enough to kindle a tremendous conflagration in this forest of dry trees.

"The convicts have disappeared!" said John Mangles.

"Yes," replied the Major; "and the disappearance of them makes me uneasy. I prefer seeing them face to face. Better to meet a tiger on the plain than a serpent in the grass. Let us beat the bushes all round the wagon."

The Major and John hunted all round the country, but there was not a convict to be seen from the edge of the wood right down to the river. Ben Joyce and his gang seemed to have flown away like a flock of marauding birds. It was too sudden a disappearance to let the travelers feel perfectly safe; consequently they resolved to keep a sharp lookout. The wagon, a regular fortress buried in mud, was made the center of the camp, and two men mounted guard round it, who were relieved hour by hour.

The first care of Lady Helena and Mary was to dress Glenarvan's wound. Lady Helena rushed toward him in terror, as he fell down struck by Ben Joyce's ball. Controlling her agony, the courageous woman helped her husband into the wagon. Then his shoulder was bared, and the Major found, on examination, that the ball had only gone into the flesh, and there was no internal lesion. Neither bone nor muscle appeared to be injured. The wound bled profusely, but Glenarvan could use his fingers and forearm; and consequently there was no occasion for any uneasiness about the issue. As soon as his shoulder was dressed, he would not allow any more fuss to be made about himself, but at once entered on the business in hand.

All the party, except Mulrady and Wilson, who were on guard, were brought into the wagon, and the Major was asked to explain how this DENOUEMENT had come about.

Beforecommencing his recital, he told Lady Helena about the escape of the convicts at Perth, and their appearance in Victoria; as also their complicity in the railway catastrophe. He handed her the _Australian and New Zealand Gazette_ they had bought in Seymour, and added that a reward had been offered by the police for the
apprehension of Ben Joyce, a redoubtable bandit, who had become a noted character during the last eighteen months, for doing deeds of villainy and crime.

But how had McNabbs found out that Ayrton and Ben Joyce were one and the same individual? This was the mystery to be unraveled, and the Major soon explained it.

Ever since their first meeting, McNabbs had felt an instinctive distrust of the quartermaster. Two or three insignificant facts, a hasty glance exchanged between him and the blacksmith at the Wimerra River, his unwillingness to cross towns and villages, his persistence about getting the DUNCAN summoned to the coast, the strange death of the animals entrusted to his care, and, lastly, a want of frankness in all his behavior—all these details combined had awakened the Major’s suspicions.

However, he could not have brought any direct accusation against him till the events of the preceding evening had occurred. He then told of his experience.

McNabbs, slipping between the tall shrubs, got within reach of the suspicious shadows he had noticed about half a mile away from the encampment. The phosphorescent furze emitted a faint light, by which he could discern three men examining marks on the ground, and one of the three was the blacksmith of Black Point.

"It is them!" said one of the men. 'Yes,' replied another, 'there is the trefoil on the mark of the horseshoe. It has been like that since the Wimerra. 'All the horses are dead.' 'The poison is not far off.' 'There is enough to kill a regiment of cavalry.' 'A useful plant this gastrolobium.'

"I heard them say this to each other, and then they were quite silent; but I did not know enough yet, so I followed them. Soon the conversation began again. 'He is a clever fellow, this Ben Joyce,' said the blacksmith. 'A capital quartermaster, with his invention of shipwreck.' 'If his project succeeds, it will be a stroke of fortune.' 'He is a very devil, is this Ayrton.' 'Call him Ben Joyce, for he has well earned his name.' And then the scoundrels left the forest.

"I had all the information I wanted now, and came back to the camp quite convinced, begging Paganel's pardon, that Australia does not reform criminals."

This was all the Major's story, and his companions sat silently thinking over it.

"Then Ayrton has dragged us here," said Glenarvan, pale with anger, "on purpose to rob and assassinate us." "For nothing else," replied the Major; "and ever since we left the Wimerra, his gang has been on our track and spying on us, waiting for a favorable opportunity."

"Yes."

"Then the wretch was never one of the sailors on the BRITANNIA; he had stolen the name of Ayrton and the shipping papers."

They were all looking at McNabbs for an answer, for he must have put the question to himself already.

"There is no great certainty about the matter," he replied, in his usual calm voice; "but in my opinion the man's name is really Ayrton. Ben Joyce is his _nom de guerre_. It is an incontestible fact that he knew Harry Grant, and also that he was quartermaster on the BRITANNIA. These facts were proved by the minute details given us by Ayrton, and are corroborated by the conversation between the convicts, which I repeated to you. We need not lose ourselves in vain conjectures, but consider it as certain that Ben Joyce is Ayrton, and that Ayrton is Ben Joyce; that is to say, one of the crew of the BRITANNIA has turned leader of the convict gang."

The explanations of McNabbs were accepted without discussion.

"Now, then," said Glenarvan, "will you tell us how and why Harry Grant's quartermaster comes to be in Australia?"

"How, I don't know," replied McNabbs; "and the police declare they are as ignorant on the subject as myself. Why, it is impossible to say; that is a mystery which the future may explain."

"The police are not even aware of Ayrton's identity with Ben Joyce," said John Mangles.

"You are right, John," replied the Major, "and this circumstance would throw light on their search."

"Then, I suppose," said Lady Helena, "the wicked wretch had got work on Paddy O'Moore's farm with a criminal intent?"

"There is not the least doubt of it. He was planning some evil design against the Irishman, when a better chance presented itself. Chance led us into his presence. He heard Paganel's story and all about the shipwreck, and the audacious fellow determined to act his part immediately. The expedition was decided on. At the Wimerra he found means of communicating with one of his gang, the blacksmith of Black Point, and left traces of our journey which might be easily recognized. The gang followed us. A poisonous plant enabled them gradually to kill our bullocks and horses. At the right moment he sunk us in the marshes of the Snowy, and gave us into the hands of his gang."

Such was the history of Ben Joyce. The Major had shown him up in his character—a bold and formidable criminal. His manifestly evil designs called for the utmost vigilance on the part of Glenarvan. Happily the unmasked bandit was less to be feared than the traitor.

But one serious consequence must come out of this revelation; no one had thought of it yet except Mary Grant.
"Miss Mary! Miss Mary!" he cried; "you are crying!"
"Crying, my child!" said Lady Helena.
"My father, madam, my father!" replied the poor girl.

She could say no more, but the truth flashed on every mind. They all knew the cause of her grief, and why tears fell from her eyes and her father's name came to her lips.

The discovery of Ayrton's treachery had destroyed all hope; the convict had invented a shipwreck to entrap Glenarvan. In the conversation overheard by McNabbs, the convicts had plainly said that the BRITANNIA had never been wrecked on the rocks in Twofold Bay. Harry Grant had never set foot on the Australian continent!

A second time they had been sent on the wrong track by an erroneous interpretation of the document. Gloomy silence fell on the whole party at the sight of the children's sorrow, and no one could find a cheering word to say. Robert was crying in his sister's arms. Paganel muttered in a tone of vexation: "That unlucky document! It may boast of having half-crazed a dozen peoples' wits!" The worthy geographer was in such a rage with himself, that he struck his forehead as if he would smash it in.

Glenarvan went out to Mulrady and Wilson, who were keeping watch. Profound silence reigned over the plain between the wood and the river. Ben Joyce and his band must be at considerable distance, for the atmosphere was in such a state of complete torpor that the slightest sound would have been heard. It was evident, from the flocks of birds on the lower branches of the trees, and the kangaroos feeding quietly on the young shoots, and a couple of emus whose confiding heads passed between the great clumps of bushes, that those peaceful solitudes were untroubled by the presence of human beings.

"You have neither seen nor heard anything for the last hour?" said Glenarvan to the two sailors.
"Nothing whatever, your honor," replied Wilson. "The convicts must be miles away from here."
"They were not in numbers enough to attack us, I suppose," added Mulrady. "Ben Joyce will have gone to recruit his party, with some bandits like himself, among the bush-rangers who may be lurking about the foot of the Alps."
"That is probably the case, Mulrady," replied Glenarvan. "The rascals are cowards; they know we are armed, and well armed too. Perhaps they are waiting for nightfall to commence the attack. We must redouble our watchfulness. Oh, if we could only get out of this bog, and down the coast; but this swollen river bars our passage. I would pay its weight in gold for a raft which would carry us over to the other side."
"Why does not your honor give orders for a raft to be constructed? We have plenty of wood."
"No, Wilson," replied Glenarvan; "this Snowy is not a river, it is an impassable torrent."

John Mangles, the Major, and Paganel just then came out of the wagon on purpose to examine the state of the river. They found it still so swollen by the heavy rain that the water was a foot above the level. It formed an impetuous current, like the American rapids. To venture over that foaming current and that rushing flood, broken into a thousand eddies and hollows and gulls, was impossible.

John Mangles declared the passage impracticable. "But we must not stay here," he added, "without attempting anything. What we were going to do before Ayrton's treachery is still more necessary now."
"What do you mean, John?" asked Glenarvan.
"I mean that our need is urgent, and that since we cannot go to Twofold Bay, we must go to Melbourne. We have still one horse. Give it to me, my Lord, and I will go to Melbourne."
"But that will be a dangerous venture, John," said Glenarvan. "Not to speak of the perils of a journey of two hundred miles over an unknown country, the road and the by-ways will be guarded by the accomplices of Ben Joyce."
"I know it, my Lord, but I know also that things can't stay long as they are; Ayrton only asked a week's absence to fetch the crew of the DUNCAN, and I will be back to the Snowy River in six days. Well, my Lord, what are your commands?"

"Before Glenarvan decides," said Paganel, "I must make an observation. That some one must go to Melbourne is evident, but that John Mangles should be the one to expose himself to the risk, cannot be. He is the captain of the DUNCAN, and must be careful of his life. I will go instead."
"That is all very well, Paganel," said the Major; "but why should you be the one to go?"
"Are we not here?" said Mulrady and Wilson.
"And do you think," replied McNabbs, "that a journey of two hundred miles on horseback frightens me."
"Friends," said Glenarvan, "one of us must go, so let it be decided by drawing lots. Write all our names, Paganel."
"Not yours, my Lord," said John Mangles.
"And why not?"
"What! separate you from Lady Helena, and before your wound is healed, too!"
"Glenarvan," said Paganel, "you cannot leave the expedition."
"No," added the Major. "Your place is here, Edward, you ought not to go."
"Danger is involved in it," said Glenarvan, "and I will take my share along with the rest. Write the names, Paganel, and put mine among them, and I hope the lot may fall on me."

His will was obeyed. The names were written, and the lots drawn. Fate fixed on Mulrady. The brave sailor shouted hurrah! and said: "My Lord, I am ready to start." Glenarvan pressed his hand, and then went back to the wagon, leaving John Mangles and the Major on watch.

Lady Helena was informed of the determination to send a message to Melbourne, and that they had drawn lots who should go, and Mulrady had been chosen. Lady Helena said a few kind words to the brave sailor, which went straight to his heart. Fate could hardly have chosen a better man, for he was not only brave and intelligent, but robust and superior to all fatigue.

Mulrady's departure was fixed for eight o'clock, immediately after the short twilight. Wilson undertook to get the horse ready. He had a project in his head of changing the horse's left shoe, for one off the horses that had died in the night. This would prevent the convicts from tracking Mulrady, or following him, as they were not mounted.

While Wilson was arranging this, Glenarvan got his letter ready for Tom Austin, but his wounded arm troubled him, and he asked Paganel to write it for him. The SAVANT was so absorbed in one fixed idea that he seemed hardly to know what he was about. In all this succession of vexations, it must be said the document was always uppermost in Paganel's mind. He was always worrying himself about each word, trying to discover some new meaning, and losing the wrong interpretation of it, and going over and over himself in perplexities.

He did not hear Glenarvan when he first spoke, but on the request being made a second time, he said: "Ah, very well. I'm ready."

While he spoke he was mechanically getting paper from his note-book. He tore a blank page off, and sat down pencil in hand to write.

Glenarvan began to dictate as follows: "Order to Tom Austin, Chief Officer, to get to sea without delay, and bring the DUNCAN to--"

Paganel was just finishing the last word, when his eye chanced to fall on the _Australian and New Zealand Gazette_ lying on the ground. The paper was so folded that only the last two syllables of the title were visible. Paganel's pencil stopped, and he seemed to become oblivious of Glenarvan and the letter entirely, till his friends called out: "Come, Paganel!"

"Ah!" said the geographer, with a loud exclamation.
"What is the matter?" asked the Major.
"Nothing, nothing," replied Paganel. Then he muttered to himself, ".Aland! aland! aland! ."

He had got up and seized the newspaper. He shook it in his efforts to keep back the words that involuntarily rose to his lips.

Lady Helena, Mary, Robert, and Glenarvan gazed at him in astonishment, at a loss to understand this unaccountable agitation. Paganel looked as if a sudden fit of insanity had come over him. But his excitement did not last. He became by degrees calmer. The gleam of joy that shone in his eyes died away. He sat down again, and said quietly:

"When you please, my Lord, I am ready." Glenarvan resumed his dictation at once, and the letter was soon completed. It read as follows: "Order to Tom Austin to go to sea without delay; and take the DUNCAN to Melbourne by the 37th degree of latitude to the eastern coast of Australia."

"Of Australia?" said Paganel. "Ah yes! of Australia."

Then he finished the letter, and gave it to Glenarvan to sign, who went through the necessary formality as well as he could, and closed and sealed the letter. Paganel, whose hand still trembled with emotion, directed it thus: "Tom Austin, Chief Officer on board the Yacht DUNCAN, Melbourne."

Then he got up and went out of the wagon, gesticulating and repeating the incomprehensible words:
"Aland aland! aland!"

CHAPTER XVIII FOUR DAYS OF ANGUISH

THE rest of the day passed on without any further incident. All the preparations for Mulrady's journey were completed, and the brave sailor rejoiced in being able to give his Lordship this proof of devotion.

Paganel had recovered his usual _sang-froid_ and manners. His look, indeed, betrayed his preoccupation, but he seemed resolved to keep it secret. No doubt he had strong reasons for this course of action, for the Major heard him repeating, like a man struggling with himself: "No, no, they would not believe it; and, besides, what good would it be? It is too late!"

Having taken this resolution, he busied himself with giving Mulrady the necessary directions for getting to
Melbourne, and showed him his way on the map. All the TRACKS, that is to say, paths through the prairie, came out on the road to Lucknow. This road, after running right down to the coast took a sudden bend in the direction of Melbourne. This was the route that must be followed steadily, for it would not do to attempt a short cut across an almost unknown country. Nothing, consequently, could be more simple. Mulrady could not lose his way.

As to dangers, there were none after he had gone a few miles beyond the encampment, out of the reach of Ben Joyce and his gang. Once past their hiding place, Mulrady was certain of soon being able to outdistance the convicts, and execute his important mission successfully.

At six o'clock they all dined together. The rain was falling in torrents. The tent was not protection enough, and the whole party had to take refuge in the wagon. This was a sure refuge. The clay kept it firmly imbedded in the soil, like a fortress resting on sure foundations. The arsenal was composed of seven carbines and seven revolvers, and could stand a pretty long siege, for they had plenty of ammunition and provisions. But before six days were over, the DUNCAN would anchor in Twofold Bay, and twenty-four hours after her crew would reach the other shore of the Snowy River; and should the passage still remain impracticable, the convicts at any rate would be forced to retire before the increased strength. But all depended on Mulrady's success in his perilous enterprise.

At eight o'clock it got very dark; now was the time to start. The horse prepared for Mulrady was brought out. His feet, by way of extra precaution, were wrapped round with cloths, so that they could not make the least noise on the ground. The animal seemed tired, and yet the safety of all depended on his strength and surefootedness. The Major advised Mulrady to let him go gently as soon as he got past the convicts. Better delay half-a-day than not arrive safely.

John Mangles gave his sailor a revolver, which he had loaded with the utmost care. This is a formidable weapon in the hand of a man who does not tremble, for six shots fired in a few seconds would easily clear a road infested with criminals. Mulrady seated himself in the saddle ready to start.

"Here is the letter you are to give to Tom Austin," said Glenarvan. "Don't let him lose an hour. He is to sail for Twofold Bay at once; and if he does not find us there, if we have not managed to cross the Snowy, let him come on to us without delay. Now go, my brave sailor, and God be with you."

He shook hands with him, and bade him good-by; and so did Lady Helena and Mary Grant. A more timorous man than the sailor would have shrunk back a little from setting out on such a dark, raining night on an errand so full of danger, across vast unknown wilds. But his farewells were calmly spoken, and he speedily disappeared down a path which skirted the wood.

At the same moment the gusts of wind redoubled their violence. The high branches of the eucalyptus clattered together noisily, and bough after bough fell on the wet ground. More than one great tree, with no living sap, but still standing hitherto, fell with a crash during this storm. The wind howled amid the cracking wood, and mingled its moans with the ominous roaring of the rain. The heavy clouds, driving along toward the east, hung on the ground like rays of vapor, and deep, cheerless gloom intensified the horrors of the night.

The travelers went back into the wagon immediately Mulrady had gone. Lady Helena, Mary Grant, Glenarvan and Paganel occupied the first compartment, which had been hermetically closed. The second was occupied by Olbinett, Wilson and Robert. The Major and John Mangles were on duty outside. This precaution was necessary, for an attack on the part of the convicts would be easy enough, and therefore probable enough.

The two faithful guardians kept close watch, bearing philosophically the rain and wind that beat on their faces. They tried to pierce through the darkness so favorable to ambushes, for nothing could be heard but the noise of the tempest, the howling branches, falling trees, and roaring of the unchained waters.

At times the wind would cease for a few moments, as if to take breath. Nothing was audible but the moan of the Snowy River, as it flowed between the motionless reeds and the dark curtain of gum trees. The silence seemed deeper in these momentary lulls, and the Major and John Mangles listened attentively.

During one of these calms a sharp whistle reached them. John Mangles went hurriedly up to the Major. "You heard that?" he asked.

"Yes," said McNabbs. "Is it man or beast?"

And then both listened. The mysterious whistle was repeated, and answered by a kind of report, but almost indistinguishable, for the storm was raging with renewed violence. McNabbs and John Mangles could not hear themselves speak. They went for comfort under the shelter of the wagon.

At this moment the leather curtains were raised and Glenarvan rejoined his two companions. He too had heard this ill-boding whistle, and the报告 which echoed under the tilt. "Which way was it?" he asked.

"There," said John, pointing to the dark track in the direction taken by Mulrady.

"How far?"

"The wind brought it; I should think, three or four miles, at least."
"Come," said Glenarvan, putting his gun on his shoulder.

"No," said the Major. "It is a decoy to get us away from the wagon."

"But if Mulrady has even now fallen beneath the blows of these rascals?" exclaimed Glenarvan, seizing McNabbs by the hand.

"We shall know by to-morrow," said the Major, coolly, determined to prevent Glenarvan from taking a step which was equally rash and futile.

"You cannot leave the camp, my Lord," said John. "I will go alone."

"You will do nothing of the kind!" cried McNabbs, energetically. "Do you want to have us killed one by one to diminish our force, and put us at the mercy of these wretches? If Mulrady has fallen a victim to them, it is a misfortune that must not be repeated. Mulrady was sent, chosen by chance. If the lot had fallen to me, I should have gone as he did; but I should neither have asked nor expected assistance."

In restraining Glenarvan and John Mangles, the Major was right in every aspect of the case. To attempt to follow the sailor, to run in the darkness of night among the convicts in their leafy ambush was madness, and more than that-it was useless. Glenarvan's party was not so numerous that it could afford to sacrifice another member of it.

Still Glenarvan seemed as if he could not yield; his hand was always on his carbine. He wandered about the wagon, and bent a listening ear to the faintest sound. The thought that one of his men was perhaps mortally wounded, abandoned to his fate, calling in vain on those for whose sake he had gone forth, was a torture to him. McNabbs was not sure that he should be able to restrain him, or if Glenarvan, carried away by his feelings, would not run into the arms of Ben Joyce.

"Edward," said he, "be calm. Listen to me as a friend. Think of Lady Helena, of Mary Grant, of all who are left. And, besides, where would you go? Where would you find Mulrady? He must have been attacked two miles off. In what direction? Which track would you follow?"

At that very moment, as if to answer the Major, a cry of distress was heard.

"Listen!" said Glenarvan.

This cry came from the same quarter as the report, but less than a quarter of a mile off.

Glenarvan, repulsing McNabbs, was already on the track, when at three hundred paces from the wagon they heard the exclamation: "Help! help!"

The voice was plaintive and despairing. John Mangles and the Major sprang toward the spot. A few seconds after they perceived among the scrub a human form dragging itself along the ground and uttering mournful groans. It was Mulrady, wounded, apparently dying; and when his companions raised him they felt their hands bathed in blood.

The rain came down with redoubled violence, and the wind raged among the branches of the dead trees. In the pelting storm, Glenarvan, the Major and John Mangles transported the body of Mulrady.

On their arrival everyone got up. Paganel, Robert, Wilson and Olbinett left the wagon, and Lady Helena gave up her compartment to poor Mulrady. The Major removed the poor fellow's flannel shirt, which was dripping with blood and rain. He soon found the wound; it was a stab in the right side.

McNabbs dressed it with great skill. He could not tell whether the weapon had touched any vital part. An intermittent jet of scarlet blood flowed from it; the patient's paleness and weakness showed that he was seriously injured. The Major washed the wound first with fresh water and then closed the orifice; after this he put on a thick pad of lint, and then folds of scraped linen held firmly in place with a bandage. He succeeded in stopping the hemorrhage. Mulrady was laid on his side, with his head and chest well raised, and Lady Helena succeeded in making him swallow a few drops of water.

After about a quarter of an hour, the wounded man, who till then had lain motionless, made a slight movement. His eyes unclosed, his lips muttered incoherent words, and the Major, bending toward him, heard him repeating: "My Lord--the letter--Ben Joyce."

The Major repeated these words, and looked at his companions. What did Mulrady mean? Ben Joyce had been the attacking party, of course; but why? Surely for the express purpose of intercepting him, and preventing his arrival at the DUNCAN. This letter--

Glenarvan searched Mulrady's pockets. The letter addressed to Tom Austin was gone!

The night wore away amid anxiety and distress; every moment, they feared, would be poor Mulrady's last. He suffered from acute fever. The Sisters of Charity, Lady Helena and Mary Grant, never left him. Never was patient so well tended, nor by such sympathetic hands.

Day came, and the rain had ceased. Great clouds filled the sky still; the ground was strewn with broken branches; the marly soil, soaked by the torrents of rain, had yielded still more; the approaches to the wagon became difficult, but it could not sink any deeper.

John Mangles, Paganel, and Glenarvan went, as soon as it was light enough, to reconnoiter in the neighborhood
of the encampment. They revisited the track, which was still stained with blood. They saw no vestige of Ben Joyce, nor of his band. They penetrated as far as the scene of the attack. Here two corpses lay on the ground, struck down by Mulrady's bullets. One was the blacksmith of Blackpoint. His face, already changed by death, was a dreadful spectacle. Glenarvan searched no further. Prudence forbade him to wander from the camp. He returned to the wagon, deeply absorbed by the critical position of affairs.

"We must not think of sending another messenger to Melbourne," said he.
"But we must," said John Mangles; "and I must try to pass where my sailor could not succeed."
"No, John! it is out of the question. You have not even a horse for the journey, which is full two hundred miles!"

This was true, for Mulrady's horse, the only one that remained, had not returned. Had he fallen during the attack on his rider, or was he straying in the bush, or had the convicts carried him off?

"Come what will," replied Glenarvan, "we will not separate again. Let us wait a week, or a fortnight, till the Snowy falls to its normal level. We can then reach Twofold Bay by short stages, and from there we can send on to the DUNCAN, by a safer channel, the order to meet us."

"That seems the only plan," said Paganel.
"Therefore, my friends," rejoined Glenarvan, "no more parting. It is too great a risk for one man to venture alone into a robber-haunted waste. And now, may God save our poor sailor, and protect the rest of us!"

Glenarvan was right in both points; first in prohibiting all isolated attempts, and second, in deciding to wait till the passage of the Snowy River was practicable. He was scarcely thirty miles from Delegete, the first frontier village of New South Wales, where he would easily find the means of transport to Twofold Bay, and from there he could telegraph to Melbourne his orders about the DUNCAN.

These measures were wise, but how late! If Glenarvan had not sent Mulrady to Lucknow what misfortunes would have been averted, not to speak of the assassination of the sailor!

When he reached the camp he found his companions in better spirits. They seemed more hopeful than before.

"He is better! he is better!" cried Robert, running out to meet Lord Glenarvan.
"Mulrady?--"
"Yes, Edward," answered Lady Helena. "A reaction has set in. The Major is more confident. Our sailor will live."
"Where is McNabbs?" asked Glenarvan.
"With him. Mulrady wanted to speak to him, and they must not be disturbed."

He then learned that about an hour since, the wounded man had awakened from his lethargy, and the fever had abated. The first thing he did on recovering his memory and speech was to ask for Lord Glenarvan, or, failing him, the Major. McNabbs seeing him so weak, would have forbidden any conversation; but Mulrady insisted with such energy that the Major had to give in. The interview had already lasted some minutes when Glenarvan returned. There was nothing for it but to await the return of McNabbs.

Presently the leather curtains of the wagon moved, and the Major appeared. He rejoined his friends at the foot of a gum-tree, where the tent was placed. His face, usually so stolid, showed that something disturbed him. When his eyes fell on Lady Helena and the young girl, his glance was full of sorrow.

Glenarvan questioned him, and extracted the following information: When he left the camp Mulrady followed one of the paths indicated by Paganel. He made as good speed as the darkness of the night would allow. He reckoned that he had gone about two miles when several men—five, he thought—sprang to his horse's head. The animal reared; Mulrady seized his revolver and fired. He thought he saw two of his assailants fall. By the flash he recognized Ben Joyce. But that was all. He had not time to fire all the barrels. He felt a violent blow on his side and was thrown to the ground.

Still he did not lose consciousness. The murderers thought he was dead. He felt them search his pockets, and then heard one of them say: "I have the letter."
"Give it to me," returned Ben Joyce, "and now the DUNCAN is ours."
At this point of the story, Glenarvan could not help uttering a cry.

McNabbs continued: "'Now you fellows,' added Ben Joyce, 'catch the horse. In two days I shall be on board the DUNCAN, and in six I shall reach Twofold Bay. This is to be the rendezvous. My Lord and his party will be still stuck in the marshes of the Snowy River. Cross the river at the bridge of Kempe Pier, proceed to the coast, and wait for me. I will easily manage to get you on board. Once at sea in a craft like the DUNCAN, we shall be masters of the Indian Ocean.' "Hurrah for Ben Joyce!" cried the convicts. Mulrady's horse was brought, and Ben Joyce disappeared, galloping on the Lucknow Road, while the band took the road southeast of the Snowy River. Mulrady, though severely wounded, had the strength to drag himself to within three hundred paces from the camp, whence we found him almost dead. There," said McNabbs, "is the history of Mulrady; and now you can understand why the brave fellow was so determined to speak."
This revelation terrified Glenarvan and the rest of the party.
"Pirates! pirates!" cried Glenarvan. "My crew massacred! my DUNCAN in the hands of these bandits!"
"Yes, for Ben Joyce will surprise the ship," said the Major, "and then--"
"Well, we must get to the coast first," said Paganel.
"But how are we to cross the Snowy River?" said Wilson.
"As they will," replied Glenarvan. "They are to cross at Kemple Pier Bridge, and so will we."
"But about Mulrady?" asked Lady Helena.
"We will carry him; we will have relays. Can I leave my crew to the mercy of Ben Joyce and his gang?"

To cross the Snowy River at Kemple Pier was practicable, but dangerous. The convicts might entrench themselves at that point, and defend it. They were at least thirty against seven! But there are moments when people do not deliberate, or when they have no choice but to go on.

"My Lord," said John Mangles, "before we throw away our chance, before venturing to this bridge, we ought to reconnoiter, and I will undertake it."

"I will go with you, John," said Paganel.

This proposal was agreed to, and John Mangles and Paganel prepared to start immediately. They were to follow the course of the Snowy River, follow its banks till they reached the place indicated by Ben Joyce, and especially they were to keep out of sight of the convicts, who were probably scouring the bush.

So the two brave comrades started, well provisioned and well armed, and were soon out of sight as they threaded their way among the tall reeds by the river. The rest anxiously awaited their return all day. Evening came, and still the scouts did not return. They began to be seriously alarmed. At last, toward eleven o'clock, Wilson announced their arrival. Paganel and John Mangles were worn out with the fatigues of a ten-mile walk.

"Well, what about the bridge? Did you find it?" asked Glenarvan, with impetuous eagerness.

"Yes, a bridge of supple-jacks," said John Mangles. "The convicts passed over, but--"

"But what?" said Glenarvan, who foreboded some new misfortune.

"They burned it after they passed!" said Paganel.

CHAPTER XIX HELPLESS AND HOPELESS

It was not a time for despair, but action. The bridge at Kemple Pier was destroyed, but the Snowy River must be crossed, come what might, and they must reach Twofold Bay before Ben Joyce and his gang, so, instead of wasting time in empty words, the next day (the 16th of January) John Mangles and Glenarvan went down to examine the river, and arrange for the passage over.

The swollen and tumultuous waters had not gone down the least. They rushed on with indescribable fury. It would be risking life to battle with them. Glenarvan stood gazing with folded arms and downcast face.

"Would you like me to try and swim across?" asked John Mangles.

"No, John, no!" said Lord Glenarvan, holding back the bold, daring young fellow, "let us wait."

And they both returned to the camp. The day passed in the most intense anxiety. Ten times Lord Glenarvan went to look at the river, trying to invent some bold way of getting over; but in vain. Had a torrent of lava rushed between the shores, it could not have been more impassable.

During these long wasted hours, Lady Helena, under the Major's advice, was nursing Mulrady with the utmost skill. The sailor felt a throbb of returning life. McNabbs ventured to affirm that no vital part was injured. Loss of blood accounted for the patient's extreme exhaustion. The wound once closed and the hemorrhage stopped, time and rest would be all that was needed to complete his cure. Lady Helena had insisted on giving up the first compartment of the wagon to him, which greatly tried his modesty. The poor fellow's greatest trouble was the delay his condition might cause Glenarvan, and he made him promise that they should leave him in the camp under Wilson's care, should the passage of the river become practicable.

But, unfortunately, no passage was practicable, either that day or the next (January 17); Glenarvan was in despair. Lady Helena and the Major vainly tried to calm him, and preached patience.

Patience, indeed, when perhaps at this very moment Ben Joyce was boarding the yacht; when the DUNCAN, loosing from her moorings, was getting up steam to reach the fatal coast, and each hour was bringing her nearer.

John Mangles felt in his own breast all that Glenarvan was suffering. He determined to conquer the difficulty at any price, and constructed a canoe in the Australian manner, with large sheets of bark of the gum-trees. These sheets were kept together by bars of wood, and formed a very fragile boat. The captain and the sailor made a trial trip in it during the day. All that skill, and strength, and tact, and courage could do they did; but they were scarcely in the current before they were upside down, and nearly paid with their lives for the dangerous experiment. The boat disappeared, dragged down by the eddy. John Mangles and Wilson had not gone ten fathoms, and the river was a mile broad, and swollen by the heavy rains and melted snows.

Thus passed the 19th and 20th of January. The Major and Glenarvan went five miles up the river in search of a
favorable passage, but everywhere they found the same roaring, rushing, impetuous torrent. The whole southern slope of the Australian Alps poured its liquid masses into this single bed.

All hope of saving the DUNCAN was now at an end. Five days had elapsed since the departure of Ben Joyce. The yacht must be at this moment at the coast, and in the hands of the convicts.

However, it was impossible that this state of things could last. The temporary influx would soon be exhausted, and the violence also. Indeed, on the morning of the 21st, Paganel announced that the water was already lower. "What does it matter now?" said Glenarvan. "It is too late!"

"That is no reason for our staying longer here," said the Major.

"Certainly not," replied John Mangles. "Perhaps tomorrow the river may be practicable."

"And will that save my unhappy men?" cried Glenarvan.

"Will your Lordship listen to me?" returned John Mangles. "I know Tom Austin. He would execute your orders, and set out as soon as departure was possible. But who knows whether the DUNCAN was ready and her injury repaired on the arrival of Ben Joyce. And suppose the

V. IV Verne yacht could not go to sea; suppose there was a delay of a day, or two days."

"You are right, John," replied Glenarvan. "We must get to Twofold Bay; we are only thirty-five miles from Delegete."

"Yes," added Paganel, "and that's a town where we shall find rapid means of conveyance. Who knows whether we shan't arrive in time to prevent a catastrophe."

"Let us start," cried Glenarvan.

John Mangles and Wilson instantly set to work to construct a canoe of larger dimensions. Experience had proved that the bark was powerless against the violence of the torrent, and John accordingly felled some of the gum-trees, and made a rude but solid raft with the trunks. It was a long task, and the day had gone before the work was ended. It was completed next morning.

By this time the waters had visibly diminished; the torrent had once more become a river, though a very rapid one, it is true. However, by pursuing a zigzag course, and overcoming it to a certain extent, John hoped to reach the opposite shore. At half-past twelve, they embarked provisions enough for a couple of days. The remainder was left with the wagon and the tent. Mulrady was doing well enough to be carried over; his convalescence was rapid.

At one o'clock, they all seated themselves on the raft, still moored to the shore. John Mangles had installed himself at the starboard, and entrusted to Wilson a sort of oar to steady the raft against the current, and lessen the leeway. He took his own stand at the back, to steer by means of a large scull; but, notwithstanding their efforts, Wilson and John Mangles soon found themselves in an inverse position, which made the action of the oars impossible.

There was no help for it; they could do nothing to arrest the gyratory movement of the raft; it turned round with dizzying rapidity, and drifted out of its course. John Mangles stood with pale face and set teeth, gazing at the whirling current.

However, the raft had reached the middle of the river, about half a mile from the starting point. Here the current was extremely strong, and this broke the whirling eddy, and gave the raft some stability. John and Wilson seized their oars again, and managed to push it in an oblique direction. This brought them nearer to the left shore. They were not more than fifty fathoms from it, when Wilson's oar snapped short off, and the raft, no longer supported, was dragged away. John tried to resist at the risk of breaking his own oar, too, and Wilson, with bleeding hands, seconded his efforts with all his might.

At last they succeeded, and the raft, after a passage of more than half an hour, struck against the steep bank of the opposite shore. The shock was so violent that the logs became disunited, the cords broke, and the water bubbled up between. The travelers had barely time to catch hold of the steep bank. They dragged out Mulrady and the two dripping ladies. Everyone was safe; but the provisions and firearms, except the carbine of the Major, went drifting down with the DEBRIS of the raft.

The river was crossed. The little company found themselves almost without provisions, thirty-five miles from Delegete, in the midst of the unknown deserts of the Victoria frontier. Neither settlers nor squatters were to be met with; it was entirely uninhabited, unless by ferocious bushrangers and bandits.

They resolved to set off without delay. Mulrady saw clearly that he would be a great drag on them, and he begged to be allowed to remain, and even to remain alone, till assistance could be sent from Delegete.

Glenarvan refused. It would be three days before he could reach Delegete, and five the shore—that is to say, the 26th of January. Now, as the DUNCAN had left Melbourne on the 16th, what difference would a few days' delay make?

"No, my friend," he said, "I will not leave anyone behind. We will make a litter and carry you in turn."

The litter was made of boughs of eucalyptus covered with branches; and, whether he would or not, Mulrady was
obliged to take his place on it. Glenarvan would be the first to carry his sailor. He took hold of one end and Wilson of the other, and all set off.

What a sad spectacle, and how lamentably was this expedition to end which had commenced so well. They were no longer in search of Harry Grant. This continent, where he was not, and never had been, threatened to prove fatal to those who sought him. And when these intrepid countrymen of his should reach the shore, they would find the DUNCAN waiting to take them home again. The first day passed silently and painfully. Every ten minutes the litter changed bearers. All the sailor’s comrades took their share in this task without murmuring, though the fatigue was augmented by the great heat.

In the evening, after a journey of only five miles, they camped under the gum-trees. The small store of provisions saved from the raft composed the evening meal. But all they had to depend upon now was the Major’s carbine.

It was a dark, rainy night, and morning seemed as if it would never dawn. They set off again, but the Major could not find a chance of firing a shot. This fatal region was only a desert, unfrequented even by animals. Fortunately, Robert discovered a bustard’s nest with a dozen of large eggs in it, which Olbinett cooked on hot cinders. These, with a few roots of purslain which were growing at the bottom of a ravine, were all the breakfast of the 22d.

The route now became extremely difficult. The sandy plains were bristling with SPINIFEX, a prickly plant, which is called in Melbourne the porcupine. It tears the clothing to rags, and makes the legs bleed. The courageous ladies never complained, but footed it bravely, setting an example, and encouraging one and another by word or look.

They stopped in the evening at Mount Bulla Bulla, on the edge of the Jungalla Creek. The supper would have been very scant, if McNabbs had not killed a large rat, the _mus conditor_, which is highly spoken of as an article of diet. Olbinett roasted it, and it would have been pronounced even superior to its reputation had it equaled the sheep in size. They were obliged to be content with it, however, and it was devoured to the bones.

On the 23d the weary but still energetic travelers started off again. After having gone round the foot of the mountain, they crossed the long prairies where the grass seemed made of whalebone. It was a tangle of darts, a medley of sharp little sticks, and a path had to be cut through either with the hatchet or fire.

That morning there was not even a question of breakfast. Nothing could be more barren than this region strewn with pieces of quartz. Not only hunger, but thirst began to assail the travelers. A burning atmosphere heightened their discomfort. Glenarvan and his friends could only go half a mile an hour. Should this lack of food and water continue till evening, they would all sink on the road, never to rise again.

But when everything fails a man, and he finds himself without resources, at the very moment when he feels he must give up, then Providence steps in. Water presented itself in the CEPHALOTES, a species of cup-shaped flower, filled with refreshing liquid, which hung from the branches of coralliform-shaped bushes. They all quenched their thirst with these, and felt new life returning.

The only food they could find was the same as the natives were forced to subsist upon, when they could find neither game, nor serpents, nor insects. Paganel discovered in the dry bed of a creek, a plant whose excellent properties had been frequently described by one of his colleagues in the Geographical Society.

It was the NARDOU, a cryptogamous plant of the family Marsilaceae, and the same which kept Burke and King alive in the deserts of the interior. Under its leaves, which resembled those of the trefoil, there were dried sporules as large as a lentil, and these sporules, when crushed between two stones, made a sort of flour. This was converted into coarse bread, which stilled the pangs of hunger at least. There was a great abundance of this plant growing in the district, and Olbinett gathered a large supply, so that they were sure of food for several days.

The next day, the 24th, Mulrady was able to walk part of the way. His wound was entirely cicatrized. The town of Delegete was not more than ten miles off, and that evening they camped in longitude 140 degrees, on the very frontier of New South Wales.

For some hours, a fine but penetrating rain had been falling. There would have been no shelter from this, if by chance John Mangles had not discovered a sawyer’s hut, deserted and dilapidated to a degree. But with this miserable cabin they were obliged to be content. Wilson wanted to kindle a fire to prepare the NARDOU bread, and he went out to pick up the dead wood scattered all over the ground. But he found it would not light, the great quantity of albuminous matter which it contained prevented all combustion. This is the incombustible wood put down by Paganel in his list of Australian products.

They had to dispense with fire, and consequently with food too, and sleep in their wet clothes, while the laughing jackasses, concealed in the high branches, seemed to ridicule the poor unfortunates. However, Glenarvan was nearly at the end of his sufferings. It was time. The two young ladies were making heroic efforts, but their strength was hourly decreasing. They dragged themselves along, almost unable to walk.
Next morning they started at daybreak. At 11 A.M. Delegete came in sight in the county of Wellesley, and fifty miles from Twofold Bay.

Means of conveyance were quickly procured here. Hope returned to Glenarvan as they approached the coast. Perhaps there might have been some slight delay, and after all they might get there before the arrival of the DUNCAN. In twenty-four hours they would reach the bay.

At noon, after a comfortable meal, all the travelers installed in a mail-coach, drawn by five strong horses, left Delegete at a gallop. The postilions, stimulated by a promise of a princely DOUCEUR, drove rapidly along over a well-kept road. They did not lose a minute in changing horses, which took place every ten miles. It seemed as if they were infected with Glenarvan's zeal. All that day, and night, too, they traveled on at the rate of six miles an hour.

In the morning at sunrise, a dull murmur fell on their ears, and announced their approach to the Indian Ocean. They required to go round the bay to gain the coast at the 37th parallel, the exact point where Tom Austin was to wait their arrival.

When the sea appeared, all eyes anxiously gazed at the offing. Was the DUNCAN, by a miracle of Providence, there running close to the shore, as a month ago, when they crossed Cape Corrientes, they had found her on the Argentine coast? They saw nothing. Sky and earth mingled in the same horizon. Not a sail enlivened the vast stretch of ocean.

One hope still remained. Perhaps Tom Austin had thought it his duty to cast anchor in Twofold Bay, for the sea was heavy, and a ship would not dare to venture near the shore. "To Eden!" cried Glenarvan. Immediately the mail-coach resumed the route round the bay, toward the little town of Eden, five miles distant. The postilions stopped not far from the lighthouse, which marks the entrance of the port. Several vessels were moored in the roadstead, but none of them bore the flag of Malcolm.

Glenarvan, John Mangles, and Paganel got out of the coach, and rushed to the custom-house, to inquire about the arrival of vessels within the last few days.

"No ship had touched the bay for a week," Glenarvan said, a sudden revulsion of feeling lifting him from despair. "Perhaps we have arrived first."

John Mangles shook his head. He knew Tom Austin. His first mate would not delay the execution of an order for ten days.

"I must know at all events how they stand," said Glenarvan. "Better certainty than doubt."

A quarter of an hour afterward a telegram was sent to the syndicate of shipbrokers in Melbourne. The whole party then repaired to the Victoria Hotel.

At 2 P.M. the following telegraphic reply was received: "LORD GLENARVAN, Eden.

"Twofold Bay.

"The DUNCAN left on the 16th current. Destination unknown. J. ANDREWS, S. B."

The telegram dropped from Glenarvan's hands.

There was no doubt now. The good, honest Scotch yacht was now a pirate ship in the hands of Ben Joyce!

So ended this journey across Australia, which had commenced under circumstances so favorable. All trace of Captain Grant and his shipwrecked men seemed to be irrevocably lost. This ill success had cost the loss of a ship's crew. Lord Glenarvan had been vanquished in the strife; and the courageous searchers, whom the unfriendly elements of the Pampas had been unable to check, had been conquered on the Australian shore by the perversity of man.

END OF BOOK TWO
Mary Grant at this crisis nerved herself to the resolution never to utter the name of her father. She suppressed her own anguish, when she thought of the unfortunate crew who had perished. The daughter was merged in the friend, and she now took upon her to console Lady Glenarvan, who till now had been her faithful comforter. She was the first to speak of returning to Scotland. John Mangles was filled with admiration at seeing her so courageous and so resigned. He wanted to say a word further in the Captain's interest, but Mary stopped him with a glance, and afterward said to him: "No, Mr. John, we must think of those who ventured their lives. Lord Glenarvan must return to Europe!"

"You are right, Miss Mary," answered John Mangles; "he must. Beside, the English authorities must be informed of the fate of the DUNCAN. But do not despair. Rather than abandon our search I will resume it alone! I will either find Captain Grant or perish in the attempt!"

It was a serious undertaking to which John Mangles bound himself; Mary accepted, and gave her hand to the young captain, as if to ratify the treaty. On John Mangles' side it was a life's devotion; on Mary's undying gratitude.

During that day, their departure was finally arranged; they resolved to reach Melbourne without delay. Next day John went to inquire about the ships ready to sail. He expected to find frequent communication between Eden and Victoria.

He was disappointed; ships were scarce. Three or four vessels, anchored in Twofold Bay, constituted the mercantile fleet of the place; none of them were bound for Melbourne, nor Sydney, nor Point de Galle, at any of which ports Glenarvan would have found ships loading for England. In fact, the Peninsular and Oriental Company has a regular line of packets between these points and England.

Under these circumstances, what was to be done? Waiting for a ship might be a tedious affair, for Twofold Bay is not much frequented. Numbers of ships pass by without touching. After due reflection and discussion, Glenarvan had nearly decided to follow the coast road to Sydney, when Paganel made an unexpected proposition.

The geographer had visited Twofold Bay on his own account, and was aware that there were no means of transport for Sydney or Melbourne. But of the three vessels anchored in the roadstead one was loading for Auckland, the capital of the northern island of New Zealand. Paganel's proposal was to take the ship in question, and get to Auckland, whence it would be easy to return to Europe by the boats of the Peninsular and Oriental Company.

This proposition was taken into serious consideration. Paganel on this occasion dispensed with the volley of arguments he generally indulged in. He confined himself to the bare proposition, adding that the voyage to New Zealand was only five or six days--the distance, in fact, being only about a thousand miles.

By a singular coincidence Auckland is situated on the self-same parallel--the thirty-seventh--which the explorers had perseveringly followed since they left the coast of Araucania. Paganel might fairly have used this as an argument in favor of his scheme; in fact, it was a natural opportunity of visiting the shores of New Zealand.

But Paganel did not lay stress on this argument. After two mistakes, he probably hesitated to attempt a third interpretation of the document. Besides, what could he make of it? It said positively that a "continent" had served as a refuge for Captain Grant, not an island. Now, New Zealand was nothing but an island. This seemed decisive. Whether, for this reason, or for some other, Paganel did not connect any idea of further search with this proposition of reaching Auckland. He merely observed that regular communication existed between that point and Great Britain, and that it was easy to take advantage of it.

John Mangles supported Paganel's proposal. He advised its adoption, as it was hopeless to await the problematical arrival of a vessel in Twofold Bay. But before coming to any decision, he thought it best to visit the ship mentioned by the geographer. Glenarvan, the Major, Paganel, Robert, and Mangles himself, took a boat, and a few strokes brought them alongside the ship anchored two cables' length from the quay.

It was a brig of 150 tons, named the MACQUARIE. It was engaged in the coasting trade between the various ports of Australia and New Zealand. The captain, or rather the "master," received his visitors gruffly enough. They perceived that they had to do with a man of no education, and whose manners were in no degree superior to those of the five sailors of his crew. With a coarse, red face, thick hands, and a broken nose, blind of an eye, and his lips stained with the pipe, Will Halley was a sadly brutal looking person. But they had no choice, and for so short a voyage it was not necessary to be very particular.

"What do you want?" asked Will Halley, when the strangers stepped on the poop of his ship.

"The captain," answered John Mangles.
"I am the captain," said Halley. "What else do you want?"
"The MACQUARIE is loading for Auckland, I believe?"
"Yes. What else?"
"What does she carry?"
"Everything salable and purchasable. What else?"
"When does she sail?"
"To-morrow at the mid-day tide. What else?"
"Does she take passengers?"
"That depends on who the passengers are, and whether they are satisfied with the ship's mess."
"They would bring their own provisions."
"What else?"
"What else?"
"Yes. How many are there?"
"Nine; two of them are ladies."
"I have no cabins."
"We will manage with such space as may be left at their disposal."
"What else?"
"Do you agree?" said John Mangles, who was not in the least put out by the captain's peculiarities.
"We'll see," said the master of the MACQUARIE.
Will Halley took two or three turns on the poop, making it resound with iron-heeled boots, and then he turned abruptly to John Mangles.
"What would you pay?" said he.
"What do you ask?" replied John.
"Fifty pounds."
Glenarvan looked consent.
"Very good! Fifty pounds," replied John Mangles.
"But passage only," added Halley.
"Yes, passage only."
"Food extra."
"Extra."
"Agreed. And now," said Will, putting out his hand, "what about the deposit money?"
"Here is half of the passage-money, twenty-five pounds," said Mangles, counting out the sum to the master.
"All aboard to-morrow," said he, "before noon. Whether or no, I weigh anchor."
"We will be punctual."
This said, Glenarvan, the Major, Robert, Paganel, and John Mangles left the ship, Halley not so much as touching the oilskin that adorned his red locks.
"What a brute," exclaimed John.
"He will do," answered Paganel. "He is a regular sea-wolf."
"A downright bear!" added the Major.
"I fancy," said John Mangles, "that the said bear has dealt in human flesh in his time."
"What matter?" answered Glenarvan, "as long as he commands the MACQUARIE, and the MACQUARIE goes to New Zealand. From Twofold Bay to Auckland we shall not see much of him; after Auckland we shall see him no more."

Lady Helena and Mary Grant were delighted to hear that their departure was arranged for to-morrow. Glenarvan warned them that the MACQUARIE was inferior in comfort to the DUNCAN. But after what they had gone through, they were indifferent to trifling annoyances. Wilson was told off to arrange the accommodation on board the MACQUARIE. Under his busy brush and broom things soon changed their aspect.
Will Halley shrugged his shoulders, and let the sailor have his way. Glenarvan and his party gave him no concern. He neither knew, nor cared to know, their names. His new freight represented fifty pounds, and he rated it far below the two hundred tons of cured hides which were stowed away in his hold. Skins first, men after. He was a merchant. As to his sailor qualification, he was said to be skillful enough in navigating these seas, whose reefs make them very dangerous.
As the day drew to a close, Glenarvan had a desire to go again to the point on the coast cut by the 37th parallel. Two motives prompted him. He wanted to examine once more the presumed scene of the wreck. Ayrton had certainly been quartermaster on the BRITANNIA, and the BRITANNIA might have been lost on this part of the Australian coast; on the east coast if not on the west. It would not do to leave without thorough investigation, a locality which they were never to revisit.
And then, failing the BRITANNIA, the DUNCAN certainly had fallen into the hands of the convicts. Perhaps there had been a fight? There might yet be found on the coast traces of a struggle, a last resistance. If the crew had perished among the waves, the waves probably had thrown some bodies on the shore.
Glenarvan, accompanied by his faithful John, went to carry out the final search. The landlord of the Victoria Hotel lent them two horses, and they set out on the northern road that skirts Twofold Bay.
It was a melancholy journey. Glenarvan and Captain John trotted along without speaking, but they understood each other. The same thoughts, the same anguish harrowed both their hearts. They looked at the sea-worn rocks; they needed no words of question or answer. John's well-tried zeal and intelligence were a guarantee that every point was scrupulously examined, the least likely places, as well as the sloping beaches and sandy plains where even the slight tides of the Pacific might have thrown some fragments of wreck. But no indication was seen that could suggest further search in that quarter—all trace of the wreck escaped them still.

As to the DUNCAN, no trace either. All that part of Australia, bordering the ocean, was desert.

Still John Mangles discovered on the skirts of the shore evident traces of camping, remains of fires recently kindled under solitary Myall-trees. Had a tribe of wandering blacks passed that way lately? No, for Glenarvan saw a token which furnished incontestable proof that the convicts had frequented that part of the coast.

This token was a grey and yellow garment worn and patched, an ill-omened rag thrown down at the foot of a tree. It bore the convict's original number at the Perth Penitentiary. The felon was not there, but his filthy garments betrayed his passage. This livery of crime, after having clothed some miscreant, was now decaying on this desert shore.

"You see, John," said Glenarvan, "the convicts got as far as here! and our poor comrades of the DUNCAN—"

"Yes," said John, in a low voice, "they never landed, they perished!"

"Those wretches!" cried Glenarvan. "If ever they fall into my hands I will avenge my crew—"

Grief had hardened Glenarvan's features. For some minutes he gazed at the expanse before him, as if taking a last look at some ship disappearing in the distance. Then his eyes became dim; he recovered himself in a moment, and without a word or look, set off at a gallop toward Eden.

The wanderers passed their last evening sadly enough. Their thoughts recalled all the misfortunes they had encountered in this country. They remembered how full of well-warranted hope they had been at Cape Bernouilli, and how cruelly disappointed at Twofold Bay!

Paganel was full of feverish agitation. John Mangles, who had watched him since the affair at Snowy River, felt that the geographer was hesitating whether to speak or not to speak. A thousand times he had pressed him with questions, and failed in obtaining an answer.

But that evening, John, in lighting him to his room, asked him why he was so nervous.

"Friend John," said Paganel, evasively, "I am not more nervous to-night than I always am."

"Mr. Paganel," answered John, "you have a secret that chokes you."

"Well!" cried the geographer, gesticulating, "what can I do? It is stronger than I!"

"What is stronger?"

"My joy on the one hand, my despair on the other."

"You rejoice and despair at the same time!"

"Yes; at the idea of visiting New Zealand."

"Why! have you any trace?" asked John, eagerly. "Have you recovered the lost tracks?"

"No, friend John. No one returns from New Zealand; but still—you know human nature. All we want to nourish hope is breath. My device is '_Spiro spero_' and it is the best motto in the world!"

CHAPTER II NAVIGATORS AND THEIR DISCOVERIES

NEXT day, the 27th of January, the passengers of the MACQUARIE were installed on board the brig. Will Halley had not offered his cabin to his lady passengers. This omission was the less to be deplored, for the den was worthy of the bear.

At half past twelve the anchor was weighed, having been loosed from its holding-ground with some difficulty. A moderate breeze was blowing from the southwest. The sails were gradually unfurled; the five hands made slow work. Wilson offered to assist the crew; but Halley begged him to be quiet and not to interfere with what did not concern him. He was accustomed to manage his own affairs, and required neither assistance nor advice.

This was aimed at John Mangles, who had smiled at the clumsiness of some maneuver. John took the hint, but mentally resolved that he would nevertheless hold himself in readiness in case the incapacity of the crew should endanger the safety of the vessel.

However, in time, the sails were adjusted by the five sailors, aided by the stimulus of the captain's oaths. The MACQUARIE stood out to sea on the larboard tack, under all her lower sails, topsails, topgallants, cross-jack, and jib. By and by, the other sails were hoisted. But in spite of this additional canvas the brig made very little way. Her rounded bow, the width of her hold, and her heavy stern, made her a bad sailor, the perfect type of a wooden shoe.

They had to make the best of it. Happily, five days, or, at most, six, would take them to Auckland, no matter how bad a sailor the MACQUARIE was.

At seven o'clock in the evening the Australian coast and the lighthouse of the port of Eden had faded out of sight. The ship labored on the lumpy sea, and rolled heavily in the trough of the waves. The passengers below
suffered a good deal from this motion. But it was impossible to stay on deck, as it rained violently. Thus they were condemned to close imprisonment.

Each one of them was lost in his own reflections. Words were few. Now and then Lady Helena and Miss Grant exchanged a few syllables. Glenarvan was restless; he went in and out, while the Major was impassive. John Mangles, followed by Robert, went on the poop from time to time, to look at the weather. Paganel sat in his corner, muttering vague and incoherent words.

What was the worthy geographer thinking of? Of New Zealand, the country to which destiny was leading him. He went mentally over all his history; he called to mind the scenes of the past in that ill-omened country.

But in all that history was there a fact, was there a solitary incident that could justify the discoverers of these islands in considering them as "a continent." Could a modern geographer or a sailor concede to them such a designation. Paganel was always revolving the meaning of the document. He was possessed with the idea; it became his ruling thought. After Patagonia, after Australia, his imagination, allured by a name, flew to New Zealand. But in that direction, one point, and only one, stood in his way.

"_Contin--contin_," he repeated, "that must mean continent!"

And then he resumed his mental retrospect of the navigators who made known to us these two great islands of the Southern Sea.

It was on the 13th of December, 1642, that the Dutch navigator Tasman, after discovering Van Diemen's Land, sighted the unknown shores of New Zealand. He coasted along for several days, and on the 17th of December his ships penetrated into a large bay, which, terminating in a narrow strait, separated the two islands.

The northern island was called by the natives Ikana-Mani, a word which signifies the fish of Mani. The southern island was called Tavai-Pouna-Mou, "the whale that yields the green-stones."

Abel Tasman sent his boats on shore, and they returned accompanied by two canoes and a noisy company of natives. These savages were middle height, of brown or yellow complexion, angular bones, harsh voices, and black hair, which was dressed in the Japanese manner, and surmounted by a tall white feather.

This first interview between Europeans and aborigines seemed to promise amicable and lasting intercourse. But the next day, when one of Tasman's boats was looking for an anchorage nearer to the land, seven canoes, manned by a great number of natives, attacked them fiercely. The boat capsized and filled. The quartermaster in command was instantly struck with a badly-sharpened spear, and fell into the sea. Of his six companions four were killed; the other two and the quartermaster were able to swim to the ships, and were picked up and recovered.

After this sad occurrence Tasman set sail, confining his revenge to giving the natives a few musket-shots, which probably did not reach them. He left this bay—which still bears the name of Massacre Bay—followed the western coast, and on the 5th of January, anchored near the northern-most point. Here the violence of the surf, as well as the unfriendly attitude of the natives, prevented his obtaining water, and he finally quitting these shores, giving them the name Staten-land or the Land of the States, in honor of the States-General.

The Dutch navigator concluded that these islands were adjacent to the islands of the same name on the east of Terra del Fuego, at the southern point of the American continent. He thought he had found "the Great Southern Continent."

"But," said Paganel to himself, "what a seventeenth century sailor might call a 'continent' would never stand for one with a nineteenth century man. No such mistake can be supposed! No! there is something here that baffles me."

CHAPTER III THE MARTYR-ROLL OF NAVIGATORS

ON the 31st of January, four days after starting, the MACQUARIE had not done two-thirds of the distance between Australia and New Zealand. Will Halley took very little heed to the working of the ship; he let things take their chance. He seldom showed himself, for which no one was sorry. No one would have complained if he had passed all his time in his cabin, but for the fact that the brutal captain was every day under the influence of gin or brandy. His sailors willingly followed his example, and no ship ever sailed more entirely depending on Providence than the MACQUARIE did from Twofold Bay.

This unpardonable carelessness obliged John Mangles to keep a watchful eye ever open. Mulrady and Wilson more than once brought round the helm when some careless steering threatened to throw the ship on her beam-ends. Often Will Halley would interfere and abuse the two sailors with a volley of oaths. The latter, in their impatience, would have liked nothing better than to bind this drunken captain, and lower him into the hold, for the rest of the voyage. But John Mangles succeeded, after some persuasion, in calming their well-grounded indignation.

Still, the position of things filled him with anxiety; but, for fear of alarming Glenarvan, he spoke only to Paganel or the Major. McNabbs recommended the same course as Mulrady and Wilson.

"If you think it would be for the general good, John," said McNabbs, "you should not hesitate to take the command of the vessel. When we get to Auckland the drunken imbecile can resume his command, and then he is at liberty to wreck himself, if that is his fancy."
"All that is very true, Mr. McNabbs, and if it is absolutely necessary I will do it. As long as we are on open sea, a
careful lookout is enough; my sailors and I are watching on the poop; but when we get near the coast, I confess I
shall be uneasy if Halley does not come to his senses."

"Could not you direct the course?" asked Paganel.

"That would be difficult," replied John. "Would you believe it that there is not a chart on board?"

"Is that so?"

"It is indeed. The MACQUARIE only does a coasting trade between Eden and Auckland, and Halley is so at
home in these waters that he takes no observations."

"I suppose he thinks the ship knows the way, and steers herself." "Ha! ha!" laughed John Mangles; "I do not
believe in ships that steer themselves; and if Halley is drunk when we get among soundings, he will get us all into
trouble."

"Let us hope," said Paganel, "that the neighborhood of land will bring him to his senses."

"Well, then," said McNabbs, "if needs were, you could not sail the MACQUARIE into Auckland?"

"Without a chart of the coast, certainly not. The coast is very dangerous. It is a series of shallow fiords as
irregular and capricious as the fiords of Norway. There are many reefs, and it requires great experience to avoid
them. The strongest ship would be lost if her keel struck one of those rocks that are submerged but a few feet below
the water."

"In that case those on board would have to take refuge on the coast."

"If there was time."

"A terrible extremity," said Paganel, "for they are not hospitable shores, and the dangers of the land are not less
appalling than the dangers of the sea."

"You refer to the Maories, Monsieur Paganel?" asked John Mangles.

"Yes, my friend. They have a bad name in these waters. It is not a matter of timid or brutish Australians, but of
an intelligent and sanguinary race, cannibals greedy of human flesh, man-eaters to whom we should look in vain for
pity."

"Well, then," exclaimed the Major, "if Captain Grant had been wrecked on the coast of New Zealand, you would
dissuade us from looking for him."

"Oh, you might search on the coasts," replied the geographer, "because you might find traces of the
BRITANNIA, but not in the interior, for it would be perfectly useless. Every European who ventures into these fatal
districts falls into the hands of the Maories, and a prisoner in the hands of the Maories is a lost man. I have urged my
friends to cross the Pampas, to toil over the plains of Australia, but I will never lure them into the mazes of the New
Zealand forest. May heaven be our guide, and keep us from ever being thrown within the power of those fierce
natives!"

CHAPTER IV THE WRECK OF THE "MACQUARIE"

STILL this wearisome voyage dragged on. On the 2d of February, six days from starting, the MACQUARIE had
not yet made a nearer acquaintance with the shores of Auckland. The wind was fair, nevertheless, and blew steadily
from the southwest; but the currents were against the ship's course, and she scarcely made any way. The heavy,
lumpy sea strained her cordage, her timbers creaked, and she labored painfully in the trough of the sea. Her standing
rigging was so out of order that it allowed play to the masts, which were violently shaken at every roll of the sea.

Fortunately, Will Halley was not a man in a hurry, and did not use a press of canvas, or his masts would
inevitably have come down. John Mangles therefore hoped that the wretched hull would reach port without accident;
but it grieved him that his companions should have to suffer so much discomfort from the defective arrangements of
the brig.

But neither Lady Helena nor Mary Grant uttered a word of complaint, though the continuous rain obliged them
to stay below, where the want of air and the violence of the motion were painfully felt. They often braved the
weather, and went on the poop till driven down again by the force of a sudden squall. Then they returned to the
narrow space, fitter for stowing cargo than accommodating passengers, especially ladies.

Their friends did their best to amuse them. Paganel tried to beguile the time with his stories, but it was a hopeless
case. Their minds were so distracted at this change of route as to be quite unhinged. Much as they had been
interested in his dissertation on the Pampas, or Australia, his lectures on New Zealand fell on cold and indifferent
ears. Besides, they were going to this new and ill-reputed country without enthusiasm, without conviction, not even
of their own free will, but solely at the bidding of destiny.

Of all the passengers on board the MACQUARIE, the most to be pitied was Lord Glenarvan. He was rarely to be
seen below. He could not stay in one place. His nervous organization, highly excited, could not submit to
confinement between four narrow bulkheads. All day long, even all night, regardless of the torrents of rain and the
dashing waves, he stayed on the poop, sometimes leaning on the rail, sometimes walking to and fro in feverish
agitation. His eyes wandered ceaselessly over the blank horizon. He scanned it eagerly during every short interval of clear weather. It seemed as if he sought to question the voiceless waters; he longed to tear away the veil of fog and vapor that obscured his view. He could not be resigned, and his features expressed the bitterness of his grief. He was a man of energy, till now happy and powerful, and deprived in a moment of power and happiness. John Mangles bore him company, and endured with him the inclemency of the weather. On this day Glenarvan looked more anxiously than ever at each point where a break in the mist enabled him to do so. John came up to him and said, "Your Lordship is looking out for land?"

Glenarvan shook his head in dissent.

"And yet," said the young captain, "you must be longing to quit this vessel. We ought to have seen the lights of Auckland thirty-six hours ago."

Glenarvan made no reply. He still looked, and for a moment his glass was pointed toward the horizon to windward.

"The land is not on that side, my Lord," said John Mangles. "Look more to starboard."

"Why, John?" replied Glenarvan. "I am not looking for the land."

"What then, my Lord?"

"My yacht! the DUNCAN," said Glenarvan, hotly. "It must be here on these coasts, skimming these very waves, playing the vile part of a pirate! It is here, John; I am certain of it, on the track of vessels between Australia and New Zealand; and I have a presentiment that we shall fall in with her."

"God keep us from such a meeting!"

"Why, John?"

"Your Lordship forgets our position. What could we do in this ship if the DUNCAN gave chase. We could not even fly!"

"Fly, John?"

"Yes, my Lord; we should try in vain! We should be taken, delivered up to the mercy of those wretches, and Ben Joyce has shown us that he does not stop at a crime! Our lives would be worth little. We would fight to the death, of course, but after that! Think of Lady Glenarvan; think of Mary Grant!"

"Poor girls!" murmured Glenarvan. "John, my heart is broken; and sometimes despair nearly masters me. I feel as if fresh misfortunes awaited us, and that Heaven itself is against us. It terrifies me!"

"You, my Lord?"

"Not for myself, John, but for those I love--whom you love, also."

"Keep up your heart, my Lord," said the young captain. "We must not look out for troubles. The MACQUARIE sails badly, but she makes some way nevertheless. Will Halley is a brute, but I am keeping my eyes open, and if the coast looks dangerous, I will put the ship's head to sea again. So that, on that score, there is little or no danger. But as to getting alongside the DUNCAN! God forbid! And if your Lordship is bent on looking out for her, let it be in order to give her a wide berth."

John Mangles was right. An encounter with the DUNCAN would have been fatal to the MACQUARIE. There was every reason to fear such an engagement in these narrow seas, in which pirates could ply their trade without risk. However, for that day at least, the yacht did not appear, and the sixth night from their departure from Twofold Bay came, without the fears of John Mangles being realized.

But that night was to be a night of terrors. Darkness came on almost suddenly at seven o'clock in the evening; the sky was very threatening. The sailor instinct rose above the stupefaction of the drunkard and roused Will Halley. He left his cabin, rubbed his eyes, and shook his great red head. Then he drew a great deep breath of air, as other people swallow a draught of water to revive themselves. He examined the masts. The wind freshened, and veering a point more to the westward, blew right for the New Zealand coast.

Will Halley, with many an oath, called his men, tightened his topmast cordage, and made all snug for the night. John Mangles approved in silence. He had ceased to hold any conversation with the coarse seaman; but neither Glenarvan nor he left the poop. Two hours after a stiff breeze came on. Will Halley took in the lower reef of his topsails. The maneuver would have been a difficult job for five men if the MACQUARIE had not carried a double yard, on the American plan. In fact, they had only to lower the upper yard to bring the sail to its smallest size.

Two hours passed; the sea was rising. The MACQUARIE was struck so violently that it seemed as if her keel had touched the rocks. There was no real danger, but the heavy vessel did not rise easily to the waves. By and by the returning waves would break over the deck in great masses. The boat was washed out of the davits by the force of the water.

John Mangles never released his watch. Any other ship would have made no account of a sea like this; but with
this heavy craft there was a danger of sinking by the bow, for the deck was filled at every lurch, and the sheet of water not being able to escape quickly by the scuppers, might submerge the ship. It would have been the wisest plan to prepare for emergency by knocking out the bulwarks with an ax to facilitate their escape, but Halley refused to take this precaution.

But a greater danger was at hand, and one that it was too late to prevent. About half-past eleven, John Mangles and Wilson, who stayed on deck throughout the gale, were suddenly struck by an unusual noise. Their nautical instincts awoke. John seized the sailor's hand. "The reef!" said he.

"Yes," said Wilson; "the waves breaking on the bank."
"Not more than two cables' length off?"
"At farthest? The land is there!"
John leaned over the side, gazed into the dark water, and called out, "Wilson, the lead!"

The master, posted forward, seemed to have no idea of his position. Wilson seized the lead-line, sprang to the fore-chains, and threw the lead; the rope ran out between his fingers, at the third knot the lead stopped.

"Captain," said John, running to Will Halley, "we are on the breakers."

Whether or not he saw Halley shrug his shoulders is of very little importance. But he hurried to the helm, put it hard down, while Wilson, leaving the line, hauled at the main-topsail brace to bring the ship to the wind. The man who was steering received a smart blow, and could not comprehend the sudden attack.

"Let her go! Let her go!" said the young captain, working her to get away from the reefs.

For half a minute the starboard side of the vessel was turned toward them, and, in spite of the darkness, John could discern a line of foam which moaned and gleamed four fathoms away.

At this moment, Will Halley, comprehending the danger, lost his head. His sailors, hardly sobered, could not understand his orders. His incoherent words, his contradictory orders showed that this stupid sot had quite lost his self-control. He was taken by surprise at the proximity of the land, which was eight miles off, when he thought it was thirty or forty miles off. The currents had thrown him out of his habitual track, and this miserable slave of routine was left quite helpless.

Still the prompt maneuver of John Mangles succeeded in keeping the MACQUARIE off the breakers. But John did not know the position. For anything he could tell he was girdled in by reefs. The wind blew them strongly toward the east, and at every lurch they might strike.

In fact, the sound of the reef soon redoubled on the starboard side of the bow. They must luff again. John put the helm down again and brought her up. The breakers increased under the bow of the vessel, and it was necessary to put her about to regain the open sea. Whether she would be able to go about under shortened sail, and badly trimmed as she was, remained to be seen, but there was nothing else to be done.

"Helm hard down!" cried Mangles to Wilson.

The MACQUARIE began to near the new line of reefs: in another moment the waves were seen dashing on submerged rocks. It was a moment of inexpressible anxiety. The spray was luminous, just as if lit up by sudden phosphorescence. The roaring of the sea was like the voice of those ancient Tritons whom poetic mythology endowed with life. Wilson and Mulrady hung to the wheel with all their weight. Some cordage gave way, which endangered the foremast. It seemed doubtful whether she would go about without further damage.

Suddenly the wind fell and the vessel fell back, and turning her became hopeless. A high wave caught her below, carried her up on the reefs, where she struck with great violence. The foremast came down with all the fore-rigging. The brig rose twice, and then lay motionless, heeled over on her port side at an angle of 30 degrees.

The glass of the skylight had been smashed to powder. The passengers rushed out. But the waves were sweeping the deck from one side to the other, and they dared not stay there. John Mangles, knowing the ship to be safely lodged in the sand, begged them to return to their own quarters.

"Tell me the truth, John," said Glenarvan, calmly.

"The truth, my Lord, is that we are at a standstill. Whether the sea will devour us is another question; but we have time to consider."

"It is midnight?"
"Yes, my Lord, and we must wait for the day."
"Can we not lower the boat?"
"In such a sea, and in the dark, it is impossible. And, besides, where could we land?"
"Well, then, John, let us wait for the daylight."

Will Halley, however, ran up and down the deck like a maniac. His crew had recovered their senses, and now broached a cask of brandy, and began to drink. John foresaw that if they became drunk, terrible scenes would ensue.

The captain could not be relied on to restrain them; the wretched man tore his hair and wrung his hands. His
whole thought was his uninsured cargo. "I am ruined! I am lost!" he would cry, as he ran from side to side.

John Mangles did not waste time on him. He armed his two companions, and they all held themselves in readiness to resist the sailors who were filling themselves with brandy, seasoned with fearful blasphemies.

"The first of these wretches that comes near the ladies, I will shoot like a dog," said the Major, quietly.

The sailors doubtless saw that the passengers were determined to hold their own, for after some attempts at pillage, they disappeared to their own quarters. John Mangles thought no more of these drunken rascals, and waited impatiently for the dawn. The ship was now quite motionless. The sea became gradually calmer. The wind fell. The hull would be safe for some hours yet. At daybreak John examined the landing-place; the yawl, which was now their only boat, would carry the crew and the passengers. It would have to make three trips at least, as it could only hold four.

As he was leaning on the skylight, thinking over the situation of affairs, John Mangles could hear the roaring of the surf. He tried to pierce the darkness. He wondered how far it was to the land they longed for no less than dreaded. A reef sometimes extends for miles along the coast. Could their fragile boat hold out on a long trip?

While John was thus ruminating and longing for a little light from the murky sky, the ladies, relying on him, slept in their little berths. The stationary attitude of the brig insured them some hours of repose. Glenarvan, John, and their companions, no longer disturbed by the noise of the crew who were now wrapped in a drunken sleep, also refreshed themselves by a short nap, and a profound silence reigned on board the ship, herself slumbering peacefully on her bed of sand.

Toward four o'clock the first peep of dawn appeared in the east. The clouds were dimly defined by the pale light of the dawn. John returned to the deck. The horizon was veiled with a curtain of fog. Some faint outlines were shadowed in the mist, but at a considerable height. A slight swell still agitated the sea, but the more distant waves were undistinguishable in a motionless bank of clouds.

John waited. The light gradually increased, and the horizon acquired a rosy hue. The curtain slowly rose over the vast watery stage. Black reefs rose out of the waters. Then a line became defined on the belt of foam, and there gleamed a luminous beacon-light point behind a low hill which concealed the scarcely risen sun. There was the land, less than nine miles off.

"Land ho!" cried John Mangles.

His companions, aroused by his voice, rushed to the poop, and gazed in silence at the coast whose outline lay on the horizon. Whether they were received as friends or enemies, that coast must be their refuge.

"Where is Halley?" asked Glenarvan.

"I do not know, my Lord," replied John Mangles.

"Where are the sailors?"

"Invisible, like himself."

"Probably dead drunk, like himself," added McNabbs.

"Let them be called," said Glenarvan, "we cannot leave them on the ship."

Mulrady and Wilson went down to the forecastle, and two minutes after they returned. The place was empty! They then searched between decks, and then the hold. But found no trace of Will Halley nor his sailors.

"What! no one?" exclaimed Glenarvan.

"Could they have fallen into the sea?" asked Paganel.

"Everything is possible," replied John Mangles, who was getting uneasy. Then turning toward the stern: "To the boat!" said he.

Wilson and Mulrady followed to launch the yawl. The yawl was gone.

CHAPTER V CANNIBALS

WILL HALLEY and his crew, taking advantage of the darkness of night and the sleep of the passengers, had fled with the only boat. There could be no doubt about it. The captain, whose duty would have kept him on board to the last, had been the first to quit the ship.

"The cowards are off!" said John Mangles. "Well, my Lord, so much the better. They have spared us some trying scenes."

"No doubt," said Glenarvan; "besides we have a captain of our own, and courageous, if unskillful sailors, your companions, John. Say the word, and we are ready to obey."

The Major, Paganel, Robert, Wilson, Mulrady, Olbinett himself, applauded Glenarvan's speech, and ranged themselves on the deck, ready to execute their captain's orders.

"What is to be done?" asked Glenarvan.

It was evident that raising the MACQUARIE was out of the question, and no less evident that she must be abandoned. Waiting on board for succor that might never come, would have been imprudence and folly. Before the arrival of a chance vessel on the scene, the MACQUARIE would have broken up. The next storm, or even a high
tide raised by the winds from seaward, would roll it on the sands, break it up into splinters, and scatter them on the
shore. John was anxious to reach the land before this inevitable consummation.

He proposed to construct a raft strong enough to carry the passengers, and a sufficient quantity of provisions, to
the coast of New Zealand.

There was no time for discussion, the work was to be set about at once, and they had made considerable progress
when night came and interrupted them.

Toward eight o'clock in the evening, after supper, while Lady Helena and Mary Grant slept in their berths, Paganel
and his friends conversed on serious matters as they walked up and down the deck. Robert had chosen to
stay with them. The brave boy listened with all his ears, ready to be of use, and willing to enlist in any perilous
adventure.

Paganel asked John Mangles whether the raft could not follow the coast as far as Auckland, instead of landing its
freight on the coast.

John replied that the voyage was impossible with such an unmanageable craft.

"And what we cannot do on a raft could have been done in the ship's boat?"

"Yes, if necessary," answered John; "but we should have had to sail by day and anchor at night."

"Then those wretches who abandoned us--"

"Oh, as for them," said John, "they were drunk, and in the darkness I have no doubt they paid for their cowardice
with their lives."

"So much the worse for them and for us," replied Paganel; "for the boat would have been very useful to us."

"What would you have, Paganel? The raft will bring us to the shore," said Glenarvan.

"The very thing I would fain avoid," exclaimed the geographer.

"What! do you think another twenty miles after crossing the Pampas and Australia, can have any terrors for us,
hardened as we are to fatigue?"

"My friend," replied Paganel, "I do not call in question our courage nor the bravery of our friends. Twenty miles
would be nothing in any other country than New Zealand. You cannot suspect me of faint-heartedness. I was the
first to persuade you to cross America and Australia. But here the case is different. I repeat, anything is better than
to venture into this treacherous country."

"Anything is better, in my judgment," said John Mangles, "than braving certain destruction on a stranded
vessel."

"What is there so formidable in New Zealand?" asked Glenarvan.

"The savages," said Paganel.

"The savages!" repeated Glenarvan. "Can we not avoid them by keeping to the shore? But in any case what have
we to fear? Surely, two resolute and well-armed Europeans need not give a thought to an attack by a handful of
miserable beings."

Paganel shook his head. "In this case there are no miserable beings to contend with. The New Zealanders are a
powerful race, who are rebelling against English rule, who fight the invaders, and often beat them, and who always
eat them!"

"Cannibals!" exclaimed Robert, "cannibals?! Then they heard him whisper, "My sister! Lady Helena."

"Don't frighten yourself, my boy," said Glenarvan; "our friend Paganel exaggerates."

"Far from it," rejoined Paganel. "Robert has shown himself a man, and I treat him as such, in not concealing the
truth from him."

Paganel was right. Cannibalism has become a fixed fact in New Zealand, as it is in the Fijis and in Torres Strait.
Superstition is no doubt partly to blame, but cannibalism is certainly owing to the fact that there are moments when
game is scarce and hunger great. The savages began by eating human flesh to appease the demands of an appetite
rarely satiated; subsequently the priests regulated and satisfied the monstrous custom. What was a meal, was raised
to the dignity of a ceremony, that is all.

Besides, in the eyes of the Maories, nothing is more natural than to eat one another. The missionaries often
questioned them about cannibalism. They asked them why they devoured their brothers; to which the chiefs made
answer that fish eat fish, dogs eat men, men eat dogs, and dogs eat one another. Even the Maori mythology has a
legend of a god who ate another god; and with such a precedent, who could resist eating his neighbor?

Another strange notion is, that in eating a dead enemy they consume his spiritual being, and so inherit his soul,
his strength and his bravery, which they hold are specially lodged in the brain. This accounts for the fact that the
brain figures in their feasts as the choicest delicacy, and is offered to the most honored guest.

But while he acknowledged all this, Paganel maintained, not without a show of reason, that sensuality, and
especially hunger, was the first cause of cannibalism among the New Zealanders, and not only among the
Polynesian races, but also among the savages of Europe.
"For," said he, "cannibalism was long prevalent among the ancestors of the most civilized people, and especially (if the Major will not think me personal) among the Scotch."

"Really," said McNabbs.

"Yes, Major," replied Paganel. "If you read certain passages of Saint Jerome, on the Atticoli of Scotland, you will see what he thought of your forefathers. And without going so far back as historic times, under the reign of Elizabeth, when Shakespeare was dreaming out his Shy-lock, a Scotch bandit, Sawney Bean, was executed for the crime of cannibalism. Was it religion that prompted him to cannibalism? No! it was hunger."

"Hunger?" said John Mangles.

"Hunger!" repeated Paganel; "but, above all, the necessity of the carnivorous appetite of replacing the bodily waste, by the azote contained in animal tissues. The lungs are satisfied with a provision of vegetable and farinaceous food. But to be strong and active the body must be supplied with those plastic elements that renew the muscles. Until the Maories become members of the Vegetarian Association they will eat meat, and human flesh as meat."

"Why not animal flesh?" asked Glenarvan.

"Because they have no animals," replied Paganel; "and that ought to be taken into account, not to extenuate, but to explain, their cannibal habits. Quadrupeds, and even birds, are rare on these inhospitable shores, so that the Maories have always eaten human flesh. There are even 'man-eating seasons,' as there are in civilized countries hunting seasons. Then begin the great wars, and whole tribes are served up on the tables of the conquerors."

"Well, then," said Glenarvan, "according to your mode of reasoning, Paganel, cannibalism will not cease in New Zealand until her pastures teem with sheep and oxen."

"Evidently, my dear Lord; and even then it will take years to wean them from Maori flesh, which they prefer to all others; for the children will still have a relish for what their fathers so highly appreciated. According to them it tastes like pork, with even more flavor. As to white men's flesh, they do not like it so well, because the whites eat salt with their food, which gives a peculiar flavor, not to the taste of connoisseurs."

"They are dainty," said the Major. "But, black or white, do they eat it raw, or cook it?"

"Why, what is that to you, Mr. McNabbs?" cried Robert.

"What is that to me!" exclaimed the Major, earnestly. "If I am to make a meal for a cannibal, I should prefer being cooked."

"Why?"

"Because then I should be sure of not being eaten alive!"

"Very good. Major," said Paganel; "but suppose they cooked you alive?"

"The fact is," answered the Major, "I would not give half-a-crown for the choice!"

"Well, McNabbs, if it will comfort you--you may as well be told--the New Zealanders do not eat flesh without cooking or smoking it. They are very clever and experienced in cookery. For my part, I very much dislike the idea of being eaten! The idea of ending one's life in the maw of a savage! bah!"

"The conclusion of all," said John Mangles, "is that we must not fall into their hands. Let us hope that one day Christianity will abolish all these monstrous customs."

"Yes, we must hope so," replied Paganel; "but, believe me, a savage who has tasted human flesh, is not easily persuaded to forego it. I will relate two facts which prove it."

"By all means let us have the facts, Paganel," said Glenarvan.

"The first is narrated in the chronicles of the Jesuit Society in Brazil. A Portuguese missionary was one day visiting an old Brazilian woman who was very ill. She had only a few days to live. The Jesuit inculcated the truths of religion, which the dying woman accepted, without objection. Then having attended to her spiritual wants, he bethought himself of her bodily needs, and offered her some European delicacies. 'Alas,' said she, 'my digestion is too weak to bear any kind of food. There is only one thing I could fancy, and nobody here could get it for me.' 'What is it?' asked the Jesuit. 'Ah! my son,' said she, 'it is the hand of a little boy! I feel as if I should enjoy munching the little bones!'"

"Horrid! but I wonder is it so very nice?" said Robert.

"My second tale will answer you, my boy," said Paganel: "One day a missionary was reproving a cannibal for the horrible custom, so abhorrent to God's laws, of eating human flesh! And beside,' said he, 'it must be so nasty! 'Oh, father,' said the savage, looking greedily at the missionary, 'say that God forbids it! That is a reason for what you tell us. But don't say it is nasty! If you had only tasted it!"

CHAPTER VI A DREADED COUNTRY

Paganel's facts were indisputable. The cruelty of the New Zealanders was beyond a doubt, therefore it was dangerous to land. But had the danger been a hundredfold greater, it had to be faced. John Mangles felt the necessity of leaving without delay a vessel doomed to certain and speedy destruction. There were two dangers, one certain and the other probable, but no one could hesitate between them.
As to their chance of being picked up by a passing vessel, they could not reasonably hope for it. The MACQUARIE was not in the track of ships bound to New Zealand. They keep further north for Auckland, further south for New Plymouth, and the ship had struck just between these two points, on the desert region of the shores of Ika-na-Mani, a dangerous, difficult coast, and infested by desperate characters.

"When shall we get away?" asked Glenarvan.

"To-morrow morning at ten o'clock," replied John Mangles. "The tide will then turn and carry us to land."

Next day, February 5, at eight o'clock, the raft was finished. John had given all his attention to the building of this structure. The foreyard, which did very well for mooring the anchors, was quite inadequate to the transport of passengers and provisions. What was needed was a strong, manageable raft, that would resist the force of the waves during a passage of nine miles. Nothing but the masts could supply suitable materials.

Wilson and Mulrady set to work; the rigging was cut clear, and the mainmast, chopped away at the base, fell over the starboard rail, which crashed under its weight. The MACQUARIE was thus razed like a pontoon.

When the lower mast, the topmasts, and the royals were sawn and split, the principal pieces of the raft were ready. They were then joined to the fragments of the foremast and the whole was fastened securely together. John took the precaution to place in the interstices half a dozen empty barrels, which would raise the structure above the level of the water. On this strong foundation, Wilson laid a kind of floor in open work, made of the gratings off the hatches. The spray could then dash on the raft without staying there, and the passengers would be kept dry. In addition to this, the hose-pipes firmly lashed together formed a kind of circular barrier which protected the deck from the waves.

That morning, John seeing that the wind was in their favor, rigged up the royal-yard in the middle of the raft as a mast. It was stayed with shrouds, and carried a makeshift sail. A large broad-bladed oar was fixed behind to act as a rudder in case the wind was sufficient to require it. The greatest pains had been expended on strengthening the raft to resist the force of the waves, but the question remained whether, in the event of a change of wind, they could steer, or indeed, whether they could hope ever to reach the land.

At nine o'clock they began to load. First came the provisions, in quantity sufficient to last till they should reach Auckland, for they could not count on the productions of this barren region.

Olbinett's stores furnished some preserved meat which remained of the purchase made for their voyage in the MACQUARIE. This was but a scanty resource. They had to fall back on the coarse viands of the ship; sea biscuits of inferior quality, and two casks of salt fish. The steward was quite crestfallen.

These provisions were put in hermetically sealed cases, staunch and safe from sea water, and then lowered on to the raft and strongly lashed to the foot of the mast. The arms and ammunition were piled in a dry corner. Fortunately the travelers were well armed with carbines and revolvers.

A holding anchor was also put on board in case John should be unable to make the land in one tide, and would have to seek moorings.

At ten o'clock the tide turned. The breeze blew gently from the northwest, and a slight swell rocked the frail craft.

"Are we ready?" asked John.

"All ready, captain," answered Wilson.

"All aboard!" cried John.

Lady Helena and Mary Grant descended by a rope ladder, and took their station at the foot of the mast on the cases of provisions, their companions near them. Wilson took the helm. John stood by the tackle, and Mulrady cut the line which held the raft to the ship's side.

The sail was spread, and the frail structure commenced its progress toward the land, aided by wind and tide. The coast was about nine miles off, a distance that a boat with good oars would have accomplished in three hours. But with a raft allowance must be made. If the wind held, they might reach the land in one tide. But if the breeze died away, the ebb would carry them away from the shore, and they would be compelled to anchor and wait for the next tide, a serious consideration, and one that filled John Mangles with anxiety.

Still he hoped to succeed. The wind freshened. The tide had turned at ten o'clock, and by three they must either make the land or anchor to save themselves from being carried out to sea. They made a good start. Little by little the black line of the reefs and the yellow banks of sand disappeared under the swelling tide. Extreme watchfulness and perfect skill were necessary to avoid these submerged rocks, and steer a bark that did not readily answer to the helm, and that constantly broke off.

At noon they were still five miles from shore. A tolerably clear sky allowed them to make out the principal features of the land. In the northeast rose a mountain about 2,300 feet high, whose sharply defined outline was exactly like the grinning face of a monkey turned toward the sky. It was Pirongia, which the map gave as exactly on the 38th parallel.
At half-past twelve, Paganel remarked that all the rocks had disappeared under the rising tide.

"All but one," answered Lady Helena.

"Which, Madam?" asked Paganel.

"There," replied she, pointing to a black speck a mile off.

"Yes, indeed," said Paganel. "Let us try to ascertain its position, so as not to get too near it, for the sea will soon conceal it."

"It is exactly in a line with the northern slope of the mountain," said John Mangles. "Wilson, mind you give it a wide berth."

"Yes, captain," answered the sailor, throwing his whole weight on the great oar that steered the raft.

In half an hour they had made half a mile. But, strange to say, the black point still rose above the waves.

John looked attentively, and in order to make it out, borrowed Paganel's telescope.

"That is no reef," said he, after a moment; "it is something floating, which rises and falls with the swell."

"Is it part of the mast of the MACQUARIE?" asked Lady Helena.

"No," said Glenarvan, "none of her timbers could have come so far."

"Stay!" said John Mangles; "I know it! It is the boat."

"The ship's boat?" exclaimed Glenarvan.

"Yes, my lord. The ship's boat, keel up."

"The unfortunate creatures," cried Lady Helena, "they have perished!"

"Yes, Madam," replied John Mangles, "they must have perished, for in the midst of these breakers in a heavy swell on that pitchy night, they ran to certain death."

For a few minutes the passengers were silent. They gazed at the frail craft as they drew near it. It must evidently have capsized about four miles from the shore, and not one of the crew could have escaped.

"But this boat may be of use to us," said Glenarvan.

"That is true," answered John Mangles. "Keep her up, Wilson."

The direction was slightly changed, but the breeze fell gradually, and it was two hours before they reached the boat.

Mulrady, stationed forward, fended off the blow, and the yawl was drawn alongside.

"Empty?" asked John Mangles.

"Yes, captain," answered the sailor, "the boat is empty. and all its seams are open. It is of no use to us."

"No use at all?" said McNabbs.

"None at all," said John Mangles.

"It is good for nothing but to burn."

"I regret it," said Paganel, "for the yawl might have taken us to Auckland."

"We must bear our fate, Monsieur Paganel," replied John Mangles. "But, for my part, in such a stormy sea I prefer our raft to that crazy boat. A very slight shock would be enough to break her up. Therefore, my lord, we have nothing to detain us further."

"As you think best, John."

"On then, Wilson," said John, "and bear straight for the land."

There was still an hour before the turn of the tide. In that time they might make two miles. But the wind soon fell almost entirely, and the raft became nearly motionless, and soon began to drift to seaward under the influence of the ebb-tide.

John did not hesitate a moment.

"Let go the anchor," said he.

Mulrady, who stood to execute this order, let go the anchor in five fathoms water. The raft backed about two fathoms on the line, which was then at full stretch. The sail was taken in, and everything made snug for a tedious period of inaction.

The returning tide would not occur till nine o'clock in the evening; and as John Mangles did not care to go on in the dark, the anchorage was for the night, or at least till five o'clock in the morning, land being in sight at a distance of less than three miles.

A considerable swell raised the waves, and seemed to set in continuously toward the coast, and perceiving this, Glenarvan asked John why he did not take advantage of this swell to get nearer to the land.

"Your Lordship is deceived by an optical illusion," said the young captain. "Although the swell seems to carry the waves landward, it does not really move at all. It is mere undulating molecular motion, nothing more. Throw a piece of wood overboard and you will see that it will remain quite stationary except as the tide affects it. There is nothing for it but patience."

"And dinner," said the Major.
Olbinett unpacked some dried meat and a dozen biscuits. The steward blushed as he proffered the meager bill of fare. But it was received with a good grace, even by the ladies, who, however, had not much appetite, owing to the violent motion.

This motion, produced by the jerking of the raft on the cable, while she lay head on to the sea, was very severe and fatiguing. The blows of the short, tumbling seas were as severe as if she had been striking on a submerged rock. Sometimes it was hard to believe that she was not aground. The cable strained violently, and every half hour John had to take in a fathom to ease it. Without this precaution it would certainly have given way, and the raft must have drifted to destruction.

John's anxiety may easily be understood. His cable might break, or his anchor lose its hold, and in either case the danger was imminent.

Night drew on; the sun's disc, enlarged by refraction, was dipping blood-red below the horizon. The distant waves glittered in the west, and sparkled like sheets of liquid silver. Nothing was to be seen in that direction but sky and water, except one sharply-defined object, the hull of the MACQUARIE motionless on her rocky bed.

The short twilight postponed the darkness only by a few minutes, and soon the coast outline, which bounded the view on the east and north, was lost in darkness.

The shipwrecked party were in an agonizing situation on their narrow raft, and overtaken by the shades of night. Some of the party fell into a troubled sleep, a prey to evil dreams; others could not close an eye. When the day dawned, the whole party were worn out with fatigue.

With the rising tide the wind blew again toward the land. It was six o'clock in the morning, and there was no time to lose. John arranged everything for resuming their voyage, and then he ordered the anchor to be weighed. But the anchor flukes had been so imbedded in the sand by the repeated jerks of the cable, that without a windlass it was impossible to detach it, even with the tackle which Wilson had improvised.

Half an hour was lost in vain efforts. John, impatient of delay, cut the rope, thus sacrificing his anchor, and also the possibility of anchoring again if this tide failed to carry them to land. But he decided that further delay was not to be thought of, and an ax-blow committed the raft to the mercy of the wind, assisted by a current of two knots an hour.

The sail was spread. They drifted slowly toward the land, which rose in gray, hazy masses, on a background of sky illuminated by the rising sun. The reef was dexterously avoided and doubled, but with the fitful breeze the raft could not get near the shore. What toil and pain to reach a coast so full of danger when attained.

At nine o'clock, the land was less than a mile off. It was a steeply-shelving shore, fringed with breakers; a practicable landing-place had to be discovered.

Gradually the breeze grew fainter, and then ceased entirely. The sail flapped idly against the mast, and John had it furled. The tide alone carried the raft to the shore, but steering had become impossible, and its passage was impeded by immense bands of FUCUS.

At ten o'clock John found himself almost at a stand-still, not three cables' lengths from the shore. Having lost their anchor, they were at the mercy of the ebb-tide.

John clenched his hands; he was racked with anxiety, and cast frenzied glances toward this inaccessible shore.

In the midst of his perplexities, a shock was felt. The raft stood still. It had landed on a sand-bank, twenty-five fathoms from the coast.

Glenarvan, Robert, Wilson, and Mulrady, jumped into the water. The raft was firmly moored to the nearest rocks. The ladies were carried to land without wetting a fold of their dresses, and soon the whole party, with their arms and provisions, were finally landed on these much dreaded New Zealand shores.

CHAPTER VII THE MAORI WAR

GLENARVAN would have liked to start without an hour's delay, and follow the coast to Auckland. But since the morning heavy clouds had been gathering, and toward eleven o'clock, after the landing was effected, the vapors condensed into violent rain, so that instead of starting they had to look for shelter.

Wilson was fortunate enough to discover what just suited their wants: a grotto hollowed out by the sea in the basaltic rocks. Here the travelers took shelter with their arms and provisions. In the cave they found a ready-garnered store of dried sea-weed, which formed a convenient couch; for fire, they lighted some wood near the mouth of the cavern, and dried themselves as well as they could.

John hoped that the duration of this deluge of rain would be in an inverse ratio to its violence, but he was doomed to disappointment. Hours passed without any abatement of its fury. Toward noon the wind freshened, and increased the force of the storm. The most patient of men would have rebelled at such an untoward incident; but what could be done; without any vehicle, they could not brave such a tempest; and, after all, unless the natives appeared on the scene, a delay of twelve hours was not so much consequence, as the journey to Auckland was only a matter of a few days. During this involuntary halt, the conversation turned on the incidents of the New Zealand war.
But to understand and appreciate the critical position into which these MACQUARIE passengers were thrown, something ought to be known of the history of the struggle which had deluged the island of Ika-na-Mani with blood.

Since the arrival of Abel Tasman in Cook's Strait, on the 16th of December, 1642, though the New Zealanders had often been visited by European vessels, they had maintained their liberty in their several islands. No European power had thought of taking possession of this archipelago, which commands the whole Pacific Ocean. The missionaries stationed at various points were the sole channels of Christian civilization. Some of them, especially the Anglicans, prepared the minds of the New Zealand chiefs for submitting to the English yoke. It was cleverly managed, and these chiefs were influenced to sign a letter addressed to Queen Victoria to ask her protection. But the most clear-sighted of them saw the folly of this step; and one of them, after having affixed his tattoo-mark to the letter by way of signature, uttered these prophetic words: "We have lost our country! henceforth it is not ours; soon the stranger will come and take it, and we shall be his slaves."

And so it was; on January 29, 1840, the English corvette HERALD arrived to claim possession.

From the year 1840, till the day the DUNCAN left the Clyde, nothing had happened here that Paganel did not know and he was ready to impart his information to his companions.

"Madam," said he, in answer to Lady Helena's questions, "I must repeat what I had occasion to remark before, that the New Zealanders are a courageous people, who yielded for a moment, but afterward fought foot to foot against the English invaders. The Maori tribes are organized like the old clans of Scotland. They are so many great families owning a chief, who is very jealous of his prerogative. The men of this race are proud and brave, one tribe tall, with straight hair, like the Maltese, or the Jews of Bagdad; the other smaller, thickset like mulattoes, but robust, haughty, and warlike. They had a famous chief, named Hihi, a real Vercingetorix, so that you need not be astonished that the war with the English has become chronic in the Northern Island, for in it is the famous tribe of the Waikatos, who defend their lands under the leadership of William Thompson."

"But," said John Mangles, "are not the English in possession of the principal points in New Zealand?"

"Certainly, dear John," replied Paganel. "After Captain Hobson took formal possession, and became governor, nine colonies were founded at various times between 1840 and 1862, in the most favorable situations. These formed the nucleus of nine provinces, four in the North Island and five in the southern island, with a total population of 184,346 inhabitants on the 30th of June, 1864."

"But what about this interminable war?" asked John Mangles.

"Well," said Paganel, "six long months have gone by since we left Europe, and I cannot say what may have happened during that time, with the exception of a few facts which I gathered from the newspapers of Maryborough and Seymour during our Australian journey. At that time the fighting was very lively in the Northern Island."

"And when did the war commence?" asked Mary Grant.

"Recommence, you mean, my dear young lady," replied Paganel; "for there was an insurrection so far back as 1845. The present war began toward the close of 1863; but long before that date the Maories were occupied in making preparations to shake off the English yoke. The national party among the natives carried on an active propaganda for the election of a Maori ruler. The object was to make old Potatau king, and to fix as the capital of the new kingdom his village, which lay between the Waikato and Waipa Rivers. Potatau was an old man, remarkable rather for cunning than bravery; but he had a Prime Minister who was both intelligent and energetic, a descendant of the Ngatihahuas, who occupied the isthmus before the arrival of the strangers. This minister, William Thompson, became the soul of the War of Independence, and organized the Maori troops, with great skill. Under this guidance a Taranaki chief gathered the scattered tribes around the same flag; a Waikato chief formed a 'Land League,' intended to prevent the natives from selling their land to the English Government, and warlike feasts were held just as in civilized countries on the verge of revolution. The English newspapers began to notice these alarming symptoms, and the government became seriously disturbed at these 'Land League' proceedings. In short, the train was laid, and the mine was ready to explode. Nothing was wanted but the spark, or rather the shock of rival interests to produce the spark.

"This shock took place in 1860, in the Taranaki province on the southwest coast of Ika-na-Mani. A native had six hundred acres of land in the neighborhood of New Plymouth. He sold them to the English Government; but when the surveyor came to measure the purchased land, the chief Kingi protested, and by the month of March he had made the six hundred acres in question into a fortified camp, surrounded with high palisades. Some days after Colonel Gold carried this fortress at the head of his troops, and that day heard the first shot fired of the native war."

"Have the rebels been successful up to this time?"

"Yes, Madam, and the English themselves have often been compelled to admire the courage and bravery of the New Zealanders. Their mode of warfare is of the guerilla type; they form skirmishing parties, come down in small detachments, and pillage the colonists' homes. General Cameron had no easy time in the campaigns, during which every bush had to be searched. In 1863, after a long and sanguinary struggle, the Maories were entrenched in strong
and fortified position on the Upper Waikato, at the end of a chain of steep hills, and covered by three miles of forts. The native prophets called on all the Maori population to defend the soil, and promised the extermination of the pakekas, or white men. General Cameron had three thousand volunteers at his disposal, and they gave no quarter to the Maories after the barbarous murder of Captain Sprent. Several bloody engagements took place; in some instances the fighting lasted twelve hours before the Maories yielded to the English cannonade. The heart of the army was the fierce Waikato tribe under William Thompson. This native general commanded at the outset 2,500 warriors, afterward increased to 8,000. The men of Shongi and Heki, two powerful chiefs, came to his assistance. The women took their part in the most trying labors of this patriotic war. But right has not always might. After severe struggles General Cameron succeeded in subduing the Waikato district, but empty and depopulated, for the Maories escaped in all directions. Some wonderful exploits were related. Four hundred Maories who were shut up in the fortress of Orakau, besieged by 1,000 English, under Brigadier-General Carey, without water or provisions, refused to surrender, but one day at noon cut their way through the then decimated 40th Regiment, and escaped to the marshes."

"But," asked John Mangles, "did the submission of the Waikato district put an end to this sanguinary war?"

"No, my friend," replied Paganel. "The English resolved to march on Taranaki province and besiege Mataitawa, William Thompson's fortress. But they did not carry it without great loss. Just as I was leaving Paris, I heard that the Governor and the General had accepted the submission of the Tauranga tribes, and left them in possession of three-fourths of their lands. It was also rumored that the principal chief of the rebellion, William Thompson, was inclined to surrender, but the Australian papers have not confirmed this, but rather the contrary, and I should not be surprised to find that at this moment the war is going on with renewed vigor."

"Then, according to you, Paganel," said Glenarvan, "this struggle is still going on in the provinces of Auckland and Taranaki?"

"I think so."

"This very province where the MACQUARIE'S wreck has deposited us."

"Exactly. We have landed a few miles above Kawhia harbor, where the Maori flag is probably still floating."

"Then our most prudent course would be to keep toward the north," remarked Glenarvan.

"By far the most prudent," said Paganel. "The New Zealanders are incensed against Europeans, and especially against the English. Therefore let us avoid falling into their hands."

"We might have the good fortune to fall in with a detachment of European troops," said Lady Helena.

"We may, Madam," replied the geographer; "but I do not expect it. Detached parties do not like to go far into the country, where the smallest tussock, the thinnest brushwood, may conceal an accomplished marksman. I don't fancy we shall pick up an escort of the 40th Regiment. But there are mission-stations on this west coast, and we shall be able to make them our halting-places till we get to Auckland."

CHAPTER VIII ON THE ROAD TO AUCKLAND

On the 7th of February, at six o'clock in the morning, the signal for departure was given by Glenarvan. During the night the rain had ceased. The sky was veiled with light gray clouds, which moderated the heat of the sun, and allowed the travelers to venture on a journey by day.

Paganel had measured on the map a distance of eighty miles between Point Kawhia and Auckland; it was an eight days' journey if they made ten miles a day. But instead of following the windings of the coast, he thought it better to make for a point thirty miles off, at the confluence of the Waikato and the Waipa, at the village of Ngarnavahia. The "overland track" passes that point, and is rather a path than a road, practicable for the vehicles which go almost across the island, from Napier, in Hawke's Bay, to Auckland. From this village it would be easy to reach Drury, and there they could rest in an excellent hotel, highly recommended by Dr. Hochstetter.
potent preservation from wild beasts, but New Zealand has neither tiger, nor lion, nor bear, nor any wild animal, but the Maori adequately fills their place, and a fire would only have served to attract this two-footed jaguar.

The night passed pleasantly with the exception of the attack of the sand-flies, called by the natives, "ngamu," and the visit of the audacious family of rats, who exercised their teeth on the provisions.

Next day, on the 8th of February, Paganel rose more sanguine, and almost reconciled to the country. The Maories, whom he particularly dreaded, had not yet appeared, and these ferocious cannibals had not molested him even in his dreams. "I begin to think that our little journey will end favorably. This evening we shall reach the confluence of the Waipa and Waikato, and after that there is not much chance of meeting natives on the way to Auckland."

"How far is it now," said Glenarvan, "to the confluence of the Waipa and Waikato?"
"Fifteen miles; just about what we did yesterday."
"But we shall be terribly delayed if this interminable scrub continues to obstruct our path."
"No," said Paganel, "we shall follow the banks of the Waipa, and then we shall have no obstacle, but on the contrary, a very easy road."
"Well, then," said Glenarvan, seeing the ladies ready, "let us make a start."

During the early part of the day, the thick brushwood seriously impeded their progress. Neither wagon nor horses could have passed where travelers passed, so that their Australian vehicle was but slightly regretted. Until practicable wagon roads are cut through these forests of scrub, New Zealand will only be accessible to foot passengers. The ferns, whose name is legion, concur with the Maories in keeping strangers off the lands.

The little party overcame many obstacles in crossing the plains in which the Hakariruoa Ranges rise. But before noon they reached the banks of the Waipa, and followed the northward course of the river.

The Major and Robert, without leaving their companions, shot some snipe and partridge under the low shrubs of the plain. Olbinett, to save time, plucked the birds as he went along.

Paganel was less absorbed by the culinary importance of the game than by the desire of obtaining some bird peculiar to New Zealand. His curiosity as a naturalist overcame his hunger as a traveler. He called to mind the peculiarities of the "tui" of the natives, sometimes called the mocking-bird from its incessant chuckle, and sometimes "the parson," in allusion to the white cravat it wears over its black, cassock-like plumage.

"The tui," said Paganel to the Major, "grows so fat during the Winter that it makes him ill, and prevents him from flying. Then he tears his breast with his beak, to relieve himself of his fat, and so becomes lighter. Does not that seem to you singular, McNabbs?"

"So singular that I don't believe a word of it," replied the Major.

Paganel, to his great regret, could not find a single specimen, or he might have shown the incredulous Major the bloody scars on the breast. But he was more fortunate with a strange animal which, hunted by men, cats and dogs, has fled toward the unoccupied country, and is fast disappearing from the fauna of New Zealand. Robert, searching like a ferret, came upon a nest made of interwoven roots, and in it a pair of birds destitute of wings and tail, with four toes, a long snipe-like beak, and a covering of white feathers over the whole body, singular creatures, which seemed to connect the oviparous tribes with the mam-mifers.

It was the New Zealand "kiwi," the _Apteryx australis_ of naturalists, which lives with equal satisfaction on larvæ, insects, worms or seeds. This bird is peculiar to the country. It has been introduced into very few of the zoological collections of Europe. Its graceless shape and comical motions have always attracted the notice of travelers, and during the great exploration of the Astrolabe and the Zelee, Dumont d'Urville was principally charged by the Academy of Sciences to bring back a specimen of these singular birds. But in spite of rewards offered to the natives, he could not obtain a single specimen.

Paganel, who was elated at such a piece of luck, tied the two birds together, and carried them along with the intention of presenting them to the Jardin des Plantes, in Paris. "Presented by M. Jacques Paganel." He mentally saw the flattering inscription on the handsomest cage in the gardens. Sanguine geographer!

The party pursued their way without fatigue along the banks of the Waipa. The country was quite deserted; not a trace of natives, nor any track that could betray the existence of man. The stream was fringed with tall bushes, or glided along sloping banks, so that nothing obstructed the view of the low range of hills which closed the eastern end of the valley. With their grotesque shapes, and their outlines lost in a deceptive haze, they brought to mind giant animals, worthy of antediluvian times. They might have been a herd of enormous whales, suddenly turned to stone. These disrupted masses proclaimed their essentially volcanic character. New Zealand is, in fact, a formation of recent plutonic origin. Its emergence from the sea is constantly increasing. Some points are known to have risen six feet in twenty years. Fire still runs across its center, shakes it, convulses it, and finds an outlet in many places by the mouths of geysers and the craters of volcanoes.

At four in the afternoon, nine miles had been easily accomplished. According to the map which Paganel
constantly referred to, the confluence of the Waipa and Waikato ought to be reached about five miles further on, and there the night halt could be made. Two or three days would then suffice for the fifty miles which lay between them and the capital; and if Glenarvan happened to fall in with the mail coach that plies between Hawkes' Bay and Auckland twice a month, eight hours would be sufficient.

"Therefore," said Glenarvan, "we shall be obliged to camp during the night once more."

"Yes," said Paganel, "but I hope for the last time."

"I am very glad to think so, for it is very trying for Lady Helena and Mary Grant."

"And they never utter a murmur," added John Mangles. "But I think I heard you mention a village at the confluence of these rivers."

"Yes," said the geographer, "here it is, marked on Johnston's map. It is Ngarnavahia, two miles below the junction."

"Well, could we not stay there for the night? Lady Helena and Miss Grant would not grudge two miles more to find a hotel even of a humble character."

"A hotel!" cried Paganel, "a hotel in a Maori village! you would not find an inn, not a tavern! This village will be a mere cluster of huts, and so far from seeking rest there, my advice is that you give it a wide berth."

"Your old fears, Paganel!" retorted Glenarvan.

"My dear Lord, where Moaies are concerned, distrust is safer than confidence. I do not know on what terms they are with the English, whether the insurrection is suppressed or successful, or whether indeed the war may not be going on with full vigor. Modesty apart, people like us would be a prize, and I must say, I would rather forego a taste of Maori hospitality. I think it certainly more prudent to avoid this village of Ngarnavahia, to skirt it at a distance, so as to avoid all encounters with the natives. When we reach Drury it will be another thing, and there our brave ladies will be able to recruit their strength at their leisure."

This advice prevailed. Lady Helena preferred to pass another night in the open air, and not to expose her companions to danger. Neither Mary Grant or she wished to halt, and they continued their march along the river.

Two hours later, the first shades of evening began to fall. The sun, before disappearing below the western horizon, darted some bright rays through an opening in the clouds. The distant eastern summits were empurpled with the parting glories of the day. It was like a flying salute addressed to the way-worn travelers.

Glenarvan and his friends hastened their steps, they knew how short the twilight is in this high latitude, and how quickly the night follows it. They were very anxious to reach the confluence of the two rivers before the darkness overtook them. But a thick fog rose from the ground, and made it very difficult to see the way.

Fortunately hearing stood them in the stead of sight; shortly a nearer sound of water indicated that the confluence was at hand. At eight o'clock the little troop arrived at the point where the Waipa loses itself in the Waikato, with a moaning sound of meeting waves.

"There is the Waikato!" cried Paganel, "and the road to Auckland is along its right bank."

"We shall see that to-morrow," said the Major, "let us camp here. It seems to me that that dark shadow is that of a little clump of trees grown expressly to shelter us. Let us have supper and then get some sleep."

"Supper by all means," said Paganel, "but no fire; nothing but biscuit and dried meat. We have reached this spot incognito, let us try and get away in the same manner. By good luck, the fog is in our favor."

The clump of trees was reached and all concurred in the wish of the geographer. The cold supper was eaten without a sound, and presently a profound sleep overcame the travelers, who were tolerably fatigued with their fifteen miles' march.

CHAPTER IX INTRODUCTION TO THE CANNIBALS

THE next morning at daybreak a thick fog was clinging to the surface of the river. A portion of the vapors that saturated the air were condensed by the cold, and lay as a dense cloud on the water. But the rays of the sun soon broke through the watery mass and melted it away.

A tongue of land, sharply pointed and bristling with bushes, projected into the uniting streams. The swifter waters of the Waipa rushed against the current of the Waikato for a quarter of a mile before they mingled with it; but the calm and majestic river soon quieted the noisy stream and carried it off quietly in its course to the Pacific Ocean.

When the vapor disappeared, a boat was seen ascending the current of the Waikato. It was a canoe seventy feet long, five broad, and three deep; the prow raised like that of a Venetian gondola, and the whole hollowed out of a trunk of a kahikatea. A bed of dry fern was laid at the bottom. It was swiftly rowed by eight oars, and steered with a paddle by a man seated in the stern.

This man was a tall Maori, about forty-five years of age, broad-chested, muscular, with powerfully developed hands and feet. His prominent and deeply-furrowed brow, his fierce look, and sinister expression, gave him a formidable aspect.

Tattooing, or "moko," as the New Zealanders call it, is a mark of great distinction. None is worthy of these
Koumou, he said in a perfectly unconcerned voice: them. He therefore made up his mind to question the chief on the fate that awaited them. Addressing himself to Kai-word, but from the few sentences they did utter, Glenarvan felt certain that the English language was familiar to procedure, he and his companions would spare themselves needless humiliation.

Savages in general, and particularly the Maories, have a notion of dignity from which they never Glenarvan's advice, they resolved to affect utter indifference before the natives. It was the only way to impress these it would scarcely have been supposed that they were hurrying to the final catastrophe. With one accord, and by the boat against the not very rapid current of the Waikato, with extraordinary velocity.

The eight rowers in the prow seemed to be servants or slaves of the chief. They rowed vigorously, and propelled the to make a final appeal to the tribes of the Waikato district, so that he might go to the aid of the indomitable William The Maori chief, whose principal warriors had been picked off by the soldiers of the 42nd Regiment, was returning to the middle of the night they were surprised in their sleep, were made prisoners, and carried on board the canoe. They had not been ill-treated, so far, but all attempts at resistance had been vain. Their arms and ammunition were in the hands of the savages, and they would soon have been targets for their own balls.

They were soon aware, from a few English words used by the natives, that they were a retreating party of the tribe who had been beaten and decimated by the English troops, and were on their way back to the Upper Waikato. The Maori chief, whose principal warriors had been picked off by the soldiers of the 42nd Regiment, was returning to make a final appeal to the tribes of the Waikato district, so that he might go to the aid of the indomitable William Thompson, who was still holding his own against the conquerors. The chief's name was "Kai-Koumou," a name of evil boding in the native language, meaning "He who eats the limbs of his enemy." He was bold and brave, but his cruelty was equally remarkable. No pity was to be expected at his hands. His name was well known to the English soldiers, and a price had been set on his head by the governor of New Zealand.

This terrible blow befell Glenarvan at the very moment when he was about to reach the long-desired haven of Auckland, and so regain his own country; but no one who looked at his cool, calm features, could have guessed the anguish he endured. Glenarvan always rose to his misfortunes. He felt that his part was to be the strength and the head and chief; ready to die for the rest if circumstances required it. He was of a deeply religious turn of mind, and never lost his trust in Providence nor his belief in the sacred character of his enterprise. In the midst of this crowning peril he did not give way to any feeling of regret at having been induced to venture into this country of savages.

His companions were worthy of him; they entered into his lofty views; and judging by their haughty demeanor, it would scarcely have been supposed that they were hurrying to the final catastrophe. With one accord, and by Glenarvan's advice, they resolved to affect utter indifference before the natives. It was the only way to impress these ferocious natures. Savages in general, and particularly the Maories, have a notion of dignity from which they never derogate. They respect, above all things, coolness and courage. Glenarvan was aware that by this mode of procedure, he and his companions would spare themselves needless humiliation.

From the moment of embarking, the natives, who were very taciturn, like all savages, had scarcely exchanged a word, but from the few sentences they did utter, Glenarvan felt certain that the English language was familiar to them. He therefore made up his mind to question the chief on the fate that awaited them. Addressing himself to Kai-Koumou, he said in a perfectly unconcerned voice:

"Where are we going, chief?"
Kai-Koumou looked coolly at him and made no answer. "What are you going to do with us?" pursued Glenarvan. A sudden gleam flashed into the eyes of Kai-Koumou, and he said in a deep voice: "Exchange you, if your own people care to have you; eat you if they don't."

Glenarvan asked no further questions; but hope revived in his heart. He concluded that some Maori chiefs had fallen into the hands of the English, and that the natives would try to get them exchanged. So they had a chance of salvation, and the case was not quite so desperate.

The canoe was speeding rapidly up the river. Paganel, whose excitable temperament always rebounded from one extreme to the other, had quite regained his spirits. He consoled himself that the natives were saving them the trouble of the journey to the English outposts, and that was so much gain. So he took it quite quietly and followed on the map the course of the Waikato across the plains and valleys of the province. Lady Helena and Mary Grant, concealing their alarm, conversed in a low voice with Glenarvan, and the keenest physiognomists would have failed to see any anxiety in their faces.

The Waikato is the national river in New Zealand. It is to the Maories what the Rhine is to the Germans, and the Danube to the Slavs. In its course of 200 miles it waters the finest lands of the North Island, from the province of Wellington to the province of Auckland. It gave its name to all those indomitable tribes of the river district, which rose _en masse_ against the invaders.

The waters of this river are still almost strangers to any craft but the native canoe. The most audacious tourist will scarcely venture to invade these sacred shores; in fact, the Upper Waikato is sealed against profane Europeans.

Paganel was aware of the feelings of veneration with which the natives regard this great arterial stream. He knew that the English and German naturalists had never penetrated further than its junction with the Waipa. He wondered how far the good pleasure of Kai-Koumou would carry his captives? He could not have guessed, but for hearing the word "Taupo" repeatedly uttered between the chief and his warriors. He consulted his map and saw that "Taupo" was the name of a lake celebrated in geographical annals, and lying in the most mountainous part of the island, at the southern extremity of Auckland province. The Waikato passes through this lake and then flows on for 120 miles.

**CHAPTER X A MOMENTOUS INTERVIEW**

An unfathomable gulf twenty-five miles long, and twenty miles broad was produced, but long before historic times, by the falling in of caverns among the trachytic lavas of the center of the island. And these waters falling from the surrounding heights have taken possession of this vast basin. The gulf has become a lake, but it is also an abyss, and no lead-line has yet sounded its depths.

Such is the wondrous lake of Taupo, lying 1,250 feet above the level of the sea, and in view of an amphitheater of mountains 2,400 feet high. On the west are rocky peaks of great size; on the north lofty summits clothed with low trees; on the east a broad beach with a road track, and covered with pumice stones, which shimmer through the leafy screen of the bushes; on the southern side rise volcanic cones behind a forest flat. Such is the majestic frame that incloses this vast sheet of water whose roaring tempests rival the cyclones of Ocean.

The whole region boils like an immense cauldron hung over subterranean fires. The ground vibrates from the agitation of the central furnace. Hot springs filter out everywhere. The crust of the earth cracks in great rifts like a cake, too quickly baked.

About a quarter of a mile off, on a craggy spur of the mountain stood a "pah," or Maori fortress. The prisoners, whose feet and hands were liberated, were landed one by one, and conducted into it by the warriors. The path which led up to the intrenchment, lay across fields of "phormium" and a grove of beautiful trees, the "kai-kateas" with persistent leaves and red berries; "dracaenas australis," the "ti-trees" of the natives, whose crown is a graceful counterpart of the cabbage-palm, and "huious," which are used to give a black dye to cloth. Large doves with metallic sheen on their plumage, and a world of starlings with reddish carmeles, flew away at the approach of the natives.

After a rather circuitous walk, Glenarvan and his party arrived at the "pah."

The fortress was defended by an outer inclosure of strong palisades, fifteen feet high; a second line of stakes; then a fence composed of osiers, with loop-holes, inclosed

V. IV. Verne the inner space, that is the plateau of the "pah," on which were erected the Maori buildings, and about forty huts arranged symmetrically.

When the captives approached they were horror-struck at the sight of the heads which adorned the posts of the inner circle. Lady Helena and Mary Grant turned away their eyes more with disgust than with terror. These heads were those of hostile chiefs who had fallen in battle, and whose bodies had served to feed the conquerors. The geographer recognized that it was so, from their eye sockets being hollow and deprived of eye-balls.

Glenarvan and his companions had taken in all this scene at a glance. They stood near an empty house, waiting the pleasure of the chief, and exposed to the abuse of a crowd of old crones. This troop of harpies surrounded them,
shaking their fists, howling and vociferating. Some English words that escaped their coarse mouths left no doubt that they were clamoring for immediate vengeance.

In the midst of all these cries and threats, Lady Helena, tranquil to all outward seeming, affected an indifference she was far from feeling. This courageous woman made heroic efforts to restrain herself, lest she should disturb Glenarvan's coolness. Poor Mary Grant felt her heart sink within her, and John Mangles stood by ready to die in her behalf. His companions bore the deluge of invectives each according to his disposition; the Major with utter indifference, Paganel with exasperation that increased every moment.

Glenarvan, to spare Lady Helena the attacks of these witches, walked straight up to Kai-Koumou, and pointing to the hideous group:

"Send them away," said he.

The Maori chief stared fixedly at his prisoner without speaking; and then, with a nod, he silenced the noisy horde. Glenarvan bowed, as a sign of thanks, and went slowly back to his place.

At this moment a hundred Maories were assembled in the "pah," old men, full grown men, youths; the former were calm, but gloomy, awaiting the orders of Kai-Koumou; the others gave themselves up to the most violent sorrow, bewailing their parents and friends who had fallen in the late engagements.

Kai-Koumou was the only one of all the chiefs that obeyed the call of William Thompson, who had returned to the lake district, and he was the first to announce to his tribe the defeat of the national insurrection, beaten on the plains of the lower Waikato. Of the two hundred warriors who, under his orders, fastened to the defence of the soil, one hundred and fifty were missing on his return. Allowing for a number being made prisoners by the invaders, how many must be lying on the field of battle, never to return to the country of their ancestors!

This was the secret of the outburst of grief with which the tribe saluted the arrival of Kai-Koumou. Up to that moment nothing had been known of the last defeat, and the fatal news fell on them like a thunder clap.

Among the savages, sorrow is always manifested by physical signs; the parents and friends of deceased warriors, the women especially, lacerated their faces and shoulders with sharpened shells. The blood spurted out and blended with their tears. Deep wounds denoted great despair. The unhappy Maories, bleeding and excited, were hideous to look upon.

There was another serious element in their grief. Not only had they lost the relative or friend they mourned, but his bones would be missing in the family mausoleum. In the Maori religion the possession of these relics is regarded as indispensable to the destinies of the future life; not the perishable flesh, but the bones, which are collected with the greatest care, cleaned, scraped, polished, even varnished, and then deposited in the "oudoupa," that is the "house of glory." These tombs are adorned with wooden statues, representing with perfect exactness the tattoo of the deceased. But now their tombs would be left empty, the religious rites would be unsolemized, and the bones that escaped the teeth of the wild dog would whiten without burial on the field of battle.

Then the sorrowful chorus redoubled. The menaces of the women were intensified by the imprecations of the men against the Europeans. Abusive epithets were lavished, the accompanying gestures became more violent. The howl was about to end in brutal action.

Kai-Koumou, fearing that he might be overpowered by the fanatics of his tribe, conducted his prisoners to a sacred place, on an abruptly raised plateau at the other end of the "pah." This hut rested against a mound elevated a hundred feet above it, which formed the steep outer buttress of the entrenchment. In this "Ware-Atoua," sacred house, the priests or arikis taught the Maories about a Triune God, father, son, and bird, or spirit. The large, well constructed hut, contained the sacred and choice food which Maoui-Ranga-Rangui eats by the mouths of his priests.

In this place, and safe for the moment from the frenzied natives, the captives lay down on the flax mats. Lady Helena was quite exhausted, her moral energies prostrate, and she fell helpless into her husband's arms.

Glenarvan pressed her to his bosom and said:

"Courage, my dear Helena; Heaven will not forsake us!"

Robert was scarcely in when he jumped on Wilson's shoulders, and squeezed his head through a crevice left between the roof and the walls, from which chaplets of amulets were hung. From that elevation he could see the whole extent of the "pah," and as far as Kai-Koumou's house.

"They are all crowding round the chief," said he softly. "They are throwing their arms about. . . . They are howling. . . . Kai-Koumou is trying to speak."

Then he was silent for a few minutes.

"Kai-Koumou is speaking. . . . The savages are quieter. . . . They are listening. . . . ."

"Evidently," said the Major, "this chief has a personal interest in protecting us. He wants to exchange his prisoners for some chiefs of his tribe! But will his warriors consent?"

"Yes! . . . They are listening. . . . They have dispersed, some are gone into their huts. . . . The others have left the intrenchment."
"Are you sure?" said the Major.
"Yes, Mr. McNabbs," replied Robert, "Kai-Koumou is left alone with the warriors of his canoe. . . . Oh! one of them is coming up here. . . ."
"Come down, Robert," said Glenarvan.
At this moment, Lady Helena who had risen, seized her husband's arm.
"Edward," she said in a resolute tone, "neither Mary Grant nor I must fall into the hands of these savages alive!"
And so saying, she handed Glenarvan a loaded revolver.
"Fire-arm!" exclaimed Glenarvan, with flashing eyes.
"Yes! the Maories do not search their prisoners. But, Edward, this is for us, not for them."
Glenarvan slipped the revolver under his coat; at the same moment the mat at the entrance was raised, and a native entered.

He motioned to the prisoners to follow him. Glenarvan and the rest walked across the "pah" and stopped before Kai-Koumou. He was surrounded by the principal warriors of his tribe, and among them the Maori whose canoe joined that of the Kai-Koumou at the confluence of Pohain-henna, on the Waikato. He was a man about forty years of age, powerfully built and of fierce and cruel aspect. His name was Kara-Tete, meaning "the irascible" in the native tongue. Kai-Koumou treated him with a certain tone of respect, and by the fineness of his tattoo, it was easy to perceive that Kara-Tete held a lofty position in the tribe, but a keen observer would have guessed the feeling of rivalry that existed between these two chiefs. The Major observed that the influence of Kara-Tete gave umbrage to Kai-Koumou. They both ruled the Waikato tribes, and were equal in authority. During this interview Kai-Koumou smiled, but his eyes betrayed a deep-seated enmity.
Kai-Koumou interrogated Glenarvan.
"You are English?" said he.
"Yes," replied Glenarvan, unhesitatingly, as his nationality would facilitate the exchange.
"And your companions?" said Kai-Koumou.
"My companions are English like myself. We are shipwrecked travelers, but it may be important to state that we have taken no part in the war."
"That matters little!" was the brutal answer of Kara-Tete. "Every Englishman is an enemy. Your people invaded our island! They robbed our fields! they burned our villages!"
"They were wrong!" said Glenarvan, quietly. "I say so, because I think it, not because I am in your power."
"Listen," said Kai-Koumou, "the Tohonga, the chief priest of Noui-Atoua has fallen into the hands of your brethren; he is a prisoner among the Pakekas. Our deity has commanded us to ransom him. For my own part, I would rather have torn out your heart, I would have stuck your head, and those of your companions, on the posts of that palisade. But Noui-Atoua has spoken."
As he uttered these words, Kai-Koumou, who till now had been quite unmoved, trembled with rage, and his features expressed intense ferocity.

Then after a few minutes' interval he proceeded more calmly.
"Do you think the English will exchange you for our Tohonga?"
Glenarvan hesitated, all the while watching the Maori chief.
"I do not know," said he, after a moment of silence.
"Speak," returned Kai-Koumou, "is your life worth that of our Tohonga?"
"No," replied Glenarvan. "I am neither a chief nor a priest among my own people."
Paganel, petrified at this reply, looked at Glenarvan in amazement. Kai-Koumou appeared equally astonished.
"You doubt it then?" said he.
"I do not know," replied Glenarvan.
"Your people will not accept you as an exchange for Tohonga?"
"Our Maori custom," replied Kai-Koumou, "is head for head."
"Offer first these ladies in exchange for your priest," said Glenarvan, pointing to Lady Helena and Mary Grant. Lady Helena was about to interrupt him. But the Major held her back.
"Those two ladies," continued Glenarvan, bowing respectfully toward Lady Helena and Mary Grant, "are personages of rank in their own country."
The warrior gazed coldly at his prisoner. An evil smile relaxed his lips for a moment; then he controlled himself, and in a voice of ill-concealed anger:
"Do you hope to deceive Kai-Koumou with lying words, accursed Pakeka? Can not the eyes of Kai-Koumou read hearts?"
And pointing to Lady Helena: "That is your wife?" he said.
"No! mine!" exclaimed Kara-Tete.

And then pushing his prisoners aside, he laid his hand on the shoulder of Lady Helena, who turned pale at his touch.

"Edward!" cried the unfortunate woman in terror.

Glenarvan, without a word, raised his arm, a shot! and Kara-Tete fell at his feet.

The sound brought a crowd of natives to the spot. A hundred arms were ready, and Glenarvan's revolver was snatched from him.

Kai-Koumou glanced at Glenarvan with a curious expression: then with one hand protecting Glenarvan, with the other he waved off the crowd who were rushing on the party.

At last his voice was heard above the tumult.

"Taboo! Taboo!" he shouted.

At that word the crowd stood still before Glenarvan and his companions, who for the time were preserved by a supernatural influence.

A few minutes after they were re-conducted to Ware-Atoua, which was their prison. But Robert Grant and Paganel were not with them.

CHAPTER XI THE CHIEF'S FUNERAL

KAI-KOUMOU, as frequently happens among the Maories, joined the title of ariki to that of tribal chief. He was invested with the dignity of priest, and, as such, he had the power to throw over persons or things the superstitious protection of the "taboo."

The "taboo," which is common to all the Polynesian races, has the primary effect of isolating the "tabooed" person and preventing the use of "tabooed" things. According to the Maori doctrine, anyone who laid sacrilegious hands on what had been declared "taboo," would be punished with death by the insulted deity, and even if the god delayed the vindication of his power, the priests took care to accelerate his vengeance.

By the chiefs, the "taboo" is made a political engine, except in some cases, for domestic reasons. For instance, a native is tabooed for several days when his hair is cut; when he is tattooed; when he is building a canoe, or a house; when he is seriously ill, and when he is dead. If excessive consumption threatens to exterminate the fish of a river, or ruin the early crop of sweet potatoes, these things are put under the protection of the taboo. If a chief wishes to clear his house of hangers-on, he taboos it; if an English trader displeases him he is tabooed. His interdict has the effect of the old royal "veto."

If an object is tabooed, no one can touch it with impunity. When a native is under the interdict, certain ailments are denied him for a prescribed period. If he is relieved, as regards the severe diet, his slaves feed him with the viands he is forbidden to touch with his hands; if he is poor and has no slaves, he has to take up the food with his mouth, like an animal.

In short, the most trifling acts of the Maories are directed and modified by this singular custom, the deity is brought into constant contact with their daily life. The taboo has the same weight as a law; or rather, the code of the Maories, indisputable and undisputed, is comprised in the frequent applications of the taboo.

As to the prisoners confined in the Ware-Atoua, it was an arbitrary taboo which had saved them from the fury of the tribe. Some of the natives, friends and partisans of Kai-Koumou, desisted at once on hearing their chief's voice, and protected the captives from the rest.

Glenarvan cherished no illusive hopes as to his own fate; nothing but his death could atone for the murder of a chief, and among these people death was only the concluding act of a martyrdom of torture. Glenarvan, therefore, was fully prepared to pay the penalty of the righteous indignation that nerved his arm, but he hoped that the wrath of Kai-Koumou would not extend beyond himself.

What a night he and his companions passed! Who could picture their agonies or measure their sufferings? Robert and Paganel had not been restored to them, but their fate was no doubtful matter. They were too surely the first victims of the frenzied natives. Even McNabbs, who was always sanguine, had abandoned hope. John Mangles was nearly frantic at the sight of Mary Grant's despair at being separated from her brother. Glenarvan pondered over the terrible request of Lady Helena, who preferred dying by his hand to submitting to torture and slavery. How was he to summon the terrible courage!

"And Mary? who has a right to strike her dead?" thought John, whose heart was broken.

Escape was clearly impossible. Ten warriors, armed to the teeth, kept watch at the door of Ware-Atoua.

The morning of February 13th arrived. No communication had taken place between the natives and the "tabooed" prisoners. A limited supply of provisions was in the house, which the unhappy inmates scarcely touched. Misery deadened the pangs of hunger. The day passed without change, and without hope; the funeral ceremonies of the dead chief would doubtless be the signal for their execution.

Although Glenarvan did not conceal from himself the probability that Kai-Koumou had given up all idea of
exchange, the Major still cherished a spark of hope.

"Who knows," said he, as he reminded Glenarvan of the effect produced on the chief by the death of Kara-Tete--
"who knows but that Kai-Koumou, in his heart, is very much obliged to you?"

But even McNabbs' remarks failed to awaken hope in Glenarvan's mind. The next day passed without any appearance of preparation for their punishment; and this was the reason of the delay.

The Maories believe that for three days after death the soul inhabits the body, and therefore, for three times twenty-four hours, the corpse remains unburied. This custom was rigorously observed. Till February 15th the "pah" was deserted.

John Mangles, hoisted on Wilson's shoulders, frequently reconnoitered the outer defences. Not a single native was visible; only the watchful sentinels relieving guard at the door of the Ware-Atoua.

But on the third day the huts opened; all the savages, men, women, and children, in all several hundred Maories, assembled in the "pah," silent and calm.

Kai-Koumou came out of his house, and surrounded by the principal chiefs of his tribe, he took his stand on a mound some feet above the level, in the center of the enclosure. The crowd of natives formed in a half circle some distance off, in dead silence.

At a sign from Kai-Koumou, a warrior bent his steps toward Ware-Atoua.

"Remember," said Lady Helena to her husband. Glenarvan pressed her to his heart, and Mary Grant went closer to John Mangles, and said hurriedly:

"Lord and Lady Glenarvan cannot but think if a wife may claim death at her husband's hands, to escape a shameful life, a betrothed wife may claim death at the hands of her betrothed husband, to escape the same fate. John! at this last moment I ask you, have we not long been betrothed to each other in our secret hearts? May I rely on you, as Lady Helena relies on Lord Glenarvan?"

"Mary!" cried the young captain in his despair. "Ah! dear Mary--"

The mat was lifted, and the captives led to Kai-Koumou; the two women were resigned to their fate; the men dissembled their sufferings with superhuman effort.

They arrived in the presence of the Maori chief.

"You killed Kara-Tete," said he to Glenarvan.

"I did," answered Glenarvan.

"You die to-morrow at sunrise."

"Alone?" asked Glenarvan, with a beating heart.

"Oh! if our Tohonga's life was not more precious than yours!" exclaimed Kai-Koumou, with a ferocious expression of regret.

At this moment there was a commotion among the natives. Glenarvan looked quickly around; the crowd made way, and a warrior appeared heated by running, and sinking with fatigue.

Kai-Koumou, as soon as he saw him, said in English, evidently for the benefit of the captives:

"You come from the camp of the Pakekas?"

"Yes," answered the Maori.

"You have seen the prisoner, our Tohonga?"

"I have seen him."

"Alive?"

"Dead! English have shot him."

It was all over with Glenarvan and his companions.

"All!" cried Kai-Koumou; "you all die to-morrow at daybreak."

Punishment fell on all indiscriminately. Lady Helena and Mary Grant were grateful to Heaven for the boon.

The captives were not taken back to Ware-Atoua. They were destined to attend the obsequies of the chief and the bloody rites that accompanied them. A guard of natives conducted them to the foot of an immense kauri, and then stood on guard without taking their eyes off the prisoners.

The three prescribed days had elapsed since the death of Kara-Tete, and the soul of the dead warrior had finally departed; so the ceremonies commenced.

The body was laid on a small mound in the central enclosure. It was clothed in a rich dress, and wrapped in a magnificent flax mat. His head, adorned with feathers, was encircled with a crown of green leaves. His face, arms, and chest had been rubbed with oil, and did not show any sign of decay.

The parents and friends arrived at the foot of the mound, and at a certain moment, as if the leader of an orchestra were leading a funeral chant, there arose a great wail of tears, sighs, and sobs. They lamented the deceased with a plaintive rhythm and doleful cadence. The kinsmen beat their heads; the kinswomen tore their faces with their nails and lavished more blood than tears. But these demonstrations were not sufficient to propitiate the soul of the
deceased, whose wrath might strike the survivors of his tribe; and his warriors, as they could not recall him to life, were anxious that he should have nothing to wish for in the other world. The wife of Kara-Tete was not to be parted from him; indeed, she would have refused to survive him. It was a custom, as well as a duty, and Maori history has no lack of such sacrifices.

This woman came on the scene; she was still young. Her disheveled hair flowed over her shoulders. Her sobs and cries filled the air. Incoherent words, regrets, sobs, broken phrases in which she extolled the virtues of the dead, alternated with her moans, and in a crowning paroxysm of sorrow, she threw herself at the foot of the mound and beat her head on the earth.

The Kai-Koumou drew near; suddenly the wretched victim rose; but a violent blow from a "MERE," a kind of club brandished by the chief, struck her to the ground; she fell senseless.

Horrible yells followed; a hundred arms threatened the terror-stricken captives. But no one moved, for the funeral ceremonies were not yet over.

The wife of Kara-Tete had joined her husband. The two bodies lay stretched side by side. But in the future life, even the presence of his faithful companion was not enough. Who would attend on them in the realm of Noui-Atoua, if their slaves did not follow them into the other world.

Six unfortunate fellows were brought to the mound. They were attendants whom the pitiless usages of war had reduced to slavery. During the chief's lifetime they had borne the severest privations, and been subjected to all kinds of ill-usage; they had been scantily fed, and incessantly occupied like beasts of burden, and now, according to Maori ideas, they were to resume to all eternity this life of bondage.

These poor creatures appeared quite resigned to their destiny. They were not taken by surprise. Their unbound hands showed that they met their fate without resistance.

Their death was speedy and not aggravated by tedious suffering; torture was reserved for the authors of the murder, who, only twenty paces off, averted their eyes from the horrible scene which was to grow yet more horrible.

Six blows of the MERE, delivered by the hands of six powerful warriors, felled the victims in the midst of a sea of blood.

This was the signal for a fearful scene of cannibalism. The bodies of slaves are not protected by taboo like those of their masters. They belong to the tribe; they were a sort of small change thrown among the mourners, and the moment the sacrifice was over, the whole crowd, chiefs, warriors, old men, women, children, without distinction of age, or sex, fell upon the senseless remains with brutal appetite. Faster than a rapid pen could describe it, the bodies, still reeking, were dismembered, divided, cut up, not into morsels, but into crumbs. Of the two hundred Maories present everyone obtained a share. They fought, they struggled, they quarreled over the smallest fragment. The drops of hot blood splashed over these festive monsters, and the whole of this detestable crew groveled under a rain of blood. It was like the delirious fury of tigers fighting over their prey, or like a circus where the wild beasts devour the deer. This scene ended, a score of fires were lit at various points of the "pah"; the smell of charred flesh polluted the air; and but for the fearful tumult of the festival, but for the cries that emanated from these flesh-sated throats, the captives might have heard the bones crunching under the teeth of the cannibals.

Glenarvan and his companions, breathless with horror, tried to conceal this fearful scene from the eyes of the two poor ladies. They understood then what fate awaited them next day at dawn, and also with what cruel torture this death would be preceded. They were dumb with horror.

The funeral dances commenced. Strong liquors distilled from the "piper excelsum" animated the intoxication of the natives. They had nothing human left. It seemed possible that the "taboo" might be forgotten, and they might rush upon the prisoners, who were already terrified at their delirious gestures.

But Kai-Koumou had kept his own senses amidst the general delirium. He allowed an hour for this orgy of blood to attain its maximum and then cease, and the final scene of the obsequies was performed with the accustomed ceremonial.

The corpses of Kara-Tete and his wife were raised, the limbs were bent, and laid against the stomach according to the Maori usage; then came the funeral, not the final interment, but a burial until the moment when the earth had destroyed the flesh and nothing remained but the skeleton.

The place of "oudoupa," or the tomb, had been chosen outside the fortress, about two miles off at the top of a low hill called Maunganamau, situated on the right bank of the lake, and to this spot the body was to be taken. Two palanquins of a very primitive kind, hand-barrows, in fact, were brought to the foot of the mound, and the corpses doubled up so that they were sitting rather than lying, and their garments kept in place by a band of hanes, were placed on them. Four warriors took up the litters on their shoulders, and the whole tribe, repeating their funeral chant, followed in procession to the place of sepulture.

The captives, still strictly guarded, saw the funeral cortege leave the inner inclosure of the "pah"; then the chants and cries grew fainter. For about half an hour the funeral procession remained out of sight, in the hollow valley, and
then came in sight again winding up the mountain side; the distance gave a fantastic effect to the undulating movement of this long serpentine column.

The tribe stopped at an elevation of about 800 feet, on the summit of Maunganamu, where the burial place of Kara-Tete had been prepared. An ordinary Maori would have had nothing but a hole and a heap of earth. But a powerful and formidable chief destined to speedy deification, was honored with a tomb worthy of his exploits.

The "oudoupa" had been fenced round, and posts, surmounted with faces painted in red ochre, stood near the grave where the bodies were to lie. The relatives had not forgotten that the "Waidoua," the spirit of the dead, lives on mortal food, as the body did in this life. Therefore, food was deposited in the inclosure as well as the arms and clothing of the deceased. Nothing was omitted for comfort. The husband and wife were laid side by side, then covered with earth and grass, after another series of laments.

Then the procession wound slowly down the mountain, and henceforth none dare ascend the slope of Maunganamu on pain of death, for it was "tabooed," like Tongariro, where lie the ashes of a chief killed by an earthquake in 1846.

CHAPTER XII STRANGELY LIBERATED

JUST as the sun was sinking beyond Lake Taupo, behind the peaks of Tuhahua and Pupepapu, the captives were conducted back to their prison. They were not to leave it again till the tops of the Wahiti Ranges were lit with the first fires of day.

They had one night in which to prepare for death. Overcome as they were with horror and fatigue, they took their last meal together.

"We shall need all our strength," Glenarvan had said, "to look death in the face. We must show these savages how Europeans can die."

The meal ended. Lady Helena repeated the evening prayer aloud, her companions, bare-headed, repeated it after her. Who does not turn his thoughts toward God in the hour of death? This done, the prisoners embraced each other. Mary Grant and Helena, in a corner of the hut, lay down on a mat. Sleep, which keeps all sorrow in abeyance, soon weighed down their eyelids; they slept in each other's arms, overcome by exhaustion and prolonged watching.

Then Glenarvan, taking his friends aside, said: "My dear friends, our lives and the lives of these poor women are in God's hands. If it is decreed that we die to-morrow, let us die bravely, like Christian men, ready to appear without terror before the Supreme Judge. God, who reads our hearts, knows that we had a noble end in view. If death awaits us instead of success, it is by His will. Stern as the decree may seem, I will not repine. But death here, means not death only, it means torture, insult, perhaps, and here are two ladies--"

Glenarvan's voice, firm till now, faltered. He was silent a moment, and having overcome his emotion, he said, addressing the young captain:

"John, you have promised Mary what I promised Lady Helena. What is your plan?"

"I believe," said John, "that in the sight of God I have a right to fulfill that promise."

"Yes, John; but we are unarmed."

"No!" replied John, showing him a dagger. "I snatched it from Kara-Tete when he fell at your feet. My Lord, whichever of us survives the other will fulfill the wish of Lady Helena and Mary Grant."

After these words were said, a profound silence ensued. At last the Major said: "My friends, keep that to the last moment. I am not an advocate of irremediable measures."

"I did not speak for ourselves," said Glenarvan. "Be it as it may, we can face death! Had we been alone, I should ere now have cried, 'My friends, let us make an effort. Let us attack these wretches! But with these poor girls--"

At this moment John raised the mat, and counted twenty-five natives keeping guard on the Ware-Atoua. A great fire had been lighted, and its lurid glow threw into strong relief the irregular outlines of the "pah." Some of the savages were sitting round the brazier; the others standing motionless, their black outlines relieved against the clear background of flame. But they all kept watchful guard on the hut confided to their care.

It has been said that between a vigilant jailer and a prisoner who wishes to escape, the chances are in favor of the prisoner; the fact is, the interest of the one is keener than that of the other. The jailer may forget that he is on guard; the prisoner never forgets that he is guarded. The captive thinks oftener of escaping than the jailer of preventing his flight, and hence we hear of frequent and wonderful escapes.

But in the present instance hatred and revenge were the jailers--not an indifferent warden; the prisoners were not bound, but it was because bonds were useless when five-and-twenty men were watching the only egress from the Ware-Atoua.

This house, with its back to the rock which closed the fortress, was only accessible by a long, narrow promontory which joined it in front to the plateau on which the "pah" was erected. On its two other sides rose pointed rocks, which jutted out over an abyss a hundred feet deep. On that side descent was impossible, and had it been possible, the bottom was shut in by the enormous rock. The only outlet was the regular door of the Ware-
Atoua, and the Maories guarded the promontory which united it to the "pah" like a drawbridge. All escape was thus hopeless, and Glenarvan having tried the walls for the twentieth time, was compelled to acknowledge that it was so.

The hours of this night, wretched as they were, slipped away. Thick darkness had settled on the mountain. Neither moon nor stars pierced the gloom. Some gusts of wind whistled by the sides of the "pah," and the posts of the house creaked: the fire outside revived with the puffs of wind, and the flames sent fitful gleams into the interior of Ware-Atoua. The group of prisoners was lit up for a moment; they were absorbed in their last thoughts, and a deathlike silence reigned in the hut.

It might have been about four o'clock in the morning when the Major's attention was called to a slight noise which seemed to come from the foundation of the posts in the wall of the hut which abutted on the rock. McNabbs was at first indifferent, but finding the noise continue, he listened; then his curiosity was aroused, and he put his ear to the ground; it sounded as if someone was scraping or hollowing out the ground outside.

As soon as he was sure of it, he crept over to Glenarvan and John Mangles, and startling them from their melancholy thoughts, led them to the end of the hut.

"Listen," said he, motioning them to stoop.

The scratching became more and more audible; they could hear the little stones grate on a hard body and roll away.

"Some animal in his burrow," said John Mangles.

Glenarvan struck his forehead.

"Who knows?" said he, "it might be a man."

"Animal or man," answered the Major, "I will soon find out!"

Wilson and Olbinett joined their companions, and all united to dig through the wall--John with his dagger, the others with stones taken from the ground, or with their nails, while Mulrady, stretched along the ground, watched the native guard through a crevice of the matting.

These savages sitting motionless around the fire, suspected nothing of what was going on twenty feet off. The soil was light and friable, and below lay a bed of silicious tufa; therefore, even without tools, the aperture deepened quickly. It soon became evident that a man, or men, clinging to the sides of the "pah," were cutting a passage into its exterior wall. What could be the object? Did they know of the existence of the prisoners, or was it some private enterprise that led to the undertaking?

The prisoners redoubled their efforts. Their fingers bled, but still they worked on; after half an hour they had gone three feet deep; they perceived by the increased sharpness of the sounds that only a thin layer of earth prevented immediate communication.

Some minutes more passed, and the Major withdrew his hand from the stroke of a sharp blade. He suppressed a cry.

John Mangles, inserting the blade of his poniard, avoided the knife which now protruded above the soil, but seized the hand that wielded it.

It was the hand of a woman or child, a European! On V. IV Verne neither side had a word been uttered. It was evidently the cue of both sides to be silent.

"Is it Robert?" whispered Glenarvan.

But softly as the name was breathed, Mary Grant, already awakened by the sounds in the hut, slipped over toward Glenarvan, and seizing the hand, all stained with earth, she covered it with kisses.

"My darling Robert," said she, never doubting, "it is you! it is you!"

"Yes, little sister," said he, "it is I am here to save you all; but be very silent."

"Brave lad!" repeated Glenarvan.

"Watch the savages outside," said Robert.

Mulrady, whose attention was distracted for a moment by the appearance of the boy, resumed his post.

"It is all right," said he. "There are only four awake; the rest are asleep."

A minute after, the hole was enlarged, and Robert passed from the arms of his sister to those of Lady Helena. Round his body was rolled a long coil of flax rope.

"My child, my child," murmured Lady Helena, "the savages did not kill you!"

"No, madam," said he; "I do not know how it happened, but in the scuffle I got away; I jumped the barrier; for two days I hid in the bushes, to try and see you; while the tribe were busy with the chief's funeral, I came and reconnoitered this side of the path, and I saw that I could get to you. I stole this knife and rope out of the desert hut. The tufts of bush and the branches made me a ladder, and I found a kind of grotto already hollowed out in the rock under this hut; I had only to bore some feet in soft earth, and here I am."

Twenty noiseless kisses were his reward.

"Let us be off!" said he, in a decided tone.
"Is Paganel below?" asked Glenarvan.
"Monsieur Paganel?" replied the boy, amazed.
"Yes; is he waiting for us?"
"No, my Lord; but is he not here?" inquired Robert.
"No, Robert!" answered Mary Grant.
"Why! have you not seen him?" asked Glenarvan. "Did you lose each other in the confusion? Did you not get away together?"
"No, my Lord!" said Robert, taken aback by the disappearance of his friend Paganel.
"Well, lose no more time," said the Major. "Wherever Paganel is, he cannot be in worse plight than ourselves. Let us go."

Truly, the moments were precious. They had to fly. The escape was not very difficult, except the twenty feet of perpendicular fall outside the grotto.

After that the slope was practicable to the foot of the mountain. From this point the prisoners could soon gain the lower valleys; while the Maories, if they perceived the flight of the prisoners, would have to make a long round to catch them, being unaware of the gallery between the Ware-Atoua and the outer rock.

The escape was commenced, and every precaution was taken. The captives passed one by one through the narrow passage into the grotto. John Mangles, before leaving the hut, disposed of all the evidences of their work, and in his turn slipped through the opening and let down over it the mats of the house, so that the entrance to the gallery was quite concealed.

The next thing was to descend the vertical wall to the slope below, and this would have been impracticable, but that Robert had brought the flax rope, which was now unrolled and fixed to a projecting point of rock, the end hanging over.

John Mangles, before his friends trusted themselves to this flax rope, tried it; he did not think it very strong; and it was of importance not to risk themselves imprudently, as a fall would be fatal.

"This rope," said he, "will only bear the weight of two persons; therefore let us go in rotation. Lord and Lady Glenarvan first; when they arrive at the bottom, three pulls at the rope will be a signal to us to follow."

"I will go first," said Robert. "I discovered a deep hollow at the foot of the slope where those who come down can conceal themselves and wait for the rest."

"Go, my boy," said Glenarvan, pressing Robert's hand.
Robert disappeared through the opening out of the grotto. A minute after, the three pulls at the cord informed them the boy had alighted safely.

Glenarvan and Lady Helena immediately ventured out of the grotto. The darkness was still very great, though some grayish streaks were already visible on the eastern summits.

The biting cold of the morning revived the poor young lady. She felt stronger and commenced her perilous descent.

Glenarvan first, then Lady Helena, let themselves down along the rope, till they came to the spot where the perpendicular wall met the top of the slope. Then Glenarvan going first and supporting his wife, began to descend backward.

He felt for the tufts and grass and shrubs able to afford a foothold; tried them and then placed Lady Helena's foot on them. Some birds, suddenly awakened, flew away, uttering feeble cries, and the fugitives trembled when a stone loosened from its bed rolled to the foot of the mountain.

They had reached half-way down the slope, when a voice was heard from the opening of the grotto.
"Stop!" whispered John Mangles.
Glenarvan, holding with one hand to a tuft of tetragonia, with the other holding his wife, waited with breathless anxiety.

Wilson had had an alarm. Having heard some unusual noise outside the Ware-Atoua, he went back into the hut and watched the Maories from behind the mat. At a sign from him, John stopped Glenarvan.

One of the warriors on guard, startled by an unusual sound, rose and drew nearer to the Ware-Atoua. He stood still about two paces from the hut and listened with his head bent forward. He remained in that attitude for a minute that seemed an hour, his ear intent, his eye peering into the darkness. Then shaking his head like one who sees he is mistaken, he went back to his companions, took an armful of dead wood, and threw it into the smouldering fire, which immediately revived. His face was lighted up by the flame, and was free from any look of doubt, and after having glanced to where the first light of dawn whitened the eastern sky, stretched himself near the fire to warm his stiffened limbs.

"All's well!" whispered Wilson.
John signaled to Glenarvan to resume his descent.
Glenarvan let himself gently down the slope; soon Lady Helena and he landed on the narrow track where Robert waited for them.

The rope was shaken three times, and in his turn John Mangles, preceding Mary Grant, followed in the dangerous route.

He arrived safely; he rejoined Lord and Lady Glenarvan in the hollow mentioned by Robert.

Five minutes after, all the fugitives had safely escaped from the Ware-Atoua, left their retreat, and keeping away from the inhabited shores of the lakes, they plunged by narrow paths into the recesses of the mountains.

They walked quickly, trying to avoid the points where they might be seen from the pah. They were quite silent, and glided among the bushes like shadows. Whither? Where chance led them, but at any rate they were free.

Toward five o'clock, the day began to dawn, bluish clouds marbled the upper stratum of clouds. The misty summits began to pierce the morning mists. The orb of day was soon to appear, and instead of giving the signal for their execution, would, on the contrary, announce their flight.

It was of vital importance that before the decisive moment arrived they should put themselves beyond the reach of the savages, so as to put them off their track. But their progress was slow, for the paths were steep. Lady Glenarvan climbed the slopes, supported, not to say carried, by Glenarvan, and Mary Grant leaned on the arm of John Mangles; Robert, radiant with joy, triumphant at his success, led the march, and the two sailors brought up the rear.

Another half an hour and the glorious sun would rise out of the mists of the horizon. For half an hour the fugitives walked on as chance led them. Paganel was not there to take the lead. He was now the object of their anxiety, and whose absence was a black shadow between them and their happiness. But they bore steadily eastward, as much as possible, and faced the gorgeous morning light. Soon they had reached a height of 500 feet above Lake Taupo, and the cold of the morning, increased by the altitude, was very keen. Dim outlines of hills and mountains rose behind one another; but Glenarvan only thought how best to get lost among them. Time enough by and by to see about escaping from the labyrinth.

At last the sun appeared and sent his first rays on their path.

Suddenly a terrific yell from a hundred throats rent the air. It came from the pah, whose direction Glenarvan did not know. Besides, a thick veil of fog, which, spread at his feet, prevented any distinct view of the valleys below.

But the fugitives could not doubt that their escape had been discovered; and now the question was, would they be able to elude pursuit? Had they been seen? Would not their track betray them?

At this moment the fog in the valley lifted, and enveloped them for a moment in a damp mist, and at three hundred feet below they perceived the swarming mass of frantic natives.

While they looked they were seen. Renewed howls broke forth, mingled with the barking of dogs, and the whole tribe, after vainly trying to scale the rock of Ware-Atoua, rushed out of the pah, and hastened by the shortest paths in pursuit of the prisoners who were flying from their vengeance.

CHAPTER XIII THE SACRED MOUNTAIN

The summit of the mountain was still a hundred feet above them. The fugitives were anxious to reach it that they might continue their flight on the eastern slope out of the view of their pursuers. They hoped then to find some practicable ridge that would allow of a passage to the neighboring peaks that were thrown together in an orographic maze, to which poor Paganel's genius would doubtless have found the clew.

They hastened up the slope, spurred on by the loud cries that drew nearer and nearer. The avenging crowd had already reached the foot of the mountain.

"Courage! my friends," cried Glenarvan, urging his companions by voice and look.

In less than five minutes they were at the top of the mountain, and then they turned to judge of their position, and decide on a route that would baffle their pursuers.

From their elevated position they could see over Lake Taupo, which stretched toward the west in its setting of picturesque mountains. On the north the peaks of Pirongia; on the south the burning crater of Tongariro. But eastward nothing but the rocky barrier of peaks and ridges that formed the Wahiti ranges, the great chain whose unbroken links stretch from the East Cape to Cook's Straits. They had no alternative but to descend the opposite slope and enter the narrow gorges, uncertain whether any outlet existed.

Glenarvan could not prolong the halt for a moment. Wearied as they might be, they must fly or be discovered.

"Let us go down!" cried he, "before our passage is cut off."

But just as the ladies had risen with a despairing effort, McNabbs stopped them and said:

"Glenarvan, it is useless. Look!"

And then they all perceived the inexplicable change that had taken place in the movements of the Maories.

Their pursuit had suddenly stopped. The ascent of the mountain had ceased by an imperious command. The natives had paused in their career, and surged like the sea waves against an opposing rock. All the crowd, thursting
for blood, stood at the foot of the mountain yelling and gesticulating, brandishing guns and hatchets, but not advancing a foot. Their dogs, rooted to the spot like themselves, barked with rage.

What stayed them? What occult power controlled these savages? The fugitives looked without understanding, fearing lest the charm that enchained Kai-Koumou's tribe should be broken.

Suddenly John Mangles uttered an exclamation which attracted the attention of his companions. He pointed to a little inclosure on the summit of the cone.

"The tomb of Kara-Tete!" said Robert.

"Are you sure, Robert?" said Glenarvan.

"Yes, my Lord, it is the tomb; I recognize it."

Robert was right. Fifty feet above, at the extreme peak of the mountain, freshly painted posts formed a small palisaded inclosure, and Glenarvan too was convinced that it was the chief's burial place. The chances of their flight had led them to the crest of Maunganamu.

Glenarvan, followed by the rest, climbed to the foot of the tomb. A large opening, covered with mats, led into it. Glenarvan was about to invade the sanctity of the "oudoupa," when he reeled backward.

"A savage!" said he.

"In the tomb?" inquired the Major.

"Yes, McNabbs."

"No matter; go in."

Glenarvan, the Major, Robert and John Mangles entered. There sat a Maori, wrapped in a large flax mat; the darkness of the "oudoupa" preventing them from distinguishing his features. He was very quiet, and was eating his breakfast quite coolly.

Glenarvan was about to speak to him when the native forestalled him by saying gayly and in good English:

"Sit down, my Lord; breakfast is ready."

It was Paganel. At the sound of his voice they all rushed into the "oudoupa," and he was cordially embraced all round. Paganel was found again. He was their salvation. They wanted to question him; to know how and why he was here on the summit of Maunganamu; but Glenarvan stopped this misplaced curiosity.

"The savages?" said he.

"The savages," said Paganel, shrugging his shoulders. "I have a contempt for those people! Come and look at them."

They all followed Paganel out of the "oudoupa." The Maories were still in the same position round the base of the mountain, uttering fearful cries.

"Shout! yell! till your lungs are gone, stupid wretches!" said Paganel. "I dare you to come here!"

"But why?" said Glenarvan.

"Because the chief is buried here, and the tomb protects us, because the mountain is tabooed."

"Tabooed?"

"Yes, my friends! and that is why I took refuge here, as the malefactors used to flee to the sanctuaries in the middle ages."

"God be praised!" said Lady Helena, lifting her hands to heaven.

The fugitives were not yet out of danger, but they had a moment's respite, which was very welcome in their exhausted state.

Glenarvan was too much overcome to speak, and the Major nodded his head with an air of perfect content.

"And now, my friends," said Paganel, "if these brutes think to exercise their patience on us, they are mistaken. In two days we shall be out of their reach."

"By flight!" said Glenarvan. "But how?"

"That I do not know," answered Paganel, "but we shall manage it."

And now everybody wanted to know about their friend's adventures. They were puzzled by the reserve of a man generally so talkative; on this occasion they had to drag the words out of his mouth; usually he was a ready storyteller, now he gave only evasive answers to the questions of the rest.

"Paganel is another man!" thought McNabbs.

His face was really altered. He wrapped himself closely in his great flax mat and seemed to deprecate observation. Everyone noticed his embarrassment, when he was the subject of conversation, though nobody appeared to remark it; when other topics were under discussion, Paganel resumed his usual gayety.

Of his adventures all that could be extracted from him at this time was as follows:

After the murder of Kara-Tete, Paganel took advantage, like Robert, of the commotion among the natives, and got out of the inclosure. But less fortunate than young Grant, he walked straight into a Maori camp, where he met a tall, intelligent-looking chief, evidently of higher rank than all the warriors of his tribe. The chief spoke excellent
English, and he saluted the new-comer by rubbing the end of his nose against the end of the geographer's nose.

Paganel wondered whether he was to consider himself a prisoner or not. But perceiving that he could not stir without the polite escort of the chief, he soon made up his mind on that point.

This chief, Hihi, or Sunbeam, was not a bad fellow. Paganel's spectacles and telescope seemed to give him a great idea of Paganel's importance, and he manifested great attachment to him, not only by kindness, but by a strong flax rope, especially at night.

This lasted for three days; to the inquiry whether he was well treated, he said "Yes and no!" without further answer; he was a prisoner, and except that he expected immediate execution, his state seemed to him no better than that in which he had left his unfortunate friends.

One night, however, he managed to break his rope and escape. He had seen from afar the burial of the chief, and knew that he was buried on the top of Maunganamu, and he was well acquainted with the fact that the mountain would be therefore tabooed. He resolved to take refuge there, being unwilling to leave the region where his companions were in durance. He succeeded in his dangerous attempt, and had arrived the previous night at the tomb of Kara-Tete, and there proposed to recruit his strength while he waited in the hope that his friends might, by Divine mercy, find the means of escape.

Such was Paganel's story. Did he designedly conceal some incident of his captivity? More than once his embarrassment led them to that conclusion. But however that might be, he was heartily congratulated on all sides. And then the present emergency came on for serious discussion. The natives dare not climb Maunganamu, but they, of course, calculated that hunger and thirst would restore them their prey. It was only a question of time, and patience is one of the virtues of all savages. Glenarvan was fully alive to the difficulty, but made up his mind to watch for an opportunity, or make one. First of all he made a thorough survey of Maunganamu, their present fortress; not for the purpose of defence, but of escape. The Major, John, Robert, Paganel, and himself, made an exact map of the mountain. They noted the direction, outlet and inclination of the paths. The ridge, a mile in length, which united Maunganamu to the Wahiti chain had a downward inclination. Its slope, narrow and jagged though it was, appeared the only practicable route, if they made good their escape at all. If they could do this without observation, under cover of night, they might possibly reach the deep valleys of the Range and put the Maories off the scent.

But there were dangers in this route; the last part of it was within pistol shot of natives posted on the lower slopes. Already when they ventured on the exposed part of the crest, they were saluted with a hail of shot which did not reach them. Some gun wads, carried by the wind, fell beside them; they were made of printed paper, which Paganel picked up out of curiosity, and with some trouble deciphered.

"That is a good idea! My friends, do you know what those creatures use for wads?"

"No, Paganel!" said Glenarvan.

"Pages of the Bible! If that is the use they make of the Holy Book, I pity the missionaries! It will be rather difficult to establish a Maori library."

"And what text of scripture did they aim at us?"

"A message from God Himself!" exclaimed John Mangles, who was in the act of reading the scorched fragment of paper. "It bids us hope in Him," added the young captain, firm in the faith of his Scotch convictions.

"Read it, John!" said Glenarvan.

And John read what the powder had left visible: "I will deliver him, for he hath trusted in me."

"My friends," said Glenarvan, "we must carry these words of hope to our dear, brave ladies. The sound will bring comfort to their hearts."

Glenarvan and his companions hastened up the steep path to the cone, and went toward the tomb. As they climbed they were astonished to perceive every few moments a kind of vibration in the soil. It was not a movement like earthquake, but that peculiar tremor that affects the metal of a boiler under high pressure. It was clear the mountain was the outer covering of a body of vapor, the product of subterranean fires.

This phenomenon of course excited no surprise in those that had just traveled among the hot springs of the Waikato. They knew that the central region of the Ika-na-Mani is essentially volcanic. It is a sieve, whose interstices furnish a passage for the earth's vapors in the shape of boiling geysers and solfataras.

Paganel, who had already noticed this, called the attention of his friends to the volcanic nature of the mountain.

The peak of Maunganamu was only one of the many cones which bristle on this part of the island. It was a volcano of the future. A slight mechanical change would produce a crater of eruption in these slopes, which consisted merely of whitish silicious tufa.

"That may be," said Glenarvan, "but we are in no more danger here than standing by the boiler of the DUNCAN; this solid crust is like sheet iron."

"I agree with you," added the Major, "but however good a boiler may be, it bursts at last after too long service."

"McNabbs," said Paganel, "I have no fancy for staying on the cone. When Providence points out a way, I will go
"I wish," remarked John, "that Maunganamu could carry us himself, with all the motive power that he has inside. It is too bad that millions of horse-power should lie under our feet unavailable for our needs. Our DUNCAN would carry us to the end of the world with the thousandth part of it."

The recollections of the DUNCAN evoked by John Mangles turned Glenarvan's thoughts into their saddest channel; for desperate as his own case was he often forgot it, in vain regret at the fate of his crew.

His mind still dwelt on it when he reached the summit of Maunganamu and met his companions in misfortune.

Lady Helena, when she saw Glenarvan, came forward to meet him.

"Dear Edward," said she, "you have made up your mind? Are we to hope or fear?"

"Hope, my dear Helena," replied Glenarvan. "The natives will never set foot on the mountain, and we shall have time to devise a plan of escape."

"More than that, madam, God himself has encouraged us to hope."

And so saying, John Mangles handed to Lady Helena the fragment of paper on which was legible the sacred words; and these young women, whose trusting hearts were always open to observe Providential interpositions, read in these words an indisputable sign of salvation.

"And now let us go to the 'oudoupa!'" cried Paganel, in his gayest mood. "It is our castle, our dining-room, our study! None can meddle with us there! Ladies! allow me to do the honors of this charming abode."

They followed Paganel, and when the savages saw them profaning anew the tabooed burial place, they renewed their fire and their fearful yells, the one as loud as the other. But fortunately the balls fell short of our friends, though the cries reached them.

Lady Helena, Mary Grant, and their companions were quite relieved to find that the Maories were more dominated by superstition than by anger, and they entered the monument.

It was a palisade made of red-painted posts. Symbolic figures, tattooed on the wood, set forth the rank and achievements of the deceased. Strings of amulets, made of shells or cut stones, hung from one part to another. In the interior, the ground was carpeted with green leaves, and in the middle, a slight mound betokened the place of the newly made grave. There lay the chief's weapons, his guns loaded and capped, his spear, his splendid ax of green jade, with a supply of powder and ball for the happy hunting grounds.

"Quite an arsenal!" said Paganel, "of which we shall make a better use. What ideas they have! Fancy carrying arms in the other world!"

"Well!" said the Major, "but these are English firearms."

"No doubt," replied Glenarvan, "and it is a very unwise practice to give firearms to savages! They turn them against the invaders, naturally enough. But at any rate, they will be very valuable to us."

"Yes," said Paganel, "but what is more useful still is the food and water provided for Kara-Tete."

Things had been handsomely done for the deceased chief; the amount of provisions denoted their esteem for the departed. There was food enough to sustain ten persons for fifteen days, or the dead man forever.

The vegetable aliments consisted of edible ferns, sweet potatoes, the "convolvulus batatas," which was indigenous, and the potato which had been imported long before by the Europeans. Large jars contained pure water, and a dozen baskets artistically plaited contained tablets of an unknown green gum.

The fugitives were therefore provided for some days against hunger and thirst, and they needed no persuasion to begin their attack on the deceased chief's stores. Glenarvan brought out the necessary quantity and put them into Olbinet's hands. The steward, who never could forget his routine ideas, even in the most exceptional circumstances, thought the meal a slender one. He did not know how to prepare the roots, and, besides, had no fire.

But Paganel soon solved the difficulty by recommending him to bury his fern roots and sweet potatoes in the soil. The temperature of the surface stratum was very high, and a thermometer plunged into the soil would have marked from 160 to 170 degrees; in fact, Olbinett narrowly missed being scalded, for just as he had scooped a hole for the roots, a jet of vapor sprang up and with a whistling sound rose six feet above the ground.

The steward fell back in terror.

"Shut off steam!" cried the Major, running to close the hole with the loose drift, while Paganel pondering on the singular phenomenon muttered to himself:

"Let me see! ha! ha! Why not?"

"Are you hurt?" inquired McNabbs of Olbinett.

"No, Major," said the steward, "but I did not expect--"

"That Providence would send you fire," interrupted Paganel in a jovial tone. "First the larder of Kara-Tete and then fire out of the ground! Upon my word, this mountain is a paradise! I propose that we found a colony, and cultivate the soil and settle here for life! We shall be the Robinsons of Maunganamu. We should want for nothing."

"If it is solid ground," said John Mangles.
"Well! it is not a thing of yesterday," said Paganel. "It has stood against the internal fire for many a day, and will do so till we leave it, at any rate."

"Breakfast is ready," announced Olbinett with as much dignity as if he was in Malcolm Castle.

Without delay, the fugitives sat down near the palisade, and began one of the many meals with which Providence had supplied them in critical circumstances. Nobody was inclined to be fastidious, but opinions were divided as regarded the edible fern. Some thought the flavor sweet and agreeable, others pronounced it leathery, insipid, and resembling the taste of gum. The sweet potatoes, cooked in the burning soil, were excellent. The geographer remarked that Kara-Tete was not badly off after all.

And now that their hunger was appeased, it was time to decide on their plan of escape.

"So soon!" exclaimed Paganel in a piteous tone. "Would you quit the home of delight so soon?"

"But, Monsieur Paganel," interposed Lady Helena, "if this be Capua, you dare not intend to imitate Hannibal!"

"Madam, I dare not contradict you, and if discussion is the order of the day, let it proceed."

"First," said Glenarvan, "I think we ought to start before we are driven to it by hunger. We are revived now, and ought to take advantage of it. To-night we will try to reach the eastern valleys by crossing the cordon of natives under cover of the darkness."

"Excellent," answered Paganel, "if the Maories allow us to pass."

"And if not?" asked John Mangles.

"Then we will use our great resources," said Paganel.

"But have we great resources?" inquired the Major.

"More than we can use!" replied Paganel, without any further explanation.

And then they waited for the night.

The natives had not stirred. Their numbers seemed even greater, perhaps owing to the influx of the stragglers of the tribe. Fires lighted at intervals formed a girdle of flame round the base of the mountain, so that when darkness fell, Maunganamu appeared to rise out of a great brasier, and to hide its head in the thick darkness. Five hundred feet below they could hear the hum and the cries of the enemy's camp.

At nine o'clock the darkness being very intense, Glenarvan and John Mangles went out to reconnoiter before embarking the whole party on this critical journey. They made the descent noiselessly, and after about ten minutes, arrived on the narrow ridge that crossed the native lines, fifty feet above the camp.

All went well so far. The Maories, stretched beside the fires, did not appear to observe the two fugitives. But in an instant a double fusillade burst forth from both sides of the ridge.

"Back," exclaimed Glenarvan; "those wretches have the eyes of cats and the guns of riflemen!"

And they turned, and once more climbed the steep slope of the mountain, and then hastened to their friends who had been alarmed at the firing. Glenarvan's hat was pierced by two balls, and they concluded that it was out of the question to venture again on the ridge between two lines of marksmen.

"Wait till to-morrow," said Paganel, "and as we cannot elude their vigilance, let me try my hand on them."

The night was cold; but happily Kara-Tete had been furnished with his best night gear, and the party wrapped themselves each in a warm flax mantle, and protected by native superstition, slept quietly inside the inclosure, on the warm ground, still violating with the violence of the internal ebullition.

CHAPTER XIV A BOLD STRATAGEM

NEXT day, February 17th, the sun's first rays awoke the sleepers of the Maunganamu. The Maories had long since been astir, coming and going at the foot of the mountain, without leaving their line of observation. Furious clamor broke out when they saw the Europeans leave the sacred place they had profaned.

Each of the party glanced first at the neighboring mountains, and at the deep valleys still drowned in mist, and over Lake Taupo, which the morning breeze ruffled slightly. And then all clustered round Paganel eager to hear his project.

Paganel soon satisfied their curiosity. "My friends," said he, "my plan has one great recommendation; if it does not accomplish all that I anticipate, we shall be no worse off than we are at present. But it must, it will succeed."

"And what is it?" asked McNabbs.

"It is this," replied Paganel, "the superstition of the natives has made this mountain a refuge for us, and we must take advantage of their superstition to escape. If I can persuade Kai-Koumou that we have expiated our profanation, that the wrath of the Deity has fallen on us: in a word, that we have died a terrible death, do you think he will leave the plateau of Maunganamu to return to his village?"

"Not a doubt of it," said Glenarvan.

"And what is the horrible death you refer to?" asked Lady Helena.

"The death of the sacrilegious, my friends," replied Paganel. "The avenging flames are under our feet. Let us open a way for them!"
"What! make a volcano!" cried John Mangles.

"Yes, an impromptu volcano, whose fury we can regulate. There are plenty of vapors ready to hand, and subterranean fires ready to issue forth. We can have an eruption ready to order."

"An excellent idea, Paganel; well conceived," said the Major.

"You understand," replied the geographer, "we are to pretend to fall victims to the flames of the Maori Pluto, and to disappear spiritually into the tomb of Kara-Tete. And stay there three, four, even five days if necessary—that is to say, till the savages are convinced that we have perished, and abandon their watch."

"But," said Miss Grant, "suppose they wish to be sure of our punishment, and climb up here to see?"

"No, my dear Mary," returned Paganel. "They will not do that. The mountain is tabooed, and if it devoured its sacrilegious intruders, it would only be more inviolably tabooed."

"It is really a very clever plan," said Glenarvan. "There is only one chance against it; that is, if the savages prolong their watch at the foot of Maunganamu, we may run short of provisions. But if we play our game well there is not much fear of that."

"And when shall we try this last chance?" asked Lady Helena.

"To-night," rejoined Paganel, "when the darkness is the deepest."

"Agreed," said McNabbs; "Paganel, you are a genius! and I, who seldom get up an enthusiasm, I answer for the success of your plan. Oh! those villains! They shall have a little miracle that will put off their conversion for V. IV Verne another century. I hope the missionaries will forgive us."

The project of Paganel was therefore adopted, and certainly with the superstitious ideas of the Maories there seemed good ground for hope. But brilliant as the idea might be, the difficulty was in the _modus operandi_. The volcano might devour the bold schemers, who offered it a crater. Could they control and direct the eruption when they had succeeded in letting loose its vapor and flames, and lava streams? The entire cone might be engulfed. It was meddling with phenomena of which nature herself has the absolute monopoly.

Paganel had thought of all this; but he intended to act prudently and without pushing things to extremes. An appearance would be enough to dupe the Maories, and there was no need for the terrible realities of an eruption.

How long that day seemed. Each one of the party inwardly counted the hours. All was made ready for flight. The oudoupa provisions were divided and formed very portable packets. Some mats and firearms completed their light equipment, all of which they took from the tomb of the chief. It is needless to say that their preparations were made within the inclosure, and that they were unseen by the savages.

At six o'clock the steward served up a refreshing meal. Where or when they would eat in the valleys of the Ranges no one could foretell. So that they had to take in supplies for the future. The principal dish was composed of half a dozen rats, caught by Wilson and stewed. Lady Helena and Mary Grant obstinately refused to taste this game, which is highly esteemed by the natives; but the men enjoyed it like the real Maories. The meat was excellent and savory, and the six devourers were devoured down to the bones.

The evening twilight came on. The sun went down in a stormy-looking bank of clouds. A few flashes of lightning glanced across the horizon and distant thunder pealed through the darkened sky.

Paganel welcomed the storm, which was a valuable aid to his plans, and completed his program. The savages are superstitiously affected by the great phenomena of nature. The New Zealanders think that thunder is the angry voice of Noui-Atoua, and lightning the fierce gleam of his eyes. Thus their deity was coming personally to chastise the violators of the taboo.

At eight o'clock, the summit of the Maunganamu was lost in portentous darkness. The sky would supply a black background for the blaze which Paganel was about to throw on it. The Maories could no longer see their prisoners; and this was the moment for action. Speed was necessary. Glenarvan, Paganel, McNabbs, Robert, the steward, and the two sailors, all lent a hand.

The spot for the crater was chosen thirty paces from Kara-Tete's tomb. It was important to keep the oudoupa intact, for if it disappeared, the taboo of the mountain would be nullified. At the spot mentioned Paganel had noticed an enormous block of stone, round which the vapors played with a certain degree of intensity. This block covered a small natural crater hollowed in the cone, and by its own weight prevented the egress of the subterranean fire. If they could move it from its socket, the vapors and the lava would issue by the disencumbered opening.

The workers used as levers some posts taken from the interior of the oudoupa, and they plied their tools vigorously against the rocky mass. Under their united efforts the stone soon moved. They made a little trench so that it might roll down the inclined plane. As they gradually raised it, the vibrations under foot became more distinct. Dull roarings of flame and the whistling sound of a furnace ran along under the thin crust. The intrepid laborers, veritable Cyclops handling Earth's fires, worked in silence; soon some fissures and jets of steam warned them that their place was growing dangerous. But a crowning effort moved the mass which rolled down and disappeared. Immediately the thin crust gave way. A column of fire rushed to the sky with loud detonations, while streams of
boiling water and lava flowed toward the native camp and the lower valleys.

All the cone trembled as if it was about to plunge into a fathomless gulf.

Glenarvan and his companions had barely time to get out of the way; they fled to the enclosure of the oudoupa, not without having been sprinkled with water at 220 degrees. This water at first spread a smell like soup, which soon changed into a strong odor of sulphur.

Then the mud, the lava, the volcanic stones, all spouted forth in a torrent. Streams of fire furrowed the sides of Maunganamu. The neighboring mountains were lit up by the glare; the dark valleys were also filled with dazzling light.

All the savages had risen, howling under the pain inflicted by the burning lava, which was bubbling and foaming in the midst of their camp.

Those whom the liquid fire had not touched fled to the surrounding hills; then turned, and gazed in terror at this fearful phenomenon, this volcano in which the anger of their deity would swallow up the profane intruders on the sacred mountain. Now and then, when the roar of the eruption became less violent, their cry was heard:

"Taboo! taboo! taboo!"

An enormous quantity of vapors, heated stones and lava was escaping by this crater of Maunganamu. It was not a mere geyser like those that girdle round Mount Hecla, in Iceland, it was itself a Hecla. All this volcanic commotion was confined till then in the envelope of the cone, because the safety valve of Tangariro was enough for its expansion; but when this new issue was afforded, it rushed forth fiercely, and by the laws of equilibrium, the other eruptions in the island must on that night have lost their usual intensity.

An hour after this volcano burst upon the world, broad streams of lava were running down its sides. Legions of rats came out of their holes, and fled from the scene.

All night long, and fanned by the tempest in the upper sky, the crater never ceased to pour forth its torrents with a violence that alarmed Glenarvan. The eruption was breaking away the edges of the opening. The prisoners, hidden behind the inclosure of stakes, watched the fearful progress of the phenomenon.

Morning came. The fury of the volcano had not slackened. Thick yellowish fumes were mixed with the flames; the lava torrents wound their serpentine course in every direction.

Glenarvan watched with a beating heart, looking from all the interstices of the palisaded enclosure, and observed the movements in the native camp.

The Maories had fled to the neighboring ledges, out of the reach of the volcano. Some corpses which lay at the foot of the cone, were charred by the fire. Further off toward the "pah," the lava had reached a group of twenty huts, which were still smoking. The Maories, forming here and there groups, contemplated the canopied summit of Maunganamu with religious awe.

Kai-Koumou approached in the midst of his warriors, and Glenarvan recognized him. The chief advanced to the foot of the hill, on the side untouched by the lava, but he did not ascend the first ledge.

Standing there, with his arms stretched out like an exerciser, he made some grimaces, whose meaning was obvious to the prisoners. As Paganel had foreseen, Kai-Koumou launched on the avenging mountain a more rigorous taboo.

Soon after the natives left their positions and followed the winding paths that led toward the pah.

"They are going!" exclaimed Glenarvan. "They have left their posts! God be praised! Our stratagem has succeeded! My dear Lady Helena, my brave friends, we are all dead and buried! But this evening when night comes, we shall rise and leave our tomb, and fly these barbarous tribes!"

It would be difficult to conceive of the joy that pervaded the oudoupa. Hope had regained the mastery in all hearts. The intrepid travelers forgot the past, forgot the future, to enjoy the present delight! And yet the task before them was not an easy one—to gain some European outpost in the midst of this unknown country. But Kai-Koumou once off their track, they thought themselves safe from all the savages in New Zealand.

A whole day had to elapse before they could make a start, and they employed it in arranging a plan of flight. Paganel had treasured up his map of New Zealand, and on it could trace out the best roads.

After discussion, the fugitives resolved to make for the Bay of Plenty, towards the east. The region was unknown, but apparently desert. The travelers, who from their past experience, had learned to make light of physical difficulties, feared nothing but meeting Maories. At any cost they wanted to avoid them and gain the east coast, where the missionaries had several stations. That part of the country had hitherto escaped the horrors of war, and the natives were not in the habit of scouring the country.

As to the distance that separated Lake Taupo from the Bay of Plenty, they calculated it about a hundred miles. Ten days' march at ten miles a day, could be done, not without fatigue, but none of the party gave that a thought. If they could only reach the mission stations they could rest there while waiting for a favorable opportunity to get to Auckland, for that was the point they desired to reach.
This question settled, they resumed their watch of the native proceedings, and continued so doing till evening fell. Not a solitary native remained at the foot of the mountain, and when darkness set in over the Taupo valleys, not a fire indicated the presence of the Maories at the base. The road was free.

At nine o’clock, the night being unusually dark, Glenarvan gave the order to start. His companions and he, armed and equipped at the expense of Kara-Tete, began cautiously to descend the slopes of Maunganamu, John Mangles and Wilson leading the way, eyes and ears on the alert. They stopped at the slightest sound, they started at every passing cloud. They slid rather than walked down the spur, that their figures might be lost in the dark mass of the mountain. At two hundred feet below the summit, John Mangles and his sailors reached the dangerous ridge that had been so obstinately defended by the natives. If by ill luck the Maories, more cunning than the fugitives, had only pretended to retreat; if they were not really duped by the volcanic phenomenon, this was the spot where their presence would be betrayed. Glenarvan could not but shudder, in spite of his confidence, and in spite of the jokes of Paganel. The fate of the whole party would hang in the balance for the ten minutes required to pass along that ridge. He felt the beating of Lady Helena’s heart, as she clung to his arm.

He had no thought of turning back. Neither had John. The young captain, followed closely by the whole party, and protected by the intense darkness, crept along the ridge, stopping when some loose stone rolled to the bottom. If the savages were still in the ambush below, these unusual sounds might provoke from both sides a dangerous fusillade.

But speed was impossible in their serpent-like progress down this sloping crest. When John Mangles had reached the lowest point, he was scarcely twenty-five feet from the plateau, where the natives were encamped the night before, and then the ridge rose again pretty steeply toward a wood for about a quarter of a mile.

All this lower part was crossed without molestation, and they commenced the ascent in silence. The clump of bush was invisible, though they knew it was there, and but for the possibility of an ambush, Glenarvan counted on being safe when the party arrived at that point. But he observed that after this point, they were no longer protected by the taboo. The ascending ridge belonged not to Maunganamu, but to the mountain system of the eastern side of Lake Taupo, so that they had not only pistol shots, but hand-to-hand fighting to fear. For ten minutes, the little band ascended by insensible degrees toward the higher table-land. John could not discern the dark wood, but he knew it ought to be within two hundred feet. Suddenly he stopped; almost retreated. He fancied he heard something in the darkness; his stoppage interrupted the march of those behind.

He remained motionless long enough to alarm his companions. They waited with unspeakable anxiety, wondering if they were doomed to retrace their steps, and return to the summit of Maunganamu.

But John, finding that the noise was not repeated, resumed the ascent of the narrow path of the ridge. Soon they perceived the shadowy outline of the wood showing faintly through the darkness. A few steps more and they were hid from sight in the thick foliage of the trees.

CHAPTER XV FROM PERIL TO SAFETY

The night favored their escape, and prudence urged them to lose no time in getting away from the fatal neighborhood of Lake Taupo. Paganel took the post of leader, and his wonderful instinct shone out anew in this difficult mountain journey. His nyctalopia was a great advantage, his cat-like sight enabling him to distinguish the smallest object in the deepest gloom.

For three hours they walked on without halting along the far-reaching slope of the eastern side. Paganel kept a little to the southeast, in order to make use of a narrow passage between the Kaimanawa and the Wahiti Ranges, through which the road from Hawkes’ Bay to Auckland passes. Once through that gorge, his plan was to keep off the road, and, under the shelter of the high ranges, march to the coast across the inhabited regions of the province.

At nine o’clock in the morning, they had made twelve miles in twelve hours. The courageous women could not be pressed further, and, besides, the locality was suitable for camping. The fugitives had reached the pass that separates the two chains. Paganel, map in hand, made a loop toward the northeast, and at ten o’clock the little party reached a sort of redan, formed by a projecting rock.

The provisions were brought out, and justice was done to their meal. Mary Grant and the Major, who had not thought highly of the edible fern till then, now ate of it heartily.

The halt lasted till two o’clock in the afternoon, then they resumed their journey; and in the evening they stopped eight miles from the mountains, and required no persuasion to sleep in the open air.

Next day was one of serious difficulties. Their route lay across this wondrous region of volcanic lakes, geysers, and solfataras, which extended to the east of the Wahiti Ranges. It is a country more pleasant for the eye to ramble over, than for the limbs. Every quarter of a mile they had to turn aside or go around for some obstacle, and thus incurred great fatigue; but what a strange sight met their eyes! What infinite variety nature lavishes on her great panoramas!

On this vast extent of twenty miles square, the subterranean forces had a field for the display of all their varied
effects. Salt springs, of singular transparency, peopled by myriads of insects, sprang up from thickets of tea-tree scrub. They diffused a powerful odor of burnt powder, and scattered on the ground a white sediment like dazzling snow. The limpid waters were nearly at boiling point, while some neighboring springs spread out like sheets of glass. Gigantic tree-ferns grew beside them, in conditions analogous to those of the Silurian vegetation.

On every side jets of water rose like park fountains, out of a sea of vapor; some of them continuous, others intermittent, as if a capricious Pluto controlled their movements. They rose like an amphitheater on natural terraces; their waters gradually flowed together under folds of white smoke, and corroding the edges of the semi-transparent steps of this gigantic staircase. They fed whole lakes with their boiling torrents.

Farther still, beyond the hot springs and tumultuous geysers, came the solfataras. The ground looked as if covered with large pustules. These were slumbering craters full of cracks and fissures from which rose various gases. The air was saturated with the acrid and unpleasant odor of sulphurous acid. The ground was encrusted with sulphur and crystalline concretions. All this incalculable wealth had been accumulating for centuries, and if the sulphur beds of Sicily should ever be exhausted, it is here, in this little known district of New Zealand, that supplies must be sought.

The fatigue in traveling in such a country as this will be best understood. Camping was very difficult, and the sportsmen of the party shot nothing worthy of Olbinett's skill; so that they had generally to content themselves with fern and sweet potato--a poor diet which was scarcely sufficient to recruit the exhausted strength of the little party, who were all anxious to escape from this barren region.

But four days at least must elapse before they could hope to leave it. On February 23, at a distance of fifty miles from Maunganamu, Glenarvan called a halt, and camped at the foot of a nameless mountain, marked on Paganel's map. The wooded plains stretched away from sight, and great forests appeared on the horizon.

That day McNabbs and Robert killed three kiwis, which filled the chief place on their table, not for long, however, for in a few moments they were all consumed from the beaks to the claws.

At dessert, between the potatoes and sweet potatoes, Paganel moved a resolution which was carried with enthusiasm. He proposed to give the name of Glenarvan to this unnamed mountain, which rose 3,000 feet high, and then was lost in the clouds, and he printed carefully on his map the name of the Scottish nobleman.
