"Mr. Jeorling," said he, "I can affirm conscientiously that I have done all it was possible to do. Can I hope henceforth that my brother William and his companions--No! No! We must go away--before winter--"

He drew himself up, and cast a last glance towards Tsalal Island.

"To-morrow, Jim," he said to West, "to-morrow we will make sail as early as possible."

At this moment a rough voice uttered the words:

"And Pym--poor Pym!"

I recognized this voice.

It was the voice I had heard in my dream.

CHAPTER XVII. AND PYM?

"And Pym--poor Pym?"

I turned round quickly.

Hunt had spoken. This strange person was standing motionless at a little distance, gazing fixedly at the horizon.

It was so unusual to hear Hunt's voice on board the schooner, that the men, whom the unaccustomed sound reached, drew near, moved by curiosity. Did not his unexpected intervention point to--I had a presentiment that it did--some wonderful revelation?

A movement of West's hand sent the men forward, leaving only the mate, the boatswain, Martin Holt, the sailing-master, and Hardy, with the captain and myself in the vicinity of Hunt. The captain approached and addressed him:

"What did you say?"

"I said, 'And Pym--poor Pym.'"

"Well, then, what do you mean by repeating the name of the man whose pernicious advice led my brother to the island on which the _Jane_ was lost, the greater part of her crew was massacred, and where we have not found even one left of those who were still here seven months ago?"

Hunt did not speak.

"Answer, I say--answer!" cried the captain.

Hunt hesitated, not because he did not know what to say, but from a certain difficulty in expressing his ideas.

The latter were quite clear, but his speech was confused, his words were unconnected. He had a certain language of his own which sometimes was picturesque, and his pronunciation was strongly marked by the hoarse accent of the Indians of the Far West.

"You see," he said, "I do not know how to tell things. My tongue stops. Understand me, I spoke of Pym, poor Pym, did I not?"

"Yes," answered West, sternly; "and what have you to say about Arthur Pym?"

"I have to say that he must not be abandoned."

"Abandoned!" I exclaimed.

"No, never! It would be cruel--too cruel. We must go to seek him."

"To seek him?" repeated Captain Len Guy.

"Understand me; it is for this that I have embarked on the _Halbrane_.--yes, to find poor Pym!"

"And where is he," I asked, "if not deep in a grave, in the cemetery of his natal city?"

"No, he is in the place where he remained, alone, all alone," continued Hunt, pointing towards the south; "and
since then the sun has risen on that horizon seven times."

It was evident that Hunt intended to designate the Antarctic regions, but what did he mean by this?
"Do you not know that Arthur Pym is dead?" said the captain.
"Dead!" replied Hunt, emphasizing the word with an expressive gesture. "No! listen to me: I know things; understand me, he is not dead."
"Come now, Hunt," said I, "remember what you do know. In the last chapter of the adventures of Arthur Pym, does not Edgar Poe relate his sudden and deplorable end?"
"Explain yourself, Hunt," said the captain, in a tone of command. "Reflect, take your time, and say plainly whatever you have to say."

And, while Hunt passed his hand over his brow, as though to collect his memory of far-off things, I observed to Captain Len Guy,--
"There is something very singular in the intervention of this man, if indeed he be not mad."
At my words the boatswain shook his head, for he did not believe Hunt to be in his right mind.
The latter understood this shake of the boatswain's head, and cried out in a harsh tone,--
"No, not mad. And madmen are respected on the prairies, even if they are not believed. And I--I must be believed. No, no, no! Pym is not dead!"
"Edgar Poe asserts that he is," I replied.
"Yes, I know, Edgar Poe of Baltimore. But--he never saw poor Pym, never, never."
"What?" exclaimed Captain Len Guy; "the two men were not acquainted?"
"No!"
"And it was not Arthur Pym himself who related his adventures to Edgar Poe?"
"No, captain, no! He, below there, at Baltimore, had only the notes written by Pym from the day when he hid himself on board the _Grampus_ to the very last hour--the last--understand me the last."
"Who, then, brought back that journal?" asked Captain Len Guy, as he seized Hunt's hand.
"It was Pym's companion, he who loved him, his poor Pym, like a son. It was Dirk Peters, the half-breed, who came back alone from there--beyond.""
"The half-breed, Dirk Peters!" I exclaimed.
"Yes."
"Alone?"
"Alone."
"And Arthur Pym may be--"
"There," answered Hunt, in a loud voice, bending towards the southern line, from which he had not diverted his gaze for a moment.

Could such an assertion prevail against the general incredulity? No, assuredly not! Martin Holt nudged Hurliguerly with his elbow, and both regarded Hunt with pity, while West observed him without speaking. Captain Len Guy made me a sign, meaning that nothing serious was to be got out of this poor fellow, whose mental faculties must have been out of gear for a long time.

And nevertheless, when I looked keenly at Hunt, it seemed to me that a sort of radiance of truth shone out of his eyes:

Then I set to work to interrogate the man, putting to him precise and pressing questions which he tried to answer categorically, as we shall see, and not once did he contradict himself.
"Tell me," I asked, "did Arthur Pym really come to Tsalal Island on board the _Grampus_?"
"Yes."
"Did Arthur Pym separate himself, with the half-breed and one of the sailors, from his companions while Captain William Guy had gone to the village of Klock-Klock?"
"Yes. The sailor was one Allen, and he was almost immediately stifled under the stones."
"Then the two others saw the attack, and the destruction of the schooner, from the top of the hill?"
"Yes."
"Then, some time later, the two left the island, after they had got possession of one of the boats which the natives could not take from them?"
"Yes."
"And, after twenty days, having reached the front of the curtain of vapour, they were both carried down into the gulf of the cataract?"

This time Hunt did not reply in the affirmative; he hesitated, he stammered out some vague words; he seemed to be trying to rekindle the half-extinguished flame of his memory. At length, looking at me and shaking his head, he answered,--
"No, not both. Understand me--Dirk never told me--"

"Dirk Peters" interposed Captain Len Guy, quickly. "You knew Dirk Peters?"

"Yes."

"Where?"

"At Vandalia, State of Illinois."

"And it is from him that you have all this information concerning the voyage?"

"From him."

"And he came back alone--alone--from that voyage, having left Arthur Pym."

"Alone!"

"Speak, man--do speak!" I cried, impatiently. Then, in broken, but intelligible sentences, Hunt spoke,--

"Yes--there--a curtain of vapour--so the half-breed often said--understand me. The two, Arthur Pym and he, were in the Tsalal boat. Then an enormous block of ice came full upon them. At the shock Dirk Peters was thrown into the sea, but he clung to the ice block, and--understand me, he saw the boat drift with the current, far, very far, too far! In vain did Pym try to rejoin his companion, he could not; the boat drifted on and on, and Pym, that poor dear Pym, was carried away. It is he who has never come back, and he is there, still there!"

If Hunt had been the half-breed in person he could not have spoken with more heartfelt emotion of "poor Pym."

It was then, in front of the "curtain of vapour," that Arthur Pym and the half-breed had been separated from each other. Dirk Peters had succeeded in returning from the ice-world to America, whither he had conveyed the notes that were communicated to Edgar Poe.

Hunt was minutely questioned upon all these points and he replied, conformably, he declared, to what the half-breed had told him many times. According to this statement, Dirk Peters had Arthur Pym's note-book in his pocket at the moment when the ice-block struck them, and thus the journal which the half-breed placed at the disposal of the American romance-writer was saved.

"Understand me," Hunt repeated, "for I tell you things as I have them from Dirk Peters. While the drift was carrying him away, he cried out with all his strength. Pym, poor Pym, had already disappeared in the midst of the vapour. The half-breed, feeding upon raw fish, which he contrived to catch, was carried back by a cross current to Tsalal Island, where he landed half dead from hunger."

"To Tsalal Island!" exclaimed Captain Len Guy. "And how long was it since they had left it?"

"Three weeks--yes, three weeks at the farthest, so Dirk Peters told me."

"Then he must have found all that remained of the crew of the _Jane_--my brother William and those who had survived with him?"

"No," replied Hunt; "and Dirk Peters always believed that they had perished--yes, to the very last man. There was no one upon the island."

"No one?" "Not a living soul."

"But the population?"

"No! No one, I tell you. The island was a desert--yes, a desert!"

This statement contradicted certain facts of which we were absolutely certain. After all, though, it that when Dirk Peters returned to Tsalal Island, the population, seized by who can tell what terror, had already taken refuge upon the south-western group, and that William Guy and his companions were still hidden in gorges of Klock-Klock. That would explain why half-breed had not come across them, and also why survivors of the _Jane_ had had nothing to fear during eleven years of their sojourn in the island. On the other hand, since Patterson had left them there seven previously, if we did not find them, that must have because they had been obliged to leave Tsalal, the being rendered uninhabitable by the earthquake.

"So that," resumed Captain Len Guy, "on the return of Dirk Peters, there was no longer an inhabitant on the island?"

"No one," repeated Hunt, "no one. The half-breed did not meet a single native."

"And what did Dirk Peters do?"

"Understand me. A forsaken boat lay there, at the back of the bay, containing some dried meat and several casks of water. The half-breed got into it, and a south wind--yes, south, very strong, the same that had driven the ice block, with the cross current, towards Tsalal Island--carried him on for weeks and weeks--to the iceberg barrier, through a passage in it--you may believe me, I am telling you only what Dirk Peters told me--and he cleared the polar circle."

"And beyond it?" I inquired.

"Beyond it. He was picked up by an American whaler, the _Sandy Hook_, and taken back to America."

Now, one thing at all events was clear. Edgar Poe had never known Arthur Pym. This was the reason why, to leave his readers in exciting uncertainty, he had brought Pym to an end "as sudden as it was deplorable," without indicating the manner or the cause of his death.
"And yet, although Arthur Pym did not return, could it be reasonably admitted that he had survived his companion for any length of time, that he was still living, eleven years having elapsed since his disappearance?"

"Yes, yes," replied Hunt.

And this he affirmed with the strong conviction that Dirk Peters had infused into his mind while the two were living together in Vandalia, in Illinois.

Now the question arose, was Hunt sane? Was it not he who had stolen into my cabin in a fit of insanity—of this I had no doubt—and murmured in my ear the words: "And Pym—poor Pym?"

Yes, and I had not been dreaming! In short, if all that Hunt had just said was true, if he was but the faithful reporter of secrets which had been entrusted to him by Dirk Peters, ought he to be believed when he repeated in a tone of mingled command and entreaty,—

"Pym is not dead. Pym is there. Poor Pym must not be forsaken!"

When I had made an end of questioning Hunt, Captain Len Guy came out of his meditative mood, profoundly troubled, and gave the word, "All hands forward!"

When the men were assembled around him, he said,—

"Listen to me, Hunt, and seriously consider the gravity of the questions I am about to put to you."

Hunt held his head up, and ran his eyes over the crew of the _Halbrane_.

"You assert, Hunt, that all you have told us concerning Arthur Pym is true?"

"Yes."

"You knew Dirk Peters?"

"Yes."

"You lived some years with him in Illinois?"

"Nine years."

"And he often related these things to you?"

"Yes."

"And, for your own part, you have no doubt that he told you the exact truth?"

"None."

"Well, then, did it never occur to him that some of the crew of the _Jane_ might have remained on Tsalal Island?"

"No."

"He believed that William Guy and his companions must all have perished in the landslip of the hill of Klock-Klock?"

"Yes, and from what he often repeated to me, Pym believed it also."

"Where did you see Dirk Peters for the last time?"

"At Vandalia."

"How long ago?"

"Over two years."

"And which of you two was the first to leave Vandalia?"

I thought I detected a slight hesitation in Hunt before he answered,—

"We left the place together."

"You, to go to?"

"The Falklands."

"And he—?"

"He?" repeated Hunt.

And then his wandering gaze fixed itself on Martin Holt, our sailing-master, whose life he had saved at the risk of his own during the tempest.

"Well!" resumed the captain, "do you not understand what I am asking you?"

"Yes."

"Then answer me. When Dirk Peters left Illinois, did he finally give up America?"

"Yes."

"To go whither? Speak!"

"To the Falklands."

"And where is he now?"

"He stands before you."

Dirk Peters! Hunt was the half-breed Dirk Peters, the devoted companion of Arthur Pym, he whom Captain Guy had so long sought for in the United States, and whose presence was probably to furnish us with a fresh reason for pursuing our daring campaign.
I shall not be at all surprised if my readers have already recognized Dirk Peters in Hunt; indeed, I shall be astonished if they have failed to do so. The extraordinary thing is that Captain Len Guy and myself, who had read Edgar Poe's book over and over again, did not see at once, when Hunt came on the ship at the Falklands, that he and the half-breed were identical! I can only admit that we were both blindfolded by some hidden action of Fate, just when certain pages of that book ought to have effectually cleared our vision.

There was no doubt whatever that Hunt really was Dirk Peters. Although he was eleven years older, he answered in every particular to the description of him given by Arthur Pym, except that he was no longer "of fierce aspect." In fact, the half-breed had changed with age and the experience of terrible scenes through which he had passed; nevertheless, he was still the faithful companion to whom Arthur Pym had often owed his safety, that same Dirk Peters who loved him as his own son, and who had never--no, never--lost the hope of finding him again one day amid the awful Antarctic wastes.

Now, why had Dirk Peters hidden himself in the Falklands under the name of Hunt? Why, since his embarkation on the _Halbrane_, had he kept up that _incognito_? Why had he not told who he was, since he was aware of the intentions of the captain, who was about to make every effort to save his countrymen by following the course of the _Jane_?

Why? No doubt because he feared that his name would inspire horror. Was it not the name of one who had shared in the horrible scenes of the _Grampus_, who had killed Parker, the sailor, who had fed upon the man's flesh, and quenched his thirst in the man's blood? To induce him to reveal his name he must needs be assured that the _Halbrane_ would attempt to discover and rescue Arthur Pym!

And as to the existence of Arthur Pym? I confess that my reason did not rebel against the admission of it as a possibility. The imploring cry of the half-breed, "Pym, poor Pym! he must not be forsaken!" troubled me profoundly.

Assuredly, since I had resolved to take part in the expedition of the _Halbrane_, I was no longer the same man! A long silence had followed the astounding declaration of the half-breed. None dreamed of doubting his veracity. He had said, "I am Dirk Peters." He was Dirk Peters.

At length, moved by irresistible impulse, I said: "My friends, before any decision is made, let us carefully consider the situation. Should we not lay up everlasting regret for ourselves if we were to abandon our expedition at the very moment when it promises to succeed? Reflect upon this, captain, and you, my companions. It is less than seven months since Patterson left your countrymen alive on Tsalal Island. If they were there then, the fact proves that for eleven years they had been enabled to exist on the resources provided by the island, having nothing to fear from the islanders, some of whom had fallen victims to circumstances unknown to us, and others had probably transferred themselves to some neighbouring island. This is quite plain, and I do not see how any objection can be raised to my reasoning."

No one made answer: there was none to be made.

"If we have not come across the captain of the _Jane_ and his people," I resumed, "it is because they have been obliged to abandon Tsalal Island since Patterson's departure. Why? In my belief, it was because the earthquake had rendered the island uninhabitable. Now, they would only have required a native boat to gain either another island or some point of the Antarctic continent by the aid of the southern current. I hardly hesitate to assert that all this has occurred; but in any case, I know, and I repeat, that we shall have done nothing if we do not persevere in the search on which the safety of your countrymen depends."

I questioned my audience by a searching look. No answer.

Captain Len Guy, whose emotion was unrestrained, bowed his head, for he felt that I was right, that by invoking the duties of humanity I was prescribing the only course open to men with feeling hearts.

"And what is in question?" I continued, after the silent pause. "To accomplish a few degrees of latitude, and that while the sea is open, while we have two months of good weather to look for, and nothing to fear from the southern winter. I certainly should not ask you to brave its severity. And shall we hesitate, when the _Halbrane_ is abundantly furnished, her crew complete and in good health? Shall we take fright at imaginary dangers? Shall we not have courage to go on, on, thither?"

And I pointed to the southern horizon. Dirk Peters pointed to it also, with an imperative gesture which spoke for him.

Still, the eyes of all were fixed upon us, but there was no response. I continued to urge every argument, and to quote every example in favour of the safety of pursuing our voyage, but the silence was unbroken and now the men stood with eyes cast down.

And yet I had not once pronounced the name of Dirk Peters, nor alluded to Dirk Peters' proposal.

I was asking myself whether I had or had not succeeded in inspiring my companions with my own belief, when Captain Len Guy spoke:

"Dirk Peters," he said, "doyou assert that Arthur Pym and you after your departure from Tsalal Island saw land
in the direction of the south?"

"Yes, land," answered the half-breed. "Islands or continent--understand me--and I believe that Pym, poor Pym, is waiting there until aid comes to him."

"There, where perhaps William Guy and his companions are also waiting," said I, to bring back the discussion to more practical points.

Captain Len Guy reflected for a little while, and then spoke:

"Is it true, Dirk Peters," he asked, "that beyond the eighty-fourth parallel the horizon is shut in by that curtain of vapour which is described in the narrative? Have you seen--seen with your own eyes--those cataracts in the air, that gulf in which Arthur Pym's boat was lost?"

The half-breed looked from one to the other of us, and shook his big head.

"I don't know," he said. "What are you asking me about, captain? A curtain of vapour? Yes, perhaps, and also appearances of land towards the south."

Evidently Dirk Peters had never read Edgar Poe's book, and very likely did not know how to read. After having handed over Pym's journal, he had not troubled himself about its publication. Having retired to Illinois at first and to the Falklands afterwards, he had no notion of the stir that the work had made, or of the fantastic and baseless climax to which our great poet had brought those strange adventures.

And, besides, might not Arthur Pym himself, with his tendency to the supernatural, have fancied that he saw these wondrous things, due solely to his imaginative brain?

Then, for the first time in the course of this discussion, West's voice made itself heard. I had no idea which side he would take. The first words he uttered were:

"Captain, your orders?"

Captain Len Guy turned towards his crew, who surrounded him, both the old and the new. Hearne remained in the background, ready to intervene if he should think it necessary.

The captain questioned the boatswain and his comrades, whose devotion was unreservedly his, by a long and anxious look, and I heard him mutter between his teeth,--

"Ah! if it depended only on me! If I were sure of the assent and the help of them all!"

"Then Hearne spoke roughly:

"Captain," said he, "it's two months since we left the Falklands. Now, my companions were engaged for a voyage which was not to take them farther beyond the icebergs than Tsalal Island."

"That is not so," exclaimed Captain Len Guy. "No! That is not so. I recruited you all for an enterprise which I have a right to pursue, so far as I please."

"Beg pardon," said Hearne, coolly, "but we have come to a point which no navigator has ever yet reached, in a sea, no ship except the _Jane_ has ever ventured into before us, and therefore my comrades and I mean to return to the Falklands before the bad season. From there you can return to Tsalal Island, and even go on to the Pole, if you so please."

A murmur of approbation greeted his words; no doubt the sealing-master justly interpreted the sentiments of the majority, composed of the new recruits. To go against their opinion, to exact the obedience of these ill-disposed men, and under such conditions to risk the unknown Antarctic waters, would have been an act of temerity—or, rather, an act of madness—that would have brought about some catastrophe.

Nevertheless, West, advancing upon Hearne, said to him in a threatening tone, "Who gave you leave to speak?"

"The captain questioned us," replied Hearne. "I had a right to reply."

The man uttered these words with such insolence that West, who was generally so self-restrained, was about to give free vent to his wrath, when Captain Len Guy, stopping him by a motion of his hand, said quietly,--

"Be calm, Jem. Nothing can be done unless we are all agreed. What is your opinion, Hurtiguerly?"

"It is very clear, captain," replied the boatswain. "I will obey your orders, whatever they may be! It is our duty not to forsake William Guy and the others so long as any chance of saving them remains."

The boatswain paused for a moment, while several of the sailors gave unequivocal signs of approbation.

"As for what concerns Arthur Pym—"

"There is no question of Arthur Pym," struck in the captain, "but only of my brother William and his companions."

I saw at this moment that Dirk Peters was about to protest, and caught hold of his arm. He shook with anger, but kept silence.

The captain continued his questioning of the men, desiring to know by name all those upon whom he might reckon. The old crew to a man acquiesced in his proposals, and pledged themselves to obey his orders implicitly and follow him whithersoever he chose to go.

Three only of the recruits joined those faithful seamen; these were English sailors. The others were of Hearne's
opinion, holding that for them the campaign was ended at Tsalal Island. They therefore refused to go beyond that point, and formally demanded that the ship should be steered northward so as to clear the icebergs at the most favourable period of the season.

Twenty men were on their side, and to constrain them to lend a hand to the working of the ship if she were to be diverted to the south would have been to provoke them to rebel. There was but one resource: to arouse their covetousness, to strike the chord of self-interest.

I intervened, therefore, and addressed them in a which placed the seriousness of my proposal beyond a doubt.

"Men of the _Halbrane_, listen to me! Just as various States have done for voyages of discovery in the Polar Regions, I offer a reward to the crew of this schooner. Two thousand dollars shall be shared among you for every degree we make beyond the eighty-fourth parallel."

Nearly seventy dollars to each man; this was a strong temptation. I felt that I had hit the mark.

"I will sign an agreement to that effect," I continued, "with Captain Len Guy as your representative, and the sums gained shall be handed to you on your return, no matter under what conditions that return be accomplished."

I waited for the effect of this promise, and, to tell the truth, I had not to wait long.

"Hurrah!" cried the boatswain, acting as fugleman to his comrades, who almost unanimously added their cheers to his. Hearne offered no farther opposition; it would always be in his power to put in his word when the stances should be more propitious.

Thus the bargain was made, and, to gain my ends, I have made a heavier sacrifice. It is true we were within seven degrees of the South and, if the _Halbrane_ should indeed reach that spot, it would never cost me more than fourteen thousand dollars.

Early in the morning of the 27th of December the _Halbrane_ put out to sea, heading south-west.

After the scene of the preceding evening Captain Len Guy had taken a few hours' rest. I met him next day on deck while West was going about fore and aft, and he called us both to him.

"Mr. Jeorling," he said, "it was with a terrible pang that I came to the resolution to bring our schooner back to the north! I felt I had not done all I ought to do for our unhappy fellow-countrymen: but I knew that the majority of the crew would be against me if I insisted on going beyond Tsalal Island."

"That is true, captain; there was a beginning of indiscipline on board, and perhaps it might have ended in a revolt."

"A revolt we should have speedily put down," said West, coolly, "were it only by knocking Hearne, who is always exciting the mutinous men, on the head."

"And you would have done well, Jem," said the captain. "Only, justice being satisfied, what would have become of the agreement together, which we must have in order to do anything?"

"Of course, captain, it is better that things passed off without violence! But for the future Hearne will have to look out for himself."

"His companions," observed the captain, "are now greedy for the prizes that have been promised them. The greed of gain will make them more willing and persevering. The generosity of Mr. Jeorling has succeeded where our entreaties would undoubtedly have failed. I thank him for it."

Captain Len Guy held out a hand to me, which I grasped cordially.

After some general conversation relating to our purpose, the ship's course, and the proposed verification of the bearings of the group of islands on the west of Tsalal which is described by Arthur Pym, the captain said,--

"As it is possible that the ravages of the earthquake did not extend to this group, and that it may still be inhabited, we must be on our guard in approaching the bearings."

"Which cannot bevery far off," I added. "And then, captain, who knows but that your brother and his sailors might have taken refu ge on one of these islands!"

This was admissible, but not a consoling eventuality, for in that case the poor fellows would have fallen into the hands of those savages of whom they were rid while they remained at Tsalal.

"Jem," resumed Captain Len Guy, "we are making good way, and no doubt land will be signalled in a few hours. Give orders for the watch to be careful."

"It's done, captain."

"There is a man in the crow's-nest?"

"Dirk Peters himself, at his own request." "All right, Jem; we may trust his vigilance."

"And also his eyes," I added, "for he is gifted with amazing sight."

For two hours of very quick sailing not the smallest indication of the group of eight islands was visible.

"It is incomprehensible that we have not come in sight of them," said the captain. "I reckon that the _Halbrane_ has made sixty miles since this morning, and the islands in question are tolerably close together."
"Then, captain, we must conclude--and it is not unlikely--that the group to which Tsalal belonged has entirely disappeared in the earthquake."

"Land ahead?" cried Dirk Peters.

We looked, but could discern nothing on the sea, nor was it until a quarter of an hour had elapsed that our glasses enabled us to recognize the tops of a few scattered islets shining in the oblique rays of the sun, two or three miles to the westward.

What a change! How had it come about? Arthur Pym described spacious islands, but only a small number of tiny islets, half a dozen at most, protruded from the waters.

At this moment the half-breed came sliding down from his lofty perch and jumped to the deck.

"Well, Dirk Peters! Have you recognized the group?" asked the captain.

"The group?" replied the half-breed, shaking his head. "No, I have only seen the tops of five or six islets. There is nothing but stone heaps there--not a single island!"

As the schooner approached we easily recognized these fragments of the group, which had been almost entirely destroyed on its western side. The scattered remains formed dangerous reefs which might seriously injure the keel or the sides of the _Halbrane_, and there was no intention of risking the ship's safety among them. We accordingly cast anchor at a safe distance, and a boat was lowered for the reception of Captain Len Guy, the boatswain, Dirk Peters, Holt, two men and myself. The still, transparent water, as Peters steered us skilfully between the projecting edges of the little reefs, allowed us to see, not a bed of sand strewn with shells, but heaps which were overgrown by land vegetation, tufts plants not belonging to the marine flora that floated the surface of the sea. Presently we landed on one of the larger islets which rose to about thirty feet above the sea.

"Do the tides rise sometimes to that height?" I inquired of the captain.

"Never," he replied, "and perhaps we shall discover some remains of the vegetable kingdom, of habitations, or of an encampment."

"The best thing we can do," said the boatswain, "is to follow Dirk Peters, who has already distanced us. The half-breed's lynx eyes will see what we can't."

Peters had indeed scaled the eminence in a moment, and we presently joined him on the top.

The islet was strewn with remains (probably of those domestic animals mentioned in Arthur Pym's journal), but these bones differed from the bones on Tsalal Island by the fact that the heaps dated from a few months only. This then agreed with the recent period at which we placed the earthquake. Besides, plants and tufts of flowers were growing here and there.

"And these are this year's," I cried, "no southern winter has passed over them."

These facts having been ascertained, no doubt could remain respecting the date of the cataclysm after the departure of Patterson. The destruction of the population of Tsalal whose bones lay about the village was not attributable to that catastrophe. William Guy and the five sailors of the _Jane_ had been able to fly in time, since no bones that could be theirs had been found on the island.

Where had they taken refuge? This was the everpressing question. What answer were we to obtain? Must we conclude that having reached one of these islets they had perished in the swallowing-up of the archipelago? We debated this point, as may be supposed, at a length and with detail which I can only indicate here. Suffice it to say that a decision was arrived at to the following effect. Our sole chance of discovering the unfortunate castaways was to continue our voyage for two or three parallels farther; the goal was there, and which of us would not sacrifice even his life to attain it?

"God is guiding us, Mr. Jeorling," said Captain Len Guy.

CHAPTER XVIII. A REVELATION.

The following day, the 29th of December, at six in the morning, the schooner set sail with a north-east wind, and this time her course was due south. The two succeeding days passed wholly without incident; neither land nor any sign of land was observed. The men on the Halbrahe took great hauls of fish, to their own satisfaction and ours. It was New Year's Day, 1840, four months and seventeen days since I had left the Kerguelens and two months and five days since the Halbrahe had sailed from the Falklands. The half-breed, between whom and myself an odd kind of tacit understanding subsisted, approached the bench on which I was sitting--the captain was in his cabin, and West was not in sight--with a plain intention of conversing with me. The subject may easily be guessed.

"Dirk Peters," said I, taking up the subject at once, "do you wish that we should talk of _him_?"

"Him?" he murmured.

"You have remained faithful to his memory, Dirk Peters."

"Forget him, sir! Never!"
"He is always there--before you?"
"Always! So many dangers shared! That makes brothers! No, it makes a father and his son! Yes! And I have seen America again, but Pym--poor Pym--he is still beyond there!"
"Dirk Peters," I asked, "have you any idea of the route which you and Arthur Pym followed in the boat after your departure from Tsalal Island?"
"None, sir! Poor Pym had no longer any instrument--you know--sea machines--for looking at the sun. We could not know, except that for the eight days the current pushed us towards the south, and the wind also. A fine breeze and a fair sea, and our shirts for a sail."
"Yes, white linen shirts, which frightened your prisoner Nu Nu--"
"Perhaps so--I did not notice. But if Pym has said so, Pym must be believed."
"And during those eight days you were able to supply yourselves with food?"
"Yes, sir, and the days after--we and the savage. You know--the three turtles that were in the boat. These animals contain a store of fresh water--and their flesh is sweet, even raw. Oh, raw flesh, sir?"
He lowered his voice, and threw a furtive glance around him. It would be impossible to describe the frightful expression of the half-breed's face as he thus recalled the terrible scenes of the _Grampus_. And it was not the expression of a cannibal of Australia or the New Hebrides, but that of a man who is pervaded by an insurmountable horror of himself.
"Was it not on the 1st of March, Dirk Peters," I asked, "that you perceived for the first time the veil of grey vapour shot with luminous and moving rays?"
"I do not remember, sir, but if Pym says it was so, Pym must be believed."
"Did he never speak to you of fiery rays which fell from the sky?" I did not use the term "polar aurora," lest the half-breed should not understand it.
"Never, sir," said Dirk Peters, after some reflection. "Did you not remark that the colour of the sea changed, grew white like milk, and that its surface became ruffled around your boat?"
"It may have been so, sir; I did not observe. The boat went on and on, and my head went with it."
"And then, the fine powder, as fine as ashes, that fell--"
"I don't remember it." "Was it not snow?"
"Snow? Yes! No! The weather was warm. What did Pym say? Pym must be believed." He lowered his voice and continued: "But Pym will tell you all that, sir. He knows. I do not know. He saw, and you will believe him."
"Yes, Dirk Peters, I shall believe him."
"We are to go in search of him, are we not?"
"I hope so."
"After we shall have found William Guy and the sailors of the _Jane_!"
"Yes, after."
"And even if we do not find them?"
"Yes, even in that case. I think I shall induce our captain. I think he will not refuse--"
"No, he will not refuse to bring help to a man--a man like him p"
"And yet," I said, "if William Guy and his people are living, can we admit that Arthur Pym--"
"Living? Yes! Living!" cried the half-breed. "By the great spirit of my fathers, he is--he is waiting for me, my poor Pym! How joyful he will be when he clasps his old Dirk in his arms, and I--I, when I feel him, there, there."
And the huge chest of the man heaved like a stormy sea. Then he went away, leaving me inexpressibly affected by the revelation of the tenderness for his unfortunate companion that lay deep in the heart of this semi-savage.
In the meantime I said but little to Captain Len Guy, whose whole heart and soul were set on the rescue of brother, of the possibility of our finding Arthur Gordon Pym. Time enough, if in the course of this strange enterprise of ours we succeeded in that object, to urge upon him one still more visionary.
At length, on the 7th of January--according to Dirk Peters, who had fixed it only by the time that had expired--we arrived at the place where Nu Nu the savage breathed his last, lying in the bottom of the boat. On that day an observation gave 86° 33' for the latitude, the longitude remaining the same between the and the forty-third meridian. Here it was, according the half-breed, that the two fugitives were parted after the collision between the boat and the floating mass of ice. But a question now arose. Since the mass of ice carrying away Dirk Peters had drifted towards the north, was this because it was subjected to the action of a countercurrent?
Yes, that must have been so, for our schooner had not felt the influence of the current which had guided her on leaving the Falklands, for fully four days. And yet, there was nothing surprising in that, for everything is variable in the austral seas. Happily, the fresh breeze from the north-east continued to blow, and the _Halbrane_ made progress toward higher waters, thirteen degrees in advance upon Weddells ship and two degrees upon the fane. As for the land--islands or continent--which Captain Len Guy was seeking on the surface of that vast ocean, it did not appear. I
was well aware that he was gradually losing confidence in our enterprise.

As for me, I was possessed by the desire to rescue Arthur Pym as well as the survivors of the _Jane_. And yet, how could he have survived? But then, the half-breed's fixed idea! Supposing our captain were to give the order to go back, what would Dirk Peters do? Throw himself into the sea rather than return northwards? This it was which made me dread some act of violence on his part, when he heard the greater number of the sailors protesting against this insensate voyage, and talking of putting the ship about, especially towards Hearne, who was stealthily inciting his comrades of the Falklands to insubordination.

It was absolutely necessary not to allow discipline to decline, or discouragement to grow among the crew; so that, on the 7th of January, Captain Len Guy at my request assembled the men and addressed them in the following words:

"Sailors of the _Halbrane_, since our departure from Tsalal Island, the schooner has gained two degrees southwards, and I now inform you, that, conformably with the engagement signed by Mr. Jeorling, four thousand dollars--that is two thousand dollars for each degree--are due to you, and will be paid at the end of the voyage."

These words were greeted with some murmurs of satisfaction, but not with cheers, except those of Hurliguerly the boatswain, and Endicott the cook, which found no echo.

On the 13th of January a conversation took place between the boatswain and myself of a nature to justify my anxiety concerning the temper of our crew.

The men were at breakfast, with the exception of Drap and Stern. The schooner was cutting the water under a stiff breeze. I was walking between the fore and main masts, watching the great flights of birds wheeling about the ship with deafening clangour, and the petrels occasionally perching on our yards. No effort was made to catch or shoot them; it would have been useless cruelty, since their oily and stringy flesh is not eatable.

At this moment Hurliguerly approached me, looked attentively at the birds, and said,--

"I remark one thing, Mr. Jeorling."
"What is it, boatswain?"
"That these birds do not fly so directly south as they did up to the present. Some of them are setting north."
"I have noticed the same fact."
"And I add, Mr. Jeorling, that those who are below there will come back without delay."
"And you conclude from this?"
"I conclude that they feel the approach of winter."
"Of winter?"
"Undoubtedly."
"No, no, boatswain; the temperature is so high that the birds can't want to get to less cold regions so prematurely."
"Oh! prematurely, Mr. Jeorling."
"Yes, boatswain; do we not know that navigators have always been able to frequent the Antarctic waters until the month of March?"
"Not at such a latitude. Besides, there are precocious winters as well as precocious summers. The fine season this year was full two months in advance, and it is to be feared the bad season may come sooner than usual."
"That is very likely," I replied. "After all, it does not signify to us, since our campaign will certainly be over in three weeks."
"If some obstacle does not arise beforehand, Mr. Jeorling."
"And what obstacle?"
"For instance, a continent stretching to the south and barring our way."
"A continent, Hurliguerly!"
"I should not be at all surprised."
"And, in fact, there would be nothing surprising in it."
"As for the lands seen by Dirk Peters," said the boatswain, "where the men of the _Jane_ might have landed on one or another of them, I don't believe in them."
"Why?"
"Because William Guy, who can only have had a small craft at his disposal, could not have got so far into these seas."
"I do not feel quite so sure of that. Nevertheless, Mr. Jeorling--"
"What would there be so surprising in William Guy's being carried to land somewhere by the action of the currents? He did not remain on board his boat for eight months, I suppose. His companions and he may have been able to land on an island, or even on a continent, and that is a sufficient motive for us to pursue our search."
"No doubt--but all are not of your opinion," replied Hurliguerly, shaking his head.
"I know," said I, "and that is what makes me most anxious. Is the ill-feeling increasing?"

"I fear so, Mr. Jeorling. The satisfaction of having gained several hundreds of dollars is already lessened, and the prospect of gaining a few more hundreds does not put a stop to disputes. And yet the prize is tempting! From Tsalal Island to the pole, admitting that we might get there, is six degrees. Now six degrees at two thousand dollars each makes twelve thousand dollars for thirty men, that is four hundred dollars a head. A nice little sum to slip into one's pocket on the return of the _Halbrane_; but, notwithstanding, that fellow Hearne works so wickedly upon his comrades that I believe they are ready to 'bout ship in spite of anybody."

"I can believe that of the recruits, boatswain, but the old crew--"

"H--m! there are three or four of those who are beginning to reflect, and they are not easy in their minds about the prolongation of the voyage."

"I fancy Captain Len Guy and his lieutenant will how to get themselves obeyed."

"We shall see, Mr. Jeorling. But may it not that our captain himself will get disheartened; that the sense of his responsibility will prevail, and that he will renounce his enterprise?"

Yes! this was what I feared, and there was no remedy on that side. "As for my friend Endicott, Mr. Jeorling, I answer for him as for myself. We would go to the end of the world--if the world has an end--did the captain want to go there. True, we two, Dirk Peters and yourself, are but a few to be a law to the others."

"And what do you think of the half-breed?" I asked.

"Well, our men appear to accuse him chiefly of the prolongation of the voyage. You see, Mr. Jeorling, though you have a good deal to do with it, you pay, and pay well, while this crazy fellow, Dirk Peters, persists in asserting that his poor Pym is still living--his poor Pym who was drowned, or frozen, or crushed--killed, anyhow, one way or another, eleven years ago!"

So completely was this my own belief that I never discussed the subject with the half-breed.

"You see, Mr. Jeorling," resumed the boatswain, "at the first some curiosity was felt about Dirk Peters. Then, after he saved Martin Holt, it was interest. Certainly, he was no more talkative than before, and the bear came no oftener out of his den! But now we know what he is, and no one likes him the better for that. At all events it was he who induced our captain, by talking of land to the south of Tsalal Island, to make this voyage, and it is owing to him that he has reached the eighty-sixth degree of latitude."

"That is quite true, boatswain."

"And so, Mr. Jeorling, I am always afraid that one of these days somebody will do Peters an ill turn."

"Dirk Peters would defend himself, and I should pity the man who laid a finger on him."

"Quite so. It would not be good for anybody to be in his hands, for they could bend iron! But then, all being against him, he would be forced into the hold."

"Well, well, we have not yet come to that, I hope, and I count on you, Hurliguerly, to prevent any against Dirk Peters. Reason with your men. Make them understand that we have time to return to the Falklands before the end of the fine season. Their reproaches must not be allowed to provide the captain with an excuse for turning back before the object is attained."

"Count on me, Mr. Jeorling, I will serve you to the best of my ability."

"You will not repent of doing so, Hurliguerly. Nothing is easier than to add a round o to the four hundred dollars which each man is to have, if that man be something more than a sailor--even were his functions simply those of boatswain on board the _Halbrane_."

Nothing important occurred on the 13th and 14th, but a fresh fall in the temperature took place. Captain Len Guy called my attention to this, pointing out the flocks of birds continuously flying north.

While he was speaking to me I felt that his last hopes were fading. And who could wonder? Of the land indicated by the half-breed nothing was seen, and we were already more than one hundred and eighty miles Tsalal Island. At every point of the compass was the sea, nothing but the vast sea with its desert horizon which the sun's disk had been nearing since the 21st and would touch on the 21st March, prior to during the six months of the austral night. Honestly, was it possible to admit that William Guy and his five panions could have accomplished such a distance on a craft, and was there one chance in a hundred that the could ever be recovered?

On the 15th of January an observation most carefully taken gave 43° 13' longitude and 88° 17' latitude. The _Halbrane_ was less than two degrees from the pole.

Captain Len Guy did not seek to conceal the result of this observation, and the sailors knew enough of nautical calculation to understand it. Besides, if the consequences had to be explained to them, were not Holt and Hardy there to do this, and Hearne, to exaggerate them to the utmost?

During the afternoon I had indubitable proof that the sealing-master had been working on the minds of the crew. The men, emerging at the foot of the mainmast, talked in whispers and cast evil glances at us. Two or three sailors made threatening gestures undisguisedly; then arose such angry mutterings that West could not to be deaf to them.
He strode forward and called out. "Silence, there! The first man who speaks will have to reckon with me?"

Captain Len Guy was shut up in his cabin, but every moment I expected to see him come out, give one last long around the waste of waters, and then order the ship’s course to be reversed. Nevertheless, on the next day the schooner was sailing in the same direction. Unfortunately--for the circumstance had some gravity--a mist was beginning to come down on us. I could not keep still, I My apprehensions were redoubled. It was that West was only awaiting the order to change the helm. What mortal anguish soever the captain's must be, I understood too well that he would not give that order without hesitation.

For several days past I had not seen the half-breed, or, least, I had not exchanged a word with him. He was boycotted by the whole crew, with the exception of the boatswain, who was careful to address him, although rarely got a word in return. Dirk Peters took not faintest notice of this state of things. He remained completely absorbed in his own thoughts, yet, had he heard West give the word to steer north, I know not acts of violence he might have driven. He seemed to avoid me; was this from a desire not to compromise me?

On the 17th, in the afternoon, however, Dirk Peters manifested an intention of speaking to me, and never, never, could I have imagined what I was to learn in that interview.

It was about half-past two, and, not feeling well, I gone to my cabin, where the side window was open, that at the back was closed. I heard a knock at the dom and asked who was there.

"Dirk Peters," was the reply.
"You want to speak to me?"
"Yes."
"I am coming out."
"If you please--I should prefer--may I come into your cabin?"
"Come in."

He entered, and shut the door behind him?

Without rising I signed to him to seat himself arm-chair, but he remained standing.

"What do you want of me, Dirk Peters?" I asked at length, as he seemed unable to make up his mind to speak.

"I want to tell you something--because it seems well that you should know it, and you only. In the crew--they must never know it."
"If it is a grave matter, and you fear any indiscretion, Dirk Peters, why do you speak to me?"
"If!--I must! Ah, yes! I must! It is impossible to keep it there! It weighs on me like a stone."

And Dirk Peters struck his breast violently.

Then he resumed:
"Yes! I am always afraid it may escape me during my sleep, and that someone will hear it, for I dream of it, and in dreaming--"

"You dream," I replied, "and of what?"

"Of him, of him. Therefore it is that I sleep in corners, all alone, for fear that his true name should be discovered."

Then it struck me that the half-breed was perhaps about to respond to an inquiry which I had not yet made--why he had gone to live at the Falklands under the name of Hunt after leaving Illinois?

I put the question to him, and he replied,--

"It is not that; no, it is not that I wish--"

"I insist, Dirk Peters, and I desire to know in the first place for what reason you did not remain in America, for what reason you chose the Falklands--"

"For what reason, sir? Because I wanted to get near Pym, my poor Pym--because I hoped to find an opportunity at the Falklands of embarking on a whaling ship bound for the southern sea."

"But that name of Hunt?"

"I would not bear my own name any longer--on account of the affair of the _Grampus_."

The half-breed was alluding to the scene of the "short straw" (or lot-drawing) on board the American brig, when it was decided between Augustus Barnard, Arthur Pym, Dirk Peters, and Parker, the sailor, that one of the four should be sacrificed--as food for the three others. I remembered the obstinate resistance of Arthur Pym, and how it was impossible for him to refuse to take his the tragedy about to be performed--he says this himself--and the horrible act whose remembrance must poison the existence of all those who had survived it.

Oh, that lot-drawing! The "short straws" were little splinters of wood of uneven length which Arthur held in his hand. The shortest was to designate him who should be immolated. And he speaks of the sort of involuntary fierce desire to deceive his corn that he felt--"to cheat" is the word he uses--but he did not "cheat," and he asks pardon for having had the idea! Let us try to put ourselves in his place!

He made up his mind, and held out his hand, closed on the four slips. Dirk Peters drew the first. Fate favoured
him. He had nothing more to fear. Arthur Pym calculated that one more chance was against him. Augustus Barnard
drew in his turn. Saved, too, he! And now Arthur Pym reckoned up the exact chances Parker and himself. At that
moment all the ferocity the tiger entered into his soul. He conceived an intense and devilish hatred of his poor
comrade, his fellow-man.

Five minutes elapsed before Parker dared to draw. At length Arthur Pym, standing with closed eyes, not
knowing whether the lot was for or against him, felt a hand seize his own. It was the hand of Dirk Peters. Arthur
Pym had escaped death. And then the half-breed upon Parker and stabbed him in the back. The frightful repast
followed--immediately--and words are not sufficient to convey to the mind the horror of the reality.

Yes! I knew that hideous story, not a fable, as I had long believed. This was what had happened on board the
_Grampus_ on the 16th of July, 1827, and vainly did I try to understand Dirk Peters' reason for recalling it to my
recollection.

"Well, Dirk Peters," I said, "I will ask you, since you were anxious to hide your name, what it was that induced
you to reveal it, when the _Halbrane_ was moored off Tsalal Island; why you did not keep to the name of Hunt?"

"Sir--understand me--there was hesitation about going farther--they wanted to turn back. This was decided, and
then I thought that by telling who I was--Dirk Peters--of the _Grampus_--poor Pym's companion--I should be heard;
they would believe with me that he was still living, they would go in search of him! And yet, it was a serious thing
to do--to acknowledge that I was Dirk Peters, he who had killed Parker! But hunger, devouring hunger!"

"Come, come, Dirk Peters," said I, "you exaggerate! If the lot had fallen to you, you would have incurred the fate
of Parker. You cannot be charged with a crime."

"Sir, would Parker's family speak of it as you do?"

"His family! Had he then relations?"

"Yes--and that is why Pym changed his name in the narrative. Parker's name was not Parker--it was--"

"Arthur Pym was right," I said, interrupting him quickly, "and as for me, I do not wish to know Parker's real
name. Keep this secret."

"No, I will tell it to you. It weighs too heavily on me, and I shall be relieved, perhaps, when I have told you, Mr.
Jeoring."

"No, Dirk Peters, no!"

"His name was Holt--Ned Holt."

"Holt!" I exclaimed, "the same name as our sailing-master's."

"Who is his own brother, sir."

"Martin Holt?"

"Yes--understand me--his brother."

"But he believes that Ned Holt perished in the wreck of the _Grampus_ with the rest."

"It was not so, and if I learned that I--"

Just at that instant a violent shock flung me out of my bunk.

The schooner had made such a lurch to the port side that she was near foundering.

I heard an angry voice cry out:

"What dog is that at the helm?"

It was the voice of West, and the person he was Hearne.

I rushed out of my cabin.

"Have you let the wheel go?" repeated West, who had seized Hearne by the collar of his jersey.

"Lieutenant--I don't know--"

"Yes, I tell you, you have let it go. A little more and the schooner would have capsized under full sail."

"Gratian," cried West, calling one of the sailors, "take the helm; and you, Hearne, go down into the hold."

On a sudden the cry of "Land!" resounded, and every eye was turned southwards.

CHAPTER XIX. LAND?

"Land" is the only word to be found at the beginning of the nineteenth chapter of Edgar Poe's book. I thought it
would be a good idea--placing after it a note of interrogation--to put it as a heading to this portion of our narrative.

Did that word, dropped from our fore-masthead, indicate an island or a continent? And, whether a continent or
an island, did not a disappointment await us? Could they be there whom we had come to seek? And Arthur Pym,
who was dead, unquestionably dead, in spite of Dirk Peters' assertions, had he ever set foot on this land?

When the welcome word resounded on board the _Jane_ on the 17th January, 1828--(a day full of incidents
according to Arthur Pym's diary)--it was succeeded by "Land on the starboard bow!" Such might have been the
signal from the masthead of the _Halbrane_.

The outlines of land lightly drawn above the sky line were visible on this side.

The land announced to the sailors of the fane was the wild and barren Bennet Islet. Less than one degree south of it lay Tsalal Island, then fertile, habitable and inhabited, and on which Captain Len Guy had hoped to meet his fellow-countrymen. But what would this unknown island, five degrees farther off in the depths of the southern sea, be for our schooner? Was it the goal so ardently desired and so earnestly sought for? Were the two brothers, William and Len Guy, to meet at this place Would the _Halbrane_ come there to the end of a voyage whose success would be definitely secured by the restoration of the survivors of the fane to their country?

I repeat that I was just like the half-breed. Our aim was not merely to discover the survivors, nor was success in this matter the only success we looked for. However, since land was before our eyes, we must get nearer to it first.

That cry of "Land" caused an immediate diversion of our thoughts. I no longer dwelt upon the secret Dirk Peters had just told me--and perhaps the half-breed forgot it also, for he rushed to the bow and fixed his eyes immovably on the horizon. As for West, whom nothing could divert from his duty, he repeated his commands. Gratian came to take the helm, and Hearne was shut up in the hold.

On the whole this was a just punishment, and none of the old crew protested against it, for Hearne's inattention awkwardness had really endangered the schooner, for a short time only.

Five or six of the Falklands sailors did, however, murmur a little.

A sign from the mate silenced them, and they returned at once to their posts.

Needless to say, Captain Len Guy, upon hearing the cry of the look-out man, had tumbled up from his cabin; and eagerly examined this land at ten or twelve miles distance.

As I have said, I was no longer thinking about the secret Dirk Peters had confided to me. Besides, so long as the secret remained between us two--and neither would betray it--there would be nothing to fear. But if ever an unlucky accident were to reveal to Martin Holt that his brother's name had been changed to Parker, that the unfortunate man had not perished in the shipwreck of the _Grampus_, but had been sacrificed to save his companions from perishing of hunger; that Dirk Peters, to whom Martin Holt himself owed his life, had killed him with his own hand, what might not happen then? This was the reason why the half-breed shrank from any expression of thanks from Martin Holt--why he avoided Martin Holt, the victim's brother.

The boatswain had just struck six bells. The schooner was sailing with the caution demanded by navigation in unknown seas. There might be shoals or reefs barely hidden under the surface on which she might run aground or be wrecked. As things stood with the _Halbrane_, and even admitting that she could be floated again, an accident would have rendered her return impossible before the winter set in. We had urgent need that every chance should be in our favour and not one against us.

West had given orders to shorten sail. When the boatswain had furled the top-gallant-sail, the top-sail and royal, the _Halbrane_ remained under her mainsail, her fore-sail and her jib: sufficient canvas to cover the distance that separated her from land in a few hours. Captain Len Guy immediately heaved the lead, which showed a depth of twenty fathoms. Several other soundings showed that the coast, which was very steep, was probably prolonged like a wall under the water. Nevertheless, as the bottom might happen to rise sharply instead of following the slope of the coast, we did not venture to proceed out the sounding line in hand.

The weather was still beautiful, although the sky was overcast by a mist from south-east to south-west. Owing to this there was some difficulty in identifying the vague outlines which stood out like floating vapour in the sky, disappearing and then reappearing between the breaks of the mist.

However, we all agreed to regard this land as from twenty-five to thirty fathoms in height, at least at its highest part.

No! we would not admit that we were the victims of a delusion, and yet our uneasy minds feared that it might so!

Is it not natural, after all, for the heart to be assailed by a thousand apprehensions as we near the end of any enterprise? At this thought my mind became confused and dreamy. The _Halbrane_ seemed to be reduced to the dimensions of a small boat lost in this boundless space—the contrary of that limitless sea of which Edgar Poe speaks, where, like a living body, the ship grows larger.

When we have charts, or even sailing directions instruct us concerning the hydrography of the coasts, the nature of the landfalls, the bays and the creeks, we may sail along boldly. In every other region, the master of a ship must not defer the order to cast anchor near the shore until the morrow. But, where we were, what an amount of prudence was necessary! And yet, no manifest obstacle was before us. Moreover, we had no cause to fear that the light would fail us during the sunny the night. At this season the sun did not set so soon under the western horizon, and its rays bathed the vast Antarctic zone in unabated light.

From that day forward the ship's log recorded that the temperature fell continuously. The thermometer in the air and in the shade did not mark more than 32° (0° C.), and when plunged into water it only indicated 26° (3° 33' C. below 0°). What could be the cause of this fall, since we were at the height of the southern summer? The crew were
obliged to resume their woollen clothing, which they had left off a month previously. The schooner, however, was sailing before the wind, and these first cold blasts were less keenly felt. Yet we recognized the necessity of reaching our goal as soon as possible. To linger in this region or to expose ourselves to the danger of wintering out would be to tempt Providence!

Captain Len Guy tested the direction of the current by heavy lead lines, and discovered that it was beginning to deviate from its former course.

"Whether it is a continent," said he, "that lies before us, or whether it is an island, we have at present no means of determining. If it be a continent, we must conclude that the current has an issue towards the south-east."

"And it is quite possible," I replied, "that the solid part of the Antarctic region may be reduced to a mere polar mound. In any case, it is well to note any of those observations which are likely to be accurate."

"That is just what I am doing, Mr. Jeorling, and we shall bring back a mass of information about this portion of the southern sea which will prove useful to navigators."

"If ever any venture to come so far south, captain! We have penetrated so far, thanks to the help of particular circumstances, the earliness of the summer season, an abnormal temperature and a rapid thaw. Such conditions may only occur once in twenty or fifty years!"

"Wherefore, Mr. Jeorling, I thank Providence for this, and hope revives in me to some extent. As the weather has been constantly fine, what is there to make it impossible for my brother and my fellow-countrymen to have landed on this coast, whither the wind and the tide bore them? What our schooner has done, their boat may have done! They surely did not start on a voyage which might prolonged to an indefinite time without a proper supply of provisions! Why should they not have found the resources as those afforded to them by the island of Tsalal during many long years? They had ammunition and arms elsewhere. Fish abound in these waters, water-fowl also. Oh yes! my heart is full of hope, and I wish I were a few hours older!"

Without being quite so sanguine as Len Guy, I was glad to see he had regained his hopeful mood. Perhaps, if his investigations were successful, I might be able to have them continued in Arthur Pym's interest—even into the heart of this strange land which we were approaching.

The _Halbrane_ was going along slowly on these clear waters, which swarmed with fish belonging to the same species as we had already met. The sea-birds were more numerous, and were evidently not frightened; for they kept flying round the mast, or perching in the yards. Several whitish ropes about five or six feet long were brought on board. They were chaplets formed of millions of shell-fish.

Whales, spouting jets of feathery water from their blow-holes, appeared at a distance, and I remarked that all of them took a southerly direction. There was therefore reason to believe that the sea extended far and wide in that direction.

The schooner covered two or three miles of her course without any increase of speed. This coast evidently stretched from north-west to south-east. Nevertheless, the telescopes revealed no distinctive features—even after three hours' navigation.

The crew, gathered together on the forecastle, were looking on without revealing their impressions. West, after going aloft to the fore-cross-trees, where he had remained ten minutes, had reported nothing precise. Stationed at the port side, leaning my elbows on the bulwarks, I closely watched the sky line, broken only towards the east.

At this moment the boatswain rejoined me, and without preface said:

"Will you allow me to give you my opinion, Mr. Jeorling?"

"Give it, boatswain," I replied, "at the risk of my not adopting it if I don't agree with it."

"It is correct, and according as we get nearer one must really be blind not to adopt it!"

"And what idea have you got?"

"That it is not land which lies before us, Mr. Jeorling!"

"What is it you are saying?"

"Look attentively, putting one finger before your eyes--look there--out a--starboard."

I did as Hurliguerly directed.

"Do you see?" he began again. "May I lose my liking for my grog if these heights do not change place, not with regard to the schooner, but with regard to themselves!"

"And what do you conclude from this?"

"That they are moving icebergs."

"Icebergs?"

"Sure enough, Mr. Jeorling."

Was not the boatswain mistaken? Were we in for a disappointment? Were there only drifting ice-mountains in the distance instead of a shore?

Presently, there was no doubt on the subject; for some time past the crew had no longer believed existence of
land in that direction.

Ten minutes afterwards, the man in the crow's-nest announced that several icebergs were coming north-west, in an oblique direction, into the course of the _Halbrane._

This news produced a great sensation on board. Our last hope was suddenly extinguished. And what a blow to Captain Len Guy! We should have to seek land of the austral zone under higher latitudes without being sure of ever coming across it!

And then the cry, "Back ship! back ship!" sounded almost unanimously on board the _Halbrane._

Yes, indeed, the recruits from the Falklands demanding that we should turn back, although Hearne was not there to fan the flame of insubordination, and I must acknowledge that the greater part of the old tars seemed to agree with them.

West awaited his chief's orders, not daring to impose silence.

Gratian was at the helm, ready to give a turn to wheel, whilst his comrades with their hands on the cleats were preparing to ease off the sheets.

Dirk Peters remained immovable, leaning against the fore-mast, his head down, his body bent, and his mouth set firm. Not a word passed his lips.

But now he turned towards me, and what a look of mingled wrath and entreaty he gave me!

I don't know what irresistible motive induced me to interfere personally, and once again to protest! A final argument had just crossed my mind--an argument whose weight could not be disputed.

So I began to speak, and I did so with such conviction that none tried to interrupt me.

The substance of what I said was as follows:--

"No! all hope must not be abandoned. Land cannot be far off. The icebergs which are formed in the open sea by the accumulation of ice are not before us. These icebergs must have broken off from the solid base of a continent or an island. Now, since the thaw begins at this season of the year, the drift will last for only a short time. Behind them we must meet the coast on which they were formed. In another twenty-four hours, or forty-eight at the most, if the land does not appear, Captain Len Guy will steer to the north again!"

Had I convinced the crew, or ought I to take advantage of Hearne's absence and of the fact that he could not communicate with them to make them understand that they were being deceived, and to repeat to them that it would endanger the schooner if our course were now to be reversed.

The boatswain came to my help, and in a good-humoured voice exclaimed,--

"Very well reasoned, and for my part I accept Mr. Jeorling's opinion. Assuredly, land is near! If we seek it beyond those icebergs, we shall discover it without much hard work, or great danger! What is one degree farther south, when it is a question of putting a hundred additional dollars into one's pocket? And let us not forget that if they are acceptable when they go in, they are none the less so when they come out!"

Upon this, Endicott, the cook, came to the aid of his friend the boatswain.

"Yes, very good things indeed are dollars!" cried he, showing two rows of shining white teeth.

Did the crew intend to yield to Hurliguerly's argument, or would they try to resist if the _Halbrane_ went on in the direction of the icebergs?

Captain Len Guy took up his telescope again, and turned it upon these moving masses; he observed them with much attention, and cried out in a loud voice,--

"Steer south-sou'-west!"

West gave orders to execute the manoeuvres. The sailors hesitated an instant. Then, recalled to obedience, they began to brace the yards and slack the sheets, and the schooner increased her speed.

When the operation was over, I went up to Hurliguerly, and drawing him aside, I said,--

"Thank you, boatswain."

"Ah, Mr. Jeorling," he replied, shaking his head, "it is all very fine for this time, but you must not do it again! Everyone would turn against me, even Endicott, perhaps."

"I have urged nothing which is not at least probable," I answered sharply.

"I don't deny that fact, Mr. Jeorling."

"Yes, Hurliguerly, yes--I believe what I have said, and I have no doubt but that we shall really see the land beyond the icebergs."

"Just possible, Mr. Jeoding, quite possible. But it must appear before two days, or, on the word of a boatswain, nothing can prevent us from putting about!"

During the next twenty-four hours the _Halbrane_ took a south-south-westerly course. Nevertheless, her direction must have been frequently changed and her speed decreased in avoiding the ice. The navigation became very difficult so soon as the schooner headed towards the line of the bergs, which it had to cut obliquely. However, there were none of the packs which blocked up all access to the iceberg on the 67th parallel. The enormous heaps
were melting away with majestic slowness. The ice-blocks appeared "quite new" (to employ a perfectly accurate expression), and perhaps they had only been formed some days. However, with a height of one hundred and fifty feet, their bulk must have been calculated by millions of tons. West was watching closely in order to avoid collisions, and did not leave the deck even for an instant.

Until now, Captain Len Guy had always been able to rely upon the indications of the compass. The magnetic pole, still hundreds of miles off, had no influence on the compass, its direction being east. The needle remained steady, and might be trusted.

So, in spite of my conviction, founded, however, on very serious arguments, there was no sign of land, and I was wondering whether it would not be better to steer more to the west, at the risk of removing the _Halbrane_ from that extreme point where the meridians of the globe cross each other.

Thus, as the hours went by—and I was only allowed forty-eight—it was only too plain that lack of courage prevailed, and that everyone was inclined to be insubordinate.

After another day and a half, I could no longer contend with the general discontent. The schooner must ultimately retrace her course towards the north.

The crew were working in silence, whilst West was giving sharp short orders for manoeuvring through the channels, sometimes luffing in order to avoid a collision, now bearing away almost square before the wind. Nevertheless, in spite of a close watch, in spite of the skill of the sailors, in spite of the prompt execution of the manoeuvres, dangerous friction against the hull, which left long traces of the ridge of the icebergs, occurred. And, in truth, the bravest could not repress a feeling of terror when thinking that the planking might have given way and the sea have invaded us.

The base of these floating ice-mountains was very steep, so that it would have been impossible for us to land upon one. Moreover, we saw no seals—these were usually very numerous where the ice-fields abounded—not even a flock of the screeching penguins which, on other occasions, the _Halbrane_ sent diving by myriads as she passed through them; the birds themselves seemed rarer and wilder. Dread, from which none of us could escape, seemed to come upon us from these desolate and deserted regions. How could we still entertain a hope that the survivors of the _Jane_ had found shelter, and obtained means of existence in those awful solitudes?

And if the Halbræhe were also shipwrecked, would there remain any evidence of her fate?

Since the previous day, from the moment our southern course had been abandoned, to cut the line of the icebergs, a change had taken place in the demeanour of the half-breed. Nearly always crouched down at the foot of the fore-mast, looking afar into the boundless space, he only got up in order to lend a hand to some manoeuvre, and without any of his former vigilance or zeal. Not that he had ceased to believe that his comrade of the _Jane_ was still living—that thought never even came into his mind! But he felt by instinct that the traces of poor Pym were not to be recovered by following this course.

"Sir," he would have said to me, "this is not the way! No, this is not the way!" And how could I have answered him?

Towards seven o'clock in the evening a rather thick mist arose; this would tend to make the navigation of the schooner difficult and dangerous.

The day, with its emotions of anxiety and alternatives, had worn me out. So I returned to my cabin, where I threw myself on my bunk in my clothes.

But sleep did not come to me, owing to my besetting thoughts. I willingly admit that the constant reading of Edgar Poe's works, and reading them in this place in which his heroes delighted, had exercised an influence on me which I did not fully recognize.

To-morrow, the forty-eight hours would be up, the last concession which the crew had made to my entreaties.

"Things are not going as you wish?" the boatswain said to me just as I was leaving the deck.

No, certainly not, since land was not to be seen behind the fleet of icebergs. If no sign of a coast appeared between these moving masses, Captain Len Guy would steer north to-morrow.

Ah! were I only master of the schooner! If I could have bought it even at the price of all my fortune, if these men had been my slaves to drive by the lash, the _Halbrane_ should never have given up this voyage, even if it led her so far as the point above which flames the Southern Cross.

My mind was quite upset, and teemed with a thousand thoughts, a thousand regrets, a thousand desires! I wanted to get up, but a heavy hand held me down in my bunk! And I longed to leave this cabin where I was struggling against nightmare in my half-sleep, to launch one of the boats of the _Halbrane_ to jump into it with Dirk Peters, who would not hesitate about following me, and so abandon both of us to the current running south.

And lo! I was doing this in a dream. It is to-morrow! Captain Len Guy has given orders to reverse our course, after a last glance at the horizon. One of the boats is in tow. I warn the half-breed. We creep along without being seen. We cut the painter. Whilst the schooner sails on ahead, we stay astern and the current carries us off.
Thus we drift on the sea without hindrance! At length our boat stops. Land is there. I see a sort of sphinx surmounting the southern peak--the sea-sphinx. I go to him. I question him. He discloses the secrets of these mysterious regions to me. And then, the phenomena whose reality Arthur Pym asserted appear around the mythic monster. The curtain of flickering vapours, striped with luminous rays, is rent asunder. And it is not a face of superhuman grandeur which arises before my astonished eyes: it is Arthur Pym, fierce guardian of the south pole, flaunting the ensign of the United States in those high latitudes!

Was this dream suddenly interrupted, or was it changed by a freak of my brain? I cannot tell, but I felt as though I had been suddenly awakened. It seemed as though a change had taken place in the motion of the schooner, which was sliding along on the surface of the quiet sea, with a slight list to starboard. And yet, there was neither rolling nor pitching. Yes, I felt myself carried off as though my bunk were the car of an air-balloon. I was not mistaken, and I had fallen from dreamland into reality.

Crash succeeded crash overhead. I could not account for them. Inside my cabin the partitions deviated from the vertical in such a way as to make one believe that the _Halbrane_ had fallen over on her beam ends. Almost immediately, I was thrown out of my bunk and barely escaped splitting my skull against the corner of the table. However, I got up again, and, clinging on to the edge of the door frame, I propped myself against the door.

At this instant the bulwarks began to crack and the port side of the ship was torn open.

Could there have been a collision between the schooner and one of those gigantic floating masses which West was unable to avoid in the mist?

Suddenly loud shouts came from the after-deck, and then screams of terror, in which the maddened voices of the crew joined.

At length there came a final crash, and the _Halbrane_ remained motionless.

I had to crawl along the floor to reach the door and gain the deck. Captain Len Guy having already left his cabin, dragged himself on his knees, so great was the list to port, and caught on as best he could.

In the fore part of the ship, between the forecastle and the fore-mast, many heads appeared.

Dirk Peters, Hardy, Martin Holt and Endicott, the latter with his black face quite vacant, were clinging to the starboard shrouds.

A man came creeping up to me, because the slope of the deck prevented him from holding himself upright: it was Hurliguerly, working himself along with his hands like a top-man on a yard.

Stretched out at full length, my feet propped up against the jamb of the door, I held out my hand to the boatswain, and helped him, not without difficulty, to hoist himself up near me.

"What is wrong?" I asked. "A stranding, Mr. Jeorling."

"We are ashore!"

"A shore presupposes land," replied the boatswain ironically, "and so far as land goes there was never any except in that rascal Dirk Peters' imagination."

"But tell me--what has happened?"

"We came upon an iceberg in the middle of the fog, and were unable to keep clear of it."

"An iceberg, boatswain?"

"Yes, an iceberg, which has chosen just now to turn head over heels. In turning, it struck the _Halbrane_ and carried it off just as a battledore catches a shuttlecock, and now here we are, stranded at certainly one hundred feet above the level of the Antarctic Sea."

Could one have imagined a more terrible conclusion to the adventurous voyage of the _Halbrane_?

In the middle of these remote regions our only means of transport had just been snatched from its natural element, and carried off by the turn of an iceberg to a height of more than one hundred feet! What a conclusion! To be swallowed up in a polar tempest, to be destroyed in a fight with savages, to be crushed in the ice, such are the dangers to which any ship engaged in the polar seas is exposed! But to think that the _Halbrane_ had been lifted by a floating mountain just as that mountain was turning over, was stranded and almost at its summit--no! such a thing seemed quite impossible.

I did not know whether we could succeed in letting down the schooner from this height with the means we had at our disposal. But I did know that Captain Len Guy, the mate and the older members of the crew, when they had recovered from their first fright, would not give up in despair, no matter how terrible the situation might be; of that I had no doubt whatsoever! They would all look to the general safety; as for the measures to be taken, no one yet knew anything. A foggy veil, a sort of greyish mist still hung over the iceberg. Nothing could be seen of its enormous mass except the narrow craggy cleft in which the schooner was wedged, nor even what place it occupied in the middle of the ice-fleet drifting towards the south-east.

Common prudence demanded that we should quit the _Halbrane_, which might slide down at a sharp shake of the iceberg. Were we even certain that the latter had regained its position on the surface of the sea? Was her stability
secure? Should we not be on the look-out for a fresh upheaval? And if the schooner were to fall into the abyss, which of us could extricate himself safe and sound from such a fall, and then from the final plunge into the depths of the ocean?

In a few minutes the crew had abandoned the **Halbrane**. Each man sought for refuge on the ice-slopes, awaiting the time when the iceberg should be freed from mist. The oblique rays from the sun did not succeed in piercing it, and the red disk could hardly be perceived through the opaque mass.

However, we could distinguish each other at about twelve feet apart. As for the **Halbrane**, she looked like a confused blackish mass standing out sharply against the whiteness of the ice.

We had now to ascertain whether any of those who were on the deck at the time of the catastrophe had been thrown over the bulwarks and precipitated, into the sea?

By Captain Len Guy’s orders all the sailors then present joined the group in which I stood with the mate, the boatswain, Hardy and Martin Holt.

So far, this catastrophe had cost us five men—these were the first since our departure from Kerguelen, but were they to be the last?

There was no doubt that these unfortunate fellows had perished, because we called them in vain, and in vain we sought for them, when the fog abated, along the sides of the iceberg, at every place where they might have been able to catch on to a projection.

When the disappearance of the five men had been ascertained, we fell into despair. Then we felt more keenly than before the dangers which threaten every expedition to the Antarctic zone.

“What about Hearne?” said a voice.

Martin Holt pronounced the name at a moment when there was general silence. Had the sealing-master been crushed to death in the narrow part of the hold where he was shut up?

West rushed towards the schooner, hoisted himself on board by means of a rope hanging over the bows, and gained the hatch which gives access to that part of the hold.

We waited silent and motionless to learn the fate of Hearne, although the evil spirit of the crew was but little worthy of our pity.

And yet, how many of us were then thinking that if we had heeded his advice, and if the schooner had taken the northern course, a whole crew would not have been reduced to take refuge on a drifting ice-mountain! I scarcely dared to calculate my own share of the vast responsibility, I who had so vehemently insisted on the prolongation of the voyage.

At length the mate reappeared on deck and Hearne followed him! By a miracle, neither the bulkheads, nor the ribs, nor the planking had yielded at the place where the sealing-master was confined.

Hearne rejoined his comrades without opening his lips, and we had no further trouble about him.

Towards six o’clock in the morning the fog cleared off, owing to a marked fall in the temperature. We had no longer to do with completely frozen vapour, but had to deal with the phenomenon called frost-rime, which often occurs in these high latitudes. Captain Len Guy recognized it by the quantity of prismatic threads, the point following the wind which roughened the light ice-crust deposited on the sides of the iceberg. Navigators know better than to confound this frost-rime with the hoar frost of the temperate zones, which only freezes when it has been deposited on the surface of the soil.

We were now enabled to estimate the size of the solid mass on which we clustered like flies on a sugar-loaf, and the schooner, seen from below, looked no bigger than the yawl of a trading vessel.

This iceberg of between three and four hundred fathoms in circumference measured from 130 to 140 feet high. According to all calculations, therefore, its depth would be four or five times greater, and it would consequently weigh millions of tons.

This is what had happened:

The iceberg, having been melted away at its base by contact with warmer waters, had risen little by little; its centre of gravity had become displaced, and its equilibrium could only be re-established by a sudden capsise, which had lifted up the part that had been underneath above the sea-level. The **Halbrane**, caught in this movement, was hoisted as by an enormous lever. Numbers of icebergs capsize thus on the polar seas, and form one of the greatest dangers to which approaching vessels are exposed.

Our schooner was caught in a hollow on the west side of the iceberg. She listed to starboard with her stern raised and her bow lowered. We could not help thinking that the slightest shake would cause her to slide along the slope of the iceberg into the sea. The collision had been so violent as to stave in some of the planks of her hull. After the first collision, the galley situated before the fore-mast had broken its fastenings. The door between Captain Len Guy’s and the mate’s cabins was torn away from the hinges. The topmast and the topgallant-mast had come down after the back-stays parted, and fresh fractures could plainly be seen as high as the cap of the masthead.
Fragments of all kinds, yards, spars, a part of the sails, breakers, cases, hen-coops, were probably floating at the foot of the mass and drifting with it.

The most alarming part of our situation was the fact that of the two boats belonging to the _Halbrane_, one had been stove in when we grounded, and the other, the larger of the two, was still hanging on by its tackles to the starboard davits. Before anything else was done this boat had to be put in a safe place, because it might prove our only means of escape.

As a result of the first examination, we found that the lower masts had remained in their places, and might be of use if ever we succeeded in releasing the schooner. But how were we to release her from her bed in the ice and restore her to her natural element?

When I found myself with Captain Len Guy, the mate, and the boatswain, I questioned them on this subject.

"I agree with you," replied West, "that the operation involves great risks, but since it is indispensable, we will accomplish it. I think it will be necessary to dig out a sort of slide down to the base of the iceberg."

"And without the delay of a single day," added Captain Len Guy.

"Do you hear, boatswain?" said Jem West.

"Work begins to-day."

"I hear, and everyone will set himself to the task," replied Hurliguerly. "If you allow me, I shall just make one observation, captain."

"What is it?"

"Before beginning the work, let us examine the hull and see what the damage is, and whether it can be repaired. For what use would it be to launch a ship stripped of her planks, which would go to the bottom at once?"

We complied with the boatswain's just demand.

The fog having cleared off, a bright sun then illumined the eastern side of the iceberg, whence the sea was visible round a large part of the horizon. Here the sides of the iceberg showed rugged projections, ledges, shoulders, and even flat instead of smooth surfaces, giving no foothold. However, caution would be necessary in order to avoid the falling of those unbalanced blocks, which a single shock might set loose. And, as a matter of fact, during the morning, several of these blocks did roll into the sea with a frightful noise just like an avalanche.

On the whole, the iceberg seemed to be very steady on its new base. So long as the centre of gravity was below the level of the water-line, there was no fear of a fresh capsize.

I had not yet had an opportunity of speaking to Dirk Peters since the catastrophe. As he had answered to his name, I knew he was not numbered among the victims. At this moment, I perceived him standing on a narrow projection; needless to specify the direction in which his eyes were turned.

Captain Len Guy, the mate, the boatswain, Hardy, and Martin Holt, whom I accompanied, went up again towards the schooner in order to make a minute investigation of the hull. On the starboard side the operation would be easy enough, because the _Halbrane_ had a list to the opposite side. On the port side we would have to slide along to the keel as well as we could by scooping out the ice, in order to insure the inspection of every part of the planking.

After an examination which lasted two hours, it was discovered that the damage was of little importance, and could be repaired in a short time. Two or three planks only were wrenched away by the collision. In the inside the skin was intact, the ribs not having given way. Our vessel, constructed for the polar seas, had resisted where many others less solidly built would have been dashed to pieces. The rudder had indeed been unshipped, but that could easily be set right.

Having finished our inspection inside and outside, we agreed that the damage was less considerable than we feared, and on that subject we became reassured. Reassured! Yes, if we could only succeed in getting the schooner afloat again.

CHAPTER XX, "UNMERCIFUL DISASTER"

In the morning, after breakfast, it was decided that the men should begin to dig a sloping bed which would allow the _Halbrane_ to slide to the foot of the iceberg. Would that Heaven might grant success to the operation, for who could contemplate without terror having to brave the severity of the austral winter, and to pass six months under such conditions as ours on a vast iceberg, dragged none could tell whither? Once the winter had set in, none of us could have escaped from that most terrible of fates--dying of cold.

At this moment, Dirk Peters, who was observing the horizon from south to east at about one hundred paces off, cried out in a rough voice: "Lying to!"

Lying to? What could the half-breed mean by that, except that the floating mass had suddenly ceased to drift? As for the cause of this stoppage, it was neither the moment to investigate it, nor to ask ourselves what the
consequences were likely to be.

"It is true, however," cried the boatswain. "The iceberg is not stirring, and perhaps has not stirred since it capsized!"

"How?" said I, "it no longer changes its place?"

"No," replied the mate, "and the proof is that the others, drifting on, are leaving it behind!"

And, in fact, whilst five or six icebergs were descending towards the south, ours was as motionless as though it had been stranded on a shoal.

The simplest explanation was that the new base had encountered ground at the bottom of the sea to which it now adhered, and would continue to adhere, unless the submerged part rose in the water so as to cause a second capsize.

This complicated matters seriously, because the dangers of positive immobility were such that the chances of drifting were preferable. At least, in the latter case there was some hope of coming across a continent or an island, or even (if the currents did not change) of crossing the boundaries of the austral region.

Here we were, then, after three months of this terrible voyage! Was there now any question of trying to save William Guy, his comrades on the lane, and Arthur Pym? Was it not for our own safety that any means at our disposal should be employed? And could it be wondered at were the sailors of the _Halbrane_ to rebel, were they to listen to Hearne's suggestions, and make their officers, or myself especially, responsible for the disasters of this expedition?

Moreover, what was likely to take place, since, notwithstanding their losses, the followers of the sealing-master were still a majority of the ship's company?

This question I could clearly see was occupying the thoughts of Captain Len Guy and West.

Again, although the recruits from the Falklands formed only a total of fourteen men, as against the twelve of the old crew, was it not to be feared that some of the latter would take Hearne's side? What if Hearne's people, urged by despair, were already thinking of seizing the only boat we now possessed, setting off towards the north, and leaving us on this iceberg? It was then, of great importance that our boat should be put in safety and closely watched.

A marked change had taken place in Captain Len Guy since the recent occurrences. He seemed to be transformed upon finding himself face to face with the dangers which menaced us. Up to that time he had been solely occupied in searching for his fellow-countrymen; he had handed over the command of the schooner to West, and he could not have given it to anyone more zealous and more capable. But from this date he resumed his position as master of the ship, and used it with the energy required by the circumstances; in a word, he again became sole master on board, after God.

At his command the crew were drawn up around him on a flat spot a little to the left of the _Halbrane_. In that place the following were assembled:--on the seniors' side: Martin Holt and Hardy, Rogers, Francis, Gratian, Bury, Stern, the cook (Endicott), and I may add Dirk Peters; on the side of the new-comers, Hearne and the thirteen other Falkland sailors. The latter composed a distinct group; the sealing-master was their spokesman and exercised a baneful influence over them.

Captain Len Guy cast a stern glance upon the men and said in a sharp tone:

"Sailors of the _Halbrane_, I must first speak to you of our lost companions. Five of us have just perished in this catastrophe."

"We are waiting to perish in our turn, in these seas, where we have been dragged in spite of--"

"Be silent, Hearne," cried West, pale with anger, "or if not--"

"Hearne has said what he had to say," Captain Len Guy continued, coldly. "Now it is said, and I advise him not to interrupt me a second time!"

The sealing-master might possibly have ventured on an answer, for he felt that he was backed by the majority of the crew; but Martin Holt held him back, and he was silent.

Captain Len Guy then took off his hat and pronounced the following words with an emotion that affected us to the bottom of our hearts:--

"We must pray for those who have died in this dangerous voyage, which was undertaken in the name of humanity. May God be pleased to take into consideration the fact that they devoted their lives to their fellow-creatures, and may He not be insensible to our prayers! Kneel down, sailors of the _Halbrane_!"

They all knelt down on the icy surface, and the murmurs of prayer ascended towards heaven.

We waited for Captain Len Guy to rise before we did so.

"Now," he resumed, "after those who are dead come those who have survived. To them I say that they must obey me, whatever my orders may be, and even in our present situation I shall not tolerate any hesitation or opposition. The responsibility for the general safety is mine, and I will not yield any of it to anyone. I am master here, as on board--"

"On board--when there is no longer a ship," muttered the sealing-master.
"You are mistaken, Hearne, the vessel is there, and we will put it back into the sea. Besides, if we had only a boat, I am the captain of it. Let him beware who forgets this!"

That day, Captain Len Guy, having taken the height of the sun by the sextant and fixed the hour by the chronometer (both of these instruments had escaped destruction in the collision), obtained the following position of his ship:--

South latitude: 88° 55'.
West longitude: 39° 12'.

The _Halbrane_ was only at 1° 5'--about 65 miles--from the south pole.

"All hands to work," was the captain's order that afternoon, and every one obeyed it with a will. There was not a moment to lose, as the question of time was more important than any other. So far as provisions were concerned, there was enough in the schooner for eighteen months on full rations, so we were not threatened with hunger, nor with thirst either, notwithstanding that owing to the water-casks having been burst in the collision, their contents had escaped through their staves. Luckily, the barrels of gin, whisky, beer, and wine, being placed in the least exposed part of the hold, were nearly all intact. Under this head we had experienced no loss, and the iceberg would supply us with good drinking-water. It is a well-known fact that ice, whether formed from fresh or salt water, contains no salt, owing to the chloride of sodium being eliminated in the change from the liquid to the solid state. The origin of the ice, therefore, is a matter of no importance. However, those blocks which are easily distinguished by their greenish colour and their perfect transparency are preferable. They are solidified rain, and therefore much more suitable for drinking-water.

Without doubt, our captain would have recognized any blocks of this description, but none were to be found on the glacier, owing to its being that part of the berg which was originally submerged, and came to the top after the fall.

The captain and West decided first to lighten the vessel, by conveying everything on board to land. The masts were to be cleared of rigging, taken out, and placed on the plateau. It was necessary to lighten the vessel as much as possible, even to clear out the ballast, owing to the difficult and dangerous operation of launching. It would be better to put off our departure for some days if this operation could be performed under more favourable circumstances. The loading might be afterwards accomplished without much difficulty.

Besides this, another reason by no means less serious presented itself to us. It would have been an act of unpardonable rashness to leave the provisions in the storeroom of the _Halbrane_, her situation on the side of the iceberg being very precarious. One shake would suffice to detach the ship, and with her would have disappeared the supplies on which our lives depended.

On this account, we passed the day in removing casks of half-salted meat, dried vegetables, flour, biscuits, tea, coffee, barrels of gin, whisky, wine and beer from the hold and store-room and placing them in safety in the hammocks near the _Halbrane_.

We also had to insure our landing against any possible accident, and, I must add, against any plot on the part of Hearne and others to seize the boat in order to return to the ice-barrier.

We placed the long boat in a cavity which would be easy to watch, about thirty feet to the left of the schooner, along with its oars, rudder, compass, anchor, masts and sail.

By day there was nothing to fear, and at night, or rather during the hours of sleep, the boatswain and one of the superiors would keep guard near the cavity, and we might rest assured that no evil could befall.

The 19th, 20th, and 21st of January were passed in working extra hard in the unshipping of the cargo and the dismantling of the _Halbrane_. We slung the lower masts by means of yards forming props. Later on, West would see to replacing the main and mizzen masts; in any case, we could do without them until we had reached the Falklands or some other winter port.

Needless to say, we had set up a camp on the plateau of which I have spoken, not far from the _Halbrane_. Sufficient shelter against the inclemency of the weather, not unfrequent at this time of the year, was to be found under tents, constructed of sails placed on spars and fastened down by pegs. The glass remained set fair; the wind was nor'-east, the temperature having risen to 46 degrees (2° 78' C.).

Endicott's kitchen was fitted up at the end of the plain, near a steep projection by which we could climb to the very top of the berg.

It is only fair to state that during these three days of hard work no fault was to be found with Hearne. The sealing-master knew he was being closely watched, and he was well aware that Captain Len Guy would not spare him if he tried to get up insubordination amongst his comrades. It was a pity that his bad instincts had induced him to play such a part, for his strength, skill, and cleverness made him a very valuable man, and he had never proved more useful than under these circumstances.

Was he changed for the better? Did he understand that general good feeling was necessary for the safety of all? I
I need not dwell on the ardour with which the half-breed did the rough work, always first to begin and the last to leave off, doing as much as four men, and scarcely sleeping, only resting during meals, which he took apart from the others. He had hardly spoken to me all since the schooner had met with this terrible accident.

What indeed could he say to me? Did I not know as well as he that it would be necessary to renounce every hope of pursuing our intended voyage?

Now and again I noticed Martin Holt and the halfbreed near each other while some difficult piece of work was in progress. Our sailing-master did not miss a chance of getting near Dirk Peters, who always tried his best to escape from him, for reasons well known to me. And whenever I thought of the secret of the fate of the so-called Parker, Martin Holt’s brother, which had been entrusted to me, that dreadful scene of the _Grampus_ filled me with horror. I was certain that if this secret were made known the half-breed would become an object of terror. He would no longer be looked upon as the rescuer of the sailing-master; and the latter, learning that his brother—Luckily, Dirk Peters and myself were the only two acquainted with the fact.

While the _Halbrane_ was being unloaded, Captain Len Guy and the mate were considering how the vessel might be launched. They had to allow for a drop of one hundred feet between the cavity in which the ship lay and the sea; this to be effected by means of an inclined bed hollowed in an oblique line along the west side of the iceberg, and to measure two or three hundred perches in length. So, while the first lot of men, commanded by the boatswain, was unloading the schooner, a second batch under West’s orders began to cut the trench between the blocks which covered the side of the floating mountain.

Floating? I know not why I use this expression, for the iceberg no longer floated, but remained as motionless as an island. There was nothing to indicate that it would ever move again. Other icebergs drifted along and passed us, going south-east, whilst ours, to use Dirk Peters’ expression, was “ly ing to.” Would its base be sufficiently undermined to allow it to detach itself? Perhaps some heavy mass of ice might strike it and set it free by the shock.

No one could predict such an event, and we had only the _Halbrane_ to rely upon for getting us out of these regions.

We were engaged in these various tasks until the 24th of January. The atmosphere was clear, the temperature was even, and the thermometer had indeed gone up to two or three degrees above freezing-point. The number of icebergs coming from the nor’-west was therefore increasing; there were now a hundred of them, and a collision with any of these might have a most disastrous result. Hardy, the caulker, hastened first of all to mend the hull; pegs had to be changed, bits of planking to be replaced, seams to be caulked. We had everything that was necessary for this work, and we might rest assured that it would be performed in the best possible manner. In the midst of the silence of these solitudes, the noise of the hammers striking nails into the side, and the sound of the mallet stuffing tow into the seams, had a startling effect. Sea-gulls, wild duck, albatross, and petrels flew in a circle round the top of the berg with a shrill screaming, and made a terrible uproar.

When I found myself with West and the captain, our conversation naturally turned on our situation and how to get out of it, and upon our chances of pulling through. The mate had good hopes that if no accident occurred the launching would be successfully accomplished. The captain was more reserved on the subject, but at the thought that he would have to renounce all hope of finding the survivors of the fane, his heart was ready to break. When the _Halbrane_ should again be ready for the sea, and when West should inquire what course he was to steer, would Captain Len Guy dare to reply, “To the south”? No! for he would not be followed either by the new hands, or by the greater portion of the older members of the crew. To continue our search in this direction, to go beyond the pole, without being certain of reaching the Indian Ocean instead of the Atlantic, would have been rashness of which no navigator would be guilty. If a continent bound the sea on this side, the schooner would run the danger of being crushed by the mass of ice before it could escape the southern winter.

Under such circumstances, to attempt to persuade Captain Len Guy to pursue the voyage would only be to court a certain refusal. It could not even be proposed, now that necessity obliged us to return northwards, and not to delay a single day in this portion of the Antarctic regions. At any rate, though I resolved not again to speak of the matter to the captain, I lost no opportunity of sounding the boatswain. Often when he had finished his work, Hurliguerly would come and join me; we would chat, and we would compare our recollections of travel.

One day as we were seated on the summit of the iceberg, gazing fixedly on the deceptive horizon, he exclaimed,—

"Who could ever have imagined, Mr. Jeorling, when the _Halbrane_ left Kerguelen, that six and a half months afterwards she would be stuck on the side of an icemountain?"

"A fact much more to be regretted," I replied, "because only for that accident we should have attained our object, and we should have begun our return journey."

"I don't mean to contradict," replied the boatswain, "but you say we should have attained our object, Do you mean by that, that we should have found our countrymen?"
"Perhaps."

"I can scarcely believe such would have been the case, Mr. Jeorling, although this was the principal and perhaps even the only object of our navigation in the polareas."

"The only one--yes--at the start," I insinuated. "But since the half-breed's revelations about Arthur Pym--"

"Ah! You are always harking back on that subject, like brave Dirk Peters."

"Always, Hurliguerly; and only that a deplorable and unforeseen accident made us run aground--"

"I leave you to your delusions, Mr. Jeorling, since you believe you have run aground--"

"Why? Is not this the case?"

"In any case it is a wonderful running aground," replied the boatswain. "Instead of a good solid bottom, we have run aground in the air."

"Then I am right, Hurliguerly, in saying it is an unfortunate adventure."

"Unfortunate, truly, but in my opinion we should take warning by it."

"What warning?"

"That it is not permitted to us to venture so far in these latitudes, and I believe that the Creator forbids His creatures to climb to the summit of the poles."

"Notwithstanding that the summit of one pole is only sixty miles away from us now."

"Granted, Mr. Jeorling, but these sixty miles are equal to thousands when we have no means of making them! And if the launch of the schooner is not successful, here are we condemned to winter quarters which the polar bears themselves would hardly relish!"

I replied only by a shake of my head, which Hurliguerly could not fail to understand.

"Do you know, Mr. Jeorling, of what I think oftenest?"

"What do you think of, boatswain?"

"Of the Kerguelens, whither we are certainly not travelling. Truly, in a bad season it was cold enough there! There is not much difference between this archipelago and the islands situated on the edge of the Antarctic Sea! But there one is not far from the Cape, and if we want to warm our shins, no iceberg bars the way. Whereas here it is the devil to weigh anchor, and one never knows if one shall find a clear course."

"I repeat it, boatswain. If this last accident had not occurred, everything would have been over by this time, one way or another. We should still have had more than six weeks to get out of these southern seas. It is seldom that a ship is so roughly treated as ours has been, and I consider it real bad luck, after our having profited by such fortunate circumstances--"

"These circumstances are all over, Mr. Jeorling," exclaimed Hurliguerly, "and I fear indeed--"

"What--you also, boatswain--you whom I believed to be so confident!"

"Confidence, Mr. Jeorling, wears out like the ends of one's trousers, What would you have me do? When I compare my lot to old Atkins, installed in his cosy inn; when I think of the Green Cormorant, of the big parlours downstairs with the little tables round which friends sip whisky and gin, discussing the news of the day, while the stove makes more noise than the weathercock on the roof--oh, then the comparison is not in our favour, and in my opinion Mr. Atkins enjoys life better than I do."

"You shall see them all again, boatswain--Atkins, the Green Cormorant, and Kerguelen! For God's sake do not let yourself grow downhearted! And if you, a sensible and courageous man, despairs already--"

"Oh, if I were the only one it would not be half so bad as it is!"

"The whole crew does not despair, surely?"

"Yes--and no," replied Hurliguerly, "for I know some who are not at all satisfied!"

"Has Hearne begun his mischief again? Is he exciting his companion?"

"Not openly at least, Mr. Jeorling, and since I have kept him under my eye I have neither seen nor heard anything. Besides, he knows what awaits him if he budges. I believe I am not mistaken, the sly dog has changed his tactics. But what does not astonish me in him, astonishes me in Martin Holt."

"What do you mean, boatswain?"

"That they seem to be on good terms with each other. See how Hearne seeks out Martin Holt, talks to him frequently, and Holt does not treat his unfavourably."

"Martin Holt is not one of those who would listen to Hearne's advice, or follow it if he tried to provoke rebellion amongst the crew."

"No doubt, Mr. Jeorling. However, I don't fancy seeing them so much together. Hearne is a dangerous and unscrupulous individual, and most likely Martin Holt does not distrust him sufficiently."

"He is wrong, boatswain."

"And--wait a moment--do you know what they were talking about the other day when I overheard a few scraps of their conversation?"
"I could not possibly guess until you tell me, Hurliguerly.

"Well, while they were conversing on the bridge of the _Halbrane_, I heard them talking about Dirk Peters, and Hearne was saying: 'You must not owe a grudge to the half-breed, Master Holt, because he refused to respond to your advances and accept your thanks! If he be only a sort of brute, he possesses plenty of courage, and has showed it in getting you out of a bad corner at the risk of his life. And besides, do not forget that he formed part of the crew of the _Grampus_ and your brother Ned, if I don't mistake--''"

"He said that, boatswain; he spoke of the _Grampus_!" I exclaimed.

"Yes--of the _Grampus_!

"And of Ned Holt?"

"Precisely, Mr. Jeorling!"

"And what answer did Martin Holt make?"

"He replied: 'I don't even know under what circumstances my unfortunate brother perished. Was it during a revolt on board? Brave man that he was, he would not betray his captain, and perhaps he was massacred.'"

"Did Hearne dwell on this, boatswain?"

"Yes, but he added: 'It is very sad for you, Master Holt! The captain of the _Grampus_, according to what I have been told, was abandoned, being placed in a small boat with one or two of his men--and who knows if your brother was not along with him?'"

"And what next?"

"Then, Mr. Jeorling, he added: 'Did it never occur to you to ask Dirk Peters to enlighten you on the subject?' 'Yes, once,' replied Martin Holt, 'I questioned the halfbreed about it, and never did I see a man so overcome. He replied in so low a voice that I could scarcely understand him, 'I know not--I know not--' and he ran away with his face buried in his hands.'"

"Was that all you heard of the conversation, boatswain?"

"That was all, Mr. Jeorling, and I thought it so strange that I wished to inform you of it."

"And what conclusion did you draw from it?"

"Nothing, except that I look upon the sealing-master as a scoundrel of the deepest dye, perfectly capable of working in secret for some evil purpose with which he would like to associate Martin Holt!"

What did Hearne's new attitude mean? Why did he strive to gain Martin Holt, one of the best of the crew, as an ally? Why did he recall the scenes of the _Grampus_? Did Hearne know more of this matter of Dirk Peters and Ned Holt than the others; this secret of which the half-breed and I believed ourselves to be the sole possessors?

The doubt caused me serious uneasiness. However, I took good care not to say anything of it to Dirk Peters. If he had for a moment suspected that Hearne spoke of what happened on board the _Grampus_, if he had heard that the rascal (as Hurliguerly called him, and not without reason) constantly talked to Martin Holt about his brother, I really do not know what would have happened.

In short, whatever the intentions of Hearne might be, it was dreadful to think that our sailing-master, on whose fidelity Captain Len Guy ought to be able to count, was in conspiracy with him.

The sealing-master must have a strong motive for acting in this way. What it was I could not imagine. Although the crew seemed to have abandoned every thought of mutiny, a strict watch was kept, especially on Hearne.

Besides, the situation must soon change, at least so far as the schooner was concerned. Two days afterwards the work was finished. The caulking operations were completed, and also the slide for lowering the vessel to the base of our floating mountain.

Just now the upper portion of the ice had been slightly softened, so that this last work did not entail much labour for pick-axe or spade. The course ran obliquely round the west side of the berg, so that the incline should not be too great at any point. With cables properly fixed, the launch, it seemed, might be effected without any mishap. I rather feared lest the melting of the ice should make the gliding less smooth at the lower part of the berg.

Needless to say, the cargo, masting, anchors, chains, &c., had not been put on board. The hull was quite heavy enough, and not easily moved, so it was necessary to lighten it as much as possible.

When the schooner was again in its element, the loading could be effected in a few days.

On the afternoon of the 28th, the finishing touches were given. It was necessary to put supports for the sides of the slide in some places where the ice had melted quickly. Then everyone was allowed to rest from 4 o'clock p.m. The captain had double rations served out to all hands, and well they merited this extra supply of spirits; they had indeed worked hard during the week. I repeat that every sign of mutiny had disappeared. The crew thought of nothing except this great operation of the launching. The _Halbrane_ in the sea would mean departure, it would also mean return! For Dirk Peters and me it would be the definite abandonment of Arthur Pym.

That night the temperature was the highest we had so far experienced. The thermometer registered 53° (11° 67’ C. below zero). So, although the sun was nearing the horizon, the ice was melting, and thousands of small streams
flowed in every direction. The early birds awoke at four o'clock, and I was one of their number. I had scarcely slept, and I fancy that Dirk Peters did not sleep much, haunted as he was by the sad thought of having to turn back!

The launch was to take place at ten o'clock. Taking every possible difficulty into account, and allowing for the minutest precautions, the captain hoped that it would be completed before the close of the day. Everyone believed that by evening the schooner would be at the foot of the berg.

Of course we had all to lend a hand to this difficult task. To each man a special duty was assigned; some were employed to facilitate the sliding with wooden rollers, if necessary; others to moderate the speed of the hull, in case it became too great, by means of hawsers and cables.

We breakfasted at nine o'clock in the tents. Our sailors were perfectly confident, and could not refrain from drinking "success to the event"; and although this was a little premature, we added our hurrahs to theirs. Success seemed very nearly assured, as the captain and the mate had worked out the matter so carefully and skilfully. At last we were about to leave our encampment and take up our stations (some of the sailors were there already), when cries of amazement and fear were raised. What a frightful scene, and, short as it may have been, what an impression of terror it left on our minds!

One of the enormous blocks which formed the bank of the mud-bed where the _Halbrane_ lay, having become loose owing to the melting of its base, had slipped and was bounding over the others down the incline.

In another moment, the schooner, being no longer retained in position, was swinging on this declivity.

Yes! I saw it! I saw the schooner topple over, slide down first on its left side, crush one of the men who delayed too long about jumping to one side, then bound from block to block, and finally fling itself into space.

In another moment the _Halbrane_, staved in, broken up, with gaping planks and shattered ribs, had sunk, causing a tremendous jet of water to spout up at the foot of the iceberg.

Horrified! yes, indeed, we were horrified when the schooner, carried off as though by an avalanche, had disappeared in the abyss! Not a particle of our _Halbrane_ remained, not even a wreck!

A minute ago she was one hundred feet in the air, now she was five hundred in the depths of the sea! Yes, we were so stupefied that we were unable to think of the dangers to come--our amazement was that of people who "cannot believe their eyes."

Prostration succeeded as a natural consequence. There was not a word spoken. We stood motionless, with our feet rooted to the icy soil. No words could express the horror of our situation!

As for West, when the schooner had disappeared in the abyss, I saw big tears fall from his eyes. The _Halbrane_ that he loved so much was now an unknown quantity! Yes, our stout-hearted mate wept.

Three of our men had perished, and in what frightful fashion! I had seen Rogers and Gratian, two of our most faithful sailors, stretch out their hands in despair as they were knocked about by the rebounding of the schooner, and finally sink with her! The other man from the Falklands, an American, was crushed in its rush; his shapeless form lay in a pool of blood. Three new victims within the last ten days had to be inscribed on the register of those who died during this fatal voyage! Ah! fortune had favoured us up to the hour when the _Halbrane_ was snatched from her own element, but her hand was now against us. And was not this last the worst blow--must it not prove the stroke of death?

The silence was broken by a tumult of despairing voices, whose despair was justified indeed by this irreparable misfortune!

And I am sure that more than one thought it would have been better to have been on the _Halbrane_ as she rebounded off the side of the iceberg!

Everything would have been over then, as all was over with Rogers and Gratian! This foolish expedition would thus have come to a conclusion worthy of such rashness and imprudence!

At last, the instinct of self-preservation triumphed, and except Hearne, who stood some distance off and affected silence, all the men shouted: "To the boat! to the boat!"

These unfortunate fellows were out of their mind. Terror led them astray. They rushed towards the crag where our one boat (which could not hold them all) had been sheltered during the unloading of the schooner.

Captain Len Guy and Jem West rushed after them. I joined them immediately, followed by the boatswain. We were armed, and resolved to make use of our arms. We had to prevent these furious men from seizing the boat, which did not belong to a few, but to all!

"Hallo, sailors!" cried the captain.

"Hallo!" repeated West, "stop there, or we fire on the first who goes a step farther!"

Both threatened the men with their pistols. The boatswain pointed his gun at them. I held my rifle, ready to fire.

It was in vain! The frenzied men heard nothing, would not hear anything, and one of them fell, struck by the
mate’s bullet, just as he was crossing the last block. He was unable to catch on to the bank with his hands, and slipping on the frozen slope, he disappeared in the abyss.

Was this the beginning of a massacre? Would others let themselves be killed at this place? Would the old hands side with the new-comers?

At that moment I remarked that Hardy, Martin Holt, Francis Bury, and Stern hesitated about coming over to our side, while Hearne, still standing motionless at some distance, gave no encouragement to the rebels.

However, we could not allow them to become masters of the boat, to bring it down, to embark ten or twelve men, and to abandon us to our certain fate on this iceberg. They had almost reached the boat, heedless of danger and deaf to threats, when a second report was heard, and one of the sailors fell, by a bullet from the boatswain’s gun.

One American and one Fuegian less to be numbered amongst the sealing-master’s partisans!

Then, in front of the boat, a man appeared. It was Dirk Peters, who had climbed the opposite slope.

The half-breed put one of his enormous hands on the stern and with the other made a sign to the furious men to clear off. Dirk Peters being there, we no longer needed our arms, as he alone would suffice to protect the boat.

And indeed, as five or six of the sailors were advancing, he went up to them, caught hold of the nearest by the belt, lifted him up, and sent him flying ten paces off. The wretched man not being able to catch hold of anything, would have rebounded into the sea had not Hearne seized him.

Owing to the half-breed’s intervention the revolt was instantly queued. Besides, we were coming up to the boat, and with us those of our men whose hesitation bad not lasted long.

No matter. The others were still thirteen to our ten. Captain Len Guy made his appearance; anger shone in his eyes, and with him was West, quite unmoved. Words failed the captain for some moments, but his looks said what his tongue could not utter. At length, in a terrible voice, he said,--

"I ought to treat you as evil-doers; however, I will only consider you as madmen! The boat belongs to everybody. It is now our only means of salvation, and you wanted to steal it—to steal it like cowards! Listen attentively to what I say for the last time! This boat, belonging to the _Halbrane_, is now the _Halbrane_ herself! I am the captain of it, and let him who disobeys me, beware!"

With these last words Captain Len Guy looked at Hearne, for whom this warning was expressly meant. The sealing-master had not appeared in the last scene, not openly at least, but nobody doubted that he had urged his comrades to make off with the boat, and that he had every intention of doing the same again.

"Now to the camp," said the captain, "and you, Dirk Peters, remain here!"

The half-breed’s only reply was to nod his big head and betake himself to his post.

The crew returned to the camp without the least hesitation. Some lay down in their sleeping-places, others wandered about. Hearne neither tried to join them nor to go near Martin Holt.

Now that the sailors were reduced to idleness, there was nothing to do except to ponder on our critical situation, and invent some means of getting out of it.

The captain, the mate, and the boatswain formed a council, and I took part in their deliberations. Captain Len Guy began by saying,--

"We have protected our boat, and we shall continue to protect it."

"Until death," declared West.

"Who knows," said I, "whether we shall not soon be forced to embark?"

"In that case," replied the captain, "as all cannot fit into it, it will be necessary to make a selection. Lots shall determine which of us are to go, and I shall not ask to be treated differently from the others."

"We have not come to that, luckily," replied the boatswain. "The iceberg is solid, and there is no fear of its melting before winter."

"No," assented West, "that is not to be feared. What it behoves us to do is, while watching the boat, to keep an eye on the provisions."

"We are lucky," added Hurllguery, "to have put our cargo in safety. Poor, dear _Halbrane_. She will remain in these seas, like the fane, her elder sister!"

Yes, without doubt, and I thought so for many reasons, the one destroyed by the savages of Tsalal, the other by one of these catastrophes that no human power can prevent.

"You are right," replied the captain, "and we must prevent our men from plundering. We are sure of enough provisions for one year, without counting what we may get by fishing."

"And it is so much the more necessary, captain, to keep a close watch, because I have seen some hovering about the spirit casks."

"I will see to that," replied West.

"But," I then asked, "had we not better prepare ourselves for the fact that we may be compelled to winter on this iceberg."
"May Heaven avert such a terrible probability," replied the captain.
"After all, if it were necessary, we could get through it, Mr. Jeorling," said the boatswain. "We could hollow out sheltering-places in the ice, so as to be able to bear the extreme cold of the pole, and so long as we had sufficient to appease our hunger--"

At this moment the horrid recollection of the _Grampus_ came to my mind--the scenes in which Dirk Peters killed Ned Holt, the brother of our sailing-master. Should we ever be in such extremity?
Would it not, before we proceed to set up winter quarters for seven or eight months, be better to leave the iceberg altogether, if such a thing were possible?
I called the attention of Captain Len Guy and West to this point.
This was a difficult question to answer, and a long silence preceded the reply.
At last the captain said,--
"Yes, that would be the best resolution to come to; and if our boat could hold us all, with the provisions necessary for a voyage that might last three or four weeks, I would not hesitate to put to sea now and return towards the north."
But I made them observe that we should be obliged to direct our course contrary to wind and current; our schooner herself could hardly have succeeded in doing this. Whilst to continue towards the south--
"Towards the south?" repeated the captain, who looked at me as though he sought to read my thoughts.
"Why not?" I answered. "If the iceberg had not been stopped in its passage, perhaps it would have drifted to some land in that direction, and might not our boat accomplish what it would have done?"
The captain, shaking his head, answered nothing. West also was silent.
"Eh! our iceberg will end by raising its anchor," replied Hurliguerly. "It does not hold to the bottom, like the Falklands or the Kerguelens! So the safest course is to wait, as the boat cannot carry twenty-three, the number of our party."

I dwelt upon the fact that it was not necessary for all twenty-three to embark. It would be sufficient, I said, for five or six of us to reconnoitre further south for twelve or fifteen miles.
"South?" repeated Captain Len Guy.
"Undoubtedly, captain," I added. "You probably know what the geographers frankly admit, that the antarctic regions are formed by a capped continent."
"Geographers know nothing, and can know nothing about it," replied West, coldly.
"It is a pity," said I, "that as we are so near, we should not attempt to solve this question of a polar continent."
I thought it better not to insist just at present.
Moreover there would be danger in sending out our only boat on a voyage of discovery, as the current might carry it too far, or it might not find us again in the same place. And, indeed, if the iceberg happened to get loose at the bottom, and to resume its interrupted drift, what would become of the men in the boat?
The drawback was that the boat was too small to carry us all, with the necessary provisions. Now, of the seniors, there remained ten men, counting Dirk Peters; of the new men there were thirteen; twenty-three in all. The largest number our boat could hold was from eleven to twelve persons. Then eleven of us, indicated by lot, would have to remain on this island of ice. And what would become of them?
With regard to this Hurliguerly made a sound observation.
"After all," he said, "I don't know that those who would embark would be better off than those who remained! I am so doubtful of the result, that I would willingly give up my place to anyone who wanted it."
Perhaps the boatswain was right. But in my own mind, when I asked that the boat might be utilized, it was only for the purpose of reconnoitring the iceberg.

We finally decided to arrange everything with a view to wintering out, even were our ice-mountain again to drift.
"We may be sure that will be agreed to by our men," declared Hurliguerly.
"What is necessary must be done," replied the mate, "and to-day we must set to work."
That was a sad day on which we began our preparations.
Endicott, the cook, was the only man who submitted without murmuring. As a negro, who cares little about the future, shallow and frivolous like all his race, he resigned himself easily to his fate; and this is, perhaps, true philosophy. Besides, when it came to the question of cooking, it mattered very little to him whether it was here or there, so long as his stoves were set up somewhere.
So he said to his friend the mate, with his broad negro smile,--
"Luckily my kitchen did not go off with the schooner, and you shall see, Hurliguerly, if I do not make up dishes just as good as on board the _Halbrane_, so long as provisions don't grow scarce, of course--"
"Well! they will not be wanting for some time to come," replied the boatswain. "We need not fear hunger, but
cold, such cold as would reduce you to an icicle the minute you cease to warm your feet. Cold that makes your skin crack and your skull split! Even if we had some hundreds of tons of coal--But, all things being well calculated, there is only just what will do to boil this large kettle."

"And that is sacred," cried Endicott; "touching is forbidden! The kitchen before all."

"And that is the reason why it never strikes you to pity yourself, you old nigger! You can always make sure of keeping your feet warm at your oven!"

"What would you have, boatswain? You are a first-rate cook, or you are not. When you are, you take advantage of it; but I will remember to keep you a little place before my stove."

"That's good! that's good, Endicott! Each one shall have his turn! There is no privilege, even for a boatswain! On the whole, it is better not to have to fear famine! One can fight against the cold. We shall dig holes in the iceberg, and cuddle ourselves up there. And why should we not have a general dwelling-room? We could make a cave for ourselves with pickaxes! I have heard tell that ice preserves heat. Well, let it preserve ours, and that is all I ask of it?"

The hour had come for us to return to the camp and to seek our sleeping-places.

Dirk Peters alone refused to be relieved of his duty as watchman of the boat, and nobody thought of disputing the post with him.

Captain Len Guy and West did not enter the tents until they had made certain that Hearne and his companions had gone to their usual place of rest. I came back likewise and went to bed.

I could not tell how long I had been sleeping, nor what time it was, when I found myself rolling on the ground after a violent shock.

What could be happening? Was it another capsize of the iceberg?

We were all up in a second, then outside the tents in the full light of a night in the polar regions.

A second floating mass of enormous size had just struck our iceberg, which had "hoisted the anchor" (as the sailors say) and was drifting towards the south.

An unhoped-for change in the situation had taken place. What were to be the consequences of our being no longer cast away at that place? The current was now carrying us in the direction of the pole! The first feeling of joy inspired by this conviction was, however, succeeded by all the terrors of the unknown l and what an unknown!

Dirk Peters only was entirely rejoiced that we had resumed the route which, he believed, would lead us to the discovery of traces of his "poor Pym"--far other ideas occupied the minds of his companions.

Captain Len Guy no longer entertained any hope of rescuing his countrymen, and having reached the condition of despair, he was bound by his duty to take his crew back to the north, so as to clear the antarctic circle while the season rendered it possible to do so. And we were being carried away towards the south!

Naturally enough, we were all deeply impressed by the fearfulness of our position, which may be summed up in a few words. We were no longer cast away, with a possible ship, but the tenants of a floating iceberg, with no hope but that our monster tenement might encounter one of the whaling ships whose business in the deep waters lies between the Orkneys, New Georgia, and the Sandwich Islands. A quantity of things had been thrown into the ice by the collision which had set our iceberg afloat, but these were chiefly articles belonging to the _Halbrane_. Owing to the precaution that had been taken on the previous day, when the cargo was stowed away in the clefts, it had been only slightly damaged. What would have become of us, had all our reserves been swallowed up in that grim encounter?

Now, the two icebergs formed but one, which was travelling south at the rate of two miles an hour. At this rate, thirty hours would suffice to bring us to the point of the axis at which the terrestrial meridians unite. Did the current which was carrying us along pass to the pole itself, or was there any land which might arrest our progress? This was another question, and I discussed it with the boatswain.

"Nobody knows, Mr. Jeorling," was Hurliguerly's reply. "If the current goes to the pole, we shall go there; and if it doesn't, we shan't. An iceberg isn't a ship, and as it has neither sails nor helm, it goes as the drift takes it."

"That's true, boatswain. And therefore I had the idea that if two or three of us were to embark in the boat--"

"Ah! you still hold to your notion of the boat--"

"Certainly, for, if there is land somewhere, is it not possible that the people of the _Jane_--"

"Have come upon it, Mr. Jeorling--at four thousand miles from Tsalal Island."

"Who knows, boatswain?"

"That may be, but allow me to say that your argument will be reasonable when the land comes in sight, if it ever does so. Our captain will see what ought to be done, and he will remember that time presses. We cannot delay in these waters, and, after all, the one thing of real importance to us is to get out of the polar circle before the winter makes it impassable."

There was good sense in Hurliguerly's words; I could not deny the fact.
During that day the greater part of the cargo was placed in the interior of a vast cave-like fissure in the side of the iceberg, where, even in case of a second collision, casks and barrels would be in safety. Our men then assisted Endicott to set up his cooking-stove between two blocks, so that it was firmly fixed, and they heaped up a great mass of coals close to it.

No murmurs, no recrimination disturbed these labours. It was evident that silence was deliberately maintained. The crew obeyed the captain and West because they gave no orders but such as were of urgent necessity. But, afterwards, would these men allow the authority of their leaders to be uncontested? How long would the recruits from the Falklands, who were already exasperated by the disasters of our enterprise, resist their desire to seize upon the boat and escape?

I did not think they would make the attempt, however, so long as our iceberg should continue to drift, for the boat could not outstrip its progress; but, if it were to run aground once more, to strike upon the coast of an island or a continent, what would not these unfortunate creatures do to escape the horrors of wintering under such conditions?

In the afternoon, during the hour of rest allowed to the crew, I had a second conversation with Dirk Peters. I had taken my customary seat at the top of the iceberg, and had occupied it for half an hour, being, as may be supposed, deep in thought, when I saw the half-breend coming quickly up the slope. We had exchanged hardly a dozen words since the iceberg had begun to move again. When Dirk Peters came up to me, he did not address me at first, and was so intent on his thoughts that I was not quite sure he saw me. At length, he leaned back against an ice-block, and spoke:

"Mr. Jeorling," he said, "you remember, in your cabin in the _Halbrane_, I told you the--the affair of the _Grampus_?"

I remembered well.

"I told you that Parker's name was not Parker, that it was Holt, and that he was Ned Holt's brother?"

"I know, Dirk Peters," I replied, "but why do you refer to that sad story again?"

"Why, Mr. Jeorling? Have not--have you never sam anything about it to anybody?"

"Not to anybody," I protested. "How could you suppose I should be so ill-advised, so imprudent, as to divulge your secret, a secret which ought never to pass our lips--a dead secret?"

"Dead, yes, dead! And yet, understand me, it seems to me that, among the crew, something is known."

I instantly recalled to mind what the boatswain had told me concerning a certain conversation in which he had overheard Hearne prompting Martin Holt to ask the half-breed what were the circumstances of his brother's death on board the _Grampus_. Had a portion of the secret got out, or was this apprehension on the part of Dirk Peters purely imaginary?

"Explain yourself," I said.

"Understand me, Mr. Jeorling, I am a bad hand at explaining. Yes, yesterday--I have thought of nothing else since--Martin Holt took me aside, far from the others, and told me that he wished to speak to me--"

"Of the _Grampus_?"

"Of the _Grampus_--yes, and of his brother, Ned Holt. For the first time he uttered that name before me--and yet we have sailed together for nearly three months."

The half-breend's voice was so changed that I could hardly hear him.

"It seemed to me," he resumed, "that in Martin Holt's mind--no, I was not mistaken--there was something like a suspicion."

"But tell me what he said! Tell me exactly what he asked you. What is it?"

I felt sure that the question put by Martin Holt, whatsoever its bearing, had been inspired by Hearne. Nevertheless, as I considered it well that the half-breed should know nothing of the sealing-master's disquieting and inexplicable intervention in this tragic affair, I decided upon concealing it from him.

"He asked me," replied Dirk Peters, "did I not remember Ned Holt of the _Grampus_, and whether he had perished in the fight with the mutineers or in the shipwreck; whether he was one of the men who had been abandoned with Captain Barnard; in short, he asked me if I could tell him how his brother died. Ah! how!"

No idea could be conveyed of the horror with which the half-breend uttered words which revealed a profound loathing of himself.

"And what answer did you make to Martin Holt?"

"None, none!"

"You should have said that Ned Holt perished in the wreck of the brig."

"I could not--understand me--I could not. The two brothers are so like each other. In Martin Holt I seemed to see Ned Holt. I was afraid, I got away from him."

The half-breend drew himself up with a sudden movement, and I sat thinking, leaning my head on my hands. These tardy questions of Holt's respecting his brother were put, I had no doubt whatsoever, at the instigation of
Hearne, but what was his motive, and was it at the Falklands that he had discovered the secret of Dirk Peters? I had not breathed a word on the subject to anymn. To the second question no answer suggested itself; the first involved a serious issue. Did the sealing-master merely desire to gratify his enmity against Dirk Peters, the only one of the Falkland sailors who had always taken the side of Captain Len Guy, and who had prevented the seizure of the boat by Hearne and his companions? Did he hope, by arousing the wrath and vengeance of Martin Holt, to detach the sailing-master from his allegiance and induce him to become an accomplice in Hearne's own designs? And, in fact, when it was a question of sailing the boat in these seas, had he not imperative need of Martin Holt, one of the best seamen of the _Halbrane_? A man who would succeed where Hearne and his companions would fail, if they had only themselves to depend on?

I became lost in this labyrinth of hypotheses, and it must be admitted that its complications added largely to the troubles of an already complicated position.

When I raised my eyes, Dirk Peters had disappeared; he had said what he came to say, and he now knew that I had not betrayed his confidence.

The customary precautions were taken for the night, no individual being allowed to remain outside the camp, with the exception of the half-breed, who was in charge of the boat.

The following day was the 31st of January. I pushed back the canvas of the tent, which I shared with Captain Len Guy and West respectively, as each succeeded the other on release from the alternate "watch," very early, and experienced a severe disappointment.

Mist, everywhere! Nay, more than mist, a thick yellow, mouldy-smelling fog. And more than this again; the temperature had fallen sensibly: this was probably a forewarning of the austral winter. The summit of our ice-mountain was lost in vapour, in a fog which would not resolve itself into rain, but would continue to muffle up the horizon.

"Bad luck!" said the boatswain, "for now if we were to pass by land we should not perceive it."

"And our drift?"

"More considerable than yesterday, Mr. Jeorling. The captain has sounded, and he makes the speed no less than between three and four miles."

"And what do you conclude from this?"

"I conclude that we must be within a narrower sea, since the current is so strong. I should not be surprised if we had land on both sides of us within ten or fifteen miles."

"This, then, would be a wide strait that cuts the antarctic continent?"

"Yes. Our captain is of that opinion."

"And, holding that opinion, is he not going to make an attempt to reach one or other of the coasts of this strait?"

"And how?"

"With the boat."

"Risk the boat in the midst of this fog!" exclaimed the boatswain, as he crossed his arms. "What are you thinking of, Mr. Jeorling? Can we cast anchor to wait for it? And all the chances would be that we should never see it again. Ah! if we only had the _Halbrane_!"

But there was no longer a _Halbrane_!

In spite of the difficulty of the ascent through the half-condensed vapour, I climbed up to the top of the iceberg, but when I had gained that eminence I strove in vain to pierce the impenetrable grey mantle in which the waters were wrapped.

I remained there, hustled by the north-east wind, which was beginning to blow freshly and might perhaps rend the fog asunder. But no, fresh vapours accumulated around our floating refuge, driven up by the immense ventilation of the open sea. Under the double action of the atmospheric and antarctic currents, we drifted more and more rapidly, and I perceived a sort of shudder pass throughout the vast bulk of the iceberg.

Then it was that I felt myself under the dominion of a sort of hallucination, one of those hallucinations which must have troubled tile mind of Arthur Pym. It seemed to me that I was losing myself in his extraordinary personality; at last I was beholding all that he had seen! Was not that impenetrable mist the curtain of vapours which he had seen in his delirium? I peered into it, seeking for those luminous rays which had streaked the sky from east to west! I sought in its depths for that limitless cataract, rolling in silence from the height of some immense rampart lost in the vastness of the zenith! I sought for the awful white giant of the South Pole!

At length reason resumed her sway. This visionary madness, intoxicating while it lasted, passed off by degrees, and I descended the slope to our camp.

The whole day passed without a change. The fog never once lifted to give us a glimpse outside of its muffling folds, and if the iceberg, which had travelled forty miles since the previous day, had passed by the extremity of the axis of the earth, we should never know it.
CHAPTER XXI. AMID THE MISTS.

So this was the sum of all our efforts, trials and disappointments! Not to speak of the destruction of the _Halbrane_, the expedition had already cost nine lives. From thirty-two men who had embarked on the schooner, our number was reduced to twenty-three: how low was that figure yet to fall?

Between the south pole and antarctic circle lay twenty degrees, and those would have to be cleared in a month or six weeks at the most; if not, the iceberg barrier would be re-formed and closed-up. As for wintering in that part of the antarctic circle, not a man of us could have survived it.

Besides, we had lost all hope of rescuing the survivors of the _Jane_, and the sole desire of the crew was to escape as quickly as possible from the awful solitudes of the south. Our drift, which had been south, down to the pole, was now north, and, if that direction should continue, perhaps we might be favoured with such good fortune as would make up for all the evil that had befallen us! In any case there was nothing for it but, in familiar phrase, “to let ourselves go.”

The mist did not lift during the end, 3rd, and 4th of February, and it would have been difficult to make out the rate of progress of our iceberg since it had passed the pole. Captain Len Guy, however, and West, considered themselves safe in reckoning it at two hundred and fifty miles.

The current did not seem to have diminished in speed or changed its course. It was now beyond a doubt that we were moving between the two halves of a continent, one on the east, the other on the west, which formed the vast antarctic region. And I thought it was matter of great regret that we could not get aground on one or the other side of this vast strait, whose surface would presently be solidified by the coming of winter.

When I expressed this sentiment to Captain Len Guy, he made me the only logical answer:

“What would you have, Mr. Jeorling? We are powerless. There is nothing to be done, and the persistent fog is the worst part of our ill luck. I no longer know where we are. It is impossible to take an observation, and this befalls us just as the sun is about to disappear for long months.”

“Let me come back to the question of the boat,” said I, “for the last time. Could we not, with the boat--”

“Go on a discovery cruise? Can you think of such a thing? That would be an imprudence I would not commit, even though the crew would allow me.”

I was on the point of exclaiming: “And what if your brother and your countrymen have found refuge on some spot of the land that undoubtedly lies about us?”

But I restrained myself. Of what avail was it to reawaken our captain’s grief? He, too, must have contemplated this eventuality, and he had not renounced his purpose of further search without being fully convinced of the folly of a last attempt.

During those three days of fog I had not caught sight of Dirk Peters, or rather he had made no attempt to approach, but had remained inflexibly at his post by the boat. Martin Holt’s questions respecting his brother Ned seemed to indicate that his secret was known--at least in part, and the half-breed held himself more than ever aloof, sleeping while the others watched, and watching in their time of sleep. I even wondered whether he regretted having confided in me, and fancied that he had aroused my repugnance by his sad story. If so, he was mistaken; I deeply pitied the poor half-breed.

Nothing could exceed the melancholy monotony of the hours which we passed in the midst of a fog so thick that the wind could not lift its curtain. The position of the iceberg could not be ascertained. It went with the current at a like speed, and had it been motionless there would have been no appreciable difference for us, for the wind had fallen--at least, so we supposed--and not a breath was stirring. The flame of a torch held up in the air did not flicker. The silence of space was broken only by the clangour of the sea-birds, which came in muffled croaking tones through the stifling atmosphere of vapour. Petrels and albatross swept the top of the iceberg, where they kept a useless watch in their flight. In what direction were those swift-winged creatures--perhaps already driven towards the confines of the arctic region but the approach of winter--bound? We could not tell. One day, the boatswain, who was determined to solve this question if possible, having mounted to the extreme top, not without risk of breaking his neck, came into such violent contact with a _quebranta huesos_--a sort of gigantic petrel measuring twelve feet with spread wings--that he was flung on his back.

“Curse the bird!” he said on his return to the camp, addressing the observation to me. “I have had a narrow escape! A thump, and down I went, sprawling. I saved myself I don’t know how, for I was all but over the side. Those ice ledges, you know, slip through one’s fingers like water. I called out to the bird, ‘Can’t you even look before you, you fool?’ But what was the good of that? The big blunderer did not even beg my pardon!”

In the afternoon of the same day our ears were assailed by a hideous braying from below. Hurliguerly remarked that as there were no ass to treat us to the concert, it must be given by penguins. Hitherto these countless dwellers
in the polar regions had not thought proper to accompany us on our moving island; we had not seen even one, either at the foot of the iceberg or on the drifting packs. There could be no doubt that they were there in thousands, for the music was unmistakably that of a multitude of performers. Now those birds frequent by choice the edges of the coasts of islands and continents in high latitudes, or the ice-fields in their neighbourhood. Was not their presence an indication that land was near?

I asked Captain Len Guy what he thought of the presence of these birds.

"I think what you think, Mr. Jeorling," he replied. "Since we have been drifting, none of them have taken refuge on the iceberg, and here they are now in crowds, if we may judge by their deafening cries. From whence do they come? No doubt from land, which is probably near."

"Is this West's opinion?"

"Yes, Mr. Jeorling, and you know he is not given to vain imaginations."

"Certainly not."

"And then another thing has struck both him and me, which has apparently escaped your attention. It is that the braying of the penguins is mingled with a sound like the lowing of cattle. Listen and you will readily distinguish it."

I listened, and, sure enough, the orchestra was more full than I had supposed.

"I hear the lowing plainly," I said; "there are, then, seals and walrus also in the sea at the base."

"That is certain, Mr. Jeorling, and I conclude from the fact that those animals—both birds and mammals—very rare since we left Tsalal Island, frequent the waters into which the currents have carried us."

"Of course, captain, of course. Oh! what a misfortune it is that we should be surrounded by this impenetrable fog!"

"Which prevents us from even getting down to the base of the iceberg! There, no doubt, we should discover whether there are seaweed drifts around us; if that be so, it would be another sign."

"Why not try, captain?"

"No, no, Mr. Jeorling, that might lead to falls, and I will not permit anybody to leave the camp. If land be there, I imagine our iceberg will strike it before long."

"And if it does not?"

"If it does not, how are we to make it?"

I thought to myself that the boat might very well be used in the latter case. But Captain Len Guy preferred to wait, and perhaps this was the wiser course under our circumstances.

At eight o'clock that evening the half-condensed mist was so compact that it was difficult to walk through it. The composition of the air seemed to be changed, as though it were passing into a solid state. It was not possible to discern whether the fog had any effect upon the compass. I knew the matter had been studied by meteorologists, and that they believe they may safely affirm that the needle is not affected by this condition of the atmosphere. I will add here that since we had left the South Pole behind no confidence could be placed in the indications of the compass; it had gone wild at the approach to the magnetic pole, to which we were no doubt on the way. Nothing could be known, therefore, concerning the course of the iceberg.

The sun did not set quite below the horizon at this period, yet the waters were wrapped in tolerably deep darkness at nine o'clock in the evening, when the muster of the crew took place.

On this occasion each man as usual answered to his name except Dirk Peters.

The call was repeated in the loudest of Hurliguerly's stentorian tones. No reply.

"Has nobody seen Dirk Peters during the day?" inquired the captain.

"Nobody," answered the boatswain.

"Can anything have happened to him?"

"Don't be afraid," cried the boatswain. "Dirk Peters is in his element, and as much at his ease in the fog as a polar bear. He has got out of one bad scrape; he will get out of a second!"

I let Hurliguerly have his say, knowing well why the half-breed kept out of the way.

That night none of us, I am sure, could sleep. We were smothered in the tents, for lack of oxygen. And we were all more or less under the influence of a strange sort of presentiment, as though our fate were about to change, for better or worse, if indeed it could be worse.

The night wore on without any alarm, and at six o'clock in the morning each of us came out to breathe a more wholesome air.

The state of things was unchanged, the density of the fog was extraordinary. It was, however, found that the barometer had risen, too quickly, it is true, for the rise to be serious. Presently other signs of change became evident. The wind, which was growing colder—a south wind since we had passed beyond the south pole—began to blow a full gale, and the noises from below were heard more distinctly through the space swept by the atmospheric currents.

At nine o'clock the iceberg doffed its cap of vapour quite suddenly, producing an indescribable transformation
scene which no fairy's wand could have accomplished in less time or with greater success.

In a few moments, the sky was clear to the extreme verge of the horizon, and the sea reappeared, illumined by the oblique rays of the sun, which now rose only a few degrees above it. A rolling swell of the waves bathed the base of our iceberg in white foam, as it drifted, together with a great multitude of floating mountains under the double action of wind and current, on a course inclining to the nor'-nor'-east.

"Land!"

This cry came from the summit of the moving mountain, and Dirk Peters was revealed to our sight, standing on the outermost block, his hand stretched towards the north.

The half-breed was not mistaken. The land this time--yes!--it was land! Its distant heights, of a blackish hue, rose within three or four miles of us.

86° 12' south latitude. 114° 17' east longitude.

The iceberg was nearly four degrees beyond the antarctic pole, and from the western longitudes that our schooner had followed tracing the course of the _Jane_, we had passed into the eastern longitudes.

CHAPTER XXII. IN CAMP.

A little after noon, the iceberg was within a mile of the land.

After their dinner, the crew climbed up to the topmost block, on which Dirk Peters was stationed. On our approach the half-breed descended the opposite slope and when I reached the top he was no longer to be seen.

The land on the north evidently formed a continent or island of considerable extent. On the west there was a sharply projecting cape, surmounted by a sloping height which resembled an enormous seal's head on the side view; then beyond that was a wide stretch of sea. On the east the land was prolonged out of sight.

Each one of us took in the position. It depended on the current—whether it would carry the iceberg into an eddy which might drive it on the coast, or continue to drift it towards the north. Which was the more admissible hypothesis?

Captain Len Guy, West, Hurliguerly, and I talked over the matter, while the crew discussed it among themselves. Finally, it was agreed that the current tended rather to carry the iceberg towards the northern point of land.

"After all," said Captain Len Guy, "if it is habitable during the months of the summer season, it does not look like being inhabited, since we cannot descry a human being on the shore."

"Let us bear in mind, captain," said I, "that the iceberg is not calculated to attract attention as the _Halbrane_ would have done."

"Evidently, Mr. Jeorling; and the natives, if there were any, would have been collected on the beach to see the _Halbrane_ already."

"We must not conclude, captain, because we do not see any natives--"

"Certainly not, Mr. Jeorling; but you will agree with me that the aspect of this land is very unlike that of Tsalal Island when the fane reached it; there is nothing here but desolation and barrenness."

"I acknowledge that—barrenness and desolation, that is all. Nevertheless, I want to ask you whether it is your intention to go ashore, captain?"

"With the boat?"

"With the boat, should the current carry our iceberg away from the land."

"We have not an hour to lose, Mr. Jeorling, and the delay of a few hours might condemn us to a cruel winter stay, if we arrived too late at the iceberg barrier."

"And, considering the distance, we are not too soon," observed West.

"I grant it," I replied, still persisting. "But, to leave this land behind us without ever having set foot on it, without having made sure that it does not preserve the traces of an encampment, if your brother, captain—his companions—"

Captain Len Guy shook his head. How could the castaways have supported life in this desolate region for several months?

Besides, the British flag was hoisted on the summit of the iceberg, and William Guy would have recognized it and come down to the shore he had been living.

No one. No one.

At this moment, West, who had been observing certain points of approach, said,--

"Let us wait a little before we come to a decision. In less than an hour we shall be able to decide. Our speed is slackening, it seems to me, and it is possible that an eddy may bring us back obliquely to the coast."

"That is my opinion too," said the boatswain, "and if our floating machine is not stationary, it is nearly so. It seems to be turning round."
West and Hurliguerly were not mistaken. For some reason or other the iceberg was getting out of the course which it had followed continuously. A giratory movement had succeeded to that of drifting, owing to the action of an eddy which set towards the coast.

Besides, several ice-mountains, in front of us, had just run aground on the edge of the shore. It was, then, useless to discuss whether we should take to the boat or not. According as we approached, the desolation of the land became more and more apparent, and the prospect of enduring six months’ wintering there would have appalled the stoutest hearts.

At five in the afternoon, the iceberg plunged into a deep rift in the coast ending in a long point on the right, and there stuck fast.

"On shore! On shore!" burst from every man, like a single exclamation, and the men were already hurrying down the slope of the iceberg, when West commanded:

"Wait for orders!"

Some hesitation was shown—especially on the part of Hearne and several of his comrades. Then the instinct of discipline prevailed, and finally the whole crew ranged themselves around Captain Len Guy. It was not necessary to lower the boat, the iceberg being in contact with the point.

The captain, the boatswain, and myself, preceding the others, were the first to quit the camp; ours were the first human feet to tread this virgin and volcanic soil.

We walked for twenty minutes on rough land, strewn with rocks of igneous origin, solidified lava, dusty slag, and grey ashes, but without enough clay to grow even the hardiest plants.

With some risk and difficulty, Captain Len Guy, the boatswain, and I succeeded in climbing the hill; this exploit occupied a whole hour. Although evening had now come, it brought no darkness in its train. From the top of the hill we could see over an extent of from thirty to forty miles, and this was what we saw.

Behind us lay the open sea, laden with floating masses; a great number of these had recently heaped themselves up against the beach and rendered it almost inaccessible.

On the west was a strip of hilly land, which extended beyond our sight, and was washed on its east side by a boundless sea. It was evident that we had been carried by the drift through a strait.

Ah! if we had only had our _Halbrane_! But our sole possession was a frail craft barely capable of containing a dozen men, and we were twenty-three!

There was nothing for it but to go down to the shore again, to carry the tents to the beach, and take measures in view of a winter sojourn under the terrible conditions imposed upon us by circumstances.

On our return to the coast the boatswain discovered several caverns in the granitic cliffs, sufficiently spacious to house us all and afford storage for the cargo of the _Halbrane_. Whatever might be our ultimate decision, we could not do better than place our material and instal ourselves in this opportune shelter.

After we had reascended the slopes of the iceberg and reached our camp, Captain Len Guy had the men mustered. The only missing man was Dirk Peters, who had decidedly isolated himself from the crew. There was nothing to fear from him, however; he would be with the faithful against the mutinous, and under all circumstances we might count upon him. When the circle had been formed, Captain Len Guy spoke, without allowing any sign of discouragement to appear, and explained the position with the utmost frankness and lucidity, stating in the first place that it was absolutely necessary to lower the cargo to the coast and stow it away in one of the caverns. Concerning the vital question of food, he stated that the supply of flour, preserved meat, and dried vegetables would suffice for the winter, however prolonged, and on that of fuel he was satisfied that we should not want for coal, provided it was not wasted; and it would be possible to economize it, as the hibernating waifs might brave the cold of the polar zone under a covering of snow and a roof of ice.

Was the captain’s tone of security feigned? I did not think so, especially as West approved of what he said.

A third question raised by Hearne remained, and was well calculated to arouse jealousy and anger among the crew. It was the question of the use to be made of the only craft remaining to us. Ought the boat to be kept for the needs of our hibernation, or used to enable us to return to the iceberg barrier?

Captain Len Guy would not pronounce upon this; he desired to postpone the decision for twenty-four or forty-eight hours. The boat, carrying the provisions necessary for such a voyage, could not accommodate more than eleven or, at the outside, twelve men. If the departure of the boat were agreed to, then its passengers must be selected by lot. The captain proceeded to state that neither West, the boatswain, I, nor he would claim any privilege, but would submit to the fortune of the lot with all the others. Both Martin Holt and Hardy were perfectly capable of taking the boat to the fishing-grounds, where the whalers would still be found.

Then, those to whom the lot should fall were not to forget their comrades, left to winter on the eighty-sixth parallel, and were to send a ship to take them off at the return of summer.

All this was said in a tone as calm as it was firm. I must do Captain Len Guy the justice to say that he rose to the
occasion.

When he had concluded—without any interruption even from Hearne—no one made a remark. There was, indeed, none to be made, since, in the given case, lots were to be drawn under conditions of perfect equality.

The hour of rest having arrived, each man entered the camp, partook of the supper prepared by Endicott, and went to sleep for the last time under the tents.

Dirk Peters had not reappeared, and I sought for him in vain.

On the following day, the 7th of February, everybody set to work early with a will. The boat was let down with all due precaution to the base of the iceberg, and drawn up by the men on a little sandy beach out of reach of the water. It was in perfectly good condition, and thoroughly serviceable.

The boatswain then set to work on the former contents of the _Halbrane_, furniture, bedding, sails, clothing, instruments, and utensils. Stowed away in a cabin, these things would no longer be exposed to the knocking about and damage of the iceberg. The cases containing preserved food and the casks of spirits were rapidly carried ashore.

I worked with the captain and West at this onerous task, and Dirk Peters also turned up and lent the valuable assistance of his great strength, but he did not utter a word to anyone.

Our occupation continual on the 8th, 9th, and 10th February, and our task was finished in the afternoon of the 10th. The cargo was safely stowed in the interior of a large grotto, with access to it by a narrow opening. We were to inhabit the adjoining grotto, and Endicott set up his kitchen in the latter, on the advice of the boatswain. Thus we should profit by the heat of the stove, which was to cook our food and warm the cavern during the long days, or rather the long nights of the austral winter.

During the process of housing and storing, I observed nothing to arouse suspicion in the bearing of Hearne and the Falklands men. Nevertheless, the half-breed was kept on guard at the boat, which might easily have been seized upon the beach.

Hurligerly, who observed his comrades closely, appeared less anxious.

On that same evening Captain Len Guy, having reassembled his people, stated that the question should be discussed on the morrow, adding that, if it were decided in the affirmative, lots should be drawn immediately. No reply was made.

It was late, and half dark outside, for at this date the sun was on the edge of the horizon, and would very soon disappear below it.

I had been asleep for some hours when I was awakened by a great shouting at a short distance. I sprang up instantly and darted out of the cavern, simultaneously with the captain and West, who had also been suddenly aroused from sleep.

"The boat! the boat!" cried West.

The boat was no longer in its place—that place so jealously guarded by Dirk Peters.

After they had pushed the boat into the sea, three men had got into it with bales and casks, while ten others strove to control the half-breed.

Hearne was there, and Martin Holt also; the latter, it seemed to me, was not interfering.

These wretches, then, intended to depart before the lots were drawn; they meant to forsake us. They had succeeded in surprising Dirk Peters, and they would have killed him, had he not fought hard for life.

In the face of this mutiny, knowing our inferiority of numbers, and not knowing whether he might count on all the old crew, Captain Len Guy re-entered the cavern with West in order to procure arms. Hearne and his accomplices were armed.

I was about to follow them when the following words arrested my steps.

The half-breed, overpowered by numbers, had been knocked down, and at this moment Martin Holt, in gratitude to the man who saved his life, was rushing to his aid, but Hearne called out to him,—

"Leave the fellow alone, and come with us!"

Martin Holt hesitated.

"Yes, leave him alone, I say; leave Dirk Peters, the assassin of your brother, alone."

"The assassin of my brother!"

"Your brother, killed on board the _Grampus_—""

"Killed! by Dirk Peters?"

"Yes! Killed and eaten—eaten!—eaten!" repeated Hearne, who pronounced the hateful worms with a kind of howl.

And then, at a sign from Hearne, two of his comrades seized Martin Holt and dragged him into the boat. Hearne was instantly followed by all those whom he had induced to join in this criminal deed.

At that moment Dirk Peters rose from the ground, and sprang upon one of the Falklands men as he was in the act of stepping on the platform of the boat, lifted him up bodily, hurled him round his head and dashed his brains out against a rock.
In an instant the half-breed fell, shot in the shoulder by a bullet from Hearne’s pistol, and the boat was pushed off.

Then Captain Len Guy and West came out of the cavern—the whole scene had passed in less than a minute—and ran down to the point, which they reached together with the boatswain, Hardy, Francis, and Stern.

The boat, which was drawn by the current, was already some distance off, and the tide was falling rapidly.

West shouldered his gun and fired; a sailor dropped into the bottom of the boat. A second shot, fired by Captain Len Guy, grazed Hearne’s breast, and the ball was lost among the ice-blocks at the moment when the boat disappeared behind the iceberg.

The only thing for us to do was to cross to the other side of the point. The current would carry the wretches thither, no doubt, before it bore them northsyard. If they passed within range, and if a second shot should hit Hearne, either killing or wounding him, his companions might perhaps decide on coming back to us.

A quarter of an hour elapsed. When the boat appeared at the other side of the point, it was so far off that our bullets could not reach it. Hearne had already had the sail set, and the boat, impelled by wind and current jointly, was soon no more than a white speck on the face of the waters, and speedily disappeared.

CHAPTER XXIII. FOUND AT LAST

The question of our wintering on the land whereon we had been thrown was settled for us. But, after all, the situation was not changed for those among the nine (now only remaining of the twenty-three) who should not have drawn the lot of departure. Who could speculate upon the chances of the whole nine? Might not all of them have drawn the lot of “stay”? And, when every chance was fully weighed, was that of those who had left us the best? To this question there could be no answer.

When the boat had disappeared, Captain Len Guy and his companions retraced their steps towards the cavern in which we must live for all the time during which we could not go out, in the dread darkness of the antarctic winter. My first thought was of Dirk Peters, who, being wounded, could not follow us when we hurried to the other side of the point.

On reaching the cavern I failed to find the half-breed, Was he severely wounded? Should we have to mourn the death of this man who was as faithful to us as to his “poor Pym”?

"Let us search for him, Mr. Jeorling!” cried the boatswain.

"We will go together,” said the captain. "Dirk Peters would never have forsaken us, and we will not forsake him."

"Would he come back,” said I, "now that what he thought was known to him and me only has come out?"

I informed my companions of the reason why the name of Ned Holt had been changed to that of Parker in Arthur Pym’s narrative, and of the circumstances under which the half-breed had apprised me of the fact. At the same time I urged every consideration that might exculpate him, dwelling in particular upon the point that if the lot had fallen to Dirk Peters, he would have been the victim of the others’ hunger.

"Dirk Peters confided this secret to you only?” inquired Captain Len Guy.

"To me only, captain."

"And you have kept it?"

"Absolutely."

"Then I cannot understand how it came to the knowledge of Hearne."

"At first,” I replied, "I thought Hearne might have talked in his sleep, and that it was by chance Martin Holt learned the secret. After reflection, however, I recalled to mind that when the half-breed related the scene on the _Grampus_ to me, he was in my cabin, and the side sash was raised. I have reason to think that the man at the wheel overheard our conversation. Now that man was Hearne, who, in order to hear it more clearly, let go the wheel, so that the _Halbrane_ lurched—"

"I remember,” said West. "I questioned the fellow sharply, and sent him clown into the hold."

"Well, then, captain,” I resumed, "it was from that day that Hearne made up to Martin Holt. Hurliguerly called my attention to the fact."

"Of course he did,” said the boatswain, "for Hearne, not being capable of managing the boat which he intended to seize, required a master-hand like Holt."

"And so,” I said, "he kept on urging Holt to question the half-breed concerning his brother’s fate, and you know how Holt came at last to learn the fearful truth. Martin Holt seemed to be stupefied by the revelation. The others dragged him away, and now he is with them! We were all agreed that things had happened as I supposed, and now the question was, did Dirk Peters, in his present state of mind, mean to absent himself? Would he consent to resume his place among us?”
We all left the cavern, and after an hour's search we came in sight of Dirk Peters, whose first impulse was to escape from us. At length, however, Hurliguerly and Francis came up with him. He stood still and made no resistance. I advanced and spoke to him, the others did the same. Captain Len Guy offered him his hand, which he took after a moment's hesitation. Then, without uttering a single word, he returned towards the beach.

From that day no allusion was ever made to the tragic story of the _Grampus_. Dirk Peters' wound proved to be slight; he merely wrapped a piece of sailcloth round the injured arm, and went off to his work with entire unconcern.

We made all the preparation in our power for a prolonged hibernation. Winter was threatening us. For some days past the sun hardly showed at all through the mists. The temperature fell to 36 degrees and would rise no more, while the solar rays, casting shadows of endless length upon the soil, gave hardly any heat. The captain made us put on warm woollen clothes without waiting for the cold to become more severe.

Icebergs, packs, streams, and drifts came in greater numbers from the south. Some of these struck and stayed upon the coast, which was already heaped up with ice, but the greater number disappeared in the direction of the north-east.

"All these pieces," said the boatswain, "will go to the closing up of the iceberg wall. If Hearne and his lot of scoundrels are not ahead of them, I imagine they will find the door shut, and as they have no key to open it with--"

"I suppose you think, boatswain, that our case is less desperate than theirs?"

"I do think so, Mr. Jorling, and I have always thought so. If everything had been done as it was settled, and the lot had fallen to me to go with the boat, I would have given up my turn to one of the others. After all, there is something in feeling dry ground under our feet. I don't wish the death of anybody, but if Hearne and his friends do not succeed in clearing the iceberg barrier--if they are doomed to pass the winter on the ice, reduced for food to a supply that will only last a few weeks, you know the fate that awaits them?"

"Yes, a fate worse than ours!"

"And besides," said the boatswain, "even supposing they do reach the Antarctic Circle. If the whalers have already left the fishing-grounds, it is not a laden and overladen craft that will keep the sea until the Australian coasts are in sight."

This was my own opinion, and also that of the captain and West.

During the following four days, we completed the storage of the whole of our belongings, and made some excursions into the interior of the country, finding "all barren," and not a trace that any landing had ever been made there.

One day, Captain Len Guy proposed that we should give a geographical name to the region whither the iceberg had carried us. It was named Halbrane Land, in memory of our schooner, and we called the strait that separated the two parts of the polar continent the _Jane_ Sound.

Then we took to shooting the penguins which swarmed upon the rocks, and to capturing some of the amphibious animals which frequented the beach. We began to feel the want of fresh meat, and Endicott's cooking rendered seal and walrus flesh quite palatable. Besides, the fat of these creatures would serve, at need, to warm the cavern and feed the cooking-stove. Our most formidable enemy would be the cold, and we must fight it by every means within our power. It remained to be seen whether the amphibia would not forsake Halbrane Land at the approach of winter, and seek a less rigorous climate in lower latitudes. Fortunately there were hundreds of other animals to secure our little company from hunger, and even from thirst, at need. The beach was the home of numbers of galapagos--a kind of turtle so called from an archipelago in the equinoctial sea, where also they abound, and mentioned by Arthur Pym as supplying food to the islanders, It will be remembered that Pym and Peters found three of these galapagos in the native boat which carried them away from Tsalal Island.

The movement of these huge creatures is slow, heavy, and waddling; they have thin necks two feet long, triangular snake-like heads, and can go without food for very long periods.

Arthur Pym has compared the antarctic turtles to dromedaries, because, like those ruminants, they have a pouch just where the neck begins, which contains from two to three gallons of cold fresh water. He relates, before the scene of the lot-drawing, that but for one of these turtles the shipwrecked crew of the _Grampus_ must have died of hunger and thirst. If Pym is to be believed, some of the great turtles weigh from twelve to fifteen hundred pounds. Those of Halbrane Land did not go beyond seven or eight hundred pounds, but their flesh was none the less savoury.

On the 19th of February an incident occurred--an incident which those who acknowledge the intervention of Providence in human affairs will recognize as providential.

It was eight o'clock in the morning; the weather was calm; the sky was tolerably clear; the thermometer stood at thirty-two degrees Fahrenheit.

We were assembled in the cavern, with the exception of the boatswain, waiting for our breakfast, which Endicott was preparing, and were about to take our places at table, when we heard a call from outside.

The voice was Hurliguerly's, and we hurried out. On seeing us, he cried.--
"Come--come quickly?"
He was standing on a rock at the foot of the hillock above the beach in which Halbrahe Land ended beyond the point, and his right hand was stretched out towards the sea.
"What is it?" asked Captain Len Guy.
"A boat."
"Is it the _Halbrane's_ boat coming back?"
"No, captain--it is not."
Then we perceived a boat, not to be mistaken for that of our schooner in form or dimensions, drifting without oars or paddle, seemingly abandoned to the current.
We had but one idea in common--to seize at any cost upon this derelict craft, which would, perhaps, prove our salvation. But how were we to reach it? how were we to get it in to the point of Halbrane Land?
While we were looking distractedly at the boat and at each other, there came a sudden splash at the end of the hillock, as though a body had fallen into the sea.
It was Dirk Peters, who, having flung off his clothes, had sprung from the top of a rock, and was swimming rapidly towards the boat before we made him out.
We cheered him heartily. I never beheld anything like that swimming. He bounded through the waves like a porpoise, and indeed he possessed the strength and swiftness of one. What might not be expected of such a man!
In a few minutes the half-breed had swum several cables' lengths towards the boat in an oblique direction. We could only see his head like a black speck on the surface of the rolling waves. A period of suspense, of intense watching of the brave swimmer succeeded. Surely, surely he would reach the boat; but must he not be carried away with it? Was it to be believed that even his great strength would enable him, swimming, to tow it to the beach?
"After all, why should there not be oars in the boat?" said the boatswain.
"He has it! He has it! Hurrah, Dirk, hurrah!" shouted Hurliguerly, and Endicott echoed his exultant cheer.
The half-breed had, in fact, reached the boat and raised himself alongside half out of the water. His big, strong hand grasped the side, and at the risk of causing the boat to capsize, he hoisted himself up to the side, stepped over it, and sat down to draw his breath.
Almost instantly a shout reached our ears. It was uttered by Dirk Peters. What had he found? Paddles! It must be so, for we saw him seat himself in the front of the boat, and paddle with all his strength in striving to get out of the current.
"Come along?" said the captain, and, turning the base of the hillock, we all ran along the edge of the beach between the blackish stones that bestrewed it.
After some time, West stopped us. The boat had reached the shelter of a small projection at that place, and it was evident that it would be run ashore there.
When it was within five or six cables' lengths, and the eddy was helping it on, Dirk Peters let go the paddles, stooped towards the after-part of the boat, and then raised himself, holding up an inert body.
An agonized cry from Captain Len Guy rent the air!
"My brother--my brother?"
"He is living! He is living!" shouted Dirk Peters.
A moment later, the boat had touched the beach, and Captain Len Guy held his brother in his arms.
Three of William Guy's companions lay apparently lifeless in the bottom of the boat.
And these four men were all that remained of the crew of the _Jane_.

CHAPTER XXIV. ELEVEN YEARS IN A FEW PAGES.
The heading of the following chapter indicates that the adventures of William Guy and his companions after destruction of the English schooner, and the details of their history subsequent to the departure of Arthur Pym and Dirk Peters, are about to be narrated with all possible brevity.
We carried our treasure-trove to the cavern, and had happiness of restoring all four men to life. In reality, it was hunger, nothing but hunger, which had reduced the poor fellows to the semblance of death.
On the 8th of February, 1828, the crew of the _Jane_, having no reason to doubt the good faith of the population of Tsala Island, or that of their chief, Too-Wit, disembarked, in order to visit the village of Klock-Klock, having previously put the schooner into a state of defense, leaving six men on board.
The crew, counting William Guy, the captain, Arthur Pym, and Dirk Peters, formed a body of thirty-two men armed with guns, pistols, and knives. The dog Tiger accompanied them.
On reaching the narrow gorge leading to the village preceded and followed by the numerous warriors of Too Wit, the little company divided, Arthur Pym, Dirk Peters, and Allen (the sailor) entering a cleft in the hill-side with
that they abandoned their island, whither they were destined never to return.

and the Wampos, who are the leading personages of Klock-Klock. It was under these extraordinary circumstances

the horizon of the eighty-fourth parallel.

had to be asked, and which nobody could answer. Nevertheless, they would not have hesitated to attempt the

sea. Where were the fugitives to go, and what was to become of them without provisions?--these were questions that

found an opportunity to escape.

their hiding-place, securing a boat, and abandoning Tsalal Island, but William Guy and his companions had not yet

the intention of crossing it to the other side. From that moment their companions were never to see them more.

After a short interval a shock was felt. The opposite hill fell down in a vast heap, burying William Guy and his
twenty-eight companions.

Twenty-two of these unfortunate men were crushed to death on the instant, and their bodies would never be

found under that mass of earth.

Seven, miraculously sheltered in the depth of a great cleft of the hill, had survived the catastrophe. These were

William Guy, Patterson, Roberts, Coyin, Trinkle, also Forbes and Sexton, since dead. As for Tiger, they knew not

whether he had perished in the landslip, or whether he had escaped. There existed in the right side of the hill, as well

as in the left, on either side of the fissure, certain winding passages, and it was by crawling along these in the

darkness that William Guy, Patterson, and the others reached a cavity which let in light and air in abundance. From

this shelter they beheld the attack on the _Jane_ by sixty pirogues, the defence made by the six men on board; the

invasion of the ship by the savages, and finally the explosion which caused the death of a vast number of natives as

well as the complete destruction of the ship.

Too-Wit and the Tsalal islanders were at first terrified by the effects of this explosion, but probably still more

disappointed. Their instincts of pillage could not be gratified, because some valueless wreckage was all that

remained of the ship and her cargo, and they had no reason to suppose that any of the crew had survived the cleverly

contrived collapse of the hill. Hence it came about that Arthur Pym and Dirk Peters on the one side, and William

Guy and his companions on the other, were enabled to remain undisturbed in the labyrinths of Klock-Klock, where

they fed on the flesh of bitterns--these they could catch with their hands--and the fruit of the nut-trees which grow

on the hill-sides. They procured fire by rubbing pieces of soft against pieces of hard wood; there was a quantity of

both within their reach.

After a whole week of this confinement, Arthur Pym and the half-breed had succeeded, as we know, in leaving

their hiding-place, securing a boat, and abandoning Tsalal Island, but William Guy and his companions had not yet

found an opportunity to escape.

After they had been shut up in the labyrinth for twentyone days, the birds on which they lived began to fail them,

and they recognized that their only means of escaping hunger--(they had not to fear thirst, for there was a spring of

fresh water in the interior of the hill)--was to go down again to the coast, lay hands upon a native boat, and get out to

sea. Where were the fugitives to go, and what was to become of them without provisions?--these were questions that

had to be asked, and which nobody could answer. Nevertheless, they would not have hesitated to attempt the

adventure if they could have a few hours of darkness; but, at that time of year, the sun did not as yet go down behind

the horizon of the eighty-fourth parallel.

Death would probably have put an end to their misery had not the situation been changed by the following

events.

On the 22nd of February, in the morning, William Guy and Patterson were talking together, in terrible perplexity

of mind, at the orifice of the cavity that opened upon the country. They no longer knew how to provide for the wants

of seven persons, who were then reduced to eating nuts only, and were suffering in consequence from severe pain in

the head and stomach. They could see big turtles crawling on the beach, but how could they venture to go thither,

of their several occupations, with their constant cry of _tékéli-li_?

Suddenly, this crowd of people became violently agitated. Men, women, and children ran wildly about on every

side. Some of the savages even took to their boats as though a great danger were at hand. What was happening?

William Guy and his companions were very soon informed. The cause of the tumult was the appearance of an

unknown animal, a terrible quadruped, which dashed into the midst of the islanders, snapping at and biting them

indiscriminately, as it sprang at their throats with a hoarse growling.

And yet the infuriated animal was alone, and might easily have been killed by stones or arrows. Why then did a

crowd of savages manifest such abject terror? Why did they take to flight? Why did they appear incapable of

defending themselves against this one beast?

The animal was white, and the sight of it had produced the phenomenon previously observed, that inexplicable

terror of whiteness common to all the natives of Tsalal.

To their extreme surprise, William Guy and his companions recognized the strange animal as the dog Tiger.

Yes! Tiger had escaped from the crumbling mass of the hill and betaken himself to the interior of the island,

whence he had returned to Klock-Klock, to spread terror among the natives. But Tiger was no mere phantom foe; he

was the most dangerous and deadly of enemies, for the poor animal was mad, and his fangs were fatal!

This was the reason why the greater part of the Tsalal islanders took to flight, headed by their chief, Too-Wit,

and the Wampos, who are the leading personages of Klock-Klock. It was under these extraordinary circumstances

that they abandoned their island, whither they were destined never to return.

Although the boats carried off the bulk of the population, a considerable number still remained on Tsalal, having
no means of escape, and their fate accomplished itself quickly. Several natives who were bitten by Tiger developed hydrophobia rapidly, and attacked the others. Fearful scenes ensued, and are briefly to be summed up in one dismal statement. The bones we had seen in or near Klock-Klock were those of the poor savages, which had lain there bleeding for eleven years!

The poor dog had died after he had done his fell work, in a corner on the beach, where Dirk Peters found his skeleton and the collar bearing the name of Arthur Pym.

Then, after those natives who could not escape from the island had all perished in the manner described, William Guy, Patterson, Trinkle, Covin, Forbes, and Sexton ventured to come out of the labyrinth, where they were on the verge of death by starvation.

What sort of existence was that of the seven survivors of the expedition during the eleven ensuing years?

On the whole, it was more endurable than might have been supposed. The natural products of an extremely fertile soil and the presence of a certain number of domestic animals secured them against want of food; they had only to make out the best shelter for themselves they could contrive, and wait for an opportunity of getting away from the island with as much patience as might be granted to them. And from whence could such an opportunity come? Only from one of the chances within the resources of Providence.

Captain William Guy, Patterson, and their five companions descended the ravine, which was half filled with the fallen masses of the hill-face, amid heaps of scoria and blocks of black granite. Before they left this gorge, it occurred to William Guy to explore the fissure on the right into which Arthur Pym, Dirk Peters, and Allen had turned, but he found it blocked up; it was impossible for him to get into the pass. Thus he remained in ignorance of the existence of the natural or artificial labyrinth which corresponded with the one he had just left, and probably communicated with it under the dry bed of the torrent. The little company, having passed the chaotic barrier that intercepted the northern route, proceeded rapidly towards the north-west. There, on the coast, at about three miles from Klock-Klock, they established themselves in a grotto very like that in our own occupation on the coast of Halbrane Land.

And it was in this place that, during long, hopeless years, the seven survivors of the fane lived, as we were about to do ourselves, but under better conditions, for the fertility of the soil of Tsalal furnished them with resources unknown in Halbrane Land. In reality, we were condemned to perish when our provisions should be exhausted, but they could have waited indefinitely--and they did wait.

They had never entertained any doubt that Arthur Pym, Dirk Peters, and Allen had perished, and this was only too true in Allen's case. How, indeed, could they ever have imagined that Pyro and the half-breed had got hold of a boat and made their escape from Tsalal Island?

So, then, as William Guy told us, not an incident occurred to break the monotony of that existence of eleven years--not even the reappearance of the islanders, who were kept away from Tsalal by superstitious terror. No danger had threatened them during all that time; but, of course, as it became more and more prolonged, they lost the hope of ever being rescued. At first, with the return of the fine season, when the sea was once more open, they had thought it possible that a ship would be sent in search of the _Jane_. But after four or five years they relinquished all hope.

There is no need for dwelling on this period, which extends from the year 1828 to the year 1839. The winters were hard. The summer did indeed extend its beneficent influence to the islands of the Tsalal group, but the cold season, with its attendant snows, rains, and tempests, spared them none of its severity.

During seven months Captain William Guy had not lost one of those who had come with him safe and sound out of the trap set for them at Klock-Klock, and this was due, no doubt, to their robust constitutions, remarkable power of endurance, and great strength of character. Alas! misfortune was making ready to fall on them.

The month of May had come--it corresponds in those regions to the month of November in northern lands--and the ice-packs which the current carried towards the north were beginning to drift past Tsalal. One day, one of the seven men failed to return to the cavern. They called, they waited, they searched for him. All was in vain. He did not reappear; no doubt he had been drowned. He was never more seen by his fellow-exiles.

This man was Patterson, the faithful companion of William Guy.

Now, what William Guy did not know, but we told him, was that Patterson--under what circumstances none would ever learn--had been carried away on the surface of an iceblock, where he died of hunger. And on that ice-block, which had travelled so far as Prince Edward Island, the boatswain had discovered the corpse of the unfortunate man almost decomposed by the action of the warmer waters.

When Captain Len Guy told his brother of the finding of the body of Patterson, and how it was owing to the notes in his pocket-book that the _Halbrane_ had been enabled to proceed towards the antarctic seas, William Guy hid his face in his hands and wept.

Other misfortunes followed upon this one.
Five months after the disappearance of Patterson, in the middle of October, Tsalal Island was laid waste from coast to coast by an earthquake, which destroyed the southwestern group almost entirely. William Guy and his companions must soon have perished on the barren land, which no longer could give them food, had not the means of leaving its coast, now merely an expanse of tumbled rocks, been afforded them in an almost miraculous manner. Two days after the earthquake, the current carried ashore within a few hundred yards of their cavern a boat which had drifted from the island group on the south-west.

Without the delay of even one day, the boat was laden with as much of the remaining provisions as it could contain, and the six men embarked in it, bidding adieu for ever to the now uninhabitable island.

Unfortunately a very strong breeze was blowing; it was impossible to resist it, and the boat was driven southwards by that very same current which had caused our iceberg to drift to the coast of Halbrane Land.

For two months and a half these poor fellows were borne across the open sea, with no control over their course. It was not until the 2nd of January in the present year (1840) that they sighted land—east of the _Jane_ Sound.

Now, we already knew this land was not more than fifty miles from Halbrane Land. Yes! so small, relatively, was the distance that separated us from those whom we had sought for in the antarctic regions far and wide, and concerning whom we had lost hope.

Their boat had gone ashore far to the south-east of us. But on how different a coast from that of Tsalal Island, or, rather, on one how like that of Halbrane Land! Nothing was to be seen but sand and stones; neither trees, shrubs, nor plants of any kind. Their provisions were almost exhausted; William Guy and his companions were soon reduced to extreme want, and two of the little company, Forbes and Sexton, died.

The remaining four resolved not to remain a single day longer in the place where they were doomed to die of hunger. They embarked in the boat with the small supply of food still remaining, and once more abandoned themselves to the current, without having been able to verify their position, for want of instruments.

Thus had they been borne upon the unknown deep for twenty-five days, their resources were completely exhausted, and they had not eaten for forty-eight hours, when the boat, with its occupants lying inanimate at the bottom of it, was sighted from Halbrane Land. The rest is already known to the reader of this strange eventful history.

And now the two brothers were at length reunited in that remote corner of the big world which we had dubbed Halbrane Land.

CHAPTER XXV. "WE WERE THE FIRST."

Two days later not one of the survivors from the two schooners, the _Jane_ and the _Halbrane_, remained upon any coast of the Antarctic region.

On the 21st of February, at six o'clock in the morning, the boat, with us all (we numbered thirteen) in it, left the little creek and doubled the point of Halbrane Land. On the previous day we had fully and finally debated the question of our departure, with the understanding that if it were settled in the affirmative, we should start without delay.

The captain of the fane was for an immediate departure, and Captain Len Guy was not opposed to it. I willingly sided with them, and West was of a similar opinion. The boatswain was inclined to oppose us. He considered it imprudent to give up a certainty for the uncertain, and he was backed by Endicott, who would in any case say "ditto" to his "Mr. Burke." However, when the time came, Hurliguerly Conformed to the view of the majority with a good grace, and declared himself quite ready to set out, since we were all of that way of thinking.

Our boat was one of those in use in the Tsalal Archipelago for plying between the islands. We knew, from the narrative of Arthur Pym, that these boats are of two kinds, one resembling rafts or flat boats, the other strongly-built pirogues. Our boat was of the former kind, forty feet long, six feet in width, and worked by several paddles.

We called our little craft the _Paracura_, after a fish which abounds in these waters. A rough image of that denizen of the southern deep was cut upon the gunwale.

Needless to say that the greater part of the cargo of the _Halbrane_ was left in our cavern, fully protected from the weather, at the disposal of any shipwrecked people who might chance to be thrown on the coast of Halbrane Land. The boatswain had planted a spar on the top of this slope to attract attention. But, our two schooners notwithstanding, what vessel would ever venture into such latitudes?

_Nota Bene._—We were just thirteen—the fatal number. Perfectly good relations subsisted among us. We had no longer to dread the rebellion of a Hearne. (How often we speculated upon the fate of those whom he had beguiled!) At seven o'clock, the extreme point of Halbrahe Land lay five miles behind us, and in the evening we gradually lost sight of the heights that varied that part of the coast.

I desire to lay special stress on the fact that not a single scrap of iron entered into the construction of this boat,
not so much as a nail or a bolt, for that metal was entirely unknown to the Tsalal islanders. The planks were bound together by a sort of liana, or creeping-plant, and caulked with moss steeped in pitch, which was turned by contact with the sea-water to a substance as hard as metal.

I have nothing special to record during the week that succeeded our departure. The breeze blew steadily from the south, and we did not meet with any unfavourable current between the banks of the _Jane_ Sound.

During those first eight days, the Paracuts, by paddling when the wind fell, had kept up the speed that was indispensable for our reaching the Pacific Ocean within a short time.

The desolate aspect of the land remained the same, while the strait was already visited by floating drifts, packs of one to two hundred feet in length, some oblong, others circular, and also by icebergs which our boat passed easily. We were made anxious, however, by the fact that these masses were proceeding towards the iceberg barrier, for would they not close the passages, which ought to be still open at this time?

I shall mention here that in proportion as Dirk Peters was carried farther and farther from the places wherein no trace of his poor Pym had been found, he was more silent than ever, and no longer even answered me when I addressed him.

It must not be forgotten that since our iceberg had passed beyond the south pole, we were in the zone of eastern longitudes counted from the zero of Greenwich to the hundred and eightieth degree. All hope must therefore be abandoned of our either touching at the Falklands, or finding whaling-ships in the waters of the Sandwich Islands, the South Orkneys, or South Georgia.

Our voyage proceeded under unaltered conditions for ten days. Our little craft was perfectly sea-worthy. The two captains and West fully appreciated its soundness, although, as I have previously said, not a scrap of iron had a place in its construction. It had not once been necessary to repair its seams, so staunch were they. To be sure, the sea was smooth, its long, rolling waves were hardly ruffled on their surface.

On the loth of March, with the same longitude the observation gave 7° 13' for latitude. The speed of the _Paracuta_ had then been thirty miles in each twenty-four hours. If this rate of progress could be maintained for three weeks, there was every chance of our finding the passes open, and being able to get round the iceberg barrier; also that the whaling-ships would not yet have left the fishing-grounds.

The sun was on the verge of the horizon, and the time was approaching when the Antarctic region would be shrouded in polar night. Fortunately, in re-ascending towards the north we were getting into waters from whence light was not yet banished. Then did we witness a phenomenon as extraordinary as any of those described by Arthur Pym. For three or four hours, sparks, accompanied by a sharp noise, shot out of our fingers' ends, our hair, and our beards. There was an electric snowstorm, with great flakes falling loosely, and the contact produced this strange luminosity. The sea rose so suddenly and tumbled about so wildly that the _Paracuta_ was several times in danger of being swallowed up by the waves, but we got through the mystic-seeming tempest all safe and sound.

Nevertheless, space was thenceforth but imperfectly lighted. Frequent mists came up and bounded our outlook to a few cable-lengths. Extreme watchfulness and caution were necessary to avoid collision with the floating masses of ice, which were travelling more slowly than the _Paracuta_.

It is also to be noted that, on the southern side, the sky was frequently lighted up by the broad and brilliant rays of the polar aurora.

The temperature fell very perceptibly, and no longer rose above twenty-three degrees.

Forty-eight hours later Captain Len Guy and his brother succeeded with great difficulty in taking an approximate observation, with the following results of their calculations:

Latitude: 75° 17' south. Latitude: 118° 3' east.

At this date, therefore (12th March), the _Paracuta_ was distant from the waters of the Antarctic Circle only four hundred miles.

During the night a thick fog came on, with a subsidence of the breeze. This was to be regretted, for it increased the risk of collision with the floating ice. Of course fog could not be a surprise to us, being where we were, but what did surprise us was the gradually increasing speed of our boat, although the falling of the wind ought to have lessened it.

This increase of speed could not be due to the current for we were going more quickly than it.

This state of things lasted until morning, without our being able to account for what was happening, when at about ten o'clock the mist began to disperse in the low zones. The coast on the west reappeared—a rocky coast, without a mountainous background; the _Paracuta_ was following its line.

And then, no more than a quarter of a mile away, we beheld a huge mound, reared above the plain to a height of three hundred feet, with a circumference of from two to three hundred feet. In its strange form this great mound resembled an enormous sphinx; the body upright, the paws stretched out, crouching in the attitude of the winged monster which Grecian Mythology has placed upon the way to Thebes.
Was this a living animal, a gigantic monster, a mastodon a thousand times the size of those enormous elephants of the polar seas whose remains are still found in the ice? In our frame of mind we might have believed that it was such a creature, and believed also that the mastodon was about to hurl itself on our little craft and crush it to atoms. After a few moments of unreasoning and unreasonable fright, we recognized that the strange object was only a great mound, singularly shaped, and that the mist had just rolled off its head, leaving it to stand out and confront us. Ah! that sphinx! I remembered, at sight of it, that on the night when the iceberg was overturned and the _Halbrane_ was carried away, I had dreamed of a fabulous animal of this kind, seated at the pole of the world, and from whom Edgar Poe could only wrest its secrets.

But our attention was to be attracted, our surprise, even our alarm, was evoked soon by phenomena still more strange than the mysterious earth form upon which the mist-curtain had been raised so suddenly.

I have said that the speed of the _Paracuta_ was gradually increasing; now it was excessive, that of the current remaining inferior to it. Now, of a sudden, the grapnel that had belonged to the _Halbrane_, and was in the bow of the boat, flew out of its socket as though drawn by an irresistible power, and the rope that held it was strained to breaking point. It seemed to tow us, as it grazed the surface of the water towards the shore.

"What's the matter?" cried William Guy. "Cut away, boatswain, cut away!" shouted West, "or we shall be dragged against the rocks."

Hurliguerly hurried to the bow of the _Paracuta_ to cut away the rope. Of a sudden the knife he held was snatched out of his hand, the rope broke, and the grapnel, like a projectile, shot off in the direction of the sphinx.

At the same moment, all the articles on board the boat that were made of iron or steel--cooking utensils, arms, Endicott's stove, our knives, which were torn from out pockets--took flight after a similar fashion in the same direction, while the boat, quickening its course, brought up against the beach.

What was happening? In order to explain these inexplicable things, were we not obliged to acknowledge that we had come into the region of those wonders which I attributed to the hallucinations of Arthur Pym?

No! These were physical facts which we had just witnessed, and not imaginary phenomenal!

We had, however, no time for reflection, and immediately upon our landing, our attention was turned in another direction by the sight of a boat lying wrecked upon the sand.

"The _Halbrane's_ boat!" cried Hurliguerly. It was indeed the boat which Hearne had stolen, and it was simply smashed to pieces; in a word, only the formless wreckage of a craft which has been flung against rocks by the sea, remained.

We observed immediately that all the ironwork of the boat had disappeared, down to the hinges of the rudder. Not one trace of the metal existed.

What could be the meaning of this?

A loud call from West brought us to a little strip of beach on the right of our stranded boat.

Three corpses lay upon the stony soil, that of Hearne, that of Martin Holt, and that of one of the Falklands men.

Of the thirteen who had gone with the sealing-master, there remained only these three, who had evidently been dead some days.

What had become of the ten missing men? Had their bodies been carried out to sea?

We searched all along the coast, into the creeks, and between the outlying rocks, but in vain. Nothing was to be found, no traces of a camp, not even the vestiges of a landing.

"Their boat," said William Guy, "must have been struck by a drifting iceberg. The rest of Hearne's companions have been drowned, and only these three bodies have come ashore, lifeless."

"But," asked the boatswain, "how is the state the boat is in to be explained?"

"And especially," added West, "the disappearance of all the iron?"

"Indeed," said I, "it looks as though every bit had been violently torn off."

Leaving the _Paracuta_ in the charge of two men, we again took our way to the interior, in order to extend our search over a wider expanse.

As we were approaching the huge mound the mist cleared away, and the form stood out with greater distinctness. It was, as I have said, almost that of a sphinx, a dusky-hued sphinx, as though the matter which composed it had been oxidized by the inclemency of the polar climate.

And then a possibility flashed into my mind, an hypothesis which explained these astonishing phenomena.

"Ah!" I exclaimed, "a loadstone! that is it! A magnet with prodigious power of attraction!"

I was understood, and in an instant the final catastrophe, to which Hearne and his companions were victims, was explained with terrible clearness.

The Antarctic Sphinx was simply a colossal magnet. Under the influence of that magnet the iron bands of the _Halbrane's_ boat had been torn out and projected as though by the action of a catapult. This was the occult force that had irresistibly attracted everything made of iron on the _Paracuta_. And the boat itself would have shared the
fate of the _Halbrane’s_ boat had a single bit of that metal been employed in its construction. Was it, then, the proximity of the magnetic pole that produced such effects?

At first we entertained this idea, but on reflection we rejected it.

At the place where the magnetic meridians cross, the only phenomenon produced is the vertical position of the magnetic needle in two similar points of the terrestrial globe. This phenomenon, already proved by observations made on the spot, must be identical in the Antarctic regions.

Thus, then, there did exist a magnet of prodigious intensity in the zone of attraction which we had entered. Under our eyes one of those surprising effects which had hitherto been classed among fables was actually produced.

The following appeared to me to be the true explanation.

The Trade-winds bring a constant succession of clouds or mists in which immense quantities of electricity not completely exhausted by storms, are stored. Hence there exists a formidable accumulation of electric fluid at the poles, and it flows towards the land in a permanent stream.

From this cause come the northern and southern auroras, whose luminous splendours shine above the horizon, especially during the long polar night, and are visible even in the temperate zones when they attain their maximum of culmination.

These continuous currents at the poles, which bewilder our compasses, must possess an extraordinary influence. And it would suffice that a block of iron should be subjected to their action for it to be changed into a magnet of power proportioned to the intensity of the current, to the number of turns of the electric helix, and to the square root of the diameter of the block of magnetized iron. Thus, then, the bulk of the sphinx which upreared its mystic form upon this outer edge of the southern lands might be calculated by thousands of cubic yards.

Now, in order that the current should circulate around it and make a magnet of it by induction, what was required? Nothing but a metallic lode, whose innumerable windings through the bowels of the soil should be connected subterraneously at the base of the block.

It seemed to me also that the place of this block ought to be in the magnetic axis, as a sort of gigantic calamite, from whence the imponderable fluid whose currents made an inexhaustible accumulator set up at the confines of the world should issue. Our compass could not have enabled us to determine whether the marvel before our eyes really was at the magnetic pole of the southern regions. All I can say is, that its needle staggered about, helpless and useless. And in fact the exact location of the Antarctic Sphinx mattered little in respect of the constitution of that artificial loadstone, and the manner in which the clouds and metallic lode supplied its attractive power.

In this very plausible fashion I was led to explain the phenomenon by instinct. It could not be doubted that we were in the vicinity of a magnet which produced these terrible but strictly natural effects by its attraction.

I communicated my idea to my companions, and they regarded this explanation as conclusive, in presence of the physical facts of which we were the actual witnesses.

"We shall incur no risk by going to the foot of the mound, I suppose," said Captain Len Guy.

"None," I replied.

"There--yes--here?"

I could not describe the impression those three words made upon us. Edgar Poe would have said that they were three cries from the depths of the under world.

It was Dirk Peters who had spoken, and his body was stretched out in the direction of the sphinx, as though it had been turned to iron and was attracted by the magnet.

Then he sped swiftly towards the sphinx-like mound, and his companions followed him over rough ground strewn with volcanic remains of all sorts.

The monster grew larger as we neared it, but lost none of its mythological shape. Alone on that vast plain it produced a sense of awe. And--but this could only have been a delusion--we seemed to be drawn towards it by the force of its magnetic attraction.

On arriving at the base of the mound, we found there the various articles on which the magnet had exerted its power; arms, utensils, the grapnel of the _Paracuta_ , all adhering to the sides of the monster. There also were the iron relics of the _Halbrane's_ boat, all her utensils, arms, and fittings, even to the nails and the iron portions of the rudder.

There was no possibility of regaining possession of any of these things. Even had they not adhered to the loadstone rock at too great a height to be reached, they adhered to it too closely to be detached. Hurliguerly was infuriated by the impossibility of recovering his knife, which he recognized at fifty feet above his head, and cried as he shook his clenched fist at the imperturbable monster,--

"Thief of a sphinx!"

Of course the things which had belonged to the _Halbrane's_ boat and the _Paracuta's_ were the only articles that adorned the mighty sides of the lonely mystic form. Never had any ship reached such a latitude of the Antarctic
Sea. Hearne and his accomplices, Captain Len Guy and his companions, were the first who had trodden this point of the southern continent. And any vessel that might have approached this colossal magnet must have incurred certain destruction. Our schooner must have perished, even as its boat had been dashed into a shapeless wreck.

West now reminded us that it was imprudent to prolong our stay upon this Land of the Sphinx—a name to be retained. Time pressed, and a few days’ delay would have entailed our wintering at the foot of the ice-barrier.

The order to return to the beach had just been given, when the voice of the half-breed was again heard, as he cried out:

"There! There! There!"

We followed the sounds to the back of the monster’s right paw, and we found Dirk Peters on his knees, with his hands stretched out before an almost naked corpse, which had been preserved intact by the cold of these regions, and was as rigid as iron. The head was bent, a white beard hung down to the waist, the nails of the feet and hands were like claws.

How had this corpse been fixed to the side of the mound at six feet above the ground?

Across the body, held in place by its cross-belt, we saw the twisted barrel of a musket, half-eaten by rust.

"Pym—my poor Pym!" groaned Dirk Peters.

He tried to rise, that he might approach and kiss the ossified corpse. But his knees bent under him, a strangled sob seemed to rend his throat, with a terrible spasm his faithful heart broke, and the half-breed fell back—dead!

The story was easy to read. After their separation, the boat had carried Arthur Pym through these Antarctic regions! Like us, once he had passed beyond the south pole, he came into the zone of the monster! And there, while his boat was swept along on the northern current, he was seized by the magnetic fluid before he could get rid of the gun which was slung over his shoulder, and hurled against the fatal loadstone Sphinx of the Ice-realm.

Now the faithful half-breed rests under the clay of the Land of the Antarctic Mystery, by the side of his "poor Pym," that hero whose strange adventures found a chronicler no less strange in the great American poet!

CHAPTER XXVI. A LITTLE REMNANT.

That same day, in the afternoon, the _Paracuta_ departed from the coast of the Land of the Sphinx, which had lain to the west of us since the 21st of February.

By the death of Dirk Peters the number of the passengers was reduced to twelve. These were all who remained of the double crew of the two schooners, the first comprising thirty-eight men, the second, thirty-two; in all seventy souls. But let it not be forgotten that the voyage of the _Halbrane_ had been undertaken in fulfilment of a duty to humanity, and four of the survivors of the _Jane_ owed their rescue to it.

And now there remains but little to tell, and that must be related as succinctly as possible. It is unnecessary to dwell upon our return voyage, which was favoured by the constancy of the currents and the wind to the northern course. The last part of the voyage was accomplished amid great fatigue, suffering, and but it ended in our safe deliverance from all these.

Firstly, a few days after our departure from the Land the Sphinx, the sun set behind the western horizon reappear no more for the whole winter. It was then the midst of the semi-darkness of the austral night that the _Paracuta_ pursued her monotonous course. True, the southern polar lights were frequently visible; but they were not the sun, that single orb of day which had illumined our horizons during the months of the Antarctic summer, and their capricious splendour could not replace his unchanging light. That long darkness of the poles sheds a moral and physical influence on mortals which no one can elude, a gloomy and overwhelming impression almost impossible to resist.

Of all the _Paracuta’s_ passengers, the boatswain and Endicott only preserved their habitual good-humour; those two were equally insensitive to the weariness and the peril of our voyage. I also except West, who was ever ready to face every eventuality, like a man who is always on the defensive. As for the two brothers Guy, their happiness in being restored to each other made them frequently oblivious of the anxieties and risks of the future.

Of Hurliguerly I cannot speak too highly. He proved himself a thoroughly good fellow, and it raised our drooping spirits to hear him repeat in his jolly voice,—

"We shall get to port all right, my friends, be sure of that. And, if you only reckon things up, you will see that we have had more good luck than bad. Oh, yes, I know, there was the loss of our schooner! Poor _Halbrane_, carried up into the air like a balloon, then flung into the deep like an avalanche! But, on the other hand, there was the iceberg which brought us to the coast, and the Tsalal boat which brought us and Captain William Guy and his three companions together. And don’t forget the current and the breeze that have pushed us on up to now, and will keep pushing us on, I’m sure of that. With so many trumps in our hand we cannot possibly lose the game. The only thing to be regretted is that we shall have to get ashore again in Australia or New Zealand, instead of casting anchor at the
Kerguelens, near the quay of Christmas Harbour, in front of the Greea Cormorant."

For a week we pursued our course without deviation to east or west, and it was not until the 21st of March that the Paracutis lost sight of Halbrane Land, being carried towards the north by the current, while the coast-line of the continent, for such we are convinced it is, trended in a round curve to the north-east.

Although the waters of this portion of sea were still open, they carried a flotilla of icebergs or ice-fields. Hence arose serious difficulties and also dangers to navigation in the midst of the gloomy mists, when we had to manoeuvre between these moving masses, either to find passage or to prevent our little craft from being crushed like grain between the millstones.

Besides, Captain Len Guy could no longer ascertain his position either in latitude or longitude. The sun being absent, calculations by the position of the stars was too complicated, it was impossible to take altitudes, and the _Paracuta_ abandoned herself to the action of the current, which invariably bore us northward, as the compass indicated. By keeping the reckoning of its medium speed, however, we concluded that on the 27th of March our boat was between the sixty-ninth and the sixty-eighth parallels, that is to say, some seventy miles only from the Antarctic Circle.

Ah! if no obstacle to the course of our perilous navigation had existed, if passage between this inner sea of the southern zone and the waters of the Pacific Ocean had been certain, the _Paracuta_ might have reached the extreme limit of the austral seas in a few days. But a few hundred miles more to sail, and the iceberg-barrier would confront us with its immovable rampart, and unless a passage could be found, we should be obliged to go round it either by the east or by the west.

Once cleared indeed--

Ah! once cleared, we should be in a frail craft upon the terrible Pacific Ocean, at the period of the year when its tempests rage with redoubled fury and strong ships dread the might of its waves.

We were determined not to think of this. Heaven would come to our aid. We should be picked up by some ship. This the boatswain asserted confidently, and we were bound to believe the boatswain.

For six entire days, until the end of April, the Paracura held her course among the ice-barrier, whose crest was profiled at an altitude of between seven and eight hundred feet above the level of the sea. The extremities were not visible either on the east or the west, and if our boat did not find an open passage, we could not clear it. By a most fortunate chance a passage was found on the above-mentioned date, and attempted, amid a thousand risks. Yes, we required all the zeal, skill, and courage of our men and their chiefs to accomplish such a task.

At last we were in the South Pacific waters, but our boat had suffered severely in getting through, and it had sprung more than one leak. We were kept busy in baling out the water, which also came in from above.

The breeze was gentle, the sea more calm than we could have hoped, and the real danger did not lie in the risks of navigation. No, it arose from the fact that not a ship was visible in these waters, not a whaler was to be seen on the fishing-grounds. At the beginning of April these places are forsaken, and we arrived some weeks too late.

We learned afterwards that had we arrived a little sooner, we should have met the vessels of the American expedition.

In fact, on the 1st of February, by 95° 50' longitude and 64° 17' latitude, Lieutenant Wilkes was still exploring these seas in one of his ships, the Vincennes, after having discovered a long extent of coast stretching from east to west. On the approach of the bad season, he returned to Hobart Town, in Tasmania. The same year, the expedition of the French captain Dumont d'Urville, which started in 1838, discovered Adélie Land in 66° 30' latitude and 38° 21' east longitude, and Clarie Coast in 64° 30' and 129° 54'. Their campaign having ended with these important discoveries, the _Astrolabe_ and the _Zélée_ left the Antarctic Ocean and returned to Hobart Town.

None of these ships, then, were in those waters; so that, when our nutshell _Paracuta_ was "alone on a lone, lone sea" beyond the ice-barrier, we were bound to believe that it was no longer possible we could be saved.

We were fifteen hundred miles away from the nearest land, and winter was a month old!

Hurliguerly himself was obliged to acknowledge the last fortunate chance upon which he had counted failed us.

On the 6th of April we were at the end of our resources; the sea began to threaten, the boat seemed likely to be swallowed up in the angry waves.

"A ship!" cried the boatswain, and on the instant we made out a vessel about four miles to the north-east, beneath the mist which had suddenly risen.

Signals were made, signals were perceived; the ship lowered her largest boat and sent it to our rescue.

This ship was the _Tasman_, an American three-master, from Charlestown, where we were received with eager welcome and cordiality. The captain treated my companions as though they had been his own countrymen.

The _Tasman_ had come from the Falkland Islands where the captain had learned that seven months previously the American schooner _Halbrane_ had gone to the southern seas in search of the shipwrecked people of the _Jane_. But as the season advanced, the schooner not having reappeared, she was given up for lost in the Antarctic regions.
Fifteen days after our rescue the _Tasman_ disembarked the survivors of the crew of the two schooners at Melbourne, and it was there that our men were paid the sums they had so hardly earned, and so well deserved.

We then learned from maps that the _Paracuta_ had debouched into the Pacific from the land called Clarie by Dumont d’Urville, and the land called Fabricia, which was discovered in 1838 by Bellenny.

Thus terminated this adventurous and extraordinary expedition, which cost, alas, too many victims. Our final word is that although the chances and the necessities of our voyage carried us farther towards the south pole than hose who preceded us, although we actually did pass beyond the axial point of the terrestrial globe, discoveries of great value still remain to be made in those waters!

Arthur Pym, the hero whom Edgar Poe has made so famous, has shown the way. It is for others to follow him, and to wrest the last Antarctic Mystery from the Sphinx of the Ice-realm.

THE END.

End of the Voyage Extraordinaire
pursued to excess, were becoming rare. The "right" whale, which bears the name of "North Caper," in the Northern Ocean, and that of "Sulphur Bottom," in the South Sea, was likely to disappear. The whalers had been obliged to fall back on the finback or jubarte, a gigantic mammifer, whose attacks are not without danger.

This is what Captain Hull had done during this cruise; but on his next voyage he calculated on reaching a higher latitude, and, if necessary, going in sight of Clarie and Adelie Lands, whose discovery, contested by the American Wilkes, certainly belongs to the illustrious commander of the "Astrolabe" and the Zelee, to the Frenchman, Dumont d'Urville.

In fact, the season had not been favorable for the "Pilgrim." In the beginning of January, that is to say, toward the middle of the Southern summer, and even when the time for the whalers to return had not yet arrived Captain Hull had been obliged to abandon the fishing places. His additional crew--a collection of pretty sad subjects--gave him an excuse, as they say, and he determined to separate from them.

The "Pilgrim" then steered to the northwest, for New Zealand, which she sighted on the 15th of January. She arrived at Waitemata, port of Auckland, situated at the lowest end of the Gulf of Chouraki, on the east coast of the northern island, and landed the fishermen who had been engaged for the season.

The crew was not satisfied. The cargo of the "Pilgrim" was at least two hundred barrels of oil short. There had never been worse fishing. Captain Hull felt the disappointment of a hunter who, for the first time, returns as he went away--or nearly so. His self-love, greatly excited, was at stake, and he did not pardon those scoundrels whose insubordination had compromised the results of his cruise.

It was in vain that he endeavored to recruit a new fishing crew at Auckland. All the disposable seamen were embarked on the other whaling vessels. He was thus obliged to give up the hope of completing the "Pilgrim's" cargo, and Captain Hull was preparing to leave Auckland definitely, when a request for a passage was made which he could not refuse.

Mrs. Weldon, wife of the "Pilgrim's" owner, was then at Auckland with her young son Jack, aged about five years, and one of her relatives, her Cousin Benedict. James W. Weldon, whom his business operations sometimes obliged to visit New Zealand, had brought the three there, and intended to bring them back to San Francisco.

But, just as the whole family was going to depart, little Jack became seriously ill, and his father, imperatively recalled by his business, was obliged to leave Auckland, leaving his wife, his son, and Cousin Benedict there.

Three months had passed away--three long months of separation, which were extremely painful to Mrs. Weldon. Meanwhile her young child was restored to health, and she was at liberty to depart, when she was informed of the arrival of the "Pilgrim."

Now, at that period, in order to return to San Francisco, Mrs. Weldon found herself under the necessity of going to Australia by one of the vessels of the Golden Age Trans-oceanic Company, which ply between Melbourne and the Isthmus of Panama by Papeiti. Then, once arrived at Panama, it would be necessary for her to await the departure of the American steamer, which establishes a regular communication between the Isthmus and California.

Thence, delays, trans-shipments, always disagreeable for a woman and a child. It was just at this time that the "Pilgrim" came into port at Auckland. Mrs. Weldon did not hesitate, but asked Captain Hull to take her on board to bring her back to San Francisco--she, her son, Cousin Benedict, and Nan, an old negress who had served her since her infancy. Three thousand marine leagues to travel on a sailing vessel! But Captain Hull's ship was so well managed, and the season still so fine on both sides of the Equator! Captain Hull consented, and immediately put his own cabin at the disposal of his passenger. He wished that, during a voyage which might last forty or fifty days, Mrs. Weldon should be installed as well as possible on board the whaler.

There were then certain advantages for Mrs. Weldon in making the voyage under these conditions. The only disadvantage was that this voyage would be necessarily prolonged in consequence of this circumstance--the "Pilgrim" would go to Valparaiso, in Chili, to effect her unloading. That done, there would be nothing but to ascend the American coast, with land breezes, which make these parts very agreeable.

Besides, Mrs. Weldon was a courageous woman, whom the sea did not frighten. Then thirty years of age, she was of robust health, being accustomed to long voyages, for, having shared with her husband the fatigues of several passages, she did not fear the chances more or less contingent, of shipping on board a ship of moderate tonnage. She knew Captain Hull to be an excellent seaman, in whom James W. Weldon had every confidence. The "Pilgrim" was a strong vessel, capital sailer, well quoted in the flotilla of American whalers. The opportunity presented itself. It was necessary to profit by it. Mrs. Weldon did profit by it.

Cousin Benedict--it need not be said--would accompany her.

This cousin was a worthy man, about fifty years of age. But, notwithstanding his fifty years, it would not have been prudent to let him go out alone. Long, rather than tall, narrow, rather than thin, his figure bony, his skull enormous and very hairy, one recognized in his whole interminable person one of those worthy savants, with gold spectacles, good and inoffensive beings, destined to remain great children all their lives, and to finish very old, like
centenaries who would die at nurse.

"Cousin Benedict"—he was called so invariably, even outside of the family, and, in truth, he was indeed one of those good men who seem to be the born cousins of all the world—Cousin Benedict, always impeded by his long arms and his long limbs, would be absolutely incapable of attending to matters alone, even in the most ordinary circumstances of life. He was not troublesome, oh! no, but rather embarrassing for others, and embarrassed for himself. Easily satisfied, besides being very accommodating, forgetting to eat or drink, if some one did not bring him something to eat or drink, insensible to the cold as to the heat, he seemed to belong less to the animal kingdom than to the vegetable kingdom. One must conceive a very useless tree, without fruit and almost without leaves, incapable of giving nourishment or shelter, but with a good heart.

Such was Cousin Benedict. He would very willingly render service to people if, as Mr. Prudhomme would say, he were capable of rendering it.

Finally, his friends loved him for his very feebleness. Mrs. Weldon regarded him as her child—a large elder brother of her little Jack.

It is proper to add here that Cousin Benedict was, meanwhile, neither idle nor unoccupied. On the contrary, he was a worker. His only passion—natural history—absorbed him entirely.

To say "Natural History" is to say a great deal.

We know that the different parts of which this science is composed are zoology, botany, mineralogy, and geology.

Now Cousin Benedict was, in no sense, a botanist, nor a mineralogist, nor a geologist.

Was he, then, a zoologist in the entire acceptation of the word, a kind of Cuvier of the New World, decomposing an animal by analysis, or putting it together again by synthesis, one of those profound connoisseurs, versed in the study of the four types to which modern science refers all animal existence, vertebrates, mollusks, articulates, and radiates? Of these four divisions, had the artless but studious savant observed the different classes, and sought the orders, the families, the tribes, the genera, the species, and the varieties which distinguish them?

No.

Had Cousin Benedict devoted himself to the study of the vertebrates, mammals, birds, reptiles, and fishes?
No.

Was it to the mollusks, from the cephalopodes to the bryozoans, that he had given his preference, and had malacology no more secrets for him?

Not at all.

Then it was on the radiates, echinoderms, acalephes, polypes, entozoons, sponges, and infusoria, that he had for such a long time burned the midnight oil?

It must, indeed, be confessed that it was not on the radiates.

Now, in zoology there only remains to be mentioned the division of the articulates, so it must be that it was on this division that Cousin Benedict's only passion was expended.

Yes, and still it is necessary to select.

This branch of the articulates counts six classes: insects, myriapodes, arachnides, crustaceans, cirrhopodes, and annelides.

Now, Cousin Benedict, scientifically speaking, would not know how to distinguish an earth-worm from a medicinal leech, a sand-fly from a glans-marinus, a common spider from a false scorpion, a shrimp from a frog, a gally-worm from a scolopendra.

But, then, what was Cousin Benedict? Simply an entomologist—nothing more.

To that, doubtless, it may be said that in its etymological acceptation, entomology is that part of the natural sciences which includes all the articulates. That is true, in a general way; but it is the custom to give this word a more restricted sense. It is then only applied, properly speaking, to the study of insects, that is to say: "All the articulate animals of which the body, composed of rings placed end to end, forms three distinct segments, and which possesses three pairs of legs, which have given them the name of hexapodes."

Now, as Cousin Benedict had confined himself to the study of the articulates of this class, he was only an entomologist.

But, let us not be mistaken about it. In this class of the insects are counted not less than ten orders:

1. Orthopterans as grasshoppers, crickets, etc. 2. Neuropterans as ant-eaters, dragon-flies or libellula. 3. Hymenopterans as bees, wasps, ants. 4. Lepidopterans as butterflies, etc. 5. Hemipterans as cicada, plant-lice, fleas, etc. 6. Coleopterans as cockchafers, fire-flies, etc. 7. Dipterans as gnats, musquitoes, flies. 8. Rhipipterans as stylops. 9. Parasites as acara, etc. 10. Thysanurans as lepidotus, flying-lice, etc.

Now, in certain of these orders, the coleopters, for example, there are recognized thirty thousand species, and sixty thousand in the dipters; so subjects for study are not wanting, and it will be conceded that there is sufficient in
this class alone to occupy a man!

Thus, Cousin Benedict's life was entirely and solely consecrated to entomology.

To this science he gave all his hours--all, without exception, even the hours of sleep, because he invariably dreamt "hexapodes." That he carried pins stuck in his sleeves and in the collar of his coat, in the bottom of his hat, and in the facings of his vest, need not be mentioned.

When Cousin Benedict returned from some scientific promenade his precious head-covering in particular was no more than a box of natural history, being bristling inside and outside with pierced insects.

And now all will be told about this original when it is stated, that it was on account of his passion for entomology that he had accompanied Mr. and Mrs. Weldon to New Zealand. There his collection was enriched by some rare subjects, and it will be readily understood that he was in haste to return to classify them in the cases of his cabinet in San Francisco.

So, as Mrs. Weldon and her child were returning to America by the "Pilgrim," nothing more natural than for Cousin Benedict to accompany them during that passage.

But it was not on him that Mrs. Weldon could rely, if she should ever find herself in any critical situation. Very fortunately, the prospect was only that of a voyage easily made during the fine season, and on board of a ship whose captain merited all her confidence.

During the three days that the "Pilgrim" was in port at Waitemata, Mrs. Weldon made her preparations in great haste, for she did not wish to delay the departure of the schooner. The native servants whom she employed in her dwelling in Auckland were dismissed, and, on the 22d January, she embarked on board the "Pilgrim," bringing only her son Jack, Cousin Benedict, and Nan, her old negress.

Cousin Benedict carried all his curious collection of insects in a special box. In this collection figured, among others, some specimens of those new staphylins, species of carnivorous coleopters, whose eyes are placed above the head, and which, till then, seemed to be peculiar to New Caledonia. A certain venomous spider, the "katipo," of the Maoris, whose bite is often fatal to the natives, had been very highly recommended to him. But a spider does not belong to the order of insects properly so called; it is placed in that of the arachnida, and, consequently, was valueless in Cousin Benedict's eyes. Thus he scorned it, and the most beautiful jewel of his collection was a remarkable staphylin from New Zealand.

It is needless to say that Cousin Benedict, by paying a heavy premium, had insured his cargo, which to him seemed much more precious than all the freight of oil and bones stowed away in the hold of the "Pilgrim."

Just as the "Pilgrim" was getting under sail, when Mrs. Weldon and her companion for the voyage found themselves on the deck of the schooner, Captain Hull approached his passenger:

"It is understood, Mrs. Weldon," he said to her, "that, if you take passage on board the 'Pilgrim,' it is on your own responsibility."

"Why do you make that observation to me, Mr. Hull?" asked Mrs. Weldon.

"Because I have not received an order from your husband in regard to it, and, all things considered, a schooner cannot offer you the guarantees of a good passage, like a packet-boat, specially intended to carry travelers."

"If my husband were here," replied Mrs. Weldon, "do you think, Mr. Hull, that he would hesitate to embark on the 'Pilgrim,' in company with his wife and child?"

"No, Mrs. Weldon, he would not hesitate," said Captain Hull; "no, indeed! no more than I should hesitate myself! The 'Pilgrim' is a good ship after all, even though she has made but a sad cruise, and I am sure of her, as much so as a seaman can be of the ship which he has commanded for several years. The reason I speak, Mrs. Weldon, is to get rid of personal responsibility, and to repeat that you will not find on board the comfort to which you have been accustomed."

"As it is only a question of comfort, Mr. Hull," replied Mrs. Weldon, "that should not stop me. I am not one of those troublesome passengers who complain incessantly of the narrowness of the cabins, and the insufficiency of the table."

Then, after looking for a few moments at her little Jack, whom she held by the hand, Mrs. Weldon said:

"Let us go, Mr. Hull!"

The orders were given to get under way at once, the sails were set, and the "Pilgrim," working to get out to sea in the shortest time possible, steered for the American coast.

But, three days after her departure, the schooner, thwarted by strong breezes from the east, was obliged to tack to larboard to make headway against the wind. So, at the date of February 2d, Captain Hull still found himself in a higher latitude than he would have wished, and in the situation of a sailor who wanted to double Cape Horn rather than reach the New Continent by the shortest course.
CHAPTER II.
DICK SAND.

Meanwhile the sea was favorable, and, except the delays, navigation would be accomplished under very
supportable conditions.

Mrs. Weldon had been installed on board the "Pilgrim" as comfortably as possible.

Neither poop nor "roufle" was at the end of the deck. There was no stern cabin, then, to receive the passengers.
She was obliged to be contented with Captain Hull's cabin, situated aft, which constituted his modest sea lodging.
And still it had been necessary for the captain to insist, in order to make her accept it. There, in that narrow lodging,
was installed Mrs. Weldon, with her child and old Nan. She took her meals there, in company with the captain and
Cousin Benedict, for whom they had fitted up a kind of cabin on board.

As to the commander of the "Pilgrim," he had settled himself in a cabin belonging to the ship's crew--a cabin
which would be occupied by the second officer, if there were a second one on board. But the brig-schooner was
navigated, we know, under conditions which enabled her to dispense with the services of a second officer.

The men of the "Pilgrim," good and strong seamen, were very much united by common ideas and habits. This
fishing season was the fourth which they had passed together. All Americans of the West, they were acquainted for a
long period, and belonged to the same coast of the State of California.

These brave men showed themselves very thoughtful towards Mrs. Weldon, the wife of the owner of their ship,
for whom they professed boundless devotion. It must be said that, largely interested in the profits of the ship, they
had navigated till then with great gain. If, by reason of their small number, they did not spare themselves, it was
because every labor increased their earnings in the settling of accounts at the end of each season. This time, it is true,
the profit would be almost nothing, and that gave them just cause to curse and swear against those New Zealand
scoundrels.

One man on board, alone among all, was not of American origin. Portuguese by birth, but speaking English
fluently, he was called Negoro, and filled the humble position of cook on board.

Negoro might be forty years old. Thin, nervous, of medium height, with very brown hair, skin somewhat
swarthy, he ought to be strong. Had he received any instruction? Yes; that appeared in certain observations which
escaped him sometimes. Besides, he never spoke of his past life, he said not a word about his family. Whence he
came, where he had lived, no one could tell. What would his future be? No one knew any more about that. He only
announced his intention of going on shore at Valparaiso. He was certainly a singular man. At all events, he did not
seem to be a sailor. He seemed to be even more strange to marine things than is usual with a master cook, part of
whose existence is passed at sea.

Meanwhile, as to being incommoded by the rolling and pitching of the ship, like men who have never navigated,
he was not in the least, and that is something for a cook on board a vessel.

Finally, he was little seen. During the day, he most generally remained confined in his narrow kitchen, before the
stove for melting, which occupied the greater part of it. When night came and the fire in the stove was out, Negoro
went to the cabin which was assigned to him at the end of the crew's quarters. Then he went to bed at once and went
to sleep.

It has been already said that the "Pilgrim's" crew was composed of five sailors and a novice.

This young novice, aged fifteen, was the child of an unknown father and mother. This poor being, abandoned
from his birth, had been received and brought up by public charity.

Dick Sand--that was his name--must have been originally from the State of New York, and doubtless from the
capital of that State.

If the name of Dick--an abbreviation of Richard--had been given to the little orphan, it was because it was the
name of the charitable passer-by who had picked him up two or three hours after his birth. As to the name of Sand, it
was attributed to him in remembrance of the place where he had been found; that is to say, on that point of land
called Sandy-Hook, which forms the entrance of the port of New York, at the mouth of the Hudson.

Dick Sand, when he should reach his full growth, would not exceed middle height, but he was well built. One
could not doubt that he was of Anglo-Saxon origin. He was brown, however, with blue eyes, in which the crystalline
sparkled with ardent fire. His seaman's craft had already prepared him well for the conflicts of life. His intelligent

circumstances.

Weldon's, his benefactor, commanded by his protector, Captain Hull. Thus he found himself in the most favorable

first time on the "Pilgrim." A good seaman ought to understand fishing as well as navigation. It is a good preparation

portion of his instruction, he did not neglect to join the practical. It was as novice that he was able to embark for the

San Francisco, and he had him brought up in the Catholic religion, to which his family adhered.

This honest seaman immediately formed a friendship with this honest young boy, and later he made him known to

the South Sea. There he learned the seaman's trade, and as one ought to learn it, from the earliest age. Little by little

he instructed himself under the direction of officers who were interested in this little old man. So the cabin-boy soon

became the novice, expecting something better, of course. The child who understands, from the beginning, that work

is the law of life, the one who knows, from an early age, that he will gain his bread only by the sweat of his brow--a

Bible precept which is the rule of humanity--that one is probably intended for great things; for some day he will

have, with the will, the strength to accomplish them.

It was, when he was a cabin-boy on board a merchant vessel, that Dick Sand was remarked by Captain Hull. This

honest seaman immediately formed a friendship with this honest young boy, and later he made him known to the

ship-owner, James W. Weldon. The latter felt a lively interest in this orphan, whose education he completed at

San Francisco, and he had him brought up in the Catholic religion, to which his family adhered.

During the course of his studies, Dick Sand showed a particular liking for geography, for voyages, while waiting
till he was old enough to learn that branch of mathematics which relates to navigation. Then to this theoretical

portion of his instruction, he did not neglect to join the practical. It was as novice that he was able to embark for the

first time on the "Pilgrim." A good seaman ought to understand fishing as well as navigation. It is a good preparation

for all the contingencies which the maritime career admits of. Besides, Dick Sand set out on a vessel of James W.

Weldon's, his benefactor, commanded by his protector, Captain Hull. Thus he found himself in the most favorable

circumstances.

To speak of the extent of his devotion to the Weldon family, to whom he owed everything, would be

superfluous. Better let the facts speak for themselves. But it will be understood how happy the young novice was

when he learned that Mrs. Weldon was going to take passage on board the "Pilgrim." Mrs. Weldon for several years

had been a mother to him, and in Jack he saw a little brother, all the time keeping in remembrance his position in

respect to the son of the rich ship-owner. But--his protectors knew it well--this good seed which they had sown had

fallen on good soil. The orphan's heart was filled with gratitude, and some day, if it should be necessary to give his

life for those who had taught him to instruct himself and to love God, the young novice would not hesitate to give it.

Finally, to be only fifteen, but to act and think as if he were thirty, that was Dick Sand.

Mrs. Weldon knew what her _protégé_ was worth. She could trust little Jack with him without any anxiety. Dick

Sand cherished this child, who, feeling himself loved by this "large brother," sought his company. During those long

leisure hours, which are frequent in a voyage, when the sea is smooth, when the well set up sails require no

management, Dick and Jack were almost always together. The young novice showed the little boy everything in his

craft which seemed amusing.

Without fear Mrs. Weldon saw Jack, in company with Dick Sand, spring out on the shrouds, climb to the top of

the mizzen-mast, or to the booms of the mizzen-topmast, and come down again like an arrow the whole length of the

backstays. Dick Sand went before or followed him, always ready to hold him up or keep him back, if his six-year-

old arms grew feeble during those exercises. All that benefited little Jack, whom sickness had made somewhat pale;

but his color soon came back on board the "Pilgrim," thanks to this gymnastic, and to the bracing sea-breezes.

So passed the time. Under these conditions the passage was being accomplished, and only the weather was not
very favorable, neither the passengers nor the crew of the "Pilgrim" would have had cause to complain.

Meanwhile this continuance of east winds made Captain Hull anxious. He did not succeed in getting the vessel into the right course. Later, near the Tropic of Capricorn, he feared finding calms which would delay him again, without speaking of the equatorial current, which would irresistibly throw him back to the west. He was troubled then, above all, for Mrs. Weldon, by the delays for which, meanwhile, he was not responsible. So, if he should meet, on his course, some transatlantic steamer on the way toward America, he already thought of advising his passenger to embark on it. Unfortunately, he was detained in latitudes too high to cross a steamer running to Panama; and, besides, at that period communication across the Pacific, between Australia and the New World, was not as frequent as it has since become.

It then was necessary to leave everything to the grace of God, and it seemed as if nothing would trouble this monotonous passage, when the first incident occurred precisely on that day, February 2d, in the latitude and longitude indicated at the beginning of this history.

Dick Sand and Jack, toward nine o'clock in the morning, in very clear weather, were installed on the booms of the mizzen-topmast. Thence they looked down on the whole ship and a portion of the ocean in a large circumferenee. Behind, the perimeter of the horizon was broken to their eyes, only by the mainmast, carrying brigantine and fore-staff. That beacon hid from them a part of the sea and the sky. In the front, they saw the bowsprit stretching over the waves, with its three jibs, which were hauled tightly, spread out like three great unequal wings. Underneath rounded the foremast, and above, the little top-sail and the little gallant-sail, whose bolt-rope quivered with the pranks of the breeze. The schooner was then running on the larboard tack, and hugging the wind as much as possible.

Dick Sand explained to Jack how the "Pilgrim," ballasted properly, well balanced in all her parts, could not capsize, even if she gave a pretty strong heel to starboard, when the little boy interrupted him.

"What do I see there?" said he.

"You see something, Jack?" demanded Dick Sand, who stood up straight on the booms.

"Yes--there!" replied little Jack, showing a point of the sea, left open by the interval between the stays of the standing-jib and the flying-jib.

Dick Sand looked at the point indicated attentively, and forthwith, with a loud voice, he cried;

"A wreck to windward, over against starboard!"

* * * * *

CHAPTER III.

THE WRECK.

Dick Sand's cry brought all the crew to their feet. The men who were not on watch came on deck. Captain Hull, leaving his cabin, went toward the bow.

Mrs. Weldon, Nan, even the indifferent Cousin Benedict himself, came to lean over the starboard rail, so as to see the wreck signaled by the young novice.

Negoro, alone, did not leave the cabin, which served him for a kitchen; and as usual, of all the crew, he was the only one whom the encounter with a wreck did not appear to interest.

Then all regarded attentively the floating object which the waves were rocking, three miles from the "Pilgrim."

"Ah! what can that be?" said a sailor.

"Some abandoned raft," replied another.

"Perhaps there are some unhappy shipwrecked ones on that raft," said Mrs. Weldon.

"We shall find out," replied Captain Hull. "But that wreck is not a raft. It is a hull thrown over on the side."

"Ah! is it not more likely to be some marine animal--some mammifer of great size?" observed Cousin Benedict.

"I do not think so," replied the novice.

"Then what is your idea, Dick?" asked Mrs. Weldon.

"An overturned hull, as the captain has said, Mrs. Weldon. It even seems to me that I see its copper keel glistening in the sun."

"Yes--indeed," replied Captain Hull. Then addressing the helmsman: "Steer to the windward, Bolton. Let her go a quarter, so as to come alongside the wreck."

"Yes, sir," replied the helmsman.

"But," continued Cousin Benedict, "I keep to what I have said. Positively it is an animal."

"Then this would be a whale in copper," replied Captain Hull, "for, positively, also, I see it shine in the sun!"

"At all events, Cousin Benedict," added Mrs. Weldon, "you will agree with us that this whale must be dead, for it is certain that it does not make the least movement."
“Ah! Cousin Weldon,” replied Cousin Benedict, who was obstinate, “this would not be the first time that one has met a whale sleeping on the surface of the waves.”

“That is a fact,” replied Captain Hull; “but to-day, the thing is not a whale, but a ship.”

“We shall soon see,” replied Cousin Benedict, who, after all, would give all the mammifers of the Arctic or Antarctic seas for an insect of a rare species.

“Steer, Bolton, steer!” cried Captain Hull again, “and do not board the wreck. Keep a cable's length. If we cannot do much harm to this hull, it might cause us some damage, and I do not care to hurt the sides of the 'Pilgrim' with it. Tack a little, Bolton, tack!”

The “Pilgrim's” prow, which had been directed toward the wreck, was turned aside by a slight movement of the helm.

The schooner was still a mile from the capsized hull. The sailors were eagerly looking at it. Perhaps it held a valuable cargo, which it would be possible to transfer to the "Pilgrim." We know that, in these salvages, the third of the value belongs to the rescuers, and, in this case, if the cargo was not damaged, the crew, as they say, would make "a good haul." This would be a fish of consolation for their incomplete fishing.

A quarter of an hour later the wreck was less than a mile from the "Pilgrim."

It was indeed a ship, which presented itself on its side, to the starboard. Capsized as far as the nettings, she heeled so much that it would be almost impossible to stand upon her deck. Nothing could be seen beyond her masts. From the port-shrouds were banging only some ends of broken rope, and the chains broken by the cloaks of white-crested waves. On the starboard side opened a large hole between the timbers of the frame-work and the damaged planks.

"This ship has been run into," cried Dick Sand.

"There is no doubt of that," replied Captain Hull; "and it is a miracle that she did not sink immediately."

"If there has been a collision," observed Mrs. Weldon, "we must hope that the crew of this ship has been picked up by those who struck her."

"It is to be hoped so, Mrs. Weldon," replied Captain Hull, "unless this crew sought refuge in their own boats after the collision, in case the colliding vessel should sail right on--which, alas! sometimes happens."

"Is it possible? That would be a proof of very great inhumanity, Mr. Hull."

"Yes, Mrs. Weldon. Yes! and instances are not wanting. As to the crew of this ship, what makes me believe that it is more likely they have left it, is that I do not see a single boat; and, unless the men on board have been picked up, I should be more inclined to think that they have tried to reach the land. But, at this distance from the American continent, or from the islands of Oceanica, it is to be feared that they have not succeeded."

"Perhaps," said Mrs. Weldon, "we shall never know the secret of this catastrophe. Meanwhile, it might be possible that some man of the crew is still on board."

"That is not probable, Mrs. Weldon," replied Captain Hull. "Our approach would be already known, and they would make some signals to us. But we shall make sure of it.--Luff a little, Bolton, luff," cried Captain Hull, while indicating with his hand what course to take.

The "Pilgrim" was now only three cables' length from the wreck, and they could no longer doubt that this hull had been completely abandoned by all its crew.

But, at that moment, Dick Sand made a gesture which imperiously demanded silence.

"Listen, listen!" said he.

Each listened.

"I hear something like a bark!" cried Dick Sand. In fact, a distant barking resounded from the interior of the hull. Certainly there was a living dog there, imprisoned perhaps, for it was possible that the hatches were hermetically closed. But they could not see it, the deck of the capsized vessel being still invisible.

"If there be only a dog there, Mr. Hull," said Mrs. "Weldon," we shall save it."

"Yes, yes!" cried little Jack, "we shall save it. I shall give it something to eat! It will love us well! Mama, I am going to bring it a piece of sugar!"

"Stay still, my child," replied Mrs. Weldon smiling. "I believe that the poor animal is dying of hunger, and it will prefer a good mess to your morsel of sugar."

"Well, then, let it have my soup," cried little Jack. "I can do without it very well."

At that moment the barking was more distinctly heard. Three hundred feet, at the most, separated the two ships. Almost immediately a dog of great height appeared on the starboard netting, and clung there, barking more despairingly than ever.

"Howik," said Captain Hull, turning toward the master of the "Pilgrim's" crew, "heave to, and lower the small boat."

"Hold on, my dog, hold on!" cried little Jack to the animal, which seemed to answer him with a half-stifled bark.
The "Pilgrim's" sails were rapidly furled, so that the ship should remain almost motionless, less than half a cable's length from the wreck.

The boat was brought alongside. Captain Hull, Dick Sand and two sailors got into it at once.

The dog barked all the time. It tried to hold on to the netting, but every moment it fell back on the deck. One would say that its barks were no longer addressed to those who were coming to him. Were they then addressed to some sailors or passengers imprisoned in this ship?

"Is there, then, on board some shipwrecked one who has survived?" Mrs. Weldon asked herself.

A few strokes of the oars and the "Pilgrim's" boat would reach the capsized hull.

But, suddenly, the dog's manner changed. Furious barks succeeded its first barks inviting the rescuers to come. The most violent anger excited the singular animal.

"What can be the matter with that dog?" said Captain Hull, while the boat was turning the stern of the vessel, so as to come alongside of the part of the deck lying under the water.

What Captain Hull could not then observe, what could not be noticed even on board the "Pilgrim," was that the dog's fury manifested itself just at the moment when Negoro, leaving his kitchen, had just come toward the forecastle.

Did the dog then know and recognize the master cook? It was very improbable.

However that may be, after looking at the dog, without showing any surprise, Negoro, who, however, frowned for an instant, returned to the crew's quarters.

Meanwhile the boat had rounded the larboard netting. A somewhat strong swell of the sea would certainly submerge the "Waldeck" in a few moments.

The brig's deck had been swept from one end to the other. There was nothing left except the stumps of the mainmast and of the mizzen-mast, both broken off two feet above the scuttles, and which had fallen in the collision, carrying away shrouds, back-stays, and rigging. Meanwhile, as far as the eye could see, no wreck was visible around the "Waldeck"--which seemed to indicate that the catastrophe was already several days old.

"If some unhappy creatures have survived the collision," said Captain Hull, "it is probable that either hunger or thirst has finished them, for the water must have gained the store-room. There are only dead bodies on board!"

"No," cried Dick Sand, "no! The dog would not bark that way. There are living beings on board!"

At that moment the animal, responding to the call of the novice, slid to the sea, and swam painfully toward the boat, for it seemed to be exhausted.

They took it in, and it rushed eagerly, not for a piece of bread that Dick Sand offered it first, but to a half-tub which contained a little fresh water.

"This poor animal is dying of thirst!" cried Dick Sand.

The boat then sought a favorable place to board the "Waldeck" more easily, and for that purpose it drew away a few strokes. The dog evidently thought that its rescuers did not wish to go on board, for he seized Dick Sand by his jacket, and his lamentable barks commenced again with new strength.

They understood it. Its pantomime and its language were as clear as a man's language could be. The boat was brought immediately as far as the larboard cat-head. There the two sailors moored it firmly, while Captain Hull and Dick Sand, setting foot on the deck at the same time as the dog, raised themselves, not without difficulty, to the hatch which opened between the stumps of the two masts.

By this hatch the two made their way into the hold.

The "Waldeck's" hold, half full of water, contained no goods. The brig sailed with ballast--a ballast of sand which had slid to larboard and which helped to keep the ship on her side. On that head, then, there was no salvage to effect.

"Nobody here," said Captain Hull.
"Nobody," replied the novice, after having gone to the foremost part of the hold.
But the dog, which was on the deck, kept on barking and seemed to call the captain's attention more
imperatively.
"Let us go up again," said Captain Hull to the novice.
Both appeared again on the deck.
The dog, running to them, sought to draw them to the poop.
They followed it.
There, in the square, five bodies—undoubtedly five corpses—were lying on the floor.
By the daylight which entered in waves by the opening, Captain Hull discovered the bodies of five negroes.
Dick Sand, going from one to the other, thought he felt that the unfortunates were still breathing.
"On board! on board!" cried Captain Hull.
The two sailors who took care of the boat were called, and helped to carry the shipwrecked men out of the poop.
This was not without difficulty, but two minutes after, the five blacks were laid in the boat, without being at all
conscious that any one was trying to save them. A few drops of cordial, then a little fresh water prudently
administered, might, perhaps, recall them to life.
The "Pilgrim" remained a half cable's length from the wreck, and the boat would soon reach her.
A girt-line was let down from the main-yard, and each of the blacks drawn up separately reposed at last on the
"Pilgrim's" deck.
The dog had accompanied them.
"The unhappy creatures!" cried Mrs. Weldon, on perceiving those poor men, who were only inert bodies.
"They are alive, Mrs. Weldon. We shall save them. Yes, we shall save them," cried Dick Sand.
"What has happened to them?" demanded Cousin Benedict.
"Wait till they can speak," replied Captain Hull, "and they will tell us their history. But first of all, let us make
them drink a little water, in which we shall mix a few drops of rum." Then, turning round: "Negoro!" he called.
At that name the dog stood up as if it knew the sound, its hair bristling, its mouth open.
Meanwhile, the cook did not appear.
"Negoro!" repeated Captain Hull.
The dog again gave signs of extreme fury.
Negoro left the kitchen.
Hardly had he shown himself on the deck, than the dog sprang on him and wanted to jump at his throat.
With a blow from the poker with which he was armed, the cook drove away the animal, which some of the
sailors succeeded in holding.
"Do you know this dog?" Captain Hull asked the master cook.
"I?" replied Negoro. "I have never seen it."
"That is singular," murmured Dick Sand.
* * * *

CHAPTER IV.
THE SURVIVORS OF THE "WALDECK."
The slave trade was still carried on, on a large scale, in all equinoctial Africa. Notwithstanding the English and
French cruisers, ships loaded with slaves leave the coasts of Angola and Mozambique every year to transport
negroes to various parts of the world, and, it must be said, of the civilized world.
Captain Hull was not ignorant of it. Though these parts were not ordinarily frequented by slave-ships, he asked
himself if these blacks, whose salvage he had just effected, were not the survivors of a cargo of slaves that the
"Waldeck" was going to sell to some Pacific colony. At all events, if that was so, the blacks became free again by
the sole act of setting foot on his deck, and he longed to tell it to them.
Meanwhile the most earnest care had been lavished on the shipwrecked men from the "Waldeck." Mrs. Weldon,
aided by Nan and Dick Sand, had administered to them a little of that good fresh water of which they must have
been deprived for several days, and that, with some nourishment, sufficed to restore them to life.
The eldest of these blacks—he might be about sixty years old—was soon able to speak, and he could answer in
English the questions which were addressed to him.
"The ship which carried you was run into?" asked Captain Hull, first of all.
"Yes," replied the old black. "Ten days ago our ship was struck, during a very dark night. We were asleep----"
"But the men of the 'Waldeck'—what has become of them?"
"They were no longer there, sir, when my companions and I reached the deck."
"Then, was the crew able to jump on board the ship which struck the 'Waldeck'?' demanded Captain Hull.

"Perhaps, and we must indeed hope so for their sakes."

"And that ship, after the collision, did it not return to pick you up?"

"No."

"Did she then go down herself?"

"She did not founder," replied the old black, shaking his head, "for we could see her running away in the night."

This fact, which was attested by all the survivors of the "Waldeck," may appear incredible. It is only too true, however, that captains, after some terrible collision, due to their imprudence, have often taken flight without troubling themselves about the unfortunate ones whom they had put in danger, and without endeavoring to carry assistance to them.

That drivers do as much and leave to others, on the public way, the trouble of repairing the misfortune which they have caused, that is indeed to be condemned. Still, their victims are assured of finding immediate help. But, that men to men, abandon each other thus at sea, it is not to be believed, it is a shame!

Meanwhile, Captain Hull knew several examples of such inhumanity, and he was obliged to tell Mrs. Weldon that such facts, monstrous as they might be, were unhappily not rare.

Then, continuing:

"Whence came the 'Waldeck?'" he asked.

"From Melbourne."

"Then you are not slaves?"

"No, sir!" the old black answered quickly, as he stood up straight. "We are subjects of the State of Pennsylvania, and citizens of free America!"

"My friends," replied Captain Hull, "believe me that you have not compromised your liberty in coming on board of the American brig, the 'Pilgrim.'"

In fact, the five blacks which the "Waldeck" carried belonged to the State of Pennsylvania. The oldest, sold in Africa as a slave at the age of six years, then brought to the United States, had been freed already many years ago by the Emancipation Proclamation. As to his companions, much younger than he, sons of slaves liberated before their birth, they were born free; no white had ever had the right of property over them. They did not even speak that "negro" language, which does not use the article, and only knows the infinitive of the verbs—a language which has disappeared little by little, indeed, since the anti-slavery war. These blacks had, then, freely left the United States, and they were returning to it freely.

As they told Captain Hull, they were engaged as laborers at an Englishman's who owned a vast mine near Melbourne, in Southern Australia. There they had passed three years, with great profit to themselves; their engagement ended, they had wished to return to America.

They then had embarked on the "Waldeck," paying their passage like ordinary passengers. On the 5th of December they left Melbourne, and seventeen days after, during a very black night, the "Waldeck" had been struck by a large steamer.

The blacks were in bed. A few seconds after the collision, which was terrible, they rushed on the deck.

Already the ship's masts had fallen, and the "Waldeck" was lying on the side; but she would not sink, the water not having invaded the hold sufficiently to cause it.

As to the captain and crew of the "Waldeck," all had disappeared, whether some had been precipitated into the sea, whether others were caught on the rigging of the colliding ship, which, after the collision, had fled to return no more.

The five blacks were left alone on board, on a half-capsized hull, twelve hundred miles from any land.

Then oldest of the negroes was named Tom. His age, as well as his energetic character, and his experience, often put to the proof during a long life of labor, made him the natural head of the companions who were engaged with him.

The other blacks were young men from twenty-five to thirty years old, whose names were Bat (abbreviation of Bartholomew), son of old Tom, Austin, Acteon, and Hercules, all four well made and vigorous, and who would bring a high price in the markets of Central Africa. Even though they had suffered terribly, one could easily recognize in them magnificent specimens of that strong race, on which a liberal education, drawn from the numerous schools of North America, had already impressed its seal.

Tom and his companions then found themselves alone on the "Waldeck" after the collision, having no means of raising that inert hull, without even power to leave it, because the two boats on board had been shattered in the boarding. They were reduced to waiting for the passage of a ship, while the wreck drifted little by little under the action of the currents. This action explained why she had been encountered so far out of her course, for the "Waldeck," having left Melbourne, ought to be found in much lower latitude.
During the ten days which elapsed between the collision and the moment when the "Pilgrim" arrived in sight of the shipwrecked vessel the five blacks were sustained by some food which they had found in the office of the landing-place. But, not being able to penetrate into the steward's room, which the water entirely covered, they had had no spirits to quench their thirst, and they had suffered cruelly, the water casks fastened to the deck having been stove in by the collision. Since the night before, Tom and his companions, tortured by thirst, had become unconscious.

Such was the recital which Tom gave, in a few words, to Captain Hull. There was no reason to doubt the veracity of the old black. His companions confirmed all that he had said; besides, the facts pleaded for the poor men.

Another living being, saved on the wreck, would doubtless have spoken with the same sincerity if it had been gifted with speech.

It was that dog, that the sight of Negoro seemed to affect in such a disagreeable manner. There was in that some truly inexplicable antipathy.

Dingo--that was the name of the dog--belonged to that race of mastiffs which is peculiar to New Holland. It was not in Australia, however, that the captain of the "Waldeck" had found it. Two years before Dingo, wandering half dead of hunger, had been met on the western coast of Africa, near the mouth of the Congo. The captain of the "Waldeck" had picked up this fine animal, who, being not very sociable, seemed to be always regretting some old master, from whom he had been violently separated, and whom it would be impossible to find again in that desert country. S. V.--those two letters engraved on his collar--were all that linked this animal to a past, whose mystery one would seek in vain to solve.

Dingo, a magnificent and robust beast, larger than the dogs of the Pyrenees, was then a superb specimen of the New Holland variety of mastiffs. When it stood up, throwing its head back, it equaled the height of a man. Its agility--its muscular strength, would be sufficient for one of those animals which without hesitation attack jaguars and panthers, and do not fear to face a bear. Its long tail of thick hair, well stocked and stiff like a lion's tail, its general hue dark fawn-color, was only varied at the nose by some whitish streaks. This animal, under the influence of anger, might become formidable, and it will be understood that Negoro was not satisfied with the reception given him by this vigorous specimen of the canine race.

Meanwhile, Dingo, if it was not sociable, was not bad. It seemed rather to be sad. An observation which had been made by old Tom on board the "Waldeck" was that this dog did not seem to like blacks. It did not seek to harm them, but certainly it shunned them. May be, on that African coast where it wandered, it had suffered some bad treatment from the natives. So, though Tom and his companions were honest men, Dingo was never drawn toward them. During the ten days that the shipwrecked dog had passed on the "Waldeck," it had kept at a distance, feeding itself, they knew not how, but having also suffered cruelly from thirst.

Such, then, were the survivors of this wreck, which the first surge of the sea would submerge. No doubt it would have carried only dead bodies into the depths of the ocean if the unexpected arrival of the "Pilgrim," herself kept back by calms and contrary winds, had not permitted Captain Hull to do a work of humanity.

This work had only to be completed by bringing back to their country the shipwrecked men from the "Waldeck," who, in this shipwreck, had lost their savings of three years of labor. This is what was going to be done. The "Pilgrim," after having effected her unloading at Valparaiso, would ascend the American coast as far as California. There Tom and his companions would be well received by James W. Weldon--his generous wife assured them of it--and they would be provided with all that would be necessary for them to return to the State of Pennsylvania.

These honest men, reassured about the future, had only to thank Mrs. Weldon and Captain Hull. Certainly they owed them a great deal, and although they were only poor negroes, perhaps, they did not despair of some day paying this debt of gratitude.

CHAPTER V.

S. V.

Meanwhile, the "Pilgrim" had continued her course, making for the east as much as possible. This lamentable continuance of calms did not cease to trouble Captain Hull--not that he was uneasy about two or three weeks' delay in a passage from New Zealand to Valparaiso, but because of the extra fatigue which this delay might bring to his lady passenger.

Meanwhile, Mrs. Weldon did not complain, and philosophically took her misfortune in patience.

That same day, February 2d, toward evening, the wreck was lost sight of.

Captain Hull was troubled, in the first place, to accommodate Tom and his companions as conveniently as possible. The crew's quarters on the "Pilgrim," built on the deck in the form of a "roufle," would be too small to hold them. An arrangement was then made to lodge them under the forecastle. Besides, these honest men, accustomed to
rude labors, could not be hard to please, and with fine weather, warm and salubrious, this sleeping-place ought to suffice for the whole passage.

The life on board, shaken for a moment from its monotony by this incident, then went on as usual.

Tom, Austin, Bat, Acteon, and Hercules would indeed wish to make themselves useful. But with these constant winds, the sails once set, there was nothing more to do. Meanwhile, when there was a veering about, the old black and his companions hastened to give a hand to the crew, and it must be confessed that when the colossal Hercules hauled some rope, they were aware of it. This vigorous negro, six feet high, brought in a tackle all by himself.

It was joy for little Jack to look at this giant. He was not afraid of him, and when Hercules hoisted him up in his arms, as if he were only a cork baby, there were cries of joy to go on.

"Lift me very high," said little Jack.
"There, Master Jack!" replied Hercules.
"Am I very heavy?"
"I do not even feel you."
"Well, higher still! To the end of your arm!" And Hercules, holding the child's two little feet in his large hand, walked him about like a gymnast in a circus. Jack saw himself, tall, taller, which amused him very much. He even tried to make himself heavy—which the colossus did not perceive at all.

Dick Sand and Hercules, they were two friends for little Jack. He was not slow in making himself a third--that was Dingo.

It has been said that Dingo was not a sociable dog. Doubtless that held good, because the society of the "Waldeck" did not suit it. On board the "Pilgrim" it was quite another thing. Jack probably knew how to touch the fine animal's heart. The latter soon took pleasure in playing with the little boy, whom this play pleased. It was soon discovered that Dingo was one of those dogs who have a particular taste for children. Besides, Jack did it no harm. His greatest pleasure was to transform Dingo into a swift steed, and it is safe to affirm that a horse of this kind is much superior to a pasteboard quadruped, even when it has wheels to its feet. So Jack galloped bare-back on the dog, which let him do it willingly, and, in truth, Jack was no heavier to it than the half of a jockey to a race-horse.

But what a break each day in the stock of sugar in the store-room!

Dingo soon became a favorite with the whole crew. Alone, Negoro continued to avoid any encounter with the animal, whose antipathy was always as strong as it was inexplicable.

Meanwhile, little Jack had not neglected Dick Sand, his friend of old, for Dingo. All the time that was unclaimed by his duties on board, the novice passed with the little boy.

Mrs. Weldon, it is needless to say, always regarded this intimacy with the most complete satisfaction.

One day, February 6th, she spoke of Dick to Captain Hull, and the captain praised the young novice in the highest terms.

"That boy," he said to Mrs. Weldon, "will be a good seaman some day, I'll guarantee. He has truly a passion for the sea, and by this passion he makes up for the theoretical parts of the calling which he has not yet learned. What he already knows is astonishing, when we think of the short time he has had to learn."

"It must be added," replied Mrs. Weldon, "that he is also an excellent person, a true boy, very superior to his age, and who has never merited any blame since we have known him."

"Yes, he is a good young man," continued the captain, "justly loved and appreciated by all."

"This cruise finished," said Mrs. Weldon, "I know that my husband's intention is to have him follow a course of navigation, so that, he may afterwards obtain a captain's commission."

"And Mr. Weldon is right," replied Captain Hull. "Dick Sand will one day do honor to the American marine."

"This poor orphan commenced life sadly," observed Mrs. Weldon. "He has been in a hard school!"

"Doubtless, Mrs. Weldon; but the lessons have not been lost on him. He has learned that he must make his own way in this world, and he is in a fair way to do it."

"Yes, the way of duty!"

"Look at him now, Mrs. Weldon," continued Captain Hull. "He is at the helm, his eye fixed on the point of the foresail. No distraction on the part of this young novice, as well as no lurch to the ship. Dick Sand has already the confidence of an old steersman. A good beginning for a seaman. Our craft, Mrs. Weldon, is one of those in which it is necessary to begin very young. He who has not been a cabin-boy will never arrive at being a perfect seaman, at least in the merchant marine. Everything must be learned, and, consequently, everything must be at the same time instinctive and rational with the sailor--the resolution to grasp, as well as the skill to execute."

"Meanwhile, Captain Hull," replied Mrs. Weldon, "good officers are not lacking in the navy."

"No," replied Captain Hull; "but, in my opinion, the best have almost all begun their career as children, and, without speaking of Nelson and a few others, the worst are not those who began by being cabin-boys."

At that moment they saw Cousin Benedict springing up from the rear companion-way. As usual he was
absorbed, and as little conscious of this world as the Prophet Elias will be when he returns to the earth.

Cousin Benedict began to walk about on the deck like an uneasy spirit, examining closely the interstices of the netting, rummaging under the hen-cages, putting his hand between the seams of the deck, there, where the pitch had scaled off.

"Ah! Cousin Benedict," asked Mrs. Weldon, "do you keep well?"

"Yes--Cousin Weldon--I am well, certainly--but I am in a hurry to get on land."

"What are you looking for under that bench, Mr. Benedict?" asked Captain Hull.

"Insects, sir," returned Cousin Benedict. "What do you expect me to look for, if not insects?"

"Insects! Faith, I must agree with you; but it is not at sea that you will enrich your collection."

"And why not, sir? It is not impossible to find on board some specimen of----"

"Cousin Benedict," said Mrs. Weldon, "do you then slander Captain Hull? His ship is so well kept, that you will return empty-handed from your hunt."

Captain Hull began to laugh.

"Mrs. Weldon exaggerates," replied he. "However, Mr. Benedict, I believe you will lose your time rummaging in our cabins."

"Ah! I know it well," cried Cousin Benedict, shrugging his shoulders. "I have had a good search----"

"But, in the 'Pilgrim's' hold," continued Captain Hull, "perhaps you will find some cockroaches--subjects of little interest, however."

"Of little interest, those nocturnal orthopters which have incurred the maledictions of Virgil and Horace!" retorted Cousin Benedict, standing up straight. "Of little interest, those near relations of the 'periplaneta orientalis' and of the American kakerlac, which inhabit----"

"Which infest!" said Captain Hull.

"Which reign on board!" retorted Cousin Benedict, fiercely.

"Amiable sovereignty!"

"Ah! you are not an entomologist, sir?"

Never at my own expense."

"Now, Cousin Benedict," said Mrs. Weldon, smiling, "do not wish us to be devoured for love of science."

"I wish, nothing, Cousin Weldon," replied, the fiery entomologist, "except to be able to add to my collection some rare subject which might do it honor."

"Are you not satisfied, then, with the conquests that you have made in New Zealand?"

"Yes, truly, Cousin Weldon. I have been rather fortunate in conquering one of those new staphylins which till now had only been found some hundreds of miles further, in New Caledonia."

At that moment Dingo, who was playing with Jack, approached Cousin Benedict, gamboling.

"Go away! go away!" said the latter, pushing off the animal.

"To love cockroaches and detest dogs!" cried Captain Hull. "Oh! Mr. Benedict!"

"A good dog, notwithstanding," said little Jack, taking Dingo's great head in his small hands.

"Yes. I do not say no," replied Cousin Benedict. "But what do you want? This devil of an animal has not realized the hopes I conceived on meeting it."

"Ah! my goodness!" cried Mrs. Weldon, "did you, then, hope to be able to classify it in the order of the dipters or the hymenopters?"

"No," replied Cousin Benedict, seriously. "But is it not true that this Dingo, though it be of the New Zealand race, was picked up on the western coast of Africa?"

"Nothing is more true," replied Mrs. Weldon, "and Tom had often heard the captain of the 'Waldeck' say so."

"Well, I had thought--I had hoped--that this dog would have brought away some specimens of hemipteras peculiar to the African fauna."

"Merciful heavens!" cried Mrs. Weldon.

"And that perhaps," added Cousin Benedict, "some penetrating or irritating flea--of a new species----"

"Do you understand, Dingo?" said Captain Hull. "Do you understand, my dog? You have failed in all your duties!"

"But I have examined it well," added the entomologist, with an accent of deep regret. "I have not been able to find a single insect."

"Which you would have immediately and mercilessly put to death, I hope!" cried Captain Hull.

"Sir," replied Cousin Benedict, dryly, "learn that Sir John Franklin made a scruple of killing the smallest insect, be it a mosquito, whose attacks are otherwise formidable as those of a flea; and meanwhile you will not hesitate to allow, that Sir John Franklin was a seaman who was as good as the next."

"Surely," said Captain Hull, bowing.
"And one day, after being frightfully devoured by a dipter, he blew and sent it away, saying to it, without even using _thou_ or _thee_: 'Go! the world is large enough for you and for me!'"

"Ah!" ejaculated Captain Hull.

"Yes, sir."

"Well, Mr. Benedict," retorted Captain Hull, "another had said that long before Sir John Franklin."

"Another?"

"Yes; and that other was Uncle Toby."

"An entomologist?" asked Cousin Benedict, quickly.

"No! Sterne's Uncle Toby, and that worthy uncle pronounced precisely the same words, while setting free a mosquito that annoyed him, but which he thought himself at liberty to _thee_ and _thou_: 'Go, poor devil,' he said to it, 'the world is large enough to contain us, thee and me!'"

"An honest man, that Uncle Toby!" replied Cousin Benedict. "Is he dead?"

"I believe so, indeed," retorted Captain Hull, gravely, "as he has never existed!"

And each began to laugh, looking at Cousin Benedict.

Thus, then, in these conversations, and many others, which invariably bore on some point of entomological science, whenever Cousin Benedict took part, passed away long hours of this navigation against contrary winds. The sea always fine, but winds which obliged the schooner to tack often. The "Pilgrim" made very little headway toward the east—the breeze was so feeble; and they longed to reach those parts where the prevailing winds would be more favorable.

It must be stated here that Cousin Benedict had endeavored to initiate the young novice into the mysteries of entomology. But Dick Sand had shown himself rather refractory to these advances. For want of better company the savant had fallen back on the negroes, who comprehended nothing about it. Tom, Acteon, Bat, and Austin had even finished by deserting the class, and the professor found himself reduced to Hercules alone, who seemed to him to have some natural disposition to distinguish a parasite from a thysanuran.

So the gigantic black lived in the world of coleopteras, carnivorous insects, hunters, gunners, ditches, cicindelles, carabes, sylphides, moles, cockchafers, horn-beetles, tenebrians, mites, lady-birds, studying all Cousin Benedict's collection, not but the latter trembled on seeing his frail specimens in Hercules' great hands, which were hard and strong as a vise. But the colossal pupil listened so quietly to the professor's lessons that it was worth risking something to give them.

While Cousin Benedict worked in that manner, Mrs. Weldon did not leave little Jack entirely unoccupied; She taught him to read and to write. As to arithmetic, it was his friend Dick Sand who inculcated the first elements.

At the age of five, one is still only a little child, and is perhaps better instructed by practical games than by theoretical lessons necessarily a little arduous.

Jack learned to read, not in a primer, but by means of movable letters, printed in red on cubes of wood. He amused himself by arranging the blocks so as to form words. Sometimes Mrs. Weldon took these cubes and composed a word; then she disarranged them, and it was for Jack to replace them in the order required.

The little boy liked this manner of learning to read very much. Each day he passed some hours, sometimes in the cabin, sometimes on the deck, in arranging and disarranging the letters of his alphabet.

Now, one day this led to an incident so extraordinary, so unexpected, that it is necessary to relate with some detail.

It was on the morning of February 9th, Jack, half-lying on the deck, was amusing himself forming a word which old Tom was to put together again, after the letters had been mixed. Tom, with his hand over his eyes so as not to cheat, as he agreed, would see nothing, and did see nothing of the work of the little boy.

Of these different letters, about fifty in number, some were large, others small. Besides, some of these cubes carried a figure, which taught the child to form numbers as well as to form words.

These cubes were arranged on the deck, and little Jack was taking sometimes one, sometimes another, to make a word—a truly great labor.

Now, for some moments, Dingo was moving round the young child, when suddenly it stopped. Its eyes became fixed, its right paw was raised, its tail wagged convulsively. Then, suddenly throwing itself on one of the cubes, it seized it in its mouth and laid it on the deck a few steps from Jack.

This cube bore a large letter—the letter S.

"Dingo, well Dingo!" cried the little boy, who at first was afraid that his S was swallowed by the dog.

But Dingo had returned, and, beginning the same performance again, it seized another cube, and went to lay it near the first.

This second cube was a large V.

This time Jack gave a cry.
At this cry, Mrs. Weldon, Captain Hull, and the young novice, who were walking on the deck, assembled. Little Jack then told them what had just passed.

Dingo knew its letters; Dingo knew how to read! That was very certain, that! Jack had seen it!

Dick Sand wanted to go and take the two cubes, to restore them to his friend Jack, but Dingo showed him its teeth.

However, the novice succeeded in gaining possession of the two cubes, and he replaced them in the set.

Dingo advanced again, seized again the same two letters, and carried them to a distance. This time its two paws lay on them; it seemed decided to guard them at all hazards. As to the other letters of the alphabet, it did not seem as if it had any knowledge of them.

"That is a curious thing," said Mrs. Weldon.

"It is, in fact, very singular," replied Captain Hull, who was looking attentively at the two letters.

"S. V. . ." said Mrs. Weldon.

"S. V. ," repeated Captain Hull. "But those are precisely the letters which are on Dingo's collar!"

Then, all at once, turning to the old black: "Tom," he asked, "have you not told me that this dog only belonged to the captain of the 'Waldeck' for a short time?"

"In fact, sir," replied Tom, "Dingo was only on board two years at the most."

"And have you not added that the captain of the 'Waldeck' had picked up this dog on the western coast of Africa?"

"Yes, sir, in the neighborhood of the mouth of the Congo. I have often heard the captain say so."

"So," asked Captain Hull, "it has never been known to whom this dog had belonged, nor whence it came?"

"Never, sir. A dog found is worse than a child! That has no papers, and, more, it cannot explain."

Captain Hull was silent, and reflected.

"Do those two letters, then, awake some remembrance?" Mrs. Weldon asked Captain Hull, after leaving him to his reflections for some moments.

"Yes, Mrs. Weldon, a remembrance, or rather a coincidence at least singular."

What?

"Those two letters might well have a meaning, and fix for us the fate of an intrepid traveler."

"What do you mean?" demanded Mrs. Weldon.

"Here is what I mean, Mrs. Weldon. In 1871--consequently two years ago--a French traveler set out, under the auspices of the Paris Geographical Society, with the intention of crossing Africa from the west to the east. His point of departure was precisely the mouth of the Congo. His point of arrival would be as near as possible to Cape Delgado, at the mouths of the Rovuma, whose course he would descend. Now, this French traveler was named Samuel Vernon."

"Samuel Vernon!" repeated Mrs. Weldon.

"Yes, Mrs. Weldon; and those two names begin precisely by those two letters which Dingo has chosen among all the others, and which are engraved on its collar."

"Exactly," replied Mrs. Weldon. "And that traveler----"

"That traveler set out," replied Captain Hull, "and has not been heard of since his departure."

"Never?" said the novice.

"Never," repeated Captain Hull.

"What do you conclude from it?" asked Mrs. Weldon.

"That, evidently, Samuel Vernon has not been able to reach the eastern coast of Africa, whether he may have been made prisoner by the natives, whether death may have struck him on the way."

"And then this dog?"

"This dog would have belonged to him; and, more fortunate than its master, if my hypothesis is true, it would have been able to return to the Congo coast, because it was there, at the time when these events must have taken place, that it was picked up by the captain of the 'Waldeck.'"

"But," observed Mrs. Weldon, "do you know if this French traveler was accompanied on his departure by a dog? Is it not a mere supposition on your part?"

"It is only a supposition, indeed, Mrs. Weldon," replied Captain Hull. "But what is certain is, that Dingo knows these two letters S and V, which are precisely the initials of the two names of the French traveler. Now, under what circumstances this animal would learn to distinguish them is what I cannot explain; but, I repeat it, it very certainly knows them; and look, it pushes them with its paw, and seems to invite us to read them with it."

In fact, they could not misunderstand Dingo's intention.

"Then was Samuel Vernon alone when he left the sea-coast of the Congo?" ask Dick Sand.

"That I know not," replied Captain Hull. "However, it is probable that he would take a native escort."
At that moment Negoro, leaving his post, showed himself on the deck. At first no one remarked his presence, and could not observe the singular look he cast on the dog when he perceived the two letters over which the animal seem to mount guard. But Dingo, having perceived the master-cook, began to show signs of the most extreme fury. Negoro returned immediately to the crew's quarters, not without a menacing gesture at the dog's skill having escaped him.

"There is some mystery there," murmured Captain Hull, who had lost none of this little scene.

"But, sir," said the novice, "is it not very astonishing that a dog should know the letters of the alphabet?"

"No!" cried little Jack. "Mama has often told me the story of a dog which knew how to read and write, and even play dominoes, like a real schoolmaster!"

"My dear child," replied Mrs. Weldon, smiling, "that dog, whose name was Munito, was not a savant, as you suppose. If I may believe what has been told me about it, Munito would not have been able to distinguish the letters which served to compose the words. But its master, a clever American, having remarked what fine hearing Munito had, applied himself to cultivating that sense, and to draw from it some very curious effects."

"How did he set to work, Mrs. Weldon?" asked Dick Sand, whom the history interested almost as much as little Jack.

"In this way, my friend." When Munito was 'to appear' before the public, letters similar to these were displayed on a table. On that table the poodle walked about, waiting till a word was proposed, whether in a loud voice or in a low voice. Only, one essential condition was that its master should know the word."

"And, in the absence of its master--" said the novice.

"The dog could have done nothing," replied Mrs. Weldon, "and here is the reason. The letters spread out on the table, Munito walked about through this alphabet. When it arrived before the letter which it should choose to form the word required, it stopped; but if it stopped it was because it heard the noise--imperceptible to all others--of a toothpick that the American snapped in his pocket. That noise was the signal for Munito to take the letter and arrange it in suitable order."

"And that was all the secret?" cried Dick Sand.

"That was the whole secret," replied Mrs. Weldon. "It is very simple, like all that is done in the matter of prestidigitation. In case of the American's absence, Munito would be no longer Munito. I am, then, astonished, his master not being there--if, indeed, the traveler, Samuel Vernon, has ever been its master--that Dingo could have recognized those two letters."

"In fact," replied Captain Hull, "it is very astonishing. But, take notice, there are only two letters in question here, two particular letters, and not a word chosen by chance. After all, that dog which rang at the door of a convent to take possession of the plate intended for the poor passers-by, that other which commissioned at the same time with one of its kind, to turn the spit for two days each, and which refused to fill that office when its turn had not come, those two dogs, I say, advanced farther than Dingo into that domain of intelligence reserved for man. Besides, we are in the presence of an inscrutable fact. Of all the letters of that alphabet, Dingo has only chosen these two: S and V. The others it does not even seem to know. Therefore we must conclude that, for a reason which escapes us, its attention has been especially drawn to those two letters."

"Ah! Captain Hull," replied the young novice, "if Dingo could speak! Perhaps he would tell us what those two letters signify, and why it has kept a tooth ready for our head cook."

"And what a tooth!" replied Captain Hull, as Dingo, opening its mouth, showed its formidable fangs.

* * * *

CHAPTER VI.
A WHALE IN SIGHT.

It will be remembered that this singular incident was made, more than once, the subject of conversation held in the stern of the "Pilgrim" between Mrs. Weldon, Captain Hull, and the young novice. The latter, more particularly, experienced an instinctive mistrust with regard to Negoro, whose conduct, meanwhile, merited no reproach.

In the prow they talked of it also, but they did not draw from it the same conclusions. There, among the ship's crew, Dingo passed merely for a dog that knew how to read, and perhaps even write, better than more than one sailor on board. As for talking, if he did not do it, it was probably for good reasons that he kept silent.

"But, one of these fine days," says the steersman, Bolton, "one fine day that dog will come and ask us how we are heading; if the wind is to the west-north-west-half-north, and we will have to answer him! There are animals that speak! Well, why should not a dog do as much if he took it into his head? It is more difficult to talk with a beak than with a mouth!"

"No doubt," replied the boatswain, Howik. "Only it has never been known."
It would have astonished these brave men to tell them that, on the contrary, it had been known, and that a certain Danish servant possessed a dog which pronounced distinctly twenty words. But whether this animal comprehended what he said was a mystery. Very evidently this dog, whose glottis was organized in a manner to enable him to emit regular sounds, attached no more sense to his words than do the paroquets, parrots, jackdaws, and magpies to theirs. A phrase with animals is nothing more than a kind of song or spoken cry, borrowed from a strange language of which they do not know the meaning.

However that might be, Dingo had become the hero of the deck, of which fact he took no proud advantage. Several times Captain Hull repeated the experiment. The wooden cubes of the alphabet were placed before Dingo, and invariably, without an error, without hesitation, the two letters, S and V, were chosen from among all by the singular animal, while the others never attracted his attention.

As for Cousin Benedict, this experiment was often renewed before him, without seeming to interest him.

"Meanwhile," he condescended to say one day, "we must not believe that the dogs alone have the privilege of being intelligent in this manner. Other animals equal them, simply in following their instinct. Look at the rats, who abandon the ship destined to founder at sea; the beavers, who know how to foresee the rising of the waters, and build their dams higher in consequence; those horses of Nicomedes, of Scanderberg, and of Oppien, whose grief was such that they died when their masters did; those asses, so remarkable for their memory, and many other beasts which have done honor to the animal kingdom. Have we not seen birds, marvelously erect, that correctly write words dictated by their professors; cockatoos that count, as well as a reckoner in the Longitude Office, the number of persons present in a parlor? Has there not existed a parrot, worth a hundred gold crowns, that recited the Apostle's Creed to the cardinal, his master, without missing a word? Finally, the legitimate pride of an entomologist should be raised to the highest point, when he sees simple insects give proofs of a superior intelligence, and affirm eloquently the axiom:

"In minimis maximus Deus,"

those ants which, represent the inspectors of public works in the largest cities, those aquatic _argyronetes_ which manufacture diving-bells, without having ever learned the mechanism; those fleas which draw carriages like veritable coachmen, which go through the exercise as well as riflemen, which fire off cannon better than the commissioned artillerymen of West Point? No! this Dingo does not merit so many eulogies, and if he is so strong on the alphabet, it is, without doubt, because he belongs to a species of mastiff, not yet classified in zoological science, the _canis alphabeticus_ of New Zealand."

In spite of these discourses and others of the envious entomologist, Dingo lost nothing in the public estimation, and continued to be treated as a phenomenon in the conversations of the forecastle.

All this time, it is probable that Negoro did not share the enthusiasm of the ship in regard to the animal. Perhaps he found it too intelligent. However, the dog always showed the same animosity against the head cook, and, doubtless, would have brought upon itself some misfortune, if it had not been, for one thing, "a dog to defend itself," and for another, protected by the sympathy of the whole crew.

So Negoro avoided coming into Dingo's presence more than ever. But Dick Sand had observed that since the incident of the two letters, the reciprocal antipathy between the man and the dog was increased. That was truly inexplicable.

On February 10th, the wind from the northeast, which, till then, had always succeeded those long and overwhelming calms, during which the "Pilgrim" was stationary, began to abate perceptibly. Captain Hull then could hope that a change in the direction of the atmospheric currents was going to take place. Perhaps the schooner would finally sail with the wind. It was still only nineteen days since her departure from the port of Auckland. The delay was not yet of much account, and, with a favorable wind, the "Pilgrim," well rigged, would easily make up for lost time. But several days must still elapse before the breezes would blow right from the west.

This part of the Pacific was always deserted. No vessel showed itself in these parts. It was a latitude truly forsaken by navigators. The whalers of the southern seas were not yet prepared to go beyond the tropic. On the "Pilgrim," which peculiar circumstances had obliged to leave the fishing grounds before the end of the season, they must not expect to cross any ship bound for the same destination.

As to the trans-pacific packet-boats, it has been already said that they did not follow so high a parallel in their passages between Australia and the American continent.

However, even if the sea is deserted, one must not give up observing it to the extreme limits of the horizon. Monotonous as it may appear to heedless minds, it is none the less infinitely varied for him who knows how to comprehend it. Its slightest changes charm the imagination of one who feels the poetry of the ocean. A marine herb which floats up and down on the waves, a branch of sargasso whose light track zebras, the surface of the waters, and end of a board, whose history he would wish to guess, he would need nothing more. Facing this infinite, the mind is no longer stopped by anything. Imagination runs riot. Each of those molecules of water, that evaporation is
continually changing from the sea to the sky, contains perhaps the secret of some catastrophe. So, those are to be envied, whose inner consciousness knows how to interrogate the mysteries of the ocean, those spirits who rise from its moving surface to the heights of heaven.

Besides, life always manifests itself above as well as below the seas. The "Pilgrim's" passengers could see flights of birds excited in the pursuit of the smallest fishes, birds which, before winter, fly from the cold climate of the poles. And more than once, Dick Sand, a scholar of Mrs. Weldon's in that branch as in others, gave proofs of marvelous skill with the gun and pistol, in bringing down some of those rapid-winged creatures.

There were white petrels here; there, other petrels, whose wings were embroidered with brown. Sometimes, also, companies of _damiers_ passed, or some of those penquins whose gait on land is so heavy and so ridiculous. However, as Captain Hull remarked, these penquins, using their stumps like true fins, can challenge the most rapid fishes in swimming, to such an extent even, that sailors have often confounded them with bonitoes.

Higher, gigantic albatrosses beat the air with great strokes, displaying an extent of ten feet between the extremities of their wings, and then came to light on the surface of the waters, which they searched with their beaks to get their food.

All these scenes made a varied spectacle, that only souls closed to the charms of nature would have found monotonous.

That day Mrs. Weldon was walking aft on the "Pilgrim," when a rather curious phenomenon attracted her attention. The waters of the sea had become reddish quite suddenly. One might have believed that they had just been stained with blood; and this inexplicable tinge extended as far as the eye could reach.

Dick Sand was then with little Jack near Mrs. Weldon.

"Dick," she said to the young novice, "Do you see that singular color of the waters of the Pacific? Is it due to the presence of a marine herb?"

"No, Mrs. Weldon," replied Dick Sand, "that tinge is produced by myriads of little crustaceans, which generally serve to nourish the great mammals. Fishermen call that, not without reason, 'whales' food.'"

"Crustaceans!" said Mrs. Weldon. "But they are so small that we might almost call them sea insects. Perhaps Cousin Benedict would be very much enchanted to make a collection of them." Then calling: "Cousin Benedict!" cried she.

Cousin Benedict appeared out of the companion-way almost at the same time as Captain Hull.

"Cousin Benedict," said Mrs. Weldon, "see that immense reddish field which extends as far as we can see."

"Hold!" said Captain Hull. "That is whales' food. Mr. Benedict, a fine occasion to study this curious species of crustacea."

"Phew!" from the entomologist.

"How--phew!" cried the captain. "But you have no right to profess such indifference. These crustaceans form one of the six classes of the articulates, if I am not mistaken, and as such----"

"Phew!" said Cousin Benedict again, shaking his lead.

"For instance----I find you passably disdainful for an entomologist!"

"Entomologist, it may be;" replied Cousin Benedict, "but more particularly hexapodist, Captain Hull, please remember."

"At all events," replied Captain Hull, "if these crustaceans do not interest you, it can't be helped; but it would be otherwise if you possessed a whale's stomach. Then what a regale! Do you see, Mrs. Weldon, when we whalers, during the fishing season, arrive in sight of a shoal of these crustaceans, we have only time to prepare our harpoons and our lines. We are certain that the game is not distant."

"Is it possible that such little beasts can feed such large ones?" cried Jack.

"Ah! my boy," replied Captain Hull, "little grains of vermicelli, of flour, of fecula powder, do they not make very good porridge? Yes; and nature has willed that it should be so. When a whale floats in the midst of these red waters, its soup is served; it has only to open its immense mouth. Myriads of crustaceans enter it. The numerous plates of those whalebones with which the animal's palate is furnished serve to strain like fishermen's nets; nothing can get out of them again, and the mass of crustaceans is ingulfed in the whale's vast stomach, as the soup of your dinner in yours."

"You think right, Jack," observed Dick Sand, "that Madam Whale does not lose time in picking these crustaceans one by one, as you pick shrimps."

"I may add," said Captain Hull, "that it is just when the enormous gourmand is occupied in this way, that it is easiest to approach it without exciting its suspicion. That is the favorable moment to harpoon it with some success."

At that instant, and as if to corroborate Captain Hull, a sailor's voice was heard from the front of the ship:

"A whale to larboard!"

Captain Hull strode up.
"A whale!" cried he.

And his fisherman's instinct urging him, he hastened to the "Pilgrim's" forecastle.

Mrs. Weldon, Jack, Dick Sand, Cousin Benedict himself, followed him at once.

In fact, four miles to windward a certain bubbling indicated that a huge marine mammifer was moving in the midst of the red waters. Whalers could not be mistaken in it. But the distance was still too considerable to make it possible to recognize the species to which this mammifer belonged. These species, in fact, are quite distinct.

Was it one of those "right" whales, which the fishermen of the Northern Ocean seek most particularly? Those cetaceans, which lack the dorsal fin, but whose skin covers a thick stratum of lard, may attain a length of eighty feet, though the average does not exceed sixty, and then a single one of those monsters furnishes as much as a hundred barrels of oil.

Was it, on the contrary, a "humpback," belonging to the species of baloenopters, a designation whose termination should at least gain it the entomologist's esteem? These possess dorsal fins, white in color, and as long as half the body, which resemble a pair of wings--something like a flying whale.

Had they not in view, more likely, a "finback" mammifer, as well known by the name "jubarte," which is provided with a dorsal fin, and whose length may equal that of the "right" whale?

Captain Hull and his crew could not yet decide, but they regarded the animal with more desire than admiration.

If it is true that a clockmaker cannot find himself in a room in the presence of a clock without experiencing the irresistible wish to wind it up, how much more must the whaler, before a whale, be seized with the imperative desire to take possession of it? The hunters of large game, they say, are more eager than the hunters of small game. Then, the larger the animal, the more it excites covetousness. Then, how should hunters of elephants and fishers of whales feel? And then there was that disappointment, felt by all the "Pilgrim's" crew, of returning with an incomplete cargo.

Meanwhile, Captain Hull tried to distinguish the animal which had been signaled in the offing. It was not very visible from that distance. Nevertheless, the trained eye of a whaler could not be deceived in certain details easier to discern at a distance.

In fact, the water-spout, that is, that column of vapor and water which the whale throws back by its rents, would attract Captain Hull's attention, and fix it on the species to which this cetacean belonged.

"That is not a 'right' whale," cried he. "Its water-spout would be at once higher and of a smaller volume. On the other hand, if the noise made by that spout in escaping could be compared to the distant noise of a cannon, I should be led to believe that that whale belongs to the species of 'humpbacks;' but there is nothing of the kind, and, on listening, we are assured that this noise is of quite a different nature. What is your opinion on this subject, Dick?"

asked Captain Hull, turning toward the novice.

"I am ready to believe, captain," replied Dick Sand, "that we have to do with a jubarte. See how his rents throw that column of liquid violently into the air. Does it not seem to you also--which would confirm my idea--that that spout contains more water than condensed vapor? And, if I am not mistaken, it is a special peculiarity of the jubarte."

"In fact, Dick," replied Captain Hull, "there is no longer any doubt possible! It is a jubarte which floats on the surface of these red waters."

"That's fine," cried little Jack.

"Yes, my boy! and when we think that the great beast is there, in process of breakfasting, and little suspecting that the whalers are watching it."

"I would dare to affirm that it is a jubarte of great size," observed Dick Sand.

"Truly," replied Captain Hull, who was gradually becoming more excited. "I think it is at least seventy feet long!"

"Good!" added the boatswain. "Half a dozen whales of that size would suffice to fill a ship as large as ours!"

"Yes, that would be sufficient," replied Captain Hull, who mounted on the bowsprit to see better.

"And with this one," added the boatswain, "we should take on board in a few hours the half of the two hundred barrels of oil which we lack."

"Yes!--truly--yes!" murmured Captain Hull.

"That is true," continued Dick Sand; "but it is sometimes a hard matter to attack those enormous jubartes!"

"Very hard, very hard!" returned Captain Hull. "Those baloenopters have formidable tails, which must not be approached without distrust. The strongest pirogue would not resist a well-given blow. But, then, the profit is worth the trouble!"

"Bah!" said one of the sailors, "a fine jubarte is all the same a fine capture!"

"And profitable!" replied another.

"It would be a pity not to salute this one on the way!"

It was evident that these brave sailors were growing excited in looking at the whale. It was a whole cargo of
barrels of oil that was floating within reach of their hands. To hear them, without doubt there was nothing more to be
done, except to stow those barrels in the "Pilgrim's" hold to complete her lading. Some of the sailors, mounted on
the ratlines of the fore-shrouds, uttered longing cries. Captain Hull, who no longer spoke, was in a dilemma. There
was something there, like an irresistible magnet, which attracted the "Pilgrim" and all her crew.

"Mama, mama!" then cried little Jack, "I should like to have the whale, to see how it is made."

"Ah! you wish to have this whale, my boy? Ah! why not, my friends?" replied Captain Hull, finally yielding to
his secret desire. "Our additional fishermen are lacking, it is true, but we alone----"

"Yes! yes!" cried the sailors, with a single voice.

"This will not be the first time that I have followed the trade of harpooner," added Captain Hull, "and you will
see if I still know how to throw the harpoon!"

"Hurrah! hurrah! hurrah!" responded the crew.

* * * * *

CHAPTER VII.

PREPARATIONS.

It will be understood that the sight of this prodigious mammifer was necessary to produce such excitement on
board the "Pilgrim."

The whale, which floated in the middle of the red waters, appeared enormous. To capture it, and thus complete
the cargo, that was very tempting. Could fishermen let such an occasion escape them?

However, Mrs. Weldon believed she ought to ask Captain Hull if it was not dangerous for his men and for him to
attack a whale under those circumstances.

"No, Mrs. Weldon," replied Captain Hull. "More than once it has been my lot to hunt the whale with a single
boat, and I have always finished by taking possession of it. I repeat it, there is no danger for us, nor, consequently,
for yourself."

Mrs. Weldon, reassured, did not persist.

Captain Hull at once made his preparations for capturing the jubarte. He knew by experience that the pursuit of
that baloenopter was not free from difficulties, and he wished to parry all.

What rendered this capture less easy was that the schooner's crew could only work by means of a single boat,
while the "Pilgrim" possessed a long-boat, placed on its stocks between the mainmast and the mizzen-mast, besides
three whale-boats, of which two were suspended on the larboard and starboard pegs, and the third aft, outside the
crown-work.

Generally these three whale-boats were employed simultaneously in the pursuit of cetaceans. But during the
fishing season, we know, an additional crew, hired at the stations of New Zealand, came to the assistance of the
"Pilgrim's" sailors.

Now, in the present circumstances, the "Pilgrim" could only furnish the five sailors on board--that is, enough to
arm a single whale-boat. To utilize the group of Tom and his friends, who had offered themselves at once, was
impossible. In fact, the working of a fishing pirogue requires very well trained seamen. A false move of the helm, or
a false stroke of an oar, would be enough to compromise the safety of the whale-boat during an attack.

On the other hand, Captain Hull did not wish to leave his ship without leaving on board at least one man from
the crew, in whom he had confidence. It was necessary to provide for all eventualities.

Now Captain Hull, obliged to choose strong seamen to man the whale-boat, was forced to put on Dick Sand the
care of guarding the "Pilgrim."

"Dick," said he to him, "I shall charge you to remain on board during my absence, which I hope will be short."

"Well, sir," replied the young novice.

Dick Sand would have wished to take part in this fishing, which had a great attraction for him, but he understood
that, for one reason, a man's arms were worth more than his for service in a whale-boat, and that for another, he
alone could replace Captain Hull. So he was satisfied. The whale-boat's crew must be composed of the five men,
including the master, Howik, which formed the whole crew of the "Pilgrim." The four sailors were going to take
their places at the oars, and Howik would hold the stern oar, which serves to guide a boat of this kind. A simple
rudder, in fact, would not have a prompt enough action, and in case the side oars should be disabled, the stern oar,
well handled, could put the whale-boat beyond the reach of the monster's blows.

There was only Captain Hull besides. He had reserved to himself the post of harpooner, and, as he had said, this
would not be his first attempt. It was he who must first throw the harpoon, then watch the unrolling of the long line
fastened at its end; then, finally finish the animal with spears, when it should return to the surface of the ocean.

Whalers sometimes employ firearms for this kind of fishing. By means of a special instrument, a sort of small
cannon, stationed either on board the ship or at the front of the boat, they throw either a harpoon, which draws with it the rope fastened to its end, or explosive balls, which produce great ravages in the body of the animal.

But the "Pilgrim" was not furnished with apparatus of this kind. This was, besides, an instrument of high price, rather difficult to manage, and fishermen, but little friendly to innovations, seem to prefer the employment of primitive weapons, which they use skilfully—that is to say,—the harpoon and spear.

It was then by the usual method, attacking the whale with the sword, that Captain Hull was going to attempt to capture the jubarte signaled five miles from his ship.

Besides, the weather would favor this expedition. The sea, being very calm, was propitious for the working of a whale-boat. The wind was going down, and the "Pilgrim" would only drift in an insensible manner while her crew were occupied in the offing.

So the starboard whale-boat was immediately lowered, and the four sailors went into it.

Howik passed them two of those long spears which serve as harpoons, then two long lances with sharp points. To those offensive arms he added five coils of those strong flexible ropes that the whalers call "lines," and which measure six hundred feet in length. Less would not do, for it sometimes happens that these cords, fastened end to end, are not enough for the "demand," the whale plunges down so deep.

Such were the different weapons which were carefully disposed in the front of the boat.

Howik and the four sailors only waited for the order to let go the rope.

A single place was vacant in the prow of the whale-boat—that which Captain Hull would occupy.

It is needless to say that the "Pilgrim's" crew, before quitting her, had brought the ship's sails aback. In other words, the yards were braced in such a manner that the sails, counteracting their action, kept the vessel almost stationary.

Just as he was about to embark, Captain Hull gave a last glance at his ship. He was sure that all was in order, the halliards well turned, the sails suitably trimmed. As he was leaving the young novice on board during an absence which might last several hours, he wished, with a good reason, that unless for some urgent cause, Dick Sand would not have to execute a single maneuver.

At the moment of departing he gave the young man some last words of advice.

"Dick," said he, "I leave you alone. Watch over everything. If, as is possible, it should become necessary to get the ship under way, in case we should be led too far in pursuit of this jubarte, Tom and his companions could come to your aid perfectly well. After telling them clearly what they would have to do, I am assured that they would do it."

"Yes, Captain Hull," replied old Tom, "and Mr. Dick can count on us."

"Command! command!" cried Bat. "We have such a strong desire to make ourselves useful."

"On what must we pull?" asked Hercules, turning up the large sleeves of his jacket.

"On nothing just now," replied Dick Sand, smiling.

"At your service," continued the colossus.

"Dick," continued Captain Hull, "the weather is beautiful. The wind has gone down. There is no indication that it will freshen again. Above all, whatever may happen, do not put a boat to sea, and do not leave the ship."

"That is understood."

"If it should become necessary for the 'Pilgrim' to come to us, I shall make a signal to you, by hoisting a flag at the end of a boat-hook."

"Rest assured, captain, I shall not lose sight of the whale-boat," replied Dick Sand.

"Good, my boy," replied Captain Hull. "Courage and coolness. Behold yourself assistant captain. Do honor to your grade. No one has been such at your age!"

Dick Sand did not reply, but he blushed while smiling. Captain Hull understood that blush and that smile.

"The honest boy!" he said to himself; "modesty and good humor, in truth, it is just like him!"

Meanwhile, by these urgent recommendations, it was plain that, even though there would be no danger in doing it, Captain Hull did not leave his ship willingly, even for a few hours. But an irresistible fisherman's instinct, above all, the strong desire to complete his cargo of oil, and not fall short of the engagements made by James W. Weldon in Valparaiso, all that told him to attempt the adventure. Besides, that sea, so fine, was marvelously conducive to the pursuit of a cetacean. Neither his crew nor he could resist such a temptation. The fishing cruise would be finally complete, and this last consideration touched Captain Hull's heart above everything.

Captain Hull went toward the ladder.

"I wish you success," said Mrs. Weldon to him.

"Thank you, Mrs. Weldon."

"I beg you, do not do too much harm to the poor whale," cried little Jack.

"No, my boy," replied Captain Hull.

"Take it very gently, sir."
"Yes--with gloves, little Jack."

"Sometimes," observed Cousin Benedict, "we find rather curious insects on the back of these large mammals."

"Well, Mr. Benedict," replied Captain Hull, laughing, "you shall have the right to 'entomologize' when our jubarte will be alongside of the 'Pilgrim.'"

Then turning to Tom:

"Tom, I count on your companions and you," said he, "to assist us in cutting up the whale, when it is lashed to the ship's hull—which will not be long."

"At your disposal, sir," replied the old black.

"Good!" replied Captain Hull.

"Dick, these honest men will aid you in preparing the empty barrels. During our absence they will bring them on deck, and by this means the work will go fast on our return."

"That shall be done, captain."

For the benefit of those who do not know, it is necessary to say that the jubarte, once dead, must be towed as far as the "Pilgrim," and firmly lashed to her starboard side. Then the sailors, shod in boots, with cramp-hooks would take their places on the back of the enormous cetacean, and cut it up methodically in parallel bands marked off from the head to the tail. These bands would be then cut across in slices of a foot and a half, then divided into pieces, which, after being stowed in the barrels, would be sent to the bottom of the hold.

Generally the whaling ship, when the fishing is over, manages to land as soon as possible, so as to finish her manipulations. The crew lands, and then proceeds to melt the lard, which, under the action of the heat, gives up all its useful part—that is, the oil. In this operation, the whale's lard weighs about a third of its weight.

But, under present circumstances, Captain Hull could not dream of putting back to finish that operation. He only counted on melting this quantity of lard at Valparaiso. Besides, with winds which could not fail to hail from the west, he hoped to make the American coast before twenty days, and that lapse of time could not compromise the results of his fishing.

The moment for setting out had come. Before the "Pilgrim's" sails had been brought aback, she had drawn a little nearer to the place where the jubarte continued to signal its presence by jets of vapor and water.

The jubarte was all this time swimming in the middle of the vast red field of crustaceans, opening its large mouth automatically, and absorbing at each draught myriads of animalcules.

According to the experienced ones on board, there was no fear that the whale dreamt of escaping. It was, doubtless, what the whalers call a "fighting" whale.

Captain Hull strode over the netting, and, descending the rope ladder, he reached the prow of the whale-boat. Mrs. Weldon, Jack, Cousin Benedict, Tom, and his companions, for a last time wished the captain success.

Dingo itself, rising on its paws and passing its head above the railing, seemed to wish to say good-by to the crew.

Then all returned to the prow, so as to lose none of the very attractive movements of such a fishing.

The whale-boat put off, and, under the impetus of its four oars, vigorously handled, it began to distance itself from the "Pilgrim."

"Watch well, Dick, watch well!" cried Captain Hull to the young novice for the last time.

"Count on me, sir."

"One eye for the ship, one eye for the whale-boat, my boy. Do not forget it."

"That shall be done, captain," replied Dick Sand, who went to take his place near the helm.

Already the light boat was several hundred feet from the ship. Captain Hull, standing at the prow, no longer able to make himself heard, renewed his injunctions by the most expressive gestures.

It was then that Dingo, its paws still resting on the railing, gave a sort of lamentable bark, which would have an unfavorable effect upon men somewhat given to superstition.

That bark even made Mrs. Weldon shudder.

"Dingo," said she, "Dingo, is that the way you encourage your friends? Come, now, a fine bark, very clear, very sonorous, very joyful."

But the dog barked no more, and, letting itself fall back on its paws, it came slowly to Mrs. Weldon, whose hand it licked affectionately.

"It does not wag its tail," murmured Tom in a low tone. "Bad sign--bad sign."

But almost at once Dingo stood up, and a howl of anger escaped it.

Mrs. Weldon turned round.

Negoro had just left his quarters, and was going toward the forecastle, with the intention, no doubt, of looking for himself at the movements of the whale-boat.

Dingo rushed at the head cook, a prey to the strongest as well as to the most inexplicable fury.
Negoro seized a hand-spike and took an attitude of defense. The dog was going to spring at his throat. "Here, Dingo, here!" cried Dick Sand, who, leaving his post of observation for an instant, ran to the prow of the ship.

Mrs. Weldon on her side, sought to calm the dog. Dingo obeyed, not without repugnance, and returned to the young novice, growling secretly.

Negoro had not pronounced a single word, but his face had grown pale for a moment. Letting go of his hand-spike, he regained his cabin.

"Hercules," then said Dick Sand, "I charge you especially to watch over that man."

"I shall watch," simply replied Hercules, clenching his two enormous fists in sign of assent.

Mrs. Weldon and Dick Sand then turned their eyes again on the whale-boat, which the four oarsmen bore rapidly away.

It was nothing but a speck on the sea.

* * * * *

CHAPTER VIII.
THE JUBARTE.

Captain Hull, an experienced whaler, would leave nothing to chance. The capture of a jubarte is a difficult thing. No precaution ought to be neglected. None was in this case.

And, first of all, Captain Hull sailed so as to come up to the whale on the leeward, so that no noise might disclose the boat's approach.

Howik then steered the whale-boat, following the rather elongated curve of that reddish shoal, in the midst of which floated the jubarte. They would thus turn the curve.

The boatswain, set over this work, was a seaman of great coolness, who inspired Captain Hull with every confidence. He had not to fear either hesitation or distraction from Howik.

"Attention to the steering, Howik," said Captain Hull. "We are going to try to surprise the jubarte. We will only show ourselves when we are near enough to harpoon it."

"That is understood, sir," replied the boatswain.

"I am going to follow the contour of these reddish waters, so as to keep to the leeward."

"Good!" said Captain Hull. "Boys, as little noise as possible in rowing."

The oars, carefully muffled with straw, worked silently. The boat, skilfully steered by the boatswain, had reached the large shoal of crustaceans. The starboard oars still sank in the green and limpid water, while those to larboard, raising the reddish liquid, seemed to rain drops of blood.

"Wine and water!" said one of the sailors.

"Yes," replied Captain Hull, "but water that we cannot drink, and wine that we cannot swallow. Come, boys, let us not speak any more, and heave closer!"

The whale-boat, steered by the boatswain, glided noiselessly on the surface of those half-greased waters, as if it were floating on a bed of oil.

The jubarte did not budge, and did not seem to have yet perceived the boat, which described a circle around it. Captain Hull, in making the circuit, necessarily went farther than the "Pilgrim," which gradually grew smaller in the distance. This rapidity with which objects diminish at sea has always an odd effect. It seems as if we look at them shortened through the large end of a telescope. This optical illusion evidently takes place because there are no points of comparison on these large spaces. It was thus with the "Pilgrim," which decreased to the eye and seemed already much more distant than she really was.

Half an hour after leaving her, Captain Hull and his companions found themselves exactly to the leeward of the whale, so that the latter occupied an intermediate point between the ship and the boat. So the moment had come to approach, while making as little noise as possible. It was not impossible for them to get beside the animal and harpoon it at good range, before its attention would be attracted.

"Row more slowly, boys," said Captain Hull, in a low voice.

"It seems to me," replied Howik, "that the gudgeon suspects something. It breathes less violently than it did just now!"

"Silence! silence!" repeated Captain Hull.

Five minutes later the whale-boat was at a cable's length from the jubarte. A cable's length, a measure peculiar to the sea, comprises a length of one hundred and twenty fathoms, that is to say, two hundred meters.

The boatswain, standing aft, steered in such a manner as to approach the left side of the mammal, but avoiding,
with the greatest care, passing within reach of the formidable tail, a single blow of which would be enough to crush the boat.

At the prow Captain Hull, his legs a little apart to maintain his equilibrium, held the weapon with which he was going to give the first blow. They could count on his skill to fix that harpoon in the thick mass which emerged from the waters.

Near the captain, in a pail, was coiled the first of the five lines, firmly fastened to the harpoon, and to which they would successively join the other four if the whale plunged to great depths.

"Are we ready, boys?" murmured Captain Hull.
"Yes," replied Howik, grasping his oar firmly in his large hands.
"Alongside! alongside!"
The boatswain obeyed the order, and the whale-boat came within less than ten feet of the animal.
The latter no longer moved, and seemed asleep.
Whales thus surprised while asleep offer an easier prize, and it often happens that the first blow which is given wounds them mortally.

"This immovableness is quite astonishing!" thought Captain Hull. "The rascal ought not to be asleep, and nevertheless----there is something there!"
The boatswain thought the same, and he tried to see the opposite side of the animal.
But it was not the moment to reflect, but to attack.
Captain Hull, holding his harpoon by the middle of the handle, balanced it several times, to make sure of good aim, while he examined the jubarte's side. Then he threw it with all the strength of his arm.

"Back, back!" cried he at once.
And the sailors, pulling together, made the boat recoil rapidly, with the intention of prudently putting it in safety from the blows of the cetacean's tail.

But at that moment a cry from the boatswain made them understand why the whale was so extraordinarily motionless for so long a time on the surface of the sea.

"A young whale!" said he.
In fact, the jubarte, after having been struck by the harpoon, was almost entirely overturned on the side, thus discovering a young whale, which she was in process of suckling.

This circumstance, as Captain Hull well knew, would render the capture of the jubarte much more difficult. The mother was evidently going to defend herself with greater fury, as much for herself as to protect her "little one"--if, indeed, we can apply that epithet to an animal which did not measure less than twenty feet.

Meanwhile, the jubarte did not rush at the boat, as there was reason to fear, and there was no necessity, before taking flight, to quickly cut the line which connected the boat with the harpoon. On the contrary, and as generally happens, the whale, followed by the young one, dived, at first in a very oblique line; then rising again with an immense bound, she commenced to cleave the waters with extreme rapidity.

But before she had made her first plunge, Captain Hull and the boatswain, both standing, had had time to see her, and consequently to estimate her at her true value.

This jubarte was, in reality, a whale of the largest size. From the head to the tail, she measured at least eighty feet. Her skin, of a yellowish brown, was much varied with numerous spots of a darker brown.

It would indeed be a pity, after an attack so happily begun, to be under the necessity of abandoning so rich a prey.

The pursuit, or rather the towing, had commenced. The whale-boat, whose oars had been raised, darted like an arrow while swinging on the tops of the waves.

Howik kept it steady, notwithstanding those rapid and frightful oscillations. Captain Hull, his eye on his prey, did not cease making his eternal refrain:

"Be watchful, Howik, be watchful!"
And they could be sure that the boatswain's vigilance would not be at fault for an instant.

Meanwhile, as the whale-boat did not fly nearly as fast as the whale, the line of the harpoon spun out with such rapidity that it was to be feared that it would take fire in rubbing against the edge of the whale-boat. So Captain Hull took care to keep it damp, by filling with water the pail at the bottom of which the line was coiled.

All this time the jubarte did not seem inclined to stop her flight, nor willing to moderate it. The second line was then lashed to the end of the first, and it was not long before it was played out with the same velocity.

At the end of five minutes it was necessary to join on the third line, which ran off under the water.
The jubarte did not stop. The harpoon had evidently not penetrated into any vital part of the body. They could even observe, by the increased obliquity of the line, that the animal, instead of returning to the surface, was sinking into lower depths.
"The devil!" cried Captain Hull, "but that rascal will use up our five lines!"
"And lead us to a good distance from the 'Pilgrim,'" replied the boatswain.
"Nevertheless, she must return to the surface to breathe," replied Captain Hull. "She is not a fish, and she must have the provision of air like a common individual."
"She has held her breath to run better," said one of the sailors, laughing.
In fact, the line was unrolling all the time with equal rapidity.
To the third line, it was soon necessary to join the fourth, and that was not done without making the sailors somewhat anxious touching their future part of the prize.
"The devil! the devil!" murmured Captain Hull. "I have never seen anything like that! Devilish jubarte!"
Finally the fifth line had to be let out, and it was already half unrolled when it seemed to slacken.
"Good! good!" cried Captain Hull. "The line is less stiff. The jubarte is getting tired."
At that moment, the "Pilgrim" was more than five miles to the leeward of the whale-boat. Captain Hull, hoisting a flag at the end of a boat-hook, gave the signal to come nearer.
And almost at once, he could see that Dick Sand, aided by Tom and his companions, commenced to brace the yards in such a manner as to trim them close to the wind.
But the breeze was feeble and irregular. It only came in short puffs. Most certainly, the "Pilgrim" would have some trouble in joining the whale-boat, if indeed she could reach it. Meanwhile, as they had foreseen, the jubarte had returned to the surface of the water to breathe, with the harpoon fixed in her side all the time. She then remained almost motionless, seeming to wait for her young whale, which this furious course must have left behind.
Captain Hull made use of the oars so as to join her again, and soon he was only a short distance from her.
Two oars were laid down and two sailors armed themselves, as the captain had done, with long lances, intended to strike the enemy.
Howik worked skilfully then, and held himself ready to make the boat turn rapidly, in case the whale should turn suddenly on it.
"Attention!" cried Captain Hull. "Do not lose a blow! Aim well, boys! Are we ready, Howik?"
"I am prepared, sir," replied the boatswain, "but one thing troubles me. It is that the beast, after having fled so rapidly, is very quiet now."
"In fact, Howik, that seems to me suspicious. Let us be careful!"
"Yes, but let us go forward."
Captain Hull grew more and more animated.
The boat drew still nearer. The jubarte only turned in her place. Her young one was no longer near her; perhaps she was trying to find it again.
Suddenly she made a movement with her tail, which took her thirty feet away.
Was she then going to take flight again, and must they take up this interminable pursuit again on the surface of the waters?
"Attention!" cried Captain Hull. "The beast is going to take a spring and throw herself on us. Steer, Howik, steer!"
The jubarte, in fact, had turned in such a manner as to present herself in front of the whale-boat. Then, beating the sea violently with her enormous fins, she rushed forward.
The boatswain, who expected this direct blow, turned in such a fashion that the jubarte passed by the boat, but without reaching it.
Captain Hull and the two sailors gave her three vigorous thrusts on the passage, seeking to strike some vital organ.
The jubarte stopped, and, throwing to a great height two columns of water mingled with blood, she turned anew on the boat, bounding, so to say, in a manner frightful to witness.
These seamen must have been expert fishermen, not to lose their presence of mind on this occasion.
Howik again skilfully avoided the jubarte's attack, by darting the boat aside.
Three new blows, well aimed, again gave the animal three new wounds. But, in passing, she struck the water so roughly with her formidable tail, that an enormous wave arose, as if the sea were suddenly opened.
The whale-boat almost capsized, and, the water rushing in over the side, it was half filled.
"The bucket, the bucket!" cried Captain Hull.
The two sailors, letting go their oars, began to bale out the boat rapidly, while the captain cut the line, now become useless.
No! the animal, rendered furious by grief, no longer dreamt of flight. It was her turn to attack, and her agony threatened to be terrible.
A third time she turned round, "head to head," a seaman would say, and threw herself anew on the boat.
But the whale-boat, half full of water, could no longer move with the same facility. In this condition, how could it avoid the shock which threatened it? If it could be no longer steered, there was still less power to escape.

And besides, no matter how quickly the boat might be propelled, the swift jubarte would have always overtaken it with a few bounds. It was no longer a question of attack, but of defense.

Captain Hull understood it all.

The third attack of the animal could not be entirely kept off. In passing she grazed the whale-boat with her enormous dorsal fin, but with so much force that Howik was thrown down from his bench.

The three lances, unfortunately affected by the oscillation, this time missed their aim.

"Howik! Howik!" cried Captain Hull, who himself had been hardly able to keep his place.

"Present!" replied the boatswain, as he got up. But he then perceived that in his fall his stern oar had broken in the middle.

"Another oar!" said Captain Hull.

"I have one," replied Howik.

At that moment, a bubbling took place under the waters only a few fathoms from the boat.

The young whale had just reappeared. The jubarte saw it, and rushed towards it.

This circumstance could only give a more terrible character to the contest. The whale was going to fight for two.

Captain Hull looked toward the "Pilgrim." His hand shook the boat-hook, which bore the flag, frantically.

What could Dick Sand do that had not been already done at the first signal from the captain? The "Pilgrim's" sails were trimmed, and the wind commenced to fill them. Unhappily the schooner did not possess a helix, by which the action could be increased to sail faster.

To lower one of the boats, and, with the aid of the blacks, row to the assistance of the captain, would be a considerable loss of time; besides, the novice had orders not to quit the ship, no matter what happened. However, he had the stern-boat lowered from its pegs, and towed it along, so that the captain and his companions might take refuge in it, in case of need.

At that moment the jubarte, covering the young whale with her body, had returned to the charge. This time she turned in such a manner as to reach the boat exactly.

"Attention, Howik!" cried Captain Hull, for the last time.

But the boatswain was, so to speak, disarmed. Instead of a lever, whose length gave force, he only held in his hand an oar relatively short. He tried to put about; it was impossible.

The sailors knew that they were lost. All rose, giving a terrible cry, which was perhaps heard on the "Pilgrim."

A terrible blow from the monster's tail had just struck the whale-boat underneath. The boat, thrown into the air with irresistible violence, fell back, broken in three pieces, in the midst of waves furiously lashed by the whale's bounds.

The unfortunate sailors, although grievously wounded, would have had, perhaps, the strength to keep up still, either by swimming or by hanging on to some of the floating wreck. That is what Captain Hull did, for he was seen for a moment hoisting the boatswain on a wreck.

But the jubarte, in the last degree of fury, turned round, sprang up, perhaps in the last pangs of a terrible agony, and with her tail she beat the troubled waters frightfully, where the unfortunate sailors were still swimming.

For some minutes one saw nothing but a liquid water-spout scattering itself in sheafs on all sides.

A quarter of an hour after, when Dick Sand, who, followed by the blacks, had rushed into the boat, had reached the scene of the catastrophe, every living creature had disappeared. There was nothing left but some pieces of the whale-boat on the surface of the waters, red with blood.

* * * * *

CHAPTER IX.
CAPTAIN SAND.

The first impression felt by the passengers of the "Pilgrim" in presence of this terrible catastrophe was a combination of pity and horror. They only thought of this frightful death of Captain Hull and the five sailors. This fearful scene had just taken place almost under their eyes, while they could do nothing to save the poor men. They had not even been able to arrive in time to pick up the whale-boat's crew, their unfortunate companions, wounded, but still living, and to oppose the "Pilgrim's" hull to the jubarte's formidable blows. Captain Hull and his men had forever disappeared.

When the schooner arrived at the fatal place, Mrs. Weldon fell on her knees, her hands raised toward Heaven.

"Let us pray!" said the pious woman.

She was joined by her little Jack, who threw himself on his knees, weeping, near his mother. The poor child
understood it all. Dick Sand, Nan, Tom, and the other blacks remained standing, their heads bowed. All repeated the prayer that Mrs. Weldon addressed to God, recommending to His infinite goodness those who had just appeared before Him.

Then Mrs. Weldon, turning to her companions, "And now, my friends," said she, "let us ask Heaven for strength and courage for ourselves."

Yes! They could not too earnestly implore the aid of Him who can do all things, for their situation was one of the gravest!

This ship which carried them had no longer a captain to command her, no longer a crew to work her. She was in the middle of that immense Pacific Ocean, hundreds of miles from any land, at the mercy of the winds and waves.

What fatality then had brought that whale in the "Pilgrim's" course? What still greater fatality had urged the unfortunate Captain Hull, generally so wise, to risk everything in order to complete his cargo? And what a catastrophe to count among the rarest of the annals of whale-fishing was this one, which did not allow of the saving of one of the whale-boat's sailors!

Yes, it was a terrible fatality! In fact, there was no longer a seaman on board the "Pilgrim." Yes, one--Dick Sand--and he was only a beginner, a young man of fifteen. Captain, boatswain, sailors, it may be said that the whole crew was now concentrated in him.

On board there was one lady passenger, a mother and her son, whose presence would render the situation much more difficult. Then there were also some blacks, honest men, courageous and zealous without a doubt, ready to obey whoever should undertake to command them, but ignorant of the simplest notions of the sailor's craft.

Dick Sand stood motionless, his arms crossed, looking at the place where Captain Hull had just been swallowed up--Captain Hull, his protector, for whom he felt a filial affection. Then his eyes searched the horizon, seeking to discover some ship, from which he would demand aid and assistance, to which he might be able at least to confide Mrs. Weldon. He would not abandon the "Pilgrim," no, indeed, without having tried his best to bring her into port. But Mrs. Weldon and her little boy would be in safety. He would have had nothing more to fear for those two beings, to whom he was devoted body and soul.

The ocean was deserted. Since the disappearance of the jubarte, not a speck came to alter the surface. All was sky and water around the "Pilgrim." The young novice knew only too well that he was beyond the routes followed by the ships of commerce, and that the other whalers were cruising still farther away at the fishing-grounds.

However, the question was, to look the situation in the face, to see things as they were. That is what Dick Sand did, asking God, from the depths of his heart, for aid and succor. What resolution was he going to take?

At that moment Negoro appeared on the deck, which he had left after the catastrophe. What had been felt in the presence of this irreparable misfortune by a being so enigmatical, no one could tell. He had contemplated the disaster without making a gesture, without departing from his speechlessness. His eye had evidently seized all the details of it. But if at such a moment one could think of observing him, he would be astonished at least, because not a muscle of his impassible face had moved. At any rate, and as if he had not heard it, he had not responded to the pious appeal of Mrs. Weldon, praying for the engulfed crew. Negoro walked aft, there even where Dick Sand was standing motionless. He stopped three steps from the novice.

"You wish to speak to me?" asked Dick Sand.

"I wish to speak to Captain Hull," replied Negoro, coolly, "or, in his absence, to boatswain Howik."

"You know well that both have perished!" cried the novice.

"Then who commands on board now?" asked Negoro, very insolently.

"I," replied Dick Sand, without hesitation.

"You!" said Negoro, shrugging his shoulders. "A captain of fifteen years?"

"A captain of fifteen years!" replied the novice, advancing toward the cook.

The latter drew back.

"Do not forget it," then said Mrs. Weldon. "There is but one captain here--Captain Sand, and it is well for all to remember that he will know how to make himself obeyed."

Negoro bowed, murmuring in an ironical tone a few words that they could not understand, and he returned to his post.

We see, Dick's resolution was taken.

Meanwhile the schooner, under the action of the breeze, which commenced to freshen, had already passed beyond the vast shoal of crustaceans.

Dick Sand examined the condition of the sails; then his eyes were cast on the deck. He had then this sentiment, that, if a frightful responsibility fell upon him in the future, it was for him to have the strength to accept it. He dared to look at the survivors of the "Pilgrim," whose eyes were now fixed on him. And, reading in their faces that he could count on them, he said to them in two words, that they could in their turn count on him.
Dick Sand had, in all sincerity, examined his conscience.
If he was capable of taking in or setting the sails of the schooner, according to circumstances, by employing the arms of Tom and his companions, he evidently did not yet possess all the knowledge necessary to determine his position by calculation.

In four or five years more, Dick Sand would know thoroughly that beautiful and difficult sailor's craft. He would know how to use the sextant--that instrument which Captain Hull's hand had held every day, and which gave him the height of the stars. He would read on the chronometer the hour of the meridian of Greenwich, and from it would be able to deduce the longitude by the hour angle. The sun would be made his counselor each day. The moon--the planets would say to him, "There, on that point of the ocean, is thy ship!" That firmament, on which the stars move like the hands of a perfect clock, which nothing shakes nor can derange, and whose accuracy is absolute--that firmament would tell him the hours and the distances. By astronomical observations he would know, as his captain had known every day, nearly to a mile, the place occupied by the "Pilgrim," and the course followed as well as the course to follow.

And now, by reckoning, that is by the progress measured on the log, pointed out by the compass, and corrected by the drift, he must alone ask his way.

However, he did not falter.

Mrs. Weldon understood all that was passing in the young novice's resolute heart.
"Thank you, Dick," she said to him, in a voice which did not tremble. "Captain Hull is no more. All his crew have perished with him. The fate of the ship is in your hands! Dick, you will save the ship and those on board!"
"Yes, Mrs. Weldon," replied Dick Sand, "yes! I shall attempt it, with the aid of God!"
"Tom and his companions are honest men on whom you can depend entirely."
"I know it, and I shall make sailors of them, and we shall work together. With fine weather that will be easy. With bad weather--well, with bad weather, we shall strive, and we shall save you yet, Mrs. Weldon--you and your little Jack, both! Yes, I feel that I shall do it."

And he repeated:
"With the aid of God!"
"Now, Dick, can you tell where the 'Pilgrim' is?" asked Mrs. Weldon.
"Easily," replied the novice. "I have only to consult the chart on board, on which her position was marked yesterday by Captain Hull."
"And will you be able to put the ship in the right direction?"
"Yes, I shall be able to put her prow to the east, nearly at the point of the American coast that we must reach."
"But, Dick," returned Mrs. Weldon, "you well understand, do you not, that this catastrophe may, and indeed must, modify our first projects? It is no longer a question of taking the 'Pilgrim' to Valparaiso. The nearest port of the American coast is now her port of destination."
"Certainly, Mrs. Weldon," replied the novice. "So fear nothing! We cannot fail to reach that American coast which stretches so far to the south."
"Where is it situated?" asked Mrs. Weldon.
"There, in that direction," replied Dick Sand, pointing to the east, which he knew by means of the compass.
"Well, Dick, we may reach Valparaiso, or any other part of the coast. What matter? What we want is to land."
"And we shall do it, Mrs. Weldon, and I shall land you on a good place," replied the young man, in a firm voice.
"Besides, in standing in for the land, I do not renounce the hope of encountering some of those vessels which do the coasting trade on that shore. Ah! Mrs. Weldon, the wind begins to blow steadily from the northwest! God grant that it may keep on; we shall make progress, and good progress. We shall drive in the offing with all our sails set, from the brigantine to the flying-jib!"

Dick Sand had spoken with the confidence of the seaman, who feels that he stands on a good ship, a ship of whose every movement he is master. He was going to take the helm and call his companions to set the sails properly, when Mrs. Weldon reminded him that he ought first to know the "Pilgrim's" position.

It was, indeed, the first thing to do. Dick Sand went into the captain's cabin for the chart on which the position of the day before was indicated. He could then show Mrs. Weldon that the schooner was in latitude 43° 35', and in longitude 164° 13', for, in the last twenty-four hours, she had not, so to say, made any progress.

Mrs. Weldon leaned over this chart. She looked at the brown color which represented the land on the right of the ocean. It was the coast of South America, an immense barrier thrown between the Pacific and the Atlantic from Cape Horn to the shores of Columbia. To consider it in that way, that chart, which, was then spread out under her eyes, on which was drawn a whole ocean, gave the impression that it would be easy to restore the "Pilgrim's" passengers to their country. It is an illusion which is invariably produced on one who is not familiar with the scale on which marine charts are drawn. And, in fact, it seemed to Mrs. Weldon that the land ought to be in sight, as it was
on that piece of paper!

And, meanwhile, on that white page, the "Pilgrim" drawn on an exact scale, would be smaller than the most microscopic of infusoria! That mathematical point, without appreciable dimensions, would appear lost, as it was in reality in the immensity of the Pacific!

Dick Sand himself had not experienced the same impression as Mrs. Weldon. He knew how far off the land was, and that many hundreds of miles would not suffice to measure the distance from it. But he had taken his part; he had become a man under the responsibility which had fallen upon him.

The moment to act had come. He must profit by this northwest breeze which was blowing up. Contrary winds had given place to favorable winds, and some clouds scattered in the zenith under the cirriform form, indicated that they would blow steadily for at least a certain time.

Dick called Tom and his companions.

"My friends," he said to them, "our ship has no longer any crew but you. I cannot work without your aid. You are not sailors, but you have good arms. Place them, then, at the 'Pilgrim's' service and we can steer her. Every one's salvation depends on the good work of every one on board."

"Mr. Dick," replied Tom, "my companions and I, we are your sailors. Our good will shall not be wanting. All that men can do, commanded by you, we shall do it."

"Well spoken, old Tom," said Mrs. Weldon.

"Yes, well spoken," continued Dick Sand; "but we must be prudent, and I shall not carry too much canvas, so as not to run any risk. Circumstances require a little less speed, but more security. I will show you, my friends, what each will have to do in the work. As to me, I shall remain at the helm, as long as fatigue does not oblige me to leave it. From time to time a few hours' sleep will be sufficient to restore me. But, during those few hours, it will be very necessary for one of you to take my place. Tom, I shall show you how we steer by means of the mariner's compass. It is not difficult, and, with a little attention, you will soon learn to keep the ship's head in the right direction."

"Whenever you like, Mr. Dick," replied the old black.

"Well," said the novice, "stay near me at the helm till the end of the day, and if fatigue overcomes me, you will then be able to replace me for a few hours."

"And I," said little Jack, "will I not be able to help my friend, Dick, a little?"

"Yes, dear child," replied Mrs. Weldon, clasping Jack in her arms, "you shall learn to steer, and I am sure that while you are at the helm we shall have good winds."

"Very sure--very sure. Mother, I promise it to you," replied the little boy, clapping his hands.

"Yes," said the young novice, smiling, "good cabin-boys know how to maintain good winds. That is well known by old sailors." Then, addressing Tom, and the other blacks: "My friends," he said to them, "we are going to put the 'Pilgrim' under full sail. You will only have to do what I shall tell you."

"At your orders," replied Tom, "at your orders, Captain Sand."

* * * * *

CHAPTER X.

THE FOUR DAYS WHICH FOLLOW.

Dick Sand was then captain of the "Pilgrim," and, without losing an instant, he took the necessary measures for putting the ship under full sail.

It was well understood that the passengers could have only one hope--that of reaching some part of the American coast, if not Valparaiso. What Dick Sand counted on doing was to ascertain the direction and speed of the "Pilgrim," so as to get an average. For that, it was sufficient to make each day on the chart the way made, as it has been said, by the log and the compass. There was then on board one of those "patent logs," with an index and helix, which give the speed very exactly for a fixed time. This useful instrument, very easily handled, could render the most useful services, and the blacks were perfectly adapted to work it.

A single cause of error would interfere--the currents. To combat it, reckoning would be insufficient; astronomical observations alone would enable one to render an exact calculation from it. Now, those observations the young novice was still unable to make.

For an instant Dick Sand had thought of bringing the "Pilgrim" back to New Zealand. The passage would be shorter, and he would certainly have done it if the wind, which, till then, had been contrary, had not become favorable. Better worth while then to steer for America.

In fact, the wind had changed almost to the contrary direction, and now it blew from the northwest with a tendency to freshen. It was then necessary to profit by it and make all the headway possible.

So Dick Sand prepared to put the "Pilgrim" under full sail.
In a schooner brig-rigged, the foremast carries four square sails; the foresail, on the lower mast; above, the topsail, on the topmast; then, on the top-gallant mast, a top-sail and a royal.

The mainmast, on the contrary, has fewer sails. It only carries a brigantine below, and a fore-staffsail above. Between these two masts, on the stays which support them at the prow, a triple row of triangular sails may be set.

Finally, at the prow, on the bowsprit, and its extreme end, were hauled the three jibs.

The jibs, the brigantine, the fore-staff, and the stay-sails are easily managed. They can be hoisted from the deck without the necessity of climbing the masts, because they are not fastened on the yards by means of rope-bands, which must be previously loosened.

On the contrary, the working of the foremast sails demands much greater proficiency in seamanship. In fact, when it is necessary to set them, the sailors must climb by the rigging--it may be in the foretop, it may be on the spars of the top-gallant mast, it may be to the top of the said mast--and that, as well in letting them fly as in drawing them in to diminish their surface in reefing them. Thence the necessity of running out on foot-ropes--movable ropes stretched below the yards--of working with one hand while holding on by the other--perilous work for any one who is not used to it. The oscillation from the rolling and pitching of the ship, very much increased by the length of the lever, the flapping of the sails under a stiff breeze, have often sent a man overboard. It was then a truly dangerous operation for Tom and his companions.

Very fortunately, the wind was moderate. The sea had not yet had time to become rough. The rolling and pitching kept within bounds.

When Dick Sand, at Captain Hull's signal, had steered toward the scene of the catastrophe, the "Pilgrim" only carried her jibs, her brigantine, her foresail, and her top-sail. To get the ship under way as quickly as possible, the novice had only to make use of, that is, to counter-brace, the foresail. The blacks had easily helped him in that maneuver.

The question now was to get under full sail, and, to complete the sails, to hoist the top-sails, the royal, the fore-staff, and the stay-sails.

"My friends," said the novice to the five blacks, "do as I tell you, and all will go right."

Dick Sand was standing at the wheel of the helm.

"Go!" cried he. "Tom, let go that rope quickly!"

"Let go?" said Tom, who did not understand that expression.

"Yes, loosen it! Now you, Bat--the same thing! Good! Heave--haul taut. Let us see, pull it in!"

"Like that?" said Bat.

"Yes, like that. Very good. Come, Hercules--strong. A good pull there!"

To say "strong" to Hercules was, perhaps, imprudent. The giant of course gave a pull that brought down the rope.

"Oh! not so strong, my honest fellow!" cried Dick Sand, smiling. "You are going to bring down the masts!"

"I have hardly pulled," replied Hercules.

"Well, only make believe! You will see that that will be enough! Well, slacken--cast off! Make fast--Make fast--like that! Good! All together! Heave--pull on the braces."

And the whole breadth of the foremast, whose larboard braces had been loosened, turned slowly. The wind then swelling the sails imparted a certain speed to the ship.

Dick Sand then had the jib sheet-ropes loosened. Then he called the blacks aft:

"Behold what is done, my friends, and well done. Now let us attend to the mainmast. But break nothing, Hercules."

"I shall try," replied the colossus, without being willing to promise more.

This second operation was quite easy. The main-boom sheet-rope having been let go gently, the brigantine took the wind more regularly, and added its powerful action to that of the forward sails.

The fore-staff was then set above the brigantine, and, as it is simply brailed up, there was nothing to do but bear on the rope, to haul aboard, then to secure it. But Hercules pulled so hard, along with his friend Acteon, without counting little Jack, who had joined them, that the rope broke off.

All three fell backwards--happily, without hurting themselves. Jack was enchanted.

"That's nothing! that's nothing!" cried the novice. "Fasten the two ends together for this time and hoist softly!"

That was done under Dick Sand's eyes, while he had not yet left the helm. The "Pilgrim" was already sailing rapidly, headed to the east, and there was nothing more to be done but keep it in that direction. Nothing easier, because the wind was favorable, and lurches were not to be feared.

"Good, my friends!" said the novice. "You will be good sailors before the end of the voyage!"

"We shall do our best, Captain Sand," replied Tom.

Mrs. Weldon also complimented those honest men.
Little Jack himself received his share of praise, for he had worked bravely.

"Indeed, I believe, Mr. Jack," said Hercules, smiling, "that it was you who broke the rope. What a good little fist you have. Without you we should have done nothing right."

And little Jack, very proud of himself, shook his friend Hercules' hand vigorously.

The setting of the "Pilgrim's" sails was not yet complete. She still lacked those top-sails whose action is not to be despised under this full-sail movement. Top-sail, royal, stay-sails, would add sensibly to the schooner's speed, and Dick Sand resolved to set them.

This operation would be more difficult than the others, not for the stay-sails, which could be hoisted, hauled aboard and fastened from below, but for the cross-jacks of the foremast. It was necessary to climb to the spars to let them out, and Dick Sand, not wishing to expose any one of his improvised crew, undertook to do it himself.

He then called Tom and put him at the wheel, showing him how he should keep the ship. Then Hercules, Bat, Acteon and Austin being placed, some at the royal halyards, others at those of the top-sails, he proceeded up the mast. To climb the rattlings of the fore-shrouds, then the rattlings of the topmast-shrouds, to gain the spars, that was only play for the young novice. In a minute he was on the foot-rope of the top-sail yard, and he let go the rope-bands which kept the sail bound.

Then he stood on the spars again and climbed on the royal yard, where he let out the sail rapidly.

Dick Sand had finished his task, and seizing one of the starboard backstays, he slid to the deck.

There, under his directions, the two sails were vigorously hauled and fastened, then the two yards hoisted to the block. The stay-sails being set next between the mainmast and the foremast, the work was finished. Hercules had broken nothing this time.

The "Pilgrim" then carried all the sails that composed her rigging. Doubtless Dick Sand could still add the foremast studding-sails to larboard, but it was difficult work under the present circumstances, and should it be necessary to take them in, in case of a squall, it could not be done fast enough. So the novice stopped there.

Tom was relieved from his post at the wheel, which Dick Sand took charge of again.

The breeze freshened. The "Pilgrim," making a slight turn to starboard, glided rapidly over the surface of the sea, leaving behind her a very flat track, which bore witness to the purity of her water-line.

"We are well under way, Mrs. Weldon," then said Dick Sand, "and, now, may God preserve this favorable wind!"

Mrs. Weldon pressed the young man's hand. Then, fatigued with all the emotions of that last hour, she sought her cabin, and fell into a sort of painful drowsiness, which was not sleep.

The new crew remained on the schooner's deck, watching on the forecastle, and ready to obey Dick Sand's orders—that is to say, to change the set of the sails according to the variations of the wind; but so long as the breeze kept both that force and that direction, there would be positively nothing to do.

During all this time what had become of Cousin Benedict?

Cousin Benedict was occupied in studying with a magnifying glass an articulate which he had at last found on board—a simple orthopter, whose head disappeared under the prothorax; an insect with flat elytrums, with round abdomen, with rather long wings, which belonged to the family of the roaches, and to the species of American cockroaches.

It was exactly while ferreting in Negoro's kitchen, that he had made that precious discovery, and at the moment when the cook was going to crush the said insect pitilessly. Thence anger, which, indeed, Negoro took no notice of.

But this Cousin Benedict, did he know what change had taken place on board since the moment when Captain Hull and his companions had commenced that fatal whale-fishing? Yes, certainly. He was even on the deck when the "Pilgrim" arrived in sight of the remains of the whale-boat. The schooner's crew had then perished before his eyes.

To pretend that this catastrophe had not affected him, would be to accuse his heart. That pity for others that all people feel, he had certainly experienced it. He was equally moved by his cousin's situation. He had come to press Mrs. Weldon's hand, as if to say to her: "Do not be afraid. I am here. I am left to you."

Then Cousin Benedict had turned toward his cabin, doubtless so as to reflect on the consequences of this disastrous event, and on the energetic measures that he must take. But on his way he had met the cockroach in question, and his desire was—held, however, against certain entomologists—to prove the cockroaches of the phoraspese species, remarkable for their colors, have very different habits from cockroaches properly so called; he had given himself up to the study, forgetting both that there had been a Captain Hull in command of the "Pilgrim," and that that unfortunate had just perished with his crew. The cockroach absorbed him entirely. He did not admire it less, and he made as much time over it as if that horrible insect had been a golden beetle.

The life on board had then returned to its usual course, though every one would remain for a long time yet under the effects of such a keen and unforeseen catastrophe.
During this day Dick Sand was everywhere, so that everything should be in its place, and that he could be prepared for the smallest contingency. The blacks obeyed him with zeal. The most perfect order reigned on board the "Pilgrim." It might then be hoped that all would go well.

On his side, Negoro made no other attempt to resist Dick Sand's authority. He appeared to have tacitly recognized him. Occupied as usual in his narrow kitchen, he was not seen more than before. Besides, at the least infraction--at the first symptom of insubordination, Dick Sand was determined to send him to the hold for the rest of the passage. At a sign from him, Hercules would take the head cook by the skin of the neck; that would not have taken long. In that case, Nan, who knew how to cook, would replace the cook in his functions. Negoro then could say to himself that he was indispensable, and, as he was closely watched, he seemed unwilling to give any cause of complaint.

The wind, though growing stronger till evening, did not necessitate any change in the "Pilgrim's" sails. Her solid masting, her iron rigging, which was in good condition, would enable her to bear in this condition even a stronger breeze.

During the night it is often the custom to lessen the sails, and particularly to take in the high sails, fore-staff, top-sail, royal, etc. That is prudent, in case some squall of wind should come up suddenly. But Dick Sand believed he could dispense with this precaution. The state of the atmosphere indicated nothing of the kind, and besides, the young novice determined to pass the first night on the deck, intending to have an eye to everything. Then the progress was more rapid, and he longed to be in less desolate parts.

It has been said that the log and the compass were the only instruments which Dick Sand could use, so as to estimate approximately the way made by the "Pilgrim."

During this day the novice threw the log every half-hour, and he noted the indications furnished by the instrument.

As to the instrument which bears the name of compass, there were two on board. One was placed in the binnacle, under the eyes of the man at the helm. Its dial, lighted by day by the diurnal light, by night by two side-lamps, indicated at every moment which way the ship headed--that is, the direction she followed. The other compass was an inverted one, fixed to the bars of the cabin which Captain Hull formerly occupied. By that means, without leaving his chamber, he could always know if the route given was exactly followed, if the man at the helm, from ignorance or negligence, allowed the ship to make too great lurches.

Besides, there is no ship employed in long voyages which does not possess at least two compasses, as she has two chronometers. It is necessary to compare these instruments with each other, and, consequently, control their indications.

The "Pilgrim" was then sufficiently provided for in that respect, and Dick Sand charged his men to take the greatest care of the two compasses, which were so necessary to him.

Now, unfortunately, during the night of the 12th to the 13th of February, while the novice was on watch, and holding the wheel of the helm, a sad accident took place. The inverted compass, which was fastened by a copper ferule to the woodwork of the cabin, broke off and fell on the floor. It was not seen till the next day.

How had the ferule come to break. It was inexplicable enough. It was possible, however, that it was oxydized, and that the pitching and rolling had broken it from the woodwork. Now, indeed, the sea had been rougher during the night. However it was, the compass was broken in such a manner that it could not be repaired.

Dick Sand was much thwarted. Henceforth he was reduced to trust solely to the compass in the binnacle. Very evidently no one was responsible for the breaking of the second compass, but it might have sad consequences. The novice then took every precaution to keep the other compass beyond the reach of every accident.

Till then, with that exception, all went well on board the "Pilgrim."

Mrs. Weldon, seeing Dick Sand's calmness, had regained confidence. It was not that she had ever yielded to despair. Above all, she counted on the goodness of God. Also, as a sincere and pious Catholic, she comforted herself by prayer.

Dick Sand had arranged so as to remain at the helm during the night. He slept five or six hours in the day, and that seemed enough for him, as he did not feel too much fatigued. During this time Tom or his son Bat took his place at the wheel of the helm, and, thanks to his counsels, they were gradually becoming passable steersmen.

Often Mrs. Weldon and the novice talked to each other. Dick Sand willingly took advice from this intelligent and courageous woman. Each day he showed her on the ship's chart the course run, which he took by reckoning, taking into account only the direction and the speed of the ship. "See, Mrs. Weldon," he often repeated to her, "with these winds blowing, we cannot fail to reach the coast of South America. I should not like to affirm it, but I verily believe that when our vessel shall arrive in sight of land, it will not be far from Valparaiso."

Mrs. Weldon could not doubt the direction of the vessel was right, favored above all by those winds from the northwest. But how far the "Pilgrim" still seemed to be from the American coast! How many dangers between her
and the firm land, only counting those which might come from a change in the state of the sea and the sky!

Jack, indifferent like children of his age, had returned to his usual games, running on the deck, amusing himself with Dingo. He found, of course, that his friend Dick was less with him than formerly; but his mother had made him understand that they must leave the young novice entirely to his occupations. Little Jack had given up to these reasons, and no longer disturbed "Captain Sand."

So passed life on board. The blacks did their work intelligently, and each day became more skilful in the sailor's craft. Tom was naturally the boatswain, and it was he, indeed, whom his companions would have chosen for that office. He commanded the watch while the novice rested, and he had with him his son Bat and Austin. Acteon and Hercules formed the other watch, under Dick Sand's direction. By this means, while one steered, the others watched at the prow.

Even though these parts were deserted, and no collision was really to be feared, the novice exacted a rigorous watch during the night. He never sailed without having his lights in position—a green light on the starboard, a red light on the larboard—and in that he acted wisely.

All the time, during those nights which Dick Sand passed entirely at the helm, he occasionally felt an irresistible heaviness over him. His hand then steered by pure instinct. It was the effect of a fatigue of which he did not wish to take account.

Now, it happened that during the night of the 13th to the 14th of February, that Dick Sand was very tired, and was obliged to take a few hours' rest. He was replaced at the helm by old Tom.

The sky was covered with thick clouds, which had gathered with the evening, under the influence of the cold air. It was then very dark, and it was impossible to distinguish the high sails lost in the darkness. Hercules and Acteon were on watch on the forecastle.

Aft, the light from the binnacle only gave a faint gleam, which the metallic apparatus of the wheel reflected softly. The ship's lanterns throwing their lights laterally, left the deck of the vessel in profound darkness.

Toward three o'clock in the morning, a kind of hypnotic phenomenon took place, of which old Tom was not even conscious. His eyes, which were fixed too long on a luminous point of the binnacle, suddenly lost the power of vision, and he fell into a true anaesthetic sleep.

Not only was he incapable of seeing, but if one had touched or pinched him hard he would probably have felt nothing.

So he did not see a shadow which glided over the deck.

It was Negoro.

Arrived aft, the head cook placed under the binnacle a pretty heavy object which he held in hand.

Then, after observing for an instant the luminous index of the compass, he retired without having been seen.

If, the next day, Dick Sand had perceived that object placed by Negoro under the binnacle, he might have hastened to take it away.

In fact, it was a piece of iron, whose influence had just altered the indications of the compass. The magnetic needle had been deviated, and instead of marking the magnetic north, which differs a little from the north of the world, it marked the northeast. It was then, a deviation of four points; in other words, of half a right angle.

Tom soon recovered from his drowsiness. His eyes were fixed on the compass. He believed, he had reason to believe, that the "Pilgrim" was not in the right direction. He then moved the helm so as to head the ship to the east—at least, he thought so.

But, with the deviation of the needle, which he could not suspect, that point, changed by four points, was the southeast.

And thus, while under the action of a favorable wind, the "Pilgrim" was supposed to follow the direction wished for, she sailed with an error of forty-five degrees in her route!

CHAPTER XI.

TEMPEST.

During the week which followed that event, from the 14th of February to the 21st, no incident took place on board. The wind from the northwest freshened gradually, and the "Pilgrim" sailed rapidly, making on average one hundred and sixty miles in twenty-four hours. It was nearly all that could be asked of a vessel of that size.

Dick Sand thought the schooner must be approaching those parts more frequented by the merchant vessels which seek to pass from one hemisphere to the other. The novice was always hoping to encounter one of those ships, and he clearly intended either to transfer his passengers, or to borrow some additional sailors, and perhaps an officer. But, though he watched vigilantly, no ship could be signaled, and the sea was always deserted.

Dick Sand continued to be somewhat astonished at that. He had crossed this part of the Pacific several times.
during his three fishing voyages to the Southern Seas. Now, in the latitude and longitude where his reckoning put him, it was seldom that some English or American ship did not appear, ascending from Cape Horn toward the equator, or coming toward the extreme point of South America.

But what Dick Sand was ignorant of, what he could not even discover, was that the "Pilgrim" was already in higher latitude--that is to say, more to the south than he supposed. That was so for two reasons:

The first was, that the currents of these parts, whose swiftness the novice could only imperfectly estimate, had contributed--while he could not possibly keep account of them--to throw the ship out of her route.

The second was, that the compass, made inaccurate by Negoro's guilty hand, henceforth only gave incorrect bearings--bearings that, since the loss of the second compass, Dick Sand could not control. So that, believing, and having reason to believe, that he was sailing eastward, in reality, he was sailing southeast. The compass, it was always before his eyes. The log, it was thrown regularly. His two instruments permitted him, in a certain measure, to direct the "Pilgrim," and to estimate the number of miles sailed. But, then, was that sufficient?

However, the novice always did his best to reassure Mrs. Weldon, whom the incidents of this voyage must at times render anxious.

"We shall arrive, we shall arrive!" he repeated. "We shall reach the American coast, here or there; it matters little, on the whole, but we cannot fail to land there!"

"I do not doubt it, Dick."

"Of course, Mrs. Weldon, I should be more at ease if you were not on board--if we had only ourselves to answer for; but----"

"But if I were not on board," replied Mrs. Weldon; "if Cousin Benedict, Jack, Nan and I, had not taken passage on the 'Pilgrim,' and if, on the other hand, Tom and his companions had not been picked up at sea, Dick, there would be only two men here, you and Negoro! What would have become of you, alone with that wicked man, in whom you cannot have confidence? Yes, my child, what would have become of you?"

"I should have begun," replied Dick Sand, resolutely, "by putting Negoro where he could not injure me."

"And you would have worked alone?"

"Yes--alone--with the aid of God!"

The firmness of these words was well calculated to encourage Mrs. Weldon. But, nevertheless, while thinking of her little Jack, she often felt uneasy. If the woman would not show what she experienced as a mother, she did not always succeed in preventing some secret anguish for him to rend her heart.

Meanwhile, if the young novice was not sufficiently advanced in his hydrographic studies to make his point, he possessed a true sailor's scent, when the question was "to tell the weather." The appearance of the sky, for one thing; on the other hand, the indications of the barometer, enabled him to be on his guard. Captain Hull, a good meteorologist, had taught him to consult this instrument, whose prognostications are remarkably sure.

Here is, in a few words, what the notices relative to the observation of the barometer contain:

1. When, after a rather long continuance of fine weather, the barometer begins to fall in a sudden and continuous manner, rain will certainly fall; but, if the fine weather has had a long duration, the mercury may fall two or three days in the tube of the barometer before any change in the state of the atmosphere may be perceived. Then, the longer the time between the falling of the mercury and the arrival of the rain, the longer will be the duration of rainy weather.

2. If, on the contrary, during a rainy period which has already had a long duration, the barometer commences to rise slowly and regularly, very certainly fine weather will come, and it will last much longer if a long interval elapses between its arrival and the rising of the barometer.

3. In the two cases given, if the change of weather follows immediately the movement of the barometrical column, that change will last only a very short time.

4. If the barometer rises with slowness and in a continuous manner for two or three days, or even more, it announces fine weather, even when the rain will not cease during those three days, and _vice versa_; but if the barometer rises two days or more during the rain, then, the fine weather having come, if it commences to fall again, the fine weather will last a very short time, and _vice versa_.

5. In the spring and in the autumn, a sudden fall of the barometer presages wind. In the summer, if the weather is very warm, it announces a storm. In winter, after a frost of some duration, a rapid falling of the barometrical column announces a change of wind, accompanied by a thaw and rain; but a rising which happens during a frost which has already lasted a certain time, prognosticates snow.

6. Rapid oscillations of the barometer should never be interpreted as presaging dry or rainy weather of any duration. Those indications are given exclusively by the rising or the falling which takes place in a slow and continuous manner.

7. Toward the end of autumn, if after prolonged rainy and windy weather, the barometer begins to rise, that
rising announces the passage of the wind to the north and the approach of the frost.

Such are the general consequences to draw from the indications of this precious instrument.

Dick Sand knew all that perfectly well, as he had ascertained for himself in different circumstances of his sailor's life, which made him very skilful in putting himself on his guard against all contingencies.

Now, just toward the 20th of February, the oscillations of the barometrical column began to preoccupy the young novice, who noted them several times a day with much care. In fact, the barometer began to fall in a slow and continuous manner, which presages rain; but, this rain being delayed, Dick Sand concluded from that, that the bad weather would last. That is what must happen.

But the rain was the wind, and in fact, at that date, the breeze freshened so much that the air was displaced with a velocity of sixty feet a second, say thirty-one miles an hour.

Dick Sand was obliged to take some precautions so as not to risk the "Pilgrim's" masting and sails.

Already he had the royal, the fore-staff, and the flying-jib taken in, and he resolved to do the same with the top-sail, then take in two reefs in the top-sail.

This last operation must present certain difficulties with a crew of little experience. Hesitation would not do, however, and no one hesitated. Dick Sand, accompanied by Bat and Austin, climbed into the rigging of the foremost, and succeeded, not without trouble, in taking in the top-sail. In less threatening weather he would have left the two yards on the mast, but, foreseeing that he would probably be obliged to level that mast, and perhaps even to lay it down upon the deck, he unrigged the two yards and sent them to the deck. In fact, it is understood that when the wind becomes too strong, not only must the sails be diminished, but also the masting. That is a great relief to the ship, which, carrying less weight above, is no longer so much strained with the rolling and pitching.

This first work accomplished--and it took two hours--Dick Sand and his companions were busy reducing the surface of the top-sail, by taking in two reefs. The "Pilgrim" did not carry, like the majority of modern ships, a double top-sail, which facilitates the operation. It was necessary, then, to work as formerly--that is to say, to run out on the foot-ropes, pull toward you a sail beaten by the wind, and lash it firmly with its reef-lines. It was difficult, long, perilous; but, finally, the diminished top-sail gave less surface to the wind, and the schooner was much relieved.

Dick Sand came down again with Bat and Austin. The "Pilgrim" was then in the sailing condition demanded by that state of the atmosphere which has been qualified as "very stiff."

During the three days which followed, 20th, 21st and 22d of February, the force and direction of the wind were not perceptibly changed. All the time the mercury continued to fall in the barometrical tube, and, on this last day, the novice noted that it kept continually below twenty-eight and seven-tenths inches.

Besides, there was no appearance that the barometer would rise for some time. The aspect of the sky was bad, and extremely windy. Besides, thick fogs covered it constantly. Their stratum was even so deep that the sun was no longer seen, and it would have been difficult to indicate precisely the place of his setting and rising.

Dick Sand began to be anxious. He no longer left the deck; he hardly slept. However, his moral energy enabled him to drive back his fears to the bottom of his heart.

The next day, February 22d, the breeze appeared to decrease a little in the morning, but Dick Sand did not trust in it. He was right, for in the afternoon the wind freshened again, and the sea became rougher.

Toward four o'clock, Negoro, who was rarely seen, left his post and came up on the forecastle. Dingo, doubtless, was sleeping in some corner, for it did not bark as usual.

Negoro, always silent, remained for half an hour observing the horizon.

Long surges succeeded each other without, as yet, being dashed together. However, they were higher than the force of the wind accounted for. One must conclude from that, that there was very bad weather in the west, perhaps at a rather short distance, and that it would not be long in reaching these parts.

Negoro watched that vast extent of sea, which was greatly troubled, around the "Pilgrim." Then his eyes, always cold and dry, turned toward the sky.

The aspect of the sky was disturbing. The vapors moved with very different velocities. The clouds of the upper zone traveled more rapidly than those of the low strata of the atmosphere. The case then must be foreseen, in which those heavy masses would fall, and might change into a tempest, perhaps a hurricane, what was yet only a very stiff breeze--that is to say, a displacement of the air at the rate of forty-three miles an hour.

Whether Negoro was not a man to be frightened, or whether he understood nothing of the threats of the weather, he did not appear to be affected. However, an evil smile glided over his lips. One would say, at the end of his observations, that this state of things was rather calculated to please him than to displease him. One moment he mounted on the bowsprit and crawled as far as the ropes, so as to extend his range of vision, as if he were seeking some indication on the horizon. Then he descended again, and tranquilly, without having pronounced a single word, without having made a gesture, he regained the crew's quarters.
Meanwhile, in the midst of all these fearful conjunctions, there remained one happy circumstance which each one on board ought to remember; it was that this wind, violent as it was or might become, was favorable, and that the "Pilgrim" seemed to be rapidly making the American coast. If, indeed, the weather did not turn to tempest, this navigation would continue to be accomplished without great danger, and the veritable perils would only spring up when the question would be to land on some badly ascertained point of the coast.

That was indeed what Dick Sand was already asking himself. When he should once make the land, how should he act, if he did not encounter some pilot, some one who knew the coast? In case the bad weather should oblige him to seek a port of refuge, what should he do, because that coast was to him absolutely unknown? Indeed, he had not yet to trouble himself with that contingency. However, when the hour should come, he would be obliged to adopt some plan. Well, Dick Sand adopted one.

During the thirteen days which elapsed, from the 24th of February to the 9th of March, the state of the atmosphere did not change in any perceptible manner. The sky was always loaded with heavy fogs. For a few hours the wind went down, then it began to blow again with the same force. Two or three times the barometer rose again, but its oscillation, comprising a dozen lines, was too sudden to announce a change of weather and a return of more manageable winds. Besides the barometrical column fell again almost immediately, and nothing could inspire any hope of the end of that bad weather within a short period.

Terrible storms burst forth also, which very seriously disturbed Dick Sand. Two or three times the lightning struck the waves only a few cable-lengths from the ship. Then the rain fell in torrents, and made those whirlpools of half condensed vapors, which surrounded the "Pilgrim" with a thick mist.

For entire hours the man at the lookout saw nothing, and the ship sailed at random.

Even though the ship, although resting firmly on the waves, was horribly shaken, Mrs. Weldon, fortunately, supported this rolling and pitching without being incommoded. But her little boy was very much tried, and she was obliged to give him all her care.

As to Cousin Benedict, he was no more sick than the American cockroaches which he made his society, and he passed his time in studying, as if he were quietly settled in his study in San Francisco.

Very fortunately, also, Tom and his companions found themselves little sensitive to sea-sickness, and they could continue to come to the young novice's aid--well accustomed, himself, to all those excessive movements of a ship which flies before the weather.

The "Pilgrim" ran rapidly under this reduced sail, and already Dick Sand foresaw that he would be obliged to reduce it again. But he wished to hold out as long as it would be possible to do so without danger. According to his reckoning, the coast ought to be no longer distant. So they watched with care. All the time the novice could hardly trust his companions' eyes to discover the first indications of land. In fact, no matter what good sight he may have, he who is not accustomed to interrogating the sea horizons is not skilful in distinguishing the first contours of a coast, above all in the middle of fogs. So Dick Sand must watch himself, and he often climbed as far as the spars to see better. But no sign yet of the American coast.

This astonished him, and Mrs. Weldon, by some words which escaped him, understood that astonishment.

It was the 9th of March. The novice kept at the prow, sometimes observing the sea and the sky, sometimes looking at the "Pilgrim's" masting, which began to strain under the force of the wind.

"You see nothing yet, Dick?" she asked him, at a moment when he had just left the long lookout.

"Nothing, Mrs. Weldon, nothing," replied the novice; and meanwhile, the horizon seems to clear a little under this violent wind, which is going to blow still harder."

"And, according to you, Dick, the American coast ought not to be distant now."

"It cannot be, Mrs. Weldon, and if anything astonishes me, it is not having made it yet."

"Meanwhile," continued Mrs. Weldon, "the ship has always followed the right course."

"Always, since the wind settled in the northwest," replied Dick Sand; "that is to say, since the day when we lost our unfortunate captain and his crew. That was the 10th of February. We are now on the 9th of March. There have been then, twenty-seven since that."

"But at that period what distance were we from the coast?" asked Mrs. Weldon.

"About four thousand five hundred miles, Mrs. Weldon. If there are things about which I have more than a doubt, I can at least guarantee this figure within about twenty miles."

"And what has been the ship's speed?"

"On an average, a hundred and eighty miles a day since the wind freshened," replied the novice. "So, I am surprised at not being in sight of land. And, what is still more extraordinary, is that we do not meet even a single one of those vessels which generally frequent these parts!"

"Could you not be deceived, Dick," returned Mrs. Weldon, "in estimating the 'Pilgrim's' speed?"

"No, Mrs. Weldon. On that point I could not be mistaken. The log has been thrown every half hour, and I have
taken its indications very accurately. Wait, I am going to have it thrown anew, and you will see that we are sailing at this moment at the rate of ten miles an hour, which would give us more than two hundred miles a day."

Dick Sand called Tom, and gave him the order to throw the log, an operation to which the old black was now quite accustomed.

The log, firmly fastened to the end of the line, was brought and sent out.

Twenty-five fathoms were hardly unrolled, when the rope suddenly slackened between Tom's hands.

"Ah! Mr. Dick!" cried he.

"Well, Tom?"

"The rope has broken!"

"Broken!" cried Dick Sand. "And the log is lost!"

Old Tom showed the end of the rope which remained in his hand.

It was only too true. It was not the fastening which had failed. The rope had broken in the middle. And, nevertheless, that rope was of the first quality. It must have been, then, that the strands of the rope at the point of rupture were singularly worn! They were, in fact, and Dick Sand could tell that when he had the end of the rope in his hands! But had they become so by use? was what the novice, become suspicious, asked himself.

However that was, the log was now lost, and Dick Sand had no longer any means of telling exactly the speed of his ship. In the way of instruments, he only possessed one compass, and he did not know that its indications were false.

Mrs. Weldon saw him so saddened by this accident, that she did not wish to insist, and, with a very heavy heart, she retired into her cabin.

But if the "Pilgrim's" speed and consequently the way sailed over could no longer be estimated, it was easy to tell that the ship's headway was not diminishing.

In fact, the next day, March 10th, the barometer fell to twenty-eight and two-tenths inches. It was the announcement of one of those blasts of wind which travel as much as sixty miles an hour.

It became urgent to change once more the state of the sails, so as not to risk the security of the vessel.

Dick Sand resolved to bring down his top-gallant mast and his fore-staff, and to furl his low sails, so as to sail under his foretop-mast stay-sail and the low reef of his top-sail.

He called Tom and his companions to help him in that difficult operation, which, unfortunately, could not be executed with rapidity.

And meanwhile time pressed, for the tempest already declared itself with violence.

Dick Sands, Austin, Acteon, and Bat climbed into the masting, while Tom remained at the wheel, and Hercules on the deck, so as to slacken the ropes, as soon as he was commanded.

After numerous efforts, the fore-staff and the top-gallant mast were gotten down upon the deck, not without these honest men having a hundred times risked being precipitated into the sea, the rolling shook the masting to such an extent. Then, the top-sail having been lessened and the foresail furled, the schooner carried only her foretop-mast stay-sail and the low reef of his top-sail.

Even though her sails were then extremely reduced, the "Pilgrim" continued, none the less, to sail with excessive velocity.

The 12th the weather took a still worse appearance. On that day, at dawn, Dick Sand saw, not without terror, the barometer fall to twenty-seven and nine-tenths inches. It was a real tempest which was raging, and such that the "Pilgrim" could not carry even the little sail she had left.

Dick Sand, seeing that his top-sail was going to be torn, gave the order to furl. But it was in vain. A more violent gust struck the ship at that moment, and tore off the sail. Austin, who was on the yard of the foretop-sail, was struck by the larboard sheet-rope. Wounded, but rather slightly, he could climb down again to the deck.

Dick Sand, extremely anxious, had but one thought. It was that the ship, urged with such fury, was going to be dashed to pieces every moment; for, according to his calculation, the rocks of the coast could not be distant. He then returned to the prow, but he saw nothing which had the appearance of land, and then, came back to the wheel.

A moment after Negoro came on deck. There, suddenly, as if in spite of himself, his arm was extended toward a point of the horizon. One would say that he recognized some high land in the fogs!

Still, once more he smiled wickedly, and without saying anything of what he had been able to see, he returned to his post.

* * * * *

CHAPTER XII.
ON THE HORIZON.
At that date the tempest took its most terrible form, that of the hurricane. The wind had set in from the southwest. The air moved with a velocity of ninety miles an hour. It was indeed a hurricane, in fact, one of those terrible windstorms which wrecks all the ships of a roadstead, and which, even on land, the most solid structures cannot resist. Such was the one which, on the 25th of July, 1825, devastated Guadaloupe. When heavy cannons, carrying balls of twenty-four pounds, are raised from their carriages, one may imagine what would become of a ship which has no other point of support than an unsteady sea? And meanwhile, it is to its mobility alone that she may owe her salvation. She yields to the wind, and, provided she is strongly built, she is in a condition to brave the most violent surges. That was the case with the "Pilgrim."

A few minutes after the top-sail had been torn in pieces, the foretop-mast stay-sail was in its turn torn off. Dick Sand must then give up the idea of setting even a storm-jib--a small sail of strong linen, which would make the ship easier to govern. The "Pilgrim" then ran without canvas, but the wind took effect on her hull, her masts, her rigging, and nothing more was needed to impart to her an excessive velocity. Sometimes even she seemed to emerge from the waves, and it was to be believed that she hardly grazed them. Under these circumstances, the rolling of the ship, tossed about on the enormous billows raised by the tempest, was frightful. There was danger of receiving some monstrous surge aft. Those mountains of water ran faster than the schooner, threatening to strike her stern if she did not rise pretty fast. That is extreme danger for every ship which scuds before the tempest. But what could be done to ward off that contingency? Greater speed could not be imparted to the "Pilgrim," because she would not have kept the smallest piece of canvas. She must then be managed as much as possible by means of the helm, whose action was often powerless.

Dick Sand no longer left the helm. He was lashed by the waist, so as not to be carried away by some surge. Tom and Bat, fastened also, stood near to help him. Hercules and Acteon, bound to the bitts, watched forward. As to Mrs. Weldon, to Little Jack, to Cousin Benedict, to Nan, they remained, by order of the novice, in the aft cabins. Mrs. Weldon would have preferred to have remained on deck, but Dick Sand was strongly opposed to it; it would be exposing herself uselessly.

All the scuttles had been hermetically nailed up. It was hoped that they would resist if some formidable billow should fall on the ship. If, by any mischance, they should yield under the weight of these avalanches, the ship might fill and sink. Very fortunately, also, the stowage had been well attended to, so that, notwithstanding the terrible tossing of the vessel, her cargo was not moved about.

Dick Sand had again reduced the number of hours which he gave to sleep. So Mrs. Weldon began to fear that he would take sick. She made him consent to take some repose.

Now, it was while he was still lying down, during the night of the 13th to the 14th of March, that a new incident took place. Tom and Bat were aft, when Negoro, who rarely appeared on that part of the deck, drew near, and even seemed to wish to enter into conversation with them; but Tom and his son did not reply to him. Suddenly, in a violent rolling of the ship, Negoro fell, and he would, doubtless, have been thrown into the sea if he had not held on to the binnacle. Dick Sand, in a moment of wakefulness, heard that cry, and rushing out of his quarters, he ran aft. Negoro had already risen, but he held in his hand the piece of iron which he had just taken from under the binnacle, and he hid it before Dick Sand could see it.

"What's the matter?" asked the novice.
"It's that cook of misfortune, who has just fallen on the compass!" replied Tom.

At those words Dick Sand, in the greatest anxiety, leaned over the binnacle. It was in good condition; the compass, lighted by two lamps, rested as usual on its concentric circles.

The young novice was greatly affected. The breaking of the only compass on board would be an irreparable misfortune.

But what Dick Sand could not observe was that, since the taking away of the piece of iron, the needle had returned to its normal position, and indicated exactly the magnetic north as it ought to be under that meridian.

The young novice was greatly affected. The breaking of the only compass on board would be an irreparable misfortune.

But what Dick Sand could not observe was that, since the taking away of the piece of iron, the needle had returned to its normal position, and indicated exactly the magnetic north as it ought to be under that meridian.
"I say," replied the head cook, "that there is no rule which forbids walking aft."

"Well, I make that the rule," replied Dick Sand, "and I forbid you, remember, to come aft."

"Indeed!" replied Negoro.

That man, so entirely under self-control, then made a menacing gesture.

The novice drew a revolver from his pocket, and pointed it at the head cook.

"Negoro," said he, "recollect that I am never without this revolver, and that on the first act of insubordination I shall blow out your brains!"

At that moment Negoro felt himself irresistibly bent to the deck.

It was Hercules, who had just simply laid his heavy hand on Negoro's shoulder.

"Captain Sand," said the giant, "do you want me to throw this rascal overboard? He will regale the fishes, who are not hard to please!"

"Not yet," replied Dick Sand.

Negoro rose as soon as the black's hand no longer weighed upon him. But, in passing Hercules:

"Accursed negro," murmured he, "I'll pay you back!"

Meanwhile, the wind had just changed; at least, it seemed to have veered round forty-five degrees. And, notwithstanding, a singular thing, which struck the novice, nothing in the condition of the sea indicated that change. The ship headed the same way all the time, but the wind and the waves, instead of taking her directly aft, now struck her by the larboard quarter--a very dangerous situation, which exposes a ship to receive bad surges. So Dick Sand was obliged to veer round four points to continue to scud before the tempest.

But, on the other hand, his attention was awakened more than ever. He asked himself if there was not some connection between Negoro's fall and the breaking of the first compass. What did the head cook intend to do there? Had he some interest in putting the second compass out of service also? What could that interest be? There was no explanation of that. Must not Negoro desire, as they all desired, to land on the American coast as soon as possible?

When Dick Sand spoke of this incident to Mrs. Weldon, the latter, though she shared his distrust in a certain measure, could find no plausible motive for what would be criminal premeditation on the part of the head cook.

However, as a matter of prudence, Negoro was well watched. Thereafter he attended to the novice's orders and he did not risk coming aft in the ship, where his duties never called him. Besides, Dingo having been installed there permanently, the cook took care to keep away.

During all that week the tempest did not abate. The barometer fell again. From the 14th to the 26th of March it was impossible to profit by a single calm to set a few sails. The "Pilgrim" scudded to the northeast with a speed which could not be less than two hundred miles in twenty-four hours, and still the land did not appear!--that land, America, which is thrown like an immense barrier between the Atlantic and the Pacific, over an extent of more than a hundred and twenty degrees!

Dick Sand asked himself if he was not a fool, if he was still in his right mind, if, for so many days, unknown to him, he was not sailing in a false direction. No, he could not find fault with himself on that point. The sun, even though he could not perceive it in the fogs, always rose before him to set behind him. But, then, that land, had it disappeared? That America, on which his vessel would go to pieces, perhaps, where was it, if it was not there? Be it the Southern Continent or the Northern Continent--for anything way possible in that chaos--the "Pilgrim" could not miss either one or the other. What had happened since the beginning of this frightful tempest? What was still going on, as that coast, whether it should prove salvation or destruction, did not appear? Must Dick Sand suppose, then, that he was deceived by his compass, whose indications he could no longer control, because the second compass was lacking to make that control? Truly, he had that fear which the absence of all land might justify.

So, when he was at the helm, Dick Sand did not cease to devour the chart with his eyes. But he interrogated it in vain; it could not give him the solution of an enigma which, in the situation in which Negoro had placed him, was incomprehensible for him, as it would have been for any one else.

On this day, however, the 26th of March, towards eight o'clock in the morning, an incident of the greatest importance took place.

Hercules, on watch forward, gave this cry:

"Land! land!"

Dick Sand sprang to the forecastle. Hercules could not have eyes like a seaman. Was he not mistaken?

"Land!" cried Dick Sand.

"There," replied Hercules, showing an almost imperceptible point on the horizon in the northeast. They hardly heard each other speak in the midst of the roaring of the sea and the sky.

"You have seen the land?" said the novice.

"Yes," replied Hercules.

And his hand was still stretched out to larboard forward.
The novice looked. He saw nothing.

At that moment, Mrs. Weldon, who had heard the cry given by Hercules, came up on deck, notwithstanding her promise not to come there.

"Madam!" cried Dick Sand.

Mrs. Weldon, unable to make herself heard, tried, for herself, to perceive that land signaled by the black, and she seemed to have concentrated all her life in her eyes.

It must be believed that Hercules's hand indicated badly the point of the horizon which he wished to show: neither Mrs. Weldon nor the novice could see anything.

But, suddenly, Dick Sand in turn stretched out his hand.

"Yes! yes! land!" said he.

A kind of summit had just appeared in an opening in the fog. His sailor's eyes could not deceive him.

"At last!" cried he; "at last!"

He clung feverishly to the netting. Mrs. Weldon, sustained by Hercules, continued to watch that land almost deserted.

The coast, formed by that high summit, rose at a distance of ten miles to leeward.

The opening being completely made in a breaking of the clouds, they saw it again more distinctly. Doubtless it was some promontory of the American continent. The "Pilgrim," without sails, was not in a condition to head toward it, but it could not fail to make the land there.

That could be only a question of a few hours. Now, it was eight o'clock in the morning. Then, very certainly, before noon the "Pilgrim" would be near the land.

At a sign from Dick Sand, Hercules led Mrs. Weldon aft again, for she could not bear up against the violence of the pitching.

The novice remained forward for another instant, then he returned to the helm, near old Tom.

At last, then, he saw that coast, so slowly made, so ardently desired! but it was now with a feeling of terror.

In fact, in the "Pilgrim's" present condition, that is to say, scudding before the tempest, land to leeward, was shipwreck with all its terrible contingencies.

Two hours passed away. The promontory was then seen off from the ship.

At that moment they saw Negoro come on deck. This time he regarded the coast with extreme attention, shook his head like a man who would know what to believe, and went down again, after pronouncing a name that nobody could hear.

Dick Sand himself sought to perceive the coast, which ought to round off behind the promontory.

Two hours rolled by. The promontory was standing on the larboard stern, but the coast was not yet to be traced.

Meanwhile the sky cleared at the horizon, and a high coast, like the American land, bordered by the immense chain of the Andes, should be visible for more than twenty miles.

Dick Sand took his telescope and moved it slowly over the whole eastern horizon.

Nothing! He could see nothing!

At two o'clock in the afternoon every trace of land had disappeared behind the "Pilgrim." Forward, the telescope could not seize any outline whatsoever of a coast, high or low.

Then a cry escaped Dick Sand. Immediately leaving the deck, he rushed into the cabin, where Mrs. Weldon was with little Jack, Nan, and Cousin Benedict.

"An island! That was only an island!" said he.

"An island, Dick! but what?" asked Mrs. Weldon.

"The chart will tell us," replied the novice.

And running to his berth, he brought the ship's chart.

"There, Mrs. Weldon, there!" said he. "That land which we have seen, it can only be this point, lost in the middle of the Pacific! It can only be the Isle of Paques; there is no other in these parts."

"And we have already left it behind?" asked Mrs. Weldon.

"Yes, well to the windward of us."

Mrs. Weldon looked attentively at the Isle of Paques, which only formed an imperceptible point on the chart.

"And at what distance is it from the American coast?"

"Thirty-five degrees."

"Which makes-----"

"About two thousand miles."

"But then the 'Pilgrim' has not sailed, if we are still so far from the continent?"

"Mrs. Weldon," replied Dick Sand, who passed his hand over his forehead for a moment, as if to concentrate his ideas, "I do not know--I cannot explain this incredible delay! No! I cannot--unless the indications of the compass
have been false? But that island can only be the Isle of Paques, because we have been obliged to scud before the
wind to the northeast, and we must thank Heaven, which has permitted me to mark our position! Yes, it is still two
thousand miles from the coast! I know, at last, where the tempest has blown us, and, if it abates, we shall be able to
land on the American continent with some chance of safety. Now, at least, our ship is no longer lost on the
immensity of the Pacific!"

This confidence, shown by the young novice, was shared by all those who heard him speak. Mrs. Weldon,
herself, gave way to it. It seemed, indeed, that these poor people were at the end of their troubles, and that the
"Pilgrim," being to the windward of her port, had only to wait for the open sea to enter it! The Isle of Paques—by its
true name Vai-Hon—discovered by David in 1686, visited by Cook and Laperouse, is situated 27° south latitude and
112° east longitude. If the schooner had been thus led more than fifteen degrees to the north, that was evidently due
to that tempest from the southwest, before which it had been obliged to scud.

Then the "Pilgrim" was still two thousand miles from the coast. However, under the impetus of that wind which
blew like thunder, it must, in less than ten days, reach some point of the coast of South America.

But could they not hope, as the novice had said, that the weather would become more manageable, and that it
would be possible to set some sail, when they should make the land?

It was still Dick Sand's hope. He said to himself that this hurricane, which had lasted so many days, would end
perhaps by "killing itself." And now that, thanks to the appearance of the Isle of Paques, he knew exactly his
position, he had reason to believe that, once master of his vessel again, he would know how to lead her to a safe
place.

Yes! to have had knowledge of that isolated point in the middle of the sea, as by a providential favor, that had
restored confidence to Dick Sand; if he was going all the time at the caprice of a hurricane, which he could not
subdue, at least, he was no longer going quite blindfold.

Besides, the "Pilgrim," well-built and rigged, had suffered little during those rude attacks of the tempest. Her
damages reduced themselves to the loss of the top-sail and the foretop-mast stay-sail—a loss which it would be easy
to repair. Not a drop of water had penetrated through the well-stanched seams of the hull and the deck. The pumps
were perfectly free. In this respect there was nothing to fear.

There was, then, this interminable hurricane, whose fury nothing seemed able to moderate. If, in a certain
measure, Dick Sand could put his ship in a condition to struggle against the violent storm, he could not order that
wind to moderate, those waves to be still, that sky to become serene again. On board, if he was "master after God,"
outside the ship, God alone commanded the winds and the waves.

* * * * *

CHAPTER XIII.

LAND! LAND!

Meanwhile, that confidence with which Dick Sand's heart filled instinctively, was going to be partly justified.

The next day, March 27th, the column of mercury rose in the barometrical tube. The oscillation was neither
sudden nor considerable—a few lines only—but the progression seemed likely to continue. The tempest was evidently
going to enter its decreasing period, and, if the sea did remain excessively rough, they could tell that the wind was
going down, veering slightly to the west.

Dick Sand could not yet think of using any sail. The smallest sail would be carried away. However, he hoped
that twenty-four hours would not elapse before it would be possible for him to rig a storm-jib.

During the night, in fact, the wind went down quite noticeably, if they compared it to what it had been till then,
and the ship was less tossed by those violent rollings which had threatened to break her in pieces.

The passengers began to appear on deck again. They no longer ran the risk of being carried away by some surge
from the sea.

Mrs. Weldon was the first to leave the hatchway where Dick Sand, from prudent motives, had obliged them to
shut themselves up during the whole duration of that long tempest. She came to talk with the novice, whom a truly
superhuman will had rendered capable of resisting so much fatigue. Thin, pale under his sunburnt complexion, he
might well be weakened by the loss of that sleep so necessary at his age. No, his valiant nature resisted everything.
Perhaps he would pay dearly some day for that period of trial. But that was not the moment to allow himself to be
cast down. Dick Sand had said all that to himself. Mrs. Weldon found him as energetic as he had ever been.

And then he had confidence, that brave Sand, and if confidence does not command itself, at least it commands.

"Dick, my dear child, my captain," said Mrs. Weldon, holding out her hand to the young novice.

"Ah! Mrs. Weldon," exclaimed Dick Sand, smiling, "you disobey your captain. You return on deck, you leave
your cabin in spite of his--prayers."
"Yes, I disobey you," replied Mrs. Weldon; "but I have, as it were, a presentiment that the tempest is going down or is going to become calm."

"It is becoming calm, in fact, Mrs. Weldon," replied the novice. "You are not mistaken. The barometer has not fallen since yesterday. The wind has moderated, and I have reason to believe that our hardest trials are over."

"Heaven hears you, Dick. All! you have suffered much, my poor child! You have done there----"

"Only my duty, Mrs. Weldon."

"But at last will you be able to take some rest?"

"Rest!" replied the novice; "I have no need of rest, Mrs. Weldon. I am well, thank God, and it is necessary for me to keep up to the end. You have called me captain, and I shall remain captain till the moment when all the 'Pilgrim's' passengers shall be in safety."

"Dick," returned Mrs. Weldon, "my husband and I, we shall never forget what you have just done."

"God has done all," replied Dick Sand; "all!"

"My child, I repeat it, that by your moral and physical energy, you have shown yourself a man--a man fit to command, and before long, as soon as your studies are finished--my husband will not contradict me--you will command for the house of James W. Weldon!"

"I--I----" exclaimed Dick Sand, whose eyes filled with tears.

"Dick," replied Mrs. Weldon, "you are already our child by adoption, and now, you are our son, the deliverer of your mother, and of your little brother Jack. My dear Dick, I embrace you for my husband and for myself!"

The courageous woman did not wish to give way while clasping the young novice in her arms, but her heart overflowed. As to Dick Sand's feelings, what pen could do them justice? He asked himself if he could not do more than give his life for his benefactors, and he accepted in advance all the trials which might come upon him in the future.

After this conversation Dick Sand felt stronger. If the wind should become so moderate that he should be able to hoist some canvas, he did not doubt being able to steer his ship to a port where all those which it carried would at last be in safety.

On the 29th, the wind having moderated a little, Dick Sand thought of setting the foresail and the top-sail, consequently to increase the speed of the "Pilgrim" while directing her course.

"Come, Tom; come, my friends!" cried he, when he went on deck at daybreak; "come, I need your arms!"

"We are ready, Captain Sand," replied old Tom.

"Ready for everything," added Hercules. "There was nothing to do during that tempest, and I begin to grow rusty."

"You should have blown with your big mouth," said little Jack; "I bet you would have been as strong as the wind!"

"That is an idea, Jack," replied Dick Sand, laughing. "When there is a calm we shall make Hercules blow on the sails."

"At your service, Mister Dick!" replied the brave black, inflating his cheeks like a gigantic Boreas.

"Now, my friends," continued the novice, we are to begin by binding a spare sail to the yard, because our top-sail was carried away in the hurricane. It will be difficult, perhaps, but it must be done."

"It shall be done!" replied Acteon.

"Can I help you?" asked little Jack, always ready to work.

"Yes, my Jack," replied the novice. "You will take your place at the wheel, with our friend Bat, and you will help him to steer."

If little Jack was proud of being assistant helmsman on the "Pilgrim," it is superfluous to say so.

"Now to work," continued Dick Sand, "and we must expose ourselves as little as possible."

The blacks, guided by the novice, went to work at once. To fasten a top-sail to its yard presented some difficulties for Tom and his companions. First the rolled up sail must be hoisted, then fastened to the yard.

However, Dick Sand commanded so well, and was so well obeyed, that after an hour's work the sail was fastened to its yard, the yard hoisted, and the top-sail properly set with two reefs.

As to the foresail and the second jib, which had been furled before the tempest, those sails were set without a great deal of trouble, in spite of the force of the wind.

At last, on that day, at ten o'clock in the morning, the "Pilgrim" was sailing under her foresail, her top-sail, and her jib.

Dick Sand had not judged it prudent to set more sail. The canvas which he carried ought to assure him, as long as the wind did not moderate, a speed of at least two hundred miles in twenty-four hours, and he did not need any greater to reach the American coast before ten days.

The novice was indeed satisfied when, returning to the wheel, he again took his post, after thanking Master Jack,
assistant helmsman of the "Pilgrim." He was no longer at the mercy of the waves. He was making headway. His joy will be understood by all those who are somewhat familiar with the things of the sea.

The next day the clouds still ran with the same velocity, but they left large openings between them, through which the rays of the sun made their way to the surface of the waters. The "Pilgrim" was at times overspread with them. A good thing is that vivifying light! Sometimes it was extinguished behind a large mass of vapors which came up in the east, then it reappeared, to disappear again, but the weather was becoming fine again.

The scuttles had been opened to ventilate the interior of the ship. A salubrious air penetrated the hold, the crew's quarters. They put the wet sails to dry, stretching them out in the sun. The deck was also cleaned. Dick Sand did not wish his ship to arrive in port without having made a bit of toilet. Without overworking the crew, a few hours spent each day at that work would bring it to a good end.

Though the novice could no longer throw the log, he was so accustomed to estimating the headway of a ship that he could take a close account of her speed. He had then no doubt of reaching land before seven days, and he gave that opinion to Mrs. Weldon, after showing her, on the chart, the probable position of the ship.

"Well, at what point of the coast shall we arrive, my dear Dick?" she asked him.

"Here, Mrs. Weldon," replied the novice, indicating that long coast line which extends from Peru to Chili. "I do not know how to be more exact. Here is the Isle of Paques, that we have left behind in the west, and, by the direction of the wind, which has been constant, I conclude that we shall reach land in the east. Ports are quite numerous on that coast, but to name the one we shall have in view when we make the land is impossible at this moment."

"Well, Dick, whichever it may be, that port will be welcome."

"Yes, Mrs. Weldon, and you will certainly find there the means to return promptly to San Francisco. The Pacific Navigation Company has a very well organized service on this coast. Its steamers touch at the principal points of the coast; nothing will be easier than to take passage for California."

"Then you do not count on bringing the 'Pilgrim' to San Francisco?" asked Mrs. Weldon.

"Yes, after having put you on shore, Mrs. Weldon. If we can procure an officer and a crew, we are going to discharge our cargo at Valparaiso, as Captain Hull would have done. Then we shall return to our own port. But that would delay you too much, and, though very sorry to be separated from you——"

"Well, Dick," replied Mrs. Weldon, "we shall see later what must be done. Tell me, you seem to fear the dangers which the land presents."

"In fact, they are to be feared," replied the novice, "but I am always hoping to meet some ship in these parts, and I am even very much surprised at not seeing any. If only one should pass, we would enter into communication with her; she would give us our exact situation, which would greatly facilitate our arrival in sight of land."

"Are there not pilots who do service along this coast?" asked Mrs. Weldon.

"There ought to be," replied Dick Sand, "but much nearer land. We must then continue to approach it."

"And if we do not meet a pilot?" asked Mrs. Weldon, who kept on questioning him in order to know how the young novice would prepare for all contingencies.

"In that case, Mrs. Weldon, either the weather will be clear, the wind moderate, and I shall endeavor to sail up the coast sufficiently near to find a refuge, or the wind will be stronger, and then——"

"Then what will you do, Dick?"

"Then, in the present condition of the 'Pilgrim,'" replied Dick Sand, "once near the land, it will be very difficult to set off again."

"What will you do?" repeated Mrs. Weldon.

"I shall be forced to run my ship aground," replied the novice, whose brow darkened for a moment. "Ah! it is a hard extremity. God grant that we may not be reduced to that. But, I repeat it, Mrs. Weldon, the appearance of the sky is reassuring, and it is impossible for a vessel or a pilot-boat not to meet us. Then, good hope. We are headed for the land, we shall see it before long."

Yes, to run a ship aground is a last extremity, to which the most energetic sailor does not resort without fear! Thus, Dick Sand did not wish to foresee it, while he had some chances of escaping it.

For several days there were, in the state of the atmosphere, alternatives which, anew, made the novice very uneasy. The wind kept in the condition of a stiff breeze all the time, and certain oscillations of the barometrical column indicated that it tended to freshen. Dick Sand then asked himself, not without apprehension, if he would be again forced to scud without sails. He had so much interest in keeping at least his top-sail, that he resolved to do so so long as it was not likely to be carried away. But, to secure the solidity of the masts, he had the shrouds and backstays hauled taut. Above all, all unnecessary risk must be avoided, as the situation would become one of the gravest, if the "Pilgrim" should be disabled by losing her masts.

Once or twice, also, the barometer rising gave reason to fear that the wind might change point for point; that is to say, that it might pass to the east. It would then be necessary to sail close to the wind!
A new anxiety for Dick Sand. What should he do with a contrary wind? Tack about? But if he was obliged to come to that, what new delays and what risks of being thrown into the offing.

Happily those fears were not realized. The wind, after shifting for several days, blowing sometimes from the north, sometimes from the south, settled definitely in the west. But it was always a strong breeze, almost a gale, which strained the masting.

It was the 5th of April. So, then, more than two months had already elapsed since the "Pilgrim" had left New Zealand. For twenty days a contrary wind and long calms had retarded her course. Then she was in a favorable condition to reach land rapidly. Her speed must even have been very considerable during the tempest. Dick Sand estimated its average at not less than two hundred miles a day! How, then, had he not yet made the coast? Did it flee before the "Pilgrim?" It was absolutely inexplicable.

And, nevertheless, no land was signaled, though one of the blacks kept watch constantly in the crossbars.

Dick Sand often ascended there himself. There, with a telescope to his eyes, he sought to discover some appearance of mountains. The Andes chain is very high. It was there in the zone of the clouds that he must seek some peak, emerging from the vapors of the horizon.

Several times Tom and his companions were deceived by false indications of land. They were only vapors of an odd form, which rose in the background. It happened sometimes that these honest men were obstinate in their belief; but, after a certain time, they were forced to acknowledge that they had been dupes of an optical illusion. The pretended land, moved away, changed form and finished by disappearing completely.

On the 6th of April there was no longer any doubt possible.

It was eight o'clock in the morning. Dick Sand had just ascended into the bars. At that moment the fogs were condensed under the first rays of the sun, and the horizon was pretty clearly defined.

From Dick Sand's lips escaped at last the so long expected cry:
"Land! land before us!"

At that cry every one ran on deck, little Jack, curious as folks are at that age, Mrs. Weldon, whose trials were going to cease with the landing, Tom and his companions, who were at last going to set foot again on the American continent, Cousin Benedict himself, who had great hope of picking up quite a rich collection of new insects for himself. Negoro, alone, did not appear.

Each then saw what Dick Sand had seen, some very distinctly, others with the eyes of faith. But on the part of the novice, so accustomed to observe sea horizons, there was no error possible, and an hour after, it must be allowed he was not deceived.

At a distance of about four miles to the east stretched a rather low coast, or at least what appeared such. It must be commanded behind by the high chain of the Andes, but the last zone of clouds did not allow the summits to be perceived.

The "Pilgrim" sailed directly and rapidly to this coast, which grew larger to the eye.

Two hours after it was only three miles away.

This part of the coast ended in the northeast by a pretty high cape, which covered a sort of roadstead protected from land winds. On the contrary, in the southeast, it lengthened out like a thin peninsula.

A few trees crowned a succession of low cliffs, which were then clearly defined under the sky. But it was evident, the geographical character of the country being given, that the high mountain chain of the Andes formed their background.

Moreover, no habitation in sight, no port, no river mouth, which might serve as a harbor for a vessel. At that moment the "Pilgrim" was running right on the land. With the reduced sail which she carried, the winds driving her to the coast, Dick Sand would not be able to set off from it.

In front lay a long band of reefs, on which the sea was foaming all white. They saw the waves unfurl half way up the cliffs. There must be a monstrous surf there.

Dick Sand, after remaining on the forecastle to observe the coast, returned aft, and, without saying a word, he took the helm.

The wind was freshening all the time. The schooner was soon only a mile from the shore.

Dick Sand then perceived a sort of little cove, into which he resolved to steer; but, before reaching it, he must cross a line of reefs, among which it would be difficult to follow a channel. The surf indicated that the water was shallow everywhere.

At that moment Dingo, who was going backwards and forwards on the deck, dashed forward, and, looking at the land, gave some lamentable barks. One would say that the dog recognized the coast, and that its instinct recalled some sad remembrance.

Negoro must have heard it, for an irresistible sentiment led him out of his cabin; and although he had reason to
fear the dog, he came almost immediately to lean on the netting.

Very fortunately for him Dingo, whose sad barks were all the time being addressed to that land, did not perceive him.

Negoro looked at that furious surf, and that did not appear to frighten him. Mrs. Weldon, who was looking at him, thought she saw his face redden a little, and that for an instant his features were contracted.

Then, did Negoro know this point of the continent where the winds were driving the "Pilgrim?"

At that moment Dick Sand left the wheel, which he gave back to old Tom. For a last time he came to look at the cove, which gradually opened. Then:

"Mrs. Weldon," said he, in a firm voice, "I have no longer any hope of finding a harbor! Before half an hour, in spite of all my efforts, the 'Pilgrim' will be on the reefs! We must run aground! I shall not bring the ship into port! I am forced to lose her to save you! But, between your safety and hers, I do not hesitate!"

"You have done all that depended on you, Dick?" asked Mrs. Weldon.

"All," replied the young novice.

And at once he made his preparations for stranding the ship.

First of all, Mrs. Weldon, Jack, Cousin Benedict and Nan, must put on life-preservers. Dick Sand, Tom and the blacks, good swimmers, also took measures to gain the coast, in case they should be precipitated into the sea.

Hercules would take charge of Mrs. Weldon. The novice took little Jack under his care.

Cousin Benedict, very tranquil, however, reappeared on the deck with his entomologist box strapped to his shoulder. The novice commended him to Bat and Austin. As to Negoro, his singular calmness said plainly enough that he had no need of anybody's aid.

Dick Sand, by a supreme precaution, had also brought on the forecastle ten barrels of the cargo containing whale's oil.

That oil, properly poured the moment the "Pilgrim" would be in the surf, ought to calm the sea for an instant, in lubricating, so to say, the molecules of water, and that operation would perhaps facilitate the ship's passage between the reefs. Dick Sand did not wish to neglect anything which might secure the common safety.

All these precautions taken, the novice returned to take his place at the wheel.

The "Pilgrim" was only two cables' lengths from the coast, that is, almost touching the reefs, her starboard side already bathed in the white foam of the surf. Each moment the novice thought that the vessel's keel was going to strike some rocky bottom.

Suddenly, Dick Sand knew, by a change in the color of the water, that a channel lengthened out among the reefs. He must enter it bravely without hesitating, so as to make the coast as near as possible to the shore.

The novice did not hesitate. A movement of the helm thrust the ship into the narrow and sinuous channel. In this place the sea was still more furious, and the waves dashed on the deck.

The blacks were posted forward, near the barrels, waiting for the novice's orders.

"Pour the oil—pour!" exclaimed Dick Sand.

Under this oil, which was poured on it in quantities, the sea grew calm, as by enchantment, only to become more terrible again a moment after.

The "Pilgrim" glided rapidly over those lubricated waters and headed straight for the shore.

Suddenly a shock took place. The ship, lifted by a formidable wave, had just stranded, and her masting had fallen without wounding anybody.

The "Pilgrim's" hull, damaged by the collision, was invaded by the water with extreme violence. But the shore was only half a cable's length off, and a chain of small blackish rocks enabled it to be reached quite easily.

So, ten minutes after, all those carried by the "Pilgrim" had landed at the foot of the cliff.

CHAPTER XIV.
THE BEST TO DO.

So then, after a voyage long delayed by calms, then favored by winds from the northwest and from the southwest--a voyage which had not lasted less than seventy-four days--the "Pilgrim" had just run aground!

However, Mrs. Weldon and her companions thanked Providence, because they were in safety. In fact, it was on a continent, and not on one of the fatal isles of Polynesia, that the tempest had thrown them. Their return to their country, from any point of South America on which they should land, ought not, it seemed, to present serious difficulties.

As to the "Pilgrim," she was lost. She was only a carcass without value, of which the surf was going to disperse the débris in a few hours. It would be impossible to save anything. But if Dick Sand had not that joy of bringing back a vessel intact to his ship-owner, at least, thanks to him, those who sailed in her were safe and sound on some
hospitable coast, and among them, the wife and child of James W. Weldon.

As to the question of knowing on what part of the American coast the schooner had been wrecked, they might dispute it for a long time. Was it, as Dick Sand must suppose, on the shore of Peru? Perhaps, for he knew, even by the bearings of the Isle of Paques, that the "Pilgrim" had been thrown to the northeast under the action of the winds; and also, without doubt, under the influence of the currents of the equatorial zone. From the forty-third degree of latitude, it had, indeed, been possible to drift to the fifteenth.

It was then important to determine, as soon as possible, the precise point of the coast where the schooner had just been lost. Granted that this coast was that of Peru, ports, towns and villages were not lacking, and consequently it would be easy to gain some inhabited place. As to this part of the coast, it seemed deserted.

It was a narrow beach, strewed with black rocks, shut off by a cliff of medium height, very irregularly cut up by large funnels due to the rupture of the rock. Here and there a few gentle declivities gave access to its crest.

In the north, at a quarter of a mile from the stranding place, was the mouth of a little river, which could not have been perceived from the offing. On its banks hung numerous _rhizomas_, sorts of mangroves, essentially distinct from their congener of India.

The crest of the cliff—that was soon discovered—was overhung by a thick forest, whose verdant masses undulated before the eyes, and extended as far as the mountains in the background. There, if Cousin Benedict had been a botanist, how many trees, new to him, would not have failed to provoke his admiration.

There were high baobabs—to which, however, an extraordinary longevity has been falsely attributed—the bark of which resembles Egyptian syenite, Bourbon palms, white pines, tamarind-trees, pepper-plants of a peculiar species, and a hundred other plants that an American is not accustomed to see in the northern region of the New Continent.

But, a circumstance rather curious, among those forest productions one would not meet a single specimen of that numerous family of palm-trees which counts more than a thousand species, spread in profusion over almost the whole surface of the globe.

Above the sea-shore a great number of very noisy birds were flying, which belonged for the greater part to different varieties of swallows, of black plumage, with a steel-blue shade, but of a light chestnut color on the upper part of the head. Here and there also rose some partridges, with necks entirely white, and of a gray color.

Mrs. Weldon and Dick Sand observed that these different birds did not appear to be at all wild. They approached without fearing anything. Then, had they not yet learned to fear the presence of man, and was this coast so deserted that the detonation of a firearm had never been heard there?

At the edge of the rocks were walking some pelicans of the species of "pelican minor," occupied in filling with little fish the sack which they carry between the branches of their lower jaw. Some gulls, coming from the offing, commenced to fly about around the "Pilgrim."

Those birds were the only living creatures that seemed to frequent this part of the coast, without counting, indeed, numbers of interesting insects that Cousin Benedict would well know how to discover. But, however little Jack would have it, one could not ask them the name of the country; in order to learn it, it would be necessary to address some native. There were none there, or at least, there was not one to be seen. No habitation, hut, or cabin, neither in the north, beyond the little river, nor in the south, nor finally on the upper part of the cliff, in the midst of the trees of the thick forest. No smoke ascended into the air, no indication, mark, or imprint indicated that this portion of the continent was visited by human beings. Dick Sand continued to be very much surprised.

"Where are we? Where can we be?" he asked himself. "What! nobody to speak to?"

Nobody, in truth, and surely, if any native had approached, Dingo would have scented him, and announced him by a bark. The dog went backward and forward on the strand, his nose to the ground, his tail down, growling secretly—certainly very singular behavior—but neither betraying the approach of man nor of any animal whatsoever.

"Dick, look at Dingo!" said Mrs. Weldon.

"Yes, that is very strange," replied the novice. "It seems as if he were trying to recover a scent."

"Very strange, indeed," murmured Mrs. Weldon; then, continuing, "what is Negoro doing?" she asked.

"He is doing what Dingo is doing," replied Dick Sand. "He goes, he comes! After all, he is free here. I have no longer the right to control him. His service ended with the stranding of the Pilgrim.""

In fact, Negoro surveyed the strand, turned back, and looked at the shore and the cliff like a man trying to recall recollections and to fix them. Did he, then, know this country? He would probably have refused to reply to that question if it had been asked. The best thing was still to have nothing to do with that very unsociable personage.

Dick Sand soon saw him walk from the side of the little river, and when Negoro had disappeared on the other side of the cliff, he ceased to think of him.

Dingo had indeed barked when the cook had arrived on the steep bank, but became silent almost immediately.

It was necessary, now, to consider the most pressing wants. Now, the most pressing was to find a refuge, a shelter of some kind, where they could install themselves for the time, and partake of some nourishment. Then they
would take counsel, and they would decide what it would be convenient to do.

As to food, they had not to trouble themselves. Without speaking of the resources which the country must offer, the ship's store-room had emptied itself for the benefit of the survivors of the shipwreck. The surf had thrown here and there among the rocks, then uncovered by the ebb-tide, a great quantity of objects. Tom and his companions had already picked up some barrels of biscuit, boxes of alimentary preserves, cases of dried meat. The water not having yet damaged them, food for the little troop was secured for more time, doubtless, than they would require to reach a town or a village. In that respect there was nothing to fear. These different waifs, already put in a safe place, could no longer be taken back by a rising sea.

Neither was sweet water lacking. First of all Dick Sand had taken care to send Hercules to the little river for a few pints. But it was a cask which the vigorous negro brought back on his shoulder, after having filled it with water fresh and pure, which the ebb of the tide left perfectly drinkable.

As to a fire, if it were necessary to light one, dead wood was not lacking in the neighborhood, and the roots of the old mangroves ought to furnish all the fuel of which they would have need. Old Tom, an ardent smoker, was provided with a certain quantity of German tinder, well preserved in a box hermetically closed, and when they wanted it, he would only have to strike the tinder-box with the flint of the strand.

It remained, then, to discover the hole in which the little troop would lie down, in case they must take one night's rest before setting out.

And, indeed, it was little Jack who found the bedroom in question. While trotting about at the foot of the cliff, he discovered, behind a turn of the rock, one of those grottoes well polished, well hollowed out, which the sea herself digs, when the waves, enlarged by the tempest, beat the coast.

The young child was delighted. He called his mother with cries of joy, and triumphantly showed her his discovery.

"Good, my Jack!" replied Mrs. Weldon. "If we were Robinson Crusoes, destined to live a long time on this shore, we should not forget to give your name to that grotto!"

The grotto was only from ten to twelve feet long, and as many wide; but, in little Jack's eyes, it was an enormous cavern. At all events, it must suffice to contain the shipwrecked ones; and, as Mrs. Weldon and Nan noted with satisfaction, it was very dry. The moon being then in her first quarter, they need not fear that those neap-tides would reach the foot of the cliff, and the grotto in consequence. Then, nothing more was needed for a few hours' rest.

Ten minutes after everybody was stretched out on a carpet of sea-weed. Negoro himself thought he must rejoin the little troop and take his part of the repast, which was going to be made in common. Doubtless he had not judged it proper to venture alone under the thick forest, through which the winding river made its way.

It was one o'clock in the afternoon. The preserved meat, the biscuit, the sweet water, with the addition of a few drops of rum, of which Bat had saved a quarter cask, made the requisites for this repast. But if Negoro took part in it, he did not at all mingle in the conversation, in which were discussed the measures demanded by the situation of the shipwrecked. All the time, without appearing to do so, he listened to it, and doubtless profited by what he heard.

During this time Dingo, who had not been forgotten, watched outside the grotto. They could be at ease. No living being would show himself on the strand without the faithful animal giving the alarm.

Mrs. Weldon, holding her little Jack, half lying and almost asleep on her lap, began to speak.

"Dick, my friend," said she, "in the name of all, I thank you for the devotion that you have shown us till now; but we do not consider you free yet. You will be our guide on land, as you were our captain at sea. We place every confidence in you. Speak, then! What must we do?"

Mrs. Weldon, old Nan, Tom and his companions, all had their eyes fixed on the young novice. Negoro himself looked at him with a singular persistence. Evidently, what Dick Sand was going to reply interested him very particularly.

Dick Sand reflected for a few moments. Then:

"Mrs. Weldon," said he, "the important thing is to know, first, where we are. I believe that our ship can only have made the land on that portion of the American sea-coast which forms the Peruvian shore. The winds and currents must have carried her as far as that latitude. But are we here in some southern province of Peru, that is to say on the least inhabited part which borders upon the pampas? Maybe so. I would even willingly believe it, seeing this beach so desolate, and, it must be, but little frequented. In that case, we might be very far from the nearest town, which would be unfortunate."

"Well, what is to be done?" repeated Mrs. Weldon.

"My advice," replied Dick Sand, "would be not to leave this shelter till we know our situation. To-morrow, after a night's rest, two of us could go to discover it. They would endeavor, without going too far, to meet some natives, to inform themselves from them, and return to the grotto. It is not possible that, in a radius of ten or twelve miles, we find nobody."
"To separate!" said Mrs. Weldon.

"That seems necessary to me," replied the novice. "If no information can be picked up, if, as is not impossible, the country is absolutely desolate, well, we shall consider some other way of extricating ourselves."

"And which of us shall go to explore?" asked Mrs. Weldon, after a moment's reflection.

"That is yet to be decided," replied Dick Sand. "At all events, I think that you, Mrs. Weldon, Jack, Mr. Benedict, and Nan, ought not to quit this grotto. Bat, Hercules, Acteon, and Austin should remain near you, while Tom and I should go forward. Negoro, doubtless, will prefer to remain here?" added Dick Sand, looking at the head-cook.

"Probably," replied Negoro, who was not a man to commit himself any more than that.

"We should take Dingo with us," continued the novice. "He would be useful to us during our exploration."

Dingo, hearing his name pronounced, reappeared at the entrance of the grotto, and seemed to approve of Dick Sand's projects by a little bark.

Since the novice had made this proposition, Mrs. Weldon remained pensive. Her repugnance to the idea of a separation, even short, was very serious. Might it not happen that the shipwreck of the "Pilgrim" would soon be known to the Indian tribes who frequented the sea-shore, either to the north or to the south, and in case some plunderers of the wrecks thrown on the shore should present themselves, was it not better for all to be united to repulse them?

That objection, made to the novice's proposition, truly merited a discussion.

It fell, however, before Dick Sand's arguments, who observed that the Indians ought not to be confounded with the savages of Africa or Polynesia, and any aggression on their part was probably not to be feared. But to entangle themselves in this country without even knowing to what province of South America it belonged, nor at what distance the nearest town of that province was situated, was to expose themselves to many fatigues. Doubtless separation might have its inconveniences, but far less than marching blindly into the midst of a forest which appeared to stretch as far as the base of the mountains.

"Besides," repeated Dick Sand, persistently, "I cannot admit that this separation will be of long duration, and I even affirm that it will not be so. After two days, at the most, if Tom and I have come across neither habitation nor inhabitant, we shall return to the grotto. But that is too improbable, and we shall not have advanced twenty miles into the interior of the country before we shall evidently be satisfied about its geographical situation. I may be mistaken in my calculation, after all, because the means of fixing it astronomically have failed me, and it is not impossible for us to be in a higher or lower latitude."

"Yes--you are certainly right, my child," replied Mrs. Weldon, in great anxiety.

"And you, Mr. Benedict," asked Dick Sand, "what do you think of this project?"

"I?" replied Cousin Benedict.

"Yes; what is your advice?"

"I have no advice," replied Cousin Benedict. "I find everything proposed, good, and I shall do everything that you wish. Do you wish to remain here one day or two? that suits me, and I shall employ my time in studying this shore from a purely entomological point of view."

"Do, then, according to your wish," said Mrs. Weldon to Dick Sand. "We shall remain here, and you shall depart with old Tom."

"That is agreed upon," said Cousin Benedict, in the most tranquil manner in the world. "As for me, I am going to pay a visit to the insects of the country."

"Do not go far away, Mr. Benedict," said the novice. "We urge you strongly not to do it."

"Do not be uneasy, my boy."

"And above all, do not bring back too many musquitoes," added old Tom.

A few moments after, the entomologist, his precious tin box strapped to his shoulders, left the grotto.

Almost at the same time Negoro abandoned it also. It appeared quite natural to that man to, be always occupied with himself. But, while Cousin Benedict clambered up the slopes of the cliff to go to explore the border of the forest, he, turning round toward the river, went away with slow steps and disappeared, a second time ascending the steep bank.

Jack slept all the time. Mrs. Weldon, leaving him on Nan's knees, then descended toward the strand. Dick Sand and his companions followed her. The question was, to see if the state of the sea then would permit them to go as far as the "Pilgrim's" hull, where there were still many objects which might be useful to the little troop.

The rocks on which the schooner had been wrecked were now dry. In the midst of the _débris_ of all kinds stood the ship's carcass, which the high sea had partly covered again. That astonished Dick Sand, for he knew that the tides are only very moderate on the American sea-shore of the Pacific. But, after all, this phenomenon might be explained by the fury of the wind which beat the coast.

On seeing their ship again, Mrs. Weldon and her companions experienced a painful impression. It was there that
they had lived for long days, there that they had suffered. The aspect of that poor ship, half broken, having neither mast nor sails, lying on her side like a being deprived of life, sadly grieved their hearts. But they must visit this hull, before the sea should come to finish demolishing it.

Dick Sand and the blacks could easily make their way into the interior, after having hoisted themselves on deck by means of the ropes which hung over the "Pilgrim's" side. While Tom, Hercules, Bat, and Austin employed themselves in taking from the storeroom all that might be useful, as much eatables as liquids, the novice made his way into the arsenal. Thanks to God, the water had not invaded this part of the ship, whose rear had remained out of the water after the stranding.

There Dick Sand found four guns in good condition, excellent Remingtons from Purdy & Co.'s factory, as well as a hundred cartridges, carefully shut up in their cartridge-boxes. There was material to arm his little band, and put it in a state of defense, if, contrary to all expectation, the Indians attacked him on the way.

The novice did not neglect to take a pocket-lantern; but the ship's charts, laid in a forward quarter and damaged by the water, were beyond use.

There were also in the "Pilgrim's" arsenal some of those solid cutlasses which serve to cut up whales. Dick Sand chose six, destined to complete the arming of his companions, and he did not forget to bring an inoffensive child's gun, which belonged to little Jack.

As to the other objects still held by the ship, they had either been dispersed, or they could no longer be used. Besides, it was useless to overburden themselves for the few days the journey would last. In food, in arms, in munitions, they were more than provided for. Meanwhile, Dick Sand, by Mrs. Weldon's advice, did not neglect to take all the money which he found on board--about five hundred dollars.

That was a small sum, indeed! Mrs. Weldon had carried a larger amount herself and she did not find it again.

Who, then, except Negoro, had been able to visit the ship before them and to lay hands on Captain Hull's and Mrs. Weldon's reserve? No one but he, surely, could be suspected. However, Dick Sand hesitated a moment. All that he knew and all that he saw of him was that everything was to be feared from that concentrated nature, from whom the misfortunes of others could snatch a smile. Yes, Negoro was an evil being, but must they conclude from that that he was a criminal? It was painful to Dick Sand's character to go as far as that. And, meanwhile, could suspicion rest on any other? No, those honest negroes had not left the grotto for an instant, while Negoro had wandered over the beach. He alone must be guilty. Dick Sand then resolved to question Negoro, and, if necessary, have him searched when he returned. He wished to know decidedly what to believe.

The sun was then going down to the horizon. At that date he had not yet crossed the equator to carry heat and light into the northern hemisphere, but he was approaching it. He fell, then, almost perpendicularly to that circular line where the sea and the sky meet. Twilight was short, darkness fell promptly—which confirmed the novice in the thought that he had landed on a point of the coast situated between the tropic of Capricorn and the equator.

Mrs. Weldon, Dick Sand, and the blacks then returned to the grotto, where they must take some hours' rest.

"The night will still be stormy," observed Tom, pointing to the horizon laden with heavy clouds.

"Yes," replied Dick Sand, "there is a strong breeze blowing up. But what matter, at present? Our poor ship is lost, and the tempest can no longer reach us?"

"God's will be done!" said Mrs. Weldon.

It was agreed that during that night, which would be very dark, each of the blacks would watch turn about at the entrance to the grotto. They could, besides, count upon Dingo to keep a careful watch.

They then perceived that Cousin Benedict had not returned.

Hercules called him with all the strength of his powerful lungs, and almost immediately they saw the entomologist coming down the slopes of the cliff, at the risk of breaking his neck.

Cousin Benedict was literally furious. He had not found a single new insect in the forest--no, not one--which was fit to figure in his collection. Scorpions, scolopendras, and other myriapodes, as many as he could wish, and even more, were discovered. And we know that Cousin Benedict did not interest himself in myriapodes.

"It was not worth the trouble," added he, "to travel five or six thousand miles, to have braved the tempest, to be wrecked on the coast, and not meet one of those American hexapodes, which do honor to an entomological museum! No; the game was not worth the candle!"

As a conclusion, Cousin Benedict asked to go away. He did not wish to remain another hour on that detested shore.

Mrs. Weldon calmed her large child. They made him hope that he would be more fortunate the next day, and all went to lie down in the grotto, to sleep there till sunrise, when Tom observed that Negoro had not yet returned, though night had arrived.

"Where can he be?" asked Mrs. Weldon.

"What matter!" said Bat.
"On the contrary, it does matter," replied Mrs. Weldon. "I should prefer having that man still near us."

"Doubtless, Mrs. Weldon," replied Dick Sand; "but if he has forsaken our company voluntarily, I do not see how we could oblige him to rejoin us. Who knows but he has his reasons for avoiding us forever?"

And taking Mrs. Weldon aside, Dick Sand confided to her his suspicions. He was not astonished to find that she had them also. Only they differed on one point.

"If Negoro reappears," said Mrs. Weldon, "he will have put the product of his theft in a safe place. Take my advice. What we had better do, not being able to convict him, will be to hide our suspicions from him, and let him believe that we are his dupes."

Mrs. Weldon was right. Dick Sand took her advice.

However, Negoro was called several times.

He did not reply. Either he was still too far away to hear, or he did not wish to return.

The blacks did not regret being rid of his presence; but, as Mrs. Weldon had just said, perhaps he was still more to be feared afar than near. And, moreover, how explain that Negoro would venture alone into that unknown country? Had he then lost his way, and on this dark night was he vainly seeking the way to the grotto?

Mrs. Weldon and Dick Sand did not know what to think. However it was, they could not, in order to wait for Negoro, deprive themselves of a repose so necessary to all.

At that moment the dog, which was running on the strand, barked aloud.

"What is the matter with Dingo?" asked Mrs. Weldon.

"We must, indeed, find out," replied the novice. "Perhaps it is Negoro coming back."

At once Hercules, Bat, Austin, and Dick Sand took their way to the mouth of the river.

But, arrived at the bank, they neither saw nor heard anything. Dingo now was silent.

Dick Sand and the blacks returned to the grotto.

The going to sleep was organized as well as possible. Each of the blacks prepared himself to watch in turn outside. But Mrs. Weldon, uneasy, could not sleep. It seemed to her that this land so ardently desired did not give her what she had been led to hope for, security for hers, and rest for herself.

* * * * *

CHAPTER XV.

HARRIS.

The next day, April 7th, Austin, who was on guard at sunrise, saw Dingo run barking to the little river. Almost immediately Mrs. Weldon, Dick Sand and the blacks came out of the grotto.

Decidedly there was something there.

"Dingo has scented a living creature, man or beast," said the novice.

"At all events it was not Negoro," observed Tom, "for Dingo would bark with fury."

"If it is not Negoro, where can he be?" asked Mrs. Weldon, giving Dick Sand a look which was only understood by him; "and if it is not he, who, then, is it?"

"We are going to see, Mrs. Weldon," replied the novice. Then, addressing Bat, Austin, and Hercules, "Arm yourselves, my friends, and come!"

Each of the blacks took a gun and a cutlass, as Dick Sand had done. A cartridge was slipped into the breech of the Remingtons, and, thus armed, all four went to the bank of the river.

Mrs. Weldon, Tom, and Acteon remained at the entrance of the grotto, where little Jack and Nan still rested by themselves.

The sun was then rising. His rays, intercepted by the high mountains in the east, did not reach the cliff directly; but as far as the western horizon, the sea sparkled under the first fires of day.

Dick Sand and his companions followed the strand of the shore, the curve of which joined the mouth of the river. There Dingo, motionless, and as if on guard, was continually barking.

It was evident that he saw or scented some native.

And, in fact, it was no longer against Negoro, against its enemy on board the ship, that the dog had a grudge this time.

At that moment a man turned the last plane of the cliff. He advanced prudently to the strand, and, by his familiar gestures, he sought to calm Dingo. They saw that he did not care to face the anger of the vigorous animal.

"It is not Negoro!" said Hercules.

"We cannot lose by the change," replied Bat.

"No," said the novice. "It is probably some native, who will spare us the ennui of a separation. We are at last going to know exactly where we are."
And all four, putting their guns back on their shoulders, went rapidly toward the unknown.

The latter, on seeing them approach, at first gave signs of the greatest surprise. Very certainly, he did not expect to meet strangers on that part of the coast. Evidently, also, he had not yet perceived the remains of the "Pilgrim," otherwise the presence of the shipwrecked would very naturally be explained to him. Besides, during the night the surf had finished demolishing the ship's hull; there was nothing left but the wrecks that floated in the offing.

At the first moment the unknown, seeing four armed men marching toward him, made a movement as if he would retrace his steps. He carried a gun in a shoulder-belt, which passed rapidly into his hand, and from his hand to his shoulder. They felt that he was not reassured.

Dick Sand made a gesture of salutation, which doubtless the unknown understood, for, after some hesitation, he continued to advance.

Dick Sand could then examine him with attention.

He was a vigorous man, forty years old at the most, his eyes bright, his hair and beard gray, his skin sunburnt like that of a nomad who has always lived in the open air, in the forest, or on the plain. A kind of blouse of tanned skin served him for a close coat, a large hat covered his head, leather boots came up above his knees, and spurs with large rowels sounded from their high heels.

What Dick Sand noticed at first—and which was so, in fact—was that he had before him, not one of those Indians, habitual rovers over the pampas, but one of those adventurers of foreign blood, often not very commendable, who are frequently met with in those distant countries.

It also seemed, by his rather familiar attitude, by the reddish color of a few hairs of his beard, that this unknown must be of Anglo-Saxon origin. At all events, he was neither an Indian nor a Spaniard.

And that appeared certain, when in answer to Dick Sand, who said to him in English, "Welcome!" he replied in the same language and without any accent.

"Welcome yourself, my young friend," said the unknown, advancing toward the novice, whose hand he pressed.

As to the blacks, he contented himself with making a gesture to them without speaking to them.

"You are English?" he asked the novice.

"From the South?"

"From the North."

This reply seemed to please the unknown, who shook the novice's hand more vigorously and this time in very an American manner.

"And may I know, my young friend," he asked, "how you find yourself on this coast?"

But, at that moment, without waiting till the novice had replied to his question, the unknown took off his hat and bowed.

Mrs. Weldon had advanced as far as the steep bank, and she then found herself facing him.

It was she who replied to this question.

"Sir," said she, "we are shipwrecked ones whose ship was broken to pieces yesterday on these reefs."

An expression of pity spread over the unknown's face, whose eyes sought the vessel which had been stranded.

"There is nothing left of our ship," added the novice. "The surf has finished the work of demolishing it during the night."

"And our first question," continued Mrs. Weldon, "will be to ask you where we are."

"But you are on the sea-coast of South America," replied the unknown, who appeared surprised at the question.

"Can you have any doubt about that?"

"Yes, sir, for the tempest had been able to make us deviate from our route," replied Dick Sand. "But I shall ask where we are more exactly. On the coast of Peru, I think."

"No, my young friend, no! A little more to the south! You are wrecked on the Bolivian coast."

"Aha!" exclaimed Dick Sand.

"And you are even on that southern part of Bolivia which borders on Chili."

"Then what is that cape?" asked Dick Sand, pointing to the promontory on the north.

"I cannot tell you the name," replied the unknown, "for if I know the country in the interior pretty well from having often traversed it, it is my first visit to this shore."

Dick Sand reflected on what he had just learned. That only half astonished him, for his calculation might have, and indeed must have, deceived him, concerning the currents; but the error was not considerable. In fact, he believed himself somewhere between the twenty-seventh and the thirtieth parallel, from the bearings he had taken from the Isle of Paques, and it was on the twenty-fifth parallel that he was wrecked. There was no impossibility in the "Pilgrim's" having deviated by relatively small digression, in such a long passage.

Besides, there was no reason to doubt the unknown's assertions, and, as that coast was that of lower Bolivia there
was nothing astonishing in its being so deserted.

"Sir," then said Dick Sand, "after your reply I must conclude that we are at a rather great distance from Lima."

"Oh! Lima is far away--over there--in the north!"

Mrs. Weldon, made suspicious first of all by Negoro's disappearance, observed the newly-arrived with extreme attention; but she could discover nothing, either in his attitude or in his manner of expressing himself which could lead her to suspect his good faith.

"Sir," said she, "without doubt my question is not rash. You do not seem to be of Peruvian origin?"

"I am American as you are, madam," said the unknown, who waited for an instant for the American lady to tell him her name.

"Mrs. Weldon," replied the latter.

"I? My name is Harris and I was born in South Carolina. But here it is twenty years since I left my country for the pampas of Bolivia, and it gives me pleasure to see compatriots."

"You live in this part of the province, Mr. Harris?" again asked Mrs. Weldon.

"No, Mrs. Weldon," replied Harris, "I live in the South, on the Chilian frontier; but at this present moment I am going to Atacama, in the northeast."

"Are we then on the borders of the desert of that name?" asked Dick Sand.

"Precisely, my young friend, and this desert extends far beyond the mountains which shut off the horizon."

"The desert of Atacama?" repeated Dick Sand.

"Yes," replied Harris. "This desert is like a country by itself, in this vast South America, from which it differs in many respects. It is, at the same time, the most curious and the least known portion of this continent."

"And you travel alone?" asked Mrs. Weldon.

"Oh, it is not the first time that I have taken this journey!" replied the American. "There is, two hundred miles from here, an important farm, the Farm of San Felice, which belongs to one of my brothers, and it is to his house that I am going for my trade. If you wish to follow me you will be well received, and the means of transport to gain the town of Atacama will not fail you. My brother will be happy to furnish them."

These offers, made freely, could only prepossess in favor of the American, who immediately continued, addressing Mrs. Weldon:

"These blacks are your slaves?"

And he pointed to Tom and his companions.

"We have no longer any slaves in the United States," replied Mrs. Weldon, quickly. "The North abolished slavery long ago, and the South has been obliged to follow the example of the North!"

"Ah! that is so," replied Harris. "I had forgotten that the war of 1862 had decided that grave question. I ask those honest men's pardon for it," added Harris, with that delicate irony which a Southerner must put into his language when speaking to blacks. "But on seeing those gentlemen in your service, I believed----"

"They are not, and have never been, in my service, sir," replied Mrs. Weldon, gravely.

"We should be honored in serving you, Mrs. Weldon," then said old Tom. "But, as Mr. Harris knows, we do not belong to anybody. I have been a slave myself, it is true, and sold as such in Africa, when I was only six years old; but my son Bat, here, was born of an enfranchised father, and, as to our companions, they were born of free parents."

"I can only congratulate you about it," replied Harris, in a tone which Mrs. Weldon did not find sufficiently serious. "In this land of Bolivia, also, we have no slaves. Then you have nothing to fear, and you can go about as freely here as in the New England States."

At that moment little Jack, followed by Nan, came out of the grotto rubbing his eyes. Then, perceiving his mother, he ran to her. Mrs. Weldon embraced him tenderly.

"The charming little boy!" said the American, approaching Jack.

"It is my son," replied Mrs. Weldon.

"Oh, Mrs. Weldon, you must have been doubly tried, because your child has been exposed to so many dangers."

"God has brought him out of them safe and sound, as He has us, Mr. Harris," replied Mrs. Weldon.

"Will you permit me to kiss him on his pretty cheeks?" asked Harris.

"Willingly," replied Mrs. Weldon.

But Mr. Harris's face, it appeared, did not please little Jack, for he clung more closely to his mother.

"Hold!" said Harris, "you do not want me to embrace you? You are afraid of me, my good little man?"

"Excuse him, sir," Mrs. Weldon hastened to say. "It is timidity on his part."

"Good! we shall become better acquainted," replied Harris. "Once at the Farm, he will amuse himself mounting a gentle pony, which will tell him good things of me."

But the offer of the gentle pony did not succeed in cajoling Jack any more than the proposition to embrace Mr. Harris.
Mrs. Weldon, thus opposed, hastened to change the conversation. They must not offend a man who had so obligingly offered his services.

During this time Dick Sand was reflecting on the proposition which had been made to them so opportunistically, to gain the Farm of San Felice. It was, as Harris had said, a journey of over two hundred miles, sometimes through forests, sometimes through plains—a very fatiguing journey, certainly, because there were absolutely no means of transport.

The young novice then presented some observations to that effect, and waited for the reply the American was going to make.

"The journey is a little long, indeed," replied Harris, "but I have there, a few hundred feet behind the steep bank, a horse which I count on offering to Mrs. Weldon and her son. For us, there is nothing difficult, nor even very fatiguing in making the journey on foot. Besides, when I spoke of two hundred miles, it was by following, as I have already done, the course of this river. But if we go through the forest, our distance will be shortened by at least eighty miles. Now, at the rate of ten miles a day, it seems to me that we shall arrive at the Farm without too much distress."

Mrs. Weldon thanked the American.

"You cannot thank me better than by accepting," replied Harris. "Though I have never crossed this forest, I do not believe I shall be embarrassed in finding the way, being sufficiently accustomed to the pampas. But there is a graver question—that of food. I have only what is barely enough for myself while on the way to the Farm of San Felice."

"Mr. Harris," replied Mrs. Weldon, "fortunately we have food in more than sufficient quantity, and we shall be happy to share with you."

"Well, Mrs. Weldon, it seems to me that all is arranged for the best, and that we have only to set out."

Harris went toward the steep bank, with the intention of going to take his horse from the place where he had left it, when Dick Sand stopped him again, by asking him a question.

To abandon the sea-coast, to force his way into the interior of the country, under that interminable forest, did not please the young novice. The sailor reappeared in him, and either to ascend or descend the coast would be more to his mind.

"Mr. Harris," said he, "instead of traveling for one hundred and twenty miles in the Desert of Atacama, why not follow the coast? Distance for distance, would it not be better worth while to seek to reach the nearest town, either north or south?"

"But my young friend," replied Harris, frowning slightly, "it seems to me that on this coast, which I know very imperfectly, there is no town nearer than three or four hundred miles."

"To the north, yes," replied Dick Sand; "but to the south——"

"To the south," replied the American, "we must descend as far as Chili. Now, the distance is almost as long, and, in your place, I should not like to pass near the pampas of the Argentine Republic. As to me, to my great regret, I could not accompany you there."

"The ships which go from Chili to Peru, do they not pass, then, in sight of this coast?" asked Mrs. Weldon.

"No," replied Harris. "They keep much more out at sea, and you ought not to meet any of them."

"Truly," replied Mr. Weldon. "Well, Dick, have you still some question to ask Mr. Harris?"

"A single one, Mrs. Weldon," replied the novice, who experienced some difficulty in giving up. "I shall ask Mr. Harris in what port he thinks we shall be able to find a ship to bring us back to San Francisco?"

"Faith, my young friend, I could not tell you," replied the American. "All that I know is, that at the Farm of San Felice we will furnish you with the means of gaining the town of Atacama, and from there——"

"Mr. Harris," then said Mrs. Weldon, "do not believe that Dick Sand hesitates to accept your offers."

"No, Mrs. Weldon, no; surely I do not hesitate," replied the young novice; "but I cannot help regretting not being stranded a few degrees farther north or farther south. We should have been in proximity to a port, and that circumstance, in facilitating our return to our country, would prevent us from taxing Mr. Harris's good will."

"Do not fear imposing upon me, Mrs. Weldon," returned Harris. "I repeat to you that too rarely have I occasion to find myself again in the presence of my compatriots. For me it is a real pleasure to oblige you."

"We accept your offer, Mr. Harris," replied Mrs. Weldon; "but I should not wish, however, to deprive you of your horse. I am a good walker——"

"And I am a very good walker," replied Harris, bowing. "Accustomed to long journeys across the pampas, it is not I who will keep back our caravan. No, Mrs. Weldon, you and your little Jack will use this horse. Besides, it is possible that we may meet some of the farm servants on the way, and, as they will be mounted—well, they will yield their horses to us."

Dick Sand saw well that in making new objections he would oppose Mrs. Weldon.
"Mr. Harris," said he, "when do we set out?"

"Even to-day, my young friend," replied Harris. "The bad season commences with the month of April, and it is of the utmost importance for you to reach the farm of San Felice first. Finally, the way across the forest is the shortest, and perhaps the safest. It is less exposed than the coast to the incursions of wandering Indians, who are indefatigable robbers."

"Tom, my friends," replied Dick Sand, turning to the blacks, "it only remains for us to make preparations for departure. Let us select, then, from among the provisions on hand, those which can be most easily transported, and let us make packs, of which each will take his share."

"Mr. Dick," said Hercules, "if you wish, I shall carry the whole load very well."

"No, my brave Hercules," replied the novice; "it will be better for us all to share the burden."

"You are a strong companion, Hercules," then said Harris, who looked at the negro as if the latter were for sale.

"In the markets of Africa you would be worth a good price."

"I am worth what I am worth," replied Hercules, laughing, "and the buyers will only have to run well, if they wish to catch me."

All was agreed upon, and to hasten the departure, each went to work. However, they had only to think of feeding the little troop for the journey from the sea-coast to the farm, that is to say, for a march of ten days.

"But, before setting out, Mr. Harris," said Mrs. Weldon, "before accepting your hospitality, I beg you to accept ours. We offer it to you with our best wishes."

"I accept, Mrs. Weldon; I accept with eagerness," replied Harris, gayly.

"In a few minutes our breakfast will be ready."

"Good, Mrs. Weldon. I am going to profit by those ten minutes to go and get my horse and bring it here. He will have breakfasted, he will."

"Do you want me to go with you, sir?" asked Dick Sand.

"As you please, my young friend," replied Harris. "Come; I shall make you acquainted with the lower course of this river."

Both set out.

During this time, Hercules was sent in search of the entomologist. Faith, Cousin Benedict was very uneasy indeed about what was passing around him. He was then wandering on the summit of the cliff in quest of an "unfindable" insect, which, however, he did not find.

Hercules brought him back against his will. Mrs. Weldon informed him that departure was decided upon, and that, for ten days, they must travel to the interior of the country.

Cousin Benedict replied that he was ready to set out, and that he would not ask better than to cross America entirely, provided they would let him "collect" on the way.

Mrs. Weldon then occupied herself, with Nan's assistance, in preparing a comfortable repast--a good precaution before setting out.

During this time, Harris, accompanied by Dick Sand, had turned the angle of the cliff. Both followed the high bank, over a space of three hundred steps. There, a horse, tied to a tree, gave joyous neighing at the approach of his master.

It was a vigorous beast, of a species that Dick Sand could not recognize. Neck and shoulders long, loins short, and hindquarters stretched out, shoulders flat, forehead almost pointed. This horse offered, however, distinctive signs of those races to which we attribute an Arabian origin.

"You see, my young friend," said Harris, "that it is a strong animal, and you may count on it not failing you on the route."

Harris detached his horse, took it by the bridle, and descended the steep bank again, preceding Dick Sand. The latter had thrown a rapid glance, as well over the river as toward the forest which shut up its two banks. But he saw nothing of a nature to make him uneasy.

However, when he had rejoined the American, he suddenly gave him the following question, which the latter could little expect:

"Mr. Harris," he asked, "you have not met a Portuguese, named Negoro, in the night?"

"Negoro?" replied Harris, in the tone of a man who does not understand what is said. "Who is this Negoro?"

"He was the cook on board," replied Dick Sand, "and he has disappeared."

"Drowned, perhaps," said Harris.

"No, no," replied Dick Sand. "Yesterday evening he was still with us, but during the night he has left us, and he has probably ascended the steep bank of this river. So I asked you, who have come from that side, if you had not met him."
"I have met nobody," replied the American; "and if your cook has ventured alone into the forest, he runs a great risk of going astray. Perhaps we shall overtake him on the way."

"Yes; perhaps!" replied Dick Sand.

When the two returned to the grotto, breakfast was ready. It was composed, like the supper of the evening before, of alimentary conserves, of corned beef and of biscuit. Harris did honor to it, like a man whom nature had endowed with a great appetite.

"Let us go," said he; "I see that we shall not die of hunger on the way! I shall not say as much for that poor devil of a Portuguese, of whom our young friend has spoken."

"Ah!" said Mrs. Weldon, "Dick Sand has told you that we have not seen Negoro again?"

"Yes, Mrs. Weldon," replied the novice. "I desired to know if Mr. Harris had not met him."

"No," replied Harris; "so let us leave that deserter where he is, and think of our departure--whenever you are ready, Mrs. Weldon."

Each took the pack which was intended for him. Mrs. Weldon, assisted by Hercules, placed herself on the horse, and the ungrateful little Jack, with his gun strapped on his back, straddled the animal without even thinking of thanking him who had put that excellent beast at his disposal. Jack, placed before his mother, then said to her that he would know how to lead the gentleman's horse very well.

They then gave him the bridle to hold, and he did not doubt that he was the veritable head of the caravan.

* * * * *

CHAPTER XVI.

ON THE WAY.

It was not without a certain apprehension--nothing seemed to justify it, however--that Dick Sand, three hundred steps from the steep bank of the river, penetrated into the thick forest, the difficult paths of which he and his companions were going to follow for ten days. On the contrary, Mrs. Weldon herself, a woman and a mother, whom the perils would make doubly anxious, had every confidence. Two very serious motives had contributed to reassure her; first, because this region of the pampas was neither very formidable on account of the natives, nor on account of the animals which were found there; next, because, under the direction of Harris, of a guide so sure of himself as the American appeared to be, they could not be afraid of going astray.

Here is the order of proceeding, which, as far as possible, would be observed during the journey:

Dick Sand and Harris, both armed, one with his long gun, the other with a Remington, kept at the head of the little troop.

Then came Bat and Austin, also armed, each with a gun and a cutlass.

Behind them followed Mrs. Weldon and little Jack, on horseback; then Nan and Tom.

In the rear, Acteon, armed with the fourth Remington, and Hercules, with a hatchet in his belt, closed the march.

Dingo went backwards and forwards, and, as Dick Sand remarked, always like an uneasy dog seeking a scent. The dog's ways had visibly changed since the "Pilgrim's" shipwreck had cast it on this sea-coast. It seemed agitated, and almost incessantly it kept up a dull grumbling, rather lamentable than furious. That was remarked by all, though no one could explain it.

As to Cousin Benedict, it had been as impossible to assign him an order of marching as Dingo. Unless he had been held by a string, he would not have kept it. His tin box strapped to his shoulder, his net in his hand, his large magnifying glass suspended to his neck, sometimes behind, sometimes in front, he scampered away among the high herbs, watching for orthopters or any other insect in "pter," at the risk of being bit by some venomous serpent.

During the first hour Mrs. Weldon, uneasy, called him back twenty times. It was no use.

"Cousin Benedict," she finished by saying to him, "I beg you very seriously not to go far away, and I urge you for the last time to pay attention to my entreaties."

"Meanwhile, cousin," replied the intractable entomologist, "when I perceive an insect?"

"When you perceive an insect," replied Mrs. Weldon, "you would do well to let it go in peace, or you will put me under the necessity of taking your box away from you."

"Take away my box!" cried Cousin Benedict, as if it were a question of snatching away his heart.

"Your box and your net," added Mrs. Weldon, pitilessly.

"My net, cousin! And why not my glasses? You will not dare! No; you will not dare!"

"Even, your glasses, which I forgot. I thank you, Cousin Benedict, for reminding me that I have that means of making you blind, and, in that way, forcing you to be wise."

This triple menace had the effect of making him keep quiet--this unsubmitive cousin--for about an hour. Then he began to go away again, and, as he would do the same, even without net, without box, and without glasses, they
were obliged to let him do as he pleased. But Hercules undertook to watch him closely—which quite naturally became one of his duties—and it was agreed that he would act with Cousin Benedict as the latter would with an insect; that is, that he would catch him, if necessary, and bring him back as delicately as the other would with the rarest of the lepidopters.

That rule made, they troubled themselves no more about Cousin Benedict.

The little troop, it has been seen, was well armed, and guarded itself carefully. But, as Harris repeated, there was no encounter to fear except with wandering Indians, and they would probably see none.

At all events, the precautions taken would suffice to keep them respectful.

The paths which wound across the thick forest did not merit that name. They were rather the tracks of animals than the tracks of men. They could only be followed with difficulty. So, in fixing the average distance that the little troop would make in a march of twelve hours at only five or six miles, Harris had calculated wisely.

The weather, however, was very fine. The sun mounted toward the zenith, spreading in waves his almost perpendicular rays. On the plain this heat would be unbearable, Harris took care to remark; but, under those impenetrable branches, they bore it easily and with impunity.

The greater part of the trees of this forest were unknown, as well to Mrs. Weldon as to her companions, black or white.

However, an expert would remark that they were more remarkable for their quality than for their height. Here, it was the "banhina," or iron wood; there, the "molompi," identical with the "pterocarpe," a solid and light wood, fit for making the spoons used in sugar manufactories or oars, from the trunk of which exuded an abundant resin; further on, "fusticks," or yellow wood, well supplied with coloring materials, and lignum-vitæs, measuring as much as twelve feet in diameter, but inferior in quality to the ordinary lignum-vitæs.

While walking, Dick Sand asked Harris the name of these different trees.

"Then you have never been on the coast of South America?" Harris asked him before replying to his question.

"Never," replied the novice; "never, during my voyages, have I had occasion to visit these coasts, and to say the truth, I do not believe that anybody who knew about them has ever spoken to me of them."

"But have you at least explored the coasts of Colombia, those of Chili, or of Patagonia?"

"No, never."

"But perhaps Mrs. Weldon has visited this part of the new continent?" asked Harris. "Americans do not fear voyages, and doubtless-----"

"No, Mr. Harris," replied Mrs. Weldon. "The commercial interests of my husband have never called him except to New Zealand, and I have not had to accompany him anywhere. Not one of us, then, knows this portion of lower Bolivia."

"Well, Mrs. Weldon, you and your companions will see a singular country, which contrasts strangely with the regions of Peru, of Brazil, or of the Argentine Republic. Its flora and fauna would astonish a naturalist. Ah! we may say that you have been shipwrecked at a good place, and if we may ever thank chance-----"

"I wish to believe that it is not chance which has led us here, but God, Mr. Harris."

"God! Yes! God!" replied Harris, in the tone of a man who takes little account of providential intervention in the things of this world.

Then, since nobody in the little troop knew either the country or its productions, Harris took a pleasure in naming pleasantly the most curious trees of the forest.

In truth, it was a pity that, in Cousin Benedict's case, the entomologist was not supplemented by the botanist! If, up to this time, he had hardly found insects either rare or new, he might have made fine discoveries in botany. There was, in profusion, vegetation of all heights, the existence of which in the tropical forests of the New World had not been yet ascertained. Cousin Benedict would certainly have attached his name to some discovery of this kind. But he did not like botany—he knew nothing about it. He even, quite naturally, held flowers in aversion, under the pretext that some of them permit themselves to imprison the insects in their corollas, and poison them with their venomous juices.

At times, the forest became marshy. They felt under foot quite a network of liquid threads, which would feed the affluents of the little river. Some of the rills, somewhat large, could only be crossed by choosing fordable places.

On their banks grew tufts of reeds, to which Harris gave the name of papyrus. He was not mistaken, and those herbaceous plants grew abundantly below the damp banks.

Then, the marsh passed, thickets of trees again covered the narrow routes of the forest.

Harris made Mrs. Weldon and Dick Sand remark some very fine ebony-trees, much larger than the common ebony-tree, which furnish a wood much blacker and much stronger than that of commerce. Then there were mango-trees, still numerous, though they were rather far from the sea. A kind of fur of white moss climbed them as far as the branches. Their thick shade and their delicious fruit made them precious trees, and meanwhile, according to
Harris, not a native would dare to propagate the species. "Whoever plants a mango-tree dies!" Such is the
superstitious maxim of the country.

During the second half of this first day of the journey, the little troop, after the midday halt, began to ascend land
slightly inclined. They were not as yet the slopes of the chain of the first plane, but a sort of undulating plateau
which connected the plain with the mountain.

There the trees, a little less compact, sometimes clustered in groups, would have rendered the march easier, if the
soil had not been invaded by herbaceous plants. One might believe himself in the jungles of Oriental India.
Vegetation appeared to be less luxuriant than in the lower valley of the little river, but it was still superior to that of
the temperate regions of the Old or of the New World.

Indigo was growing there in profusion, and, according to Harris, this leguminous plant passed with reason for
the most usurping plant of the country. If a field came to be abandoned, this parasite, as much despised as the thistle
or the nettle, took possession of it immediately.

One tree seemed lacking in this forest, which ought to be very common in this part of the new continent; it was
the caoutchouc-tree. In fact, the "ficus primoides," the "castilloa elastica," the "cecropia peltats," the "collophora
utilis," the "cameraria letifolia," and above all, the "syphonia elastica," which belong to different families, abound in
the provinces of South America. And meanwhile, a rather singular thing, there was not a single one to be seen.

Now, Dick Sand had particularly promised his friend Jack to show him some caoutchouc trees. So a great
decception for the little boy, who figured to himself that gourds, speaking babies, articulate punchinellos, and elastic
balloons grew quite naturally on those trees. He complained.

"Patience, my good little man," replied Harris. "We shall find some of those caoutchoucs, and by hundreds, in
the neighborhood of the farm."

"Handsome ones, very elastic?" asked little Jack.

"The most elastic there are. Hold! while waiting, do you want a good fruit to take away your thirst?" And, while
speaking, Harris went to gather from a tree some fruits, which seemed to be as pleasant to the taste as those from the
peach-tree.

"Are you very sure, Mr. Harris," asked Mrs. Weldon, "that this fruit can do no harm?"

"Mrs. Weldon, I am going to convince you," replied the American, who took a large mouthful of one of those
fruits. "It is a mango."

And little Jack, without any more pressing, followed Harris's example, He declared that it was very good, "those
pears," and the tree was at once put under contribution.

Those mangos belonged to a species whose fruit is ripe in March and April, others being so only in September,
and, consequently, their mangos were just in time.

"Yes, it is good, good, good!" said little Jack, with his mouth full. "But my friend Dick has promised me
cayoutchoux, if I was very good, and I want caoutchoucs!"

"You will have them, Jack," replied Mrs. Weldon, "because Mr. Harris assures you of it."

"But that is not all," went on Jack. "My friend Dick has promised me some other thing!"

"What then, has friend Dick promised?" asked Harris, smiling.

"Some humming-birds, sir."

"And you shall have some humming-birds, my good little man, but farther on--farther on," replied Harris.

The fact is that little Jack had a right to claim some of these charming creatures, for he was now in a country
where they should abound. The Indians, who know how to weave their feathers artistically, have lavished the most
poetical names on those jewels of the flying race. They call them either the "rays" or the "hairs of the sun." Here, it
is "the little king of the flowers;" there, "the celestial flower that comes in its flight to caress the terrestrial flower." It
is again "the bouquet of jewels, which sparkles in the fire of the day." It can be believed that their imagination would
know how to furnish a new poetical appellation for each of the one hundred and fifty species which constitute this
marvelous tribe of humming-birds.

Meanwhile, however numerous these humming-birds might be in the forests of Bolivia, little Jack was obliged to
still content himself with Harris's promise. According to the American, they were still too close to the coast, and the
humming-birds did not like these deserts so near the ocean. The presence of man did not frighten them at the
"hacienda;" they heard nothing all day but their cry of "teretere" and the murmur of their wings, similar to that of a
spinning-wheel.

"Ah! how I should like to be there!" cried little Jack.

The surest method of getting there--to the "hacienda" of San Felice--was not to stop on the road. Mrs. Weldon
and her companions only took the time absolutely necessary for repose.

The aspect of the forest already changed. Between the less crowded trees large clearings opened here and there.
The sun, piercing the green carpet, then showed its structure of red, syenite granite, similar to slabs of lapis-lazuli.
On some heights the sarsaparilla abounded, a plant with fleshy tubercles, which formed an inextricable tangle. The forest, with the narrow paths, was better for them.

Before sunset the little troop were about eight miles from the point of departure. This journey had been made without accident, and even without great fatigue. It is true, it was the first journey on the march, and no doubt the following halting places would be rougher.

By a common consent they decided to make a halt at this place. The question then was, not to establish a real camp, but to simply organize a resting-place. One man on guard, relieved every two hours, would suffice to watch during the night, neither the natives nor the deer being truly formidable.

They found nothing better for shelter than an enormous mango-tree, whose large branches, very bushy, formed a kind of natural veranda. If necessary, they could nestle in the branches.

Only, on the arrival of the little troop, a deafening concert arose from the top of the tree.

The mango served as a perch for a colony of gray parrots, prattling, quarrelsome, ferocious birds, which set upon living birds, and those who would judge them from their congeners which Europe keeps in cages, would be singularly mistaken.

These parrots jabbered with such a noise that Dick Sand thought of firing at them to oblige them to be silent, or to put them to flight. But Harris dissuaded him, under the pretext that in these solitudes it was better not to disclose his presence by the detonation of a fire-arm.

"Let us pass along without noise," he said, "and we shall pass along without danger."

Supper was prepared at once, without any need of proceeding to cook food. It was composed of conserves and biscuit. A little rill, which wound under the plants, furnished drinkable water, which they did not drink without improving it with a few drops of rum. As to dessert, the mango was there with its juicy fruit, which the parrots did not allow to be picked without protesting with their abominable cries.

At the end of the supper it began to be dark. The shade rose slowly from the ground to the tops of the trees, from which the foliage soon stood out like a fine tracery on the more luminous background of the sky. The first stars seemed to be shining flowers, which twinkled at the end of the last branches. The wind went down with the night, and no longer trembled in the branches of the trees. The parrots themselves had become mute. Nature was going to rest, and inviting every living being to follow her in this deep sleep.

Preparations for retiring had to be of a very primitive character.

"Shall we not light a large fire for the night?" Dick Sand asked the American.

"What's the good?" replied Harris. "Fortunately the nights are not cold, and this enormous mango will preserve the soil from all evaporation. We have neither cold nor dampness to fear. I repeat, my young friend, what I told you just now. Let us move along incognito. No more fire than gunshots, if possible."

"I believe, indeed," then said Mrs. Weldon, "that we have nothing to fear from the Indians—even from those wanderers of the woods, of whom you have spoken, Mr. Harris. But, are there not other four-footed wanderers, that the sight of a fire would help to keep at a distance?"

"Mrs. Weldon," replied the American, "you do too much honor to the deer of this country. Indeed, they fear man more than he fears them."

"We are in a wood," said Jack, "and there is always beasts in the woods."

"There are woods and woods, my good little man, as there are beasts and beasts," replied Harris, laughing. "Imagine that you are in the middle of a large park. Truly, it is not without reason that the Indians say of this country, 'Es como el pariso!' It is like an earthly paradise!"

"Then there are serpents?" said Jack.

"No, my Jack," replied Mrs. Weldon, "there are no serpents, and you may sleep tranquilly."

"And lions?" asked Jack.

"Not the ghost of a lion, my good little man," replied Harris.

"Tigers, then?"

"Ask your mama if she has ever heard tell of tigers on this continent."

"Never," replied Mrs. Weldon.

"Good!" said Cousin Benedict, who, by chance, was listening to the conversation: "if there are neither lions nor tigers in the New World, which is perfectly true, we at least encounter cougars and jaguars."

"Are they bad?" asked little Jack.

"Phew!" replied Harris; "a native has little fear of attacking those animals, and we are strong. Stay! Hercules would be strong enough to crush two jaguars at once, one in each hand!"

"You will watch well, Hercules," then said little Jack, "and if a beast comes to bite us----"

"It is I who will bite it, Mr. Jack!" replied Hercules, showing his mouth, armed with superb teeth.

"Yes, you will watch, Hercules," said the novice, "but your companions and I will relieve you, turn about."
"No, Mr. Dick," replied Acteon, "Hercules, Bat, Austin, and I, we four will be enough for this labor. You must rest the whole night."

"Thank you, Acteon," replied Dick Sand, "but I ought to----"

"No! let those brave men do it, my dear Dick!" then said Mrs. Weldon.

"I, also; I shall watch!" added little Jack, whose eyelids were already closing.

"Yes, my Jack, yes! you will watch!" replied his mother, who did not wish to contradict him.

"But," the little boy said again, "if there are no lions, if there are no tigers in the forest, there are wolves!"

"Oh! wolves in jest!" replied the American. "They are not even wolves, but kinds of foxes, or rather of those dogs of the woods which they call 'guaras.'"

"And those _guaras_, they bite?" asked little Jack.

"Bah! Dingo would make only one mouthful of those beasts!"

"Never mind," replied Jack, with a last yawn; "guaras are wolves, because they are called wolves!"

And with that Jack fell asleep peaceably in Nan's arms, beside the trunk of the mango. Mrs. Weldon, lying near her, gave a last kiss to her little boy, and her tired eyes quickly closed for the night.

A few moments later Hercules brought back to the camp Cousin Benedict, who had just gone off to commence a chase for pyrophores. They are "cocuyos," or luminous flies, which the stylish put in their hair, like so many living gems. These insects which throw a bright and bluish light from two spots situated at the base of their corselet, are very numerous in South America. Cousin Benedict then counted on making a large collection, but Hercules did not leave him time, and, in spite of his recriminations, the negro brought him to the halting-place. That was because, when Hercules had orders, he executed them with military preciseness, which, no doubt, prevented the incarceration of a notable quantity of luminous flies in the entomologist's tin box.

A few moments after, with the exception of the giant, who was watching, all were reposing in a profound sleep.

CHAPTER XVII.
A HUNDRED MILES IN TWO DAYS.

Generally, travelers or ramblers in the woods, who have slept in the forests under the lovely stars, are awakened by howlings as fantastic as disagreeable. There is everything in this morning concert: clucking, grunting, croaking, sneering, barking, and almost "speaking," if one may make use of this word, which completes the series of different noises.

There are the monkeys who thus salute the daybreak. There we meet the little "marikina," the marmoset with a speckled mask; the "mono gris," the skin of which the Indians use to recover the batteries of their guns; the "sagous," recognizable from their long bunches of hair, and many others, specimens of this numerous family.

Of these various four-handed animals, the most remarkable are decidedly the "gueribas," with curling tails and a face like Beelzebub. When the sun rises, the oldest of the band, with an imposing and mysterious voice, sings a monotonous psalm. It is the baritone of the troop. The young tenors repeat after him the morning symphony. The Indians say then that the "gueribas" recite their _pater-nosters_.

But, on this day, it seemed that the monkeys did not offer their prayer, for no one heard them; and, meanwhile, their voice is loud, for it is produced by the rapid vibration of a kind of bony drum, formed by a swelling of the hyoides bone in the neck.

In short, for one reason or for another, neither the "gueribas," nor the "sagous," nor any other four-handed animals of this immense forest, sang, on this morning, their usual concert.

This would not have satisfied the wandering Indians. Not that these natives appreciate this kind of strange choral music, but they willingly give chase to the monkeys, and if they do, it is because the flesh of this animal is excellent, above all, when it is smoke-dried.

Dick Sand, of course, could not be familiar with the habits of the "gueribas," neither were his companions, or this not hearing them would have undoubtedly been a subject of surprise. They awoke then, one after the other, much refreshed by these few hours of repose, which no alarm had come to disturb.

Little Jack was not the last to stretch his arms. His first question was, to ask if Hercules had eaten a wolf during the night. No wolf had shown himself, and consequently Hercules had not yet breakfasted.

All, besides, were fasting like him, and after the morning prayer, Nan occupied herself preparing the repast.

The bill of fare was that of the supper of the night before, but with appetites sharpened by the morning air of the forest, no one dreamed of being difficult to please. It was necessary, above all, to gather strength for a good day's march, and they did it. For the first time, perhaps, Cousin Benedict comprehended that to eat was not an action indifferent or useless to life; only, he declared that he had not come to "visit" this country to walk with his hands in his pockets, and that, if Hercules prevented him from chasing the "cocuyos," and other luminous flies, Hercules
would have some trouble with him.

This threat did not seem to frighten the giant to any great extent. However, Mrs. Weldon took him aside and told him that, perhaps, he might allow his big baby to run to the right and left, but on condition that he did not lose sight of him. It would not do to completely sever Cousin Benedict from the pleasures so natural to his age.

At seven o'clock in the morning, the little troop took up their journey toward the east, preserving the order of march that had been adopted the previous day. It was always the forest. On this virgin soil, where the heat and the moisture agreed to produce vegetation, it might well be thought that the reign of growth appeared in all its power. The parallel of this vast plateau was almost confounded with tropical latitudes, and, during certain months in summer, the sun, in passing to the zenith, darted its perpendicular rays there. There was, therefore, an enormous quantity of imprisoned heat in this earth, of which the subsoil preserved the damp. Also, nothing could be more magnificent than this succession of forests, or rather this interminable forest.

Meanwhile, Dick Sand had not failed to observe this—-that, according to Harris, they were in the region of the pampas. Now, pampas is a word from the "quichna" language, which signifies a plain. Now, if his recollections did not deceive him, he believed that these plains presented the following characteristics: Lack of water, absence of trees, a failure of stones, an almost luxuriant abundance of thistles during the rainy season, thistles which became almost shrubby with the warm season, and then formed impenetrable thickets; then, also, dwarf trees, thorny shrubs, the whole giving to these plains a rather arid and desolate aspect.

Now, it had not been thus, since the little troop, guided by the American, had left the coast. The forest had not ceased to spread to the limits of the horizon. No, this was not the pampas, such as the young novice had imagined them. Had nature, as Harris had told him, been able to make a region apart from the plateau of Atacama, of which he knew nothing, if it did not form one of the most vast deserts of South America, between the Andes and the Pacific Ocean?

On that day Dick Sand propounded some questions on this subject, and expressed to the American the surprise he felt at this singular appearance of the pampas.

But he was quickly undeceived by Harris, who gave him the most exact details about this part of Bolivia, thus witnessing to his great knowledge of the country.

"You are right, my young friend," he said to the novice. "The true pampa is indeed such as the books of travels have depicted it to you, that is, a plain rather arid, and the crossing of which is often difficult. It recalls our savannahs of North America—-except that these are a little marshy. Yes, such is indeed the pampa of the Rio Colorado, such are the "llanos" of the Orinoco and of Venezuela. But here, we are in a country, the appearance of which even astonishes me. It is true, it is the first time I have followed this route across the plateau, a route which has the advantage of shortening our journey. But, if I have not yet seen it, I know that it presents an extraordinary contrast to the veritable pampa. As to this one, you would find it again, not between the Cordilleras of the west and the high chain of the Andes, but beyond the mountains, over all that eastern part of the continent which extends as far as the Atlantic."

"Must we then clear the Andes range?" Dick Sand asked, quickly.

"No, my young friend, no," replied the American, smiling. "So I said: You _would_ find it again, and not: You _will_ find it again. Be reassured, we shall not leave this plateau, those elevations of which do not exceed fifteen hundred feet. Ah! if it had been necessary to cross the Cordilleras with only the means of transport at our disposal, I should never have drawn you into such an undertaking."

"In fact," replied Dick Sand, "it would be better to ascend or descend the coast."

"Oh! a hundred times!" replied Harris. "But the Farm of San Felice is situated on this side of the Cordilleras. So, then, our journey, neither in its first nor in its second part, will offer any real difficulty."

"And you do not fear going astray in these forests, which you cross for the first time?" asked Dick Sand.

"No, my young friend, no," replied Harris. "I know indeed that this forest is like an immense sea, or rather like the bottom of a sea, where a sailor himself could not take the latitude nor recognize his position. But accustomed to traveling in the woods, I know how to find my route only by the inclination of certain trees, by the direction of their leaves, by the movement or the composition of the soil, by a thousand details which escape you! Be sure of it, I will lead you, you and yours, where you ought to go!"

All these things were said very clearly by Harris. Dick Sand and he, at the head of the troop, often talked without any one mingling in their conversation. If the novice felt some doubts that the American did not always succeed in scattering, he preferred to keep them to himself.

The 8th, 9th, 10th, 11th, and 12th of April passed in this manner, without any incident to mark the journey. They did not make more than eight to nine miles in twelve hours. The times consecrated to eating or repose came at regular intervals, and though a little fatigue was felt already, the sanitary condition was still very satisfactory.

Little Jack began to suffer a little from this life in the woods, to which he was not accustomed, and which was
becoming very monotonous for him. And then all the promises which had been made him had not been kept. The caoutchouc jumping-jacks, the humming-birds, all those seemed constantly to recede. There had also been a question of showing him the most beautiful parrots in the world, and they ought not to be wanting in these rich forests. Where, then, were the popinjays with green plumage, almost all originally from these countries, the _aras_, with naked cheeks, with long pointed tails, with glittering colors, whose paws never rest on the earth, and the "camindes," which are more peculiar to tropical countries, and the many-colored she-parrots, with feathered faces, and finally all those prattling birds which, according to the Indians, still speak the language of extinct tribes?

Of parrots, little Jack only saw ash-gray jakos, with red tails, which abounded under the trees. But these jakos were not new to him. They have transported them into all parts of the world. On the two continents they fill the houses with their insupportable chattering, and, of all the family of the "psittacius," they are the ones which learn to speak most easily.

It must be said, besides, that if Jack was not contented, Cousin Benedict was no more so. He had been allowed to wander a little to the right or to the left during the march. However, he had not found any insect which was fit to enrich his collection. Even the "pyrophores" obstinately refused to show themselves to him, and attract him by the phosphorescences of their corselet. Nature seemed truly to mock the unhappy entomologist, whose temper was becoming cross.

For four days more the march toward the northeast was continued in the same way. On the 16th of April the distance traversed from the coast could not be estimated at less than one hundred miles. If Harris had not gone astray—and he affirmed it without hesitation—the Farm of San Felice was no more than twenty miles from the halting place of that day. Before forty-eight hours the little troop then would have a comfortable shelter where its members could at last repose from their fatigues.

Meanwhile, though the plateau had been almost entirely crossed in its middle part, not a native, not a wanderer had been encountered under the immense forest.

More than once, without saying anything about it, Dick Sand regretted being unable to go ashore on some other point of the coast. More to the south, or more to the north, villages, hamlets, or plantations would not have been lacking, and long before this Mrs. Weldon and her companions would have found an asylum.

But, if the country seemed to be abandoned by man, animals showed themselves more frequently during these last days. At times was heard a kind of long, plaintive cry, that Harris attributed to some of those large tardi-grades, habitual denizens of those vast wooded regions, named "ais."

On that day, also, during the midday halt, a hissing passed through the air, which made Mrs. Weldon very uneasy, because it was so strange.

"What is that?" she asked, rising hastily.

"A serpent!" cried Dick Sand, who gun, in hand, threw himself before Mrs. Weldon.

They might fear, in fact, that some reptile would glide among the plants to the halting place. It would be nothing astonishing if it were one of those enormous "sucurus," kinds of boas, which sometimes measure forty feet in length.

But Harris reminded Dick Sand that the blacks were already following, and he reassured Mrs. Weldon.

According to him, that hissing could not be produced by a "sucurus," because that serpent does not hiss; but he indicated the presence of several inoffensive quadrupeds, rather numerous in that country.

"Be reassured, then," said he, "and make no movement which may frighten those animals."

"But what are they?" asked Dick Sand, who made it like a law of conscience to interrogate and make the American speak—who, however, never required pressing before replying.

"They are antelopes, my young friend," replied Harris.

"Oh! how I should like to see them!" cried Jack.

"That is very difficult, my good little man," replied the American, "very difficult."

"Perhaps we may try to approach than—those hissing antelopes?" returned Dick Sand.

"Oh! you will not take three steps," replied the American, shaking his head, "before the whole band will take flight. I beg of you, then, not to trouble yourself."

But Dick Sand had his reasons for being curious. He wished to see, and, gun in hand, he glided among the herbs. Immediately a dozen graceful gazelles, with small, sharp horns, passed with the rapidity of a water-spout. Their hair, bright red, looked like a cloud of fire under the tall underwood of the forest.

"I had warned you," said Harris, when the novice returned to take his place.

Those antelopes were so light of foot, that it had been truly impossible to distinguish them; but it was not so with another troop of animals which was signaled the same day. Those could be seen—imperfectly, it is true—but their apparition led to a rather singular discussion between Harris and some of his companions.

The little troop, about four o'clock in the afternoon, had stopped for a moment near an opening in the woods, when three or four animals of great height went out of a thicket a hundred steps off, and scampered away at once
with remarkable speed.

In spite of the American's recommendations, this time the novice, having quickly shouldered his gun, fired at one of these animals. But at the moment when the charge was going off, the weapon had been rapidly turned aside by Harris, and Dick Sand, skilful as he was, had missed his aim.

"No firing; no firing!" said the American.

"Ah, now, but those are giraffes!" cried Dick Sand, without otherwise replying to Harris's observation.

"Giraffes!" repeated Jack, standing up on the horse's saddle. "Where are they, the large beasts?"

"Giraffes!" replied Mrs. Weldon. "You are mistaken, my dear Dick. There are no giraffes in America."

"Indeed," said Harris, who appeared rather surprised, "there cannot be any giraffes in this country."

"What, then?" said Dick Sand.

"I really do not know what to think," replied Harris. "Have not your eyes deceived you, my young friend, and are not those animals more likely to be ostriches?"

"Ostriches!" repeated Dick Sand and Mrs. Weldon, looking at each other in great surprise.

"Yes, only ostriches," repeated Harris.

"But ostriches are birds," returned Dick Sand, "and consequently they have only two feet."

"Well," replied Harris, "I indeed thought I saw that those animals, which have just made off so rapidly, were bipeds."

"Bipeds!" replied the novice.

"Indeed it seemed to me that I saw animals with four legs," then said Mrs. Weldon.

"I also," added old Tom; then Bat, Acteon, and Austin confirmed those words.

"Ostriches with four legs!" cried Harris, with a burst of laughter. "That would be ridiculous!"

"So," returned Dick Sand, "we have believed they were giraffes, and not ostriches."

"No, my young friend, no," said Harris. "You have certainly seen badly. That is explained by the rapidity with which those animals have flown away. Besides, it has happened more than once that hunters have been deceived like you, and in the best faith in the world."

What the American said was very plausible. Between an ostrich of great height and a giraffe of medium height, seen at a certain distance, it is easy to make a mistake. If it were a question of a beak or a nose, both are none the less joined to the end of a long neck turned backward, and, strictly speaking, it may be said that an ostrich is only a half giraffe. It only needs the hind legs. Then, this biped and this quadruped, passing rapidly, on a sudden may, very properly, be taken one for the other.

Besides, the best proof that Mrs. Weldon and the others were mistaken was that there are no giraffes in America. Dick Sand then made this reflection:

"But I believed that ostriches were not met with in the New World any more than giraffes."

"Yes, my young friend," replied Harris; "and, indeed, South America possesses a peculiar species. To this species belongs the 'nandon,' which you have just seen."

Harris spoke the truth. The "nandon" is a long-legged bird, rather common in the plains of South America, and its flesh, when it is young, is good to eat.

This strong animal, whose height sometimes exceeds two meters, has a straight beak; wings long, and formed of tufted feathers of a bluish shade; feet formed of three claws, furnished with nails—which essentially distinguishes it from the ostriches of Africa.

These very exact details were given by Harris, who appeared to be very strongly posted on the manners of the "nandons."

Mrs. Weldon and her companions were obliged to acknowledge that they had been deceived.

"Besides," added Harris, "possibly we may encounter another band of these ostriches. Well, next time look better, and no longer allow yourselves to take birds for quadrupeds! But above all, my young friend, do not forget my recommendations, and do not fire on any animal whatsoever. We have no need of hunting to procure food, and no detonation of a fire-arm must announce our presence in this forest."

Meanwhile Dick Sand remained pensive. Once more a doubt had just arisen on his mind.

The next day, April 17th, the march was continued, and the American affirmed that twenty-four hours would not pass before the little troop should be installed at the Farm of San Felice.

"There, Mrs. Weldon," added he, "you will receive all the care necessary to your position, and a few days' rest will quite restore you. Perhaps you will not find at this farm the luxury to which you are accustomed in your residence in San Francisco, but you will see that our improved lands in the interior do not lack what is comfortable. We are not absolutely savages."

"Mr. Harris," replied Mrs. Weldon, "if we have only thanks to offer you for your generous resort, at least we shall offer them to you with all our hearts. Yes! It is time for us to arrive there!"
"You are very much fatigued, Mrs. Weldon?"
"I, no matter!" replied Mrs. Weldon; "but I perceive that my little Jack is gradually becoming exhausted! The fever begins to affect him at certain hours!"
"Yes," replied Harris, "and although the climate of this plateau is very healthful, it must be acknowledged that in March and April intermittent fevers reign."
"Doubtless," then said Dick Sand, "but also Nature, who is always and everywhere provident, has put the remedy near the evil!"
"And how is that, my young friend?" asked Harris, who did not seem to understand.
"Are we not, then, in the region of the quininae?" replied Dick Sand.
"In fact," said Harris, "you are perfectly right. The trees which furnish the precious febrifuge bark are native here."
"I am even astonished," added Dick Sand, "that we have not yet seen a single one."
"Ah! my young friend," replied Harris, "those trees are not easy to distinguish. Though they are often of great height, though their leaves are large, their flowers rosy and odoriferous, we do not discover them easily. It is rarely that they grow in groups. They are rather scattered through the forests, and the Indians who collect the quinina can only recognize them by their foliage, always green."
"Mr. Harris," said Mrs. Weldon, "if you see one of those trees you will show it to me."
"Certainly, Mrs. Weldon, but at the farm you will find some sulphate of quinine. That is worth still more to break the fever than the simple bark of the tree."
Formerly, this bark was only reduced to powder, which bore the name of "Jesuits' Powder," because, in 1649, the Jesuits of Rome received a considerable quantity from their mission in America.
This last day of the journey passed without other incident. Evening came and the halt was organized for the whole night as usual. Till then it had not rained, but the weather was preparing to change, for a warm mist rose from the soil and soon found a thick fog.
They were touching, in fact, on the rainy season. Fortunately, the next day, a comfortable shelter would be hospitably offered to the little troop. There were only a few hours to elapse.
Though, according to Harris, who could only establish his calculation by the time which the journey had lasted, they could not be more than six miles from the farm, the ordinary precautions were taken for the night. Tom and his companions would watch one after the other. Dick Sand insisted that nothing should be neglected in that respect.
Less than ever, would he depart from his habitual prudence, for a terrible suspicion was incrusted in his mind; but he did not wish to say anything yet.
The retiring to rest had been made at the feet of a group of large trees. Fatigue aiding, Mrs. Weldon and hers were already asleep, when they were awakened by a great cry.
"Eh! what's the matter?" asked Dick Sand, quickly, who was on his feet first of all.
"It is I! it is I who have cried!" replied Cousin Benedict.
"And what is the matter with you?" asked Mrs. Weldon.
"I have just been bit!"
"By a serpent?" asked Mrs. Weldon, with alarm.
"No, no! It was not a serpent, but an insect," replied Cousin Benedict. "Ah! I have it! I have it!"
"Well, crush your insect," said Harris, "and let us sleep, Mr. Benedict!"
"Crush an insect!" cried Cousin Benedict. "Not so! I must see what it is!"
"Some mosquito!" said Harris, shrugging his shoulders.
"No! It is a fly," replied Cousin Benedict, "and a fly which ought to be very curious!"
Dick Sand had lit a little portable lantern, and he approached Cousin Benedict.
"Divine goodness!" cried the latter. "Behold what consoles me for all my deceptions! I have, then, at last made a discovery!"
The honest man was raving. He looked at his fly in triumph. He would willingly kiss it.
"But what is it, then?" asked Mrs. Weldon.
"A dipter, cousin, a famous dipter!" And Cousin Benedict showed a fly smaller than a bee, of a dull color, streaked with yellow on the lower part of its body.
"And this fly is not venomous?" asked Mrs. Weldon.
"No, cousin, no; at least not for man. But for animals, for antelopes, for buffaloes, even for elephants, it is another thing. Ah! adorable insect!"
"At last," asked Dick Sand, "will you tell us, Mr. Benedict, what is this fly?"
"This fly," replied the entomologist, "this fly that I hold between my fingers, this fly--it is a _tsetse_! It is that famous dipter that is the honor of a country, and, till now, no one has ever found a _tsetse_ in America!"
Dick Sand did not dare to ask Cousin Benedict in what part of the world this redoubtable _tsetse_ was only to be met. And when his companions, after this incident, had returned to their interrupted sleep, Dick Sand, in spite of the fatigue which overwhelmed him, did not close his eyes the whole night.

* * * * *

CHAPTER XVIII.
THE TERRIBLE WORD.

It was time to arrive. Extreme lassitude made it impossible for Mrs. Weldon to continue any longer a journey made under such painful conditions. Her little boy, crimson during the fits of fever, very pale during the intermissions, was pitiable to see. His mother extremely anxious, had not been willing to leave Jack even in the care of the good Nan. She held him, half-lying, in her arms.

Yes, it was time to arrive. But, to trust to the American, on the very evening of this day which was breaking—the evening of the 18th of April, the little troop should finally reach the shelter of the "hacienda" of San Felice.

Twelve days' journey for a woman, twelve nights passed in the open air; it was enough to overwhelm Mrs. Weldon, energetic as she was. But, for a child, it was worse, and the sight of little Jack sick, and without the most ordinary cares, had sufficed to crush her.

Dick Sand, Nan, Tom, and his companions had supported the fatigues of the journey better.

Their provisions, although they were commencing to get exhausted, had not become injured, and their condition was satisfactory.

As for Harris, he seemed made for the difficulties of these long journeys across the forests, and it did not appear that fatigue could affect him. Only, in proportion as he neared the farm, Dick Sand observed that he was more preoccupied and less frank in behavior than before. The contrary would have been more natural. This was, at least, the opinion of the young novice, who had now become more than suspicious of the American. And meanwhile, what interest could Harris have in deceiving them? Dick Sand could not have explained it, but he watched their guide more closely.

The American probably felt himself suspected by Dick Sand, and, no doubt, it was this mistrust which made him still more taciturn with "his young friend."

The march had been resumed.

In the forest, less thick, the trees were scattered in groups, and no longer formed impenetrable masses. Was it, then, the true pampas of which Harris had spoken?

During the first hours of the day, no accident happened to aggravate the anxieties that Dick Sand felt. Only two facts were observed by him. Perhaps they were not very important, but in these actual junctures, no detail could be neglected.

It was the behavior of Dingo which, above all, attracted more especially the young man's attention.

In fact the dog, which, during all this journey, had seemed to be following a scent, became quite different, and that almost suddenly. Until then, his nose to the ground, generally smelling the herbs or the shrubs, he either kept quiet, or he made a sort of sad, barking noise, like an expression of grief or of regret.

Now, on this day, the barking of the singular animal became like bursts, sometimes furious, such as they formerly were when Negoro appeared on the deck of the "Pilgrim." A suspicion crossed suddenly Dick Sand's mind, and it was confirmed by Tom, who said to him:

"How very singular, Mr. Dick! Dingo no longer smells the ground as he did yesterday! His nose is in the air, he is agitated, his hair stands up! One would think he scented in the distance----"

"Negoro, is it not so?" replied Dick Sand, who seized the old black's arm, and signed to him to speak in a low voice.

"Negoro, Mr. Dick! May it not be that he has followed our steps?"

"Yes, Tom; and that at this moment even he may not be very far from us."

"But why?" said Tom.

"Either Negoro does not know this country," went on Dick Sand, "and then he would have every interest in not losing sight of us-----"

"Or?" said Tom, who anxiously regarded the novice.

"Or," replied Dick Sand, "he does know it, and then he-----"

"But how should Negoro know this country? He has never come here!"

"Has he never been here?" murmured Dick Sand.

"It is an incontestable fact that Dingo acts as if this man whom he detests were near us!"

Then, interrupting himself to call the dog, which, after some hesitation, came to him:
"Eh!" said he; "Negoro! Negoro!"

A furious barking was Dingo's reply. This name had its usual effect upon him, and he darted forward, as if Negoro had been hidden behind some thicket.

Harris had witnessed all this scene. With his lips a little drawn, he approached the novice.

"What did you ask Dingo then?" said he.

"Oh, not much, Mr. Harris," replied old Tom, jokingly. "We asked him for news of the ship-companion whom we have lost!"

"Ah!" said the American, "the Portuguese, the ship's cook of whom you have already spoken to me?"

"Yes," replied Tom. "One would say, to hear Dingo, that Negoro is in the vicinity."

"How could he get as far as this?" replied Harris.

"He never was in this country that I know of; at least, he concealed it from us," replied Tom.

"It would be astonishing," said Harris. "But, if you wish, we will beat these thickets. It is possible that this poor devil has need of help; that he is in distress."

"It is useless, Mr. Harris," replied Dick Sand. "If Negoro has known how to come as far as this, he will know how to go farther. He is a man to keep out of trouble."

"As you please," replied Harris.

"Let us go. Dingo, be quiet," added Dick Sand, briefly, so as to end the conversation.

The second observation made by the novice was in connection with the American horse. He did not appear to "feel the stable," as do animals of his species. He did not suck in the air; he did not hasten his speed; he did not dilate his nostrils; he uttered none of the neighings that indicate the end of a journey. To observe him well, he appeared to be as indifferent as if the farm, to which he had gone several times, however, and which he ought to know, had been several hundreds of miles away.

"That is not a horse near home," thought the young novice.

And, meanwhile, according to what Harris had said the evening before, there only remained six miles to go, and, of these last six miles, at five o'clock in the evening four had been certainly cleared.

Now, if the horse felt nothing of the stable, of which he should have great need, nothing besides announced the approaches to a great clearing, such as the Farm of San Felice must be.

Mrs. Weldon, indifferent as she then was to what did not concern her child, was struck at seeing the country still so desolate. What! not a native, not a farm-servant, at such a short distance! Harris must be wild! No! she repulsed this idea. A new delay would have been the death of her little Jack!

Meanwhile, Harris always kept in advance, but he seemed to observe the depths of the wood, and looked to the right and left, like a man who was not sure of himself--nor of his road.

Mrs. Weldon shut her eyes so as not to see him.

After a plain a mile in extent, the forest, without being as dense as in the west, had reappeared, and the little troop was again lost under the great trees.

At six o'clock in the evening they had reached a thicket, which appeared to have recently given passage to a band of powerful animals. Dick Sand looked around him very attentively. At a distance which far surpassed the human height, the branches were torn off or broken. At the same time the herbs, roughly scattered, exhibited on the soil, a little marshy, prints of steps which could not be those of jaguars, or cougars.

Were these, then, the "ais," or some other tardigraves, whose feet had thus marked the soil? But how, then, explain the break in the branches at such a height?

Elephants might have, without doubt, left such imprints, stamped these large traces, made a similar hole in the impenetrable underwood. But elephants are not found in America. These enormous thick-skinned quadrupeds are not natives of the New World. As yet, they have never been acclimated there.

The hypothesis that elephants had passed there was absolutely inadmissible.

However that might be, Dick Sand hardly knew how much this inexplicable fact gave him to think about. He did not even question the American on this point. What could he expect from a man who had tried to make him take giraffes for ostriches? Harris would have given him some explanation, more or less imaginative, which would not have changed the situation.

At all events, Dick had formed his opinion of Harris. He felt in him a traitor! He only awaited an occasion to unmask his disloyalty, to have the right to do it, and everything told him that this opportunity was near.

But what could be Harris's secret end? What future, then, awaited the survivors of the "Pilgrim?" Dick Sand repeated to himself that his responsibility had not ceased with the shipwreck. It was more than ever necessary for him to provide for the safety of those whom the waves had thrown on this coast! This woman, this young child, these blacks--all his companions in misfortune--it was he alone who must save them! But, if he could attempt anything on board ship, if he could act on the sea, here, in the midst of the terrible trials which he foresaw, what part
could he take?

Dick Sand would not shut his eyes before the frightful reality that each instant made more indisputable. In this juncture he again became the captain of fifteen years, as he had been on the "Pilgrim." But he would not say anything which could alarm the poor mother before the moment for action had arrived.

And he said nothing, not even when, arrived on the bank of a rather large stream, preceding the little troop about one hundred feet, he perceived enormous animals, which threw themselves under the large plants on the brink.

"Hippopotami! hippopotami!" he was going to exclaim.

And they were, indeed, these thick-skinned animals, with a big head, a large, swollen snout, a mouth armed with teeth which extend a foot beyond it--animals which are squat on their short limbs, the skin of which, unprovided with hair, is of a tawny red. Hippopotami in America!

They continued to march during the whole day, but painfully. Fatigue commenced to retard even the most robust. It was truly time to arrive, or they would be forced to stop.

Mrs. Weldon, wholly occupied with her little Jack, did not perhaps feel the fatigue, but her strength was exhausted. All, more or less, were tired. Dick Sand, resisted by a supreme moral energy, caused by the sentiment of duty.

Toward four o'clock in the evening, old Tom found, in the grass, an object which attracted his attention. It was an arm, a kind of knife, of a particular shape, formed of a large, curved blade, set in a square, ivory handle, rather roughly ornamented. Tom carried this knife to Dick Sand, who took it, examined it, and, finally, showed it to the American, saying:

"No doubt the natives are not very far off."

"That is so," replied Harris, "and meanwhile----"

"Meanwhile?" repeated Dick Sand, who now steadily looked Harris in the face.

"We should be very near the farm," replied Harris, hesitating, "and I do not recognize----"

"You are then astray?" quickly asked Dick Sand.

"Astray! no. The farm cannot be more than three miles away, now. But, I wished to take the shortest road through the forest, and perhaps I have made a little mistake!"

"Perhaps," replied Dick Sand.

"I would do well, I think, to go in advance," said Harris.

"No, Mr. Harris, we will not separate," replied Dick Sand, in a decided tone.

"As you will," replied the American. "But, during the night, it will be difficult for me to guide you."

"Never mind that!" replied Dick Sand. "We are going to halt. Mrs. Weldon will consent to pass a last night under the trees, and to-morrow, when it is broad daylight, we will proceed on our journey! Two or three miles still, that will be an hour's walk!"

"Be it so," replied Harris.

At that moment Dingo commenced to bark furiously.

"Here, Dingo, here!" cried Dick Sand. "You know well that no one is there, and that we are in the desert!"

This last halt was then decided upon.

Mrs. Weldon let her companions work without saying a word. Her little Jack was sleeping in her arms, made drowsy by the fever.

They sought the best place to pass the night. This was under a large bunch of trees, where Dick Sand thought of disposing all for their rest. But old Tom, who was helping him in these preparations, stopped suddenly, crying out:

"Mr. Dick! look! look!"

"What is it, old Tom?" asked Dick Sand, in the calm tone of a man who attends to everything.

"There--there!" cried Tom; "on those trees--blood stains!--and--on the ground--mutilated limbs!"

Dick Sand rushed toward the spot indicated by old Tom. Then, returning to him: "Silence, Tom, silence!" said he.

In fact, there on the ground were hands cut off, and above these human remains were several broken forks, and a chain in pieces!

Happily, Mrs. Weldon had seen nothing of this horrible spectacle.

As for Harris, he kept at a distance, and any one observing him at this moment would have been struck at the change made in him. His face had something ferocious in it.

Dingo had rejoined Dick Sand, and before these bloody remains, he barked with rage.

The novice had hard work to drive him away.

Meanwhile, old Tom, at the sight of these forks, of this broken chain, had remained motionless, as if his feet were rooted in the soil. His eyes were wide open, his hands clenched; he stared, murmuring these incoherent words:

"I have seen--already seen--these forks--when little--I have seen!"
And no doubt the memories of his early infancy returned to him vaguely. He tried to recall them. He was going to speak.

"Be silent, Tom!" repeated Dick Sand. "For Mrs. Weldon's sake, for all our sakes, be silent!"

And the novice led the old black away.

Another halting place was chosen, at some distance, and all was arranged for the night.

The repast was prepared, but they hardly touched it. Fatigue took away their hunger. All were under an indefinable impression of anxiety which bordered on terror.

 Darkness came gradually: soon it was profound. The sky was covered with great stormy clouds. Between the trees in the western horizon they saw some flashes of heat lightning. The wind had fallen; not a leaf moved on the trees. An absolute silence succeeded the noises of the day, and it might be believed that the heavy atmosphere, saturated with electricity, was becoming unfit for the transmission of sounds.

Dick Sand, Austin, and Bat watched together. They tried to see, to hear, during this very dark night, if any light whatsoever, or any suspicious noise should strike their eyes or their ears. Nothing troubled either the calm or the obscurity of the forest.

Torn, not sleepy, but absorbed in his remembrances, his head bent, remained quiet, as if he had been struck by some sudden blow.

Mrs. Weldon rocked her child in her arms, and only thought of him.

Only Cousin Benedict slept, perhaps, for he alone did not suffer from the common impression. His faculty for looking forward did not go so far.

Suddenly, about eleven o'clock, a prolonged and grave roaring was heard, with which was mingled a sort of sharper shuddering. Tom stood up and stretched out his hand toward a dense thicket, a mile or more distant.

Dick Sand seized his arm, but he could not prevent Tom from crying in a loud voice: "The lion! the lion!"

This roaring, which he had so often heard in his infancy, the old black had just recognized it.

"The lion!" he repeated.

Dick Sand, incapable of controlling himself longer, rushed, cutlass in hand, to the place occupied by Harris.

Harris was no longer there, and his horse had disappeared with him.

A sort of revelation took place in Dick Sand's mind. He was not where he had believed he was!

So it was not on the American coast that the "Pilgrim" had gone ashore! It was not the Isle of Paques, whose bearing the novice had taken at sea, but some other island situated exactly to the west of this continent, as the Isle of Paques is situated to the west of America.

The compass had deceived him during a part of the voyage, we know why! Led away by the tempest over a false route, he must have doubled Cape Horn, and from the Pacific Ocean he had passed into the Atlantic! The speed of his ship, which he could only imperfectly estimate, had been doubled, unknown to him, by the force of the hurricane!

Behold why the caoutchouc trees, the quinquinas, the products of South America were missing in this country, which was neither the plateau of Atacama nor the Bolivian pampa!

Yes, they were giraffes, not ostriches, which had fled away in the opening! They were elephants that had crossed the thick underwood! They were hippopotami whose repose Dick Sand had troubled under the large plants! It was the _tsetse_, that dipter picked up by Benedict, the formidable _tsetse_ under whose stings the animals of the caravans perish!

Finally, it was, indeed, the roaring of the lion that had just sounded through the forest! And those forks, those chains, that knife of singular form, they were the tools of the slave-trader! Those mutilated hands, they were the hands of captives!

The Portuguese Negoro, and the American Harris, must be in collusion! And those terrible words guessed by Dick Sand, finally escaped his lips:

"Africa! Equatorial Africa! Africa of the slave-trade and the slaves!"

End of Part I

_PART II_

* * * * *

CHAPTER I.
THE SLAVE TRADE.

The slave trade! Nobody is ignorant of the significance of this word, which should never have found a place in
human language. This abominable traffic, for a long time practised to the profit of the European nations which possessed colonies beyond the sea, has been already forbidden for many years. Meanwhile it is always going on a large scale, and principally in Central Africa. Even in this nineteenth century the signature of a few States, calling themselves Christians, are still missing from the Act for the Abolition of Slavery.

We might believe that the trade is no longer carried on; that this buying and this selling of human creatures has ceased; it is not so, and that is what the reader must know if he wishes to become more deeply interested in the second part of this history. He must learn what these men-hunts actually are still, these hunts which threaten to depopulate a whole continent for the maintenance of a few slave colonies; where and how these barbarous captures are executed; how much blood they cost; how they provoke incendiarism and pillage; finally, for whose profit they are made.

It is in the fifteenth century only that we see the trade in blacks carried on for the first time. Behold under what circumstances it was established:

The Mussulmans, after being expelled from Spain, took refuge beyond the Strait on the coast of Africa. The Portuguese, who then occupied that part of the coast, pursued them with fury. A certain number of those fugitives were made prisoners and brought back to Portugal. Reduced to slavery, they constituted the first nucleus of African slaves which has been formed in Western Europe since the Christian Era.

But those Mussulmans belonged, for the most part, to rich families, who wished to buy them back for gold. The Portuguese refused to accept a ransom, however large it might be. They had only to make foreign gold. What they lacked were the arms so indispensable then for the work of the growing colonies, and, to say it all, the arms of the slave.

The Mussulman families, being unable to buy back their captive relatives, then offered to exchange them for a much larger number of black Africans, whom it was only too easy to carry off. The offer was accepted by the Portuguese, who found that exchange to their advantage, and thus the slave trade was founded in Europe.

Toward the end of the sixteenth century this odious traffic was generally admitted, and it was not repugnant to the still barbarous manners. All the States protected it so as to colonize more rapidly and more surely the isles of the New World. In fact, the slaves of black origin could resist the climate, where the badly acclimated whites, still unfit to support the heat of intertropical climates, would have perished by thousands. The transport of negroes to the American colonies was then carried on regularly by special vessels, and this branch of transatlantic commerce led to the creation of important stations on different points of the African coast. The "merchandise" cost little in the country of production, and the returns were considerable.

But, necessary as was the foundation of the colonies beyond the sea from all points of view, it could not justify those markets for human flesh. Generous voices soon made themselves heard, which protested against the trade in blacks, and demanded from the European governments a decree of abolition in the name of the principles of humanity.

In 1751, the Quakers put themselves at the head of the abolition movement, even in the heart of that North America where, a hundred years later, the War of Secession was to burst forth, to which this question of slavery was not a foreign one. Different States in the North--Virginia, Connecticut, Massachusetts, Pennsylvania--decreed the abolition of the slave trade, and freed the slaves brought to their territories at great expense.

But the campaign commenced by the Quakers did not limit itself to the northern provinces of the New World. Slaveholders were warmly attacked beyond the Atlantic. France and England, more particularly, recruited partisans for this just cause. "Let the colonies perish rather than a principle!" Such was the generous command which resounded through all the Old World, and, in spite of the great political and commercial interests engaged in the question, it was effectively transmitted through Europe.

The impetus was given. In 1807, England abolished the slave-trade in her colonies, and France followed her example in 1814. The two powerful nations exchanged a treaty on this subject--a treaty confirmed by Napoleon during the Hundred Days.

However, that was as yet only a purely theoretical declaration. The slave-ships did not cease to cross the seas, and to dispose of their "ebony cargoes" in colonial ports.

More practical measures must be taken in order to put an end to this commerce. The United States, in 1820, and England, in 1824, declared the slave trade an act of piracy, and those who practised it pirates. As such, they drew on themselves the penalty of death, and they were pursued to the end. France soon adhered to the new treaty; but the States of South America, and the Spanish and Portuguese colonies, did not join in the Act of Abolition. The exportation of blacks then continued to their profit, notwithstanding the right of search generally recognized, which was limited to the verification of the flag of suspicious vessels.

Meanwhile, the new Law of Abolition had not a retroactive effect. No more new slaves were made, but the old ones had not yet recovered their liberty.
It was under those circumstances that England set an example. In May, 1833, a general declaration emancipated all the blacks in the colonies of Great Britain, and in August, 1838, six hundred and seventy thousand slaves were declared free.

Ten years later, in 1848, the Republic emancipated the slaves of the French colonies, say about two hundred and sixty thousand blacks. In 1861, the war which broke out between the Federals and Confederates, of the United States, finishing the work of emancipation, extended it to all North America.

The three great powers had then accomplished this work of humanity. At the present hour, the trade is no longer carried on, except for the benefit of the Spanish and Portuguese colonies, and to satisfy the wants of the populations of the Orient, Turks, or Arabs. Brazil, if she has not yet restored her old slaves to liberty, at least no longer receives new ones, and the children of the blacks are born free there.

It is in the interior of Africa, in the prosecution of those bloody wars, waged by the African chiefs among themselves for this man-hunt, that entire tribes are reduced to slavery. Two opposite directions are then given to the caravans: one to the west, toward the Portuguese colony of Angola; the other to the east, on the Mozambique. Of these unfortunate beings, of whom only a small portion arrive at their destination, some are exported, it may be to Cuba, it may be to Madagascar; others to the Arab or Turkish provinces of Asia, to Mecca, or to Muscat. The English and French cruisers can only prevent this traffic to a small extent, as it is so difficult to obtain an effective surveillance over such far-extended coasts.

But the figures of these odious exportations, are they still considerable?

Yes! The number of slaves who arrive at the coast is estimated at not less than eighty thousand; and this number, it appears, only represents the tenth of natives massacred.

After these dreadful butcheries the devastated fields are deserted, the burnt villages are without inhabitants, the rivers carry down dead bodies, deer occupy the country. Livingstone, the day after one of these men-hunts, no longer recognized the provinces he had visited a few months before. All the other travelers—Grant, Speke, Burton, Cameron, and Stanley—do not speak otherwise of this wooded plateau of Central Africa, the principal theater of the wars between the chiefs. In the region of the great lakes, over all that vast country which feeds the market of Zanzibar, in Bornou and Fezzan, farther south, on the banks of the Nyassa and the Zambesi, farther west, in the districts of the upper Zaire, which the daring Stanley has just crossed, is seen the same spectacle—ruins, massacres, depopulation. Then will slavery in Africa only end with the disappearance of the black race; and will it be with this race as it is with the Australian race, or the race in New Holland?

But the market of the Spanish and Portuguese colonies will close some day. That outlet will be wanting. Civilized nations can no longer tolerate the slave trade!

Yes, without doubt; and this year even, 1878, ought to see the enfranchisement of all the slaves still possessed by Christian States. However, for long years to come the Mussulman nations will maintain this traffic, which depopulates the African continent. It is for them, in fact, that the most important emigration of the blacks is made, as the number of natives snatched from their provinces and brought to the eastern coast annually exceeds forty thousand. Long before the expedition to Egypt the negroes of the Senaara were sold by thousands to the negroes of the Darfour, and reciprocally. General Bonaparte was able to buy a pretty large number of these blacks, of whom he made organized soldiers, like the Mamelukes. Since then, during this century, of which four-fifths have now passed away, commerce in slaves has not diminished in Africa. On the contrary.

And, in fact, Islamism is favorable to the slave trade. The black slave must replace the white slave of former times, in Turkish provinces. So contractors of every origin pursue this execrable traffic on a large scale. They thus carry a supplement of population to those races, which are dying out and will disappear some day, because they do not regenerate themselves by labor. These slaves, as in the time of Bonaparte, often become soldiers. With certain nations of the upper Niger, they compose the half of the armies of the African chiefs. Under these circumstances, their fate is not sensibly inferior to that of free men. Besides, when the slave is not a soldier, he is money which has circulation; even in Egypt and at Bornou, officers and functionaries are paid in that money. William Lejean has seen it and has told of it.

Such is, then, the actual state of the trade.

Must it be added that a number of agents of the great European powers are not ashamed to show a deplorable indulgence for this commerce. Nevertheless, nothing is truer; while the cruisers watch the coasts of the Atlantic and the Indian Oceans, the traffic goes on regularly in the interior, the caravans walk on under the eyes of certain functionaries, and massacres, where ten blacks perish to furnish one slave, take place at stated periods!

So it will now be understood how terrible were those words just pronounced by Dick Sand.

"Africa! Equatorial Africa! Africa of slave-traders and slaves!"

And he was not deceived; it was Africa with all its dangers, for his companions and for himself.

But on what part of the African continent had an inexplicable fatality landed him? Evidently on the western
of the cataracts of Massassa, he lost one of his companions, Francis Pocock. July 18th he was drawn with his boat
was the upper Zaire, or Congo, and that by following its course he could descend directly to the sea.

courageous American, reascending as far as the second degree of northern latitude, ascertained that the Loualaba

then was to gain a complete knowledge of Loualaba, of which he had only had a glimpse.

It was the first view in the unknown of the great Portuguese Colony.

Eighteen years after, two daring discoverers crossed Africa from the east to the west, and arrived, one south, the

other north, of Angola, after unheard-of difficulties.

The first, according to the date, was a lieutenant in the English navy, Verney-Howet Cameron. In 1872, there

was reason to fear that the expedition of the American, Stanley, was in great danger. It had been sent to the great

lake region in search of Livingstone. Lieutenant Cameron offered to go over the same road.

The offer was accepted. Cameron, accompanied by Dr. Dillon, Lieutenant Cecil Murphy and Robert Moffat, a

nephew of Livingstone, started from Zanzibar. After having crossed Ougogo, he met Livingstone's faithful servants
carrying their master's body to the eastern coast. He continued his route to the west, with the unconquerable desire to
pass from one coast to the other.

He crossed Ounyanyembe, Ougounda, and Kahouele, where he collected the great traveler's papers. Having
passed over Tanganyika, and the Bambarré mountains, he reached Loualaba, but could not descend its course. After
having visited all the provinces devastated by war and depopulated by the slave trade, Kilemmba, Ouroua, the
sources of the Lomane, Oulouda, Lovale, and having crossed the Coanza and the immense forests in which Harris
has just entrapped Dick Sand and his companions, the energetic Cameron finally perceived the Atlantic Ocean and
arrived at Saint Philip of Benguela. This journey of three years and four months had cost the lives of his two
companions, Dr. Dillon and Robert Moffat.

Henry Moreland Stanley, the American, almost immediately succeeded the Englishman, Cameron, on the road
of discoveries. We know that this intrepid correspondent of the New York _Herald_, sent in search of Livingstone,
had found him on October 30th, 1871, at Oujiji, on Lake Tanganyika. Having so happily accomplished his object for
the sake of humanity, Stanley determined to pursue his journey in the interest of geographical science. His object
then was to gain a complete knowledge of Loualaba, of which he had only had a glimpse.

Cameron was then lost in the provinces of Central Africa, when, in November, 1874, Stanley quitted Bagamoga,
on the eastern coast. Twenty-one months after, August 24th, 1876, he abandoned Oujiji, which was decimated by an
epidemic of smallpox. In seventy-four days he effected the passage of the lake at Nyangwe, a great slave market,
which had been already visited by Livingstone and Cameron. Here he witnessed the most horrible scenes, practised
in the Maroungou and Manyouema countries by the officers of the Sultan of Zanzibar.

Stanley then took measures to explore the course of the Loualaba and to descend it as far as its mouth. One
hundred and forty bearers, engaged at Nyangwe, and nineteen boats, formed the material and the force of his
expedition.

From the very start he had to fight the cannibals of Ougouson. From the start, also, he had to attend to the
carrying of boats, so as to pass insuperable cataracts.

Under the equator, at the point where the Loualaba makes a bend to the northeast, fifty-four boats, manned by
several hundred natives, attacked Stanley's little fleet, which succeeded in putting them to flight. Then the
courageous American, reascending as far as the second degree of northern latitude, ascertained that the Loualaba
was the upper Zaire, or Congo, and that by following its course he could descend directly to the sea.

This he did, fighting nearly every day against the tribes that lived near the river. On June 3d, 1877, at the passage
of the cataracts of Massassa, he lost one of his companions, Francis Pocock. July 18th he was drawn with his boat.
into the falls of M'belo, and only escaped death by a miracle.

Finally, August 6th, Henry Stanley arrived at the village of Ni-Sanda, four days' journey from the coast.

Two days after, at Banza-M'bouko, he found the provisions sent by two merchants from Emboma.

He finally rested at this little coast town, aged, at thirty-five years, by over-fatigue and privations, after an entire passage of the African continent, which had taken two years and nine months of his life.

However, the course of the Loualaba was explored as far as the Atlantic; and if the Nile is the great artery of the North, if the Zambesi is the great artery of the East, we now know that Africa still possesses in the West the third of the largest rivers in the world—a river which, in a course of two thousand, nine hundred miles, under the names of Loualaba, Zaire, and Congo, unites the lake region with the Atlantic Ocean.

However, between these two books of travel--Stanley's and Cameron's--the province of Angola is somewhat better known in this year than in 1873, at that period when the "Pilgrim" was lost on the African coast. It was well known that it was the seat of the western slave-trade, thanks to its important markets of Bihe, Cassange, and Kazounde.

It was into this country that Dick Sand had been drawn, more than one hundred miles from the coast, with a woman exhausted by fatigue and grief, a dying child, and some companions of African descent, the prey, as everything indicated, to the rapacity of slave merchants.

Yes, it was Africa, and not that America where neither the natives, nor the deer, nor the climate are very formidable. It was not that favorable region, situated between the Cordilleras and the coast, where straggling villages abound, and where missions are hospitably opened to all travelers.

They were far away, those provinces of Peru and Bolivia, where the tempest would have surely carried the "Pilgrim," if a criminal hand had not changed its course, where the shipwrecked ones would have found so many facilities for returning to their country.

It was the terrible Angola, not even that part of the coast inspected by the Portuguese authorities, but the interior of the colony, which is crossed by caravans of slaves under the whip of the driver.

What did Dick Sand know of this country where treason had thrown him? Very little; what the missionaries of the sixteenth and seventeenth centuries had said of it; what the Portuguese merchants, who frequented the road from St. Paul de Loanda to the Zaire, by way of San Salvador, knew of it; what Dr. Livingstone had written about it, after his journey of 1853, and that would have been sufficient to overwhelm a soul less strong than his.

Truly, the situation was terrible.

CHAPTER II.

HARRIS AND NEGORO.

The day after that on which Dick Sand and his companions had established their last halt in the forest, two men met together about three miles from there, as it had been previously arranged between them.

These two men were Harris and Negoro; and we are going to see now what chance had brought together, on the coast of Angola, the Portuguese come from New Zealand, and the American, whom the business of trader obliged to often traverse this province of Western Africa.

Harris and Negoro were seated at the foot of an enormous banyan, on the steep bank of an impetuous stream, which ran between a double hedge of papyrus.

The conversation commenced, for the Portuguese and the American had just met, and at first they dwelt on the deeds which had been accomplished during these last hours.

"And so, Harris," said Negoro, "you have not been able to draw this little troop of Captain Sand, as they call this novice of fifteen years, any farther into Angola?"

"No, comrade," replied Harris; "and it is even astonishing that I have succeeded in leading him a hundred miles at least from the coast. Several days ago my young friend, Dick Sand, looked at me with an anxious air, his suspicions gradually changed into certainties--and faith--"

"Another hundred miles, Harris, and those people would be still more surely in our hands! However, they must not escape us!"

"Ah! How could they?" replied Harris, shrugging his shoulders. "I repeat it, Negoro, there was only time to part company with them. Ten times have I read in my young friend's eyes that he was tempted to send a ball into my breast, and I have too bad a stomach to digest those prunes which weigh a dozen to the pound."

"Good!" returned Negoro; "I also have an account to settle with this novice."

"And you shall settle it at your ease, with interest, comrade. As to me, during the first three days of the journey I succeeded very well in making him take this province for the Desert of Atacama, which I visited formerly. But the child claimed his caoutchoucs and his humming-birds. The mother demanded her quinquinas. The cousin was crazy
to find cocuyos. Faith, I was at the end of my imagination, and after with great difficulty making them swallow ostriches--a god-send, indeed, Negoro!--I no longer knew what to invent. Besides, I well saw that my young friend no longer accepted my explanations. Then we fell on elephants' prints. The hippopotami were added to the party. And you know, Negoro, hippopotami and elephants in America are like honest men in the penitentiaries of Benguela. Finally, to finish me, there was the old black, who must find forks and chains at the foot of a tree. Slaves had freed themselves from them to flee. At the same moment the lion roared, starting the company, and it is not easy to pass off that roaring for the mewing of an inoffensive cat. I then had only time to spring on my horse and make my way here."

"I understand," replied Negoro. "Nevertheless, I would wish to hold them a hundred miles further in the province."

"One does what he can, comrade," replied Harris. "As to you, who followed our caravan from the coast, you have done well to keep your distance. They felt you were there. There is a certain Dingo that does not seem to love you. What have you done to that animal?"

"Nothing," replied Negoro; "but before long it will receive a ball in the head."

"As you would have received one from Dick Sand, if you had shewn ever so little of your person within two hundred feet of his gun. Ah! how well he fires, my young friend; and, between you and me, I am obliged to admit that he is, in his way, a fine boy."

"No matter how fine he is, Harris, he will pay dear for his insolence," replied Negoro, whose countenance expressed implacable cruelty.

"Good," murmured Harris, "my comrade remains just the same as I have always known him! Voyages have not injured him!"

Then, after a moment's silence: "Ah, there, Negoro," continued he, "when I met you so fortunately there below, at the scene of the shipwreck, at the mouth of the Longa, you only had time to recommend those honest people to me, while begging me to lead them as far as possible across this pretended Bolivia. You have not told me what you have been doing these two years! Two years, comrade, in our chance existence, is a long time. One fine day, after having taken charge of a caravan of slaves on old Alvez's account--whose very humble agents we are--you left Cassange, and have not been heard of since! I have thought that you had some disagreement with the English cruiser, and that you were hung!"

"I came very near it, Harris."

"That will come, Negoro."

"Thank you!"

"What would you have?" replied Harris, with an indifference quite philosophical; "it is one of the chances of the trade! We do not carry on the slave-trade on the coast of Africa without running the risk of dying elsewhere than in our beds! So, you have been taken?"

"Yes!"

"By the English?"

"No! By the Portuguese."

"Before or after having delivered your cargo?" asked Harris.

"After--," replied Negoro, who had hesitated a little about replying. "These Portuguese now make difficulties. They want no more slavery, though they have used it so long to their profit. I was denounced--watched. They took me--"

"And condemned--"

"Me to finish my days in the penitentiary of St. Paul de Loanda."

"A thousand devils!" exclaimed Harris. "That is an unhealthy place for men accustomed, like us, to live in the open air. As to me, perhaps I should prefer being hung."

"One does not escape from the gallows," replied Negoro; "but from prison--"

"You were able to make your escape?"

"Yes, Harris. Only fifteen days after being put in prison. I was able to hide myself at the bottom of the hold of an English steamer, sailing for Auckland, of New Zealand. A barrel of water and a case of conserves, between which I had intruded, furnished me with food and drink during the whole passage. Oh! I suffered terribly, from not being willing to show myself when we were at sea. But, if I had been imprudent enough to do it, I would have been confined again at the bottom of the hold, and, voluntarily or not, the torture would be the same. Besides, on my arrival at Auckland, they would have returned me again to the English authorities, and finally brought me back to the penitentiary of Loanda, or, perhaps, hung me, as you said. That was why I preferred to travel incognito."

"And without paying your passage!" exclaimed Harris, laughing. "Ah! that is not considerate, comrade, to be fed and carried gratis!"
"Yes," returned Negoro, "but thirty days' passage at the bottom of the hold--"

"At last that was over, Negoro. You set out for New Zealand, in the land of the Maoris. But you have returned. Was the return made under the same circumstances?"

"Not so, Harris. You may well believe that, over there, I had only one idea--to return to Angola and take up my trade of slave-trader again."

"Yes," replied Harris, "one loves his trade--from habit."

"For eighteen months--"

Having pronounced those last words, Negoro stopped suddenly. He seized his companion's arm, and listened.

"Harris," said he, lowering his voice, "was there not a trembling in that papyrus bush?"

"Yes, indeed," replied Harris, seizing his gun, always ready to fire.

Negoro and he stood up, looked around them, and listened with the greatest attention.

"There is nothing there," said Harris. "It is this brook, swelled by the storm, which runs more noisily. For two years, comrade, you have been unaccustomed to the noises of the forest, but you will get used to them again. Continue, then, the narration of your adventures. When I understand the past, we shall talk of the future."

Negoro and Harris sat down again at the foot of the banyan. The Portuguese continued, in these terms:

"For eighteen months I vegetated in Auckland. When the steamer arrived there I was able to leave it without being seen; but not a piastre, not a dollar in my pocket! In order to live I had to follow all trades--"

"Even the trade of an honest man, Negoro?"

"As you say, Harris."

"Poor boy!"

"Now, I was always waiting for an opportunity, which was long coming, when the 'Pilgrim,' a whaler, arrived at the port of Auckland."

"That vessel which went ashore on the coast of Angola?"

"Even the same, Harris, and on which Mrs. Weldon, her child, and her cousin were going to take passage. Now, as an old sailor, having even been second on board a slave ship, I was not out of my element in taking service on a ship. I then presented myself to the 'Pilgrim's' captain, but the crew was made up. Very fortunately for me, the schooner's cook had deserted. Now, he is no sailor who does not know how to cook. I offered myself as head cook. For want of a better, I was accepted. A few days after, the 'Pilgrim' had lost sight of the land of New Zealand."

"But," asked Harris, "according to what my young friend has told me, the 'Pilgrim' did not set sail at all for the coast of Africa. How then has she arrived here?"

"Dick Sand ought not to be able to understand it yet, and perhaps he will never understand it," replied Negoro; "but I am going to explain to you what has passed, Harris, and you will be able to tell it again to your young friend, if it pleases you to do so."

"How, then?" replied Harris. "Speak, comrade, speak!"

"The 'Pilgrim,'" continued Negoro, "as on the way to Valparaiso. When I went on board, I only intended to go to Chili. It was always a good half of the way between New Zealand and Angola, and I was drawing nearer Africa's coast by several thousand miles. But it so happened that only three weeks after leaving Auckland, Captain Hull, who commanded the 'Pilgrim,' disappeared with all his crew, while chasing a whale. On that day, then, only two sailors remained on board--the novice and the cook, Negoro."

"And you took command of the ship?" asked Harris.

"I had that idea at first, but I saw that they distrusted me. There were live strong blacks on board, free men. I would not have been the master, and, on reflection, I remained what I was at the departure--the 'Pilgrim's' cook."

"Then it was chance that led this ship to the coast of Africa?"

"No, Harris," replied Negoro; "there has been no chance in all this adventure except meeting you, in one of your journeys, just on that part of the coast where the 'Pilgrim' was wrecked. But as to coming in sight of Angola, it was by my will, my secret will, that that was done. Your young friend, still much of a novice in navigation, could only tell his position by means of the log and the compass. Well, one day, the log went to the bottom. One night the compass was made false, and the 'Pilgrim,' driven by a violent tempest, took the wrong route. The length of the voyage, inexplicable to Dick Sand, would be the same to the most experienced seaman. Without the novice knowing or even suspecting it, Cape Horn was doubled, but I, Harris, I recognized it in the midst of the fogs. Then, thanks to me, the needle in the compass took its true direction again, and the ship, blown to the northeast by that frightful hurricane, has just been cast on the coast of Africa, just on this land of Angola which I wished to reach."

"And even at that moment, Negoro," replied Harris, "chance had led me there to receive you, and guide those honest people to the interior. They believed themselves--they could only believe themselves in America. It was easy for me to make them take this province for lower Bolivia, to which it has really some resemblance."

"Yes, they believed it, as your young friend believed they had made the Isle of Paques, when they passed in sight
of Tristan d'Acunha."

"Anybody would be deceived by it, Negoro."

"I know it, Harris, and I even counted on profiting by that error. Finally, behold Mrs. Weldon and her companions one hundred miles in the interior of this Africa, where I wanted to bring them!"

"But," replied Harris, "they know now where they are."

"Ah! what matter at present!" cried Negoro.

"And what will you do with them?" asked Harris.

"What will I do with them?" replied Negoro. "Before telling you, Harris, give me news of our master, the slave-trader, Alvez, whom I have not seen for two years."

"Oh, the old rascal is remarkably well," replied Harris, "and he will be enchanted to see you again."

"Is he at the Bihe market?" asked Negoro.

"No, comrade, he has been at his establishment at Kazounde for a year."

"And business is lively?"

"Yes, a thousand devils!" exclaimed Harris, "although the slave trade becomes more and more difficult, at least on this coast. The Portuguese authorities on one side, and the English cruisers on the other, limit exportations. There are few places, except in the environs of Mossamedes, to the south of Angola, that the shipping of blacks can now be made with any chance of success. So, at this time, the pens are filled with slaves, waiting for the ships which ought to carry them to Spanish colonies. As to passing them by Benguela, or St. Paul de Loanda, that is not possible. The governors no longer understand reason, no more do the chiefs (title given to the Portuguese governors of secondary establishments). We must, then, return to the factories of the interior. This is what old Alvez intends to do. He will go from the Nyangwe and Tanganyika side to change his stuffs for ivory and slaves. Business is always profitable with upper Egypt and the Mozambique coast, which furnishes all Madagascar. But I fear the time will come when the trade can be no longer carried on. The English are making great progress in the interior of Africa. The missionaries advance and work against us. That Livingstone, curse him, after exploring the lake region, is going, they say, to travel toward Angola. Then they speak of a Lieutenant Cameron, who proposes to cross the continent from east to west. They also fear that the American, Stanley, wishes to do as much. All these visits will end by damaging our operations, Negoro, and if we care for our own interests, not one of those visitors will return to relate in Europe what he has had the indiscretion to come to see in Africa."

Would not one say, to hear them, the rascals, that they were speaking like honest merchants whose affairs were momentarily cramped by a commercial crisis? Who would believe that, instead of sacks of coffee or casks of sugar, they were talking of human beings to export like merchandise? These traders have no other idea of right or wrong. The moral sense is entirely lacking in them, and if they had any, how quickly they would lose it among the frightful atrocities of the African slave trade.

But where Harris was right, was when he said that civilization was gradually penetrating those savage countries in the wake of those hardy travelers, whose names are indissoluble linked to the discoveries of Equatorial Africa. At the head, David Livingstone, after him, Grant, Speke, Burton, Cameron, Stanley, those heroes will leave imperishable names as benefactors of humanity.

When their conversation reached that point, Harris knew what the last two years of Negoro's life had been. The trader Alvez's old agent, the escaped prisoner from the Loanda penitentiary, reappeared the same as Harris had always known him, that is, ready to do anything. But what plan Negoro intended to take in regard to the shipwrecked from the "Pilgrim," Harris did not yet know. He asked his accomplice about it.

"And now," said he, "what are you going to do with those people?"

"I shall make two parties of them," replied Negoro, like a man whose plan had been long formed, "those whom I shall sell as slaves, and those whom----"

The Portuguese did not finish, but his ferocious physiognomy spoke plainly enough.

"Which will you sell?" asked Harris.

"Those blacks who accompany Mrs. Weldon," replied Negoro. "Old Tom is not perhaps of much value, but the others are four strong fellows, who will bring a high price in the Kazounde market."

"I well believe it, Negoro," replied Harris. "Four negroes, well made, accustomed to work, have very little resemblance to those brutes which come to us from the interior. Certainly, you will sell them at a high price. Slaves, born in America, and exported to the markets of Angola; that is rare merchandise! But," added the American, "you have not told me if there was any money on board the 'Pilgrim."

"Oh! a few hundred dollars only, which I have succeeded in saving. Fortunately, I count on certain returns."

"Which, then, comrade?" asked Harris, with curiosity.

"Nothing!" replied Negoro, who appeared to regret having spoken more than he intended.

"It now remains to take possession of all that high-priced merchandise," said Harris.
"Is it, then, so difficult?" asked Negoro.

"No, comrade. Ten miles from here, on the Coanza, a caravan of slaves is encamped, conducted by the Arab, Ibn Hamis. He only awaits my return to take the road for Kazounde. There are more native soldiers there than are needed to capture Dick Sand and his companions. It will be sufficient for my young friend to conceive the idea of going to the Coanza."

"But will he get that idea?" asked Negoro.

"Surely," replied Harris, "because he is intelligent, and cannot suspect the danger that awaits him. Dick Sand would not think of returning to the coast by the way we have followed together. He would be lost among these immense forests. He will seek, then, I am sure, to reach one of the rivers that flow toward the coast, so as to descend it on a raft. He has no other plan to take, and I know he will take it."

"Yes, perhaps so," replied Negoro, who was reflecting.

"It is not ‘perhaps so,’ it is ‘assuredly so,’ that must be said," continued Harris. "Do you see, Negoro? It is as if I had appointed a rendezvous with my young friend on the banks of the Coanza."

"Well, then," replied Negoro, "let us go. I know Dick Sand. He will not delay an hour, and we must get before him."

"Let us start, comrade."

Harris and Negoro both stood up, when the noise that had before attracted the Portuguese's attention was renewed. It was a trembling of the stems between the high papyrus.

Negoro stopped, and seized Harris's hand.

Suddenly a low barking was heard. A dog appeared at the foot of the bank, with its mouth open, ready to spring.

"Dingo!" cried Harris.

"Ah! this time it shall not escape me!" replied Negoro.

Dingo was going to jump upon him, when Negoro, seizing Harris's gun, quickly put it to his shoulder and fired.

A long howl of pain replied to the detonation, and Dingo disappeared between the double row of bushes that bordered the brook.

Negoro descended at once to the bottom of the bank.

Drops of blood stained some of the papyrus stems, and a long red track was left on the pebbles of the brook.

"At last that cursed animal is paid off!" exclaimed Negoro.

Harris had been present at this whole scene without saying a word.

"Ah now, Negoro," said he, "that dog had a particular grudge against you."

"It seemed so, Harris, but it will have a grudge against me no longer!"

"And why did it detest you so much, comrade?"

"Oh! an old affair to settle between it and me."

"An old affair?" replied Harris.

Negoro said no more about it, and Harris concluded that the Portuguese had been silent on some past adventure, but he did not insist on knowing it.

A few moments later, both, descending the course of the brook, went toward the Coanza, across the forest.

* * * * *

CHAPTER III.

ON THE MARCH.

Africa! That name so terrible under the present circumstances, that name which he must now substitute for that of America, was not for an instant out of Dick Sand's thoughts. When the young novice traced back the last weeks, it was to ask himself how the "Pilgrim" had ended by reaching this dangerous shore, how it had doubled Cape Horn, and passed from one ocean to the other! He could now explain to himself why, in spite of the rapid motion of his vessel, land was so long coming in sight, because the length of the distance which he should have made to reach the American coast had been doubled without his knowledge.

"Africa! Africa!" Dick Sand repeated.

Then, suddenly, while he called up with tenacious mind all the incidents of this inexplicable voyage, he felt that his compass must have been injured. He remembered, too, that the first compass had been broken, and that the log-line had snapped—a fact which had made it impossible for him to establish the speed of the "Pilgrim."

"Yes," thought he, "there remained but one compass on board, one only, the indications of which I could not control! And one night I was awakened by a cry from old Tom. Negoro was there, aft. He had just fallen on the binnacle. May he not have put it out of order?"

Dick Sand was growing enlightened. He had his finger on the truth. He now understood all that was ambiguous
in Negoro's conduct. He saw his hand in this chain of incidents which had led to the loss of the "Pilgrim," and had so fearfully endangered those on board of her.

But what, then, was this miserable man? Had he been a sailor and known so well how to hide the fact? Was he capable of contriving this odious plot which had thrown the ship on the coast of Africa?

At any rate, if obscure points still existed in the past, the present could offer no more of them. The young novice knew only too well that he was in Africa, and very probably in the fatal province of Angola, more than a hundred miles from the coast. He also knew that Harris's treason could no longer be doubted. From this fact, the most simple logic led him to conclude that the American and the Portuguese had long known each other, that a fatal chance had united them on this coast, and that a plan had been concerted between them, the result of which would be dreadful for the survivors of the "Pilgrim."

And now, why these odious actions? That Negoro wished, at all hazards, to seize Tom and his companions, and sell them for slaves in this slave-trading country, might be admitted. That the Portuguese, moved by a sentiment of hatred, would seek to be revenged on him, Dick Sand, who had treated him as he deserved, might also be conceived. But Mrs. Weldon, this mother, and this young child—what would the wretch do with them? If Dick Sand could have overheard a little of the conversation between Harris and Negoro, he would have known what to expect, and what dangers menaced Mrs. Weldon, the blacks, and himself.

The situation was frightful, but the young novice did not yield under it. Captain on board, he remained captain on land. He must save Mrs. Weldon, little Jack, all those whose fate Heaven had placed in his hands. His task was only commencing. He would accomplish it to the end.

After two or three hours, during which the present and the future were summed up in his mind, with their good and their evil chances—the last, alas! the most numerous—Dick Sand rose, firm and resolved.

The first glimmer of light then touched the summits of the forest. With the exception of the novice and Tom, all slept. Dick Sand approached the old black.

"Tom," he said to him, in a low tone, "you have recognized the roaring of the lion, you have remembered the instruments of the slave-traders. You know that we are in Africa!"

"Yes, Mr. Dick, I know it."

"Well, Tom, not a word of all that, neither to Mrs. Weldon nor to your companions. We must be the only ones to know, the only ones to have any fears."

" Alone—in fact. It is necessary," replied Tom.

"Tom," continued the novice, "we have to watch more carefully than ever. We are in an enemy's country—and what enemies! what a country! To keep our companions on their guard, it will be enough to tell them that we have been betrayed by Harris. They will think that we fear an attack from wandering Indians, and that will suffice."

"You can count absolutely on their courage and devotion, Mr. Dick."

"I know it, as I count on your good sense and your experience. You will come to my help, old Tom?"

"Always, and everywhere, Mr. Dick."

Dick Sand's plan was accepted and approved by the old black. If Harris were detected in open treason before the hour for action, at least the young novice and his companions were not in fear of any immediate danger. In fact, it was the discovery of the irons abandoned by some slaves, and the roaring of the lion, that had caused the American's sudden disappearance.

He knew that he was discovered, and he had fled probably before the little party which he guided had reached the place where an attack had been arranged. As for Negoro, whose presence Dingo had certainly recognized during these last days of the march, he must have rejoined Harris, so as to consult with him. At any rate, several hours would pass before Dick Sand and his friends would be assailed, and it was necessary to profit by them.

The only plan was to regain the coast as quickly as possible. This coast, as the young novice had every reason to believe, was that of Angola. After having reached it, Dick Sand would try to gain, either to the north or to the south, the Portuguese settlements, where his companions could await in safety some opportunity to return to their country.

But, to effect this return to the coast, should they take the road already passed over? Dick Sand did not think so, and in that he was going to agree with Harris, who had clearly foreseen that circumstances would oblige the young novice to shorten the road.

In fact, it would have been difficult, not to say imprudent, to recommence this difficult journey through the forest, which, besides, could only tend to bring them out at the place they had started from. This would also allow Negoro's accomplices to follow an assured track. The only thing they could do was to cross a river, without leaving any traces, and, later on, to descend its course. At the same time, there was less to fear from an attack by animals, which by a happy chance had so far kept at a good distance. Even the animosity of the natives, under these circumstances, seemed less important. Once embarked on a solid raft, Dick Sand and his companions, being well armed, would be in the best condition to defend themselves. The whole thing was to find the river.
It must be added that, given the actual state of Mrs. Weldon and her little Jack, this mode of traveling would be the most suitable. Arms would not fail to carry the sick child. Lacking Harris's horse, they could even make a litter of branches, on which Mrs. Weldon could be borne. But this would require two men out of five, and Dick Sand wished, with good reason, that all his companions might be free in their movements in case of a sudden attack.

And then, in descending the current of a river, the young novice would find himself in his element!

The question now was, whether a navigable stream of water existed in the neighborhood. Dick Sand thought it probable, and for this reason: The river which emptied into the Atlantic at the place where the "Pilgrim" had stranded could not ascend much to the north, nor much to the east, of the province, because a chain of mountains quite close to them--those which they had mistaken for the Cordilleras--shut in the horizon on these two sides. Then, either the river descended from these heights, or it made a bend toward the south, and, in these two cases, Dick Sand could not take long to find the course. Perhaps, even before reaching the river--for it had a right to this qualification, being a direct tributary of the ocean--one of its affluents would be met with which would suffice for the transport of the little party.

At any rate, a stream of some sort could not be far away.

In fact, during the last miles of the journey the nature of the earth had been modified. The declivities diminished and became damp. Here and there ran narrow streams, which indicated that the sub-soil enclosed everywhere a watery network. During the last day's march the caravan had kept along one of these rivulets, whose waters, reddened with oxyde of iron, eat away its steep, worn banks. To find it again could not take long, or be very difficult. Evidently they could not descend its impetuous course, but it would be easy to follow it to its junction with a more considerable, possibly a navigable, affluent.

Such was the very simple plan which Dick Sand determined upon, after having conferred with old Tom.

Day came, all their companions gradually awoke. Mrs. Weldon placed little Jack in Nan's arms. The child was drowsy and faded-looking during the intermittent periods, and was sad to see.

Mrs. Weldon approached Dick Sand. "Dick," she asked, after a steady glance, "where is Harris? I do not perceive him."

The young novice thought that, while letting his companions believe that they were treading on the soil of Bolivia, it would not do to hide from them the American's treason. So he said, without hesitation: "Harris is no longer here."

"Has he, then, gone ahead?" asked Mrs. Weldon. "He has fled, Mrs. Weldon," replied Dick Sand. "This Harris is a traitor, and it is according to Negoro's plan that he led us this far." "For what motive?" quickly asked Mrs. Weldon.

"I do not know," replied Dick Sand; "but what I do know is, that we must return, without delay, to the coast."

"That man--a traitor!" repeated Mrs. Weldon. "I had a presentiment of it! And you think, Dick, that he is in league with Negoro?"

"That may be, Mrs. Weldon. The wretch is on our track. Chance has brought these two scoundrels together, and--"

"And I hope that they will not be separated when I find them again!" said Hercules. "I will break the head of one against the other's head!" added the giant, holding out his formidable fists.

"But my child!" cried Mrs. Weldon. "The care that I hoped to find for him at the farm of San Felice--"

"Jack will get well," said old Tom, "when he approaches the more healthy part of the coast."

"Dick," remarked Mrs. Weldon, "you are sure that this Harris has betrayed us?"

"Yes, Mrs. Weldon," replied the young novice, who would have liked to avoid any explanation on this subject. He also hastened to add, while looking at the old black:

"This very night Tom and I discovered his treason, and if he had not jumped on his horse and fled, I would have killed him."

"So this farm--"

"There is neither farm, nor village, nor settlement in the neighborhood," replied Dick Sand. "Mrs. Weldon, I repeat to you, we must return to the coast."

"By the same road, Dick?"

"No, Mrs. Weldon, but by descending a river which will take us to the sea without fatigue and without danger. A few more miles on foot, and I do not doubt--"

"Oh, I am strong, Dick!" replied Mrs. Weldon, who struggled against her own weakness. "I will walk! I will carry my child!"

"We are here, Mrs. Weldon," said Bat, "and we will carry you!"

"Yes, yes," added Austin. "Two branches of a tree, foliage laid across."

"Thanks, my friends," replied Mrs. Weldon; "but I want to march. I will march. Forward!"

"Forward!" exclaimed the young novice.
"Give me Jack," said Hercules, who took the child from Nan's arms. "When I am not carrying something, I am
tired."

The brave negro gently took in his strong arms the little sleeping boy, who did not even wake.

Their arms were carefully examined. What remained of the provisions was placed in one package, so as to be
carried by one man. Austin threw it on his back, and his companions thus became free in their movements.

Cousin Benedict, whose long limbs were like steel and defied all fatigue, was ready to set out. Had he remarked
Harris's disappearance? It would be imprudent to affirm it. Little disturbed him. Besides, he was under the effects of
one of the most terrible catastrophes that could befall him.

In fact, a grave complication, Cousin Benedict had lost his magnifying-glass and his spectacles. Very happily,
also, but without his suspecting it, Bat had found the two precious articles in the tall grass where they had slept, but,
by Dick Sand's advice, he kept them safely. By this means they would be sure that the big child would keep quiet
during the march, because he could see no farther, as they say, than the end of his nose.

Thus, placed between Acteon and Austin, with the formal injunction not to leave them, the woful Benedict
uttered no complaint, but followed in his place, like a blind man led by a string.

The little party had not gone fifty steps when old Tom suddenly stopped it with one word.

"Dingo?" said he.

"In fact, Dingo is not here!" replied Hercules.

The black called the dog several times with his powerful voice.

No barking replied to him.

Dick Sand remained silent. The absence of the dog, was to be regretted, for he had preserved the little party from
all surprise.

"Could Dingo have followed Harris?" asked Tom.

"Harris? No," replied Dick Sand; "but he may have put himself on Negoro's scent. He felt him in our steps."

"This cook of misfortune would quickly end him with a ball!" cried Hercules.

"Provided Dingo did not first strangle him," replied Bat.

"Perhaps so," replied the young novice. "But we cannot wait for Dingo's return. Besides, if he is living, the
intelligent animal will know how to find us. Forward!"

The weather was very warm. Since daybreak large clouds obscured the horizon. Already a storm was threatened
in the air. Probably the day would not end without some thunder-claps. Happily the forest, more or less dense,
retained a little freshness of the surface of the soil. Here and there great forest trees inclosed prairies covered with a
tall, thick grass. In certain spots enormous trunks, already petrified, lay on the ground, indicating the presence of
coal mines, which are frequently met with on the African continent. Then, in the clearings, where the green carpet
was mingled with some sprigs of roses, the flowers were various in color, yellow and blue ginger plants, pale
lobelias, red orchids, incessantly visited by the insects which fertilized them.

The trees no longer formed impenetrable masses, but their nature was more varied. There were a kind of palm-
tree, which gives an oil found only in Africa; cotton-trees forming thickets from eight to ten feet high, whose wood-
stalks produce a cotton with long hairs, almost analogous to that of Fernambouc. From the copals there oozes, by the
holes which certain insects make, an odorous gum, which runs along the ground and collects for the wants of the
natives. Here spread the lemon-trees, the grenadiers of a savage condition of a country, and twenty other odorous
plants, which prove the prodigious fertility of this plateau of Central Africa. In several places, also, the perfume was
agreeably mingled with the tine odor of vanilla, although they could not discover what tree exhaled it.

This whole collection of trees and plants was perfectly green, although it was in the middle of the dry season,
and only rare storms could water these luxuriant forests. It was then the time for fevers; but, as Livingstone has
observed, they can be cured by leaving the place where they have been contracted. Dick Sand knew this remark of
the great traveler, and he hoped that little Jack would not contradict it. He told it to Mrs. Weldon, after having
observed that the periodical access had not returned as they feared, and that the child slept quietly in Hercules' arms.

Thus they went forward carefully and rapidly. Sometimes they discovered traces where men or animals had
recently passed. The twisted and broken branches of the brushwood and the thickets afforded an opportunity to walk
with a more equal step. But the greater part of the time numerous obstacles, which they had to overcome, retarded
the little party, to Dick Sand's great disappointment.

There were twisted lianes that might justly be compared with the disordered rigging of a ship, certain vines
similar to bent swords, whose blades were ornamented with long thorns, vegetable serpents, fifty or sixty feet long,
which had the faculty of turning to prick the passer-by with their sharp spikes. The blacks, hatchet in hand, cut them
down with vigorous blows, but the lianes reappeared constantly, reaching from the earth to the top of the highest
trees which they encircled.

The animal kingdom was not less curious than the vegetable kingdom in this part of the province. Birds flew in
vast numbers under these powerful branches; but it will be understood that they had no gunshot to fear from the men, who wished to pass as secretly as rapidly. There were Guinea fowls in large flocks, heath-cocks of various kinds, very difficult to approach, and some of those birds which the Americans of the North have, by onomatopoeia, called “whip-poor-wills,” three syllables which exactly reproduce their cries. Dick Sand and Tom might truly have believed themselves in some province of the new continent. But, alas! they knew what to expect.

Until then the deer, so dangerous in Africa, had not approached the little troop. They again saw, in this first halt, some giraffes, which Harris had undoubtedly called ostriches. These swift animals passed rapidly, frightened by the apparition of a caravan in these little-frequented forests. In the distance, on the edge of the prairie, there arose at times a thick cloud of dust. It was a herd of buffaloes, which galloped with the noise of wagons heavily laden.

For two miles Dick Sand thus followed the course of the rivulet which must end in a more important river. He was in haste to confide his companions to the rapid current of one of the coast rivers. He felt sure that the dangers and the fatigue would be much less than on the shore.

Towards noon three miles had been cleared without any bad incident or meeting. There was no trace of either Harris or Negoro. Dingo had not reappeared. It was necessary to halt to take rest and nourishment.

The encampment was established in a bamboo thicket, which completely sheltered the little party.

They talked very little during this repast. Mrs. Weldon had taken her little boy in her arms; she could not take her eyes off of him; she could not eat.

"You must take some nourishment, Mrs. Weldon," Dick Sand repeated several times. "What will become of you if your strength gives out? Eat, eat! We will soon start again, and a good current will carry us without fatigue to the coast."

Mrs. Weldon looked in Dick Sand's face while he thus talked. The young novice's burning eyes spoke of the courage by which he felt animated. In seeing him thus, in observing these brave, devoted blacks, wife and mother, she could not yet despair; and, besides, why was she abandoned? Did she not think herself on hospitable ground? Harris's treason could not, in her eyes, have any very serious consequences. Dick Sand read her thought, and he kept his eyes on the ground.

* * * * *

CHAPTER IV.
THE BAD ROADS OF ANGOLA.

At this moment little Jack awoke, and put his arms around his mother's neck. His eyes looked better. The fever had not returned.

"You are better, my darling," said Mrs. Weldon, pressing the sick child to her heart.

"Yes, mama," replied Jack, "but I am a little thirsty."

They could only give the child some fresh water, of which he drank with pleasure.

"And my friend Dick?" he said.

"Here I am, Jack," replied Dick Sand, coming to take the young child's hand.

"And my friend Hercules?"

"Hercules is here, Mr. Jack," replied the giant, bringing nearer his good face.

"And the horse?" demanded little Jack.

"The horse? Gone, Mr. Jack," replied Hercules. "I will carry you. Will you find that I trot too hard?"

"No," replied little Jack; "but then I shall no longer have any bridle to hold."

"Oh! you will put a bit in _my_ mouth, if you wish," said Hercules, opening his large mouth, "and you may pull back so long as that will give you pleasure."

"You know very well that I shall not pull back."

"Good! You would be wrong! I have a hard mouth."

"But Mr. Harris's farm?" the little boy asked again.

"We shall soon arrive there, my Jack," replied Mrs. Weldon. "Yes, soon!"

"Will we set out again?" then said Dick Sand, in order to cut short this conversation.

"Yes, Dick, let us go," replied Mrs. Weldon.

The camp was broken up, and the march continued again in the same order. It was necessary to pass through the underwood, so as not to leave the course of the rivulet. There had been some paths there, formerly, but those paths were dead, according to the native expression—that is, brambles and brushwood had usurped them. In these painful conditions they might spend three hours in making one mile. The blacks worked without relaxation. Hercules, after putting little Jack back in Nan's arms, took his part of the work; and what a part! He gave stout "heaves," making his ax turn round, and a hole was made before them, as if he had been a devouring fire.
Fortunately, this fatiguing work would not last. This first mile cleared, they saw a large hole, opened through the underwood, which ended obliquely at the rivulet and followed its bank. It was a passage made by elephants, and those animals, doubtless by hundreds, were in the habit of traversing this part of the forest. Great holes, made by the feet of the enormous pachyderms, riddled a soil softened during the rainy season. Its spongy nature also prepared it for those large imprints.

It soon appeared that this passage did not serve for those gigantic animals alone. Human beings had more than once taken this route, but as flocks, brutally led to the slaughter-house, would have followed it. Here and there bones of dead bodies strewed the ground; remains of skeletons, half gnawed by animals, some of which still bore the slave's fetters.

There are, in Central Africa, long roads thus marked out by human débris. Hundreds of miles are traversed by caravans, and how many unhappy wretches fall by the way, under the agents' whips, killed by fatigue or privations, decimated by sickness! How many more massacred by the traders themselves, when food fails! Yes, when they can no longer feed them, they kill them with the gun, with the sword, with the knife! These massacres are not rare.

So, then, caravans of slaves had followed this road. For a mile Dick Sand and his companions struck against these scattered bones at each step, putting to flight enormous fern-owls. Those owls rose at their approach, with a heavy flight, and turned round in the air.

Mrs. Weldon looked without seeing. Dick Sand trembled lest she should question him, for he hoped to lead her back to the coast without telling her that Harris's treachery had led them astray in an African province. Fortunately, Mrs. Weldon did not explain to herself what she had under her eyes. She had desired to take her child again, and little Jack, asleep, absorbed all her care. Nan walked near her, and neither of them asked the young novice the terrible questions he dreaded.

Old Tom went along with his eyes down. He understood only too well why this opening was strewn with human bones.

His companions looked to the right, to the left, with an air of surprise, as if they were crossing an interminable cemetery, the tombs of which had been overthrown by a cataclysm; but they passed in silence.

Meanwhile, the bed of the rivulet became deeper and wider at the same time. Its current was less impetuous. Dick Sand hoped that it would soon become navigable, or that it would before long reach a more important river, tributary to the Atlantic.

Cost what it might, the young novice was determined to follow this stream of water. Neither did he hesitate to abandon this opening; because, as ending by an oblique line, it led away from the rivulet.

The little party a second time ventured through the dense underwood. They marched, ax in hand, through leaves and bushes inextricably interlaced.

But if this vegetation obstructed the ground, they were no longer in the thick forest that bordered the coast. Trees became rare. Large sheaves of bamboo alone rose above the grass, and so high that even Hercules was not a head over them. The passage of the little party was only revealed by the movement of these stalks.

Toward three o'clock in the afternoon of that day, the nature of the ground totally changed. Here were long plains, which must have been entirely inundated in the rainy season. The earth, now more swampy, was carpeted by thick mosses, beneath charming ferns. Should it be diversified by any steep ascents, they would see brown hematites appear, the last deposits of some rich vein of mineral.

Dick Sand then recalled—and very fortunately—what he had read in "Livingstone's Travels." More than once the daring doctor had nearly rested in these marshes, so treacherous under foot.

"Listen to me, my friends," said he, going ahead. "Try the ground before stepping on it."

"In fact," replied Tom, "they say that these grounds have been softened by the rain; but, however, it has not rained during these last days."

"No," replied Bat; "but the storm is not far off."

"The greater reason," replied Dick Sand, "why we should hurry and get clear of this swamp before it commences. Hercules, take little Jack in your arms. Bat, Austin, keep near Mrs. Weldon, so as to be able to help her if necessary. You, Mr. Benedict--Why, what are you doing, Mr. Benedict?"

"I am falling!" innocently replied Cousin Benedict, who had just disappeared as if a trap had been suddenly opened beneath his feet.

In fact, the poor man had ventured on a sort of quagmire, and had disappeared half-way in the sticky mud. They stretched out their hands, and he rose, covered with slime, but quite satisfied at not having injured his precious entomologist's box. Acteon went beside him, and made it his duty to preserve the unlucky, near-sighted man from any new disasters.

Besides, Cousin Benedict had made rather a bad choice of the quagmire for his plunge. When they drew him out of the sticky earth a large quantity of bubbles rose to the surface, and, in bursting, they emitted some gases of a
suffocating odor. Livingstone, who had been sunk up to his chest in this slime, compared these grounds to a
collection of enormous sponges, made of black, porous earth, from which numerous streams of water spouted when
they were stepped upon. These places were always very dangerous.

For the space of half a mile Dick Sand and his companions must march over this spongy soil. It even became so
bad that Mrs. Weldon was obliged to stop, for she sank deep in the mire. Hercules, Bat, and Austin, wishing to spare
her the unpleasantness more than the fatigue of a passage across this marshy plain, made a litter of bamboos, on
which she consented to sit. Her little Jack was placed in her arms, and they endeavored to cross that pestilential
marsh in the quickest manner.

The difficulties were great. Acteon held Cousin Benedict firmly. Tom aided Nan, who, without him, would have
disappeared several times in some crevice. The three other blacks carried the litter. At the head, Dick Sand sounded
the earth. The choice of the place to step on was not made without trouble. They marched from preference on the
edges, which were covered by a thick and tough grass. Often the support failed, and they sank to the knees in the
slime.

At last, about five o'clock in the evening, the marsh being cleared, the soil regained sufficient firmness, thanks to
its clayey nature; but they felt it damp underneath. Very evidently these lands lay below the neighboring rivers, and
the water ran through their pores.

At that time the heat had become overwhelming. It would even have been unbearable, if thick storm clouds had not
interposed between the burning rays and the ground. Distant lightnings began to rend the sky and low rollings of
thunder grumbled in the depths of the heavens. A formidable storm was going to burst forth.

Now, these cataclysms are terrible in Africa: rain in torrents, squalls of wind which the strongest trees cannot
resist, clap after clap of thunder, such is the contest of the elements in that latitude.

Dick Sand knew it well, and he became very uneasy. They could not pass the night without shelter. The plain
was likely to be inundated, and it did not present a single elevation on which it was possible to seek refuge.

But refuge, where would they seek it in this low desert, without a tree, without a bush? The bowels of the earth
even would not give it. Two feet below the surface they would find water.

However, toward the north a series of low hills seemed to limit the marshy plain. It was as the border of this
depression of land. A few trees were profiled there on a more distant, clearer belt, left by the clouds on the line of
the horizon.

There, if shelter were still lacking, the little band would at least no longer risk being caught in a possible
inundation. There perhaps was salvation for all.

"Forward, my friends, forward!" repeated Dick Sand. "Three miles more and we shall be safer than in these
bottom-lands."

"Hurry! hurry!" cried Hercules.

The brave black would have wished to take that whole world in big arms and carry it alone.

Those words inspired those courageous men, and in spite of the fatigue of a day's march, they advanced more
quickly than they had done at the commencement from the halting-place.

When the storm burst forth the end to be attained was still more than two miles off. Now—a fact which was the
more to be feared—the rain did not accompany the first lightnings exchanged between the ground and the electrical
clouds. Darkness then became almost complete, though the sun had not disappeared below the horizon. But the
dome of vapors gradually lowered, as if it threatened to fall in—a falling in which must result in a torrent of rain.
Lightnings, red or blue, split it in a thousand places, and enveloped the plain in an inextricable network of fire.

Twenty times Dick and his companions ran the risk of being struck by lightning. On this plateau, deprived of
trees, they formed the only projecting points which could attract the electrical discharges. Jack, awakened by the
noise of the thunder, hid himself in Hercules' arms. He was very much afraid, poor little boy, but he did not wish to
let his mother see it, for fear of afflicting her more. Hercules, while taking great steps, consoled him as well as he
could.

"Do not be afraid, little Jack," he repeated. "If the thunder comes near us, I will break it in two with a single
hand. I am stronger than it!"

And, truly, the giant's strength reassured Jack a little.

Meanwhile the rain must soon fall, and then it would in torrents, poured out by those clouds in condensing. What
would become of Mrs. Weldon and her companions, if they did not find a shelter?

Dick Sand stopped a moment near old Tom.

"What must be done?" said he.

"Continue our march, Mr. Dick," replied Tom. "We cannot remain on this plain, that the rain is going to
transform into a marsh!"

"No, Tom, no! But a shelter! Where? What? If it were only a hut—"
Dick Sand had suddenly broken off his sentence. A more vivid flash of lightning had just illuminated the whole plain.

"What have I seen there, a quarter of a mile off?" exclaimed Dick Sand.

"Yes, I also, I have seen--" replied old Tom, shaking his head.

"A camp, is it not?"

"Yes, Mr. Dick, it must be a camp, but a camp of natives!"

A new flash enabled them to observe this camp more closely. It occupied a part of the immense plain.

There, in fact, rose a hundred conical tents, symmetrically arranged, and measuring from twelve to fifteen feet in height. Not a soldier showed himself, however. Were they then shut up under their tents, so as to let the storm pass, or was the camp abandoned?

In the first case, whatever Heaven should threaten, Dick Sand must flee in the quickest manner. In the second, there was, perhaps, the shelter he asked.

"I shall find out," he said to himself; then, addressing old Tom: "Stay here. Let no one follow me. I shall go to reconnoiter that camp."

"Let one of us accompany you, Mr. Dick."

"No, Tom, I shall go alone. I can approach without being seen. Stay here."

The little troop, that followed Tom and Dick Sand, halted. The young novice left at once and disappeared in the darkness, which was profound when the lightning did not tear the sky.

Some large drops of rain already began to fall.

"What is the matter?" asked Mrs. Weldon, approaching the old black.

"We have perceived a camp, Mrs. Weldon," replied Tom; "a camp--or, perhaps, a village, and our captain wished to reconnoiter it before leading us to it."

Mrs. Weldon was satisfied with this reply. Three minutes after, Dick Sand was returning.

"Come! come!" he cried, in a voice which expressed his entire satisfaction.

"The camp is abandoned?" asked Tom.

"It is not a camp," replied the young novice; "it is not a village. They are ant-hills!"

"Ant-hills!" exclaimed Cousin Benedict, whom that word aroused.

"Yes, Mr. Benedict, but ant-hills twelve feet high, at least, and in which we shall endeavor to hide ourselves."

"But then," replied Cousin Benedict, "those would be ant-hills of the warlike termite or of the devouring termite. Only those ingenious insects raise such monuments, which the greatest architects would not disown."

"Whether they be termites or not, Mr. Benedict," replied Dick Sand, "we must dislodge them and take their place."

"They will devour us. They will be defending their rights."

"Forward! Forward!"

"But, wait now!" said Cousin Benedict again. "I thought those ant-hills only existed in Africa."

"Forward!" exclaimed Dick Sand, for the last time, with a sort of violence. He was so much afraid that Mrs. Weldon might hear the last word pronounced by the entomologist.

They followed Dick Sand with all haste. A furious wind had sprung up. Large drops crackled on the ground. In a few moments the squalls of wind would become unbearable. Soon one of those cones which stood on the plain was reached. No matter how threatening the termites might be, the human beings must not hesitate. If they could not drive the insects away, they must share their abode.

At the bottom of this cone, made with a kind of reddish clay, there was a very narrow hole. Hercules enlarged it with his cutlass in a few moments, so as to give a passage even to a man like himself.

To Cousin Benedict's extreme surprise, not one of the thousands of termites that ought to occupy the ant-hill showed itself. Was, then, the cone abandoned?

The hole enlarged, Dick and his companions glided into it. Hercules disappeared the last, just as the rain fell with such rage that it seemed to extinguish the lightnings.

But those wind squalls were no longer to be feared. A happy chance had furnished this little troop with a solid shelter, better than a tent, better than a native's hut.

It was one of those termite cones that, according to Lieutenant Cameron's comparison, are more astonishing than the pyramids of Egypt, raised by the hands of men, because they have been built by such small insects.

"It is," said he, "as if a nation had built Mount Everest, the highest mountain of the Himalaya chain."

CHAPTER V.
ANTS AND THEIR DWELLING.
At this moment the storm burst with a violence unknown in temperate latitudes.

It was providential that Dick Sand and his companions had found this refuge!

In fact, the rain did not fall in distinct drops, but in streams of various thickness. Sometimes it was a compact mass forming a sheet of water, like a cataract, a Niagara. Imagine an aerial basin, containing a whole sea, being upset. Under such showers the ground was hollowed out, the plains were changed to lakes, the streams to torrents, the rivers, overflowing, inundated vast territories. In temperate zones the violence of the storms decreases according to their duration; but in Africa, however heavy they are, they continue for several entire days. How can so much electricity be collected in the clouds? How can such quantities of vapor be accumulated? It is very difficult to comprehend this. However, such are the facts, and one might suppose himself transported to the extraordinary epochs of the diluvian period.

Fortunately, the ant-cone, with its thick walls, was perfectly impervious. A beaver's hut, of well-beaten earth, could not have been more water-tight. A torrent could have passed over it without a single drop of water filtering through its pores.

As soon as Dick Sand and his companions had taken possession of the cone they occupied themselves in examining its interior arrangement. The lantern was lighted, and the ant-hill was sufficiently illuminated. This cone, which measured twelve feet in height inside, was eleven feet wide, except in its upper part, which rounded in the form of a sugar loaf. Everywhere the walls were about one foot in thickness, and there was a distance between the stories of cells which adorned them.

We may be astonished at the construction of such monuments, due to these industrious swarms of insects, but it is true that they are frequently found in the interior of Africa. Smeathman, a Dutch traveler of the last century, with four of his companions, occupied the top of one of these cones. In the Lounde, Livingstone observed several of these ant-hills, built of reddish clay, and attaining a height of fifteen and twenty feet. Lieutenant Cameron has many a time mistaken for a camp these collections of cones which dotted the plain in N'yangwe. He has even stopped at the foot of great edifices, not more than twenty feet high, but composed of forty or fifty enormous rounded cones, flanked with bell-towers like the dome of a cathedral, such as Southern Africa possesses.

To what species of ant was due, then, the prodigious style of architecture of these cones?

"To the warlike termite," Cousin Benedict had replied, without hesitating, as soon as he had recognized the nature of the materials employed in their construction.

And, in fact, the walls, as has been said, were made of reddish clay. Had they been formed of a gray or black alluvian earth, they must have been attributed to the "termes mordax" or the "termes atrox." As we see, these insects have not very cheering names—a fact which cannot but please a strong entomologist, such as Cousin Benedict.

The central part of the cone, in which the little troop had first found shelter, and which formed the empty interior, would not have contained them; but large cavities, in close contact, made a number of divisions, in which a person of medium height could find refuge. Imagine a succession of open drawers, and at the bottom of those drawers millions of cells which the termites had occupied, and the interior disposition of the ant-hill is easily understood. To sum up, these drawers are in tiers, like the berths in a ship's cabin. In the upper ones Mrs. Weldon, little Jack, Nan, and Cousin Benedict took refuge. In the lower row Austin, Bat, and Acteon hid themselves. As for Dick Sand, Tom, and Hercules, they remained in the lower part of the cone.

"My friends," then said the young novice to the two blacks, "the ground is becoming damp. We must fill it up by crumbling the red clay from the base; but take care not to obstruct the hole by which the air enters. We cannot risk being smothered in this ant-hill."

"We have only one night to spend here," replied old Tom.

"Well, let us try and make it recover us from our fatigue. This is the first time in ten days that we have not to sleep in the open air."

"Ten days!" repeated Tom.

"Besides," added Dick Sand, "as this cone forms a solid shelter, perhaps we had better stay here twenty-four hours. During that time, I will go in search of the stream that we are in need of; it cannot be very distant. I think that until we have constructed our raft, it will be better not to quit this shelter. The storm cannot reach us here. Let us make the floor stronger and dryer."

Dick Sand's orders were executed at once. Hercules, with his ax, crumbled the first story of cells, which was composed of crisp red clay. He thus raised, more than a foot, the interior part of the swampy earth on which the ant-hill rested, and Dick Sand made sure that the air could freely penetrate to the interior of the cone through the orifice pierced at its base.

It was, certainly, a fortunate circumstance that the ant-hill had been abandoned by the termites. With a few thousands of these ants, it would have been uninhabitable. But, had it been evacuated for some time, or had the voracious newroptera but just quit it? It was not superfluous to ponder this question.
Cousin Benedict was so much surprised at the abandonment, that he at once considered the reason for it, and he was soon convinced that the emigration had been recent.

In fact, he did not wait, but, descending to the lower part of the cone, and taking the lantern, he commenced to examine the most secret corners of the ant-hill. He thus discovered what is called the "general store-house" of the termites, that is to say, the place where these industrious insects lay up the provisions of the colony.

It was a cavity hollowed in the wall, not far from the royal cell, which Hercules's labor had destroyed, along with the cells destined for the young larvae.

In this store-room Cousin Benedict collected a certain quantity of particles of gum and the juices of plants, scarcely solidified, which proved that the termites had lately brought them from without.

"Well, no!" cried he. "No!" as if he were replying to some contradiction, "No, this ant-hill has not been long abandoned."

"Who says to the contrary, Mr. Benedict?" said Dick Sand. "Recently or not, the important thing for us is that the termites have left it, because we have to take their place."

"The important thing," replied Cousin Benedict, "will be to know why they have left it. Yesterday--this morning, perhaps--these sagacious newroptera were still here, because, see these liquid juices; and this evening----"

"Well, what do you conclude, Mr. Benedict?" asked Dick Sand.

"That a secret presentiment has caused them to abandon the cone. Not only have all the termites left their cells, but they have taken care to carry away the young larvae, of which I cannot find one. Well, I repeat that all this was not done without a motive, and that these sagacious insects foresaw some near danger."

"They foresaw that we were going to invade their dwelling," replied Hercules, laughing.

"Indeed!" replied Cousin Benedict, whom this answer sensibly shocked. "You think yourself so strong that you would be dangerous to these courageous insects? A few thousand of these newroptera would quickly reduce you to a skeleton if they found you dead on the road."

"Dead, certainly," replied Hercules, who would not give up; "but, living, I could crush masses of them."

"You might crush a hundred thousand, five hundred thousand, a million," replied Cousin Benedict, with animation, "but not a thousand millions; and a thousand millions would devour you, living or dead, to the last morsel."

During this discussion, which was less trifling than might be supposed, Dick Sand reflected on the observations made by Cousin Benedict. There was no doubt that the savant knew too much about the habits of the termites to be mistaken. If he declared that a secret instinct warned them to leave the ant-hill recently, it was because there was truly peril in remaining in it.

Meanwhile, as it was impossible to abandon this shelter at a moment when the storm was raging with unparalleled intensity, Dick Sand looked no farther for an explanation of what seemed to be inexplicable, and he contented himself with saying:

"Well, Mr. Benedict, if the termites have left their provisions in this ant-hill, we must not forget that we have brought ours, and let us have supper. To-morrow, when the storm will be over, we will consult together on our future plans."

They then occupied themselves in preparing the evening meal, for, great as their fatigue was, it had not affected the appetite of these vigorous walkers. On the contrary, the food, which had to last for two more days, was very welcome. The damp had not reached the biscuits, and for several minutes it could be heard cracking under the solid teeth of Dick Sand and his companions. Between Hercules's jaws it was like grain under the miller's grindstone. It did not crackle, it powdered.

Mrs. Weldon alone scarcely eat, and even Dick Sand's entreaties were vain. It seemed to him that this brave woman was more preoccupied, more sad than she had been hitherto. Meanwhile her little Jack suffered less; the fever had not returned, and at this time he was sleeping, under his mother's eyes, in a cell well lined with garments. Dick Sand knew not what to think.

It is useless to say that Cousin Benedict did honor to the repast, not that he paid any attention either to the quality or to the quantity of the food that he devoured, but because he had found an opportunity to deliver a lecture in entomology on the termites. Ah! if he had been able to find a termite, a single one, in the deserted ant hill! But nothing.

"These admirable insects," said he, without taking the trouble to find out if any one were listening--"these admirable insects belong to the marvelous order of newroptera, whose horns are longer than the head, the jaws very distinct, and whose lower wings are generally equal to the upper ones. Five tribes constitute this order: the Panorpates (scorpion flies), the Myrmileoniens, the Hemerobins, the Termitines and the Perlides. It is useless to add that the insects which now interest us, and whose dwelling we occupy, perhaps unduly, are the Termitines."

At this moment Dick Sand listened very attentively to Cousin Benedict. Had the meeting with these termites
excited in him the thought that he was perhaps on the African continent, without knowing by what chance he had arrived there? The young novice was very anxious to find out.

The savant, mounted on his favorite hobby, continued to ride it beautifully.

"Now these termitines," said he, "are characterized by four joints on the instep, horned jaws, and remarkable strength. We have the _mantispe_ species, the _raphidie_, and the termite species. The last is often known under the term of white ants, in which we count the deadly termite, the yellow corslet termite, the termite that shuns the light, the biter, the destroyer--"

"And those that constructed this ant-hill?" asked Dick Sand.

"They are the martial ants," replied Cousin Benedict, who pronounced this word as if it had been the Macedonians, or some other ancient people brave in war. "Yes, the warlike ants, and of all sizes. Between Hercules and a dwarf the difference would be less than between the largest of these insects and the smallest. Among them are 'workers' of five millimeters in length 'soldiers' of ten, and males and females of twenty. We find also a kind otherwise very curious: the _sirafous_ half an inch in length, which have pincers for jaws, and a head larger than the body, like the sharks. They are the sharks among insects, and in a fight between some _sirafous_ and a shark, I would bet on the _sirafous_."

"And where are these _sirafous_ commonly observed?" then asked Dick Sand.

"In Africa," replied Cousin Benedict; "in the central and southern provinces. Africa is, in fact, the country of ants. You should read what Livingstone says of them in the last notes reported by Stanley. More fortunate than myself, the doctor has witnessed a Homeric battle, joined between an army of black ants and an army of red ants. The latter, which are called 'drivers,' and which the natives name _sirafous_, were victorious.

"The others, the _tchoungous_, took flight, carrying their eggs and their young, not without having bravely defended themselves. Never, according to Livingstone, never was the spirit of battle carried farther, either among men or beasts! With their tenacious jaws, which tear out the piece, these _sirafous_ make the bravest man recoil. The largest animals—even lions and elephants—flee before them.

"Nothing stops them; neither trees, which they climb to the summit, nor streams, which they cross by making a suspension bridge of their own bodies, hooked together. And numerous! Another African traveler—Du Chaillu—has seen a column of these ants defile past him for twelve hours without stopping on the road. But why be astonished at the sight of such myriads? The fecundity of these insects is surprising; and, to return to our fighting termites, it has been proved that a female deposits as much as sixty thousand eggs in a day! Besides, these newroptera furnish the natives with a juicy food. Broiled ants, my friends; I know of nothing better in the world!"

"Have you then eaten them, Mr. Benedict?" asked Hercules.

"Never," replied the wise professor; "but I shall eat some."

"Where?"

"Here."

"Here; we are not in Africa!" said Tom, very quickly.

"No, no!" replied Cousin Benedict; "and, thus far, these warlike termites, and their villages of ant-hills, have only been observed on the African Continent. Ah! such travelers. They do not know how to see! Well! all the better, after all. I have discovered a _tsetse_ in America. To the glory of this, I shall join that of having found the warlike termites on the same continent! What matter for an article that will make a sensation in educated Europe, and, perhaps, appear in folio form, with prints and engravings, besides the text!"

"It was evident that the truth had not entered Cousin Benedict's brain. The poor man and all his companions, Dick Sand and Tom excepted, believed themselves, and must believe themselves, where they were not! It needed other incidents, facts still more grave than certain scientific curiosities, to undeceive them!"

It was then nine o'clock in the morning. Cousin Benedict had talked for a long time. Did he perceive that his auditors, propped up in their cells, had gradually fallen asleep during his entomological lecture? No; certainly not. He lectured for himself. Dick Sand no longer questioned him, and remained motionless, although he did not sleep. As for Hercules, he had resisted longer than the others; but fatigue soon finished by shutting his eyes, and, with his eyes, his ears.

For some time longer Cousin Benedict continued to lecture. However, sleep finally got the best of him, and he mounted to the upper cavity of the cone, in which he had chosen his domicile.

Deep silence fell on the interior of the cone, while the storm filled space with noise and fire. Nothing seemed to indicate that the tempest was nearly over.

The lantern had been extinguished. The interior of the cone, while the storm filled space with noise and fire. Nothing seemed to indicate that the tempest was nearly over.

The savant, mounted on his favorite hobby, continued to ride it beautifully.

"Now these termitines," said he, "are characterized by four joints on the instep, horned jaws, and remarkable strength. We have the _mantispe_ species, the _raphidie_, and the termite species. The last is often known under the term of white ants, in which we count the deadly termite, the yellow corslet termite, the termite that shuns the light, the biter, the destroyer--"

"And those that constructed this ant-hill?" asked Dick Sand.

"They are the martial ants," replied Cousin Benedict, who pronounced this word as if it had been the Macedonians, or some other ancient people brave in war. "Yes, the warlike ants, and of all sizes. Between Hercules and a dwarf the difference would be less than between the largest of these insects and the smallest. Among them are 'workers' of five millimeters in length 'soldiers' of ten, and males and females of twenty. We find also a kind otherwise very curious: the _sirafous_ half an inch in length, which have pincers for jaws, and a head larger than the body, like the sharks. They are the sharks among insects, and in a fight between some _sirafous_ and a shark, I would bet on the _sirafous_."

"And where are these _sirafous_ commonly observed?" then asked Dick Sand.

"In Africa," replied Cousin Benedict; "in the central and southern provinces. Africa is, in fact, the country of ants. You should read what Livingstone says of them in the last notes reported by Stanley. More fortunate than myself, the doctor has witnessed a Homeric battle, joined between an army of black ants and an army of red ants. Besides, these newroptera furnish the natives with a juicy food. Broiled ants, my friends; I know of nothing better in the world!"

"Have you then eaten them, Mr. Benedict?" asked Hercules.

"Never," replied the wise professor; "but I shall eat some."

"Where?"

"Here."

"Here; we are not in Africa!" said Tom, very quickly.

"No, no!" replied Cousin Benedict; "and, thus far, these warlike termites, and their villages of ant-hills, have only been observed on the African Continent. Ah! such travelers. They do not know how to see! Well! all the better, after all. I have discovered a _tsetse_ in America. To the glory of this, I shall join that of having found the warlike termites on the same continent! What matter for an article that will make a sensation in educated Europe, and, perhaps, appear in folio form, with prints and engravings, besides the text!"

It was evident that the truth had not entered Cousin Benedict's brain. The poor man and all his companions, Dick Sand and Tom excepted, believed themselves, and must believe themselves, where they were not! It needed other incidents, facts still more grave than certain scientific curiosities, to undeceive them!

It was then nine o'clock in the morning. Cousin Benedict had talked for a long time. Did he perceive that his auditors, propped up in their cells, had gradually fallen asleep during his entomological lecture? No; certainly not. He lectured for himself. Dick Sand no longer questioned him, and remained motionless, although he did not sleep. As for Hercules, he had resisted longer than the others; but fatigue soon finished by shutting his eyes, and, with his eyes, his ears.

For some time longer Cousin Benedict continued to lecture. However, sleep finally got the best of him, and he mounted to the upper cavity of the cone, in which he had chosen his domicile.

Deep silence fell on the interior of the cone, while the storm filled space with noise and fire. Nothing seemed to indicate that the tempest was nearly over.

The lantern had been extinguished. The interior of the cone, while the storm filled space with noise and fire. Nothing seemed to indicate that the tempest was nearly over.
into the hands of these natives.

And how to avoid this danger, the worst of all, during their return to the coast. Harris and Negoro had not led them a hundred miles into the interior of Angola without a secret design to gain possession of them.

But what did this miserable Portuguese intend? Who had merited his hatred? The young novice repeated to himself, that he alone had incurred it. Then he passed in review all the incidents that had taken place during the "Pilgrim's" voyage; the meeting with the wreck and the blacks; the pursuit of the whale; the disappearance of Captain Hull and his crew.

Dick Sand had found himself, at the age of fifteen, intrusted with the command of a vessel, the compass and log of which were soon injured by Negoro's criminal actions. He again saw himself using his authority in the presence of this insolent cook, threatening to put him in irons, or to blow out his brains with a pistol shot. Ah, why had he hesitated to do it? Negoro's corpse would have been thrown overboard, and none of these catastrophes would have happened.

Such were the young man's various thoughts. Then they dwelt a moment on the shipwreck which had ended the "Pilgrim's" voyage. The traitor Harris appeared then, and this province of South America gradually became transformed. Bolivia changed to the terrible Angola, with its feverish climate, its savage deer, its natives still more cruel. Could the little party escape during its return to the coast? This river which he was seeking, which he hoped to find, would it conduct them to the shore with more safety, and with less fatigue? He would not doubt it, for he knew well that a march of a hundred miles through this inhospitable country, in the midst of incessant dangers, was no longer possible.

"Happily," he said to himself, "Mrs. Weldon and all are ignorant of the danger of the situation. Old Tom and I, we alone are to know that Negoro has thrown us on the coast of Africa; and that Harris has led me into the wilds of Angola."

Dick Sand was thus sunk in overpowering thoughts, when he felt a breath on his forehead. A hand rested on his shoulder, and a trembling voice murmured these words in his ear:

"I know all, my poor Dick, but God can yet save us! His will be done!"

CHAPTER VI.

THE DIVING-BELL.

To this unexpected revelation Dick Sand could not reply. Besides, Mrs. Weldon had gone back at once to her place beside little Jack. She evidently did not wish to say any more about it, and the young novice had not the courage to detain her.

Thus Mrs. Weldon knew what to believe. The various incidents, of the way had enlightened her also, and perhaps, too, that word, "Africa!" so unluckily pronounced the night before by Cousin Benedict.

"Mrs. Weldon knows everything," repeated Dick Sand to himself. "Well, perhaps it is better so. The brave woman does not despair. I shall not despair either."

Dick Sand now longed for day to return, that he might explore the surroundings of this termite village. He must find a tributary of the Atlantic with a rapid course to transport all his little troop. He had a presentiment that this watercourse could not be far distant. Above all, they must avoid an encounter with the natives, perhaps already sent in pursuit of them under Harris's and Negoro's direction.

But it was not day yet. No light made its way into the cone through the lower orifice. Rumblings, rendered low by the thickness of the walls, indicated that the storm still raged. Listening, Dick Sand also heard the rain falling with violence at the base of the ant-hill. As the large drops no longer struck a hard soil, he must conclude that the whole plain was inundated.

It must have been about eleven o'clock. Dick Sand then felt that a kind of torpor, if not a true sleep, was going to overcome him. It would, however, be rest. But, just as he was yielding to it, the thought came to him that, by the settling of the clay, washed in, the lower orifice was likely to be obstructed. All passage for the outer air would be closed. Within, the respiration of ten persons would soon vitiate the air by loading it with carbonic acid.

Dick Sand then slipped to the ground, which had been raised by the clay from the first floor of cells.

That cushion was still perfectly dry, and the orifice entirely free. The air penetrated freely to the interior of the cone, and with it some flashes of lightning, and the loud noises of that storm, that a diluvian rain could not extinguish.

Dick Sand saw that all was well. No immediate danger seemed to menace these human termites, substituted for the colony of newroptera. The young novice then thought of refreshing himself by a few hours' sleep, as he already felt its influence. Only with supreme precaution Dick Sand lay on that bed of clay, at the bottom of the cone, near the narrow edifice.
By this means, if any accident happened outside, he would be the first to remark it. The rising day would also awaken him, and he would be ready to begin the exploration of the plain.

Dick Sand lay down then, his head against the wall, his gun under his hand, and almost immediately he was asleep.

How long this drowsiness lasted he could not tell, when he was awakened by a lively sensation of coolness.

He rose and recognized, not without great anxiety, that the water was invading the ant hill, and even so rapidly, that in a few seconds it would reach the story of cells occupied by Tom and Hercules.

The latter, awakened by Dick Sand, were told about this new complication.

The lighted lantern soon showed the interior of the cone.

The water had stopped at a height of about five feet, and remained stationary.

"What is the matter, Dick?" asked Mrs. Weldon.

"It is nothing," replied the young novice. "The lower part of the cone has been inundated. It is probably that during this storm a neighboring river has overflowed on this plain."

"Good!" said Hercules; "that proves the river is there!"

"Yes," replied Dick Sand, "and it will carry us to the coast. Be reassured, then, Mrs. Weldon; the water cannot reach you, nor little Jack, nor Nan, nor Mr. Benedict."

Mrs. Weldon did not reply. As to the cousin, he slept like a veritable termite.

Meanwhile the blacks, leaning over this sheet of water, which reflected the lantern's light, waited for Dick Sand to indicate to them what should be done. He was measuring the height of the inundation.

After having the provisions and arms put out of the reach of the inundation, Dick Sand was silent.

"The water has penetrated by the orifice," said Tom.

"Yes," replied Dick Sand, "and now it prevents the interior air from being renewed."

"Could we not make a hole in the wall above the level of the water?" asked the old black.

"Doubtless, Tom; but if we have five feet of water within, there are perhaps six or seven, even more, without."

"You think, Mr. Dick--?"

"I think, Tom, that the water, rising inside the ant-hill, has compressed the air in the upper part, and that this air now makes an obstacle to prevent the water from rising higher. But if we pierce a hole in the wall by which the air would escape, either the water would still rise till it reached the outside level, or if it passed the hole, it would rise to that point where the compressed air would again keep it back. We must be here like workmen in a diving-bell."

"What must be done?" asked Tom.

"Reflect well before acting," replied Dick Sand. "An imprudence might cost us our lives!"

The young novice's observation was very true.

In comparing the cone to a submerged bell, he was right. Only in that apparatus the air is constantly renewed by means of pumps. The divers breathe comfortably, and they suffer no other inconveniences than those resulting from a prolonged sojourn in a compressed atmosphere, no longer at a normal pressure.

But here, beside those inconveniences, space was already reduced a third by the invasion of the water. As to the air, it would only be renewed if they put it in communication with the outer atmosphere by means of a hole.

Could they, without running the danger spoken of by Dick Sand, pierce that hole? Would not the situation be aggravated by it?

What was certain was, that the water now rested at a level which only two causes could make it exceed, namely: if they pierced a hole, and the level of the rising waters was higher outside, or if the height of this rising water should still increase. In either of these cases, only a narrow space would remain inside the cone, where the air, not renewed, would be still more compressed.

But might not the ant-hill be torn from the ground and overthrown by the inundation, to the extreme danger of those within it? No, no more than a beaver's hut, so firmly did it adhere by its base.

Then, the event most to be feared was the persistence of the storm, and, consequently, the increase of the inundation. Thirty feet of water on the plain would cover the cone with eighteen feet of water, and bear on the air within with the pressure of an atmosphere.

Now, after reflecting well upon it, Dick Sand was led to fear that this inundation might increase considerably.

In fact, it could not be due solely to that deluge poured out by the clouds. It seemed more probable that a neighboring watercourse, swelled by the storm, had burst its banks, and was spreading over this plain lying below it. What proof had they that the ant-hill was not then entirely submerged, and that it was full time to leave it by the top part, which would not be difficult to demolish?

Dick Sand, now extremely anxious, asked himself what he ought to do. Must he wait or suddenly announce the probable result of the situation, after ascertaining the condition of things?

It was then three o'clock in the morning. All, motionless, silent, listened. The noise from outside came very
feebly through the obstructed orifice. All the time a dull sound, strong and continued, well indicated that the contest of the elements had not ceased.

At that moment old Tom observed that the water level was gradually rising.

"Yes," replied Dick Sand, "and if it rises, as the air cannot escape from within, it is because the rising of the waters increases and presses it more and more."

"It is but slight so far," said Tom.

"Without doubt," replied Dick Sand; "but where will this level stop?"

"Mr. Dick," asked Bat, "would you like me to go out of the ant-hill? By diving, I should try to slip out by the hole."

"It will be better for me to try it," replied Dick Sand.

"No, Mr. Dick, no," replied old Tom, quickly; "let my son do it, and trust to his skill. In case he could not return, your presence is necessary here."

Then, lower:

"Do not forget Mrs. Weldon and little Jack."

"Be it so," replied Dick Sand. "Go, then, Bat. If the ant-hill is submerged, do not seek to enter it again. We shall try to come out as you will have done. But if the cone still emerges, strike on its top with the ax that you will take with you. We will hear you, and it will be the signal for us to demolish the top from our side. You understand?"

"Yes, Mr. Dick," replied Bat.

"Go, then, boy," added old Tom, pressing his son's hand.

Bat, after laying in a good provision of air by a long aspiration, plunged under the liquid mass, whose depth then exceeded five feet. It was a rather difficult task, because he would have to seek the lower orifice, slip through it, and then rise to the outside surface of the waters.

That must be done quickly.

Nearly half a minute passed away. Dick Sand then thought that Bat had succeeded in passing outside when the black emerged.

"Well!" exclaimed Dick Sand.

"The hole is stopped up by rubbish!" replied Bat, as soon as he could take breath.

"Stopped up!" repeated Tom.

"Yes," replied Bat. "The water has probably diluted the clay. I have felt around the walls with my hand. There is no longer any hole."

Dick Sand shook his head. His companions and he were hermetically sequestered in this cone, perhaps submerged by the water.

"If there is no longer any hole," then said Hercules, "we must make one."

"Wait," replied the young novice, stopping Hercules, who, hatchet in hand, was preparing to dive.

Dick Sand reflected for a few moments, and then he said:

"We are going to proceed in another manner. The whole question is to know whether the water covers the ant-hill or not. If we make a small opening at the summit of the cone, we shall find out which it is. But in case the ant-hill should be submerged now, the water would fill it entirely, and we would be lost. Let us feel our way."

"But quickly," replied Tom.

In fact, the level continued to rise gradually. There were then six feet of water inside the cone. With the exception of Mrs. Weldon, her son, Cousin Benedict, and Nan, who had taken refuge in the upper cavities, all were immersed to the waist.

Then there was a necessity for quick action, as Dick Sand proposed.

It was one foot above the interior level, consequently seven feet from the ground, that Dick Sand resolved to pierce a hole in the clay wall.

If, by this hole, they were in communication with the outer air, the cone emerges. If, on the contrary, this hole was pierced below the water level outside, the air would be driven inward, and in that case they must stop it up at once, or the water would rise to its orifice. Then they would commence again a foot higher, and so on. If, at last, at the top, they did not yet find the outer air, it was because there was a depth of more than fifteen feet of water in the plain, and that the whole termite village had disappeared under the inundation. Then what chance had the prisoners in the ant-hill to escape the most terrible of deaths, death by slow asphyxia?

Dick Sand knew all that, but he did not lose his presence of mind for a moment. He had closely calculated the consequences of the experiment he wished to try. Besides, to wait longer was not possible. Asphyxia was threatening in this narrow space, reduced every moment, in a medium already saturated with carbonic acid.

The best tool Dick Sand could employ to pierce a hole through the wall was a ramrod furnished with a screw, intended to draw the wadding from a gun. By making it turn rapidly, this screw scooped out the clay like an auger,
and the hole was made little by little. Then it would not have a larger diameter than that of the ramrod, but that would be sufficient. The air could come through very well.

Hercules holding up the lantern lighted Dick Sand. They had some wax candles to take its place, and they had not to fear lack of light from that source.

A minute after the beginning of the operation, the ramrod went freely through the wall. At once a rather dull noise was produced, resembling that made by globules of air escaping through a column of water. The air escaped, and, at the same moment, the level of the water rose in the cone, and stopped at the height of the hole. This proved that they had pierced too low—that is to say, below the liquid mass.

"Begin again," the young novice said, coolly, after rapidly stopping the hole with a handful of clay.

The water was again stationary in the cone, but the reserved space had diminished more than eight inches. Respiration became difficult, for the oxygen was beginning to fail. They saw it also by the lantern's light, which reddened and lost a part of its brightness.

One foot above the first hole, Dick Sand began at once to pierce a second by the same process. If the experiment failed, the water would rise still higher inside the cone—but that risk must be run.

While Dick Sand was working his auger, they heard Cousin Benedict cry out, suddenly:

"Mercy! look--look--look why!"

Hercules raised his lantern and threw its light on Cousin Benedict, whose face expressed the most perfect satisfaction.

"Yes," repeated he, "look why those intelligent termites have abandoned the ant-hill! They had felt the inundation beforehand. Ah! instinct, my friends, instinct. The termites are wiser than we are, much wiser."

And that was all the moral Cousin Benedict drew from the situation.

At that moment Dick Sand drew out the ramrod, which had penetrated the wall. A hissing was produced. The water rose another foot inside the cone—the hole had not reached the open air outside.

The situation was dreadful. Mrs. Weldon, then almost reached by the water, had raised little Jack in her arms. All were stifling in this narrow space. Their ears buzzed.

The lantern only threw a faint light.

"Is the cone, then, entirely under water?" murmured Dick Sand.

He must know; and, in order to know, he must pierce a third hole, at the very top.

But it was asphyxia, it was immediate death, if the result of this last attempt should prove fruitless. The air remaining inside would escape through the upper sheet of water, and the water would fill the whole cone.

"Mrs. Weldon," then said Dick Sand, "you know the situation. If we delay, respirable air will fail us. If the third attempt fails, water will fill all this space. Our only chance is that the summit of the cone is above the level of the inundation. We must try this last experiment. Are you willing?"

"Do it, Dick!" replied Mrs. Weldon.

At that moment the lantern went out in that medium already unfit for combustion. Mrs. Weldon and her companions were plunged in the most complete darkness.

Dick Sand was perched on Hercules's shoulders. The latter was hanging on to one of the lateral cavities. Only his head was above the bed of water.

Mrs. Weldon, Jack, and Cousin Benedict were in the last story of cells.

Dick Sand scratched the wall, and his ramrod pierced the clay rapidly. In this place the wall, being thicker and harder also, was more difficult to penetrate. Dick Sand hastened, not without terrible anxiety, for by this narrow opening either life was going to penetrate with the air, or with the water it was death.

Suddenly a sharp hissing was heard. The compressed air escaped—but a ray of daylight filtered through the wall. The water only rose eight inches, and stopped, without Dick Sand being obliged to close the hole. The equilibrium was established between the level within and that outside. The summit of the cone emerged. Mrs. Weldon and her companions were saved.

At once, after a frantic hurra, in which Hercules's thundering voice prevailed, the cutlasses were put to work. The summit, quickly attacked, gradually crumbled. The hole was enlarged, the pure air entered in waves, and with it the first rays of the rising sun. The top once taken off the cone, it would be easy to hoist themselves on to its wall, and they would devise means of reaching some neighboring height, above all inundations.

Dick Sand first mounted to the summit of the cone.

A cry escaped him.

That particular noise, too well known by African travelers, the whizzing of arrows, passed through the air.

Dick Sand had had time to perceive a camp a hundred feet from the ant-hill, and ten feet from the cone, on the inundated plain, long boats, filled with natives.

It was from one of those boats that the flight of arrows had come the moment the young novice's head appeared.
out of the hole.

Dick Sand, in a word, had told all to his companions. Seizing his gun, followed by Hercules, Acteon, and Bat, he reappeared at the summit of the cone, and all fired on one of the boats.

Several natives fell, and yells, accompanied by shots, replied to the detonation of the fire-arms.

But what could Dick Sand and his companions do against a hundred Africans, who surrounded them on all sides?

The ant-hill was assailed. Mrs. Weldon, her child, and Cousin Benedict, all were brutally snatched from it, and without having had time to speak to each other or to shake hands for the last time, they saw themselves separated from each other, doubtless in virtue of orders previously given.

A last boat took away Mrs. Weldon, little Jack and Cousin Benedict. Dick Sand saw them disappear in the middle of the camp.

As to him, accompanied by Nan, Old Tom, Hercules, Bat, Acteon and Austin, he was thrown into a second boat, which went toward another point of the hill.

Twenty natives entered this boat.

It was followed by five others.

Resistance was not possible, and nevertheless, Dick Sand and his companions attempted it. Some soldiers of the caravan were wounded by them, and certainly they would have paid for this resistance with their lives, if there had not been a formal order to spare them.

In a few minutes, the passage was made. But just as the boat landed, Hercules, with an irresistible bound, sprang on the ground. Two natives having sprung on him, the giant turned his gun like a club, and the natives fell, with their skulls broken.

A moment after, Hercules disappeared under the cover of the trees, in the midst of a shower of balls, as Dick Sand and his companions, having been put on land, were chained like slaves.

CHAPTER VII.
IN CAMP ON THE BANKS OF THE COANZA.

The aspect of the country was entirely changed since the inundation. It had made a lake of the plain where the termite village stood. The cones of twenty ant-hills emerged, and formed the only projecting points on this large basin.

The Coanza had overflowed during the night, with the waters of its tributaries swelled by the storm.

This Coanza, one of the rivers of Angola, flows into the Atlantic, a hundred miles from the cape where the "Pilgrim" was wrecked. It was this river that Lieutenant Cameron had to cross some years later, before reaching Benguela. The Coanza is intended to become the vehicle for the interior transit of this portion of the Portuguese colony. Already steamers ascend its lower course, and before ten years elapse, they will ply over its upper bed. Dick Sand had then acted wisely in seeking some navigable river toward the north. The rivulet he had followed had just been emptied into the Coanza. Only for this sudden attack, of which he had had no intimation to put him on his guard, he would have found the Coanza a mile farther on. His companions and he would have embarked on a raft, easily constructed, and they would have had a good chance to descend the stream to the Portuguese villages, where the steamers come into port. There, their safety would be secured.

It would not be so.

The camp, perceived by Dick Sand, was established on an elevation near the ant-hill, into which fate had thrown him, as in a trap. At the summit of that elevation rose an enormous sycamore fig-tree, which would easily shelter five hundred men under its immense branches. Those who have not seen those giant trees of Central Africa, can form no idea of them. Their branches form a forest, and one could be lost in it. Farther on, great banyans, of the kind whose seeds do not change into fruits, completed the outline of this vast landscape.

It was under the sycamore's shelter, hidden, as in a mysterious asylum, that a whole caravan--the one whose arrival Harris had announced to Negoro--had just halted. This numerous procession of natives, snatched from their villages by the trader Alvez's agents, were going to the Kazounde market. Thence the slaves, as needed, would be sent either to the barracks of the west coast, or to Nyangwe, toward the great lake region, to be distributed either in upper Egypt, or in the factories of Zanzibar.

As soon as they arrived at the camp, Dick Sand and his companions had been treated as slaves. Old Tom, his son Austin, Acteon, poor Nan, negroes by birth, though they did not belong to the African race, were treated like captive natives. After they were disarmed, in spite of the strongest resistance, they were held by the throat, two by two, by means of a pole six or seven feet long, forked at each end, and closed by an iron rod. By this means they were forced to march in line, one behind the other, unable to get away either to the right or to the left. As an over precaution, a
heavy chain was attached to their waists. They had their arms free, to carry burdens, their feet free to march, but they
could not use them to flee. Thus they were going to travel hundreds of miles under an overseer's lash. Placed apart,
overcome by the reaction which followed the first moments of their struggle against the negroes, they no longer
made a movement. Why had they not been able to follow Hercules in his flight? And, meanwhile, what could they
hope for the fugitive? Strong as he was, what would become of him in that inhospitable country, where hunger,
solitude, savage beasts, natives, all were against him? Would he not soon regret his companion's fate? They,
however, had no pity to expect from the chiefs of the caravan, Arabs or Portuguese, speaking a language they could
not understand. These chiefs only entered into communication with their prisoners by menacing looks and gestures.

Dick Sand himself was not coupled with any other slave. He was a white man, and probably they had not dared
to inflict the common treatment on him. Unarmed, he had his feet and hands free, but a driver watched him
especially. He observed the camp, expecting each moment to see Negoro or Harris appear. His expectation was in
vain. He had no doubt, however, that those two miserable men had directed the attack against the ant-hill.

Thus the thought came to him that Mrs. Weldon, little Jack, and Cousin Benedict had been led away separately
by orders from the American or from the Portuguese. Seeing neither one nor the other, he said to himself that
perhaps the two accomplices even accompanied their victims. Where were they leading them? What would they do
with them? It was his most cruel care. Dick Sand forgot his own situation to think only of Mrs. Weldon and hers.

The caravan, camped under the gigantic sycamore, did not count less than eight hundred persons, say five
hundred slaves of both sexes, two hundred soldiers, porters, marauders, guards, drivers, agents, or chiefs.

These chiefs were of Arab and Portuguese origin. It would be difficult to imagine the cruelties that these inhuman
beings inflicted on their captives. They struck them without relaxation, and those who fell exhausted, not fit to be
sold, were finished with gunshots or the knife. Thus they hold them by terror. But the result of this system is, that on
the arrival of the caravan, fifty out of a hundred slaves are missing from the trader's list. A few may have escaped,
but the bones of those who died from torture mark out the long routes from the interior to the coast.

It is supposed that the agents of European origin, Portuguese for the most part, are only rascals whom their
country has rejected, convicts, escaped prisoners, old slave-drivers whom the authorities have been unable to hang--
in a word, the refuse of humanity. Such was Negoro, such was Harris, now in the service of one of the greatest
contractors of Central Africa, Jose-Antonio Alvez, well known by the traders of the province, about whom
Lieutenant Cameron has given some curious information.

The soldiers who escort the captives are generally natives in the pay of the traders. But the latter have not the
monopoly of those raids which procure the slaves for them. The negro kings also make atrocious wars with each
other, and with the same object. Then the vanquished adults, the women and children, reduced to slavery, are sold
by the vanquishers for a few yards of calico, some powder, a few firearms, pink or red pearls, and often even, as
Livingstone says, in periods of famine, for a few grains of maize.

The soldiers who escorted old Alvez's caravan might give a true idea of what African armies are.

It was an assemblage of negro bandits, hardly clothed, who brandished long flint-lock guns, the gun-barrels
garnished with a great number of copper rings. With such an escort, to which are joined marauders who are no
better, the agents often have all they can do. They dispute orders, they insist on their own halting places and hours,
they threaten to desert, and it is not rare for the agents to be forced to yield to the exactions of this soldiery.

Though the slaves, men or women, are generally subjected to carry burdens while the caravan is on the march,
yet a certain number of porters accompany it. They are called more particularly "Pagazis," and they carry bundles of
precious objects, principally ivory. Such is the size of these elephants' teeth sometimes, of which some weigh as
much as one hundred and sixty pounds, that it takes two of these "Pagazis" to carry them to the factories. Thence
this precious merchandise is exported to the markets of Khartoum, of Zanzibar and Natal.

On arriving, these "Pagazis" are paid the price agreed upon. It consists in twenty yards of cotton cloth, or of that
stuff which bears the name of "Merikani," a little powder, a handful of cowry (shells very common in that country,
which serve as money), a few pearls, or even those of the slaves who would be difficult to sell. The slaves are paid,
when the trader has no other money.

Among the five hundred slaves that the caravan counted, there were few grown men. That is because, the
"Razzia" being finished and the village set on fire, every native above forty is unmercifully massacred and hung to a
neighboring tree. Only the young adults of both sexes and the children are intended to furnish the markets. After
these men-hunts, hardly a tenth of the vanquished survive. This explains the frightful depopulation which changes
vast territories of equatorial Africa into deserts.

Here, the children and the adults were hardly clothed with a rag of that bark stuff, produced by certain trees, and
called "mbouzon" in the country. Thus the state of this troop of human beings, women covered with wounds from
the "havildars'" whips, children ghastly and meager, with bleeding feet, whom their mothers tried to carry in addition
to their burdens, young men closely riveted to the fork, more torturing than the convict's chain, is the most
lamentable that can be imagined.

Yes, the sight of the miserable people, hardly living, whose voices have no sound, ebony skeletons according to Livingstone's expression, would touch the hearts of wild beasts. But so much misery did not touch those hardened Arabs nor those Portuguese, who, according to Lieutenant Cameron, are still more cruel. This is what Cameron says: "To obtain these fifty women, of whom Alvez called himself proprietor, ten villages had been destroyed, ten villages having each from one hundred to two hundred souls: a total of fifteen hundred inhabitants. Some had been able to escape, but the greater part--almost all--had perished in the flames, had been killed in defending their families, or had died of hunger in the jungle, unless the beasts of prey had terminated their sufferings more promptly.

"Those crimes, perpetrated in the center of Africa by men who boast of the name of Christians, and consider themselves Portuguese, would seem incredible to the inhabitants of civilized countries. It is impossible that the government of Lisbon knows the atrocities committed by people who boast of being her subjects." --Tour of the World.

In Portugal there have been very warm protestations against these assertions of Cameron's.

It need not be said that, during the marches, as during the halts, the prisoners were very carefully guarded. Thus, Dick Sand soon understood that he must not even attempt to get away. But then, how find Mrs. Weldon again? That she and her child had been carried away by Negoro was only too certain. The Portuguese had separated her from her companions for reasons unknown as yet to the young novice. But he could not doubt Negoro's intervention, and his heart was breaking at the thought of the dangers of all kinds which threatened Mrs. Weldon.

"Ah!" he said to himself, "when I think that I have held those two miserable men, both of them, at the end of my gun, and that I have not killed them!"

This thought was one of those which returned most persistently to Dick Sand's mind. What misfortunes the death, the just death of Harris and Negoro might have prevented! What misery, at least, for those whom these brokers in human flesh were now treating as slaves!

All the horror of Mrs. Weldon's and little Jack's situation now represented itself to Dick Sand. Neither the mother nor the child could count on Cousin Benedict. The poor man could hardly take care of himself.

Doubtless they were taking all three to some district remote from the province of Angola. But who was carrying the still sick child?

"His mother; yes, his mother," Dick Sand repeated to himself. "She will have recovered strength for him; she will have done what these unhappy female slaves do, and she will fall like them. Ah! may God put me again in front of her executioners, and I--"

But he was a prisoner! He counted one head in this live-stock that the overseers were driving to the interior of Africa. He did not even know whether Negoro and Harris themselves were directing the convoy of which their victims made a part. Dingo was no longer there to scent the Portuguese, to announce his approach. Hercules alone might come to the assistance of the unfortunate Mrs. Weldon. But was that miracle to be hoped for?

However, Dick Sand fell back again on that idea. He said to himself that the strong black man was free. Of his devotion there was no doubt. All that a human being could do, Hercules would do in Mrs. Weldon's interest. Yes, either Hercules would try to find them and put himself in communication with them; or if that failed him, he would endeavor to concert with him, Dick Sand, and perhaps carry him off, deliver him by force. During the night halts, mingling with these prisoners, black like them, could he not deceive the soldier's vigilance, reach him, break his bonds, and lead him away into the forest? And both of them, then free, what would they not do for Mrs. Weldon's safety. A water course would enable them to descend to the coast. Dick Sand would again take up that plan so unfortunately prevented by the natives' attack, with new chances of success and a greater knowledge of the difficulties.

The young novice thus alternated between fear and hope. In fact, he resisted despair, thanks to his energetic nature, and held himself in readiness to profit by the least chance that might offer itself to him.

What he most desired to know was to what market the agents were taking the convoy of slaves. Was it to one of the factories of Angola, and would it be an affair of a few halting-places only, or would this convoy travel for hundreds of miles still, across Central Africa? The principal market of the contractors is that of N'yangwe, in Manyema, on that meridian which divides the African continent into two almost equal parts, there where extends the country of the great lakes, that Livingstone was then traversing. But it was far from the camp on the Coanza to that village. Months of travel would not suffice to reach it.

That was one of Dick Sand's most serious thoughts; for, once at N'yangwe, in case even Mrs. Weldon, Hercules, the other blacks and he should succeed in escaping, how difficult it would be, not to say impossible, to return to the seacoast, in the midst of the dangers of such a long route.

But Dick Sand soon had reason to think that the convoy would soon reach its destination. Though he did not understand the language employed by the chiefs of the caravan, sometimes Arab, sometimes the African idiom, he
remarked that the name of an important market of that region was often pronounced. It was the name Kazounde, and
he knew that a very great trade in slaves was carried on there. He was then naturally led to believe that there the fate
of the prisoners would be decided, whether for the profit of the king of that district or for the benefit of some rich
trader of the country. We know that he was not mistaken.

Now, Dick Sand, being posted in the facts of modern geography, knew very exactly what is known of Kazounde.
The distance from Saint Paul de Loanda to this city does not exceed four hundred miles, and consequently two
hundred and fifty miles, at the most, separates it from the camp established on the Coanza. Dick Sand made his
calculation approximately, taking the distance traveled by the little troop under Harris's lead as the base. Now, under
ordinary circumstances, this journey would only require from ten to twelve days. Doubling that time for the needs of
a caravan already exhausted by a long route, Dick Sand might estimate the length of the journey from the Coanza to
Kazounde at three weeks.

Dick Sand wished very much to impart what he believed he knew to Tom and his companions. It would be a
kind of consolation for them to be assured that they were not being led to the center of Africa, into those fatal
countries which they could not hope to leave. Now, a few words uttered in passing would be sufficient to enlighten
them. Would he succeed in saying those words?

Tom and Bat—chance had reunited the father and son—Acteon and Austin, forked two by two, were at the right
extremity of the camp. An overseer and a dozen soldiers watched them.

Dick Sand, free in his movements, resolved to gradually diminish the distance that separated him from his
companions to fifty steps. He then commenced to maneuver to that end.

Very likely old Tom divined Dick Sand's thought. A word, pronounced in a low voice, warned his companions
to be attentive. They did not stir, but they kept themselves ready to see, as well as to hear.

Soon, with an indifferent air, Dick Sand had gained fifty steps more. From the place where he then was, he could
have called out, in such a manner as to be heard, that name Kazounde, and tell them what the probable length of the
journey would be. But to complete his instructions, and confer with them on their conduct during the journey, would
be still better. He then continued to draw nearer to them. Already his heart was beating with hope; he was only a few
steps from the desired end, when the overseer, as if he had suddenly penetrated his intention, rushed on him. At the
cries of that enraged person, ten soldiers ran to the spot, and Dick Sand was brutally led back to the rear, while Tom
and his companions were taken to the other extremity of the camp.

Exasperated, Dick Sand had thrown himself upon the overseer. He had ended by breaking his gun in his hands.
He had almost succeeded in snatching it from him. But seven or eight soldiers assailed him at once, and force was
used to secure him. Furious, they would have massacred him, if one of the chiefs of the caravan, an Arab of great
height and ferocious physiognomy, had not intervened. This Arab was the chief Ibn Hamis, of whom Harris had
spoken. He pronounced a few words which Dick Sand could not understand, and the soldiers, obliged to release their
prey, went away.

It was, then, very evident, for one thing, that there had been a formal order not to allow the young novice to
communicate with his companions; and for another, that his life should not be taken.

Who could have given such orders, if not Harris or Negoro?

At that moment—it was nine o'clock in the morning, April 19th—the harsh sounds from a "condou's" horn (a kind
of ruminating animal among the African deer) burst forth, and the drum was heard. The halt was going to end.

All, chiefs, porters, soldiers, slaves, were immediately on foot. Laden with their packs, several groups of
captives were formed under the leadership of an overseer, who unfurled a banner of bright colors.

The signal for departure was given. Songs then rose on the air; but they were the vanquished, not the
vanquishers, who sang thus.

This is what they said in these songs—a threatening expression of a simple faith from the slaves against their
oppressors—against their executioners:

"You have sent me to the coast, but I shall be dead; I shall have a yoke no longer, and I shall return to kill you."

CHAPTER VIII.
SOME OF DICK SAND'S NOTES.

Though the storm of the day before had ceased, the weather was still very unsettled. It was, besides, the period
of the "masika," the second period of the rainy season, under this zone of the African heaven. The nights in
particular would be rainy during one, two, or three weeks, which could only increase the misery of the caravan.

It set out that day in cloudy weather, and, after quitting the banks of the Coanza, made its way almost directly to
the east. Fifty soldiers marched at the head, a hundred on each of the two sides of the convoy, the rest as a rear-
guard. It would be difficult for the prisoners to flee, even if they had not been chained. Women, children, and men
were going pell-mell, and the overseers urged them on with the whip. There were unfortunate mothers who, nursing one child, held a second by the hand that was free. Others dragged these little beings along, without clothing, without shoes, on the sharp grasses of the soil.

The chief of the caravan, that ferocious Ibn Hamis, who had interfered in the struggle between Dick Sand and his overseer, watched this whole troop, going backwards and forwards from the head to the foot of the long column. If his agents and he troubled themselves but little about the sufferings of their captives, they must reckon more seriously either with the soldiers who claimed some additional rations, or with the "pagazis" who wanted to halt. Thence discussions; often even an exchange of brutality. The slaves suffered more from the overseers' constant irritation. Nothing was heard but threats from one side, and cries of grief from the other. Those who marched in the last ranks treaded a soil that the first had stained with their blood.

Dick Sand's companions, always carefully kept in front of the convoy, could have no communication with him. They advanced in file, the neck held in the heavy fork, which did not permit a single head-movement. The whips did not spare them any more than their sad companions in misfortune.

Bat, coupled with his father, marched before him, taxing his ingenuity not to shake the fork, choosing the best places to step on, because old Tom must pass after him. From time to time, when the overseer was a little behind, he uttered various words of encouragement, some of which reached Tom. He even tried to retard his march, if he felt that Tom was getting tired. It was suffering, for this good son to be unable to turn his head towards his good father, whom he loved. Doubtless, Tom had the satisfaction of seeing his son; however, he paid dear for it. How many times great tears flowed from his eyes when the overseer's whip fell upon Bat! It was a worse punishment than if it had fallen on his own flesh.

Austin and Acteon marched a few steps behind, tied to each other, and brutally treated every moment. Ah, how they envied Hercules's fate! Whatever were the dangers that threatened the latter in that savage country, he could at least use his strength and defend his life.

During the first moments of their captivity, old Tom had finally made known the whole truth to his companions. They had learned from him, to their profound astonishment, that they were in Africa; that Negoro's and Harris's double treachery had first thrown them there, and then led them away, and that no pity was to be expected from their masters.

Nan was not better treated. She made part of a group of women who occupied the middle of the convoy. They had chained her with a young mother of two children, one at the breast, the other aged three years, who walked with difficulty. Nan, moved with pity, had burdened herself with the little creature, and the poor slave had thanked her by a tear. Nan then carried the infant, at the same time, sparing her the fatigue, to which she would have yielded, and the blows the overseer would have given her. But it was a heavy burden for old Nan. She felt that her strength would soon fail her, and then she thought of little Jack. She pictured him to herself in his mother's arms. Sickness had wasted him very much, but he must be still heavy for Mrs. Weldon's weakened arms. Where was she? What would become of her? Would her old servant ever see her again?

Dick Sand had been placed almost in the rear of the convoy. He could neither perceive Tom, nor his companions, nor Nan. The head of the long caravan was only visible to him when it was crossing some plain. He walked, a prey, to the saddest thoughts, from which the agents' cries hardly drew his attention. He neither thought of himself, nor the fatigue he must still support, nor of the tortures probably reserved for him by Negoro. He only thought of Mrs. Weldon. In rain he sought on the ground, on the brambles by the paths, on the lower branches of the trees, to find some trace of her passage. She could not have taken another road, if as everything indicated, they were leading her to Kazounde. What would he not give to find some indication of her march to the destination where they themselves were being led!

Such was the situation of the young novice and his companions in body and mind. But whatever they might have to fear for themselves, great as was their own sufferings, pity took possession of them on seeing the frightful misery of that sad troop of captives, and the revolting brutality of their masters. Alas! they could do nothing to succor the afflicted, nothing to resist the others.

All the country situated east of the Coanza was only a forest for over an extent of twenty miles. The trees, however, whether they perish under the biting of the numerous insects of these countries, or whether troops of elephants beat them down while they are still young, are less crowded here than in the country next to the seacoast. The march, then, under the trees, would not present obstacles. The shrubs might be more troublesome than the trees. There was, in fact, an abundance of those cotton-trees, seven to eight feet high, the cotton of which serves to manufacture the black and white striped stuffs used in the interior of the province.

In certain places, the soil transformed itself into thick jungles, in which the convoy disappeared. Of all the animals of the country, the elephants and giraffes alone were taller than those reeds which resemble bamboos, those herbs, the stalks of which measure an inch in diameter. The agents must know the country marvelously well, not to
be lost in these jungles.

Each day the caravan set out at daybreak, and only halted at midday for an hour. Some packs containing tapioca were then opened, and this food was parsimoniously distributed to the slaves. To this potatoes were added, or goat’s meat and veal, when the soldiers had pillaged some village in passing. But the fatigue had been such, the repose so insufficient, so impossible even during these rainy nights, that when the hour for the distribution of food arrived the prisoners could hardly eat. So, eight days after the departure from the Coanza, twenty had fallen by the way, at the mercy of the beasts that prowled behind the convoy. Lions, panthers and leopards waited for the victims which could not fail them, and each evening after sunset their roaring sounded at such a short distance that one might fear a direct attack.

On hearing those roars, rendered more formidable by the darkness, Dick Sand thought with terror of the obstacles such encounters would present against Hercules’s enterprise, of the perils that menaced each of his steps. And meanwhile if he himself should find an opportunity to flee, he would not hesitate.

Here are some notes taken by Dick Sand during this journey from the Coanza to Kazounde. Twenty-five "marches" were employed to make this distance of two hundred and fifty miles, the "march" in the traders’ language being ten miles, halting by day and night.

_From 25th to 27th April._--Saw a village surrounded by walls of reeds, eight or nine feet high. Fields cultivated with maize, beans, "sorghas" and various arachides. Two blacks seized and made prisoners. Fifteen killed. Population fled.

The next day crossed an impetuous river, one hundred and fifty yards wide. Floating bridge, formed of trunks of trees, fastened with lianes. Piles half broken. Two women, tied to the same fork, precipitated into the water. One was carrying her little child. The waters are disturbed and become stained with blood. Crocodiles glide between the parts of the bridge. There is danger of stepping into their open mouths.

_April 28th._--Crossed a forest of bauhiniers. Trees of straight timber--those which furnish the iron wood for the Portuguese.

Heavy rain. Earth wet. March extremely painful.

Perceived, toward the center of the convoy, poor Nan, carrying a little negro child in her arms. She drags herself along with difficulty. The slave chained with her limps, and the blood flows from her shoulder, torn by lashes from the whip.

In the evening camped under an enormous baobab with white flowers and a light green foliage.

During the night roars of lions and leopards. Shots fired by one of the natives at a panther. What has become of Hercules?

_April 29th and 30th._--First colds of what they call the African winter. Dew very abundant. End of the rainy season with the month of April; it commences with the month of November. Plains still largely inundated. East winds which check perspiration and renders one more liable to take the marsh fevers.

No trace of Mrs. Weldon, nor of Mr. Benedict. Where would they take them, if not to Kazounde? They must have followed the road of the caravan and preceded us. I am eaten up with anxiety. Little Jack must be seized again with the fever in this unhealthy region. But does he still live?

_From May 1st to May 6th._--Crossed, with several halting-places, long plains, which evaporation has not been able to dry up. Water everywhere up to the waist. Myriads of leeches adhering to the skin. We must march for all that. On some elevations that emerge are lotus and papyrus. At the bottom, under the water, other plants, with large cabbage leaves, on which the feet slip, which occasions numerous falls.

In these waters, considerable quantities of little fish of the silurus species. The natives catch them by billions in wickers and sell them to the caravans.

Impossible to find a place to camp for the night. We see no limit to the inundated plain. We must march in the dark. To-morrow many slaves will be missing from the convoy. What misery! When one falls, why get up again? A few moments more under these waters, and all would be finished. The overseer's stick would not reach you in the darkness.

Yes, but Mrs. Weldon and her son! I have not the right to abandon them. I shall resist to the end. It is my duty.

Dreadful cries are heard in the night. Twenty soldiers have torn some branches from resinous trees whose branches were above water. Livid lights in the darkness.

This is the cause of the cries I heard. An attack of crocodiles; twelve or fifteen of those monsters have thrown themselves in the darkness on the flank of the caravan.

Women and children have been seized and carried away by the crocodiles to their "pasture lands"--so Livingstone calls those deep holes where this amphibious animal deposits its prey, after having drowned it, for it only eats it when it has reached a certain degree of decomposition.

I have been rudely grazed by the scales of one of these crocodiles. An adult slave has been seized near me and
torn from the fork that held him by the neck. The fork was broken. What a cry of despair! What a howl of grief! I hear it still!

_May 7th and 8th._--The next day they count the victims. Twenty slaves have disappeared.

At daybreak I look for Tom and his companions. God be praised! they are living. Alas! ought I to praise God? Is one not happier to be done with all this misery?

Tom is at the head of the convoy. At a moment when his son Bat made a turn, the fork was presented obliquely, and Tom was able to see me.

I search in vain for old Nan. Is she in the central group? or has she perished during that frightful night?

The next day, passed the limit of the inundated plain, after twenty-four hours in the water. We halt on a hill. The sun dries us a little. We eat, but what miserable food! A little tapioca, a few handfuls of maize. Nothing but the troubled water to drink. Prisoners extended on the ground--how many will not get up!

No! it is not possible that Mrs. Weldon and her son have passed through so much misery! God would be so gracious to them as to have them led to Kazounde by another road. The unhappy mother could not resist.

New case of small-pox in the caravan; the "ndoue," as they say. The sick could not be able to go far. Will they abandon them?

_May 9th._--They have begun the march again at sunrise. No laggards. The overseer's whip has quickly raised those overcome by fatigue or sickness. Those slaves have a value; they are money. The agents will not leave them behind while they have strength enough to march.

I am surrounded by living skeletons. They have no longer voice enough to complain. I have seen old Nan at last. She is a sad sight. The child she was carrying is no longer in her arms. She is alone, too. That will be less painful for her; but the chain is still around her waist, and she has been obliged to throw the end over her shoulder.

By hastening, I have been able to draw near her. One would say that she did not recognize me. Am I, then, changed to that extent?

"Nan," I said.

The old servant looked at me a long time, and then she exclaimed:

"You, Mr. Dick! I--I--before long I shall be dead!"

"No! no! Courage!" I replied, while my eyes fell so as not to see what was only the unfortunate woman's bloodless specter.

"Dead!" she continued; "and I shall not see my dear mistress again, nor my little Jack. My God! my God! have pity on me!"

I wished to support old Nan, whose whole body trembled under her torn clothing. It would have been a mercy to see myself tied to her, and to carry my part of that chain, whose whole weight she bore since her companion's death.

A strong arm pushes me back, and the unhappy Nan is thrown back into the crowd of slaves, lashed by the whips. I wished to throw myself on that brutal----The Arab chief appears, seizes my arm, and holds me till I find myself again in the caravan's last rank.

Then, in his turn, he pronounces the name, "Negoro!"

Negoro! It is then by the Portuguese's orders that he acts and treats me differently from my companions in misfortune?

For what fate am I reserved?

_May 10th._--To-day passed near two villages in flames. The stubble burns on all sides. Dead bodies are hung from the trees the fire has spared. Population fled.

Fields devastated. The _razzie_ is exercised there. Two hundred murders, perhaps, to obtain a dozen slaves.

Evening has arrived. Halt for the night. Camp made under great trees. High shrubs forming a thicket on the border of the forest.

Some prisoners fled the night before, after breaking their forks. They have been retaken, and treated with unprecedented cruelty. The soldiers' and overseers' watchfulness is redoubled.

Night has come. Roaring of lions and hyenas, distant snorting of hippopotami. Doubtless some lake or watercourse near.

In spite of my fatigue, I cannot sleep. I think of so many things.

Then, it seems to me that I hear prowling in the high grass. Some animal, perhaps. Would it dare force an entrance into the camp?

I listen. Nothing! Yes! An animal is passing through the reeds. I am unarmed! I shall defend myself, nevertheless. My life may be useful to Mrs. Weldon, to my companions.

I look through the profound darkness. There is no moon. The night is extremely dark.

Two eyes shine in the darkness, among the papyrus--two eyes of a hyena or a leopard. They disappear--reappear. At last there is a rustling of the bushes. An animal springs upon me!
I am going to cry out, to give the alarm. Fortunately, I was able to restrain myself. I cannot believe my eyes! It is Dingo! Dingo, who is near me! Brave Dingo! How is it restored to me? How has it been able to find me again? Ah! instinct! Would instinct be sufficient to explain such miracles of fidelity? It licks my hands. Ah! good dog, now my only friend, they have not killed you, then!

It understands me.
I return its caresses.
It wants to bark.
I calm it. It must not be heard.

Let it follow the caravan in this way, without being seen, and perhaps----But what! It rubs its neck obstinately against my hands. It seems to say to me: "Look for something." I look, and I feel something there, fastened to its neck. A piece of reed is slipped under the collar, on which are graven those two letters, S.V., the mystery of which is still inexplicable to us.

Yes. I have unfastened the reed. I have broken it! There is a letter inside. But this letter--I cannot read it. I must wait for daylight!--daylight! I should like to keep Dingo; but the good animal, even while licking my hands, seems in a hurry to leave me. It understands that its mission is finished. With one bound aside, it disappears among the bushes without noise. May God spare it from the lions' and hyenas' teeth!

Dingo has certainly returned to him who sent it to me.

This letter, that I cannot yet read, burns my hands! Who has written it? Would it come from Mrs. Weldon? Does it come from Hercules? How has the faithful animal, that we believed dead, met either the one or the other? What is this letter going to tell me? Is it a plan of escape that it brings me? Or does it only give me news of those dear to me? Whatever it may be, this incident has greatly moved me, and has relaxed my misery.

Ah! the day comes so slowly. I watch for the least light on the horizon. I cannot close my eyes. I still hear the roaring of the animals. My poor Dingo, can you escape them? At last day is going to appear, and almost without dawn, under these tropical latitudes.

I settle myself so as not to be seen. I try to read--I cannot yet. At last I have read. The letter is from Hercules's hand. It is written on a bit of paper, in pencil. Here is what it says:

"Mrs. Weldon was taken away with little Jack in a _kitanda_. Harris and Negoro accompany it. They precede the caravan by three or four marches, with Cousin Benedict. I have not been able to communicate with her. I have found Dingo, who must have been wounded by a shot, but cured. Good hope, Mr. Dick. I only think of you all, and I fled to be more useful to you. HERCULES."

Ah! Mrs. Weldon and her son are living. God be praised! They have not to suffer the fatigues of these rude halting-places. A _kitanda_--it is a kind of litter of dry grass, suspended to a long bamboo, that two men carry on the shoulder. A stuff curtain covers it over. Mrs. Weldon and her little Jack are in that _kitanda_. What does Harris and Negoro want to do with them? Those wretches are evidently going to Kazounde. Yes, yes, I shall find them again. Ah! in all this misery it is good news, it is joy that Dingo has brought me!

_From May 11th to 15th_.--The caravan continues its march. The prisoners drag themselves along more and more painfully. The majority have marks of blood under their feet. I calculate that it will take ten days more to reach Kazounde. How many will have ceased to suffer before then? But I--I must arrive there, I shall arrive there.

It is atrocious! There are, in the convoy, unfortunate ones whose bodies are only wounds. The cords that bind them enter into the flesh.

Since yesterday a mother carries in her arms her little infant, dead from hunger. She will not separate from it.

Our route is strewn with dead bodies. The smallpox rages with new violence.

We have just passed near a tree. To this tree slaves were attached by the neck. They were left there to die of hunger.

_From May 16th to 24th_.--I am almost exhausted, but I have no right to give up. The rains have entirely ceased. We have days of "hard marching." That is what the traders call the "tirikesa," or afternoon march. We must go faster, and the ground rises in rather steep ascents.

We pass through high shrubs of a very tough kind. They are the "nyassi," the branches of which tear the skin off my face, whose sharp seeds penetrate to my skin, under my dilapidated clothes. My strong boots have fortunately kept good.

The agents have commenced to abandon the slaves too sick to keep up. Besides, food threatens to fail; soldiers and _pagazis_ would revolt if their rations were diminished. They dare not retrench from them, and then so much worse for the captives.

"Let them eat one another!" said the chief.

Then it follows that young slaves, still strong, die without the appearance of sickness. I remember what Dr. Livingstone has said on that subject: "Those unfortunates complain of the heart; they put their hands there, and they
fall. It is positively the heart that breaks! That is peculiar to free men, reduced to slavery unexpectedly!"

To-day, twenty captives who could no longer drag themselves along, have been massacred with axes, by the _havildars_! The Arab chief is not opposed to massacre. The scene has been frightful!

Poor old Nan has fallen under the knife, in this horrible butchery! I strike against her corpse in passing! I cannot even give her a Christian burial! She is first of the "Pilgrim's" survivors whom God has called back to him. Poor good creature! Poor Nan!

I watch for Dingo every night. It returns no more! Has misfortune overtaken it or Hercules? No! no! I do not want to believe it! This silence, which appears so long to me, only proves one thing--it is that Hercules has nothing new to tell me yet. Besides, he must be prudent, and on his guard.

* * * * *

CHAPTER IX.
KAZOUNDE.

On May 26th, the caravan of slaves arrived at Kazounde. Fifty per cent. of the prisoners taken in the last raid had fallen on the road. Meanwhile, the business was still good for the traders; demands were coming in, and the price of slaves was about to rise in the African markets.

Angola at this period did an immense trade in blacks. The Portuguese authorities of St. Paul de Loanda, or of Benguela, could not stop it without difficulty, for the convoys traveled towards the interior of the African continent. The pens near the coast overflowed with prisoners, the few slavers that succeeded in eluding the cruisers along the shore not being sufficient to carry all of them to the Spanish colonies of America.

Kazounde, situated three hundred miles from the mouth of the Coanza, is one of the principal "lakonis," one of the most important markets of the province. On its grand square the "tchitoka" business is transacted; there, the slaves are exposed and sold. It is from this point that the caravans radiate toward the region of the great lakes.

Kazounde, like all the large towns of Central Africa, is divided into two distinct parts. One is the quarter of the Arab, Portuguese or native traders, and it contains their pens; the other is the residence of the negro king, some ferocious crowned drunkard, who reigns through terror, and lives from supplies furnished by the contractors.

At Kazounde, the commercial quarter then belonged to that Jose-Antonio Alvez, of whom Harris and Negoro had spoken, they being simply agents in his pay. This contractor's principal establishment was there, he had a second at Bihe, and a third at Cassange, in Benguela, which Lieutenant Cameron visited some years later.

Imagine a large central street, on each side groups of houses, "tembes," with flat roofs, walls of baked earth, and a square court which served as an enclosure for cattle. At the end of the street was the vast "tchitoka" surrounded by slave-pens. Above this collection of buildings rose some enormous banyans, whose branches swayed with graceful movements. Here and there great palms, with their heads in the air, drove the dust on the streets like brooms. Twenty birds of prey watched over the public health. Such is the business quarter of Kazounde.

Near by ran the Louhi, a river whose course, still undetermined, is an affluent, or at least a sub-affluent, of the Coango, a tributary of the Zoïre.

The residence of the King of Kazounde, which borders on the business quarter, is a confused collection of ill-built hovels, which spread over the space of a mile square. Of these hovels, some are open, others are inclosed by a palisade of reeds, or bordered with a hedge of fig-trees. In one particular enclosure, surrounded by a fence of papyrus, thirty of these huts served us dwellings for the chief's slaves, in another group lived his wives, and a "tembe," still larger and higher, was half hidden in a plantation of cassada. Such was the residence of the King of Kazounde, a man of fifty--named Moini Lounga; and already almost deprived of the power of his predecessors. He had not four thousand of soldiers there, where the principal Portuguese traders could count twenty thousand, and he could no longer, as in former times, decree the sacrifice of twenty-five or thirty slaves a day.

This king was, besides, a prematurely-aged man, exhausted by debauch, crazed by strong drink, a ferocious maniac, mutilating his subjects, his officers or his ministers, as the whim seized him, cutting the nose and ears off some, and the foot or the hand from others. His own death, not unlooked for, would be received without regret.

A single man in all Kazounde might, perhaps, lose by the death of Moini Lounga. This was the contractor, Jose-Antonio Alvez, who agreed very well with the drunkard, whose authority was recognized by the whole province. If the accession of his first wife, Queen Moini, should be contested, the States of Moini Lounga might be invaded by a neighboring competitor, one of the kings of Oukonson. The latter, being younger and more active, had already seized some villages belonging to the Kazounde government. He had in his services another trader, a rival of Alvez Tipo-Type, a black Arab of a pure race, whom Cameron met at Nyangwe.

What was this Alvez, the real sovereign under the reign of an imbruted negro, whose vices he had developed and served?
Jose-Antonio Alvez, already advanced in years, was not, as one might suppose, a "msoungou," that is to say, a man of the white race. There was nothing Portuguese about him but his name, borrowed, no doubt, for the needs of commerce. He was a real negro, well known among traders, and called Kenndele. He was born, in fact, at Donndo, or the borders of the Coanza. He had commenced by being simply the agent of the slave-brokers, and would have finished as a famous trader, that is to say, in the skin of an old knave, who called himself the most honest man in the world.

Cameron met this Alvez in the latter part of 1874, at Kilemmba, the capital of Kassonngo, chief of Ouroua. He guided Cameron with his caravan to his own establishment at Bihe, over a route of seven hundred miles. The convoy of slaves, on arriving at Kazounde, had been conducted to the large square.

It was the 26th of May. Dick Sand's calculations were then verified. The journey had lasted thirty-eight days from the departure of the army encamped on the banks of the Coanza. Five weeks of the most fearful miseries that human beings could support.

It was noon when the train entered Kazounde. The drums were beaten, horns were blown in the midst of the detonations of fire-arms. The soldiers guarding the caravan discharged their guns in the air, and the men employed by Jose-Antonio Alvez replied with interest. All these bandits were happy at meeting again, after an absence which had lasted for four months. They were now going to rest and make up for lost time in excesses and idleness.

The prisoners then formed a total of two hundred and fifty, the majority being completely exhausted. After having been driven like cattle, they were to be shut up in pens, which American farmers would not have used for pigs. Twelve or fifteen hundred other captives awaited them, all of whom would be exposed in the market at Kazounde on the next day but one. These pens were filled up with the slaves from the caravan. The heavy forks had been taken off them, but they were still in chains.

The "pagazis" had stopped on the square after having disposed of their loads of ivory, which the Kazounde dealers would deliver. Then, being paid with a few yards of calico or other stuff at the highest price, they would return and join some other caravan.

Old Tom and his companions had been freed from the iron collar which they had carried for five weeks. Bat and his father embraced each other, and all shook hands; but no one ventured to speak. What could they say that would not be an expression of despair? Bat, Acteon and Austin, all three vigorous, accustomed to hard work, had been able to resist fatigue; but old Tom, weakened by privations, was nearly exhausted. A few more days and his corpse would have been left, like poor Nan's, as food for the beasts of the province.

As soon as they arrived, the four men had been placed in a narrow pen, and the door had been at once shut upon them. There they had found some food, and they awaited the trader's visit, with whom, although quite in vain, they intended to urge the fact that they were Americans.

Dick Sand had remained alone on the square, under the special care of a keeper.

At length he was at Kazounde, where he did not doubt that Mrs. Weldon, little Jack, and Cousin Benedict had preceded him. He had looked for them in crossing the various quarters of the town, even in the depths of the "tembes" that lined the streets, on this "tchitoka" now almost deserted.

Mrs. Weldon was not there.

"Have they not brought her here?" he asked himself. "But where could she be? No; Hercules cannot be mistaken. Then, again, he must have learned the secret designs of Negoro and Harris; yet they, too--I do not see them."

Dick Sand felt the most painful anxiety. He could understand that Mrs. Weldon, retained a prisoner, would be concealed from him. But Harris and Negoro, particularly the latter, should hasten to see him, now in their power, if only to enjoy their triumph--to insult him, torture him, perhaps avenge themselves. From the fact that they were not there, must he conclude that they had taken another direction, and that Mrs. Weldon was to be conducted to some other point of Central Africa? Should the presence of the American and the Portuguese be the signal for his punishment, Dick Sand impatiently desired it. Harris and Negoro at Kazounde, was for him the certainty that Mrs. Weldon and her child were also there.

Dick Sand then told himself that, since the night when Dingo had brought him Hercules's note, the dog had not been seen. The young man had prepared an answer at great risks. In it he told Hercules to think only of Mrs. Weldon, not to lose sight of her, and to keep her informed as well as possible of what happened; but he had not been able to send it to its destination. If Dingo had been able to penetrate the ranks of the caravan once, why did not Hercules let him try it a second time? Had the faithful animal perished in some fruitless attempt? Perhaps Hercules was following Mrs. Weldon, as Dick Sand would have done in his place. Followed by Dingo, he might have plunged into the depths of the woody plateau of Africa, in the hope of reaching one of the interior establishments.

What could Dick Sand imagine if, in fact, neither Mrs. Weldon nor her enemies were there? He had been so sure, perhaps foolishly, of finding them at Kazounde, that not to see them there at once gave him a terrible shock. He felt a sensation of despair that he could not subdue. His life, if it were no longer useful to those whom he loved, was
good for nothing, and he had only to die. But, in thinking in that manner, Dick Sand mistook his own character. Under the pressure of these trials, the child became a man, and with him discouragement could only be an accidental tribute paid to human nature.

A loud concert of trumpet-calls and cries suddenly commenced. Dick Sand, who had just sunk down in the dust of the "tchitoka," stood up. Every new incident might put him on the track of those whom he sought.

In despair a moment before, he now no longer despairs.

"Alvez! Alvez!" This name was repeated by a crowd of natives and soldiers who now invaded the grand square. The man on whom the fate of so many unfortunate people depended was about to appear. It was possible that his agents, Harris and Negoro, were with him. Dick Sand stood upright, his eyes open, his nostrils dilated. The two traitors would find this lad of fifteen years before them, upright, firm, looking them in the face. It would not be the captain of the "Pilgrim" who would tremble before the old ship's cook.

A hammock, a kind of "kitanda" covered by an old patched curtain, discolored, fringed with rags, appeared at the end of the principal street. An old negro descended. It was the trader, Jose-Antonio Alvez. Several attendants accompanied him, making strong demonstrations.

Along with Alvez appeared his friend Coimbra, the son of Major Coimbra of Bihe, and, according to Lieutenant Cameron, the greatest scamp in the province. He was a dirty creature, his breast was uncovered, his eyes were bloodshot, his hair was rough and curly, his face yellow; he was dressed in a ragged shirt and a straw petticoat. He would have been called a horrible old man in his tattered straw hat. This Coimbra was the confidant, the tool of Alvez, an organizer of raids, worthy of commanding the trader's bandits.

As for the trader, he might have looked a little less sordid than his attendant. He wore the dress of an old Turk the day after a carnival. He did not furnish a very high specimen of the factory chiefs who carry on the trade on a large scale.

To Dick Sand's great disappointment, neither Harris nor Negoro appeared in the crowd that followed Alvez. Must he, then, renounce all hope of finding them at Kazounde?

Meanwhile, the chief of the caravan, the Arab, Ibn Hamis, shook hands with Alvez and Coimbra. He received numerous congratulations. Alvez made a grimace at the fifty per cent. of slaves failing in the general count, but, on the whole, the affair was very satisfactory. With what the trader possessed of human merchandise in his pens, he could satisfy the demands from the interior, and barter slaves for ivory teeth and those "hannas" of copper, a kind of St. Andrew's cross, in which form this metal is carried into the center of Africa.

The overseers were also complimented. As for the porters, the trader gave orders that their salary should be immediately paid them.

Jose-Antonio Alvez and Coimbra spoke a kind of Portuguese mingled with a native idiom, which a native of Lisbon would scarcely have understood. Dick Sand could not hear what these merchants were saying. Were they talking of him and his companions, so treacherously joined to the persons in the convoy? The young man could not doubt it, when, at a gesture from the Arab, Ibn Hamis, an overseer, went toward the pen where Tom, Austin, Bat and Acteon had been shut up.

Almost immediately the four Americans were led before Alvez.

Dick Sand slowly approached. He wished to lose nothing of this scene.

Alvez's face lit up at the sight of these few well-made blacks, to whom rest and more abundant food had promptly restored their natural vigor. He looked with contempt at old Tom, whose age would affect his value, but the other three would sell high at the next Kazounde sale.

Alvez remembered a few English words which some agents, like the American, Harris, had taught him, and the old monkey thought he would ironically welcome his new slaves.

Tom understood the trader's words; he at once advanced, and, showing his companions, said: "We are free men--citizens of the United States."

Alvez certainly understood him; he replied with a good-humored grimace, wagging his head: "Yes, yes, Americans! Welcome, welcome!"

"Welcome," added Coimbra.

He advanced toward Austin, and like a merchant who examines a sample, after having felt his chest and his shoulders, he wanted to make him open his mouth, so as to see his teeth.

But at this moment Signor Coimbra received in his face the worst blow that a major's son had ever caught. Alvez's confidant staggered under it.

Several soldiers threw themselves on Austin, who would perhaps pay dearly for this angry action.

Alvez stopped them by a look. He laughed, indeed, at the misfortune of his friend, Coimbra, who had lost two of the five or six teeth remaining to him.

Alvez did not intend to have his merchandise injured. Then, he was of a gay disposition, and it was a long time
since he had laughed so much.

Meanwhile, he consoled the much discomfited Coimbra, and the latter, helped to his feet, again took his place near the trader, while throwing a menacing look at the audacious Austin.

At this moment Dick Sand, driven forward by an overseer, was led before Alvez.

The latter evidently knew all about the young man, whence he came, and how he had been taken to the camp on the Coanza.

So he said, after having given him an evil glance:

"The little Yankee!"

"Yes, Yankee!" replied Dick Sand. "What do they wish to do with my companions and me?"

"Yankee! Yankee! Yankee!" repeated Alvez.

Did he not or would he not understand the question put to him?

A second time Dick Sand asked the question regarding his companions and himself. He then turned to Coimbra, whose features, degraded as they were by the abuse of alcoholic liquors, he saw were not of native origin.

Coimbra repeated the menacing gesture already made at Austin, and did not answer.

During this time Alvez talked rapidly with the Arab, Ibn Hamis, and evidently of things that concerned Dick Sand and his friends.

No doubt they were to be again separated, and who could tell if another chance to exchange a few words would ever again be offered them.

"My friends," said Dick, in a low voice, and as if he were only speaking to himself, "just a few words! I have received, by Dingo, a letter from Hercules. He has followed the caravan. Harris and Negoro took away Mrs. Weldon, Jack, and Mr. Benedict. Where? I know not, if they are not here at Kazounde. Patience! courage! Be ready at any moment. God may yet have pity on us!"

"And Nan?" quickly asked old Tom.

"Nan is dead!"

"The first!"

"And the last!" replied Dick Sand, "for we know well----"

At this moment a hand was laid on his shoulder, and he heard these words, spoken in the amiable voice which he knew only too well:

"Ah, my young friend, if I am not mistaken! Enchanted to see you again!"

Dick Sand turned.

Harris was before him.

"Where is Mrs. Weldon?" cried Dick Sand, walking toward the American.

"Alas!" replied Harris, pretending a pity that he did not feel, "the poor mother! How could she survive!"

"Dead!" cried Dick Sand. "And her child?"

"The poor baby!" replied Harris, in the same tone, "how could he outlive such fatigue!"

So, all whom Dick Sand loved were dead!

What passed within him? An irresistible movement of anger, a desire for vengeance, which he must satisfy at any price!

Dick Sand jumped upon Harris, seized a dagger from the American's belt, and plunged it into his heart.

"Curse you!" cried Harris, falling.

Harris was dead.

CHAPTER X.

THE GREAT MARKET DAY.

Dick Sand's action had been so rapid that no one could stop him. A few natives threw themselves upon him, and he would have been murdered had not Negoro appeared.

At a sign from the Portuguese, the natives drew back, raised Harris's corpse and carried it away. Alvez and Coimbra demanded Dick Sand's immediate death, but Negoro said to them in a low voice that they would lose nothing by waiting. The order was given to take away the young novice, with a caution not to lose sight of him for a moment.

Dick Sand had seen Negoro for the first time since their departure from the coast. He knew that this wretch was alone responsible for the loss of the "Pilgrim." He ought to hate him still more than his accomplices. And yet, after having struck the American, he scorned to address a word to Negoro. Harris had said that Mrs. Weldon and her child had succumbed. Nothing interested him now, not even what they would do with him. They would send him away. Where? It did not matter.
Dick Sand, heavily chained, was left on the floor of a pen without a window, a kind of dungeon where the trader, Alvez, shut up the slaves condemned to death for rebellion or unlawful acts. There he could no longer have any communication with the exterior; he no longer dreamed of regretting it. He had avenged those whom he loved, who no longer lived. Whatever fate awaited him, he was ready for it.

It will be understood that if Negoro had stopped the natives who were about to punish Harris's murderer, it was only because he wished to reserve Dick Sand for one of those terrible torments of which the natives hold the secret. The ship's cook held in his power the captain of fifteen years. He only wanted Hercules to make his vengeance complete.

Two days afterward, May 28th, the sale began, the great "lakoni," during which the traders of the principal factories of the interior would meet the natives of the neighboring provinces. This market was not specially for the sale of slaves, but all the products of this fertile Africa would be gathered there with the producers.

From early morning all was intense animation on the vast "tchitoka" of Kazounde, and it is difficult to give a proper idea of the scene. It was a concourse of four or five thousand persons, including Alvez's slaves, among whom were Tom and his companions. These four men, for the reason that they belonged to a different race, are all the more valuable to the brokers in human flesh. Alvez was there, the first among all. Attended by Coimbra, he offered the slaves in lots. These the traders from the interior would form into caravans. Among these traders were certain half-breeds from Oujiji, the principal market of Lake Tanganyika, and some Arabs, who are far superior to the half-breeds in this kind of trade.

The natives flocked there in great numbers. There were children, men, and women, the latter being animated traders, who, as regards a genius for bargaining, could only be compared to their white sisters.

In the markets of large cities, even on a great day of sale, there is never much noise or confusion. Among the civilized the need of selling exceeds the desire to buy. Among these African savages offers are made with as much eagerness as demands.

The "lakoni" is a festival day for the natives of both sexes, and if for good reasons they do not put on their best clothes, they at least wear their handsomest ornaments.

Some wear the hair divided in four parts, covered with cushions, and in plaits tied like a chignon or arranged in pan-handles on the front of the head with bunches of red feathers. Others have the hair in bent horns sticky with red earth and oil, like the red lead used to close the joints of machines. In these masses of real or false hair is worn a bristling assemblage of skewers, iron and ivory pins, often even, among elegant people, a tattooing-knife is stuck in the crisp mass, each hair of which is put through a "sofi" or glass bead, thus forming a tapestry of different-colored grains. Such are the edifices most generally seen on the heads of the men.

The women prefer to divide their hair in little tufts of the size of a cherry, in wreaths, in twists the ends of which form designs in relief, and in corkscrews, worn the length of the face. A few, more simple and perhaps prettier, let their long hair hang down the back, in the English style, and others wear it cut over the forehead in a fringe, like the French. Generally they wear on these wigs a greasy putty, made of red clay or of glossy "ukola," a red substance extracted from sandal-wood, so that these elegant persons look as if their heads were dressed with tiles.

It must not be supposed that this luxury of ornamentation is confined to the hair of the natives. What are ears for if not to pass pins of precious wood through, also copper rings, charms of plaited maize, which draw them forward, or little gourds which do for snuff-boxes, and to such an extent that the distended lobes of these appendages fall sometimes to the shoulders of their owners?

After all, the African savages have no pockets, and how could they have any? This gives rise to the necessity of placing where they can their knives, pipes, and other customary objects. As for the neck, arms, wrists, legs, and ankles, these various parts of the body are undoubtedly destined to carry the copper and brass bracelets, the horns cut off and decorated with bright buttons, the rows of red pearls, called _same-sames_ or "talakas," and which were very fashionable. Besides, with these jewels, worn in profusion, the wealthy people of the place looked like traveling shrines.

Again, if nature gave the natives teeth, was it not that they could pull out the upper and lower incisors, file them in points, and curve them in sharp fangs like the fangs of a rattlesnake? If she has placed nails at the end of the fingers, is it not that they may grow so immoderately that the use of the hand is rendered almost impossible? If the skin, black or brown, covers the human frame, is it not so as to zebra it by "temmbos" or tattooings representing trees, birds, crescents, full moons, or waving lines, in which Livingstone thought he could trace the designs of ancient Egypt? This tattooing, done by fathers, is practised by means of a blue matter introduced into the incisions, and is "stereotyped" point by point on the bodies of the children, thus establishing to what tribe or to what family they belong. The coat-of-arms must be engraved on the breast, when it cannot be painted on the panel of a carriage.

Such are the native fashions in ornament. In regard to garments properly so called, they are summed up very easily; for the men, an apron of antelope leather, reaching to the knees, or perhaps a petticoat of a straw material of
brilliant colors; for the women, a belt of pearls, supporting at the hips a green petticoat, embroidered in silk, ornamented with glass beads or coury; sometimes they wear garments made of "lambba," a straw material, blue, black, and yellow, which is much prized by the natives of Zanzibar.

These, of course, are the negroes of the best families. The others, merchants, and slaves, are seldom clothed. The women generally act as porters, and reach the market with enormous baskets on their back, which they hold by means of a leathern strap passed over the forehead. Then, their places being taken, and the merchandise unpacked, they squat in their empty baskets.

The astonishing fertility of the country causes the choice alimentary produces to be brought to this "lakoni." There were quantities of the rice which returns a hundred per cent., of the maize, which, in three crops in eight months, produces two hundred per cent., the sesamum, the pepper of Ouroua, stronger than the Cayenne, allspice, tapioca, sorghum, nutmegs, salt, and palm-oil.

Hundreds of goats were gathered there, hogs, sheep without wool, evidently of Tartar origin, quantities of poultry and fish. Specimens of pottery, very gracefully turned, attracted the eyes by their violent colors.

Various drinks, which the little natives cried about in a squeaking voice, enticed the unwary, in the form of plantain wine, "pombe," a liquor in great demand, "malofou," sweet beer, made from the fruit of the banana-tree and mead, a limpid mixture of honey and water fermented with malt.

But what made the Kazounde market still more curious was the commerce in stuffs and ivory.

In the line of stuffs, one might count by thousands of "choukkas" or armfuls, the "Mericani" unbleached calico, come from Salem, in Massachusetts, the "kanaki," a blue gingham, thirty-four inches wide, the "sohari," a stuff in blue and white squares, with a red border, mixed with small blue stripes. It is cheaper than the "dioulis," a silk from Surat, with a green, red or yellow ground, which is worth from seventy to eighty dollars for a remnant of three yards when woven with gold.

As for ivory, it was brought from all parts of Central Africa, being destined for Khartoum, Zanzibar, or Natal. A large number of merchants are employed solely in this branch of African commerce.

Imagine how many elephants are killed to furnish the five hundred thousand kilograms of ivory, which are annually exported to European markets, and principally to the English! The western coast of Africa alone produces one hundred and forty tons of this precious substance. The average weight is twenty-eight pounds for a pair of elephant's tusks, which, in 1874, were valued as high as fifteen hundred francs; but there are some that weigh one hundred and seventy-five pounds, and at the Kazounde market, admirers would have found some admirable ones. They were of an opaque ivory, translucent, soft under the tool, and with a brown rind, preserving its whiteness and not growing yellow with time like the ivories of other provinces.

And, now, how are these various business affairs regulated between buyers and sellers? What is the current coin? As we have said, for the African traders this money is the slave.

The native pays in glass beads of Venetian manufacture, called "catchocolos," when they are of a lime white; "bouboulous," when they are black; "sikounderetches," when they are red. These beads or pearls, strung in ten rows or "khetes," going twice around the neck, make the "foundo," which is of great value. The usual measure of the beads is the "frasilah," which weighs seventy pounds. Livingstone, Cameron, and Stanley were always careful to be abundantly provided with this money.

In default of glass beads, the "pice," a Zanzibar piece, worth four centimes, and the "vroungouas," shells peculiar to the eastern coasts, are current in the markets of the African continent. As for the cannibal tribes, they attach a certain value to the teeth of the human jaw, and at the "lakoni," these chaplets were to be seen on the necks of natives, who had no doubt eaten their producers; but these teeth were ceasing to be used as money.

Such, then, was the appearance of the great market. Toward the middle of the day the gaiety reached a climax; the noise became deafening. The fury of the neglected vendors, and the anger of the overcharged customers, were beyond description. Thence frequent quarrels, and, as we know, few guardians of the peace to quell the fray in this howling crowd.

Toward the middle of the day, Alvez gave orders to bring the slaves, whom he wished to sell, to the square. The crowd was thus increased by two thousand unfortunate beings of all ages, whom the trader had kept in pens for several months. This "stock" was not in a bad condition. Long rest and sufficient food had improved these slaves so as to look to advantage at the "lakoni." As for the last arrivals, they could not stand any comparison with them, and, after a month in the pens, Alvez could certainly have sold them with more profit. The demands, however, from the eastern coast, were so great that he decided to expose and sell them as they were.

This was a misfortune for Tom and his three companions. The drivers pushed them into the crowd that invaded the "tchitoka." They were strongly chained, and their glances told what horror, what fury and shame overwhelmed them.

"Mr. Dick is not there," Bat said, after some time, during which he had searched the vast plain with his eyes.
"No," replied Acteon, "they will not put him up for sale."
"He will be killed, if he is not already," added the old black. "As for us, we have but one hope left, which is, that the same trader will buy us all. It would be a great consolation not to be separated."
"Ah! to know that you are far away from me, working like a slave, my poor, old father!" cried Bat, sobbing aloud.
"No," said Tom. "No; they will not separate us, and perhaps we might----"
"If Hercules were here!" cried Austin.
But the giant had not reappeared. Since the news sent to Dick Sand, they had heard no one mention either Hercules or Dingo. Should they envy him his fate? Why, yes; for if Hercules were dead, he was saved from the chains of slavery!
Meanwhile, the sale had commenced. Alvez's agents marched the various lots of men, women and children through the crowd, without caring if they separated mothers from their infants. May we not call these beings "unfortunates," who were treated only as domestic animals?
Tom and his companions were thus led from buyers to buyers. An agent walked before them naming the price adjudged to their lot. Arab or mongrel brokers, from the central provinces, came to examine them. They did not discover in them the traits peculiar to the African race, these traits being modified in America after the second generation. But these vigorous and intelligent negroes, so very different from the blacks brought from the banks of the Zambeze or the Loualaba, were all the more valuable. They felt them, turned them, and looked at their teeth. Horse-dealers thus examine the animals they wish to buy. Then they threw a stick to a distance, made them run and pick it up, and thus observed their gait.
This was the method employed for all, and all were submitted to these humiliating trials. Do not believe that these people are completely indifferent to this treatment! No, excepting the children, who cannot comprehend the state of degradation to which they are reduced, all, men or women, were ashamed.
Besides, they were not spared injuries and blows. Coimbra, half drunk, and Alvez's agents, treated them with extreme brutality, and from their new masters, who had just paid for them in ivory stuffs and beads, they would receive no better treatment. Violently separated, a mother from her child, a husband from his wife, a brother from a sister, they were not allowed a last caress nor a last kiss, and on the "lakoni" they saw each other for the last time.
In fact, the demands of the trade exacted that the slaves should be sent in different directions, according to their sex. The traders who buy the men do not buy women. The latter, in virtue of polygamy, which is legal among the Mussulmans, are sent to the Arabic countries, where they are exchanged for ivory. The men, being destined to the hardest labor, go to the factories of the two coasts, and are exported either to the Spanish colonies or to the markets of Muscat and Madagascar. This sorting leads to heart-breaking scenes between those whom the agents separate, and who will die without ever seeing each other again.
The four companions in turn submitted to the common fate. But, to tell the truth, they did not fear this event. It was better for them to be exported into a slave colony. There, at least, they might have a chance to protest. On the contrary, if sent to the interior, they might renounce all hope of ever regaining their liberty.
It happened as they wished. They even had the almost unhoped for consolation of not being separated. They were in brisk demand, being wanted by several traders. Alvez clapped his hands. The prices rose. It was strange to see these slaves of unknown value in the Kazounde market, and Alvez had taken good care to conceal where they came from. Tom and his friends, not speaking the language of the country, could not protest.
Their master was a rich Arab trader, who in a few days would send them to Lake Tanganyika, the great thoroughfare for slaves; then, from that point, toward the factories of Zanzibar.
Would they ever reach there, through the most unhealthy and the most dangerous countries of Central Africa? Fifteen hundred miles to march under these conditions, in the midst of frequent wars, raised and carried on between chiefs, in a murderous climate. Was old Tom strong enough to support such misery? Would he not fall on the road like old Nan? But the poor men were not separated. The chain that held them all was lighter to carry. The Arab trader would evidently take care of merchandise which promised him a large profit in the Zanzibar market.
Tom, Bat, Acteon, and Austin then left the place. They saw and heard nothing of the scene which was to end the great "lakoni" of Kazounde.

CHAPTER XI
THE KING OF KAZOUNDE IS OFFERED A PUNCH.
It was four o'clock in the afternoon when a loud noise of drums, cymbals, and other instruments of African origin resounded at the end of the principal street. In all corners of the market-place the animation was redoubled. Half a day of cries and wrestling had neither weakened the voices nor broken the limbs of these abominable traders.
A large number of slaves still remained to be sold. The traders disputed over the lots with an ardor of which the London Exchange would give but an imperfect idea, even on a day when stocks were rising.

All business was stopped, and the criers took their breath as soon as the discordant concert commenced.

The King of Kazounde, Moini Loungga, had come to honor the great "lakoni" with a visit. A numerous train of women, officers, soldiers and slaves followed him. Alvez and some other traders went to meet him, and naturally exaggerated the attention which this crowned brute particularly enjoyed.

Moini Loungga was carried in an old palanquin, and descended, not without the aid of a dozen arms, in the center of the large square.

This king was fifty years old, but he looked eighty. Imagine a frightful monkey who had reached extreme old age; on his head a sort of crown, ornamented with leopard's claws, dyed red, and enlarged by tufts of whitish hair; this was the crown of the sovereigns of Kazounde. From his waist hung two petticoats made of leather, embroidered with pearls, and harder than a blacksmith's apron. He had on his breast a quantity of tattooing which bore witness to the ancient nobility of the king; and, to believe him, the genealogy of Moini Loungga was lost in the night of time. On the ankles, wrists and arms of his majesty, bracelets of leather were rolled, and he wore a pair of domestic shoes with yellow tops, which Alvez had presented him with about twenty years before.

His majesty carried in his left hand a large stick with a plated knob, and in his right a small broom to drive away flies, the handle of which was enriched with pearls.

Over his head was carried one of those old patched umbrellas, which seemed to have been cut out of a harlequin's dress.

On the monarch's neck and on his nose were the magnifying glass and the spectacles which had caused Cousin Benedict so much trouble. They had been hidden in Bat's pocket.

Such is the portrait of his negro majesty, who made the country tremble in a circumference of a hundred miles.

Moini Loungga, from the fact of occupying a throne, pretended to be of celestial origin, and had any of his subjects doubted the fact, he would have sent them into another world to discover it. He said that, being of a divine essence, he was not subject to terrestrial laws. If he ate, it was because he wished to do so; if he drank, it was because it gave him pleasure. It was impossible for him to drink any more. His ministers and his officers, all incurable drunkards, would have passed before him for sober men.

The court was alcoholized to the last chief, and incessantly imbibed strong beer, cider, and, above all, a certain drink which Alvez furnished in profusion.

Moini Loungga counted in his harem wives of all ages and of all kinds. The larger part of them accompanied him in this visit to the "lakoni."

Moini, the first, according to date, was a vixen of forty years, of royal blood, like her colleagues. She wore a bright tartan, a straw petticoat embroidered with pearls, and necklaces wherever she could put them. Her hair was dressed so as to make an enormous framework on her little head. She was, in fact, a monster.

The other wives, who were either the cousins or the sisters of the king, were less richly dressed, but much younger. They walked behind her, ready to fulfil, at a sign from their master, their duties as human furniture. These unfortunate beings were really nothing else. If the king wished to sit down, two of these women bent toward the earth and served him for a chair, while his feet rested on the bodies of some others, as if on an ebony carpet.

In Moini Loungga's suite came his officers, his captains, and his magicians.

A remarkable thing about these savages, who staggered like their master, was that each lacked a part of his body-one an ear, another an eye, this one the nose, that one the hand. Not one was whole. That is because they apply only two kinds of punishment in Kazounde--mutilation or death--all at the caprice of the king. For the least fault, some amputation, and the most cruelly punished are those whose ears are cut off, because they can no longer wear rings in their ears.

The captains of the _kilolos_, governors of districts, hereditary or named for four years, wore hats of zebra skin and red vests for their whole uniform. Their hands brandished long palm canes, steeped at one end with charmed drugs.

As to the soldiers, they had for offensive and defensive weapons, bows, of which the wood, twined with the cord, was ornamented with fringes; knives, whetted with a serpent's tongue; broad and long lances; shields of palm wood, decorated in arabesque style. For what there was of uniform, properly so called, it cost his majesty's treasury absolutely nothing.

Finally, the kind's cortège comprised, in the last place, the court magicians and the instrumentalists.

The sorcerers, the "mganngas," are the doctors of the country. These savages attach an absolute faith to divinatory services, to incantations, to the fetiches, clay figures stained with white and red, representing fantastic animals or figures of men and women cut out of whole wood. For the rest, those magicians were not less mutilated than the other courtiers, and doubtless the monarch paid them in this way for the cures that did not succeed.
The instrumentalists, men or women, made sharp rattles whizz, noisy drums sound or shudder under small sticks
terminated by a caoutchouc ball, "marimehas," kinds of dulcimers formed of two rows of gourds of various
dimensions—the whole very deafening for any one who does not possess a pair of African ears.

Above this crowd, which composed the royal cortège, waved some flags and standards, then at the ends of spears
the bleached skulls of the rival chiefs whom Moini Loungga had vanquished.

When the king had quitted his palanquin, acclamations burst forth from all sides. The soldiers of the caravan
discharged their old guns, the low detonations of which were but little louder than the vociferations of the crowd.
The overseers, after rubbing their black noses with cinnabar powder, which they carried in a sack, bowed to the
ground. Then Alvez, advancing in his turn, handed the king a supply of fresh tobacco—"soothing herb," as they call
it in the country. Moini Loungga had great need of being soothed, for he was, they did not know why, in a very bad
humor.

At the same time Alvez, Coimbra, Ibn Hamis, and the Arab traders, or mongrels, came to pay their court to the
powerful sovereign of Kazounde. "Marhaba," said the Arabs, which is their word of welcome in the language of
Central Africa. Others clapped their hands and bowed to the ground. Some daubed themselves with mud, and gave
signs of the greatest servility to this hideous majesty.

Moini Loungga hardly looked at all these people, and walked, keeping his limbs apart, as if the ground were
rolling and pitching. He walked in this manner, or rather he rolled in the midst of waves of slaves, and if the traders
feared that he might take a notion to apportion some of the prisoners to himself, the latter would no less dread falling
into the power of such a brute.

Negoro had not left Alvez for a moment, and in his company presented his homage to the king. Both conversed
in the native language, if, however, that word "converse" can be used of a conversation in which Moini Loungga
only took part by monosyllables that hardly found a passage through his drunken lips. And still, did he not ask his
friend, Alvez, to renew his supply of brandy just exhausted by large libations?

"King Loungga is welcome to the market of Kazounde," said the trader.
"I am thirsty," replied the monarch.
"He will take his part in the business of the great 'lakoni,'" added Alvez.
"Drink!" replied Moini Loungga.
"My friend Negoro is happy to see the King of Kazounde again, after such a long absence."
"Drink!" repeated the drunkard, whose whole person gave forth a disgusting odor of alcohol.
"Well, some 'pombe! some mead!' exclaimed Jose-Antonio Alvez, like a man who well knew what Moini
Loungga wanted.

"No, no!" replied the king; "my friend Alvez's brandy, and for each drop of his fire-water I shall give him----"
"A drop of blood from a white man!" exclaimed Negoro, after making a sign to Alvez, which the latter
understood and approved.

"A white man! Put a white man to death!" repeated Moini Loungga, whose ferocious instincts were aroused by
the Portuguese's proposition.
"One of Alvez's agents has been killed by this white man," returned Negoro.
"Yes, my agent, Harris," replied the trader, "and his death must be avenged!"
"Send that white man to King Massongo, on the Upper Zaire, among the Assonas. They will cut him in pieces.
They will eat him alive. They have not forgotten the taste of human flesh!" exclaimed Moini Loungga.

He was, in fact, the king of a tribe of man-eaters, that Massongo. It is only too true that in certain provinces of
Central Africa cannibalism is still openly practised. Livingstone states it in his "Notes of Travel." On the borders of
the Loualaba the Manyemas not only eat the men killed in the wars, but they buy slaves to devour them, saying that
"human flesh is easily salted, and needs little seasoning." Those cannibals Cameron has found again among the
Moene-Bongga, where they only feast on dead bodies after steeping them for several days in a running stream.
Stanley has also encountered those customs of cannibalism among the inhabitants of the Oukonson. Cannibalism is
evidently well spread among the tribes of the center.

But, cruel as was the kind of death proposed by the king for Dick Sand, it did not suit Negoro, who did not care
to give up his victim.

"It was here," said he, "that the white man killed our comrade Harris."
"It is here that he ought to die!" added Alvez.
"Where you please, Alvez," replied Moini Loungga; "but a drop of fire-water for a drop of blood!"
"Yes," replied the trader, "fire-water, and you will see that it well merits that name! We shall make it blaze, this
water! Jose-Antonio Alvez will offer a punch to the King Moini Loungga."

The drunkard shook his friend Alvez's hands. He could not contain his joy. His wives, his courtiers shared his
ecstasy. They had never seen brandy blaze, and doubtless they counted on drinking it all blazing. Then, after the
thirst for alcohol, the thirst for blood, so imperious among these savages, would be satisfied also.

Poor Dick Sand! What a horrible punishment awaited him. When we think of the terrible or grotesque effects of intoxication in civilized countries, we understand how far it can urge barbarous beings.

We will readily believe that the thought of torturing a white could displease none of the natives, neither Jose-Antonio Alvez, a negro like themselves, nor Coimbra, a mongrel of black blood, nor Negoro either, animated with a ferocious hatred against the whites.

The evening had come, an evening without twilight, that was going to make day change tonight almost at once, a propitious hour for the blazing of the brandy.

It was truly a triumphant idea of Alvez's, to offer a punch to this negro majesty, and to make him love brandy under a new form. Moini Loungga began to find that fire-water did not sufficiently justify its name. Perhaps, blazing and burning, it would tickle more agreeably the blunted papillas of his tongue.

The evening's program then comprised a punch first, a punishment afterwards.

Dick Sand, closely shut up in his dark prison, would only come out to go to his death. The other slaves, sold or not, had been put back in the barracks. There only remained at the "tchitoka," the traders, the overseers and the soldiers ready to take their part of the punch, if the king and his court allowed them.

Jose-Antonio Alvez, advised by Negoro, did the thing well. They brought a vast copper basin, capable of containing at least two hundred pints, which was placed in the middle of the great place. Barrels holding alcohol of inferior quality, but well refined, were emptied into the basin. They spared neither the cinnamon, nor the allspice, nor any of the ingredients that might improve this punch for savages.

All had made a circle around the king. Moini Loungga advanced staggering to the basin. One would say that this vat of brandy fascinated him, and that he was going to throw himself into it.

Alvez generously held him back and put a lighted match into his hand.

"Fire!" cried he with a cunning grimace of satisfaction.

"Fire!" replied Moini Loungga lashing the liquid with the end of the match.

What a flare and what an effect, when the bluish flames played on the surface of the basin. Alvez, doubtless to render that alcohol still sharper, had mingled with it a few handfuls of sea salt. The assistants' faces were then given that spectral lividity that the imagination ascribes to phantoms.

Those negroes, drunk in advance, began to cry out, to gesticulate, and, taking each other by the hand, formed an immense circle around the King of Kazounde.

Alvez, furnished with an enormous metal spoon, stirred the liquid, which threw a great white glare over those delirious monkeys.

Moini Loungga advanced. He seized the spoon from the trader's hands, plunged it into the basin, then, drawing it out full of punch in flames, he brought it to his lips.

What a cry the King of Kazounde then gave! An act of spontaneous combustion had just taken place. The king had taken fire like a petroleum bonbon. This fire developed little heat, but it devoured none the less.

At this spectacle the natives' dance was suddenly stopped.

One of Moini Loungga's ministers threw himself on his sovereign to extinguish him; but, not less alcoholized than his master, he took fire in his turn.

In this way, Moini Loungga's whole court was in peril of burning up.

Alvez and Negoro did not know how to help his majesty. The women, frightened, had taken flight. As to Coimbra, he took his departure rapidly, well knowing his inflammable nature.

The king and the minister, who had fallen on the ground, were burning up, a prey to frightful sufferings.

In bodies so thoroughly alcoholized, combustion only produces a light and bluish flame, that water cannot extinguish. Even stifled outside, it would still continue to burn inwardly. When liquor has penetrated all the tissues, there exists no means of arresting the combustion.

A few minutes after, Moini Loungga and his minister had succumbed, but they still burned. Soon, in the place where they had fallen, there was nothing left but a few light coals, one or two pieces of the vertebral column, fingers, toes, that the fire does not consume, in cases of spontaneous combustion, but which it covers with an infectious and penetrating soot.

It was all that was left of the King of Kazounde and of his minister.

CHAPTER XII.
A ROYAL BURIAL.

The next day, May 29th, the city of Kazounde presented a strange aspect. The natives, terrified, kept themselves
shut up in their huts. They had never seen a king, who said he was of divine essence, nor a simple minister, die of this horrible death. They had already burned some of their fellow-beings, and the oldest could not forget certain culinary preparations relating to cannibalism.

They knew then how the incineration of a human body takes place with difficulty, and behold their king and his minister had burnt all alone! That seemed to them, and indeed ought to seem to them, inexplicable.

Jose-Antonio Alvez kept still in his house. He might fear that he would be held responsible for the accident. Negoro had informed him of what had passed, warning him to take care of himself. To charge him with Moini Loungga’s death might be a bad affair, from which he might not be able to extricate himself without damage.

But Negoro had a good idea. By his means Alvez spread the report that the death of Kazounde’s sovereign was supernatural; that the great Manitou only reserved it for his elect. The natives, so inclined to superstition, accepted this lie. The fire that came out of the bodies of the king and his minister became a sacred fire. They had nothing to do but honor Moini Loungga by obsequies worthy of a man elevated to the rank of the gods.

These obsequies, with all the ceremonial connected with them among the African tribes, was an occasion offered to Negoro to make Dick Sand play a part. What this death of Moini Loungga was going to cost in blood, would be believed with difficulty, if the Central Africa travelers, Lieutenant Cameron among others, had not related facts that cannot be doubted.

The King of Kazounde’s natural heir was the Queen Moini. In proceeding without delay with the funeral ceremonies she acted with sovereign authority, and could thus distance the competitors, among others that King of the Oukonson, who tended to encroach upon the rights of Kazounde’s sovereigns. Besides, Moini, even by becoming queen, avoided the cruel fate reserved for the other wives of the deceased; at the same time she would get rid of the youngest ones, of whom she, first in date, had necessarily to complain. This result would particularly suit the ferocious temperament of that vixen. So she had it announced, with deer’s horns and other instruments, that the obsequies of the defunct king would take place the next evening with all the usual ceremony.

No protestation was made, neither at court nor from the natives. Alvez and the other traders had nothing to fear from the accession of this Queen Moini. With a few presents, a few flattering remarks, they would easily subject her to their influence. Thus the royal heritage was transmitted without difficulty. There was terror only in the harem, and not without reason.

The preparatory labors for the funeral were commenced the same day. At the end of the principal street of Kazounde flowed a deep and rapid stream, an affluent of the Coango. The question was to turn this stream aside, so as to leave its bed dry. It was in that bed that the royal grave must be dug. After the burial the stream would be restored to its natural channel.

The natives were busily employed in constructing a dam, that forced the stream to make a provisional bed across the plain of Kazounde. At the last tableau of this funeral ceremony the barricade would be broken, and the torrent would take its old bed again.

Negoro intended Dick Sand to complete the number of victims sacrificed on the king's tomb. He had been a witness of the young novice's irresistible movement of anger, when Harris had acquainted him with the death of Mrs. Weldon and little Jack.

Negoro, cowardly rascal, had not exposed himself to the same fate as his accomplice. But now, before a prisoner firmly fastened by the feet and hands, he supposed he had nothing to fear, and resolved to pay him a visit. Negoro was one of those miserable wretches who are not satisfied with torturing their victims; they must also enjoy their sufferings.

Toward the middle of the day, then, he repaired to the barrack where Dick Sand was guarded, in sight of an overseer. There, closely bound, was lying the young novice, almost entirely deprived of food for twenty-four hours, weakened by past misery, tortured by those bands that entered into his flesh; hardly able to turn himself, he was waiting for death, no matter how cruel it might be, as a limit to so many evils.

However, at the sight of Negoro he shuddered from head to foot. He made an instinctive effort to break the bands that prevented him from throwing himself on that miserable man and having revenge.

But Hercules himself would not succeed in breaking them. He understood that it was another kind of contest that was going to take place between the two, and arming himself with calmness, Dick Sand compelled himself to look Negoro right in the face, and decided not to honor him with a reply, no matter what he might say.

"I believed it to be my duty," Negoro said to him it first, "to come to salute my young captain for the last time, and to let him know how I regret, for his sake, that he does not command here any longer, as he commanded on board the 'Pilgrim.'"

And, seeing that Dick Sand did not reply:

"What, captain, do you no longer recognize your old cook? He comes, however, to take your orders, and to ask you what he ought to serve for your breakfast."
At the same time Negoro brutally kicked the young novice, who was lying on the ground.

"Besides," added he, "I should have another question to address to you, my young captain. Could you yet explain to me, how, wishing to land on the American coast, you have ended by arriving in Angola, where you are?"

Certainly, Dick Sand had no more need of the Portuguese's words to understand what he had truly divined, when he knew at last that the "Pilgrim's" compass must have been made false by this traitor. But Negoro's question was an avowal. Still he only replied by a contemptuous silence.

"You will acknowledge, captain," continued Kegoro, "that it was fortunate for you that there was a seaman on board—a real one, at that. Great God, where would we be without him? Instead of perishing on some breaker, where the tempest would have thrown you, you have arrived, thanks to him, in a friendly port, and if it is to any one that you owe being at last in a safe place, it is to that seaman whom you have wronged in despising, my young master!"

Speaking thus, Negoro, whose apparent calmness was only the result of an immense effort, had brought his form near Dick Sand. His face, suddenly become ferocious, touched him so closely that one would believe that he was going to devour him. This rascal could no longer contain his fury.

"Every dog has his day!" he exclaimed, in the paroxysm of fury excited in him by his victim's calmness. "To-day I am captain, I am master! Your life is in my hands!"

"Take it," Sand replied, without emotion. "But, know there is in heaven a God, avenger of all crimes, and your punishment is not distant!"

"If God occupies himself with human beings, there is only time for Him to take care of you!"

"I am ready to appear before the Supreme Judge," replied Dick Sand, coldly, "and death will not make me afraid."

"We shall see about that!" howled Negoro. "You count on help of some kind, perhaps—help at Kazounde, where Alvez and I are all-powerful! You are a fool! You say to yourself, perhaps, that your companions are still there, that old Tom and the others. Undeceive yourself. It is a long time since they were sold and sent to Zanzibar—too fortunate if they do not die of fatigue on the way!"

"God has a thousand ways of doing justice," replied Dick Sand. "The smallest instrument is sufficient for him. Hercules is free."

"Hercules!" exclaimed Negoro, striking the ground with his foot; "he perished long ago under the lions' and panthers' teeth. I regret only one thing, that is, that those ferocious beasts should have forestalled my vengeance!"

"If Hercules is dead," replied Dick Sand, "Dingo is alive. A dog like that, Negoro, is more than enough to take revenge on a man of your kind. I know you well, Negoro; you are not brave. Dingo will seek for you; it will know how to find you again. Some day you will die under his teeth!"

"Miserable boy!" exclaimed the Portuguese, exasperated. "Miserable boy! Dingo died from a ball that I fired at it. It is dead, like Mrs. Weldon and her son; dead, as all the survivors of the 'Pilgrim' shall die!"

"And as you yourself shall die before long," replied Dick Sand, whose tranquil look made the Portuguese grow pale.

Negoro, beside himself, was on the point of passing from words to deeds, and strangling his unarmed prisoner with his hands. Already he had sprung upon him, and was shaking him with fury, when a sudden reflection stopped him. He remembered that he was going to kill his victim, that all would be over, and that this would spare him the twenty-four hours of torture he intended for him. He then stood up, said a few words to the overseer, standing impassive, commanded him to watch closely over the prisoner, and went out of the barrack.

Instead of casting him down, this scene had restored all Dick Sand's moral force. His physical energy underwent a happy reaction, and at the same time regained the mastery. In bending over him in his rage, had Negoro slightly loosened the bands that till then had rendered all movement impossible? It was probable, for Dick Sand thought that his members had more play than before the arrival of his executioner. The young novice, feeling solaced, said to himself that perhaps it would be possible to get his arms free without too much effort. Guarded as he was, in a prison firmly shut, that would doubtless be only a torture—only a suffering less; but it was such a moment in life when the smallest good is invaluable.

Certainly, Dick Sand hoped for nothing. No human succor could come to him except from outside, and whence could it come to him? He was then resigned. To tell the truth, he no longer cared to live. He thought of all those who had met death before him, and he only aspired to join them. Negoro had just repeated what Harris had told him: "Mrs. Weldon and little Jack had succumbed." It was, indeed, only too probable that Hercules, exposed to so many dangers, must have perished also, and from a cruel death. Tom and his companions were at a distance, forever lost to him—Dick Sand ought to believe it. To hope for anything but the end of his troubles, by a death that could not be more terrible than his life, would be signal folly. He then prepared to die, above all throwing himself upon God, and asking courage from Him to go on to the end without giving way. But thoughts of God are good and noble thoughts! It is not in vain that one lifts his soul to Him who can do all, and, when Dick Sand had offered his whole sacrifice,
he found that, if one could penetrate to the bottom of his heart, he might perhaps discover there a last ray of hope—that glimmer which a breath from on high can change, in spite of all probabilities, into dazzling light.

The hours passed away. Night came. The rays of light, that penetrated through the thatch of the barrack, gradually disappeared. The last noises of the "tchitoka," which, during that day had been very silent, after the frightful uproar of the night before—those last noises died out. Darkness became very profound in the interior of the narrow prison. Soon all reposed in the city of Kazounde.

Dick Sand fell into a restoring sleep, that lasted two hours. After that he awoke, still stronger. He succeeded in freeing one of his arms from their bands—it was already a little reduced—and it was a delight for him to be able to extend it and draw it back at will.

The night must be half over. The overseer slept with heavy sleep, due to a bottle of brandy, the neck of which was still held in his shut hand. The savage had emptied it to the last drop. Dick Sand's first idea was to take possession of his jailer's weapons, which might be of great use to him in case of escape; but at that moment he thought he heard a slight scratching at the lower part of the door of the barrack. Helping himself with his arms, he succeeded in crawling as far as the door-sill without waking the overseer.

Dick Sand was not mistaken. The scratching continued, and in a more distinct manner. It seemed that from the outside some one was digging the earth under the door. Was it an animal? Was it a man?

"Hercules! If it were Hercules!" the young novice said to himself.

His eyes were fixed on his guard; he was motionless, and under the influence of a leaden sleep. Dick Sand, bringing his lips to the door-sill, thought he might risk murmuring Hercules's name. A moan, like a low and plaintive bark, replied to him.

"It is not Hercules," said Dick to himself, "but it is Dingo. He has scented me as far as this barrack. Should he bring me another word from Hercules? But if Dingo is not dead, Negoro has lied, and perhaps—"

At that moment a paw passed under the door. Dick Sand seized it, and recognized Dingo's paw. But, if it had a letter, that letter could only be attached to its neck. What to do? Was it possible to make that hole large enough for Dingo to put in its head? At all events, he must try it.

But hardly had Dick Sand begun to dig the soil with his nails, than barks that were not Dingo's sounded over the place. The faithful animal had just been scented by the native dogs, and doubtless could do nothing more than take to flight. Some detonations burst forth. The overseer half awoke. Dick Sand, no longer able to think of escaping, because the alarm was given, must then roll himself up again in his corner, and, after a lovely hope, he saw appear that day which would be without a to-morrow for him.

During all that day the grave-diggers' labors were pushed on with briskness. A large number of natives took part, under the direction of Queen Moini's first minister. All must be ready at the hour named, under penalty of mutilation, for the new sovereign promised to follow the defunct king's ways, point by point.

The ceremony would take place with torches and with great pomp. The whole population of Kazounde, native or not, must assist at it.
The body of the king, laid in a palanquin, was carried in the last ranks of the cortège. It was surrounded by his wives of the second order, some of whom were going to accompany him beyond this life. Queen Moini, in great state, marched behind what might be called the catafalque. It was positively night when all the people arrived on the banks of the brook; but the resin torches, shaken by the porters, threw great bursts of light over the crowd.

The ditch was seen distinctly. It was carpeted with black, living bodies, for they moved under the chains that bound them to the ground. Fifty slaves were waiting there till the torrent should close over them. The majority were young natives, some resigned and mute, others giving a few groans. The wives all dressed as for a _fête_, and who must perish, had been chosen by the queen.

One of these victims, she who bore the title of second wife, was bent on her hands and knees, to serve as a royal footstool, as she had done in the king's lifetime. The third wife came to hold up the manikin, while the fourth lay at its feet, in the guise of a cushion.

Before the manikin, at the end of the ditch, a post, painted red, rose from the earth. To this post was fastened a white man, who was going to be counted also among the victims of these bloody obsequies.

That white man was Dick Sand. His body, half naked, bore the marks of the tortures he had already suffered by Negoro's orders. Tied to this post, he waited for death like a man who has no hope except in another life.

However, the moment had not yet arrived when the barricade would be broken.

On a signal from the queen, the fourth wife, she who was placed at the king's feet, was beheaded by Kazounde's executioner, and her blood flowed into the ditch. It was the beginning of a frightful scene of butchery. Fifty slaves fell under the executioner's knife. The bed of the river ran waves of blood.

During half an hour the victims' cries mingled with the assistants' vociferations, and one would seek in vain in that crowd for a sentiment of repugnance or of pity.

At last Queen Moini made a gesture, and the barricade that held back the upper waters gradually opened. By a refinement of cruelty, the current was allowed to filter down the river, instead of being precipitated by an instantaneous bursting open of the dam. Slow death instead of quick death!

The water first drowned the carpet of slaves which covered the bottom of the ditch. Horrible leaps were made by those living creatures, who struggled against asphyxia. They saw Dick Sand, submerged to the knees, make a last effort to break his bonds. But the water mounted. The last heads disappeared under the torrent, that took its course again, and nothing indicated that at the bottom of this river was dug a tomb, where one hundred victims had just perished in honor of Kazounde's king.

The pen would refuse to paint such pictures, if regard for the truth did not impose the duty of describing them in their abominable reality. Man is still there, in those sad countries. To be ignorant of it is not allowable.

* * * * *

CHAPTER XIII.

THE INTERIOR OF A FACTORY.

Harris and Negoro had told a lie in saying that Mrs. Weldon and little Jack were dead. She, her son, and Cousin Benedict were then in Kazounde.

After the assault on the ant-hill, they had been taken away beyond the camp on the Coanza by Harris and Negoro, accompanied by a dozen native soldiers.

A palanquin, the "kitanda" of the country, received Mrs. Weldon and little Jack. Why such care on the part of such a man as Negoro? Mrs. Weldon was afraid to explain it to herself.

The journey from the Counza to Kazounde was made rapidly and without fatigue. Cousin Benedict, on whom trouble seemed to have no effect, walked with a firm step. As he was allowed to search to the right and to the left, he did not think of complaining. The little troop, then, arrived at Kazounde eight days before Ibn Hamis's caravan. Mrs. Weldon was shut up, with her child and Cousin Benedict, in Alvez's establishment.

Little Jack was much better. On leaving the marshy country, where he had taken the fever, he gradually became better, and now he was doing well. No doubt neither he nor his mother could have borne the hardships of the caravan; but owing to the manner in which they had made this journey, during which they had been given a certain amount of care, they were in a satisfactory condition, physically at least.

As to her companions, Mrs. Weldon had heard nothing of them. After having seen Hercules flee into the forest, she did not know what had become of him. As to Dick Sand, as Harris and Negoro were no longer there to torture him, she hoped that his being a white man would perhaps spare him some bad treatment. As to Nan, Tom, Bat, Austin, and Acteon, they were blacks, and it was too certain that they would be treated as such. Poor people! who should never have trodden that land of Africa, and whom treachery had just cast there.

When Ibn Hamis's caravan had arrived at Kazounde, Mrs. Weldon, having no communication with the outer
him to her heart, while covering him with kisses. All that she could do was not to cry before him.

indeed, to have deserted him. He wished to see his comrade, Dick Sand, again. His young imagination was very

misfortune.

natural to his age. He rarely quitted his mother, who did not like to leave him alone, and always dreaded some

Little Jack often spoke of his father, whom he had not seen for so long. He asked to be taken back to him. He
inquired after all, for old Nan, for his friend Hercules, for Bat, for Austin, for Acteon, and for Dingo, that appeared,
indeed, to have deserted him. He wished to see his comrade, Dick Sand, again. His young imagination was very
much affected, and only lived in those remembrances. To his questions Mrs. Weldon could only reply by pressing
him to her heart, while covering him with kisses. All that she could do was not to cry before him.
Meanwhile, Mrs. Weldon had not failed to observe that, if bad treatment had been spared her during the journey from the Coanza, nothing in Alvez's establishment indicated that there would be any change of conduct in regard to her. There were in the factory only the slaves in the trader's service. All the others, which formed the object of his trade, had been penned up in the barrack of the _tchitoka_, then sold to the brokers from the interior.

Now, the storehouses of the establishment were overflowing with stuffs and ivory. The stuffs were intended to be exchanged in the provinces of the center, the ivory to be exported from the principal markets of the continent.

In fact, then, there were few people in the factory. Mrs. Weldon and Jack occupied a hut apart; Cousin Benedict another. They did not communicate with the trader's servants. They ate together. The food, consisting of goat's flesh or mutton, vegetables, tapioca, _sorgho_, and the fruits of the country, was sufficient.

Halima, a young slave, was especially devoted to Mrs. Weldon's service. In her way, and as she could, she even evinced for her a kind of savage, but certainly sincere, affection.

Mrs. Weldon hardly saw Jose-Antonio Alvez, who occupied the principal house of the factory. She did not see Negoro at all, as he lodged outside; but his absence was quite inexplicable. This absence continued to astonish her, and make her feel anxious at the same time.

"What does he want? What is he waiting for?" she asked herself. "Why has he brought us to Kazounde?"

So had passed the eight days that preceded and followed the arrival of Ibn Hamis's caravan—that is, the two days before the funeral ceremonies, and the six days that followed.

In the midst of so many anxieties, Mrs. Weldon could not forget that her husband must be a prey to the most frightful despair, on not seeing either his wife or his son return to San Francisco. Mr. Weldon could not know that his wife had adopted that fatal idea of taking passage on board the "Pilgrim," and he would believe that she had embarked on one of the steamers of the Trans-Pacific Company. Now, these steamers arrived regularly, and neither Mrs. Weldon, nor Jack, nor Cousin Benedict were on them. Besides, the "Pilgrim" itself was already overdue at Sun Francisco. As she did not reappear, James W. Weldon must now rank her in the category of ships supposed to be lost, because not heard of.

What a terrible blow for him, when news of the departure of the "Pilgrim" and the embarkation of Mrs. Weldon should reach him from his correspondents in Auckland! What had he done? Had he refused to believe that his son and she had perished at sea? But then, where would he search? Evidently on the isles of the Pacific, perhaps on the American coast. But never, no never, would the thought occur to him that she had been thrown on the coast of this fatal Africa!

So thought Mrs. Weldon. But what could she attempt? Flee! How? She was closely watched. And then to flee was to venture into those thick forests, in the midst of a thousand dangers, to attempt a journey of more than two hundred miles to reach the coast. And meanwhile Mrs. Weldon was decided to do it, if no other means offered themselves for her to recover her liberty. But, first, she wished to know exactly what Negoro's designs were.

At last she knew them.

On the 6th of June, three days after the burial of Kazounde's king, Negoro entered the factory, where he had not yet set foot since his return. He went right to the hut occupied by his prisoner.

Mrs. Weldon was alone. Cousin Benedict was taking one of his scientific walks. Little Jack, watched by the slave Halima, was walking in the enclosure of the establishment.

Negoro pushed open the door of the hut without knocking.

"Mrs. Weldon," said he, "Tom and his companions have been sold for the markets of Oujiji!"

"May God protect them!" said Mrs. "Weldon, shedding tears.

"Nan died on the way, Dick Sand has perished----"

"Nan dead! and Dick!" cried Mrs. Weldon.

"Yes, it is just for your captain of fifteen to pay for Harris's murder with his life," continued Negoro. "You are alone in Kazounde, mistress; alone, in the power of the 'Pilgrim' old cook—absolutely alone, do you understand?"

What Negoro said was only too true, even concerning Tom and his friends. The old black man, his son Bat, Acteon and Austin had departed the day before with the trader of Oujiji's caravan, without the consolation of seeing Mrs. Weldon again, without even knowing that their companion in misery was in Kazounde, in Alvez's establishment. They had departed for the lake country, a journey figured by hundreds of miles, that very few accomplish, and from which very few return.

"Well?" murmured Mrs. Weldon, looking at Negoro without answering.

"Mrs. Weldon," returned the Portuguese, in an abrupt voice, "I could revenge myself on you for the bad treatment I suffered on board the 'Pilgrim.' But Dick Sand's death will satisfy my vengeance. Now, mistress, I become the merchant again, and behold my projects with regard to you."

Mrs. Weldon looked at him without saying a word.

"You," continued the Portuguese, "your child, and that imbecile who runs after the flies, you have a commercial
"I am of a free race," replied Mrs. Weldon, in a firm tone. "You are a slave, if I wish it."
"And who would buy a white woman?"
"A man who will pay for her whatever I shall ask him."
Mrs. Weldon bent her head for a moment, for she knew that anything was possible in that frightful country. "You have heard?" continued Negoro. "Who is this man to whom you will pretend to sell me?" replied Mrs. Weldon.
"To sell you or to re-sell you. At least, I suppose so!" added the Portuguese, sneering.
"The name of this man?" asked Mrs. Weldon. "This man—he is James W. Weldon, your husband."
"My husband!" exclaimed Mrs. Weldon, who could not believe what she had just heard. "Himself, Mrs. Weldon—your husband, to whom I do not wish simply to restore his wife, his child, and his cousin, but to sell them, and, at a high price."

Mrs. Weldon asked herself if Negoro was not setting a trap for her. However, she believed he was speaking seriously. To a wretch to whom money is everything, it seems that we can trust, when business is in question. Now, this was business.
"And when do you propose to make this business operation?" returned Mrs. Weldon. "As soon as possible."
"Where?"
"Just here. Certainly James Weldon will not hesitate to come as far as Kazounde for his wife and son."
"No, he will not hesitate. But who will tell him?"
"I! I shall go to San Francisco to find James Weldon. I have money enough for this voyage."
"The money stolen from on board the 'Pilgrim'?"
"Yes, that, and more besides," replied Negoro, insolently. "But, if I wish to sell you soon, I also wish to sell you at a high price. I think that James Weldon will not regard a hundred thousand dollars——"
"He will not regard them, if he can give them," replied Mrs. Weldon, coldly. "Only my husband, to whom you will say, doubtless, that I am held a prisoner at Kazounde, in Central Africa——"
"Precisely!"
"My husband will not believe you without proofs, and he will not be so imprudent as to come to Kazounde on your word alone."
"He will come here," returned Negoro, "if I bring him a letter written by you, which will tell him your situation, which will describe me as a faithful servant, escaped from the hands of these savages."
"My hand shall never write that letter!" Mrs. Weldon replied, in a still colder manner. "You refuse?" exclaimed Negoro. "I refuse!"

The thought of the dangers her husband would pass through in coming as far as Kazounde, the little dependence that could be placed on the Portuguese's promises, the facility with which the latter could retain James Weldon, after taking the ransom agreed upon, all these reasons taken together made Mrs. Weldon refuse Negoro's proposition flatly and at once. Mrs. Weldon spoke, thinking only of herself, forgetting her child for the moment.
"You shall write that letter!" continued the Portuguese. "No!" replied Mrs. Weldon again. "Ah, take care!" exclaimed Negoro. "You are not alone here! Your child is, like you, in my power, and I well know how——"

Mrs. Weldon wished to reply that that would be impossible. Her heart was beating as if it would break; she was voiceless.

"Mrs. Weldon," said Negoro, "you will reflect on the offer I have made you. In eight days you will have handed me a letter to James Weldon's address, or you will repent of it."
That said, the Portuguese retired, without giving vent to his anger; but it was easy to see that nothing would stop him from constraining Mrs. Weldon to obey him.

CHAPTER XIV.
SOME NEWS OF DR. LIVINGSTONE.
Left alone, Mrs. Weldon at first only fixed her mind on this thought, that eight days would pass before Negoro would return for a definite answer. There was time to reflect and decide on a course of action. There could be no
question of the Portuguese's probity except in his own interest. The "market value" that he attributed to his prisoner would evidently be a safeguard for her, and protect her for the time, at least, against any temptation that might put her in danger. Perhaps she would think of a compromise that would restore her to her husband without obliging Mr. Weldon to come to Kazounde. On receipt of a letter from his wife, she well knew that James Weldon would set out. He would brave the perils of this journey into the most dangerous countries of Africa. But, once at Kazounde, when Negoro should have that fortune of a hundred thousand dollars in his hands, what guaranty would James W. Weldon, his wife, his son and Cousin Benedict have, that they would be allowed to depart? Could not Queen Moini's caprice prevent them? Would not this "sale" of Mrs. Weldon and hers be better accomplished if it took place at the coast, at some point agreed upon, which would spare Mr. Weldon both the dangers of the journey to the interior, and the difficulties, not to say the impossibilities, of a return?

So reflected Mrs. Weldon. That was why she had refused at once to accede to Negoro's proposition and give him a letter for her husband. She also thought that, if Negoro had put off his second visit for eight days, it was because he needed that time to prepare for his journey. If not, he would return sooner to force her consent.

"Would he really separate me from my child?" murmured she.

At that moment Jack entered the hut, and, by an instinctive movement, his mother seized him, as if Negoro were there, ready to snatch him from her.

"You are in great grief, mother?" asked the little boy.
"No, dear Jack," replied Mrs. Weldon; "I was thinking of your papa! You would be very glad to see him again?"
"Oh! yes, mother! Is he going to come?"
"No! no! He must not come!"
"Then we will go to see him again?"
"Yes, darling Jack!"
"With my friend Dick--and Hercules--and old Tom?"
"Yes! yes!" replied Mrs. Weldon, putting her head down to hide her tears.
"Has papa written to you?" asked little Jack.
"No, my love."
"Then you are going to write to him, mother?"
"Yes--yes--perhaps!" replied Mrs. Weldon.

And without knowing it, little Jack entered directly into his mother's thoughts. To avoid answering him further, she covered him with kisses.

It must be stated that another motive of some value was joined to the different reasons that had urged Mrs. Weldon to resist Negoro's injunctions. Perhaps Mrs. Weldon had a very unexpected chance of being restored to liberty without her husband's intervention, and even against Negoro's will. It was only a faint ray of hope, very vague as yet, but it was one.

In fact, a few words of conversation, overheard by her several days before, made her foresee a possible succor near at hand—one might say a providential succor.

Alvez and a mongrel from Oujiji were talking a few steps from the hut occupied by Mrs. Weldon. It is not astonishing that the slave-trade was the subject of conversation between those worthy merchants. The two brokers in human flesh were talking business. They were discussing the future of their commerce, and were worried about the efforts the English were making to destroy it—not only on the exterior, by cruisers, but in the interior, by their missionaries and their travelers.

Jose-Antonio Alvez found that the explorations of these hardy pioneers could only injure commercial operations. His interlocutor shared his views, and thought that all these visitors, civil or religious, should be received with gun-shots.

This had been done to some extent. But, to the great displeasure of the traders, if they killed some of these curious ones, others escaped them. Now, these latter, on returning to their country, recounted "with exaggerations," Alvez said, the horrors of the slave-trade, and that injured this commerce immensely—it being too much diminished already.

The mongrel agreed to that, and deplored it; above all, concerning the markets of N'yangwe, of Oujiji, of Zanzibar, and of all the great lake regions. There had come successively Speke, Grant, Livingstone, Stanley, and others. It was an invasion! Soon all England and all America would occupy the country!

Alvez sincerely pitied his comrade, and he declared that the provinces of Western Africa had been, till that time, less badly treated—that is to say, less visited; but the epidemic of travelers was beginning to spread. If Kazounde had been spared, it was not so with Cassange, and with Bihe, where Alvez owned factories. It may be remembered, also, that Harris had spoken to Negoro of a certain Lieutenant Cameron, who might, indeed, have the presumption to cross Africa from one side to the other, and after entering it by Zanzibar, leave it by Angola.
In fact, the trader had reason to fear, and we know that, some years after, Cameron to the south and Stanley to the north, were going to explore these little-known provinces of the west, describe the permanent monstrosities of the trade, unveil the guilty complicities of foreign agents, and make the responsibility fall on the right parties.

Neither Alvez nor the mongrel could know anything yet of this exploration of Cameron's and of Stanley's; but what they did know, what they said, what Mrs. Weldon heard, and what was of such great interest to her--in a word, what had sustained her in her refusal to subscribe at once to Negoro's demands, was this:

Before long, very probably, Dr. David Livingstone would arrive at Kazounde.

Now, the arrival of Livingstone with his escort, the influence which the great traveler enjoyed in Africa, the concourse of Portuguese authorities from Angola that could not fail to meet him, all that might bring about the deliverance of Mrs. Weldon and hers, in spite of Negoro, in spite of Alvez. It was perhaps their restoration to their country within a short time, and without James W. Weldon risking his life in a journey, the result of which could only be deplorable.

But was there any probability that Dr. Livingstone would soon visit that part of the continent? Yes, for in following that missionary tour, he was going to complete the exploration of Central Africa.

We know the heroic life of this son of the tea merchant, who lived in Blantyre, a village in the county of Lanark. Born on the 13th of March, 1813, David Livingstone, the second of six children, became, by force of study, both a theologian and doctor. After making his novitiate in the "London Missionary Society," he embarked for the Cape in 1840, with the intention of joining the missionary Moffat in Southern Africa.

From the Cape, the future traveler repaired to the country of the Bechnanas, which he explored for the first time, returned to Kuruman and married Moffat's daughter, that brave companion who would be worthy of him. In 1843 he founded a mission in the valley of the Mabotsa.

Four years later, we find him established at Kolobeng, two hundred and twenty-five miles to the north of Kuruman, in the country of the Bechnanas.

Two years after, in 1849, Livingstone left Kolobeng with his wife, his three children and two friends, Messrs. Oswell and Murray. August 1st, of the same year, he discovered Lake N'gami, and returned to Kolobeng, by descending the Zouga.

In this journey Livingstone, stopped by the bad will of the natives, had not passed beyond the N'gami. A second attempt was not more fortunate. A third must succeed. Then, taking a northern route, again with his family and Mr. Oswell, after frightful sufferings (for lack of food, for lack of water) that almost cost him the lives of his children, he reached the country of the Makalolos beside the Chobe, a branch of the Zambezi. The chief, Sebituane, joined him at Linyanti. At the end of June, 1851, the Zambezi was discovered, and the doctor returned to the Cape to bring his family to England.

In fact, the intrepid Livingstone wished to be alone while risking his life in the daring journey he was going to undertake.

On leaving the Cape this time, the question was to cross Africa obliquely from the south to the west, so as to reach Saint Paul de Loanda.

On the third of June, 1852, the doctor set out with a few natives. He arrived at Kuruman and skirted the Desert of Kalahari. The 31st December he entered Litoubarouba and found the country of the Bechnanas ravaged by the Boers, old Dutch colonists, who were masters of the Cape before the English took possession of it.

Livingstone left Litoubarouba on the 15th of January, 1853, penetrated to the center of the country of the Bamangouatos, and, on May 23d, he arrived at Linyanti, where the young sovereign of the Makalolos, Sckeleton, received him with great honor.

There, the doctor held back by the intense fevers, devoted himself to studying the manners of the country, and, for the first time, he could ascertain the ravages made by the slave-trade in Africa.

One month after he descended the Chobe, reached the Zambezi, entered Naniele, visited Katonga and Libonta, arrived at the confluence of the Zambezi and the Leeba, formed the project of ascending by that watercourse as far as the Portuguese possessions of the west, and, after nine weeks' absence, returned to Linyanti to make preparations.

On the 11th of November, 1853, the doctor, accompanied by twenty-seven Makalolos, left Linyanti, and on the 27th of December he reached the mouth of the Leeba. This watercourse was ascended as far as the territory of the Balondas, there where it receives the Makonda, which comes from the east. It was the first time that a white man penetrated into this region.

January 14th, Livingstone entered Shinte's residence. He was the most powerful sovereign of the Balondas. He gave Livingstone a good reception, and, the 26th of the same month, after crossing the Leeba, he arrived at King Katema's. There, again, a good reception, and thence the departure of the little troop that on the 20th of February encamped on the borders of Lake Dilolo.

On setting out from this point, a difficult country, exigencies of the natives, attacks from the tribes, revolt of his
companions, threats of death, everything conspired against Livingstone, and a less energetic man would have abandoned the party. The doctor persevered, and on the 4th of April, he reached the banks of the Coango, a large watercourse which forms the eastern boundary of the Portuguese possessions, and flows northward into the Zaire.

Six days after, Livingstone entered Cassange, where the trader Alvez had seen him passing through, and on the 31st of May he arrived at Saint Paul de Loanda. For the first time, and after a journey of two years, Africa had just been crossed obliquely from the south to the west.

David Livingstone left Loanda, September 24th of the same year. He skirted the right bank of that Coanza that had been so fatal to Dick Sand and his party, arrived at the confluence of the Lombe, crossing numerous caravans of slaves, passed by Cassange again, left it on the 20th of February, crossed the Coango, and reached the Zambezi at Kawawa. On the 8th of June he discovered Lake Dilolo again, saw Shinte again, descended the Zambezi, and reentered Linyanti, which he left on the 3d of November, 1855.

This second part of the journey, which would lead the doctor toward the eastern coast, would enable him to finish completely this crossing of Africa from the west to the east.

After having visited the famous Victoria Falls, the "thundering foam," David Livingstone abandoned the Zambezi to take a northeastern direction. The passage across the territory of the Batokas (natives who were besotted by the inhalation of hemp), the visit to Semalembone (the powerful chief of the region), the crossing of the Kafone, the finding of the Zambezi again, the visit to King Mbourouma, the sight of the ruins of Zambo (an ancient Portuguese city), the encounter with the Chief Mpende on the 17th of January, 1856 (then at war with the Portuguese), the final arrival at Tete, on the border of the Zambezi, on the 2d of March—such were the principal halting-places of this tour.

The 22d of April Livingstone left that station, formerly a rich one, descended as far as the delta of the river, and arrived at Quilimane, at its mouth, on the 20th of May, four years after leaving the Cape. On the 12th of July he embarked for Maurice, and on the 22d of December he was returning to England, after sixteen years' absence.

The prize of the Geographical Society of Paris, the grand medal of the London Geographical Society, and brilliant receptions greeted the illustrious traveler. Another would, perhaps, have thought that repose was well earned. The doctor did not think so, and departed on the 1st of March, 1858, accompanied by his brother Charles, Captain Bedinfield, the Drs. Kirk and Meller, and by Messrs. Thornton and Baines. He arrived in May on the coast of Mozambique, having for an object the exploration of the basin of the Zambezi.

All would not return from this voyage. A little steamer, the "My Robert," enabled the explorers to ascend the great river by the Rongone. They arrived at Tete, September the 8th; thence reconnaissance of the lower course of the Zambezi and of the Chire, its left branch, in January, 1859; visit to Lake Chirona in April; exploration of the Manganjas' territory; discovery of Lake Nyassa on September 10th; return to the Victoria Falls, August 9th, 1860; arrival of Bishop Mackensie and his missionaries at the mouth of the Zambezi, January 31st, 1861; the exploration of the Rovouma, on the "Pioneer," in March; the return to Lake Nyassa in September, 1861, and residence there till the end of October; January 30th, 1862, arrival of Mrs. Livingstone and a second steamer, the "Lady Nyassa:" such were the events that marked the first years of this new expedition. At this time, Bishop Mackensie and one of his missionaries had already succumbed to the unhealthfulness of the climate, and on the 27th of April, Mrs. Livingstone died in her husband's arms.

In May, the doctor attempted a second reconnaissance of the Rovouma; then, at the end of November, he entered the Zambezi again, and sailed up the Chire again. In April, 1863, he lost his companion, Thornton, sent back to Europe his brother Charles and Dr. Kirk, who were both exhausted by sickness, and November 10th, for the third time, he saw Nyassa, of which he completed the hydrography. Three months after he was again at the mouth of the Zambezi, passed to Zanzibar, and July 20th, 1864, after five years' absence, he arrived in London, where he published his work entitled: "Exploration of the Zambezi and its Branches."

January 28th, 1866, Livingstone landed again at Zanzibar. He was beginning his fourth voyage.

August 8th, after having witnessed the horrible scenes provoked by the slave-trade in that country, the doctor, taking this time only a few _cipayes_ and a few negroes, found himself again at Mokalaose, on the banks of the Nyassa. Six weeks later, the majority of the men forming the escort took flight, returned to Zanzibar, and there falsely spread the report of Livingstone's death.

He, however, did not draw back. He wished to visit the country comprised between the Nyassa and Lake Tanganyika. December 10th, guided by some natives, he traversed the Loangona River, and April 2d, 1867, he discovered Lake Liemmba. There he remained a month between life and death. Hardly well again August 30th he reached Lake Moero, of which he visited the northern shore, and November 21st he entered the town of Cayembe, where he lived forty days, during which he twice renewed his exploration of Lake Moero.

From Cayembe Livingstone took a northern direction, with the design of reaching the important town of Oujiji, on the Tanganyika. Surprised by the rising of the waters, and abandoned by his guides, he was obliged to return to
Cayembe. He redescended to the south June 6th, and six weeks after gained the great lake Bangoneolo. He remained there till August 9th, and then sought to reascend toward Lake Tanganyika.

What a journey! On setting out, January 7th, 1869, the heroic doctor's feebleness was such that he had to be carried. In February he at last reached the lake and arrived at Oujiji, where he found some articles sent to his address by the Oriental Company of Calcutta.

Livingstone then had but one idea, to gain the sources of the valley of the Nile by ascending the Tanganyika. September 21st he was at Bambarre, in the Manonyema, a cannibal country, and arrived at the Loualaba--that Loualaba that Cameron was going to suspect, and Stanley to discover, to be only the upper Zaire, or Congo. At Mamohela the doctor was sick for eighty days. He had only three servants. July 21st, 1871, he departed again for the Tanganyika, and only reentered Oujiji October 23d. He was then a mere skeleton.

Meanwhile, before this period, people had been a long time without news of the traveler. In Europe they believed him to be dead. He himself had almost lost hope of being ever relieved.

Eleven days after his entrance into Oujiji shots were heard a quarter of a mile from the lake. The doctor arrives. A man, a white man, is before him. "Doctor Livingstone, I presume?"

"Yes," replied the latter, raising his cap, with a friendly smile.

Their hands were warmly clasped.

"I thank God," continued the white man, "that He has permitted me to meet you."

"I am happy," said Livingstone, "to be here to receive you."

The white man was the American Stanley, a reporter of the New York _Herald_, whom Mr. Bennett, the proprietor of that journal, had just sent to find David Livingstone.

In the month of October, 1870, this American, without hesitation, without a word, simply as a hero, had embarked at Bombay for Zanzibar, and almost following Speke and Burton's route, after untold sufferings, his life being menaced several times, he arrived at Oujiji.

The two travelers, now become fast friends, then made an expedition to the north of Lake Tanganyika. They embarked, pushed as far as Cape Malaya, and after a minute exploration, were of the opinion that the great lake had for an outlet a branch of the Loualaba.

It was what Cameron and Stanley himself were going to determine positively some years after. December 12th, Livingstone and his companion were returning to Oujiji.

Stanley prepared to depart. December 27th, after a navigation of eight days, the doctor and he arrived at Ousimba; then, February 23d, they entered Kouihara.

March 12th was the day of parting.

"You have accomplished," said the doctor to his companion, "what few men would have done, and done it much better than certain great travelers. I am very grateful to you for it. May God lead you, my friend, and may He bless you!"

"May He," said Stanley, taking Livingstone's hand, "bring you back to us safe and sound, dear doctor!"

Stanley drew back quickly from this embrace, and turned so as to conceal his tears. "Good-by, doctor, dear friend," he said in a stifled voice.

"Good-by," replied Livingstone, feebly.

Stanley departed, and July 12th, 1872, he landed at Marseilles.

Livingstone was going to return to his discoveries. August 25th, after five months passed at Konihara, accompanied by his black servants, Souzi, Chouma, and Amoda, by two other servants, by Jacob Wainwright, and by fifty-six men sent by Stanley, he went toward the south of the Tanganyika.

A month after, the caravan arrived at M'oura, in the midst of storms, caused by an extreme drought. Then came the rains, the bad will of the natives, and the loss of the beasts of burden, from falling under the stings of the tsetse. January 24th, 1873, the little troop was at Tchitounkone. April 27th, after having left Lake Bangoneolo to the east, the troop was going toward the village of Tchitambo.

At that place some traders had left Livingstone. This is what Alvez and his colleague had learned from them. They had good reason to believe that the doctor, after exploring the south of the lake, would venture across the Loanda, and come to seek unknown countries in the west. Thence he was to ascend toward Angola, to visit those regions infested by the slave-trade, to push as far as Kazounde; the tour seemed to be all marked out, and it was very probable that Livingstone would follow it.

Mrs. Weldon then could count on the approaching arrival of the great traveler, because, in the beginning of June, it was already more than two months since he had reached the south of Lake Bangoneolo.

Now, June 13th, the day before that on which Negoro would come to claim from Mrs. Weldon the letter that would put one hundred thousand dollars in his hands, sad news was spread, at which Alvez and the traders only rejoiced.
May 1st, 1873, at dawn, Dr. David Livingstone died. In fact, on April 29th, the little caravan had reached the village of Tchitambo, to the south of the lake. The doctor was carried there on a litter. On the 30th, in the night, under the influence of excessive grief, he moaned out this complaint, that was hardly heard: "Oh, dear! dear!" and he fell back from drowsiness.

At the end of an hour he called his servant, Souzi, asking for some medicine, then murmuring in a feeble voice: "It is well. Now you can go."

Toward four o'clock in the morning, Souzi and five men of the escort entered the doctor's hut. David Livingstone, kneeling near his bed, his head resting on his hands, seemed to be engaged in prayer. Souzi gently touched his cheek; it was cold. David Livingstone was no more.

Nine months after, his body, carried by faithful servants at the price of unheard-of fatigues, arrived at Zanzibar. On April 12th, 1874, it was buried in Westminster Abbey, among those of her great men, whom England honors equally with her kings.

CHAPTER XV.
WHERE A MANTICORE MAY LEAD.

To what plank of safety will not an unfortunate being cling? Will not the eyes of the condemned seek to seize any ray of hope, no matter how vague?

So it had been with Mrs. Weldon. One can understand what she must have felt when she learned, from Alvez himself, that Dr. Livingstone had just died in a little Bangoneolo village.

It seemed to her that she was more isolated than ever; that a sort of bond that attached her to the traveler, and with him to the civilized world, had just been broken.

The plank of safety sank under her hand, the ray of hope went out before her eyes. Tom and his companions had left Kazounde for the lake region. Not the least news of Hercules. Mrs. Weldon was not sure of any one. She must then fall back on Negoro's proposition, while trying to amend it and secure a definite result from it.

June 14th, the day fixed by him, Negoro presented himself at Mrs. Weldon's hut.

The Portuguese was, as always, so he said, perfectly practical. However, he abated nothing from the amount of the ransom, which his prisoner did not even discuss. But Mrs. Weldon also showed herself very practical in saying to him:

"If you wish to make an agreement, do not render it impossible by unacceptable conditions. The exchange of our liberty for the sum you exact may take place, without my husband coming into a country where you see what can be done with a white man! Now, I do not wish him to come here at any price!"

After some hesitation Negoro yielded, and Mrs. Weldon finished with the concession that James Weldon should not venture as far as Kazounde. A ship would land him at Mossamedes, a little port to the south of Angola, ordinarily frequented by slave-ships, and well-known by Negoro. It was there that the Portuguese would conduct James W. Weldon; and at a certain time Alvez's agent would bring thither Mrs. Weldon, Jack, and Cousin Benedict. The ransom would be given to those agents on the giving up of the prisoners, and Negoro, who would play the part of a perfectly honest man with James Weldon, would disappear on the ship's arrival.

Mrs. Weldon had gained a very important point. She spared her husband the dangers of a voyage to Kazounde, the risk of being kept there, after paying the exacted ransom, and the perils of the return. As to the six hundred miles that separated Kazounde from Mossamedes, by going over them as she had traveled on leaving the Coanza, Mrs. Weldon would only have a little fatigue to fear. Besides, it would be to Alvez's interest--for he was in the affair--for the prisoners to arrive safe and sound.

The conditions being thus settled, Mrs. Weldon wrote to her husband, leaving to Negoro the care of passing himself off as a devoted servant, who had escaped from the natives. Negoro took the letter, which did not allow James Weldon to hesitate about following him as far as Mossamedes, and, the next day, escorted by twenty blacks, he traveled toward the north.

Why did he take that direction? Was it, then, Negoro's intention to embark on one of the vessels which frequent the mouths of the Congo, and thus avoid the Portuguese stations, as well as the penitentiaries in which he had been an involuntary guest? It was probable. At least, that was the reason he gave Alvez.

After his departure, Mrs. Weldon must try to arrange her existence in such a manner as to pass the time of her sojourn at Kazounde as happily as possible. Under the most favorable circumstances, it would last three or four months. Negoro's going and returning would require at least that time.

Mrs. Weldon's intention was, not to leave the factory. Her child, Cousin Benedict, and she, were comparatively safe there. Halima's good care softened the severity of this sequestration a little. Besides, it was probable that the trader would not permit her to leave the establishment. The great premium that the prisoner's ransom would procure.
him, made it well worth while to guard her carefully.

It was even fortunate that Alvez was not obliged to leave Kazounde to visit his two other factories of Bihe and Cassange. Coimbra was going to take his place in the expedition on new _razzias_ or raids. There was no motive for regretting the presence of that drunkard. Above all, Negoro, before setting out, had given Alvez the most urgent commands in regard to Mrs. Weldon. It was necessary to watch her closely. They did not know what had become of Hercules. If he had not perished in that dreadful province of Kazounde, perhaps he would attempt to get near the prisoner and snatch her from Alvez's hands. The trader perfectly understood a situation which ciphered itself out by a good number of dollars. He would answer for Mrs. Weldon as for his own body.

So the monotonous life of the prisoner during the first days after her arrival at the factory, was continued. What passed in this enclosure reproduced very exactly the various acts of native existence outside. Alvez lived like the other natives of Kazounde. The women of the establishment worked as they would have done in the town, for the greater comfort of their husbands or their masters. Their occupations included preparing rice with heavy blows of the pestle in wooden mortars, to perfect decortication; cleansing and winnowing maize, and all the manipulations necessary to draw from it a granulous substance which serves to compose that potage called "mtyelle" in the country; the harvesting of the _sorgo_, a kind of large millet, the ripening of which had just been solemnly celebrated at this time; the extraction of that fragrant oil from the "mpafon" drupes, kinds of olives, the essence of which forms a perfume sought for by the natives; spinning of the cotton, the fibers of which are twisted by means of a spindle a foot and a half long, to which the spinners impart a rapid rotation; the fabrication of bark stuffs with the mallet; the extraction from the tapioca roots, and the preparation of the earth for the different products of the country, cassava, flour that they make from the manioc beans, of which the pods, fifteen inches long, named "mositsanes," grow on trees twenty feet high; arachides intended to make oil, perennial peas of a bright blue, known under the name of "icholobs," the flowers of which relieve the slightly insipid taste of the milk of sorgho; native coffee, sugar canes, the juice of which is reduced to a syrup; onions, Indian pears, sesameum, cucumbers, the seeds of which are roasted like chestnuts; the preparation of fermented drinks, the "malofori," made with bananas, the "pombe" and other liquors; the care of the domestic animals, of those cows that only allow themselves to be milked in the presence of their little one or of a stuffed calf; of those heifers of small race, with short horns, some of which have a hump; of those goats which, in the country where their flesh serves for food, are an important object of exchange, one might say current money like the slave; finally, the feeding of the birds, swine, sheep, oxen, and so forth.

This long enumeration shows what rude labors fall on the feeble sex in those savage regions of the African continent.

During this time the men smoke tobacco or hemp, chase the elephant or the buffalo, and hire themselves to the traders for the raids. The harvest of maize or of slaves is always a harvest that takes place in fixed seasons.

Of those various occupations, Mrs. Weldon only saw in Alvez's factory the part laid on the women. Sometimes she stopped, looking at them, while the slaves, it must be said, only replied to her by ugly grimaces. A race instinct led these unfortunates to hate a white woman, and they had no commiseration for her in their hearts. Halima alone was an exception, and Mrs. Weldon, having learned certain words of the native language, was soon able to exchange a few sentences with the young slave.

Little Jack often accompanied his mother when she walked in the inclosure; but he wished very much to go outside. There was, however, in an enormous baobab, marabout nests, formed of a few sticks, and "souimangas" nests, birds with scarlet breasts and throats, which resemble those of the tissirins; then "widows," that strip the thatch for the benefit of their family; "calaos," whose song was agreeable, bright gray parrots with red tails, which, in the Manyema, are called "rous," and give their name to the chiefs of the tribes; insectivorous "drougos," similar to gray linnets, with large, red beaks. Here and there also fluttered hundreds of butterflies of different species, especially in the neighborhood of the brooks that crossed the factory; but that was rather Cousin Benedict's affair than little Jack's, and the latter regretted greatly not being taller, so as to look over the walls. Alas! where was his poor friend, Dick Sand—he who had brought him so high up in the "Pilgrim's" masts? How he would have followed him on the branches of those trees, whose tops rose to more than a hundred feet! What good times they would have had together!

Cousin Benedict always found himself very well where he was, provided insects were not lacking. Happily, he had discovered in the factory—and he studied as much as he could without magnifying glass or spectacles—a small bee which forms its cells among the worm-holes of the wood, and a "sphex" that lays its eggs in cells that are not its own, as the cuckoo in the nests of other birds. Mosquitoes were not lacking either, on the banks of the rivulets, and they tattooed him with bites to the extent of making him unrecognizable. And when Mrs. Weldon reproached him with letting himself be thus devoured by those venomous insects: "It is their instinct, Cousin Weldon," he replied to her, scratching himself till the blood came; "it is their instinct, and we must not have a grudge against them!"
At last, one day--it was the 17th of June--Cousin Benedict was on the point of being the happiest of entomologists. But this adventure, which had unexpected consequences, needs to be related with some minuteness.

It was about eleven o'clock in the morning. An overpowering heat had obliged the inhabitants of the factory to keep in their huts, and one would not even meet a single native in the streets of Kazounde.

Mrs. Weldon was dozing near little Jack, who was sleeping soundly. Cousin Benedict, himself, suffering from the influence of this tropical temperature, had given up his favorite hunts, which was a great sacrifice for him, for, in those rays of the midday sun, he heard the rustle of a whole world of insects. He was sheltered, then, at the end of his hut, and there, sleep began to take possession of him in this involuntary siesta.

Suddenly, as his eyes half closed, he heard a humming; this is one of those insupportable buzzings of insects, some of which can give fifteen or sixteen thousand beats of their wings in a second.

"A hexapode!" exclaimed Cousin Benedict, awakened at once, and passing from the horizontal to the vertical position.

There was no doubt that it was a hexapode that was buzzing in his hut. But, if Cousin Benedict was very near-sighted, he had at least very acute hearing, so acute even that he could recognize one insect from another by the intensity of its buzz, and it seemed to him that this one was unknown, though it could only be produced by a giant of the species.

"What is this hexapode?" Cousin Benedict asked himself.

Behold him, seeking to perceive the insect, which was very difficult to his eyes without glasses, but trying above all to recognize it by the buzzing of its wings.

His instinct as an entomologist warned him that he had something to accomplish, and that the insect, so providentially entered into his hut, ought not to be the first comer.

Cousin Benedict no longer moved. He listened. A few rays of light reached him. His eyes then discovered a large black point that flew about, but did not pass near enough for him to recognize it. He held his breath, and if he felt himself stung in some part of the face or hands, he was determined not to make a single movement that might put his hexapode to flight. At last the buzzing insect, after turning around him for a long time, came to rest on his head. Cousin Benedict's mouth widened for an instant, as if to give a smile--and what a smile! He felt the light animal running on his hair. An irresistible desire to put his hand there seized him for a moment; but he resisted it, and did well.

"No, no!" thought he, "I would miss it, or what would be worse, I would injure it. Let it come more within my reach. See it walking! It descends. I feel its dear little feet running on my skull! This must be a hexapode of great height. My God! only grant that it may descend on the end of my nose, and there, by squinting a little, I might perhaps see it, and determine to what order, genus, species, or variety it belongs."

So thought Cousin Benedict. But it was a long distance from his skull, which was rather pointed, to the end of his nose, which was very long. How many other roads the capricious insect might take, beside his ears, beside his forehead--roads that would take it to a distance from the savant's eyes--without counting that at any moment it might take its flight, leave the hut, and lose itself in those solar rays where, doubtless, its life was passed, and in the midst of the buzzing of its congeners that would attract it outside!

Cousin Benedict said all that to himself. Never, in all his life as an entomologist, had he passed more touching minutes. An African hexapode, of a new species, or, at least, of a new variety, or even of a new sub-variety, was there on his head, and he could not recognize it except it designed to walk at least an inch from his eyes.

However, Cousin Benedict's prayer must be heard. The insect, after having traveled over the half-bald head, as on the summit of some wild bush, began to descend Cousin Benedict's forehead, and the latter might at last conceive the hope that it would venture to the top of his nose. Once arrived at that top, why would it not descend to the base?

"In its place, I--I would descend," thought the worthy savant.

What is truer than that, in Cousin Benedict's place, any other would have struck his forehead violently, so as to crush the enticing insect, or at least to put it to flight. To feel six feet moving on his skin, without speaking of the fear of being bitten, and not make a gesture, one will agree that it was the height of heroism. The Spartan allowing his breast to be devoured by a fox; the Roman holding burning coals between his fingers, were not more masters of themselves than Cousin Benedict, who was undoubtedly descended from those two heroes.

After twenty little circuits, the insect arrived at the top of the nose. Then there was a moment's hesitation that made all Cousin Benedict's blood rush to his heart. Would the hexapode ascend again beyond the line of the eyes, or would it descend below?

It descended. Cousin Benedict felt its caterpillar feet coming toward the base of his nose. The insect turned neither to the right nor to the left. It rested between its two buzzing wings, on the slightly hooked edge of that learned nose, so well formed to carry spectacles. It cleared the little furrow produced by the incessant use of that optical instrument, so much missed by the poor cousin, and it stopped just at the extremity of his nasal appendage.
It was the best place this hasapode could choose. At that distance, Cousin Benedict's two eyes, by making their visual rays converge, could, like two lens, dart their double look on the insect.

"Almighty God!" exclaimed Cousin Benedict, who could not repress a cry, "the tuberculous manticore."

Now, he must not cry it out, he must only think it. But was it not too much to ask from the most enthusiastic of entomologists?

To have on the end of his nose a tuberculous manticore, with large elytrums—an insect of the cicendeletes tribe—a very rare specimen in collections—one that seems peculiar to those southern parts of Africa, and yet not utter a cry of admiration; that is beyond human strength.

Unfortunately the manticore heard this cry, which was almost immediately followed by a sneeze, that shook the appendage on which it rested. Cousin Benedict wished to take possession of it, extended his hand, shut it violently, and only succeeded in seizing the end of his own nose.

"Malediction!" exclaimed he. But then he showed a remarkable coolness.

He knew that the tuberculous manticore only flutters about, so to say, that it walks rather than flies. He then knelt, and succeeded in perceiving, at less than ten inches from his eyes, the black point that was gliding rapidly in a ray of light.

Evidently it was better to study it in this independent attitude. Only he must not lose sight of it.

"To seize the manticore would be to risk crushing it," Cousin Benedict said to himself. "No; I shall follow it! I shall admire it! I have time enough to take it!"

Was Cousin Benedict wrong? However that may be, see him now on all fours, his nose to the ground like a dog that smells a scent, and following seven or eight inches behind the superb hexapode. One moment after he was outside his hut, under the midday sun, and a few minutes later at the foot of the palisade that shut in Alvez's establishment.

At this place was the manticore going to clear the enclosure with a bound, and put a wall between its adorer and itself? No, that was not in its nature, and Cousin Benedict knew it well. So he was always there, crawling like a snake, too far off to recognize the insect entomologically—besides, that was done—but near enough to perceive that large, moving point traveling over the ground.

The manticore, arrived near the palisade, had met the large entrance of a mole-hill that opened at the foot of the enclosure. There, without hesitating, it entered this subterranean gallery, for it is in the habit of seeking those obscure passages. Cousin Benedict believed that he was going to lose sight of it. But, to his great surprise, the passage was at least two feet high, and the mole-hill formed a gallery where his long, thin body could enter. Besides, he put the ardor of a ferret into his pursuit, and did not even perceive that in "earthing" himself thus, he was passing outside the palisade.

In fact, the mole-hill established a natural communication between the inside and the outside. In half a minute Cousin Benedict was outside of the factory. That did not trouble him. He was absorbed in admiration of the elegant insect that was leading him on. But the latter, doubtless, had enough of this long walk. Its elytrums turned aside, its wings spread out. Cousin Benedict felt the danger, and, with his curved hand, he was going to make a provisional prison for the manticore, when—f-r-r-r-r!—it flew away!

What despair! But the manticore could not go far. Cousin Benedict rose; he looked, he darted forward, his two hands stretched out and open. The insect flew above his head, and he only perceived a large black point, without appreciable form to him.

Would the manticore come to the ground again to rest, after having traced a few capricious circles around Cousin Benedict's bald head? All the probabilities were in favor of its doing so.

Unfortunately for the unhappy savant, this part of Alvez's establishment, which was situated at the northern extremity of the town, bordered on a vast forest, which covered the territory of Kazounde for a space of several square miles. If the manticore gained the cover of the trees, and if there, it should flutter from branch to branch, he must renounce all hope of making it figure in that famous tin box, in which it would be the most precious jewel.

Alas! that was what happened. The manticore had rested again on the ground. Cousin Benedict, having the unexpected hope of seeing it again, threw himself on the ground at once. But the manticore no longer walked: it proceeded by little jumps.

Cousin Benedict, exhausted, his knees and hands bleeding, jumped also. His two arms, his hands open, were extended to the right, to the left, according as the black point bounded here or there. It might be said that he was drawing his body over that burning soil, as a swimmer does on the surface of the water.

Useless trouble! His two hands always closed on nothing. The insect escaped him while playing with him, and soon, arrived under the fresh branches, it arose, after throwing into Cousin Benedict's ear, which it touched lightly, the most intense but also the most ironical buzzing of its coleopter wings.

"Malediction!" exclaimed Cousin Benedict, a second time. "It escapes me. Ungrateful hexapode! Thou to whom
I reserved a place of honor in my collection! Well, no, I shall not give thee up! I shall follow thee till I reach thee!"

He forgot, this discomfited cousin, that his nearsighted eyes would not enable him to perceive the _manticore_ among the foliage. But he was no longer master of himself. Vexation, anger, made him a fool. It was himself, and only himself, that he must blame for his loss. If he had taken possession of the insect at first, instead of following it "in its independent ways," nothing of all that would have happened, and he would possess that admirable specimen of African _manticores_, the name of which is that of a fabulous animal, having a man's head and a lion's body.

Cousin Benedict had lost his head. He little thought that the most unforeseen of circumstances had just restored him to liberty. He did not dream that the ant-hill, into which he had just entered, had opened to him an escape, and that he had just left Alvez's establishment. The forest was there, and under the trees was his _manticore_, flying away! At any price, he wanted to see it again.

See him, then, running across the thick forest, no longer conscious even of what he was doing, always imagining he saw the precious insect, beating the air with his long arms like a gigantic field-spider. Where he was going, how he would return, and if he should return, he did not even ask himself, and for a good mile he made his way thus, at the risk of being met by some native, or attacked by some beast.

Suddenly, as he passed near a thicket, a gigantic being sprang out and threw himself on him. Then, as Cousin Benedict would have done with the _manticore_, that being seized him with one hand by the nape of the neck, with the other by the lower part of the back, and before he had time to know what was happening, he was carried across the forest.

Truly, Cousin Benedict had that day lost a fine occasion of being able to proclaim himself the happiest entomologist of the five parts of the world.

* * * * *

CHAPTER XVI.
A MAGICIAN.

When Mrs. Weldon, on the 17th of the month, did not see Cousin Benedict reappear at the accustomed hour, she was seized with the greatest uneasiness. She could not imagine what had become of her big baby. That he had succeeded in escaping from the factory, the enclosure of which was absolutely impassable, was not admissible. Besides, Mrs. Weldon knew her cousin. Had one proposed to this original to flee, abandoning his tin box and his collection of African insects, he would have refused without the shadow of hesitation. Now, the box was there in the hut, intact, containing all that the savant had been able to collect since his arrival on the continent. To suppose that he was voluntarily separated from his entomological treasures, was inadmissible.

Nevertheless, Cousin Benedict was no longer in Jose-Antonio Alvez's establishment.

During all that day Mrs. Weldon looked for him persistently. Little Jack and the slave Halima joined her. It was useless.

Mrs. Weldon was then forced to adopt this sad hypothesis: the prisoner had been carried away by the trader's orders, for motives that she could not fathom. But then, what had Alvez done with him? Had he incarcerated him in one of the barracks of the large square? Why this carrying away, coming after the agreement made between Mrs. Weldon and Negoro, an agreement which included Cousin Benedict in the number of the prisoners whom the trader would conduct to Mossamedes, to be placed in James W. Weldon's hands for a ransom?

If Mrs. Weldon had been a witness of Alvez's anger, when the latter learned of the prisoner's disappearance, she would have understood that this disappearance was indeed made against his will. But then, if Cousin Benedict had escaped voluntarily, why had he not let her into the secret of his escape?

However, the search of Alvez and his servants, which was made with the greatest care, led to the discovery of that mole-hill, which put the factory in direct communication with the neighboring forest. The trader no longer doubted that the "fly-hunter" had fled by that narrow opening. One may then judge of his fury, when he said to himself that this flight would doubtless be put to account, and would diminish the prize that the affair would bring him.

"That imbecile is not worth much," thought he, "nevertheless, I shall be compelled to pay dear for him. Ah! if I take him again!"

But notwithstanding the searchings that were made inside, and though the woods were beaten over a large radius, it was impossible to find any trace of the fugitive.

Mrs. Weldon must resign herself to the loss of her cousin, and Alvez mourn over his prisoner. As it could not be admitted that the latter had established communications with the outside, it appeared evident that chance alone had made him discover the existence of the mole-hill, and that he had taken flight without thinking any more of those he left behind than if they had never existed.
Mrs. Weldon was forced to allow that it must be so, but she did not dream of blaming the poor man, so perfectly unconscious of his actions.

"The unfortunate! what will become of him?" she asked herself.

It is needless to say that the mole-hill had been closed up the same day, and with the greatest care, and that the watch was doubled inside as well as outside the factory.

The monotonous life of the prisoners then continued for Mrs. Weldon and her child.

Meanwhile, a climatic fact, very rare at that period of the year, was produced in the province. Persistent rains began about the 19th of June, though the _masika_ period, that finishes in April, was passed. In fact, the sky was covered, and continual showers inundated the territory of Kazounde.

What was only a vexation for Mrs. Weldon, because she must renounce her walks inside the factory, became a public misfortune for the natives. The low lands, covered with harvests already ripe, were entirely submerged. The inhabitants of the province, to whom the crop suddenly failed, soon found themselves in distress. All the labors of the season were compromised, and Queen Moini, any more than her ministers, did not know how to face the catastrophe.

They then had recourse to the magicians, but not to those whose profession is to heal the sick by their incantations and sorceries, or who predict success to the natives. There was a public misfortune on hand, and the best "mganngas," who have the privilege of provoking or stopping the rains, were prayed to, to conjure away the peril.

Their labor was in vain. It was in vain that they intoned their monotonous chant, rang their little bells and hand-bells, employed their most precious amulets, and more particularly, a horn full of mud and bark, the point of which was terminated by three little horns. The spirits were exorcised by throwing little balls of dung, or in spitting in the faces of the most august personages of the court; but they did not succeed in chasing away the bad spirits that presided over the formation of the clouds.

Now, things were going from bad to worse, when Queen Moini thought of inviting a celebrated magician, then in the north of Angola. He was a magician of the first order, whose power was the more marvelous because they had never tested it in this country where he had never come. But there was no question of its success among the Masikas.

It was on the 25th of June, in the morning, that the new magician suddenly announced his arrival at Kazounde with great ringing of bells.

This sorcerer came straight to the "tchitoka," and immediately the crowd of natives rushed toward him. The sky was a little less rainy, the wind indicated a tendency to change, and those signs of calm, coinciding with the arrival of the magician, predisposed the minds of the natives in his favor.

Besides, he was a superb man—a black of the finest water. He was at least six feet high, and must be extraordinarily strong. This prestige already influenced the crowd.

Generally, the sorcerers were in bands of three, four, or five when they went through the villages, and a certain number of acolytes, or companions, made their cortege. This magician was alone. His whole breast was zebraed with white marks, done with pipe clay. The lower part of his body disappeared under an ample skirt of grass stuff, the "train" of which would not have disgraced a modern elegant. A collar of birds' skulls was round his neck; on his head was a sort of leathern helmet, with plumes ornamented with pearls; around his loins a copper belt, to which hung several hundred bells, noisier than the sonorous harness of a Spanish mule: thus this magnificent specimen of the corporation of native wizards was dressed.

All the material of his art was comprised in a kind of basket, of which a calebash formed the bottom, and which was filled with shells, amulets, little wooden idols, and other fetiches, plus a notable quantity of dung balls, important accessories to the incantations and divinatory practises of the center of Africa.

One peculiarity was soon discovered by the crowd. This magician was dumb. But this infirmity could only increase the consideration with which they were disposed to surround him. He only made a guttural sound, low and languid, which had no signification. The more reason for being well skilled in the mysteries of witchcraft.

The magician first made the tour of the great place, executing a kind of dance which put in motion all his chime of bells. The crowd followed, imitating his movements—it might be said, as a troop of monkeys following a gigantic, four-handed animal. Then, suddenly, the sorcerer, treading the principal street of Kazounde, went toward the royal residence.

As soon as Queen Moini had been informed of the arrival of the new wizard, she appeared, followed by her courtiers.

The magician bowed to the ground, and lifted up his head again, showing his superb height. His arms were then extended toward the sky, which was rapidly furrowed by masses of clouds. The sorcerer pointed to those clouds with his hand; he imitated their movements in an animated pantomime. He showed them fleeing to the west, but returning to the east by a rotary movement that no power could stop.
Then, suddenly, to the great surprise of the town and the court, this sorcerer took the redoubtable sovereign of Kazounde by the hand. A few courtiers wished to oppose this act, which was contrary to all etiquette; but the strong magician, seizing the nearest by the nape of the neck, sent him staggering fifteen paces off.

The queen did not appear to disapprove of this proud manner of acting. A sort of grimace, which ought to be a smile, was addressed to the wizard, who drew the queen on with rapid steps, while the crowd rushed after him.

This time it was toward Alvez's establishment that the sorcerer directed his steps. He soon reached the door, which was shut. A simple blow from his shoulder threw it to the ground, and he led the conquered queen into the interior of the factory.

The trader, his soldiers and his slaves, ran to punish the daring being who took it upon himself to throw down doors without waiting for them to be opened to him. Suddenly, seeing that their sovereign did not protest, they stood still, in a respectful attitude.

No doubt Alvez was about to ask the queen why he was honored by her visit, but the magician did not give him time. Making the crowd recede so as to leave a large space free around him, he recommenced his pantomime with still greater animation. He pointed to the clouds, he threatened them, he exorcised them; he made a sign as if he could first stop them, and then scatter them. His enormous cheeks were puffed out, and he blew on this mass of heavy vapors as if he had the strength to disperse them. Then, standing upright, he seemed to intend stopping them in their course, and one would have said that, owing to his gigantic height, he could have seized them.

The superstitious Moini, "overcome" by the acting of this tall comedian, could no longer control herself. Cries escaped her. She raved in her turn, and instinctively repeated the magician's gestures. The courtiers and the crowd followed her example, and the mute's guttural sounds were lost amid those songs; cries, and yells which the native language furnishes with so much prodigality.

Did the clouds cease to rise on the eastern horizon and veil the tropical sun? Did they vanish before the exorcisms of this new wizard? No. And just at this moment, when the queen and her people imagined that they had appeased the evil spirits that had watered them with so many showers, the sky, somewhat clear since daybreak, became darker than ever. Large drops of rain fell pattering on the ground.

Then a sudden change took place in the crowd. They then saw that this sorcerer was worth no more than the others. The queen's brows were frowning. They understood that he at least was in danger of losing his ears. The natives had contracted the circle around him; fists threatened him, and they were about to punish him, when an unforeseen incident changed the object of their evil intentions.

The magician, who overlooked the whole yelling crowd, stretched his arms toward one spot in the enclosure.

Mrs. Weldon and little Jack, attracted by the noise and the clamor, had just left their hut. The magician, with an angry gesture, had pointed to them with his left hand, while his right was raised toward the sky.

They! it was they! It was this white woman--it was her child--they were causing all this evil. They had brought these clouds from their rainy country, to inundate the territories of Kazounde.

It was at once understood. Queen Moini, pointing to Mrs. Weldon, made a threatening gesture. The natives, uttering still more terrible cries, rushed toward her.

Mrs. Weldon thought herself lost, and clasping her son in her arms, she stood motionless as a statue before this over-excited crowd.

The magician went toward her. The natives stood aside in the presence of this wizard, who, with the cause of the evil, seemed to have found the remedy.

The trader, Alvez, knowing that the life of the prisoner was precious, now approached, not being sure of what he ought to do.

The magician had seized little Jack, and snatching him from his mother's arms, he held him toward the sky. It seemed as if he were about to dash the child to the earth, so as to appease the gods.

With a terrible cry, Mrs. Weldon fell to the ground insensible.

But the magician, after having made a sign to the queen, which no doubt reassured her as to his intentions, raised the unhappy mother, and while the crowd, completely subdued, parted to give him space, he carried her away with her child.

Alvez was furious, not expecting this result. After having lost one of the three prisoners, to see the prize confided to his care thus escape, and, with the prize, the large bribe promised him by Negoro! Never! not if the whole territory of Kazounde were submerged by a new deluge! He tried to oppose this abduction.

The natives now began to mutter against him. The queen had him seized by her guards, and, knowing what it might cost him, the trader was forced to keep quiet, while cursing the stupid credulity of Queen Moini's subjects.

The savages, in fact, expected to see the clouds disappear with those who had brought them, and they did not doubt that the magician would destroy the scourge, from which they suffered so much, in the blood of the strangers.
Meanwhile, the magician carried off his victims as a lion would a couple of kids which did not satisfy his powerful appetite. Little Jack was terrified, his mother was unconscious. The crowd, roused to the highest degree of fury, escorted the magician with yells; but he left the enclosure, crossed Kazounde, and reentered the forest, walking nearly three miles, without resting for a moment. Finally he was alone, the natives having understood that he did not wish to be followed. He arrived at the bank of a river, whose rapid current flowed toward the north.

There, at the end of a large opening, behind the long, drooping branches of a thicket which hid the steep bank, was moored a canoe, covered by a sort of thatch.

The magician lowered his double burden into the boat, and following himself, shoved out from the bank, and the current rapidly carried them down the stream. The next minute he said, in a very distinct voice:

"Captain, here are Mrs. Weldon and little Jack; I present them to you. Forward. And may all the clouds in heaven fall on those idiots of Kazounde!"

* * * * *

CHAPTER XVII.

DRIFTING.

It was Hercules, not easily recognized in his magician's attire, who was speaking thus, and it was Dick Sand whom he was addressing--Dick Sand, still feeble enough, to lean on Cousin Benedict, near whom Dingo was lying. Mrs. Weldon, who had regained consciousness, could only pronounce these words:

"You! Dick! You!"

The young novice rose, but already Mrs. Weldon was pressing him in her arms, and Jack was lavishing caresses on him.

"My friend Dick! my friend Dick!" repeated the little boy. Then, turning to Hercules: "And I," he added, "I did not know you!"

"Hey! what a disguise!" replied Hercules, rubbing his breast to efface the variety of colors that striped it.

"You were too ugly!" said little Jack.

"Bless me! I was the devil, and the devil is not handsome."

"Hercules!" said Mrs. Weldon, holding out her hand to the brave black.

"He has delivered you," added Dick Sand, "as he has saved me, though he will not allow it."

"Saved! saved! We are not saved yet!" replied Hercules. "And besides, without Mr. Benedict, who came to tell us where you were, Mrs. Weldon, we could not have done anything."

In fact, it was Hercules who, five days before, had jumped upon the savant at the moment when, having been led two miles from the factory, the latter was running in pursuit of his precious manticore. Without this incident, neither Dick Sand nor the black would have known Mrs. Weldon's retreat, and Hercules would not have ventured to Kazounde in a magician's dress.

While the boat drifted with rapidity in this narrow part of the river, Hercules related what had passed since his flight from the camp on the Coanza; how, without being seen, he had followed the _kitanda_ in which Mrs. Weldon and her son were; how he had found Dingo wounded; how the two had arrived in the neighborhood of Kazounde; how a note from Hercules, carried by the dog, told Dick Sand what had become of Mrs. Weldon; how, after the unexpected arrival of Cousin Benedict, he had vainly tried to make his way into the factory, more carefully guarded than ever; how, at last, he had found this opportunity of snatching the prisoner from that horrible Jose-Antonio Alvez. Now, this opportunity had offered itself that same day. A _mgannga_, or magician, on his witchcraft circuit, that celebrated magician so impatiently expected, was passing through the forest in which Hercules roamed every night, watching, waiting, ready for anything.

To spring upon the magician, despoil him of his baggage, and of his magician's vestments, to fasten him to the foot of a tree with liane knots that the Davenports themselves could not have untied, to paint his body, taking the sorcerer's for a model, and to act out his character in charming and controlling the rains, had been the work of several hours. Still, the incredible credulity of the natives was necessary for his success.

During this recital, given rapidly by Hercules, nothing concerning Dick Sand had been mentioned.

"And you, Dick!" asked Mrs. Weldon.

"I, Mrs. Weldon!" replied the young man. "I can tell you nothing. My last thought was for you, for Jack! I tried in vain to break the cords that fastened me to the stake. The water rose over my head. I lost consciousness. When I came to myself, I was sheltered in a hole, concealed by the papyrus of this bank, and Hercules was on his knees beside me, lavishing his care upon me."

"Well! that is because I am a physician," replied Hercules; "a diviner, a sorcerer, a magician, a fortuneteller!"

"Hercules," said Mrs. Weldon, "tell me, how did you save Dick Sand?"
"Did I do it, Mrs. Weldon?" replied Hercules; "Might not the current have broken the stake to which our captain was tied, and in the middle of the night, carried him half-dead on this beam, to the place where I received him? Besides, in the darkness, there was no difficulty in gliding among the victims that carpeted the ditch, waiting for the bursting of the dam, diving under water, and, with a little strength, pulling up our captain and the stake to which these scoundrels had bound him! There was nothing very extraordinary in all that! The first-comer could have done as much. Mr. Benedict himself, or even Dingo! In fact, might it not have been Dingo?"

A yelping was heard; and Jack, taking hold of the dog's large head, gave him several little friendly taps.

"Dingo," he asked, "did you save our friend Dick?"

At the same time he turned the dog's head from right to left.

"He says, no, Hercules!" said Jack. "You see that it was not he. Dingo, did Hercules save our captain?"

The little boy forced Dingo's good head to move up and down, five or six times.

"He says, yes, Hercules! he says, yes!" cried little Jack. "You see then that it was you!"

"Friend Dingo," replied Hercules, caressing the dog. "that is wrong. You promised me not to betray me."

Yes, it was indeed Hercules, who had risked his life to save Dick Sand. But he had done it, and his modesty would not allow him to agree to the fact. Besides, he thought it a very simple thing, and he repeated that any one of his companions would have done the same under the circumstances.

This led Mrs. Weldon to speak of old Tom, of his son, of Acteon and Bat, his unfortunate companions. They had started for the lake region. Hercules had seen them pass with the caravan of slaves. He had followed them, but no opportunity to communicate with them had presented itself. They were gone! they were lost! Hercules had been laughing heartily, but now he shed tears which he did not try to restrain.

"Do not cry, my friend," Mrs. Weldon said to him. "God may be merciful, and allow us to meet them again."

In a few words she informed Dick Sand of all that had happened during her stay in Alvez's factory.

"Perhaps," she added, "it would have been better to have remained at Kazounde."

"What a fool I was!" cried Hercules.

"No, Hercules, no!" said Dick Sand. "These wretches would have found means to draw Mr. Weldon into some new trap. Let us flee together, and without delay. We shall reach the coast before Negoro can return to Mossamedes. There, the Portuguese authorities will give us aid and protection; and when Alvez comes to take his one hundred thousand dollars--"

"A hundred thousand blows on the old scoundrel's skull!" cried Hercules; "and I will undertake to keep the count."

However, here was a new complication, although it was very evident that Mrs. Weldon would not dream of returning to Kazounde. The point now was to anticipate Negoro. All Dick Sand's projects must tend toward that end.

Dick Sand was now putting in practise the plan which he had long contemplated, of gaining the coast by utilizing the current of a river or a stream. Now, the watercourse was there; its direction was northward, and it was possible that it emptied into the Zaire. In that case, instead of reaching St. Paul de Loanda, it would be at the mouth of the great river that Mrs. Weldon and her companions would arrive. This was not important, because help would not fail them in the colonies of Lower Guinea.

Having decided to descend the current of this river, Dick Sand's first idea was to embark on one of the herbaceous rafts, a kind of floating isle (of which Cameron has often spoken), which drifts in large numbers on the surface of African rivers.

But Hercules, while roaming at night on the bank, had been fortunate enough to find a drifting boat. Dick Sand could not hope for anything better, and chance had served him kindly. In fact, it was not one of those narrow boats which the natives generally use.

The perogue found by Hercules was one of those whose length exceeds thirty feet, and the width four--and they are carried rapidly on the waters of the great lakes by the aid of numerous paddles. Mrs. Weldon and her companions could install themselves comfortably in it, and it was sufficient to keep it in the stream by means of an oar to descend the current of the river.

At first, Dick Sand, wishing to pass unseen, had formed a project to travel only at night. But to drift twelve hours out of the twenty-four, was to double the length of a journey which might be quite long. Happily, Dick Sand had taken a fancy to cover the perogue with a roof of long grasses, sustained on a rod, which projected fore and aft. This, when on the water, concealed even the long oar. One would have said that it was a pile of herbs which drifted down stream, in the midst of floating islets. Such was the ingenious arrangement of the thatch, that the birds were deceived, and, seeing there some grains to pilfer, red-beaked gulls, "arrhiniusgas" of black plumage, and gray and white halcyons frequently came to rest upon it.

Besides, this green roof formed a shelter from the heat of the sun. A voyage made under these conditions might then be accomplished almost without fatigue, but not without danger.
In fact, the journey would be a long one, and it would be necessary to procure food each day. Hence the risk of hunting on the banks if fishing would not suffice, and Dick Sand had no firearms but the gun carried off by Hercules after the attack on the ant-hill; but he counted on every shot. Perhaps even by passing his gun through the thatch of the boat he might fire with surety, like a butter through the holes in his hut.

Meanwhile, the perogue drifted with the force of the current a distance not less than two miles an hour, as near as Dick Sand could estimate it.

He hoped to make, thus, fifty miles a day. But, on account of this very rapidity of the current, continual care was necessary to avoid obstacles--rocks, trunks of trees, and the high bottoms of the river. Besides, it was to be feared that this current would change to rapids, or to cataracts, a frequent occurrence on the rivers of Africa.

The journey would be a long one, and it would be necessary to procure food each day. Hence the risk of hunting on the banks if fishing would not suffice, and Dick Sand had no firearms but the gun carried off by Hercules after the attack on the ant-hill; but he counted on ever...
boat again took the channel.

Must it be confessed! That great child of a Cousin Benedict had hoped for a moment that they would not be able
to pass. Such a voyage seemed to him unnecessary. He regretted Alvez's factory and the hut that contained his
precious entomologist's box. His chagrin was real, and indeed it was pitiful to see the poor man. Not an insect; no,
not one to preserve!

What, then, was his joy when Hercules, "his pupil" after all, brought him a horrible little beast which he had
found on a sprig of the tikatika. Singularly enough the brave black seemed a little confused in presenting it to him.

But what exclamations Cousin Benedict uttered when he had brought this insect, which he held between his
index finger and his thumb, as near as possible to his short-sighted eyes, which neither glasses nor microscope could
now assist.

"Hercules!" he cried, "Hercules! Ah! see what will gain your pardon! Cousin Weldon! Dick! a hexapode, unique
in its species, and of African origin! This, at least, they will not dispute with me, and it shall quit me only with my
life!"

"It is, then, very precious?" asked Mrs. Weldon.

"Precious!" cried Cousin Benedict. "An insect which is neither a coleopter, nor a neuropteran, nor a hymenopter;
which does not belong to any of the ten orders recognized by savants, and which they will be rather tempted to rank
in the second section of the arachnides. A sort of spider, which would be a spider if it had eight legs, and is,
however, a hexapode, because it has but six. Ah! my friends, Heaven owed me this joy; and at length I shall give my
name to a scientific discovery! That insect shall be the 'Hexapodes Benedictus.'"

The enthusiastic savant was so happy--he forgot so many miseries past and to come in riding his favorite hobby-
that neither Mrs. Weldon nor Dick Sand grudged him his felicitations.

All this time the perogue moved on the dark waters of the river. The silence of night was only disturbed by the
clattering scales of the crocodiles, or the snorting of the hippopotami that sported on the banks.

Then, through the sprigs of the thatch, the moon appeared behind the tops of the trees, throwing its soft light to
the interior of the boat.

Suddenly, on the right bank, was heard a distant hubbub, then a dull noise as if giant pumps were working in the
dark.

It was several hundred elephants, that, satiated by the woody roots which they had devoured during the day,
came to quench their thirst before the hour of repose. One would really have supposed that all these trunks, lowered
and raised by the same automatic movement, would have drained the river dry.

CHAPTER XVIII.

VARIOUS INCIDENTS.

For eight days the boat drifted, carried by the current under the conditions already described. No incident of any
importance occurred. For a space of many miles the river bathed the borders of superb forests; then the country,
shorn of these fine trees, spread in jungles to the limits of the horizon.

If there were no natives in this country--a fact which Dick Sand did not dream of regretting--the animals at least
abounded there. Zebras sported on the banks, elks, and "caamas," a species of antelope which were extremely
graceful, and they disappeared at night to give place to the leopards, whose growls could be heard, and even to the
lions which bounded in the tall grasses. Thus far the fugitives had not suffered from these ferocious creatures,
whether in the forests or in the river.

Meanwhile, each day, generally in the afternoon, Dick Sand neared one bank or the other, moored the boat,
disembarked, and explored the shore for a short distance.

In fact, it was necessary to renew their daily food. Now, in this country, barren of all cultivation, they could not
depend upon the tapioca, the sorgho, the maize, and the fruits, which formed the vegetable food of the native tribes.
These plants only grew in a wild state, and were not eatable. Dick Sand was thus forced to hunt, although the firing
of his gun might bring about an unpleasant meeting.

They made a fire by rubbing a little stick against a piece of the wild fig-tree, native fashion, or even simiesque
style, for it is affirmed that certain of the gorillas procure a fire by this means. Then, for several days, they cooked a
little elk or antelope flesh. During the 4th of July Dick Sand succeeded in killing, with a single ball, a "pokou,"
which gave them a good supply of venison. This animal, was five feet long; it had long horns provided with rings, a
yellowish red skin, dotted with brilliant spots, and white on the stomach; and the flesh was found to be excellent.

It followed then, taking into account these almost daily landings and the hours of repose that were necessary at
night, that the distance on the 8th of July could hot be estimated as more than one hundred miles. This was
considerable, however, and already Dick Sand asked himself where this interminable river ended. Its course
absorbed some small tributaries and did not sensibly enlarge. As for the general direction, after having been north for a long time, it took a bend toward the northwest.

However, this river furnished its share of food. Long lianes, armed with thorns, which served as fishhooks, caught several of those delicately-flavored "sandjikas," which, once smoked, are easily carried in this region; black "usakas" were also caught, and some "mormdes," with large heads, the genciva of which have teeth like the hairs of a brush, and some little "dagalas," the friends of running waters, belonging to the clupe species, and resembling the whitebait of the Thames.

During the 9th of July, Dick Sand had to give proof of extreme coolness. He was alone on the shore, carrying off a "caama," the horns of which showed above the thicket. He had just shot it, and now there bounded, thirty feet off, a formidable hunter, that no doubt came to claim its prey, and was not in a humor to give it up. It was a lion of great height, one of those which the natives call "karamos," and not one of the kind without a mane, named "lion of the Nyassi." This one measured five feet in height--a formidable beast. With one bound the lion had fallen on the "caama," which Dick Sand's ball had just thrown to the ground, and, still full of life, it shook and cried under the paw of the powerful animal.

Dick Sand was disarmed, not having had time to slide a second cartridge into his gun.

Dick Sand, in front, lowering his voice, gave directions to avoid striking against these rotten constructions. The night was clear. They saw well to direct the boat, but they could also be seen.

Then came a terrible moment. Two natives, who talked in loud tones, were squatting close to the water on the piles, between which the current carried the boat, and the direction could not be changed for a narrower pass. Now, would they not see it, and at their cries might not the whole village be alarmed?

A space of a hundred feet at most remained to be passed, when Dick Sand heard the two natives call more quickly to each other. One showed the other the mass of drifting herbs, which threatened to break the long liane ropes which they were occupied in stretching at that moment.

Rising hastily, they called out for help. Five or six other blacks ran at once along the piles and posted themselves on the cross-beams which supported them, uttering loud exclamations which the listeners could not understand.

In the boat, on the contrary, was absolute silence, except for the few orders given by Dick Sand in a low voice, and complete repose, except the movement of Hercules's right arm moving the oar; at times a low growl from Dingo, whose jaws Jack held together with his little hands; outside, the murmur of the water which broke against the piles, then above, the cries of the ferocious cannibals.

The natives, meanwhile, rapidly drew up their ropes. If they were raised in time the boat would pass, otherwise it would be caught, and all would be over with those who drifted against the piles, then above, the cries of the ferocious cannibals.

The natives, meanwhile, rapidly drew up their ropes. If they were raised in time the boat would pass, otherwise it would be caught, and all would be over with those who drifted against the piles, then above, the cries of the ferocious cannibals.

The boat was caught between the piles. By an unheard-of piece of fortune, the last effort made by the natives had raised the ropes.

But in passing, as Dick Sand had feared, the boat was deprived of a part of the grasses which now floated at its right.

One of the natives uttered a cry. Had he had time to recognize what the roof covered, and was he going to alarm his comrades? It was more than probable.

Dick Sand and his friends were already out of reach, and in a few moments, under the impetus of this current, now changed into a kind of rapid, they had lost sight of the lacustrine village.

"To the left bank!" Dick Sand ordered, as being more prudent. "The stream is again navigable."

"To the left bank!" replied Hercules, giving the oar a vigorous stroke.

Dick Sand stood beside him and looked at the surface of the water, which the moon lit up. He saw nothing suspicious. Not a boat had started in pursuit. Perhaps these savages had none; and at daybreak not a native appeared, either on the bank or on the water. After that, increasing their precautions, the boat kept close to the left bank.

During the four following days, from the 11th to the 14th of July, Mrs. Weldon and her companions remarked that this portion of the territory had decidedly changed. It was no longer a deserted country; it was also a desert, and they might have compared it to that Kalahari explored by Livingstone on his first voyage.

The arid soil recalled nothing of the fertile fields of the upper country.

And always this interminable stream, to which might be given the name of river, as it seemed that it could only end at the Atlantic Ocean.

The question of food, in this desert country, became a problem. Nothing remained of their former stock. Fishing gave little; hunting was no longer of any use. Elks, antelopes, pokous, and other animals, could find nothing to live on in this desert, and with them had also disappeared the carnivorous animals.

The nights no longer echoed the accustomed roarings. Nothing broke the silence but the concert of frogs, which Cameron compares with the noise of calkers caking a ship; with riveters who rivet, and the drillers who drill, in a
shipbuilder's yard.

The country on the two banks was flat and destitute of trees as far as the most distant hills that bounded it on the east and west. The spurge grew alone and in profusion—not the euphosbium which produces cassava or tapioca flour, but those from which they draw an oil which does not serve as food.

Meantime it is necessary to provide some nourishment.

Dick Sand knew not what to do, and Hercules reminded him that the natives often eat the young shoots of the ferns and the pith which the papyrus leaf contains. He himself, while following the caravan of Ibn Ilamis across the desert, had been more than once reduced to this expedient to satisfy his hunger. Happily, the ferns and the papyrus grew in profusion along the banks, and the marrow or pith, which has a sweet flavor, was appreciated by all, particularly by little Jack.

This was not a very cheering prospect; the food was not strengthening, but the next day, thanks to Cousin Benedict, they were better served. Since the discovery of the "Hexapodus Benedictus," which was to immortalize his name, Cousin Benedict had recovered his usual manners. The insect was put in a safe place, that is to say, stuck in the crown of his hat, and the savant had recommenced his search whenever they were on shore. During that day, while hunting in the high grass, he started a bird whose warbling attracted him.

Dick Sand was going to shoot it, when Cousin Benedict cried out:
"Don't fire, Dick! Don't fire! A bird among five persons would not be enough."

"It will be enough for Jack," replied Dick Sand, taking aim at the bird, which was in no hurry to fly away.

"No, no!" said Cousin Benedict, "do not fire! It is an indicator, and it will bring us honey in abundance."

Dick Sand lowered his gun, realizing that a few pounds of honey were worth more than one bird; and Cousin Benedict and he followed the bird, which rose and flew away, inviting them to go with it.

They had not far to go, and a few minutes after, some old trunks, hidden in between the spurge, appeared in the midst of an intense buzzing of bees.

Cousin Benedict would have preferred not to have robbed these industrious hymenopters of the "fruit of their labors," as he expressed it. But Dick Sand did not understand it in that way. He smoked out the bees with some dry herbs and obtained a considerable quantity of honey. Then leaving to the indicator the cakes of wax, which made its share of the profit, Cousin Benedict and he returned to the boat.

The honey was well received, but it was but little, and, in fact, all would have suffered cruelly from hunger, if, during the day of the 12th, the boat had not stopped near a creek where some locusts swarmed. They covered the ground and the shrubs in myriads, two or three deep. Now, Cousin Benedict not failing to say that the natives frequently eat these orthopters—which was perfectly true—they took possession of this manna. There was enough to fill the boat ten times, and broiled over a mild fire, these edible locusts would have seemed excellent even to less famished people. Cousin Benedict, for his part, eat a notable quantity of them, sighing, it is true—still, he eat them.

Nevertheless, it was time for this long series of moral and physical trials to come to an end. Although drifting on this rapid river was not so fatiguing as had been the walking through the first forests near the coast, still, the excessive heat of the day, the damp mists at night, and the incessant attacks of the mosquitoes, made this descent of the watercourse very painful. It was time to arrive somewhere, and yet Dick Sand could see no limit to the journey. Would it last eight days or a month? Nothing indicated an answer. Had the river flowed directly to the west, they would have already reached the northern coast of Angola; but the general direction had been rather to the north, and they could travel thus a long time before reaching the coast.

Dick Sand was, therefore, extremely anxious, when a sudden change of direction took place on the morning of the 14th of July.

Little Jack was in the front of the boat, and he was gazing through the thatch, when a large expanse of water appeared on the horizon.

"The sea!" he shouted.

At this word Dick Sand trembled, and came close to little Jack.

"The sea?" he replied. "No, not yet; but at least a river which flows toward the west, and of which this stream is only a tributary. Perhaps it is the Zaire itself."

"May God grant that it is!" replied Mrs. Weldon.

Yes; for if this were the Zaire or Congo, which Stanley was to discover a few years later, they had only to descend its course so as to reach the Portuguese settlements at its mouth. Dick Sand hoped that it might be so, and he was inclined to believe it.

During the 15th, 16th, 17th and 18th of July, in the midst of a more fertile country, the boat drifted on the silvery waters of the river. They still took the same precautions, and it was always a mass of herbs that the current seemed to carry on its surface.

A few days more, and no doubt the survivors of the "Pilgrim" would see the termination of their miseries. Self-
sacrifice had been shared in by all, and if the young novice would not claim the greater part of it, Mrs. Weldon would demand its recognition for him.

But on the 18th of July, during the night, an incident took place which compromised the safety of the party. Toward three o'clock in the morning a distant noise, still very low, was heard in the west. Dick Sand, very anxious, wished to know what caused it. While Mrs. Weldon, Jack, and Cousin Benedict slept in the bottom of the boat, he called Hercules to the front, and told him to listen with the greatest attention. The night was calm. Not a breeze stirred the atmosphere.

"It is the noise of the sea," said Hercules, whose eyes shone with joy.

"No," replied Dick Sand, holding down his head.

"What is it then?" asked Hercules.

"Wait until day; but we must watch with the greatest care."

At this answer, Hercules returned to his post.

Dick Sand stood in front, listening all the time. The noise increased. It was soon like distant roaring.

Day broke almost without dawn. About half a mile down the river, just above the water, a sort of cloud floated in the atmosphere. But it was not a mass of vapor, and this became only too evident, when, under the first solar rays, which broke in piercing it, a beautiful rainbow spread from one bank to the other.

"To the shore!" cried Dick Sand, whose voice awoke Mrs. Weldon. "It is a cataract! Those clouds are spray! To the shore, Hercules!"

Dick Sand was not mistaken. Before them, the bed of the river broke in a descent of more than a hundred feet, and the waters rushed down with superb but irresistible impetuosity. Another half mile, and the boat would have been engulfed in the abyss.

CHAPTER XIX.

S. V.

With a vigorous plow of the oar, Hercules had pushed toward the left bank. Besides, the current was not more rapid in that place, and the bed of the river kept its normal declivity to the falls. As has been said, it was the sudden sinking of the ground, and the attraction was only felt three or four hundred feet above the cataract.

On the left bank were large and very thick trees. No light penetrated their impenetrable curtain. It was not without terror that Dick Sand looked at this territory, inhabited by the cannibals of the Lower Congo, which he must now cross, because the boat could no longer follow the stream. He could not dream of carrying it below the falls. It was a terrible blow for these poor people, on the eve perhaps of reaching the Portuguese villages at its mouth. They were well aided, however. Would not Heaven come to their assistance?

The boat soon reached the left bank of the river. As it drew near, Dingo gave strange marks of impatience and grief at the same time.

Dick Sand, who was watching the animal--for all was danger--asked himself if some beast or some native was not concealed in the high papyrus of the bank. But he soon saw that the animal was not agitated by a sentiment of anger.

"One would say that Dingo was crying!" exclaimed little Jack, clasping Dingo in his two arms.

Dingo escaped from him, and, springing into the water, when the boat was only twenty feet from the bank, reached the shore and disappeared among the bushes.

Neither Mrs. Weldon, nor Dick Sand, nor Hercules, knew what to think.

They landed a few moments after in the middle of a foam green with hairweed and other aquatic plants. Some kingfishers, giving a sharp whistle, and some little herons, white as snow, immediately flew away. Hercules fastened the boat firmly to a mangrove stump, and all climbed up the steep bank overhung by large trees.

There was no path in this forest. However, faint traces on the ground indicated that this place had been recently visited by natives or animals.

Dick Sand, with loaded gun, and Hercules, with his hatchet in his hand, had not gone ten steps before they found Dingo again. The dog, nose to the ground, was following a scent, barking all the time. A first inexplicable presentiment had drawn the animal to this part of the shore, a second led it into the depths of the wood. That was clearly visible to all.

"Attention!" said Dick Sand. "Mrs. Weldon, Mr. Benedict, Jack, do not leave us! Attention, Hercules!"

At this moment Dingo raised its head, and, by little bounds, invited them to follow.

A moment after Mrs. Weldon and her companions rejoined it at the foot of an old sycamore, lost in the thickest part of the wood.

There was a dilapidated hut, with disjoined boards, before which Dingo was barking lamentably.
"Who can be there?" exclaimed Dick Sand.

He entered the hut.

Mrs. Weldon and the others followed him.

The ground was scattered with bones, already bleached under the discoloring action of the atmosphere.

"A man died in that hut!" said Mrs. Weldon.

"And Dingo knew that man!" replied Dick Sand. "It was, it must have been, his master! Ah, see!"

Dick Sand pointed to the naked trunk of the sycamore at the end of the hut.

There appeared two large red letters, already almost effaced, but which could be still distinguished.

Dingo had rested its right paw on the tree, and it seemed to indicate them.

"S. V.!" exclaimed Dick Sand. "Those letters which Dingo knew among all others! Those initials that it carries on its collar!"

He did not finish, and stooping, he picked up a little copper box, all oxydized, which lay in a corner of the hut.

That box was opened, and a morsel of paper fell from it, on which Dick Sand read these few words:

"Assassinated--robbed by my guide, Negoro--3d December, 1871--here--120 miles from the coast--Dingo!--with me!"

"S. VERNON."

The note told everything. Samuel Vernon set out with his dog, Dingo, to explore the center of Africa, guided by Negoro. The money which he carried had excited the wretch's cupidity, and he resolved to take possession of it. The French traveler, arrived at this point of the Congo's banks, had established his camp in this hut. There he was mortally wounded, robbed, abandoned. The murder accomplished, no doubt Negoro took to flight, and it was then that he fell into the hands of the Portuguese. Recognized as one of the trader Alvez's agents, conducted to Saint Paul de Loanda, he was condemned to finish his days in one of the penitentiaries of the colony. We know that he succeeded in escaping, in reaching New Zealand, and how he embarked on the "Pilgrim" to the misfortune of those who had taken passage on it. But what happened after the crime? Nothing but what was easy to understand! The unfortunate Vernon, before dying, had evidently had time to write the note which, with the date and the motive of the assassination, gave the name of the assassin. This note he had shut up in that box where, doubtless, the stolen money was, and, in a last effort, his bloody finger had traced like an epitaph the initials of his name. Before those two red letters, Dingo must have remained for many days! He had learned to know them! He could no longer forget them! Then, returned to the coast, the dog had been picked up by the captain of the "Waldeck," and finally, on board the "Pilgrim," found itself again with Negoro. During this time, the bones of the traveler were whitening in the depths of this lost forest of Central Africa, and he no longer lived except in the remembrance of his dog.

Yes, such must have been the way the events had happened. As Dick Sand and Hercules prepared to give a Christian burial to the remains of Samuel Vernon, Dingo, this time giving a howl of rage, dashed out of the hut.

Almost at once horrible cries were heard at a short distance. Evidently a man was struggling with the powerful animal.

Hercules did what Dingo had done. In his turn he sprang out of the hut, and Dick Sand, Mrs. Weldon, Jack, Benedict, following his steps, saw him throw himself on a man, who fell to the ground, held at the neck by the dog's formidable teeth.

It was Negoro.

In going to the mouth of the Zaire, so as to embark for America, this rascal, leaving his escort behind, had come to the very place where he had assassinated the traveler who had trusted himself to him.

But there was a reason for it, and all understood it when they perceived some handfuls of French gold which glittered in a recently-dug hole at the foot of a tree. So it was evident that after the murder, and before falling into the hands of the Portuguese, Negoro had hidden the product of his crime, with the intention of returning some day to get it. He was going to take possession of this gold when Dingo scented him and sprang at his throat. The wretch, surprised, had drawn his cutlass and struck the dog at the moment when Hercules threw himself on him, crying:

"Ah, villain! I am going to strangle you at last!"

There was nothing more to do. The Portuguese gave no sign of life, struck, it maybe said, by divine justice, and on the very spot where the crime had been committed. But the faithful dog had received a mortal blow, and dragging itself to the hut, it came to die there--where Samuel Vernon had died.

Hercules buried deep the traveler's remains, and Dingo, lamented by all, was put in the same grave as its master. Negoro was no more, but the natives who accompanied him from Kazounde could not be far away. On not seeing him return, they would certainly seek him along the river. This was a very serious danger.

Dick Sand and Mrs. Weldon took counsel as to what they should do, and do without losing an instant.

One fact acquired was that this stream was the Congo, which the natives call Kwango, or Ikoutouya Kongo, and which is the Zaire under one longitude, the Loualaba under another. It was indeed that great artery of Central Africa,
to which the heroic Stanley has given the glorious name of "Livingstone," but which the geographers should perhaps replace by his own.

But, if there was no longer any doubt that this was the Congo, the French traveler's note indicated that its mouth was still one hundred and twenty miles from this point, and, unfortunately, at this place it was no longer navigable. High falls—very likely the falls of Ntamo—forbid the descent of any boat. Thus it was necessary to follow one or the other bank, at least to a point below the cataracts, either one or two miles, when they could make a raft, and trust themselves again to the current.

"It remains, then," said Dick Sand, in conclusion, "to decide if we shall descend the left bank, where we are, or the right bank of the river. Both, Mrs. Weldon, appear dangerous to me, and the natives are formidable. However, it seems as if we risk more on this bank, because we have the fear of meeting Negoro's escort."

"Let us pass over to the other bank," replied Mrs. Weldon.

"Is it practicable?" observed Dick Sand. "The road to the Congo's mouths is rather on the left bank, as Negoro was following it. Never mind. We must not hesitate. But before crossing the river with you, Mrs. Weldon, I must know if we can descend it below the falls."

That was prudent, and Dick Sand wished to put his project into execution on the instant.

The river at this place was not more than three or four hundred feet wide, and to cross it was easy for the young novice, accustomed to handling the oar. Mrs. Weldon, Jack, and Cousin Benedict would remain under Hercules's care till his return.

These arrangements made, Dick Sand was going to set out, when Mrs. Weldon said to him:

"You do not fear being carried away by the falls, Dick?"

"No, Mrs. Weldon. I shall cross four hundred feet above."

"But on the other bank—"

"I shall not land if I see the least danger."

"Take your gun."

"Yes, but do not be uneasy about me."

"Perhaps it would be better for us not to separate, Dick," added Mrs. Weldon, as if urged by some presentiment.

"No—let me go alone," replied Dick Sand. "I must act for the security of all. Before one hour I shall be back. Watch well, Hercules."

On this reply the boat, unfastened, carried Dick Sand to the other side of the Zaire.

Mrs. Weldon and Hercules, lying in the papyrus thickets, followed him with their eyes.

Dick Sand soon reached the middle of the stream. The current, without being very strong, was a little accentuated there by the attraction of the falls. Four hundred feet below, the imposing roaring of the waters filled the space, and some spray, carried by the western wind, reached the young novice. He shuddered at the thought that the boat, if it had been less carefully watched during the last night, would have been lost over those cataracts, that would only have restored dead bodies. But that was no longer to be feared, and, at that moment, the oar skilfully handled sufficed to maintain it in a direction a little oblique to the current.

A quarter of an hour after, Dick Sand had reached the opposite shore, and was preparing to spring on the bank.

At that moment cries were heard, and ten natives rushed on the mass of plants that still hid the boat.

They were the cannibals from the lake village. For eight days they had followed the right bank of the river. Under that thatch, which was torn by the stakes of their village, they had discovered the fugitives, that is to say, a sure prey for them, because the barrier of the falls would sooner or later oblige those unfortunate ones to land on one or the other side of the river.

Dick Sand saw that he was lost, but he asked himself if the sacrifice of his life might not save his companions. Master of himself, standing in the front of the boat, his gun pointed, he held the cannibals in check.

Meanwhile, they snatched away the thatch, under which they expected to find other victims. When they saw that the young novice alone had fallen into their hands, they betrayed their disappointment by frightful cries. A boy of fifteen among ten!

But, then, one of those natives stood up, his arm stretched toward the left bank, and pointed to Mrs. Weldon and her companions, who, having seen all and not knowing what to do, had just climbed up the bank!

Dick Sand, not even dreaming of himself, waited for an inspiration from Heaven that might save them.

The boat was going to be pushed out into the stream. The cannibals were going to cross the river. They did not budge before the gun aimed at them, knowing the effect of fire-arms. But one of them had seized the oar; he managed it like a man who knew how to use it, and the boat crossed the river obliquely. Soon it was not more than a hundred feet from the left bank.

"Flee!" cried Dick Sand to Mrs. Weldon. "Flee!"

Neither Mrs. Weldon nor Hercules stirred. One would say that their feet were fastened to the ground.
Flee! Besides, what good would it do? In less than an hour they would fall into the hands of the cannibals! Dick Sand understood it. But, then, that supreme inspiration which he asked from Heaven was sent him. He saw the possibility of saving all those whom he loved by making the sacrifice of his own life! He did not hesitate to do it. "May God protect them!" murmured he, "and in His infinite goodness may He have pity on me!"

At the same instant Dick Sand pointed his gun at the native who was steering the boat, and the oar, broken by a ball, flew into fragments.

The cannibals gave a cry of terror.

In fact, the boat, no longer directed by the oar, went with the stream. The current bore it along with increasing swiftness, and, in a few moments, it was only a hundred feet from the falls.

Mrs. Weldon and Hercules understood all. Dick Sand attempted to save them by precipitating the cannibals, with himself, into the abyss. Little Jack and his mother, kneeling on the bank, sent him a last farewell. Hercules's powerless hand was stretched out to him.

At that moment the natives, wishing to gain the left bank by swimming, threw themselves out of the boat, which they capsized.

Dick Sand had lost none of his coolness in the presence of the death which menaced him. A last thought then came to him. It was that this boat, even because it was floating keel upward, might serve to save him.

In fact, two dangers were to be feared when Dick Sand should be going over the cataract: asphyxia by the water, and asphyxia by the air. Now, this overturned hull was like a box, in which he might, perhaps, keep his head out of the water, at the same time that he would be sheltered from the exterior air, which would certainly have stifled him in the rapidity of his fall. In these conditions, it seems that a man would have some chance of escaping the double asphyxia, even in descending the cataracts of a Niagara.

Dick Sand saw all that like lightning. By a last instinct he clung to the seat which united the two sides of the boat, and, his head out of the water, under the capsized hull, he felt the irresistible current carrying him away, and the almost perpendicular fall taking place.

The boat sank into the abyss hollowed out by the waters at the foot of the cataract, and, after plunging deep, returned to the surface of the river.

Dick Sand, a good swimmer, understood that his safety now depended on the vigor of his arms.

A quarter of an hour after he reached the left bank, and there found Mrs. Weldon, little Jack, and Cousin Benedict, whom Hercules had led there in all haste.

But already the cannibals had disappeared in the tumult of the waters. They, whom the capsized boat had not protected, had ceased to live even before reaching the last depths of the abyss, and their bodies were going to be torn to pieces on those sharp rocks on which the under-current of the stream dashed itself.

CHAPTER XX.
CONCLUSION.

Two days after, the 20th of July, Mrs. Weldon and her companions met a caravan going toward Emboma, at the mouth of the Congo. These were not slave merchants, but honest Portuguese traders, who dealt in ivory. They made the fugitives welcome, and the latter part of the journey was accomplished under more agreeable conditions.

The meeting with this caravan was really a blessing from Heaven. Dick Sand would never have been able to descend the Zaire on a raft. From the Falls of Ntamo, as far as Yellala, the stream was a succession of rapids and cataracts. Stanley counted seventy-two, and no boat could undertake to pass them. It was at the mouth of the Congo that the intrepid traveler, four years later, fought the last of the thirty-two combats which he waged with the natives. Lower down, in the cataracts of Mbelo, he escaped death by a miracle.

On the 11th of August, Mrs. Weldon, Dick Sand, Jack, Hercules, and Cousin Benedict arrived at Emboma. Messrs. Motta Viega and Harrison received them with generous hospitality. A steamer was about sailing for the Isthmus of Panama. Mrs. Weldon and her companions took passage in it, and happily reached the American coast.

A despatch sent to San Francisco informed Mr. Weldon of the unlooked-for return of his wife and his child. He had vainly searched for tidings of them at every place where he thought the "Pilgrim" might have been wrecked.

Finally, on the 25th of August, the survivors of the shipwreck reached the capital of California. Ah! if old Tom and his companions had only been with them!

What shall we say of Dick Sand and of Hercules? One became the son, the other the friend, of the family. James Weldon knew how much he owed to the young novice, how much to the brave black. He was happy; and it was fortunate for him that Negoro had not reached him, for he would have paid the ransom of his wife and child with his whole fortune. He would have started for the African coast, and, once there, who can tell to what dangers, to what treachery, he would have been exposed?
A single word about Cousin Benedict. The very day of his arrival the worthy savant, after having shaken hands
with Mr. Weldon, shut himself up in his study and set to work, as if finishing a sentence interrupted the day before.
He meditated an enormous work on the "Hexapodes Benedictus," one of the _desiderata_ of entomological science.

There, in his study, lined with insects, Cousin Benedict's first action was to find a microscope and a pair of
glasses. Great heaven! What a cry of despair he uttered the first time he used them to study the single specimen
furnished by the African entomology!

The "Hexapodes Benedictus" was not a hexapode! It was a common spider! And if it had but six legs, instead of
eight, it was simply because the two front legs were missing! And if they were missing, these two legs, it was
because, in taking it, Hercules had, unfortunately, broken them off! Now, this mutilation reduced the pretended
"Hexapodes Benedictus" to the condition of an invalid, and placed it in the most ordinary class of spiders—a fact
which Cousin Benedict's near-sightedness had prevented him from discovering sooner. It gave him a fit of sickness,
from which, however, he happily recovered.

Three years after, little Jack was eight years old, and Dick Sand made him repeat his lessons, while working
faithfully at his own studies. In fact, hardly was he at home when, realizing how ignorant he was, he had
commenced to study with a kind of remorse—like a man who, for want of knowledge, finds himself unequal to his
task.

"Yes," he often repeated; "if, on board of the 'Pilgrim,' I had known all that a sailor should know, what
misfortunes we would have escaped!"

Thus spoke Dick Sand. At the age of eighteen he finished with distinction his hydrographical studies, and,
honored with a brevet by special favor, he took command of one of Mr. Weldon's vessels.

See what the little orphan, rescued on the beach at Sandy Hook, had obtained by his work and conduct. He was,
in spite of his youth, surrounded by the esteem, one might say the respect, of all who knew him; but his simplicity
and modesty were so natural to him, that he was not aware of it. He did not even suspect—although no one could
attribute to him what are called brilliant exploits—that the firmness, courage, and fidelity displayed in so many trials
had made of him a sort of hero.

Meanwhile, one thought oppressed him. In his rare leisure hours he always dreamed of old Tom, of Bat, of
Austin, and of Acteon, and of the misfortune for which he held himself responsible. It was also a subject of real grief
to Mrs. Weldon, the actual situation of her former companions in misery. Mr. Weldon, Dick Sand, and Hercules
moved heaven and earth to find traces of them. Finally they succeeded—thanks to the correspondents which the rich
shipowner had in different parts of the world. It was at Madagascar—where, however, slavery was soon to be
abolished—that Tom and his companions had been sold. Dick Sand wished to consecrate his little savings to ransom
them, but Mr. Weldon would not hear of it. One of his correspondents arranged the affair, and one day, the 15th of
November, 1877, four blacks rang the bell of his house.

They were old Tom, Bat, Acteon, and Austin. The brave men, after escaping so many dangers, came near being
stiffed, on that day, by their delighted friends.

Only poor Nan was missing from those whom the "Pilgrim" had thrown on the fatal coast of Africa. But the old
servant could not be recalled to life, and neither could Dingo be restored to them. Certainly it was miraculous that
these two alone had succumbed amid such adventures.

It is unnecessary to say that on that occasion they had a festival at the house of the California merchant. The best
toast, which all applauded, was that given by Mrs. Weldon to Dick Sand, "To the Captain at Fifteen!"

THE END.

PART I. THE GIANT RAFT

CHAPTER I. A CAPTAIN OF THE WOODS
"Phy jsl yld dqqf dzxg asgzz q q q e h x g kf n d r x u j u g l o c y t d x v k s b x h h u y p o h d v y r y m h

h h o t o z v d k s p s u v j h d."
THE MAN who held in his hand the document of which this strange assemblage of letters formed the concluding paragraph remained for some moments lost in thought.

It contained about a hundred of these lines, with the letters at even distances, and undivided into words. It seemed to have been written many years before, and time had already laid his tawny finger on the sheet of good stout paper which was covered with the hieroglyphics.

On what principle had these letters been arranged? He who held the paper was alone able to tell. With such cipher language it is as with the locks of some of our iron safes—in either case the protection is the same. The combinations which they lead to can be counted by millions, and no calculator’s life would suffice to express them. Some particular "word" has to be known before the lock of the safe will act, and some "cipher" is necessary before that cryptogram can be read.

He who had just reperused the document was but a simple "captain of the woods." Under the name of _"Capitaes do Mato"_ are known in Brazil those individuals who are engaged in the recapture of fugitive slaves. The institution dates from 1722. At that period anti-slavery ideas had entered the minds of a few philanthropists, and more than a century had to elapse before the mass of the people grasped and applied them. That freedom was a right, that the very first of the natural rights of man was to be free and to belong only to himself, would seem to be self-evident, and yet thousands of years had to pass before the glorious thought was generally accepted, and the nations of the earth had the courage to proclaim it.

In 1852, the year in which our story opens, there were still slaves in Brazil, and as a natural consequence, captains of the woods to pursue them. For certain reasons of political economy the hour of general emancipation had been delayed, but the black had at this date the right to ransom himself, the children which were born to him were born free. The day was not far distant when the magnificent country, into which could be put three-quarters of the continent of Europe, would no longer count a single slave among its ten millions of inhabitants.

The occupation of the captains of the woods was doomed, and at the period we speak of the advantages obtainable from the capture of fugitives were rapidly diminishing. While, however, the calling continued sufficiently profitable, the captains of the woods formed a peculiar class of adventurers, principally composed of freedmen and deserters—not of very enviable reputation. The slave hunters in fact belonged to the dregs of society, and we shall not be far wrong in assuming that the man with the cryptogram was a fitting comrade for his fellow _"capitaes do mato."_ Torres—for that was his name—unlike the majority of his companions, was neither half-breed, Indian, nor negro. He was a white of Brazilian origin, and had received a better education than befitted his present condition. One of those unclassed men who are found so frequently in the distant countries of the New World, at a time when the Brazilian law still excluded mulattoes and others of mixed blood from certain employments, it was evident that if such exclusion had affected him, it had done so on account of his worthless character, and not because of his birth.

Torres at the present moment was not, however, in Brazil. He had just passed the frontier, and was wandering in the forests of Peru, from which issue the waters of the Upper Amazon.

He was a man of about thirty years of age, on whom the fatigues of a precarious existence seemed, thanks to an exceptional temperament and an iron constitution, to have had no effect. Of middle height, broad shoulders, regular features, and decided gait, his face was tainted with the scorching air of the tropics. He had a thick black beard, and eyes lost under contracting eyebrows, giving that swift but hard glance so characteristic of insolent natures. Clothed as backwoodsmen are generally clothed, not over elaborately, his garments bore witness to long and roughish wear. On his head, stuck jauntily on one side, was a leather hat with a large brim. Trousers he had of coarse wool, which were tucked into the tops of the thick, heavy boots which formed the most substantial part of his attire, and over all, and hiding all, was a faded yellowish poncho.

But if Torres was a captain of the woods it was evident that he was not now employed in that capacity, his means of attack and defense being obviously insufficient for any one engaged in the pursuit of the blacks. No firearms—neither gun nor revolver. In his belt only one of those weapons, more sword than hunting-knife, called a _"manchetta,"_ and in addition he had an _"enchada,"_ which is a sort of hoe, specially employed in the pursuit of the tatous and agoutis which abound in the forests of the Upper Amazon, where there is generally little to fear from wild beasts.

On the 4th of May, 1852, it happened, then, that our adventurer was deeply absorbed in the reading of the document on which his eyes were fixed, and, accustomed as he was to live in the forests of South America, he was perfectly indifferent to their splendors. Nothing could distract his attention; neither the constant cry of the howling monkeys, which St. Hillaire has graphically compared to the ax of the woodman as he strikes the branches of the trees, nor the sharp jingle of the rings of the rattlesnake (not an aggressive reptile, it is true, but one of the most venomous); neither the bawling voice of the horned toad, the most hideous of its kind, nor even the solemn and sonorous croak of the bellowing frog, which, though it cannot equal the bull in size, can surpass him in noise.

Torres heard nothing of all these sounds, which form, as it were, the complex voice of the forests of the New
World. Reclining at the foot of a magnificent tree, he did not even admire the lofty boughs of that "pao ferro," or iron wood, with its somber bark, hard as the metal which it replaces in the weapon and utensil of the Indian savage. No. Lost in thought, the captain of the woods turned the curious paper again and again between his fingers. With the cipher, of which he had the secret, he assigned to each letter its true value. He read, he verified the sense of those lines, unintelligible to all but him, and then he smiled--and a most unpleasant smile it was.

Then he murmured some phrases in an undertone which none in the solitude of the Peruvian forests could hear, and which no one, had he been anywhere else, would have heard.

"Yes," said he, at length, "here are a hundred lines very neatly written, which, for some one that I know, have an importance that is undoubted. That somebody is rich. It is a question of life or death for him, and looked at in every way it will cost him something." And, scrutinizing the paper with greedy eyes, "At a conto (1) only for each word of this last sentence it will amount to a considerable sum, and it is this sentence which fixes the price. It sums up the entire document. It gives their true names to true personages; but before trying to understand it I ought to begin by counting the number of words it contains, and even when this is done its true meaning may be missed."

In saying this Torres began to count mentally.

"There are fifty-eight words, and that makes fifty-eight contos. With nothing but that one could live in Brazil, in America, wherever one wished, and even live without doing anything! And what would it be, then, if all the words of this document were paid for at the same price? It would be necessary to count by hundreds of contos. Ah! there is quite a fortune here for me to realize if I am not the greatest of duffers!"

It seemed as though the hands of Torres felt the enormous sum, and were already closing over the rolls of gold. Suddenly his thoughts took another turn.

"At length," he cried, "I see land; and I do not regret the voyage which has led me from the coast of the Atlantic to the Upper Amazon. This man may quit America and go beyond the seas, and then how can I touch him? But no! he is there, and if I climb to the top of this tree I can see the roof under which he lives with his family!" Then seizing the paper and shaking it with terrible meaning: "Before to-morrow I will be in his presence; before to-morrow he will know that his honor and his life are contained in these lines. And when he wishes to see the cipher which permits him to read them, he--well, he will pay for it. He will pay, if I wish it, with all his fortune, as he ought to pay with all his blood! Ah! My worthy comrade, who gave me this cipher, who told me where I could find his old colleague, and the name under which he has been hiding himself for so many years, hardly suspects that he has made my fortune!"

For the last time Torres glanced over the yellow paper, and then, after carefully folding it, put it away into a little copper box which he used for a purse. This box was about as big as a cigar case, and if what was in it was all Torres possessed he would nowhere have been considered a wealthy man. He had a few of all the coins of the neighboring States--ten double-condors in gold of the United States of Colombia, worth about a hundred francs; Brazilian reis, worth about as much; golden sols of Peru, worth, say, double; some Chilian escudos, worth fifty francs or more, and some smaller coins; but the lot would not amount to more than five hundred francs, and Torres would have been somewhat embarrassed had he been asked how or where he had got them. One thing was certain, that for some months, after having suddenly abandoned the trade of the slave hunter, which he carried on in the province of Para, Torres had ascended the basin of the Amazon, crossed the Brazilian frontier, and come into Peruvian territory. To such a man the necessaries of life were but few; expenses he had none--nothing for his lodging, nothing for his clothes. The forest provided his food, which in the backwoods cost him naught. A few reis were enough for his tobacco, which he bought at the mission stations or in the villages, and for a trifle more he filled his flask with liquor. With little he could go far.

When he had pushed the paper into the metal box, of which the lid shut tightly with a snap, Torres, instead of putting it into the pocket of his under-vest, thought to be extra careful, and placed it near him in a hollow of a root of the tree beneath which he was sitting. This proceeding, as it turned out, might have cost him dear.

It was very warm; the air was oppressive. If the church of the nearest village had possessed a clock, the clock would have struck two, and, coming with the wind, Torres would have heard it, for it was not more than a couple of miles off. But he cared not as to time. Accustomed to regulate his proceedings by the height of the sun, calculated with more or less accuracy, he could scarcely be supposed to conduct himself with military precision. He breakfasted or dined when he pleased or when he could; he slept when and where sleep overtook him. If his table was not always spread, his bed was always ready at the foot of some tree in the open forest. And in other respects Torres was not difficult to please. He had traveled during most of the morning, and having already eaten a little, he began to feel the want of a snooze. Two or three hours' rest would, he thought, put him in a state to continue his road, and so he laid himself down on the grass as comfortably as he could, and waited for sleep beneath the ironwood-tree.

Torres was not one of those people who drop off to sleep without certain preliminaries. HE was in the habit of
drinking a drop or two of strong liquor, and of then smoking a pipe; the spirits, he said, overexcited the brain, and
the tobacco smoke agreeably mingled with the general haziness of his reverie.

Torres commenced, then, by applying to his lips a flask which he carried at his side; it contained the liquor
generally known under the name of "chica" in Peru, and more particularly under that of "caysuma" in the Upper
Amazon, to which fermented distillation of the root of the sweet manioc the captain had added a good dose of
"tafia" or native rum.

When Torres had drunk a little of this mixture he shook the flask, and discovered, not without regret, that it was
nearly empty.

"Must get some more," he said very quietly.

Then taking out a short wooden pipe, he filled it with the coarse and bitter tobacco of Brazil, of which the leaves
belong to that old "petun" introduced into France by Nicot, to whom we owe the popularization of the most
productive and widespread of the solanaceae.

This native tobacco had little in common with the fine qualities of our present manufacturers; but Torres was not
more difficult to please in this matter than in others, and so, having filled his pipe, he struck a match and applied
the flame to a piece of that stick substance which is the secretion of certain of the hymenoptera, and is known as "ants'
amadou." With the amadou he lighted up, and after about a dozen whiffs his eyes closed, his pipe escaped from his
fingers, and he fell asleep.

(1) One thousand reis are equal to three francs, and a conto of reis is worth three thousand francs.

CHAPTER II. ROBBER AND ROBBED

TORRES SLEPT for about half an hour, and then there was a noise among the trees—a sound of light footsteps,
as though some visitor was walking with naked feet, and taking all the precaution he could lest he should be heard.

To have put himself on guard against any suspicious approach would have been the first care of our adventurer had
his eyes been open at the time. But he had not then awoke, and what advanced was able to arrive in his presence, at
ten paces from the tree, without being perceived.

It was not a man at all, it was a "guariba."

Of all the prehensile-tailed monkeys which haunt the forests of the Upper Amazon—graceful sahuis, horned
sapajous, gray-coated monos, sagouins which seem to wear a mask on their grimacing faces—the guariba is without
doubt the most eccentric. Of sociable disposition, and not very savage, differing therein very greatly from the
mucura, who is as ferocious as he is foul, he delights in company, and generally travels in troops. It was he whose
presence had been signaled from afar by the monotonous concert of voices, so like the psalm-singing of some
church choir. But if nature has not made him vicious, it is none the less necessary to attack him with caution, and
under any circumstances a sleeping traveler ought not to leave himself exposed, lest a guariba should surprise him
when he is not in a position to defend himself.

This monkey, which is also known in Brazil as the "barbado," was of large size. The suppleness and stoutness of
his limbs proclaimed him a powerful creature, as fit to fight on the ground as to leap from branch to branch at the
tops of the giants of the forest.

He advanced then cautiously, and with short steps. He glanced to the right and to the left, and rapidly swung his
tail. To these representatives of the monkey tribe nature has not been content to give four hands—she has shown
herself more generous, and added a fifth, for the extremity of their caudal appendage possesses a perfect power of
prehension.

The guariba noiselessly approached, brandishing a study cudgel, which, wielded by his muscular arm, would
have proved a formidable weapon. For some minutes he had seen the man at the foot of the tree, but the sleeper did
not move, and this doubtless induced him to come and look at him a little nearer. He came forward then, not without
hesitation, and stopped at last about three paces off.

On his bearded face was pictured a grin, which showed his sharp-edged teeth, white as ivory, and the cudgel
began to move about in a way that was not very reassuring for the captain of the woods.

Unmistakably the sight of Torres did not inspire the guariba with friendly thoughts. Had he then particular
reasons for wishing evil to this defenseless specimen of the human race which chance had delivered over to him?
Perhaps! We know how certain animals retain the memory of the bad treatment they have received, and it is possible
that against backwoodsmen in general he bore some special grudge.

In fact Indians especially make more fuss about the monkey than any other kind of game, and, no matter to what
species it belongs, follow its chase with the ardor of Nimrods, not only for the pleasure of hunting it, but for the
pleasure of eating it.

Whatever it was, the guariba did not seen disinclined to change characters this time, and if he did not quite forget
that nature had made him but a simple herbivore, and longed to devour the captain of the woods, he seemed at least to have made up his mind to get rid of one of his natural enemies.

After looking at him for some minutes the guariba began to move round the tree. He stepped slowly, holding his breath, and getting nearer and nearer. His attitude was threatening, his countenance ferocious. Nothing could have seemed easier to him than to have crushed this motionless man at a single blow, and assuredly at that moment the life of Torres hung by a thread.

In truth, the guariba stopped a second time close up to the tree, placed himself at the side, so as to command the head of the sleeper, and lifted his stick to give the blow.

But if Torres had been imprudent in putting near him in the crevice of the root the little case which contained his document and his fortune, it was this imprudence which saved his life.

A sunbeam shooting between the branches just glinted on the case, the polished metal of which lighted up like a looking-glass. The monkey, with the frivolity peculiar to his species, instantly had his attention distracted. His ideas, if such an animal could have ideas, took another direction. He stopped, caught hold of the case, jumped back a pace or two, and, raising it to the level of his eyes, looked at it not without surprise as he moved it about and used it like a mirror. He was if anything still more astonished when he heard the rattle of the gold pieces it contained. The music enchanted him. It was like a rattle in the hands of a child. He carried it to his mouth, and his teeth grated against the metal, but made no impression on it.

Doubtless the guariba thought he had found some fruit of a new kind, a sort of huge almost brilliant all over, and with a kernel playing freely in its shell. But if he soon discovered his mistake he did not consider it a reason for throwing the case away; on the contrary, he grasped it more tightly in his left hand, and dropped the cudgel, which broke off a dry twig in its fall.

At this noise Torres woke, and with the quickness of those who are always on the watch, with whom there is no transition from the sleeping to the waking state, was immediately on his legs.

In an instant Torres had recognized with whom he had to deal.

"A guariba!" he cried.
And his hand seizing his manchetta, he put himself into a posture of defense.

The monkey, alarmed, jumped back at once, and not so brave before a waking man as a sleeping one, performed a rapid caper, and glided under the trees.

"It was time!" said Torres; "the rogue would have settled me without any ceremony!"

Of a sudden, between the hands of the monkey, who had stopped at about twenty paces, and was watching him with violent grimaces, as if he would like to snap his fingers at him, he caught sight of his precious case.

"The beggar!" he said. "If he has not killed me, he has done what is almost as bad. He has robbed me!"
The thought that the case held his money was not however, what then concerned him. But that which made him jump was the recollection that it contained the precious document, the loss of which was irreparable, as it carried with it that of all his hopes.

"Botheration!" said he.

And at the moment, cost what it might to recapture his case, Torres threw himself in pursuit of the guariba.

He knew that to reach such an active animal was not easy. On the ground he could get away too fast, in the branches he could get away too far. A well-aimed gunshot could alone stop him as he ran or climbed, but Torres possessed no firearm. His sword-knife and hoe were useless unless he could get near enough to hit him.

It soon became evident that the monkey could not be reached unless by surprise. Hence Torres found it necessary to employ cunning in dealing with the mischievous animal. To stop, to hide himself behind some tree trunk, to disappear under a bush, might induce the guariba to pull up and retrace his steps, and there was nothing else for Torres to try. This was what he did, and the pursuit commenced under these conditions; but when the captain of the woods disappeared, the monkey patiently waited until he came into sight again, and at this game Torres fatigued himself without result.

"Confound the guariba!" he shouted at length. "There will be no end to this, and he will lead me back to the Brazilian frontier. If only he would let go of my case! But no! The jingling of the money amuses him. Oh, you thief! If I could only get hold of you!"

And Torres recommenced the pursuit, and the monkey scuttled off with renewed vigor.

An hour passed in this way without any result. Torres showed a persistency which was quite natural. How without this document could he get his money?

And then anger seized him. He swore, he stamped, he threatened the guariba. That annoying animal only responded by a chuckling which was enough to put him beside himself.

And then Torres gave himself up to the chase. He ran at top speed, entangling himself in the high undergrowth, among those thick brambles and interlacing creepers, across which the guariba passed like a steeplechaser. Big roots
hidden beneath the grass lay often in the way. He stumbled over them and again started in pursuit. At length, to his
astonishment, he found himself shouting:

"Come here! come here! you robber!" as if he could make him understand him.

His strength gave out, breath failed him, and he was obliged to stop. "Confound it!" said he, "when I am after
runaway slaves across the jungle they never give me such trouble as this! But I will have you, you wretched
monkey! I will go, yes, I will go as far as my legs will carry me, and we shall see!"

The guariba had remained motionless when he saw that the adventurer had ceased to pursue him. He rested also,
for he had nearly reached that degree of exhaustion which had forbidden all movement on the part of Torres.

He remained like this during ten minutes, nibbling away at two or three roots, which he picked off the ground,
and from time to time he rattled the case at his ear.

Torres, driven to distraction, picked up the stones within his reach, and threw them at him, but did no harm at
such a distance.

But he hesitated to make a fresh start. On one hand, to keep on in chase of the monkey with so little chance of
reaching him was madness. On the other, to accept as definite this accidental interruption to all his plans, to be not
only conquered, but cheated and hoaxed by a dumb animal, was maddening. And in the meantime Torres had begun
to think that when the night came the robber would disappear without trouble, and he, the robbed one, would find a
difficulty in retracing his way through the dense forest. In fact, the pursuit had taken him many miles from the bank
of the river, and he would even now find it difficult to return to it.

Torres hesitated; he tried to resume his thoughts with coolness, and finally, after giving vent to a last
imprecation, he was about to abandon all idea of regaining possession of his case, when once more, in spite of
himself, there flashed across him the thought of his document, the remembrance of all that scaffolding on which his
future hopes depended, on which he had counted so much; and he resolved to make another effort.

Then he got up.
The guariba got up too.
He made several steps in advance.
The monkey made as many in the rear, but this time, instead of plunging more deeply into the forest, he stopped
at the foot of an enormous ficus--the tree of which the different kinds are so numerous all over the Upper Amazon
basin.

To seize the trunk with his four hands, to climb with the agility of a clown who is acting the monkey, to hook on
with his prehensile tail to the first branches, which stretched away horizontally at forty feet from the ground, and
to hoist himself to the top of the tree, to the point where the higher branches just bent beneath its weight, was only
sport to the active guariba, and the work of but a few seconds.

Up there, installed at his ease, he resumed his interrupted repast, and gathered the fruits which were within his
reach. Torres, like him, was much in want of something to eat and drink, but it was impossible! His pouch was flat,
his flask was empty.

However, instead of retracing his steps he directed them toward the tree, although the position taken up by the
monkey was still more unfavorable for him. He could not dream for one instant of climbing the ficus, which the
thief would have quickly abandoned for another.

And all the time the miserable case rattled at his ear.

Then in his fury, in his folly, Torres apostrophized the guariba. It would be impossible for us to tell the series of
invectives in which he indulged. Not only did he call him a half-breed, which is the greatest of insults in the mouth
of a Brazilian of white descent, but _"curiboca"_--that is to say, half-breed negro and Indian, and of all the insults
that one man can hurl at another in this equatorial latitude _"curiboca"_ is the cruelest.

But the monkey, who was only a humble quadruman, was simply amused at what would have revolted a
representative of humanity.

Then Torres began to throw stones at him again, and bits of roots and everything he could get hold of that would
do for a missile. Had he the hope to seriously hurt the monkey? No! he no longer knew what he was about. To tell
the truth, anger at his powerlessness had deprived him of his wits. Perhaps he hoped that in one of the movements
which the guariba would make in passing from branch to branch the case might escape him, perhaps he thought that
if he continued to worry the monkey he might throw it at his head. But no! the monkey did not part with the case,
and, holding it with one hand, he had still three left with which to move.

Torres, in despair, was just about to abandon the chase for good, and to return toward the Amazon, when he
heard the sound of voices. Yes! the sound of human voices.

Those were speaking at about twenty paces to the right of him.

The first care of Torres was to hide himself in a dense thicket. Like a prudent man, he did not wish to show
himself without at least knowing with whom he might have to deal. Panting, puzzled, his ears on the stretch, he
waited, when suddenly the sharp report of a gun rang through the woods.

    A cry followed, and the monkey, mortally wounded, fell heavily on the ground, still holding Torres' case.
    "By Jove!" he muttered, "that bullet came at the right time!"
    And then, without fearing to be seen, he came out of the thicket, and two young gentlemen appeared from under
    the trees.

    They were Brazilians clothed as hunters, with leather boots, light palm-leaf hats, waistcoats, or rather tunics,
    buckled in at the waist, and more convenient than the national poncho. By their features and their complexion they
    were at once recognizable as of Portuguese descent.

    Each of them was armed with one of those long guns of Spanish make which slightly remind us of the arms of
    the Arabs, guns of long range and considerable precision, which the dwellers in the forest of the upper Amazon
    handle with success.

    What had just happened was a proof of this. At an angular distance of more than eighty paces the quadruman had
    been shot full in the head.

    The two young men carried in addition, in their belts, a sort of dagger-knife, which is known in Brazil as a
    _"foca,"_ and which hunters do not hesitate to use when attacking the ounce and other wild animals which, if not
    very formidable, are pretty numerous in these forests.

    Torres had obviously little to fear from this meeting, and so he went on running toward the monkey's corpse.

    But the young men, who were taking the same direction, had less ground to cover, and coming forward a few
    paces, found themselves face to face with Torres.

    The latter had recovered his presence of mind.

    "Many thanks, gentlemen," said he gayly, as he raised the brim of his hat; "in killing this wretched animal you
    have just done me a great service!"

    The hunters looked at him inquiringly, not knowing what value to attach to his thanks.

    Torres explained matters in a few words.

    "You thought you had killed a monkey," said he, "but as it happens you have killed a thief!"
    "If we have been of use to you," said the youngest of the two, "it was by accident, but we are none the less
    pleased to find that we have done some good."

    And taking several steps to the rear, he bent over the guariba, and, not without an effort, withdrew the case from
    his stiffened hand.

    "Doubtless that, sir, is what belongs to you?"

    "The very thing," said Torres briskly, catching hold of the case and failing to repress a huge sigh of relief.

    "Whom ought I to thank, gentlemen," said he, "for the service you have rendered me?"

    "My friend, Manoel, assistant surgeon, Brazilian army," replied the young man.

    "If it was I who shot the monkey, Benito," said Manoel, "it was you that pointed him out to me."

    "In that case, sir," replied Torres, "I am under an obligation to you both, as well to you, Mr. Manoel, as to you,
    Mr. ----"  

    "Benito Garral," replied Manoel.

    The captain of the woods required great command over himself to avoid giving a jump when he heard this name,
    and more especially when the young man obligingly continued:

    "My father, Joam Garral, has his farm about three miles from here. If you would like, Mr. ----"

    "Torres," replied the adventurer.

    "If you would like to accompany us there, Mr. Torres, you will be hospitably received."

    "I do not know that I can," said Torres, who, surprised by this unexpected meeting, hesitated to make a start. "I
    fear in truth that I am not able to accept your offer. The occurrence I have just related to you has caused me to lose
    time. It is necessary for me to return at once to the Amazon--as I purpose descending thence to Para."

    "Very well, Mr. Torres," replied Benito, "it is not unlikely that we shall see you again in our travels, for before a
    month has passed my father and all his family will have taken the same road as you."

    "Ah!" said Torres sharply, "your father is thinking of recrossing the Brazilian frontier?"

    "Yes, for a voyage of some months," replied Benoito. "At least we hope to make him decide so. Don't we,
    Manoel?"

    Manoel nodded affirmatively.

    "Well, gentlemen," replied Torres, "it is very probable that we shall meet again on the road. But I cannot, much
to my regret, accept your offer now. I thank you, nevertheless, and I consider myself as twice your debtor."

    And having said so, Torres saluted the young men, who in turn saluted him, and set out on their way to the farm.

    As for Torres he looked after them as they got further and further away, and when he had lost sight of them--

    "Ah! he is about to recross the frontier!" said he, with a deep voice. "Let him recross it! and he will be still more
at my mercy! Pleasant journey to you, Joam Garral!"

And having uttered these words the captain of the woods, making for the south so as to regain the left bank of
the river by the shortest road, disappeared into the dense forest.

CHAPTER III. THE GARRAL FAMILY

THE VILLAGE of Iquitos is situated on the left bank of the Amazon, near the seventy-fourth meridian, on that
portion of the great river which still bears the name of the Marânón, and of which the bed separates Peru from the
republic of Ecuador. It is about fifty-five leagues to the west of the Brazilian frontier.

Iquitos, like every other collection of huts, hamlet, or village met with in the basin of the Upper Amazon, was
founded by the missionaries. Up to the seventeenth year of the century the Iquito Indians, who then formed the
entire population, were settled in the interior of the province at some distance from the river. But one day the springs
in their territory all dried up under the influence of a volcanic eruption, and they were obliged to come and take up
their abode on the left of the Marânón. The race soon altered through the alliances which were entered into with the
eriverine Indians, Ticunas, or Omaguas, mixed descent with a few Spaniards, and to-day Iquitos has a population of
two or three families of half-breeds.

The village is most picturesquely grouped on a kind of esplanade, and runs along at about sixty feet from the
river. It consists of some forty miserable huts, whose thatched roofs only just render them worthy of the name of
cottages. A stairway made of crossed trunks of trees leads up to the village, which lies hidden from the traveler's
eyes until the steps have been ascended. Once at the top he finds himself before an inclosure admitting of slight
defense, and consisting of many different shrubs and arborescent plants, attached to each other by festoons of lianas,
which here and there have made their way above the summits of the graceful palms and banana-trees.

At the time we speak of the Indians of Iquitos went about in almost a state of nudity. The Spaniards and half-
breeds alone were clothed, and much as they scorned their indigenous fellow-citizens, wore only a simple shirt, light
cotton trousers, and a straw hat. All lived cheerlessly enough in the village, mixing little together, and if they did
meet occasionally, it was only at such times as the bell of the mission called them to the dilapidated cottage which
served them for a church.

But if existence in the village of Iquitos, as in most of the hamlets of the Upper Amazon, was almost in a
rudimentary stage, it was only necessary to journey a league further down the river to find on the same bank a
wealthy settlement, with all the elements of comfortable life.

This was the farm of Joam Garral, toward which our two young friends returned after their meeting with the

Brazilian by birth, Joam Garral was without family or fortune. Trouble, he said, had obliged him to quit his
country and abandon all thoughts of return. He asked his host to excuse his entering on his past misfortunes--
misfortunes as serious as they were unmerited. What he sought, and what he wished, was a new life, a life of labor. 
He had started on his travels with some slight thought of entering a fazenda in the interior. He was educated, 
intelligent. He had in all his bearing that inexpressible something which tells you that the man is genuine and of 
frank and upright character. Magalhães, quite taken with him, asked him to remain at the farm, where he would, in a 
measure, supply that which was wanting in the worthy farmer.

Joam Garral accepted the offer without hesitation. His intention had been to join a "seringal," or caoutchouc 
concern, in which in those days a good workman could earn from five to six piastres a day, and could hope to 
become a master if he had any luck; but Magalhães very truly observed that if the pay was good, work was only 
found in the seringals at harvest time--that is to say, during only a few months of the year--and this would not 
constitute the permanent position that a young man ought to wish for.

The Portuguese was right. Joam Garral saw it, and entered resolutely into the service of the fazenda, deciding to 
devote to it all his powers.

Magalhães had no cause to regret his generous action. His business recovered. His wood trade, which extended 
by means of the Amazon up to Para, was soon considerably extended under the impulse of Joam Garral. The fazenda 
began to grow in proportion, and to spread out along the bank of the river up to its junction with the Nanay. A 
delightful residence was made of the house; it was raised a story, surrounded by a veranda, and half hidden under 
beautiful trees--mimosas, fig-sycamores, bauhinias, and paullinias, whose trunks were invisible beneath a network 
of scarlet-flowered bromelias and passion-flowers.

At a distance, behind huge bushes and a dense mass of arborescent plants, were concealed the buildings in which 
the staff of the fazenda were accommodated--the servants' offices, the cabins of the blacks, and the huts of the 
Indians. From the bank of the river, bordered with reeds and aquatic plants, the tree-encircled house was alone 
visible.

A vast meadow, laboriously cleared along the lagoons, offered excellent pasturage. Cattle abounded--a new 
source of profit in these fertile countries, where a herd doubles in four years, and where ten per cent. interest is 
earned by nothing more than the skins and the hides of the animals killed for the consumption of those who raise 
them! A few _"sitiros,"_ or manioc and coffee plantations, were started in parts of the woods which were cleared. 
Fields of sugar-canues soon required the construction of a mill to crush the sacchariferous stalks destined to be used 
hereafter in the manufacture of molasses, tafia, and rum. In short, ten years after the arrival of Joam Garral at the 
farm at Iquitos the fazenda had become one of the richest establishments on the Upper Amazon. Thanks to the good 
management exercised by the young clerk over the works at home and the business abroad, its prosperity daily 
increased.

The Portuguese did not wait so long to acknowledge what he owed to Joam Garral. In order to recompense him 
in proportion to his merits he had from the first given him an interest in the profits of his business, and four years 
after his arrival he had made him a partner on the same footing as himself, and with equal shares.

But there was more that he had in store for him. Yaquita, his daughter, had, in this silent young man, so gentle to 
others, so stern to himself, recognized the sterling qualities which her father had done. She was in love with him, but 
though on his side Joam had not remained insensible to the merits and the beauty of this excellent girl, he was too 
proud and reserved to dream of asking her to marry him.

A serious incident hastened the solution.

Magalhães was one day superintending a clearance and was mortally wounded by the fall of a tree. Carried home 
helpless to the farm, and feeling himself lost, he raised up Yaquita, who was weeping by his side, took her hand, and 
put it into that of Joam Garral, making him swear to take her for his wife.

"You have made my fortune," he said, "and I shall not die in peace unless by this union I know that the fortune 
of my daughter is assured."

"I can continue her devoted servant, her brother, her protector, without being her husband," Joam Garral had at 
first replied. "I owe you all, Magalhães. I will never forget it, but the price you would pay for my endeavors is out of 
all proportion to what they are worth."

The old man insisted. Death would not allow him to wait; he demanded the promise, and it was made to him.

Yaquita was then twenty-two years old, Joam was twenty-six. They loved each other and they were married 
some hours before the death of Magalhães, who had just strength left to bless their union.

It was under these circumstances that in 1830 Joam Garral became the new fazender of Iquitos, to the immense 
felicity of all those who composed the staff of the farm.

The prosperity of the settlement could not do otherwise than grow when these two minds were thus united.

A year after her marriage Yaquita presented her husband with a son, and, two years after, a daughter. Benito and 
Minha, the grandchildren of the old Portuguese, became worthy of their grandfather, children worthy of Joam and
Yaquita.

The daughter grew to be one of the most charming of girls. She never left the fazenda. Brought up in pure and healthy surroundings, in the midst of the beauteous nature of the tropics, the education given to her by her mother, and the instruction received by her from her father, were ample. What more could she have learned in a convent at Manaos or Belem? Where would she have found better examples of the domestic virtues? Would her mind and feelings have been more delicately formed away from her home? If it was ordained that she was not to succeed her mother in the management of the fazenda, she was equal to any other position to which she might be called.

With Benito it was another thing. His father very wisely wished him to receive as solid and complete an education as could then be obtained in the large towns of Brazil. There was nothing which the rich fazender refused his son. Benito was possessed of a cheerful disposition, an active mind, a lively intelligence, and qualities of heart equal to those of his head. At the age of twelve he was sent into Para, to Belem, and there, under the direction of excellent professors, he acquired the elements of an education which could not but eventually make him a distinguished man. Nothing in literature, in the sciences, in the arts, was a stranger to him. He studied as if the fortune of his father would not allow him to remain idle. He was not among such as imagine that riches exempt men from work—he was one of those noble characters, resolute and just, who believe that nothing should diminish our natural obligation in this respect if we wish to be worthy of the name of men.

During the first years of his residence at Belem, Benito had made the acquaintance of Manoel Valdez. This young man, the son of a merchant in Para, was pursuing his studies in the same institution as Benito. The conformity of their characters and their tastes proved no barrier to their uniting in the closest of friendships, and they became inseparable companions.

Manoel, born in 1832, was one year older than Benito. He had only a mother, and she lived on the modest fortune which her husband had left her. When Manoel's preliminary studies were finished, he had taken up the subject of medicine. He had a passionate taste for that noble profession, and his intention was to enter the army, toward which he felt himself attracted.

At the time that we saw him with his friend Benito, Manoel Valdez had already obtained his first step, and he had come away on leave for some months to the fazenda, where he was accustomed to pass his holidays. Well-built, and of distinguished bearing, with a certain native pride which became him well, the young man was treated by Joam and Yaquita as another son. But if this quality of son made him the brother of Benito, the title was scarcely attributable to some secret grief? Herein was a constant source of anxiety to his wife. 

In the year 1852—of which four months had already passed before the commencement of this history—Joam Garral attained the age of forty-eight years. In that sultry climate, which wears men away so quickly, he had known how, by sobriety, self-denial, suitable living, and constant work, to remain untouched where others had prematurely succumbed. His hair, which he wore short, and his beard, which was full, had already grown gray, and gave him the look of a Puritan. The proverbial honesty of the Brazilian merchants and fazenders showed itself in his features, of which straightforwardness was the leading characteristic. His calm temperament seemed to indicate an interior fire, kept well under control. The fearlessness of his look denoted a deep-rooted strength, to which, when danger threatened, he could never appeal in vain.

But, notwithstanding one could not help remarking about this quiet man of vigorous health, with whom all things had succeeded in life, a depth of sadness which even the tenderness of Yaquita had not been able to subdue.

Respected by all, placed in all the conditions that would seem necessary to happiness, why was not this just man more cheerful and less reserved? Why did he seem to be happy for others and not for himself? Was this disposition attributable to some secret grief? Herein was a constant source of anxiety to his wife.

Yaquita was now forty-four. In that tropical country where women are already old at thirty she had learned the secret of resisting the climate's destructive influences, and her features, a little sharpened but still beautiful, retained the haughty outline of the Portuguese type, in which nobility of face unites so naturally with dignity of mind.

Benito and Minha responded with an affection unbounded and unceasing for the love which their parents bore them.

Benito was now aged twenty-one, and quick, brave, and sympathetic, contrasted outwardly with his friend Manoel, who was more serious and reflective. It was a great treat for Benito, after quite a year passed at Belem, so far from the fazenda, to return with his young friend to his home to see once more his father, his mother, his sister, and to find himself, enthusiastic hunter as he was, in the midst of these superb forests of the Upper Amazon, some of whose secrets remained after so many centuries still unsolved by man.

Minha was twenty years old. A lovely girl, brunette, and with large blue eyes, eyes which seemed to open into her very soul; of middle height, good figure, and winning grace, in every way the very image of Yaquita. A little more serious than her brother, affable, good-natured, and charitable, she was beloved by all. On this subject you
could fearlessly interrogate the humblest servants of the fazenda. It was unnecessary to ask her brother's friend, Manoel Valdez, what he thought of her. He was too much interested in the question to have replied without a certain amount of partiality.

This sketch of the Garral family would not be complete, and would lack some of its features, were we not to mention the numerous staff of the fazenda.

In the first place, then, it behooves us to name an old negress, of some sixty years, called Cybele, free through the will of her master, a slave through her affection for him and his, and who had been the nurse of Yaquita. She was one of the family. She thee-ed and thou-ed both daughter and mother. The whole of this good creature's life was passed in these fields, in the middle of these forests, on that bank of the river which bounded the horizon of the farm. Coming as a child to Iquitos in the slave-trading times, she had never quitted the village; she was married there, and early a widow, had lost her only son, and remained in the service of Magalhaes. Of the Amazon she knew no more than what flowed before her eyes.

With her, and more specially attached to the service of Minha, was a pretty, laughing mulatto, of the same age as her mistress, to whom she was completely devoted. She was called Lina. One of those gentle creatures, a little spoiled, perhaps, to whom a good deal of familiarity is allowed, but who in return adore their mistresses. Quick, restless, coaxing, and lazy, she could do what she pleased in the house.

As for servants they were of two kinds--Indians, of whom there were about a hundred, employed always for the works of the fazenda, and blacks to about double the number, who were not yet free, but whose children were not born slaves. Joam Garral had herein preceded the Brazilian government. In this country, moreover, the negroes coming from Benguela, the Congo, or the Gold Coast were always treated with kindness, and it was not at the fazenda of Iquitos that one would look for those sad examples of cruelty which were so frequent on foreign plantations.

CHAPTER IV. HESITATION

MANOEL WAS in love with the sister of his friend Benito, and she was in love with him. Each was sensible of the other's worth, and each was worthy of the other.

When he was no longer able to mistake the state of his feelings toward Minha, Manoel had opened his heart to Benito.

"Manoel, my friend," had immediately answered the enthusiastic young fellow, "you could not do better than wish to marry my sister. Leave it to me! I will commence by speaking to the mother, and I think I can promise that you will not have to wait long for her consent."

Half an hour afterward he had done so.

Benito had nothing to tell his mother which she did not know; Yaquita had already divined the young people's secret.

Before ten minutes had elapsed Benito was in the presence of Minha. They had but to agree; there was no need for much eloquence. At the first words the head of the gentle girl was laid on her brother's shoulder, and the confession, "I am so happy!" was whispered from her heart.

The answer almost came before the question; that was obvious. Benito did not ask for more.

There could be little doubt as to Joam Garral's consent. But if Yaquita and her children did not at once speak to him about the marriage, it was because they wished at the same time to touch on a question which might be more difficult to solve. That question was, Where should the wedding take place?

Where should it be celebrated? In the humble cottage which served for the village church? Why not? Joam and Yaquita had there received the nuptial benediction of the Padre Passanha, who was then the curate of Iquitos parish. At that time, as now, there was no distinction in Brazil between the civil and religious acts, and the registers of the mission were sufficient testimony to a ceremony which no officer of the civil power was intrusted to attend to.

Joam Garral would probably wish the marriage to take place at Iquitos, with grand ceremonies and the attendance of the whole staff of the fazenda, but if such was to be his idea he would have to withstand a vigorous attack concerning it.

"Manoel," Minha said to her betrothed, "if I was consulted in the matter we should not be married here, but at Para. Madame Valdez is an invalid; she cannot visit Iquitos, and I should not like to become her daughter without knowing and being known by her. My mother agrees with me in thinking so. We should like to persuade my father to take us to Belem. Do you not think so?"

To this proposition Manoel had replied by pressing Minha's hand. He also had a great wish for his mother to be present at his marriage. Benito had approved the scheme without hesitation, and it was only necessary to persuade Joam Garral. And hence on this day the young men had gone out hunting in the woods, so as to leave Yaquita alone
with her husband.

In the afternoon these two were in the large room of the house. Joam Garral, who had just come in, was half-reclining on a couch of plaited bamboos, when Yaquita, a little anxious, came and seated herself beside him.

To tell Joam of the feelings which Manoel entertained toward his daughter was not what troubled her. The happiness of Minha could not but be assured by the marriage, and Joam would be glad to welcome to his arms the new son whose sterling qualities he recognized and appreciated. But to persuade her husband to leave the fazenda Yaquita felt to be a very serious matter.

In fact, since Joam Garral, then a young man, had arrived in the country, he had never left it for a day. Though the sight of the Amazon, with its waters gently flowing to the east, invited him to follow its course; though Joam every year sent rafts of wood to Manaos, to Belem, and the seacoast of Para; though he had seen each year Benito leave after his holidays to return to his studies, yet the thought seemed never to have occurred to him to go with him.

The products of the farm, of the forest, and of the fields, the fazender sold on the spot. He had no wish, either with thought or look, to go beyond the horizon which bounded his Eden.

From this it followed that for twenty-five years Joam Garral had never crossed the Brazilian frontier, his wife and daughter had never set foot on Brazilian soil. The longing to see something of that beautiful country of which Benito was often talking was not wanting, nevertheless. Two or three times Yaquita had sounded her husband in the matter. But she had noticed that the thought of leaving the fazenda, if only for a few weeks, brought an increase of sadness to his face. His eyes would close, and in a tone of mild reproach he would answer:

"Why leave our home? Are we not comfortable here?"

And Yaquita, in the presence of the man whose active kindness and unchangeable tenderness rendered her so happy, had not the courage to persist.

This time, however, there was a serious reason to make it worth while. The marriage of Minha afforded an excellent opportunity, it being so natural for them to accompany her to Belem, where she was going to live with her husband. She would there see and learn to love the mother of Manoel Valdez. How could Joam Garral hesitate in the face of so praiseworthy a desire? Why, on the other hand, did he not participate in this desire to become acquainted with her who was to be the second mother of his child?

Yaquita took her husband's hand, and with that gentle voice which had been to him all the music of his life:

"Joam," she said, "I am going to talk to you about something which we ardently wish, and which will make you as happy as we are."

"What is it about, Yaquita?" asked Joam.

"Manoel loves your daughter, he is loved by her, and in this union they will find the happiness----" At the first words of Yaquita Joam Garral had risen, without being able to control a sudden start. His eyes were immediately cast down, and he seemed to designedly avoid the look of his wife.

"What is the matter with you?" asked Yaquita.

"Minha? To get married!" murmured Joam.

"My dear," said Yaquita, feeling somewhat hurt, "have you any objection to make to the marriage? Have you not for some time noticed the feelings which Manoel has entertained toward our daughter?"

"Yes; and a year since----" And Joam sat down without finishing his thoughts. By an effort of his will he had again become master of himself. The unaccountable impression which had been made upon him disappeared. Gradually his eyes returned to meet those of Yaquita, and he remained thoughtfully looking at her.

Yaquita took his hand.

"Joam," she said, "have I been deceived? Had you no idea that this marriage would one day take place, and that it would give her every chance of happiness?"

"Yes," answered Joam. "All! Certainly. But, Yaquita, this wedding--this wedding that we are both thinking of--when is it coming off? Shortly?"

"It will come off when you choose, Joam."

"And it will take place here--at Iquitos?"

This question obliged Yaquita to enter on the other matter which she had at heart. She did not do so, however, without some hesitation, which was quite intelligible.

"Joan," said she, after a moment's silence, "listen to me. Regarding this wedding, I have got a proposal which I hope you will approve of. Two or three times during the last twenty years I have asked you to take me and my daughter to the provinces of the Lower Amazon, and to Para, where we have never been. The cares of the fazenda, the works which have required your presence, have not allowed you to grant our request. To absent yourself even for a few days would then have injured your business. But now everything has been successful beyond your dreams, and if the hour of repose has not yet come for you, you can at least for a few weeks get away from your work."
Joam Garral did not answer, but Yaquita felt his hand tremble in hers, as though under the shock of some sorrowful recollection. At the same time a half-smile came to her husband's lips—a mute invitation for her to finish what she had begun.

"Joam," she continued, "here is an occasion which we shall never see again in this life. Minha is going to be married away from us, and is going to leave us! It is the first sorrow which our daughter has caused us, and my heart quails when I think of the separation which is so near! But I should be content if I could accompany her to Belem! Does it not seem right to you, even in other respects that we should know her husband's mother, who is to replace me, and to whom we are about to entrust her? Added to this, Minha does not wish to grieve Madame Valdez by getting married at a distance from her. When we were married, Joam, if your mother had been alive, would you not have liked her to be present at your wedding?"

At these words of Yaquita Joam made a movement which he could not repress.

"My dear," continued Yaquita, "with Minha, with our two sons, Benito and Manoel, with you, how I should like to see Brazil, and to journey down this splendid river, even to the provinces on the seacoast through which it runs! It seems to me that the separation would be so much less cruel! As we came back we should revisit our daughter in her house with her second mother. I would not think of her as gone I knew not where. I would fancy myself much less a stranger to the doings of her life."

This time Joam had fixed his eyes on his wife and looked at her for some time without saying anything.

What ailed him? Why this hesitation to grant a request which was so just in itself—to say "Yes," when it would give such pleasure to all who belonged to him? His business affairs could not afford a sufficient reason. A few weeks of absence would not compromise matters to such a degree. His manager would be able to take his place without any hitch in the fazenda. And yet all this time he hesitated.

Yaquita had taken both her husband's hands in hers, and pressed them tenderly.

"Joam," she said, "it is not a mere whim that I am asking you to grant. No! For a long time I have thought over the proposition I have just made to you; and if you consent, it will be the realization of my most cherished desire. Our children know why I am now talking to you. Minha, Benito, Manoel, all ask this favor, that we should accompany them. We would all rather have the wedding at Belem than at Iquitos. It will be better for your daughter, for her establishment, for the position which she will take at Belem, that she should arrive with her people, and appear less of a stranger in the town in which she will spend most of her life."

Joam Garral leaned on his elbows. For a moment he hid his face in his hands, like a man who had to collect his thoughts before he made answer. There was evidently some hesitation which he was anxious to overcome, even some trouble which his wife felt but could not explain. A secret battle was being fought under that thoughtful brow. Yaquita got anxious, and almost reproached herself for raising the question. Anyhow, she was resigned to what Joam should decide. If the expedition would cost too much, she would silence her wishes; she would never more speak of leaving the fazenda, and never ask the reason for the inexplicable refusal.

Some minutes passed. Joam Garral rose. He went to the door, and did not return. Then he seemed to give a last look on that glorious nature, on that corner of the world where for twenty years of his life he had met with all his happiness.

Then with slow steps he returned to his wife. His face bore a new expression, that of a man who had taken a last decision, and with whom irresolution had ceased.

"You are right," he said, in a firm voice. "The journey is necessary. When shall we start?"

"Ah! Joam! my Joam!" cried Yaquita, in her joy. "Thank you for me! Thank you for them!"

And tears of affection came to her eyes as her husband clasped her to his heart.

At this moment happy voices were heard outside at the door of the house.

Manoel and Benito appeared an instant after at the threshold, almost at the same moment as Minha entered the room.

"Children! your father consents!" cried Yaquita. "We are going to Belem!"

With a grave face, and without speaking a word, Joam Garral received the congratulations of his son and the kisses of his daughter.

"And what date, father," asked Benito, "have you fixed for the wedding?"

"Date?" answered Joam. "Date? We shall see. We will fix it at Belem."

"I am so happy! I am so happy!" repeated Minha, as she had done on the day when she had first known of Manoel's request. "We shall now see the Amazon in all its glory throughout its course through the provinces of Brazil! Thanks, father!"

And the young enthusiast, whose imagination was already stirred, continued to her brother and to Manoel:

"Let us be off to the library! Let us get hold of every book and every map that we can find which will tell us anything about this magnificent river system! Don't let us travel like blind folks! I want to see everything and know..."
CHAPTER V. THE AMAZON

"THE LARGEST river in the whole world!" said Benito to Manoel Valdez, on the morrow.

They were sitting on the bank which formed the southern boundary of the fazenda, and looking at the liquid molecules passing slowly by, which, coming from the enormous range of the Andes, were on their road to lose themselves in the Atlantic Ocean eight hundred leagues away.

"And the river which carries to the sea the largest volume of water," replied Manoel.

"A volume so considerable," added Benito, "that it freshens the sea water for an immense distance from its mouth, and the force of whose current is felt by ships at eight leagues from the coast."

"A river whose course is developed over more than thirty degrees of latitude."

"And in a basin which from south to north does not comprise less than twenty-five degrees." "A basin!" exclaimed Benito. "Can you call it a basin, the vast plain through which it runs, the savannah which on all sides stretches out of sight, without a hill to give a gradient, without a mountain to bound the horizon?"

"And along its whole extent," continued Manoel, "like the thousand tentacles of some gigantic polyp, two hundred tributaries, flowing from north or south, themselves fed by smaller affluents without number, by the side of which the large rivers of Europe are but petty streamlets."

"And in its course five hundred and sixty islands, without counting islets, drifting or stationary, forming a kind of archipelago, and yielding of themselves the wealth of a kingdom!"

"And along its flanks canals, lagoons, and lakes, such as cannot be met with even in Switzerland, Lombardy, Scotland, or Canada."

"A river which, fed by its myriad tributaries, discharges into the Atlantic over two hundred and fifty millions of cubic meters of water every hour."

"A river whose course serves as the boundary of two republics, and sweeps majestically across the largest empire of South America, as if it were, in very truth, the Pacific Ocean itself flowing out along its own canal into the Atlantic."

"And what a mouth! An arm of the sea in which one island, Marajo, has a circumference of more than five hundred leagues!"

"And whose waters the ocean does not pond back without raising in a strife which is phenomenal, a tide-race, or _'pororoca,'_ to which the ebbs, the bores, and the eddies of other rivers are but tiny ripples fanned up by the breeze."

"A river which three names are scarcely enough to distinguish, and which ships of heavy tonnage, without any change in their cargoes, can ascend for more than three thousand miles from its mouth."

"A river which, by itself, its affluents, and subsidiary streams, opens a navigable commercial route across the whole of the south of the continent, passing from the Magdalena to the Ortequazza, from the Ortequazza to the Caqueta, from the Caqueta to the Putumayo, from the Putumayo to the Amazon! Four thousand miles of waterway, which only require a few canals to make the network of navigation complete!"

"In short, the biggest and most admirable river system which we have in the world."

The two young men were speaking in a kind of frenzy of their incomparable river. They were themselves children of this great Amazon, whose affluents, well worthy of itself, from the highways which penetrate Bolivia, Peru, Ecuador, New Grenada, Venezuela, and the four Guianas--English, French, Dutch and Brazilian.

What nations, what races, has it seen whose origin is lost in the far-distant past! It is one of the largest rivers of the globe. Its true source still baffles our explorers. Numbers of States still claim the honor of giving it birth. The Amazon was not likely to escape the inevitable fate, and Peru, Ecuador, and Colombia have for years disputed as to the honor of its glorious paternity.

To-day, however, there seems to be little doubt but that the Amazon rises in Peru, in the district of Huaraco, in the department of Tarma, and that it starts from the Lake of Lauricocha, which is situated between the eleventh and twelfth degree of south latitude.

Those who make the river rise in Bolivia, and descend form the mountains of Titicaca, have to prove that the true Amazon is the Ucayali, which is formed by the junction of the Paro and the Apurimac--an assertion which is now generally rejected.

At its departure from Lake Lauricocha the youthful river starts toward the northeast for a distance of five hundred and sixty miles, and does not strike to the west until it has received an important tributary--the Panta. It is called the Marañon in its journey through Colombia and Peru up to the Brazilian frontier--or, rather, the Maranhao, for Marañon is only the French rendering of the Portuguese name.
From the frontier of Brazil to Manaos, where the superb Rio Negro joins it, it takes the name of the Solimaës, or Solimoens, from the name of the Indian tribe Solimao, of which survivors are still found in the neighboring provinces. And, finally, from Manaos to the sea it is the Amasenas, or river of the Amazons, a name given it by the old Spaniards, the descendants of the adventurous Orellana, whose vague but enthusiastic stories went to show that there existed a tribe of female warriors on the Rio Nhamunda, one of the middle-sized affluents of the great river.

From its commencement the Amazon is recognizable as destined to become a magnificent stream. There are neither rapids nor obstacles of any sort until it reaches a defile where its course is slightly narrowed between two picturesque and unequal precipices. No falls are met with until this point is reached, where it curves to the eastward, and passes through the intermediary chain of the Andes. Hereabouts are a few waterfalls, were it not for which the river would be navigable from its mouth to its source. As it is, however, according the Humboldt, the Amazon is free for five-sixths of its length.

And from its first starting there is no lack of tributaries, which are themselves fed by subsidiary streams. There is the Chinchipa, coming from the northeast, on its left. On its right it is joined by the Chachapoyas, coming from the northeast. On the left we have the Marona and the Pastuca; and the Guallaga comes in from the right near the mission station of Laguna. On the left there comes the Chambyra and the Tigré, flowing from the northeast; and on the right the Huallaga, which joins the main stream twenty-eight hundred miles from the Atlantic, and can be ascended by steamboats for over two hundred miles into the very heart of Peru. To the right, again, near the mission of San Joachim d’Omaguas, just where the upper basin terminates, and after flowing majestically across the pampas of Sacramento, it receives the magnificent Ucayali, the great artery which, fed by numerous affluents, descends from Lake Chucuito, in the northeast of Arica.

Such are the principal branches above the village of Iquitos. Down the stream the tributaries become so considerable that the beds of most European rivers would fail to contain them. But the mouths of these auxiliary waters Joam Garral and his people will pass as they journey down the Amazon.

To the beauties of this unrivaled river, which waters the finest country in the world, and keeps along its whole course at a few degrees to the south of the equator, there is to be added another quality, possessed by neither the Nile, the Mississippi, nor the Livingstone--or, in other words, the old Congo-Zaira-Lualaba--and that is (although some ill-informed travelers have stated to the contrary) that the Amazon crosses a most healthy part of South America. Its basin is constantly swept by westerly winds. It is not a narrow valley surrounded by high mountains which border its banks, but a huge plain, measuring three hundred and fifty leagues from north to south, scarcely varied with a few knolls, whose whole extent the atmospheric currents can traverse unchecked.

Professor Agassiz very properly protested against the pretended unhealthiness of the climate of a country which is destined to become one of the most active of the world’s producers. According to him, "a soft and gentle breeze is constantly observable, and produces an evaporation, thanks to which the temperature is kept down, and the sun does not give out heat unchecked. The constancy of this refreshing breeze renders the climate of the river Amazon agreeable, and even delightful."

The Abbé Durand has likewise testified that if the temperature does not drop below 25 degrees Centigrade, it never rises above 33 degrees, and this gives for the year a mean temperature of from 28 degrees to 29 degrees, with a range of only 8 degrees.

After such statements we are safe in affirming that the basin of the Amazon has none of the burning heats of countries like Asia and Africa, which are crossed by the same parallels.

The vast plain which serves for its valley is accessible over its whole extent to the generous breezes which come from off the Atlantic.

And the provinces to which the river has given its name have acknowledged right to call themselves the healthiest of a country which is one of the finest on the earth.

And how can we say that the hydrographical system of the Amazon is not known?

In the sixteenth century Orellana, the lieutenant of one of the brothers Pizarro, descended the Rio Negro, arrived on the main river in 1540, ventured without a guide across the unknown district, and, after eighteen months of a navigation of which is record is most record, reached the mouth.

In 1636 and 1637 the Portuguese Pedro Texeira ascended the Amazon to Napo, with a fleet of forty-seven pirogues.

In 1743 La Condamine, after having measured an arc of the meridian at the equator, left his companions Bouguer and Godin des Odonais, embarked on the Chinchipe, descended it to its junction with the Marañon, reached the mouth at Napo on the 31st of July, just in time to observe an emersion of the first satellite of Jupiter--which allowed this "Humboldt of the eighteenth century" to accurately determine the latitude and longitude of the spot--visited the villages on both banks, and on the 6th of September arrived in front of the fort of Para. This immense journey had important results--not only was the course of the Amazon made out in scientific fashion, but it seemed
almost certain that it communicated with the Orinoco.

Fifty-five years later Humboldt and Bonpland completed the valuable work of La Condamine, and drew up the map of the Manañon as far as Napo.

Since this period the Amazon itself and all its principal tributaries have been frequently visited. In 1827 Lister-Maw, in 1834 and 1835 Smyth, in 1844 the French lieutenant in command of the "Boulonnaise," the Brazilian Valdez in 1840, the French "Paul Marcoy" from 1848 to 1860, the whimsical painter Biard in 1859, Professor Agassiz in 1865 and 1866, in 1967 the Brazilian engineer Franz Keller-Linzenger, and lastly, in 1879 Doctor Crevaux, have explored the course of the river, ascended many of its tributaries, and ascertained the navigability of its principal affluents.

But what has won the greatest honor for the Brazilian government is that on the 31st of July, 1857, after numerous frontier disputes between France and Brazil, about the Guiana boundary, the course of the Amazon was declared to be free and open to all flags; and, to make practice harmonize with theory, Brazil entered into negotiations with the neighboring powers for the exploration of every river-road in the basin of the Amazon.

To-day lines of well-found steamboats, which correspond direct with Liverpool, are plying on the river from its mouth up to Manaos; others ascend to Iquitos; others by way of the Tapajoz, the Madeira, the Rio Negro, or the Purus, make their way into the center of Peru and Bolivia.

One can easily imagine the progress which commerce will one day make in this immense and wealthy area, which is without a rival in the world.

But to this medal of the future there is a reverse. No progress can be accomplished without detriment to the indigenous races.

In face, on the Upper Amazon many Indian tribes have already disappeared, among others the Curicicurus and the Sorimaos. On the Putumayo, if a few Yuris are still met with, the Yahuas have abandoned the district to take refuge among some of the distant tributaries, and the Maoos have quitted its banks to wander in their diminished numbers among the forests of Japura.

The Tunantins is almost depopulated, and there are only a few families of wandering Indians at the mouth of the Jurua. The Teffé is almost deserted, and near the sources of the Japur there remained but the fragments of the great nation of the Umaüa. The Coari is forsaken. There are but few Muras Indians on the banks of the Purus. Of the ancient Manaos one can count but a wandering party or two. On the banks of the Rio Negro there are only a few half-breeds, Portuguese and natives, where a few years ago twenty-four different nations had their homes.

Such is the law of progress. The Indians will disappear. Before the Anglo-Saxon race Australians and Tasmanians have vanished. Before the conquerors of the Far West the North American Indians have been wiped out. One day perhaps the Arabs will be annihilated by the colonization of the French.

But we must return to 1852. The means of communication, so numerous now, did not then exist, and the journey of Joam Garral would require not less than four months, owing to the conditions under which it was made.

Hence this observation of Benito, while the two friends were watching the river as it gently flowed at their feet:

"Manoel, my friend, if there is very little interval between our arrival at Belem and the moment of our separation, the time will appear to you to be very short."

"Yes, Benito," said Manoel, "and very long as well, for Minha cannot by my wife until the end of the voyage."

CHAPTER VI. A FOREST ON THE GROUND

THE GARRAL family were in high glee. The magnificent journey on the Amazon was to be undertaken under conditions as agreeable as possible. Not only were the fazender and his family to start on a voyage for several months, but, as we shall see, he was to be accompanied by a part of the staff of the farm.

In beholding every one happy around him, Joam forgot the anxieties which appeared to trouble his life. From the day his decision was taken he had been another man, and when he busied himself about the preparations for the expedition he regained his former activity. His people rejoiced exceedingly at seeing him again at work. His moral self reacted against his physical self, and Joam again became the active, energetic man of his earlier years, and moved about once more as though he had spent his life in the open air, under the invigorating influences of forests, fields, and running waters.

Moreover, the few weeks that were to precede his departure had been well employed.

At this period, as we have just remarked, the course of the Amazon was not yet furrowed by the numberless steam vessels, which companies were only then thinking of putting into the river. The service was worked by individuals on their own account alone, and often the boats were only employed in the business of the riverside establishments.

These boats were either "ubas," canoes made from the trunk of a tree, hollowed out by fire, and finished with
the ax, pointed and light in front, and heavy and broad in the stern, able to carry from one to a dozen paddlers, and
of three or four tons burden: _"egariteas,"_ constructed on a larger scale, of broader design, and leaving on each side
a gangway for the rowers: or _"jangada,"_ rafts of no particular shape, propelled by a triangular sail, and
surmounted by a cabin of mud and straw, which served the Indian and his family for a floating home.

These three kinds of craft formed the lesser flotilla of the Amazon, and were only suited for a moderate traffic of
passengers or merchandise.

Larger vessels, however, existed, either _"vigilingas,"_ ranging from eight up to ten tons, with three masts
rigged with red sails, and which in calm weather were rowed by four long paddles not at all easy to work against the
stream; or _"cobertas,"_ of twenty tons burden, a kind of junk with a poop behind and a cabin down below, with two
masts and square sails of unequal size, and propelled, when the wind fell, by six long sweeps which Indians worked
from a forecastle.

But neither of these vessels satisfied Joam Garral. From the moment that he had resolved to descend the Amazon
he had thought of making the most of the voyage by carrying a huge convoy of goods into Para. From this point of
view there was no necessity to descend the river in a hurry. And the determination to which he had come pleased
every one, excepting, perhaps, Manoel, who would for very good reasons have preferred some rapid steamboat.

But though the means of transport devised by Joam were primitive in the extreme, he was going to take with him
a numerous following and abandon himself to the stream under exceptional conditions of comfort and security.

It would be, in truth, as if a part of the fazenda of Iquitos had been cut away from the bank and carried down the
Amazon with all that composed the family of the fazender--masters and servants, in their dwellings, their cottages,
and their huts.

The settlement of Iquitos included a part of those magnificent forests which, in the central districts of South
America, are practically inexhaustible.

Joam Garral thoroughly understood the management of these woods, which were rich in the most precious and
diverse species adapted for joinery, cabinet work, ship building, and carpentry, and from them he annually drew
considerable profits.

The river was there in front of him, and could it not be as safely and economically used as a railway if one
existed? So every year Joam Garral felled some hundreds of trees from his stock and formed immense rafts of
floating wood, of joists, beams, and slightly squared trunks, which were taken to Para in charge of capable pilots
who were thoroughly acquainted with the depths of the river and the direction of its currents.

This year Joam Garral decided to do as he had done in preceding years. Only, when the raft was made up, he was
going to leave to Benito all the detail of the trading part of the business. But there was no time to lose. The
beginning of June was the best season to start, for the waters, increased by the floods of the upper basin, would
gradually and gradually subside until the month of October.

The first steps had thus to be taken without delay, for the raft was to be of unusual proportions. It would be
necessary to fell a half-mile square of the forest which was situated at the junction of the Nanay and the Amazon--
that is to say, the whole river side of the fazenda, to form the enormous mass, for such were the _jangadas,_ or river
rafts, which attained the dimensions of a small island.

It was in this _jangada,_ safer than any other vessel of the country, larger than a hundred _egariteas_ or
_vigilingas_ coupled together, that Joam Garral proposed to embark with his family, his servants, and his
merchandise.

"Excellent idea!" had cried Minha, clapping her hands, when she learned her father's scheme.

"Yes," said Yaquita, "and in that way we shall reach Belem without danger or fatigue."

"And during the stoppages we can have some hunting in the forests which line the banks," added Benito.

"Won't it take rather long?" observed Manoel; "could we not hit upon some quicker way of descending the
Amazon?"

It would take some time, obviously, but the interested observation of the young doctor received no attention
from any one.

Joam Garral then called in an Indian who was the principal manager of the fazenda.

"In a month," he said to him, "the jangada must be built and ready to launch."

"We'll set to work this very day, sir."

It was a heavy task. There were about a hundred Indians and blacks, and during the first fortnight in May they
did wonders. Some people unaccustomed to these great tree massacres would perhaps have groaned to see giants
many hundred years old fall in a few hours beneath the axes of the woodmen; but there was such a quantity on the
banks of the river, up stream and down stream, even to the most distant points of the horizon, that the felling of this
half-mile of forest would scarcely leave an appreciable void.

The superintendent of the men, after receiving the instructions of Joam Garral, had first cleared the ground of the
creepers, brushwood, weeds, and arborescent plants which obstructed it. Before taking to the saw and the ax they had armed themselves with a felling-sword, that indispensable tool of every one who desires to penetrate the Amazonian forests, a large blade slightly curved, wide and flat, and two or three feet long, and strongly handled, which the natives wield with consummate address. In a few hours, with the help of the felling-sword, they had cleared the ground, cut down the underwood, and opened large gaps into the densest portions of the wood.

In this way the work progressed. The ground was cleared in front of the woodmen. The old trunks were divested of their clothing of creepers, cacti, ferns, mosses, and bromelias. They were stripped naked to the bark, until such time as the bark itself was stripped from off them.

Then the whole of the workers, before whom fled an innumerable crowd of monkeys who were hardly their superiors in agility, swung themselves into the upper branches, sawing off the heavier boughs and cutting down the topmost limbs, which had to be cleared away on the spot. Very soon there remained only a doomed forest, with long bare stems, bereft of their crowns, through which the sun luxuriantly rayed on to the humid soil which perhaps its shots had never before caressed.

There was not a single tree which could not be used for some work of skill, either in carpentry or cabinet-work. There, shooting up like columns of ivory ringed with brown, were wax-palms one hundred and twenty feet high, and four feet thick at their base; white chestnuts, which yield the three-cornered nuts; _"murichis,"_ unexcelled for building purposes; _"barrigudos,"_ measuring a couple of yards at the swelling, which is found at a few feet above the earth, trees with shining russet bark dotted with gray tubercles, each pointed stem of which supports a horizontal parasol; and _"bombax,"_ of superb stature, with its straight and smooth white stem. Among these magnificent specimens of the Amazonian flora there fell many _"quatibos"_ whose rosy canopies towered above the neighboring trees, whose fruits are like little cups with rows of chestnuts ranged within, and whose wood of clear violet is specially in demand for ship-building. And besides there was the ironwood; and more particularly the _"ibiriratea,"_ nearly black in its skin, and so close grained that of it the Indians make their battle-axes; _"jacarandas,"_ more precious than mahogany; _"caesalpinas,"_ only now found in the depths of the old forests which have escaped the woodman's ax; _"sapucaias,"_ one hundred and fifty feet high, buttressed by natural arches, which, starting from three yards from their base, rejoin the tree some thirty feet up the stem, twining themselves round the trunk like the filatures of a twisted column, whose head expands in a bouquet of vegetable fireworks made up of the yellow, purple, and snowy white of the parasitic plants.

Three weeks after the work was begun not one was standing of all the trees which had covered the angle of the Amazon and the Nanay. The clearance was complete. Joam Garral had not even had to bestir himself in the demolition of a forest which it would take twenty or thirty years to replace. Not a stick of young or old wood was left to mark the boundary of a future clearing, not even an angle to mark the limit of the denudation. It was indeed a clean sweep; the trees were cut to the level of the earth, to wait the day when their roots would be got out, over which the coming spring would still spread its verdant cloak.

This square space, washed on its sides by the waters of the river and its tributary, was destined to be cleared, plowed, planted, and sown, and the following year fields of manioc, coffee-shrubs, sugar-canies, arrowroot, maize, and peanuts would occupy the ground so recently covered by the trees.

The last week of the month had not arrived when the trunks, classified according to their varieties and specific gravity, were symmetrically arranged on the bank of the Amazon, at the spot where the immense jangada was to be guilting--with, of course, the different habitations for the accommodation of the crew, would become a veritable floating village--to wait the time when the waters of the river, swollen by the floods, would raise it and carry it for hundreds of leagues to the Atlantic coast.

The whole time the work was going on Joam Garral had been engaged in superintending it. From the clearing to the bank of the fazenda he had formed a large mound on which the portions of the raft were disposed, and to this matter he had attended entirely himself.

Yaqita was occupied with Cybele with the preparations for the departure, though the old negress could not be made to understand why they wanted to go or what they hoped to see.

"But you will see things that you never saw before," Yaqita kept saying to her.

"Will they be better than what I see now?" was Cybele's invariable reply.

Minha and her favorite for their part took care of what more particularly concerned them. They were not preparing for a simple voyage; for them it was a permanent departure, and there were a thousand details to look after for settling in the other country in which the young mulatto was to live with the mistress to whom she was so devotedly attached. Minha was a trifle sorrowful, but the joyous Lina was quite unaffected at leaving Iquitos. Minha Valdez would be the same to her as Minha Garral, and to check her spirits she would have to be separated from her mistress, and that was never thought of.

Benito had actively assisted his father in the work, which was on the point of completion. He commenced his
apprenticeship to the trade of a fazender, which would probably one day become his own, as he was about to do that of a merchant on their descent of the river.

As for Manoel, he divided his time between the house, where Yaquita and her daughter were as busy as possible, and the clearing, to which Benito fetched him rather oftener than he thought convenient, and on the whole the division was very unequal, as may well be imagined.

CHAPTER VII. FOLLOWING A LIANA

IT WAS a Sunday, the 26th of May, and the young people had made up their minds to take a holiday. The weather was splendid, the heat being tempered by the refreshing breezes which blew from off the Cordilleras, and everything invited them out for an excursion into the country.

Benito and Manoel had offered to accompany Minha through the thick woods which bordered the right bank of the Amazon opposite the fazenda.

It was, in a manner, a farewell visit to the charming environs of Iquitos. The young men went equipped for the chase, but as sportsmen who had no intention of going far from their companions in pursuit of any game. Manoel could be trusted for that, and the girls—for Lina could not leave her mistress—went prepared for a walk, an excursion of two or three leagues being not too long to frighten them.

Neither Joam Garral nor Yaquita had time to go with them. For one reason the plan of the jangada was not yet complete, and it was necessary that its construction should not be interrupted for a day, and another was that Yaquita and Cybele, well seconded as they were by the domestics of the fazenda, had not an hour to lose.

Minha had accepted the offer with much pleasure, and so, after breakfast on the day we speak of, at about eleven o'clock, the two young men and the two girls met on the bank at the angle where the two streams joined. One of the blacks went with them. They all embarked in one of the ubas used in the service of the farm, and after having passed between the islands of Iquitos and Parianta, they reached the right bank of the Amazon.

They landed at a clump of superb tree-ferns, which were crowned, at a height of some thirty feet with a sort of halo made of the dainty branches of green velvet and the delicate lacework of the drooping fronds.

"Well, Manoel," said Minha, "it is for me to do the honors of the forest; you are only a stranger in these regions of the Upper Amazon. We are at home here, and you must allow me to do my duty, as mistress of the house."

"Dearest Minha," replied the young man, "you will be none the less mistress of your house in our town of Belem than at the fazenda of Iquitos, and there as here——"

"Now, then," interrupted Benito, "you did not come here to exchange loving speeches, I imagine. Just forget for a few hours that you are engaged."

"Not for an hour—not for an instant!" said Manoel.

"Perhaps you will if Minha orders you?"

"Minha will not order me."

"Who knows?" said Lina, laughing.

"Lina is right," answered Minha, who held out her hand to Manoel. "Try to forget! Forget! my brother requires it. All is broken off! As long as this walk lasts we are not engaged: I am no more than the sister of Benito! You are only my friend!"

"To be sure," said Benito.

"Bravo! bravo! there are only strangers here," said the young mulatto, clapping her hands.

"Strangers who see each other for the first time," added the girl; "who meet, bow to——"

"Mademoiselle!" said Manoel, turning to Minha.

"To whom have I the honor to speak, sir?" said she in the most serious manner possible.

"To Manoel Valdez, who will be glad if your brother will introduce me."

"Oh, away with your nonsense!" cried Benito. "Stupid idea that I had! Be engaged, my friends—be it as much as you like! Be it always!"

"Always!" said Minha, from whom the word escaped so naturally that Lina's peals of laughter redoubled.

A grateful glance from Manoel repaid Minha for the imprudence of her tongue.

"Come along," said Benito, so as to get his sister out of her embarrassment; "if we walk on we shall not talk so much."

"One moment, brother," she said. "You have seen how ready I am to obey you. You wished to oblige Manoel and me to forget each other, so as not to spoil your walk. Very well; and now I am going to ask a sacrifice from you so that you shall not spoil mine. Whether it pleases you or not, Benito, you must promise me to forget——"

"Forget what?"

"That you are a sportsman!"
"What! you forbid me to----"

"I forbid you to fire at any of these charming birds--any of the parrots, caciques, or curucus which are flying
about so happily among the trees! And the same interdiction with regard to the smaller game with which we shall
have to do to-day. If any ounce, jaguar, or such thing comes too near, well----"

"But----" said Benito.

"If not, I will take Manoel's arm, and we shall save or lose ourselves, and you will be obliged to run after us."

"Would you not like me to refuse, eh?" asked Benito, looking at Manoel.

"I think I should!" replied the young man.

"Well then--no!" said Benito; "I do not refuse; I will obey and annoy you. Come on!"

And so the four, followed by the black, struck under the splendid trees, whose thick foliage prevented the sun's
rays from every reaching the soil.

There is nothing more magnificent than this part of the right bank of the Amazon. There, in such picturesque
confusion, so many different trees shoot up that it is possible to count more than a hundred different species in a
square mile. A forester could easily see that no woodman had been there with his hatchet or ax, for the effects of a
clearing are visible for many centuries afterward. If the new trees are even a hundred years old, the general aspect
still differs from what it was originally, for the lianas and other parasitic plants alter, and signs remain which no
native can misunderstand.

The happy group moved then into the tall herbage, across the thickets and under the bushes, chatting and
laughing. In front, when the brambles were too thick, the negro, felling-sword in hand, cleared the way, and put
thousands of birds to flight.

Minha was right to intercede for the little winged world which flew about in the higher foliage, for the finest
representations of tropical ornithology were there to be seen--green parrots and clamorous parakeets, which seemed
to be the natural fruit of these gigantic trees; humming-birds in all their varieties, light-blue and ruby red;
_"tisauras"_ with long scissor-like tails, looking like detached flowers which the wind blew from branch to branch;
blackbirds, with orange plumage bound with brown; golden-edged beccaficos; and _"sabias,"_ black as crows; all
united in a deafening concert of shrieks and whistles. The long beak of the toucan stood out against the golden
clusters of the _"quiriris,"_ and the treepeckers or woodpeckers of Brazil wagged their little heads, speckled all over
with their purple spots. It was truly a scene of enchantment.

But all were silent and went into hiding when above the tops of the trees there grated like a rusty weathercock
the _"alma de gato"_ or "soul of the cat," a kind of light fawn-colored sparrow-hawk. If he proudly hooted,
displaying in the air the long white plumes of his tail, he in his turn meekly took to flight when in the loftier heights
there appeared the _"gaviao,"_ the large white-headed eagle, the terror of the whole winged population of these
woods.

Minha made Manoel admire the natural wonders which could not be found in their simplicity in the more
civilized provinces of the east. He listened to her more with his eyes than his ears, for the cries and the songs of
these thousands of birds were every now and then so penetrating that he was not able to hear what she said. The
noisy laughter of Lina was alone sufficiently shrill to ring out with its joyous note above every kind of clucking,
chirping, hooting, whistling, and cooing.

At the end of an hour they had scarcely gone a mile. As they left the river the trees assumed another aspect, and
the animal life was no longer met with near the ground, but at from sixty to eighty feet above, where troops of
monkeys chased each other along the higher branches. Here and there a few cones of the solar rays shot down into
the underwood. In fact, in these tropical forests light does not seem to be necessary for their existence. The air is
enough for the vegetable growth, whether it be large or small, tree or plant, and all the heat required for the
development of their sap is derived not from the surrounding atmosphere, but from the bosom of the soil itself,
where it is stored up as in an enormous stove.

And on the bromelias, grass plantains, orchids, cacti, and in short all the parasites which formed a little forest
beneath the large one, many marvelous insects were they tempted to pluck as though they had been genuine
blossoms--nestors with blue wings like shimmering watered silk, leilu butterflies reflected with gold and striped with
fringes of green, agrippina moths, ten inches long, with leaves for wings, maribunda bees, like living emeralds set in
sockets of gold, and legions of lampyrons or pyrophorus coleopters, valagumas with breastplates of bronze, and
green elytræ, with yellow light pouring from their eyes, who, when the night comes, illuminate the forest with their
many-colored scintillations.

"What wonders!" repeated the enthusiastic girl.

"You are at home, Minha, or at least you say so," said Benito, "and that is the way you talk of your riches!"

"Sneer away, little brother!" replied Minha; "such beautiful things are only lent to us; is it not so, Manoel? They
come from the hand of the Almighty and belong to the world!"
"Let Benito laugh on, Minha," said Manoel. "He hides it very well, but he is a poet himself when his time comes, and he admires as much as we do all these beauties of nature. Only when his gun is on his arm, good-by to poetry!"

"Then be a poet now," replied the girl.

"I am a poet," said Benito. "Of Nature-enchanting, etc."

We may confess, however, that in forbidding him to use his gun Minha had imposed on him a genuine privation. There was no lack of game in the woods, and several magnificent opportunities he had declined with regret.

In some of the less wooded parts, in places where the breaks were tolerably spacious, they saw several pairs of ostriches, of the species known as "_naudus,_," from four to five feet high, accompanied by their inseparable "_seriemas,_," a sort of turkey, infinitely better from an edible point of view than the huge birds they escort.

"See what that wretched promise costs me," sighed Benito, as, at a gesture from his sister, he replaced under his arm the gun which had instinctively gone up to his shoulder.

"We ought to respect the seriemas," said Manoel, "for they are great destroyers of the snakes."

"Just as we ought to respect the snakes," replied Benito, "because they eat the noxious insects, and just as we ought the insects because they live on smaller insects more offensive still. At that rate we ought to respect everything."

But the instinct of the young sportsman was about to be put to a still more rigorous trial. The woods became of a sudden full of game. Swift stags and graceful roebucks scampered off beneath the bushes, and a well-aimed bullet would assuredly have stopped them. Here and there turkeys showed themselves with their milk and coffee-colored plumage; and peccaries, a sort of wild pig highly appreciated by lovers of venison, and agouties, which are the hares and rabbits of Central America; and tatous belonging to the order of edentates, with their scaly shells of patterns of mosaic.

And truly Benito showed more than virtue, and even genuine heroism, when he came across some tapirs, called "_antas_" in Brazil, diminutives of the elephant, already nearly undiscoverable on the banks of the Upper Amazon and its tributaries, pachyderms so dear to the hunters for their rarity, so appreciated by the gourmands for their meat, superior far to beef, and above all for the protuberance on the nape of the neck, which is a morsel fit for a king.

His gun almost burned his fingers, but faithful to his promise he kept it quiet.

But yet--and he cautioned his sister about this--the gun would go off in spite of him, and probably register a master-stroke in sporting annals, if within range there should come a "_tamandoa assa,_," a kind of large and very curious ant-eater.

Happily the big ant-eater did not show himself, neither did any panthers, leopards, jaguars, guepars, or cougars, called indifferently ounces in South America, and to whom it is not advisable to get too near.

"After all," said Benito, who stopped for an instant, "to walk is very well, but to walk without an object----"

"Without an object!" replied his sister; "but our object is to see, to admire, to visit for the last time these forests of Central America, which we shall not find again in Para, and to bid them a fast farewell."

"Ah! an idea!"

"An idea of Lina's can be no other than a silly one," said Benito, shaking his head.

"It is unkind, brother," said Minha, "to make fun of Lina when she has been thinking how to give our walk the object which you have just regretted it lacks."

"Besides, Mr. Benito, I am sure my idea will please you," replied the mulatto.

"Well, what is it?" asked Minha.

"You see that liana?"

And Lina pointed to a liana of the "_cipos_" kind, twisted round a gigantic sensitive mimosa, whose leaves, light as feathers, shut up at the least disturbance.

"Well?" said Benito.

"I proposed," replied Minha, "that we try to follow that liana to its very end."

"It is an idea, and it is an object!" observed Benito, "to follow this liana, no matter what may be the obstacles, thickets, underwood, rocks, brooks, torrents, to let nothing stop us, not even----"

"Certainly, you are right, brother!" said Minha; "Lina is a trifle absurd."

"Come on, then!" replied her brother; "you say that Lina is absurd so as to say that Benito is absurd to approve of it!"

"Well, both of you are absurd, if that will amuse you," returned Minha. "Let us follow the liana!"

"You are not afraid?" said Manoel.

"Still objections!" shouted Benito.

"Ah, Manoel! you would not speak like that if you were already on your way and Minha was waiting for you at the end."
"I am silent," replied Manoel; "I have no more to say. I obey. Let us follow the liana!"

And off they went as happy as children home for their holidays.

This vegetable might take them far if they determined to follow it to its extremity, like the thread of Ariadne, as far almost as that which the heiress of Minos used to lead her from the labyrinth, and perhaps entangle them more deeply.

It was in fact a creeper of the salses family, one of the cipos known under the name of the red "japicanga," whose length sometimes measures several miles. But, after all, they could leave it when they liked.

The cipo passed from one tree to another without breaking its continuity, sometimes twisting round the trunks, sometimes garlanding the branches, here jumping form a dragon-tree to a rosewood, then from a gigantic chestnut, the "Bertholletia excelsa," to some of the wine palms, "baccabas," whose branches have been appropriately compared by Agassiz to long sticks of coral flecked with green. Here round "tucumas," or ficuses, capriciously twisted like centenarian olive-trees, and of which Brazil had fifty-four varieties; here round the kinds of euphorbias, which produce caoutchouc, "gualtes," noble palm-trees, with slender, graceful, and glossy stems; and cacao-trees, which shoot up of their own accord on the banks of the Amazon and its tributaries, having different melastomas, some with red flowers and others ornamented with panicles of whitish berries.

But the halts! the shouts of cheating! when the happy company thought they had lost their guiding thread! For it was necessary to go back and disentangle it from the knot of parasitic plants.

"There it is!" said Lina, "I see it!"
"You are wrong," replied Minha; "that is not it, that is a liana of another kind."
"No, Lina is right!" said Benito.
"No, Lina is wrong!" Manoel would naturally return.

Hence highly serious, long-continued discussions, in which no one would give in.

Then the black on one side and Benito on the other would rush at the trees and clamber up to the branches encircled by the cipo so as to arrive at the true direction.

Now nothing was assuredly less easy in that jumble of knots, among which twisted the liana in the middle of bromelias, "karatas," armed with their sharp prickles, orchids with rosy flowers and violet lips the size of gloves, and oncidiums more tangled than a skein of worsted between a kitten's paws.

And then when the liana ran down again to the ground the difficulty of picking it out under the mass of lycopods, large-leaved heliconias, rosy-tasseled calliandras, rhipsalas encircling it like the thread on an electric reel, between the knots of the large white ipomas, under the fleshy stems of the vanilla, and in the midst of the shoots and branchlets of the grenadilla and the vine.

And when the cipo was found again what shouts of joy, and how they resumed the walk for an instant interrupted!

For an hour the young people had already been advancing, and nothing had happened to warn them that they were approaching the end.

They shook the liana with vigor, but it would not give, and the birds flew away in hundreds, and the monkeys fled from tree to tree, so as to point out the way.

If a thicket barred the road the felling-sword cut a deep gap, and the group passed in. If it was a high rock, carpeted with verdure, over which the liana twisted like a serpent, they climbed it and passed on.

A large break now appeared. There, in the more open air, which is as necessary to it as the light of the sun, the tree of the tropics, _par excellence_, which, according to Humboldt, "accompanies man in the infancy of his civilization," the great provider of the inhabitant of the torrid zones, a banana-tree, was standing alone. The long festoon of the liana curled round its higher branches, moving away to the other side of the clearing, and disappeared again into the forest.

"Shall we stop soon?" asked Manoel.
"No; a thousand times no!" cried Benito, "not without having reached the end of it!"
"Perhaps," observed Minha, "it will soon be time to think of returning."
"Oh, dearest mistress, let us go on again!" replied Lina.
"On forever!" added Benito.

And they plunged more deeply into the forest, which, becoming clearer, allowed them to advance more easily.

Besides, the cipo bore away to the north, and toward the river. It became less inconvenient to follow, seeing that they approached the right bank, and it would be easy to get back afterward.

A quarter of an hour later they all stopped at the foot of a ravine in front of a small tributary of the Amazon. But a bridge of lianas, made of "bejucos," twined together by their interlacing branches, crossed the stream. The cipo, dividing into two strings, served for a handrail, and passed from one bank to the other.

Benito, all the time in front, had already stepped on the swinging floor of this vegetable bridge.
Manoel wished to keep his sister back.
"Stay--stay, Minha!" he said, "Benito may go further if he likes, but let us remain here."
"No! Come on, come on, dear mistress!" said Lina. "Don't be afraid, the liana is getting thinner; we shall get the better of it, and find out its end!"

And, without hesitation, the young mulatto boldly ventured toward Benito.
"What children they are!" replied Minha. "Come along, Manoel, we must follow."
And they all cleared the bridge, which swayed above the ravine like a swing, and plunged again beneath the mighty trees.

But they had not proceeded for ten minutes along the interminable cipo, in the direction of the river, when they stopped, and this time not without cause.
"Have we got to the end of the liana?" asked Minha.
"No," replied Benito; "but we had better advance with care. Look!" and Benito pointed to the cipo which, lost in the branches of a high ficus, was agitated by violent shakings.
"What causes that?" asked Manoel.
"Perhaps some animal that we had better approach with a little circumspection!"
And Benito, cocking his gun, motioned them to let him go on a bit, and stepped about ten paces to the front.
Manoel, the two girls, and the black remained motionless where they were.
Suddenly Benito raised a shout, and they saw him rush toward a tree; they all ran as well.
Sight the most unforeseen, and little adapted to gratify the eyes!
A man, hanging by the neck, struggled at the end of the liana, which, supple as a cord, had formed into a slipknot, and the shakings came from the jerks into which he still agitated it in the last convulsions of his agony!
Benito threw himself on the unfortunate fellow, and with a cut of his hunting-knife severed the cipo.
The man slipped on to the ground. Manoel leaned over him, to try and recall him to life, if it was not too late.
"Poor man!" murmured Minha.
"Mr. Manoel! Mr. Manoel!" cried Lina. "He breathes again! His heart beats; you must save him."
"True," said Manoel, "but I think it was about time that we came up."
He was about thirty years old, a white, clothed badly enough, much emaciated, and he seemed to have suffered a good deal.

At his feet were an empty flask, thrown on the ground, and a cup and ball in palm wood, of which the ball, made of the head of a tortoise, was tied on with a fiber.
"To hang himself! to hang himself!" repeated Lina, "and young still! What could have driven him to do such a thing?"
But the attempts of Manoel had not been long in bringing the luckless wight to life again, and he opened his eyes and gave an "ahem!" so vigorous and unexpected that Lina, frightened, replied to his cry with another.
"Who are you, my friend?" Benito asked him.
"An ex-hanger-on, as far as I see."
"But your name?"
"Wait a minute and I will recall myself," said he, passing his hand over his forehead. "I am known as Fragoso, at your service; and I am still able to curl and cut your hair, to shave you, and to make you comfortable according to all the rules of my art. I am a barber, so to speak more truly, the most desperate of Figaros."

"And what made you think of----"
"What would you have, my gallant sir?" replied Fragoso, with a smile; "a moment of despair, which I would have duly regretted had the regrets been in another world! But eight hundred leagues of country to traverse, and not a coin in my pouch, was not very comforting! I had lost courage obviously."
To conclude, Fragoso had a good and pleasing figure, and as he recovered it was evident that he was of a lively disposition. He was one of those wandering barbers who travel on the banks of the Upper Amazon, going from village to village, and putting the resources of their art at the service of negroes, negresses, Indians and Indian women, who appreciate them very much.

But poor Fragoso, abandoned and miserable, having eaten nothing for forty hours, astray in the forest, had for an instant lost his head, and we know the rest.
"My friend," said Benito to him, "you will go back with us to the fazenda of Iquitos?"
"With pleasure," replied Fragoso; "you cut me down and I belong to you. I must somehow be dependent."
"Well, dear mistress, don't you think we did well to continue our walk?" asked Lina.
"That I do," returned the girl.
"Never mind," said Benito; "I never thought that we should finish by finding a man at the end of the cipo."
"And, above all, a barber in difficulties, and on the road to hang himself!" replied Fragoso.
The poor fellow, who was now wide awake, was told about what had passed. He warmly thanked Lina for the good idea she had had of following the liana, and they all started on the road to the fazenda, where Fragoso was received in a way that gave him neither wish nor want to try his wretched task again.

CHAPTER VIII. THE JANGADA

The half-mile square of forest was cleared. With the carpenters remained the task of arranging in the form of a raft the many venerable trees which were lying on the strand.

And an easy task it was. Under the direction of Joam Garral the Indians displayed their incomparable ingenuity. In everything connected with house-building or ship-building these natives are, it must be admitted, astonishing workmen. They have only an ax and a saw, and they work on woods so hard that the edge of their tools gets absolutely jagged; yet they square up trunks, shape beams out of enormous stems, and get out of them joists and planking without the aid of any machinery whatever, and, endowed with prodigious natural ability, do all these things easily with their skilled and patient hands.

The trees had not been launched into the Amazon to begin with; Joam Garral was accustomed to proceed in a different way. The whole mass of trunks was symmetrically arranged on a flat part of the bank, which he had already leveled up at the junction of the Nanay with the great river.

There it was that the jangada was to be built; thence it was that the Amazon was to float it when the time came for it to start for its destination.

And here an explanatory note is necessary in regard to the geography of this immense body of water, and more especially as relating to a singular phenomenon which the riverside inhabitants describe from personal observation.

The two rivers which are, perhaps, more extensive than the great artery of Brazil, the Nile and the Missouri-Mississippi, flow one from south to north across the African continent, the other from north to south through North America. They cross districts of many different latitudes, and consequently of many different climates.

The Amazon, on the contrary, is entirely comprised--at least it is from the point where it turns to the east, on the frontiers of Ecuador and Peru--between the second and fourth parallels of south latitude. Hence this immense river system is under the same climatic conditions during the whole of its course.

In these parts there are two distinct seasons during which rain falls. In the north of Brazil the rainy season is in September; in the south it occurs in March. Consequently the right-hand tributaries and the left-hand tributaries bring down their floods at half-yearly intervals, and hence the level of the Amazon, after reaching its maximum in June, gradually falls until October.

This Joam Garral knew by experience, and he intended to profit by the phenomenon to launch the jangada, after having built it in comfort on the river bank. In fact, between the mean and the higher level the height of the Amazon could vary as much as forty feet, and between the mean and the lower level as much as thirty feet. A difference of seventy feet like this gave the fazender all he required.

The building was commenced without delay. Along the huge bank the trunks were got into place according to their sizes and floating power, which of course had to be taken into account, as among these thick and heavy woods there were many whose specific gravity was but little below that of water.

The first layer was entirely composed of trunks laid side by side. A little interval had to be left between them, and they were bound together by transverse beams, which assured the solidity of the whole. _"Piaçaba"_ ropes strapped them together as firmly as any chain cables could have done. This material, which consists of the ramicles of a certain palm-tree growing very abundantly on the river banks, is in universal use in the district. Piaçaba floats, resists immersion, and is cheaply made--very good reasons for causing it to be valuable, and making it even an article of commerce with the Old World.

Above this double row of trunks and beams were disposed the joists and planks which formed the floor of the jangada, and rose about thirty inches above the load water-line. The bulk was enormous, as we must confess when it is considered that the raft measured a thousand feet long and sixty broad, and thus had a superificies of sixty thousand square feet. They were, in fact, about to commit a whole forest to the Amazon.

The work of building was conducted under the immediate direction of Joam Garral. But when that part was finished the question of arrangement was submitted to the discussion of all, including even the gallant Fragoso.

Just a word as to what he was doing in his new situation at the fazenda.

The barber had never been so happy as since the day when he had been received by the hospitable family. Joam Garral had offered to take him to Para, on the road to which he was when the liana, according to his account, had seized him by the neck and brought him up with a round turn. Fragoso had accepted the offer, thanked him from the bottom of his heart, and ever since had sought to make himself useful in a thousand ways. He was a very intelligent fellow--what one might call a "double right-hander"--that is to say, he could do everything, and could do everything
well. As merry as Lina, always singing, and always ready with some good-natured joke, he was not long in being liked by all.

But it was with the young mulatto that he claimed to have contracted the heaviest obligation.

"A famous idea that of yours, Miss Lina," he was constantly saying, "to play at 'following the liana!' It is a capital game even if you do not always find a poor chap of a barber at the end!"

"Quite a chance, Mr. Fragoso," would laughingly reply Lina; "I assure you, you owe me nothing!"

"What! nothing! I owe you my life, and I want it prolonged for a hundred years, and that my recollection of the fact may endure even longer! You see, it is not my trade to be hanged! If I tried my hand at it, it was through necessity. But, on consideration, I would rather die of hunger, and before quite going off I should try a little pasturage with the brutes! As for this liana, it is a lien between us, and so you will see!"

The conversation generally took a joking turn, but at the bottom Fragoso was very grateful to the mulatto for having taken the initiative in his rescue, and Lina was not insensible to the attentions of the brave fellow, who was as straightforward, frank, and good-looking as she was. Their friendship gave rise to many a pleasant, "Ah, ah!" on the part of Benito, old Cybele, and others.

To return to the Jangada. After some discussion it was decided, as the voyage was to be of some months' duration, to make it as complete and comfortable as possible. The Garral family, comprising the father, mother, daughter, Benito, Manoel, and the servants, Cybele and Lina, were to live in a separate house. In addition to these, there were to go forty Indians, forty blacks, Fragoso, and the pilot who was to take charge of the navigation of the raft.

Though the crew was large, it was not more than sufficient for the service on board. To work the jangada along the windings of the river and between the hundreds of islands and islets which lay in its course required fully as many as were taken, for if the current furnished the motive power, it had nothing to do with the steering, and the hundred and sixty arms were no more than were necessary to work the long boathooks by which the giant raft was to be kept in mid-stream.

In the first place, then, in the hinder part of the jangada they built the master's house. It was arranged to contain several bedrooms and a large dining-hall. One of the rooms was destined for Joam and his wife, another for Lina and Cybele near those of their mistresses, and a third room for Benito and Manoel. Minha had a room away from the others, which was not by any means the least comfortably designed.

This, the principal house, was carefully made of weather-boarding, saturated with boiling resin, and thus rendered water-tight throughout. It was capitally lighted with windows on all sides. In front, the entrance-door gave immediate access to the common room. A light veranda, resting on slender bamboos, protected the exterior from the direct action of the solar rays. The whole was painted a light-ocher color, which reflected the heat instead of absorbing it, and kept down the temperature of the interior.

But when the heavy work, so to speak, had been completed, Minha intervened with:

"Father, now your care has inclosed and covered us, you must allow us to arrange our dwelling to please ourselves. The outside belongs to you, the inside to us. Mother and I would like it to be as though our house at the fazenda went with us on the journey, so as to make you fancy that we had never left Iquitos!"

"Do just as you like, Minha," replied Joam Garral, smiling in the sad way he often did.

"That will be nice!"

"I leave everything to your good taste."

"And that will do us honor, father. It ought to, for the sake of the splendid country we are going through—which is yours, by the way, and into which you are to enter after so many years' absence."

"Yes, Minha; yes," replied Joam. "It is rather as if we were returning from exile--voluntary exile! Do your best; I approve beforehand of what you do."

On Minha and Lina, to whom were added of their own free will Manoel on the one side and Fragoso on the other, devolved the care of decorating the inside of the house. With some imagination and a little artistic feeling the result was highly satisfactory.

The best furniture of the fazenda naturally found its place within, as after arriving in Para they could easily return it by one of the _igariteos_. Tables, bamboo easy-chairs, cane sofas, carved wood shelves, everything that constituted the charming furniture of the tropics, was disposed with taste about the floating home. No one is likely to imagine that the walls remained bare. The boards were hidden beneath hangings of most agreeable variety. These hangings were made of valuable bark, that of the _"tuturis,"_ which is raised up in large folds like the brocades and damasks and softest and richest materials of our modern looms. On the floors of the rooms were jaguar skins, with wonderful spots, and thick monkey furs of exquisite fleeciness. Light curtains of the russet silk, produced by the _"sumauma,"_ hung from the windows. The beds, enveloped in mosquito curtains, had their pillows, mattresses, and bolsters filled with that fresh and elastic substance which in the Upper Amazon is yielded by the bombax.
Throughout on the shelves and side-tables were little odds and ends, brought from Rio Janeiro or Belem, those most precious to Minha being such as had come from Manoel. What could be more pleasing in her eyes than the knickknacks given by a loving hand which spoke to her without saying anything?

In a few days the interior was completed, and it looked just like the interior of the fazenda. A stationary house under a lovely clump of trees on the borders of some beautiful river! Until it descended between the banks of the larger stream it would not be out of keeping with the picturesque landscape which stretched away on each side of it.

We may add that the exterior of the house was no less charming than the interior.

In fact, on the outside the young fellows had given free scope to their taste and imagination.

From the basement to the roof it was literally covered with foliage. A confused mass of orchids, bromelias, and climbing plants, all in flower, rooted in boxes of excellent soil hidden beneath masses of verdure. The trunk of some ficus or mimosa was never covered by a more startlingly tropical attire. What whimsical climbers—ruby red and golden yellow, with variegated clusters and tangled twigs—turned over the brackets, under the ridges, on the rafters of the roof, and across the lintels of the doors! They had brought them wholesale from the woods in the neighborhood of the fazenda. A huge liana bound all the parasites together; several times it made the round of the house, clinging on to every angle, encircling every projection, forking, uniting, it everywhere threw out its irregular branchlets, and allowed not a bit of the house to be seen beneath its enormous clusters of bloom.

As a delicate piece of attention, the author of which can be easily recognized, the end of the cipo spread out before the very window of the young mulatto, as though a long arm was forever holding a bouquet of fresh flowers across the blind.

To sum up, it was as charming as could be; and as Yaquita, her daughter, and Lina were content, we need say no more about it.

"It would not take much to make us plant trees on the jangada," said Benito.

"Oh, trees!" ejaculated Minha.

"Why not?" replied Manoel. "Transported on to this solid platform, with some good soil, I am sure they would do well, and we would have no change of climate to fear for them, as the Amazon flows all the time along the same parallel."

"Besides," said Benito, "every day islets of verdure, torn from the banks, go drifting down the river. Do they not pass along with their trees, bushes, thickets, rocks, and fields, to lose themselves in the Atlantic eight hundred leagues away? Why, then, should we not transform our raft into a floating garden?"

"Would you like a forest, miss?" said Fragoso, who stopped at nothing.

"Yes, a forest!" cried the young mulatto; "a forest with its birds and its monkeys----"

"Its snakes, its jaguars!" continued Benito.

"Its Indians, its nomadic tribes," added Manoel, "and even its cannibals!"

"But where are you going to, Fragoso?" said Minha, seeing the active barber making a rush at the bank.

"To look after the forest!" replied Fragoso.

"Useless, my friend," answered the smiling Minha. "Manoel has given me a nosegay and I am quite content. It is true," she added, pointing to the house hidden beneath the flowers, "that he has hidden our house in his betrothal bouquet!"

CHAPTER IX. THE EVENING OF THE FIFTH OF JUNE

WHILE THE master's house was being constructed, Joam Garral was also busied in the arrangement of the outbuildings, comprising the kitchen, and offices in which provisions of all kinds were intended to be stored.

In the first place, there was an important stock of the roots of that little tree, some six or ten feet in height, which yields the manioc, and which form the principal food of the inhabitants of these inter-tropical countries. The root, very much like a long black radish, grows in clumps like potatoes. If it is not poisonous in Africa, it is certain that in South America it contains a more noxious juice, which it is necessary to previously get rid of by pressure. When this result is obtained, the root is reduced to flour, and is then used in many ways, even in the form of tapioca, according to the fancy of the natives.

On board the jangada there was a huge pile of this useful product destined for general consumption.

As for preserved meats, not forgetting a whole flock of sheep, kept in a special stable built in the front, they consisted principally of a quantity of the _"presunto"_ hams of the district, which are of first-class quality; but the guns of the young fellows and of some of the Indians were reckoned on for additional supplies, excellent hunters as they were, to whom there was likely to be no lack of game on the islands and in the forests bordering on the stream. The river was expected to furnish its daily quota; prawns, which ought rather to be called crawfish; _"tambagus,"_ the finest fish in the district, of a flavor superior to that of salmon, to which it is often compared; _"pirarucus"_ with
red scales, as large as sturgeons, which when salted are used in great quantities throughout Brazil; _"candirus,"_ awkward to capture, but good to eat; _"piranhas,"_ or devil-fish, striped with red bands, and thirty inches long; turtles large and small, which are counted by millions, and form so large a part of the food of the natives; some of every one of these things it was hoped would figure in turn on the tables of the master and his men.

And so each day shooting and fishing were to be regularly indulged in.

For beverages they had a good store of the best that country produced; _"caysuma"_ or _"machachera,"_ from the Upper and Lower Amazon, an agreeable liquor of slightly acidulated taste, which is distilled from the boiled root of the sweet manioc; _"beiju,"_ from Brazil, a sort of national brandy, the _"chica"_ of Peru; the _"mazato"_ of the Ucayali, extracted from the boiled fruits of the banana-tree, pressed and fermented; _"guarana,"_ a kind of paste made from the double almond of the _"paulliniasorbilis,"_ a genuine tablet of chocolate so far as its color goes, which is reduced to a fine powder, and with the addition of water yields an excellent drink.

And this was not all. There is in these countries a species of dark violet wine, which is got from the juice of the palm, and the aromatic flavor of this _"assais"_ is greatly appreciated by the Brazilians, and of it there were on board a respectable number of frasques (each holding a little more than half a gallon), which would probably be emptied before they arrived at Para.

The special cellar of the jangada did honor to Benito, who had been appointed its commander-in-chief. Several hundred bottles of sherry, port, and letubal recalled names dear to the earlier conquerors of South America. In addition, the young butler had stored away certain demijohns, holding half a dozen gallons each, of excellent _"tafia,"_ a sugared brandy a trifle more pronounced in taste than the national _"beiju._"

As far as tobacco was concerned, there was none of that coarse kind which usually contents the natives of the Amazonian basin. It all came direct from Villa Bella da Imperatriz—or, in other words, from the district in which is grown the best tobacco in Central America.

The principal habitation, with its annexes—kitchen, offices, and cellars—was placed in the rear—or, let us say, stern of the craft—and formed a part reserved for the Garral family and their personal servants.

In the center the huts for the Indians and the blacks had been erected. The staff were thus placed under the same conditions as at the fazenda of Iquitos, and would always be able to work under the direction of the pilot.

To house the crew a good many huts were required, and these gave to the jangada the appearance of a small village got adrift, and, to tell the truth, it was a better built and better peopled village than many of those on the Upper Amazon.

For the Indians Joam Garral had designed regular cabins—huts without walls, with only light poles supporting the roof of foliage. The air circulated freely throughout these open constructions and swung the hammock suspended in the interior, and the natives, among whom were three or four complete families, with women and children, were lodged as if they were on shore.

The blacks here found their customary sheds. They differed from the cabins by being closed in on their four faces, of which only one gave access to the interior. The Indians, accustomed to live in the open air, free and untrammelled, were not able to accustom themselves to the imprisonment of the _ajoupas,_ which agreed better with the life of the blacks.

In the bow regular warehouses had arisen, containing the goods which Joam Garral was carrying to Belem at the same time as the products of his forests.

There, in vast storerooms, under the direction of Benito, the rich cargo had been placed with as much order as if it had been carefully stowed away in a ship's hold.

In the first place, seven thousand arrobas of caoutchouc, each of about thirty pounds, composed the most precious part of the cargo, for every pound of it was worth from three to four francs. The jangada also took fifty hundredweight of sarsaparilla, a smilax which forms an important branch of foreign trade throughout the Amazon districts, and is getting rarer and rarer along the banks of the river, so that the natives are very careful to spare the stems when they gather them. Tonquin bans, known in Brazil under the name of _"cumars,"_ and used in the manufacture of certain essential oils; sassafras, from which is extracted a precious balsam for wounds; bales of dyeing plants, cases of several gums, and a quantity of precious woods, completed a well-adapted cargo for lucrative and easy sale in the provinces of Para.

Some may feel astonished that the number of Indians and negroes embarked were only sufficient to work the raft, and that a larger number were not taken in case of an attack by the riverside Indians.

Such would have been useless. The natives of Central America are not to be feared in the least, and the times are quite changed since it was necessary to provide against their aggressions. The Indians along the river belong to peaceable tribes, and the fiercest of them have retired before the advancing civilization, and drawn further and further away from the river and its tributaries. Negro deserters, escaped from the penal colonies of Brazil, England, Holland, or France, are alone to be feared. But there are only a small number of these fugitives, they only move in
isolated groups across the savannahs or the woods, and the jangada was, in a measure, secured from any attack on the parts of the backwoodsmen.

On the other hand, there were a number of settlements on the river--towns, villages, and missions. The immense stream no longer traverses a desert, but a basin which is being colonized day by day. Danger was not taken into consideration. There were no precautions against attacks.

To conclude our description of the jangada, we have only to speak of one or two erections of different kinds which gave it a very picturesque aspect.

In the bow was the cabin of the pilot--we say in the bow, and not at the stern, where the helmsman is generally found. In navigating under such circumstances a rudder is of no use. Long oars have no effect on a raft of such dimensions, even when worked with a hundred sturdy arms. It was from the sides, by means of long boat-hooks or props thrust against the bed of the stream, that the jangada was kept in the current, and had its direction altered when going astray. By this means they could range alongside either bank, if they wished for any reason to come to a halt. Three or four ubas, and two pirogues, with the necessary rigging, were carried on board, and afforded easy communications with the banks. The pilot had to look after the channels of the river, the deviations of the current, the eddies which it was necessary to avoid, the creeks or bays which afforded favorable anchorage, and to do this he had to be in the bow.

If the pilot was the material director of this immense machine--for can we not justly call it so?--another personage was its spiritual director; this was Padre Passanha, who had charge of the mission at Iquitos.

A religious family, like that of Joam Garral's, had availed themselves enthusiastically of this occasion of taking him with them.

Padre Passanha, then aged seventy, was a man of great worth, full of evangelical fervor, charitable and good, and in countries where the representatives of religion are not always examples of the virtues, he stood out as the accomplished type of those great missionaries who have done so much for civilization in the interior of the most savage regions of the world.

For fifty years Padre Passanha had lived at Iquitos, in the mission of which he was the chief. He was loved by all, and worthy so. The Garral family held him in great esteem; it was he who had married the daughter of Farmer Magalhaës to the clerk who had been received at the fazenda. He had known the children from birth; he had baptized them, educated them, and hoped to give each of them the nuptial blessing.

The age of the padre did not allow of his exercising his important ministry any longer. The horn of retreat for him had sounded; he was about to be replaced at Iquitos by a younger missionary, and he was preparing to return to Para, to end his days in one of those convents which are reserved for the old servants of God.

What better occasion could offer than that of descending the river with the family which was as his own? They had proposed it to him, and he had accepted, and when arrived at Belem he was to marry the young couple, Minha and Manoel.

But if Padre Passanha during the course of the voyage was to take his meals with the family, Joam Garral desired to build for him a dwelling apart, and heaven knows what care Yaquita and her daughter took to make him comfortable! Assuredly the good old priest had never been so lodged in his modest parsonage!

The parsonage was not enough for Padre Passanha; he ought to have a chapel.

The chapel then was built in the center of the jangada, and a little bell surmounted it.

It was small enough, undoubtedly, and it could not hold the whole of the crew, but it was richly decorated, and if Joam Garral found his own house on the raft, Padre Passanha had no cause to regret the poverty-stricken church of Iquitos.

Such was the wonderful structure which was going down the Amazon. It was then on the bank waiting till the flood came to carry it away. From the observation and calculation of the rising it would seem as though there was not much longer to wait.

All was ready to date, the 5th of June.

The pilot arrived the evening before. He was a man about fifty, well up in his profession, but rather fond of drink. Such as he was, Joam Garral in large matters at different times had employed him to take his rafts to Belem, and he had never had cause to repent it.

It is as well to add that Araujo--that was his name--never saw better than when he had imbibed a few glasses of tafia; and he never did any work at all without a certain demijohn of that liquor, to which he paid frequent court.

The rise of the flood had clearly manifested itself for several days. From minute to minute the level of the river rose, and during the twenty-four hours which preceded the maximum the waters covered the bank on which the raft rested, but did not lift the raft.

As soon as the movement was assured, and there could be no error as to the height to which the flood would rise, all those interested in the undertaking were seized with no little excitement. For if through some inexplicable cause
the waters of the Amazon did not rise sufficiently to flood the jangada, it would all have to be built over again. But as the fall of the river would be very rapid it would take long months before similar conditions recurred.

On the 5th of June, toward the evening, the future passengers of the jangada were collected on a plateau which was about a hundred feet above the bank, and waited for the hour with an anxiety quite intelligible.

There were Yaquita, her daughter, Manoel Valdez, Padre Passanha, Benito, Lina, Fragoso, Cybele, and some of the servants, Indian or negro, of the fazenda.

Fragoso could not keep himself still; he went and he came, he ran down the bank and ran up the plateau, he noted the points of the river gauge, and shouted "Hurrah!" as the water crept up.

"It will swim, it will swim!" he shouted. "The raft which is to take us to Belem! It will float if all the cataracts of the sky have to open to flood the Amazon!"

Joam Garral was on the raft with the pilot and some of the crew. It was for him to take all the necessary measures at the critical moment. The jangada was moored to the bank with solid cables, so that it could not be carried away by the current when it floated off.

Quite a tribe from one hundred and fifty to two hundred Indians, without counting the population of the village, had come to assist at the interesting spectacle.

They were all keenly on the watch, and silence reigned over the impressionable crowd.

Toward five o'clock in the evening the water had reached a level higher than that of the night before--by more than a foot--and the bank had already entirely disappeared beneath the liquid covering.

A certain groaning arose among the planks of the enormous structure, but there was still wanting a few inches before it was quite lifted and detached from the ground.

For an hour the groanings increased. The joists grated on all sides. A struggle was going on in which little by little the trunks were being dragged from their sandy bed.

Toward half-past six cries of joy arose. The jangada floated at last, and the current took it toward the middle of the river, but, in obedience to the cables, it quietly took up its position near the bank at the moment that Padre Passanha gave it his blessing, as if it were a vessel launched into the sea whose destinies are in the hands of the Most High!

CHAPTER X. FROM IQUITOS TO PEVAS

ON THE 6th of June, the very next day, Joam Garral and his people bade good-by to the superintendent and the Indians and negroes who were to stay behind at the fazenda. At six o'clock in the morning the jangada received all its passengers, or rather inhabitants, and each of them took possession of his cabin, or perhaps we had better say his house.

The moment of departure had come. Araujo, the pilot, got into his place at the bow, and the crew, armed with their long poles, went to their proper quarters.

Joam Garral, assisted by Benito and Manoel, superintended the unmooring.

At the command of the pilot the ropes were eased off, and the poles applied to the bank so as to give the jangada a start. The current was not long in seizing it, and coasting the left bank, the islands of Iquitos and Parianta were passed on the right.

The voyage had commenced--where would it finish? In Para, at Belem, eight hundred leagues from this little Peruvian village, if nothing happened to modify the route. How would it finish? That was the secret of the future.

The weather was magnificent. A pleasant _"pampero"_ tempered the ardor of the sun--one of those winds which in June or July come from off the Cordilleras, many hundred leagues away, after having swept across the huge plain of the Sacramento. Had the raft been provided with masts and sails she would have felt the effects of the breeze, and her speed would have been greater; but owing to the sinuosities of the river and its abrupt changes, which they were bound to follow, they had had to renounce such assistance.

In a flat district like that through which the Amazon flows, which is almost a boundless plain, the gradient of the river bed is scarcely perceptible. It has been calculated that between Tabatinga on the Brazilian frontier, and the source of this huge body of water, the difference of level does not exceed a decimeter in each league. There is no other river in the world whose inclination is so slight.

It follows from this that the average speed of the current cannot be estimated at more than two leagues in twenty-four hours, and sometimes, while the droughts are on, it is even less. However, during the period of the floods it has been known to increase to between thirty and forty kilometers.

Happily, it was under these latter conditions that the jangada was to proceed; but, cumbersome in its movements, it could not keep up to the speed of the current which ran past it. There are also to be taken into account the stoppages occasioned by the bends in the river, the numerous islands which had to be rounded, the shoals which had to be
avoided, and the hours of halting, which were necessarily lost when the night was too dark to advance securely, so that we cannot allow more than twenty-five kilometers for each twenty-four hours.

In addition, the surface of the water is far from being completely clear. Trees still green, vegetable remains, islets of plants constantly torn from the banks, formed quite a flotilla of fragments carried on by the currents, and were so many obstacles to speedy navigation.

The mouth of the Nanay was soon passed, and lost to sight behind a point on the left bank, which, with its carpet of russet grasses tinted by the sun, formed a ruddy relief to the green forests on the horizon.

The jangada took the center of the stream between the numerous picturesque islands, of which there are a dozen between Iquitos and Pucalpapa.

Araujo, who did not forget to clear his vision and his memory by an occasional application to his demijohn, maneuvered very ably when passing through this archipelago. At his word of command fifty poles from each side of the raft were raised in the air, and struck the water with an automatic movement very curious to behold.

While this was going on, Yaquita, aided by Lina and Cybele, was getting everything in order, and the Indian cooks were preparing the breakfast.

As for the two young fellows and Minha, they were walking up and down in company with Padre Passanha, and from time to time the lady stopped and watered the plants which were placed about the base of the dwelling-house.

"Well, padre," said Benito, "do you know a more agreeable way of traveling?"

"No, my dear boy," replied the padre; "it is truly traveling with all one's belongings."

"And without any fatigue," added Manoel; "we might do hundreds of thousands of miles in this way."

"And," said Minha, "you do not repent having taken passage with us? Does it not seem to you as if we were afloat on an island drifted quietly away from the bed of the river with its prairies and its trees? Only----"

"Only?" repeated the padre.

"Only we have made the island with our own hands; it belongs to us, and I prefer it to all the islands of the Amazon. I have a right to be proud of it."

"Yes, my daughter; and I absolve you from your pride. Besides, I am not allowed to scold you in the presence of Manoel!"

"But, on the other hand," replied she, gayly, "you should teach Manoel to scold me when I deserve it. He is a great deal too indulgent to my little self."

"Well, then, dear Minha," said Manoel, "I shall profit by that permission to remind you----"

"Of what?"

"That you were very busy in the library at the fazenda, and that you promised to make me very learned about everything connected with the Upper Amazon. We know very little about it in Para, and here we have been passing several islands and you have not even told me their names!"

"What is the good of that?" said she.

"Yes; what is the good of it?" repeated Benito. "What can be the use of remembering the hundreds of names in the 'Tupi' dialect with which these islands are dressed out? It is enough to know them. The Americans are much more practical with their Mississippi islands; they number them----"

"As they number the avenues and streets of their towns," replied Manoel. "Frankly, I don't care much for that numerical system; it conveys nothing to the imagination--Sixty-fourth Island or Sixty-fifth Island, any more than Sixth Street or Third Avenue. Don't you agree with me, Minha?"

"Yes, Manoel; though I am of somewhat the same way of thinking as my brother. But even if we do not know their names, the islands of our great river are truly splendid! See how they rest under the shadows of those gigantic palm-trees with their drooping leaves! And the girdle of reeds which encircles them through which a pirogue can with difficulty make its way! And the mangrove trees, whose fantastic roots buttress them to the bank like the claws of some gigantic crab! Yes, the islands are beautiful, but, beautiful as they are, they cannot equal the one we have made our own!"

"My little Minha is enthusiastic to-day," said the padre.

"Ah, padre! I am so happy to see everybody happy around me!"

At this moment the voice of Yaquita was heard calling Minha into the house.

The young girl smilingly ran off.

"You will have an amiable companion," said the padre. "All the joy of the house goes away with you, my friend."

"Brave little sister!" said Benito, "we shall miss her greatly, and the padre is right. However, if you do not marry her, Manoel--there is still time--she will stay with us."

"She will stay with you, Benito," replied Manoel. "Believe me, I have a presentiment that we shall all be reunited!"
The first day passed capitally; breakfast, dinner, siesta, walks, all took place as if Joam Garral and his people were still in the comfortable fazenda of Iquitos.

During these twenty-four hours the mouths of the rivers Bacali, Chochio, Pucalppa, on the left of the stream, and those of the rivers Itinicari, Maniti, Moyoc, Tucuya, and the islands of this name on the right, were passed without accident. The night, lighted by the moon, allowed them to save a halt, and the giant raft glided peacefully on along the surface of the Amazon.

On the morrow, the 7th of June, the jangada breasted the banks of the village of Pucalppa, named also New Oran. Old Oran, situated fifteen leagues down stream on the same left bank of the river, is almost abandoned for the new settlement, whose population consists of Indians belonging to the Mayoruna and Orejone tribes. Nothing can be more picturesque than this village with its ruddy-colored banks, its unfinished church, its cottages, whose chimneys are hidden amid the palms, and its two or three ubas half-stranded on the shore.

During the whole of the 7th of June the jangada continued to follow the left bank of the river, passing several unknown tributaries of no importance. For a moment there was a chance of her grounding on the easterly shore of the island of Sinicure; but the pilot, well served by the crew, ward off the danger and remained in the flow of the stream.

In the evening they arrived alongside a narrow island, called Napo Island, from the name of the river which here comes in from the north-northwest, and mingles its waters with those of the Amazon through a mouth about eight hundred yards across, after having watered the territories of the Coto and Orejone Indians.

It was on the morning of the 7th of June that the jangada was abreast the little island of Mango, which causes the Napo to split into two streams before falling into the Amazon.

Several years later a French traveler, Paul Marcoy, went out to examine the color of the waters of this tributary, which has been graphically compared to the cloudy greenish opal of absinthe. At the same time he corrected some of the measurements of La Condamine. But then the mouth of the Napo was sensibly increased by the floods and it was with a good deal of rapidity that its current, coming from the eastern slopes of Cotopaxi, hurried fiercely to mingle itself with the tawny waters of the Amazon.

A few Indians had wandered to the mouth of this river. They were robust in build, of tall stature, with shaggy hair, and had their noses pierced with a rod of palm, and the lobes of their ears lengthened to their shoulders by the weight of heavy rings of precious wood. Some women were with them. None of them showed any intention of coming on board. It is asserted that these natives are cannibals; but if that is true—and it is said of many of the riverine tribes—there must have been more evidence for the cannibalism than we get to-day.

Some hours later the village of Bella Vista, situated on a somewhat lower bank, appeared, with its cluster of magnificent trees, towering above a few huts roofed with straw, over which there drooped the large leaves of some medium-sized banana-trees, like the waters overflowing from a tazza.

Then the pilot, so as to follow a better current, which turned off from the bank, directed the raft toward the right side of the river, which he had not yet approached. The maneuver was not accomplished without certain difficulties, which were successfully overcome after a good many resorts to the demijohn.

This allowed them to pass in passing some of those numerous lagoons with black waters, which are distributed along the course of the Amazon, and which often have no communication with the river. One of these, bearing the name of the Lagoon of Oran, is of fair size, and receives the water by a large strait. In the middle of the stream are scattered several islands and two or three islets curiously grouped; and on the opposite bank Benito recognized the site of the ancient Oran, of which they could only see a few uncertain traces.

During two days the jangada traveled sometimes under the left bank, sometimes under the right, according to the condition of the current, without giving the least sign of grounding.

The passengers had already become used to this new life. Joam Garral, leaving to his son everything that referred to the commercial side of the expedition, kept himself principally to his room, thinking and writing. What he was writing about he told to nobody, not even Yaquita, and it seemed to have already assumed the importance of a veritable essay.

Benito, all observation, chatted with the pilot and acted as manager. Yaquita, her daughter, and Manoel, nearly always formed a group apart, discussing their future projects just as they had walked and done in the park of the fazenda. The life was, in fact, the same. Not quite, perhaps, to Benito, who had not yet found occasion to participate in the pleasures of the chase. If, however, the forests of Iquitos failed him with their wild beasts, agoutis, peccaries, and cabiais, the birds flew in flocks from the banks of the river and fearlessly perched on the jangada. When they were of such quality as to figure fairly on the table, Benito shot them; and, in the interest of all, his sister raised no objection; but if he came across any gray or yellow herons, or red or white ibises, which haunt the sides, he spared them through love for Minha. One single species of grebe, which is uneatable, found no grace in the eyes of the young merchant; this was the _"caiarara,"_ as quick to dive as to swim or fly; a bird with a disagreeable cry, but
whose down bears a high price in the different markets of the Amazonian basin.

At length, after having passed the village of Omaguas and the mouth of the Ambiacu, the jangada arrived at Pevas on the evening of the 11th of June, and was moored to the bank.

As it was to remain here for some hours before nightfall, Benito disembarked, taking with him the ever-ready Fragosso, and the two sportsmen started off to beat the thickets in the environs of the little place. An agouti and a cabai, not to mention a dozen partridges, enriched the larder after this fortunate excursion. At Pevas, where there is a population of two hundred and sixty inhabitants, Benito would perhaps have done some trade with the lay brothers of the mission, who are at the same time wholesale merchants, but these had just sent away some bales of sarsaparilla and arrobas of caoutchouc toward the Lower Amazon, and their stores were empty.

The jangada departed at daybreak, and passed the little archipelago of the Iatio and Cochiquinas islands, after having left the village of the latter name on the right. Several mouths of smaller unnamed affluents showed themselves on the right of the river through the spaces between the islands.

Many natives, with shaved heads, tattooed cheeks and foreheads, carrying plates of metal in the lobes of their ears, noses, and lower lips, appeared for an instant on the shore. They were armed with arrows and blow tubes, but made no use of them, and did not even attempt to communicate with the jangada.

CHAPTER XI. FROM PEVAS TO THE FRONTIER

DURING THE FEW days which followed nothing occurred worthy of note. The nights were so fine that the long raft went on its way with the stream without even a halt. The two picturesque banks of the river seemed to change like the panoramas of the theaters which unroll from one wing to another. By a kind of optical illusion it appeared as though the raft was motionless between two moving pathways.

Benito had no shooting on the banks, for no halt was made, but game was very advantageously replaced by the results of the fishing.

A great variety of excellent fish were taken—"pacos," "surubis," "gamitanas," of exquisite flavor, and several of those large rays called "duridaris," with rose-colored stomachs and black backs armed with highly poisonous darts. There were also collected by thousands those "candirus," a kind of small silurus, of which many are microscopic, and which so frequently make a pin-cushion of the calves of the bather when he imprudently ventures into their haunts.

The rich waters of the Amazon were also frequented by many other aquatic animals, which escorted the jangada through its waves for whole hours together.

There were the gigantic "pria-rucus," ten and twelve feet long, cuirassed with large scales with scarlet borders, whose flesh was not much appreciated by the natives. Neither did they care to capture many of the graceful dolphins which played about in hundreds, striking with their tails the planks of the raft, gamboling at the bow and stern, and making the water alive with colored reflections and spurs of spray, which the refracted light converted into so many rainbows.

On the 16th of June the jangada, after fortunately clearing several shallows in approaching the banks, arrived near the large island of San Pablo, and the following evening she stopped at the village of Moromoros, which is situated on the left side of the Amazon. Twenty-four hours afterward, passing the mouths of the Atacoari or Cocha— or rather the "furo," or canal, which communicates with the lake of Cabello-Cocha on the right bank—she put in at the rising ground of the mission of Cocha. This was the country of the Marahua Indians, whose long floating hair, and mouths opening in the middle of a kind of fan made of the spines of palm-trees, six inches long, give them a cat-like look—and their endeavor being, according to Paul Marcoy, to resemble the tiger, whose boldness, strength, and cunning they admire above everything. Several women came with these Marahuas, smoking cigars, but holding the lighted ends in their teeth. All of them, like the king of the Amazonian forests, go about almost naked.

The mission of Cocha was then in charge of a Franciscan monk, who was anxious to visit Padre Passanha. Joam Garral received him with a warm welcome, and offered him a seat at the dinner-table.

On that day was given a dinner which did honor to the Indian cook. The traditional soup of fragrant herbs; cake, so often made to replace bread in Brazil, composed of the flour of the manioc thoroughly impregnated with the gravy of meat and tomato jelly; poultry with rice, swimming in a sharp sauce made of vinegar and _"malagueta;"_ a dish of spiced herbs, and cold cake sprinkled with cinnamon, formed enough to tempt a poor monk reduced to the ordinary meager fare of his parish. They tried all they could to detain him, and Yaqita and her daughter did their utmost in persuasion. But the Franciscan had to visit on that evening an Indian who was lying ill at Cocha, and he heartily thanked the hospitable family and departed, not without taking a few presents, which would be well received by the neophytes of the mission.

For two days Araujo was very busy. The bed of the river gradually enlarged, but the islands became more
numerous, and the current, embarrassed by these obstacles, increased in strength. Great care was necessary in passing between the islands of Cabello-Cocha, Tarapote, and Cacao. Many stoppages had to be made, and occasionally they were obliged to pole off the jangada, which now and then threatened to run aground. Every one assisted in the work, and it was under these difficult circumstances that, on the evening of the 20th of June, they found themselves at Nuestra-Senora-di-Loreto.

Loreto is the last Peruvian town situated on the left bank of the river before arriving at the Brazilian frontier. It is only a little village, composed of about twenty houses, grouped on a slightly undulating bank, formed of ochrous earth and clay.

It was in 1770 that this mission was founded by the Jesuit missionaries. The Ticuma Indians, who inhabit the territories on the north of the river, are natives with ruddy skins, bushy hair, and striped designs on their faces, making them look like the lacquer on a Chinese table. Both men and women are simply clothed, with cotton bands bound round their thighs and stomachs. They are now not more than two hundred in number, and on the banks of the Atacoari are found the last traces of a nation which was formerly so powerful under its famous chiefs.

At Loreto there also live a few Peruvian soldiers and two or three Portuguese merchants, trading in cotton stuffs, salt fish, and sarsparilla.

Benito went ashore, to buy, if possible, a few bales of this smilax, which is always so much in demand in the markets of the Amazon. Joam Garral, occupied all the time in the work which gave him not a moment's rest, did not stir. Yaquita, her daughter, and Manoel also remained on board. The mosquitoes of Loreto have a deserved reputation for driving away such visitors as do not care to leave much of their blood with the redoubtable diptera.

Manoel had a few appropriate words to say about these insects, and they were not of a nature to encourage an inclination to brave their stings.

"They say that all the new species which infest the banks of the Amazon collect at the village of Loreto. I believe it, but do not wish to confirm it. There, Minha, you can take your choice between the gray mosquito, the hairy mosquito, the white-clawed mosquito, the dwarf mosquito, the trumpeter, the little fifer, the urtiquis, the harlequin, the big black, and the red of the woods; or rather they make take their choice of you for a little repast, and you will come back hardly recognizable! I fancy these bloodthirsty diptera guard the Brazilian frontier considerably better than the poverty-stricken soldiers we see on the bank."

"But if everything is of use in nature," asked Minha, "what is the use of mosquitoes?"

"They minister to the happiness of entomologists," replied Manoel; "and I should be much embarrassed to find a better explanation."

What Manoel had said of the Loreto mosquitoes was only too true. When Benito had finished his business and returned on board, his face and hands were tattooed with thousands of red points, without counting some chigoes, which, in spite of the leather of his boots, had introduced themselves beneath his toes.

"Let us set off this very instant," said Benito, "or these wretched insects will invade us, and the jangada will become uninhabitable!"

"And we shall take them into Para," said Manoel, "where there are already quite enough for its own needs."

And so, in order not to pass even the night near the banks, the jangada pushed off into the stream.

On leaving Loreto the Amazon turns slightly toward the southwest, between the islands of Arava, Cuyari, and Uruoteca. The jangada then glided along the black waters of the Cajaru, as they mingled with the white stream of the Amazon. After having passed this tributary on the left, it peacefully arrived during the evening of the 23d of June alongside the large island of Jahuma.

The setting of the sun on a clear horizon, free from all haze, announced one of those beautiful tropical nights which are unknown in the temperate zones. A light breeze freshened the air; the moon arose in the constellated depths of the sky, and for several hours took the place of the twilight which is absent from these latitudes. But even during this period the stars shone with unequaled purity. The immense plain seemed to stretch into the infinite like a sea, and at the extremity of the axis, which measures more than two hundred thousand millions of leagues, there appeared on the north the single diamond of the pole star, on the south the four brilliants of the Southern Cross.

The trees on the left bank and on the island of Jahuma stood up in sharp black outline. There were recognizable in the undecided _silhouettes_ the trunks, or rather columns, of _“copahus,”_ which spread out in umbrellas, groups of _“sandis,”_ from which is extracted the thick and sugared milk, intoxicating as wine itself, and _“vignaticos”_ eighty feet high, whose summits shake at the passage of the lightest currents of air. "What a magnificent sermon are these forests of the Amazon!" has been justly said. Yes; and we might add, "What a magnificent hymn there is in the nights of the tropics!"

The birds were giving forth their last evening notes--_“bentivis,”_ who hang their nests on the bank-side reeds; _“niambus,”_ a kind of partridge, whose song is composed of four notes, in perfect accord; _“kamichis,”_ with their plaintive melody; kingfishers, whose call responds like a signal to the last cry of their congeners: _“canindes,”_ with
their sonorous trumpets; and red macaws, who fold their wings in the foliage of the _"jaquetibas,"_ when night comes on to dim their glowing colors.

On the jangada every one was at his post, in the attitude of repose. The pilot alone, standing in the bow, showed his tall stature, scarcely defined in the earlier shadows. The watch, with his long pole on his shoulder, reminded one of an encampment of Tartar horsemen. The Brazilian flag hung from the top of the staff in the bow, and the breeze was scarcely strong enough to lift the bunting.

At eight o'clock the three first tinklings of the Angelus escaped from the bell of the little chapel. The three tinklings of the second and third verses sounded in their turn, and the salutation was completed in the series of more rapid strokes of the little bell.

However, the family after this July day remained sitting under the veranda to breathe the fresh air from the open. It had been so each evening, and while Joam Garral, always silent, was contented to listen, the young people gayly chatted away till bedtime.

"Ah! our splendid river! our magnificent Amazon!" exclaimed the young girl, whose enthusiasm for the immense stream never failed.

"Unequaled river, in very truth," said Manoel; "and I do not understand all its sublime beauties. We are going down it, however, like Orellana and La Condamine did so many centuries ago, and I am not at all surprised at their marvelous descriptions."

"A little fabulous," replied Benito.

"Now, brother," said Minha seriously, "say no evil of our Amazon."

"To remind you that it has its legends, my sister, is to say no ill of it."

"Yes, that is true; and it has some marvelous ones," replied Minha.

"What legends?" asked Manoel. "I dare avow that they have not yet found their way into Para--or rather that, for my part, I am not acquainted with them."

"What, then do you learn in the Belem colleges?" laughingly asked Minha.

"I begin to perceive that they teach us nothing," replied Manoel.

"What, sir!" replied Minha, with a pleasant seriousness, "you do not know, among other fables, that an enormous reptile called the _"minhocao,"_ sometimes visits the Amazon, and that the waters of the river rise or fall according as this serpent plunges in or quits them, so gigantic is he?"

"But have you ever seen this phenomenal minhocao?"

"Alas, no!" replied Lina.

"What a pity!" Fragoso thought it proper to add.

"And the 'Mae d'Aqua,'" continued the girl--"that proud and redoubtable woman whose look fascinates and drags beneath the waters of the river the imprudent ones who gaze on her."

"Oh, as for the 'Mae d'Aqua,' she exists!" cried the naïve Lina; "they say that she still walks on the banks, but disappears like a water sprite as soon as you approach her."

"Very well, Lina," said Benito; "the first time you see her just let me know."

"So that she may seize you and take you to the bottom of the river? Never, Mr. Benito!"

"She believes it!" shouted Minha.

"There are people who believe in the trunk of Manaos," said Fragoso, always ready to intervene on behalf of Lina.

"The 'trunk of Manaos'?" asked Manoel. "What about the trunk of Manaos?"

"Mr. Manoel," answered Fragoso, with comic gravity, "it appears that there is--or rather formerly was--a trunk of _"turuma,"_ which every year at the same time descended the Rio Negro, stopping several days at Manaos, and going on into Para, halting at every port, where the natives ornamented it with little flags. Arrived at Belem, it came to a halt, turned back on its road, remounted the Amazon to the Rio Negro, and returned to the forest from which it had mysteriously started. One day somebody tried to drag it ashore, but the river rose in anger, and the attempt had to be given up. And on another occasion the captain of a ship harpooned it and tried to tow it along. This time again the river, in anger, broke off the ropes, and the trunk mysteriously escaped."

"What became of it?" asked the mulatto.

"It appears that on its last voyage, Miss Lina," replied Fragoso, "it mistook the way, and instead of going up the Negro it continued in the Amazon, and it has never been seen again."

"Oh, if we could only meet it!" said Lina.

"If we meet it," answered Benito, "we will put you on it! It will take you back to the mysterious forest, and you will likewise pass into the state of a legendary mind!"

"And why not?" asked the mulatto.

"So much for your legends," said Manoel; "and I think your river is worthy of them. But it has also its histories,
which are worth something more. I know one, and if I were not afraid of grieving you--for it is a very sad one--I would relate it."

"Oh! tell it, by all means, Mr. Manoel," exclaimed Lina; "I like stories which make you cry!"

"What, do you cry, Lina?" said Benito.

"Yes, Mr. Benito; but I cry when laughing."

"Oh, well! let us save it, Manoel!"

"It is the history of a Frenchwoman whose sorrows rendered these banks memorable in the eighteenth century."

"We are listening," said Minha.

"Here goes, then," said Manoel. "In 1741, at the time of the expedition of the two Frenchmen, Bouguer and La Condamine, who were sent to measure a terrestrial degree on the equator, they were accompanied by a very distinguished astronomer, Godin des Odonais. Godin des Odonais set out then, but he did not set out alone, for the New World; he took with him his young wife, his children, his father-in-law, and his brother-in-law. The travelers arrived at Quito in good health. There commenced a series of misfortunes for Madame Odonais; in a few months she lost some of her children. When Godin des Odonais had completed his work, toward the end of the year 1759, he left Quito and started for Cayenne. Once arrived in this town he wanted his family to come to him, but war had been declared, and he was obliged to ask the Portuguese government for permission for a free passage for Madame Odonais and her people. What do you think? Many years passed before the permission could be given. In 1765 Godin des Odonais, maddened by the delay, resolved to ascend the Amazon in search of his wife at Quito; but at the moment of his departure a sudden illness stopped him, and he could not carry out his intention. However, his application had not been useless, and Madame des Odonais learned at last that the king of Portugal had given the necessary permission, and prepared to embark and descend the river to her husband. At the same time an escort was ordered to be ready in the missions of the Upper Amazon. Madame des Odonais was a woman of great courage, as you will see presently; she never hesitated, and notwithstanding the dangers of such a voyage across the continent, she started."

"It was her duty to her husband, Manoel," said Yaquita, "and I would have done the same."

"Madame des Odonais," continued Manoel, "came to Rio Bamba, at the south of Quito, bringing her brother-in-law, her children, and a French doctor. Their endeavor was to reach the missions on the Brazilian frontier, where they hoped to find a ship and the escort. The voyage at first was favorable; it was made down the tributaries of the Amazon in a canoe. The difficulties, however, gradually increased with the dangers and fatigues of a country decimated by the smallpox. Of several guides who offered their services, the most part disappeared after a few days; one of them, the last who remained faithful to the travelers, was drowned in the Bobonasa, in endeavoring to help the French doctor. At length the canoe, damaged by rocks and floating trees, became useless. It was therefore necessary to get on shore, and there at the edge of the impenetrable forest they built a few huts of foliage. The doctor offered to go on in front with a negro who had never wished to leave Madame des Odonais. The two went off; they waited for them several days, but in vain. They never returned.

"In the meantime the victuals were getting exhausted. The forsaken ones in vain endeavored to descend the Bobonasa on a raft. They had to again take to the forest, and make their way on foot through the almost impenetrable undergrowth. The fatigues were too much for the poor folks! They died off one by one in spite of the cares of the noble Frenchwoman. At the end of a few days children, relations, and servants, were all dead!"

"What an unfortunate woman!" said Lina.

"Madame des Odonais alone remained," continued Manoel. "There she was, at a thousand leagues from the ocean which she was trying to reach! It was no longer a mother who continued her journey toward the river--the mother had lost her children; she had buried them with her own hands! It was a wife who wished to see her husband once again! She traveled night and day, and at length regained the Bobonasa. She was there received by some kind-hearted Indians, who took her to the missions, where the escort was waiting. But she arrived alone, and behind her the stages of the route were marked with graves! Madame des Odonais reached Loreto, where we were a few days back. From this Peruvian village she descended the Amazon, as we are doing at this moment, and at length she rejoined her husband after a separation of nineteen years."

"Poor lady!" said Minha.

"Above all, poor mother!" answered Yaquita.

At this moment Araujo, the pilot, came afg and said:

"Joam Garral, we are off the Ronde Island. We are passing the frontier!"

"The frontier!" replied Joam.

And rising, he went to the side of the jangada, and looked long and earnestly at the Ronde Island, with the waves breaking up against it. Then his hand sought his forehead, as if to rid himself of some remembrance.

"The frontier!" murmured he, bowing his head by an involuntary movement.
CHAPTER XII. FRAGOSO AT WORK

"BRAZÁ" (burning embers) is a word found in the Spanish language as far back as the twelfth century. It has been used to make the word "brazil," as descriptive of certain woods which yield a reddish dye. From this has come the name "Brazil," given to that vast district of South America which is crossed by the equator, and in which these products are so frequently met with. In very early days these woods were the object of considerable trade. Although correctly called "ibirapitunga," from the place of production, the name of "brazil" stuck to them, and it has become that of the country, which seems like an immense heap of embers lighted by the rays of the tropical sun.

Brazil was from the first occupied by the Portuguese. About the commencement of the sixteenth century, Alvarez Cabral, the pilot, took possession of it, and although France and Holland partially established themselves there, it has remained Portuguese, and possesses all the qualities which distinguish that gallant little nation. It is today the largest state of South America, and has at its head the intelligent artist-king Dom Pedro.

"What is your privilege in the tribe?" asked Montaigne of an Indian whom he met at Havre.

"The privilege of marching first to battle!" innocently answered the Indian.

War, we know, was for a long time the surest and most rapid vehicle of civilization. The Brazilians did what this Indian did: they fought, they defended their conquests, they enlarged them, and we see them marching in the first rank of the civilizing advance.

It was in 1824, sixteen years after the foundation of the Portugo-Brazilian Empire, that Brazil proclaimed its independence by the voice of Don Juan, whom the French armies had chased from Portugal.

It remained only to define the frontier between the new empire and that of its neighbor, Peru. This was no easy matter.

If Brazil wished to extend to the Rio Napo in the west, Peru attempted to reach eight degrees further, as far as the Lake of Ega.

But in the meantime Brazil had to interfere to hinder the kidnaping of the Indians from the Amazon, a practice which was engaged in much to the profit of the Hispano-Brazilian missions. There was no better method of checking this trade than that of fortifying the Island of the Ronde, a little above Tabatinga, and there establishing a post.

This afforded the solution, and from that time the frontier of the two countries passed through the middle of this island.

Above, the river is Peruvian, and is called the Marañon, as has been said. Below, it is Brazilian, and takes the name of the Amazon.

It was on the evening of the 25th of June that the jangada stopped before Tabatinga, the first Brazilian town situated on the left bank, at the entrance of the river of which it bears the name, and belonging to the parish of St. Paul, established on the right a little further down stream.

Joam Garral had decided to pass thirty-six hours here, so as to give a little rest to the crew. They would not start, therefore, until the morning of the 27th.

On this occasion Yaquita and her children, less likely, perhaps, than at Iquitos to be fed upon by the native mosquitoes, had announced their intention of going on ashore and visiting the town.

The population of Tabatinga is estimated at four hundred, nearly all Indians, comprising, no doubt, many of those wandering families who are never settled at particular spots on the banks of the Amazon or its smaller tributaries.

The post at the island of the Ronde has been abandoned for some years, and transferred to Tabatinga. It can thus be called a garrison town, but the garrison is only composed of nine soldiers, nearly all Indians, and a sergeant, who is the actual commandant of the place.

A bank about thirty feet high, in which are cut the steps of a not very solid staircase, forms here the curtain of the esplanade which carries the pigmy fort. The house of the commandant consists of a couple of huts placed in a square, and the soldiers occupy an oblong building a hundred feet away, at the foot of a large tree.

The collection of cabins exactly resembles all the villages and hamlets which are scattered along the banks of the river, although in them a staff carrying the Brazilian colors does not rise above a sentry-box, forever destitute of its sentinel, nor are four small mortars present to cannonade on an emergency any vessel which does not come in when ordered.

As for the village properly so called, it is situated below, at the base of the plateau. A road, which is but a ravine shaded by ficuses and miritis, leads to it in a few minutes. There, on a half-cracked hill of clay, stand a dozen houses, covered with the leaves of the "boiassu" palm placed round a central space.

All this is not very curious, but the environs of Tabatinga are charming, particularly at the mouth of the Javary,
which is of sufficient extent to contain the Archipelago of the Aramasa Islands. Hereabouts are grouped many fine
trees, and among them a large number of the palms, whose supple fibers are used in the fabrication of hammocks
and fishing-nets, and are the cause of some trade. To conclude, the place is one of the most picturesque on the Upper
Amazon.

Tabatinga is destined to become before long a station of some importance, and will no doubt rapidly develop, for
there will stop the Brazilian steamers which ascend the river, and the Peruvian steamers which descend it. There
they will tranship passengers and cargoes. It does not require much for an English or American village to become in
a few years the center of considerable commerce.

The river is very beautiful along this part of its course. The influence of ordinary tides is not perceptible at
Tabatinga, which is more than six hundred leagues from the Atlantic. But it is not so with the _"pororoca,"_ that
species of eddy which for three days in the height of the syzygies raises the waters of the Amazon, and turns them
back at the rate of seventeen kilometers per hour. They say that the effects of this bore are felt up to the Brazilian
frontier.

On the morrow, the 26th of June, the Garral family prepared to go off and visit the village. Though Joam,
Benito, and Manoel had already set foot in a Brazilian town, it was otherwise with Yaquita and her daughter; for
them it was, so to speak, a taking possession. It is conceivable, therefore, that Yaquita and Minha should attach
some importance to the event.

If, on his part, Fragoso, in his capacity of wandering barber, had already run through the different provinces of
South America, Lina, like her young mistress, had never been on Brazilian soil.

But before leaving the jangada Fragoso had sought Joam Garral, and had the following conversation with him.

"Mr. Garral," said he, "from the day when you received me at the fazenda of Iquitos, lodged, clothed, fed--in a
word, took me in so hospitably--I have owed you----"

"You owe me absolutely nothing, my friend," answered Joam, "so do not insist----"

"Oh, do not be alarmed!" exclaimed Fragoso, "I am not going to pay it off! Let me add, that you took me on
board the jangada and gave me the means of descending the river. But here we are, on the soil of Brazil, which,
according to all probability, I ought never to have seen again. Without that liana----"

"It is to Lina, and to Lina alone, that you should tender your thanks," said Joam.

"I know," said Fragoso, "and I will never forget what I owe here, any more than what I owe you."

"They tell me, Fragoso," continued Joam, "that you are going to say good-by, and intend to remain at
Tabatinga."

"By no means, Mr. Garral, since you have allowed me to accompany you to Belem, where I hope at the least to
be able to resume my old trade."

"Well, if that is your intention--what were you going to ask me?"

"I was going to ask if you saw any inconvenience in my working at my profession on our route. There is no
necessity for my hand to rust; and, besides, a few handfuls of reis would not be so bad at the bottom of my pocket,
more particularly if I had earned them. You know, Mr. Garral, that a barber who is also a hairdresser--and I hardly
like to say a doctor, out of respect to Mr. Manoel--always finds customers in these Upper Amazon villages."

"Particularly among the Brazilians," answered Joam. "As for the natives----"

"I beg pardon," replied Fragoso, "particularly among the natives. Ah! although there is no beard to trim--for
nature has been very stingy toward them in that way--there are always some heads of hair to be dressed in the latest
fashion. They are very fond of it, these savages, both the men and the women! I shall not be installed ten minutes in
the square at Tabatinga, with my cup and ball in hand--the cup and ball I have brought on board, and which I can
manage with pretty pleasantly--before a circle of braves and squaws will have formed around me. They will struggle
for my favors. I could remain here for a month, and the whole tribe of the Ticunas would come to me to have their
hair looked after! They won't hesitate to make the acquaintance of 'curling tongs'--that is what they will call me--if I
revisit the walls of Tabatinga! I have already had two tries here, and my scissors and comb have done marvels! It
does not do to return too often on the same track. The Indian ladies don't have their hair curled every day, like the
beauties of our Brazilian cities. No; when it is done, it is done for year, and during the twelvemonth they will take
every care not to endanger the edifice which I have raised--with what talent I dare not say. Now it is nearly a year
since I was at Tabatinga; I go to find my monuments in ruin! And if it is not objectionable to you, Mr. Garral, I
would render myself again worthy of the reputation which I have acquired in these parts, the question of reis, and
not that of conceit, being, you understand, the principal."

"Go on, then, friend," replied Joam Garral laughingly; "but be quick! we can only remain a day at Tabatinga, and
we shall start to-morrow at dawn."

"I will not lose a minute," answered Fragoso--"just time to take the tools of my profession, and I am off."

"Off you go, Fragoso," said Joam, "and may the reis rain into your pocket!"
"Yes, and that is a proper sort of rain, and there can never be too much of it for your obedient servant."

And so saying Fragoso rapidly moved away.

A moment afterward the family, with the exception of Joam, went ashore. The jangada was able to approach near enough to the bank for the landing to take place without much trouble. A staircase, in a miserable state, cut in the cliff, allowed the visitors to arrive on the crest of the plateau.

Yaqita and her party were received by the commandant of the fort, a poor fellow who, however, knew the laws of hospitality, and offered them some breakfast in his cottage. Here and there passed and repassed several soldiers on guard, while on the threshold of the barrack appeared a few children, with their mothers of Ticuna blood, affording very poor specimens of the mixed race.

In place of accepting the breakfast of the sergeant, Yaqita invited the commandant and his wife to come and have theirs on board the jangada.

The commandant did not wait for a second invitation, and an appointment was made for eleven o'clock. In the meantime Yaqita, her daughter, and the young mulatto, accompanied by Manoel, went for a walk in the neighborhood, leaving Benito to settle with the commandant about the tolls—he being chief of the custom-house as well as of the military establishment.

That done, Benito, as was his wont, strolled off with his gun into the adjoining woods. On this occasion Manoel had declined to accompany him. Fragoso had left the jangada, but instead of mounting to the fort he had made for the village, crossing the ravine which led off from the right on the level of the bank. He reckoned more on the native custom of Tabatinga than on that of the garrison. Doubtless the soldiers’ wives would not have wished better than to have been put under his hands, but the husbands scarcely cared to part with a few reis for the sake of gratifying the whims of their coquettish partners.

Among the natives it was quite the reverse. Husbands and wives, the jolly barber knew them well, and he knew they would give him a better reception.

Behold, then, Fragoso on the road, coming up the shady lane beneath the ficuses, and arriving in the central square of Tabatinga!

As soon as he set foot in the place the famous barber was signaled, recognized, surrounded. Fragoso had no big box, nor drum, nor cornet to attract the attention of his clients—not even a carriage of shining copper, with resplendent lamps and ornamented glass panels, nor a huge parasol, no anything whatever to impress the public, as they generally have at fairs. No; but Fragoso had his cup and ball, and how that ball were manipulated between his fingers! With what address did he receive the turtle's head, which did for the ball, on the pointed end of the stick! With what grace did he make the ball describe some learned curve of which mathematicians have not yet calculated the value—even those who have determined the wondrous curve of “the dog who follows his master!”

Every native was there—men, women, the old and the young, in their nearly primitive costume, looking on with all their eyes, listening with all their ears. The smiling entertainer, half in Portuguese, half in Ticunian, favored them with his customary oration in a tone of the most rollicking good humor. What he said was what is said by all the charlatans who place their services at the public disposal, whether they be Spanish Figaros or French perruquiers. At the bottom the same self-possession, the same knowledge of human weakness, the same description of threadbare witticisms, the same amusing dexterity, and, on the part of the natives, the same wide-mouth astonishment, the same curiosity, the same credulity as the simple folk of the civilized world.

It followed, then, that ten minutes later the public were completely won, and crowded round Fragoso, who was installed in a _"loja"_ of the place, a sort of serving-bar to the inn.

The _loja_ belonged to a Brazilian settled at Tabatinga. There, for a few vatems, which are the sols of the country, and worth about twenty reis, or half a dozen centimes each, the natives could get drinks of the crudest, and particularly assai, a liquor half-sold, half-liquid, made of the fruit of the palm-tree, and drunk from a _"coui"_ or half-calabash in general use in this district of the Amazon.

And then men and women, with equal eagerness, took their places on the barber's stool. The scissors of Fragoso had little to do, for it was not a question of cutting these wealthy heads of hair, nearly all remarkable for their softness and their quality, but the use to which he could put his comb and the tongs, which were kept warming in the corner in a brasier.

And then the encouragements of the artist to the crowd!

"Look here! look here!" said he; "how will that do, my friends—if you don't sleep on the top of it! There you are, for a twelvemonth! and these are the latest novelties from Belem and Rio de Janeiro! The queen's maids of honor are not more cleverly decked out; and observe, I am not stingy with the pomade!"

No, he was not stingy with it. True, it was only a little grease, with which he had mixed some of the juices of a few flowers, but he plastered it on like cement!

And as to the names of the capillary edifices—for the monuments reared by the hands of Fragoso were of every
order of architecture--buckles, rings, clubs, tresses, crimpings, rolls, corkscrews, curls, everything found there a place. Nothing false; no towers, no chignons, no shams! These head were not enfeebled by cuttings nor thinned by fallings-off, but were forests in all their native virginity! Fragoso, however, was not above adding a few natural flowers, two or three long fish-bones, and some fine bone or copper ornaments, which were brought him by the dandies of the district. Assuredly, the exquisites of the Directory would have envied the arrangement of these high-art coiffures, three and four stories high, and the great Leonard himself would have bowed before his transatlantic rival.

And then the vatems, the handfuls of reis--the only coins for which the natives of the Amazon exchange their goods--which rained into the pocket of Fragoso, and which he collected with evident satisfaction. But assuredly night would come before he could satisfy the demands of the customers, who were so constantly renewed. It was not only the population of Tabatinga which crowded to the door of the loja. The news of the arrival of Fragoso was not slow to get abroad; natives came to him from all sides: Ticunas from the left bank of the river, Mayorunas from the right bank, as well as those who live on the Cajuru and those who come from the villages of the Javary.

A long array of anxious ones formed itself in the square. The happy ones coming from the hands of Fragoso went proudly from one house to another, showed themselves off without daring to shake themselves, like the big children that they were.

It thus happened that when noon came the much-occupied barber had not had time to return on board, but had had to content himself with a little assai, some manioc flour, and turtle eggs, which he rapidly devoured between two applications of the curling-tongs.

But it was a great harvest for the innkeeper, as all the operations could not be conducted without a large absorption of liquors drawn from the cellars of the inn. In fact, it was an event for the town of Tabatinga, this visit of the celebrated Fragoso, barber in ordinary and extraordinary to the tribes of the Upper Amazon!

CHAPTER XIII. TORRES

AT FIVE O'CLOCK in the evening Fragoso was still there, and was asking himself if he would have to pass the night on the spot to satisfy the expectant crowd, when a stranger arrived in the square, and seeing all this native gathering, advanced toward the inn.

For some minutes the stranger eyed Fragoso attentively with some circumspection. The examination was obviously satisfactory, for he entered the loja.

He was a man about thirty-five years of age. He was dressed in a somewhat elegant traveling costume, which added much to his personal appearance. But his strong black beard, which the scissors had not touched for some time, and his hair, a trifle long, imperiously required the good offices of a barber.

"Good-day, friend, good-day!" said he, lightly striking Fragoso on the shoulder.

Fragoso turned round when he heard the words pronounced in pure Brazilian, and not in the mixed idiom of the natives.

"A compatriot?" he asked, without stopping the twisting of the refractory mouth of a Mayouma head.

"Yes," answered the stranger. "A compatriot who has need of your services."

"To be sure! In a minute," said Fragoso. "Wait till I have finished with this lady!"

And this was done in a couple of strokes with the curling-tongs.

Although he was the last comer, and had no right to the vacant place, he sat down on the stool without causing any expostulation on the part of the natives who lost a turn.

Fragoso put down the irons for the scissors, and, after the manner of his brethren, said:

"What can I do for you, sir?"

"Cut my beard and my hair," answered the stranger.

"All right!" said Fragoso, inserting his comb into the mass of hair.

And then the scissors to do their work.

"And you come from far?" asked Fragoso, who could not work without a good deal to say.

"I have come from the neighborhood of Iquitos."

"So have I!" exclaimed Fragoso. "I have come down the Amazon from Iquitos to Tabatinga. May I ask your name?"

"No objection at all," replied the stranger. "My name is Torres."

When the hair was cut in the latest style Fragoso began to thin his beard, but at this moment, as he was looking straight into his face, he stopped, then began again, and then:

"Eh! Mr. Torres," said he; "I seem to know you. We must have seen each other somewhere?"

"I do not think so," quickly answered Torres.
"I am always wrong!" replied Fragoso, and he hurried on to finish his task.

A moment after Torres continued the conversation which this question of Fragoso had interrupted, with:

"How did you come from Iquitos?"

"From Iquitos to Tabatinga?"

"Yes."

"On board a raft, on which I was given a passage by a worthy fazender who is going down the Amazon with his family."

"A friend indeed!" replied Torres. "That is a chance, and if your fazender would take me----"

"Do you intend, then, to go down the river?"

"Precisely."

"Into Para?"

"No, only to Manaos, where I have business."

"Well, my host is very kind, and I think he would cheerfully oblige you."

"Do you think so?"

"I might almost say I am sure."

"And what is the name of this fazender?" asked Torres carelessly.

"Joam Garral," answered Fragoso.

And at the same time he muttered to himself:

"I certainly have seen this fellow somewhere!"

Torres was not the man to allow a conversation to drop which was likely to interest him, and for very good reasons.

"And so you think Joam Garral would give me a passage?"

"I do not doubt it," replied Fragoso. "What he would do for a poor chap like me he would not refuse to do for a compatriot like you."

"Is he alone on board the jangada?"

"No," replied Fragoso. "I was going to tell you that he is traveling with all his family--and jolly people they are, I assure you. He is accompanied by a crew of Indians and negroes, who form part of the staff at the fazenda."

"Is he rich?"

"Oh, certainly!" answered Fragoso--"very rich. Even the timber which forms the jangada, and the cargo it carries, constitute a fortune!"

"The Joam Garral and his whole family have just passed the Brazilian frontier?"

"Yes," said Fragoso; "his wife, his son, his daughter, and Miss Minha's betrothed."

"Ah! he has a daughter?" said Torres.

"A charming girl!"

"Going to get married?"

"Yes, to a brave young fellow," replied Fragoso--"an army surgeon in garrison at Belem, and the wedding is to take place as soon as we get to the end of the voyage."

"Good!" said the smiling Torres; "it is what you might call a betrothal journey."

"A voyage of betrothal, of pleasure, and of business!" said Fragoso. "Madame Yaquita and her daughter have never set foot on Brazilian ground; and as for Joam Garral, it is the first time he has crossed the frontier since he went to the farm of old Magalhaës."

"I suppose," asked Torres, "that there are some servants with the family?"

"Of course," replied Fragoso--"old Cybele, on the farm for the last fifty years, and a pretty mulatto, Miss Lina, who is more of a companion than a servant to her mistress. Ah, what an amiable disposition! What a heart, and what eyes! And the ideas she has about everything, particularly about lianas--" Fragoso, started on this subject, would not have been able to stop himself, and Lina would have been the object of a good many enthusiastic declarations, had Torres not quitted the chair for another customer.

"What do I owe you?" asked he of the barber.

"Nothing," answered Fragoso. "Between compatriots, when they meet on the frontier, there can be no question of that sort."

"But," replied Torres, "I want to----"

"Very well, we will settle that later on, on board the jangada."

"But I do not know that, and I do not like to ask Joam Garral to allow me----"

"Do not hesitate!" exclaimed Fragoso; "I will speak to him if you would like it better, and he will be very happy to be of use to you under the circumstances."

And at that instant Manoel and Benito, coming into the town after dinner, appeared at the door of the loja,
wishing to see Fragoso at work.
Torres turned toward them and suddenly said: "There are two gentlemen I know—or rather I remember."
"You remember them!" asked Fragoso, surprised.
"Yes, undoubtedly! A month ago, in the forest of Iquitos, they got me out of a considerable difficulty."
"But they are Benito Garral and Manoel Valdez."
"I know. They told me their names, but I never expected to see them here."
Torres advanced toward the two young men, who looked at him without recognizing him.
"You do not remember me, gentlemen?" he asked.
"Wait a little," answered Benito; "Mr. Torres, if I remember aright; it was you who, in the forest of Iquitos, got into difficulties with a guariba?"
"Quite true, gentlemen," replied Torres. "For six weeks I have been traveling down the Amazon, and I have just crossed the frontier at the same time as you have."
"Very pleased to see you again," said Benito; "but you have not forgotten that you promised to come to the fazenda to my father?"
"I have not forgotten it," answered Torres.
"And you would have done better to have accepted my offer; it would have allowed you to have waited for our departure, rested from you fatigues, and descended with us to the frontier; so many days of walking saved."
"To be sure!" answered Torres.
"Our compatriot is not going to stop at the frontier," said Fragoso, "he is going on to Manaos."
"Well, then," replied Benito, "if you will come on board the jangada you will be well received, and I am sure my father will give you a passage."
"Willingly," said Torres; "and you will allow me to thank you in advance."
Manoel took no part in the conversation; he let Benito make the offer of his services, and attentively watched Torres, whose face he scarcely remembered. There was an entire want of frankness in the eyes, whose look changed unceasingly, as if he was afraid to fix them anywhere. But Manoel kept this impression to himself, not wishing to injure a compatriot whom they were about to oblige.
"Gentlemen," said Torres, "if you like, I am ready to follow you to the landing-place."
"Come, then," answered Benito.
A quarter of an hour afterward Torres was on board the jangada. Benito introduced him to Joam Garral, acquainting him with the circumstances under which they had previously met him, and asked him to give him a passage down to Manaos.
"I am happy, sir, to be able to oblige you," replied Joam.
"Thank you," said Torres, who at the moment of putting forth his hand kept it back in spite of himself.
"We shall be off at daybreak to-morrow," added Joam Garral, "so you had better get your things on board."
"Oh, that will not take me long!" answered Torres; "there is only myself and nothing else!"
"Make yourself at home," said Joam Garral.
That evening Torres took possession of a cabin near to that of the barber. It was not till eight o'clock that the latter returned to the raft, and gave the young mulatto an account of his exploits, and repeated, with no little vanity, that the renown of the illustrious Fragoso was increasing in the basin of the Upper Amazon.

CHAPTER XIV. STILL DESCENDING

At daybreak on the morrow, the 27th of June, the cables were cast off, and the raft continued its journey down the river.

An extra passenger was on board. Whence came this Torres? No one exactly knew. Where was he going to? "To Manaos," he said. Torres was careful to let no suspicion of his past life escape him, nor of the profession that he had followed till within the last two months, and no one would have thought that the jangada had given refuge to an old captain of the woods. Joam Garral did not wish to mar the service he was rendering by questions of too pressing a nature.

In taking him on board the fazender had obeyed a sentiment of humanity. In the midst of these vast Amazonian deserts, more especially at the time when the steamers had not begun to furrow the waters, it was very difficult to find means of safe and rapid transit. Boats did not ply regularly, and in most cases the traveler was obliged to walk across the forests. This is what Torres had done, and what he would continue to have done, and it was for him unexpected good luck to have got a passage on the raft.

From the moment that Benito had explained under what conditions he had met Torres the introduction was complete, and he was able to consider himself as a passenger on an Atlantic steamer, who is free to take part in the
general life if he cares, or free to keep himself a little apart if of an unsociable disposition.

It was noticed, at least during the first few days, that Torres did not try to become intimate with the Garral family. He maintained a good deal of reserve, answering if addressed, but never provoking a reply.

If he appeared more open with any one, it was with Fragoso. Did he not owe to this gay companion the idea of taking passage on board the raft? Many times he asked him about the position of the Garrals at Iquitos, the sentiments of the daughter for Manoel Valdez, and always discreetly. Generally, when he was not walking alone in the bow of the jangada, he kept to his cabin.

He breakfasted and dined with Joam Garral and his family, but he took little part in their conversation, and retired when the repast was finished.

During the morning the raft passed by the picturesque group of islands situated in the vast estuary of the Javary. This important affluent of the Amazon comes from the southwest, and from source to mouth has not a single island, nor a single rapid, to check its course. The mouth is about three thousand feet in width, and the river comes in some miles above the site formerly occupied by the town of the same name, whose possession was disputed for so long by Spaniards and Portuguese.

Up to the morning of the 30th of June there had been nothing particular to distinguish the voyage. Occasionally they met a few vessels gliding along by the banks attached one to another in such a way that a single Indian could manage the whole—"navigar de bubina," as this kind of navigation is called by the people of the country, that is to say, "confidence navigation."

They had passed the island of Araria, the Archipelago of the Calderon islands, the island of Capiatu, and many others whose names have not yet come to the knowledge of geographers.

On the 30th of June the pilot signaled on the right the little village of Jurupari-Tapera, where they halted for two or three hours.

Manoel and Benito had gone shooting in the neighborhood, and brought back some feathered game, which was well received in the larder. At the same time they had got an animal of whom a naturalist would have made more than did the cook.

It was a creature of a dark color, something like a large Newfoundland dog.

"A great ant-eater!" exclaimed Benito, as he threw it on the deck of the jangada.

"And a magnificent specimen which would not disgrace the collection of a museum!" added Manoel.

"Did you take much trouble to catch the curious animal?" asked Minha.

"Yes, little sister," replied Benito, "and you were not there to ask for mercy! These dogs die hard, and no less than three bullets were necessary to bring this fellow down."

The ant-eater looked superb, with his long tail and grizzly hair; with his pointed snout, which is plunged into the ant-hills whose insects form its principal food; and his long, thin paws, armed with sharp nails, five inches long, and which can shut up like the fingers of one's hand. But what a hand was this hand of the ant-eater! When it has got hold of anything you have to cut it off to make it let go! It is of this hand that the traveler, Emile Carrey, has so justly observed: "The tiger himself would perish in its grasp."

On the 2d of July, in the morning, the jangada arrived at the foot of San Pablo d'Olivença, after having floated through the midst of numerous islands which in all seasons are clad with verdure and shaded with magnificent trees, and the chief of which bear the names of Jurupari, Rita, Maracanatena, and Cururu Sapo. Many times they passed by the mouths of iguarapes, or little affluents, with black waters.

The coloration of these waters is a very curious phenomenon. It is peculiar to a certain number of these tributaries of the Amazon, which differ greatly in importance.

Manoel remarked how thick the cloudiness was, for it could be clearly seen on the surface of the whitish waters of the river.

"They have tried to explain this coloring in many ways," said he, "but I do not think the most learned have yet arrived at a satisfactory explanation."

"The waters are really black with a magnificent reflection of gold," replied Minha, showing a light, reddish-brown cloth, which was floating level with the jangada.

"Yes," said Manoel, "and Humboldt has already observed the curious reflection that you have; but on looking at it attentively you will see that it is rather the color of sepia which pervades the whole."

"Good!" exclaimed Benito. "Another phenomenon on which the savants are not agreed."

"Perhaps," said Fragoso, "they might ask the opinions of the caymans, dolphins, and manatees, for they certainly prefer the black waters to the others to enjoy themselves in."

"They are particularly attractive to those animals," replied Manoel, "but why it is rather embarrassing to say. For instance, is the coloration due to the hydrocarbons which the waters hold in solution, or is it because they flow through districts of peat, coal, and anthracite; or should we not rather attribute it to the enormous quantity of minute
plants which they bear along? There is nothing certain in the matter. Under any circumstances, they are excellent to
drink, of a freshness quite enviable for the climate, and without after-taste, and perfectly harmless. Take a little of
the water, Minha, and drink it; you will find it all right."

The water is in truth limpid and fresh, and would advantageously replace many of the table-waters used in
Europe. They drew several frasques for kitchen use.

It has been said that in the morning of the 2d of July the jangada had arrived at San Pablo d'Olivença, where they
turn out in thousands those long strings of beads which are made from the scales of the "coco de piassaba." This
trade is here extensively followed. It may, perhaps, seem singular that the ancient lords of the country, Tupinambas
and Tupiniquis, should find their principal occupation in making objects for the Catholic religion. But, after all, why
not? These Indians are no longer the Indians of days gone by. Instead of being clothed in the national fashion, with a
frontlet of macaw feathers, bow, and blow-tube, have they not adopted the American costume of white cotton
trousers, and a cotton poncho woven by their wives, who have become thorough adepts in its manufacture?

San Pablo d'Olivença, a town of some importance, has not less than two thousand inhabitants, derived from all
the neighboring tribes. At present the capital of the Upper Amazon, it began as a simple Mission, founded by the
Portuguese Carmelites about 1692, and afterward acquired by the Jesuit missionaries.

From the beginning it has been the country of the Omaguas, whose name means "flat-heads," and is derived
from the barbarous custom of the native mothers of squeezing the heads of their newborn children between two
plates, so as to give them an oblong skull, which was then the fashion. Like everything else, that has changed; heads
have re-taken their natural form, and there is not the slightest trace of the ancient deformity in the skulls of the
chaplet-makers.

Every one, with the exception of Joam Garral, went ashore. Torres also remained on board, and showed no
desire to visit San Pablo d'Olivença, which he did not, however, seem to be acquainted with.

Assuredly if the adventurer was taciturn he was not inquisitive.

Benito had no difficulty in doing a little bartering, and adding slightly to the cargo of the jangada. He and the
family received an excellent reception from the principal authorities of the town, the commandant of the place, and
the chief of the custom-house, whose functions did not in the least prevent them from engaging in trade. They even
intrusted the young merchant with a few products of the country for him to dispose of on their account at Manaos
and Belem.

The town is composed of some sixty houses, arranged on the plain which hereabouts crowns the river-bank.
Some of the huts are covered with tiles—a very rare thing in these countries; but, on the other hand, the humble
church, dedicated to St. Peter and St. Paul, has only a roof of straw, rather more appropriate for a stable of
Bethlehem than for an edifice consecrated to religion in one of the most Catholic countries of the world.

The commandant, his lieutenant, and the head of the police accepted an invitation to dine with the family, and
they were received by Joam Garral with the respect due to their rank.

During dinner Torres showed himself more talkative than usual. He spoke about some of his excursions into the
interior of Brazil like a man who knew the country. But in speaking of these travels Torres did not neglect to ask the
commandant if he knew Manaos, if his colleague would be there at this time, and if the judge, the first magistrate of
the province, was accustomed to absent himself at this period of the hot season. It seemed that in putting this series
of questions Torres looked at Joam Garral. It was marked enough for even Benito to notice it, not without surprise,
and he observed that his father gave particular attention to the questions so curiously propounded by Torres.

The commandant of San Pablo d'Olivença assured the adventurer that the authorities were not now absent from
Manaos, and he even asked Joam Garral to convey to them his compliments. In all probability the raft would arrive
before the town in seven weeks, or a little later, say about the 20th or the 25th of August.

The guests of the fazender took leave of the Garral family toward the evening, and the following morning, that
of the 3d of July, the jangada recommenced its descent of the river.

At noon they passed on the left the mouth of the Yacurupa. This tributary, properly speaking, is a true canal, for
it discharges its waters into the Iça, which is itself an affluent of the Amazon.

A peculiar phenomenon, for the river displaces itself to feed its own tributaries!

Toward three o'clock in the afternoon the giant raft passed the mouth of the Jandiatuba, which brings its
magnificent black waters from the southwest, and discharges them into the main artery by a mouth of four hundred
meters in extent, after having watered the territories of the Culino Indians.

A number of islands were breasted—Pimaicaira, Caturia, Chico, Motachina; some inhabited, others deserted, but
all covered with superb vegetation, which forms an unbroken garland of green from one end of the Amazon to the
other.
CHAPTER XV. THE CONTINUED DESCENT

ON THE EVENING of the 5th of July, the atmosphere had been oppressive since the morning and threatened approaching storms. Large bats of ruddy color skimmed with their huge wings the current of the Amazon. Among them could be distinguished the "_perros voladores,"_ somber brown above and light-colored beneath, for which Minha, and particularly the young mulatto, felt an instinctive aversion.

These were, in fact, the horrible vampires which suck the blood of the cattle, and even attack man if he is imprudent enough to sleep out in the fields.

"Oh, the dreadful creatures!" cried Lina, hiding her eyes; "they fill me with horror!"

"And they are really formidable," added Minha; "are they not, Manoel?"

"To be sure--very formidable," answered he. "These vampires have a particular instinct which leads them to bleed you in the places where the blood most easily comes, and principally behind the ear. During the operation the continue to move their wings, and cause an agreeable freshness which renders the sleep of the sleeper more profound. They tell of people, unconsciously submitted to this hemorrhage for many hours, who have never awoke!"

"Talk no more of things like that, Manoel," said Yaquita, "or neither Minha nor Lina will dare sleep to-night."

"Never fear!" replied Manoel; "if necessary we will watch over them as they sleep."

"Silence!" said Benito.

"What is the matter?" asked Manoel.

"Do you not hear a very curious noise on that side?" continued Benito, pointing to the right bank.

"Certainly," answered Yaquita.

"What causes the noise?" asked Minha. "One would think it was shingle rolling on the beach of the islands."

"Good! I know what it is," answered Benito. "Tomorrow, at daybreak, there will be a rare treat for those who like fresh turtle eggs and little turtles!"

He was not deceived; the noise was produced by innumerable chelonians of all sizes, which were attracted to the islands to lay their eggs.

It is in the sand of the beach that these amphibians choose the most convenient places to deposit their eggs. The operation commences with sunset, and finishes with the dawn.

At this moment the chief turtle had left the bed of the river to reconnoiter for a favorable spot; the others, collected in thousands, were soon after occupied in digging with their hind paddles a trench six hundred feet long, a dozen wide, and six deep. After laying their eggs they cover them with a bed of sand, which they beat down with their carapaces as if they were rammers.

This egg-laying operation is a grand affair for the riverine Indians of the Amazon and its tributaries. They watch for the arrival of the chelonians, and proceed to the extraction of the eggs to the sound of the drum; and the harvest is divided into three parts--one to the watchers, another to the Indians, a third to the state, represented by the captains of the shore, who, in their capacity of police, have to superintend the collection of the dues. To certain beaches which the decrease of the waters has left uncovered, and which have the privilege of attracting the greater number of turtles, there has been given the name of "royal beaches." When the harvest is gathered it is a holiday for the Indians, who give themselves up to games, dancing, and drinking; and it is also a holiday for the alligators of the river, who hold high revelry on the remains of the amphibians.

Turtles, or turtle eggs, are an object of very considerable trade throughout the Amazonian basin. They watch for the arrival of the chelonians, and proceed to the extraction of the eggs to the sound of the drum; and the harvest is divided into three parts--one to the watchers, another to the Indians, a third to the state, represented by the captains of the shore, who, in their capacity of police, have to superintend the collection of the dues. To certain beaches which the decrease of the waters has left uncovered, and which have the privilege of attracting the greater number of turtles, there has been given the name of "royal beaches." When the harvest is gathered it is a holiday for the Indians, who give themselves up to games, dancing, and drinking; and it is also a holiday for the alligators of the river, who hold high revelry on the remains of the amphibians.

Turtles, or turtle eggs, are an object of very considerable trade throughout the Amazonian basin. It is these chelonians whom they "turn"--that is to say, put on their backs--when they come from laying their eggs, and whom they preserve alive, keeping them in palisaded pools like fish-pools, or attaching them to a stake by a cord just long enough to allow them to go and come on the land or under the water. In this way they always have the meat of these animals fresh.

They proceed differently with the little turtles which are just hatched. There is no need to pack them or tie them up. Their shell is still soft, their flesh extremely tender, and after they have cooked them they eat them just like ostriches. In this form large quantities are consumed.

However, this is not the most general use to which the chelonian eggs are put in the provinces of Amazones and Para. The manufacture of _"manteigna de tartaruga,"_ or turtle butter, which will bear comparison with the best products of Normandy or Brittany, does not take less every year that from two hundred and fifty to three hundred millions of eggs. But the turtles are innumerable all along the river, and they deposit their eggs on the sands of the beach in incalculable quantities. However, on account of the destruction caused not only by the natives, but by the water-fowl from the side, the urubus in the air, and the alligators in the river, their number has been so diminished that for every little turtle a Brazilian pataque, or about a franc, has to be paid.

On the morrow, at daybreak, Benito, Fragoso, and a few Indians took a pirogue and landed on the beach of one of the large islands which they had passed during the night. It was not necessary for the jangada to halt. They knew they could catch her up.
On the shore they saw the little hillocks which indicated the places where, that very night, each packet of eggs had been deposited in the trench in groups of from one hundred and sixty to one hundred and ninety. These there was no wish to get out. But an earlier laying had taken place two months before, the eggs had hatched under the action of the heat stored in the sand, and already several thousands of little turtles were running about the beach.

The hunters were therefore in luck. The pirogue was filled with these interesting amphibians, and they arrived just in time for breakfast. The booty was divided between the passengers and crew of the jangada, and if any lasted till the evening it did not last any longer.

In the morning of the 7th of July they were before San Jose de Matura, a town situated near a small river filled up with long grass, and on the borders of which a legend says that Indians with tails once existed.

In the morning of the 8th of July they caught sight of the village of San Antonio, two or three little houses lost in the trees at the mouth of the Iça, or Putumayo, which is about nine hundred meters wide.

The Putumayo is one of the most important affluents of the Amazon. Here in the sixteenth century missions were founded by the Spaniards, which were afterward destroyed by the Portuguese, and not a trace of them now remains.

Representatives of different tribes of Indians are found in the neighborhood, which are easily recognizable by the differences in their tattoo marks.

The Iça is a body of water coming from the east of the Pasto Mountains to the northeast of Quito, through the finest forests of wild cacao-trees. Navigable for a distance of a hundred and forty leagues for steamers of not greater draught than six feet, it may one day become one of the chief waterways in the west of America.

The bad weather was at last met with. It did not show itself in continual rains, but in frequent storms. These could not hinder the progress of the raft, which offered little resistance to the wind. Its great length rendered it almost insensible to the swell of the Amazon, but during the torrential showers the Garral family had to keep indoors. They had to occupy profitably these hours of leisure. They chatted together, communicated their observations, and their tongues were seldom idle.

It was under these circumstances that little by little Torres had begun to take a more active part in the conversation. The details of his many voyages throughout the whole north of Brazil afforded him numerous subjects to talk about. The man had certainly seen a great deal, but his observations were those of a skeptic, and he often shocked the straightforward people who were listening to him. It should be said that he showed himself much impressed toward Minha. But these attentions, although they were displeasing to Manoel, were not sufficiently marked for him to interfere. On the other hand, Minha felt for him an instinctive repulsion which she was at no pains to conceal.

On the 5th of July the mouth of the Tunantins appeared on the left bank, forming an estuary of some four hundred feet across, in which it pours its blackish waters, coming from the west-northwest, after having watered the territories of the Cacena Indians. At this spot the Amazon appears under a truly grandiose aspect, but its course is more than ever encumbered with islands and islets. It required all the address of the pilot to steer through the archipelago, going from one bank to another, avoiding the shallows, shirking the eddies, and maintaining the advance.

They might have taken the Ahuaty Parana, a sort of natural canal, which goes off a little below the mouth of the Tunantins, and re-enters the principal stream a hundred an twenty miles further on by the Rio Japura; but if the larger portion of this measures a hundred and fifty feet across, the narrowest is only sixty feet, and the raft would have met with a difficulty.

On the 13th of July, after having touched at the island of Capuro, passed the mouth of the Jutahy, which, coming from the east-southeast, brings in its black waters by a mouth five hundred feet wide, and admired the legions of monkeys, sulphur-white in color, with cinnabar-red faces, who are insatiable lovers of the nuts produced by the palm-trees from which the river derives its name, the travelers arrived on the 18th of July before the little village of Fonteboa.

At this place the jangada halted for twelve hours, so as to give a rest to the crew.

Fonteboa, like most of the mission villages of the Amazon, has not escaped the capricious fate which, during a lengthened period, moves them about from one place to the other. Probably the hamlet has now finished with its nomadic existence, and has definitely become stationary. So much the better; for it is a charming place, with its thirty houses covered with foliage, and its church dedicated to Notre Dame de Guadaloupe, the Black Virgin of Mexico. Fonteboa has one thousand inhabitants, drawn from the Indians on both banks, who rear numerous cattle in the fields in the neighborhood. These occupations do not end here, for they are intrepid hunters, or, if they prefer it, intrepid fishers for the manatee.

On the morning of their arrival the young fellows assisted at a very interesting expedition of this nature. Two of these herbivorous cetaceans had just been signaled in the black waters of the Cayaratu, which comes in at Fonteboa. Six brown points were seen moving along the surface, and these were the two pointed snouts and four pinions of the
Inexperienced fishermen would at first have taken these moving points for floating wreckage, but the natives of Fonteboa were not to be so deceived. Besides, very soon loud blowings indicated that the spouting animals were vigorously ejecting the air which had become useless for their breathing purposes.

Two ubas, each carrying three fishermen, set off from the bank and approached the manatees, who soon took flight. The black points at first traced a long furrow on the top of the water, and then disappeared for a time. The fishermen continued their cautious advance. One of them, armed with a very primitive harpoon—a long nail at the end of a stick—kept himself in the bow of the boat, while the other two noiselessly paddled on. They waited till the necessity of breathing would bring the manatees up again. In ten minutes or thereabouts the animals would certainly appear in a circle more or less confined.

In fact, this time had scarcely elapsed before the black points emerged at a little distance, and two jets of air mingled with vapor were noiselessly shot forth.

The ubas approached, the harpoons were thrown at the same instant; one missed its mark, but the other struck one of the cetaceans near his tail.

It was only necessary to stun the animal, who rarely defends himself when touched by the iron of the harpoon. In a few pulls the cord brought him alongside the uba, and he was towed to the beach at the foot of the village.

It was not a manatee of any size, for it only measured about three feet long. These poor cetaceans have been so hunted that they have become very rare in the Amazon and its affluents, and so little time is left them to grow that the giants of the species do not now exceed seven feet. What are these, after manatees twelve and fifteen feet long, which still abound in the rivers and lakes of Africa?

But it would be difficult to hinder their destruction. The flesh of the manatee is excellent, superior even to that of pork, and the oil furnished by its lard, which is three inches thick, is a product of great value. When the meat is smoke-dried it keeps for a long time, and is capital food. If to this is added that the animal is easily caught, it is not to be wondered at that the species is on its way to complete destruction.

On the 19th of July, at sunrise, the jangada left Fonteboa, and entered between the two completely deserted banks of the river, and breasted some islands shaded with the grand forests of cacao-trees. The sky was heavily charged with electric cumuli, warning them of renewed storms.

The Rio Jurua, coming from the southwest, soon joins the river on the left. A vessel can go up it into Peru without encountering insurmountable obstacles among its white waters, which are fed by a great number of petty affluents.

"It is perhaps in these parts," said Manoel, "that we ought to look for those female warriors who so much astonished Orellana. But we ought to say that, like their predecessors, they do not form separate tribes; they are simply the wives who accompany their husbands to the fight, and who, among the Jurusas, have a great reputation for bravery."

The jangada continued to descend; but what a labyrinth the Amazon now appeared! The Rio Japura, whose mouth was forty-eight miles on ahead, and which is one of its largest tributaries, runs almost parallel with the river.

Between them were canals, iguarapes, lagoons, temporary lakes, an inextricable network which renders the hydrography of this country so difficult.

But if Araujo had no map to guide him, his experience served him more surely, and it was wonderful to see him unraveling the chaos, without ever turning aside from the main river.

In fact, he did so well that on the 25th of July, in the afternoon, after having passed before the village of Parani-Tapera, the raft was anchored at the entrance of the Lake of Ego, or Tefe, which it was useless to enter, for they would not have been able to get out of it again into the Amazon.

But the town of Ega is of some importance; it was worthy of a halt to visit it. It was arranged, therefore, that the jangada should remain on this spot till the 27th of July, and that on the morrow the large pirogue should take the whole family to Ega. This would give a rest, which was deservedly due to the hard-working crew of the raft.

The night passed at the moorings near a slightly rising shore, and nothing disturbed the quiet. A little sheet-lightning was observable on the horizon, but it came from a distant storm which did not reach the entrance to the lake.

CHAPTER XVI. EGA

At six o'clock in the morning of the 20th of July, Yaquita, Minha, Lina, and the two young men prepared to leave the jangada.

Joam Garral, who had shown no intention of putting his foot on shore, had decided this time, at the request of the ladies of his family, to leave his absorbing daily work and accompany them on their excursion. Torres had evinced
no desire to visit Ega, to the great satisfaction of Manoel, who had taken a great dislike to the man and only waited for an opportunity to declare it.

As to Fragoso, he could not have the same reason for going to Ega as had taken him to Tabatinga, which is a place of little importance compared to this.

Ega is a chief town with fifteen hundred inhabitants, and in it reside all those authorities which compose the administration of a considerable city—considerable for the country; that is to say, the military commandant, the chief of the police, the judges, the schoolmaster, and troops under the command of officers of all ranks.

With so many functionaries living in a town, with their wives and children, it is easy to see that hair-dressers would be in demand. Such was the case, and Fragoso would not have paid his expenses.

Doubtless, however, the jolly fellow, who could do no business in Ega, had thought to be of the party if Lina went with her mistress, but, just as they were leaving the raft, he resolved to remain, at the request of Lina herself.

"Mr. Fragoso!" she said to him, after taking him aside.

"Miss Lina?" answered Fragoso.

"I do not think that your friend Torres intends to go with us to Ega."

"Certainly not, he is going to stay on board, Miss Lina, but you wold oblige me by not calling him my friend!"

"But you undertook to ask a passage for him before he had shown any intention of doing so."

"Yes, and on that occasion, if you would like to know what I think, I made a fool of myself!"

"Quite so! and if you would like to know what I think, I do not like the man at all, Mr. Fragoso."

"Neither do I, Miss Lina, and I have all the time an idea that I have seen him somewhere before. But the remembrance is too vague; the impression, however, is far from being a pleasant one!"

"Where and when could you have met him? Cannot you call it to mind? It might be useful to know who he is and what he has been."

"No--I try all I can. How long was it ago? In what country? Under what circumstances? And I cannot hit upon it."

"Mr. Fragoso!"

"Miss Lina!"

"Stay on board and keep watch on Torres during our absence!"

"What? Not go with you to Ega, and remain a whole day without seeing you?"

"I ask you to do so!"

"Is it an order?"

"It is an entreaty!"

"I will remain!"

"Mr. Fragoso!"

"Miss Lina!"

"I thank you!"

"Thank me, then, with a good shake of the hand," replied Fragoso; "that is worth something."

Lina held out her hand, and Fragoso kept it for a few moments while he looked into her face. And that is the reason why he did not take his place in the pirogue, and became, without appearing to be, the guard upon Torres.

Did the latter notice the feelings of aversion with which he was regarded? Perhaps, but doubtless he had his reasons for taking no account of them.

A distance of four leagues separated the mooring-place from the town of Ega. Eight leagues, there and back, in a pirogue containing six persons, besides two negroes as rowers, would take some hours, not to mention the fatigue caused by the high temperature, though the sky was veiled with clouds.

Fortunately a lovely breeze blew from the northwest, and if it held would be favorable for crossing Lake Teffe. They could go to Ega and return rapidly without having to tack.

So the lateen sail was hoisted on the mast of the pirogue. Benito took the tiller, and off they went, after a last gesture from Lina to Fragoso to keep his eyes open.

The southern shore of the lake had to be followed to get to Ega.

After two hours the pirogue arrived at the port of this ancient mission founded by the Carmelites, which became a town in 1759, and which General Gama placed forever under Brazilian rule.

The passengers landed on a flat beach, on which were to be found not only boats from the interior, but a few of those little schooners which are used in the coasting-trade on the Atlantic seaboard.

When the two girls entered Ega they were at first much astonished.

"What a large town!" said Minha.

"What houses! what people!" replied Lina, whose eyes seemed to have expanded so that she might see better.

"Rather!" said Benito laughingly. "More than fifteen hundred inhabitants! Two hundred houses at the very least!
Some of them with a first floor! And two or three streets! Genuine streets!"

"My dear Manoel!" said Minha, "do protect us against my brother! He is making fun of us, and only because he
had already been in the finest towns in Amazones and Para!"

"Quite so, and he is also poking fun at his mother," added Yaquita, "for I confess I never saw anything equal to
this!"

"Then, mother and sister, you must take great care that you do not fall into a trance when you get to Manaos, and
vanish altogether when you reach Belem!"

"Never fear," answered Manoel; "the ladies will have been gently prepared for these grand wonders by visiting
the principal cities of the Upper Amazon!"

"Now, Manoel," said Minha, "you are talking just like my brother! Are you making fun of us, too?"

"No, Minha, I assure you."

"Laugh on, gentlemen," said Lina, "and let us look around, my dear mistress, for it is very fine!"

Very fine! A collection of houses, built of mud, whitewashed, and principally covered with thatch or palm-
leaves; a few built of stone or wood, with verandas, doors, and shutters painted a bright green, standing in the
middle of a small orchard of orange-trees in flower. But there were two or three public buildings, a barrack, and a
church dedicated to St. Theresa, which was a cathedral by the side of the modest chapel at Iquitos. On looking
ward toward the lake a beautiful panorama unfolded itself, bordered by a frame of cocoanut-trees and assais, which ended
at the edge of the liquid level, and showed beyond the picturesque village of Noqueira, with its few small houses lost
in the mass of the old olive-trees on the beach.

But for the two girls there was another cause of wonderment, quite feminine wonderment too, in the fashions of
the fair Egans, not the primitive costume of the natives, converted Omaas or Muas, but the dress of true Brazilian
ladies. The wives and daughters of the principal functionaries and merchants o the town pretentiously showed off
their Parisian toilettes, a little out of date perhaps, for Ega is five hundred leagues away from Para, and this is itself
many thousands of miles from Paris.

"Just look at those fine ladies in their fine clothes!"

"Lina will go mad!" exclaimed Benito.

"If those dresses were worn properly," said Minha, "they might not be so ridiculous!"

"My dear Minha," said Manoel, "with your simple gown and straw hat, you are better dressed than any one of
these Brazilians, with their headgear and flying petticoats, which are foreign to their country and their race."

"If it pleases you to think so," answered Minha, "I do not envy any of them."

But they had come to see. They walked through the streets, which contained more stalls than shops; they strolled
about the market-place, the rendezvous of the fashionable, who were nearly stifled in their European clothes; they
even breakfasted at an hotel--it was scarcely an inn--whose cookery caused them to deeply regret the excellent
service on the raft.

After dinner, at which only turtle flesh, served up in different forms, appeared, the Garral family went for the last
time to admire the borders of the lake as the setting sun gilded it with its rays; then they rejoined their pirogue,
somewhat disillusioned perhaps as to the magnificence of a town which one hour would give time enough to visit,
and a little tired with walking about its stifling streets which were not nearly so pleasant as the shady pathways of
Iquitos. The inquisitive Lina's enthusiasm alone had not been damped.

They all took their places in the pirogue. The wind remained in the northwest, and had freshened with the
evening. The sail was hoisted. They took the same course as in the morning, across the lake fed by the black waters
of the Rio Teffe, which, according to the Indians, is navigable toward the southwest for forty days' journey. At eight
o'clock the pirogue regained the mooring-place and hailed the jangada.

As soon as Lina could get Fragoso aside--

"Have you seen anything suspicious?" she inquired.

"Nothing, Miss Lina," he replied; "Torres has scarcely left his cabin, where he has been reading and writing."

"He did not get into the house or the dining-room, as I feared?"

"No, all the time he was not in his cabin he was in the bow of the raft."

"And what was he doing?"

"Holding an old piece of paper in his hand, consulting it with great attention, and muttering a lot of
incomprehensible words."

"All that is not so unimportant as you think, Mr. Fragoso. These readings and writings and old papers have their
interest! He is neither a professor nor ä lawyer, this reader and writer!"

"You are right!"

"Still watch him, Mr. Fragoso!"

"I will watch him always, Miss Lina," replied Fragoso.
On the morrow, the 27th of July, at daybreak, Benito gave the pilot the signal to start.

Away between the islands, in the Bay of Arenapo, the mouth of the Japura, six thousand six hundred feet wide, was seen for an instant. This large tributary comes into the Amazon through eight mouths, as if it were pouring into some gulf or ocean. But its waters come from afar, and it is the mountains of the republic of Ecuador which start them on a course that there are no falls to break until two hundred and ten leagues from its junction with the main stream.

All this day was spent in descending to the island of Yapura, after which the river, less interfered with, makes navigation much easier. The current is not so rapid and the islets are easily avoided, so that there were no touchings or groundings.

The next day the jangada coasted along by vast beaches formed by undulating high domes, which served as the barriers of immense pasture grounds, in which the whole of the cattle in Europe could be raised and fed. These sand banks are considered to be the richest turtle grounds in the basin of the Upper Amazon.

On the evening of the 29th of July they were securely moored off the island of Catua, so as to pass the night, which promised to be dark.

On this island, as soon as the sun rose above the horizon, there appeared a party of Muras Indians, the remains of that ancient and powerful tribe, which formerly occupied more than a hundred leagues of the river bank between the Teffe and the Madeira.

These Indians went and came, watching the raft, which remained stationary. There were about a hundred of them armed with blow-tubes formed of a reed peculiar to these parts, and which is strengthened outside by the stem of a dwarf palm from which the pith has been extracted.

Joam Garral quitted for an instant the work which took up all his time, to warn his people to keep a good guard and not to provoke these Indians.

In truth the sides were not well matched. The Muras are remarkably clever at sending through their blow-tubes arrows which cause incurable wounds, even at a range of three hundred paces.

These arrows, made of the "coucourite" palm, are feathered with cotton, and nine or ten inches long, with a point like a needle, and poisoned with "curare."

Curare, or "wourah," the liquor "which kills in a whisper," as the Indians say, is prepared from the sap of one of the euphorbiaceæ and the juice of a bulbous strychnos, not to mention the paste of venomous ants and poisonous serpent fangs which they mix with it.

"It is indeed a terrible poison," said Manoel. "It attacks at once those nerves by which the movements are subordinated to the will. But the heart is not touched, and it does not cease to beat until the extinction of the vital functions, and besides no antidote is known to the poison, which commences by numbness of the limbs."

Very fortunately, these Muras made no hostile demonstrations, although they entertain a profound hatred toward the whites. They have, in truth, no longer the courage of their ancestors.

At nightfall a five-holed flute was heard behind the trees in the island, playing several airs in a minor key. Another flute answered. This interchange of musical phrases lasted for two or three minutes, and the Muras disappeared.

Fragoso, in an exuberant moment, had tried to reply by a song in his own fashion, but Lina had clapped her hand on his mouth, and prevented his showing off his insignificant singing talents, which he was so willinglv lavish of.

On the 2d of August, at three o'clock in the afternoon, the raft arrived twenty leagues away from there at Lake Apoara, which is fed by the black waters of the river of the same name, and two days afterward, about five o'clock, it stopped at the entrance into Lake Coary.

This lake is one of the largest which communicates with the Amazon, and it serves as a reservoir for different rivers. Five or six affluents run into it, and there are stored and mixed up, and emerge by a narrow channel into the main stream.

After catching a glimpse of the hamlet of Tahua-Miri, mounted on its piles as on stilts, as a protection against inundation from the floods, which often sweep up over these low sand banks, the raft was moored for the night.

The stoppage was made in sight of the village of Coary, a dozen houses, considerably dilapidated, built in the midst of a thick mass of orange and calabash trees.

Nothing can be more changeable than the aspect of this village, for according to the rise or fall of the water the lake stretches away on all sides of it, or is reduced to a narrow canal, scarcely deep enough to communicate with the Amazon.

On the following morning, that of the 5th of August, they started at dawn, passing the canal of Yucura, belonging to the tangled system of lakes and furos of the Rio Zapura, and on the morning of the 6th of August they reached the entrance to Lake Miana.

No fresh incident occurred in the life on board, which proceeded with almost methodical regularity.
Fragoso, urged on by Lina, did not cease to watch Torres. Many times he tried to get him to talk about his past life, but the adventurer eluded all conversation on the subject, and ended by maintaining a strict reserve toward the barber.

After catching a glimpse of the hamlet of Tahua-Miri, mounted on its piles as on stilts, as a protection against inundation from the floods, which often sweep up and over these low sand banks, the raft was moored for the night.

His intercourse with the Garral family remained the same. If he spoke little to Joam, he addressed himself more willingly to Yaquita and her daughter, and appeared not to notice the evident coolness with which he was received. They all agreed that when the raft arrived at Manaos, Torres should leave it, and that they would never speak of him again. Yaquita followed the advice of Padre Passanha, who counseled patience, but the good priest had not such an easy task in Manoel, who was quite disposed to put on shore the intruder who had been so unfortunately taken on to the raft.

The only thing that happened on this evening was the following:
A pirogue, going down the river, came alongside the jangada, after being hailed by Joam Garral.
"Are you going to Manaos?" asked he of the Indian who commanded and was steering her.
"Yes," replied he.
"When will you get there?"
"In eight days."
"Then you will arrive before we shall. Will you deliver a letter for me?"
"With pleasure."
"Take this letter, then, my friend, and deliver it at Manaos."

The Indian took the letter which Joam gave him, and a handful of reis was the price of the commission he had undertaken.

No members of the family, then gone into the house, knew anything of this. Torres was the only witness. He heard a few words exchanged between Joam and the Indian, and from the cloud which passed over his face it was easy to see that the sending of this letter considerably surprised him.

CHAPTER XVII. AN ATTACK

HOWEVER, if Manoel, to avoid giving rise to a violent scene on board, said nothing on the subject of Torres, he resolved to have an explanation with Benito.
"Benito," he began, after taking him to the bow of the jangada, "I have something to say to you."

Benito, generally so good-humored, stopped as he looked at Manoel, and a cloud came over his countenance.
"I know why," he said; "it is about Torres."
"Yes, Benito."
"And I also wish to speak to you."

"You have then noticed his attention to Minha?" said Manoel, turning pale.
"Ah! It is not a feeling of jealousy, though, that exasperates you against such a man?" said Benito quickly.
"No!" replied Manoel. "Decidedly not! Heaven forbid I should do such an injury to the girl who is to become my wife. No, Benito! She holds the adventurer in horror! I am not thinking anything of that sort; but it distresses me to see this adventurer constantly obstructing himself by his presence and conversation on your mother and sister, and seeking to introduce himself into that intimacy with your family which is already mine."

"Manoel," gravely answered Benito, "I share your aversion for this dubious individual, and had I consulted my feelings I would already have driven Torres off the raft! But I dare not!"
"You dare not?" said Manoel, seizing the hand of his friend. "You dare not?"
"Listen to me, Manoel," continued Benito. "You have observed Torres well, have you not? You have remarked his attentions to my sister! Nothing can be truer! But while you have been noticing that, have you not seen that this annoying man never keeps his eyes off my father, no matter if he is near to him or far from him, and that he seems to have some spiteful secret intention in watching him with such unaccountable persistency?"

"What are you talking about, Benito? Have you any reason to think that Torres bears some grudge against Joam Garral?"
"No! I think nothing!" replied Benito; "it is only a presentiment! But look well at Torres, study his face with care, and you will see what an evil grin he has whenever my father comes into his sight."
"Well, then," exclaimed Manoel, "if it is so, Benito, the more reason for clearing him out!"
"More reason—or less reason," replied Benito. "Manoel, I fear—what? I know not—but to force my father to get rid of Torres would perhaps be imprudent! I repeat it, I am afraid, though no positive fact enables me to explain my fear to myself!"
And Benito seemed to shudder with anger as he said these words.
"Then," said Manoel, "you think we had better wait?"
"Yes; wait, before doing anything, but above all things let us be on our guard!"
"After all," answered Manoel, "in twenty days we shall be at Manaos. There Torres must stop. There he will leave us, and we shall be relieved of his presence for good! Till then we must keep our eyes on him!"
"You understand me, Manoel?" asked Benito.
"I understand you, my friend, my brother!" replied Manoel, "although I do not share, and cannot share, your fears! What connection can possibly exist between your father and this adventurer? Evidently your father has never seen him!"

"I do not say that my father knows Torres," said Benito; "but assuredly it seems to me that Torres knows my father. What was the fellow doing in the neighborhood of the fazenda when we met him in the forest of Iquitos? Why did he then refuse the hospitality which we offered, so as to afterward manage to force himself on us as our traveling companion? We arrive at Tabatinga, and there he is as if he was waiting for us! The probability is that these meetings were in pursuance of a preconceived plan. When I see the shifty, dogged look of Torres, all this crowds on my mind. I do not know! I am losing myself in things that defy explanation! Oh! why did I ever think of offering to take him on board this raft?"

"Be calm, Benito, I pray you!"

"Manoel!" continued Benito, who seemed to be powerless to contain himself, "think you that if it only concerned me—this man who inspires us all with such aversion and disgust—I should not hesitate to throw him overboard! But when it concerns my father, I fear lest in giving way to my impressions I may be injuring my object! Something tells me that with this scheming fellow there may be danger in doing anything until he has given us the right—the right and the duty—to do it. In short, on the jangada, he is in our power, and if we both keep good watch over my father, we can spoil his game, no matter how sure it may be, and force him to unmask and betray himself! Then wait a little longer!"

The arrival of Torres in the bow of the raft broke off the conversation. Torres looked slyly at the two young men, but said not a word.

Benito was not deceived when he said that the adventurer's eyes were never off Joam Garral as long as he fancied he was unobserved.

No! he was not deceived when he said that Torres' face grew evil when he looked at his father!

By what mysterious bond could these two men—one nobleness itself, that was self-evident—be connected with each other?

Such being the state of affairs it was certainly difficult for Torres, constantly watched as he was by the two young men, by Fragoso and Lina, to make a single movement without having instantly to repress it. Perhaps he understood the position. If he did, he did not show it, for his manner changed not in the least.

Satisfied with their mutual explanation, Manoel and Benito promised to keep him in sight without doing anything to awaken his suspicions.

During the following days the jangada passed on the right the mouths of the rivers Camara, Aru, and Yuripari, whose waters instead of flowing into the Amazon run off to the south to feed the Rio des Purus, and return by it into the main river. At five o'clock on the evening of the 10th of August they put into the island of Cocos.

They there passed a _"seringal."_ This name is applied to a caoutchouc plantation, the caoutchouc being extracted from the _"seringueira"_ tree, whose scientific name is _siphonia elastica_.

It is said that, by negligence or bad management, the number of these trees is decreasing in the basin of the Amazon, but the forests of seringueira trees are still very considerable on the banks of the Madeira, Purus, and other tributaries.

There were here some twenty Indians collecting and working the caoutchouc, an operation which principally takes place during the months of May, June, and July.

After having ascertained that the trees, well prepared by the river floods which have bathed their stems to a height of about four feet, are in good condition for the harvest, the Indians are set to work.

Incisions are made into the albumen of the seringueiras; below the wound small pots are attached, which twenty-four hours suffice to fill with a milky sap. It can also be collected by means of a hollow bamboo, and a receptacle placed on the ground at the foot of the tree.

The sap being obtained, the Indians, to prevent the separation of its peculiar resins, fumigate it over a fire of the nuts of the assai palm. By spreading out the sap on a wooden scoop, and shaking it in the smoke, its coagulation is almost immediately obtained; it assumes a grayish-yellow tinge and solidifies. The layers formed in succession are detached from the scoop, exposed to the sun, hardened, and assume the brownish color with which we are familiar. The manufacture is then complete.
Benito, finding a capital opportunity, bought from the Indians all the caoutchouc stored in their cabins, which, by the way, are mostly built on piles. The price he gave them was sufficiently remunerative, and they were highly satisfied.

Four days later, on the 14th of August, the jangada passed the mouths of the Purus.

This is another of the large affluents of the Amazon, and seems to possess a navigable course, even for large ships, of over five hundred leagues. It rises in the southwest, and measures nearly five thousand feet across at its junction with the main river. After winding beneath the shade of ficuses, tabuaries, nipa palms, and cecropias, it enters the Amazon by five mouths.

Hereabouts Araujo the pilot managed with great ease. The course of the river was but slightly obstructed with islands, and besides, from one bank to another its width is about two leagues.

The current, too, took along the jangada more steadily, and on the 18th of August it stopped at the village of Pasquiero to pass the night.

The sun was already low on the horizon, and with the rapidity peculiar to these low latitudes, was about to set vertically, like an enormous meteor.

Joam Garral and his wife, Lina, and old Cybele, were in front of the house.

Torres, after having for an instant turned toward Joam as if he would speak to him, and prevented perhaps by the arrival of Padre Passanha, who had come to bid the family good-night, had gone back to his cabin.

The Indians and the negroes were at their quarters along the sides. Araujo, seated at the bow, was watching the current which extended straight away in front of him.

Manoel and Benito, with their eyes open, but chatting and smoking with apparent indifference, walked about the central part of the craft awaiting the hour of repose.

All at once Manoel stopped Benito with his hand and said:

"What a queer smell! Am I wrong? Do you not notice it?"

"One would say that it was the odor of burning musk!" replied Benito. "There ought to be some alligators asleep on the neighboring beach!"

"Well, nature has done wisely in allowing them so to betray themselves."

"Yes," said Benito, "it is fortunate, for they are sufficiently formidable creatures!"

Often at the close of the day these saurians love to stretch themselves on the shore, and install themselves comfortably there to pass the night. Crouched at the opening of a hole, into which they have crept back, they sleep with the mouth open, the upper jaw perpendicularly erect, so as to lie in wait for their prey. To these amphibians it is but sport to launch themselves in its pursuit, either by swimming through the waters propelled by their tails or running along the bank with a speed no man can equal.

It is on these huge beaches that the caymans are born, live, and die, not without affording extraordinary examples of longevity. Not only can the old ones, the centenarians, be recognized by the greenish moss which carpets their carcass and is scattered over their protuberances, but by their natural ferocity, which increases with age.

As Benito said, they are formidable creatures, and it is fortunate that their attacks can be guarded against.

Suddenly cries were heard in the bow.

"Caymans! caymans!"

Manoel and Benito came forward and looked.

Three large saurians, from fifteen to twenty feet long, had managed to clamber on to the platform of the raft.

"Bring the guns! Bring the guns!" shouted Benito, making signs to the Indians and the blacks to get behind.

"Into the house!" said Manoel; "make haste!"

And in truth, as they could not attack them at once, the best thing they could do was to get into shelter without delay.

It was done in an instant. The Garral family took refuge in the house, where the two young men joined them.

The Indians and the negroes ran into their huts and cabins. As they were shutting the door:

"And Minha?" said Manoel.

"She is not there!" replied Lina, who had just run to her mistress' room.

"Good heavens! where is she?" exclaimed her mother, and they all shouted at once:

"Minha! Minha!"

No reply.

"There she is, on the bow of the jangada!" said Benito.

"Minha!" shouted Manoel.

The two young men, and Fragoso and Joam Garral, thinking no more of danger, rushed out of the house, guns in hand.

Scarcely were they outside when two of the alligators made a half turn and ran toward them.
A dose of buckshot to the head, close to the eye, from Benito, stopped one of the monsters, who, mortally wounded, writhed in frightful convulsions and fell on his side.

But the second still lived, and came on, and there was no way of avoiding him.

The huge alligator tore up to Joam Garral, and after knocking him over with a sweep of his tail, ran at him with open jaws.

At this moment Torres rushed from the cabin, hatchet in hand, and struck such a terrific blow that its edge sunk into the jaw of the cayman and left him defenseless.

Blinded by the blood, the animal flew to the side, and, designedly or not, fell over and was lost in the stream.

"Minha! Minha!" shouted Manoel in distraction, when he got to the bow of the jangada.

Suddenly she came into view. She had taken refuge in the cabin of Araujo, and the cabin had just been upset by a powerful blow from the third alligator. Minha was flying aft, pursued by the monster, who was not six feet away from her.

Minha fell.

A second shot from Benito failed to stop the cayman. He only struck the animal's carapace, and the scales flew to splinters but the ball did not penetrate.

Manoel threw himself at the girl to raise her, or to snatch her from death! A side blow from the animal's tail knocked him down too.

Minha fainted, and the mouth of the alligator opened to crush her!

And then Fragoso jumped in to the animal, and thrust in a knife to the very bottom of his throat, at the risk of having his arm snapped off by the two jaws, had they quickly closed.

Fragoso pulled out his arm in time, but he could not avoid the chock of the cayman, and was hurled back into the river, whose waters reddened all around.

"Fragoso! Fragoso!" shrieked Lina, kneeling on the edge of the raft.

A second afterward Fragoso reappeared on the surface of the Amazon--safe and sound.

But, at the peril of his life he had saved the young girl, who soon came to. And as all hands were held out to him--Manoel's, Yaquta's, Minha's, and Lina's, and he did not know what to say, he ended by squeezing the hands of the young mulatto.

However, though Fragoso had saved Minha, it was assuredly to the intervention of Torres that Joam Garral owed his safety.

It was not, therefore, the fazender's life that the adventurer wanted. In the face of this fact, so much had to be admitted.

Manoel said this to Benito in an undertone.

"That is true!" replied Benito, embarrassed. "You are right, and in a sense it is one cruel care the less! Nevertheless, Manoel, my suspicions still exist! It is not always a man's worst enemy who wishes him dead!"

Joam Garral walked up to Torres.

"Thank you, Torres!" he said, holding out his hand. The adventurer took a step or two backward without replying.

"Torres," continued Joam, "I am sorry that we are arriving at the end of our voyage, and that in a few days we must part! I owe you----"

"Joam Garral!" answered Torres, "you owe me nothing! Your life is precious to me above all things! But if you will allow me--I have been thinking--in place of stopping at Manaos, I will go on to Belem. Will you take me there?"

Joam Garral replied by an affirmative nod.

In hearing this demand Benito in an unguarded moment was about to intervene, but Manoel stopped him, and the young man checked himself, though not without a violent effort.

CHAPTER XVIII. THE ARRIVAL DINNER

IN THE MORNING, after a night which was scarcely sufficient to calm so much excitement, they unmoored from the cayman beach and departed. Before five days, if nothing interfered with their voyage, the raft would reach the port of Manaos.

Minha had quite recovered from her fright, and her eyes and smiles thanked all those who had risked their lives for her.

As for Lina, it seemed as though she was more grateful to the brave Fragoso than if it was herself that he had saved.

"I will pay you back, sooner or later, Mr. Fragoso," said she, smiling.
"And how, Miss Lina?"

"Oh! You know very well!"

"Then if I know it, let it be soon and not late!" replied the good-natured fellow.

And from this day it began to be whispered about that the charming Lina was engaged to Fragoso, that their marriage would take place at the same time as that of Minha and Manoel, and that the young couple would remain at Belem with the others.

"Capital! capital!" repeated Fragoso unceasingly; "but I never thought Para was such a long way off!"

As for Manoel and Benito, they had had a long conversation about what had passed. There could be no question about obtaining from Joam Garral the dismissal of his rescuer.

"Your life is precious to me above all things!" Torres had said.

This reply, hyperbolical and enigmatical at the time, Benito had heard and remembered.

In the meantime the young men could do nothing. More than ever they were reduced to waiting--to waiting not for four or five days, but for seven or eight weeks--that is to say, for whatever time it would take for the raft to get to Belem.

"There is in all this some mystery that I cannot understand," said Benito.

"Yes, but we are assured on one point," answered Manoel. "It is certain that Torres does not want your father's life. For the rest, we must still watch!"

It seemed that from this day Torres desired to keep himself more reserved. He did not seek to intrude on the family, and was even less assiduous toward Minha. There seemed a relief in the situation of which all, save perhaps Joam Garral, felt the gravity.

On the evening of the same day they left on the right the island of Baroso, formed by a furo of that name, and Lake Manaori, which is fed by a confused series of petty tributaries.

The night passed without incident, though Joam Garral had advised them to watch with great care.

On the morrow, the 20th of August, the pilot, who kept near the right bank on account of the uncertain eddies on the left, entered between the bank and the islands.

Beyond this bank the country was dotted with large and small lakes, much as those of Calderon, Huarandeina, and other black-watered lagoons. This water system marks the approach of the Rio Negro, the most remarkable of all the tributaries of the Amazon. In reality the main river still bore the name of the Solimoens, and it is only after the junction of the Rio Negro that it takes the name which has made it celebrated among the rivers of the globe.

During this day the raft had to be worked under curious conditions.

The arm followed by the pilot, between Calderon Island and the shore, was very narrow, although it appeared sufficiently large. This was owing to a great portion of the island being slightly above the mean level, but still covered by the high flood waters. On each side were massed forests of giant trees, whose summits towered some fifty feet above the ground, and joining one bank to the other formed an immense cradle.

On the left nothing could be more picturesque than this flooded forest, which seemed to have been planted in the middle of a lake. The stems of the trees arose from the clear, still water, in which every interlacement of their boughs was reflected with unequaled purity. They were arranged on an immense sheet of glass, like the trees in miniature on some table _epergne_, and their reflection could not be more perfect. The difference between the image and the reality could scarcely be described. Duplicates of grandeur, terminated above and below by a vast parasol of green, they seemed to form two hemispheres, inside which the jangada appeared to follow one of the great circles.

It had been necessary to bring the raft under these boughs, against which flowed the gentle current of the stream. It was impossible to go back. Hence the task of navigating with extreme care, so as to avoid the collisions on either side.

In this all Araujo's ability was shown, and he was admirably seconded by his crew. The trees of the forest furnished the resting-places for the long poles which kept the jangada in its course. The least blow to the jangada would have endangered the complete demolition of the woodwork, and caused the loss, if not of the crew, of the greater part of the cargo.

"It is truly very beautiful," said Minha, "and it would be very pleasant for us always to travel in this way, on this quiet water, shaded from the rays of the sun."

"At the same time pleasant and dangerous, dear Minha," said Manoel. "In a pirogue there is doubtless nothing to fear in sailing here, but on a huge raft of wood better have a free course and a clear stream."

"We shall be quite through the forest in a couple of hours," said the pilot.

"Look well at it, then!" said Lina. "All these beautiful things pass so quickly! Ah! dear mistress! do you see the troops of monkeys disporting in the higher branches, and the birds admiring themselves in the pellucid water!"

"And the flowers half-opened on the surface," replied Minha, "and which the current dandles like the breeze!"

"And the long lianas, which so oddly stretch from one tree to another!" added the young mulatto.
"And no Fragoso at the end of them!" said Lina's betrothed. "That was rather a nice flower you gathered in the forest of Iquitos!"

"Just behold the flower—the only one in the world," said Lina quizzingly; "and, mistress! just look at the splendid plants!"

And Lina pointed to the nymphæas with their colossal leaves, whose flowers bear buds as large as cocoanuts. Then, just where the banks plunged beneath the waters, there were clumps of "mucumus," reeds with large leaves, whose elastic stems bend to give passage to the pirogues and close again behind them. There was there what would tempt any sportsman, for a whole world of aquatic birds fluttered between the higher clusters, which shook with the stream.

Ibises half-lollingly posed on some old trunk, and gray herons motionless on one leg, solemn flamingoes who from a distance looked like red umbrellas scattered in the foliage, and phœnicopters of every color, enlivened the temporary morass.

And along the top of the water glided long and swiftly-swimming snakes, among them the formidable gymnotus, whose electric discharges successively repeated paralyze the most robust of men or animals, and end by dealing death. Precautions had to be taken against the "sucurijus" serpents, which, coiled round the trunk of some tree, unroll themselves, hang down, seize their prey, and draw into their rings, which are powerful enough to crush a bullock. Have there not been met with in these Amazonian forests reptiles from thirty to thirty-five feet long? and even, according to M. Carrey, do not some exist whose length reaches forty-seven feet, and whose girth is that of a hogshead?

Had one of these sucurijus, indeed, got on to the raft he would have proved as formidable as an alligator.

Very fortunately the travelers had to contend with neither gymnotus nor sucuriju, and the passage across the submerged forest, which lasted about two hours, was effected without accident.

Three days passed. They neared Manaos. Twenty-four hours more and the raft would be off the mouth of the Rio Negro, before the capital of the province of Amazonas.

In fact, on the 23d of August, at five o'clock in the evening, they stopped at the southern point of Muras Island, on the right bank of the stream. They only had to cross obliquely for a few miles to arrive at the port, but the pilot Araujo very properly would not risk it on that day, as night was coming on. The three miles which remained would take three hours to travel, and to keep to the course of the river it was necessary, above all things, to have a clear outlook.

This evening the dinner, which promised to be the last of this first part of the voyage, was not served without a certain amount of ceremony. Half the journey on the Amazon had been accomplished, and the task was worthy of a jovial repast. It was fitting to drink to the health of Amazones a few glasses of that generous liquor which comes from the coasts of Oporto and Setubal. Besides, this was, in a way, the betrothal dinner of Fragoso and the charming Lina—that of Manoel and Minha had taken place at the fazenda of Iquitos several weeks before. After the young master and mistress, it was the turn of the faithful couple who were attached to them by so many bonds of gratitude.

So Lina, who was to remain in the service of Minha, and Fragoso, who was about to enter into that of Manoel Valdez, sat at the common table, and even had the places of honor reserved for them.

Torres, naturally, was present at the dinner, which was worthy of the larder and kitchen of the jangada.

The adventurer, seated opposite to Joam Garral, who was always taciturn, listened to all that was said, but took no part in the conversation. Benito quietly and attentively watched him. The eyes of Torres, with a peculiar expression, constantly sought his father. One would have called them the eyes of some wild beast trying to fascinate his prey before he sprang on it.

Manoel talked mostly with Minha. Between whiles his eyes wandered to Torres, but he acted his part more successfully than Benito in a situation which, if it did not finish at Manaos, would certainly end at Belem.

The dinner was jolly enough. Lina kept it going with her good humor, Fragoso with his witty repartees. The Padre Passanha looked gayly round on the little world he cherished, and on the two young couples which his hands would shortly bless in the waters of Para.

"Eat, padre," said Benito, who joined in the general conversation; "do honor to this betrothal dinner. You will want some strength to celebrate both marriages at once!"

"Well, my dear boy," replied Passanha, "seek out some lovely and gentle girl who wishes you well, and you will see that I can marry you at the same time!"

"Well answered, padre!" exclaimed Manoel. "Let us drink to the coming marriage of Benito."

"We must look out for some nice young lady at Belem," said Minha. "He should do what everybody else does."

"To the wedding of Mr. Benito!" said Fragoso, "who ought to wish all the world to marry him!"

"They are right, sir," said Yaquita. "I also drink to your marriage, and may you be as happy as Minha and Manoel, and as I and your father have been!"
"As you always will be, it is to be hoped," said Torres, drinking a glass of port without having pledged anybody. "All here have their happiness in their own hands."

It was difficult to say, but this wish, coming from the adventurer, left an unpleasant impression.

Manoel felt this, and wishing to destroy its effect, "Look here, padre," said he, "while we are on this subject, are there not any more couples to betroth on the raft?"

"I do not know," answered Padre Passanha, "unless Torres—you are not married, I believe?"

"No; I am, and always shall be, a bachelor."

Benito and Manoel thought that while thus speaking Torres looked toward Minha.

"And what should prevent you marrying?" replied Padre Passanha; "at Belem you could find a wife whose age would suit yours, and it would be possible perhaps for you to settle in that town. That would be better than this wandering life, of which, up to the present, you have not made so very much."

"You are right, padre," answered Torres; "I do not say no. Besides the example is contagious. Seeing all these young couples gives me rather a longing for marriage. But I am quite a stranger in Belem, and, for certain reasons, that would make my settlement more difficult."

"Where do you come from, then?" asked Fragoso, who always had the idea that he had already met Torres somewhere.

"From the province of Minas Geraes."

"And you were born——"?

"In the capital of the diamond district, Tijuco."

Those who had seen Joam Garral at this moment would have been surprised at the fixity of his look which met that of Torres.

CHAPTER XIX. ANCIENT HISTORY

BUT THE CONVERSATION was continued by Fragoso, who immediately rejoined:

"What! you come from Tijuco, from the very capital of the diamond district?"

"Yes," said Torres. "Do you hail from that province?"

"No! I come from the Atlantic seaboard in the north of Brazil," replied Fragoso.

"You do not know this diamond country, Mr. Manoel?" asked Torres.

A negative shake of the head from the young man was the only reply.

"And you, Mr. Benito," continued Torres, addressing the younger Garral, whom he evidently wished to join in the conversation; "you have never had curiosity enough to visit the diamond arraval?"

"Never," dryly replied Benito.

"Ah! I should like to see that country," said Fragoso, who unconsciously played Torres' game. "It seems to me I should finish by picking up a diamond worth something considerable."

"And what would you do with this diamond worth something considerable, Fragoso?" queried Lina.

"Sell it!"

"Then you would get rich all of a sudden!"

"Very rich!"

"Well, if you had been rich three months ago you would never have had the idea of--that liana!"

"And if I had not had that," exclaimed Fragoso, "I should not have found a charming little wife who--well, assuredly, all is for the best!"

"You see, Fragoso," said Minha, "when you marry Lina, diamond takes the place of diamond, and you do not lose by the change!"

"To be sure, Miss Minha," gallantly replied Fragoso; "rather I gain!"

There could be no doubt that Torres did not want the subject to drop, for he went on with:

"It is a fact that at Tijuco sudden fortunes are realized enough to turn any man's head! Have you heard tell of the famous diamond of Abaete, which was valued at more than two million contos of reis? Well, this stone, which weighed an ounce, came from the Brazilian mines! And they were three convicts--yes! three men sentenced to transportation for life--who found it by chance in the River Abaete, at ninety leagues from Terro de Frio."

"At a stroke their fortune was made?" asked Fragoso.

"No," replied Torres; "the diamond was handed over to the governor-general of the mines. The value of the stone was recognized, and King John VI., of Portugal, had it cut, and wore it on his neck on great occasions. As for the convicts, they got their pardon, but that was all, and the cleverest could not get much of an income out of that!"

"You, doubtless?" said Benito very dryly.

"Yes--I? Why not?" answered Torres. "Have you ever been to the diamond district?" added he, this time
addressing Joam Garral.

"Never!" said Joam, looking straight at him.

"That is a pity!" replied he. "You should go there one day. It is a very curious place, I assure you. The diamond valley is an isolated spot in the vast empire of Brazil, something like a park of a dozen leagues in circumference, which in the nature of its soil, its vegetation, and its sandy rocks surrounded by a circle of high mountains, differs considerably from the neighboring provinces. But, as I have told you, it is one of the richest places in the world, for from 1807 to 1817 the annual return was about eighteen thousand carats. Ah! there have been some rare finds there, not only for the climbers who seek the precious stone up to the very tops of the mountains, but also for the smugglers who fraudulently export it. But the work in the mines is not so pleasant, and the two thousand negroes employed in that work by the government are obliged even to divert the watercourses to get at the diamantiferous sand. Formerly it was easier work."

"In short," said Fragoso, "the good time has gone!"

"But what is still easy is to get the diamonds in scoundrel-fashion—that is, by theft; and—stop! in 1826, when I was about eight years old, a terrible drama happened at Tijuco, which showed that criminal would recoil from nothing if they could gain a fortune by one bold stroke. But perhaps you are not interested?"

"On the contrary, Torres; go on," replied Joam Garral, in a singularly calm voice.

"So be it," answered Torres. "Well, the story is about stealing diamonds, and a handful of those pretty stones is worth a million, sometimes two!"

And Torres, whose face expressed the vilest sentiments of cupidity, almost unconsciously made a gesture of opening and shutting his hand.

"This is what happened," he continued. "At Tijuco it is customary to send off in one delivery the diamonds collected during the year. They are divided into two lots, according to their size, after being sorted in a dozen sieves with holes of different dimensions. These lots are put into sacks and forwarded to Rio de Janeiro; but as they are worth many millions you may imagine they are heavily escorted. A workman chosen by the superintendent, four cavalrymen from the district regiment, and ten men on foot, complete the convoy. They first make for Villa Rica, where the commandant puts his seal on the sacks, and then the convoy continues its journey to Rio de Janeiro. I should add, that, for the sake of precaution, the start is always kept secret. Well, in 1826, a young fellow named Dacosta, who was about twenty-two or twenty-three years of age, and who for some years had been employed at Tijuco in the offices of the governor-general, devised the following scheme. He leagued himself with a band of smugglers, and informed them of the date of the departure of the convoy. The scoundrels took their measures accordingly. They were numerous and well armed. Close to Villa Rica, during the night of the 22d of January, the gang suddenly attacked the diamond escort, who defended themselves bravely, but were all massacred, with the exception of one man, who, seriously wounded, managed to escape and bring the news of the horrible deed. The workman was not spared any more than the soldiers. He fell beneath he blows of the thieves, and was doubtless dragged away and thrown over some precipice, for his body was never found."

"And this Dacosta?" asked Joam Garral.

"Well, his crime did not do him much good, for suspicion soon pointed toward him. He was accused of having got up the affair. In vain he protested that he was innocent. Thanks to the situation he held, he was in a position to know the date on which the convoy's departure was to take place. He alone could have informed the smugglers. He was charged, arrested, tried, and sentenced to death. Such a sentence required his execution in twenty-four hours."

"Was the fellow executed?" asked Fragoso.

"No," replied Torres; "they shut him up in the prison at Villa Rica, and during the night, a few hours only before his execution, whether alone or helped by others, he managed to escape."

"Has this young man been heard of since?" asked Joam Garral.

"Never," replied Torres. "He probably left Brazil, and now, in some distant land, lives a cheerful life with the proceeds of the robbery which he is sure to have realized."

"Perhaps, on the other hand, he died miserably!" answered Joam Garral.

"And, perhaps," added Padre Passanha, "Heaven caused him to feel remorse for his crime."

Here they all rose from the table, and, having finished their dinner, went out to breathe the evening air. The sun was low on the horizon, but an hour had still to elapse before nightfall.

"These stories are not very lively," said Fragoso, "and our betrothal dinner was best at the beginning."

"But it was your fault, Fragoso," answered Lina.

"How my fault?"

"It was you who went on talking about the district and the diamonds, when you should not have done so."

"Well, that's true," replied Fragoso; "but I had no idea we were going to wind up in that fashion."

"You are the first to blame!"
"And the first to be punished, Miss Lina; for I did not hear you laugh all through the dessert."
The whole family strolled toward the bow of the jangada. Manoel and Benito walked one behind the other without speaking. Yaquita and her daughter silently followed, and all felt an unaccountable impression of sadness, as if they had a presentiment of some coming calamity.
Torres stepped up to Joam Garral, who, with bowed head, seemed to be lost in thought, and putting his hand on his shoulder, said, "Joam Garral, may I have a few minutes' conversation with you?"
Joam looked at Torres.
"Here?" he asked.
"No; in private."
"Come, then."
They went toward the house, entered it, and the door was shut on them.
It would be difficult to depict what every one felt when Joam Garral and Torres disappeared. What could there be in common between the adventurer and the honest fazender of Iquitos? The menace of some frightful misfortune seemed to hang over the whole family, and they scarcely dared speak to each other.
"Manoel!" said Benito, seizing his friend's arm, "whatever happens, this man must leave us tomorrow at Manaos."
"Yes! it is imperative!" answered Manoel.
"And if through him some misfortune happens to my father--I shall kill him!"

CHAPTER XX. BETWEEN THE TWO MEN
FOR A MOMENT, alone in the room, where none could see or hear them, Joam Garral and Torres looked at each other without uttering a word. Did the adventurer hesitate to speak? Did he suspect that Joam Garral would only reply to his demands by a scornful silence?
Yes! Probably so. So Torres did not question him. At the outset of the conversation he took the affirmative, and assumed the part of an accuser.
"Joam," he said, "your name is not Garral. Your name is Dacosta!"
At the guilty name which Torres thus gave him, Joam Garral could not repress a slight shudder.
"You are Joam Dacosta," continued Torres, "who, twenty-five years ago, were a clerk in the governor-general's office at Tijuco, and you are the man who was sentenced to death in this affair of the robbery and murder!"
No response from Joam Garral, whose strange tranquillity surprised the adventurer. Had he made a mistake in accusing his host? No! For Joam Garral made no start at the terrible accusations. Doubtless he wanted to know to what Torres was coming.
"Joam Dacosta, I repeat! It was you whom they sought for this diamond affair, whom they convicted of crime and sentenced to death, and it was you who escaped from the prison at Villa Rica a few hours before you should have been executed! Do you not answer?"
Rather a long silence followed this direct question which Torres asked. Joam Garral, still calm, took a seat. His elbow rested on a small table, and he looked fixedly at his accuser without bending his head.
"Will you reply?" repeated Torres.
"What reply do you want from me?" said Joam quietly.
"A reply," slowly answered Torres, "that will keep me from finding out the chief of the police at Manaos, and saying to him, 'A man is there whose identity can easily be established, who can be recognized even after twenty-five years' absence, and this man was the instigator of the diamond robbery at Tijuco. He was the accomplice of the murderers of the soldiers of the escort; he is the man who escaped from execution; he is Joam Garral, whose true name is Joam Dacosta.'"
"And so, Torres," said Joam Garral, "I shall have nothing to fear from you if I give the answer you require?"
"Nothing, for neither you nor I will have any interest in talking about the matter."
"Neither you nor I?" asked Joam Garral. "It is not with money, then, that your silence is to be bought?"
"No! No matter how much you offered me!"
"What do you want, then?"
"Joam Garral," replied Torres, "here is my proposal. Do not be in a hurry to reply by a formal refusal. Remember that you are in my power."
"What is this proposal?" asked Joam.
Torres hesitated for a moment.
The attitude of this guilty man, whose life he held in his hands, was enough to astonish him. He had expected a stormy discussion and prayers and tears. He had before him a man convicted of the most heinous of crimes, and the
man never flinched. At length, crossing his arms, he said: "You have a daughter!--I like her--and I want to marry her!"

Apparently Joam Garral expected anything from such a man, and was as quiet as before. "And so," he said, "the worthy Torres is anxious to enter the family of a murderer and a thief?"

"I am the sole judge of what it suits me to do," said Torres. "I wish to be the son-in-law of Joam Garral, and I will."

"You ignore, then, that my daughter is going to marry Manoel Valdez?"

"You will break it off with Manoel Valdez!"

"And if my daughter declines?"

"If you tell her all, I have no doubt she would consent," was the impudent answer.

"All?"

"All, if necessary. Between her own feelings and the honor of her family and the life of her father she would not hesitate."

"You are a consummate scoundrel, Torres," quietly said Joam, whose coolness never forsook him. "A scoundrel and a murderer were made to understand each other."

At these words Joam Garral rose, advanced to the adventurer, and looking him straight in the face, "Torres," he said, "if you wish to become one of the family of Joam Dacosta, you ought to know that Joam Dacosta was innocent of the crime for which he was condemned."

"Really!"

"And I add," replied Joam, "that you hold the proof of his innocence, and are keeping it back to proclaim it on the day when you marry his daughter."

"Fair play, Joam Garral," answered Torres, lowering his voice, "and when you have heard me out, you will see if you dare refuse me your daughter!"

"I am listening, Torres."

"Well," said the adventurer, half keeping back his words, as if he was sorry to let them escape from his lips, "I know you are innocent! I know it, for I know the true culprit, and I am in a position to prove your innocence."

"And the unhappy man who committed the crime?"

"Is dead."

"Dead!" exclaimed Joam Garral; and the word made him turn pale, in spite of himself, as if it had deprived him of all power of reinstatement.

"Dead," repeated Torres; "but this man, whom I knew a long time after his crime, and without knowing that he was a convict, had written out at length, in his own hand, the story of this affair of the diamonds, even to the smallest details. Feeling his end approaching, he was seized with remorse. He knew where Joam Dacosta had taken refuge, and under what name the innocent man had again begun a new life. He knew that he was rich, in the bosom of a happy family, but he knew also that there was no happiness for him. And this happiness he desired to add to the reputation to which he was entitled. But death came--he intrusted to me, his companion, to do what he could no longer do. He gave me the proofs of Dacosta's innocence for me to transmit them to him, and he died."

"The man's name?" exclaimed Joam Garral, in a tone he could not control.

"You will know it when I am one of your family."

"And the writing?"

Joam Garral was ready to throw himself on Torres, to search him, to snatch from him the proofs of his innocence.

"The writing is in a safe place," replied Torres, "and you will not have it until your daughter has become my wife. Now will you still refuse me?"

"Yes," replied Joam, "but in return for that paper the half of my fortune is yours."

"The half of your fortune?" exclaimed Torres; "agreed, on condition that Minha brings it to me at her marriage."

"And it is thus that you respect the wishes of a dying man, of a criminal tortured by remorse, and who has charge you to repair as much as he could the evil which he had done?"

"It is thus."

"Once more, Torres," said Joam Garral, "you are a consummate scoundrel."

"Be it so."

"And as I am not a criminal we were not made to understand one another."

"And your refuse?"

"I refuse."

"It will be your ruin, then, Joam Garral. Everything accuses you in the proceedings that have already taken place.
You are condemned to death, and you know, in sentences for crimes of that nature, the government is forbidden the right of commuting the penalty. Denounced, you are taken; taken, you are executed. And I will denounce you."

Master as he was of himself, Joam could stand it no longer. He was about to rush on Torres.

A gesture from the rascal cooled his anger.

"Take care," said Torres, "your wife knows not that she is the wife of Joam Dacosta, your children do not know they are the children of Joam Dacosta, and you are not going to give them the information."

Joam Garral stopped himself. He regained his usual command over himself, and his features recovered their habitual calm.

"This discussion has lasted long enough," said he, moving toward the door, "and I know what there is left for me to do."

"Take care, Joam Garral!" said Torres, for the last time, for he could scarcely believe that his ignoble attempt at extortion had collapsed.

Joam Garral made him no answer. He threw back the door which opened under the veranda, made a sign to Torres to follow him, and they advanced toward the center of the jangada, where the family were assembled.

Benito, Manoel, and all of them, under a feeling of deep anxiety, had risen. They could see that the bearing of Torres was still menacing, and that the fire of anger still shone in his eyes.

In extraordinary contrast, Joam Garral was master of himself, and almost smiling.

Both of them stopped before Yaquita and her people. Not one dared to say a word to them.

It was Torres who, in a hollow voice, and with his customary impudence, broke the painful silence.

"For the last time, Joam Garral," he said, "I ask you for a last reply!"

"And here is my reply."

And addressing his wife:

"Yaquita," he said, "peculiar circumstances oblige me to alter what we have formerly decided as to the marriage of Minha and Manoel."

"At last!" exclaimed Torres.

Joam Garral, without answering him, shot at the adventurer a glance of the deepest scorn.

But at the words Manoel had felt his heart beat as if it would break. The girl arose, ashy pale, as if she would seek shelter by the side of her mother. Yaquita opened her arms to protect, to defend her.

"Father," said Benito, who had placed himself between Joam Garral and Torres, "what were you going to say?"

"I was going to say," answered Joam Garral, raising his voice, "that to wait for our arrival in Para for the wedding of Minha and Manoel is to wait too long. The marriage will take place here, not later than to-morrow, on the jangada, with the aid of Padre Passanha, if, after a conversation I am about to have with Manoel, he agrees with me to defer it no longer."

"Ah, father, father!" exclaimed the young man.

"Wait a little before you call me so, Manoel," replied Joam, in a tone of unspeakable suffering.

Here Torres, with crossed arms, gave the whole family a look of inconceivable insolence.

"So that is you last word?" said he, extending his hand toward Joam Garral.

"No, that is not my last word."

"What is it, then?"

"This, Torres. I am master here. You will be off, if you please, and even if you do not please, and leave the jangada at this very instant!"

"Yes, this instant!" exclaimed Benito, "or I will throw you overboard."

Torres shrugged his shoulders.

"No threats," he said; "they are of no use. It suits me also to land, and without delay. But you will remember me, Joam Garral. We shall not be long before we meet."

"If it only depends on me," answered Joam Garral, "we shall soon meet, and rather sooner, perhaps, than you will like. To-morrow I shall be with Judge Ribeiro, the first magistrate of the province, whom I have advised of my arrival at Manaos. If you dare, meet me there!"

"At Judge Ribeiro's?" said Torres, evidently disconcerted.

And then, showing the pirogue to Torres, with a gesture of supreme contempt Joam Garral ordered four of his people to land him without delay on the nearest point of the island.

The scoundrel at last disappeared.

The family, who were still appalled, respected the silence of its chief; but Fragoso, comprehending scarce half the gravity of the situation, and carried away by his customary vivacity, came up to Joam Garral.

"If the wedding of Miss Minha and Mr. Manoel is to take place to-morrow on the raft----"
"Yours shall take place at the same time," kindly answered Joam Garral.

And making a sign to Manoel, he retired to his room with him.

The interview between Joam and Manoel had lasted for half an hour, and it seemed a century to the family, when the door of the room was reopened.

Manoel came out alone; his face glowed with generous resolution.

Going up to Yaquita, he said, "My mother!" to Minha he said, "My wife!" and to Benito he said, "My brother!"

And, turning toward Lina and Fragoso, he said to all, "To-morrow!"

He knew all that had passed between Joam Garral and Torres. He knew that, counting on the protection of Judge Ribeiro, by means of a correspondence which he had had with him for a year past without speaking of it to his people, Joam Garral had at last succeeded in clearing himself and convincing him of his innocence. He knew that Joam Garral had boldly undertaken the voyage with the sole object of canceling the hateful proceedings of which he had been the victim, so as not to leave on his daughter and son-in-law the weight of the terrible situation which he had had to endure so long himself.

Yes, Manoel knew all this, and, further, he knew that Joam Garral—or rather Joam Dacosta—was innocent, and his misfortunes made him even dearer and more devoted to him. What he did not know was that the material proof of the innocence of the fazender existed, and that this proof was in the hands of Torres. Joam Garral wished to reserve for the judge himself the use of this proof, which, if the adventurer had spoken truly, would demonstrate his innocence.

Manoel confined himself, then, to announcing that he was going to Padre Passanha to ask him to get things ready for the two weddings.

Next day, the 24th of August, scarcely an hour before the ceremony was to take place, a large pirogue came off from the left bank of the river and hailed the jangada. A dozen paddlers had swiftly brought it from Manaos, and with a few men it carried the chief of the police, who made himself known and came on board.

At the moment Joam Garral and his family, attired for the ceremony, were coming out of the house.

"Joam Garral?" asked the chief of the police.

"I am here," replied Joam.

"Joam Garral," continued the chief of the police, "you have also been Joam Dacosta; both names have been borne by the same man—I arrest you!"

At these words Yaquita and Minha, struck with stupor, stopped without any power to move.

"My father a murderer?" exclaimed Benito, rushing toward Joam Garral.

By a gesture his father silenced him.

"I will only ask you one question," said Joam with firm voice, addressing the chief of police. "Has the warrant in virtue of which you arrest me been issued against me by the justice at Manaos—by Judge Ribeiro?"

"No," answered the chief of the police, "it was given to me, with an order for its immediate execution, by his substitute. Judge Ribeiro was struck with apoplexy yesterday evening, and died during the night at two o'clock, without having recovered his consciousness."

"Dead!" exclaimed Joam Garral, crushed for a moment by the news—"dead! dead!"

But soon raising his head, he said to his wife and children, "Judge Ribeiro alone knew that I was innocent, my dear ones. The death of the judge may be fatal to me, but that is no reason for me to despair."

And, turning toward Manoel, "Heaven help us!" he said to him; "we shall see if truth will come down to the earth from Above."

The chief of the police made a sign to his men, who advanced to secure Joam Garral.

"But speak, father!" shouted Benito, mad with despair; "say one word, and we shall contest even by force this horrible mistake of which you are the victim!"

"There is no mistake here, my son," replied Joam Garral; "Joam Dacosta and Joam Garral are one. I am in truth Joam Dacosta! I am the honest man whom a legal error unjustly doomed to death twenty-five years ago in the place of the true culprit! That I am quite innocent I swear before Heaven, once for all, on your heads, my children, and on the head of your mother!"

"All communication between you and yours is now forbidden," said the chief of the police. "You are my prisoner, Joam Garral, and I will rigorously execute my warrant."

Joam restrained by a gesture his dismayed children and servants.

"Let the justice of man be done while we wait for the justice of God!"

And with his head unbent, he stepped into the pirogue.

It seemed, indeed, as though of all present Joam Garral was the only one whom this fearful thunderbolt, which had fallen so unexpectedly on his head, had failed to overwhelm.
PART II. THE CRYPTOGRAM

CHAPTER I. MANAOS

THE TOWN of Manaos is in 3° 8' 4" south latitude, and 67° 27' west longitude, reckoning from the Paris meridian. It is some four hundred and twenty leagues from Belem, and about ten miles from the _embouchure_ of the Rio Negro.

Manaos is not built on the Amazon. It is on the left bank of the Rio Negro, the most important and remarkable of all the tributaries of the great artery of Brazil, that the capital of the province, with its picturesque group of private houses and public buildings, towers above the surrounding plain.

The Rio Negro, which was discovered by the Spaniard Favella in 1645, rises in the very heart of the province of Popayan, on the flanks of the mountains which separate Brazil from New Grenada, and it communicates with the Orinoco by two of its affluents, the Pimichin and the Cassiquary.

After a noble course of some seventeen hundred miles it mingles its cloudy waters with those of the Amazon through a mouth eleven hundred feet wide, but such is its vigorous influx that many a mile has to be completed before those waters lose their distinctive character. Hereabouts the ends of both its banks trend off and form a huge bay fifteen leagues across, extending to the islands of Anavilhanas; and in one of its indentations the port of Manaos is situated. Vessels of all kinds are there collected in great numbers, some moored in the stream awaiting a favorable wind, others under repair up the numerous _iguarapes_ or canals, which so capriciously intersect the town, and give it its slightly Dutch appearance.

With the introduction of steam vessels, which is now rapidly taking place, the trade of Manaos is destined to increase enormously. Woods used in building and furniture work, cocoa, caoutchouc, coffee, sarsaparilla, sugar-canes, indigo, muscadu nuts, salt fish, turtle butter, and other commodities, are brought here from all parts, down the innumerable streams into the Rio Negro from the west and north, into the Madeira from the west and south, and then into the Amazon, and by it away eastward to the coast of the Atlantic.

Manaos was formerly called Moura, or Barra de Rio Negro. From 1757 to 1804 it was only part of the captaincy which bears the name of the great river at whose mouth it is placed; but since 1826 it has been the capital of the large province of Amazones, borrowing its latest name from an Indian tribe which formerly existed in these parts of equatorial America.

Careless travelers have frequently confounded it with the famous Manoa, a city of romance, built, it was reported, near the legendary lake of Parima--which would seem to be merely the Upper Branco, a tributary of the Rio Negro. Here was the Empire of El Dorado, whose monarch, if we are to believe the fables of the district, was every morning covered with powder of gold, there being so much of the precious metal abounding in this privileged locality that it was swept up with the very dust of the streets. This assertion, however, when put to the test, was disproved, and with extreme regret, for the auriferous deposits which had deceived the greedy scrutiny of the gold-seekers turned out to be only worthless flakes of mica!

In short, Manaos has none of the fabulous splendors of the mythical capital of El Dorado. It is an ordinary town of about five thousand inhabitants, and of these at least three thousand are in government employ. This fact is to be attributed to the number of its public buildings, which consist of the legislative chamber, the government house, the treasury, the post-office, and the custom-house, and, in addition, a college founded in 1848, and a hospital erected in 1851. When with these is also mentioned a cemetery on the south side of a hill, on which, in 1669, a fortress, which has since been demolished, was thrown up against the pirates of the Amazon, some idea can be gained as to the importance of the official establishments of the city. Of religious buildings it would be difficult to find more than two, the small Church of the Conception and the Chapel of Notre Dame des Remedes, built on a knoll which overlooks the town. These are very few for a town of Spanish origin, though to them should perhaps be added the Carmelite Convent, burned down in 1850, of which only the ruins remain. The population of Manaos does not exceed the number above given, and after reckoning the public officials and soldiers, is principally made up of Portuguese and Indian merchants belonging to the different tribes of the Rio Negro.

Three principal thoroughfares of considerable irregularity run through the town, and they bear names highly characteristic of the tone of thought prevalent in these parts--God-the-Father Street, God-the-Son Street, and God-the-Holy Ghost Street!

In the west of the town is a magnificent avenue of centenarian orange trees which were carefully respected by the architects who out of the old city made the new. Round these principal thoroughfares is interwoven a perfect network of unpaved alleys, intersected every now and then by four canals, which are occasionally crossed by wooden bridges. In a few places these iguarapes flow with their brownish waters through large vacant spaces
covered with straggling weeds and flowers of startling hues, and here and there are natural squares shaded by magnificent trees, with an occasional white-barked sumaumeira shooting up, and spreading out its large dome-like parasol above its gnarled branches.

The private houses have to be sought for among some hundreds of dwellings, of very rudimentary type, some roofed with tiles, others with interlaced branches of the palm-tree, and with prominent miradors, and projecting shops for the most part tenanted by Portuguese traders.

And what manner of people are they who stroll on to the fashionable promenade from the public buildings and private residences? Men of good appearance, with black cloth coats, chimney-pot hats, patent-leather boots, highly-colored gloves, and diamond pins in their necktie bows; and women in loud, imposing toilets, with flounced dressed and headgear of the latest style; and Indians, also on the road to Europeanization in a way which bids fair to destroy every bit of local color in this central portion of the district of the Amazon!

Such is Manaos, which, for the benefit of the reader, it was necessary to sketch. Here the voyage of the giant raft, so tragically interrupted, had just come to a pause in the midst of its long journey, and here will be unfolded the further vicissitudes of the mysterious history of the fazender of Iquitos.

CHAPTER II. THE FIRST MOMENTS

SCARCELY HAD the pirogue which bore off Joam Garral, or rather Joam Dacosta--for it is more convenient that he should resume his real name--disappeared, than Benito stepped up to Manoel.

"What is it you know?" he asked.

"I know that your father is innocent! Yes, innocent!" replied Manoel, "and that he was sentenced to death twenty-three years ago for a crime which he never committed!"

"He has told you all about it, Manoel?"

"All about it," replied the young man. "The noble fazender did not wish that any part of his past life should be hidden from him who, when he marries his daughter, is to be his second son."

"And the proof of his innocence my father can one day produce?"

"That proof, Benito, lies wholly in the twenty-three years of an honorable and honored life, lies entirely in the bearing of Joam Dacosta, who comes forward to say to justice, 'Here am I! I do not care for this false existence any more. I do not care to hide under a name which is not my true one! You have condemned an innocent man! Confess your errors and set matters right.'"

"And when my father spoke like that, you did not hesitate for a moment to believe him?"

"Not for an instant," replied Manoel.

The hands of the two young fellows closed in a long and cordial grasp.

Then Benito went up to Padre Passanha.

"Padre," he said, "take my mother and sister away to their rooms. Do not leave them all day. No one here doubts my father's innocence--not one, you know that! To-morrow my mother and I will seek out the chief of the police. They will not refuse us permission to visit the prison. No! that would be too cruel. We will see my father again, and decide what steps shall be taken to procure his vindication."

Yaquita was almost helpless, but the brave woman, though nearly crushed by this sudden blow, arose. With Yaquita Dacosta it was as with Yaquita Garral. She had not a doubt as to the innocence of her husband. The idea even never occurred to her that Joam Dacosta had been to blame in marrying her under a name which was not his own. She only thought of the life of happiness she had led with the noble man who had been injured so unjustly. Yes! On the morrow she would go to the gate of the prison, and never leave it until it was opened!

Padre Passanha took her and her daughter, who could not restrain her tears, and the three entered the house.

The two young fellows found themselves alone.

"And now," said Benito, "I ought to know all that my father has told you."

"I have nothing to hide from you."

"Why did Torres come on board the jangada?"

"To see to Joam Dacosta the secret of his past life."

"And so, when we first met Torres in the forest of Iquitos, his plan had already been formed to enter into communication with my father?"

"There cannot be a doubt of it," replied Manoel. "The scoundrel was on his way to the fazenda with the idea of consummating a vile scheme of extortion which he had been preparing for a long time."

"And when he learned from us that my father and his whole family were about to pass the frontier, he suddenly changed his line of conduct?"

"Yes. Because Joam Dacosta once in Brazilian territory became more at his mercy than while within the
frontiers of Peru. That is why we found Torres at Tabatinga, where he was waiting in expectation of our arrival."

"And it was I who offered him a passage on the raft!" exclaimed Benito, with a gesture of despair.

"Brother," said Manoel, "you need not reproach yourself. Torres would have joined us sooner or later. He was not the man to abandon such a trail. Had we lost him at Tabatinga, we should have found him at Manaos."

"Yes, Manoel, you are right. But we are not concerned with the past now. We must think of the present. An end to useless recriminations! Let us see!" And while speaking, Benito, passing his hand across his forehead, endeavored to grasp the details of the strange affair.

"How," he asked, "did Torres ascertain that my father had been sentenced twenty-three years back for this abominable crime at Tijuco?"

"I do not know," answered Manoel, "and everything leads me to think that your father did not know that."

"But Torres knew that Garral was the name under which Joam Dacosta was living?"

"Evidently."

"And he knew that it was in Peru, at Iquitos, that for so many years my father had taken refuge?"

"He knew it," said Manoel, "but how he came to know it I do not understand."

"One more question," continued Benito. "What was the proposition that Torres made to my father during the short interview which preceded his expulsion?"

"He threatened to denounce Joam Garral as being Joam Dacosta, if he declined to purchase his silence."

"And at what price?"

"At the price of his daughter's hand!" answered Manoel unhesitatingly, but pale with anger.

"The scoundrel dared to do that!" exclaimed Benito.

"To this infamous request, Benito, you saw the reply that your father gave."

"Yes, Manoel, yes! The indignant reply of an honest man. He kicked Torres off the raft. But it is not enough to have kicked him out. No! That will not do for me. It was on Torres' information that they came here and arrested my father; is not that so?"

"Yes, on his denunciation."

"Well," continued Benito, shaking his fist toward the left bank of the river, "I must find out Torres. I must know how he became master of the secret. He must tell me if he knows the real author of this crime. He shall speak out. And if he does not speak out, I know what I shall have to do."

"What you will have to do is for me to do as well!" added Manoel, more coolly, but not less resolutely.

"No! Manoel, no, to me alone!"

"We are brothers, Benito," replied Manoel. "The right of demanding an explanation belongs to us both."

Benito made no reply. Evidently on that subject his decision was irrevocable.

At this moment the pilot Araujo, who had been observing the state of the river, came up to them.

"Have you decided," he asked, "if the raft is to remain at her moorings at the Isle of Muras, or to go on to the port of Manaos?"

The question had to be decided before nightfall, and the sooner it was settled the better.

In fact, the news of the arrest of Joam Dacosta ought already to have spread through the town. That it was of a nature to excite the interest of the population of Manaos could scarcely be doubted. But would it provoke more than curiosity against the condemned man, who was the principal author of the crime of Tijuco, which had formerly created such a sensation? Ought they not to fear that some popular movement might be directed against the prisoner? In the face of this hypothesis was it not better to leave the jangada moored near the Isle of Muras on the right bank of the river at a few miles from Manaos?

The pros and cons of the question were well weighed.

"No!" at length exclaimed Benito; "to remain here would look as though we were abandoning my father and doubting his innocence--as though we were afraid to make common cause with him. We must go to Manaos, and without delay."

"You are right," replied Manoel. "Let us go."

Araujo, with an approving nod, began his preparations for leaving the island. The maneuver necessitated a good deal of care. They had to work the raft slantingly across the current of the Amazon, here doubled in force by that of the Rio Negro, and to make for the embouchure of the tributary about a dozen miles down on the left bank.

The ropes were cast off from the island. The jangada, again started on the river, began to drift off diagonally. Araujo, cleverly profiting by the bendings of the current, which were due to the projections of the banks, and assisted by the long poles of his crew, succeeded in working the immense raft in the desired direction.

In two hours the jangada was on the other side of the Amazon, a little above the mouth of the Rio Negro, and fairly in the current which was to take it to the lower bank of the vast bay which opened on the left side of the stream.
At five o'clock in the evening it was strongly moored alongside this bank, not in the port of Manaos itself, which it could not enter without stemming a rather powerful current, but a short mile below it.

The raft was then in the black waters of the Rio Negro, near rather a high bluff covered with cecropias with buds of reddish-brown, and palisaded with stiff-stalked reeds called _"froxas,"_ of which the Indians make some of their weapons.

A few citizens were strolling about the bank. A feeling of curiosity had doubtless attracted them to the anchorage of the raft. The news of the arrest of Joam Dacosta had soon spread about, but the curiosity of the Manaens did not outrun their discretion, and they were very quiet.

Benito's intention had been to land that evening, but Manoel dissuaded him.

"Wait till to-morrow," he said; "night is approaching, and there is no necessity for us to leave the raft."

"So be it! To-morrow!" answered Benito.

And here Yaquita, followed by her daughter and Padre Passanha, came out of the house. Minha was still weeping, but her mother's face was tearless, and she had that look of calm resolution which showed that the wife was now ready for all things, either to do her duty or to insist on her rights.

Yaquita slowly advanced toward Manoel.

"Manoel," she said, "listen to what I have to say, for my conscience commands me to speak as I am about to do."

"I am listening," replied Manoel.

Yaquita, looking him straight in the face, continued: "Yesterday, after the interview you had with Joam Dacosta, my husband, you came to me and called me--mother! You took Minha's hand, and called her--your wife! You then knew everything, and the past life of Joam Dacosta had been disclosed to you."

"Yes," answered Manoel, "and heaven forbid I should have had any hesitation in doing so!"

"Perhaps so," replied Yaquita; "but then Joam Dacosta had not been arrested. The position is not now the same. However innocent he may be, my husband is in the hands of justice; his past life has been publicly proclaimed. Minha is a convict's daughter."

"Minha Dacosta or Minha Garral, what matters it to me?" exclaimed Manoel, who could keep silent no longer.

"Manoel!" murmured Minha.

And she would certainly have fallen had not Lina's arm supported her.

"Mother, if you do not wish to kill her," said Manoel, "call me your son!"

"My son! my child!"

It was all Yaquita could say, and the tears, which she restrained with difficulty, filled her eyes.

And then they all re-entered the house. But during the long night not an hour's sleep fell to the lot of the unfortunate family who were being so cruelly tried.

CHAPTER III. RETROSPECTIVE

JOAM DACOSTA had relied entirely on Judge Albeiro, and his death was most unfortunate.

Before he was judge at Manaos, and chief magistrate in the province, Ribeiro had known the young clerk at the time he was being prosecuted for the murder in the diamond arrayal. He was then an advocate at Villa Rica, and he it was who defended the prisoner at the trial. He took the cause to heart and made it his own, and from an examination of the papers and detailed information, and not from the simple fact of his position in the matter, he came to the conclusion that his client was wrongfully accused, and that he had taken not the slightest part in the murder of the escort or the theft of the diamonds--in a word, that Joam Dacosta was innocent.

But, notwithstanding this conviction, notwithstanding his talent and zeal, Ribeiro was unable to persuade the jury to take the same view of the matter. How could he remove so strong a presumption? If it was not Joam Dacosta, who had every facility for informing the scoundrels of the convoy's departure, who was it? The official who accompanied the escort had perished with the greater part of the soldiers, and suspicion could not point against him. Everything agreed in distinguishing Dacosta as the true and only author of the crime.

Ribeiro defended him with great warmth and with all his powers, but he could not succeed in saving him. The verdict of the jury was affirmative on all the questions. Joam Dacosta, convicted of aggravated and premeditated murder, did not even obtain the benefit of extenuating circumstances, and heard himself condemned to death.

There was no hope left for the accused. No commutation of the sentence was possible, for the crime was committed in the diamond arrayal. The condemned man was lost. But during the night which preceded his execution, and when the gallows was already erected, Joam Dacosta managed to escape from the prison at Villa Rica. We know the rest.

Twenty years later Ribeiro the advocate became the chief justice of Manaos. In the depths of his retreat the fazender of Iquitos heard of the change, and in it saw a favorable opportunity for bringing forward the revision of
the former proceedings against him with some chance of success. He knew that the old convictions of the advocate would be still unshaken in the mind of the judge. He therefore resolved to try and rehabilitate himself. Had it not been for Ribeiro's nomination to the chief justiceship in the province of Amazones, he might perhaps have hesitated, for he had no new material proof of his innocence to bring forward. Although the honest man suffered acutely, he might still have remained hidden in exile at Iquitos, and still have asked for time to smother the remembrances of the horrible occurrence, but something was urging him to act in the matter without delay.

In fact, before Yaquita had spoken to him, Joam Dacosta had noticed that Manoel was in love with his daughter. The union of the young army doctor and his daughter was in every respect a suitable one. It was evident to Joam that some day or other he would be asked for her hand in marriage, and he did not wish to be obliged to refuse. But then the thought that his daughter would have to marry under a name which did not belong to her, that Manoel Valdez, thinking he was entering the family of Garral, would enter that of Dacosta, the head of which was under sentence of death, was intolerable to him. No! The wedding should not take place unless under proper conditions! Never!

Let us recall what had happened up to this time. Four years after the young clerk, who eventually became the partner of Magalhaës, had arrived at Iquitos, the old Portuguese had been taken back to the farm mortally injured. A few days only were left for him to live. He was alarmed at the thought that his daughter would be left alone and unprotected; but knowing that Joam and Yaquita were in love with each other, he desired their union without delay.

Joan at first refused. He offered to remain the protector or the servant of Yaquita without becoming her husband. The wish of the dying Magalhaës was so urgent that resistance became impossible. Yaquita put her hand into the hand of Joam, and Joam did not withdraw it.

Yes! It was a serious matter! Joam Dacosta ought to have confessed all, or to have fled forever from the house in which he had been so hospitably received, from the establishment of which he had built up the prosperity! Yes! To confess everything rather than to give to the daughter of his benefactor a name which was not his, instead of the name of a felon condemned to death for murder, innocent though he might be!

But the case was pressing, the old fazender was on the point of death, his hands were stretched out toward the young people! Joam was silent, the marriage took place, and the remainder of his life was devoted to the happiness of the girl he had made his wife.

"The day when I confess everything," Joam repeated, "Yaquita will pardon everything! She will not doubt me for an instant! But if I ought not to have deceived her, I certainly will not deceive the honest fellow who wishes to enter our family by marrying Mina! No! I would rather give myself up and have done with this life!"

Many times had Joam thought of telling his wife about his past life. Yes! the avowal was on his lips whenever she asked him to take her into Brazil, and with her and her daughter descend the beautiful Amazon river. He knew sufficient of Yaquita to be sure that her affection for him would not thereby be diminished in the least. But courage failed him!

And this is easily intelligible in the face of the happiness of the family, which increased on every side. This happiness was his work, and it might be destroyed forever by his return.

Such had been his life for those long years; such had been the continuous source of his sufferings, of which he had kept the secret so well; such had been the existence of this man, who had no action to be ashamed of, and whom a great injustice compelled to hide away from himself!

But at length the day arrived when there could no longer remain a doubt as to the affection which Manoel bore to Minha, when he could see that a year would not go by before he was asked to give his consent to her marriage, and after a short delay he no longer hesitated to proceed in the matter.

A letter from him, addressed to Judge Ribeiro, acquainted the chief justice with the secret of the existence of Joam Dacosta, with the name under which he was concealed, with the place where he lived with his family, and at the same time with his formal intention of delivering himself up to justice, and taking steps to procure the revision of the proceedings, which would either result in his rehabilitation or in the execution of the iniquitous judgment delivered at Villa Rica.

What were the feelings which agitated the heart of the worthy magistrate? We can easily divine them. It was no longer to the advocate that the accused applied; it was to the chief justice of the province that the convict appealed. Joam Dacosta gave himself over to him entirely, and did not even ask him to keep the secret.

Judge Ribeiro was at first troubled about this unexpected revelation, but he soon recovered himself, and scrupulously considered the duties which the position imposed on him. It was his place to pursue criminals, and here was one who delivered himself into his hands. This criminal, it was true, he had defended; he had never doubted but that he had been unjustly condemned; his joy had been extreme when he saw him escape by flight from the last penalty; he had even instigated and facilitated his flight! But what the advocate had done in the past could the magistrate do in the present?
"Well, yes!" had the judge said, "my conscience tells me not to abandon this just man. The step he is taking is a fresh proof of his innocence, a moral proof, even if he brings me others, which may be the most convincing of all! No! I will not abandon him!"

From this day forward a secret correspondence took place between the magistrate and Joam Dacosta. Ribeiro at the outset cautioned his client against compromising himself by any imprudence. He had again to work up the matter, again to read over the papers, again to look through the inquiries. He had to find out if any new facts had come to light in the diamond province referring to so serious a case. Had any of the accomplices of the crime, of the smugglers who had attacked the convoy, been arrested since the attempt? Had any confessions or half-confessions been brought forward? Joam Dacosta had done nothing but protest his innocence from the very first. But that was not enough, and Judge Ribeiro was desirous of finding in the case itself the clue to the real culprit.

Joam Dacosta had accordingly been prudent. He had promised to be so. But in all his trials it was an immense consolation for him to find his old advocate, though now a chief justice, so firmly convinced that he was not guilty. Yes! Joam Dacosta, in spite of his condemnation, was a victim, a martyr, an honest man to whom society owed a signal reparation! And when the magistrate knew the past career of the fazender of Iquitos since his sentence, the position of his family, all that life of devotion, of work, employed unceasingly for the happiness of those belonging to him, he was not only more convinced but more affected, and determined to do all that he could to procure the rehabilitation of the felon of Tijuco.

For six months a correspondence had passed between these two men.

One day, the case being pressing, Joam Dacosta wrote to Judge Ribeiro:
"In two months I will be with you, in the power of the chief justice of the province!"
"Come, then," replied Ribeiro.

The jangada was then ready to go down the river. Joam Dacosta embarked on it with all his people. During the voyage, to the great astonishment of his wife and son, he landed but rarely, as we know. More often he remained shut up on his room, writing, working, not at his trading accounts, but, without saying anything about it, at a kind of memoir, which he called “The History of My Life,” and which was meant to be used in the revision of the legal proceedings.

Eight days before his new arrest, made on account of information given by Torres, which forestalled and perhaps would ruin his prospects, he intrusted to an Indian on the Amazon a letter, in which he warned Judge Ribeiro of his approaching arrival.

The letter was sent and delivered as addressed, and the magistrate only waited for Joam Dacosta to commence on the serious undertaking which he hoped to bring to a successful issue.

During the night before the arrival of the raft at Manaos Judge Ribeiro was seized with an attack of apoplexy. But the denunciation of Torres, whose scheme of extortion had collapsed in face of the noble anger of his victim, had produced its effect. Joam Dacosta was arrested in the bosom of his family, and his old advocate was no longer in this world to defend him!

Yes, the blow was terrible indeed. His lot was cast, whatever his fate might be; there was no going back for him! And Joam Dacosta rose from beneath the blow which had so unexpectedly struck him. It was not only his own honor which was in question, but the honor of all who belonged to him.

CHAPTER IV. MORAL PROOFS

THE WARRANT against Joam Dacosta, alias Joam Garral, had been issued by the assistant of Judge Ribeiro, who filled the position of the magistrate in the province of Amazonas, until the nomination of the successor of the late justice.

This assistant bore the name of Vicente Jarriquez. He was a surly little fellow, whom forty years’ practice in criminal procedure had not rendered particularly friendly toward those who came before him. He had had so many cases of this sort, and tried and sentenced so many rascals, that a prisoner's innocence seemed to him _à priori_ inadmissible. To be sure, he did not come to a decision unconscentiously; but his conscience was strongly fortified and was not easily affected by the circumstances of the examination or the arguments for the defense. Like a good many judges, he thought but little of the indulgence of the jury, and when a prisoner was brought before him, after having passed through the sieve of inquest, inquiry, and examination, there was every presumption in his eyes that the man was quite ten times guilty.

Jarriquez, however, was not a bad man. Nervous, fidgety, talkative, keen, crafty, he had a curious look about him, with his big head on his little body; his ruffled hair, which would not have disgraced the judge's wig of the past; his piercing gimlet-like eyes, with their expression of surprising acuteness; his prominent nose, with which he would assuredly have gesticulated had it been movable; his ears wide open, so as to better catch all that was said, even
when it was out of range of ordinary auditory apparatus; his fingers unceasingly tapping the table in front of him, like those of a pianist practicing on the mute; and his body so long and his legs so short, and his feet perpetually crossing and recrossing, as he sat in state in his magistrate's chair.

In private life, Jarriquez, who was a confirmed old bachelor, never left his law-books but for the table which he did not despise; for chess, of which he was a past master; and above all things for Chinese puzzles, enigmas, charades, rebuses, anagrams, riddles, and such things, with which, like more than one European justice--thorough sphinxes by taste as well as by profession--he principally passed his leisure.

It will be seen that he was an original, and it will be seen also how much Joam Dacosta had lost by the death of Judge Ribeiro, inasmuch as his case would come before this not very agreeable judge.

Moreover, the task of Jarriquez was in a way very simple. He had either to inquire nor to rule; he had not even to regulate a discussion nor to obtain a verdict, neither to apply the articles of the penal code nor to pronounce a sentence. Unfortunately for the fazender, such formalities were no longer necessary; Joam Dacosta had been arrested, convicted, and sentenced twenty-three years ago for the crime at Tijuco; no limitation had yet affected his sentence. No demand in commutation of the penalty could be introduced, and no appeal for mercy could be received. It was only necessary then to establish his identity, and as soon as the order arrived from Rio Janeiro justice would have to take its course.

But in the nature of things Joam Dacosta would protest his innocence; he would say he had been unjustly condemned. The magistrate's duty, notwithstanding the opinions he held, would be to listen to him. The question would be, what proofs could the convict offer to make good his assertions? And if he was not able to produce them when he appeared before his first judges, was he able to do so now?

Herein consisted all the interest of the examination. There would have to be admitted the fact of a defaulter, prosperous and safe in a foreign country, leaving his refuge of his own free will to face the justice which his past life should have taught him to dread, and herein would be one of those rare and curious cases which ought to interest even a magistrate hardened with all the surroundings of forensic strife. Was it impudent folly on the part of the doomed man of Tijuco, who was tired of his life, or was it the impulse of a conscience which would at all risks have wrong set right? The problem was a strange one, it must be acknowledged.

On the morrow of Joam Dacosta's arrest, Judge Jarriquez made his way to the prison in God-the-Son Street, where the convict had been placed. The prison was an old missionary convent, situated on the bank of one of the principal iguarapes of the town. To the voluntary prisoners of former times there had succeeded in this building, which was but little adapted for the purpose, the compulsory prisoners of to-day. The room occupied by Joam Dacosta was nothing like one of those sad little cells which form part of our modern penitentiary system: but an old monk's room, with a barred window without shutters, opening on to an uncultivated space, a bench in one corner, and a kind of pallet in the other. It was from this apartment that Joam Dacosta, on this 25th of August, about eleven o'clock in the morning, was taken and brought into the judge's room, which was the old common hall of the convent.

Judge Jarriquez was there in front of his desk, perched on his high chair, his back turned toward the window, so that his face was in shadow while that of the accused remained in full daylight. His clerk, with the indifference which characterizes these legal folks, had taken his seat at the end of the table, his pen behind his ear, ready to record the questions and answers.

Joam Dacosta was introduced into the room, and at a sign from the judge the guards who had brought him withdrew.

Judge Jarriquez looked at the accused for some time. The latter, leaning slightly forward and maintaining a becoming attitude, neither careless nor humble, waited with dignity for the questions to which he was expected to reply.

"Your name?" said Judge Jarriquez.
"Joam Dacosta."
"Your age?"
"Fifty-two."
"Where do you live?"
"In Peru, at the village of Iquitos."
"Under what name?"
"Under that of Garral, which is that of my mother."
"And why do you bear that name?"
"Because for twenty-three years I wished to hide myself from the pursuit of Brazilian justice."

The answers were so exact, and seemed to show that Joam Dacosta had made up his mind to confess everything concerning his past and present life, that Judge Jarriquez, little accustomed to such a course, cocked up his nose more than was usual to him.
"And why," he continued, "should Brazilian justice pursue you?"
"Because I was sentenced to death in 1826 in the diamond affair at Tijuco."
"You confess then that you are Joam Dacosta?"
"I am Joam Dacosta."

All this was said with great calmness, and as simply as possible. The little eyes of Judge Jarriquez, hidden by their lids, seemed to say:

"Never came across anything like this before."

He had put the invariable question which had hitherto brought the invariable reply from culprits of every category protesting their innocence. The fingers of the judge began to beat a gentle tattoo on the table.

"Joam Dacosta," he asked, "what were you doing at Iquitos?"
"I was a fazender, and engaged in managing a farming establishment of considerable size."
"It was prospering."
"Greatly prospering."
"How long ago did you leave your fazenda?"
"About nine weeks."
"Why?"
"As to that, sir," answered Dacosta, "I invented a pretext, but in reality I had a motive."
"What was the pretext?"
"The responsibility of taking into Para a large raft, and a cargo of different products of the Amazon."
"Ah! and what was the real motive of your departure?"

And in asking this question Jarriquez said to himself:

"Now we shall get into denials and falsehoods."

"The real motive," replied Joam Dacosta, in a firm voice, "was the resolution I had taken to give myself up to the justice of my country."

"You give yourself up!" exclaimed the judge, rising from his stool. "You give yourself up of your own free will?"
"Of my own free will."
"And why?"
"Because I had had enough of this lying life, this obligation to live under a false name, of this impossibility to be able to restore to my wife and children that which belongs to them; in short, sir, because----"
"Because?"
"I was innocent!"
"That is what I was waiting for," said Judge Jarriquez.

And while his fingers tattooed a slightly more audible march, he made a sign with his head to Dacosta, which signified as clearly as possible, "Go on! Tell me your history. I know it, but I do not wish to interrupt you in telling it in your own way."

Joam Dacosta, who did not disregard the magistrate's far from encouraging attitude, could not but see this, and he told the history of his whole life. He spoke quietly without departing from the calm he had imposed upon himself, without omitting any circumstances which had preceded or succeeded his condemnation. In the same tone he insisted on the honored and honorable life he had led since his escape, on his duties as head of his family, as husband and father, which he had so worthily fulfilled. He laid stress only on one circumstance—that which had brought him to Manaos to urge on the revision of the proceedings against him, to procure his rehabilitation—and that he was compelled to do.

Judge Jarriquez, who was naturally prepossessed against all criminals, did not interrupt him. He contented himself with opening and shutting his eyes like a man who heard the story told for the hundredth time; and when Joam Dacosta laid on the table the memoir which he had drawn up, he made no movement to take it.

"You have finished?" he said.
"Yes, sir."
"And you persist in asserting that you only left Iquitos to procure the revision of the judgment against you."
"I had no other intention."
"What is there to prove that? Who can prove that, without the denunciation which had brought about your arrest, you would have given yourself up?"
"This memoir, in the first place."
"That memoir was in your possession, and there is nothing to show that had you not been arrested, you would have put it to the use you say you intended."

"At the least, sir, there was one thing that was not in my possession, and of the authenticity of which there can be
no doubt."

"What?"

"The letter I wrote to your predecessor, Judge Ribeiro, the letter which gave him notice of my early arrival."

"Ah! you wrote?"

"Yes. And the letter which ought to have arrived at its destination should have been handed over to you."

"Really!" answered Judge Jarriquez, in a slightly incredulous tone. "You wrote to Judge Ribeiro."

"Before he was a judge in this province," answered Joam Dacosta, "he was an advocate at Villa Rica. He it was who defended me in the trial at Tijuco. He never doubted of the justice of my cause. He did all he could to save me. Twenty years later, when he had become chief justice at Manaos, I let him know who I was, where I was, and what I wished to attempt. His opinion about me had not changed, and it was at his advice I left the fazenda, and came in person to proceed with my rehabilitation. But death had unfortunately struck him, and maybe I shall be lost, sir, if in Judge Jarriquez I do not find another Judge Ribeiro."

The magistrate, appealed to so directly, was about to start up in defiance of all the traditions of the judicial bench, but he managed to restrain himself, and was contented with muttering:

"Very strong, indeed; very strong!"

Judge Jarriquez was evidently hard of heart, and proof against all surprise.

At this moment a guard entered the room, and handed a sealed packet to the magistrate.

He broke the seal and drew a letter from the envelope. He opened it and read it, not without a certain contraction of his eyebrows, and then said:

"I have no reason for hiding from you, Joam Dacosta, that this is the letter you have been speaking about, addressed by you to Judge Ribeiro and sent on to me. I have, therefore, no reason to doubt what you have said on the subject."

"Not only on that subject," answered Dacosta, "but on the subject of all the circumstances of my life which I have brought to your knowledge, and which are none of them open to question."

"Eh! Joam Dacosta," quickly replied Judge Jarriquez. "You protest your innocence; but all prisoners do as much! After all, you only offer moral presumptions. Have you any material proof?"

"Perhaps I have," answered Joam Dacosta.

At these words, Judge Jarriquez left his chair. This was too much for him, and he had to take two or three circuits of the room to recover himself.

CHAPTER V. MATERIAL PROOFS

WHEN THE MAGISTRATE had again taken his place, like a man who considered he was perfectly master of himself, he leaned back in his chair, and with his head raised and his eyes looking straight in front, as though not even noticing the accused, remarked, in a tone of the most perfect indifference:

"Go on." Joam Dacosta reflected for a minute as if hesitating to resume the order of his thoughts, and then answered as follows:

"Up to the present, sir, I have only given you moral presumptions of my innocence grounded on the dignity, propriety, and honesty of the whole of my life. I should have thought that such proofs were those most worthy of being brought forward in matters of justice."

Judge Jarriquez could not restrain a movement of his shoulders, showing that such was not his opinion.

"Since they are not enough, I proceed with the material proofs which I shall perhaps be able to produce," continued Dacosta; "I say perhaps, for I do not yet know what credit to attach to them. And, sir, I have never spoken of these things to my wife or children, not wishing to raise a hope which might be destroyed."

"To the point," answered Jarriquez.

"I have every reason to believe, sir, that my arrest on the eve of the arrival of the raft at Manaos is due to information given to the chief of the police!"

"You are not mistaken, Joam Dacosta, but I ought to tell you that the information is anonymous."

"It matters little, for I know that it could only come from a scoundrel called Torres."

"And what right have you to speak in such a way of this--informer?"

"A scoundrel! Yes, sir!" replied Joam quickly. "This man, whom I received with hospitality, only came to me to propose that I should purchase his silence to offer me an odious bargain that I shall never regret having refused, whatever may be the consequences of his denunciation!"

"Always this method!" thought Judge Jarriquez; "accusing others to clear himself."

But he none the less listened with extreme attention to Joam's recital of his relations with the adventurer up to
the moment when Torres let him know that he knew and could reveal the name of the true author of the crime of Tijuco.

"And what is the name of the guilty man?" asked Jarriquez, shaken in his indifference.

"I do not know," answered Joam Dacosta. "Torres was too cautious to let it out."

"And the culprit is living?"

"He is dead."

The fingers of Judge Jarriquez tattooed more quickly, and he could not avoid exclaiming, "The man who can furnish the proof of a prisoner's innocence is always dead."

"If the real culprit is dead, sir," replied Dacosta, "Torres at least is living, and the proof, written throughout in the handwriting of the author of the crime, he has assured me is in his hands! He offered to sell it to me!"

"Eh! Joam Dacosta!" answered Judge Jarriquez, "that would not have been dear at the cost of the whole of your fortune!"

"If Torres had only asked my fortune, I would have given it to him and not one of my people would have demurred! Yes, you are right, sir; a man cannot pay too dearly for the redemption of his honor! But this scoundrel, knowing that I was at his mercy, required more than my fortune!"

"How so?"

"My daughter's hand was to be the cost of the bargain! I refused; he denounced me, and that is why I am now before you!"

"And if Torres had not informed against you," asked Judge Jarriquez--"if Torres had not met with you on your voyage, what would you have done on learning on your arrival of the death of Judge Ribeiro? Would you then have delivered yourself into the hands of justice?"

"Without the slightest hesitation," replied Joam, in a firm voice; "for, I repeat it, I had no other object in leaving Iquitos to come to Manaos."

This was said in such a tone of truthfulness that Judge Jarriquez experienced a kind of feeling making its way to that corner of the heart where convictions are formed, but he did not yet give in.

He could hardly help being astonished. A judge engaged merely in this examination, he knew nothing of what is known by those who have followed this history, and who cannot doubt but that Torres held in his hands the material proof of Joam Dacosta's innocence. They know that the document existed; that it contained this evidence; and perhaps they may be led to think that Judge Jarriquez was pitilessly incredulous. But they should remember that Judge Jarriquez was not in their position; that he was accustomed to the invariable protestations of the culprits who came before him. The document which Joam Dacosta appealed to was not produced; he did not really know if it actually existed; and to conclude, he had before him a man whose guilt had for him the certainty of a settled thing.

However, he wished, perhaps through curiosity, to drive Joam Dacosta behind his last entrenchments.

"And so," he said, "all your hope now rests on the declaration which has been made to you by Torres."

"Yes, sir, if my whole life does not plead for me."

"Where do you think Torres really is?"

"I think in Manaos."

"And you hope that he will speak--that he will consent to good-naturedly hand over to you the document for which you have declined to pay the price he asked?"

"I hope so, sir," replied Joam Dacosta; "the situation now is not the same for Torres; he has denounced me, and consequently he cannot retain any hope of resuming his bargaining under the previous conditions. But this document might still be worth a fortune if, supposing I am acquitted or executed, it should ever escape him. Hence his interest is to sell me the document, which can thus not injure him in any way, and I think he will act according to his interest."

The reasoning of Joam Dacosta was unanswerable, and Judge Jarriquez felt it to be so. He made the only possible objection.

"The interest of Torres is doubtless to sell you the document--if the document exists."

"If it does not exist," answered Joam Dacosta, in a penetrating voice, "in trusting to the justice of men, I must put my trust only in God!"

At these words Judge Jarriquez rose, and, in not quite such an indifferent tone, said, "Joam Dacosta, in examining you here, in allowing you to relate the particulars of your past life and to protest your innocence, I have gone further than my instructions allow me. An information has already been laid in this affair, and you have appeared before the jury at Villa Rica, whose verdict was given unanimously, and without even the addition of extenuating circumstances. You have been found guilty of the instigation of, and complicity in, the murder of the soldiers and the robbery of the diamonds at Tijuco, the capital sentence was pronounced on you, and it was only by flight that you escaped execution. But that you came here to deliver yourself over, or not, to the hands of justice
twenty-three years afterward, you would never have been retaken. For the last time, you admit that you are Joam Dacosta, the condemned man of the diamond arrayal?"

"I am Joam Dacosta."

"You are ready to sign this declaration?"

"I am ready."

And with a hand without a tremble Joam Dacosta put his name to the foot of the declaration and the report which Judge Jarriquez had made his clerk draw up.

"The report, addressed to the minister of justice, is to be sent off to Rio Janeiro," said the magistrate. "Many days will elapse before we receive orders to carry out your sentence. If then, as you say, Torres possesses the proof of your innocence, do all you can yourself--do all you can through your friends--do everything, so that that proof can be produced in time. Once the order arrives no delay will be possible, and justice must take its course."

Joam Dacosta bowed slightly.

"Shall I be allowed in the meantime to see my wife and children?" he asked.

"After to-day, if you wish," answered Judge Jarriquez; "you are no longer in close confinement, and they can be brought to you as soon as they apply."

The magistrate then rang the bell. The guards entered the room, and took away Joam Dacosta.

Judge Jarriquez watched him as he went out, and shook his head and muttered:

"Well, well! This is a much stranger affair than I ever thought it would be!"

CHAPTER VI. THE LAST BLOW

WHILE JOAM DACOSTA was undergoing this examination, Yaquita, from an inquiry made by Manoel, ascertained that she and her children would be permitted to see the prisoner that very day about four o'clock in the afternoon.

Yaquita had not left her room since the evening before. Minha and Lina kept near her, waiting for the time when she would be admitted to see her husband.

Yaquita Garral or Yaquita Dacosta, he would still find her the devoted wife and brave companion he had ever known her to be.

About eleven o'clock in the morning Benito joined Manoel and Fragoso, who were talking in the bow of the jangada.

"Manoel," said he, "I have a favor to ask you."

"What is it?"

"And you too, Fragoso."

"I am at your service, Mr. Benito," answered the barber.

"What is the matter?" asked Manoel, looking at his friend, whose expression was that of a man who had come to some unalterable resolution.

"You never doubt my father's innocence? Is that so?" said Benito.

"Ah!" exclaimed Fragoso. "Rather I think it was I who committed the crime."

"Well, we must now commence on the project I thought of yesterday."

"To find out Torres?" asked Manoel.

"Yes, and know from him how he found out my father's retreat. There is something inexplicable about it. Did he know it before? I cannot understand it, for my father never left Iquitos for more than twenty years, and this scoundrel is hardly thirty! But the day will not close before I know it; or, woe to Torres!"

Benito's resolution admitted of no discussion; and besides, neither Manoel nor Fragoso had the slightest thought of dissuading him.

"I will ask, then," continued Benito, "for both of you to accompany me. We shall start in a minute or two. It will not do to wait till Torres has left Manaos. He has no longer got his silence to sell, and the idea might occur to him. Let us be off!"

And so all three of them landed on the bank of the Rio Negro and started for the town.

Manaos was not so considerable that it could not be searched in a few hours. They had made up their minds to go from house to house, if necessary, to look for Torres, but their better plan seemed to be to apply in the first instance to the keepers of the taverns and lojas where the adventurer was most likely to put up. There could hardly be a doubt that the ex-captain of the woods would not have given his name; he might have personal reasons for avoiding all communication with the police. Nevertheless, unless he had left Manaos, it was almost impossible for him to escape the young fellows' search. In any case, there would be no use in applying to the police, for it was very probable—in fact, we know that it actually was so—that the information given to them had been anonymous.
For an hour Benito, Manoel, and Fragoso walked along the principal streets of the town, inquiring of the tradesmen in their shops, the tavern-keepers in their cabarets, and even the bystanders, without any one being able to recognize the individual whose description they so accurately gave.

Had Torres left Manaos? Would they have to give up all hope of coming across him?

In vain Manoel tried to calm Benito, whose head seemed on fire. Cost what it might, he must get at Torres! Chance at last favored them, and it was Fragoso who put them on the right track.

In a tavern in Holy Ghost Street, from the description which the people received of the adventurer, they replied that the individual in question had put up at the loja the evening before.

"Did he sleep here?" asked Fragoso.
"Yes," answered the tavern-keeper.
"Is he here now?"
"No. He has gone out."
"But has he settled his bill, as a man would who has gone for good?"
"By no means; he left his room about an hour ago, and he will doubtless come back to supper."
"Do you know what road he took when he went out?"
"We saw him turning toward the Amazon, going through the lower town, and you will probably meet him on that side."

Fragoso did not want any more. A few seconds afterward he rejoined the young fellows, and said:
"I am on the track."
"He is there!" exclaimed Benito.
"No; he has just gone out, and they have seen him walking across to the bank of the Amazon."
"Come on!" replied Benito.

They had to go back toward the river, and the shortest way was for them to take the left bank of the Rio Negro, down to its mouth.

Benito and his companions soon left the last houses of the town behind, and followed the bank, making a slight detour so as not to be observed from the jangada.

The plain was at this time deserted. Far away the view extended across the flat, where cultivated fields had replaced the former forests.

Benito did not speak; he could not utter a word. Manoel and Fragoso respected his silence. And so the three of them went along and looked about on all sides as they traversed the space between the bank of the Rio Negro and that of the Amazon. Three-quarters of an hour after leaving Manaos, and still they had seen nothing!

Once or twice Indians working in the fields were met with. Manoel questioned them, and one of them at length told him that a man, such as he described, had just passed in the direction of the angle formed by the two rivers at their confluence.

Without waiting for more, Benito, by an irresistible movement, strode to the front, and his two companions had to hurry on to avoid being left behind.

The left bank of the Amazon was then about a quarter of a mile off. A sort of cliff appeared ahead, hiding a part of the horizon, and bounding the view a few hundred paces in advance.

Benito, hurrying on, soon disappeared behind one of the sandy knolls.
"Quicker! quicker!" said Manoel to Fragoso. "We must not leave him alone for an instant."
And they were dashing along when a shout struck on their ears.

Had Benito caught sight of Torres? What had he seen? Had Benito and Torres already met?

Manoel and Fragoso, fifty paces further on, after swiftly running round one of the spurs of the bank, saw two men standing face to face to each other.

They were Torres and Benito.

In an instant Manoel and Fragoso had hurried up to them. It might have been supposed that in Benito's state of excitement he would be unable to restrain himself when he found himself once again in the presence of the adventurer. It was not so.

As soon as the young man saw himself face to face with Torres, and was certain that he could not escape, a complete change took place in his manner, his coolness returned, and he became once more master of himself.

The two men looked at one another for a few moments without a word.
Torres first broke silence, and, in the impudent tone habitual to him, remarked:
"Ah! How goes it, Mr. Benito Garral?"
"No, Benito Dacosta!" answered the young man.
"Quite so," continued Torres. "Mr. Benito Dacosta, accompanied by Mr. Manoel Valdez and my friend Fragoso!"
At the irritating qualification thus accorded him by the adventurer, Fragoso, who was by no means loath to do him some damage, was about to rush to the attack, when Benito, quite unmoved, held him back.

"What is the matter with you, my lad?" exclaimed Torres, retreating for a few steps. "I think I had better put myself on guard."

And as he spoke he drew from beneath his poncho his manchetta, the weapon, adapted at will for offense or defense, which a Brazilian is never without. And then, slightly stooping, and planted firmly on his feet, he waited for what was to follow.

"I have come to look for you, Torres," said Benito, who had not stirred in the least at this threatening attitude.

"To look for me?" answered the adventurer. "It is not very difficult to find me. And why have you come to look for me?"

"To know from your own lips what you appear to know of the past life of my father."

"Really?"

"Yes. I want to know how you recognized him, why you were prowling about our fazenda in the forest of Iquitos, and why you were waiting for us at Tabatinga."

"Well! it seems to me nothing could be clearer!" answered Torres, with a grin. "I was waiting to get a passage on the jangada, and I went on board with the intention of making him a very simple proposition--which possibly he was wrong in rejecting."

At these words Manoel could stand it no longer. With pale face and eye of fire he strode up to Torres.

Benito, wishing to exhaust every means of conciliation, thrust himself between them.

"Calm yourself, Manoel!" he said. "I am calm--even I."

And then continuing:

"Quite so, Torres; I know the reason of your coming on board the raft. Possessed of a secret which was doubtless given to you, you wanted to make it a means of extortion. But that is not what I want to know at present."

"What is it, then?"

"I want to know how you recognized Joam Dacosta in the fazenda of Iquitos?"

"How I recognized him?" replied Torres. "That is my business, and I see no reason why I should tell you. The important fact is, that I was not mistaken when I denounced in him the real author of the crime of Tijuco!"

"You say that to me?" exclaimed Benito, who began to lose his self-possession.

"I will tell you nothing," returned Torres; "Joam Dacosta declined my propositions! He refused to admit me into his family! Well! now that his secret is known, now that he is a prisoner, it is I who refuse to enter his family, the family of a thief, of a murderer, of a condemned felon, for whom the gallows now waits!"

"Scoundrel!" exclaimed Benito, who drew his manchetta from his belt and put himself in position.

Manoel and Fragoso, by a similar movement, quickly drew their weapons.

"Three against one!" said Torres.

"No! one against one!" answered Benito.

"Really! I should have thought an assassination would have better suited an assassin's son!"

"Torres!" exclaimed Benito, "defend yourself, or I will kill you like a mad dog!"

"Mad! so be it!" answered Torres. "But I bite, Benito Dacosta, and beware of the wounds!"

And then again grasping his manchetta, he put himself on guard and ready to attack his enemy.

Benito had stepped back a few paces.

"Torres," he said, regaining all his coolness, which for a moment he had lost; "you were the guest of my father, you threatened him, you betrayed him, you denounced him, you accused an innocent man, and with God's help I am going to kill you!"

Torres replied with the most insolent smile imaginable. Perhaps at the moment the scoundrel had an idea of stopping any struggle between Benito and him, and he could have done so. In fact he had seen that Joam Dacosta had said nothing about the document which formed the material proof of his innocence.

Had he revealed to Benito that he, Torres, possessed this proof, Benito would have been that instant disarmed. But his desire to wait till the very last moment, so as to get the very best price for the document he possessed, the recollection of the young man's insulting words, and the hate which he bore to all that belonged to him, made him forget his own interest.

In addition to being thoroughly accustomed to the manchetta, which he often had had occasion to use, the adventurer was strong, active, and artful, so that against an adversary who was scarcely twenty, who could have neither his strength nor his dexterity, the chances were greatly in his favor.

Manoel by a last effort wished to insist on fighting him instead of Benito.

"No, Manoel," was the cool reply, "it is for me alone to avenge my father, and as everything here ought to be in order, you shall be my second."
"Benito!"
"As for you, Fragoso, you will not refuse if I ask you to act as second for that man?"
"So be it," answered Fragoso, "though it is not an office of honor. Without the least ceremony," he added, "I would have killed him like a wild beast."

The place where the duel was about to take place was a level bank about fifty paces long, on the top of a cliff rising perpendicularly some fifty feet above the Amazon. The river slowly flowed at the foot, and bathed the clumps of reeds which bristled round its base.

There was, therefore, none too much room, and the combatant who was the first to give way would quickly be driven over into the abyss.

The signal was given by Manoel, and Torres and Benito stepped forward.

Benito had complete command over himself. The defender of a sacred cause, his coolness was unruffled, much more so than that of Torres, whose conscience insensible and hardened as it was, was bound at the moment to trouble him.

The two met, and the first blow came from Benito. Torres parried it. They then jumped back, but almost at the same instant they rushed together, and with their left hands seized each other by the shoulder--never to leave go again.

Torres, who was the strongest, struck a side blow with his manchetta which Benito could not quite parry. His left side was touched, and his poncho was reddened with his blood. But he quickly replied, and slightly wounded Torres in the hand.

Several blows were then interchanged, but nothing decisive was done. The ever silent gaze of Benito pierced the eyes of Torres like a sword blade thrust to his very heart. Visibly the scoundrel began to quail. He recoiled little by little, pressed back by his implacable foe, who was more determined on taking the life of his father's denouncer than in defending his own. To strike was all that Benito longed for; to parry was all that the other now attempted to do.

Soon Torres saw himself thrust to the very edge of the bank, at a spot where, slightly scooped away, it overhung the river. He perceived the danger; he tried to retake the offensive and regain the lost ground. His agitation increased, his looks grew livid. At length he was obliged to stoop beneath the arm which threatened him.

"Die, then!" exclaimed Benito.

The blow was struck full on its chest, but the point of the manchetta was stopped by a hard substance hidden beneath the poncho of the adventurer.

Benito renewed his attack, and Torres, whose return thrust did not touch his adversary, felt himself lost. He was again obliged to retreat. Then he would have shouted--shouted that the life of Joam Dacosta depended on his own! He had not time!

A second thrust of the manchetta pierced his heart. He fell backward, and the ground suddenly failing him, he was precipitated down the cliff. As a last effort his hands convulsively clutched at a clump of reeds, but they could not stop him, and he disappeared beneath the waters of the river.

Benito was supported on Manoel's shoulder; Fragoso grasped his hands. He would not even give his companions time to dress his wound, which was very slight.

"To the jangada!" he said, "to the jangada!"

Manoel and Fragoso with deep emotion followed him without speaking a word.

A quarter of an hour afterward the three reached the bank to which the raft was moored. Benito and Manoel rushed into the room where were Yaquita and Minha, and told them all that had passed.

"My son!" "My brother!"

The words were uttered at the same moment.

"To the prison!" said Benito.

"Yes! Come! come!" replied Yaquita.

Benito, followed by Manoel, hurried along his mother, and half an hour later they arrived before the prison. Owing to the order previously given by Judge Jarriquez they were immediately admitted, and conducted to the chamber occupied by the prisoner.

The door opened. Joam Dacosta saw his wife, his son, and Manoel enter the room.

"Ah! Joam, my Joam!" exclaimed Yaquita.

"Yaquita! my wife! my children!" replied the prisoner, who opened his arms and pressed them to his heart.

"My Joam, innocent!"

"Innocent and avenged!" said Benito.

"Avenged? What do you mean?"

"Torres is dead, father; killed by my hand!"

"Dead!--Torres!--Dead!" gasped Joam Dacosta. "My son! You have ruined me!"
CHAPTER VII. RESOLUTIONS

A FEW HOURS later the whole family had returned to the raft, and were assembled in the large room. All were there, except the prisoner, on whom the last blow had just fallen. Benito was quite overwhelmed, and accused himself of having destroyed his father, and had it not been for the entreaties of Yaquita, of his sister, of Padre Passanha, and of Manoel, the distracted youth would in the first moments of despair have probably made away with himself. But he was never allowed to get out of sight; he was never left alone. And besides, how could he have acted otherwise? Ah! why had not Joam Dacosta told him all before he left the jangada? Why had he refrained from speaking, except before a judge, of this material proof of his innocence? Why, in his interview with Manoel after the expulsion of Torres, had he been silent about the document which the adventurer pretended to hold in his hands? But, after all, what faith ought he to place in what Torres had said? Could he be certain that such a document was in the rascal's possession?

Whatever might be the reason, the family now knew everything, and that from the lips of Joam Dacosta himself. They knew that Torres had declared that the proof of the innocence of the convict of Tijuco actually existed; that the document had been written by the very hand of the author of the attack; that the criminal, seized by remorse at the moment of his death, had intrusted it to his companion, Torres; and that he, instead of fulfilling the wishes of the dying man, had made the handing over of the document an excuse for extortion. But they knew also that Torres had just been killed, and that his body was engulfed in the waters of the Amazon, and that he died without even mentioning the name of the guilty man.

Unless he was saved by a miracle, Joam Dacosta might now be considered as irrevocably lost. The death of Judge Ribeiro on the one hand, the death of Torres on the other, were blows from which he could not recover! It should here be said that public opinion at Manaos, unreasoning as it always is, was all against he prisoner. The unexpected arrest of Joam Dacosta had revived the memory of the terrible crime of Tijuco, which had lain forgotten for twenty-three years. The trial of the young clerk at the mines of the diamond arrayal, his capital sentence, his escape a few hours before his intended execution—all were remembered, analyzed, and commented on. An article which had just appeared in the _O Diario d'o Grand Para,_ the most widely circulated journal in these parts, after giving a history of the circumstances of the crime, showed itself decidedly hostile to the prisoner. Why should these people believe in Joam Dacosta's innocence, when they were ignorant of all that his friends knew—of what they alone knew?

And so the people of Manaos became excited. A mob of Indians and negroes hurried, in their blind folly, to surround the prison and roar forth tumultuous shouts of death. In this part of the two Americas, where executions under Lynch law are of frequent occurrence, the mob soon surrenders itself to its cruel instincts, and it was feared that on this occasion it would do justice with its own hands.

What a night it was for the passengers from the fazenda! Masters and servants had been affected by the blow! Were not the servants of the fazenda members of one family? Every one of them would watch over the safety of Yaquita and her people! On the bank of the Rio Negro there was a constant coming and going of the natives, evidently excited by the arrest of Joam Dacosta, and who could say to what excesses these half-barbarous men might be led?

The time, however, passed without any demonstration against the jangada.

On the morrow, the 26th of August, as soon as the sun rose, Manoel and Fragoso, who had never left Benito for an instant during this terrible night, attempted to distract his attention from his despair. After taking him aside they made him understand that there was no time to be lost—that they must make up their minds to act.

"Benito," said Manoel, "pull yourself together! Be a man again! Be a son again!"
"My father!" exclaimed Benito. "I have killed him!"
"No!" replied Manoel. "With heaven's help it is possible that all may not be lost!"
"Listen to us, Mr. Benito," said Fragoso.

The young man, passing his hand over his eyes, made a violent effort to collect himself.

"Benito," continued Manoel, "Torres never gave a hint to put us on the track of his past life. We therefore cannot tell who was the author of the crime of Tijuco, or under what conditions it was committed. To try in that direction is to lose our time."

"And time presses!" added Fragoso.

"Besides," said Manoel, "suppose we do find out who this companion of Torres was, he is dead, and he could not testify in any way to the innocence of Joam Dacosta. But it is none the less certain that the proof of this innocence exists, and there is not room to doubt the existence of a document which Torres was anxious to make the subject of a bargain. He told us so himself. The document is a complete avowal written in the handwriting of the culprit, which
relates the attack in its smallest details, and which clears our father! Yes! a hundred times, yes! The document exists!"

"But Torres does not exist!" groaned Benito, "and the document has perished with him!"

"Wait, and don't despair yet!" answered Manoel. "You remember under what circumstances we made the acquaintance of Torres? It was in the depths of the forest of Iquitos. He was in pursuit of a monkey which had stolen a metal case, which it so strangely kept, and the chase had lasted a couple of hours when the monkey fell to our guns. Now, do you think that it was for the few pieces of gold contained in the case that Torres was in such a fury to recover it? and do you not remember the extraordinary satisfaction which he displayed when we gave him back the case which we had taken out of the monkey's paw?"

"Yes! yes!" answered Benito. "This case which I held--which I gave back to him! Perhaps it contained----"

"It is more than probable! It is certain!" replied Manoel.

"And I beg to add," said Fragoso, "for now the fact recurs to my memory, that during the time you were at Ega I remained on board, at Lina's advice, to keep an eye on Torres, and I saw him--yes, I saw him--reading, an old faded paper, and muttering words which I could not understand."

"That was the document!" exclaimed Benito, who snatched at the hope--the only one that was left. "But this document; had he not put it in some place of security?"

"No," answered Manoel--"no; it was too precious for Torres to dream of parting with it. He was bound to carry it always about with him, and doubtless in that very case."

"Wait! wait, Manoel!" exclaimed Benito; "I remember--yes, I remember. During the struggle, at the first blow I struck Torres in his chest, my manchetta was stopped by some hard substance under his poncho, like a plate of metal----"

"That was the case!" said Fragoso.

"Yes," replied Manoel; "doubt is impossible! That was the case; it was in his breast-pocket."

"But the corpse of Torres?"

"We will recover it!"

"But the paper! The water will have stained it, perhaps destroyed it, or rendered it undecipherable!"

"Why," answered Manoel, "if the metal case which held it was water-tight?"

"Manoel," replied Benito, who seized on the last hope, "you are right! The corpse of Torres must be recovered! We will ransack the whole of this part of the river, if necessary, but we will recover it!"

The pilot Araujo was then summoned and informed of what they were going to do.

"Good!" replied he; "I know all the eddies and currents where the Rio Negro and the Amazon join, and we shall succeed in recovering the body. Let us take two pirogues, two ubas, a dozen of our Indians, and make a start."

Padre Passanha was then coming out of Yaquta's room.

Benito went to him, and in a few words told him what they were going to do to get possession of the document.

"Say nothing to my mother or my sister," he added; "if this last hope fails it will kill them!"

"Go, my lad, go," replied Passanha, "and may God help you in your search."

Five minutes afterward the four boats started from the raft. After descending the Rio Negro they arrived near the bank of the Amazon, at the very place where Torres, mortally wounded, had disappeared beneath the waters of the stream.

CHAPTER VIII. THE FIRST SEARCH

THE SEARCH had to commence at once, and that for two weighty reasons.

The first of these was--and this was a question of life or death--that this proof of Joam Dacosta's innocence must be produced before the arrival of the order from Rio Janeiro. Once the identity of the prisoner was established, it was impossible that such an order could be other than the order for his execution.

The second was that the body of Torres should be got out of the water as quickly as possible so as to regain undamaged the metal case and the paper it ought to contain.

At this juncture Araujo displayed not only zeal and intelligence, but also a perfect knowledge of the state of the river at its confluence with the Rio Negro.

"If Torres," he said to the young men, "had been from the first carried away by the current, we should have to drag the river throughout a large area, for we shall have a good many days to wait for his body to reappear on the surface through the effects of decomposition."

"We cannot do that," replied Manoel. "This very day we ought to succeed."

"If, on the contrary," continued the pilot, "the corpse has got stuck among the reeds and vegetation at the foot of the bank, we shall not be an hour before we find it."
"To work, then!" answered Benito.

There was but one way of working. The boats approached the bank, and the Indians, furnished with long poles, began to sound every part of the river at the base of the bluff which had served for the scene of combat.

The place had been easily recognized. A track of blood stained the declivity in its chalky part, and ran perpendicularly down into the water; and there many a clot scattered on the reeds indicated the very spot where the corpse had disappeared.

About fifty feet down stream a point jutted out from the riverside and kept back the waters in a kind of eddy, as in a large basin. There was no current whatever near the shore, and the reeds shot up out of the river unbent. Every hope then existed that Torres' body had not been carried away by the main stream. Where the bed of the river showed sufficient slope, it was perhaps possible for the corpse to have rolled several feet along the ridge, and even there no effect of the current could be traced.

The ubas and the pirogues, dividing the work among them, limited the field of their researches to the extreme edge of the eddy, and from the circumference to the center the crews' long poles left not a single point unexplored. But no amount of sounding discovered the body of the adventurer, neither among the clumps of reeds nor on the bottom of the river, whose slope was then carefully examined.

Two hours after the work had begun they had been led to think that the body, having probably struck against the declivity, had fallen off obliquely and rolled beyond the limits of this eddy, where the action of the current commenced to be felt.

"But that is no reason why we should despair," said Manoel, "still less why we should give up our search."

"Will it be necessary," exclaimed Benito, "to search the river throughout its breadth and its length?"

"Throughout its breadth, perhaps," answered Araujo, "throughout its length, no--fortunately."

"And why?" asked Manoel.

"Because the Amazon, about a mile away from its junction with the Rio Negro, makes a sudden bend, and at the same time its bed rises, so that there is a kind of natural barrier, well known to sailors as the Bar of Frias, which things floating near the surface are alone able to clear. In short, the currents are ponded back, and they cannot possibly have any effect over this depression."

This was fortunate, it must be admitted. But was Araujo mistaken? The old pilot of the Amazon could be relied on. For the thirty years that he had followed his profession the crossing of the Bar of Frias, where the current was increased in force by its decrease in depth, had often given him trouble. The narrowness of the channel and the elevation of the bed made the passage exceedingly difficult, and many a raft had there come to grief.

And so Araujo was right in declaring that if the corpse of Torres was still retained by its weight on the sandy bed of the river, it could not have been dragged over the bar. It is true that later on, when, on account of the expansion of the gases, it would again rise to the surface, the current would bear it away, and it would then be irrevocably lost down the stream, a long way beyond the obstruction. But this purely physical effect would not take place for several days.

They could not have applied to a man who was more skillful or more conversant with the locality than Araujo, and when he affirmed that the body could not have been borne out of the narrow channel for more than a mile or so, they were sure to recover it if they thoroughly sounded that portion of the river.

Not an island, not an islet, checked the course of the Amazon in these parts. Hence, when the foot of the two banks had been visited up to the bar, it was in the bed itself, about five hundred feet in width, that more careful investigations had to be commenced.

The way the work was conducted was this. The boats taking the right and left of the Amazon lay alongside the banks. The reeds and vegetation were tried with the poles. Of the smallest ledges in the banks in which a body could rest, not one escaped the scrutiny of Araujo and his Indians.

But all this labor produced no result, and half the day had elapsed without the body being brought to the surface of the stream.

An hour's rest was given to the Indians. During this time they partook of some refreshment, and then they returned to their task.

Four of the boats, in charge of the pilot, Benito, Fragoso, and Manoel, divided the river between the Rio Negro and the Bar of Frias into four portions. They set to work to explore its very bed. In certain places the poles proved insufficient to thoroughly search among the deeps, and hence a few dredges--or rather harrows, made of stones and old iron, bound round with a solid bar--were taken on board, and when the boats had pushed off these rakes were thrown in and the river bottom stirred up in every direction.

It was in this difficult task that Benito and his companions were employed till the evening. The ubas and pirogues, worked by the oars, traversed the whole surface of the river up to the bar of Frias.

There had been moments of excitement during this spell of work, when the harrows, catching in something at the
bottom, offered some slight resistance. They were then hauled up, but in place of the body so eagerly searched for, there would appear only heavy stones or tufts of herbage which they had dragged from their sandy bed. No one, however, had an idea of giving up the enterprise. They none of them thought of themselves in this work of salvation. Benito, Manoel, Araujo had not even to stir up the Indians or to encourage them. The gallant fellows knew that they were working for the fazender of Iquitos—for the man whom they loved, for the chief of the excellent family who treated their servants so well.

Yes; and so they would have passed the night in dragging the river. Of every minute lost all knew the value. A little before the sun disappeared, Araujo, finding it useless to continue his operations in the gloom, gave the signal for the boats to join company and return together to the confluence of the Rio Negro and regain the jangada.

The work so carefully and intelligently conducted was not, however, at an end. Manoel and Fragoso, as they came back, dared not mention their ill success before Benito. They feared that the disappointment would only force him to some act of despair.

But neither courage nor coolness deserted the young fellow; he was determined to follow to the end this supreme effort to save the honor and the life of his father, and he it was who addressed his companions, and said: "Tomorrow we will try again, and under better conditions if possible."

"Yes," answered Manoel; "you are right, Benito. We can do better. We cannot pretend to have entirely explored the river along the whole of the banks and over the whole of its bed."

"No; we cannot have done that," replied Araujo; "and I maintain what I said—that the body of Torres is there, and that it is there because it has not been carried away, because it could not be drawn over the Bar of Frias, and because it will take many days before it rises to the surface and floats down the stream. Yes, it is there, and not a demijohn of tafia will pass my lips until I find it!"

This affirmation from the pilot was worth a good deal, and was of a hope-inspiring nature.

However, Benito, who did not care so much for words as he did for things, thought proper to reply, "Yes, Araujo; the body of Torres is in the river, and we shall find it if—"

"If?" said the pilot.

"If it has not become the prey of the alligators!"

Manoel and Fragoso waited anxiously for Araujo's reply.

The pilot was silent for a few moments; they felt that he was reflecting before he spoke. "Mr. Benito," he said at length, "I am not in the habit of speaking lightly. I had the same idea as you; but listen. During the ten hours we have been at work have you seen a single cayman in the river?"

"Not one," said Fragoso.

"If you have not seen one," continued the pilot, "it was because there were none to see, for these animals have nothing to keep them in the white waters when, a quarter of a mile off, there are large stretches of the black waters, which they so greatly prefer. When the raft was attacked by some of these creatures it was in a part where there was no place for them to flee to. Here it is quite different. Go to the Rio Negro, and there you will see caymans by the score. Had Torres' body fallen into that tributary there might be no chance of recovering it. But it was in the Amazon that it was lost, and in the Amazon it will be found."

Benito, relieved from his fears, took the pilot's hand and shook it, and contented himself with the reply, "Tomorrow, my friends!"

Ten minutes later they were all on board the jangada. During the day Yaquit had passed some hours with her husband. But before she started, and when she saw neither the pilot, nor Manoel, nor Benito, nor the boats, she had guessed the search on which they had gone, but she said nothing to Joam Dacosta, as she hoped that in the morning she would be able to inform him of their success.

But when Benito set foot on the raft she perceived that their search had been fruitless. However, she advanced toward him. "Nothing?" she asked.

"Nothing," replied Benito. "But the morrow is left to us."

The members of the family retired to their rooms, and nothing more was said as to what had passed. Manoel tried to make Benito lie down, so as to take a few hours' rest.

"What is the good of that?" asked Benito. "Do you think I could sleep?"

CHAPTER IX. THE SECOND ATTEMPT

ON THE MORROW, the 27th of August, Benito took Manoel apart, before the sun had risen, and said to him: "Our yesterday's search was vain. If we begin again under the same conditions we may be just as unlucky."

"We must do so, however," replied Manoel.

"Yes," continued Benito; "but suppose we do not find the body, can you tell me how long it will be before it
rises to the surface?"

"If Torres," answered Manoel, "had fallen into the water living, and not mortally wounded, it would take five or six days; but as he only disappeared after being so wounded, perhaps two or three days would be enough to bring him up again."

This answer of Manoel, which was quite correct, requires some explanation. Every human body which falls into the water will float if equilibrium is established between its density and that of its liquid bed. This is well known to be the fact, even when a person does not know how to swim. Under such circumstances, if you are entirely submerged, and only keep your mouth and nose away from the water, you are sure to float. But this is not generally done. The first movement of a drowning man is to try and hold as much as he can of himself above the water; he holds up his head and lifts up his arms, and these parts of his body, being no longer supported by the liquid, do not lose that amount of weight which they would do if completely immersed. Hence an excess of weight, and eventually entire submersion, for the water makes its way to the lungs through the mouth, takes the place of the air which fills them, and the body sinks to the bottom.

On the other hand, when the man who falls into the water is already dead the conditions are different, and more favorable for his floating, for then the movements of which we have spoken are checked, and the liquid does not make its way to the lungs so copiously, as there is no attempt to respire, and he is consequently more likely to promptly reappear. Manoel then was right in drawing the distinction between the man who falls into the water living and the man who falls into it dead. In the one case the return to the surface takes much longer than in the other.

The reappearance of the body after an immersion more or less prolonged is always determined by the decomposition, which causes the gases to form. These bring about the expansion of the cellular tissues, the volume augments and the weight decreases, and then, weighing less than the water it displaces, the body attains the proper conditions for floating.

"And thus," continued Manoel, "supposing the conditions continue favorable, and Torres did not live after he fell into the water, if the decomposition is not modified by circumstances which we cannot foresee, he will not reappear before three days."

"We have not got three days," answered Benito. "We cannot wait, you know; we must try again, and in some new way."

"What can you do?" answered Manoel.

"Plunge down myself beneath the waters," replied Benito, "and search with my eyes--with my hands."

"Plunge in a hundred times--a thousand times!" exclaimed Manoel. "So be it. I think, like you, that we ought to go straight at what we want, and not struggle on with poles and drags like a blind man who only works by touch. I also think that we cannot wait three days. But to jump in, come up again, and go down again will give only a short period for the exploration. No; it will never do, and we shall only risk a second failure."

"Have you no other plan to propose, Manoel?" asked Benito, looking earnestly at his friend.

"Well, listen. There is what would seem to be a Providential circumstance that may be of use to us."

"What is that?"

"Yesterday, as we hurried through Manaos, I noticed that they were repairing one of the quays on the bank of the Rio Negro. The submarine works were being carried on with the aid of a diving-dress. Let us borrow, or hire, or buy, at any price, this apparatus, and then we may resume our researches under more favorable conditions."

"Tell Araujo, Fragoso, and our men, and let us be off," was the instant reply of Benito.

The pilot and the barber were informed of the decision with regard to Manoel's project. Both were ordered to go with the four boats and the Indians to the basin of Frias, and there to wait for the two young men.

Manoel and Benito started off without losing a moment, and reached the quay at Manaos. There they offered the contractor such a price that he put the apparatus at their service for the whole day.

"Will you not have one of my men," he asked, "to help you?"

"Give us your foreman and one of his mates to work the air-pump," replied Manoel.

"But who is going to wear the diving-dress?"

"I am," answered Benito.

"You!" exclaimed Manoel.

"I intend to do so."

It was useless to resist.

An hour afterward the raft and all the instruments necessary for the enterprise had drifted down to the bank where the boats were waiting.

The diving-dress is well known. By its means men can descend beneath the waters and remain there a certain time without the action of the lungs being in any way injured. The diver is clothed in a waterproof suit of India rubber, and his feet are attached to leaden shoes, which allow him to retain his upright position beneath the surface.
At the collar of the dress, and about the height of the neck, there is fitted a collar of copper, on which is screwed a metal globe with a glass front. In this globe the diver places his head, which he can move about at his ease. To the globe are attached two pipes; one used for carrying off the air ejected from the lungs, and which is unfit for respiration, and the other in communication with a pump worked on the raft, and bringing in the fresh air. When the diver is at work the raft remains immovable above him; when the diver moves about on the bottom of the river the raft follows his movements, or he follows those of the raft, according to his convenience.

These diving-dresses are now much improved, and are less dangerous than formerly. The man beneath the liquid mass can easily bear the additional pressure, and if anything was to be feared below the waters it was rather some cayman who might there be met with. But, as had been observed by Araujo, not one of these amphibians had been seen, and they are well known to prefer the black waters of the tributaries of the Amazon. Besides, in case of danger, the diver has always his check-string fastened to the raft, and at the least warning can be quickly hauled to the surface.

Benito, invariably very cool once his resolution was taken, commenced to put his idea into execution, and got into the diving dress. His head disappeared in the metal globe, his hand grasped a sort of iron spear with which to stir up the vegetation and detritus accumulated in the river bed, and on his giving the signal he was lowered into the stream.

The men on the raft immediately commenced to work the air-pump, while four Indians from the jangada, under the orders of Araujo, gently propelled it with their long poles in the desired direction.

The two pirogues, commanded one by Fragoso, the other by Manoel, escorted the raft, and held themselves ready to start in any direction, should Benito find the corpse of Torres and again bring it to the surface of the Amazon.

CHAPTER X. A CANNON SHOT

Benito then had disappeared beneath the vast sheet which still covered the corpse of the adventurer. Ah! If he had had the power to divert the waters of the river, to turn them into vapor, or to drain them off—if he could have made the Frias basin dry down stream, from the bar up to the influx of the Rio Negro, the case hidden in Torres' clothes would already have been in his hand! His father's innocence would have been recognized! Joam Dacosta, restored to liberty, would have again started on the descent of the river, and what terrible trials would have been avoided!

Benito had reached the bottom. His heavy shoes made the gravel on the bed crunch beneath him. He was in some ten or fifteen feet of water, at the base of the cliff, which was here very steep, and at the very spot where Torres had disappeared.

Near him was a tangled mass of reeds and twigs and aquatic plants, all laced together, which assuredly during the researches of the previous day no pole could have penetrated. It was consequently possible that the body was entangled among the submarine shrubs, and still in the place where it had originally fallen.

Hereabouts, thanks to the eddy produced by the prolongation of one of the spurs running out into the stream, the current was absolutely _nil_. Benito guided his movements by those of the raft, which the long poles of the Indians kept just over his head.

The light penetrated deep through the clear waters, and the magnificent sun, shining in a cloudless sky, shot its rays down into them unchecked. Under ordinary conditions, at a depth of some twenty feet in water, the view becomes exceedingly blurred, but here the waters seemed to be impregnated with a luminous fluid, and Benito was able to descend still lower without the darkness concealing the river bed.

The young man slowly made his way along the bank. With his iron-shod spear he probed the plants and rubbish accumulated along its foot. Flocks of fish, if we can use such an expression, escaped on all sides from the dense thickets like flocks of birds. It seemed as though the thousand pieces of a broken mirror glimmered through the waters. At the same time scores of crustaceans scampered over the sand, like huge ants hurrying from their hills.

Notwithstanding that Benito did not leave a single point of the river unexplored, he never caught sight of the object of his search. He noticed, however, that the slope of the river bed was very abrupt, and he concluded that Torres had rolled beyond the eddy toward the center of the stream. If so, he would probably still recover the body, for the current could hardly touch it at the depth, which was already great, and seemed sensibly to increase. Benito then resolved to pursue his investigations on the side where he had begun to probe the vegetation. This was why he continued to advance in that direction, and the raft had to follow him during a quarter of an hour, as had been previously arranged.

The quarter of an hour had elapsed, and Benito had found nothing. He felt the need of ascending to the surface, so as to once more experience those physiological conditions in which he could recoup his strength. In certain spots,
where the depth of the river necessitated it, he had had to descend about thirty feet. He had thus to support a pressure almost equal to an atmosphere, with the result of the physical fatigue and mental agitation which attack those who are not used to this kind of work. Benito then pulled the communication cord, and the men on the raft commenced to haul him in, but they worked slowly, taking a minute to draw him up two or three feet so as not to produce in his internal organs the dreadful effects of decompression.

As soon as the young man had set foot on the raft the metallic sphere of the diving-dress was raised, and he took a long breath and sat down to rest.

The pirogues immediately rowed alongside. Manoel, Fragoso, and Araujo came close to him, waiting for him to speak.

"Well?" asked Manoel.
"Still nothing! Nothing!"
"Have you not seen a trace?"
"Not one!"
"Shall I go down now?"
"No, Manoel," answered Benito; "I have begun; I know where to go. Let me do it!"

Benito then explained to the pilot that his intention was to visit the lower part of the bank up to the Bar of Frias, for there the slope had perhaps stopped the corpse, if, floating between the two streams, it had in the least degree been affected by the current. But first he wanted to skirt the bank and carefully explore a sort of hole formed in the slope of the bed, to the bottom of which the poles had evidently not been able to penetrate. Araujo approved of this plan, and made the necessary preparations.

Manoel gave Benito a little advice. "As you want to pursue your search on that side," he said, "the raft will have to go over there obliquely; but mind what you are doing, Benito. That is much deeper than where you have been yet; it may be fifty or sixty feet, and you will have to support a pressure of quite two atmospheres. Only venture with extreme caution, or you may lose your presence of mind, or no longer know where you are or what to do. If your head feels as if in a vice, and your ears tingle, do not hesitate to give us the signal, and we will at once haul you up. You can then begin again if you like, as you will have got accustomed to move about in the deeper parts of the river."

Benito promised to attend to these hints, of which he recognized the importance. He was particularly struck with the fact that his presence of mind might abandon him at the very moment he wanted it most.

Benito shook hands with Manoel; the sphere of the diving-dress was again screwed to his neck, the pump began to work, and the diver once more disappeared beneath the stream.

The raft was then taken about forty feet along the left bank, but as it moved toward the center of the river the current increased in strength, the ubas were moored, and the rowers kept it from drifting, so as only to allow it to advance with extreme slowness.

Benito descended very gently, and again found himself on the firm sand. When his heels touched the ground it could be seen, by the length of the haulage cord, that he was at a depth of some sixty-five or seventy feet. He was therefore in a considerable hole, excavated far below the ordinary level.

The liquid medium was more obscure, but the limpidity of these transparent waters still allowed the light to penetrate sufficiently for Benito to distinguish the objects scattered on the bed of the river, and to approach them with some safety. Besides, the sand, sprinkled with mica flakes, seemed to form a sort of reflector, and the very grains could be counted glittering like luminous dust.

Benito moved on, examining and sounding the smallest cavities with his spear. He continued to advance very slowly; the communication cord was paid out, and as the pipes which served for the inlet and outlet of the air were never tightened, the pump was worked under the proper conditions.

Benito turned off so as to reach the middle of the bed of the Amazon, where there was the greatest depression. Sometimes profound obscurity thickened around him, and then he could see nothing, so feeble was the light; but this was a purely passing phenomenon, and due to the raft, which, floating above his head, intercepted the solar rays and made the night replace the day. An instant afterward the huge shadow would be dissipated, and the reflection of the sands appear again in full force.

All the time Benito was going deeper. He felt the increase of the pressure with which his body was wrapped by the liquid mass. His respiration became less easy; the retractibility of his organs no longer worked with as much ease as in the midst of an atmosphere more conveniently adapted for them. And so he found himself under the action of physiological effects to which he was unaccustomed. The rumbling grew louder in his ears, but as his thought was always lucid, as he felt that the action of his brain was quite clear—even a little more so than usual—he delayed giving the signal for return, and continued to go down deeper still.

Suddenly, in the subdued light which surrounded him, his attention was attracted by a confused mass. It seemed
to take the form of a corpse, entangled beneath a clump of aquatic plants. Intense excitement seized him. He stepped toward the mass; with his spear he felt it. It was the carcass of a huge cayman, already reduced to a skeleton, and which the current of the Río Negro had swept into the bed of the Amazon. Benito recoiled, and, in spite of the assertions of the pilot, the thought recurred to him that some living cayman might even then be met with in the deeps near the Bar of Frias!

But he repelled the idea, and continued his progress, so as to reach the bottom of the depression.

And now he had arrived at a depth of from eighty to a hundred feet, and consequently was experiencing a pressure of three atmospheres. If, then, this cavity was also drawn blank, he would have to suspend his researches.

Experience has shown that the extreme limit for such submarine explorations lies between a hundred and twenty and a hundred and thirty feet, and that below this there is great danger, the human organism not only being hindered from performing his functions under such a pressure, but the apparatus failing to keep up a sufficient supply of air with the desirable regularity.

But Benito was resolved to go as far as his mental powers and physical energies would let him. By some strange presentiment he was drawn toward this abyss; it seemed to him as though the corpse was very likely to have rolled to the bottom of the hole, and that Torres, if he had any heavy things about him, such as a belt containing either money or arms, would have sunk to the very lowest point. Of a sudden, in a deep hollow, he saw a body through the gloom! Yes! A corpse, still clothed, stretched out like a man asleep, with his arms folded under his head!

Was that Torres? In the obscurity, then very dense, he found it difficult to see; but it was a human body that lay there, less than ten paces off, and perfectly motionless!

A sharp pang shot through Benito. His heart, for an instant, ceased to beat. He thought he was going to lose consciousness. By a supreme effort he recovered himself. He stepped toward the corpse.

Suddenly a shock as violent as unexpected made his whole frame vibrate! A long whip seemed to twine round his body, and in spite of the thick diving-dress he felt himself lashed again and again.

"A gymnotus!" he said.

It was the only word that passed his lips.

In fact, it was a _"puraque,"_ the name given by the Brazilians to the gymnotus, or electric snake, which had just attacked him.

It is well known that the gymnotus is a kind of eel, with a blackish, slimy skin, furnished along the back and tail with an apparatus composed of plates joined by vertical lamellæ, and acted on by nerves of considerable power. This apparatus is endowed with singular electrical properties, and is apt to produce very formidable results. Some of these gymnotuses are about the length of a common snake, others are about ten feet long, while others, which, however, are rare, even reach fifteen or twenty feet, and are from eight to ten inches in diameter.

Gymnotuses are plentiful enough both in the Amazon and its tributaries; and it was one of these living coils, about ten feet long, which, after uncurving itself like a bow, again attacked the diver.

Benito knew what he had to fear from this formidable animal. His clothes were powerless to protect him. The discharges of the gymnotus, at first somewhat weak, become more and more violent, and there would come a time when, exhausted by the shocks, he would be rendered powerless.

Benito, unable to resist the blows, half-dropped upon the sand. His limbs were becoming paralyzed little by little under the electric influences of the gymnotus, which lightly touched his body as it wrapped him in its folds. His arms even he could not lift, and soon his spear escaped him, and his hand had not strength enough left to pull the cord and give the signal.

Benito felt that he was lost. Neither Manoel nor his companions could suspect the horrible combat which was going on beneath them between the formidable puraque and the unhappy diver, who only fought to suffer, without any power of defending himself.

And that at the moment when a body--the body of Torres without a doubt!--had just met his view.

By a supreme instinct of self-preservation Benito uttered a cry. His voice was lost in the metallic sphere from which not a sound could escape!

And now the puraque redoubled its attacks; it gave forth shock after shock, which made Benito writhe on the sand like the sections of a divided worm, and his muscles were wrenched again and again beneath the living lash.

Benito thought that all was over; his eyes grew dim, his limbs began to stiffen.

But before he quite lost his power of sight and reason he became the witness of a phenomenon, unexpected, inexplicable, and marvelous in the extreme.

A deadened roar resounded through the liquid depths. It was like a thunder-clap, the reverberations of which rolled along the river bed, then violently agitated by the electrical discharges of the gymnotus. Benito felt himself bathed as it were in the dreadful booming which found an echo in the very deepest of the river depths.

And then a last cry escaped him, for fearful was the vision which appeared before his eyes!
The corpse of the drowned man which had been stretched on the sand arose! The undulations of the water lifted up the arms, and they swayed about as if with some peculiar animation. Convulsive throbs made the movement of the corpse still more alarming.

It was indeed the body of Torres. One of the sun’s rays shot down to it through the liquid mass, and Benito recognized the bloated, ashy features of the scoundrel who fell by his own hand, and whose last breath had left him beneath the waters.

And while Benito could not make a single movement with his paralyzed limbs, while his heavy shoes kept him down as if he had been nailed to the sand, the corpse straightened itself up, the head swayed to and fro, and disentangling itself from the hole in which it had been kept by a mass of aquatic weeds, it slowly ascended to the surface of the Amazon.

CHAPTER XI. THE CONTENTS OF THE CASE

WHAT WAS it that had happened? A purely physical phenomenon, of which the following is the explanation.

The gunboat Santa Ana, bound for Manaos, had come up the river and passed the bar at Frias. Just before she reached the _embouchure_ of the Rio Negro she hoisted her colors and saluted the Brazilian flag. At the report vibrations were produced along the surface of the stream, and these vibrations making their way down to the bottom of the river, had been sufficient to raise the corpse of Torres, already lightened by the commencement of its decomposition and the distension of its cellular system. The body of the drowned man had in the ordinary course risen to the surface of the water.

This well-known phenomenon explains the reappearance of the corpse, but it must be admitted that the arrival of the Santa Ana was a fortunate coincidence.

By a shout from Manoel, repeated by all his companions, one of the pirogues was immediately steered for the body, while the diver was at the same time hauled up to the raft.

Great was Manoel’s emotion when Benito, drawn on to the platform, was laid there in a state of complete inertia, not a single exterior movement betraying that he still lived.

Was not this a second corpse which the waters of the Amazon had given up?

As quickly as possible the diving-dress was taken off him.

Benito had entirely lost consciousness beneath the violent shocks of the gymnotus.

Manoel, distracted, called to him, breathed into him, and endeavored to recover the heart’s pulsation.

"It beats! It beats!" he exclaimed.

Yes! Benito’s heart did still beat, and in a few minutes Manoel’s efforts restored him to life.

"The body! the Body!"

Such were the first words, the only ones which escaped from Benito’s lips.

"There it is!" answered Fragoso, pointing to a pirogue then coming up to the raft with the corpse.

"But what has been the matter, Benito?" asked Manoel. "Has it been the want of air?"

"No!" said Benito; "a puraque attacked me! But the noise? the detonation?"

"A cannon shot!" replied Manoel. "It was the cannon shot which brought the corpse to the surface."

At this moment the pirogue came up to the raft with the body of Torres, which had been taken on board by the Indians. His sojourn in the water had not disfigured him very much. He was easily recognizable, and there was no doubt as to his identity.

Fragoso, kneeling down in the pirogue, had already begun to undo the clothes of the drowned man, which came away in fragments.

At the moment Torres’ right arm, which was now left bare, attracted his attention. On it there appeared the distinct scar of an old wound produced by a blow from a knife.

"That scar!" exclaimed Fragoso. "But—that is good! I remember now----"

"What?" demanded Manoel.

"A quarrel! Yes! a quarrel I witnessed in the province of Madeira three years ago. How could I have forgotten it! This Torres was then a captain of the woods. Ah! I know now where I had seen him, the scoundrel!"

"That does not matter to us now!" cried Benito. "The case! the case! Has he still got that?" and Benito was about to tear away the last coverings of the corpse to get at it.

Manoel stopped him.

"One moment, Benito," he said; and then, turning to the men on the raft who did not belong to the jangada, and whose evidence could not be suspected at any future time:

"Just take note, my friends," he said, "of what we are doing here, so that you can relate before the magistrate what has passed."
The men came up to the pirogue.

Fragoso undid the belt which encircled the body of Torres underneath the torn poncho, and feeling his breast-pocket, exclaimed:

"The case!"

A cry of joy escaped from Benito. He stretched forward to seize the case, to make sure than it contained----

"No!" again interrupted Manoel, whose coolness did not forsake him. "It is necessary that not the slightest possible doubt should exist in the mind of the magistrate! It is better that disinterested witnesses should affirm that this case was really found on the corpse of Torres!"

"You are right," replied Benito.

"My friend," said Manoel to the foreman of the raft, "just feel in the pocket of the waistcoat."

The foreman obeyed. He drew forth a metal case, with the cover screwed on, and which seemed to have suffered in no way from its sojourn in the water.

"The paper! Is the paper still inside?" exclaimed Benito, who could not contain himself.

"It is for the magistrate to open this case!" answered Manoel. "To him alone belongs the duty of verifying that the document was found within it."

"Yes, yes. Again you are right, Manoel," said Benito. "To Manaos, my friends--to Manaos!"

Benito, Manoel, Fragoso, and the foreman who held the case, immediately jumped into one of the pirogues, and were starting off, when Fragoso said:

"And the corpse?"

The pirogue stopped.

In fact, the Indians had already thrown back the body into the water, and it was drifting away down the river.

"Torres was only a scoundrel," said Benito. "If I had to fight him, it was God that struck him, and his body ought not to go unburied!"

And so orders were given to the second pirogue to recover the corpse, and take it to the bank to await its burial.

But at the same moment a flock of birds of prey, which skimmed along the surface of the stream, pounced on the floating body. They were urubus, a kind of small vulture, with naked necks and long claws, and black as crows. In South America they are known as gallinazos, and their voracity is unparalleled. The body, torn open by their beaks, gave forth the gases which inflated it, its density increased, it sank down little by little, and for the last time what remained of Torres disappeared beneath the waters of the Amazon.

Ten minutes afterward the pirogue arrived at Manaos. Benito and his companions jumped ashore, and hurried through the streets of the town. In a few minutes they had reached the dwelling of Judge Jarriquez, and informed him, through one of his servants, that they wished to see him immediately.

The judge ordered them to be shown into his study.

There Manoel recounted all that had passed, from the moment when Torres had been killed until the moment when the case had been found on his corpse, and taken from his breast-pocket by the foreman.

Although this recital was of a nature to corroborate all that Joam Dacosta had said on the subject of Torres, and of the bargain which he had endeavored to make, Judge Jarriquez could not restrain a smile of incredulity.

"There is the case, sir," said Manoel. "For not a single instant has it been in our hands, and the man who gives it to you is he who took it from the body of Torres."

The magistrate took the case and examined it with care, turning it over and over as though it were made of some precious material. Then he shook it, and a few coins inside sounded with a metallic ring. Did not, then, the case contain the document which had been so much sought after--the document written in the very hand of the true author of the crime of Tijuco, and which Torres had wished to sell at such an ignoble price to Joam Dacosta? Was this material proof of the convict's innocence irrevocably lost?

We can easily imagine the violent agitation which had seized upon the spectators of this scene. Benito could scarcely utter a word, he felt his heart ready to burst. "Open it, sir! open the case!" he at last exclaimed, in a broken voice.

Judge Jarriquez began to unscrew the lid; then, when the cover was removed, he turned up the case, and from it a few pieces of gold dropped out and rolled on the table.

"But the paper! the paper!" again gasped Benito, who clutched hold of the table to save himself from falling.

The magistrate put his fingers into the case and drew out, not without difficulty, a faded paper, folded with care, and which the water did not seem to have even touched.

"The document! that is the document!" shouted Fragoso; "that is the very paper I saw in the hands of Torres!"

Judge Jarriquez unfolded the paper and cast his eyes over it, and then he turned it over so as to examine it on the back and the front, which were both covered with writing. "A document it really is!" said he; "there is no doubt of that. It is indeed a document!"
"Yes," replied Benito; "and that is the document which proves my father's innocence!"
"I do not know that," replied Judge Jarriquez; "and I am much afraid it will be very difficult to know it."
"Why?" exclaimed Benito, who became pale as death.
"Because this document is a cryptogram, and----"
"Well?"
"We have not got the key!"

CHAPTER XII. THE DOCUMENT

THIS WAS a contingency which neither Joam Dacosta nor his people could have anticipated. In fact, as those who have not forgotten the first scene in this story are aware, the document was written in a disguised form in one of the numerous systems used in cryptography.

But in which of them?

To discover this would require all the ingenuity of which the human brain was capable.

Before dismissing Benito and his companions, Judge Jarriquez had an exact copy made of the document, and, keeping the original, handed it over to them after due comparison, so that they could communicate with the prisoner.

Then, making an appointment for the morrow, they retired, and not wishing to lose an instant in seeing Joam Dacosta, they hastened on to the prison, and there, in a short interview, informed him of all that had passed.

Joam Dacosta took the document and carefully examined it. Shaking his head, he handed it back to his son.

"Perhaps," he said, "there is therein written the proof I shall never be able to produce. But if that proof escapes me, if the whole tenor of my life does not plead for me, I have nothing more to expect from the justice of men, and my fate is in the hands of God!"

And all felt it to be so. If the document remained indecipherable, the position of the convict was a desperate one.

"We shall find it, father!" exclaimed Benito. "There never was a document of this sort yet which could stand examination. Have confidence—yes, confidence! Heaven has, so to speak, miraculously given us the paper which vindicates you, and, after guiding our hands to recover it, it will not refuse to direct our brains to unravel it."

Joam Dacosta shook hands with Benito and Manoel, and then the three young men, much agitated, retired to the jangada, where Yaquita was awaiting them.

Yaquita was soon informed of what had happened since the evening—the reappearance of the body of Torres, the discovery of the document, and the strange form under which the real culprit, the companion of the adventurer, had thought proper to write his confession—doubtless, so that it should not compromise him if it fell into strange hands.

Naturally, Lina was informed of this unexpected complication, and of the discovery made by Fragoso that Torres was an old captain of the woods belonging to the gang who were employed about the mouths of the Madeira.

"But under what circumstances did you meet him?" asked the young mulatto.

"It was during one of my runs across the province of Amazones," replied Fragoso, "when I was going from village to village, working at my trade."

"And the scar?"

"What happened was this: One day I arrived at the mission of Aranas at the moment that Torres, whom I had never before seen, had picked a quarrel with one of his comrades—and a bad lot they are!—and this quarrel ended with a stab from a knife, which entered the arm of the captain of the woods. There was no doctor there, and so I took charge of the wound, and that is how I made his acquaintance."

"What does it matter after all," replied the young girl, "that we know what Torres had been? He was not the author of the crime, and it does not help us in the least."

"No, it does not," answered Fragoso; "for we shall end by reading the document, and then the innocence of Joam Dacosta will be palpable to the eyes of all."

This was likewise the hope of Yaquita, of Benito, of Manoel, and of Minha, and, shut up in the house, they passed long hours in endeavoring to decipher the writing.

But if it was their hope—and there is no need to insist on that point—it was none the less that of Judge Jarriquez.

After having drawn up his report at the end of his examination establishing the identity of Joam Dacosta, the magistrate had sent it off to headquarters, and therewith he thought he had finished with the affair so far as he was concerned. It could not well be otherwise.

On the discovery of the document, Jarriquez suddenly found himself face to face with the study of which he was a master. He, the seeker after numerical combinations, the solver of amusing problems, the answerer of charades, rebuses, logogryphs, and such things, was at last in his true element.

At the thought that the document might perhaps contain the justification of Joam Dacosta, he felt all the instinct of the analyst aroused. Here, before his very eyes, was a cryptogram! And so from that moment he thought of
nothing but how to discover its meaning, and it is scarcely necessary to say that he made up his mind to work at it continuously, even if he forgot to eat or to drink.

After the departure of the young people, Judge Jarriquez installed himself in his study. His door, barred against every one, assured him of several hours of perfect solitude. His spectacles were on his nose, his snuff-box on the table. He took a good pinch so as to develop the finesse and sagacity of his mind. He picked up the document and became absorbed in meditation, which soon became materialized in the shape of a monologue. The worthy justice was one of those unreserved men who think more easily aloud than to himself. "Let us proceed with method," he said. "No method, no logic; no logic, no success."

Then, taking the document, he ran through it from beginning to end, without understanding it in the least.

The document contained a hundred lines, which were divided into half a dozen paragraphs.

"Hum!" said the judge, after a little reflection; "to try every paragraph, one after the other, would be to lose precious time, and be of no use. I had better select one of these paragraphs, and take the one which is likely to prove the most interesting. Which of them would do this better than the last, where the recital of the whole affair is probably summed up? Proper names might put me on the track, among others that of Joam Dacosta; and if he had anything to do with this document, his name will evidently not be absent from its concluding paragraph."

The magistrate's reasoning was logical, and he was decidedly right in bringing all his resources to bear in the first place on the gist of the cryptogram as contained in its last paragraph.

Here is the paragraph, for it is necessary to again bring the eyes of the reader so as to show how an analyst set to work to discover its meaning.

"Phyjslydqdgzgasgzzqeehxgkfndrxujuglcytdxvksbxhhuypohdvyrmhuhpuydkjomphetozslntpmvffovpdajxhynojjgygaymexynuqlnmvlyfgsuzmqitzlbqygsqbvncrdrgruzbirmxyuyhqhpzdrrgcrohepxuxlfvrlplphonthvddqfhqsntzhhhhnhfempqkyuuektogzgkyuumfvljdqdpzzqykrplxhxqyrmvklomhhotozvdkspssuvjhd."_

At the outset, Judge Jarriquez noticed that the lines of the document were not divided either into words or phrases, and that there was a complete absence of punctuation. This fact could but render the reading of the document more difficult.

"Let us see, however," he said, "if there is not some assemblage of letters which appears to form a word--I mean a pronounceable word, whose number of consonants is in proportion to its vowels. And at the beginning I see the word _phy_; further on the word _gas_. Hallow! _ujugi_. Does that mean the African town on the banks of Tanganyika? What has that to do with all this? Further on here is the word _ypo_. Is it Greek, then? Close by here is _rym_ and _puy_; and _jox_; and _pheto_ and _jyggay_; and _mv_; and _qurz_. And before that we have got _red_ and _let_. That is good! those are two English words. Then _ohe--syk;_ then _rym_ once more, and then the word _oto._"

Judge Jarriquez let the paper drop, and thought for a few minutes.

"All the words I see in this thing seem queer!" he said. "In fact, there is nothing to give a clue to their origin. Some look like Greek, some like Dutch; some have an English twist, and some look like nothing at all! To say nothing of these series of consonants which are not wanted in any human pronunciation. Most assuredly it will not be very easy to find the key to this cryptogram."

The magistrate's fingers commenced to beat a tattoo on his desk--a kind of reveille to arouse his dormant faculties.

"Let us see," he said, "how many letters there are in the paragraph."

He counted them, pen in hand.

"Two hundred and seventy-six!" he said. "Well, now let us try what proportion these different letters bear to each other."

This occupied him for some time. The judge took up the document, and, with his pen in his hand, he noted each letter in alphabetical order.

In a quarter of an hour he had obtained the following table:

```
<table>
<thead>
<tr>
<th>Letter</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>3 times</td>
</tr>
<tr>
<td>b</td>
<td>4 times</td>
</tr>
<tr>
<td>c</td>
<td>3 times</td>
</tr>
<tr>
<td>d</td>
<td>16 times</td>
</tr>
<tr>
<td>e</td>
<td>9 times</td>
</tr>
<tr>
<td>f</td>
<td>10 times</td>
</tr>
<tr>
<td>g</td>
<td>13 times</td>
</tr>
<tr>
<td>h</td>
<td>23 times</td>
</tr>
<tr>
<td>i</td>
<td>4 times</td>
</tr>
<tr>
<td>j</td>
<td>8 times</td>
</tr>
<tr>
<td>k</td>
<td>9 times</td>
</tr>
<tr>
<td>l</td>
<td>1 time</td>
</tr>
<tr>
<td>m</td>
<td>9 times</td>
</tr>
<tr>
<td>n</td>
<td>9 times</td>
</tr>
<tr>
<td>o</td>
<td>12 times</td>
</tr>
<tr>
<td>p</td>
<td>16 times</td>
</tr>
<tr>
<td>q</td>
<td>16 times</td>
</tr>
<tr>
<td>r</td>
<td>12 times</td>
</tr>
<tr>
<td>s</td>
<td>10 times</td>
</tr>
<tr>
<td>t</td>
<td>8 times</td>
</tr>
<tr>
<td>u</td>
<td>17 times</td>
</tr>
<tr>
<td>v</td>
<td>13 times</td>
</tr>
<tr>
<td>w</td>
<td>12 times</td>
</tr>
<tr>
<td>x</td>
<td>19 times</td>
</tr>
<tr>
<td>y</td>
<td>12 times</td>
</tr>
<tr>
<td>z</td>
<td>12 times</td>
</tr>
</tbody>
</table>
```

"Ah, ah!" he exclaimed. "One thing strikes me at once, and that is that in this paragraph all the letters of the alphabet are not used. That is very strange. If we take up a book and open it by chance it will be very seldom that we shall hit upon two hundred and seventy-six letters without all the signs of the alphabet figuring among them. After all, it may be chance," and then he passed to a different train of thought. "One important point is to see if the vowels and consonants are in their normal proportion."
And so he seized his pen, counted up the vowels, and obtained the following result:
\[ \begin{array}{l}
_a = 3 \text{ times } \_e = 9 \quad \_i = 4 \quad \_o = 12 \quad \_u = 17 \quad \_y = 19 \\
\end{array} \]

"And thus there are in this paragraph, after we have done our subtraction, sixty-four vowels and two hundred and twelve consonants. Good! that is the normal proportion. That is about a fifth, as in the alphabet, where there are six vowels among twenty-six letters. It is possible, therefore, that the document is written in the language of our country, and that only the signification of each letter is changed. If it has been modified in regular order, and a \_b\_ is always represented by an \_l\_ and \_o\_ by a \_v\_, a \_g\_ by a \_k\_, an \_u\_ by an \_r\_, etc., I will give up my judgeship if I do not read it. What can I do better than follow the method of that great analytical genius, Edgar Allan Poe?"

Judge Jarriquez herein alluded to a story by the great American romancer, which is a masterpiece. Who has not read the "Gold Bug?" In this novel a cryptogram, composed of ciphers, letters, algebraic signs, asterisks, full-stops, and commas, is submitted to a truly mathematical analysis, and is deciphered under extraordinary conditions, which the admirers of that strange genius can never forget. On the reading of the American document depended only a treasure, while on that of this one depended a man's life. Its solution was consequently all the more interesting.

The magistrate, who had often read and re-read his "Gold Bug," was perfectly acquainted with the steps in the analysis so minutely described by Edgar Poe, and he resolved to proceed in the same way on this occasion. In doing so he was certain, as he had said, that if the value or signification of each letter remained constant, he would, sooner or later, arrive at the solution of the document.

"What did Edgar Poe do?" he repeated. "First of all he began by finding out the sign--here there are only letters, let us say the letter--which was reproduced the ofteneast. I see that that is \_h\_ for it is met with twenty-three times. This enormous proportion shows, to begin with, that \_h\_ does not stand for \_h\_, but, on the contrary, that it represents the letter which recurs most frequently in our language, for I suppose the document is written in Portuguese. In English or French it would certainly be \_e\_, in Italian it would be \_i\_ or \_a\_ in Portuguese it will be \_a\_ or \_o\_. Now let us say that it signifies \_a\_ or \_o\_."

After this was done, the judge found out the letter which recurred most frequently after \_h\_ and so on, and he formed the following table:
\[ \begin{array}{l}
\_h\_ = 23 \text{ times } \_y\_ = 19 \quad \_u\_ = 17 \quad \_d\_ p \_q\_ = 16 \quad \_g\_ v\_ = 13 \quad \_o\_ r \_x\_ z\_ = 12 \quad \_f\_ s\_ = 10 \quad \_e\_ k\_ l\_ m\_ n\_ = 9 \quad \_j\_ t\_ = 8 \quad \_b\_ i\_ = 8 \quad \_a\_ c\_ = 8 \\
\end{array} \]

"Now the letter \_a\_ only occurs thrice!" exclaimed the judge, "and it ought to occur the ofteneast. Ah! that clearly proves that the meaning had been changed. And now, after \_a\_ or \_o\_ what are the letters which figure ofteneast in our language? Let us see," and Judge Jarriquez, with truly remarkable sagacity, which denoted a very observant mind, started on this new quest. In this he was only imitating the American romancer, who, great analyst as he was, had, by simple induction, been able to construct an alphabet corresponding to the signs of the cryptogram and by means of it to eventually read the pirate's parchment note with ease.

The magistrate set to work in the same way, and we may affirm that he was no whit inferior to his illustrious master. Thanks to his previous work at logogryphs and squares, rectangular arrangements and other enigmas, which depend only on an arbitrary disposition of the letters, he was already pretty strong in such mental pastimes. On this occasion he sought to establish the order in which the letters were reproduced--vowels first, consonants afterward.

Three hours had elapsed since he began. He had before his eyes an alphabet which, if his procedure were right, would give him the right meaning of the letters in the document. He had only to successively apply the letters of his alphabet to those of his paragraph. But before making this application some slight emotion seized upon the judge. He fully experienced the intellectual gratification--much greater than, perhaps, would be thought--of the man who, after hours of obstinate endeavor, saw the impatiently sought-for sense of the logogryph coming into view.

"Now let us try," he said; "and I shall be very much surprised if I have not got the solution of the enigma!"

Judge Jarriquez took off his spectacles and wiped the glasses; then he put them back again and went over the table. His special alphabet was in one hand, the cryptogram in the other. He commenced to write under the first line of the paragraph the true letters, which, according to him, ought to correspond exactly with each of the cryptographic letters. As with the first line so did he with the second, and the third, and the fourth, until he reached the end of the paragraph.

Oddity as he was, he did not stop to see as he wrote if the assemblage of letters made intelligible words. No; during the first stage his mind refused all verification of that sort. What he desired was to give himself the ecstasy of reading it all straight off at once.

And now he had done.
"Let us read!" he exclaimed.

And he read. Good heavens! what cacophony! The lines he had formed with the letters of his alphabet had no more sense in them than those of the document! It was another series of letters, and that was all. They formed no word; they had no value. In short, they were just as hieroglyphic.
CHAPTER XIII. IS IT A MATTER OF FIGURES?

IT WAS SEVEN o'clock in the evening. Judge Jarriquez had all the time been absorbed in working at the puzzle—and was no further advanced—and had forgotten the time of repast and the time of repose, when there came a knock at his study door.

It was time. An hour later, and all the cerebral substance of the vexed magistrate would certainly have evaporated under the intense heat into which he had worked his head.

At the order to enter—which was given in an impatient tone—the door opened and Manoel presented himself.

The young doctor had left his friends on board the jangada at work on the indecipherable document, and had come to see Judge Jarriquez. He was anxious to know if he had been fortunate in his researches. He had come to ask if he had at length discovered the system on which the cryptogram had been written.

The magistrate was not sorry to see Manoel come in. He was in that state of excitement that solitude was exasperating to him. He wanted some one to speak to, some one as anxious to penetrate the mystery as he was. Manoel was just the man.

"Sir," said Manoel as he entered, "one question! Have you succeeded better than we have?"

"Sit down first," exclaimed Judge Jarriquez, who got up and began to pace the room. "Sit down. If we are both of us standing, you will walk one way and I shall walk the other, and the room will be too narrow to hold us."

Manoel sat down and repeated his question.

"No! I have not had any success!" replied the magistrate; "I do not think I am any better off. I have got nothing to tell you; but I have found out a certainty."

"What is that, sir?"

"That the document is not based on conventional signs, but on what is known in cryptology as a cipher, that is to say, on a number."

"Well, sir," answered Manoel, "cannot a document of that kind always be read?"

"Yes," said Jarriquez, "if a letter is invariably represented by the same letter; if an _a_ for example, is always a _p_, and a _p_ is always an _x_; if not, it cannot."

"And in this document?"

"In this document the value of the letter changes with the arbitrarily selected cipher which necessitates it. So a _b_ will in one place be represented by a _k_ will later on become a _z_ later on an _u_ or an _n_ or an _f_ or any other letter."

"And then?"

"And then, I am sorry to say, the cryptogram is indecipherable."

"Indecipherable!" exclaimed Manoel. "No, sir; we shall end by finding the key of the document on which the man's life depends."

Manoel had risen, a prey to the excitement he could not control; the reply he had received was too hopeless, and he refused to accept it for good.

At a gesture from the judge, however, he sat down again, and in a calmer voice asked:

"And in the first place, sir, what makes you think that the basis of this document is a number, or, as you call it, a cipher?"

"Listen to me, young man," replied the judge, "and you will be forced to give in to the evidence."

The magistrate took the document and put it before the eyes of Manoel and showed him what he had done.

"I began," he said, "by treating this document in the proper way, that is to say, logically, leaving nothing to chance. I applied to it an alphabet based on the proportion the letters bear to one another which is usual in our language, and I sought to obtain the meaning by following the precepts of our immortal analyst, Edgar Poe. Well, what succeeded with him collapsed with me."

"Collapsed!" exclaimed Manoel.

"Yes, my dear young man, and I at once saw that success sought in that fashion was impossible. In truth, a stronger man than I might have been deceived."

"But I should like to understand," said Manoel, "and I do not----"

"Take the document," continued Judge Jarriquez; "first look at the disposition of the letters, and read it through."

Manoel obeyed.

"Do you not see that the combination of several of the letters is very strange?" asked the magistrate.

"I do not see anything," said Manoel, after having for perhaps the hundredth time read through the document.

"Well! study the last paragraph! There you understand the sense of the whole is bound to be summed up. Do you
see anything abnormal?"

"Nothing."

"There is, however, one thing which absolutely proves that the language is subject to the laws of number."

"And that is?"

"That is that you see three _h's_ coming together in two different places."

What Jarriquez said was correct, and it was of a nature to attract attention. The two hundred and fourth, two hundred and fifth, and two hundred and sixth letters of the paragraph, and the two hundred and fifty-eighth, two hundred and fifty-ninth, and two hundred and sixtieth letters of the paragraph were consecutive _h's_. At first this peculiarity had not struck the magistrate.

"And that proves?" asked Manoel, without divining the deduction that could be drawn from the combination.

"That simply proves that the basis of the document is a number. It shows _à priori_ that each letter is modified in virtue of the ciphers of the number and according to the place which it occupies."

"And why?"

"Because in no language will you find words with three consecutive repetitions of the letter _h._"

Manoel was struck with the argument; he thought about it, and, in short, had no reply to make.

"And had I made the observation sooner," continued the magistrate, "I might have spared myself a good deal of trouble and a headache which extends from my occiput to my sinciput."

"But, sir," asked Manoel, who felt the little hope vanishing on which he had hitherto rested, "what do you mean by a cipher?"

"Tell me a number."

"Any number you like.

"Give me an example and you will understand the explanation better."

Judge Jarriquez sat down at the table, took up a sheet of paper and a pencil, and said:

"Now, Mr. Manoel, let us choose a sentence by chance, the first that comes; for instance:

_Judge Jarriquez has an ingenious mind._"

I write this phrase so as to space the letters different and I get:

_Judgejarriquezhasaningeniousmind._"

"That done," said the magistrate, to whom the phrase seemed to contain a proposition beyond dispute, looking Manoel straight in the face, "suppose I take a number by chance, so as to give a cryptographic form to this natural succession of words; suppose now this word is composed of three ciphers, and let these ciphers be 2, 3, and 4. Now on the line below I put the number 234, and repeat it as many times as are necessary to get to the end of the phrase, and so that every cipher comes underneath a letter. This is what we get:

_Judgejarriquezhasaningeniousmind._

4 2 3 4 And now, Mr. Manoel, replacing each letter by the letter in advance of it in alphabetical order according to the value of the ciphers, we get:

_j_ + 2 = _l_ _u_ + 3 = _x_ _d_ + 4 = _h_ _g_ + 2 = _i_ _e_ + 3 = _h_ _j_ + 4 = _n_ _a_ + 2 = _c_ _r_ + 3 = _u_ _r_ + 4 = _v_ _i_ + 2 = _k_ _q_ + 3 = _t_ _u_ + 4 = _y_ _e_ + 2 = _g_ _a_ + 3 = _c_ _h_ + 4 = _t_ _a_ + 2 = _c_ _s_ + 3 = _v_ _a_ + 4 = _e_ _n_ + 2 = _p_ _i_ + 3 = _l_ _n_ + 4 = _r_ _g_ + 2 = _i_ _e_ + 3 = _h_ _n_ + 4 = _r_ _i_ + 2 = _k_ _o_ + 3 = _r_ _u_ + 4 = _y_ _s_ + 2 = _u_ and so on.

"If, on account of the value of the ciphers which compose the number I come to the end of the alphabet without having enough complementary letters to deduct, I begin again at the beginning. That is what happens at the end of my name when the _z_ is replaced by the 3. As after _z_ the alphabet has no more letters, I commence to count from _a_, and so get the _c_. That done, when I get to the end of this cryptographic system, made up of the 234—which was arbitrarily selected, do not forget!—the phrase which you recognize above is replaced by

_łxhihncuvktygclvhrkrympg._

"And now, young man, just look at it, and do you not think it is very much like what is in the document? Well, what is the consequence? Why, that the signification of the letters depends on a cipher which chance puts beneath them, and the cryptographic letter which answers to a true one is not always the same. So in this phrase the first _j_ is represented by an _l_, the second by an _n_; the first _e_ by an _h_; the second _a_ by _g_; the third by _r_; the first _d_ is represented by an _h_; the last by _a_; the first _u_ by an _x_; the last by _y_; the first and second _a's_ by _c_ hak, the last by _e_; and in my own name one _r_ is represented by _u_ the other by _v_; and so on. Now do you see that if you do not know the cipher 234 you will never be able to read the lines, and consequently if we do not know the number of the document it remains undecipherable."

On hearing the magistrate reason with such careful logic, Manoel was at first overwhelmed, but, raising his head, he exclaimed:

"No, sir, I will not renounce the hope of finding the number!"
"We might have done so," answered Judge Jarriquez, "if the lines of the document had been divided into words."

"And why?"

"For this reason, young man. I think we can assume that in the last paragraph all that is written in these earlier paragraphs is summed up. Now I am convinced that in it will be found the name of Joam Dacosta. Well, if the lines had been divided into words, in trying the words one after the other--I mean the words composed of seven letters, as the name of Dacosta is--it would not have been impossible to evolve the number which is the key of the document."

"Will you explain to me how you ought to proceed to do that, sir?" asked Manoel, who probably caught a glimpse of one more hope.

"Nothing can be more simple," answered the judge. "Let us take, for example, one of the words in the sentence we have just written--my name, if you like. It is represented in the cryptogram by this queer succession of letters, _ncuvtkygc_. Well, arranging these letters in a column, one under the other, and then placing against them the letters of my name and deducting one from the other the numbers of their places in alphabetical order, I see the following result:

Between _n_ and _j_ we have 4 letters -- _c_ -- _a_ -- 2 -- _u_ -- _r_ -- 3 -- _v_ -- _r_ -- 4 -- _k_ -- _l_ -- 2 -- _t_ -- _q_ -- 3 -- _y_ -- _u_ -- 4 -- _g_ -- _e_ -- 2 -- _c_ -- _z_ -- 3 -- 2 -- _r_ -- _q_ -- 3 -- _y_ -- _u_ -- 4 -- _g_ -- _e_ -- 2 -- _c_ -- _z_ -- 3 --

"Now what is the column of ciphers made up of that we have got by this simple operation? Look here! 423 423 423, that is to say, of repetitions of the numbers 423, or 234, or 342."

"Yes, that is it!" answered Manoel.

"You understand, then, by this means, that in calculating the true letter from the false, instead of the false from the true, I have been able to discover the number with ease; and the number I was in search of is really the 234 which I took as the key of my cryptogram."

"Well, sir!" exclaimed Manoel, "if that is so, the name of Dacosta is in the last paragraph; and taking successively each letter of those lines for the first of the seven letters which compose his name, we ought to get----"

"That would be impossible," interrupted the judge, "except on one condition."

"What is that?"

"That the first cipher of the number should happen to be the first letter of the word Dacosta, and I think you will agree with me that that is not probable."

"Quite so!" sighed Manoel, who, with this improbability, saw the last chance vanish.

"And so we must trust to chance alone," continued Jarriquez, who shook his head, "and chance does not often do much in things of this sort."

"But still," said Manoel, "chance might give us this number."

"This number," exclaimed the magistrate--"this number? But how many ciphers is it composed of? Of two, or three, or four, or nine, or ten? Is it made of different ciphers only or of ciphers in different order many times repeated? Do you not know, young man, that with the ordinary ten ciphers, using all at a time, but without any repetition, you can make three million two hundred and sixty-eight thousand and eight hundred different numbers, and that if you use the same cipher more than once in the number, these millions of combinations will be enormously increased! And do you not know that if we employ every one of the five hundred and twenty-five thousand and six hundred minutes of which the year is composed to try at each of these numbers, it would take you six years, and that you would want three centuries if each operation took you an hour? No! You ask the impossible!"

"Impossible, sir?" answered Manoel. "An innocent man has been branded as guilty, and Joam Dacosta is to lose his life and his honor while you hold in your hands the material proof of his innocence! That is what is impossible!"

"Ah! young man!" exclaimed Jarriquez, "who told you, after all, that Torres did not tell a lie? Who told you that he really did have in his hands a document written by the author of the crime? that this paper was the document, and that this document refers to Joam Dacosta?"

"Who told me so?" repeated Manoel, and his face was hidden in his hands.

In fact, nothing could prove for certain that the document had anything to do with the affair in the diamond province. There was, in fact, nothing to show that it was not utterly devoid of meaning, and that it had been imagined by Torres himself, who was as capable of selling a false thing as a true one!

"It does not matter, Manoel," continued the judge, rising; "it does not matter! Whatever it may be to which the document refers, I have not yet given up discovering the cipher. After all, it is worth more than a logogryph or a rebus!"

At these words Manoel rose, shook hands with the magistrate, and returned to the jangada, feeling more hopeless when he went back than when he set out.

CHAPTER XIV. CHANCE!
A COMPLETE change took place in public opinion on the subject of Joam Dacosta. To anger succeeded pity. The population no longer thronged to the prison of Manaos to roar out cries of death to the prisoner. On the contrary, the most forward of them in accusing him of being the principal author of the crime of Tijuco now averred that he was not guilty, and demanded his immediate restoration to liberty. Thus it always is with the mob--from one extreme they run to the other. But the change was intelligible.

The events which had happened during the last few days--the struggle between Benito and Torres; the search for the corpse, which had reappeared under such extraordinary circumstances; the finding of the "indecipherable" document, if we can so call it; the information it concealed, the assurance that it contained, or rather the wish that it contained, the material proof of the guiltlessness of Joam Dacosta; and the hope that it was written by the real culprit--all these things had contributed to work the change in public opinion. What the people had desired and impatiently demanded forty-eight hours before, they now feared, and that was the arrival of the instructions due from Rio de Janeiro.

These, however, were not likely to be delayed.

Joam Dacosta had been arrested on the 24th of August, and examined next day. The judge's report was sent off on the 26th. It was now the 28th. In three or four days more the minister would have come to a decision regarding the convict, and it was only too certain that justice would take its course.

There was no doubt that such would be the case. On the other hand, that the assurance of Dacosta's innocence would appear from the document, was not doubted by anybody, neither by his family nor by the fickle population of Manaos, who excitedly followed the phases of this dramatic affair.

But, on the other hand, in the eyes of disinterested or indifferent persons who were not affected by the event, what value could be assigned to this document? and how could they even declare that it referred to the crime in the diamond arrayal? It existed, that was undeniable; it had been found on the corpse of Torres, nothing could be more certain. It could even be seen, by comparing it with the letter in which Torres gave the information about Joam Dacosta, that the document was not in the handwriting of the adventurer. But, as had been suggested by Judge Jarriquez, why should not the scoundrel have invented it for the sake of his bargain? And this was less unlikely to be the case, considering that Torres had declined to part with it until after his marriage with Dacosta's daughter--that is to say, when it would have been impossible to undo an accomplished fact.

All these views were held by some people in some form, and we can quite understand what interest the affair created. In any case, the situation of Joam Dacosta was most hazardous. If the document were not deciphered, it would be just the same as if it did not exist; and if the secret of the cryptogram were not miraculously divulged or revealed before the end of the three days, the supreme sentence would inevitably be suffered by the doomed man of Tijuco. And this miracle a man attempted to perform! The man was Jarriquez, and he now really set to work more in the interest of Joam Dacosta than for the satisfaction of his analytical faculties. A complete change had also taken place in his opinion. Was not this man, who had voluntarily abandoned his retreat at Iquitos, who had come at the risk of his life to demand his rehabilitation at the hands of Brazilian justice, a moral enigma worth all the others put together? And so the judge had resolved never to leave the document until he had discovered the cipher. He set to work at it in a fury. He ate no more; he slept no more! All his time was passed in inventing combinations of numbers, in forging a key to force this lock!

This idea had taken possession of Judge Jarriquez's brain at the end of the first day. Suppressed frenzy consumed him, and kept him in a perpetual heat. His whole house trembled; his servants, black or white, dared not come near him. Fortunately he was a bachelor; had there been a Madame Jarriquez she would have had a very uncomfortable time of it. Never had a problem so taken possession of this oddity, and he had thoroughly made up his mind to get at the solution, even if his head exploded like an overheated boiler under the tension of its vapor.

It was perfectly clear to the mind of the worthy magistrate that the key to the document was a number, composed of two or more ciphers, but what this number was all investigation seemed powerless to discover.

This was the enterprise on which Jarriquez, in quite a fury, was engaged, and during this 28th of August he brought all his faculties to bear on it, and worked away almost superhumanly.

To arrive at the number by chance, he said, was to lose himself in millions of combinations, which would absorb the life of a first-rate calculator. But if he could in no respect reckon on chance, was it impossible to proceed by reasoning? Decidedly not! And so it was "to reason till he became unreasoning" that Judge Jarriquez gave himself up after vainly seeking repose in a few hours of sleep. He who ventured in upon him at this moment, after braving the formal defenses which protected his solitude, would have found him, as on the day before, in his study, before his desk, with the document under his eyes, the thousands of letters of which seemed all jumbled together and flying about his head.

"Ah!" he exclaimed, "why did not the scoundrel who wrote this separate the words in this paragraph? We might--we will try--but no! However, if there is anything here about the murder and the robbery, two or three words there
must be in it--'arrayal,' 'diamond,' 'Tijuco,' 'Dacosta,' and others; and in putting down their cryptological equivalents
the number could be arrived at. But there is nothing--not a single break!--not one word by itself! One word of two
hundred and seventy-six letters! I hope the wretch may be blessed two hundred and seventy-six times for
complicating his system in this way! He ought to be hanged two hundred and seventy-six times!"

And a violent thump with his fist on the document emphasized this charitable wish.

"But," continued the magistrate, "if I cannot find one of the words in the body of the document, I might at least
try my hand at the beginning and end of each paragraph. There may be a chance there that I ought not to miss."

And impressed with this idea Judge Jarriquez successively tried if the letters which commenced or finished the
different paragraphs could be made to correspond with those which formed the most important word, which was
sure to be found somewhre, that of _Dacosta_.

He could do nothing of the kind.

In fact, to take only the last paragraph with which he began, the formula was:
\[ P = D \quad h = a \quad y = c \quad f = o \quad s = s \quad l = t \quad y = a \]

Now, at the very first letter Jarriquez was stopped in his calculations, for the difference in alphabetical position
between the _d_ and the _p_ gave him not one cipher, but two, namely, 12, and in this kind of cryptograph only one
letter can take the place of another.

It was the same for the seven last letters of the paragraph, _p s u v j h d_, of which the series also commences
with a _p_ and which in no case could stand for the _d_ in _Dacosta_ because these letters were in like manner
twelve spaces apart.

So it was not his name that figured here.

The same observation applies to the words _arrayal_ and _Tijuco_, which were successively tried, but whose
construction did not correspond with the cryptographic series.

After he had got so far, Judge Jarriquez, with his head nearly splitting, arose and paced his office, went for fresh
air to the window, and gave utterance to a growl, at the noise of which a flock of hummingbirds, murmuring among
the foliage of a mimosa tree, betook themselves to flight. Then he returned to the document.

He picked it up and turned it over and over.

"The humbug! the rascal!" he hissed; "it will end by driving me mad! But steady! Be calm! Don't let our spirits
go down! This is not the time!"

And then, having refreshed himself by giving his head a thorough sluicing with cold water:

"Let us try another way," he said, "and as I cannot hit upon the number from the arrangement of the letters, let us
see what number the author of the document would have chosen in confessing that he was the author of the crime at
Tijuco."

This was another method for the magistrate to enter upon, and maybe he was right, for there was a certain
amount of logic about it.

"And first let us try a date! Why should not the culprit have taken the date of the year in which Dacosta, the
innocent man he allowed to be sentenced in his own place, was born? Was he likely to forget a number which was
so important to him? Then Joam Dacosta was born in 1804. Let us see what 1804 will give us as a cryptographical
number."

And Judge Jarriquez wrote the first letters of the paragraph, and putting over them the number 1804 repeated
thrice, he obtained

\[ 1804 \quad 1804 \quad 1804 \quad _{phyj} \quad slyd \quad dqfd_ \]

Then in counting up the spaces in alphabetical order, he obtained
\[ \_s.yf \quad rdy. \quad cif._ \]

And this was meaningless! And he wanted three letters which he had to replace by points, because the ciphers, 8,
4, and 4, which command the three letters, _h, d_, and _d_, do not give corresponding letters in ascending the series.

"That is not it again!" exclaimed Jarriquez. "Let us try another number."

And he asked himself, if instead of this first date the author of the document had not rather selected the date of
the year in which the crime was committed.

This was in 1826.

And so proceeding as above, he obtained.
\[ 1826 \quad 1826 \quad 1826 \quad _{phyj} \quad slyd \quad dqfd_ \]

and that gave
\[ \_o.vd \quad rdv. \quad cid._ \]

the same meaningless series, the same absence of sense, as many letters wanting as in the former instance, and
for the same reason.

"Bother the number!" exclaimed the magistrate. "We must give it up again. Let us have another one! Perhaps the
rascal chose the number of contos representing the amount of the booty!"

Now the value of the stolen diamonds was estimated at eight hundred and thirty-four contos, or about 2,500,000 francs, and so the formula became

834 834 834 _phy js1 ydd qfd_
and this gave a result as little gratifying as the others----

"Confound the document and him who imagined it!" shouted Jarriquez, throwing down the paper, which was wafted to the other side of the room. "It would try the patience of a saint!"

But the short burst of anger passed away, and the magistrate, who had no idea of being beaten, picked up the paper. What he had done with the first letters of the different paragraphs he did with the last—and to no purpose. Then he tried everything his excited imagination could suggest.

He tried in succession the numbers which represented Dacosta’s age, which would have been known to the author of the crime, the date of his arrest, the date of the sentence at the Villa Rica assizes, the date fixed for the execution, etc., etc., even the number of victims at the affray at Tijuco!

Nothing! All the time nothing!

Judge Jarriquez had worked himself into such a state of exasperation that there really was some fear that his mental faculties would lose their balance. He jumped about, and twisted about, and wrestled about as if he really had got hold of his enemy’s body. Then suddenly he cried, "Now for chance! Heaven help me now, logic is powerless!"

His hand seized a bell-pull hanging near his table. The bell rang furiously, and the magistrate strode up to the door, which he opened. "Bobo!" he shouted.

A moment or two elapsed.

Bobo was a freed negro, who was the privileged servant of Jarriquez. He did not appear; it was evident that Bobo was afraid to come into his master’s room.

Another ring at the bell; another call to Bobo, who, for his own safety, pretended to be deaf on this occasion. And now a third ring at the bell, which unhitched the crank and broke the cord.

This time Bobo came up. "What is it, sir?" asked Bobo, prudently waiting on the threshold.

"Advance, without uttering a single word!" replied the judge, whose flaming eyes made the negro quake again.

Bobo advanced.

"Bobo," said Jarriquez, "attend to what I say, and answer immediately; do not even take time to think, or I----" Bobo, with fixed eyes and open mouth, brought his feet together like a soldier and stood at attention.

"Are you ready?" asked his master.

"I am."

"Now, then, tell me, without a moment's thought—you understand—the first number than comes into your head."

"76223," answered Bobo, all in a breath. Bobo thought he would please his master by giving him a pretty large one!

Judge Jarriquez had run to the table, and, pencil in hand, had made out a formula with the number given by Bobo, and which Bobo had in this way only given him at a venture.

It is obvious that it was most unlikely that a number such as 76223 was the key of the document, and it produced no other result than to bring to the lips of Jarriquez such a vigorous ejaculation that Bobo disappeared like a shot!

CHAPTER XV. THE LAST EFFORTS

THE MAGISTRATE, however, was not the only one who passed his time unprofitably. Benito, Manoel, and Minha tried all they could together to extract the secret from the document on which depended their father’s life and honor. On his part, Fragoso, aided by Lina, could not remain quiet, but all their ingenuity had failed, and the number still escaped them.

"Why don't you find it, Fragoso?" asked the young mulatto.

"I will find it," answered Fragoso.

And he did not find it!

Here we should say that Fragoso had an idea of a project of which he had not even spoken to Lina, but which had taken full possession of his mind. This was to go in search of the gang to which the ex-captain of the woods had belonged, and to find out who was the probable author of this cipher document, which was supposed to be the confession of the culprit of Tijuco. The part of the Amazon where these people were employed, the very place where Fragoso had met Torres a few years before, was not very far from Manaos. He would only have to descend the river for about fifty miles, to the mouth of the Madeira, a tributary coming in on the right, and there he was almost sure to meet the head of these _"capitaes do mato,"_ to which Torres belonged. In two days, or three days at the outside,
Manoel, who neglect nothing that might lead to the penetration of the mystery—not even chance, that "nickname ofPara" had reproduced it in facsimile. Autograph copies were spread about in great numbers at the suggestion of

Every one had been given an opportunity of deciphering its incomprehensible contents, for the "Diario d'o Grand

principal object of conversation.

the midst of this enthralment of public opinion, which evoked so much of the mysterious, the document was the

judge!"

It is none the less true, however, that on the 29th of August, before sunrise, Fragoso, without saying anything to

anybody, secretly left the jangada, arrived at Manaos, and embarked in one of the egariteas which daily descend the

Amazon.

And great was the astonishment when he was not seen on board, and did not appear during the day. No one, not
even Lina, could explain the absence of so devoted a servant at such a crisis.

Some of them even asked, and not without reason, if the poor fellow, rendered desperate at having, when he met
him on the frontier, personally contributed to bringing Torres on board the raft, had not made away with himself.

But if Fragoso could so reproach himself, how about Benito? In the first place at Iquitos he had invited Torres to
visit the fazenda; in the second place he had brought him on board the jangada, to become a passenger on it; and in
the third place, in killing him, he had annihilated the only witness whose evidence could save the condemned man.

And so Benito considered himself responsible for everything—the arrest of his father, and the terrible events of
which it had been the consequence.

In fact, had Torres been alive, Benito could not tell but that, in some way or another, from pity or for reward, he
would have finished by handing over the document. Would not Torres, whom nothing could compromise, have been
persuaded to speak, had money been brought to bear upon him? Would not the long-sought-for proof have been
furnished to the judge? Yes, undoubtedly! And the only man who could have furnished this evidence had been killed
through Benito!

Such was what the wretched man continually repeated to his mother, to Manoel, and to himself. Such were the
cruel responsibilities which his conscience laid to his charge.

Between her husband, with whom she passed all the time that was allowed her, and her son, a prey to despair
which made her tremble for his reason, the brave Yaquita lost none of her moral energy. In her they found the
valiant daughter of Magalhaës, the worthy wife of the fazender of Iquitos.

The attitude of Joam Dacosta was well adapted to sustain her in this ordeal. That gallant man, that rigid Puritan,
that austere worker, whose whole life had been a battle, had not yet shown a moment of weakness.

The most terrible blow which had struck him without prostrating him had been the death of Judge Ribeiro, in
whose mind his innocence did not admit of a doubt. Was it not with the help of his old defender that he had hoped to
strive for his rehabilitation? The intervention of Torres he had regarded throughout as being quite secondary for him.
And of this document he had no knowledge when he left Iquitos to hand himself over to the justice of his country.
He only took with him moral proofs. When a material proof was unexpectedly produced in the course of the affair,
before or after his arrest, he was certainly not the man to despise it. But if, on account of regrettable circumstances,
the proof disappeared, he would find himself once more in the same position as when he passed the Brazilian
frontier—the position of a man who came to say, "Here is my past life; here is my present; here is an entirely honest
existence of work and devotion which I bring you. You passed on me at first an erroneous judgment. After twenty-
three years of exile I have come to give myself up! Here I am; judge me again!"

And the most terrible blow which had struck him without prostrating him had been the death of Judge Ribeiro, in

strive for his rehabilitation? The intervention of Torres he had regarded throughout as being quite secondary for him.
And of this document he had no knowledge when he left Iquitos to hand himself over to the justice of his country.
He only took with him moral proofs. When a material proof was unexpectedly produced in the course of the affair,
before or after his arrest, he was certainly not the man to despise it. But if, on account of regrettable circumstances,
the proof disappeared, he would find himself once more in the same position as when he passed the Brazilian
frontier—the position of a man who came to say, "Here is my past life; here is my present; here is an entirely honest
existence of work and devotion which I bring you. You passed on me at first an erroneous judgment. After twenty-
three years of exile I have come to give myself up! Here I am; judge me again!"

And the most terrible blow which had struck him without prostrating him had been the death of Judge Ribeiro, in
whose mind his innocence did not admit of a doubt. Was it not with the help of his old defender that he had hoped to
strive for his rehabilitation? The intervention of Torres he had regarded throughout as being quite secondary for him.
And of this document he had no knowledge when he left Iquitos to hand himself over to the justice of his country.
He only took with him moral proofs. When a material proof was unexpectedly produced in the course of the affair,
before or after his arrest, he was certainly not the man to despise it. But if, on account of regrettable circumstances,
the proof disappeared, he would find himself once more in the same position as when he passed the Brazilian
frontier—the position of a man who came to say, "Here is my past life; here is my present; here is an entirely honest
existence of work and devotion which I bring you. You passed on me at first an erroneous judgment. After twenty-
three years of exile I have come to give myself up! Here I am; judge me again!"

The death of Torres, the impossibility of reading the document found on him, had thus not produced on Joam
Dacosta the impression which it had on his children, his friends, his household, and all who were interested in him.

"I have faith in my innocence," he repeated to Yaquita, "as I have faith in God. If my life is still useful to my
people, and a miracle is necessary to save me, that miracle will be performed; if not, I shall die! God alone is my
judge!"

The excitement increased in Manaos as the time ran on; the affair was discussed with unexampled acerbity. In
the midst of this enthralment of public opinion, which evoked so much of the mysterious, the document was the
principal object of conversation.

At the end of this fourth day not a single person doubted but that it contained the vindication of the doomed man.
Every one had been given an opportunity of deciphering its incomprehensible contents, for the "Diario d'o Grand
Para" had reproduced it in facsimile. Autograph copies were spread about in great numbers at the suggestion of
Manoel, who neglect nothing that might lead to the penetration of the mystery—not even chance, that "nickname of
Providence," as some one has called it.

In addition, a reward of one hundred contos (or three hundred thousand francs) was promised to any one who could discover the cipher so fruitlessly sought after--and read the document. This was quite a fortune, and so people of all classes forgot to eat, drink, or sleep to attack this unintelligible cryptogram.

Up to the present, however, all had been useless, and probably the most ingenious analysts in the world would have spent their time in vain. It had been advertised that any solution should be sent, without delay, to Judge Jarriquez, to his house in God-the-Son Street; but the evening of the 29th of August came and none had arrived, nor was any likely to arrive.

Of all those who took up the study of the puzzle, Judge Jarriquez was one of the most to be pitied. By a natural association of ideas, he also joined in the general opinion that the document referred to the affair at Tijuco, and that it had been written by the hand of the guilty man, and exonerated Joam Dacosta. And so he put even more ardor into his search for the key. It was not only the art for art's sake which guided him, it was a sentiment of justice, of pity toward a man suffering under an unjust condemnation. If it is the fact that a certain quantity of phosphorus is expended in the work of the brain, it would be difficult to say how many milligrammes the judge had parted with to excite the network of his "sensorium," and after all, to find out nothing, absolutely nothing.

But Jarriquez had no idea of abandoning the inquiry. If he could only now trust to chance, he would work on for that chance. He tried to evoke it by all means possible and impossible. He had given himself over to fury and anger, and, what was worse, to impotent anger!

During the latter part of this day he had been trying different numbers--numbers selected arbitrarily--and how many of them can scarcely be imagined. Had he had the time, he would not have shrunk from plunging into the millions of combinations of which the ten symbols of numeration are capable. He would have given his whole life to it at the risk of going mad before the year was out. Mad! was be not that already? He had had the idea that the document might be read through the paper, and so he turned it round and exposed it to the light, and tried it in that way.

Nothing! The numbers already thought of, and which he tried in this new way, gave no result. Perhaps the document read backward, and the last letter was really the first, for the author would have done this had he wished to make the reading more difficult.

Nothing! The new combination only furnished a series of letters just as enigmatic.

At eight o'clock in the evening Jarriquez, with his face in his hands, knocked up, worn out mentally and physically, had neither strength to move, to speak, to think, or to associate one idea with another.

Suddenly a noise was heard outside. Almost immediately, notwithstanding his formal orders, the door of his study was thrown open. Benito and Manoel were before him, Benito looking dreadfully pale, and Manoel supporting him, for the unfortunate young man had hardly strength to support himself.

The magistrate quickly arose.

"What is it, gentlemen? What do you want?" he asked.

"The cipher! the cipher!" exclaimed Benito, mad with grief--"the cipher of the document."

"Do you know it, then?" shouted the judge.

"No, sir," said Manoel. "But you?"

"Nothing! nothing!"

"Nothing?" gasped Benito, and in a paroxysm of despair he took a knife from his belt and would have plunged it into his breast had not the judge and Manoel jumped forward and managed to disarm him.

"Benito," said Jarriquez, in a voice which he tried to keep calm, "if you father cannot escape the expiation of a crime which is not his, you could do something better than kill yourself."

"What?" said Benito.

"Try and save his life!"

"How?"

"That is for you to discover," answered the magistrate, "and not for me to say."

CHAPTER XVI. PREPARATIONS

ON THE FOLLOWING day, the 30th of August, Benito and Manoel talked matters over together. They had understood the thought to which the judge had not dared to give utterance in their presence, and were engaged in devising some means by which the condemned man could escape the penalty of the law.

Nothing else was left for them to do. It was only too certain that for the authorities at Rio Janeiro the undeciphered document would have no value whatever, that it would be a dead letter, that the first verdict which declared Joam Dacosta the perpetrator of the crime at Tijuco would not be set aside, and that, as in such cases no
commutation of the sentence was possible, the order for his execution would inevitably be received.

Once more, then, Joam Dacosta would have to escape by flight from an unjust imprisonment.

It was at the outset agreed between the two young men that the secret should be carefully kept, and that neither Yaquita nor Minha should be informed of preparations, which would probably only give rise to hopes destined never to be realized. Who could tell if, owing to some unforeseen circumstance, the attempt at escape would not prove a miserable failure?

The presence of Fragoso on such an occasion would have been most valuable. Discreet and devoted, his services would have been most welcome to the two young fellows; but Fragoso had not reappeared. Lina, when asked, could only say that she knew not what had become of him, nor why he had left the raft without telling her anything about it.

And assuredly, had Fragoso foreseen that things would have turned out as they were doing, he would never have left the Dacosta family on an expedition which appeared to promise no serious result. Far better for him to have assisted in the escape of the doomed man than to have hurried off in search of the former comrades of Torres!

But Fragoso was away, and his assistance had to be dispensed with.

At daybreak Benito and Manoel left the raft and proceeded to Manaos. They soon reached the town, and passed through its narrow streets, which at that early hour were quite deserted. In a few minutes they arrived in front of the prison. The waste ground, amid which the old convent which served for a house of detention was built, was traversed by them in all directions, for they had come to study it with the utmost care.

Fifty-five feet from the ground, in an angle of the building, they recognized the window of the cell in which Joam Dacosta was confined. The window was secured with iron bars in a miserable state of repair, which it would be easy to tear down or cut through if they could only get near enough. The badly jointed stones in the wall, which were crumbled away everywhere and there, offered many a ledge for the feet to rest on, if only a rope could be fixed to climb up by. One of the bars had slipped out of its socket, and formed a hook over which it might be possible to throw a rope. That done, one or two of the bars could be removed, so as to permit a man to get through. Benito and Manoel would then have to make their way into the prisoner's room, and without much difficulty the escape could be managed by means of the rope fastened to the projecting iron. During the night, if the sky were very cloudy, none of these operations would be noticed before the day dawned. Joam Dacosta could get safely away.

Manoel and Benito spent an hour about the spot, taking care not to attract attention, but examining the locality with great exactness, particularly as regarded the position of the window, the arrangement of the iron bars, and the place from which it would be best to throw the line.

"That is agreed," said Manoel at length. "And now, ought Joam Dacosta to be told about this?"

"No, Manoel. Neither to him, any more than to my mother, ought we to impart the secret of an attempt in which there is such a risk of failure."

"We shall succeed, Benito!" continued Manoel. "However, we must prepare for everything; and in case the chief of the prison should discover us at the moment of escape---"

"We shall have money enough to purchase his silence," answered Benito.

"Good!" replied Manoel. "But once your father is out of prison he cannot remain hidden in the town or on the jangada. Where is he to find refuge?"

This was the second question to solve: and a very difficult one it was.

A hundred paces away from the prison, however, the waste land was crossed by one of those canals which flow through the town into the Rio Negro. This canal afforded an easy way of gaining the river if a pirogue were in waiting for the fugitive. From the foot of the wall to the canal side was hardly a hundred yards.

Benito and Manoel decided that about eight o'clock in the evening one of the pirogues, with two strong rowers, under the command of the pilot Araujo, should start from the jangada. They could ascend the Rio Negro, enter the canal, and, crossing the waste land, remain concealed throughout the night under the tall vegetation on the banks.

But once on board, where was Joam Dacosta to seek refuge? To return to Iquitos was to follow a road full of difficulties and peril, and a long one in any case, should the fugitive either travel across the country or by the river. Neither by horse nor pirogue could he be got out of danger quickly enough, and the fazenda was no longer a safe retreat. He would not return to it as the fazender, Joam Garral, but as the convict, Joam Dacosta, continually in fear of his extradition. He could never dream of resuming his former life.

To get away by the Rio Negro into the north of the province, or even beyond the Brazilian territory, would require more time than he could spare, and his first care must be to escape from immediate pursuit.

To start again down the Amazon? But stations, village, and towns abounded on both sides of the river. The description of the fugitive would be sent to all the police, and he would run the risk of being arrested long before he reached the Atlantic. And supposing he reached the coast, where and how was he to hide and wait for a passage to put the sea between himself and his pursuers?
On consideration of these various plans, Benito and Manoel agreed that neither of them was practicable. One, however, did offer some chance of safety, and that was to embark in the pirogue, follow the canal into the Rio Negro, descend this tributary under the guidance of the pilot, reach the confluence of the rivers, and run down the Amazon along its right bank for some sixty miles during the nights, resting during the daylight, and so gaining the _embouchure_ of the Madeira.

This tributary, which, fed by a hundred affluents, descends from the watershed of the Cordilleras, is a regular waterway opening into the very heart of Bolivia. A pirogue could pass up it and leave no trace of its passage, and a refuge could be found in some town or village beyond the Brazilian frontier. There Joam Dacosta would be comparatively safe, and there for several months he could wait for an opportunity of reaching the Pacific coast and taking passage in some vessel leaving one of its ports; and if the ship were bound for one of the States of North America he would be free. Once there, he could sell the fazenda, leave his country forever, and seek beyond the sea, in the Old World, a final retreat in which to end an existence so cruelly and unjustly disturbed. Anywhere he might go, his family--not excepting Manoel, who was bound to him by so many ties--would assuredly follow without the slightest hesitation.

"Let us go," said Benito; "we must have all ready before night, and we have no time to lose."

The young men returned on board by way of the canal bank, which led along the Rio Negro. They satisfied themselves that the passage of the pirogue would be quite possible, and that no obstacles such as locks or boats under repair were there to stop it. They then descended the left bank of the tributary, avoiding the slowly-filling streets of the town, and reached the jangada.

Benito's first care was to see his mother. He felt sufficiently master of himself to dissemble the anxiety which consumed him. He wished to assure her that all hope was not lost, that the mystery of the document would be cleared up, that in any case public opinion was in favor of Joam, and that, in face of the agitation which was being made in his favor, justice would grant all the necessary time for the production of the material proof his innocence.

"Yes, mother," he added, "before to-morrow we shall be free from anxiety."

"May heaven grant it so!" replied Yaquita, and she looked at him so keenly that Benito could hardly meet her glance.

On his part, and as if by pre-arrangement, Manoel had tried to reassure Minha by telling her that Judge Jarriquez was convinced of the innocence of Joam, and would try to save him by every means in his power.

"I only wish he would, Manoel," answered she, endeavoring in vain to restrain her tears.

And Manoel left her, for the tears were also welling up in his eyes and witnessing against the words of hope to which he had just given utterance.

And now the time had arrived for them to make their daily visit to the prisoner, and Yaquita and her daughter set off to Manaos.

For an hour the young men were in consultation with Araujo. They acquainted him with their plan in all its details, and they discussed not only the projected escape, but the measures which were necessary for the safety of the fugitive.

Araujo approved of everything; he undertook during the approaching night to take the pirogue up the canal without attracting any notice, and he knew its course thoroughly as far as the spot where he was to await the arrival of Joam Dacosta. To get back to the mouth of the Rio Negro was easy enough, and the pirogue would be able to pass unnoticed among the numerous craft continually descending the river.

Araujo had no objection to offer to the idea of following the Amazon down to its confluence with the Madeira. The course of the Madeira was familiar to him for quite two hundred miles up, and in the midst of these thinly-peopled provinces, even if pursuit took place in their direction, all attempts at capture could be easily frustrated; they could reach the interior of Bolivia, and if Joam decided to leave his country he could procure a passage with less danger on the coast of the Pacific than on that of the Atlantic.

Araujo's approval was most welcome to the young fellows; they had great faith in the practical good sense of the pilot, and not without reason. His zeal was undoubted, and he would assuredly have risked both life and liberty to save the fazender of Iquitos.

With the utmost secrecy Araujo at once set about his preparations. A considerable sum in gold was handed over to him by Benito to meet all eventualities during the voyage on the Madeira. In getting the pirogue ready, he announced his intention of going in search of Fragoso, whose fate excited a good deal of anxiety among his companions. He stowed away in the boat provisions for many days, and did not forget the ropes and tools which would be required by the young men when they reached the canal at the appointed time and place.

These preparations evoked no curiosity on the part of the crew of the jangada, and even the two stalwart negroes were not let into the secret. They, however, could be absolutely depended on. Whenever they learned what the work of safety was in which they were engaged--when Joam Dacosta, once more free, was confided to their charge--
Araujo knew well that they would dare anything, even to the risk of their own lives, to save the life of their master. By the afternoon all was ready, and they had only the night to wait for. But before making a start Manoel wished to call on Judge Jarriquez for the last time. The magistrate might perhaps have found out something new about the document. Benito preferred to remain on the raft and wait for the return of his mother and sister.

Manoel then presented himself at the abode of Judge Jarriquez, and was immediately admitted. The magistrate, in the study which he never quitted, was still the victim of the same excitement. The document crumpled by his impatient fingers, was still there before his eyes on the table.

"Sir," said Manoel, whose voice trembled as he asked the question, "have you received anything from Rio de Janeiro."

"No," answered the judge; "the order has not yet come to hand, but it may at any moment."
"And the document?"
"Nothing yet!" exclaimed he. "Everything my imagination can suggest I have tried, and no result."
"None?"
"Nevertheless, I distinctly see one word in the document--only one!"
"What is that--what is the word?"
"Fly!"

Manoel said nothing, but he pressed the hand which Jarriquez held out to him, and returned to the jangada to wait for the moment of action.

CHAPTER XVII. THE LAST NIGHT

THE VISIT of Yaquita and her daughter had been like all such visits during the few hours which each day the husband and wife spent together. In the presence of the two beings whom Joam so dearly loved his heart nearly failed him. But the husband--the father--retained his self-command. It was he who comforted the two poor women and inspired them with a little of the hope of which so little now remained to him. They had come with the intention of cheering the prisoner. Alas! far more than he they themselves were in want of cheering! But when they found him still bearing himself unflinchingly in the midst of his terrible trial, they recovered a little of their hope.

Once more had Joam spoken encouraging words to them. His indomitable energy was due not only to the feeling of his innocence, but to his faith in that God, a portion of whose justice yet dwells in the hearts of men. No! Joam Dacosta would never lose his life for the crime of Tijuco!

Hardly ever did he mention the document. Whether it were apocryphal or no, whether it were in the handwriting of Torres or in that of the real perpetrator of the crime, whether it contained or did not contain the longed-for vindication, it was on no such doubtful hypothesis that Joam Dacosta presumed to trust. No; he reckoned on a better argument in his favor, and it was to his long life of toil and honor that he relegated the task of pleading for him.

This evening, then, his wife and daughter, strengthened by the manly words, which thrilled them to the core of their hearts, had left him more confident than they had ever been since his arrest. For the last time the prisoner had embraced them, and with redoubled tenderness. It seemed as though the _dénouement_ was nigh.

Joam Dacosta, after they had left, remained for some time perfectly motionless. His arms rested on a small table and supported his head. Of what was he thinking? Had he at last been convinced that human justice, after failing the first time, would at length pronounce his acquittal?

Yes, he still hoped. With the report of Judge Jarriquez establishing his identity, he knew that his memoir, which he had penned with so much sincerity, would have been sent to Rio de Janeiro, and was now in the hands of the chief justice. This memoir, as we know, was the history of his life from his entry into the offices of the diamond arrayal until the very moment when the jangada stopped before Manaos. Joam Dacosta was pondering over his whole career. He again lived his past life from the moment when, as an orphan, he had set foot in Tijuco. There his zeal had raised him high in the offices of the governor-general, into which he had been admitted when still very young. The future smiled on him; he would have filled some important position. Then this sudden catastrophe; the robbery of the diamond convoy, the massacre of the escort, the suspicion directed against him as the only official who could have divulged the secret of the expedition, his arrest, his appearance before the jury, his conviction in spite of all the efforts of his advocate, the last hours spent in the condemned cell at Villa Rica, his escape under conditions which betokened almost superhuman courage, his flight through the northern provinces, his arrival on the Peruvian frontier, and the reception which the starving fugitive had met with from the hospitable fazender Magalhaës.

The prisoner once more passed in review these events, which had so cruelly marred his life. And then, lost in his thoughts and recollections, he sat, regardless of a peculiar noise on the outer wall of the convent, of the jerks of a rope hitched on to a bar of his window, and of grating steel as it cut through iron, which ought at once to have
attracted the attention of a less absorbed man.

Joam Dacosta continued to live the years of his youth after his arrival in Peru. He again saw the fazender, the clerk, the partner of the old Portuguese, toiling hard for the prosperity of the establishment at Iquitos. Ah! why at the outset had he not told all to his benefactor? He would never have doubted him. It was the only error with which he could reproach himself. Why had he not confessed to him whence he had come, and who he was—above all, at the moment when Magalhaës had place in his hand the hand of the daughter who would never have believed that he was the author of so frightful a crime.

And now the noise outside became loud enough to attract the prisoner's attention. For an instant Joam raised his head; his eyes sought the window, but with a vacant look, as though he were unconscious, and the next instant his head again sank into his hands. Again he was in thought back at Iquitos.

There the old fazender was dying; before his end he longed for the future of his daughter to be assured, for his partner to be the sole master of the settlement which had grown so prosperous under his management. Should Dacosta have spoken then? Perhaps; but he dared not do it. He again lived the happy days he had spent with Yaquita, and again thought of the birth of his children, again felt the happiness which had its only trouble in the remembrances of Tijuco and the remorse that he had not confessed his terrible secret.

The chain of events was reproduced in Joam's mind with a clearness and completeness quite remarkable.

And now he was thinking of the day when his daughter's marriage with Manoel had been decided. Could he allow that union to take place under a false name without acquainting the lad with the mystery of his life? No! And so at the advice of Judge Ribeiro he resolved to come and claim the revision of his sentence, to demand the rehabilitation which was his due! He was starting with his people, and then came the intervention of Torres, the detestable bargain proposed by the scoundrel, the indignant refusal of the father to hand over his daughter to save his honor and his life, and then the denunciation and the arrest!

Suddenly the window flew open with a violent push from without.

Joam started up; the souvenire of the past vanished like a shadow.

Benito leaped into the room; he was in the presence of his father, and the next moment Manoel, tearing down the remaining bars, appeared before him.

Joam Dacosta would have uttered a cry of surprise. Benito left him no time to do so.

"Father," he said, "the window grating is down. A rope leads to the ground. A pirogue is waiting for you on the canal not a hundred yards off. Araujo is there ready to take you far away from Manaos, on the other bank of the Amazon where your track will never be discovered. Father, you must escape this very moment! It was the judge's own suggestion!"

"It must be done!" added Manoel.

"Fly! Fly a second time! Escape again?"

And with crossed arms, and head erect, Joam Dacosta stepped forward.

"Never!" he said, in a voice so firm that Benito and Manoel stood bewildered.

The young men had never thought of a difficulty like this. They had never reckoned on the hindrances to escape coming from the prisoner himself.

Benito advanced to his father, and looking him straight in the face, and taking both his hands in his, not to force him, but to try and convince him, said:

"Never, did you say, father?"

"Never!"

"Father," said Manoel--"for I also have the right to call you father--listen to us! If we tell you that you ought to fly without losing an instant, it is because if you remain you will be guilty toward others, toward yourself!"

"To remain," continued Benito, "is to remain to die! The order for execution may come at any moment! If you imagine that the justice of men will nullify a wrong decision, if you think it will rehabilitate you whom it condemned twenty years since, you are mistaken! There is hope no longer! You must escape! Come!"

By an irresistible impulse Benito seized his father and drew him toward the window.

Joam Dacosta struggled from his son's grasp and recoiled a second time.

"To fly," he answered, in the tone of a man whose resolution was unalterable, "is to dishonor myself, and you with me! It would be a confession of my guilt! Of my own free will I surrendered myself to my country's judges, and I will await their decision, whatever that decision may be!"

"But the presumptions on which you trusted are insufficient," replied Manoel, "and the material proof of your innocence is still wanting! If we tell you that you ought to fly, it is because Judge Jarriquez himself told us so. You have now only this one chance left to escape from death!"

"I will die, then," said Joam, in a calm voice. "I will die protesting against the decision which condemned me! The first time, a few hours before the execution--I fled! Yes! I was then young. I had all my life before me in which
to struggle against man's injustice! But to save myself now, to begin again the miserable existence of a felon hiding under a false name, whose every effort is required to avoid the pursuit of the police, again to live the life of anxiety which I have led for twenty-three years, and oblige you to share it with me; to wait each day for a denunciation which sooner or later must come, to wait for the claim for extradition which would follow me to a foreign country! Am I to live for that? No! Never!"

"Father," interrupted Benito, whose mind threatened to give way before such obstinacy, "you shall fly! I will have it so!" And he caught hold of Joam Dacosta, and tried by force to drag him toward the window.

"No! no!"

"You wish to drive me mad?"

"My son," exclaimed Joam Dacosta, "listen to me! Once already I escaped from the prison at Villa Rica, and people believed I fled from well-merited punishment. Yes, they had reason to think so. Well, for the honor of the name which you bear I shall not do so again."

Benito had fallen on his knees before his father. He held up his hands to him; he begged him:

"But this order, father," he repeated, "this order which is due to-day--even now--it will contain your sentence of death."

"The order may come, but my determination will not change. No, my son! Joam Dacosta, guilty, might fly! Joam Dacosta, innocent, will not fly!"

The scene which followed these words was heart-rending. Benito struggled with his father. Manoel, distracted, kept near the window ready to carry off the prisoner--when the door of the room opened.

On the threshold appeared the chief of the police, accompanied by the head warder of the prison and a few soldiers. The chief of the police understood at a glance that an attempt at escape was being made; but he also understood from the prisoner's attitude that he it was who had no wish to go! He said nothing. The sincerest pity was depicted on his face. Doubtless he also, like Judge Jarriquez, would have liked Dacosta to have escaped.

It was too late!

The chief of the police, who held a paper in his hand, advanced toward the prisoner.

"Before all of you," said Joam Dacosta, "let me tell you, sir, that it only rested with me to get away, and that I would not do so."

The chief of the police bowed his head, and then, in a voice which he vainly tried to control:

"Joam Dacosta," he said, "the order has this moment arrived from the chief justice at Rio Janeiro."

"Father!" exclaimed Manoel and Benito.

"This order," asked Joam Dacosta, who had crossed his arms, "this order requires the execution of my sentence?"

"Yes!"

"And that will take place?"

"To-morrow."

Benito threw himself on his father. Again would he have dragged him from his cell, but the soldiers came and drew away the prisoner from his grasp.

At a sign from the chief of the police Benito and Manoel were taken away. An end had to be put to this painful scene, which had already lasted too long.

"Sir," said the doomed man, "before to-morrow, before the hour of my execution, may I pass a few moments with Padre Passanha, whom I ask you to tell?"

"It will be forbidden."

"May I see my family, and embrace for a last time my wife and children?"

"You shall see them."

"Thank you, sir," answered Joam; "and now keep guard over that window; it will not do for them to take me out of here against my will."

And then the chief of the police, after a respectful bow, retired with the warder and the soldiers.

The doomed man, who had now but a few hours to live, was left alone.

CHAPTER XVIII. FRAGOSO

AND SO the order had come, and, as Judge Jarriquez had foreseen, it was an order requiring the immediate execution of the sentence pronounced on Joam Dacosta. No proof had been produced; justice must take its course.

It was the very day--the 31st of August, at nine o'clock in the morning of which the condemned man was to perish on the gallows.

The death penalty in Brazil is generally commuted except in the case of negroes, but this time it was to be suffered by a white man.
Such are the penal arrangements relative to crimes in the diamond arrayal, for which, in the public interest, the law allows no appear to mercy.

Nothing could now save Joam Dacosta. It was not only life, but honor that he was about to lose.

But on the 31st of August a man was approaching Manaos with all the speed his horse was capable of, and such had been the pace at which he had come that half a mile from the town the gallant creature fell, incapable of carrying him any further.

The rider did not even stop to raise his steed. Evidently he had asked and obtained from it all that was possible, and, despite the state of exhaustion in which he found himself, he rushed off in the direction of the city.

The man came from the eastern provinces, and had followed the left bank of the river. All his means had gone in the purchase of this horse, which, swifter far than any pirogue on the Amazon, had brought him to Manaos.

It was Fragoso!

Had, then, the brave fellow succeeded in the enterprise of which he had spoken to nobody? Had he found the party to which Torres belonged? Had he discovered some secret which would yet save Joam Dacosta?

He hardly knew. But in any case he was in great haste to acquaint Judge Jarriquez with what he had ascertained during his short excursion.

And this is what had happened.

Fragoso had made no mistake when he recognized Torres as one of the captains of the party which was employed in the river provinces of the Madeira.

He set out, and on reaching the mouth of that tributary he learned that the chief of these _capitães da mato_ was then in the neighborhood.

Without losing a minute, Fragoso started on the search, and, not without difficulty, succeeded in meeting him.

To Fragoso's questions the chief of the party had no hesitation in replying; he had no interest in keeping silence with regard to the few simple matters on which he was interrogated. In fact, three questions only of importance were asked him by Fragoso, and these were:

"Did not a captain of the woods named Torres belong to your party a few months ago?"
"Yes."
"At that time had he not one intimate friend among his companions who has recently died?"
"Just so!"
"And the name of that friend was?"
"Ortega."

This was all that Fragoso had learned. Was this information of a kind to modify Dacosta's position? It was hardly likely.

Fragoso saw this, and pressed the chief of the band to tell him what he knew of this Ortega, of the place where he came from, and of his antecedents generally. Such information would have been of great importance if Ortega, as Torres had declared, was the true author of the crime of Tijuco. But unfortunately the chief could give him no information whatever in the matter.

What was certain was that Ortega had been a member of the band for many years, that an intimate friendship existed between him and Torres, that they were always seen together, and that Torres had watched at his bedside when he died.

This was all the chief of the band knew, and he could tell no more. Fragoso, then, had to be contented with these insignificant details, and departed immediately.

But if the devoted fellow had not brought back the proof that Ortega was the author of the crime of Tijuco, he had gained one thing, and that was the knowledge that Torres had told the truth when he affirmed that one of his comrades in the band had died, and that he had been present during his last moments.

The hypothesis that Ortega had given him the document in question had now become admissible. Nothing was more probable than that this document had reference to the crime of which Ortega was really the author, and that it contained the confession of the culprit, accompanied by circumstances which permitted of no doubt as to its truth.

And so, if the document could be read, if the key had been found, if the cipher on which the system hung were known, no doubt of its truth could be entertained.

But this cipher Fragoso did not know. A few more presumptions, a half-certainty that the adventurer had invented nothing, certain circumstances tending to prove that the secret of the matter was contained in the document-and that was all that the gallant fellow brought back from his visit to the chief of the gang of which Torres had been a member.

Nevertheless, little as it was, he was in all haste to relate it to Judge Jarriquez. He knew that he had not an hour to lose, and that was why on this very morning, at about eight o'clock, he arrived, exhausted with fatigue, within half a mile of Manaos. The distance between there and the town he traversed in a few minutes. A kind of irresistible
presentiment urged him on, and he had almost come to believe that Joam Dacosta's safety rested in his hands.

Suddenly Fragoso stopped as if his feet had become rooted in the ground. He had reached the entrance to a small square, on which opened one of the town gates.

There, in the midst of a dense crowd, arose the gallows, towering up some twenty feet, and from it there hung the rope!

Fragoso felt his consciousness abandon him. He fell; his eyes involuntarily closed. He did not wish to look, and these words escaped his lips: "Too late! too late!" But by a superhuman effort he raised himself up. No; it was _not_ too late, the corpse of Joam Dacosta was _not_ hanging at the end of the rope!

"Judge Jarriquez! Judge Jarriquez!" shouted Fragoso, and panting and bewildered he rushed toward the city gate, dashed up the principal street of Manaos, and fell half-dead on the threshold of the judge's house. The door was shut. Fragoso had still strength enough left to knock at it.

One of the magistrate's servants came to open it; his master would see no one.

In spite of this denial, Fragoso pushed back the man who guarded the entrance, and with a bound threw himself into the judge's study.

"I come from the province where Torres pursued his calling as captain of the woods!" he gasped. "Mr. Judge, Torres told the truth. Stop--stop the execution?"

"You found the gang?"

"Yes."

"And you have brought me the cipher of the document?"

Fragoso did not reply.

"Come, leave me alone! leave me alone!" shouted Jarriquez, and, a prey to an outburst of rage, he grasped the document to tear it to atoms.

Fragoso seized his hands and stopped him. "The truth is there!" he said.

"I know," answered Jarriquez; "but it is a truth which will never see the light!"

"It will appear--it must! it must!"

"Once more, have you the cipher?"

"No," replied Fragoso; "but, I repeat, Torres has not lied. One of his companions, with whom he was very intimate, died a few months ago, and there can be no doubt but that this man gave him the document he came to sell to Joam Dacosta."

"No," answered Jarriquez--"no, there is no doubt about it--as far as we are concerned; but that is not enough for those who dispose of the doomed man's life. Leave me!"

Fragoso, repulsed, would not quit the spot. Again he threw himself at the judge's feet. "Joam Dacosta is innocent!" he cried; "you will not leave him to die? It was not he who committed the crime of Tijuco; it was the comrade of Torres, the author of that document! It was Ortega!"

As he uttered the name the judge bounded backward. A kind of calm swiftly succeeded to the tempest which raged within him. He dropped the document from his clenched hand, smoothed it out on the table, sat down, and, passing his hand over his eyes--"That name?" he said--"Ortega? Let us see," and then he proceeded with the new name brought back by Fragoso as he had done with the other names so vainly tried by himself.

After placing it above the first six letters of the paragraph he obtained the following formula:

\[ \text{O r t e g a}_\text{P h y j s l} \]

"Nothing!" he said. "That give us--nothing!"

And in fact the \(_h\) placed under the \(_r\) could not be expressed by a cipher, for, in alphabetical order, this letter occupies an earlier position to that of the \(_r\)."

The \(_p\), the \(_y\), the \(_j\), arranged beneath the letters \(_o, t, e\), disclosed the cipher 1, 4, 5, but as for the \(_s_\) and the \(_l\) at the end of the word, the interval which separated them from the \(_g\) and the \(_a\) was a dozen letters, and hence impossible to express by a single cipher, so that they corresponded to neither \(_g\) nor \(_a\)."

And here appalling shouts arose in the streets; they were the cries of despair.

Fragoso jumped to one of the windows, and opened it before the judge could hinder him.

The people filled the road. The hour had come at which the doomed man was to start from the prison, and the crowd was flowing back to the spot where the gallows had been erected.

Judge Jarriquez, quite frightful to look upon, devoured the lines of the document with a fixed stare.

"The last letters!" he muttered. "Let us try once more the last letters!"

It was the last hope.

And then, with a hand whose agitation nearly prevented him from writing at all, he placed the name of Ortega over the six last letters of the paragraph, as he had done over the first.

An exclamation immediately escaped him. He saw, at first glance, that the six last letters were inferior in
alphabetical order to those which composed Ortega's name, and that consequently they might yield the number.

And when he reduced the formula, reckoning each later letter from the earlier letter of the word, he obtained.

O r t e g a 4 3 2 5 1 3 _ S u v j h d_

The number thus disclosed was 432513.

But was this number that which had been used in the document? Was it not as erroneous as those he had previously tried?

At this moment the shouts below redoubled—shouts of pity which betrayed the sympathy of the excited crowd. A few minutes more were all that the doomed man had to live!

Fragoso, maddened with grief, darted from the room! He wished to see, for the last time, his benefactor who was on the road to death! He longed to throw himself before the mournful procession and stop it, shouting, "Do not kill this just man! do not kill him!"

But already Judge Jarriquez had placed the given number above the first letters of the paragraph, repeating them as often as was necessary, as follows:

4 3 2 5 1 3 4 3 2 5 1 3 4 3 2 5 1 3 _ P h y j s l y d q f d z x g a s g z z q e h_

And then, reckoning the true letters according to their alphabetical order, he read:

"Le véritable auteur du vol de----"

A yell of delight escaped him! This number, 432513, was the number sought for so long! The name of Ortega had enabled him to discover it! At length he held the key of the document, which would incontestably prove the innocence of Joam Dacosta, and without reading any more he flew from his study into the street, shouting:

"Halt! Halt!"

To cleave the crowd, which opened as he ran, to dash to the prison, whence the convict was coming at the last moment, with his wife and children clinging to him with the violence of despair, was but the work of a minute for Judge Jarriquez.

Stopping before Joam Dacosta, he could not speak for a second, and then these words escaped his lips:

"Innocent! Innocent!"

CHAPTER XIX. THE CRIME OF TIJUCO

ON THE ARRIVAL of the judge the mournful procession halted. A roaring echo had repeated after him and again repeated the cry which escaped from every mouth:

"Innocent! Innocent!"

Then complete silence fell on all. The people did not want to lose one syllable of what was about to be proclaimed.

Judge Jarriquez sat down on a stone seat, and then, while Minha, Benito, Manoel, and Fragoso stood round him, while Joam Dacosta clasped Yaquita to his heart, he first unraveled the last paragraph of the document by means of the number, and as the words appeared by the institution of the true letters for the cryptological ones, he divided and punctuated them, and then read it out in a loud voice. And this is what he read in the midst of profound silence:

"Le véritable auteur du vol des diamants et de_ 43 2513432513 342513 14 32513432 51 34 _Ph yjsylddf dzxgas gz zqq ehx gkfndrxu ju gi l'assassinat des soldats qui escortaient le convoi, _32513432513 432 5134325 134 32513432 513 432513 _ocytidxvksbx bhu yphohdy rym huhpuydkjox ph etozsl

"The real author of the robbery of the diamonds and of the murder of the soldiers who escorted the convoy, committed during the night of the twenty-second of January, one thousand eight hundred and twenty-six, was thus not Joam Dacosta, unjustly condemned to death; it was I, the wretched servant of the Administration of the diamond district; yes, I alone, who sign this with my true name, Ortega."

The reading of this had hardly finished when the air was rent with prolonged hurrahs.

What could be more conclusive than this last paragraph, which summarized the whole of the document, and
proclaimed so absolutely the innocence of the fazender of Iquitos, and which snatched from the gallows this victim of a frightful judicial mistake!

Joam Dacosta, surrounded by his wife, his children, and his friends, was unable to shake the hands which were held out to him. Such was the strength of his character that a reaction occurred, tears of joy escaped from his eyes, and at the same instant his heart was lifted up to that Providence which had come to save him so miraculously at the moment he was about to offer the last expiation to that God who would not permit the accomplishment of that greatest of crimes, the death of an innocent man!

Yes! There could be no doubt as to the vindication of Joam Dacosta. The true author of the crime of Tijuco confessed of his own free will, and described the circumstances under which it had been perpetrated!

By means of the number Judge Jarriquez interpreted the whole of the cryptogram.

And this was what Ortega confessed.

He had been the colleague of Joam Dacosta, employed, like him, at Tijuco, in the offices of the governor of the diamond arrayal. He had been the official appointed to accompany the convoy to Rio de Janeiro, and, far from recoiling at the horrible idea of enriching himself by means of murder and robbery, he had informed the smugglers of the very day the convoy was to leave Tijuco.

During the attack of the scoundrels, who awaited the convoy just beyond Villa Rica, he pretended to defend himself with the soldiers of the escort, and then, falling among the dead, he was carried away by his accomplices. Hence it was that the solitary soldier who survived the massacre had reported that Ortega had perished in the struggle.

But the robbery did not profit the guilty man in the long run, for, a little time afterward, he was robbed by those whom he had helped to commit the crime.

Penniless, and unable to enter Tijuco again, Ortega fled away to the provinces in the north of Brazil, to those districts of the Upper Amazon where the capitaeas da mato are to be found. He had to live somehow, and so he joined this not very honorable company; they neither asked him who he was nor whence he came, and so Ortega became a captain of the woods, and for many years he followed the trade of a chaser of men.

During this time Torres, the adventurer, himself in absolute want, became his companion. Ortega and he became most intimate. But, as he had told Torres, remorse began gradually to trouble the scoundrel's life. The remembrance of his crime became horrible to him. He knew that another had been condemned in his place! He knew subsequently that the innocent man had escaped from the last penalty, but that he would never be free from the shadow of the capital sentence! And then, during an expedition of his party for several months beyond the Peruvian frontier, chance caused Ortega to visit the neighborhood of Iquitos, and there in Joam Garral, who did not recognize him, he recognized Joam Dacosta.

Henceforth he resolved to make all the reparation he could for the injustice of which his old comrade had been the victim. He committed to the document all the facts relative to the crime of Tijuco, writing it first in French, which had been his mother's native tongue, and then putting it into the mysterious form we know, his intention being to transmit it to the fazender of Iquitos, with the cipher by which it could be read.

Death prevented his completing his work of reparation. Mortally wounded in a scuffle with some negroes on the Madeira, Ortega felt he was doomed. His comrade Torres was then with him. He thought he could intrust to his friend the secret which had so grievously darkened his life. He gave him the document, and made him swear to convey it to Joam Dacosta, whose name and address he gave him, and with his last breath he whispered the number 432513, without which the document would remain undecipherable.

Ortega dead, we know how the unworthy Torres acquitted himself of his mission, how he resolved to turn to his own profit the secret of which he was the possessor, and how he tried to make it the subject of an odious bargain.

Torres died without accomplishing his work, and carried his secret with him. But the name of Ortega, brought back by Fragoso, and which was the signature of the document, had afforded the means of unraveling the cryptogram, thanks to the sagacity of Judge Jarriquez. Yes, the material proof sought after for so long was the incontestable witness of the innocence of Joam Dacosta, returned to life, restored to honor.

The cheers redoubled when the worthy magistrate, in a loud voice, and for the edification of all, read from the document this terrible history.

And from that moment Judge Jarriquez, who possessed this indubitable proof, arranged with the chief of the police, and declined to allow Joam Dacosta, while waiting new instructions from Rio Janeiro, to stay in any prison but his own house.

There could be no difficulty about this, and in the center of the crowd of the entire population of Manaos, Joam Dacosta, accompanied by all his family, beheld himself conducted like a conqueror to the magistrate's residence.

And in that minute the honest fazender of Iquitos was well repaid for all that he had suffered during the long years of exile, and if he was happy for his family's sake more than for his own, he was none the less proud for his
country's sake that this supreme injustice had not been consummated!

And in all this what had become of Fragoso?

Well, the good-hearted fellow was covered with caresses! Benito, Manoel, and Minha had overwhelmed him, and Lina had by no means spared him. He did not know what to do, he defended himself as best he could. He did not deserve anything like it. Chance alone had done it. Were any thanks due to him for having recognized Torres as a captain of the woods? No, certainly not. As to his idea of hurrying off in search of the band to which Torres had belonged, he did not think it had been worth much, and as to the name of Ortega, he did not even know its value.

Gallant Fragoso! Whether he wished it or no, he had none the less saved Joam Dacosta!

And herein what a strange succession of different events all tending to the same end. The deliverance of Fragoso at the time when he was dying of exhaustion in the forest of Iquitos; the hospitable reception he had met with at the fazenda, the meeting with Torres on the Brazilian frontier, his embarkation on the jangada; and lastly, the fact that Fragoso had seen him somewhere before.

"Well, yes!" Fragoso ended by exclaiming; "but it is not to me that all this happiness is due, it is due to Lina!"

"To me?" replied the young mulatto.

"No doubt of it. Without the liana, without the idea of the liana, could I ever have been the cause of so much happiness?"

So that Fragoso and Lina were praised and petted by all the family, and by all the new friends whom so many trials had procured them at Manaos, need hardly be insisted on.

But had not Judge Jarriquez also had his share in this rehabilitation of an innocent man? If, in spite of all the shrewdness of his analytical talents, he had not been able to read the document, which was absolutely undecipherable to any one who had not got the key, had he not at any rate discovered the system on which the cryptogram was composed? Without him what could have been done with only the name of Ortega to reconstitute the number which the author of the crime and Torres, both of whom were dead, alone knew?

And so he also received abundant thanks.

Needless to say that the same day there was sent to Rio de Janeiro a detailed report of the whole affair, and with it the original document and the cipher to enable it to be read. New instructions from the minister of justice had to be waited for, though there could be no doubt that they would order the immediate discharge of the prisoner. A few days would thus have to be passed at Manaos, and then Joam Dacosta and his people, free from all constraint, and released from all apprehension, would take leave of their host to go on board once more and continue their descent of the Amazon to Para, where the voyage was intended to terminate with the double marriage of Minha and Manoel and Lina and Fragoso.

Four days afterward, on the fourth of September, the order of discharge arrived. The document had been recognized as authentic. The handwriting was really that of Ortega, who had been formerly employed in the diamond district, and there could be no doubt that the confession of his crime, with the minutest details that were given, had been entirely written with his own hand.

The innocence of the convict of Villa Rica was at length admitted. The rehabilitation of Joam Dacosta was at last officially proclaimed.

That very day Judge Jarriquez dined with the family on board the giant raft, and when evening came he shook hands with them all. Touching were the adieus, but an engagement was made for them to see him again on their return at Manaos, and later on the fazenda of Iquitos.

On the morning of the morrow, the fifth of September, the signal for departure was given. Joam Dacosta and Yaquita, with their daughter and sons, were on the deck of the enormous raft. The jangada had its moorings slackened off and began to move with the current, and when it disappeared round the bend of the Rio Negro, the hurrahs of the whole population of Manaos, who were assembled on the bank, again and again re-echoed across the stream.

CHAPTER XX. THE LOWER AMAZON

LITTLE REMAINS to tell of the second part of the voyage down the mighty river. It was but a series of days of joy. Joam Dacosta returned to a new life, which shed its happiness on all who belonged to him.

The giant raft glided along with greater rapidity on the waters now swollen by the floods. On the left they passed the small village of Don Jose de Matuni, and on the right the mouth of that Madeira which owes its name to the floating masses of vegetable remains and trunks denuded of their foliage which it bears from the depths of Bolivia. They passed the archipelago of Caniny, whose islets are veritable boxes of palms, and before the village of Serpa, which, successively transported from one back to the other, has definitely settled on the left of the river, with its little houses, whose thresholds stand on the yellow carpet of the beach.
The village of Silves, built on the left of the Amazon, and the town of Villa Bella, which is the principal guarana market in the whole province, were soon left behind by the giant raft. And so was the village of Faro and its celebrated river of the Nhamundas, on which, in 1539, Orellana asserted he was attacked by female warriors, who have never been seen again since, and thus gave us the legend which justifies the immortal name of the river of the Amazons.

Here it is that the province of Rio Negro terminates. The jurisdiction of Para then commences; and on the 22d of September the family, marveling much at a valley which has no equal in the world, entered that portion of the Brazilian empire which has no boundary to the east except the Atlantic.

"How magnificent!" remarked Minha, over and over again.
"How long!" murmured Manoel.
"How beautiful!" repeated Lina.
"When shall we get there?" murmured Fragoso.

And this was what might have been expected of these folks from the different points of view, though time passed pleasantly enough with them all the same. Benito, who was neither patient nor impatient, had recovered all his former good humor.

Soon the jangada glided between interminable plantations of cocoa-trees with their somber green flanked by the yellow thatch or ruddy tiles of the roofs of the huts of the settlers on both banks from Obidos up to the town of Monto Alegre.

Then there opened out the mouth of the Rio Trombetas, bathing with its black waters the houses of Obidos, situated at about one hundred and eighty miles from Belem, quite a small town, and even a _"citade"_ with large streets bordered with handsome habitations, and a great center for cocoa produce. Then they saw another tributary, the Tapajos, with its greenish-gray waters descending from the south-west; and then Santarem, a wealthy town of not less than five thousand inhabitants, Indians for the most part, whose nearest houses were built on the vast beach of white sand.

After its departure from Manaos the jangada did not stop anywhere as it passed down the much less encumbered course of the Amazon. Day and night it moved along under the vigilant care of its trusty pilot; no more stoppages either for the gratification of the passengers or for business purposes. Unceasingly it progressed, and the end rapidly grew nearer.

On leaving Alemquer, situated on the left bank, a new horizon appeared in view. In place of the curtain of forests which had shut them in up to then, our friends beheld a foreground of hills, whose undulations could be easily described, and beyond them the faint summits of veritable mountains vandyked across the distant depth of sky. Neither Yaquita, nor her daughter, nor Lina, nor old Cybele, had ever seen anything like this.

But in this jurisdiction of Para, Manoel was at home, and he could tell them the names of the double chain which gradually narrowed the valley of the huge river.

"To the right," said he, "that is the Sierra de Paracuarta, which curves in a half-circle to the south! To the left, that is the Sierra de Curuva, of which we have already passed the first outposts."

"Then they close in?" asked Fragoso.
"They close in!" replied Manoel.

And the two young men seemed to understand each other, for the same slight but significant nodding of the head accompanied the question and reply.

At last, notwithstanding the tide, which since leaving Obidos had begun to be felt, and which somewhat checked the progress of the raft, the town of Monto Alegre was passed, then that of Pravnha de Outeiro, then the mouth of the Xingu, frequented by Yurumas Indians, whose principal industry consists in preparing their enemies' heads for natural history cabinets.

To what a superb size the Amazon had now developed as already this monarch of rivers gave signs of opening out like a sea! Plants from eight to ten feet high clustered along the beach, and bordered it with a forest of reeds. Porto de Mos, Boa Vista, and Gurupa, whose prosperity is on the decline, were soon among the places left in the rear.

Then the river divided into two important branches, which flowed off toward the Atlantic, one going away northeastward, the other eastward, and between them appeared the beginning of the large island of Marajo. This island is quite a province in itself. It measures no less than a hundred and eighty leagues in circumference. Cut up by marshes and rivers, all savannah to the east, all forest to the west, it offers most excellent advantages for the raising of cattle, which can here be seen in their thousands. This immense barricade of Marajo is the natural obstacle which has compelled the Amazon to divide before precipitating its torrents of water into the sea. Following the upper branch, the jangada, after passing the islands of Caviana and Mexiana, would have found an _embouchure_ of some fifty leagues across, but it would also have met with the bar of the prororoca, that terrible eddy which, for the three
days preceding the new or full moon, takes but two minutes instead of six hours to raise the river from twelve to fifteen feet above ordinary high-water mark.

This is by far the most formidable of tide-races. Most fortunately the lower branch, known as the Canal of Breves, which is the natural area of the Para, is not subject to the visitations of this terrible phenomenon, and its tides are of a more regular description. Araujo, the pilot, was quite aware of this. He steered, therefore, into the midst of magnificent forests, here and there gliding past island covered with muritis palms; and the weather was so favorable that they did not experience any of the storms which so frequently rage along this Breves Canal.

A few days afterward the jangada passed the village of the same name, which, although built on the ground flooded for many months in the year, has become, since 1845, an important town of a hundred houses. Throughout these districts, which are frequented by Tapuyas, the Indians of the Lower Amazon become more and more commingled with the white population, and promise to be completely absorbed by them.

And still the jangada continued its journey down the river. Here, at the risk of entanglement, it grazed the branches of the mangliers, whose roots stretched down into the waters like the claws of gigantic crustaceans; then the smooth trunks of the paletuviers, with their pale-green foliage, served as the resting-places for the long poles of the crew as they kept the raft in the strength of the current.

Then came the Tocantins, whose waters, due to the different rivers of the province of Goyaz, mingle with those of the Amazon by an _embouchure_ of great size, then the Moju, then the town of Santa Ana.

Majestically the panorama of both banks moved along without a pause, as though some ingenious mechanism necessitated its unrolling in the opposite direction to that of the stream.

Already numerous vessels descending the river, ubas, egariteas, vigilandas, pirogues of all builds, and small coasters from the lower districts of the Amazon and the Atlantic seaboard, formed a procession with the giant raft, and seemed like sloops beside some might man-of-war.

At length there appeared on the left Santa Maria de Belem do Para--the "town" as they call it in that country--with its picturesque lines of white houses at many different levels, its convents nestled among the palm-trees, the steeples of its cathedral and of Nostra Senora de Merced, and the flotilla of its brigantines, brigs, and barks, which form its commercial communications with the old world.

The hearts of the passengers of the giant raft beat high. At length they were coming to the end of the voyage which they had thought they would never reach. While the arrest of Joam detained them at Manaos, halfway on their journey, could they ever have hoped to see the capital of the province of Para?

It was in the course of this day, the 15th of October--four months and a half after leaving the fazenda of Iquitos--that, as they rounded a sharp bend in the river, Belem came into sight.

The arrival of the jangada had been signaled for some days. The whole town knew the story of Joam Dacosta. They came forth to welcome him, and to him and his people accorded a most sympathetic reception.

Hundreds of craft of all sorts conveyed them to the fazender, and soon the jangada was invaded by all those who wished to welcome the return of their compatriot after his long exile. Thousands of sight-seers--or more correctly speaking, thousands of friends crowded on to the floating village as soon as it came to its moorings, and it was vast and solid enough to support the entire population. Among those who hurried on board one of the first pirogues had brought Madame Valdez. Manoel's mother was at last able to clasp to her arms the daughter whom her son had chosen. If the good lady had not been able to come to Iquitos, was it not as though a portion of the fazenda, with her new family, had come down the Amazon to her?

Before evening the pilot Araujo had securely moored the raft at the entrance of a creek behind the arsenal. That was to be its last resting-place, its last halt, after its voyage of eight hundred leagues on the great Brazilian artery. There the huts of the Indians, the cottage of the negroes, the store-rooms which held the valuable cargo, would be gradually demolished; there the principal dwelling, nestled beneath its verdant tapestry of flowers and foliage, and the little chapel whose humble bell was then replying to the sounding clangor from the steeples of Belem, would each in its turn disappear.

But, ere this was done, a ceremony had to take place on the jangada--the marriage of Manoel and Minha, the marriage of Lina and Fragoso. To Father Passanha fell the duty of celebrating the double union which promised so happily. In that little chapel the two couples were to receive the nuptial benediction from his hands.

If it happened to be so small as to be only capable of holding the members of Dacosta's family, was not the giant raft large enough to receive all those who wished to assist at the ceremony? and if not, and the crowd became so great, did not the ledges of the river banks afford sufficient room for as many others of the sympathizing crowd as were desirous of welcoming him whom so signal a reparation had made the hero of the day?

It was on the morrow, the 16th of October, that with great pomp the marriages were celebrated.

It was a magnificent day, and from about ten o'clock in the morning the raft began to receive its crowd of guests. On the bank could be seen almost the entire population of Belem in holiday costume. On the river, vessels of all
sorts crammed with visitors gathered round the enormous mass of timber, and the waters of the Amazon literally disappeared even up to the left bank beneath the vast flotilla.

When the chapel bell rang out its opening note it seemed like a signal of joy to ear and eye. In an instant the churches of Belem replied to the bell of the jangada. The vessels in the port decked themselves with flags up to their mastheads, and the Brazilian colors were saluted by the many other national flags. Discharges of musketry reverberated on all sides, and it was only with difficulty that their joyous detonations could cope with the loud hurrahs from the assembled thousands.

The Dacosta family came forth from their house and moved through the crowd toward the little chapel. Joam was received with absolutely frantic applause. He gave his arm to Madame Valdez; Yaquita was escorted by the governor of Belem, who, accompanied by the friends of the young army surgeon, had expressed a wish to honor the ceremony with his presence. Manoel walked by the side of Minha, who looked most fascinating in her bride's costume, and then came Fragoso, holding the hand of Lina, who seemed quite radiant with joy. Then followed Benito, then old Cybele and the servants of the worthy family between the double ranks of the crew of the jangada.

Padre Passanha awaited the two couples at the entrance of the chapel. The ceremony was very simple, and the same bands which had formerly blessed Joam and Yaquita were again stretched forth to give the nuptial benediction to their child.

So much happiness was not likely to be interrupted by the sorrow of long separation. In fact, Manoel Valdez almost immediately sent in his resignation, so as to join the family at Iquitos, where he is still following the profession of a country doctor.

Naturally the Fragosos did not hesitate to go back with those who were to them friends rather than masters.

Madame Valdez had no desire to separate so happy a group, but she insisted on one thing, and that was that they should often come and see her at Belem. Nothing could be easier. Was not the mighty river a bond of communication between Belem and Iquitos? In a few days the first mail steamer was to begin a regular and rapid service, and it would then only take a week to ascend the Amazon, on which it had taken the giant raft so many months to drift. The important commercial negotiations, ably managed by Benito, were carried through under the best of conditions, and soon of what had formed this jangada—that is to say, the huge raft of timber constructed from an entire forest at Iquitos—there remained not a trace.

A month afterward the fazender, his wife, his son, Manoel and Minha Valdez, Lina and Fragoso, departed by one of the Amazon steamers for the immense establishment at Iquitos of which Benito was to take the management.

Joam Dacosta re-entered his home with his head erect, and it was indeed a family of happy hearts which he brought back with him from beyond the Brazilian frontier. As for Fragoso, twenty times a day was he heard to repeat, "What! without the liana?" and he wound up by bestowing the name on the young mulatto who, by her affection for the gallant fellow, fully justified its appropriateness. "If it were not for the one letter," he said, "would not Lina and Liana be the same?"

FACING THE FLAG
BY JULES VERNE

CHAPTER I.
HEALTHFUL HOUSE.

The carte de visite received that day, June 15, 189-, by the director of the establishment of Healthful House was a very neat one, and simply bore, without escutcheon or coronet, the name:
COUNT D'ARTIGAS.

Below this name, in a corner of the card, the following address was written in lead pencil:
"On board the schooner Ebba, anchored off New-Berne, Pamlico Sound."

The capital of North Carolina--one of the forty-four states of the Union at this epoch--is the rather important town of Raleigh, which is about one hundred and fifty miles in the interior of the province. It is owing to its central position that this city has become the seat of the State legislature, for there are others that equal and even surpass it in industrial and commercial importance, such as Wilmington, Charlotte, Fayetteville, Edenton, Washington, Salisbury, Tarborough, Halifax, and New-Berne. The latter town is situated on estuary of the Neuse River, which empties itself into Pamlico Sound, a sort of vast maritime lake protected by a natural dyke formed by the isles and islets of the Carolina coast.

The director of Healthful House could never have imagined why the card should have been sent to him, had it
not been accompanied by a note from the Count d'Artigas soliciting permission to visit the establishment. The
personage in question hoped that the director would grant his request, and announced that he would present himself
in the afternoon, accompanied by Captain Spade, commander of the schooner Ebba.

This desire to penetrate to the interior of the celebrated sanitarium, then in great request by the wealthy invalids
of the United States, was natural enough on the part of a foreigner. Others who did not bear such a high-sounding
name as the Count d'Artigas had visited it, and had been unstinting in their compliments to the director. The latter
therefore hastened to accord the authorization demanded, and added that he would be honored to open the doors of
the establishment to the Count d'Artigas.

Healthful House, which contained a select personnel, and was assured of the co-operation of the most celebrated
doctors in the country, was a private enterprise. Independent of hospitals and almshouses, but subjected to the
surveillance of the State, it comprised all the conditions of comfort and salubrity essential to establishments of this
description designed to receive an opulent clientele.

It would have been difficult to find a more agreeable situation than that of Healthful House. On the landward
slope of a hill extended a park of two hundred acres planted with the magnificent vegetation that grows so
luxuriantly in that part of North America, which is equal in latitude to the Canary and Madeira Islands. At the
furthest limit of the park lay the wide estuary of the Neuse, swept by the cool breezes of Pamlico Sound and by
the winds that blew from the ocean beyond the narrow lido of the coast.

Healthful House, where rich invalids were cared for under such excellent hygienic conditions, was more
generally reserved for the treatment of chronic complaints; but the management did not decline to admit patients
affected by mental troubles, when the latter were not of an incurable nature.

It thus happened--a circumstance that was bound to attract a good deal of attention to Healthful House, and
which perhaps was the motive for the visit of the Count d'Artigas--that a person of world-wide notoriety had for
eighteen months been under special observation there.

This person was a Frenchman named Thomas Roch, forty-five years of age. He was, beyond question, suffering
from some mental malady, but expert alienists admitted that he had not entirely lost the use of his reasoning
faculties. It was only too evident that he had lost all notion of things as far as the ordinary acts of life were
concerned; but in regard to subjects demanding the exercise of his genius, his sanity was unimpaired and
unassailable--a fact which demonstrates how true is the dictum that genius and madness are often closely allied!
Otherwise his condition manifested itself by complete loss of memory;--the impossibility of concentrating his
attention upon anything, lack of judgment, delirium and incoherence. He no longer even possessed the natural
animal instinct of self-preservation, and had to be watched like an infant whom one never permits out of one's sight.
Therefore a warder was detailed to keep close watch over him by day and by night in Pavilion No. 17, at the end of
Healthful House Park, which had been specially set apart for him.

Ordinary insanity, when it is not incurable, can only be cured by moral means. Medicine and therapeutics are
powerless, and their inefficacy has long been recognized by specialists. Were these moral means applicable to the
case of Thomas Roch? One may be permitted to doubt it, even amid the tranquil and salubrious surroundings of
Healthful House. As a matter of fact the very symptoms of uneasiness, changes of temper, irritability, queer traits of
character, melancholy, apathy, and a repugnance for serious occupations were distinctly apparent; no treatment
seemed capable of curing or even alleviating these symptoms. This was patent to all his medical attendants.

It has been justly remarked that madness is an excess of subjectivity; that is to say, a state in which the mind
accords too much to mental labor and not enough to outward impressions. In the case of Thomas Roch this
indifference was practically absolute. He lived but within himself, so to speak, a prey to a fixed idea which had
brought him to the condition in which we find him. Could any circumstance occur to counteract it--to "exteriorize"
him, as it were? The thing was improbable, but it was not impossible.

It is now necessary to explain how this Frenchman came to quit France, what motive attracted him to the United
States, why the Federal government had judged it prudent and necessary to intern him in this sanitarium, where
every utterance that unconsciously escaped him during his crises were noted and recorded with the minutest care.

Eighteen months previously the Secretary of the Navy at Washington, had received a demand for an audience in
gard to a communication that Thomas Roch desired to make to him.

As soon as he glanced at the name, the secretary perfectly understood the nature of the communication and the
terms which would accompany it, and an immediate audience was unhesitatingly accorded.

Thomas Roch's notoriety was indeed such that, out of solicitude for the interests confided to his keeping, and
which he was bound to safeguard, he could not hesitate to receive the petitioner and listen to the proposals which the
latter desired personally to submit to him.

Thomas Roch was an inventor--an inventor of genius. Several important discoveries had brought him
prominently to the notice of the world. Thanks to him, problems that had previously remained purely theoretical had
received practical application. He occupied a conspicuous place in the front rank of the army of science. It will be seen how worry, deceptions, mortification, and the outrages with which he was overwhelmed by the cynical wits of the press combined to drive him to that degree of madness which necessitated his internment in Healthful House.

His latest invention in war-engines bore the name of Roch's Fulgurator. This apparatus possessed, if he was to be believed, such superiority over all others, that the State which acquired it would become absolute master of earth and ocean.

The deplorable difficulties inventors encounter in connection with their inventions are only too well known, especially when they endeavor to get them adopted by governmental commissions. Several of the most celebrated examples are still fresh in everybody's memory. It is useless to insist upon this point, because there are sometimes circumstances underlying affairs of this kind upon which it is difficult to obtain any light. In regard to Thomas Roch, however, it is only fair to say that, as in the case of the majority of his predecessors, his pretensions were excessive. He placed such an exorbitant price upon his new engine that it was practicably impossible to treat with him.

This was due to the fact—and it should not be lost sight of—that in respect of previous inventions which had been most fruitful in result, he had been imposed upon with the greatest audacity. Being unable to obtain therefrom the profits which he had a right to expect, his temper had become soured. He became suspicious, would give up nothing without knowing just what he was doing, impose conditions that were perhaps unacceptable, wanted his mere assertions accepted as sufficient guarantee, and in any case asked for such a large sum of money on account before condescending to furnish the test of practical experiment that his overtures could not be entertained.

In the first place he had offered the fulgurator to France, and made known the nature of it to the commission appointed to pass upon his proposition. The fulgurator was a sort of auto-propulsive engine, of peculiar construction, charged with an explosive composed of new substances and which only produced its effect under the action of a deflagrator that was also new.

When this engine, no matter in what way it was launched, exploded, not on striking the object aimed at, but several hundred yards from it, its action upon the atmospheric strata was so terrific that any construction, warship or floating battery, within a zone of twelve thousand square yards, would be blown to atoms. This was the principle of the shell launched by the Zalinski pneumatic gun which experiments had already been made at that epoch, but its results were multiplied at least a hundred-fold.

If, therefore, Thomas Roch's invention possessed this power, it assured the offensive and defensive superiority of his native country. But might not the inventor be exaggerating, notwithstanding that the tests of other engines he had conceived had proved incontestably that they were all he had claimed them to be? This, experiment could alone show, and it was precisely here where the rub came in. Roch would not agree to experiment until the millions at which he valued his fulgurator had first been paid to him.

It is certain that a sort of disequilibrium had then occurred in his mental faculties. It was felt that he was developing a condition of mind that would gradually lead to definite madness. No government could possibly condescend to treat with him under the conditions he imposed.

The French commission was compelled to break off all negotiations with him, and the newspapers, even those of the Radical Opposition, had to admit that it was difficult to follow up the affair.

In view of the excess of subjectivity which was unceasingly augmenting in the profoundly disturbed mind of Thomas Roch, no one will be surprised at the fact that the cord of patriotism gradually relaxed until it ceased to vibrate. For the honor of human nature be it said that Thomas Roch was by this time irresponsible for his actions. He preserved his whole consciousness only in so far as subjects bearing directly upon his invention were concerned. In this particular he had lost nothing of his mental power. But in all that related to the most ordinary details of existence his moral decrepitude increased daily and deprived him of complete responsibility for his acts.

Thomas Roch's invention having been refused by the commission, steps ought to have been taken to prevent him from offering it elsewhere. Nothing of the kind was done, and there a great mistake was made.

The inevitable was bound to happen, and it did. Under a growing irritability the sentiment of patriotism, which is the very essence of the citizen—who before belonging to himself belongs to his country—became extinct in the soul of the disappointed inventor. His thoughts turned towards other nations. He crossed the frontier, and forgetting the ineffaceable past, offered the fulgurator to Germany.

There, as soon as his exorbitant demands were made known, the government refused to receive his communication. Besides, it so happened that the military authorities were just then absorbed by the construction of a new ballistic engine, and imagined they could afford to ignore that of the French inventor.

As the result of this second rebuff Roch's anger became coupled with hatred—an instinctive hatred of humanity—especially after his pourparlers with the British Admiralty came to naught. The English being practical people, did not at first repulse Thomas Roch. They sounded him and tried to get round him; but Roch would listen to nothing. His secret was worth millions, and these millions he would have, or they would not have his secret. The Admiralty
at last declined to have anything more to do with him.

It was in these conditions, when his intellectual trouble was growing daily worse, that he made a last effort by approaching the American Government. That was about eighteen months before this story opens.

The Americans, being even more practical than the English, did not attempt to bargain for Roch's fulgurator, to which, in view of the French chemist's reputation, they attached exceptional importance. They rightly esteemed him a man of genius, and took the measures justified by his condition, prepared to indemnify him equitably later.

As Thomas Roch gave only too visible proofs of mental alienation, the Administration, in the very interest of his invention, judged it prudent to sequestrate him.

As is already known, he was not confined in a lunatic asylum, but was conveyed to Healthful House, which offered every guarantee for the proper treatment of his malady. Yet, though the most careful attention had been devoted to him, no improvement had manifested itself.

Thomas Roch, let it be again remarked--this point cannot be too often insisted upon--incapable though he was of comprehending and performing the ordinary acts and duties of life, recovered all his powers when the field of his discoveries was touched upon. He became animated, and spoke with the assurance of a man who knows whereof he is descanting, and an authority that carried conviction with it. In the heat of his eloquence he would describe the marvellous qualities of his fulgurator and the truly extraordinary effects it caused. As to the nature of the explosive and of the deflagrator, the elements of which the latter was composed, their manufacture, and the way in which they were employed, he preserved complete silence, and all attempts to worm the secret out of him remained ineffectual. Once or twice, during the height of the paroxysms to which he was occasionally subject, there had been reason to believe that his secret would escape him, and every precaution had been taken to note his slightest utterance. But Thomas Roch had each time disappointed his watchers. If he no longer preserved the sentiment of self-preservation, he at least knew how to preserve the secret of his discovery.

Pavilion No. 17 was situated in the middle of a garden that was surrounded by hedges, and here Roch was accustomed to take exercise under the surveillance of his guardian. This guardian lived in the same pavilion, slept in the same room with him, and kept constant watch upon him, never leaving him for an hour. He hung upon the lightest words uttered by the patient in the course of his hallucinations, which generally occurred in the intermediary state between sleeping and waking--watched and listened while he dreamed.

This guardian was known as Gaydon. Shortly after the sequestration of Thomas Roch, having learned that an attendant speaking French fluently was wanted, he had applied at Healthful House for the place, and had been engaged to look after the new inmate.

In reality the alleged Gaydon was a French engineer named Simon Hart, who for several years past had been connected with a manufactory of chemical products in New Jersey. Simon Hart was forty years of age. His high forehead was furrowed with the wrinkle that denoted the thinker, and his resolute bearing denoted energy combined with tenacity. Extremely well versed in the various questions relating to the perfecting of modern armaments, Hart knew everything that had been invented in the shape of explosives, of which there were over eleven hundred at that time, and was fully able to appreciate such a man as Thomas Roch. He firmly believed in the power of the latter's fulgurator, and had no doubt whatever that the inventor had conceived an engine that was capable of revolutionizing the condition of both offensive and defensive warfare on land and sea. He was aware that the demon of insanity had respected the man of science, and that in Roch's partially diseased brain the flame of genius still burned brightly. Then it occurred to him that if, during Roch's crises, his secret was revealed, this invention of a Frenchman would be seized upon by some other country to the detriment of France. Impelled by a spirit of patriotism, he made up his mind to offer himself as Thomas Roch's guardian, by passing himself off as an American thoroughly conversant with the French language, in order that if the inventor did at any time disclose his secret, France alone should benefit thereby. On pretext of returning to Europe, he resigned his position at the New Jersey manufactory, and changed his name so that none should know what had become of him.

Thus it came to pass that Simon Hart, alias Gaydon, had been an attendant at Healthful House for fifteen months. It required no little courage on the part of a man of his position and education to perform the menial and exacting duties of an insane man's attendant; but, as has been before remarked, he was actuated by a spirit of the purest and noblest patriotism. The idea of depriving Roch of the legitimate benefits due to the inventor, if he succeeded in learning his secret, never for an instant entered his mind.

He had kept the patient under the closest possible observation for fifteen months yet had not been able to learn anything from him, or worm out of him a single reply to his questions that was of the slightest value. But he had become more convinced than ever of the importance of Thomas Roch's discovery, and was extremely apprehensive lest the partial madness of the inventor should become general, or lest he should die during one of his paroxysms and carry his secret with him to the grave.

This was Simon Hart's position, and this the mission to which he had wholly devoted himself in the interest of
his native country.

However, notwithstanding his deceptions and troubles, Thomas Roch's physical health, thanks to his vigorous constitution, was not particularly affected. A man of medium height, with a large head, high, wide forehead, strongly-cut features, iron-gray hair and moustache, eyes generally haggard, but which became piercing and imperious when illuminated by his dominant idea, thin lips closely compressed, as though to prevent the escape of a word that could betray his secret--such was the inventor confined in one of the pavilions of Healthful House, probably unconscious of his sequestration, and confided to the surveillance of Simon Hart the engineer, become Gaydon the warder.

CHAPTER II.
COUNT D'ARTIGAS.

Just who was this Count d'Artigas? A Spaniard? So his name would appear to indicate. Yet on the stern of his schooner, in letters of gold, was the name Ebba, which is of pure Norwegian origin. And had you asked him the name of the captain of the Ebba, he would have replied, Spade, and would doubtless have added that that of the boatswain was Effrondat, and that of the ship's cook, Helim--all singularly dissimilar and indicating very different nationalities.

Could any plausible hypothesis be deducted from the type presented by Count d'Artigas? Not easily. If the color of his skin, his black hair, and the easy grace of his attitude denoted a Spanish origin, the ensemble of his person showed none of the racial characteristics peculiar to the natives of the Iberian peninsula.

He was a man of about forty-five years of age, about the average height, and robustly constituted. With his calm and haughty demeanor he resembled an Hindoo lord in whose blood might mingle that of some superb type of Malay. If he was not naturally of a cold temperament, he at least, with his imperious gestures and brevity of speech, endeavored to make it appear that he was. As to the language usually spoken by him and his crew, it was one of those idioms current in the islands of the Indian Ocean and the adjacent seas. Yet when his maritime excursions brought him to the coasts of the old or new world he spoke English with remarkable facility, and with so slight an accent as to scarcely betray his foreign origin.

None could have told anything about his past, nor even about his present life, nor from what source he derived his fortune,—obviously a large one, inasmuch as he was able to gratify his every whim and lived in the greatest luxury whenever he visited America,—nor where he resided when at home, nor where was the port from which his schooner hailed, and none would have ventured to question him upon any of these points so little disposed was he to be communicative. He was not the kind of man to give anything away or compromise himself in the slightest degree, even when interviewed by American reporters.

All that was known about him was what was published in the papers when the arrival of the Ebba was reported in some port, and particularly in the ports of the east coast of the United States, where the schooner was accustomed to put in at regular periods to lay in provisions and stores for a lengthy voyage. She would take on board not only flour, biscuits, preserves, fresh and dried meat, live stock, wines, beers, and spirits, but also clothing, household utensils, and objects of luxury—all of the finest quality and highest price, and which were paid for either in dollars, guineas, or other coins of various countries and denominations.

Consequently, if no one knew anything about the private life of Count d'Artigas, he was nevertheless very well known in the various ports of the United States from the Florida peninsula to New England.

It is therefore in no way surprising that the director of Healthful House should have felt greatly flattered by the Count's visit, and have received him with every mark of honor and respect.

It was the first time that the schooner Ebba had dropped anchor in the port of New-Berne, and no doubt a mere whim of her owner had brought him to the mouth of the Neuse. Otherwise why should he have come to such a place? Certainly not to lay in stores, for Pamlico Sound offered neither the resources nor facilities to be found in such ports as Boston, New York, Dover, Savannah, Wilmington in North Carolina, and Charleston in South Carolina. What could he have procured with his piastres and bank-notes in the small markets of New-Berne? This chief town of Craven County contained barely six thousand inhabitants. Its commerce consisted principally in the exportation of grain, pigs, furniture, and naval munitions. Besides, a few weeks previously, the schooner had loaded up for some destination which, as usual, was unknown.

Had this enigmatical personage then come solely for the purpose of visiting Healthful House? Very likely. There would have been nothing surprising in the fact, seeing that the establishment enjoyed a high and well-merited reputation.

Or perhaps the Count had been inspired by curiosity to meet Thomas Roch? This curiosity would have been legitimate and natural enough in view of the universal renown of the French inventor. Fancy--a mad genius who
claimed that his discoveries were destined to revolutionize the methods of modern military art!

As he had notified the director he would do, the Count d'Artigas presented himself in the afternoon at the door of Healthful House, accompanied by Captain Spade, the commander of the Ebba.

In conformity with orders given, both were admitted and conducted to the office of the director. The latter received his distinguished visitor with empressement, placed himself at his disposal, and intimated his intention of personally conducting him over the establishment, not being willing to concede to anybody else the honor of being his cicerone. The Count on his part was profuse in the expression of his thanks for the considerations extended to him.

They went over the common rooms and private habitations of the establishment, the director prattling unceasingly about the care with which the patients were tended—much better care, if he was to be believed, than they could possibly have had in the bosoms of their families—and priding himself upon the results achieved, and which had earned for the place its well-merited success.

The Count d'Artigas listened to his ceaseless chatter with apparent interest, probably in order the better to dissemble the real motive of his visit. However, after going the rounds for an hour he ventured to remark:

"Have you not among your patients, sir, one anent whom there was a great deal of talk some time ago, and whose presence here contributed in no small measure to attract public attention to Healthful House?"

"You refer to Thomas Roch, I presume, Count?" queried the director.

"Precisely—that Frenchman—that inventor—whose mental condition is said to be very precarious."

"Very precarious, Count, and happily so, perhaps! In my opinion humanity has nothing to gain by his discoveries, the application of which would increase the already too numerous means of destruction."

"You speak wisely, sir, and I entirely agree with you. Real progress does not lie in that direction, and I regard as inimical to society all those who seek to follow it. But has this inventor entirely lost the use of his intellectual faculties?"

"Entirely, no; save as regards the ordinary things of life. In this respect he no longer possesses either comprehension or responsibility. His genius as an inventor, however, remains intact; it has survived his moral degeneracy, and, had his insensate demands been complied with, I have no doubt he would have produced a new war engine—which the world can get along very well without."

"Very well without, as you say, sir," re-echoed the Count d'Artigas, and Captain Spade nodded approval.

"But you will be able to judge for yourself, Count, for here is the pavilion occupied by Thomas Roch. If his confinement is well justified from the point of view of public security he is none the less treated with all the consideration due to him and the attention which his condition necessitates. Besides, Healthful House is beyond the reach of indiscreet persons who might...."

The director completed the phrase with a significant motion of his head—which brought an imperceptible smile to the lips of the stranger.

"But," asked the Count, "is Thomas Roch never left alone?"

"Never, Count, never. He has a permanent attendant in whom we have implicit confidence, who speaks his language and keeps the closest possible watch upon him. If in some way or other some indication relative to his discovery were to escape him, it would be immediately noted down and its value would be passed upon by those competent to judge."

Here the Count d'Artigas stole a rapid and meaning glance at Captain Spade, who responded with a gesture which said plainly enough: "I understand." And had any one observed the captain during the visit, they could not have failed to remark that he examined with the greatest minuteness that portion of the park surrounding Pavilion No. 17, and the different paths leading to the latter—probably in view of some prearranged scheme.

The garden of the pavilion was near the high wall surrounding the property, from the foot of which on the other side the hill sloped gently to the right bank of the Neuse.

The pavilion itself was a one-story building surmounted by a terrace in the Italian style. It contained two rooms and an ante-room with strongly-barred windows. On each side and in rear of the habitation were clusters of fine trees, which were then in full leaf. In front was a cool, green velvety lawn, ornamented with shrubs and brilliantly tinted flowers. The whole garden extended over about half an acre, and was reserved exclusively for the use of Thomas Roch, who was free to wander about it at pleasure under the surveillance of his guardian.

When the Count d'Artigas, Captain Spade, and the director entered the garden, the first person they saw was the warder Gaydon, standing at the door of the pavilion. Unnoticed by the director the Count d'Artigas eyed the attendant with singular persistency.

It was not the first time that strangers had come to see the occupant of Pavilion No. 17, for the French inventor was justly regarded as the most interesting inmate of Healthful House. Nevertheless, Gaydon's attention was attracted by the originality of the type presented by the two visitors, of whose nationality he was ignorant. If the
name of the Count d'Artigas was not unfamiliar to him, he had never had occasion to meet that wealthy gentleman
during the latter's sojourn in the eastern ports. He therefore had no idea as to who the Count was. Neither was he
aware that the schooner Ebba was then anchored at the entrance to the Neuse, at the foot of the hill upon which
Healthful House was situated.

"Gaydon," demanded the director, "where is Thomas Roch?"
"Yonder," replied the warder, pointing to a man who was walking meditatively under the trees in rear of the
pavilion.

"The Count d'Artigas has been authorized to visit Healthful House," the director explained; "and does not wish
to go away without having seen Thomas Roch, who was lately the subject of a good deal too much discussion."

"And who would be talked about a great deal more," added the Count, "had the Federal Government not taken
the precaution to confine him in this establishment."

"A necessary precaution, Count."

"Necessary, as you observe, Mr. Director. It is better for the peace of the world that his secret should die with
him."

After having glanced at the Count d'Artigas, Gaydon had not uttered a word; but preceding the two strangers he
walked towards the clump of trees where the inventor was pacing back and forth.

Thomas Roch paid no attention to them. He appeared to be oblivious of their presence.

Meanwhile, Captain Spade, while being careful not to excite suspicion, had been minutely examining the
immediate surroundings of the pavilion and the end of the park in which it was situated. From the top of the sloping
alleys he could easily distinguish the peak of a mast which showed above the wall of the park. He recognized the
peak at a glance as being that of the Ella, and knew therefore that the wall at this part skirted the right bank of the
Neuse.

The Count d'Artigas' whole attention was concentrated upon the French inventor. The latter's health appeared to
have suffered in no way from his eighteen months' confinement; but his queer attitude, his incoherent gestures, his
haggard eye, and his indifference to what was passing around him testified only too plainly to the degeneration of
his mental faculties.

At length Thomas Roch dropped into a seat and with the end of a switch traced in the sand of the alley the
outline of a fortification. Then kneeling down he made a number of little mounds that were evidently intended to
represent bastions. He next plucked some leaves from a neighboring tree and stuck them in the mounds like so many
tiny flags. All this was done with the utmost seriousness and without any attention whatever being paid to the
onlookers.

It was the amusement of a child, but a child would have lacked this characteristic gravity.

"Is he then absolutely mad?" demanded the Count d'Artigas, who in spite of his habitual impassibility appeared
to be somewhat disappointed.

"I warned you, Count, that nothing could be obtained from him."
"Couldn't he at least pay some attention to us?"
"It would perhaps be difficult to induce him to do so."
Then turning to the attendant:
"Speak to him, Gaydon. Perhaps he will answer you."
"Oh! he'll answer me right enough, sir, never fear," replied Gaydon.
He went up to the inventor and touching him on the shoulder, said gently: "Thomas Roch!"

The latter raised his head, and of the persons present he doubtless saw but his keeper, though Captain Spade had
come up and all formed a circle about him.

"Thomas Roch," continued Gaydon, speaking in English, "here are some visitors to see you. They are interested
in your health—in your work."

The last word alone seemed to rouse him from his indifference.

"My work?" he replied, also in English, which he spoke like a native.

Then taking a pebble between his index finger and bent thumb, as a boy plays at marbles, he projected it against
one of the little sand-heaps. It scattered, and he jumped for joy.

"Blown to pieces! The bastion is blown to pieces! My explosive has destroyed everything at one blow!" he
shouted, the light of triumph flashing in his eyes.

"You see," said the director, addressing the Count d'Artigas. "The idea of his invention never leaves him."
"And it will die with him," affirmed the attendant.

"Couldn't you, Gaydon, get him to talk about his fulgurator?" asked his chief.
"I will try, if you order me to do so, sir."

"Well, I do order you, for I think it might interest the Count d'Artigas."
"Certainly," assented the Count, whose physiognomy betrayed no sign of the sentiments which were agitating him.

"I ought to warn you that I risk bringing on another fit," observed Gaydon.

"You can drop the conversation when you consider it prudent. Tell Thomas Roch that a foreigner wishes to negotiate with him for the purchase of his fulgurator."

"But are you not afraid he may give his secret away?" questioned the Count.

He spoke with such vivacity that Gaydon could not restrain a glance of distrust, which, however, did not appear to disturb the equanimity of that impenetrable nobleman.

"No fear of that," said the warder. "No promise would induce him to divulge his secret. Until the millions he demands are counted into his hand he will remain as mute as a stone."

"I don't happen to be carrying those millions about me," remarked the Count quietly.

Gaydon again touched Roch on the shoulder and repeated:

"Thomas Roch, here are some foreigners who are anxious to acquire your invention."

The madman started.

"My invention?" he cried. "My deflagrator?"

And his growing animation plainly indicated the imminence of the fit that Gaydon had been apprehensive about, and which questions of this character invariably brought on.

"How much will you give me for it--how much?" continued Roch. "How much--how much?"

"Ten million dollars," replied Gaydon.

"Ten millions! Ten millions! A fulgurator ten million times more powerful than anything hitherto invented! Ten millions for an autopropulsive projectile which, when it explodes, destroys everything in sight within a radius of over twelve thousand square yards! Ten millions for the only deflagrator that can provoke its explosion! Why, all the wealth of the world wouldn't suffice to purchase the secret of my engine, and rather than sell it at such a price I would cut my tongue in half with my teeth. Ten millions, when it is worth a billion--a billion--a billion!"

It was clear that Roch had lost all notion of things, and had Gaydon offered him ten billions the madman would have replied in exactly the same manner.

The Count d'Artigas and Captain Spade had not taken their eyes off him. The Count was impassible as usual, though his brow had darkened, but the captain shook his head in a manner that implied plainly: "Decidedly there is nothing to hope from this poor devil!"

After his outburst Roch fled across the garden crying hoarsely:

"Billions! Billions!"

Gaydon turned to the director and remarked:

"I told you how it would be."

Then he rushed after his patient, caught him by the arm, and led him, without any attempt at resistance, into the pavilion and closed the door.

The Count d'Artigas remained alone with the director, Captain Spade having strolled off again in the direction of the wall at the bottom of the park.

"You see I was not guilty of exaggeration, Count," said the director. "It is obvious to every one that Thomas Roch is becoming daily worse. In my opinion his case is a hopeless one. If all the money he asks for were offered to him, nothing could be got from him."

"Very likely," replied the Count, "still, if his pecuniary demands are supremely absurd, he has none the less invented an engine the power of which is infinite, one might say."

"That is the opinion expressed by competent persons, Count. But what he has discovered will ere long be lost with himself in one of these fits which are becoming more frequent and intense. Very soon even the motive of interest, the only sentiment that appears to have survived in his mind, will become extinct."

"Mayhap the sentiment of hatred will remain, though," muttered the Count, as Spade joined them at the garden gate.

CHAPTER III.

KIDNAPPED.

Half an hour later the Count d'Artigas and Captain Spade were following the beech-lined road that separated the Healthful House estate from the right bank of the Neuse. Both had taken leave of the director, the latter declaring himself greatly honored by their visit, and the former thanking him warmly for his courteous reception. A hundred-dollar bill left as a tip for the staff of the establishment had certainly not belied the Count's reputation for generosity. He was--there could be no doubt about it--a foreigner of the highest distinction, if distinction be measured by
generosity.
Issuing by the gate at the main entrance to Healthful House, they had skirted the wall that surrounded the property, and which was high enough to preclude the possibility of climbing it. Not a word passed between them for some time; the Count was deep in thought and Captain Spade was not in the habit of addressing him without being first spoken to.

At last when they stood beneath the rear wall behind which, though it was not visible, the Count knew Pavilion No. 17 was situated, he said:

"You managed, I presume, to thoroughly explore the place, and are acquainted with every detail of it?"
"Certainly, Count" replied Captain Spade, emphasizing the title.
"You are perfectly sure about it?"
"Perfectly. I could go through the park with my eyes shut. If you still persist in carrying out your scheme the pavilion can be easily reached."
"I do persist, Spade."
"Notwithstanding Thomas Roch's mental condition?"
"Notwithstanding his condition; and if we succeed in carrying him off----"
"That is my affair. When night comes on I undertake to enter the park of Healthful House, and then the pavilion garden without being seen by anybody."
"By the entrance gate?"
"No, on this side."
"Yes, but on this side there is the wall, and if you succeed in climbing it, how are you going to get over it again with Thomas Roch? What if the madman cries out--what if he should resist--what if his keeper gives the alarm?"
"Don't worry yourself in the least about that. We have only got to go in and come out by this door."

Captain Spade pointed to a narrow door let into the wall a few paces distant, and which was doubtless used by the staff of the establishment when they had occasion to go out by the river.
"That is the way I propose to go in. It's much easier than scaling the wall with a ladder."
"But the door is closed."
"It will open."
"Has it no bolts?"
"Yes, but I shot them back while we were strolling about, and the director didn't notice what I had done."
"How are you going to open it?" queried the Count, going to the door.
"Here is the key," replied Spade, producing it.

He had withdrawn it from the lock, where it happened to be, when he had unbolted the door.
"Capital!" exclaimed the Count. "It couldn't be better. The business will be easier than I expected. Let us get back to the schooner. At eight o'clock one of the boats will put you ashore with five men."
"Yes, five men will do," said Captain Spade. "There will be enough of them to effect our object even if the keeper is aroused and it becomes necessary to put him out of the way."
"Put him out of the way--well, if it becomes absolutely necessary of course you must, but it would be better to seize him too and bring him aboard the Ebba Who knows but what he has already learned a part of Roch's secret?"
"True."
"Besides, Thomas Roch is used to him, and I don't propose to make him change his habits in any way."

This observation was accompanied by such a significant smile that Captain Spade could entertain no doubt as to the rôle reserved for the warder of Healthful House.

The plan to kidnap them both was thus settled, and appeared to have every chance of being successful; unless during the couple of hours of daylight that yet remained it was noticed that the key of the door had been stolen and the bolts drawn back, Captain Spade and his men could at least count upon being able to enter the park, and the rest, the captain affirmed, would be easy enough.

Thomas Roch was the only patient in the establishment isolated and kept under special surveillance. All the other invalids lived in the main building, or occupied pavilions in the front of the park. The plan was to try and seize Roch and Gaydon separately and bind and gag them before they could cry out.

The Count d'Artigas and his companion wended their way to a creek where one of the Ebba's boats awaited them. The schooner was anchored two cable lengths from the shore, her sails neatly rolled upon her yards, which were squared as neatly as those of a pleasure yacht or of a man-of-war. At the peak of the mainmast a narrow red pennant was gently swayed by the wind, which came in fitful puffs from the east.

The Count and the captain jumped into the boat and a few strokes of the four oars brought them alongside of the schooner. They climbed on deck and going forward to the jib-boom, leaned over the starboard bulwark and gazed at an object that floated on the water a few strokes ahead of the vessel. It was a small buoy that was rocked by the
ripple of the ebbing tide.

Twilight gradually set in, and the outline of New-Berne on the left bank of the sinuous Neuse became more and more indistinct until it disappeared in the deepening shades of night. A mist set in from the sea, but though it obscured the moon it brought no sign of rain. The lights gleamed out one by one in the houses of the town. The fishing smacks came slowly up the river to their anchorage, impelled by the oars of their crews which struck the water with sharp, rhythmical strokes, and with their sails distended on the chance of catching an occasional puff of the dropping wind to help them along. A couple of steamers passed, sending up volumes of black smoke and myriads of sparks from their double stacks, and lashing the water into foam with their powerful paddles.

At eight o'clock the Count d'Artigas appeared on the schooner's deck accompanied by a man about fifty years of age, to whom he remarked:

"It is time to go, Serko."

"Very well, I will tell Spade," replied Serko.

At that moment the captain joined them.

"You had better get ready to go," said the Count.

"All is ready."

"Be careful to prevent any alarm being given, and arrange matters so that no one will for a minute suspect that Thomas Roch and his keeper have been brought on board the Ebba."

"They wouldn't find them if they came to look for them," observed Serko, shrugging his shoulders and laughing heartily as though he had perpetrated a huge joke.

"Nevertheless, it is better not to arouse their suspicion," said d'Artigas.

The boat was lowered, and Captain Spade and five sailors took their places in it. Four of the latter got out the oars. The boatswain, Effrondat, who was to remain in charge of the boat, went to the stern beside Captain Spade and took the tiller.

"Good luck, Spade," said Serko with a smile, "and don't make more noise about it than if you were a gallant carrying off his lady-love."

"I won't--unless that Gaydon chap--"

"We must have both Roch and Gaydon," insisted the Count d'Artigas.

"That is understood," replied Spade.

The boat pushed off, and the sailors on the deck of the schooner watched it till it was lost to sight in the darkness.

Pending its return, no preparations for the Ebba's departure were made. Perhaps there was no intention of quitting the port after the men had been kidnapped. Besides, how could the vessel have reached the open sea? Not a breath of air was now stirring, and in half an hour the tide would be setting in again, and rising strongly and rapidly for several miles above New-Berne.

Anchored, as has already been said, a couple of cable-lengths from the shore, the Ebba might have been brought much nearer to it, for the water was deep enough, and this would have facilitated the task of the kidnappers when they returned from their expedition. If, however, the Count d'Artigas preferred to let the vessel stay where she was, he probably had his reasons.

Not a soul was in sight on the bank, and the road, with its borders of beech trees that skirted the wall of Healthful House estate, was equally deserted. The boat was made fast to the shore. Then Captain Spade and his four sailors landed, leaving the boatswain in charge, and disappeared amid the trees.

When they reached the wall Captain Spade stopped and the sailors drew up on each side of the doorway. The captain had only to turn the key in the lock and push the door, unless one of the servants, noticing that the door was not secured as usual, had bolted it. In this event their task would be an extremely difficult one, even if they succeeded in scaling the high wall.

The captain put his ear to the key-hole and listened.

Not a sound was to be heard in the park. Not even a leaf was rustling in the branches of the beeches under which they were standing. The surrounding country was wrapt in the profoundest silence.

Captain Spade drew the key from his pocket, inserted it in the lock and turned it noiselessly. Then he cautiously pushed the door, which opened inward.

Things were, then, just as he had left them, and no one had noticed the theft of the key.

After assuring himself that nobody happened to be in the neighborhood of the pavilion the captain entered, followed by his men. The door was left wide open, so that they could beat a hurried and uninterrupted retreat in case of necessity. The trees and bushes in this shady part of the park were very thick, and it was so dark that it would not have been easy to distinguish the pavilion had not a light shone brightly in one of the windows.

No doubt this was the window of the room occupied by Roch and his guardian, Gaydon, seeing that the latter
never left the patient placed in his charge either by night or day. Captain Spade had expected to find him there.

The party approached cautiously, taking the utmost precaution to avoid kicking a pebble or stepping on a twig, the noise of which might have revealed their presence. In this way they reached the door of the pavilion near which was the curtained window of the room in which the light was burning.

But if the door was locked, how were they going to get in? Captain Spade must have asked himself. He had no key, and to attempt to effect an entrance through the window would be hazardous, for, unless Gaydon could be prevented from giving the alarm, he would rouse the whole establishment.

There was no help for it, however. The essential was to get possession of Roch. If they could kidnap Gaydon, too, in conformity with the intentions of the Count d'Artigas, so much the better. If not--

Captain Spade crept stealthily to the window, and standing on tiptoe, looked in. Through an aperture in the curtain he could see all over the room.

Gaydon was standing beside Thomas Roch, who had not yet recovered from the fit with which he had been attacked during the Count d'Artigas' visit. His condition necessitated special attention, and the warder was ministering to the patient under the direction of a third person.

The latter was one of the doctors attached to Healthful House, and had been at once sent to the pavilion by the director when Roch's paroxysm came on. His presence of course rendered the situation more complicated and the work of the kidnappers more difficult.

Roch, fully dressed, was extended upon a sofa. He was now fairly calm. The paroxysm, which was abating, would be followed by several hours of torpor and exhaustion.

Just as Captain Spade peeped through the window the doctor was making preparations to leave. The Captain heard him say to Gaydon that his (the doctor's) presence was not likely to be required any more that night, and that there was nothing to be done beyond following the instructions he had given.

The doctor then walked towards the door, which, it will be remembered, was close to the window in front of which Spade and his men were standing. If they remained where they were they could not fail to be seen, not only by the doctor, but by the warder, who was accompanying him to the door.

Before they made their appearance, however, the sailors, at a sign from their chief, had dispersed and hidden themselves behind the bushes, while Spade himself crouched in the shadow beneath the window. Luckily Gaydon had not brought the lamp with him, so that the captain was in no danger of being seen.

As he was about to take leave of Gaydon, the doctor stopped on the step and remarked:

"This is one of the worst attacks our patient has had. One or two more like that and he will lose the little reason he still possesses."

"Just so," said Gaydon. "I wonder that the director doesn't prohibit all visitors from entering the pavilion. Roch owes his present attack to a Count d'Artigas, for whose amusement harmful questions were put to him."

"I will call the director's attention to the matter," responded the doctor.

He then descended the steps and Gaydon, leaving the door of the pavilion ajar, accompanied him to the end of the path.

When they had gone Captain Spade stood up, and his men rejoined him.

Had they not better profit by the chance thus unexpectedly afforded them to enter the room and secure Roch, who was in a semi-comatose condition, and then await Gaydon's return, and seize the warder as he entered?

This would have involved considerable risk. Gaydon, at a glance, would perceive that his patient was missing and raise an alarm; the doctor would come running back; the whole staff of Healthful House would turn out, and Spade would not have time to escape with his precious prisoner and lock the door in the wall after him.

He did not have much chance to deliberate about it, for the warder was heard returning along the gravel path. Spade decided that the best thing to be done was to spring upon him as he passed and stifle his cries and overpower him before he could attempt to offer any resistance. The carrying off of the mad inventor would be easy enough, inasmuch as he was unconscious, and could not raise a finger to help himself.

Gaydon came round a clump of bushes and approached the entrance to the pavilion. As he raised his foot to mount the steps the four sailors sprang upon him, bore him backwards to the ground, and had gagged him, securely bound him hand and foot, and bandaged his eyes before he began to realize what had happened.

Two of the men then kept guard over him, while Captain Spade and the others entered the house.

As the captain had surmised, Thomas Roch had sunk into such a torpor that he could have heard nothing of what had been going on outside. Reclining at full length, with his eyes closed, he might have been taken for a dead man but for his heavy breathing. There was no need either to bind or gag him. One man took him by the head and another by the feet and started off with him to the schooner.

Captain Spade was the last to quit the house after extinguishing the lamp and closing the door behind him. In this way there was no reason to suppose that the inmates would be missed before morning.
Gaydon was carried off in the same way as Thomas Roch had been. The two remaining sailors lifted him and bore him quietly but rapidly down the path to the door in the wall. The park was pitch dark. Not even a glimmer of the lights in the windows of Healthful House could be seen through the thick foliage.

Arrived at the wall, Spade, who had led the way, stepped aside to allow the sailors with their burdens to pass through, then followed and closed and locked the door. He put the key in his pocket, intending to throw it into the Neuse as soon as they were safely on board the schooner.

There was no one on the road, nor on the bank of the river.

The party made for the boat, and found that Effrondat, the boatswain, had made all ready to receive them.

Thomas Roch and Gaydon were laid in the bottom of the boat, and the sailors again took their places at the oars.

"Hurry up, Effrondat, and cast off the painter," ordered the captain.

The boatswain obeyed, and pushed the boat off with his foot as he scrambled in.

The men bent to their oars and rowed rapidly to the schooner, which was easily distinguishable, having hung out a light at her mizzenmast head.

In two minutes they were alongside.

The Count d'Artigas was leaning on the bulwarks by the gangway.

"All right, Spade?" he questioned.

"Yes, sir, all right!"
"Both of them?"
"Both the madman and his keeper."
"Doesn't anybody know about it up at Healthful House?"
"Not a soul."

It was not likely that Gaydon, whose eyes and ears were bandaged, but who preserved all his sang-froid, could have recognized the voices of the Count d'Artigas and Captain Spade. Nor did he have the chance to. No attempt was immediately made to hoist him on board. He had been lying in the bottom of the boat alongside the schooner for fully half an hour, he calculated, before he felt himself lifted, and then lowered, doubtless to the bottom of the hold.

The kidnapping having been accomplished it would seem that it only remained for the Ebba to weigh anchor, descend the estuary and make her way out to sea through Pamlico Sound. Yet no preparations for departure were made.

Was it not dangerous to stay where they were after their daring raid? Had the Count d'Artigas hidden his prisoners so securely as to preclude the possibility of their being discovered if the Ebba, whose presence in proximity to Healthful House could not fail to excite suspicion, received a visit from the New-Berne police?

However this might have been, an hour after the return of the expedition, every soul on board save the watch—the Count d'Artigas, Serko, and Captain Spade in their respective cabins, and the crew in the fore-castle, were sound asleep.

CHAPTER IV.
THE SCHOOENER EBBBA.

It was not till the next morning, and then very leisurely, that the Ebba began to make preparations for her departure. From the extremity of New-Berne quay the crew might have been seen holystoning the deck, after which they loosened the reef lines, under the direction of Effrondat, the boatswain, hoisted in the boats and cleared the halyards.

At eight o'clock the Count d'Artigas had not yet appeared on deck. His companion, Serko the engineer, as he was called on board, had not quitted his cabin. Captain Spade was strolling quietly about giving orders.

The Ebba would have made a splendid racing yacht, though she had never participated in any of the yacht races either on the North American or British coasts. The height of her masts, the extent of the canvas she carried, her shapely, raking hull, denoted her to be a craft of great speed, and her general lines showed that she was also built to weather the roughest gales at sea. In a favorable wind she would probably make twelve knots an hour.

Notwithstanding these advantages, however, she must in a dead calm necessarily suffer from the same disadvantages as other sailing vessels, and it might have been supposed that the Count d'Artigas would have preferred a steam-yacht with which he could have gone anywhere, at any time, in any weather. But apparently he was satisfied to stick to the old method, even when he made his long trips across the Atlantic.

On this particular morning the wind was blowing gently from the west, which was very favorable to the Ebba, and would enable her to stand straight out of the Neuse, across Pamlico Sound, and through one of the inlets that led to the open sea.

At ten o'clock the Ebba was still rocking lazily at anchor, her stem up stream and her cable tautened by the
rapidly ebbing tide. The small buoy that on the previous evening had been moored near the schooner was no longer to be seen, and had doubtless been hoisted in.

Suddenly a gun boomed out and a slight wreath of white smoke arose from the battery. It was answered by other reports from the guns on the chain of islands along the coast.

"Guns barking," he said laconically.
"We expected it," replied Serko, shrugging his shoulders. "They are signals to close the passes."
"What has that to do with us?" asked the Count d'Artigas quietly.
"Nothing at all," said the engineer.

They all, of course, knew that the alarm-guns indicated that the disappearance of Thomas Roch and the warder Gaydon from Healthful House had been discovered.

At daybreak the doctor had gone to Pavilion No. 17 to see how his patient had passed the night, and had found no one there. He immediately notified the director, who had the grounds thoroughly searched. It was then discovered that the door in rear of the park was unbolted, and that, though locked, the key had been taken away. It was evident that Roch and his attendant had been carried out that way. But who were the kidnappers? No one could possibly imagine. All that could be ascertained was that at half-past seven on the previous night one of the doctors had attended Thomas Roch, who was suffering from one of his fits, and that when the medical man had left him the invalid was in an unconscious condition. What had happened after the doctor took leave of Gaydon at the end of the garden-path could not even be conjectured.

The news of the disappearance was telegraphed to New Berne, and thence to Raleigh. On receipt of it the Governor had instantly wired orders that no vessel was to be allowed to quit Pamlico Sound without having been first subjected to a most rigorous search. Another dispatch ordered the cruiser Falcon, which was stationed in the port, to carry out the Governor's instructions in this respect. At the same time measures were taken to keep a strict lookout in every town and village in the State.

The Count d'Artigas could see the Falcon, which was a couple of miles away to the east in the estuary, getting steam up and making hurried preparations to carry out her mission. It would take at least an hour before the warship could be got ready to steam out, and the schooner might by that time have gained a good start.

"Shall I weigh anchor?" demanded Captain Spade.
"Yes, as we have a fair wind; but you can take your time about it," replied the Count d'Artigas.
"The passes of Pamlico Sound will be under observation," observed Engineer Serko, "and no vessel will be able to get out without receiving a visit from gentlemen as inquisitive as they will be indiscreet."
"Never mind, get under way all the same," ordered the Count. "When the officers of the cruiser or the Custom-House officers have been over the Ebba the embargo will be raised. I shall be indeed surprised if we are not allowed to go about our business."

"With a thousand pardons for the liberty taken, and best wishes for a good voyage and speedy return," chuckled Engineer Serko, following the phrase with a loud and prolonged laugh.

When the news was received at New-Berne, the authorities at first were puzzled to know whether the missing inventor and his keeper had fled or been carried off. As, however, Roch's flight could not have taken place without the connivance of Gaydon, this supposition was speedily abandoned. In the opinion of the director and management of Healthful House the warder was absolutely above suspicion. They must both, then, have been kidnapped.

It can easily be imagined what a sensation the news caused in the town. What! the French inventor who had been so closely guarded had disappeared, and with him the secret of the wonderful fulgurator that nobody had been able to worm out of him? Might not the most serious consequences follow? Might not the discovery of the new engine be lost to America forever? If the daring act had been perpetrated on behalf of another nation, might not that nation, having Thomas Roch in its power, be eventually able to extract from him what the Federal Government had vainly endeavored to obtain? And was it reasonable, was it permissible, to suppose for an instant that he had been carried off for the benefit of a private individual?

Certainly not, was the emphatic reply to the latter question, which was too ridiculous to be entertained. Therefore the whole power of the State was employed in an effort to recover the inventor. In every county of North Carolina a special surveillance was organized on every road and at every railroad station, and every house in town and country was searched. Every port from Wilmington to Norfolk was closed, and no craft of any description could leave without being thoroughly overhauled. Not only the cruiser Falcon, but every available cutter and launch was sent out with orders to patrol Pamlico Sound and board yachts, merchant vessels and fishing smacks indiscriminately whether anchored or not and search them down to the keelson.

Still the crew of the Ebba prepared calmly to weigh anchor, and the Count d'Artigas did not appear to be in the least concerned at the orders of the authorities and at the consequences that would ensue, if Thomas Roch and his
keeper, Gaydon, were found on board.

At last all was ready, the crew manned the capstan bars, the sails were hoisted, and the schooner glided gracefully through the water towards the Sound.

Twenty miles from New-Berne the estuary curves abruptly and shoots off towards the northwest for about the same distance, gradually widening until it empties itself into Pamlico Sound.

The latter is a vast expanse about seventy miles across from Sivan Island to Roanoke. On the seaward side stretches a chain of long and narrow islands, forming a natural breakwater north and south from Cape Lookout to Cape Hatteras and from the latter to Cape Henry, near Norfolk City, in Virginia.

Numerous beacons on the islands and islets form an easy guide for vessels at night seeking refuge from the Atlantic gales, and once inside the chain they are certain of finding plenty of good anchoring grounds.

Several passes afford an outlet from the Sound to the sea. Beyond Sivan Island lighthouse is Ocracoke inlet, and next is the inlet of Hatteras. There are also three others known as Logger Head inlet, New inlet, and Oregon inlet. The Ocracoke was the one nearest the Ebba, and she could make it without tacking, but the Falcon was searching all vessels that passed through. This did not, however, make any particular difference, for by this time all the passes, upon which the guns of the forts had been trained, were guarded by government vessels.

The Ebba, therefore, kept on her way, neither trying to avoid nor offering to approach the searchers. She seemed to be merely a pleasure-yacht out for a morning sail.

No attempt had up to that time been made to accost her. Was she, then, specially privileged, and to be spared the bother of being searched? Was the Count d'Artigas considered too high and mighty a personage to be thus molested, and delayed even for an hour? It was unlikely, for though he was regarded as a distinguished foreigner who lived the life of luxury enjoyed by the favored of fortune, no one, as a matter of fact, knew who he was, nor whence he came, nor whither he was going.

The schooner sped gracefully over the calm waters of the sound, her flag—a gold crescent in the angle of a red field—streaming proudly in the breeze. Count d'Artigas was cosily ensconced in a basket-work chair on the after-deck, conversing with Engineer Serko and Captain Spade.

"They don't seem in a hurry to board us," remarked Serko.

"They can come whenever they think proper," said the Count in a tone of supreme indifference.

"No doubt they are waiting for us at the entrance to the inlet," suggested Captain Spade.

"Let them wait," grunted the wealthy nobleman.

Then he relapsed into his customary unconcerned impassibility.

Captain Spade's hypothesis was doubtless correct. The Falcon had as yet made no move towards the schooner, but would almost certainly do so as soon as the latter reached the inlet, and the Count would have to submit to a search of his vessel if he wished to reach the open sea.

How was it then that he manifested such extraordinary unconcern? Were Thomas Roch and Gaydon so safely hidden that their hiding-place could not possibly be discovered?

The thing was possible, but perhaps the Count d'Artigas would not have been quite so confident had he been aware that the Ebba had been specially signalled to the warship and revenue cutters as a suspect.

The Count's visit to Healthful House on the previous day had now attracted particular attention to him and his schooner. Evidently, at the time, the director could have had no reason to suspect the motive of his visit. But a few hours later, Thomas Roch and his keeper had been carried off. No one else from outside had been near the pavilion that day. It was admitted that it would have been an easy matter for the Count's companion, while the former distracted the director's attention, to push back the bolts of the door in the wall and steal the key. Then the fact that the Ebba was anchored in rear of, and only a few hundred yards from, the estate, was in itself suspicious. Nothing would have been easier for the desperadoes than to enter by the door, surprise their victims, and carry them off to the schooner.

These suspicions, neither the director nor the personnel of the establishment had at first liked to give expression to, but when the Ebba was seen to weigh anchor and head for the open sea, they appeared to be confirmed.

They were communicated to the authorities of New-Berne, who immediately ordered the commander of the Falcon to intercept the schooner, to search her minutely high and low, and from stem to stern, and on no account to let her proceed, unless he was absolutely certain that Roch and Gaydon were not on board.

Assuredly the Count d'Artigas could have had no idea that his vessel was the object of such stringent orders; but even if he had, it is questionable whether this superbly haughty and disdainful nobleman would have manifested any particular anxiety.

Towards three o'clock, the warship which was cruising before the inlet, after having sent search parties aboard a few fishing-smacks, suddenly manoeuvred to the entrance of the pass, and awaited the approaching schooner. The latter surely did not imagine that she could force a passage in spite of the cruiser, or escape from a vessel propelled
by steam. Besides, had she attempted such a foolhardy trick, a couple of shots from the Falcon's guns would speedily have constrained her to lay to.

Presently a boat, manned by two officers and ten sailors, put off from the cruiser and rowed towards the Ebba. When they were only about half a cable's length off, one of the men rose and waved a flag.

"That's a signal to stop," said Engineer Serko.

"Precisely," remarked the Count d'Artigas.

"We shall have to lay to."

"Then lay to."

Captain Spade went forward and gave the necessary orders, and in a few minutes the vessel slackened speed, and was soon merely drifting with the tide.

The Falcon's boat pulled alongside, and a man in the bows held on to her with a boat-hook. The gangway was lowered by a couple of hands on the schooner, and the two officers, followed by eight of their men, climbed on deck.

They found the crew of the Ebba drawn up in line on the forecastle.

The officer in command of the boarding-party--a first lieutenant--advanced towards the owner of the schooner, and the following questions and answers were exchanged:

"This schooner belongs to the Count d'Artigas, to whom, I presume, I have the honor of speaking?"

"Yes, sir."

"What is her name?"

"The Ebba."

"She is commanded by?--"

"Captain Spade."

"What is his nationality?"

"Hindo-Malay."

The officer scrutinized the schooner's flag, while the Count d'Artigas added:

"Will you be good enough to tell me, sir, to what circumstance I owe the pleasure of your visit on board my vessel?"

"Orders have been received," replied the officer, "to search every vessel now anchored in Pamlico Sound, or which attempts to leave it."

He did not deem it necessary to insist upon this point since the Ebba, above every other, was to be subjected to the bother of a rigorous examination.

"You, of course, sir, have no intention of refusing me permission to go over your schooner?"

"Assuredly not, sir. My vessel is at your disposal from peaks to bilges. Only I should like to know why all the vessels which happen to be in Pamlico Sound to-day are being subjected to this formality."

"I see no reason why you should not be informed, Monsieur the Count," replied the officer. "The governor of North Carolina has been apprised that Healthful House has been broken into and two persons kidnapped, and the authorities merely wish to satisfy themselves that the persons carried off have not been embarked during the night."

"Is it possible?" exclaimed the Count, feigning surprise. "And who are the persons who have thus disappeared from Healthful House?"

"An inventor--a madman--and his keeper."

"A madman, sir? Do you, may I ask, refer to the Frenchman, Thomas Roch?"

"The same."

"The Thomas Roch whom I saw yesterday during my visit to the establishment--whom I questioned in presence of the director--who was seized with a violent paroxysm just as Captain Spade and I were leaving?"

The officer observed the stranger with the keenest attention, in an effort to surprise anything suspicious in his attitude or remarks.

"It is incredible!" added the Count, as though he had just heard about the outrage for the first time.

"I can easily understand, sir, how uneasy the authorities must be," he went on, "in view of Thomas Roch's personality, and I cannot but approve of the measures taken. I need hardly say that neither the French inventor nor his keeper is on board the Ebba. However, you can assure yourself of the fact by examining the schooner as minutely as you desire. Captain Spade, show these gentlemen over the vessel."

Then saluting the lieutenant of the Falcon coldly, the Count d'Artigas sank into his deck-chair again and replaced his cigar between his lips, while the two officers and eight sailors, conducted by Captain Spade, began their search.

In the first place they descended the main hatchway to the after saloon--a luxuriously-appointed place, filled with art objects of great value, hung with rich tapestries and hangings, and wainscotted with costly woods.

It goes without saying that this and the adjoining cabins were searched with a care that could not have been
surpassed by the most experienced detectives. Moreover, Captain Spade assisted them by every means in his power, obviously anxious that they should not preserve the slightest suspicion of the Ebba's owner.

After the grand saloon and cabins, the elegant dining-saloon was visited. Then the cook's galley, Captain Spade's cabin, and the quarters of the crew in the forecastle were overhauled, but no sign of Thomas Roch or Gaydon was to be seen.

Next, every inch of the hold, etc., was examined, with the aid of a couple of lanterns. Water-kegs, wine, brandy, whisky and beer barrels, biscuit-boxes, in fact, all the provision boxes and everything the hold contained, including the stock of coal, was moved and probed, and even the bilges were scrutinized, but all in vain.

Evidently the suspicion that the Count d'Artigas had carried off the missing men was unfounded and unjust. Even a rat could not have escaped the notice of the vigilant searchers, leave alone two men.

When they returned on deck, however, the officers, as a matter of precaution looked into the boats hanging on the davits, and punched the lowered sails, with the same result.

"You must pardon us for having disturbed you, Monsieur the Count," said the lieutenant.
"You were compelled to obey your orders, gentlemen."
"It was merely a formality, of course," ventured the officer.
"I assure you, gentlemen, that I have had no hand in this kidnapping."
"We can no longer believe so, Monsieur the Count, and will withdraw."
"As you please. Is the Ebba now free to proceed?"
"Certainly."
"Then au revoir, gentlemen, au revoir, for I am an habitué of this coast and shall soon be back again. I hope that ere my return you will have discovered the author of the outrage, and have Thomas Roch safely back in Healthful House. It is a consummation devoutly to be wished in the interest of the United States— I might even say of the whole world."

The two officers courteously saluted the Count, who responded with a nod. Captain Spade accompanied them to the gangway, and they were soon making for the cruiser, which had steamed near to pick them up.

Meanwhile the breeze had freshened considerably, and when, at a sign from d'Artigas, Captain Spade set sail again, the Ebba skimmed swiftly through the inlet, and half an hour after was standing out to sea.

For an hour she continued steering east-northeast, and then, the wind, being merely a land breeze, dropped, and the schooner lay becalmed, her sails limp, and her flag drooping like a wet rag. It seemed that it would be impossible for the vessel to continue her voyage that night unless a breeze sprang up, and of this there was no sign.

Since the schooner had cleared the inlet Captain Spade had stood in the bows gazing into the water, now to port, now to starboard, as if on the lookout for something. Presently he shouted in a stentorian voice:
"Furl sail!"
The sailors rushed to their posts, and in an instant the sails came rattling down and were furled.

Was it Count d'Artigas' intention to wait there till daybreak brought a breeze with it? Presumably, or the sails would have remained hoisted to catch the faintest puff.

A boat was lowered and Captain Spade jumped into it, accompanied by a sailor, who paddled it towards an object that was floating on the water a few yards away.

This object was a small buoy, similar to that which had floated on the bosom of the Neuse when the Ebba lay off Healthful House.

The buoy, with a towline affixed to it, was lifted into the boat that was then paddled to the bow of the Ella, from the deck of which another hawser was cast to the captain, who made it fast to the towline of the buoy. Having dropped the latter overboard again, the captain and the sailor returned to the ship and the boat was hoisted in.

Almost immediately the hawser tautened, and the Elba, though not a stitch of canvas had been set, sped off in an easterly direction at a speed that could not have been less than ten knots an hour.

Night was falling fast, and soon the rapidly receding lights along the American coast were lost in the mist on the horizon.

CHAPTER V.
WHERE AM I?
(Notes by Simon Hart, the Engineer.)
Where am I? What has happened since the sudden aggression of which I was the victim near the pavilion.
I had just quitted the doctor, and was about to mount the steps, close the door and resume my post beside
Thomas Roch when several men sprang upon me and knocked me down. Who are they? My eyes having been bandaged I was unable to recognize them. I could not cry for help, having been gagged. I could make no resistance, for they had bound me hand and foot. Thus powerless, I felt myself lifted and carried about one hundred paces, then hoisted, then lowered, then laid down.

Where? Where?

And Thomas Roch, what has become of him? It must have been he rather than I they were after. I was but Gaydon, the warden. None suspected that I was Simon Hart, the engineer, nor could they have suspected my nationality. Why, therefore, should they have desired to kidnap a mere hospital attendant?

There can consequently be no doubt that the French inventor has been carried off; and if he was snatched from Healthful House it must have been in the hope of forcing his secret from him.

But I am reasoning on the supposition that Thomas Roch was carried off with me. Is it so? Yes--it must be--it is. I can entertain no doubt whatever about it. I have not fallen into the hands of malefactors whose only intention is robbery. They would not have acted in this way. After rendering it impossible for me to cry out, after having thrown me into a clump of bushes in the corner of the garden, after having kidnapped Thomas Roch they would not have shut me up--where I now am.

Where? This is the question which I have been asking myself for hours without being able to answer it.

However, one thing is certain, and that is that I have embarked upon an extraordinary adventure, that will end?--In what manner I know not--I dare not even imagine what the upshot of it will be. Anyhow, it is my intention to commit to memory, minute by minute, the least circumstance, and then, if it be possible, to jot down my daily impressions. Who knows what the future has in store for me? And who knows but what, in my new position, I may finally discover the secret of Roth's fulgurator? If I am to be delivered one day, this secret must be made known, as well as who is the author, or who are the authors, of this criminal outrage, which may be attended with such serious consequences.

I continually revert to this question, hoping that some incident will occur to enlighten me:

Where am I?

Let me begin from the beginning.

After having been carried by the head and feet from Healthful House, I felt that I was laid, without any brutality, I must admit, upon the stretchers of a row-boat of small dimensions.

The rocking caused by the weight of my body was succeeded shortly afterwards by a further rocking--which I attribute to the embarking of a second person. Can there be room for doubt that it was Thomas Roch? As far as he was concerned they would not have had to take the precaution of gagging him, or of bandaging his eyes, or of binding him. He must still have been in a state of prostration which precluded the possibility of his making any resistance, or even of being conscious of what was being done. The proof that I am not deceiving myself is that I could smell the unmistakable odor of ether. Now, yesterday, before taking leave of us, the doctor administered a few drops of ether to the invalid and--I remember distinctly--a little of this extremely volatile substance fell upon his clothing while he was struggling in his fit. There is therefore nothing astonishing in the fact that this odor should have clung to him, nor that I should have distinguished it, even beneath the bandages that covered my face.

Yes, Thomas Roch was extended near me in the boat. And to think that had I not returned to the pavilion when I did, had I delayed a few minutes longer, I should have found him gone!

Let me think. What could have inspired that Count d'Artigas with the unfortunate curiosity to visit Healthful House? If he had not been allowed to see my patient nothing of the kind would have happened. Talking to Thomas Roch about his inventions brought on a fit of exceptional violence. The director is primarily to blame for not heeding my warning. Had he listened to me the doctor would not have been called upon to attend him, the door of the pavilion would have been locked, and the attempt of the band would have been frustrated.

As to the interest there could have been in carrying off Thomas Roch, either on behalf of a private person or of one of the states of the Old World, it is so evident that there is no need to dwell upon it. However, I can be perfectly easy about the result. No one can possibly succeed in learning what for fifteen months I have been unable to ascertain. In the condition of intellectual collapse into which my fellow-countryman has fallen, all attempts to force his secret from him will be futile. Moreover, he is bound to go from bad to worse until he is hopelessly insane, even as regards those points upon which he has hitherto preserved his reason intact.

After all, however, it is less about Thomas Roch than myself that I must think just now, and this is what I have experienced, to resume the thread of my adventure where I dropped it:

After more rocking caused by our captors jumping into it, the boat is rowed off. The distance must be very short, for a minute after we bumped against something. I surmise that this something must be the hull of a ship, and that we have run alongside. There is some scurrying and excitement. Indistinctly through my bandages I can hear orders being given and a confused murmur of voices that lasts for about five minutes, but I cannot distinguish a word that is
said.

The only thought that occurs to me now is that they will hoist me on board and lower me to the bottom of the hold and keep me there till the vessel is far out at sea. Obviously they will not allow either Thomas Roch or his keeper to appear on deck as long as she remains in Pamlico Sound.

My conjecture is correct. Still gagged and bound I am at last lifted by the legs and shoulders. My impression, however, is that I am not being raised over a ship's bulwark, but on the contrary am being lowered. Are they going to drop me overboard to drown like a rat, so as to get rid of a dangerous witness? This thought flashes into my brain, and a quiver of anguish passes through my body from head to foot. Instinctively I draw a long breath, and my lungs are filled with the precious air they will speedily lack.

No, there is no immediate cause for alarm. I am laid with comparative gentleness upon a hard floor, which gives me the sensation of metallic coldness. I am lying at full length. To my extreme surprise, I find that the ropes with which I was bound have been untied and loosened. The trampling about around me has ceased. The next instant I hear a door closed with a bang.

Where am I? And, in the first place, am I alone? I tear the gag from my mouth, and the bandages from my head. It is dark--pitch dark. Not a ray of light, not even the vague perception of light that the eyes preserve when the lids are tightly closed.

I shout--I shout repeatedly. No response. My voice is smothered. The air I breathe is hot, heavy, thick, and the working of my lungs will become difficult, impossible, unless the store of air is renewed.

I extend my arms and feel about me, and this is what I conclude:

I am in a compartment with sheet-iron walls, which cannot measure more than four cubic yards. I can feel that the walls are of bolted plates, like the sides of a ship's water-tight compartment.

I can feel that the entrance to it is by a door on one side, for the hinges protrude somewhat. This door must open inwards, and it is through here, no doubt, that I was carried in.

I place my ear to the door, but not a sound can be heard. The silence is as profound as the obscurity--a strange silence that is only broken by the sonorousness of the metallic floor when I move about. None of the dull noises usually to be heard on board a ship is perceptible, not even the rippling of the water along the hull. Nor is there the slightest movement to be felt; yet, in the estuary of the Neuse, the current is always strong enough, to cause a marked oscillation to any vessel.

But does the compartment in which I am confined, really belong to a ship? How do I know that I am afloat on the Neuse, though I was conveyed a short distance in a boat? Might not the latter, instead of heading for a ship in waiting for it, opposite Healthful House, have been rowed to a point further down the river? In this case is it not possible that I was carried into the collar of a house? This would explain the complete immobility of the compartment. It is true that the walls are of bolted plates, and that there is a vague smell of salt water, that odor sui generis which generally pervades the interior of a ship, and which there is no mistaking.

An interval, which I estimate at about four hours, must have passed since my incarceration. It must therefore be near midnight. Shall I be left here in this way till morning? Luckily, I dined at six o'clock, which is the regular dinner-hour at Healthful House. I am not suffering from hunger. In fact I feel more inclined to sleep than to eat. Still, I hope I shall have energy enough to resist the inclination. I will not give way to it. I must try and find out what is going on outside. But neither sound nor light can penetrate this iron box. Wait a minute, though; perhaps by listening intently I may hear some sound, however feeble. Therefore I concentrate all my vital power in my sense of hearing. Moreover, I try--in case I should really not be on terra firma--to distinguish some movement, some oscillation of my prison. Admitting that the ship is still at anchor, it cannot be long before it will start--otherwise I shall have to give up imagining why Thomas Roch and I have been carried off.

Let me consider the matter calmly. I am on board a vessel that was anchored in the Neuse, waiting under sail or steam, for the result of the expedition. A boat brought me aboard, but, I repeat, I did not feel that I was lifted over her bulwarks. Was I passed through a porthole? But after all, what does it matter? Whether I was lowered into the hold or not, I am certainly upon something that is floating and moving.

At last--it is no illusion--a slight rolling proves to me, beyond a doubt, that I am not on land. We are evidently moving, but the motion is scarcely perceptible. It is not a jerky, but rather a gliding movement, as though we were skimming through the water without effort, on an even keel.

Let me consider the matter calmly. I am on board a vessel that was anchored in the Neuse, waiting under sail or steam, for the result of the expedition. A boat brought me aboard, but, I repeat, I did not feel that I was lifted over her bulwarks. Was I passed through a porthole? But after all, what does it matter? Whether I was lowered into the hold or not, I am certainly upon something that is floating and moving.

No doubt I shall soon be let out, together with Thomas Roch, supposing them to have locked him up as carefully as they have me. By being let out, I mean being accorded permission to go on deck. It will not be for some hours to come, however, that is certain, for they won't want us to be seen, so that there is no chance of getting a whiff of fresh air till we are well out at sea. If it is a sailing vessel, she must have waited for a breeze--for the breeze that freshens off shore at daybreak, and is favorable to ships navigating Pamlico Sound.

It certainly cannot be a steamer. I could not have failed to smell the oil and other odors of the engine-room. And
then I should feel the trembling of the machinery, the jerks of the pistons, and the movements of the screws or paddles.

The best thing to do is to wait patiently. I shan't be taken out of this hole until to-morrow, anyway. Moreover, if I am not released, somebody will surely bring me something to eat. There is no reason to suppose that they intend to starve me to death. They wouldn't have taken the trouble to bring me aboard, but would have dropped me to the bottom of the river had they been desirous of getting rid of me. Once we are out at sea, what will they have to fear from me? No one could hear my shouts. As to demanding an explanation and making a fuss, it would be useless. Besides, what am I to the men who have carried us off? A mere hospital attendant—one Gaydon, who is of no consequence. It is Thomas Roch they were after. I was taken along too because I happened to return to the pavilion at the critical moment.

At any rate, no matter what happens, no matter who our kidnappers may be, no matter where we are taken, I shall stick to this resolution: I will continue to play my role of warder. No one, no! none, can suspect that Gaydon is Simon Hart, the engineer. There are two advantages in this: in the first place, they will take no notice of a poor devil of a warder, and in the second, I may be able to solve the mystery surrounding this plot and turn my knowledge to profit, if I succeed in making my escape.

But whither are my thoughts wandering? I must perforce wait till we arrive at our destination before thinking of escaping. It will be time enough to bother about that when the occasion presents itself. Until then the essential is that they remain ignorant as to my identity, and they cannot, and shall not, know who I am.

I am now certain that we are going through the water. But there is one thing that puzzles me. It is hot a sailing vessel, neither can it be a steamer. Yet it is incontestably propelled by some powerful machine. There are none of the noises, nor is there the trembling that accompanies the working of steam engines. The movement of the vessel is more continuous and regular, it is a sort of direct rotation that is communicated by the motor, whatever the latter may be. No mistake is possible: the ship is propelled by some special mechanism. But what is it?

Is it one of those turbines that have been spoken of lately, which, fitted into a submerged tube, are destined to replace the ordinary screw, it being claimed that they utilize the resistance of the water better than the latter and give increased speed to a ship?

In a few hours' time I shall doubtless know all about this means of locomotion.

Meanwhile there is another thing that equally puzzles me. There is not the slightest rolling or pitching. How is it that Pamlico Sound is so extraordinarily calm? The varying currents continuously ruffle the surface of the Sound, even if nothing else does.

It is true the tide may be out, and I remember that last night the wind had fallen altogether. Still, no matter, the thing is inexplicable, for a ship propelled by machinery, no matter at what speed she may be going, always oscillates more or less, and I cannot perceive the slightest rocking.

Such are the thoughts with which my mind is persistently filled. Despite an almost overpowering desire to sleep, despite the torpor that is coming upon me in this suffocating atmosphere, I am resolved not to close my eyes. I will keep awake till daylight, and there will be no daylight for me till it is let into my prison from the outside. Perhaps even if the door were open it would not penetrate to this black hole, and I shall probably not see it again until I am taken on deck.

I am squatting in a corner of my prison, for I have no stool or anything to sit upon, but as my eyelids are heavy and I feel somnolent in spite of myself, I get up and walk about. Then I wax wrathful, anger fills my soul, I beat upon the iron walls with my fists, and shout for help. In vain! I hurt my hands against the bolts of the plates, and no one answers my cries.

Such conduct is unworthy of me. I flattered myself that I would remain calm under all circumstances and here I am acting like a child.

The absence of any rolling or lurching movement at least proves that we are not yet at sea. Instead of crossing Pamlico Sound, may we not be going in the opposite direction, up the River Neuse? No! What would they go further inland for? If Thomas Roch has been carried off from Healthful House, his captors obviously mean to take him out of the United States—probably to a distant island in the Atlantic, or to some point on the European continent. It is, therefore, not up the Neuse that our maritime machine, whatever it may be, is going, but across Pamlico Sound, which must be as calm as a mirror.

Very well, then, when we get to sea I shall soon, know, for the vessel will rock right enough in the swell off shore, even though there be no wind,—unless I am aboard a battleship, or big cruiser, and this I fancy can hardly be!

But hark! If I mistake not—no, it was not imagination—I hear footsteps. Some one is approaching the side of the compartment where the door is. One of the crew no doubt. Are they going to let me out at last? I can now hear voices. A conversation is going on outside the door, but it is carried on in a language that I do not understand. I shout to them—I shout again, but no answer is vouchsafed.
There is nothing to do, then, but wait, wait, wait! I keep repeating the word and it rings in my ears like a bell. Let me try to calculate how long I have been here. The ship must have been under way for at least four or five hours. I reckon it must be past midnight, but I cannot tell, for unfortunately my watch is of no use to me in this Cimmerian darkness.

Now, if we have been going for five hours, we must have cleared Pamlico Sound, whether we issued by Ocracoke or Hatteras inlet, and must be off the coast a good mile, at least. Yet I haven't felt any motion from the swell of the sea.

It is inexplicable, incredible! Come now, have I made a mistake? Am I the dupe of an illusion? Am I not imprisoned in the hold of a ship under way?

Another hour has passed and the movement of the ship suddenly ceases; I realize perfectly that she is stationary. Has she reached her destination? In this event we can only be in one of the coast ports to the north or south of Pamlico Sound. But why should Thomas Roch be landed again? The abduction must soon have been discovered, and our kidnappers would run the greatest risk of falling into the hands of the authorities if they attempted to disembark.

However this may be, if the vessel is coming to anchor I shall hear the noise of the chain as it is paid out, and feel the jerk as the ship is brought up. I know that sound and that jerk well from experience, and I am bound to hear and feel them in a minute or two.

I wait--I listen.

A dead and disquieting silence reigns on board. I begin to wonder whether I am not the only living being in the ship.

Now I feel an irresistible torpor coming over me. The air is vitiated. I cannot breathe. My chest is bursting. I try to resist, but it is impossible to do so. The temperature rises to such a degree that I am compelled to divest myself of part of my clothing. Then I lie me down in a corner. My heavy eyelids close, and I sink into a prostration that eventually forces me into heavy slumber.

How long have I been asleep? I cannot say. Is it night? Is it day? I know not. I remark, however, that I breathe more easily, and that the air is no longer poisoned carbonic acid.

Was the air renewed while I slept? Has the door been opened? Has anybody been in here?

Yes, here is the proof of it!

In feeling about, my hand has come in contact with a mug filled with a liquid that exhales an inviting odor. I raise it to my lips, which, are burning, for I am suffering such an agony of thirst that I would even drink brackish water.

It is ale--an ale of excellent quality--which refreshes and comforts me, and I drain the pint to the last drop.

But if they have not condemned me to die of thirst, neither have they condemned me to die of hunger, I suppose?

No, for in one of the corners I find a basket, and this basket contains some bread and cold meat.

I fall to, eating greedily, and my strength little by little returns.

Decidedly, I am not so abandoned as I thought I was. Some one entered this obscure hole, and the open door admitted a little of the oxygen from the outside, without which I should have been suffocated. Then the wherewithal to quench my thirst and appease the pangs of hunger was placed within my reach.

How much longer will this incarceration last? Days? Months? I cannot estimate the hours that have elapsed since I fell asleep, nor have I any idea as to what time of the day or night it may be. I was careful to wind up my watch, though, and perhaps by feeling the hands--Yes, I think the little hand marks eight o'clock--in the morning, no doubt. What I do know, however, is that the ship is not in motion. There is not the slightest quiver.

Hours and hours, weary, interminable hours go by, and I wonder whether they are again waiting till night comes on to renew my stock of air and provisions. Yes, they are waiting to take advantage of my slumbers. But this time I am resolved to resist. I will feign to be asleep--and I shall know how to force an answer from whoever enters!

CHAPTER VI.
ON DECK.

Here I am in the open air, breathing freely once more. I have at last been hauled out of that stifling box and taken on deck. I gaze around me in every direction and see no sign of land. On every hand is that circular line which defines earth and sky. No, there is not even a speck of land to be seen to the west, where the coast of North America extends for thousands of miles.

The setting sun now throws but slanting rays upon the bosom of the ocean. It must be about six o'clock in the evening. I take out my watch and it marks thirteen minutes past six.

As I have already mentioned, I waited for the door of my prison to open, thoroughly resolved not to fall asleep
again, but to spring upon the first person who entered and force him to answer my questions. I was not aware then that it was day, but it was, and hour after hour passed and no one came. I began to suffer again from hunger and thirst, for I had not preserved either bite or sup.

As soon as I awoke I felt that the ship was in motion again, after having, I calculated, remained stationary since the previous day--no doubt in some lonely creek, since I had not heard or felt her come to anchor.

A few minutes ago--it must therefore have been six o'clock--I again heard footsteps on the other side of the iron wall of my compartment. Was anybody coming to my cell? Yes, for I heard the creaking of the bolts as they were drawn back, and then the door opened, and the darkness in which I had been plunged since the first hour of my captivity was illumined by the light of a lantern.

Two men, whom I had no time to look at, entered and seized me by the arms. A thick cloth was thrown over my head, which was enveloped in such a manner that I could see absolutely nothing.

What did it all mean? What were they going to do with me? I struggled, but they held me in an iron grasp. I questioned them, but they made no reply. The men spoke to each other in a language that I could not understand, and had never heard before.

They stood upon no ceremony with me. It is true I was only a madhouse warder, and they probably did not consider it necessary to do so; but I question very much whether Simon Hart, the engineer, would have received any more courtesy at their hands.

This time, however, no attempt was made to gag me nor to bind either my arms or legs. I was simply restrained by main force from breaking away from them.

In a moment I was dragged out of the compartment and pushed along a narrow passage. Next, the steps of a metallic stairway resounded under our feet. Then the fresh air blew in my face and I inhaled it with avidity. Finally they took their hands from off me, and I found myself free. I immediately tore the cloth off my head and gazed about me.

I am on board a schooner which is ripping through the water at a great rate and leaving a long white trail behind her.

I had to clutch at one of the stays for support, dazzled as I was by the light after my forty-eight hours' imprisonment in complete obscurity.

On the deck a dozen men with rough, weather-beaten faces come and go--very dissimilar types of men, to whom it would be impossible to attribute any particular nationality. They scarcely take any notice of me.

As to the schooner, I estimate that she registers from two hundred and fifty to three hundred tons. She has a fairly wide beam, her masts are strong and lofty, and her large spread of canvas must carry her along at a spanking rate in a good breeze.

Aft, a grizzly-faced man is at the wheel, and he is keeping her head to the sea that is running pretty high.

I try to find out the name of the vessel, but it is not to be seen anywhere, even on the life-buoys.

I walk up to one of the sailors and inquire:

"What is the name of this ship?"

No answer, and I fancy the man does not understand me.

"Where is the captain?" I continue.

But the sailor pays no more heed to this than he did to the previous question.

I turn on my heel and go forward.

Above the forward hatchway a bell is suspended. Maybe the name of the schooner is engraved upon it. I examine it, but can find no name upon it.

I then return to the stern and address the man at the wheel. He gazes at me sourly, shrugs his shoulders, and bending, grasps the spokes of the wheel solidly, and brings the schooner, which had been headed off by a large wave from port, stern on to sea again.

Seeing that nothing is to be got from that quarter, I turn away and look about to see if I can find Thomas Roch, but I do not perceive him anywhere. Is he not on board? He must be. They could have had no reason for carrying me off alone. No one could have had any idea that I was Simon Hart, the engineer, and even had they known it what interest could they have had in me, and what could they expect of me?

Therefore, as Roch is not on deck, I conclude that he is locked in one of the cabins, and trust he has met with better treatment than his ex-guardian.

But what is this--and how on earth could I have failed to notice it before? How is this schooner moving? Her sails are furled--there is not an inch of canvas set--the wind has fallen, and the few puffs that occasionally come from the east are unfavorable, in view of the fact that we are going in that very direction. And yet the schooner speeds through the sea, her bows down, throwing off clouds of foam, and leaving a long, milky, undulating trail in her wake.
Is she a steam-yacht? No--there is not a smokestack about her. Is she propelled by electricity--by a battery of accumulators, or by piles of great power that work her screw and send her along at this rate?

I can come to no other conclusion. In any case she must be fitted with a screw, and by leaning over the stern I shall be able to see it, and can find out what sets it working afterwards.

The man at the wheel watches me ironically as I approach, but makes no effort to prevent me from looking over.

I gaze long and earnestly, but there is no foaming and seething of the water such as is invariably caused by the revolutions of the screw--naught but the long white furrow that a sailing vessel leaves behind is discernible in the schooner's wake.

Then, what kind of a machine is it that imparts such a marvellous speed to the vessel? As I have already said, the wind is against her, and there is a heavy swell on.

I must--I will know. No one pays the slightest attention, and I again go forward.

As I approach the forecastle I find myself face to face with a man who is leaning nonchalantly on the raised hatchway and who is watching me. He seems to be waiting for me to speak to him.

I recognize him instantly. He is the person who accompanied the Count d'Artigas during the latter's visit to Healthful House. There can be no mistake--it is he right enough.

It was, then, that rich foreigner who abducted Thomas Roch, and I am on board the Ebba his schooner-yacht which is so well known on the American coast!

The man before me will enlighten me about what I want to know. I remember that he and the Count spoke English together.

I take him to be the captain of the schooner.

"Captain," I say, "you are the person I saw at Healthful House. You remember me, of course?"

He looks me up and down but does not condescend to reply.

"I am Warder Gaydon, the attendant of Thomas Roch," I continue, "and I want to know why you have carried me off and placed me on board this schooner?"

The captain interrupts me with a sign. It is not made to me, however, but to some sailors standing near.

They catch me by the arms, and taking no notice of the angry movement that I cannot restrain, bundle me down the hatchway. The hatchway stair in reality, I remark, is a perpendicular iron ladder, at the bottom of which, to right and left, are some cabins, and forward, the men's quarters.

Are they going to put me back in my dark prison at the bottom of the hold?

No. They turn to the left and push me into a cabin. It is lighted by a port-hole, which is open, and through which the fresh air comes in gusts from the briny. The furniture consists of a bunk, a chair, a chest of drawers, a wash-hand-stand and a table.

The latter is spread for dinner, and I sit down. Then the cook's mate comes in with two or three dishes. He is a colored lad, and as he is about to withdraw, I try to question him, but he, too, vouchsafes no reply. Perhaps he doesn't understand me.

The door is closed, and I fall to and eat with an excellent appetite, with the intention of putting off all further questioning till some future occasion when I shall stand a chance of getting answered.

It is true I am a prisoner, but this time I am comfortable enough, and I hope I shall be permitted to occupy this cabin for the remainder of the voyage, and not be lowered into that black hole again.

I now give myself up to my thoughts, the first of which is that it was the Count d'Artigas who planned the abduction; that it was he who is responsible for the kidnapping of Thomas Roch, and that consequently the French inventor must be just as comfortably installed somewhere on board the schooner.

But who is this Count d'Artigas? Where does he hail from? If he has seized Thomas Roch, is it not because he is determined to secure the secret of the fulgurator at no matter what cost? Very likely, and I must therefore be careful not to betray my identity, for if they knew the truth, I should never be afforded a chance to get away.

But what a lot of mysteries to clear up, how many inexplicable things to explain--the origin of this d'Artigas, his intentions as to the future, whether we are bound, the port to which the schooner belongs, and this mysterious progress through the water without sails and without screws, at a speed of at least ten knots an hour!

The air becoming keener as night deepens, I close and secure the port-hole, and as my cabin is bolted on the outside, the best thing I can do is to get into my bunk and let myself be gently rocked to sleep by the broad Atlantic in this mysterious cradle, the Ebba.

The next morning I rise at daybreak, and having performed my ablutions, dress myself and wait.

Presently the idea of trying the door occurs to me. I find that it has been unbolted, and pushing it open, climb the iron ladder and emerge on deck.

The crew are washing down the deck, and standing aft and conversing are two men, one of whom is the captain. The latter manifests no surprise at seeing me, and indicates my presence to his companion by a nod.
This other man, whom I have never before seen, is an individual of about fifty years of age, whose dark hair is streaked with gray. His features are delicately chiselled, his eyes are bright, and his expression is intelligent and not at all displeasing. He is somewhat of the Grecian type, and I have no doubt that he is of Hellenic origin when I hear him called Serko—Engineer Serko—by the Captain of the Ebba.

As to the latter, he is called Spade—Captain Spade—and this name has an Italian twang about it. Thus there is a Greek, an Italian, and a crew recruited from every corner of the earth to man a schooner with a Norwegian name! This mixture strikes me as being suspicious.

And that Count d'Artigas, with his Spanish name and Asiatic type, where does he come from?

Captain Spade and Engineer Serko continue to converse in a low tone of voice. The former is keeping a sharp eye on the man at the wheel, who does not appear to pay any particular attention to the compass in front of him. He seems to pay more heed to the gestures of one of the sailors stationed forward, and who signals to him to put the helm to port or to starboard.

Thomas Roch is near them, gazing vacantly out upon the vast expanse which is not limited on the horizon by a single speck of land. Two sailors watch his every movement. It is evidently feared that the madman may possibly attempt to jump overboard.

I wonder whether I shall be permitted to communicate with my ward.

I walk towards him, and Captain Spade and Engineer Serko watch me.

Thomas Roch doesn't see me coming, and I stand beside him. Still he takes no notice of me, and makes no movement. His eyes, which sparkle brightly, wander over the ocean, and he draws in deep breaths of the salt, vivifying atmosphere. Added to the air surcharged with oxygen is a magnificent sunset in a cloudless sky. Does he perceive the change in his situation? Has he already forgotten about Healthful House, the pavilion in which he was a prisoner, and Gaydon, his keeper? It is highly probable. The past has presumably been effaced from his memory and he lives solely in the present.

In my opinion, even on the deck of the Ebba, in the middle of the sea, Thomas Roch is still the helpless, irresponsible man whom I tended for fifteen months. His intellectual condition has undergone no change, and his reason will return only when he is spoken to about his inventions. The Count d'Artigas is perfectly aware of this mental disposition, having had a proof of it during his visit, and he evidently relies thereon to surprise sooner or later the inventor's secret. But with what object?

"Thomas Roch!" I exclaim.

My voice seems to strike him, and after gazing at me fixedly for an instant he averts his eyes quickly.

I take his hand and press it. He withdraws it brusquely and walks away, without having recognized me, in the direction of Captain Spade and Engineer Serko.

Does he think of speaking to one or other of these men, and if they speak to him will he be more reasonable than he was with me, and reply to them?

At this moment his physiognomy lights up with a gleam of intelligence. His attention, obviously, has been attracted by the queer progress of the schooner. He gazes at the masts and the furled sails. Then he turns back and stops at the place where, if the Ebba were a steamer, the funnel ought to be, and which in this case ought to be belching forth a cloud of black smoke.

What appeared so strange to me evidently strikes Thomas Roch as being strange, too. He cannot explain what I found inexplicable, and, as I did, he walks aft to see if there is a screw.

On the flanks of the Ebba a shoal of porpoises are sporting. Swift as is the schooner's course they easily pass her, leaping and gambolling in their native element with surprising grace and agility.

Thomas Roch pays no attention to them, but leans over the stern.

Engineer Serko and Captain Spade, fearful lest he should fall overboard, hurry to him and drag him gently, but firmly, away.

I observe from long experience that Roch is a prey to violent excitement. He turns about and gesticulates, uttering incoherent phrases the while.

It is plain to me that another fit is coming on, similar to the one he had in the pavilion of Healthful House on the night we were abducted. He will have to be seized and carried down to his cabin, and I shall perhaps be summoned to attend to him.

Meanwhile Engineer Serko and Captain Spade do not lose sight of him for a moment. They are evidently curious to see what he will do.

After walking towards the mainmast and assuring himself that the sails are not set, he goes up to it and flinging his arms around it, tries with all his might to shake it, as though seeking to pull it down.

Finding his efforts futile, he quits it and goes to the foremost, where the same performance is gone through. He waxes more and more excited. His vague utterances are followed by inarticulate cries.
Suddenly he rushes to the port stays and clings to them, and I begin to fear that he will leap into the rigging and climb to the cross-tree, where he might be precipitated into the sea by a lurch of the ship.

On a sign from Captain Spade, some sailors run up and try to make him relinquish his grasp of the stays, but are unable to do so. I know that during his fits he is endowed with the strength of ten men, and many a time I have been compelled to summon assistance in order to overpower him.

Other members of the crew, however, come up, and the unhappy madman is borne to the deck, where two big sailors hold him down, despite his extraordinary strength.

The only thing to do is to convey him to his cabin, and let him lie there till he gets over his fit. This is what will be done in conformity with orders given by a new-comer whose voice seems familiar to me.

I turn and recognize him.

He is the Count d'Artigas, with a frown on his face and an imperious manner, just as I had seen him at Healthful House.

I at once advance toward him. I want an explanation and mean to have it.

"By what right, sir?"--I begin.

"By the right of might," replies the Count.

Then he turns on his heel, and Thomas Roch is carried below.

CHAPTER VII.
TWO DAYS AT SEA.

Perhaps--should circumstances render it necessary--I may be induced to tell the Count d'Artigas that I am Simon Hart, the engineer. Who knows but what I may receive more consideration than if I remain Warder Gaydon? This measure, however, demands reflection. I have always been dominated by the thought that if the owner of the Ebba kidnapped the French inventor, it was in the hope of getting possession of Roch's fulgurator, for which, neither the old nor new continent would pay the impossible price demanded. In that case the best thing I can do is to remain Warder Gaydon, on the chance that I may be allowed to continue in attendance upon him. In this way, if Thomas Roch should ever divulge his secret, I may learn what it was impossible to do at Healthful House, and can act accordingly.

Meanwhile, where is the Ebba bound?--first question.

Who and what is the Count d'Artigas?--second question.

The first will be answered in a few days' time, no doubt, in view of the rapidity with which we are ripping through the water, under the action of a means of propulsion that I shall end by finding out all about. As regards the second, I am by no means so sure that my curiosity will ever be gratified.

In my opinion this enigmatical personage has an all important reason for hiding his origin, and I am afraid there is no indication by which I can gauge his nationality. If the Count d'Artigas speaks English fluently--and I was able to assure myself of that fact during his visit to Pavilion No. 17,--he pronounces it with a harsh, vibrating accent, which is not to be found among the peoples of northern latitudes. I do not remember ever to have heard anything like it in the course of my travels either in the Old or New World--unless it be the harshness characteristic of the idioms in use among the Malays. And, in truth, with his olive, verging on copper-tinted skin, his jet-black, crinkly hair, his piercing, deep-set, restless eyes, his square shoulders and marked muscular development, it is by no means unlikely that he belongs to one of the extreme Eastern races.

I believe this name of d'Artigas is an assumed one, and his title of Count likewise. If his schooner bears a Norwegian name, he at any rate is not of Scandinavian origin. He has nothing of the races of Northern Europe about him.

But whoever and whatever he may be, this man abducted Thomas Roch--and me with him--with no good intention, I'll be bound.

But what I should like to know is, has he acted as the agent of a foreign power, or on his own account? Does he wish to profit alone by Thomas Roch's invention, and is he in the position to dispose of it profitably? That is another question that I cannot yet answer. Maybe I shall be able to find out from what I hear and see ere I make my escape, if escape be possible.

The Ebba continues on her way in the same mysterious manner. I am free to walk about the deck, without, however, being able to go beyond the fore hatchway. Once I attempted to go as far as the bows where I could, by leaning over, perceive the schooner's stem as it cut through the water, but acting, it was plain, on orders received, the watch on deck turned me back, and one of them, addressing me brusquely in harsh, grating English, said:

"Go back! Go back! You are interfering with the working of the ship!"

With the working of the ship! There was no working.
Did they realize that I was trying to discover by what means the schooner was propelled? Very likely, and Captain Spade, who had looked on, must have known it, too. Even a hospital attendant could not fail to be astonished at the fact that a vessel without either screw or sails was going along at such a speed. However this may be, for some reason or other, the bows of the Ebba are barred to me.

Toward ten o'clock a breeze springs up—a northwest wind and very favorable—and Captain Spade gives an order to the boatswain. The latter immediately pipes all hands on deck, and the mainsail, the foresail, staysail and jibs are hoisted. The work could not have been executed with greater regularity and discipline on board a man-of-war.

The Ebba now has a slight list to port, and her speed is notably increased. But the motor continues to push her along, as is evident from the fact that the sails are not always as full as they ought to be if the schooner were bowling along solely under their action. However, they continue to render yeoman's service, for the breeze has set in steadily.

The sky is clear, for the clouds in the west disappear as soon as they attain the horizon, and the sunlight dances on the water.

My preoccupation now is to find out as near as possible where we are bound for. I am a good-enough sailor to be able to estimate the approximate speed of a ship. In my opinion the Ebba has been travelling at the rate of from ten to eleven knots an hour. As to the direction we have been going in, it is always the same, and I have been able to verify this by casual glances at the binnacle. If the fore part of the vessel is barred to Warder Gaydon he has been allowed a free run of the remainder of it. Time and again I have glanced at the compass, and noticed that the needle invariably pointed to the east, or to be exact, east-southeast.

These are the conditions in which we are navigating this part of the Atlantic Ocean, which is bounded on the west by the coast of the United States of America.

I appeal to my memory. What are the islands or groups of islands to be found in the direction we are going, ere the continent of the Old World is reached?

North Carolina, which the schooner quitted forty-eight hours ago, is traversed by the thirty-fifth parallel of latitude, and this parallel, extending eastward, must, if I mistake not, cut the African coast at Morocco. But along the line, about three thousand miles from America, are the Azores. Is it presumable that the Ebba is heading for this archipelago, that the port to which she belongs is somewhere in these islands which constitute one of Portugal's insular domains? I cannot admit such an hypothesis.

Besides, before the Azores, on the line of the thirty-fifth parallel, is the Bermuda group, which belongs to England. It seems to me to be a good deal less hypothetical that, if the Count d'Artigas was entrusted with the abduction of Thomas Roch by a European Power at all, it was by the United Kingdom of Great Britain and Ireland. The possibility, however, remains that he may be acting solely in his own interest.

Three or four times during the day Count d'Artigas has come aft and remained for some time scanning the surrounding horizon attentively. When a sail or the smoke from a steamer heaves in sight he examines the passing vessel for a considerable time with a powerful telescope. I may add that he has not once condescended to notice my presence on deck.

Now and then Captain Spade joins him and both exchange a few words in a language that I can neither understand nor recognize.

It is with Engineer Serko, however, that the owner of the Ebba converses more readily than with anybody else, and the latter appears to be very intimate with him. The engineer is a good deal more free, more loquacious and less surly than his companions, and I wonder what position he occupies on the schooner. Is he a personal friend of the Count d'Artigas? Does he scour the seas with him, sharing the enviable life enjoyed by the rich yachtsman? He is the only man of the lot who seems to manifest, if not sympathy with, at least some interest in me.

I have not seen Thomas Roch all day. He must be shut in his cabin, still under the influence of the fit that came upon him last night.

I feel certain that this is so, when about three o'clock in the afternoon, just as he is about to go below, the Count beckons me to approach.

I do not know what he wishes to say to me, this Count d'Artigas, but I do know what I will say to him.

"Do these fits to which Thomas Roch is subject last long?" he asks me in English.

"Sometimes forty-eight hours," I reply.

"What is to be done?"

"Nothing at all. Let him alone until he falls asleep. After a night's sleep the fit will be over and Thomas Roch will be his own helpless self again."

"Very well, Warder Gaydon, you will continue to attend him as you did at Healthful House, if it be necessary."

"To attend to him!"

"Yes--on board the schooner--pending our arrival."

"Where?"
"Where we shall be to-morrow afternoon," replies the Count.
To-morrow, I say to myself. Then we are not bound for the coast of Africa, nor even the Azores. There only remains the hypothesis that we are making for the Bermudas.

Count d'Artigas is about to go down the hatchway when I interrogate him in my turn:
"Sir," I exclaim, "I desire to know, I have the right to know, where I am going, and----"
"Here, Warder Gaydon," he interrupted, "you have no rights. All you have to do is to answer when you are spoken to." "I protest!"
"Protest, then," replies this haughty and imperious personage, glancing at me menacingly.

Then he disappears down the hatchway, leaving me face to face with Engineer Serko.
"If I were you, Warder Gaydon, I would resign myself to the inevitable," remarks the latter with a smile. "When one is caught in a trap----"
"One can cry out, I suppose?"
"What is the use when no one is near to hear you?"
"I shall be heard some day, sir."

"Some day--that's a long way off. However, shout as much as you please."

And with this ironical advice, Engineer Serko leaves me to my own reflections.

Towards four o'clock a big ship is reported about six miles off to the east, coming in our direction. She is moving rapidly and grows perceptibly larger. Black clouds of smoke pour out of her two funnels. She is a warship, for a narrow pennant floats from her main-mast, and though she is not flying any flag I take her to be an American cruiser.

I wonder whether the Ebba will render her the customary salute as she passes.

No; for the schooner suddenly changes her course with the evident intention of avoiding her.

This proceeding on the part of such a suspicious yacht does not astonish me greatly. But what does cause me extreme surprise is Captain Spade's way of manoeuvring.
He runs forward to a signalling apparatus in the bows, similar to that by which orders are transmitted to the engine room of a steamer. As soon as he presses one of the buttons of this apparatus the Ebba veers off a point to the south-west.

Evidently an order of "some kind" has been transmitted to the driver of the machine of "some kind" which causes this inexplicable movement of the schooner by the action of a motor of "some kind" the principle of which I cannot guess at.

The result of this manoeuvre is that the Ebba slants away from the cruiser, whose course does not vary. Why should this warship cause a pleasure-yacht to turn out of its way? I have no idea.

But the Ebba behaves in a very different manner when about six o'clock in the evening a second ship comes in sight on the port bow. This time, instead of seeking to avoid her, Captain Spade signals an order by means of the apparatus above referred to, and resumes his course to the east--which will bring him close to the said ship.

An hour later, the two vessels are only about four miles from each other.

The wind has dropped completely. The strange ship, which is a three-masted merchantman, is taking in her top-gallant sails. It is useless to expect the wind to spring up again during the night, and she will lay becalmed till morning. The Ebba, however, propelled by her mysterious motor, continues to approach her.

It goes without saying, that Captain Spade has also begun to take in sail, and the work, under the direction of the boatswain Effondat, is executed with the same precision and promptness that struck me before.

When the twilight deepens into darkness, only a mile and a half separates the vessels.

Captain Spade then comes up to me--I am standing on the starboard side--and unceremoniously orders me to go below.

I can but obey. I remark, however, ere I go, that the boatswain has not lighted the head-lamps, whereas the lamps of the three-master shine brightly--green to starboard, and red to port.

I entertain no doubt that the schooner intends to pass her without being seen; for though she has slackened speed somewhat, her direction has not been in any way modified.

I enter my cabin under the impression of a vague foreboding. My supper is on the table, but uneasy, I know not why, I hardly touch it, and lie down to wait for sleep that does not come.

I remain in this condition for two hours. The silence is unbroken save by the water that ripples along the vessel's sides.

My mind is full of the events of the past two days, and other thoughts crowd thickly upon me. To-morrow afternoon we shall reach our destination. To-morrow, I shall resume, on land, my attendance upon Thomas Roch, "if it be necessary," said the Count d'Artigas.

If, when I was thrown into that black hole at the bottom of the hold, I was able to perceive when the schooner
started off across Pamlico Sound, I now feel that she has come to a stop. It must be about ten o'clock.

Why has she stopped? When Captain Spade ordered me below, there was no land in sight. In this direction, there is no island until the Bermuda group is reached—-at least there is none on the map—and we shall have to go another fifty or sixty miles before the Bermudas can be sighted by the lookout men. Not only has the Ebba stopped, but her immobility is almost complete. There is not a breath of wind, and scarcely any swell, and her slight, regular rocking is hardly perceptible.

Then my thoughts turn to the merchantman, which was only a mile and a half off, on our bow, when I came below. If the schooner continued her course towards her, she must be almost alongside now. We certainly cannot be lying more than one or two cables' length from her. The three-master, which was becalmed at sundown, could not have gone west. She must be close by, and if the night is clear, I shall be able to see her through the porthole.

It occurs to me, that perhaps a chance of escape presents itself. Why should I not attempt it, since no hope of being restored to liberty is held out to me? It is true I cannot swim, but if I seize a life buoy and jump overboard, I may be able to reach the ship, if I am not observed by the watch on deck.

I must quit my cabin and go up by the forward hatchway. I listen. I hear no noise, either in the men's quarters, or on deck. The sailors must all be asleep at this hour. Here goes.

I try to open the door, and find it is bolted on the outside, as I might have expected.

I must give up the attempt, which, after all, had small chance of success.

The best thing I can do, is to go to sleep, for I am weary of mind, if not of body. I am restless and racked by conflicting thoughts, and apprehensions of I know not what. Oh! if I could but sink into the blessed oblivion of slumber!

I must have managed to fall asleep, for I have just been awakened by a noise—an unusual noise, such as I have not hitherto heard on board the schooner.

Day begins to peer through the glass of my port-hole, which is turned towards the east. I look at my watch. It is half-past four.

The first thing I wonder is, whether the Ebba has resumed her voyage.

No, I am certain she has not, either by sail, or by her motor. The sea is as calm at sunrise as it was at sunset. If the Ebba has been going ahead while I slept, she is at any rate, stationary now.

The noise to which I referred, is caused by men hurrying to and fro on deck—by men heavily laden. I fancy I can also hear a similar noise in the hold beneath my cabin floor, the entrance to which is situated abaft the foremast. I also feel that something is scraping against the schooner's hull. Have boats come alongside? Are the crew engaged in loading or unloading merchandise?

And yet we cannot possibly have reached our journey's end. The Count d'Artigas said that we should not reach our destination till this afternoon. Now, I repeat, she was, last night, fully fifty or sixty miles from the nearest land, the group of the Bermudas. That she could have returned westward, and can be in proximity to the American coast, is inadmissible, in view of the distance. Moreover, I have reason to believe that the Ebba has remained stationary all night. Before I fell asleep, I know she had stopped, and I now know that she is not moving.

However, I shall see when I am allowed to go on deck. My cabin door is still bolted, I find on trying it; but I do not think they are likely to keep me here when broad daylight is on.

An hour goes by, and it gradually gets lighter. I look out of my porthole. The ocean is covered by a mist, which the first rays of the sun will speedily disperse.

I can, however, see for a half a mile, and if the three-masted merchantman is not visible, it is probably because she is lying off the other, or port, side of the Ebba.

Presently I hear a key turned in my door, and the bolts drawn. I push the door open and clamber up the iron ladder to the deck, just as the men are battening down the cover of the hold.

I look for the Count d'Artigas, but do not see him. He has not yet left his cabin.

Aft, Captain Spade and Engineer Serko are superintending the stowing of some bales, which have doubtless been hoisted from the hold. This explains the noisy operations that were going on when I was awakened. Obviously, if the crew are getting out the cargo, we are approaching the end of our voyage. We are not far from port, and perhaps in a few hours, the schooner will drop anchor.

But what about the sailing ship that was to port of us? She ought to be in the same place, seeing that there has been and is no wind.

I look for her, but she is nowhere to be seen. There is not a sail, not a speck on the horizon either east, west, north or south.

After cogitating upon the circumstance I can only arrive at the following conclusion, which, however, can only be accepted under reserve: Although I did not notice it, the Ebba resumed her voyage while I slept, leaving the three-master becalmed behind her, and this is why the merchantman is no longer visible.
I am careful not to question Captain Spade about it, nor even Engineer Serko, as I should certainly receive no
answer.

Besides, at this moment Captain Spade goes to the signalling apparatus and presses one of the buttons on the
upper disk. Almost immediately the Ebba gives a jerk, then with her sails still furled, she starts off eastward again.

Two hours later the Count d’Artigas comes up through the main hatchway and takes his customary place aft.
Serko and Captain Spade at once approach and engage in conversation with him.

All three raise their telescopes and sweep the horizon from southeast to northeast.

No one will be surprised to learn that I gaze intently in the same direction; but having no telescope I cannot
distinguish anything.

The midday meal over we all return on deck—all with the exception of Thomas Roch, who has not quitted his
cabin.

Towards one o’clock land is sighted by the lookout man on the foretop cross-tree. Inasmuch as the Elba is
bowling along at great speed I shall soon be able to make out the coast line.

In effect, two hours later a vague semicircular line that curves outward is discernible about eight miles off. As
the schooner approaches it becomes more distinct. It is a mountain, or at all events very high ground, and from its
summit a cloud of smoke ascends.

What! A volcano in these parts? It must then be----

CHAPTER VIII.
BACK CUP.

In my opinion the Ebba could have struck no other group of islands but the Bermudas in this part of the Atlantic.
This is clear from the distance covered from the American coast and the direction sailed in since we issued from
Pamlico Sound. This direction has constantly been south-southeast, and the distance, judging from the Ebba’s rate of
speed, which has scarcely varied, is approximately seven hundred and fifty miles.

Still, the schooner does not slacken speed. The Count d’Artigas and Engineer Serko remain aft, by the man at the
wheel. Captain Spade has gone forward.

Are we not going to leave this island, which appears to be isolated, to the west?

It does not seem likely, since it is still broad daylight, and the hour at which the Ebba was timed to arrive.

All the sailors are drawn up on deck, awaiting orders, and Boatswain Effrondat is making preparations to anchor.

Ere a couple of hours have passed I shall know all about it. It will be the first answer to one of the many
questions that have perplexed me since the schooner put to sea.

And yet it is most unlikely that the port to which the Ebba belongs is situated on one of the Bermuda islands, in
the middle of an English archipelago—unless the Count d’Artigas has kidnapped Thomas Roch for the British
government, which I cannot believe.

I become aware that this extraordinary man is gazing at me with singular persistence. Although he can have no
suspicion that I am Simon Hart, the engineer, he must be asking himself what I think of this adventure. If Warder
Gaydon is but a poor devil, this poor devil will manifest as much unconcern as to what is in store for him as any
gentleman could—even though he were the proprietor of this queer pleasure yacht. Still I am a little uneasy under his
gaze.

I dare say that if the Count d’Artigas could guess how certain things have suddenly become clear to me, he
would not hesitate to have me thrown overboard.

Prudence therefore commands me to be more circumspect than ever.

Without giving rise to any suspicion—even in the mind of Engineer Serko—I have succeeded in raising a corner
of the mysterious veil, and I begin to see ahead a bit.

As the Ebba draws nearer, the island, or rather islet, towards which she is speeding shows more sharply against
the blue background of the sky. The sun which has passed the zenith, shines full upon the western side. The islet is
isolated, or at any rate I cannot see any others of the group to which it belongs, either to north or south.

This islet, of curious contexture, resembles as near as possible a cup turned upside down, from which a
fuliginous vapor arises. Its summit—the bottom of the cup, if you like—is about three hundred feet above the level of
the sea, and its flanks, which are steep and regular, are as bare as the sea-washed rocks at its base.

There is another peculiarity about it which must render the islet easily recognizable by mariners approaching it
from the west, and this is a rock which forms a natural arch at the base of the mountain—the handle of the cup, so to
speak—and through which the waves wash as freely as the sunshine passes. Seen this way the islet fully justifies the
name of Back Cup given to it.

Well, I know and recognize this islet! It is situated at the extremity of the archipelago of the Bermudas. It is the
"reversed cup" that I had occasion to visit a few years ago--No, I am not mistaken. I then climbed over the calcareous and crooked rocks at its base on the east side. Yes, it is Back Cup, sure enough!

Had I been less self-possessed I might have uttered an exclamation of surprise--and satisfaction--which, with good reason, would have excited the attention and suspicion of the Count d'Artigas.

These are the circumstances under which I came to explore Back Cup while on a visit to Bermuda.

This archipelago, which is situated about seven hundred and fifty miles from North Carolina is composed of several hundred islands or islets. Its centre is crossed by the sixty-fourth meridian and the thirty-second parallel. Since the Englishman Lomer was shipwrecked and cast up there in 1609, the Bermudas have belonged to the United Kingdom, and in consequence the colonial population has increased to ten thousand inhabitants. It was not for its productions of cotton, coffee, indigo, and arrowroot that England annexed the group--seized it, one might say; but because it formed a splendid maritime station in that part of the Ocean, and in proximity to the United States of America. Possession was taken of it without any protest on the part of other powers, and Bermuda is now administered by a British governor with the addition of a council and a General Assembly.

The principal islands of the archipelago are called St. David, Somerset, Hamilton, and St. George. The latter has a free port, and the town of the same name is also the capital of the group.

The largest of these isles is not more than seventeen miles long and five wide. Leaving out the medium-sized ones, there remains but an agglomeration of islets and reefs scattered over an area of twelve square leagues.

Although the climate of Bermuda is very healthy, very salubrious, the isles are nevertheless frightfully beaten by the heavy winter tempests of the Atlantic, and their approach by navigators presents certain difficulties.

What the archipelago especially lacks are rivers and rios. However, as abundant rains fall frequently, this drawback is got over by the inhabitants, who treasure up the heaven-sent water for household and agricultural purposes. This has necessitated the construction of vast cisterns which the downfalls keep filled. These works of engineering skill justly merit the admiration they receive and do honor to the genius of man.

It was in connection with the setting up of these cisterns that I made the trip, as well as out of curiosity to inspect the fine works.

I obtained from the company of which I was the engineer in New Jersey a vacation of several weeks, and embarked at New York for the Bermudas.

While I was staying on Hamilton Island, in the vast port of Southampton, an event occurred of great interest to geologists.

One day a whole flotilla of fishers, men, women and children, entered Southampton Harbor. For fifty years these families had lived on the east coast of Back Cup, where they had erected log-cabins and houses of stone. Their position for carrying on their industry was an exceptionally favorable one, for the waters teem with fish all the year round, and in March and April whales abound.

Nothing had hitherto occurred to disturb their tranquil existence. They were quite contented with their rough lot, which was rendered less onerous by the facility of communication with Hamilton and St. George. Their solid barks took cargoes of fish there, which they exchanged for the necessities of life.

Why had they thus abandoned the islet with the intention, as it pretty soon appeared, of never returning to it? The reason turned out to be that they no longer considered themselves in safety there.

A couple of months previously they had been at first surprised, then alarmed, by several distinct detonations that appeared to have taken place in the interior of the mountain. At the same time smoke and flames issued from the summit--or the bottom of the reversed cup, if you like. Now no one had ever suspected that the islet was of volcanic origin, or that there was a crater at the top, no one having been able to climb its sides. Now, however, there could be no possible doubt that the mountain was an ancient volcano that had suddenly become active again and threatened the village with destruction.

During the ensuing two months internal rumblings and explosions continued to be heard, which were accompanied by bursts of flame from the top--especially at night. The island was shaken by the explosions--the shocks could be distinctly felt. All these phenomena were indicative of an imminent eruption, and there was no spot at the base of the mountain that could afford any protection from the rivers of lava that would inevitably pour down its smooth, steep slopes and overwhelm the village in their boiling flood. Besides, the very mountain might be destroyed in the eruption.

There was nothing for the population exposed to such a dire catastrophe to do but leave. This they did. Their humble Lares and Penates, in fact all their belongings, were loaded into the fishing-smacks, and the entire colony sought refuge in Southampton Harbor.

The news that a volcano, that had presumably been smouldering for centuries at the western extremity of the group, showed signs of breaking out again, caused a sensation throughout the Bermudas. But while some were terrified, the curiosity of others was aroused, mine included. The phenomenon was worth investigation, even if the
simple fisher-folk had exaggerated.

Back Cup, which, as already stated, lies at the western extremity of the archipelago, is connected therewith by a chain of small islets and reefs, which cannot be approached from the east. Being only three hundred feet in altitude, it cannot be seen either from St. George or Hamilton. I joined a party of explorers and we embarked in a cutter that landed us on the island, and made our way to the abandoned village of the Bermudan fishers.

The internal crackings and detonations could be plainly heard, and a sheaf of smoke was swayed by the wind at the summit.

Beyond a peradventure the ancient volcano had been started again by the subterranean fire, and an eruption at any moment was to be apprehended.

In vain we attempted to climb to the mouth of the crater. The mountain sheered down at an angle of from seventy-five to eighty degrees, and its smooth, slippery sides afforded absolutely no foothold. Anything more barren than this rocky freak of nature it would be difficult to conceive. Only a few tufts of wild herbs were to be seen upon the whole island, and these seemed to have no raison d'être.

Our explorations were therefore necessarily limited, and in view of the active symptoms of danger that manifested themselves, we could but approve the action of the villagers in abandoning the place; for we entertained no doubt that its destruction was imminent.

These were the circumstances in which I was led to visit Back Cup, and no one will consequently be surprised at the fact that I recognized it immediately we hove in sight of the queer structure.

No, I repeat, the Count d'Artigas would probably not be overpleased if he were aware that Warder Gaydon is perfectly acquainted with this islet, even if the Ebba was to anchor there—which, as there is no port, is, to say the least, extremely improbable.

As we draw nearer, I attentively examine Back Cup. Not one of its former inhabitants has been induced to return, and, as it is absolutely deserted, I cannot imagine why the schooner should visit the place.

Perhaps, however, the Count d'Artigas and his companions have no intention of landing there. Even though the Ebba should find temporary shelter between the rocky sides of a narrow creek there is nothing to give ground to the supposition that a wealthy yachtsman would have the remotest idea of fixing upon as his residence an arid cone exposed to all the terrible tempests of the Western Atlantic. To live hero is all very well for rustic fishermen, but not for the Count d'Artigas, Engineer Serko, Captain Spade and his crew.

Back Cup is now only half a mile off, and the seaweed thrown up on its rocky base is plainly discernible. The only living things upon it are the sea-gulls and other birds that circle in clouds around the smoking crater.

When she is only two cable's lengths off, the schooner slackens speed, and then stops at the entrance of a sort of natural canal formed by a couple of reefs that barely rise above the water.

I wonder whether the Ebba will venture to try the dangerous feat of passing through it. I do not think so. She will probably lay where she is--though why she should do so I do not know--for a few hours, and then continue her voyage towards the east.

However this may be I see no preparations in progress for dropping anchor. The anchors are suspended in their usual places, the cables have not been cleared, and no motion has been made to lower a single boat.

At this moment Count d'Artigas, Engineer Serko and Captain Spade go forward and perform some manoeuvre that is inexplicable to me.

I walk along the port side of the deck until I am near the foremast, and then I can see a small buoy that the sailors are hoisting in. Almost immediately the water, at the same spot becomes dark and I observe a black mass rising to the surface. Is it a big whale rising for air, and is the Ebba in danger of being shattered by a blow from the monster's tail?

Now I understand! At last the mystery is solved. I know what was the motor that caused the schooner to go at such an extraordinary speed without sails and without a screw. Her indefatigable motor is emerging from the sea, after having towed her from the coast of America to the archipelago of the Bermudas. There it is, floating alongside—a submersible boat, a submarine tug, worked by a screw set in motion by the current from a battery of accumulators or powerful electric piles.

On the upper part of the long cigar-shaped iron tug is a platform in the middle of which is the "lid" by which an entrance is effected. In the fore part of the platform projects a periscope, or lookout, formed by port-holes or lenses through which an electric searchlight can throw its gleam for some distance under water in front of and on each side of the tug. Now relieved of its ballast of water the boat has risen to the surface. Its lid will open and fresh air will penetrate it to every part. In all probability, if it remained submerged during the day it rose at night and towed the Ebba on the surface.

But if the mechanical power of the tug is produced by electricity the latter must be furnished by some manufactory where it is stored, and the means of procuring the batteries is not to be found on Back Cup, I suppose.
And then, why does the Ebba have recourse to this submarine towing system? Why is she not provided with her own means of propulsion, like other pleasure-boats?

These are things, however, upon which I have at present no leisure to ruminate.

The lid of the tug opens and several men issue on to the platform. They are the crew of this submarine boat, and Captain Spade has been able to communicate with them and transmit his orders as to the direction to be taken by means of electric signals connected with the tug by a wire that passes along the stem of the schooner.

Engineer Serko approaches me and says, pointing to the boat:

"Get in."

"Get in!" I exclaim.

"Yes, in the tug, and look sharp about it."

As usual there is nothing for it but to obey. I hasten to comply with the order and clamber over the side.

At the same time Thomas Roch appears on deck accompanied by one of the crew. He appears to be very calm, and very indifferent too, and makes no resistance when he is lifted over and lowered into the tug. When he has been taken in, Count d'Artigas and Engineer Serko follow.

Captain Spade and the crew of the Ebba remain behind, with the exception of four men who man the dinghy, which has been lowered. They have hold of a long hawser, with which the schooner is probably to be towed through the reef. Is there then a creek in the middle of the rocks where the vessel is secure from the breakers? Is this the port to which she belongs?

They row off with the hawser and make the end fast to a ring in the reef. Then the crew on board haul on it and in five minutes the schooner is so completely lost to sight among the rocks that even the tip of her mast could not be seen from the sea.

Who in Bermuda imagines that a vessel is accustomed to lay up in this secret creek? Who in America would have any idea that the rich yachtsman so well known in all the eastern ports abides in the solitude of Back Cup mountain?

Twenty minutes later the dinghy returns with the four men towards the tug which was evidently waiting for them before proceeding--where?

They climb on board, the little boat is made fast astern, a movement is felt, the screw revolves rapidly and the tug skims along the surface to Back Cup, skirting the reefs to the south.

Three cable's lengths further on, another tortuous canal is seen that leads to the island. Into this the tug enters. When it gets close inshore, an order is given to two men who jump out and haul the dinghy up on a narrow sandy beach out of the reach of wave or weed, and where it will be easily get-at-able when wanted.

This done the sailors return to the tug and Engineer Serko signs to me to go below.

A short iron ladder leads into a central cabin where various bales and packages are stored, and for which no doubt there was not room in the hold of the schooner. I am pushed into a side cabin, the door is shut upon me, and here I am once more a prisoner in profound darkness.

I recognize the cabin the moment I enter it. It is the place in which I spent so many long hours after our abduction from Healthful House, and in which I was confined until well out at sea off Pamlico Sound.

It is evident that Thomas Roch has been placed in a similar compartment.

A loud noise is heard, the banging of the lid as it closes, and the tug begins to sink as the water is admitted to the tanks.

This movement is succeeded by another--a movement that impels the boat through the water.

Three minutes later it stops, and I feel that we are rising to the surface again.

Another noise made by the lid being raised.

The door of my cabin opens, and I rush out and clamber on to the platform.

I look around and find that the tug has penetrated to the interior of Back Cup mountain.

This is the mysterious retreat where Count d'Artigas lives with his companions--out of the world, so to speak.

CHAPTER IX.
INSIDE BACK CUP.

The next morning I am able to make a first inspection of the vast cavern of Back Cup. No one seeks to prevent me.

What a night I have passed! What strange visions I have seen! With what impatience I waited for morning!

I was conducted to a grotto about a hundred paces from the edge of the lake where the tug stopped. The grotto, twelve feet by ten, was lighted by an incandescent lamp, and fitted with an entrance door that was closed upon me.

I am not surprised that electricity is employed in lighting the interior of the cavern, as it is also used in the
submarine boat. But where is it generated? Where does it come from? Is there a manufactory installed somewhere or
other in this vast crypt, with machinery, dynamos and accumulators?

My cell is neatly furnished with a table on which provisions are spread, a bunk with bedding, a basket chair, a
wash-hand-stand with toilet set, and a closet containing linen and various suits of clothes. In a drawer of the table I
find paper, ink and pens.

My dinner consists of fresh fish, preserved meat, bread of excellent quality, ale and whisky; but I am so excited
that I scarcely touch it. Yet I feel that I ought to fortify myself and recover my calmness of mind. I must and will
solve the mystery surrounding the handful of men who burrow in the bowels of this island.

So it is under the carapace of Back Cup that Count d'Artigas has established himself! This cavity, the existence
of which is not even suspected, is his home when he is not sailing in the Ebba along the coasts of the new world or
the old. This is the unknown retreat he has discovered, to which access is obtained by a submarine passage twelve or
fifteen feet below the surface of the ocean.

Why has he severed himself from the world? What has been his past? If, as I suspect, this name of d'Artigas and
this title of Count are assumed, what motive has he for hiding his identity? Has he been banished, is he an outcast of
society that he should have selected this place above all others? Am I not in the power of an evildoer anxious to
ensure impunity for his crimes and to defy the law by seeking refuge in this undiscoverable burrow? I have the right
of supposing anything in the case of this suspicious foreigner, and I exercise it.

Then the question to which I have never been able to suggest a satisfactory answer once more surges into my
mind. Why was Thomas Roch abducted from Healthful House in the manner already fully described? Does the
Count d'Artigas hope to force from him the secret of his fulgurator with a view to utilizing it for the defence of Back
Cup in case his retreat should by chance be discovered? Hardly. It would be easy enough to starve the gang out of
Back Cup, by preventing the tug from supplying them with provisions. On the other hand, the schooner could never
break through the investing lines, and if she did her description would be known in every port. In this event, of what
possible use would Thomas Roch's invention be to the Count d'Artigas Decidedly, I cannot understand it!

About seven o'clock in the morning I jump out of bed. If I am a prisoner in the cavern I am at least not
imprisoned in my grotto cell. The door yields when I turn the handle and push against it, and I walk out.

Thirty yards in front of me is a rocky plane, forming a sort of quay that extends to right and left. Several sailors
of the Ebba are engaged in landing bales and stores from the interior of the tug, which lays alongside a little stone
jetty.

A dim light to which my eyes soon grow accustomed envelops the cavern and comes from a hole in the centre of
the roof, through which the blue sky can be seen.

"It is from that hole that the smoke which can be seen for such a distance issues," I say to myself, and this
discovery suggests a whole series of reflections.

Back Cup, then, is not a volcano, as was supposed—as I supposed myself. The flames that were seen a few years
ago, and the columns of smoke that still rise were and are produced artificially. The detonations and rumblings that
so alarmed the Bermudan fishers were not caused by the internal workings of nature. These various phenomena
were fictitious. They manifested themselves at the mere will of the owner of the island, who wanted to scare away
the inhabitants who resided on the coast. He succeeded, this Count d'Artigas, and remains the sole and undisputed
monarch of the mountain. By exploding gunpowder, and burning seaweed swept up in inexhaustible quantities by
the ocean, he has been able to simulate a volcano upon the point of eruption and effectually scare away!

The light becomes stronger as the sun rises higher, the daylight streams through the fictitious crater, and I shall
soon be able to estimate the cavern's dimensions. This is how I calculate:

Exteriorly the island of Back Cup, which is as nearly as possible circular, measures two hundred and fifty yards
in circumference, and presents an interior superficies of about six acres. The sides of the mountain at its base vary in
thickness from thirty to a hundred yards.

It therefore follows that this excavation practically occupies the whole of that part of Back Cup island which
appears above water. As to the length of the submarine tunnel by which communication is obtained with the outside,
and through which the tug passed, I estimate that it is fifty yards in length.

The size of the cavern can be judged from these approximate figures. But vast as it is, I remember that there are
caverns of larger dimensions both in the old and new worlds. For instance in Carniole, Northumberland, Derbyshire,
Piedmont, the Balearics, Hungary and California are larger grottoes than Back Cup, and those at Han-sur-Lesse in
Belgium, and the Mammoth Caves in Kentucky, are also more extensive. The latter contain no fewer than two
hundred and twenty-six domes, seven rivers, eight cataracts, thirty two wells of unknown depth, and an immense
lake which extends over six or seven leagues, the limit of which has never been reached by explorers.

I know these Kentucky grottoes, having visited them, as many thousands of tourists have done. The principal
one will serve as a comparison to Back Cup. The roof of the former, like that of the latter, is supported by pillars of various lengths, which give it the appearance of a Gothic cathedral, with naves and aisles, though it lacks the architectural regularity of a religious edifice. The only difference is that whereas the roof of the Kentucky grotto is over four hundred feet high, that of Back Cup is not above two hundred and twenty at that part of it where the round hole through which issue the smoke and flames is situated.

Another peculiarity, and a very important one, that requires to be pointed out, is that whereas the majority of the grottoes referred to are easily accessible, and were therefore bound to be discovered some time or other, the same remark does not apply to Back Cup. Although it is marked on the map as an island forming part of the Bermuda group, how could any one imagine that it is hollow, that its rocky sides are only the walls of an enormous cavern? In order to make such a discovery it would be necessary to get inside, and to get inside a submarine apparatus similar to that of the Count d'Artigas would be necessary.

In my opinion this strange yachtsman's discovery of the tunnel by which he has been able to found this disquieting colony of Back Cup must have been due to pure chance.

Now I turn my attention to the lake and observe that it is a very small one, measuring not more than four hundred yards in circumference. It is, properly speaking, a lagoon, the rocky sides of which are perpendicular. It is large enough for the tug to work about in it, and holds enough water too, for it must be one hundred and twenty-five feet deep.

It goes without saying that this crypt, given its position and structure, belongs to the category of those which are due to the encroachments of the sea. It is at once of Neptunian and Plutonian origin, like the grottoes of Crozon and Morgate in the bay of Douarnenez in France, of Bonifacio on the Corsican coast, Thorogatten in Norway, the height of which is estimated at over three hundred feet, the catavauls of Greece, the grottoes of Gibraltar in Spain, and Tourana in Cochin China, whose carapace indicates that they are all the product of this dual geological labor.

The islet of Back Cup is in great part formed of calcareous rocks, which slope upwards gently from the lagoon towards the sides and are separated from each other by narrow beaches of fine sand. Thick layers of seaweed that have been swept through the tunnel by the tide and thrown up around the lake have been piled into heaps, some of which are dry and some still wet, but all of which exhale the strong odor of the briny ocean. This, however, is not the only combustible employed by the inhabitants of Back Cup, for I see an enormous store of coal that must have been brought by the schooner and the tug. But it is the incineration of masses of dried seaweed that causes the smoke vomited forth by the crater of the mountain.

Continuing my walk I perceive on the northern side of the lagoon the habitations of this colony of troglodytes--do they not merit the appellation? This part of the cavern, which is known as the Beehive, fully justifies its name, for it is honeycombed by cells excavated in the limestone rock and in which these human bees--or perhaps they should rather be called wasps--reside.

The lay of the cavern to the east is very different. Here hundreds of pillars of all shapes rise to the dome, and form a veritable forest of stone trees through the sinuous avenues of which one can thread one's way to the extreme limit of the place.

By counting the cells of the Beehive I calculate that Count d'Artigas' companions number from eighty to one hundred.

As my eye wanders over the place I notice that the Count is standing in front of one of the cells, which is isolated from the others, and talking to Engineer Serko and Captain Spade. After a while they stroll down to the jetty alongside which the tug is lying.

A dozen men have been emptying the merchandise out of the tug and transporting the goods in boats to the other side, where great cellars have been excavated in the rocks and form the storehouses of the band.

The orifice of the tunnel is not visible in the waters of the lagoon, and I remember that when I was brought here I felt the tug sink several feet before it entered. In this respect therefore Back Cup does not resemble either the grottoes of Staffa or Morgate, entrance to which is always open, even at high tide. There may be another passage communicating with the coast, either natural or artificial, and this I shall have to make my business to find out.

The island well merits its name of Back Cup. It is indeed a gigantic cup turned upside down, not only to outward appearance, but inwardly, too, though people are ignorant of the fact. I have already remarked that the Beehive is situated to the north of the lagoon, that is to say to the left on entering by the tunnel. On the opposite side are the storerooms filled with provisions of all kinds, bales of merchandise, barrels of wine, beer, and spirits and various packets bearing different marks and labels that show that they came from all parts of the world. One would think that the cargoes of a score of ships had been landed here.

A little farther on is a large wooden shed the nature of which is easily distinguishable. From a pole above it a network of thick copper wires extends which conducts the current to the powerful electric lights suspended from the roof or dome, and to the incandescent lamps in each of the cells of the hive. A large number of lamps are also
installed among the stone pillars and light up the avenues to their extremities.

"Shall I be permitted to roam about wherever I please?" I ask myself. I hope so. I cannot for the life of me see why the Count d'Artigas should prohibit me from doing so, for I cannot get farther than the surrounding walls of his mysterious domain. I question whether there is any other issue than the tunnel, and how on earth could I get through that?

Besides, admitting that I am able to get through it, I cannot get off the island. My disappearance would be soon noticed, and the tug would take out a dozen men who would explore every nook and cranny. I should inevitably be recaptured, brought back to the Beehive, and deprived of my liberty for good.

I must therefore give up all idea of making my escape, unless I can see that it has some chance of being successful, and if ever an opportunity does present itself I shall not be slow to take advantage of it.

On strolling round by the rows of cells I am able to observe a few of these companions of the Count d'Artigas who are content to pass their monotonous existence in the depths of Back Cup. As I said before, calculating from the number of cells in the Beehive, there must be between eighty and a hundred of them.

They pay no attention whatever to me as I pass, and on examining them closely it seems to me that they must have been recruited from every country. I do not distinguish any community of origin among them, not even a similarity by which they might be classed as North Americans, Europeans or Asiatics. The color of their skin shades from white to yellow and black--the black peculiar to Australia rather than to Africa. To sum up, they appear for the most part to pertain to the Malay races. I may add that the Count d'Artigas certainly belongs to that particular race which peoples the Dutch isles in the West Pacific, while Engineer Serko must be Levantine and Captain Spade of Italian origin.

But if the inhabitants of Back Cup are not bound to each other by ties of race, they certainly are by instinct and inclination. What forbidding, savage-looking faces they have, to be sure! They are men of violent character who have probably never placed any restraint upon their passions, nor hesitated at anything, and it occurs to me that in all likelihood they have sought refuge in this cavern, where they fancy they can continue to defy the law with impunity, after a long series of crimes--robbery, murder, arson, and excesses of all descriptions committed together. In this case Back Cup is nothing but a lair of pirates, the Count d'Artigas is the leader of the band and Serko and Spade are his lieutenants.

I cannot get this idea out of my head, and the more I consider the more convinced I am that I am right, especially as everything I see during my stroll about the cavern seems to confirm my opinion.

However this may be, and whatever may be the circumstances that have brought them together in this place, Count d'Artigas' companions appear to accept his all-powerful domination without question. On the other hand, if he keeps them under his iron heel by enforcing the severest discipline, certain advantages, some compensation, must accrue from the servitude to which they bow. What can this compensation be?

Having turned that part of the bank under which the tunnel passes, I find myself on the opposite side of the lagoon, where are situated the storerooms containing the merchandise brought by the Ebba on each trip, and which contain a great quantity of bales.

Beyond is the manufactory of electric energy. I gaze in at the windows as I pass and notice that it contains machines of the latest invention and highest attained perfection, which take up little space. Not one steam engine, with its more or less complicated mechanism and need of fuel, is to be seen in the place. As I had surmised, piles of extraordinary power supply the current to the lamps in the cavern, as well as to the dynamos of the tug. No doubt the current is also utilized for domestic purposes, such as warming the Beehive and cooking food, I can see that in a neighboring cavity it is applied to the alembics used to produce fresh water. At any rate the colonists of Back Cup are not reduced to catching the rain water that falls so abundantly upon the exterior of the mountain.

A few paces from the electric power house is a large cistern that, save in the matter of proportions, is the counterpart of those I visited in Bermuda. In the latter place the cisterns have to supply the needs of over ten thousand people, this one of a hundred--what?

I am not sure yet what to call them. That their chief had serious reasons for choosing the bowels of this island for his abiding place is obvious. But what were those reasons? I can understand monks shutting themselves behind their monastery walls with the intention of separating themselves from the world, but these subjects of the Count d'Artigas have nothing of the monk about them, and would not be mistaken for such by the most simple-minded of mortals.

I continue my way through the pillars to the extremity of the cavern. No one has sought to stop me, no one has spoken to me, not a soul apparently has taken the very slightest notice of me. This portion of Back Cup is extremely curious, and comparable to the most marvellous of the grottoes of Kentucky or the Balears. I need hardly say that nowhere is the labor of man apparent. All this is the handiwork of nature, and it is not without wonder, mingled with awe, that I reflect upon the telluric forces capable of engendering such prodigious substructions. The daylight from
the crater in the centre only strikes this part of the cavern obliquely, so that it is very imperfectly lighted, but at night, when illuminated by the electric lamps, its aspect must be positively fantastic.

I have examined the walls everywhere with minute attention, but have been unable to discover any means of communicating with the outside.

Quite a colony of birds—gulls, sea-swallows and other feathery denizens of the Bermudan beaches have made their home in the cavern. They have apparently never been hunted, for they are in no way disturbed by the presence of man.

But besides sea-birds, which are free to come and go as they please by the orifice in the dome, there is a whole farmyard of domestic poultry, and cows and pigs. The food supply is therefore no less assured than it is varied, when the fish of all kinds that abound in the lagoon and around the island are taken into consideration.

Moreover, a mere glance at the colonists of Back Cup amply suffices to show that they are not accustomed to fare scantily. They are all vigorous, robust seafaring men, weatherbeaten and seasoned in the burning beat of tropical latitudes, whose rich blood is surcharged with oxygen by the breezes of the ocean. There is not a youth nor an old man among them. They are all in their prime, their ages ranging from thirty to fifty.

But why do they submit to such an existence? Do they never leave their rocky retreat?

Perhaps I shall find out ere I am much older.

CHAPTER X.
KER KARRAJE.

The cell in which I reside is about a hundred paces from the habitation of the Count d'Artigas, which is one of the end ones of this row of the Beehive. If I am not to share it with Thomas Roch, I presume the latter's cell is not far off, for in order that Warder Gaydon may continue to care for the ex-patient of Healthful House, their respective apartments will have to be contiguous. However, I suppose I shall soon be enlightened on this point.

Captain Spade and Engineer Serko reside separately in proximity to D'Artigas' mansion.

Mansion? Yes, why not dignify it with the title since this habitation has been arranged with a certain art? Skillful hands have carved an ornamental façade in the rock. A large door affords access to it. Colored glass windows in wooden frames let into the limestone walls admit the light. The interior comprises several chambers, a dining-room and a drawing-room lighted by a stained-glass window, the whole being perfectly ventilated. The furniture is of various styles and shapes and of French, English and American make. The kitchen, larder, etc., are in adjoining cells in rear of the Beehive.

In the afternoon, just as I issue from my cell with the firm intention of "obtaining an audience" of the Count d'Artigas, I catch sight of him coming along the shore of the lagoon towards the hive. Either he does not see me, or wishes to avoid me, for he quickens his steps and I am unable to catch him.

"Well, he will have to receive me, anyhow!" I mutter to myself.

I hurry up to the door through which he has just disappeared and which has closed behind him.

It is guarded by a gigantic, dark-skinned Malay, who orders me away in no amiable tone of voice.

I decline to comply with his injunction, and repeat to him twice the following request in my very best English:

"Tell the Count d'Artigas that I desire to be received immediately."

I might just as well have addressed myself to the surrounding rock. This savage, no doubt, does not understand a word of English, for he scowls at me and orders me away again with a menacing cry.

I have a good mind to attempt to force the door and shout so that the Count d'Artigas cannot fail to hear me, but in all probability I shall only succeed in rousing the wrath of the Malay, who appears to be endowed with herculean strength. I therefore judge discretion to be the better part of valor, and put off the explanation that is owing to me—and which, sooner or later, I will have—to a more propitious occasion.

I meander off in front of the Beehive towards the east, and my thoughts revert to Thomas Roch. I am surprised that I have not seen him yet. Can he be in the throes of a fresh paroxysm?

This hypothesis is hardly admissible, for if the Count d'Artigas is to be believed, he would in this event have summoned me to attend to the inventor.

A little farther on I encounter Engineer Serko.

With his inviting manner and usual good-humor this ironical individual smiles when he perceives me, and does not seek to avoid me. If he knew I was a colleague, an engineer—providing he himself really is one—perhaps he might receive me with more cordiality than I have yet encountered, but I am not going to be such a fool as to tell him who and what I am.

He stops, with laughing eyes and mocking mouth, and accompanies a "Good day, how do you do?" with a gracious gesture of salutation.
I respond coldly to his politeness—a fact which he affects not to notice.

"May Saint Jonathan protect you, Mr. Gaydon!" he continues in his clear, ringing voice. "You are not, I presume, disposed to regret the fortunate circumstance by which you were permitted to visit this surpassingly marvellous cavern—and it really is one of the finest, although the least known on this spheroid."

This word of a scientific language used in conversation with a simple hospital attendant surprises me, I admit, and I merely reply:

"I should have no reason to complain, Mr. Serko, if, after having had the pleasure of visiting this cavern, I were at liberty to quit it."

"What! Already thinking of leaving us, Mr. Gaydon,—of returning to your dismal pavilion at Healthful House? Why, you have scarcely had time to explore our magnificent domain, or to admire the incomparable beauty with which nature has endowed it."

"What I have seen suffices," I answer; "and should you perchance be talking seriously I will assure you seriously that I do not want to see any more of it."

"Come, now, Mr. Gaydon, permit me to point out that you have not yet had the opportunity of appreciating the advantages of an existence passed in such unrivalled surroundings. It is a quiet life, exempt from care, with an assured future, material conditions such as are not to be met with anywhere, an even climate and no more to fear from the tempests which desolate the coasts in this part of the Atlantic than from the cold of winter, or the heat of summer. This temperate and salubrious atmosphere is scarcely affected by changes of season. Here we have no need to apprehend the wrath of either Pluto or Neptune."

"Sir," I reply, "it is impossible that this climate can suit you, that you can appreciate living in this grotto of----"

I was on the point of pronouncing the name of Back Cup. Fortunately I restrained myself in time. What would happen if they suspected that I am aware of the name of their island, and, consequently, of its position at the extremity of the Bermuda group?

"However," I continue, "if this climate does not suit me, I have, I presume, the right to make a change."

"The right, of course."

"I understand from your remark that I shall be furnished with the means of returning to America when I want to go?"

"I have no reason for opposing your desires, Mr. Gaydon," Engineer Serko replies, "and I regard your presumption as a very natural one. Observe, however, that we live here in a noble and superb independence, that we acknowledge the authority of no foreign power, that we are subject to no outside authority, that we are the colonists of no state, either of the old or new world. This is worth consideration by whomsoever has a sense of pride and independence. Besides, what memories are evoked in a cultivated mind by these grottoes which seem to have been chiselled by the hands of the gods and in which they were wont to render their oracles by the mouth of Trophonius."

Decidedly, Engineer Serko is fond of citing mythology! Trophonius after Pluto and Neptune? Does he imagine that Warder Gaydon ever heard of Trophonius? It is clear this mocker continues to mock, and I have to exercise the greatest patience in order not to reply in the same tone.

"A moment ago," I continue shortly, "I wanted to enter yon habitation, which, if I mistake not, is that of the Count d'Artigas, but I was prevented."

"By whom, Mr. Gaydon?"

"By a man in the Count's employ."

"He probably had received strict orders about it."

"Possibly, yet whether he likes it or not, Count d'Artigas will have to see me and listen to me."

"Maybe it would be difficult, and even impossible to get him to do so," says Engineer Serko with a smile.

"Why so?"

"Because there is no such person as Count d'Artigas here."

"You are jesting, I presume; I have just seen him."

"It was not the Count d'Artigas whom you saw, Mr. Gaydon."

"Who was it then, may I ask?"

"The pirate Ker Karraje."

This name was thrown at me in a hard tone of voice, and Engineer Serko walked off before I had presence of mind enough to detain him.

The pirate Ker Karraje!

Yes, this name is a revelation to me. I know it well, and what memories it evokes! It by itself explains what has hitherto been inexplicable to me. I now know into whose hands I have fallen.

With what I already knew, with what I have learned since my arrival in Back Cup from Engineer Serko, this is what I am able to tell about the past and present of Ker Karraje:
Eight or nine years ago, the West Pacific was infested by pirates who acted with the greatest audacity. A band of criminals of various origins, composed of escaped convicts, military and naval deserters, etc., operated with incredible audacity under the orders of a redoubtable chief. The nucleus of the band had been formed by men pertaining to the scum of Europe who had been attracted to New South Wales, in Australia, by the discovery of gold there. Among these gold-diggers, were Captain Spade and Engineer Serko, two outcasts, whom a certain community of ideas and character soon bound together in close friendship.

These intelligent, well educated, resolute men would most assuredly have succeeded in any career. But being without conscience or scruples, and determined to get rich at no matter what cost, deriving from gambling and speculation what they might have earned by patient and steady work, they engaged in all sorts of impossible adventures. One day they were rich, the next day poor, like most of the questionable individuals who had hurried to the gold-fields in search of fortune.

Among the diggers in New South Wales was a man of incomparable audacity, one of those men who stick at nothing—not even at crime—and whose influence upon bad and violent natures is irresistible.

That man's name was Ker Karraje.

The origin or nationality or antecedents of this pirate were never established by the investigations ordered in regard to him. He eluded all pursuit, and his name—or at least the name he gave himself—was known all over the world, and inspired horror and terror everywhere, as being that of a legendary personage, a bogey, invisible and unseizable.

I have now reason to believe that Ker Karraje is a Malay. However, it is of little consequence, after all. What is certain is that he was with reason regarded as a formidable and dangerous villain who had many crimes, committed in distant seas, to answer for.

After spending a few years on the Australian goldfields, where he made the acquaintance of Engineer Serko and Captain Spade, Ker Karraje managed to seize a ship in the port of Melbourne, in the province of Victoria. He was joined by about thirty rascals whose number was speedily tripled. In that part of the Pacific Ocean where piracy is still carried on with great facility, and I may say, profit, the number of ships pillaged, crews massacred, and raids committed in certain western islands which the colonists were unable to defend, cannot be estimated.

Although the whereabouts of Ker Karraje's vessel, commanded by Captain Spade, was several times made known to the authorities, all attempts to capture it proved futile. The marauder would disappear among the innumerable islands of which he knew every cove and creek, and it was impossible to come across him.

He maintained a perfect reign of terror. England, France, Germany, Russia and America vainly dispatched warships in pursuit of the phantom vessel which disappeared, no one knew whither, after robberies and murders that could not be prevented or punished had been committed by her crew.

One day this series of crimes came to an end, and no more was heard of Ker Karraje. Had he abandoned the Pacific for other seas? Would this pirate break out in a fresh place? It was argued that notwithstanding what they must have spent in orgies and debauchery the pirate and his companions must still have an enormous amount of wealth hidden in some place known only to themselves, and that they were enjoying their ill-gotten gains.

Where had the band hidden themselves since they had ceased their depredations? This was a question which everybody asked and none was able to answer. All attempts to run them to earth were vain. Terror and uneasiness having ceased with the danger, Ker Karraje's exploits soon began to be forgotten, even in the West Pacific.

This is what had happened—and what will never be known unless I succeed in escaping from Back Cup: These wretches were, as a matter of fact, possessed of great wealth when they abandoned the Southern Seas. Having destroyed their ship they dispersed in different directions after having arranged to meet on the American continent.

Engineer Serko, who was well versed in his profession, and was a clever mechanic to boot, and who had made a special study of submarine craft, proposed to Ker Karraje that they should construct one of these boats in order to continue their criminal exploits with greater secrecy and effectiveness.

Ker Karraje at once saw the practical nature of the proposition, and as they had no lack of money the idea was soon carried out.

While the so-called Count d'Artigas ordered the construction of the schooner Ebba at the shipyards of Gotteborg, in Sweden, he gave to the Cramps of Philadelphia, in America, the plans of a submarine boat whose construction excited no suspicion. Besides, as will be seen, it soon disappeared and was never heard of again.

The boat was constructed from a model and under the personal supervision of Engineer Serko, and fitted with all the known appliances of nautical science. The screw was worked with electric piles of recent invention which imparted enormous propulsive power to the motor.

It goes without saying that no one imagined that Count d'Artigas was none other than Ker Karraje, the former pirate of the Pacific, and that Engineer Serko was the most formidable and resolute of his accomplices. The former
was regarded as a foreigner of noble birth and great fortune, who for several months had been frequenting the ports of the United States, the Ebba having been launched long before the tug was ready.

Work upon the latter occupied fully eighteen months, and when the boat was finished it excited the admiration of all those interested in these engines of submarine navigation. By its external form, its interior arrangements, its air-supply system, the rapidity with which it could be immersed, the facility with which it could be handled and controlled, and its extraordinary speed, it was conceded to be far superior to the Goubet, the Gymnote, the Zede, and other similar boats which had made great strides towards perfection.

After several extremely successful experiments a public test was given in the open sea, four miles off Charleston, in presence of several American and foreign warships, merchant vessels, and pleasure boats invited for the occasion.

Of course the Ebba was among them, with the Count d’Artigas, Engineer Serko, and Captain Spade on board, and the old crew as well, save half a dozen men who manned the submarine machine, which was worked by a mechanical engineer named Gibson, a bold and very clever Englishman.

The programme of this definite experiment comprised various evolutions on the surface of the water, which were to be followed by an immersion to last several hours, the boat being ordered not to rise again until a certain buoy stationed many miles out at sea had been attained.

At the appointed time the lid was closed and the boat at first manoeuvred on the surface. Her speed and the ease with which she turned and twisted were loudly praised by all the technical spectators.

Then at a signal given on board the Ebba the tug sank slowly out of sight, and several vessels started for the buoy where she was to reappear.

Three hours went by, but there was no sign of the boat.

No one could suppose that in accordance with instructions received from the Count d’Artigas and Engineer Serko this submarine machine, which was destined to act as the invisible tug of the schooner, would not emerge till it had gone several miles beyond the rendezvous. Therefore, with the exception of those who were in the secret, no one entertained any doubt that the boat and all inside her had perished as the result of an accident either to her metallic covering or machinery.

On board the Ebba consternation was admirably simulated. On board the other vessels it was real. Drags were used and divers sent down along the course the boat was supposed to have taken, but it could not be found, and it was agreed that it had been swallowed up in the depths of the Atlantic.

Two days later the Count d’Artigas put to sea again, and in forty-eight hours came up with the tug at the place appointed.

This is how Ker Karraje became possessed of the admirable vessel which was to perform the double function of towing the schooner and attacking ships. With this terrible engine of destruction, whose very existence was ignored, the Count d’Artigas was able to recommence his career of piracy with security and impunity.

These details I have learned from Engineer Serko, who is very proud of his handiwork,—and also very positive that the prisoner of Back Cup will never be able to disclose the secret.

It will easily be realized how powerful was the offensive weapon Ker Karraje now possessed. During the night the tug would rush at a merchant vessel, and bore a hole in her with its powerful ram. At the same time the schooner which could not possibly have excited any suspicion, would run alongside and her horde of cutthroats would pour on to the doomed vessel’s deck and massacre the helpless crew, after which they would hurriedly transfer that part of the cargo that was worth taking to the Ebba. Thus it happened that ship after ship was added to the long list of those that never reached port and were classed as having gone down with all on board.

For a year after the odious comedy in the bay of Charleston Ker Karraje operated in the Atlantic, and his wealth increased to enormous proportions. The merchandise for which he had no use was disposed of in distant markets in exchange for gold and silver. But what was sadly needed was a place where the profits could be safely hidden pending the time when they were to be finally divided.

Chance came to their aid. While exploring the bottom of the sea in the neighborhood of the Bermudas, Engineer Serko and Driver Gibson discovered at the base of Back Cup island the tunnel which led to the interior of the mountain. Would it have been possible for Ker Karraje to have found a more admirable refuge than this, absolutely safe as it was from any possible chance of discovery? Thus it came to pass that one of the islands of the Archipelago of Bermuda, erstwhile the haunt of buccaneers, became the lair of another gang a good deal more to be dreaded.

This retreat having been definitely adopted, Count d’Artigas and his companions set about getting their place in order. Engineer Serko installed an electric power house, without having recourse to machines whose construction abroad might have aroused suspicion, simply employing piles that could be easily mounted and required but metal plates and chemical substances that the Ebba procured during her visits to the American coast.

What happened on the night of the 19th inst. can easily be divined. If the three-masted merchantman which lay
becalmed was not visible at break of day it was because she had been scuttled by the tug, boarded by the cut-throat band on the Ebba, and sunk with all on board after being pillaged. The bales and things that I had seen on the schooner were a part of her cargo, and all unknown to me the gallant ship was lying at the bottom of the broad Atlantic!

How will this adventure end? Shall I ever be able to escape from Back Cup, denounce the false Count d'Artigas and rid the seas of Ker Karraje's pirates?

And if Ker Karraje is terrible as it is, how much more so will he become if he ever obtains possession of Roch's fulgurator! His power will be increased a hundred-fold? If he were able to employ this new engine of destruction no merchantman could resist him, no warship escape total destruction.

I remain for some time absorbed and oppressed by the reflections with which the revelation of Ker Karraje's name inspires me. All that I have ever heard about this famous pirate recurs to me--his existence when he skimmed the Southern Seas, the useless expeditions organized by the maritime powers to hunt him down. The unaccountable loss of so many vessels in the Atlantic during the past few years is attributable to him. He had merely changed the scene of his exploits. It was supposed that he had been got rid of, whereas he is continuing his piratical practices in the most frequented ocean on the globe, by means of the tug which is believed to be lying at the bottom of Charleston Bay.

"Now," I say to myself, "I know his real name and that of his lair--Ker Karraje and Back Cup;" and I surmise that if Engineer Serko has let me into the secret he must have been authorized to do so. Am I not meant to understand from this that I must give up all hope of ever recovering my liberty?

Engineer Serko had manifestly remarked the impression created upon me by this revelation. I remember that on leaving me he went towards Ker Karraje's habitation, no doubt with the intention of apprising him of what had passed.

After a rather long walk around the lagoon I am about to return to my cell, when I hear footsteps behind me. I turn and find myself face to face with the Count d'Artigas, who is accompanied by Captain Spade. He glances at me sharply, and in a burst of irritation that I cannot suppress, I exclaim:

"You are keeping me here, sir, against all right. If it was to wait upon Thomas Roch that you carried me off from Healthful House, I refuse to attend to him, and insist upon being sent back."

The pirate chief makes a gesture, but does not reply.

Then my temper gets the better of me altogether.

"Answer me, Count d'Artigas--or rather, for I know who you are--answer me, Ker Karraje!" I shout.

"The Count d'Artigas is Ker Karraje," he coolly replies, "just as Warder Gaydon is Engineer Simon Hart; and Ker Karraje will never restore to liberty Engineer Simon Hart, who knows his secrets."

CHAPTER XI.

FIVE WEEKS IN BACK CUP.

The situation is plain. Ker Karraje knows who I am. He knew who I was when he kidnapped Thomas Roch and his attendant.

How did this man manage to find out what I was able to keep from the staff of Healthful House? How comes it that he knew that a French engineer was performing the duties of attendant to Thomas Roch? I do not know how he discovered it, but the fact remains that he did.

Evidently he had means of information which must have been costly, but from which he has derived considerable profit. Besides, men of his kidney do not count the cost when they wish to attain an end they have in view.

Henceforward Ker Karraje, or rather Engineer Serko, will replace me as attendant upon Thomas Roch. Will he succeed better than I did? God grant that he may not, that the civilized world may be spared such a misfortune!

I did not reply to Ker Karraje's Parthian shot, for I was stricken dumb. I did not, however, collapse, as the alleged Count d'Artigas perhaps expected I would.

No! I looked him straight in the eyes, which glittered angrily, and crossed my arms defiantly, as he had done. And yet he held my life in his hands! At a sign a bullet would have laid me dead at his feet. Then my body, cast into the lagoon, would have been borne out to sea through the tunnel and there would have been an end of me.

After this scene I am left at liberty, just as before. No measure is taken against me, I can walk among the pillars to the very end of the cavern, which--it is only too clear--possesses no other issue except the tunnel.

When I return to my cell, at the extremity of the Beehive, a prey to a thousand thoughts suggested by my situation, I say to myself:

"If Ker Karraje knows I am Simon Hart, the engineer, he must at any rate never know that I am aware of the
position of Back Cup Island."

As to the plan of confiding Thomas Roch to my care, I do not think he ever seriously entertained it, seeing that my identity had been revealed to him. I regret this, inasmuch as the inventor will indubitably be the object of pressing solicitations, and as Engineer Serko will employ every means in his power to obtain the composition of the explosive and deflagrator, of which he will make such detestable use during future piratical exploits. Yes, it would have been far better if I could have remained Thomas Roch's keeper here, as in Healthful House.

For fifteen days I see nothing of my late charge. No one, I repeat, has placed any obstacles in the way of my daily peregrinations. I have no need to occupy myself about the material part of my existence. My meals are brought to me regularly, direct from the kitchen of the Count d'Artigas--I cannot accustom myself to calling him by any other name. The food leaves nothing to be desired, thanks to the provisions that the Ebba brings on her return from each voyage.

It is very fortunate, too, that I have been supplied with all the writing materials I require, for during my long hours of idleness I have been able to jot down in my notebook the slightest incidents that have occurred since I was abducted from Healthful House, and to keep a diary day by day. As long as I am permitted to use a pen I shall continue my notes. Mayhap some day, they will help to clear up the mysteries of Back Cup.

From July 5 to July 25.--A fortnight has passed, and all my attempts to get near Thomas Roch have been frustrated. Orders have evidently been given to keep him away from my influence, inefficacious though the latter has hitherto been. My only hope is that the Count d'Artigas, Engineer Serko, and Captain Spade will waste their time trying to get at the inventor's secrets.

Three or four times to my knowledge, at least, Thomas Roch and Engineer Serko have walked together around the lagoon. As far as I have been able to judge, the former listened with some attention to what the other was saying to him. Serko has conducted him over the whole cavern, shown him the electric power house and the mechanism of the tug. Thomas Roch's mental condition has visibly improved since his departure from Healthful House.

Thomas Roch lives in a private room in Ker Karraje's "mansion." I have no doubt that he is daily sounded in regard to his discoveries, especially by Engineer Serko. Will he be able to resist the temptation if they offer him the exorbitant price that he demands? Has he any idea of the value of money? These wretches may dazzle him with the gold that they have accumulated by years of rapine. In the present state of his mind may he not be induced to disclose the composition of his fulgurator? They would then only have to fetch the necessary substances and Thomas Roch would have plenty of time in Back Cup to devote to his chemical combinations. As to the war-engines themselves nothing would be easier than to have them made in sections in different parts of the American continent. My hair stands on end when I think what they could and would do with them if once they gained possession of them.

These intolerable apprehensions no longer leave me a minute's peace; they are wearing me out and my health is suffering in consequence. Although the air in the interior of Back Cup is pure, I become subject to attacks of suffocation, and I feel as though my prison walls were falling upon me and crushing me under their weight. I am, besides, oppressed by the feeling that I am cut off from the world, as effectually as though I were no longer upon our planet--for I know nothing of what is going on outside.

Ah! if it were only possible to escape through that submarine tunnel, or through the hole in the dome and slide to the base of the mountain!

On the morning of the 25th I at last encounter Thomas Roch. He is alone on the other side of the lagoon, and I wonder, inasmuch as I have not seen them since the previous day, whether Ker Karraje, Engineer Serko, and Captain Spade have not gone off on some expedition.

I walk round towards Thomas Roch, and before he can see me I examine him attentively.

His serious, thoughtful physiognomy is no longer that of a madman. He walks slowly, with his eyes bent on the ground, and under his arm a drawing-board upon which is stretched a sheet of paper covered with designs.

Suddenly he raises his head, advances a step and recognizes me.

"Ah! Gaydon, it is you, is it?" he cries, "I have then escaped from you! I am free!"

He can, indeed, regard himself as being free--a good deal more at liberty in Back Cup than he was in Healthful House. But maybe my presence evokes unpleasant memories, and will bring on another fit, for he continues with extraordinary animation:

"Yes, I know you, Gaydon.--Do not approach me! Stand off! stand off! You would like to get me back in your clutches, incarcerate me again in your dungeon! Never! I have friends here who will protect me. They are powerful, they are rich. The Count d'Artigas is my backer and Engineer Serko is my partner. We are going to exploit my invention! We are going to make my fulgurator! Hence! Get you gone!"

Thomas Roch is in a perfect fury. He raises his voice, agitates his arms, and finally pulls from his pockets many rolls of dollar bills and banknotes, and handfuls of English, French, American and German gold coins, which slip through his fingers and roll about the cavern.
How could he get all this money except from Ker Karraje, and as the price of his secret? The noise he makes attracts a number of men to the scene. They watch us for a moment, then seize Thomas Roch and drag him away. As soon as I am out of his sight he ceases to struggle and becomes calm again.

July 27.--Two hours after meeting with Thomas Roch, I went down to the lagoon and walked out to the edge of the stone jetty.

The tug is not moored in its accustomed place, nor can I see it anywhere about the lake. Ker Karraje and Engineer Serko had not gone yesterday, as I supposed, for I saw them in the evening.

To-day, however, I have reason to believe that they really have gone away in the tug with Captain Spade and the crew of the Ebba, and that the latter must be sailing away.

Have they set out on a piracy expedition? Very likely. It is equally likely that Ker Karraje, become once more the Count d'Artigas, travelling for pleasure on board his yacht, intends to put into some port on the American coast to procure the substances necessary to the preparation of Roch's fulgurator.

Ah! if it had only been possible for me to hide in the tug, to slip into the Ebba's hold, and stow myself away until the schooner arrived in port! Then perchance I might have escaped and delivered the world from this band of pirates.

It will be seen how tenaciously I cling to the thought of escape--of fleeing--fleeing at any cost from this lair. But flight is impossible, except through the tunnel, by means of a submarine boat. Is it not folly to think of such a thing? Sheer folly, and yet what other way is there of getting out of Back Cup?

While I give myself up to these reflections the water of the lagoon opens a few yards from me and the tug appears. The lid is raised and Gibson, the engineer, and the men issue on to the platform. Other men come up and catch the line that is thrown to them. They haul upon it, and the tug is soon moored in its accustomed place.

This time, therefore, at any rate, the schooner is not being towed, and the tug merely went out to put Ker Karraje and his companions aboard the Ebba.

This only confirms my impression that the sole object of their trip is to reach an American port where the Count d'Artigas can procure the materials for making the explosive, and order the machines in some foundry. On the day fixed for their return the tug will go out through the tunnel again to meet the schooner and Ker Karraje will return to Back Cup.

Decidedly, this evildoer is carrying out his designs and has succeeded sooner than I thought would be possible.

August 3.--An incident occurred to-day of which the lagoon was the theatre--a very curious incident that must be exceedingly rare.

Towards three o'clock in the afternoon there was a prodigious bubbling in the water, which ceased for a minute or two and then recommenced in the centre of the lagoon.

About fifteen pirates, whose attention had been attracted by this unaccountable phenomenon, hurried down to the bank manifesting signs of astonishment not unmixed with fear--at least I thought so.

The agitation of the water was not caused by the tug, as the latter was lying alongside the jetty, and the idea that some other submarine boat had found its way through the tunnel was highly improbable.

Almost at the same instant cries were heard on the opposite bank. The newcomers shouted something in a hoarse voice to the men on the side where I was standing, and these immediately rushed off towards the Beehive.

I conjectured that they had caught sight of some sea-monster that had found its way in, and was floundering in the lagoon, and that they had rushed off to fetch arms and harpoons to try and capture it.

I was right, for they speedily returned with the latter weapons and rifles loaded with explosive bullets.

The monster in question was a whale, of the species that is common enough in Bermudan waters, which after swimming through the tunnel was plunging about in the narrow limits of the lake. As it was constrained to take refuge in Back Cup I concluded that it must have been hard pressed by whalers.

Some minutes elapsed before the monster rose to the surface. Then the green shiny mass appeared spouting furiously and darting to and fro as though fighting with some formidable enemy.

"If it was driven in here by whalers," I said to myself, "there must be a vessel in proximity to Back Cup--peradventure within a stone's throw of it. Her boats must have entered the western passes to the very foot of the mountain. And to think I am unable to communicate with them! But even if I could, I fail to see how I could go to them through these massive walls."

I soon found, however, that it was not fishers, but sharks that had driven the whale through the tunnel, and which infest these waters in great numbers. I could see them plainly as they darted about, turning upon their backs and displaying their enormous mouths which were bristling with their cruel teeth. There were five or six of the monsters, and they attacked the whale with great viciousness. The latter's only means of defence was its tail, with which it lashed at them with terrific force and rapidity. But the whale had received several wounds and the water was tinged with its life-blood; for plunge and lash as it would, it could not escape the bites of its enemies.
However, the voracious sharks were not permitted to vanquish their prey, for man, far more powerful with his instruments of death, was about to take a hand and snatch it from them. Gathered around the lagoon were the companions of Ker Karraje, every whit as ferocious as the sharks themselves, and well deserving the same name, for what else are they?

Standing amid a group, at the extremity of the jetty, and armed with a harpoon, was the big Malay who had prevented me from entering Ker Karraje's house. When the whale got within shot, he hurled the harpoon with great force and skill, and it sank into the leviathan's flesh just under the left fin. The whale plunged immediately, followed by the relentless sharks. The rope attached to the weapon ran out for about sixty yards, and then slackened. The men at once began to haul on it, and the monster rose to the surface again near the end of the tunnel, struggling desperately in its death agony, and spouting great columns of water tinged with blood. One blow of its tail struck a shark, and hurled it clean out of water against the rocky side, where it dropped in again, badly, if not fatally injured.

The harpoon was torn from the flesh by the jerk, and the whale went under. It came up again for the last time, and lashed the water so that it washed up from the tunnel end, disclosing the top of the orifice.

Then the sharks again rushed on their prey, but were scared off by a hail of the explosive bullets. Two men then jumped into a boat and attached a line to the dead monster. The latter was hauled into the jetty, and the Malays started to cut it up with a dexterity that showed they were no novices at the work.

No more sharks were to be seen, but I concluded that it would be as well to refrain from taking a bath in the lagoon for some days to come.

I now know exactly where the entrance to the tunnel is situated. The orifice on this side is only ten feet below the edge of the western bank. But of what use is this knowledge to me?

August 7.--Twelve days have elapsed since the Count d'Artigas, Engineer Serko, and Captain Spade put to sea. There is nothing to indicate that their return is expected, though the tug is always kept in readiness for immediate departure by Gibson, the engine-driver. If the Ebba is not afraid to enter the ports of the United States by day, I rather fancy she prefers to enter the rocky channel of Back Cup at nightfall. I also fancy, somehow, that Ker Karraje and his companions will return to-night.

August 10.--At ten o'clock last night, as I anticipated, the tug went under and out, just in time to meet the Ebba and tow her through the channel to her creek, after which she returned with Ker Karraje and the others.

When I look out this morning, I see Thomas Roch and Engineer Serko walking down to the lagoon, and talking. What they are talking about I can easily guess. I go forward and take a good look at my ex-patient. He is asking questions of Engineer Serko With great animation. His eyes gleam, his face is flushed, and he is all eagerness to reach the jetty. Engineer Serko can hardly keep up with him.

The crew of the tug are unloading her, and they have just brought ashore ten medium-sized boxes. These boxes bear a peculiar red mark, which Thomas Roch examines closely.

Engineer Serko orders the men to transport them to the storehouses on the left bank, and the boxes are forthwith loaded on a boat and rowed over.

In my opinion, these boxes contain the substances by the combination or mixture of which, the fulgurator and deflagrator are to be made. The engines, doubtless, are being made in an American foundry, and when they are ready, the schooner will fetch them and bring them to Back Cup.

For once in a while, anyhow, the Ebba has not returned with any stolen merchandise. She went out and has returned with a clear bill. But with what terrible power Ker Karraje will be armed for both offensive and defensive operations at sea! If Thomas Roch is to be credited, this fulgurator could shatter the terrestrial spheroid at one blow. And who knows but what one day, he will try the experiment?

CHAPTER XII.

ENGINEER SERKO'S ADVICE.

Thomas Roch has started work and spends hours and hours in a wooden shed on the left bank of the lagoon that has been set apart as his laboratory and workshop. No one enters it except himself. Does he insist upon preparing the explosive in secret and does he intend to keep the formula thereof to himself? I should not wonder.

The manner of employing Roch's fulgurator is, I believe, very simple indeed. The projectile in which it is used requires neither gun nor mortar to launch it, nor pneumatic tube like the Zalinski shell. It is autopropulsive, it projects itself, and no ship within a certain zone when the engine explodes could escape utter destruction. With such a weapon as this at his command Ker Karraje would be invincible.

From August 11 to August 17.--During the past week Thomas Roch has been working without intermission. Every morning the inventor goes to his laboratory and does not issue therefrom till night. I have made no attempt to stop him or speak to him, knowing that it would be useless to do so.
Although he is still indifferent to everything that does not touch upon his work he appears to be perfectly self-
possessed. Why should he not have recovered his reason? Has he not obtained what he has so long sought for? Is he
not at last able to carry out the plans he formed years and years ago?

August 18.--At one o'clock this morning I was roused by several detonations.

"Has Back Cup been attacked?" was my first thought. "Has the schooner excited suspicion, and been chased to
the entrance to the passes? Is the island being bombarded with a view to its destruction? Has justice at last overtaken
these evil-doers ere Thomas Roch has been able to complete the manufacture of his explosive, and before the
autopropulsive engine could be fetched from the continent?"

The detonations, which are very violent, continue, succeeding each other at regular intervals, and it occurs to me
that if the schooner has been destroyed, all communication with the bases of supply being impossible, Back Cup
cannot be provisioned.

It is true the tug would be able to land the Count d'Artigas somewhere on the American coast where, money
being no object, he could easily buy or order another vessel. But no matter. If Back Cup is only destroyed before
Ker Karraje has Roch's fulgurator at his disposal I shall render thanks to heaven.

A few hours later, at the usual time, I quit my cell. All is quiet at the Beehive. The men are going about their
business as usual. The tug is moored near the jetty. Thomas Roch is going to his laboratory, and Ker Karraje and
Engineer Serko are tranquilly pacing backwards and forwards by the lake and chatting. The island therefore could
not have been attacked during the night. Yet I was awakened by the report of cannon, this I will swear.

At this moment Ker Karraje goes off towards his abode and Engineer Serko, smilingly ironical, as usual,
advances to meet me.

"Well, Mr. Simon Hart," he says, "are you getting accustomed to your tranquil existence? Do you appreciate at
their just merit the advantages of this enchanted grotto? Have you given up all hope of recovering your liberty some
day or other?"

What is the use of waxing wroth with this jester? I reply calmly:

"No, sir. I have not given up hope, and I still expect that I shall be released."

"What! Mr. Hart, separate ourselves from a man whom we all esteem--and I from a colleague who perhaps, in
the course of Thomas Roch's fits of delirium, has learned some of his secrets? You are not serious!"

So this is why they are keeping me a prisoner in Back Cup! They suppose that I am in part familiar with Koch's
invention, and they hope to force me to tell what I know if Thomas Koch refuses to give up his secret. This is the
reason why I was kidnapped with him, and why I have not been accommodated with an involuntary plunge in the
lagoon with a stone fastened to my neck. I see it all now, and it is just as well to know it.

"Very serious," I affirm, in response to the last remark of my interlocutor.

"Well," he continues, "if I had the honor to be Simon Hart, the engineer, I should reason as follows: 'Given, on
the one hand, the personality of Ker Karraje, the reasons which incited him to select such a mysterious retreat as this
cavern, the necessity of the said cavern being kept from any attempt to discover it, not only in the interest of the
Count d'Artigas, but in that of his companions--'

"Of his accomplices, if you please."

"Of his accomplices," then--'and on the other hand, given the fact that I know the real name of the Count
d'Artigas and in what mysterious safe he keeps his riches--'

"Riches stolen, and stained with blood, Mr. Serko."

"Riches stolen and stained with blood,' if you like--'I ought to understand that this question of liberty cannot be
settled in accordance with my desires.'"

It is useless to argue the point under these conditions, and I switch the conversation on to another line.

"May I ask," I continue, "how you came to find out that Gaydon, the warder, was Simon Hart, the engineer?"

"I see no reason for keeping you in ignorance on the subject, my dear colleague. It was largely by hazard. We
had certain relations with the manufactory in New Jersey with which you were connected, and which you quitted
suddenly one day under somewhat singular circumstances. Well, during a visit I made to Healthful House some
months before the Count d'Artigas went there, I saw and recognized you."

"You?"

"My very self, and from that moment I promised myself the pleasure of having you for a fellow-passenger on
board the Ebba."

I do not recall ever having seen this Serko at Healthful House, but what he says is very likely true.

"I hope your whim of having me for a companion will cost you dear, some day or other," I say to myself.

Then, abruptly, I go on:

"If I am not mistaken, you have succeeded in inducing Thomas Roch to disclose the secret of his fulgurator?"

"Yes, Mr. Hart. We paid millions for it. But millions, you know, are nothing to us. We have only the trouble of
taking them! Therefore we filled all his pockets--covered him with millions!"

"Of what use are these millions to him if he is not allowed to enjoy them outside?"

"That, Mr. Hart, is a matter that does not trouble him a little bit! This man of genius thinks nothing of the future:
he lives but in the present. While engines are being constructed from his plans over yonder in America, he is
preparing his explosive with chemical substances with which he has been abundantly supplied. He! he! What an
invention it is, this autopropulsive engine, which flies through the air of its own power and accelerates its speed till
the goal is reached, thanks to the properties of a certain powder of progressive combustion! Here we have an
invention that will bring about a radical change in the art of war."

"Defensive war, Mr. Serko."

"And offensive war, Mr. Hart."

"Naturally," I answer.

Then pumping him still more closely, I go on:

"So, what no one else has been able to obtain from Thomas Roch--"

"We obtained without much difficulty."

"By paying him."

"By paying him an incredible price--and, moreover, by causing to vibrate what in him is a very sensitive chord."

"What chord?"

"That of vengeance!"

"Vengeance?--against whom?"

"Against all those who have made themselves his enemies by discouraging him, by spurning him, expelling him,
by constraining him to go a-begging from country to country with an invention of incontestable superiority! Now all
notion of patriotism is extinct in his soul. He has now but one thought, one ferocious desire: to avenge himself upon
those who have denied him--and even upon all mankind! Really, Mr. Hart, your governments of Europe and
America committed a stupendous blunder in refusing to pay Roch the price his fulgurator is worth!"

And Engineer Serko describes enthusiastically the various advantages of the new explosive which, he says, is
incontestably superior to any yet invented.

"And what a destructive effect it has," he adds. "It is analogous to that of the Zalinski shell, but is a hundred
times more powerful, and requires no machine for firing it, as it flies through the air on its own wings, so to speak."

I listen in the hope that Engineer Serko will give away a part of the secret, but in vain. He is careful not to say
more than he wants to.

"Has Thomas Roch," I ask, "made you acquainted with the composition of his explosive?"

"Yes, Mr. Hart--if it is all the same to you--and we shall shortly have considerable quantities of it stored in a safe
place."

"But will there not be a great and ever-impending danger in accumulating large quantities of it? If an accident
were to happen it would be all up with the island of----!"

Once more the name of Back Cup was on the point of escaping me. They might consider me too well-informed
if they were aware that in addition to being acquainted with the Count d'Artigas' real name I also know where his
stronghold is situated.

Luckily Engineer Serko has not remarked my reticence, and he replies:

"There will be no cause for alarm. Thomas Roch's explosive will not burst unless subjected to a special
deflagrator. Neither fire nor shock will explode it."

"And has Thomas Roch also sold you the secret of his deflagrator?"

"Not yet, Mr. Hart, but it will not be long before the bargain is concluded. Therefore, I repeat, no danger is to be
apprehended, and you need not keep awake of nights on that account. A thousand devils, sir! We have no desire to
be blown up with our cavern and treasures! A few more years of good business and we shall divide the profits,
which will be large enough to enable each one of us to live as he thinks proper and enjoy life to the top of his bent--
after the dissolution of the firm of Ker Karraje and Co. I may add that though there is no danger of an explosion, we
have everything to fear from a denunciation--which you are in the position to make, Mr. Hart. Therefore, if you take
my advice, you will, like a sensible man, resign yourself to the inevitable until the disbanding of the company. We
shall then see what in the interest of our security is best to be done with you!"

It will be admitted that these words are not exactly calculated to reassure me. However, a lot of things may
happen ere then. I have learned one good thing from this conversation, and that is that if Thomas Roch has sold his
explosive to Ker Karraje and Co., he has at any rate, kept the secret of his deflagrator, without which the explosive is
of no more value than the dust of the highway.

But before terminating the interview I think I ought to make a very natural observation to Mr. Serko.

"Sir," I say, "you are now acquainted with the composition of Thomas Roch's explosive. Does it really possess
the destructive power that the inventor attributes to it? Has it ever been tried? May you not have purchased a composition as inert as a pinch of snuff?"

"You are doubtless better informed upon this point than you pretend, Mr. Hart. Nevertheless, I thank you for the interest you manifest in our affairs, and am able to reassure you. The other night we made a series of decisive experiments. With only a few grains of this substance great blocks of rock were reduced to impalpable dust!"

This explanation evidently applies to the detonation I heard.

"Thus, my dear colleague," continues Engineer Serko, "I can assure you that our expectations have been answered. The effects of the explosive surpass anything that could have been imagined. A few thousand tons of it would burst our spheroid and scatter the fragments into space. You can be absolutely certain that it is capable of destroying no matter what vessel at a distance considerably greater than that attained by present projectiles and within a zone of at least a mile. The weak point in the invention is that rather too much time has to be expended in regulating the firing."

Engineer Serko stops short, as though reluctant to give any further information, but finally adds:

"Therefore, I end as I began, Mr. Hart. Resign yourself to the inevitable. Accept your new existence without reserve. Give yourself up to the tranquil delights of this subterranean life. If one is in good health, one preserves it; if one has lost one's health, one recovers it here. That is what is happening to your fellow countryman. Yes, the best thing you can do is to resign yourself to your lot."

Thereupon this giver of good advice leaves me, after saluting me with a friendly gesture, like a man whose good intentions merit appreciation. But what irony there is in his words, in his glance, in his attitude. Shall I ever be able to get even with him?

I now know that at any rate it is not easy to regulate the aim of Roch's auto-propulsive engine. It is probable that it always bursts at the same distance, and that beyond the zone in which the effects of the fulgurator are so terrible, and once it has been passed, a ship is safe from its effects. If I could only inform the world of this vital fact!

August 20.--For two days no incident worth recording has occurred. I have explored Back Cup to its extreme limits. At night when the long perspective of arched columns are illuminated by the electric lamps, I am almost religiously impressed when I gaze upon the natural wonders of this cavern, which has become my prison. I have never given up hope of finding somewhere in the walls a fissure of some kind of which the pirates are ignorant and through which I could make my escape. It is true that once outside I should have to wait till a passing ship hove in sight. My evasion would speedily be known at the Beehive, and I should soon be recaptured, unless--a happy thought strikes me--unless I could get at the Ebba's boat that was drawn up high and dry on the little sandy beach in the creek. In this I might be able to make my way to St. George or Hamilton.

This evening--it was about nine o'clock--I stretched myself on a bed of sand at the foot of one of the columns, about one hundred yards to the east of the lagoon. Shortly afterwards I heard footsteps, then voices. Hiding myself as best I could behind the rocky base of the pillar, I listened with all my ears.

I recognized the voices as those of Ker Karraje and Engineer Serko. The two men stopped close to where I was lying, and continued their conversation in English—which is the language generally used in Back Cup. I was therefore able to understand all that they said.

They were talking about Thomas Roch, or rather his fulgurator.

"In a week's time," said Ker Karraje, "I shall put to sea in the Ebba, and fetch the sections of the engines that are being cast in that Virginian foundry."

"And when they are here," observed Engineer Serko, "I will piece them together and fix up the frames for firing them. But beforehand, there is a job to be done which it seems to me is indispensable."

"What is that?"

"To cut a tunnel through the wall of the cavern."

"Through the wall of the cavern?"

"Oh! nothing but a narrow passage through which only one man at a time could squeeze, a hole easy enough to block, and the outside end of which would be hidden among the rocks."

"Of what use could it be to us, Serko?"

"I have often thought about the utility of having some other way of getting out besides the submarine tunnel. We never know what the future may have in store for us."

"But the walls are so thick and hard," objected Ker Karraje.

"Oh, with a few grains of Roch's explosive I undertake to reduce the rock to such fine powder that we shall be able to blow it away with our breath," Serko replied.

It can easily be imagined with what interest and eagerness I listened to this. Here was a ray of hope. It was proposed to open up communication with the outside by a tunnel in the wall, and this held out the possibility of escape.
As this thought flashed through my mind, Ker Karraje said:
"Very well, Serko, and if it becomes necessary some day to defend Back Cup and prevent any ship from approaching it----. It is true," he went on, without finishing the reflection, "our retreat would have to have been discovered by accident—or by denunciation."
"We have nothing to fear either from accident or denunciation," affirmed Serko.
"By one of our band, no, of course not, but by Simon Hart, perhaps."
"Hart!" exclaimed Serko. "He would have to escape first and no one can escape from Back Cup. I am, by the bye, interested in this Hart. He is a colleague, after all, and I have always suspected that he knows more about Roch's invention than he pretends. I will get round him so that we shall soon be discussing physics, mechanics, and matters ballistic like a couple of friends."
"No matter," replied the generous and sensible Count d'Artigas, "when we are in full possession of the secret we had better get rid of the fellow."
"We have plenty of time to do that, Ker Karraje."
"If God permits you to, you wretches," I muttered to myself, while my heart thumped against my ribs.
And yet, without the intervention of Providence, what hope is there for me?
The conversation then took another direction.
"Now that we know the composition of the explosive, Serko," said Ker Karraje, "we must, at all cost, get that of the deflagrator from Thomas Roch."
"Yes," replied Engineer Serko, "that is what I am trying to do. Unfortunately, however, Roch positively refuses to discuss it. Still he has already made a few drops of it with which those experiments were made, and he will furnish as with some more to blow a hole through the wall."
"But what about our expeditions at sea?" queried Ker Karraje.
"Patience! We shall end by getting Roch's thunderbolts entirely in our own hand, and then----"
"Are you sure, Serko?"
"Quite sure,--by paying the price, Ker Karraje."
The conversation dropped at this point, and they strolled off without having seen me--very luckily for me, I guess. If Engineer Serko spoke up somewhat in defence of a colleague, Ker Karraje is apparently animated with much less benevolent sentiments in regard to me. On the least suspicion they would throw me into the lake, and if I ever got through the tunnel, it would only be as a corpse carried out by the ebbing tide.
August 21.--Engineer Serko has been prospecting with a view to piercing the proposed passage through the wall, in such a way that its existence will never be dreamed of outside. After a minute examination he decided to tunnel through the northern end of the cavern about sixty feet from the first cells of the Beehive.
I am anxious for the passage to be made, for who knows but what it may be the way to freedom for me? Ah! if I only knew how to swim, perhaps I should have attempted to escape through the submarine tunnel, as since it was disclosed by the lashing back of the waters by the whale in its death-struggle, I know exactly where the orifice is situated. It seems to me that at the time of the great tides, this orifice must be partly uncovered. At the full and new moon, when the sea attains its maximum depression below the normal level, it is possible that—I must satisfy myself about this.
I do not know how the fact will help me in any way, even if the entrance to the tunnel is partly uncovered, but I cannot afford to miss any detail that may possibly aid in my escape from Back Cup.
August 29.--This morning I am witnessing the departure of the tug. The Count d'Artigas is, no doubt, going off in the Ebba to fetch the sections of Thomas Roch's engines. Before embarking, the Count converses long and earnestly with Engineer Serko, who, apparently, is not going to accompany him on this trip, and is evidently giving him some recommendations, of which I may be the object. Then, having stepped on to the platform, he goes below, the lid shuts with a bang, and the tug sinks out of sight, leaving a trail of bubbles behind it.
The hours go by, night is coming on, yet the tug does not return. I conclude that it has gone to tow the schooner, and perhaps to destroy any merchant vessels that may come in their way.
It cannot, however, be absent very long, as the trip to America and back will not take more than a week.
Besides, if I can judge from the calm atmosphere in the interior of the cavern, the Ebba must be favored with beautiful weather. This is, in fact, the fine season in this part of the world. Ah! if only I could break out of my prison!

CHAPTER XIII.
GOD BE WITH IT.
From August 29 to September 10.--Thirteen days have gone by and the Ebba has not returned. Did she then not
make straight for the American coast? Has she been delayed by a buccaneering cruise in the neighborhood of Back Cup? It seems to me that Ker Karraje's only desire would be to get back with the sections of Roch's engines as soon as possible. Maybe the Virginian foundry had not quite finished them.

Engineer Serko does not display the least anxiety or impatience. He continues to greet me with his accustomed ironical cordiality, and with a kindly air that I distrust—with good reason. He affects to be solicitous as to my health, urges me to make the best of a bad job, calls me Ali Baba, assures me that there is not, in the whole world, such an enchanting spot as this Arabian Nights cavern, observes that I am fed, warmed, lodged, and clothed, that I have no taxes to pay, and that even the inhabitants of the favored principality of Monaco do not enjoy an existence more free from care.

Sometimes this ironical verbiage brings the blood to my face, and I am tempted to seize this cynical banterer by the throat and choke the life out of him. They would kill me afterwards. Still, what would that matter! Would it not be better to end in this way than to spend years and years amid these infernal and infamous surroundings? However, while there is life there is hope, I reflect, and this thought restrains me.

I have scarcely set eyes upon Thomas Roch since the Ebba went away. He shuts himself up in his laboratory and works unremittingly. If he utilizes all the substances placed at his disposition there will be enough to blow up Back Cup and the whole Bermudan archipelago with it!

I cling to the hope that he will never consent to give up the secret of his deflagrator, and that Engineer Serko's efforts to acquire it will remain futile.

September 3.--To-day I have been able to witness with my own eyes the power of Roch's explosive, and also the manner in which the fulgurator is employed.

During the morning the men began to pierce the passage through the wall of the cavern at the spot fixed upon by Engineer Serko, who superintended the work in person. The work began at the base, where the rock is as hard as granite. To have continued it with pickaxes would have entailed long and arduous labor, inasmuch as the wall at this place is not less than from twenty to thirty yards in thickness, but thanks to Roch's fulgurator the passage will be completed easily and rapidly.

I may well be astonished at what I have seen. The pickaxes hardly made any impression on the rock, but its disaggregation was effected with really remarkable facility by means of the fulgurator.

A few grains of this explosive shattered the rocky mass and reduced it to almost impalpable powder that one's breath could disperse as easily as vapor. The explosion produced an excavation measuring fully a cubic yard. It was accompanied by a sharp detonation that may be compared to the report of a cannon.

The first charge used, although a very small one, a mere pinch, blew the men in every direction, and two of them were seriously injured. Engineer Serko himself was projected several yards, and sustained some rather severe contusions.

Here is how this substance, whose bursting force surpasses anything hitherto conceived, is employed.

A small hole about an inch and a half in length is pierced obliquely in the rock. A few grains of the explosive are then inserted, but no wad is used.

Then Thomas Roch steps forward. In his hand is a little glass phial containing a bluish, oily liquid that congeals almost as soon as it comes in contact with the air. He pours one drop on the entrance of the hole, and draws back, but not with undue haste. It takes a certain time—about thirty-five seconds, I reckon—before the combination of the fulgurator and deflagrator is effected. But when the explosion does take place its power of disaggregation is such—I repeat—that it may be regarded as unlimited. It is at any rate a thousand times superior to that of any known explosive.

Under these circumstances it will probably not take more than a week to complete the tunnel.

September 19.--For some time past I have observed that the tide rises and falls twice every twenty-four hours, and that the ebb and flow produce a rather swift current through the submarine tunnel. It is pretty certain therefore that a floating object thrown into the lagoon when the top of the orifice is uncovered would be carried out by the receding tide. It is just possible that during the lowest equinoctial tides the top of the orifice is uncovered. This I shall be able to ascertain, as this is precisely the time they occur. To-day, September 19, I could almost distinguish the summit of the hole under the water. The day after to-morrow, if ever, it will be uncovered.

Very well then, if I cannot myself attempt to get through, may be a bottle thrown into the lagoon might be carried out during the last few minutes of the ebb. And might not this bottle by chance—an ultra-providential chance, I must avow—be picked up by a ship passing near Back Cup? Perhaps even it might be borne away by a friendly current and cast upon one of the Bermudan beaches. What if that bottle contained a letter?

I cannot get this thought out of my mind, and it works me up into a great state of excitement. Then objections crop up—this one among others: the bottle might be swept against the rocks and smashed ere ever it could get out of the tunnel. Very true, but what if, instead of a bottle a diminutive, tightly closed keg were used? It would not run any
danger of being smashed and would besides stand a much better chance of reaching the open sea.

September 20.--This evening, I, unperceived, entered one of the store houses containing the booty pillaged from various ships and procured a keg very suitable for my experiment.

I hid the keg under my coat, and returned to the Beehive and my cell. Then without losing an instant I set to work. Paper, pen, ink, nothing was wanting, as will be supposed from the fact that for three months I have been making notes and dotting down my impressions daily.

I indite the following message:

"On June 15 last Thomas Roch and his keeper Gaydon, or rather Simon Hart, the French engineer who occupied Pavilion No. 17, at Healthful House, near New-Berne, North Carolina, United States of America, were kidnapped and carried on board the schooner Ebba, belonging to the Count d'Artigas. Both are now confined in the interior of a cavern which serves as a lair for the said Count d'Artigas—who is really Ker Karraje, the pirate who some time ago carried on his depredations in the West Pacific—and for about a hundred men of which his band is composed.

"When he has obtained possession of Roch's fulgurator whose power is, so to speak, without limit, Ker Karraje will be in a position to carry on his crimes with complete impunity.

"It is therefore urgent that the states interested should destroy his lair without delay.

"The cavern in which the pirate Ker Karraje has taken refuge is in the interior of the islet of Back Cup, which is wrongly regarded as an active volcano. It is situated at the western extremity of the archipelago of Bermuda, and on the east is bounded by a range of reefs, but on the north, south, and west is open.

"Communication with the inside of the mountain is only possible through a tunnel a few yards under water in a narrow pass on the west. A submarine apparatus therefore is necessary to effect an entrance, at any rate until a tunnel they are boring through the northwestern wall of the cavern is completed.

"The pirate Ker Karraje employs an apparatus of this kind—the submarine boat that the Count d'Artigas ordered of the Cramps and which was supposed to have been lost during the public experiment with it in Charleston Bay. This boat is used not only for the purpose of entering and issuing from Back Cup, but also to tow the schooner and attack merchant vessels in Bermudan waters.

"This schooner Ebba, so well known on the American coast, is kept in a small creek on the western side of the island, behind a mass of rocks, and is invisible from the sea.

"The best place to land is on the west coast formerly occupied by the colony of Bermudan fishers; but it would first be advisable to effect a breach in the side of the cavern by means of the most powerful melinite shells.

"The fact that Ker Karraje may be in the position to use Roch's fulgurator for the defence of the island must also be taken into consideration. Let it be well borne in mind that if its destructive power surpasses anything ever conceived or dreamed of, it extends over a zone not exceeding a mile in extent. The distance of this dangerous zone is variable, but once the engines have been set, the modification of the distance occupies some time, and a warship that succeeds in passing the zone has nothing further to fear.

"This document is written on the twentieth day of September at eight o'clock in the evening and is signed with my name

"THOMAS HART, Engineer."

The above is the text of the statement I have just drawn up. It says all that is necessary about the island, whose exact situation is marked on all modern charts and maps, and points out the expediency of acting without delay, and what to do in case Ker Karraje is in the position to employ Roch's fulgurator.

I add a plan of the cavern showing its internal configuration, the situation of the lagoon, the lay of the Beehive, Ker Karraje's habitation, my cell, and Thomas Roch's laboratory.

I wrap the document in a piece of tarpaulin and insert the package in the little keg, which measures six inches by three and a half. It is perfectly watertight and will stand any amount of knocking about against the rocks.

There is one danger, however, and that is, that it may be swept back by the returning tide, cast up on the island, and fall into the hands of the crew of the Ebba when the schooner is hauled into her creek. If Ker Karraje ever gets hold of it, it will be all up with me.

It will be readily conceived with what anxiety I have awaited the moment to make the attempt: I am in a perfect fever of excitement, for it is a matter of life or death to me. I calculate from previous observations that the tide will be very low at about a quarter to nine. The top of the tunnel ought then to be a foot and a half above water, which is more than enough to permit of the keg passing through it. It will be another half hour at least before the flow sets in again, and by that time the keg may be far enough away to escape being thrown back on the coast.

I peer out of my cell. There is no one about, and I advance to the side of the lagoon, where by the light of a nearby lamp, I perceive the arch of the tunnel, towards which the current seems to be setting pretty swiftly.

I go down to the very edge, and cast in the keg which contains the precious document and all my hopes.

"God be with it!" I fervently exclaim. "God be with it!"
For a minute or two the little barrel remains stationary, and then floats back to the side again. I throw it out once more with all my strength.

This time it is in the track of the current, which to my great joy sweeps it along and in twenty seconds, it has disappeared in the tunnel.

Yes, God be with it! May Heaven guide thee, little barrel! May it protect all those whom Ker Karraje menaces and grant that this band of pirates may not escape from the justice of man!

CHAPTER XIV.

BATTLE BETWEEN THE "SWORD" AND THE TUG.

Through all this sleepless night I have followed the keg in fancy. How many times I seem to see it swept against the rocks in the tunnel into a creek, or some excavation. I am in a cold perspiration from head to foot. Then I imagine that it has been carried out to sea. Heavens! if the returning tide should sweep it back to the entrance and then through the tunnel into the lagoon! I must be on the lookout for it.

I rise before the sun and saunter down to the lagoon. Not a single object is floating on its calm surface.

The work on the tunnel through the side of the cavern goes on, and at four o'clock in the afternoon on September 23, Engineer Serko blows away the last rock obstructing the issue, and communication with the outer world is established. It is only a very narrow hole, and one has to stoop to go through it. The exterior orifice is lost among the crannies of the rocky coast, and it would be easy to obstruct it, if such a measure became necessary.

It goes without saying that the passage will be strictly guarded. No one without special authorization will be able either to go out or come in, therefore there is little hope of escape in that direction.

September 25.--This morning the tug rose from the depth of the lagoon to the surface, and has now run alongside the jetty. The Count d'Artigas and Captain Spade disembark, and the crew set to work to land the provisions--boxes of canned meat, preserves, barrels of wine and spirits, and other things brought by the Ebba, among which are several packages destined for Thomas Roch. The men also land the various sections of Roch's engines which are discoid in shape.

The inventor watches their operations, and his eyes glisten with eagerness. He examines one of the sections, and nods approval. I notice that his joy no longer finds expression in incoherent utterances, that he is completely transformed from what he was while a patient at Healthful House. So much is this the case that I begin to ask myself whether his madness which was asserted to be incurable, has not been radically cured.

At last Thomas Roch embarks in the boat used for crossing the lake and is rowed over to his laboratory. Engineer Serko accompanies him. In an hour's time the tug's cargo has all been taken out and transported to the storehouses.

Ker Karraje exchanges a word or two with Engineer Serko and then enters his mansion. Later, in the afternoon, I see them walking up and down in front of the Beehive and talking earnestly together.

Then they enter the new tunnel, followed by Captain Spade. If I could but follow them! If I could but breathe for awhile the bracing air of the Atlantic, of which the interior of Back Cup only receives attenuated puffs, so to speak.

From September 26 to October 10.--Fifteen days have elapsed. Under the directions of Engineer Serko and Thomas Roch the sections of the engines have been fitted together. Then the construction of their supports is begun. These supports are simple trestles, fitted with transverse troughs or grooves of various degrees of inclination, and which could be easily installed on the deck of the Ebba, or even on the platform of the tug, which can be kept on a level with the surface.

Thus Ker Karraje, will be ruler of the seas, with his yacht. No warship, however big, however powerful, will be able to cross the zone of danger, whereas the Ebba will be out of range of its guns. If only my notice were found! If only the existence of this lair of Back Cup were known! Means would soon be found, if not of destroying the place, at least of starving the band into submission!

October 20.--To my extreme surprise I find this morning that the tug has gone away again. I recall that yesterday the elements of the piles were renewed, but I thought it was only to keep them in order. In view of the fact that the outside can now be reached through the new tunnel, and that Thomas Roch has everything he requires, I can only conclude that the tug has gone off on another marauding expedition.

Yet this is the season of the equinoctial gales, and the Bermudan waters are swept by frequent tempests. This is evident from the violent gusts that drive back the smoke through the crater and the heavy rain that accompanies it, as well as by the water in the lagoon, which swells and washes over the brown rocks on its shores.

But it is by no means sure that the Ebba has quitted her cove. However staunch she may be, she is, it seems to me, of too light a build to face such tempests as now rage, even with the help of the tug.

On the other hand, although the tug has nothing to fear from the heavy seas, as it would be in calm water a few
yards below the surface, it is hardly likely that it has gone on a trip unless to accompany the schooner.

I do not know to what its departure can be attributed, but its absence is likely to be prolonged, for it has not yet returned.

Engineer Serko has remained behind, but Ker Karraje, Captain Spade, and the crew of the schooner, I find, have left.

Life in the cavern goes on with its usual dispiriting monotony. I pass hour after hour in my cell, meditating, hoping, despairing, following in fancy the voyage of my little barrel, tossed about at the mercy of the currents and whose chances of being picked up, I fear, are becoming fainter each day, and killing time by writing my diary, which will probably not survive me.

Thomas Roch is constantly occupied in his laboratory manufacturing his deflagrator. I still entertain the conviction that nothing will ever induce him to give up the secret of the liquid's composition; but I am perfectly aware that he will not hesitate to place his invention at Ker Karraje's service.

I often meet Engineer Serko when my strolls take me in the direction of the Beehive. He always shows himself disposed to chat with me, though, it is true, he does so in a tone of impertinent frivolity. We converse upon all sorts of subjects, but rarely of my position. Recrimination thereanent is useless and only subjects me to renewed bantering.

October 22.--To-day I asked Engineer Serko whether the Ebba had put to sea again with the tug.

"Yes, Mr. Simon Hart," he replied, "and though the clouds gather and loud the tempest roars, be in no uneasiness in regard to our dear Ebba."

"Will she be gone long?"

"We expect her back within forty-eight hours. It is the last voyage Count d'Artigas proposes to make before the winter gales render navigation in these parts impracticable."

"Is her voyage one of business or pleasure?"

"Of business, Mr. Hart, of business," answered Engineer Serko with a smile. "Our engines are now completed, and when the fine weather returns we shall resume offensive operations."

"Against unfortunate merchantmen."

"As unfortunate as they are richly laden."

"Acts of piracy, whose impunity will, I trust, not always be assured," I cried.

"Calm yourself, dear colleague, be calm! Be calm! No one, you know, can ever discover our retreat, and none can ever disclose the secret! Besides, with these engines, which are so easily handled and are of such terrible power, it would be easy for us to blow to pieces any ship that attempted to get within a certain radius of the island."

"Providing," I said, "that Thomas Roch has sold you the composition of his deflagrator as he has sold you that of his fulgurator."

"That he has done, Mr. Hart, and it behooves me to set your mind at rest upon that point."

From this categorical response I ought to have concluded that the misfortune had been consummated, but a certain hesitation in the intonation of his voice warned me that implicit reliance was not to be placed upon Engineer Serko's assertions.

October 25.--What a frightful adventure I have just been mixed up in, and what a wonder I did not lose my life! It is only by a miracle that I am able to resume these notes, which have been interrupted for forty-eight hours. With a little luck, I should have been delivered! I should now be in one of the Bermudan ports--St. George or Hamilton. The mysteries of Back Cup would have been cleared up. The description of the schooner would have been wired all over the world, and she would not dare to put into any port. The provisioning of Back Cup would be impossible, and Ker Karraje's bandits would be condemned to starve to death!

This is what occurred:

At eight o'clock in the evening on October 23, I quitted my cell in an indefinable state of nervousness, and with a presentiment that a serious event was imminent. In vain I had tried to seek calmness in sleep. It was impossible to do so, and I rose and went out.

Outside Back Cup the weather must have been very rough. Violent gusts of wind swept in through the crater and agitated the water of the lagoon.

I walked along the shore on the Beehive side. No one was about. It was rather cold, and the air was damp. The pirates were all snugly ensconced in their cells, with the exception of one man, who stood guard over the new passage, notwithstanding that the outer entrance had been blocked. From where he was this man could not see the lagoon, moreover there were only two lamps alight, one on each side of the lake, and the forest of pillars was wrapt in the profoundest obscurity.

I was walking about in the shadow, when some one passed me.

I saw that he was Thomas Roch.
He was walking slowly, absorbed by his thoughts, his brain at work, as usual.

Was this not a favorable opportunity to talk to him, to enlighten him about what he was probably ignorant, namely, the character of the people into whose hands he had fallen?

"He cannot," I argued, "know that the Count d'Artigas is none other than Ker Karraje, the pirate. He cannot be aware that he has given up a part of his invention to such a bandit. I must open his eyes to the fact that he will never be able to enjoy his millions, that he is a prisoner in Back Cup, and will never be allowed to leave it, any more than I shall. Yes, I will make an appeal to his sentiments of humanity, and point out to him what frightful misfortunes he will be responsible for if he does not keep the secret of his deflagrator."

All this I had said to myself, and was preparing to carry out my resolution, when I suddenly felt myself seized from behind.

Two men held me by the arms, and another appeared in front of me. Before I had time to cry out the man exclaimed in English:

"Hush! not a word! Are you not Simon Hart?"

"Yes, how did you know?"

"I saw you come out of your cell."

"Who are you, then?"

"Lieutenant Davon, of the British Navy, of H.M.S. Standard, which is stationed at the Bermudas."

Emotion choked me so that it was impossible for me to utter a word.

"We have come to rescue you from Ker Karraje, and also propose to carry off Thomas Roch," he added.

"Thomas Roch?" I stammered.

"In a keg, Lieutenant Davon, which I committed to the waters of the lagoon."

"And which contained," went on the officer, "the notice by which we were apprised that the island of Back Cup served as a refuge for Ker Karraje and his band—Ker Karraje, this false Count d'Artigas, the author of the double abduction from Healthful House."

"Ah! Lieutenant Davon——"

"Now we have not a moment to spare, we must profit by the obscurity."

"One word, Lieutenant Davon, how did you penetrate to the interior of Back Cup?"

"By means of the submarine boat Sword, with which we have been making experiments at St. George for six months past."

"A submarine boat!"

"Yes, it awaits us at the foot of the rocks. And now, Mr. Hart, where is Ker Karraje's tug?"

"It has been away for three weeks."

"Ker Karraje is not here, then?"

"No, but we expect him back every day—every hour, I might say."

"It matters little," replied Lieutenant Davon. "It is not after Ker Karraje, but Thomas Roch, we have come—and you also, Mr. Hart. The Sword will not leave the lagoon till you are both on board. If she does not turn up at St. George again, they will know that I have failed—and they will try again."

"Where is the Sword, Lieutenant?"

"On this side, in the shadow of the bank, where it cannot be seen. Thanks to your directions, I and my crew were able to locate the tunnel. We came through all right, and ten minutes ago rose to the surface of the lake. Two men landed with me. I saw you issue from the cell marked on your plan. Do you know where Thomas Roch is?"

"A few paces off. He has just passed me, on his way to his laboratory."

"God be praised, Mr. Hart!"

"Amen, Lieutenant Davon."

The lieutenant, the two men and I took the path around the lagoon. We had not gone far when we perceived Thomas Roch in front of us. To throw ourselves upon him, gag him before he could utter a cry, bind him before he could offer any resistance, and bear him off to the place where the Sword was moored was the work of a minute.

The Sword was a submersible boat of only twelve tons, and consequently much inferior to the tug, both in respect of dimensions and power. Her screw was worked by a couple of dynamos fitted with accumulators that had been charged twelve hours previously in the port of St. George. However, the Sword would suffice to take us out of this prison, to restore us to liberty—that liberty of which I had given up all hope. Thomas Roch was at last to be rescued from the clutches of Ker Karraje and Engineer Serko. The rascals would not be able to utilize his invention, and nothing could prevent the warships from landing a storming party on the island, who would force the tunnel in the wall and secure the pirates!

We saw no one while the two men were conveying Thomas Roch to the Sword, and all got on board without
incident. The lid was shut and secured, the water compartments filled, and the Sword sank out of sight. We were saved!

The Sword was divided into three water-tight compartments. The after one contained the accumulators and machinery. The middle one, occupied by the pilot, was surmounted by a periscope fitted with lenticular portholes, through which an electric search-lamp lighted the way through the water. Forward, in the other compartment, Thomas Roch and I were shut in.

My companion, though the gag which was choking him had been removed, was still bound, and, I thought, knew what was going on.

But we were in a hurry to be off, and hoped to reach St. George that very night if no obstacle was encountered.

I pushed open the door of the compartment and rejoined Lieutenant Davon, who was standing by the man at the wheel. In the after compartment three other men, including the engineer, awaited the lieutenant's orders to set the machinery in motion.

"Lieutenant Davon," I said, "I do not think there is any particular reason why I should stay in there with Roch. If I can help you to get through the tunnel, pray command me."

"Yes, I shall be glad to have you by me, Mr. Hart."

It was then exactly thirty-seven minutes past eight.

The search-lamp threw a vague light through the water ahead of the Sword. From where we were, we had to cross the lagoon through its entire length to get to the tunnel. It would be pretty difficult to fetch it, we knew, but, if necessary, we could hug the sides of the lake until we located it. Once outside the tunnel the Sword would rise to the surface and make for St. George at full speed.

"At what depth are we now?" I asked the lieutenant.

"About a fathom."

"It is not necessary to go any lower," I said. "From what I was able to observe during the equinoctial tides, I should think that we are in the axis of the tunnel."

"All right," he replied.

Yes, it was all right, and I felt that Providence was speaking by the mouth of the officer. Certainly Providence could not have chosen a better agent to work its will.

In the light of the lamp I examined him. He was about thirty years of age, cool, phlegmatic, with resolute physiognomy--the English officer in all his native impassibility--no more disturbed than if he had been on board the Standard, operating with extraordinary sang-froid, I might even say, with the precision of a machine.

"On coming through the tunnel I estimated its length at about fifty yards," he remarked.

"Yes, Lieutenant, about fifty yards from one extremity to the other."

This calculation must have been pretty exact, since the new tunnel cut on a level with the coast is thirty-five feet in length.

The order was given to go ahead, and the Sword moved forward very slowly for fear of colliding against the rocky side.

Sometimes we came near enough to it to distinguish a black mass ahead of it, but a turn of the wheel put us in the right direction again. Navigating a submarine boat in the open sea is difficult enough. How much more so in the confines of a lagoon!

After five minutes' manoeuvring, the Sword, which was kept at about a fathom below the surface, had not succeeded in sightting the orifice.

"Perhaps it would be better to return to the surface, Lieutenant," I said. "We should then be able to see where we are."

"I think you are right, Mr. Hart, if you can point out just about where the tunnel is located."

"I think I can."

"Very well, then."

As a precaution the light was turned off. The engineer set the pumps in motion, and, lightened of its water ballast, the boat slowly rose in the darkness to the surface.

I remained at my post so that I could peer through the lookouts.

At last the ascensional movement of the Sword stopped, and the periscope emerged about a foot.

On one side of me, lighted by the lamp by the shore, I could see the Beehive.

"What is your opinion?" demanded the lieutenant.

"We are too far north. The orifice is in the west side of the cavern."

"Is anybody about?"

"Not a soul."

"Capital, Mr. Hart. Then we will keep on a level with the surface, and when we are in front of the tunnel, and
you give the signal, we will sink."

It was the best thing to be done. We moved off again and the pilot kept her head towards the tunnel.

When we were about twelve yards off I gave the signal to stop. As soon as the current was turned off the Sword stopped, opened her water tanks and slowly sank again.

Then the light in the lookout was turned on again, and there in front of us was a black circle that did not reflect the lamp's rays.

"There it is, there is the tunnel!" I cried.

Was it not the door by which I was going to escape from my prison? Was not liberty awaiting me on the other side?

Gently the Sword moved towards the orifice.

Oh! the horrible mischance! How have I survived it? How is it that my heart is not broken?

A dim light appeared in the depth of the tunnel, about twenty-five yards in front of us. The advancing light could be none other than that, projected through the lookout of Ker Karraje's submarine boat.

"The tug! The tug!" I exclaimed. "Lieutenant, here is the tug returning to Back Cup!"

"Full speed astern," ordered the officer, and the Sword drew back just as she was about to enter the tunnel.

One chance remained. The lieutenant had swiftly turned off the light, and it was just possible that we had not been seen by the people in the tug. Perhaps, in the dark waters of the lagoon, we should escape notice, and when the oncoming boat had risen and moored to the jetty, we should be able to slip out unperceived.

We had backed close in to the south side and the Sword was about to stop, but alas, for our hopes! Captain Spade had seen that another submarine boat was about to issue through the tunnel, and he was making preparations to chase us. How could a frail craft like the Sword defend itself against the attacks of Ker Karraje's powerful machine?

Lieutenant Davon turned to me and said: "Go back to the compartment where Thomas Roch is and shut yourself in. I will close the after-door. There is just a chance that if the tug rams us the water-tight compartments will keep us up."

After shaking hands with the lieutenant, who was as cool as though we were in no danger, I went forward and rejoined Thomas Roch. I closed the door and awaited the issue in profound darkness.

Then I could feel the desperate efforts made by the Sword to escape from or ram her enemy. I could feel her rushing, gyrating and plunging. Now she would twist to avoid a collision. Now she would rise to the surface, then sink to the bottom of the lagoon. Can any one conceive such a struggle as that in which, like two marine monsters, these machines were engaged in beneath the troubled waters of this inland lake?

A few minutes elapsed, and I began to think that the Sword had eluded the tug and was rushing through the tunnel.

Suddenly there was a collision. The shock was not, it seemed to me, very violent, but I could be under no illusion: the Sword had been struck on her starboard quarter. Perhaps her plates had resisted, and if not, the water would only invade one of her compartments, I thought.

Almost immediately after, however, there was another shock that pushed the Sword with extreme violence. She was raised by the ram of the tug which sawed and ripped its way into her side. Then I could feel her heel over and sink straight down, stern foremost.

Thomas Roch and I were tumbled over violently by this movement. There was another bump, another ripping sound, and the Sword lay still.

Just what happened after that I am unable to say, for I lost consciousness.

I have since learned that all this occurred many hours ago.

I however distinctly remember that my last thought was:

"If I am to die, at any rate Thomas Roch and his secret perish with me--and the pirates of Back Cup will not escape punishment for their crimes."

CHAPTER XV.

EXPECTATION.

As soon as I recover my senses I find myself lying on my bed in my cell, where it appears I have been lying for thirty-six hours.

I am not alone. Engineer Serko is near me. He has attended to me himself, not because he regards me as a friend, I surmise, but as a man from whom indispensable explanations are awaited, and who afterwards can be done away with if necessary.

I am still so weak that I could not walk a step. A little more and I should have been asphyxiated in that narrow
Am I in condition to reply to the questions that Engineer Serko is dying to put to me? Yes—but I shall maintain the utmost reserve.

In the first place I wonder what has become of Lieutenant Davon and the crew of the Sword. Did those brave Englishmen perish in the collision? Are they safe and sound like us—for I suppose that Thomas Roch has also survived?

The first question that Engineer Serko puts to me is this: "Will you explain to me what happened, Mr. Hart?"

Instead of replying it occurs to me to question him myself. "And Thomas Roch?" I inquire.

"In good health, Mr. Hart." Then he adds in an imperious tone: "Tell me what occurred!"

"In the first place, tell me what became of the others."

"What others?" replies Serko, glancing at me savagely.

"Why, those men who threw themselves upon Thomas Roch and me, who gagged, bound, and carried us off and shut us up,ail know not where?"

On reflection I had come to the conclusion that the best thing to do was to pretend that I had been surprised before I knew where I was or who my aggressors were.

"You will know what became of them later. But first, tell me how, the thing was done."

By the threatening tone of his voice, as he for the third time puts this question, I understand the nature of the suspicions entertained of me. Yet to be in the position to accuse me of having had relations with the outside he would have had to get possession of my keg. This he could not have done, seeing that it is in the hands of the Bermudan authorities. The pirates cannot, I am convinced, have a single proof to back up their suspicions.

I therefore recount how about eight o'clock on the previous evening I was walking along the edge of the lagoon, after Thomas Roch had passed me, going towards his laboratory, when I felt myself seized from behind; how having been gagged, bound, and blindfolded, I felt myself carried off and lowered into a hole with another person whom I thought I recognized from his groans as Thomas Roch; how I soon felt that I was on board a boat of some description and naturally concluded that it was the tug; how I felt it sink; how I felt a shock that threw me violently against the side, and how I felt myself suffocating and lost consciousness, since I remember nothing further.

Engineer Serko listens with profound attention, a stern look in his eyes and a frown on his brow; and yet he can have no reason that authorizes him to doubt my word.

"You claim that three men threw themselves upon you?" he asks.

"Yes. I thought they were some of your people, for I did not see them coming. Who were they?"

"Strangers, as you must have known from their language."

"They did not utter a word!"

"Have you no idea as to their nationality?"

"Not the remotest."

Do you know what were their intentions in entering the cavern?"

"I do not."

"What is your opinion about it?"

"My opinion, Mr. Serko? I repeat I thought they were two or three of your pirates who had come to throw me into the lagoon by the Count d'Artigas' orders, and that they were going to do the same thing to Thomas Roch. I supposed that having obtained his secrets—as you informed me was the case—you had no further use for him and were about to get rid of us both."

"Is it possible, Mr. Hart, that you could have thought such a thing!" continued Serko in his sarcastic way.

"I did, until having been able to remove the bandage from my eyes, I perceived that I was in the tug."

"It was not the tug, but a boat of the same kind that had got through the tunnel."

"A submarine boat?" I ejaculate.

"Yes, and manned by persons whose mission was to kidnap you and Thomas Roch."

"Kidnap us?" I echo, continuing to feign surprise.

"And," adds Engineer Serko, "I want to know what you think about the matter."

"What I think about it? Well, it appears to me that there is only one plausible explanation possible. If the secret of your retreat has not been betrayed—and I cannot conceive how you could have been betrayed or what imprudence you or yours could have committed—my opinion is that this submarine boat was exploring the bottom of the sea in this neighborhood, that she must have found her way into the tunnel, that she rose to the surface of the lagoon, that her crew, greatly surprised to find themselves inside an inhabited cavern, seized hold of the first persons they came across, Thomas Roch and myself, and others as well perhaps, for of course I do not know—"
Engineer Serko has become serious again. Does he realize the inanity of the hypothesis I try to pass off on him? Does he think I know more than I will say? However this may be, he accepts my professed view, and says:

"In effect, Mr. Hart, it must have happened as you suggest, and when the stranger tried to make her way out through the tunnel just as the tug was entering, there was a collision—a collision of which she was the victim. But we are not the kind of people to allow our fellow-men to perish before our eyes. Moreover, the disappearance of Thomas Roch and yourself was almost immediately discovered. Two such valuable lives had to be saved at all hazards. We set to work. There are many expert divers among our men. They hastily donned their suits and descended to the bottom of the lagoon. They passed lines around the hull of the Sword—"

"The Sword?" I exclaim.

"That is the name we saw painted on the bow of the vessel when we raised her to the surface. What satisfaction we experienced when we recovered you—unconscious, it is true, but still breathing—and were able to bring you back to life! Unfortunately all our attentions to the officer who commanded the Sword, and to his crew were useless. The shock had torn open the after and middle compartments, and they paid with their lives the misfortune—due to chance, as you observe—of having discovered our mysterious retreat."

On learning that Lieutenant Davon and his companions are dead, my heart is filled with anguish; but to keep up my role—as they were persons with whom, presumably, I was not acquainted, and had never seen—I am careful not to display any emotion. I must, on no account, afford ground for the suspicion that there was any connivance between the commander of the Sword and me. For aught I know, Engineer Serko may have reason to be very skeptical about the discovery of the tunnel being accidental.

What, however, I am most concerned about is that the unlooked-for occasion to recover my liberty was lost. Shall I ever be afforded another chance? However this may be, my notice reached the English authorities of the archipelago, and they now know where Ker Karraje is to be found. When it is seen that the Sword does not return to Bermuda, there can be no doubt that another attempt will be made to get inside Back Cup, in which, had it not been for the inopportune return of the tug, I should no longer be a prisoner.

I have resumed my usual existence, and having allayed all mistrust, am permitted to wander freely about the cavern, as usual.

It is patent that the adventure has had no ill effect upon Thomas Roch. Intelligent nursing brought him around, as it did me. In full possession of his mental faculties he has returned to work, and spends the entire day in his laboratory.

The Ebba brought back from her last trip bales, boxes, and a quantity of objects of varied origin, and I conclude that a number of ships must have been pillaged during this marauding expedition.

The work on the trestles for Roch's engine goes steadily forward, and there are now no fewer than fifty engines. If Ker Karraje and Engineer Serko are under the necessity of defending Back Cup, three or four will be sufficient to render the island unapproachable, as they will cover a zone which no vessel could enter without being blown to pieces. And it occurs to me that they intend to put Back Cup in a state of defence after having argued as follows:

"If the appearance of the Sword in the lagoon was due to chance the situation remains unchanged, and no power, not even England, will think of seeking for the Sword inside the cavern. If, on the other hand, as the result of an incomprehensible revelation, it has been learned that Back Cup is become the retreat of Ker Karraje, if the expedition of the Sword was a first effort against the island, another of a different kind—either a bombardment from a distance, or an attack by a landing party—is to be expected. Therefore, ere we can quit Back Cup and carry away our plunder, we shall have to defend ourselves by means of Roch's fulgurator."

In my opinion the rascals must have gone on to reason still further in this wise:

"Is there any connection between the disclosure of our secret—if it was, and however it may have been made—and the double abduction from Healthful House? Is it known that Thomas Roch and his keeper are confined in Back Cup? Is it known that the abduction was effected in the interest of Ker Karraje? Have Americans, English, French, Germans, and Russians reason to fear that an attack in force against the island would be doomed to failure?"

Ker Karraje must know very well that these powers would not hesitate to attack him, however great the danger might be. The destruction of his lair is an urgent duty in the interest of public security and of humanity. After sweeping the West Pacific the pirate and his companions are infesting the West Atlantic, and must be wiped out at all costs.

In any case, it is imperative that the inhabitants of Back Cup should be on their guard. This fact is realized, and, from the day on which the Sword was destroyed, strict watch has been kept. Thanks to the new passage, they are able to hide among the rocks without having recourse to the submarine tunnel to get there, and day and night a dozen sentries are posted about the island. The moment a ship appears in sight the fact is at once made known inside the cavern.

Nothing occurs for some days, and the latter succeed each other with dreadful monotony. The pirates, however,
feel that Back Cup no longer enjoys its former security. Every moment an alarm from the sentries posted outside is expected. The situation is no longer the same since the advent of the Sword. Gallant Lieutenant Davon, gallant crew, may England, may the civilized nations, never forget that you have sacrificed your lives in the cause of humanity!

It is evident that now, however powerful may be their means of defence, even more powerful than a network of torpedoes, Engineer Serko and Captain Spade are filled with an anxiety that they vainly essay to dissemble. They hold frequent conferences together. Maybe they discuss the advisability of quitting Back Cup with their wealth, for they are aware that if the existence of the cavern is known means will be found to reduce it, even if the inmates have to be starved out.

This is, of course, mere conjecture on my part. What is essential to me is that they do not suspect me of having launched the keg that was so providentially picked up at Bermuda. Never, I must say, has Engineer Serko ever made any allusion to any such probability. No, I am not even suspected. If the contrary were the case I am sufficiently acquainted with Ker Karraje to know that he would long ago have sent me to rejoin Lieutenant Davon and the Sword at the bottom of the lagoon.

The winter tempests have set in with a vengeance. The wind howls though the hole in the roof, and rude gusts sweep through the forest of pillars producing sonorous sounds, so sonorous, so deep, that one might sometimes almost fancy they were produced by the firing of the guns of a squadron. Flocks of seabirds take refuge in the cavern from the gale, and at intervals, when it lulls, almost deafen us with their screaming.

It is to be presumed that in such weather the schooner will make no attempt to put to sea, for the stock of provisions is ample enough to last all the season. Moreover, I imagine the Count d'Artigas will not be so eager in future to show his Ebba along the American coast, where he risks being received, not, as hitherto, with the consideration due to a wealthy yachtsman, but in the manner Ker Karraje so richly merits.

It occurs to me that if the apparition of the Sword was the commencement of a campaign against the island, a question of great moment relative to the future of Back Cup arises.

Therefore, one day, prudently, so as not to excite any suspicion, I ventured to pump Engineer Serko about it. We were in the neighborhood of Thomas Roch's laboratory, and had been conversing for some time, when Engineer Serko touched upon the extraordinary apparition of an English submarine boat in the lagoon. On this occasion he seemed to incline to the view that it might have been a premeditated expedition against Ker Karraje.

"That is not my opinion," I replied, in order to bring him to the question that I wanted to put to him.

"Why?" he demanded.

"Because if your retreat were known a fresh attempt, if not to penetrate to the cavern, at least to destroy Back Cup, would ere this have been made."

"Destroy it!" cried Serko. "It would be a dangerous undertaking, in view of the means of defence of which we now dispose."

"They can know nothing about this matter, Mr. Serko. It is not imagined, either in the new world or the old, that the abduction from Healthful House was effected for your especial benefit, or that you have succeeded in coming to terms with Thomas Roch for his invention."

Engineer Serko made no response to this observation, which, for that matter, was unanswerable.

I continued:

"Therefore a squadron sent by the maritime powers who have an interest in breaking up this island would not hesitate to approach and shell it. Now, I argue from this that as this squadron has not yet appeared, it is not likely to come at all, and that nothing is known as to Ker Karraje's whereabouts, and you must admit that this hypothesis is the most cheerful one, as far as you are concerned."

"That may be," Engineer Serko replied, "but what is, is. Whether they are aware of the fact or no, if warships approach within five or six miles of this island they will be sunk before they have had time to fire a single shot!"

"Well, and what then?"

"What then? Why the probability is that no others would care to repeat the experiment."

"That, again, may be. But these warships would invest you beyond the dangerous zone, and the Ebba would not be able to put in to the ports she previously visited with the Count d'Artigas. In this event, how would you be able to provision the island?"

Engineer Serko remained silent.

This argument, which he must already have brooded over, was too logical to be refuted or dismissed, and I have an idea that the pirates contemplate abandoning Back Cup.

Nevertheless, not relishing being cornered, he continued:

"We should still have the tug, and what the Ebba could not do, this would."

"The tug?" I cried. "But if Ker Karraje's secrets are known, do you suppose the powers are not also aware of the existence of the Count d'Artigas' submarine boat?"
Engineer Serko looked at me suspiciously.
"Mr. Hart," he said, "you appear to me to carry your deductions rather far."
"I, Mr. Serko?"
"Yes, and I think you talk about all this like a man who knows more than he ought to."
This remark brought me up abruptly. It was evident that my arguments might give rise to the suspicion that I was not altogether irresponsible for the recent incident. Engineer Serko scrutinized me sharply as though he would read my innermost thoughts.
"Mr. Serko," I observed, "by profession, as well as by inclination, I am accustomed to reason upon everything. This is why I communicated to you the result of my reasoning, which you can take into consideration or not, as you like."

Thereupon we separate. But I fancy my lack of reserve may have excited suspicions which may not be easy to allay.

From this interview, however, I gleaned a precious bit of information, namely, that the dangerous zone of Roch's fulgurator is between five and six miles off. Perhaps, during the next equinoctial tides, another notice to this effect in another keg may also reach a safe destination.

But how many weary months to wait before the orifice of the tunnel will again be uncovered!

The rough weather continues, and the squalls are more violent than ever. Is it the state of the sea that delays another campaign against Back Cup? Lieutenant Davon certainly assured me that if his expedition failed, if the Sword did not return to St. George, another attempt under different conditions would be made with a view to breaking up this bandits' lair. Sooner or later the work of justice must be done, and Back Cup be destroyed, even though I may not survive its destruction.

Ah! why can I not go and breathe, if only for a single instant, the vivifying air outside? Why am I not permitted to cast one glance over the ocean towards the distant horizon of the Bermudas? My whole life is concentrated in one desire: to get through the tunnel in the wall and hide myself among the rocks. Perchance I might be the first to catch sight of the smoke of a squadron heading for the island.

This project, alas! is unrealizable, as sentries are posted day and night at each extremity of the passage. No one can enter it without Engineer Serko's authorization. Were I to attempt it, I should risk being deprived of my liberty to walk about the cavern, and even worse might happen to me.

Since our last conversation, Engineer Serko's attitude towards me has undergone a change. His gaze has lost its old-time sarcasm and is distrustful, suspicious, searching and as stern as Ker Karraje's.

November 17.--This afternoon there was a great commotion in the Beehive, and the men rushed out of their cells with loud cries.

I was reclining on my bed, but immediately rose and hurried out.

All the pirates were making for the passage, in front of which were Ker Karraje, Engineer Serko, Captain Spade, Boatswain Effrondat, Engine-driver Gibson and the Count d'Artigas' big Malay attendant.

I soon learn the reason for the tumult, for the sentries rush in with shouts of alarm.

Several vessels have been sighted to the northwest--warships steaming at full speed in the direction of Back Cup.
squadron is in view of Back Cup, and that his fulgurator will be employed to defend the island?

What is certain is that half a hundred engines, each charged with several pounds of the explosive and of the substance that ensures a trajectory superior to that of any other projectile, are ready for their work of destruction.

As to the deflagrator liquid, Thomas Roch has a certain number of phials of it, and--I know only too well--will not refuse to help Ker Karraje's pirates with it.

During these preparations night has come on. Only the lamps of the Beehive are lighted and a semi-obscurity reigns in the cavern.

I return to my cell. It is to my interest to keep out of the way as much as possible, for Engineer Serko's suspicions might be revived now that the squadron is approaching Back Cup.

But will the vessels sighted continue on their course in this direction? May they not be merely passing on their way to Bermuda? For an instant this doubt enters my mind. No, no, it cannot be! Besides, I have just heard Captain Spade declare that they are lying to in view of the island.

To what nation do they belong? Have the English, desirous of avenging the destruction of the Sword, alone undertaken the expedition? May not cruisers of other nations be with them? I know not, and it is impossible to ascertain. And what does it matter, after all, so long as this haunt is destroyed, even though I should perish in the ruins like the heroic Lieutenant Davon and his brave crew?

Preparations for defence continue with coolness and method under Engineer Serko's superintendence. These pirates are obviously certain that they will be able to annihilate their assailants as soon as the latter enter the dangerous zone. Their confidence in Roch's fulgurator is absolute. Absorbed by the idea that these warship are powerless against them, they think neither of the difficulties nor menaces held out by the future.

I surmise that the trestles have been set up on the northwest coast with the grooves turned to send the engines to the north, west, and south. On the east, as already stated, the island is defended by the chain of reefs that stretches away to the Bermudas.

About nine o'clock I venture out of my cell. They will pay little attention to me, and perhaps I may escape notice in the obscurity. Ah! if I could get through that passage and hide behind some rock, so that I could witness what goes on at daybreak! And why should I not succeed now that Ker Karraje, Engineer Serko, Captain Spade, and the pirates have taken their posts outside?

The shores of the lake are deserted, but the entrance to the passage is kept by Count d'Artigas' Malay. I saunter, without any fixed idea, towards Thomas Roch's laboratory. This reminds me of my compatriot. I am, on reflection, disposed to think that he knows nothing about the presence of a squadron off Back Cup. Probably not until the last moment will Engineer Serko apprise him of its proximity, not till he brusquely points out to him the vengeance he can accomplish.

Then I conceive the idea of enlightening Thomas Roch, myself, of the responsibility he is incurring and of revealing to him in this supreme hour the character of the men who want him to co-operate in their criminal projects.

Yes, I will, attempt it, and may I succeed in fanning into a flame any spark of patriotism that may still linger in his rebellious soul!

Roch is shut up in his laboratory. He must be alone, for never does he allow any one to enter while he is preparing his deflagrator.

As I pass the jetty I notice that the tug is moored in its accustomed place. Here I judge it prudent to walk behind the first row of pillars and approach the laboratory laterally--which will enable me to see whether anybody is with him. When I have gone a short distance along the sombre avenue I see a bright light on the opposite side of the lagoon. It is the electric light in Roch's laboratory as seen through a narrow window in the front.

Except in that particular spot, the southern shore of the lake is in darkness, whereas, in the opposite direction, the Beehive is lit up to its extremity at the northern wall. Through the opening in the dome, over the lake I can see the stars shining. The sky is clear, the tempest has abated, and the squalls no longer penetrate to the interior of Back Cup.

When near the laboratory, I creep along the wall and peep in at the window.

Thomas Roch is there alone. The light shines full on his face. If it is somewhat drawn, and the lines on the forehead are more pronounced, his physiognomy, at least, denotes perfect calmness and self-possession. No, he is no longer the inmate of Pavilion No. 17, the madman of Healthful House, and I ask myself whether he is not radically cured, whether there is no further danger of his reason collapsing in a final paroxysm.

He has just laid two glass phials upon the table, and holds a third in his hand. He holds it up to the light, and observes the limpidity of the liquid it contains.

I have half a mind to rush in, seize the tubes and smash them, but I reflect that he would have time to make some more of the stuff. Better stick to my first plan.

I push the door open and enter.
"Thomas Roch!" I exclaim.
He has not heard, nor has he seen me.
"Thomas Roch!" I repeat.
He raises his head, turns and gazes at me.
"Ah! it is you, Simon Hart!" he replies calmly, even indifferently.
He knows my name. Engineer Serko must have informed him that it was Simon Hart, and not Keeper Gaydon who was watching over him at Healthful House.
"You know who I am?" I say.
"Yes, as I know what your object was in undertaking such a position. You lived in hopes of surprising a secret that they would not pay for at its just value!"

Thomas Roch knows everything, and perhaps it is just as well, in view of what I am going to say.
"Well, you did not succeed, Simon Hart, and as far as this is concerned," he added, flourishing the phial, "no one else has succeeded, or ever will succeed."

As I conjectured, he has not, then, made known the composition of his deflagrator. Looking him straight in the face, I reply:
"You know who I am, Thomas Roch, but do you know in whose place you are?"
"In my own place!" he cries.
That is what Ker Karraje has permitted him to believe. The inventor thinks he is at home in Back Cup, that the riches accumulated in this cavern are his, and that if an attack is made upon the place, it will be with the object of stealing what belongs to him! And he will defend it under the impression that he has the right to do so!

"Thomas Roch," I continue, "listen to me."
"What do you want to say to me, Simon Hart?"
"This cavern into which we have been dragged, is occupied by a band of pirates, and--"
Roch does not give me time to complete the sentence--I doubt even whether he has understood me.
"I repeat," he interrupts vehemently, "that the treasures stored here are the price of my invention. They have paid me what I asked for my fulgurator--what I was everywhere refused--even in my own country--which is also yours--and I will not allow myself to be despoiled!

What can I reply to such insensate assertions? I, however, go on:
"Thomas Roch, do you remember Healthful House?"
"Healthful House, where I was sequestrated after Warder Gaydon had been entrusted with the mission of spying upon me in order to rob me of my secret? I do, indeed."
"I never dreamed of depriving you of the benefit of your secret, Thomas Roch. I would never have accepted such a mission. But you were ill, your reason was affected, and your invention was too valuable to be lost. Yes, had you disclosed the secret during one of your fits you would have preserved all the benefit and all the honor of it."
"Really, Simon Hart!" Roch replies disdainfully. "Honor and benefit! Your assurances come somewhat late in the day. You forget that on the pretext of insanity, I was thrown into a dungeon. Yes, it was a pretext; for my reason has never left me, even for an hour, as you can see from what I have accomplished since I am free."

"Free! Do you imagine you are free, Thomas Roch? Are you not more closely confined within the walls of this cavern than you ever were at Healthful House?"
"A man who is in his own home," he replies angrily, "goes out as he likes and when he likes. I have only to say the word and all the doors will open before me. This place is mine. Count d'Artigas gave it to me with everything it contains. Woe to those who attempt to attack it. I have here the wherewithal to annihilate them, Simon Hart!" The inventor waves the phial feverishly as he speaks.
"The Count d'Artigas has deceived you," I cry, "as he has deceived so many others. Under this name is dissembled one of the most formidable monsters who ever scoured the Pacific and Atlantic oceans. He is a bandit steeped in crime--he is the odious Ker Karraje!"
"Ker Karraje!" echoes Thomas Roch.

And I wonder if this name has not impressed him, if he remembers who the man is who bears it. If it did impress him, it was only momentarily.
"I do not know this Ker Karraje," he says, pointing towards the door to order me out. "I only know the Count d'Artigas."
"Thomas Roch," I persist, in a final effort, "the Count d'Artigas and Ker Karraje are one and the same person. If this man has purchased your secret, it is with the intention of ensuring impunity for his crimes and facilities for committing fresh ones. He is the chief of these pirates."
"Pirates!" cries Roch, whose irritation increases the more I press him. "The real pirates are those who dare to menace me even in this retreat, who tried it on with the Sword--for Serko has told me everything--who sought to
steal in my own home what belongs to me, what is but the just price of my discovery."

"No, Thomas Roch, the pirates are those who have imprisoned you in this cavern of Back Cup, who will utilize your genius to defend it, and who will get rid of you when they are in entire possession of your secrets!"

Thomas Roch here interrupts me. He does not appear to listen to what I say. He has a fixed idea, that of vengeance, which has been skilfully worked upon by Engineer Serko, and in which his hatred is concentrated to the exclusion of everything else.

"The bandits," he hisses, "are those who spurned me without a hearing, who heaped injustice and ignominy upon me, who drove me from country to country, whereas I offered them superiority, invincibleness, omnipotence!"

It is the eternal story of the unappreciated inventor, to whom the indifferent or envious refuse the means of testing his inventions, to pay him the value he sets upon them. I know it well—and also know all the exaggeration that has been written upon this subject.

It is clearly no time for reasoning with Thomas Roch. My arguments are entirely lost upon the hapless dupe of Ker Karraje and his accomplices. In revealing to him the real name of the Count d'Artigas, and denouncing to him this band and their chief I had hoped to wean him from their influence and make him realize the criminal end they have in view. My hope was vain. He does not believe me. And then what does he care whether the brigand's name is Count d'Artigas or Ker Karraje? Is not he, Thomas Roch, master of Back Cup? Is he not the owner of these riches accumulated by twenty years of murder and rapine?

Disarmed before such moral degeneracy, knowing not how I can touch his ulcerated, irresponsible heart, I turn towards the door. It only remains for me to withdraw. What is to be, will be, since it is out of my power to prevent the frightful dénouement that will occur in a few hours.

Thomas Roch takes no more notice of me. He seems to have forgotten that I am here. He has resumed his manipulations without realizing that he is not alone.

There is only one means of preventing the imminent catastrophe. Throw myself upon Roch, place him beyond the power of doing harm—strike him—kill him—yes, kill him! It is my right—it is my duty!

I have no arms, but on a near-by shelf I see some tools—a chisel and a hammer. What is to prevent me from knocking his brains out? Once he is dead I have but to smash the phials and his invention dies with him. The warships can approach, land their men upon the island, demolish Back Cup with their shells. Ker Karraje and his band will be killed to a man. Can I hesitate at a murder that will bring about the chastisement of so many crimes?

I advance to the shelf and stretch forth my hand to seize the chisel.

As I do so, Thomas Roch turns round.

It is too late to strike. A struggle would ensue. The noise and his cries would be heard, for there are still some pirates not far off, I can even now hear some one approaching, and have only just time to fly if I would not be seen.

Nevertheless, I make one last attempt to awaken the sentiment of patriotism within him.

"Thomas Roch," I say, "warships are in sight. They have come to destroy this lair. Maybe one of them flies the French flag!"

He gazes at me. He was not aware that Back Cup is going to be attacked, and I have just apprised him of the fact. His brow darkens and his eyes flash.

"Thomas Roch, would you dare to fire upon your country's flag--the tricolor flag?"

He raises his head, shakes it nervously, and with a disdainful gesture:

"What do you mean by 'your country'? I no longer have any country, Simon Hart. The inventor spurned no longer has a country. Where he finds an asylum, there is his fatherland! They seek to take what is mine. I will defend it, and woe, woe to those who dare to attack me!"

Then rushing to the door of the laboratory and throwing it violently open he shouts so loudly that he must be heard at the Beehive:

"Go! Get you gone!"

I have not a second to lose, and I dash out.

CHAPTER XVII.
ONE AGAINST FIVE.

For a whole hour I wander about among Back Cup's dark vaults, amid the stone trees, to the extreme limit of the cavern. It is here that I have so often sought an issue, a crevice, a crack through which I might squeeze to the shore of the island.

My search has been futile. In my present condition, a prey to indefinable hallucinations it seems to me that these walls are thicker than ever, that they are gradually closing in upon and will crush me.

How long this mental trouble lasts I cannot say. But I afterwards find myself on the Beehive side, opposite the
cell in which I cannot hope for either repose or sleep. Sleep, when my brain is in a whirl of excitement? Sleep, when I am near the end of a situation that threatened to be prolonged for years and years?

What will the end be as far as I am personally concerned? What am I to expect from the attack upon Back Cup, the success of which I have been unable to assure by placing Thomas Roch beyond the possibility of doing harm? His engines are ready to be launched, and as soon as the vessels have reached the dangerous zone they will be blown to atoms.

However this may be, I am condemned to pass the remaining hours of the night in my cell. The time has come for me to go in. At daybreak I shall see what is best for me to do. Meanwhile, for aught I know I may hear the thunder of Roch's fulgurator as it destroys the ships approaching to make a night attack.

I take a last look round. On the opposite side a light, a single light, is burning. It is the lamp in Roch's laboratory and it casts its reflection upon the waters of the lake.

No one is about, and it occurs to me that the pirates must have taken up their lighting positions outside and that the Beehive is empty.

Then, impelled by an irresistible instinct, instead of returning to my cell, I creep along the wall, listening, spying, ready to hide if I hear voices or footsteps.

I at length reach the passage.

God in heaven! No one is on guard there--the passage is free!

Without giving myself time to reflect I dart into the dark hole, and grope my way along it. Soon I feel a fresher air--the salt, vivifying air of the sea, that I have not breathed for five months. I inspire it with avidity, with all the power of my lungs.

The outer extremity of the passage appears against the star-studded sky. There is not even a shadow in the way. Perhaps I shall be able to get outside.

I lay down, and crawl along noiselessly to the orifice and peer out.

Not a soul is in sight!

By skirting the rocks towards the east, to the side which cannot be approached from the sea on account of the reefs and which is not likely to be watched, I reach a narrow excavation about two hundred and twenty-five yards from where the point of the coast extends towards the northwest.

At last I am out of the cavern. I am not free, but it is the beginning of freedom.

On the point the forms of a few sentries stand out against the clear sky, so motionless that they might be mistaken for pieces of the rock.

On the horizon to the west the position lights of the warship show in a luminous line.

From a few gray patches discernable in the east, I calculate that it must be about five o'clock in the morning.

November 18.--It is now light enough for me to be able to complete my notes relating the details of my visit to Thomas Roch's laboratory--the last lines my hand will trace, perhaps.

I have begun to write, and shall dot down the incidents of the attack as they occur.

The light damp mist that hangs over the water soon lifts under the influence of the breeze, and at last I can distinguish the warships.

There are five of them, and they are lying in a line about six miles off, and consequently beyond the range of Roch's engines.

My fear that after passing in sight of the Bermudas the squadron would continue on its way to the Antilles or Mexico was therefore unfounded. No, there it is, awaiting broad daylight in order to attack Back Cup.

There is a movement on the coast. Three or four pirates emerge from the rocks, the sentries are recalled and draw in, and the entire band is soon assembled. They do not seek shelter inside the cavern, knowing full well that the ships can never get near enough for the shells of the big guns to reach, the island.

I run no risk of being discovered, for only my head protrudes above the hole in the rock and no one is likely to come this way. The only thing that worries me is that Serko, or somebody else may take it into his head to see if I am in my cell, and if necessary to lock me in, though what they have to fear from me I cannot conceive.

At twenty-five minutes past seven: Ker Karraje, Engineer Serko and Captain Spade advance to the extremity of the point, where they sweep the north-western horizon with their telescopes. Behind them the six trestles are installed, in the grooves of which are Roch's autopropulsive engines.

Thirty-five minutes past seven: Smoke arises from the stacks of the warships, which are getting under way and will soon be within range of the engines.

Horrible cries of joy, salvos of hurrahs--howls of wild beasts I might more appropriately say--arise from the pirate horde.

At this moment Engineer Serko quits Ker Karraje, whom he leaves with Captain Spade, and enters the cavern, no doubt to fetch Thomas Roch.
When Ker Karraje orders the latter to launch his engines against the ships will he remember what I told him? Will not his crime appear to him in all its horror? Will he refuse to obey? No, I am only too convinced of the contrary. It is useless to entertain any illusion on the subject. The inventor believes he is on his own property. They are going to attack it. He will defend it.

The five warships slowly advance, making for the point. Perhaps they imagine on board that Thomas Roch has not given up his last and greatest secret to the pirates—and, as a matter of fact, he had not done so when I threw the keg into the lagoon. If the commanders propose to land storming parties and the ships advance into the zone of danger there will soon be nothing left of them but bits of shapeless floating wreckage.

Here comes Thomas Roch accompanied by Engineer Serko. On issuing from the passage both go to the trestle that is pointing towards the leading warship.

Ker Karraje and Captain Spade are awaiting them.

As far as I am able to judge, Roch is calm. He knows what he is going to do. No hesitation troubles the soul of the hapless man whom hatred has led astray.

Between his fingers shines the glass phial containing the deflagrator liquid.

He then gazes towards the nearest ship, which is about five miles distant.

She is a cruiser of about two thousand five hundred tons—not more.

She flies no flag, but from her build I take her to belong to a nation for which no Frenchman can entertain any particular regard.

The four other warships remain behind.

It is this cruiser which is to begin the attack.

Let her use her guns, then, since the pirates allow her to approach, and may the first of her projectiles strike Thomas Roch!

While Engineer Serko is estimating the distance, Roch places himself behind the trestle. Three engines are resting on it, charged with the explosive, and which are assured a long trajectory by the fusing matter without it being necessary to impart a gyratory movement to them—as in the case of Inventor Turpin's gyroscopic projectiles. Besides, if they drop within a few hundred yards of the vessel, they will be quite near enough to utterly destroy it.

The time has come.

"Thomas Roch!" Engineer Serko cries, and points to the cruiser.

The latter is steaming slowly towards the northwestern point of the island and is between four and five miles off. Roch nods assent, and waves them back from the trestle.

Ker Karraje, Captain Spade and the others draw back about fifty paces.

Thomas Roch then takes the stopper from the phial which he holds in his right hand, and successively pours into a hole in the rear-end of each engine a few drops of the liquid, which mixes with the fusing matter.

Forty-five seconds elapse—the time necessary for the combination to be effected—forty-five seconds during which it seems to me that my heart ceases to beat.

A frightful whistling is then heard, and the three engines tear through the air, describing a prolonged curve at a height of three hundred feet, and pass the cruiser.

Have they missed it? Is the danger over?

No! the engines, after the manner of Artillery Captain Chapel's discoid projectile, return towards the doomed vessel like an Australian boomerang.

The next instant the air is shaken with a violence comparable to that which would be caused by the explosion of a magazine of melinite or dynamite, Back Cup Island trembles to its very foundations.

The cruiser has disappeared,—blown to pieces. The effect is that of the Zalinski shell, but centupled by the infinite power of Roch's fulgurator.

What shouts the bandits raise as they rush towards the extremity of the point! Ker Karraje, Engineer Serko, and Captain Spade remain rooted to the spot, hardly able to credit the evidence of their own eyes.

As to Thomas Roch, he stands with folded arms, and flashing eyes, his face radiant with pride and triumph.

I understand, while I abhor his feelings.

If the other warships approach they will share the same fate as the cruiser. They will inevitably be destroyed. Oh! if they would but give up the struggle and withdraw to safety, even though my last hope would go with them! The nations can consult and arrive at some other plan for destroying the island. They can surround the place with a belt of ships that the pirates cannot break through and starve them to death like so many rats in a hole.

But I know that the warships will not retire, even though they know they are going to certain death. One after the other they will all make the attempt.

And I am right. Signals are exchanged between them. Almost immediately clouds of black smoke arise and the vessels again advance.
One of them, under forced draught, distances the others in her anxiety to bring her big guns quickly into action. At all risks I issue from my hole, and gaze at the on-coming warship with feverish eyes, awaiting, without being able to prevent it, another catastrophe.

This vessel, which visibly grows larger as it comes nearer, is a cruiser of about the same tonnage as the one that preceded her. No flag is flying and I cannot guess her nationality. She continues steaming at full speed in an effort to pass the zone of danger before other engines can be launched. But how can she escape them since they will swoop back upon her?

Thomas Roch places himself behind the second trestle as the cruiser passes on to the surface of the abysm in which she will in turn soon be swallowed up.

No sound disturbs the stillness. Suddenly the rolling of drums and the blare of bugles is heard on board the warship.

I know those bugle calls: they are French bugles! Great God! She is one of the ships of my own country's navy and a French inventor is about to destroy her!

No! it shall not be. I will rush towards Thomas Roch—shout to him that she is a French ship. He does not, cannot, know it.

At a sign from Engineer Serko the inventor has raised the phial. The bugles sound louder and more strident. It is the salute to the flag. A flag unfurls to the breeze—the tricolor, whose blue, white and red sections stand out luminously against the sky.

Ah! What is this? I understand! Thomas Roch is fascinated at the sight of his national emblem. Slowly he lowers his arm as the flag flutters up to the mast-head. Then he draws back and covers his eyes with his hand.

Heavens above! All sentiment of patriotism is not then dead in his ulcerated heart, seeing that it beats at the sight of his country's flag!

My emotion is not less than his. At the risk of being seen—and what do I now care if I am seen?—I creep over the rocks. I will be there to sustain Thomas Roch and prevent him from weakening. If I pay for it with my life I will once more adjure him in the name of his country. I will cry to him:

"Frenchman, it is the tricolor that flies on yonder ship! Frenchman, it is a very part of France that is approaching you! Frenchman, would you be so criminal as to strike it?"

But my intervention will not be necessary. Thomas Roch is not a prey to one of the fits to which he was formerly subject. He is perfectly sane.

When he found himself facing the flag he understood—and drew back.

A few pirates approach to lead him to the trestle again. He struggles and pushes them from him. Ker Karraje and Engineer Serko run up. They point to the rapidly advancing ship. They order him to launch his engines.

Thomas Roch refuses. Captain Spade and the others, mad with rage, menace him—curse him—strike him—try to wrest the phial from him.

Roch throws it on the ground and crushes it under foot. Then panic seizes upon the crowd of wretches. The cruiser has passed the zone and they cannot return her fire. Shells begin to rain all over the island, bursting the rocks in every direction.

But where is Thomas Roch? Has he been killed by one of the projectiles? No, I see him for the last time as he dashes into the passage.

Ker Karraje, Engineer Serko and the others follow him to seek shelter inside of Back Cup.

I will not return to the cavern at any price, even if I get killed by staying where I am. I will jot down my final notes and when the French sailors land on the point I will go—

END OF ENGINEER SIMON HART'S NOTES.

CHAPTER XVIII.

ON BOARD THE "TONNANT."

After the failure of Lieutenant Davon's mission with the Sword, the English authorities waited in vain for the expedition to return, and the conviction at length gained ground that the bold sailors had perished; but whether the Sword had been lost by striking against a rock or had been destroyed by Ker Karraje's pirates, could not, of course, be ascertained.

The object of the expedition, based upon the indications of the document found in the keg that was thrown up on the shore at St. George, was to carry off Thomas Roch ere his engines were completed. The French inventor having been recovered—without forgetting Engineer Simon Hart—he was to be handed over to the care of the Bermudan
authorities. That done, there would be nothing to fear from his fulgurator when the island was attacked.

When, however, the Sword had been given up for lost, another expedition of a different kind, was decided upon.
The time that had elapsed--nearly eight weeks--from the date of the document found in the keg, had to be taken
into consideration. It was thought that during the interval, Ker Karraje might have gained possession of Roch's
secrets.

An entente concluded between the maritime powers, resulted in the sending of five warships to Bermudan
waters. As there was a vast cavern inside Back Cup mountain, it was decided to attempt to bring the latter down like
the walls of a bastion, by bombarding it with powerful modern artillery.

The squadron assembled at the entrance to the Chesapeake, in Virginia, and sailed for the archipelago, which
was sighted on the evening of November 17.
The next morning the vessel selected for the first attack, steamed forward. It was about four and a half miles
from the island, when three engines, after passing the vessel, swerved round and exploded about sixty yards from
her. She sank immediately.
The effect of the explosion, which was superior to any previously obtained by new explosives, was
instantaneous. Even at the distance they were from the spot where it occurred, the four remaining ships felt the
shock severely.

Two things were to be deduced from this sudden catastrophe:
1.--The pirate Ker Karraje was in possession of Roch's fulgurator.
2.--The new engine possessed the destructive power attributed to it by its inventor.

After the disappearance of the unfortunate cruiser, the other vessels lowered boats to pick up a few survivors
who were clinging to the floating wreckage.

Then it was that the signals were exchanged and the warships started towards the island.
The swiftest of them, the Tonnant, a French cruiser, forged ahead while the others forced their draught in an
effort to catch up with her.
The Tonnant, at the risk of being blown to pieces in turn, penetrated the danger zone half a mile, and then ran up
her flag while manoeuvring to bring her heavy guns into action.

From the bridge the officers could see Ker Karraje's band scattered on the rocks of the island.
The occasion was an excellent one for getting a shot at them before the bombardment of their retreat was begun,
and fire was opened with the result that the pirates made a rush to get into the cavern.

A few minutes later there was a shock terrific enough to shake the sky down.

Where the mountain had been, naught but a heap of smoking, crumbling rocks was to be seen. Back Cup had
become a group of jagged reefs against which the sea, that had been thrown back like a gigantic tidal wave, was
beating and frothing.

What was the cause of the explosion?
Had it been voluntarily caused by the pirates when they realized that escape was impossible?
The Tonnant had not been seriously damaged by the flying rocks. Her boats were lowered and made towards all
that was left of Back Cup.
The landing parties explored the ruins, and found a few horribly mangled corpses. Not a vestige of the cavern
was to be seen.

One body, and one only, was found intact. It was lying on the northeast side of the reefs. In one hand, tightly
clapsed, was a note-book, the last line of which was incomplete.

A close examination showed that the man was still breathing. He was conveyed on board the Tonnant, where it
was learned from the note-book that he was Simon Hart.

For some time his life was despaired of, but he was eventually brought round, and from the answers made to the
questions addressed to him the following conclusion was reached:

Moved to his very soul at the sight of the tricolor flag, being at last conscious of the crime of lèse-patrie he was
about to commit, Thomas Roch rushed through the passage to the magazine where a considerable quantity of his
explosive was stored. Then, before he could be prevented, brought about the terrible explosion which destroyed the
island of Back Cup.

And now Ker Karraje and his pirates have disappeared--and with them Thomas Roch and the secret of his
invention.

THE END.
End of the Voyage Extraordinaire

FIVE WEEKS IN A BALLOON;
OR,
CHAPTER FIRST.

The End of a much-applauded Speech.--The Presentation of Dr. Samuel Ferguson.--Excelsior.--Full-length Portrait of the Doctor.--A Fatalist convinced.--A Dinner at the Travellers' Club.--Several Toasts for the Occasion.

There was a large audience assembled on the 14th of January, 1862, at the session of the Royal Geographical Society, No. 3 Waterloo Place, London. The president, Sir Francis M----, made an important communication to his colleagues, in an address that was frequently interrupted by applause.

This rare specimen of eloquence terminated with the following sonorous phrases bubbling over with patriotism:

"England has always marched at the head of nations" (for, the reader will observe, the nations always march at the head of each other), "by the intrepidity of her explorers in the line of geographical discovery." (General assent).

"Dr. Samuel Ferguson, one of her most glorious sons, will not reflect discredit on his origin." ("No, indeed!" from all parts of the hall.)

"This attempt, should it succeed" ("It will succeed!")", will complete and link together the notions, as yet disjointed, which the world entertains of African cartology" (vehement applause); "and, should it fail, it will, at least, remain on record as one of the most daring conceptions of human genius!" (Tremendous cheering.)

"Huzza! huzza!" shouted the immense audience, completely electrified by these inspiring words.

"Huzza for the intrepid Ferguson!" cried one of the most excitable of the enthusiastic crowd.

The wildest cheering resounded on all sides; the name of Ferguson was in every mouth, and we may safely believe that it lost nothing in passing through English throats. Indeed, the hall fairly shook with it.

And there were present, also, those fearless travellers and explorers whose energetic temperaments had borne them through every quarter of the globe, many of them grown old and worn out in the service of science. All had, in some degree, physically or morally, undergone the sorest trials. They had escaped shipwreck; conflagration; Indian tomahawks and war-clubs; the fagot and the stake; nay, even the cannibal maws of the South Sea Islanders. But still their hearts beat high during Sir Francis M----'s address, which certainly was the finest oratorical success that the Royal Geographical Society of London had yet achieved.

But, in England, enthusiasm does not stop short with mere words. It strikes off money faster than the dies of the Royal Mint itself. So a subscription to encourage Dr. Ferguson was voted there and then, and it at once attained the handsome amount of two thousand five hundred pounds. The sum was made commensurate with the importance of the enterprise.

A member of the Society then inquired of the president whether Dr. Ferguson was not to be officially introduced.

"The doctor is at the disposition of the meeting," replied Sir Francis.

"Let him come in, then! Bring him in!" shouted the audience. "We'd like to see a man of such extraordinary daring, face to face!"

"Perhaps this incredible proposition of his is only intended to mystify us," growled an apoplectic old admiral.

"Suppose that there should turn out to be no such person as Dr. Ferguson?" exclaimed another voice, with a malicious twang.

"Why, then, we'd have to invent one!" replied a facetious member of this grave Society.

"Ask Dr. Ferguson to come in," was the quiet remark of Sir Francis M----.

And come in the doctor did, and stood there, quite unmoved by the thunders of applause that greeted his appearance.

He was a man of about forty years of age, of medium height and physique. His sanguine temperament was disclosed in the deep color of his cheeks. His countenance was coldly expressive, with regular features, and a large nose--one of those noses that resemble the prow of a ship, and stamp the faces of men predestined to accomplish great discoveries. His eyes, which were gentle and intelligent, rather than bold, lent a peculiar charm to his physiognomy. His arms were long, and his feet were planted with that solidity which indicates a great pedestrian.

A calm gravity seemed to surround the doctor's entire person, and no one would dream that he could become the agent of any mystification, however harmless.

Hence, the applause that greeted him at the outset continued until he, with a friendly gesture, claimed silence on his own behalf. He stepped toward the seat that had been prepared for him on his presentation, and then, standing erect and motionless, he, with a determined glance, pointed his right forefinger upward, and pronounced aloud the
Never had one of Bright's or Cobden's sudden onslaughts, never had one of Palmerston's abrupt demands for funds to plate the rocks of the English coast with iron, made such a sensation. Sir Francis M----'s address was completely overshadowed. The doctor had shown himself moderate, sublime, and self-contained, in one; he had uttered the word of the situation--

"Excelsior!"

The gouty old admiral who had been finding fault, was completely won over by the singular man before him, and immediately moved the insertion of Dr. Ferguson's speech in "The Proceedings of the Royal Geographical Society of London."

Who, then, was this person, and what was the enterprise that he proposed?

Ferguson's father, a brave and worthy captain in the English Navy, had associated his son with him, from the young man's earliest years, in the perils and adventures of his profession. The fine little fellow, who seemed to have never known the meaning of fear, early revealed a keen and active mind, an investigating intelligence, and a remarkable turn for scientific study; moreover, he disclosed uncommon address in extricating himself from difficulty; he was never perplexed, not even in handling his fork for the first time—an exercise in which children generally have so little success.

His fancy kindled early at the recitals he read of daring enterprise and maritime adventure, and he followed with enthusiasm the discoveries that signalized the first part of the nineteenth century. He mused over the glory of the Mungo Parks, the Bruces, the Caillies, the Levaillants, and to some extent, I verily believe, of Selkirk (Robinson Crusoe), whom he considered in no wise inferior to the rest. How many a well-employed hour he passed with that hero on his isle of Juan Fernandez! Often he criticised the ideas of the shipwrecked sailor, and sometimes discussed his plans and projects. He would have done differently, in such and such a case, or quite as well at least--of that he felt assured. But of one thing he was satisfied, that he never should have left that pleasant island, where he was as happy as a king without subjects—no, not if the inducement held out had been promotion to the first lordship in the admiralty!

It may readily be conjectured whether these tendencies were developed during a youth of adventure, spent in every nook and corner of the Globe. Moreover, his father, who was a man of thorough instruction, omitted no opportunity to consolidate this keen intelligence by serious studies in hydrography, physics, and mechanics, along with a slight tincture of botany, medicine, and astronomy.

Upon the death of the estimable captain, Samuel Ferguson, then twenty-two years of age, had already made his voyage around the world. He had enlisted in the Bengalese Corps of Engineers, and distinguished himself in several affairs; but this soldier's life had not exactly suited him; caring but little for command, he had not been fond of obedience. He, therefore, sent in his resignation, and half botanizing, half playing the hunter, he made his way toward the north of the Indian Peninsula, and crossed it from Calcutta to Surat—a mere amateur trip for him.

From Surat we see him going over to Australia, and in 1845 participating in Captain Sturt's expedition, which had been sent out to explore the new Caspian Sea, supposed to exist in the centre of New Holland.

Samuel Ferguson returned to England about 1850, and, more than ever possessed by the demon of discovery, he spent the intervening time, until 1853, in accompanying Captain McClure on the expedition that went around the American Continent from Behring's Straits to Cape Farewell.

Notwithstanding fatigues of every description, and in all climates, Ferguson's constitution continued marvellously sound. He felt at ease in the midst of the most complete privations; in fine, he was the very type of the thoroughly accomplished explorer whose stomach expands or contracts at will; whose limbs grow longer or shorter according to the resting-place that each stage of a journey may bring; who can fall asleep at any hour of the day or awake at any hour of the night.

Nothing, then, was less surprising, after that, than to find our traveller, in the period from 1855 to 1857, visiting the whole region west of the Thibet, in company with the brothers Schlagintweit, and bringing back some curious ethnographic observations from that expedition.

During these different journeys, Ferguson had been the most active and interesting correspondent of the Daily Telegraph, the penny newspaper whose circulation amounts to 140,000 copies, and yet scarcely suffices for its many legions of readers. Thus, the doctor had become well known to the public, although he could not claim membership in either of the Royal Geographical Societies of London, Paris, Berlin, Vienna, or St. Peters burg, or yet with the Travellers' Club, or even the Royal Polytechnic Institute, where his friend the statistician Cockburn ruled in state.

The latter savant had, one day, gone so far as to propose to him the following problem: Given the number of miles travelled by the doctor in making the circuit of the Globe, how many more had his head described than his feet, by reason of the different lengths of the radii?—or, the number of miles traversed by the doctor's head and feet...
respectively being given, required the exact height of that gentleman?

This was done with the idea of complimenting him, but the doctor had held himself aloof from all the learned bodies—belonging, as he did, to the church militant and not to the church polemical. He found his time better employed in seeking than in discussing, in discovering rather than discoursing.

There is a story told of an Englishman who came one day to Geneva, intending to visit the lake. He was placed in one of those odd vehicles in which the passengers sit side by side, as they do in an omnibus. Well, it so happened that the Englishman got a seat that left him with his back turned toward the lake. The vehicle completed its circular trip without his thinking to turn around once, and he went back to London delighted with the Lake of Geneva.

Doctor Ferguson, however, had turned around to look about him on his journeyings, and turned to such good purpose that he had seen a great deal. In doing so, he had simply obeyed the laws of his nature, and we have good reason to believe that he was, to some extent, a fatalist, but of an orthodox school of fatalism withal, that led him to rely upon himself and even upon Providence. He claimed that he was impelled, rather than drawn by his own volition, to journey as he did, and that he traversed the world like the locomotive, which does not direct itself, but is guided and directed by the track it runs on.

"I do not follow my route;" he often said, "it is my route that follows me."

The reader will not be surprised, then, at the calmness with which the doctor received the applause that welcomed him in the Royal Society. He was above all such trifles, having no pride, and less vanity. He looked upon the proposition addressed to him by Sir Francis M---- as the simplest thing in the world, and scarcely noticed the immense effect that it produced.

When the session closed, the doctor was escorted to the rooms of the Travellers' Club, in Pall Mall. A superb entertainment had been prepared there in his honor. The dimensions of the dishes served were made to correspond with the importance of the personage entertained, and the boiled sturgeon that figured at this magnificent repast was not an inch shorter than Dr. Ferguson himself.

Numerous toasts were offered and quaffed, in the wines of France, to the celebrated travellers who had made their names illustrious by their explorations of African territory. The guests drank to their health or to their memory, in alphabetical order, a good old English way of doing the thing. Among those remembered thus, were: Abbadie, Adams, Adamson, Anderson, Arnaud, Baikie, Baldwin, Barth, Batouda, Beke, Beltram, Du Berba, Bimbachi, Bolognesi, Bolwik, Belzoni, Bonnemain, Brisson, Browne, Bruce, Brun-Rollet, Burchell, Burckhardt, Burton, Cailland, Caillie, Campbell, Chapman, Clapperton, Clot-Bey, Colombieu, Courval, Cumming, Cuny, Debono, Decken, Denham, Desavanchers, Dickson, Dickson, Dochard, Du Chaillu, Duncan, Durand, Duroule, Duveyrier, D'Escayrac, De Lauture, Erhardt, Ferret, Fresnel, Galinier, Galton, Geoffroy, Golberry, Hahn, Halm, Harnier, Hecquart, Heuglin, Hornemann, Houghton, Imbert, Kauffmann, Knoblecher, Krapf, Kummer, Lafargue, Laing, Lafaille, Lambert, Lamiral, Lampriere, John Lander, Richard Lander, Lefebvre, Lejean, Levaillet, Livingstone, MacCarthy, Maggier, Maizan, Malzac, Moffat, Mollien, Monteiro, Morrison, Mungo Park, Neimans, Overweg, Panet, Partarrieau, Pascal, Pearse, Peddie, Penney, Petherick, Poncet, Prax, Raffenen, Rahb, Rehmann, Richardson, Riley, Ritchey, Rochet d'Héricourt, Rongawi, Roscher, Ruppel, Saugnier, Speke, Steidner, Thibaud, Thompson, Thornton, Toole, Tousny, Trotter, Tuckey, Tyrwhitt, Vaudey, Veyssiere, Vincent, Vinco, Vogel, Wahlberg, Warrington, Washington, Werne, Wild, and last, but not least, Dr. Ferguson, who, by his incredible attempt, was to link together the achievements of all these explorers, and complete the series of African discovery.

CHAPTER SECOND.

The Article in the Daily Telegraph.--War between the Scientific Journals.-- Mr. Petermann backs his Friend Dr. Ferguson.--Reply of the Savant Koner. --Bets made.--Sundry Propositions offered to the Doctor.

On the next day, in its number of January 15th, the Daily Telegraph published an article couched in the following terms:

"Africa is, at length, about to surrender the secret of her vast solitudes; a modern OEdipus is to give us the key to that enigma which the learned men of sixty centuries have not been able to decipher. In other days, to seek the sources of the Nile—fontes Nili quoerere—was regarded as a mad endeavor, a chimera that could not be realized.

"Dr. Barth, in following out to Soudan the track traced by Denham and Clapperton; Dr. Livingstone, in multiplying his fearless explorations from the Cape of Good Hope to the basin of the Zambesi; Captains Burton and Speke, in the discovery of the great interior lakes, have opened three highways to modern civilization. THEIR POINT OF INTERSECTION, which no traveller has yet been able to reach, is the very heart of Africa, and it is thither that all efforts should now be directed.

"The labors of these hardy pioneers of science are now about to be knit together by the daring project of Dr. Samuel Ferguson, whose fine explorations our readers have frequently had the opportunity of appreciating.
"This intrepid discoverer proposes to traverse all Africa from east to west IN A BALLOON. If we are well informed, the point of departure for this surprising journey is to be the island of Zanzibar, upon the eastern coast. As for the point of arrival, it is reserved for Providence alone to designate.

The proposal for this scientific undertaking was officially made, yesterday, at the rooms of the Royal Geographical Society, and the sum of twenty-five hundred pounds was voted to defray the expenses of the enterprise.

We shall keep our readers informed as to the progress of this enterprise, which has no precedent in the annals of exploration."

As may be supposed, the foregoing article had an enormous echo among scientific people. At first, it stirred up a storm of incredulity; Dr. Ferguson passed for a purely chimerical personage of the Barnum stamp, who, after having gone through the United States, was proposed to "do" the British Isles.

A humorous reply appeared in the February number of the Bulletins de la Societe Geographique of Geneva, which very wittily showed up the Royal Society of London and their phenomenal sturgeon.

But Herr Petermann, in his Mittheilungen, published at Gotha, reduced the Geneva journal to the most absolute silence. Herr Petermann knew Dr. Ferguson personally, and guaranteed the intrepidity of his dauntless friend.

Besides, all manner of doubt was quickly put out of the question: preparations for the trip were set on foot at London; the factories of Lyons received a heavy order for the silk required for the body of the balloon; and, finally, the British Government placed the transport-ship Resolute, Captain Bennett, at the disposal of the expedition.

At once, upon word of all this, a thousand encouragements were offered, and felicitations came pouring in from all quarters. The details of the undertaking were published in full in the bulletins of the Geographical Society of Paris; a remarkable article appeared in the Nouvelles Annales des Voyages, de la Geographie, de l'Histoire, et de l'Archaeologie de M. V. A. Malte-Brun ("New Annals of Travels, Geography, History, and Archaeology, by M. V. A. Malte-Brun"); and a searching essay in the Zeitschrift fur Allgemeine Erdkunde, by Dr. W. Koner, triumphantly demonstrated the feasibility of the journey, its chances of success, the nature of the obstacles existing, the immense advantages of the aerial mode of locomotion, and found fault with nothing but the selected point of departure, which it contended should be Massowah, a small port in Abyssinia, whence James Bruce, in 1768, started upon his explorations in search of the sources of the Nile. Apart from that, it mentioned, in terms of unreserved admiration, the energetic character of Dr. Ferguson, and the heart, thrice panoplied in bronze, that could conceive and undertake such an enterprise.

The North American Review could not, without some displeasure, contemplate so much glory monopolized by England. It therefore rather ridiculed the doctor's scheme, and urged him, by all means, to push his explorations as far as America, while he was about it.

In a word, without going over all the journals in the world, there was not a scientific publication, from the Journal of Evangelical Missions to the Revue Algerienne et Coloniale, from the Annales de la Propagation de la Foi to the Church Missionary Intelligencer, that had not something to say about the affair in all its phases.

Many large bets were made at London and throughout England generally, first, as to the real or supposititious existence of Dr. Ferguson; secondly, as to the trip itself, which, some contended, would not be undertaken at all, and which was really contemplated, according to others; thirdly, upon the success or failure of the enterprise; and fourthly, upon the probabilities of Dr. Ferguson's return. The betting-books were covered with entries of immense sums, as though the Epsom races were at stake.

Thus, believers and unbelievers, the learned and the ignorant, alike had their eyes fixed on the doctor, and he became the lion of the day, without knowing that he carried such a mane. On his part, he willingly gave the most accurate information touching his project. He was very easily approached, being naturally the most affable man in the world. More than one bold adventurer presented himself, offering to share the dangers as well as the glory of the undertaking; but he refused them all, without giving his reasons for rejecting them.

Numerous inventors of mechanism applicable to the guidance of balloons came to propose their systems, but he would accept none; and, when he was asked whether he had discovered something of his own for that purpose, he constantly refused to give any explanation, and merely busied himself more actively than ever with the preparations for his journey.

CHAPTER THIRD.
The Doctor's Friend.--The Origin of their Friendship.--Dick Kennedy at London.--An unexpected but not very consoling Proposal.--A Proverb by no means cheering.--A few Names from the African Martyrology.--The Advantages of a Balloon.--Dr. Ferguson's Secret.

Dr. Ferguson had a friend--not another self, indeed, an alter ego, for friendship could not exist between two
beings exactly alike.

But, if they possessed different qualities, aptitudes, and temperaments, Dick Kennedy and Samuel Ferguson lived with one and the same heart, and that gave them no great trouble. In fact, quite the reverse.

Dick Kennedy was a Scotchman, in the full acceptation of the word—open, resolute, and headstrong. He lived in the town of Leith, which is near Edinburgh, and, in truth, is a mere suburb of Auld Reekie. Sometimes he was a fisherman, but he was always and everywhere a determined hunter, and that was nothing remarkable for a son of Caledonia, who had known some little climbing among the Highland mountains. He was cited as a wonderful shot with the rifle, since not only could he split a bullet on a knife-blade, but he could divide it into two such equal parts that, upon weighing them, scarcely any difference would be perceptible.

Kennedy's countenance strikingly recalled that of Herbert Glendinning, as Sir Walter Scott has depicted it in "The Monastery"; his stature was above six feet; full of grace and easy movement, he yet seemed gifted with herculean strength; a face embrowned by the sun; eyes keen and black; a natural air of daring courage; in fine, something sound, solid, and reliable in his entire person, spoke, at first glance, in favor of the bonny Scot.

The acquaintanceship of these two friends had been formed in India, when they belonged to the same regiment. While Dick would be out in pursuit of the tiger and the elephant, Samuel would be in search of plants and insects. Each could call himself expert in his own province, and more than one rare botanical specimen, that to science was as great a victory won as the conquest of a pair of ivory tusks, became the doctor's booty.

These two young men, moreover, never had occasion to save each other's lives, or to render any reciprocal service. Hence, an unalterable friendship. Destiny sometimes bore them apart, but sympathy always united them again.

Since their return to England they had been frequently separated by the doctor's distant expeditions; but, on his return, the latter never failed to go, not to ASK for hospitality, but to bestow some weeks of his presence at the home of his crony Dick.

The Scot talked of the past; the doctor busily prepared for the future. The one looked back, the other forward. Hence, a restless spirit personified in Ferguson; perfect calmness typified in Kennedy—such was the contrast.

After his journey to the Thibet, the doctor had remained nearly two years without hinting at new explorations; and Dick, supposing that his friend's instinct for travel and thirst for adventure had at length died out, was perfectly enchanted. They would have ended badly, some day or other, he thought to himself; no matter what experience one has with men, one does not travel always with impunity among cannibals and wild beasts. So, Kennedy besought the doctor to tie up his bark for life, having done enough for science, and too much for the gratitude of men.

The doctor contented himself with making no reply to this. He remained absorbed in his own reflections, giving himself up to secret calculations, passing his nights among heaps of figures, and making experiments with the strangest-looking machinery, inexplicable to everybody but himself. It could readily be guessed, though, that some great thought was fermenting in his brain.

"What can he have been planning?" wondered Kennedy, when, in the month of January, his friend quitted him to return to London.

He found out one morning when he looked into the Daily Telegraph.

"Merciful Heaven!" he exclaimed, "the lunatic! the madman! Cross Africa in a balloon! Nothing but that was wanted to cap the climax! That's what he's been bothering his wits about these two years past!"

Now, reader, substitute for all these exclamation points, as many ringing thumps with a brawny fist upon the table, and you have some idea of the manual exercise that Dick went through while he thus spoke.

When his confidential maid-of-all-work, the aged Elspeth, tried to insinuate that the whole thing might be a hoax--

"Not a bit of it!" said he. "Don't I know my man? Isn't it just like him? Travel through the air! There, now, he's jealous of the eagles, next! No! I warrant you, he'll not do it! I'll find a way to stop him! He! why if they'd let him alone, he'd start some day for the moon!"

On that very evening Kennedy, half alarmed, and half exasperated, took the train for London, where he arrived next morning.

Three-quarters of an hour later a cab deposited him at the door of the doctor's modest dwelling, in Soho Square, Greek Street. Forthwith he bounded up the steps and announced his arrival with five good, hearty, sounding raps at the door.

Ferguson opened, in person.

"Dick! you here?" he exclaimed, but with no great expression of surprise, after all.

"Dick himself!" was the response.

"What, my dear boy, you at London, and this the mid-season of the winter shooting?"

"Yes! here I am, at London!"
"And what have you come to town for?"
"To prevent the greatest piece of folly that ever was conceived."
"Folly!" said the doctor.
"Is what this paper says, the truth?" rejoined Kennedy, holding out the copy of the Daily Telegraph, mentioned above.
"Ah! that's what you mean, is it? These newspapers are great tattlers! But, sit down, my dear Dick."
"No, I won't sit down!--Then, you really intend to attempt this journey?"
"Most certainly! all my preparations are getting along finely, and I--"
"Where are your traps? Let me have a chance at them! I'll make them fly! I'll put your preparations in fine order." And so saying, the gallant Scot gave way to a genuine explosion of wrath.
"Come, be calm, my dear Dick!" resumed the doctor. "You're angry at me because I did not acquaint you with my new project."
"He calls this his new project!"
"I have been very busy," the doctor went on, without heeding the interruption; "I have had so much to look after! But rest assured that I should not have started without writing to you."
"Oh, indeed! I'm highly honored."
"Because it is my intention to take you with me."
Upon this, the Scotchman gave a leap that a wild goat would not have been ashamed of among his native crags.
"Ah! really, then, you want them to send us both to Bedlam!"
"I have counted positively upon you, my dear Dick, and I have picked you out from all the rest."
Kennedy stood speechless with amazement.
"After listening to me for ten minutes," said the doctor, "you will thank me!"
"Are you speaking seriously?"
"Very seriously."
"And suppose that I refuse to go with you?"
"But you won't refuse."
"But, suppose that I were to refuse?"
"Well, I'd go alone."
"Let us sit down," said Kennedy, "and talk without excitement. The moment you give up jesting about it, we can discuss the thing."
"Let us discuss it, then, at breakfast, if you have no objections, my dear Dick."
The two friends took their seats opposite to each other, at a little table with a plate of toast and a huge tea-urn before them.
"My dear Samuel," said the sportsman, "your project is insane! it is impossible! it has no resemblance to anything reasonable or practicable!"
"That's for us to find out when we shall have tried it!"
"But trying it is exactly what you ought not to attempt."
"Why so, if you please?"
"Well, the risks, the difficulty of the thing."
"As for difficulties," replied Ferguson, in a serious tone, "they were made to be overcome; as for risks and dangers, who can flatter himself that he is to escape them? Every thing in life involves danger; it may even be dangerous to sit down at one's own table, or to put one's hat on one's own head. Moreover, we must look upon what is to occur as having already occurred, and see nothing but the present in the future, for the future is but the present a little farther on."
"There it is!" exclaimed Kennedy, with a shrug. "As great a fatalist as ever!"
"Yes! but in the good sense of the word. Let us not trouble ourselves, then, about what fate has in store for us, and let us not forget our good old English proverb: 'The man who was born to be hung will never be drowned!'"
There was no reply to make, but that did not prevent Kennedy from resuming a series of arguments which may be readily conjectured, but which were too long for us to repeat.
"Well, then," he said, after an hour's discussion, "if you are absolutely determined to make this trip across the African continent—if it is necessary for your happiness, why not pursue the ordinary routes?"
"Why?" ejaculated the doctor, growing animated. "Because, all attempts to do so, up to this time, have utterly failed. Because, from Mungo Park, assassinated on the Niger, to Vogel, who disappeared in the Wadai country; from Oudney, who died at Murmur, and Clapperton, lost at Sackatou, to the Frenchman Maizan, who was cut to pieces; from Major Laing, killed by the Touaregs, to Roscher, from Hamburg, massacred in the beginning of 1860, the names of victim after victim have been inscribed on the lists of African martyrdom! Because, to contend
successfully against the elements; against hunger, and thirst, and fever; against savage beasts, and still more savage men, is impossible! Because, what cannot be done in one way, should be tried in another. In fine, because what one cannot pass through directly in the middle, must be passed by going to one side or overhead!

"If passing over it were the only question!" interposed Kennedy; "but passing high up in the air, doctor, there's the rub!"

"Come, then," said the doctor, "what have I to fear? You will admit that I have taken my precautions in such manner as to be certain that my balloon will not fall; but, should it disappoint me, I should find myself on the ground in the normal conditions imposed upon other explorers. But, my balloon will not deceive me, and we need make no such calculations."

"Yes, but you must take them into view."

"No, Dick. I intend not to be separated from the balloon until I reach the western coast of Africa. With it, every thing is possible; without it, I fall back into the dangers and difficulties as well as the natural obstacles that ordinarily attend such an expedition: with it, neither heat, nor torrents, nor tempests, nor the simoom, nor unhealthy climates, nor wild animals, nor savage men, are to be feared! If I feel too hot, I can ascend; if too cold, I can come down. Should there be a mountain, I can pass over it; a precipice, I can sweep across it; a river, I can sail beyond it; a storm, I can rise away above it; a torrent, I can skim it like a bird! I can advance without fatigue, I can halt without need of repos; I can soar above the nascent cities! I can speed onward with the rapidity of a tornado, sometimes at the loftiest heights, sometimes only a hundred feet above the soil, while the map of Africa unrolls itself beneath my gaze in the great atlas of the world."

Even the stubborn Kennedy began to feel moved, and yet the spectacle thus conjured up before him gave him the vertigo. He riveted his eyes upon the doctor with wonder and admiration, and yet with fear, for he already felt himself swinging aloft in space.

"Come, come," said he, at last. "Let us see, Samuel. Then you have discovered the means of guiding a balloon?"

"Not by any means. That is a Utopian idea."

"Then, you will go--"

"Whithersoever Providence wills; but, at all events, from east to west."

"Why so?"

"Because I expect to avail myself of the trade-winds, the direction of which is always the same."

"Ah! yes, indeed!" said Kennedy, reflecting; "the trade-winds--yes--truly--one might--there's something in that!"

"Something in it--yes, my excellent friend--there's EVERY THING in it. The English Government has placed a transport at my disposal, and three or four vessels are to cruise off the western coast of Africa, about the presumed period of my arrival. In three months, at most, I shall be at Zanzibar, where I will inflate my balloon, and from that point we shall launch ourselves."

"We!" said Dick.

"Have you still a shadow of an objection to offer? Speak, friend Kennedy."

"An objection! I have a thousand; but among other things, tell me, if you expect to see the country. If you expect to mount and descend at pleasure, you cannot do so, without losing your gas. Up to this time no other means have been devised, and it is this that has always prevented long journeys in the air."

"My dear Dick, I have only one word to answer--I shall not lose one particle of gas."

"And yet you can descend when you please?"

"I shall descend when I please."

"And how will you do that?"

"Ah, ha! therein lies my secret, friend Dick. Have faith, and let my device be yours--"Excelsior!"

"Excelsior be it then," said the sportsman, who did not understand a word of Latin.

But he made up his mind to oppose his friend's departure by all means in his power, and so pretended to give in, at the same time keeping on the watch. As for the doctor, he went on diligently with his preparations.

CHAPTER FOURTH.

African Explorations.--Barth, Richardson, Overweg, Werne, Brun-Rollet, Penney, Andrea, Debono, Miani, Guillaume Lejean, Bruce, Krapf and Rebmann, Maizan, Roscher, Burton and Speke.

The aerial line which Dr. Ferguson counted upon following had not been chosen at random; his point of departure had been carefully studied, and it was not without good cause that he had resolved to ascend at the island of Zanzibar. This island, lying near to the eastern coast of Africa, is in the sixth degree of south latitude, that is to say, four hundred and thirty geographical miles below the equator.

From this island the latest expedition, sent by way of the great lakes to explore the sources of the Nile, had just
set out.

But it would be well to indicate what explorations Dr. Ferguson hoped to link together. The two principal ones were those of Dr. Barth in 1849, and of Lieutenants Burton and Speke in 1858.

Dr. Barth is a Hamburger, who obtained permission for himself and for his countryman Overweg to join the expedition of the Englishman Richardson. The latter was charged with a mission in the Soudan.

This vast region is situated between the fifteenth and tenth degrees of north latitude; that is to say, that, in order to approach it, the explorer must penetrate fifteen hundred miles into the interior of Africa.

Until then, the country in question had been known only through the journeys of Denham, of Clapperton, and of Oudney, made from 1822 to 1824. Richardson, Barth, and Overweg, jealously anxious to push their investigations farther, arrived at Tunis and Tripoli, like their predecessors, and got as far as Mourzouk, the capital of Fezzan.

They then abandoned the perpendicular line, and made a sharp turn westward toward Ghat, guided, with difficulty, by the Touaregs. After a thousand scenes of pillage, of vexation, and attacks by armed forces, their caravan arrived, in October, at the vast oasis of Asben. Dr. Barth separated from his companions, made an excursion to the town of Aghades, and rejoined the expedition, which resumed its march on the 12th of December. At length it reached the province of Damergou; there the three travellers parted, and Barth took the road to Kano, where he arrived by dint of perseverance, and after paying considerable tribute.

In spite of an intense fever, he quitted that place on the 7th of March, accompanied by a single servant. The principal aim of his journey was to reconnoitre Lake Tchad, from which he was still three hundred and fifty miles distant. He therefore advanced toward the east, and reached the town of Zouricolo, in the Bornou country, which is the core of the great central empire of Africa. There he heard of the death of Richardson, who had succumbed to fatigue and privation. He next arrived at Kouka, the capital of Bornou, on the borders of the lake. Finally, at the end of three weeks, on the 14th of April, twelve months after having quitted Tripoli, he reached the town of Ngornou.

We find him again setting forth on the 29th of March, 1851, with Overweg, to visit the kingdom of Adamaoua, to the south of the lake, and from there he pushed on as far as the town of Yola, a little below nine degrees north latitude. This was the extreme southern limit reached by that daring traveller.

He returned in the month of August to Kouka; from there he successively traversed the Mandara, Barghimi, and Klanem countries, and reached his extreme limit in the east, the town of Masena, situated at seventeen degrees twenty minutes west longitude.

On the 25th of November, 1852, after the death of Overweg, his last companion, he plunged into the west, visited Sockoto, crossed the Niger, and finally reached Timbuctoo, where he had to languish, during eight long months, under vexations inflicted upon him by the sheik, and all kinds of ill-treatment and wretchedness. But the presence of a Christian in the city could not long be tolerated, and the Foullans threatened to besiege it. The doctor, therefore, left it on the 17th of March, 1854, and fled to the frontier, where he remained for thirty-three days in the most abject destitution. He then managed to get back to Kano in November, thence to Kouka, where he resumed Denham's route after four months' delay. He regained Tripoli toward the close of August, 1855, and arrived in London on the 6th of September, the only survivor of his party.

Such was the venturesome journey of Dr. Barth.

Dr. Ferguson carefully noted the fact, that he had stopped at four degrees north latitude and seventeen degrees west longitude.

Now let us see what Lieutenants Burton and Speke accomplished in Eastern Africa.

The various expeditions that had ascended the Nile could never manage to reach the mysterious source of that river. According to the narrative of the German doctor, Ferdinand Werne, the expedition attempted in 1840, under the auspices of Mehemet Ali, stopped at Gondokoro, between the fourth and fifth parallels of north latitude.

In 1855, Brun-Rollet, a native of Savoy, appointed consul for Sardinia in Eastern Soudan, to take the place of Vaudey, who had just died, set out from Karthoum, and, under the name of Yacoub the merchant, trading in gums and ivory, got as far as Belenia, beyond the fourth degree, but had to return in ill-health to Karthoum, where he died in 1857.

Neither Dr. Penney--the head of the Egyptian medical service, who, in a small steamer, penetrated one degree beyond Gondokoro, and then came back to die of exhaustion at Karthoum--nor Miani, the Venetian, who, turning the cataracts below Gondokoro, reached the second parallel-- nor the Maltese trader, Andrea Debono, who pushed his journey up the Nile still farther--could work their way beyond the apparently impassable limit.

In 1859, M. Guillaume Lejean, intrusted with a mission by the French Government, reached Karthoum by way of the Red Sea, and embarked upon the Nile with a retinue of twenty-one hired men and twenty soldiers, but he could not get past Gondokoro, and ran extreme risk of his life among the negro tribes, who were in full revolt. The expedition directed by M. d'Escayrac de Lauture made an equally unsuccessful attempt to reach the famous sources of the Nile.
This fatal limit invariably brought every traveller to a halt. In ancient times, the ambassadors of Nero reached the ninth degree of latitude, but in eighteen centuries only from five to six degrees, or from three hundred to three hundred and sixty geographical miles, were gained.

Many travellers endeavored to reach the sources of the Nile by taking their point of departure on the eastern coast of Africa.

Between 1768 and 1772 the Scotch traveller, Bruce, set out from Massowah, a port of Abyssinia, traversed the Tigre, visited the ruins of Axum, saw the sources of the Nile where they did not exist, and obtained no serious result.

In 1844, Dr. Krapf, an Anglican missionary, founded an establishment at Monbaz, on the coast of Zanguebar, and, in company with the Rev. Dr. Rebmann, discovered two mountain-ranges three hundred miles from the coast. These were the mountains of Kilimandjaro and Kenia, which Messrs. de Heuglin and Thornton have partly scaled so recently.

In 1845, Maizan, the French explorer, disembarked, alone, at Bagamayo, directly opposite to Zanzibar, and got as far as Deje-la-Mhora, where the chief caused him to be put to death in the most cruel torment.

In 1859, in the month of August, the young traveller, Roscher, from Hamburg, set out with a caravan of Arab merchants, reached Lake Nyassa, and was there assassinated while he slept.

Finally, in 1857, Lieutenants Burton and Speke, both officers in the Bengal army, were sent by the London Geographical Society to explore the great African lakes, and on the 17th of June they quitted Zanzibar, and plunged directly into the west.

After four months of incredible suffering, their baggage having been pillaged, and their attendants beaten and slain, they arrived at Kazeh, a sort of central rendezvous for traders and caravans. They were in the midst of the country of the Moon, and there they collected some precious documents concerning the manners, government, religion, fauna, and flora of the region. They next made for the first of the great lakes, the one named Tanganayika, situated between the third and eighth degrees of south latitude. They reached it on the 14th of February, 1858, and visited the various tribes residing on its banks, the most of whom are cannibals.

They departed again on the 26th of May, and reentered Kazeh on the 20th of June. There Burton, who was completely worn out, lay ill for several months, during which time Speke made a push to the northward of more than three hundred miles, going as far as Lake Okeracua, which he came in sight of on the 3d of August; but he could descry only the opening of it at latitude two degrees thirty minutes.

He reached Kazeh, on his return, on the 25th of August, and, in company with Burton, again took up the route to Zanzibar, where they arrived in the month of March in the following year. These two daring explorers then reembarked for England; and the Geographical Society of Paris decreed them its annual prize medal.

Dr. Ferguson carefully remarked that they had not gone beyond the second degree of south latitude, nor the twenty-ninth of east longitude.

The problem, therefore, was how to link the explorations of Burton and Speke with those of Dr. Barth, since to do so was to undertake to traverse an extent of more than twelve degrees of territory.

CHAPTER FIFTH.

Kennedy's Dreams.--Articles and Pronouns in the Plural.--Dick's Insinuations. --A Promenade over the Map of Africa.--What is contained between two Points of the Compass.--Expeditions now on foot.--Speke and Grant.--Krapf, De Decken, and De Heuglin.

Dr. Ferguson energetically pushed the preparations for his departure, and in person superintended the construction of his balloon, with certain modifications; in regard to which he observed the most absolute silence. For a long time past he had been applying himself to the study of the Arab language and the various Mandingoe idioms, and, thanks to his talents as a polyglot, he had made rapid progress.

In the mean while his friend, the sportsman, never let him out of his sight--afraid, no doubt, that the doctor might take his departure, without saying a word to anybody. On this subject, he regaled him with the most persuasive arguments, which, however, did NOT persuade Samuel Ferguson, and wasted his breath in pathetic entreaties, by which the latter seemed to be but slightly moved. In fine, Dick felt that the doctor was slipping through his fingers.

The poor Scot was really to be pitied. He could not look upon the azure vault without a sombre terror: when asleep, he felt oscillations that made the head reel; and every night he had visions of being swung aloft at immeasurable heights.

We must add that, during these fearful nightmares, he once or twice fell out of bed. His first care then was to show Ferguson a severe contusion that he had received on the cranium. "And yet," he would add, with warmth, "that was at the height of only three feet--not an inch more--and such a bump as this! Only think, then!"

This insinuation, full of sad meaning as it was, did not seem to touch the doctor's heart.
"We'll not fall," was his invariable reply.
"But, still, suppose that we WERE to fall!"
"We will NOT fall!"
This was decisive, and Kennedy had nothing more to say.
What particularly exasperated Dick was, that the doctor seemed completely to lose sight of his personality--of his--Kennedy's--and to look upon him as irrevocably destined to become his aerial companion. Not even the shadow of a doubt was ever suggested; and Samuel made an intolerable misuse of the first person plural:
"'We' are getting along; 'we' shall be ready on the ----; 'we' shall start on the ----," etc., etc.
And then there was the singular possessive adjective:
"'Our' balloon; 'our' car; 'our' expedition."
And the same in the plural, too:
"'Our' preparations; 'our' discoveries; 'our' ascensions."
Dick shuddered at them, although he was determined not to go; but he did not want to annoy his friend. Let us also disclose the fact that, without knowing exactly why himself, he had sent to Edinburgh for a certain selection of heavy clothing, and his best hunting-gear and fire-arms.
One day, after having admitted that, with an overwhelming run of good-luck, there MIGHT be one chance of success in a thousand, he pretended to yield entirely to the doctor's wishes; but, in order to still put off the journey, he opened the most varied series of subterfuges. He threw himself back upon questioning the utility of the expedition--its opportuneness, etc. This discovery of the sources of the Nile, was it likely to be of any use?--Would one have really labored for the welfare of humanity?--When, after all, the African tribes should have been civilized, would they be any happier?--Were folks certain that civilization had not its chosen abode there rather than in Europe?--Perhaps!--And then, couldn't one wait a little longer?--The trip across Africa would certainly be accomplished some day, and in a less hazardous manner.--In another month, or in six months before the year was over, some explorer would undoubtedly come in--etc., etc.
These hints produced an effect exactly opposite to what was desired or intended, and the doctor trembled with impatience.
"Are you willing, then, wretched Dick--are you willing, false friend--that this glory should belong to another? Must I then be untrue to my past history; recoil before obstacles that are not serious; requite with cowardly hesitation what both the English Government and the Royal Society of London have done for me?"
"But," resumed Kennedy, who made great use of that conjunction.
"But," said the doctor, "are you not aware that my journey is to compete with the success of the expeditions now on foot? Don't you know that fresh explorers are advancing toward the centre of Africa?"
"Still--"
"Listen to me, Dick," and cast your eyes over that map."
Dick glanced over it, with resignation.
"Now, ascend the course of the Nile."
"I have ascended it," replied the Scotchman, with docility.
"Stop at Gondokoro."
"I am there."
And Kennedy thought to himself how easy such a trip was--on the map!
"Now, take one of the points of these dividers and let it rest upon that place beyond which the most daring explorers have scarcely gone."
"I have done so."
"And now look along the coast for the island of Zanzibar, in latitude six degrees south."
"I have it."
"Now, follow the same parallel and arrive at Kazeh."
"I have done so."
"Run up again along the thirty-third degree of longitude to the opening of Lake Oukereoue, at the point where Lieutenant Speke had to halt."
"I am there; a little more, and I should have tumbled into the lake."
"Very good! Now, do you know what we have the right to suppose, according to the information given by the tribes that live along its shores?"
"I haven't the least idea."
"Why, that this lake, the lower extremity of which is in two degrees and thirty minutes, must extend also two degrees and a half above the equator."
"Really!"
"Well from this northern extremity there flows a stream which must necessarily join the Nile, if it be not the Nile itself."
"That is, indeed, curious."
"Then, let the other point of your dividers rest upon that extremity of Lake Oukereoue."
"It is done, friend Ferguson."
"Now, how many degrees can you count between the two points?"
"Scarcely two."
"And do you know what that means, Dick?"
"Not the least in the world."
"Why, that makes scarcely one hundred and twenty miles—in other words, a nothing."
"Almost nothing, Samuel."
"Well, do you know what is taking place at this moment?"
"No, upon my honor, I do not."
"Very well, then, I'll tell you. The Geographical Society regard as very important the exploration of this lake of which Speke caught a glimpse. Under their auspices, Lieutenant (now Captain) Speke has associated with him Captain Grant, of the army in India; they have put themselves at the head of a numerous and well-equipped expedition; their mission is to ascend the lake and return to Gondokoro; they have received a subsidy of more than five thousand pounds, and the Governor of the Cape of Good Hope has placed Hottentot soldiers at their disposal; they set out from Zanzibar at the close of October, 1860. In the mean while John Petherick, the English consul at the city of Karthoum, has received about seven hundred pounds from the foreign office; he is to equip a steamer at Karthoum, stock it with sufficient provisions, and make his way to Gondokoro; there, he will await Captain Speke's caravan, and be able to replenish its supplies to some extent."
"Well planned," said Kennedy.
"You can easily see, then, that time presses if we are to take part in these exploring labors. And that is not all, since, while some are thus advancing with sure steps to the discovery of the sources of the Nile, others are penetrating to the very heart of Africa."
"On foot?" said Kennedy.
"Yes, on foot," rejoined the doctor, without noticing the insinuation. "Doctor Krapf proposes to push forward, in the west, by way of the Djob, a river lying under the equator. Baron de Decken has already set out from Monbaz, has reconnoitred the mountains of Kenaia and Kilimandjaro, and is now plunging in toward the centre."
"But all this time on foot?"
"On foot or on mules."
"Exactly the same, so far as I am concerned," ejaculated Kennedy.
"Lastly," resumed the doctor, "M. de Heuglin, the Austrian vice-consul at Karthoum, has just organized a very important expedition, the first aim of which is to search for the traveller Vogel, who, in 1853, was sent into the Soudan to associate himself with the labors of Dr. Barth. In 1856, he quitted Bornou, and determined to explore the unknown country that lies between Lake Tchad and Darfur. Nothing has been seen of him since that time. Letters that were received in Alexandria, in 1860, said that he was killed at the order of the King of Wadai; but other letters, addressed by Dr. Hartmann to the traveller's father, relate that, according to the recital of a felatah of Bornou, Vogel was merely held as a prisoner at Wara. All hope is not then lost. Hence, a committee has been organized under the presidency of the Regent of Saxe-Cogurg-Gotha; my friend Petermann is its secretary; a national subscription has provided for the expense of the expedition, whose strength has been increased by the voluntary accession of several learned men, and M. de Heuglin set out from Massowah, in the month of June. While engaged in looking for Vogel, he is also to explore all the country between the Nile and Lake Tchad, that is to say, to knit together the operations of Captain Speke and those of Dr. Barth, and then Africa will have been traversed from east to west."
* After the departure of Dr. Ferguson, it was ascertained that M. de Heuglin, owing to some disagreement, took a route different from the one assigned to his expedition, the command of the latter having been transferred to Mr. Muntzinger.
"Well," said the canny Scot, "since every thing is getting on so well, what's the use of our going down there?"
Dr. Ferguson made no reply, but contented himself with a significant shrug of the shoulders.

CHAPTER SIXTH.
A Servant--match him!—He can see the Satellites of Jupiter.—Dick and Joe hard at it.—Doubt and Faith.—The Weighing Ceremony.—Joe and Wellington.—He gets a Half-crown.
Dr. Ferguson had a servant who answered with alacrity to the name of Joe. He was an excellent fellow, who
testified the most absolute confidence in his master, and the most unlimited devotion to his interests, even anticipating his wishes and orders, which were always intelligently executed. In fine, he was a Caleb without the growling, and a perfect pattern of constant good-humor. Had he been made on purpose for the place, it could not have been better done. Ferguson put himself entirely in his hands, so far as the ordinary details of existence were concerned, and he did well. Incomparable, whole-souled Joe! a servant who orders your dinner; who likes what you like; who packs your trunk, without forgetting your socks or your linen; who has charge of your keys and your secrets, and takes no advantage of all this!

But then, what a man the doctor was in the eyes of this worthy Joe! With what respect and what confidence the latter received all his decisions! When Ferguson had spoken, he would be a fool who should attempt to question the matter. Every thing he thought was exactly right; every thing he said, the perfection of wisdom; every thing he ordered to be done, quite feasible; all that he undertook, practicable; all that he accomplished, admirable. You might have cut Joe to pieces— not an agreeable operation, to be sure—and yet he would not have altered his opinion of his master.

So, when the doctor conceived the project of crossing Africa through the air, for Joe the thing was already done; obstacles no longer existed; from the moment when the doctor had made up his mind to start, he had arrived—along with his faithful attendant, too, for the noble fellow knew, without a word uttered about it, that he would be one of the party.

Moreover, he was just the man to render the greatest service by his intelligence and his wonderful agility. Had the occasion arisen to name a professor of gymnastics for the monkeys in the Zoological Garden (who are smart enough, by-the-way!), Joe would certainly have received the appointment. Leaping, climbing, almost flying— these were all sport to him.

If Ferguson was the head and Kennedy the arm, Joe was to be the right hand of the expedition. He had, already, accompanied his master on several journeys, and had a smattering of science appropriate to his condition and style of mind, but he was especially remarkable for a sort of mild philosophy, a charming turn of optimism. In his sight every thing was easy, logical, natural, and, consequently, he could see no use in complaining or grumbling.

Among other gifts, he possessed a strength and range of vision that were perfectly surprising. He enjoyed, in common with Moestlin, Kepler's professor, the rare faculty of distinguishing the satellites of Jupiter with the naked eye, and of counting fourteen of the stars in the group of Pleiades, the remotest of them being only of the ninth magnitude. He presumed none of the more for that; on the contrary, he made his bow to you, at a distance, and when occasion arose he bravely knew how to use his eyes.

With such profound faith as Joe felt in the doctor, it is not to be wondered at that incessant discussions sprang up between him and Kennedy, without any lack of respect to the latter, however.

One doubted, the other believed; one had a prudent foresight, the other blind confidence. The doctor, however, vibrated between doubt and confidence; that is to say, he troubled his head with neither one nor the other.

"Well, Mr. Kennedy," Joe would say.
"Well, my boy?"
"The moment's at hand. It seems that we are to sail for the moon."
"You mean the Mountains of the Moon, which are not quite so far off. But, never mind, one trip is just as dangerous as the other!"
"Dangerous! What! with a man like Dr. Ferguson?"
"I don't want to spoil your illusions, my good Joe; but this undertaking of his is nothing more nor less than the act of a madman. He won't go, though!"
"He won't go, eh? Then you haven't seen his balloon at Mitchell's factory in the Borough?"
"I'll take precious good care to keep away from it!"
"Well, you'll lose a fine sight, sir. What a splendid thing it is! What a pretty shape! What a nice car! How snug we'll feel in it!"
"Then you really think of going with your master?"
"I?" answered Joe, with an accent of profound conviction. "Why, I'd go with him wherever he pleases! Who ever heard of such a thing? Leave him to go off alone, after we've been all over the world together! Who would help him, when he was tired? Who would give him a hand in climbing over the rocks? Who would attend him when he was sick? No, Mr. Kennedy, Joe will always stick to the doctor!"
"You're a fine fellow, Joe!"
"But, then, you're coming with us!"
"Oh! certainly," said Kennedy; "that is to say, I will go with you up to the last moment, to prevent Samuel even then from being guilty of such an act of folly! I will follow him as far as Zanzibar, so as to stop him there, if possible."
"You'll stop nothing at all, Mr. Kennedy, with all respect to you, sir. My master is no hare-brained person; he takes a long time to think over what he means to do, and then, when he once gets started, the Evil One himself couldn't make him give it up."

"Well, we'll see about that."

"Don't flatter yourself, sir--but then, the main thing is, to have you with us. For a hunter like you, sir, Africa's a great country. So, either way, you won't be sorry for the trip."

"No, that's a fact, I shan't be sorry for it, if I can get this crazy man to give up his scheme."

"By-the-way," said Joe, "you know that the weighing comes off to-day."

"The weighing--what weighing?"

"Why, my master, and you, and I, are all to be weighed to-day!"

"What! like horse-jockeys?"

"Yes, like jockeys. Only, never fear, you won't be expected to make yourself lean, if you're found to be heavy. You'll go as you are."

"Well, I can tell you, I am not going to let myself be weighed," said Kennedy, firmly.

"But, sir, it seems that the doctor's machine requires it."

"Well, his machine will have to do without it."

"Humph! and suppose that it couldn't go up, then?"

"Egad! that's all I want!"

"Come! come, Mr. Kennedy! My master will be sending for us directly."

"I shan't go."

"Oh! now, you won't vex the doctor in that way!"

"Aye! that I will."

"Well!" said Joe with a laugh, "you say that because he's not here; but when he says to your face, 'Dick!' (with all respect to you, sir,) 'Dick, I want to know exactly how much you weigh,' you'll go, I warrant it."

"No, I will NOT go!"

At this moment the doctor entered his study, where this discussion had been taking place; and, as he came in, cast a glance at Kennedy, who did not feel altogether at his ease.

"Dick," said the doctor, "come with Joe; I want to know how much you both weigh."

"But--"

"You may keep your hat on. Come!" And Kennedy went.

They repaired in company to the workshop of the Messrs. Mitchell, where one of those so-called "Roman" scales was in readiness. It was necessary, by the way, for the doctor to know the weight of his companions, so as to fix the equilibrium of his balloon; so he made Dick get up on the platform of the scales. The latter, without making any resistance, said, in an undertone:

"Oh! well, that doesn't bind me to any thing."

"One hundred and fifty-three pounds," said the doctor, noting it down on his tablets.

"Am I too heavy?"

"Why, no, Mr. Kennedy!" said Joe; "and then, you know, I am light to make up for it."

So saying, Joe, with enthusiasm, took his place on the scales, and very nearly upset them in his ready haste. He struck the attitude of Wellington where he is made to ape Achilles, at Hyde-Park entrance, and was superb in it, without the shield.

"One hundred and twenty pounds," wrote the doctor.

"Ah! ha!" said Joe, with a smile of satisfaction And why did he smile? He never could tell himself.

"It's my turn now," said Ferguson--and he put down one hundred and thirty-five pounds to his own account.

"All three of us," said he, "do not weigh much more than four hundred pounds."

"But, sir," said Joe, "if it was necessary for your expedition, I could make myself thinner by twenty pounds, by not eating so much."

"Useless, my boy!" replied the doctor. "You may eat as much as you like, and here's half-a-crown to buy you the ballast."

CHAPTER SEVENTH.

Dr. Ferguson had long been engaged upon the details of his expedition. It is easy to comprehend that the balloon--that marvellous vehicle which was to convey him through the air--was the constant object of his solicitude.
At the outset, in order not to give the balloon too ponderous dimensions, he had decided to fill it with hydrogen gas, which is fourteen and a half times lighter than common air. The production of this gas is easy, and it has given the greatest satisfaction hitherto in aerostatic experiments.

The doctor, according to very accurate calculations, found that, including the articles indispensable to his journey and his apparatus, he should have to carry a weight of 4,000 pounds; therefore he had to find out what would be the ascensional force of a balloon capable of raising such a weight, and, consequently, what would be its capacity.

A weight of four thousand pounds is represented by a displacement of the air amounting to forty-four thousand eight hundred and forty-seven cubic feet; or, in other words, forty-four thousand eight hundred and forty-seven cubic feet of air weigh about four thousand pounds.

By giving the balloon these cubic dimensions, and filling it with hydrogen gas, instead of common air—the former being fourteen and a half times lighter and weighing therefore only two hundred and seventy-six pounds—a difference of three thousand seven hundred and twenty-four pounds in equilibrium is produced; and it is this difference between the weight of the gas contained in the balloon and the weight of the surrounding atmosphere that constitutes the ascensional force of the former.

However, were the forty-four thousand eight hundred and forty-seven cubic feet of gas of which we speak, all introduced into the balloon, it would be entirely filled; but that would not do, because, as the balloon continued to mount into the more rarefied layers of the atmosphere, the gas within would dilate, and soon burst the cover containing it. Balloons, then, are usually only two-thirds filled.

But the doctor, in carrying out a project known only to himself, resolved to fill his balloon only one-half; and, since he had to carry forty-four thousand eight hundred and forty-seven cubic feet of gas, to give his balloon nearly double capacity he arranged it in that elongated, oval shape which has come to be preferred. The horizontal diameter was fifty feet, and the vertical diameter seventy-five feet. He thus obtained a spheroid, the capacity of which amounted, in round numbers, to ninety thousand cubic feet.

Could Dr. Ferguson have used two balloons, his chances of success would have been increased; for, should one burst in the air, he could, by throwing out ballast, keep himself up with the other. But the management of two balloons would, necessarily, be very difficult, in view of the problem how to keep them both at an equal ascensional force.

After having pondered the matter carefully, Dr. Ferguson, by an ingenious arrangement, combined the advantages of two balloons, without incurring their inconveniences. He constructed two of different sizes, and inclosed the smaller in the larger one. His external balloon, which had the dimensions given above, contained a less one of the same shape, which was only forty-five feet in horizontal, and sixty-eight feet in vertical diameter. The capacity of this interior balloon was only sixty-seven thousand cubic feet: it was to float in the fluid surrounding it. A valve opened from one balloon into the other, and thus enabled the aeronaut to communicate with both.

This arrangement offered the advantage, that if gas had to be let off, so as to descend, that which was in the outer balloon would go first; and, were it completely emptied, the smaller one would still remain intact. The outer envelope might then be cast off as a useless encumbrance; and the second balloon, left free to itself, would not offer the same hold to the currents of air as a half-inflated one must needs present.

Moreover, in case of an accident happening to the outside balloon, such as getting torn, for instance, the other would remain intact.

The balloons were made of a strong but light Lyons silk, coated with gutta percha. This gummy, resinous substance is absolutely water-proof, and also resists acids and gas perfectly. The silk was doubled, at the upper extremity of the oval, where most of the strain would come.

Such an envelope as this could retain the inflating fluid for any length of time. It weighed half a pound per nine square feet. Hence the surface of the outside balloon being about eleven thousand six hundred square feet, its envelope weighed six hundred and fifty pounds. The envelope of the second or inner balloon, having nine thousand two hundred square feet of surface, weighed only about five hundred and ten pounds, or say eleven hundred and sixty pounds for both.

The network that supported the car was made of very strong hempen cord, and the two valves were the object of the most minute and careful attention, as the rudder of a ship would be.

The car, which was of a circular form and fifteen feet in diameter, was made of wicker-work, strengthened with a slight covering of iron, and protected below by a system of elastic springs, to deaden the shock of collision. Its weight, along with that of the network, did not exceed two hundred and fifty pounds.

In addition to the above, the doctor caused to be constructed two sheet-iron chests two lines in thickness. These were connected by means of pipes furnished with stopcocks. He joined to these a spiral, two inches in diameter, which terminated in two branch pieces of unequal length, the longer of which, however, was twenty-five feet in
height and the shorter only fifteen feet.

These sheet-iron chests were embedded in the car in such a way as to take up the least possible amount of space. The spiral, which was not to be adjusted until some future moment, was packed up, separately, along with a very strong Buntzen electric battery. This apparatus had been so ingeniously combined that it did not weigh more than seven hundred pounds, even including twenty-five gallons of water in another receptacle.

The instruments provided for the journey consisted of two barometers, two thermometers, two compasses, a sextant, two chronometers, an artificial horizon, and an altazimuth, to throw out the height of distant and inaccessible objects.

The Greenwich Observatory had placed itself at the doctor's disposal. The latter, however, did not intend to make experiments in physics; he merely wanted to be able to know in what direction he was passing, and to determine the position of the principal rivers, mountains, and towns.

He also provided himself with three thoroughly tested iron anchors, and a light but strong silk ladder fifty feet in length.

He at the same time carefully weighed his stores of provision, which consisted of tea, coffee, biscuit, salted meat, and pemmican, a preparation which comprises many nutritive elements in a small space. Besides a sufficient stock of pure brandy, he arranged two water-tanks, each of which contained twenty-two gallons.

The consumption of these articles would necessarily, little by little, diminish the weight to be sustained, for it must be remembered that the equilibrium of a balloon floating in the atmosphere is extremely sensitive. The loss of an almost insignificant weight suffices to produce a very noticeable displacement.

Nor did the doctor forget an awning to shelter the car, nor the coverings and blankets that were to be the bedding of the journey, nor some fowling pieces and rifles, with their requisite supply of powder and ball.

Here is the summation of his various items, and their weight, as he computed it:

Ferguson........................... 135 pounds. Kennedy............................ 153 " Joe................................ 120 " Weight of the outside balloon..... 650 " Weight of the second balloon...... 510 " Car and network.................... 280 " Anchors, instruments, awnings, and sundry utensils, guns, coverings, etc............... 190 " Meat, pemmican, biscuits, tea, coffee, brandy...................... 386 " Water................................ 400 " Apparatus.......................... 700 " Weight of the hydrogen............. 276 " Ballast........................... 200 " ----- 4,000 pounds.

Such were the items of the four thousand pounds that Dr. Ferguson proposed to carry up with him. He took only two hundred pounds of ballast for "unforeseen emergencies," as he remarked, since otherwise he did not expect to use any, thanks to the peculiarity of his apparatus.

CHAPTER EIGHTH.

Joe's Importance.--The Commander of the Resolute.--Kennedy's Arsenal.--Mutual Amenities.--The Farewell Dinner.--Departure on the 21st of February.--The Doctor's Scientific Sessions.-- Duveyrier.--Livingstone.--Details of the Aerial Voyage.--Kennedy silenced.

About the 10th of February, the preparations were pretty well completed; and the balloons, firmly secured, one within the other, were altogether finished. They had been subjected to a powerful pneumatic pressure in all parts, and the test gave excellent evidence of their solidity and of the care applied in their construction.

Joe hardly knew what he was about, with delight. He trotted incessantly to and fro between his home in Greek Street, and the Mitchell establishment, always full of business, but always in the highest spirits, giving details of the affair to people who did not even ask him, so proud was he, above all things, of being permitted to accompany his master. I have even a shrewd suspicion that what with showing the balloon, explaining the plans and views of the doctor, giving folks a glimpse of the latter, through a half-opened window, or pointing him out as he passed along the streets, the clever scamp earned a few half-crowns, but we must not find fault with him for that. He had as much right as anybody else to speculate upon the admiration and curiosity of his contemporaries.

On the 16th of February, the Resolute cast anchor near Greenwich. She was a screw propeller of eight hundred tons, a fast sailer, and the very vessel that had been sent out to the polar regions, to revictual the last expedition of Sir James Ross. Her commander, Captain Bennet, had the name of being a very amiable person, and he took a particular interest in the doctor's expedition, having been one of that gentleman's admirers for a long time. Bennet was rather a man of science than a man of war, which did not, however, prevent his vessel from carrying four carronades, that had never hurt any body, to be sure, but had performed the most pacific duty in the world.

The hold of the Resolute was so arranged as to find a stowing-place for the balloon. The latter was shipped with the greatest precaution on the 18th of February, and was then carefully deposited at the bottom of the vessel in such a way as to prevent accident. The car and its accessories, the anchors, the cords, the supplies, the water-tanks, which were to be filled on arriving, all were embarked and put away under Ferguson's own eyes.
Ten tons of sulphuric acid and ten tons of iron filings, were put on board for the future production of the hydrogen gas. The quantity was more than enough, but it was well to be provided against accident. The apparatus to be employed in manufacturing the gas, including some thirty empty casks, was also stowed away in the hold.

These various preparations were terminated on the 18th of February, in the evening. Two state-rooms, comfortably fitted up, were ready for the reception of Dr. Ferguson and his friend Kennedy. The latter, all the while swearing that he would not go, went on board with a regular arsenal of hunting weapons, among which were two double-barrelled breech-loading fowling-pieces, and a rifle that had withstood every test, of the make of Purdey, Moore & Dickson, at Edinburgh. With such a weapon a marksman would find no difficulty in lodging a bullet in the eye of a chamois at the distance of two thousand paces. Along with these implements, he had two of Colt's six-shooters, for unforeseen emergencies. His powder-case, his cartridge-pouch, his lead, and his bullets, did not exceed a certain weight prescribed by the doctor.

The three travellers got themselves to rights on board during the working-hours of February 19th. They were received with much distinction by the captain and his officers, the doctor continuing as reserved as ever, and thinking of nothing but his expedition. Dick seemed a good deal moved, but was unwilling to betray it; while Joe was fairly dancing and breaking out in laughable remarks. The worthy fellow soon became the jester and merry-andrew of the boatswain's mess, where a berth had been kept for him.

On the 20th, a grand farewell dinner was given to Dr. Ferguson and Kennedy by the Royal Geographical Society. Commander Bennet and his officers were present at the entertainment, which was signalized by copious libations and numerous toasts. Healths were drunk, in sufficient abundance to guarantee all the guests a lifetime of centuries. Sir Francis M---- presided, with restrained but dignified feeling.

To his own supreme confusion, Dick Kennedy came in for a large share in the jovial felicitations of the night. After having drunk to the "intrepid Ferguson, the glory of England," they had to drink to "the no less courageous Kennedy, his daring companion."

Dick blushed a good deal, and that passed for modesty; whereupon the applause redoubled, and Dick blushed again.

A message from the Queen arrived while they were at dessert. Her Majesty offered her compliments to the two travellers, and expressed her wishes for their safe and successful journey. This, of course, rendered imperative fresh toasts to "Her most gracious Majesty."

At midnight, after touching farewells and warm shaking of hands, the guests separated.

The boats of the Resolute were in waiting at the stairs of Westminster Bridge. The captain leaped in, accompanied by his officers and passengers, and the rapid current of the Thames, aiding the strong arms of the rowers, bore them swiftly to Greenwich. In an hour's time all were asleep on board.

The next morning, February 21st, at three o'clock, the furnaces began to roar; at five, the anchors were weighed, and the Resolute, powerfully driven by her screw, began to plough the water toward the mouth of the Thames.

It is needless to say that the topic of conversation with every one on board was Dr. Ferguson's enterprise. Seeing and hearing the doctor soon inspired everybody with such confidence that, in a very short time, there was no one, excepting the incredulous Scotchman, on the steamer who had the least doubt of the perfect feasibility and success of the expedition.

During the long, unoccupied hours of the voyage, the doctor held regular sittings, with lectures on geographical science, in the officers' mess-room. These young men felt an intense interest in the discoveries made during the last forty years in Africa; and the doctor related to them the explorations of Barth, Burton, Speke, and Grant, and depicted the wonders of this vast, mysterious country, now thrown open on all sides to the investigations of science. On the north, the young Duveyrier was exploring Sahara, and bringing the chiefs of the Touaregs to Paris. Under the inspiration of the French Government, two expeditions were preparing, which, descending from the north, and coming from the west, would cross each other at Timbuctoo. In the south, the indefatigable Livingstone was still advancing toward the equator; and, since March, 1862, he had, in company with Mackenzie, ascended the river Rovoonia. The nineteenth century would, assuredly, not pass, contended the doctor, without Africa having been compelled to surrender the secrets she has kept locked up in her bosom for six thousand years.

But the interest of Dr. Ferguson's hearers was excited to the highest pitch when he made known to them, in detail, the preparations for his own journey. They took pleasure in verifying his calculations; they discussed them; and the doctor frankly took part in the discussion.

As a general thing, they were surprised at the limited quantity of provision that he took with him; and one day one of the officers questioned him on that subject.

"That peculiar point astonishes you, does it?" said Ferguson.

"It does, indeed."

"But how long do you think my trip is going to last? Whole months? If so, you are greatly mistaken. Were it to
be a long one, we should be lost; we should never get back. But you must know that the distance from Zanzibar to
the coast of Senegal is only thirty-five hundred--say four thousand miles. Well, at the rate of two hundred and forty
miles every twelve hours, which does not come near the rapidity of our railroad trains, by travelling day and night, it
would take only seven days to cross Africa!"
"But then you could see nothing, make no geographical observations, or reconnoitre the face of the country."
"Ah!" replied the doctor, "if I am master of my balloon--if I can ascend and descend at will, I shall stop when I
please, especially when too violent currents of air threaten to carry me out of my way with them."
"And you will encounter such," said Captain Bennet. "There are tornadoes that sweep at the rate of more than
two hundred and forty miles per hour."
"You see, then, that with such speed as that, we could cross Africa in twelve hours. One would rise at Zanzibar,
and go to bed at St. Louis!"
"But," rejoined the officer, "could any balloon withstand the wear and tear of such velocity?"
"It has happened before," replied Ferguson.
"And the balloon withstand it?"
"Perfectly well. It was at the time of the coronation of Napoleon, in 1804. The aeronaut, Gernerin, sent up a
balloon at Paris, about eleven o'clock in the evening. It bore the following inscription, in letters of gold: 'Paris, 25
Frimaire; year XIII; Coronation of the Emperor Napoleon by his Holiness, Pius VII.' On the next morning, the
inhabitants of Rome saw the same balloon soaring above the Vatican, whence it crossed the Campagna, and finally
fluttered down into the lake of Bracciano. So you see, gentlemen, that a balloon can resist such velocities."
"A balloon--that might be; but a man?" insinuated Kennedy.
"Yes, a man, too!--for the balloon is always motionless with reference to the air that surrounds it. What moves is
the mass of the atmosphere itself: for instance, one may light a taper in the car, and the flame will not even waver.
An aeronaut in Garnerin's balloon would not have suffered in the least from the speed. But then I have no occasion
to attempt such velocity; and if I can anchor to some tree, or some favorable inequality of the ground, at night, I
shall not fail to do so. Besides, we take provision for two months with us, after all; and there is nothing to prevent
our skilful huntsman here from furnishing game in abundance when we come to alight."
"Ah! Mr. Kennedy," said a young midshipman, with envious eyes, "what splendid shots you'll have!"
"Without counting," said another, "that you'll have the glory as well as the sport!"
"Gentlemen," replied the hunter, stammering with confusion, "I greatly--appreciate--your compliments-- but
they--don't--belong to me."
"You!" exclaimed every body, "don't you intend to go?"
"I am not going!"
"You won't accompany Dr. Ferguson?"
"Not only shall I not accompany him, but I am here so as to be present at the last moment to prevent his going."
Every eye was now turned to the doctor.
"Never mind him!" said the latter, calmly. "This is a matter that we can't argue with him. At heart he knows
perfectly well that he IS going."
"By Saint Andrew!" said Kennedy, "I swear--"
"Swear to nothing, friend Dick; you have been ganged and weighed--you and your powder, your guns, and your
bullets; so don't let us say anything more about it."

And, in fact, from that day until the arrival at Zanzibar, Dick never opened his mouth. He talked neither about
that nor about anything else. He kept absolutely silent.

CHAPTER NINTH.
They double the Cape.--The Forecastle.--A Course of Cosmography by Professor Joe.--Concerning the Method
of guiding Balloons.--How to seek out Atmospheric Currents.--Eureka.

The Resolute plunged along rapidly toward the Cape of Good Hope, the weather continuing fine, although the
sea ran heavier.
On the 30th of March, twenty-seven days after the departure from London, the Table Mountain loomed up on
the horizon. Cape City lying at the foot of an amphitheatre of hills, could be distinguished through the ship's glasses,
and soon the Resolute cast anchor in the port. But the captain touched there only to replenish his coal bunkers, and
that was but a day's job. On the morrow, he steered away to the south'ard, so as to double the southernmost point of
Africa, and enter the Mozambique Channel.
This was not Joe's first sea-voyage, and so, for his part, he soon found himself at home on board; every body
liked him for his frankness and good-humor. A considerable share of his master's renown was reflected upon him.
He was listened to as an oracle, and he made no more mistakes than the next one.

So, while the doctor was pursuing his descriptive course of lecturing in the officers' mess, Joe reigned supreme on the forecastle, holding forth in his own peculiar manner, and making history to suit himself—a style of procedure pursued, by the way, by the greatest historians of all ages and nations.

The topic of discourse was, naturally, the aerial voyage. Joe had experienced some trouble in getting the rebellious spirits to believe in it; but, once accepted by them, nothing connected with it was any longer an impossibility to the imaginations of the seamen stimulated by Joe's harangues.

Our dazzling narrator persuaded his hearers that, after this trip, many others still more wonderful would be undertaken. In fact, it was to be but the first of a long series of superhuman expeditions.

"You see, my friends, when a man has had a taste of that kind of travelling, he can't get along afterward with any other; so, on our next expedition, instead of going off to one side, we'll go right ahead, going up, too, all the time."

"Humph! then you'll go to the moon!" said one of the crowd, with a stare of amazement.

"To the moon!" exclaimed Joe, "To the moon! pooh! that's too common. Everybody might go to the moon, that way. Besides, there's no water there, and you have to carry such a lot of it along with you. Then you have to take air along in bottles, so as to breathe."

"Ay! ay! that's all right! But can a man get a drop of the real stuff there?" said a sailor who liked his toddy.

"Not a drop!" was Joe's answer. "No! old fellow, not in the moon. But we're going to skip round among those little twinklers up there--the stars--and the splendid planets that my old man so often talks about. For instance, we'll commence with Saturn--"

"That one with the ring?" asked the boatswain.

"Yes! the wedding-ring--only no one knows what's become of his wife!"

"What? will you go so high up as that?" said one of the ship-boys, gaping with wonder. "Why, your master must be Old Nick himself."

"Oh! no, he's too good for that."

"But, after Saturn--what then?" was the next inquiry of his impatient audience.

"After Saturn? Well, we'll visit Jupiter. A funny place that is, too, where the days are only nine hours and a half long--a good thing for the lazy fellows--and the years, would you believe it--last twelve of ours, which is fine for folks who have only six months to live. They get off a little longer by that."

"Twelve years!" ejaculated the boy.

"Yes, my youngster; so that in that country you'd be toddling after your mammy yet, and that old chap yonder, who looks about fifty, would only be a little shaver of four and a half."

"Blazes! that's a good 'un!" shouted the whole forecastle together.

"Solemn truth!" said Joe, stoutly.

"But what can you expect? When people will stay in this world, they learn nothing and keep as ignorant as bears. But just come along to Jupiter and you'll see. But they have to look out up there, for he's got satellites that are not just the easiest things to pass."

All the men laughed, but they more than half believed him. Then he went on to talk about Neptune, where seafaring men get a jovial reception, and Mars, where the military get the best of the sidewalk to such an extent that folks can hardly stand it. Finally, he drew them a heavenly picture of the delights of Venus.

"And when we get back from that expedition," said the indefatigable narrator, "they'll decorate us with the Southern Cross that shines up there in the Creator's button-hole."

"Ay, and you'd have well earned it!" said the sailors.

Thus passed the long evenings on the forecastle in merry chat, and during the same time the doctor went on with his instructive discourses.

One day the conversation turned upon the means of directing balloons, and the doctor was asked his opinion about it.

"I don't think," said he, "that we shall succeed in finding out a system of directing them. I am familiar with all the plans attempted and proposed, and not one has succeeded, not one is practicable. You may readily understand that I have occupied my mind with this subject, which was, necessarily, so interesting to me, but I have not been able to solve the problem with the appliances now known to mechanical science. We would have to discover a motive power of extraordinary force, and almost impossible lightness of machinery. And, even then, we could not resist atmospheric currents of any considerable strength. Until now, the effort has been rather to direct the car than the balloon, and that has been one great error."

"Still there are many points of resemblance between a balloon and a ship which is directed at will."

"Not at all," retorted the doctor, "there is little or no similarity between the two cases. Air is infinitely less dense than water, in which the ship is only half submerged, while the whole bulk of a balloon is plunged in the
atmosphere, and remains motionless with reference to the element that surrounds it."

"You think, then, that aerostatic science has said its last word?"

"Not at all! not at all! But we must look for another point in the case, and if we cannot manage to guide our balloon, we must, at least, try to keep it in favorable aerial currents. In proportion as we ascend, the latter become much more uniform and flow more constantly in one direction. They are no longer disturbed by the mountains and valleys that traverse the surface of the globe, and these, you know, are the chief cause of the variations of the wind and the inequality of their force. Therefore, these zones having been once determined, the balloon will merely have to be placed in the currents best adapted to its destination."

"But then," continued Captain Bennet, "in order to reach them, you must keep constantly ascending or descending. That is the real difficulty, doctor."

"And why, my dear captain?"

"Let us understand one another. It would be a difficulty and an obstacle only for long journeys, and not for short aerial excursions."

"And why so, if you please?"

"Because you can ascend only by throwing out ballast; you can descend only after letting off gas, and by these processes your ballast and your gas are soon exhausted."

"My dear sir, that's the whole question. There is the only difficulty that science need now seek to overcome. The problem is not how to guide the balloon, but how to take it up and down without expending the gas which is its strength, its life-blood, its soul, if I may use the expression."

"You are right, my dear doctor; but this problem is not yet solved; this means has not yet been discovered."

"I beg your pardon, it HAS been discovered."

"By whom?"

"By me!"

"By you?"

"You may readily believe that otherwise I should not have risked this expedition across Africa in a balloon. In twenty-four hours I should have been without gas!"

"But you said nothing about that in England?"

"No! I did not want to have myself overhauled in public. I saw no use in that. I made my preparatory experiments in secret and was satisfied. I have no occasion, then, to learn any thing more from them."

"Well! doctor, would it be proper to ask what is your secret?"

"Here it is, gentlemen--the simplest thing in the world!"

The attention of his auditory was now directed to the doctor in the utmost degree as he quietly proceeded with his explanation.

CHAPTER TENTH.
Former Experiments.--The Doctor's Five Receptacles.--The Gas Cylinder.--The Calorifere.--The System of Manoeuvring.--Success certain.

"The attempt has often been made, gentlemen," said the doctor, "to rise and descend at will, without losing ballast or gas from the balloon. A French aeronaut, M. Meunier, tried to accomplish this by compressing air in an inner receptacle. A Belgian, Dr. Van Hecke, by means of wings and paddles, obtained a vertical power that would have sufficed in most cases, but the practical results secured from these experiments have been insignificant.

"I therefore resolved to go about the thing more directly; so, at the start, I dispensed with ballast altogether, excepting as a provision for cases of special emergency, such as the breakage of my apparatus, or the necessity of ascending very suddenly, so as to avoid unforeseen obstacles.

"My means of ascent and descent consist simply in dilating or contracting the gas that is in the balloon by the application of different temperatures, and here is the method of obtaining that result.

"You saw me bring on board with the car several cases or receptacles, the use of which you may not have understood. They are five in number.

"The first contains about twenty-five gallons of water, to which I add a few drops of sulphuric acid, so as to augment its capacity as a conductor of electricity, and then I decompose it by means of a powerful Buntzen battery. Water, as you know, consists of two parts of hydrogen to one of oxygen gas.

"The latter, through the action of the battery, passes at its positive pole into the second receptacle. A third receptacle, placed above the second one, and of double its capacity, receives the hydrogen passing into it by the negative pole.

"Stopcocks, of which one has an orifice twice the size of the other, communicate between these receptacles and a
fourth one, which is called the mixture reservoir, since in it the two gases obtained by the decomposition of the water do really commingle. The capacity of this fourth tank is about forty-one cubic feet.

"On the upper part of this tank is a platinum tube provided with a stopcock.

"You will now readily understand, gentlemen, the apparatus that I have described to you is really a gas cylinder and blow-pipe for oxygen and hydrogen, the heat of which exceeds that of a forge fire.

"This much established, I proceed to the second part of my apparatus. From the lowest part of my balloon, which is hermetically closed, issue two tubes a little distance apart. The one starts among the upper layers of the hydrogen gas, the other amid the lower layers.

"These two pipes are provided at intervals with strong jointings of india-rubber, which enable them to move in harmony with the oscillations of the balloon.

"Both of them run down as far as the car, and lose themselves in an iron receptacle of cylindrical form, which is called the heat-tank. The latter is closed at its two ends by two strong plates of the same metal.

"The pipe running from the lower part of the balloon runs into this cylindrical receptacle through the lower plate; it penetrates the latter and then takes the form of a helicoidal or screw-shaped spiral, the rings of which, rising one over the other, occupy nearly the whole of the height of the tank. Before again issuing from it, this spiral runs into a small cone with a concave base, that is turned downward in the shape of a spherical cap.

"It is from the top of this cone that the second pipe issues, and it runs, as I have said, into the upper beds of the balloon.

"The spherical cap of the small cone is of platinum, so as not to melt by the action of the cylinder and blow-pipe, for the latter are placed upon the bottom of the iron tank in the midst of the helicoidal spiral, and the extremity of their flame will slightly touch the cap in question.

"You all know, gentlemen, what a calorifere, to heat apartments, is. You know how it acts. The air of the apartments is forced to pass through its pipes, and is then released with a heightened temperature. Well, what I have just described to you is nothing more nor less than a calorifere.

"In fact, what is it that takes place? The cylinder once lighted, the hydrogen in the spiral and in the concave cone becomes heated, and rapidly ascends through the pipe that leads to the upper part of the balloon. A vacuum is created below, and it attracts the gas in the lower parts; this becomes heated in its turn, and is continually replaced; thus, an extremely rapid current of gas is established in the pipes and in the spiral, which issues from the balloon and then returns to it, and is heated over again, incessantly.

"Now, the cases increase 1/480 of their volume for each degree of heat applied. If, then, I force the temperature 18 degrees, the hydrogen of the balloon will dilate 18/480 or 1614 cubic feet, and will, therefore, displace 1614 more cubic feet of air, which will increase its ascensional power by 160 pounds. This is equivalent to throwing out 18 degrees, the hydrogen of the balloon will dilate 18/480 or 1614 cubic feet, and will, therefore, displace 1614 more cubic feet of air, which will increase its ascensional power by 160 pounds. This is equivalent to throwing out a weight of ballast. If I augment the temperature by 180 degrees, the gas will dilate 180/480 and will displace 16,740 cubic feet more, and its ascensional force will be augmented by 1,600 pounds.

"Thus, you see, gentlemen, that I can easily effect very considerable changes of equilibrium. The volume of the balloon has been calculated in such manner that, when half inflated, it displaces a weight of air exactly equal to that of the envelope containing the hydrogen gas, and of the car occupied by the passengers, and all its apparatus and accessories. At this point of inflation, it is in exact equilibrium with the air, and neither mounts nor descends.

"In order, then, to effect an ascent, I give the gas a temperature superior to the temperature of the surrounding air by means of my cylinder. By this excess of heat it obtains a larger distention, and inflates the balloon more. The latter, then, ascends in proportion as I heat the hydrogen.

"The descent, of course, is effected by lowering the heat of the cylinder, and letting the temperature abate. The ascent would be, usually, more rapid than the descent; but that is a fortunate circumstance, since it is of no importance to me to descend rapidly, while, on the other hand, it is by a very rapid ascent that I avoid obstacles. The real danger lurks below, and not above.

"Besides, as I have said, I have a certain quantity of ballast, which will enable me to ascend more rapidly still, when necessary. My valve, at the top of the balloon, is nothing more nor less than a safety-valve. The balloon always retains the same quantity of hydrogen, and the variations of temperature that I produce in the midst of this shut-up gas are, of themselves, sufficient to provide for all these ascending and descending movements.

"Now, gentlemen, as a practical detail, let me add this:

"The combustion of the hydrogen and of the oxygen at the point of the cylinder produces solely the vapor or steam of water. I have, therefore, provided the lower part of the cylindrical iron box with a scape-pipe, with a valve operating by means of a pressure of two atmospheres; consequently, so soon as this amount of pressure is attained, the steam escapes of itself.

"Here are the exact figures: 25 gallons of water, separated into its constituent elements, yield 200 pounds of oxygen and 25 pounds of hydrogen. This represents, at atmospheric tension, 1,800 cubic feet of the former and
3,780 cubic feet of the latter, or 5,670 cubic feet, in all, of the mixture. Hence, the stopcock of my cylinder, when fully open, expends 27 cubic feet per hour, with a flame at least six times as strong as that of the large lamps used for lighting streets. On an average, then, and in order to keep myself at a very moderate elevation, I should not burn more than nine cubic feet per hour, so that my twenty-five gallons of water represent six hundred and thirty-six hours of aerial navigation, or a little more than twenty-six days.

"Well, as I can descend when I please, to replenish my stock of water on the way, my trip might be indefinitely prolonged.

"Such, gentlemen, is my secret. It is simple, and, like most simple things, it cannot fail to succeed. The dilation and contraction of the gas in the balloon is my means of locomotion, which calls for neither cumbersome wings, nor any other mechanical motor. A calorifere to produce the changes of temperature, and a cylinder to generate the heat, are neither inconvenient nor heavy. I think, therefore, that I have combined all the elements of success."

Dr. Ferguson here terminated his discourse, and was most heartily applauded. There was not an objection to make to it; all had been foreseen and decided.

"However," said the captain, "the thing may prove dangerous."

"What matters that," replied the doctor, "provided that it be practicable?"

CHAPTER ELEVENTH.

The Arrival at Zanzibar.--The English Consul.--Ill-will of the Inhabitants.--The Island of Koumbeni.--The Rain-Makers.--Inflation of the Balloon.--Departure on the 18th of April.--The last Good-by. --The Victoria.

An invariably favorable wind had accelerated the progress of the Resolute toward the place of her destination. The navigation of the Mozambique Channel was especially calm and pleasant. The agreeable character of the trip by sea was regarded as a good omen of the probable issue of the trip through the air. Every one looked forward to the hour of arrival, and sought to give the last touch to the doctor's preparations.

At length the vessel hove in sight of the town of Zanzibar, upon the island of the same name, and, on the 15th of April, at 11 o'clock in the morning, she anchored in the port.

The island of Zanzibar belongs to the Imaum of Muscat, an ally of France and England, and is, undoubtedly, his finest settlement. The port is frequented by a great many vessels from the neighboring countries.

The island is separated from the African coast only by a channel, the greatest width of which is but thirty miles. It has a large trade in gums, ivory, and, above all, in "ebony," for Zanzibar is the great slave-market. Thither converges all the booty captured in the battles which the chiefs of the interior are continually fighting. This traffic extends along the whole eastern coast, and as far as the Nile latitudes. Mr. G. Lejean even reports that he has seen it carried on, openly, under the French flag.

Upon the arrival of the Resolute, the English consul at Zanzibar came on board to offer his services to the doctor, of whose projects the European newspapers had made him aware for a month past. But, up to that moment, he had remained with the numerous phalanx of the incredulous.

"I doubted," said he, holding out his hand to Dr. Ferguson, "but now I doubt no longer."

He invited the doctor, Kennedy, and the faithful Joe, of course, to his own dwelling. Through his courtesy, the doctor was enabled to have knowledge of the various letters that he had received from Captain Speke. The captain and his companions had suffered dreadfully from hunger and bad weather before reaching the Ugogo country. They could advance only with extreme difficulty, and did not expect to be able to communicate again for a long time.

"Those are perils and privations which we shall manage to avoid," said the doctor.

The baggage of the three travellers was conveyed to the consul's residence. Arrangements were made for disembarking the balloon upon the beach at Zanzibar. There was a convenient spot, near the signal-mast, close by an immense building, that would serve to shelter it from the east winds. This huge tower, resembling a tun standing on one end, beside which the famous Heidelberg tun would have seemed but a very ordinary barrel, served as a fortification, and on its platform were stationed Belootchees, armed with lances. These Belootchees are a kind of brawling, good-for-nothing Janizaries.

But, when about to land the balloon, the consul was informed that the population of the island would oppose their doing so by force. Nothing is so blind as fanatical passion. The news of the arrival of a Christian, who was to ascend into the air, was received with rage. The negroes, more exasperated than the Arabs, saw in this project an attack upon their religion. They took it into their heads that some mischief was meant to the sun and the moon. Now, these two luminaries are objects of veneration to the African tribes, and they determined to oppose so sacrilegious an enterprise.

The consul, informed of their intentions, conferred with Dr. Ferguson and Captain Bennet on the subject. The latter was unwilling to yield to threats, but his friend dissuaded him from any idea of violent retaliation.
"We shall certainly come out winners," he said. "Even the imaum's soldiers will lend us a hand, if we need it. But, my dear captain, an accident may happen in a moment, and it would require but one unlucky blow to do the balloon an irreparable injury, so that the trip would be totally defeated; therefore we must act with the greatest caution."

"But what are we to do? If we land on the coast of Africa, we shall encounter the same difficulties. What are we to do?"

"Nothing is more simple," replied the consul. "You observe those small islands outside of the port; land your balloon on one of them; surround it with a guard of sailors, and you will have no risk to run."

"Just the thing!" said the doctor, "and we shall be entirely at our ease in completing our preparations."

The captain yielded to these suggestions, and the Resolute was headed for the island of Koumbeni. During the morning of the 16th April, the balloon was placed in safety in the middle of a clearing in the great woods, with which the soil is studded.

Two masts, eighty feet in height, were raised at the same distance from each other. Blocks and tackle, placed at their extremities, afforded the means of elevating the balloon, by the aid of a transverse rope. It was then entirely uninflated. The interior balloon was fastened to the exterior one, in such manner as to be lifted up in the same way. To the lower end of each balloon were fixed the pipes that served to introduce the hydrogen gas.

The whole day, on the 17th, was spent in arranging the apparatus destined to produce the gas; it consisted of some thirty casks, in which the decomposition of water was effected by means of iron-filings and sulphuric acid placed together in a large quantity of the first-named fluid. The hydrogen passed into a huge central cask, after having been washed on the way, and thence into each balloon by the conduit-pipes. In this manner each of them received a certain accurately-ascertained quantity of gas. For this purpose, there had to be employed eighteen hundred and sixty-six pounds of sulphuric acid, sixteen thousand and fifty pounds of iron, and nine thousand one hundred and sixty-six gallons of water. This operation commenced on the following night, about three A.M., and lasted nearly eight hours. The next day, the balloon, covered with its network, undulated gracefully above its car, which was held to the ground by numerous sacks of earth. The inflating apparatus was put together with extreme care, and the pipes issuing from the balloon were securely fitted to the cylindrical case.

The anchors, the cordage, the instruments, the travelling-wraps, the awning, the provisions, and the arms, were put in the place assigned to them in the car. The supply of water was procured at Zanzibar. The two hundred pounds of ballast were distributed in fifty bags placed at the bottom of the car, but within arm's-reach.

These preparations were concluded about five o'clock in the evening, while sentinels kept close watch around the island, and the boats of the Resolute patrolled the channel.

The blacks continued to show their displeasure by grimaces and contortions. Their obi-men, or wizards, went up and down among the angry throngs, pouring fuel on the flame of their fanaticism; and some of the excited wretches, more furious and daring than the rest, attempted to get to the island by swimming, but they were easily driven off.

Thereupon the sorceries and incantations commenced; the "rain-makers," who pretend to have control over the clouds, invoked the storms and the "stone-showers," as the blacks call hail, to their aid. To compel them to do so, they plucked leaves of all the different trees that grow in that country, and boiled them over a slow fire, while, at the same time, a sheep was killed by thrusting a long needle into its heart. But, in spite of all their ceremonies, the sky remained clear and beautiful, and they profited nothing by their slaughtered sheep and their ugly grimaces.

The blacks then abandoned themselves to the most furious orgies, and got fearfully drunk on "tembo," a kind of ardent spirits drawn from the cocoa-nut tree, and an extremely heady sort of beer called "togwa." Their chants, which were destitute of all melody, but were sung in excellent time, continued until far into the night.

About six o'clock in the evening, the captain assembled the travellers and the officers of the ship at a farewell repast in his cabin. Kennedy, whom nobody ventured to question now, sat with his eyes riveted on Dr. Ferguson, murmuring indistinguishable words. In other respects, the dinner was a gloomy one. The approach of the final repast in his cabin. Kennedy, whom nobody ventured to question now, sat with his eyes riveted on Dr. Ferguson, murmuring indistinguishable words. In other respects, the dinner was a gloomy one. The approach of the final moment filled everybody with the most serious reflections. What had fate in store for these daring adventurers? Should they ever again find themselves in the midst of their friends, or seated at the domestic hearth? Were their ardent spirits drawn from the cocoa-nut tree, and an extremely heady sort of beer called "togwa." Their chants, which were destitute of all melody, but were sung in excellent time, continued until far into the night.

Such thoughts as these, which had been dim and vague until then, or but slightly regarded when they came up, returned upon their excited fancies with intense force at this parting moment. Dr. Ferguson, still cold and impassible, talked of this, that, and the other; but he strove in vain to overcome this infectious gloominess. He utterly failed.

As some demonstration against the personal safety of the doctor and his companions was feared, all three slept that night on board the Resolute. At six o'clock in the morning they left their cabin, and landed on the island of Koumbeni.

The balloon was swaying gently to and fro in the morning breeze; the sand-bags that had held it down were now
replaced by some twenty strong-armed sailors, and Captain Bennet and his officers were present to witness the solemn departure of their friends.

At this moment Kennedy went right up to the doctor, grasped his hand, and said:
"Samuel, have you absolutely determined to go?"
"Solemnly determined, my dear Dick."
"I have done every thing that I could to prevent this expedition, have I not?"
"Every thing!"
"Well, then, my conscience is clear on that score, and I will go with you."
"I was sure you would!" said the doctor, betraying in his features swift traces of emotion.

At last the moment of final leave-taking arrived. The captain and his officers embraced their dauntless friends with great feeling, not excepting even Joe, who, worthy fellow, was as proud and happy as a prince. Every one in the party insisted upon having a final shake of the doctor's hand.

At nine o'clock the three travellers got into their car. The doctor lit the combustible in his cylinder and turned the flame so as to produce a rapid heat, and the balloon, which had rested on the ground in perfect equipoise, began to rise in a few minutes, so that the seamen had to slacken the ropes they held it by. The car then rose about twenty feet above their heads.

"My friends!" exclaimed the doctor, standing up between his two companions, and taking off his hat, "let us give our aerial ship a name that will bring her good luck! let us christen her Victoria!"

This speech was answered with stentorian cheers of "Huzza for the Queen! Huzza for Old England!"

At this moment the ascensional force of the balloon increased prodigiously, and Ferguson, Kennedy, and Joe, waved a last good-by to their friends.

"Let go all!" shouted the doctor, and at the word the Victoria shot rapidly up into the sky, while the four carronades on board the Resolute thundered forth a parting salute in her honor.

CHAPTER TWELFTH
Crossing the Strait.--The Mrima.--Dick's Remark and Joe's Proposition.--A Recipe for Coffee-making.--The Uzaramo.--The Unfortunate Maizan.--Mount Dathumi.--The Doctor's Cards.--Night under a Nopal.

The air was pure, the wind moderate, and the balloon ascended almost perpendicularly to a height of fifteen hundred feet, as indicated by a depression of two inches in the barometric column.

At this height a more decided current carried the balloon toward the southwest. What a magnificent spectacle was then outspread beneath the gaze of the travellers! The island of Zanzibar could be seen in its entire extent, marked out by its deeper color upon a vast planisphere; the fields had the appearance of patterns of different colors, and thick clumps of green indicated the groves and thickets.

The inhabitants of the island looked no larger than insects. The huzzaing and shouting were little by little lost in the distance, and only the discharge of the ship's guns could be heard in the concavity beneath the balloon, as the latter sped on its flight.

"How fine that is!" said Joe, breaking silence for the first time.

He got no reply. The doctor was busy observing the variations of the barometer and noting down the details of his ascent.

Kennedy looked on, and had not eyes enough to take in all that he saw.

The rays of the sun coming to the aid of the heating cylinder, the tension of the gas increased, and the Victoria attained the height of twenty-five hundred feet.

The Resolute looked like a mere cockle-shell, and the African coast could be distinctly seen in the west marked out by a fringe of foam.

"You don't talk?" said Joe, again.

"We are looking!" said the doctor, directing his spy-glass toward the mainland.

"For my part, I must talk!"

"As much as you please, Joe; talk as much as you like!"

And Joe went on alone with a tremendous volley of exclamations. The "ohs!" and the "ahs!" exploded one after the other, incessantly, from his lips.

During his passage over the sea the doctor deemed it best to keep at his present elevation. He could thus reconnoitre a greater stretch of the coast. The thermometer and the barometer, hanging up inside of the half-opened awning, were always within sight, and a second barometer suspended outside was to serve during the night watches.

At the end of about two hours the Victoria, driven along at a speed of a little more than eight miles, very visibly neared the coast of the mainland. The doctor, thereupon, determined to descend a little nearer to the ground. So he
moderated the flame of his cylinder, and the balloon, in a few moments, had descended to an altitude only three
hundred feet above the soil.

It was then found to be passing just over the Mrima country, the name of this part of the eastern coast of Africa.
Dense borders of mango-trees protected its margin, and the ebb-tide disclosed to view their thick roots, chafed
and gnawed by the teeth of the Indian Ocean. The sands which, at an earlier period, formed the coast-line, rounded away
along the distant horizon, and Mount Nguru reared aloft its sharp summit in the northwest.

The Victoria passed near to a village which the doctor found marked upon his chart as Kaole. Its entire
population had assembled in crowds, and were yelling with anger and fear, at the same time vainly directing their
arrows against this monster of the air that swept along so majestically away above all their powerless fury.

The wind was setting to the southward, but the doctor felt no concern on that score, since it enabled him the
better to follow the route traced by Captains Burton and Speke.

Kennedy had, at length, become as talkative as Joe, and the two kept up a continual interchange of admiring
interjections and exclamations.

"Out upon stage-coaches!" said one.
"Steamers indeed!" said the other.
"Railroads! eh? rubbish!" put in Kennedy, "that you travel on, without seeing the country!"
"Balloons! they're the sort for me!" Joe would add. "Why, you don't feel yourself going, and Nature takes the
trouble to spread herself out before one's eyes!"
"What a splendid sight! What a spectacle! What a delight! a dream in a hammock!"
"Suppose we take our breakfast?" was Joe's unpoetical change of tune, at last, for the keen, open air had mightily
sharpened his appetite.

"Good idea, my boy!"
"Oh! it won't take us long to do the cooking--biscuit and potted meat?"
"And as much coffee as you like," said the doctor. "I give you leave to borrow a little heat from my cylinder.
There's enough and to spare, for that matter, and so we shall avoid the risk of a conflagration."
"That would be a dreadful misfortune!" ejaculated Kennedy. "It's the same as a powder-magazine suspended
over our heads."
"Not precisely," said Ferguson, "but still if the gas were to take fire it would burn up gradually, and we should
settle down on the ground, which would be disagreeable; but never fear--our balloon is hermetically sealed."
"Let us eat a bite, then," replied Kennedy.
"Now, gentlemen," put in Joe, "while doing the same as you, I'm going to get you up a cup of coffee that I think
you'll have something to say about."
"The fact is," added the doctor, "that Joe, along with a thousand other virtues, has a remarkable talent for the
preparation of that delicious beverage: he compounds it of a mixture of various origin, but he never would reveal to
me the ingredients."

"Well, master, since we are so far above-ground, I can tell you the secret. It is just to mix equal quantities of
Mocha, of Bourbon coffee, and of Rio Nunez."

A few moments later, three steaming cups of coffee were served, and topped off a substantial breakfast, which
was additionally seasoned by the jokes and repartees of the guests. Each one then resumed his post of observation.

The country over which they were passing was remarkable for its fertility. Narrow, winding paths plunged in
beneath the overarching verdure. They swept along above cultivated fields of tobacco, maize, and barley, at full
maturity, and here and there immense rice-fields, full of straight stalks and purple blossoms. They could distinguish
sheep and goats too, confined in large cages, set up on piles to keep them out of reach of the leopards' fangs.
Luxuriant vegetation spread in wild profuseness over this prodigal soil.

Village after village rang with yells of terror and astonishment at the sight of the Victoria, and Dr. Ferguson
prudently kept her above the reach of the barbarian arrows. The savages below, thus baffled, ran together from their
huddle of huts and followed the travellers with their vain imprecations while they remained in sight.

At noon, the doctor, upon consulting his map, calculated that they were passing over the Uzaramo* country. The
soil was thickly studded with cocoa-nut, papaw, and cotton-wood trees, above which the balloon seemed to disport
itself like a bird. Joe found this splendid vegetation a matter of course, seeing that they were in Africa. Kennedy
described some hares and quails that asked nothing better than to get a good shot from his fowling-piece, but it would
have been powder wasted, since there was no time to pick up the game.

* U and Ou signify country in the language of that region.

The aeronauts swept on with the speed of twelve miles per hour, and soon were passing in thirty-eight degrees
twenty minutes east longitude, over the village of Tounda.

"It was there," said the doctor, "that Burton and Speke were seized with violent fevers, and for a moment thought
their expedition ruined. And yet they were only a short distance from the coast, but fatigue and privation were beginning to tell upon them severely."

In fact, there is a perpetual malaria reigning throughout the country in question. Even the doctor could hope to escape its effects only by rising above the range of the miasma that exhalates from this damp region whence the blazing rays of the sun pump up its poisonous vapors. Once in a while they could descry a caravan resting in a "kraal," awaiting the freshness and cool of the evening to resume its route. These kraals are wide patches of cleared land, surrounded by hedges and jungles, where traders take shelter against not only the wild beasts, but also the robber tribes of the country. They could see the natives running and scattering in all directions at the sight of the Victoria. Kennedy was keen to get a closer look at them, but the doctor invariably held out against the idea.

"The chiefs are armed with muskets," he said, "and our balloon would be too conspicuous a mark for their bullets."

"Would a bullet-hole bring us down?" asked Joe.

"Not immediately; but such a hole would soon become a large torn orifice through which our gas would escape."

"Then, let us keep at a respectful distance from yon miscreants. What must they think as they see us sailing in the air? I'm sure they must feel like worshipping us!"

"Let them worship away, then," replied the doctor, "but at a distance. There is no harm done in getting as far away from them as possible. See! the country is already changing its aspect: the villages are fewer and farther between; the mango-trees have disappeared, for their growth ceases at this latitude. The soil is becoming hilly and portends mountains not far off."

"Yes," said Kennedy, "it seems to me that I can see some high land on this side."

"In the west--those are the nearest ranges of the Ourizara--Mount Duthumi, no doubt, behind which I hope to find shelter for the night. I'll stir up the heat in the cylinder a little, for we must keep at an elevation of five or six hundred feet."

"That was a grant idea of yours, sir," said Joe. "It's mighty easy to manage it; you turn a cock, and the thing's done."

"Ah! here we are more at our ease," said the sportsman, as the balloon ascended; "the reflection of the sun on those red sands was getting to be insupportable."

"What splendid trees!" cried Joe. "They're quite natural, but they are very fine! Why a dozen of them would make a forest!"

"Those are baobabs," replied Dr. Ferguson. "See, there's one with a trunk fully one hundred feet in circumference. It was, perhaps, at the foot of that very tree that Maizan, the French traveller, expired in 1845, for we are over the village of Deje-la-Mhora, to which he pushed on alone. He was seized by the chief of this region, fastened to the foot of a baobab, and the ferocious black then severed all his joints while the war-song of his tribe was chanted; he then made a gash in the prisoner's neck, stopped to sharpen his knife, and fairly tore away the poor wretch's head before it had been cut from the body. The unfortunate Frenchman was but twenty-six years of age."

"And France has never avenged so hideous a crime?" said Kennedy.

"France did demand satisfaction, and the Said of Zanzibar did all in his power to capture the murderer, but in vain."

"I move that we don't stop here!" urged Joe; "let us go up, master, let us go up higher by all means."

"All the more willingly, Joe, that there is Mount Duthumi right ahead of us. If my calculations be right we shall have passed it before seven o'clock in the evening."

"Shall we not travel at night?" asked the Scotchman.

"No, as little as possible. With care and vigilance we might do so safely, but it is not enough to sweep across Africa. We want to see it."

"Up to this time we have nothing to complain of, master. The best cultivated and most fertile country in the world instead of a desert! Believe the geographers after that!"

"Let us wait, Joe! we shall see by-and-by."

About half-past six in the evening the Victoria was directly opposite Mount Duthumi; in order to pass, it had to ascend to a height of more than three thousand feet, and to accomplish that the doctor had only to raise the temperature of his gas eighteen degrees. It might have been correctly said that he held his balloon in his hand. Kennedy had only to indicate to him the obstacles to be surmounted, and the Victoria sped through the air, skimming the summits of the range.

At eight o'clock it descended the farther slope, the acclivity of which was much less abrupt. The anchors were thrown out from the car and one of them, coming in contact with the branches of an enormous nopal, caught on it firmly. Joe at once let himself slide down the rope and secured it. The silk ladder was then lowered to him and he remounted to the car with agility. The balloon now remained perfectly at rest sheltered from the eastern winds.
The evening meal was got ready, and the aeronauts, excited by their day's journey, made a heavy onslaught upon the provisions.

"What distance have we traversed to-day?" asked Kennedy, disposing of some alarming mouthfuls.

The doctor took his bearings, by means of lunar observations, and consulted the excellent map that he had with him for his guidance. It belonged to the Atlas of "Der Neuester Endeckungen in Afrika" ("The Latest Discoveries in Africa"), published at Gotha by his learned friend Dr. Petermann, and by that savant sent to him. This Atlas was to serve the doctor on his whole journey; for it contained the itinerary of Burton and Speke to the great lakes; the Soudan, according to Dr. Barth; the Lower Senegal, according to Guillaume Lejean; and the Delta of the Niger, by Dr. Blaikie.

Ferguson had also provided himself with a work which combined in one compilation all the notions already acquired concerning the Nile. It was entitled "The Sources of the Nile; being a General Survey of the Basin of that River and of its Head-Stream, with the History of the Nilotic Discovery, by Charles Beke, D.D."

He also had the excellent charts published in the "Bulletins of the Geographical Society of London;" and not a single point of the countries already discovered could, therefore, escape his notice.

Upon tracing on his maps, he found that his latitudinal route had been two degrees, or one hundred and twenty miles, to the westward.

Kennedy remarked that the route tended toward the south; but this direction was satisfactory to the doctor, who desired to reconnoitre the tracks of his predecessors as much as possible. It was agreed that the night should be divided into three watches, so that each of the party should take his turn in watching over the safety of the rest. The doctor took the watch commencing at nine o'clock; Kennedy, the one commencing at midnight; and Joe, the three o'clock morning watch.

So Kennedy and Joe, well wrapped in their blankets, stretched themselves at full length under the awning, and slept quietly; while Dr. Ferguson kept on the lookout.

CHAPTER THIRTEENTH.

Change of Weather.--Kennedy has the Fever.--The Doctor's Medicine.--Travels on Land.--The Basin of Imenge.--Mount Rubeho.--Six Thousand Feet Elevation.--A Halt in the Daytime.

The night was calm. However, on Saturday morning, Kennedy, as he awoke, complained of lassitude and feverish chills. The weather was changing. The sky, covered with clouds, seemed to be laying in supplies for a fresh deluge. A gloomy region is that Zungomoro country, where it rains continually, excepting, perhaps, for a couple of weeks in the month of January.

A violent shower was not long in drenching our travellers. Below them, the roads, intersected by "nullahs," a sort of instantaneous torrent, were soon rendered impracticable, entangled as they were, besides, with thorny thickets and gigantic lianas, or creeping vines. The sulphuretted hydrogen emanations, which Captain Burton mentions, could be distinctly smelt.

"According to his statement, and I think he's right," said the doctor, "one could readily believe that there is a corpse hidden behind every thicket."

"An ugly country this!" sighed Joe; "and it seems to me that Mr. Kennedy is none the better for having passed the night in it."

"To tell the truth, I have quite a high fever," said the sportsman.

"There's nothing remarkable about that, my dear Dick, for we are in one of the most unhealthy regions in Africa; but we shall not remain here long; so let's be off."

Thanks to a skilful manoeuvre achieved by Joe, the anchor was disengaged, and Joe reascended to the car by means of the ladder. The doctor vigorously dilated the gas, and the Victoria resumed her flight, driven along by a spanking breeze.

Only a few scattered huts could be seen through the pestilential mists; but the appearance of the country soon changed, for it often happens in Africa that some of the unhealthiest districts lie close beside others that are perfectly salubrious.

Kennedy was visibly suffering, and the fever was mastering his vigorous constitution.

"It won't do to fall ill, though," he grumbled; and so saying, he wrapped himself in a blanket, and lay down under the awning.

"A little patience, Dick, and you'll soon get over this," said the doctor.

"Get over it! Egad, Samuel, if you've any drug in your travelling-chest that will set me on my feet again, bring it without delay. I'll swallow it with my eyes shut!"

"Oh, I can do better than that, friend Dick; for I can give you a febrifuge that won't cost any thing."
"And how will you do that?"

"Very easily. I am simply going to take you up above these clouds that are now deluging us, and remove you from this pestilential atmosphere. I ask for only ten minutes, in order to dilate the hydrogen."

The ten minutes had scarcely elapsed ere the travellers were beyond the rainy belt of country.

"Wait a little, now, Dick, and you'll begin to feel the effect of pure air and sunshine."

"There's a cure for you!" said Joe; "why, it's wonderful!"

"No, it's merely natural."

"Oh! natural; yes, no doubt of that!"

"I bring Dick into good air, as the doctors do, every day, in Europe, or, as I would send a patient at Martinique to the Pitons, a lofty mountain on that island, to get clear of the yellow fever."

"Ah! by Jove, this balloon is a paradise!" exclaimed Kennedy, feeling much better already.

"It leads to it, anyhow!" replied Joe, quite gravely.

It was a curious spectacle--that mass of clouds piled up, at the moment, away below them! The vapors rolled over each other, and mingled together in confused masses of superb brilliance, as they reflected the rays of the sun. The Victoria had attained an altitude of four thousand feet, and the thermometer indicated a certain diminution of temperature. The land below could no longer be seen. Fifty miles away to the westward, Mount Rubeho raised its sparkling crest, marking the limit of the Ugogo country in east longitude thirty-six degrees twenty minutes. The wind was blowing at the rate of twenty miles an hour, but the aeronauts felt nothing of this increased speed. They observed no jar, and had scarcely any sense of motion at all.

Three hours later, the doctor's prediction was fully verified. Kennedy no longer felt a single shiver of the fever, but partook of some breakfast with an excellent appetite.

That beats sulphate of quinine!" said the energetic Scot, with hearty emphasis and much satisfaction.

"Positively," said Joe, "this is where I'll have to retire to when I get old!"

About ten o'clock in the morning the atmosphere cleared up, the clouds parted, and the country beneath could again be seen, the Victoria meanwhile rapidly descending. Dr. Ferguson was in search of a current that would carry him more to the northeast, and he found it about six hundred feet from the ground. The country was becoming more broken, and even mountainous. The Zungomoro district was fading out of sight in the east with the last cocoa-nut-trees of that latitude.

Ere long, the crests of a mountain-range assumed a more decided prominence. A few peaks rose here and there, and it became necessary to keep a sharp lookout for the pointed cones that seemed to spring up every moment.

"We're right among the breakers!" said Kennedy.

"Keep cool, Dick. We shan't touch them," was the doctor's quiet answer.

"It's a jolly way to travel, anyhow!" said Joe, with his usual flow of spirits.

In fact, the doctor managed his balloon with wondrous dexterity.

"Now, if we had been compelled to go afoot over that drenched soil," said he, "we should still be dragging along in a pestilential mire. Since our departure from Zanzibar, half our beasts of burden would have died with fatigue. We should be looking like ghosts ourselves, and despair would be seizing on our hearts. We should be in continual squabbles with our guides and porters, and completely exposed to their unbridled brutality. During the daytime, a damp, penetrating, unendurable humidity! At night, a cold frequently intolerable, and the stings of a kind of fly whose bite pierces the thickest cloth, and drives the victim crazy! All this, too, without saying anything about wild beasts and ferocious native tribes!"

"I move that we don't try it!" said Joe, in his droll way.

"I exaggerate nothing," continued Ferguson, "for, upon reading the narratives of such travellers as have had the hardihood to venture into these regions, your eyes would fill with tears."

About eleven o'clock they were passing over the basin of Imenge, and the tribes scattered over the adjacent hills were impotently menacing the Victoria with their weapons. Finally, she sped along as far as the last undulations of the country which precede Rubeho. These form the last and loftiest chain of the mountains of Usagara.

The aeronauts took careful and complete note of the orographic conformation of the country. The three ramifications mentioned, of which the Duthumi forms the first link, are separated by immense longitudinal plains. These elevated summits consist of rounded cones, between which the soil is bestrewn with erratic blocks of stone and gravelly bowlders. The most abrupt declivity of these mountains confronts the Zanzibar coast, but the western slopes are merely inclined planes. The depressions in the soil are covered with a black, rich loam, on which there is a vigorous vegetation. Various water-courses filter through, toward the east, and work their way onward to flow into the Kingani, in the midst of gigantic clumps of sycamore, tamarind, calabash, and palmyra trees.

"Attention!" said Dr. Ferguson. "We are approaching Rubeho, the name of which signifies, in the language of the country, the 'Passage of the Winds,' and we would do well to double its jagged pinnacles at a certain height. If
my chart be exact, we are going to ascend to an elevation of five thousand feet."
"Shall we often have occasion to reach those far upper belts of the atmosphere?"
"Very seldom: the height of the African mountains appears to be quite moderate compared with that of the European and Asiatic ranges; but, in any case, our good Victoria will find no difficulty in passing over them."

In a very little while, the gas expanded under the action of the heat, and the balloon took a very decided ascensional movement. Besides, the dilation of the hydrogen involved no danger, and only three-fourths of the vast capacity of the balloon was filled when the barometer, by a depression of eight inches, announced an elevation of six thousand feet.

"Shall we go this high very long?" asked Joe.
"The atmosphere of the earth has a height of six thousand fathoms," said the doctor; "and, with a very large balloon, one might go far. That is what Messrs. Brioschi and Gay-Lussac did; but then the blood burst from their mouths and ears. Respirable air was wanting. Some years ago, two fearless Frenchmen, Messrs. Barral and Bixio, also ventured into the very lofty regions; but their balloon burst--""

"And they fell?" asked Kennedy, abruptly.
"Certainly they did; but as learned men should always fall--namely, without hurting themselves."
"Well, gentlemen," said Joe, "you may try their fall over again, if you like; but, as for me, who am but a dolt, I prefer keeping at the medium height--neither too far up, nor too low down. It won't do to be too ambitious."

At the height of six thousand feet, the density of the atmosphere has already greatly diminished; sound is conveyed with difficulty, and the voice is not so easily heard. The view of objects becomes confused; the gaze no longer takes in any but large, quite ill-distinguishable masses; men and animals on the surface become absolutely invisible; the roads and rivers get to look like threads, and the lakes dwindle to ponds.

The doctor and his friends felt themselves in a very anomalous condition; an atmospheric current of extreme velocity was bearing them away beyond arid mountains, upon whose summits vast fields of snow surprised the gaze; while their convulsed appearance told of Titanic travail in the earliest epoch of the world's existence.

The sun shone at the zenith, and his rays fell perpendicularly upon those lonely summits. The doctor took an accurate design of these mountains, which form four distinct ridges almost in a straight line, the northernmost being the longest.

The Victoria soon descended the slope opposite to the Rubeho, skirting an acclivity covered with woods, and dotted with trees of very deep-green foliage. Then came crests and ravines, in a sort of desert which preceded the Ugogo country; and lower down were yellow plains, parched and fissured by the intense heat, and, here and there, bestrewn with saline plants and brambly thickets.

Some underbrush, which, farther on, became forests, embellished the horizon. The doctor went nearer to the ground; the anchors were thrown out, and one of them soon caught in the boughs of a huge sycamore.

Joe, slipping nimbly down the tree, carefully attached the anchor, and the doctor left his cylinder at work to a certain degree in order to retain sufficient ascensional force in the balloon to keep it in the air. Meanwhile the wind had suddenly died away.

"Now," said Ferguson, "take two guns, friend Dick--one for yourself and one for Joe--and both of you try to bring back some nice cuts of antelope-meat; they will make us a good dinner."
"Off to the hunt!" exclaimed Kennedy, joyously.
He climbed briskly out of the car and descended. Joe had swung himself down from branch to branch, and was waiting for him below, stretching his limbs in the mean time.
"Don't fly away without us, doctor!" shouted Joe.
"Never fear, my boy!--I am securely lashed. I'll spend the time getting my notes into shape. A good hunt to you! but be careful. Besides, from my post here, I can observe the face of the country, and, at the least suspicious thing I notice, I'll fire a signal-shot, and with that you must rally home."
"Agreed!" said Kennedy; and off they went.

CHAPTER FOURTEENTH.
The Forest of Gum-Trees.--The Blue Antelope.--The Rallying-Signal.--An Unexpected Attack.--The Kanyeme.--A Night in the Open Air.--The Mabunguru.--Jihoue-la-Mkoa.--A Supply of Water.--Arrival at Kazeh.

The country, dry and parched as it was, consisting of a clayey soil that cracked open with the heat, seemed, indeed, a desert: here and there were a few traces of caravans; the bones of men and animals, that had been half-gnawed away, mouldering together in the same dust.

After half an hour's walking, Dick and Joe plunged into a forest of gum-trees, their eyes alert on all sides, and their fingers on the trigger. There was no foreseeing what they might encounter. Without being a rifleman, Joe could
handle fire-arms with no trifling dexterity.

"A walk does one good, Mr. Kennedy, but this isn't the easiest ground in the world," he said, kicking aside some fragments of quartz with which the soil was bestrewn.

Kennedy motioned to his companion to be silent and to halt. The present case compelled them to dispense with hunting-dogs, and, no matter what Joe's agility might be, he could not be expected to have the scent of a setter or a greyhound.

A herd of a dozen antelopes were quenching their thirst in the bed of a torrent where some pools of water had lodged. The graceful creatures, sniffing danger in the breeze, seemed to be disturbed and uneasy. Their beautiful heads could be seen between every draught, raised in the air with quick and sudden motion as they sniffed the wind in the direction of our two hunters, with their flexible nostrils.

Kennedy stole around behind some clumps of shrubbery, while Joe remained motionless where he was. The former, at length, got within gunshot and fired.

The herd disappeared in the twinkling of an eye; one male antelope only, that was hit just behind the shoulder-joint, fell headlong to the ground, and Kennedy leaped toward his booty.

It was a blaubrok, a superb animal of a pale-bluish color shading upon the gray, but with the belly and the inside of the legs as white as the driven snow.

"A splendid shot!" exclaimed the hunter. "It's a very rare species of the antelope, and I hope to be able to prepare his skin in such a way as to keep it."

"Indeed!" said Joe, "do you think of doing that, Mr. Kennedy?"

"Why, certainly I do! Just see what a fine hide it is!"

"But Dr. Ferguson will never allow us to take such an extra weight!"

"You're right, Joe. Still it is a pity to have to leave such a noble animal."

"The whole of it? Oh, we won't do that, sir; we'll take all the good eatable parts of it, and, if you'll let me, I'll cut him up just as well as the chairman of the honorable corporation of butchers of the city of London could do."

"As you please, my boy! But you know that in my hunter's way I can just as easily skin and cut up a piece of game as kill it."

"I'm sure of that, Mr. Kennedy. Well, then, you can build a fireplace with a few stones; there's plenty of dry dead-wood, and I can make the hot coals tell in a few minutes."

"Oh! that won't take long," said Kennedy, going to work on the fireplace, where he had a brisk flame crackling and sparkling in a minute or two.

Joe had cut some of the nicest steaks and the best parts of the tenderloin from the carcass of the antelope, and these were quickly transformed to the most savory of broils.

"There, those will tickle the doctor!" said Kennedy.

"Do you know what I was thinking about?" said Joe.

"Why, about the steaks you're broiling, to be sure!" replied Dick.

"Not the least in the world. I was thinking what a figure we'd cut if we couldn't find the balloon again."

"By George, what an idea! Why, do you think the doctor would desert us?"

"No; but suppose his anchor were to slip!"

"Impossible! and, besides, the doctor would find no difficulty in coming down again with his balloon; he handles it at his ease."

"But suppose the wind were to sweep it off, so that he couldn't come back toward us?"

"Come, come, Joe! a truce to your suppositions; they're any thing but pleasant."

"Ah! sir, every thing that happens in this world is natural, of course; but, then, any thing may happen, and we ought to look out beforehand."

At this moment the report of a gun rang out upon the air.

"What's that?" exclaimed Joe.

"It's my rifle, I know the ring of her!" said Kennedy.

"A signal!"

"Yes; danger for us!"

"For him, too, perhaps."

"Let's be off!"

And the hunters, having gathered up the product of their expedition, rapidly made their way back along the path that they had marked by breaking boughs and bushes when they came. The density of the underbrush prevented their seeing the balloon, although they could not be far from it.

A second shot was heard.

"We must hurry!" said Joe.
"There! a third report!"
"Why, it sounds to me as if he was defending himself against something."
"Let us make haste!"
They now began to run at the top of their speed. When they reached the outskirts of the forest, they, at first glance, saw the balloon in its place and the doctor in the car.
"What's the matter?" shouted Kennedy.
"Good God!" suddenly exclaimed Joe.
"What do you see?"
"Down there! look! a crowd of blacks surrounding the balloon!"
And, in fact, there, two miles from where they were, they saw some thirty wild natives close together, yelling, gesticulating, and cutting all kinds of antics at the foot of the sycamore. Some, climbing into the tree itself, were making their way to the topmost branches. The danger seemed pressing.
"My master is lost!" cried Joe.
"Come! a little more coolness, Joe, and let us see how we stand. We hold the lives of four of those villains in our hands. Forward, then!"
They had made a mile with headlong speed, when another report was heard from the car. The shot had, evidently, told upon a huge black demon, who had been hoisting himself up by the anchor-rope. A lifeless body fell from bough to bough, and hung about twenty feet from the ground, its arms and legs swaying to and fro in the air.
"Hi!" said Joe, halting, "what does that fellow hold by?"
"No matter what!" said Kennedy; "let us run! let us run!"
"Ah! Mr. Kennedy," said Joe, again, in a roar of laughter, "by his tail! by his tail! it's an ape! They're all apes!"
"Well, they're worse than men!" said Kennedy, as he dashed into the midst of the howling crowd.
It was, indeed, a troop of very formidable baboons of the dog-faced species. These creatures are brutal, ferocious, and horrible to look upon, with their dog-like muzzles and savage expression. However, a few shots scattered them, and the chattering horde scampered off, leaving several of their number on the ground.
In a moment Kennedy was on the ladder, and Joe, clambering up the branches, detached the anchor; the car then dipped to where he was, and he got into it without difficulty. A few minutes later, the Victoria slowly ascended and soared away to the eastward, wafted by a moderate wind.
"That was an attack for you!" said Joe.
"We thought you were surrounded by natives."
"Well, fortunately, they were only apes," said the doctor.
"At a distance there's no great difference," remarked Kennedy.
"Nor close at hand, either," added Joe.
"Well, however that may be," resumed Ferguson, "this attack of apes might have had the most serious consequences. Had the anchor yielded to their repeated efforts, who knows whither the wind would have carried me?"
"What did I tell you, Mr. Kennedy?"
"You were right, Joe; but, even right as you may have been, you were, at that moment, preparing some antelope-steaks, the very sight of which gave me a monstrous appetite."
"I believe you!" said the doctor; "the flesh of the antelope is exquisite."
"You may judge of that yourself, now, sir, for supper's ready."
"Upon my word as a sportsman, those venison-steaks have a gamy flavor that's not to be sneezed at, I tell you."
"Good!" said Joe, with his mouth full, "I could live on antelope all the days of my life; and all the better with a glass of grog to wash it down."
So saying, the good fellow went to work to prepare a jorum of that fragrant beverage, and all hands tasted it with satisfaction.
"Every thing has gone well thus far," said he.
"Very well indeed!" assented Kennedy.
"Come, now, Mr. Kennedy, are you sorry that you came with us?"
"I'd like to see anybody prevent my coming!"
It was now four o'clock in the afternoon. The Victoria had struck a more rapid current. The face of the country was gradually rising, and, ere long, the barometer indicated a height of fifteen hundred feet above the level of the sea. The doctor was, therefore, obliged to keep his balloon up by a quite considerable dilation of gas, and the cylinder was hard at work all the time.
Toward seven o'clock, the balloon was sailing over the basin of Kanyeme. The doctor immediately recognized that immense clearing, ten miles in extent, with its villages buried in the midst of baobab and calabash trees. It is the
residence of one of the sultans of the Ugogo country, where civilization is, perhaps, the least backward. The natives there are less addicted to selling members of their own families, but still, men and animals all live together in round huts, without frames, that look like haystacks.

Beyond Kanye the soil becomes arid and stony, but in an hour's journey, in a fertile dip of the soil, vegetation had resumed all its vigor at some distance from Mbaburu. The wind fell with the close of the day, and the atmosphere seemed to sleep. The doctor vainly sought for a current of air at different heights, and, at last, seeing this calm of all nature, he resolved to pass the night afloat, and, for greater safety, rose to the height of one thousand feet, where the balloon remained motionless. The night was magnificent, the heavens glittering with stars, and profoundly silent in the upper air.

Dick and Joe stretched themselves on their peaceful couch, and were soon sound asleep, the doctor keeping the first watch. At twelve o'clock the latter was relieved by Kennedy.

"Should the slightest accident happen, waken me," said Ferguson, "and, above all things, don't lose sight of the barometer. To us it is the compass!"

The night was cold. There were twenty-seven degrees of difference between its temperature and that of the daytime. With nightfall had begun the nocturnal concert of animals driven from their hiding-places by hunger and thirst. The frogs struck in their guttural soprano, redoubled by the yelping of the jackals, while the imposing bass of the African lion sustained the accords of this living orchestra.

Upon resuming his post, in the morning, the doctor consulted his compass, and found that the wind had changed during the night. The balloon had been bearing about thirty miles to the northwest during the last two hours. It was then passing over Mabunguru, a stony country, strewn with blocks of syenite of a fine polish, and knobbed with huge bowlders and angular ridges of rock; conic masses, like the rocks of Karnak, studded the soil like so many Druidic dolmens; the bones of buffaloes and elephants whitened it here and there; but few trees could be seen, excepting in the east, where there were dense woods, among which a few villages lay half concealed.

Toward seven o'clock they saw a huge round rock nearly two miles in extent, like an immense tortoise.

"We are on the right track," said Dr. Ferguson. "There's Jihoue-la-Mkoa, where we must halt for a few minutes. I am going to renew the supply of water necessary for my cylinder, and so let us try to anchor somewhere."

"There are very few trees," replied the hunger.

"Never mind, let us try. Joe, throw out the anchors!"

The balloon, gradually losing its ascensional force, approached the ground; the anchors ran along until, at last, one of them caught in the fissure of a rock, and the balloon remained motionless.

It must not be supposed that the doctor could entirely extinguish his cylinder, during these halts. The equilibrium of the balloon had been calculated at the level of the sea; and, as the country was continually ascending, and had reached an elevation of from six to seven hundred feet, the balloon would have had a tendency to go lower than the surface of the soil itself. It was, therefore, necessary to sustain it by a certain dilation of the gas. But, in case the doctor, in the absence of all wind, had let the car rest upon the ground, the balloon, thus relieved of a considerable weight, would have kept up of itself, without the aid of the cylinder.

The maps indicated extensive ponds on the western slope of the Jihoue-la-Mkoa. Joe went thither alone with a cask that would hold about ten gallons. He found the place pointed out to him, without difficulty, near to a deserted village; got his stock of water, and returned in less than three-quarters of an hour. He had seen nothing particular excepting some immense elephant-pits. In fact, he came very near falling into one of them, at the bottom of which lay a half-eaten carcass.

He brought back with him a sort of clover which the apes eat with avidity. The doctor recognized the fruit of the "mnenbu"-tree which grows in profusion, on the western part of Jihoue-la-Mkoa. Ferguson waited for Joe with a certain feeling of impatience, for even a short halt in this inhospitable region always inspires a degree of fear.

The water was got aboard without trouble, as the car was nearly resting on the ground. Joe then found it easy to loosen the anchor and leaped lightly to his place beside the doctor. The latter then replenished the flame in the cylinder, and the balloon majestically soared into the air.

It was then about one hundred miles from Kazeh, an important establishment in the interior of Africa, where, thanks to a south-southeasterly current, the travellers might hope to arrive on that same day. They were moving at the rate of fourteen miles per hour, and the guidance of the balloon was becoming difficult, as they dared not rise very high without extreme dilation of the gas, the country itself being at an average height of three thousand feet. Hence, the doctor preferred not to force the dilation, and so adroitly followed the sinuosities of a pretty sharply-inclined plane, and swept very close to the villages of Thembo and Tura-Wels. The latter forms part of the Unyamwezy, a magnificent country, where the trees attain enormous dimensions; among them the cactus, which grows to gigantic size.

About two o'clock, in magnificent weather, but under a fiery sun that devoured the least breath of air, the balloon
was floating over the town of Kazeh, situated about three hundred and fifty miles from the coast.

"We left Zanzibar at nine o'clock in the morning," said the doctor, consulting his notes, "and, after two days' passage, we have, including our deviations, travelled nearly five hundred geographical miles. Captains Burton and Speke took four months and a half to make the same distance!"

CHAPTER FIFTEENTH.

Kazeh, an important point in Central Africa, is not a city; in truth, there are no cities in the interior. Kazeh is but a collection of six extensive excavations. There are enclosed a few houses and slave-huts, with little courtyards and small gardens, carefully cultivated with onions, potatoes, cucumbers, pumpkins, and mushrooms, of perfect flavor, growing most luxuriantly.

The Unyamwezy is the country of the Moon--above all the rest, the fertile and magnificent garden-spot of Africa. In its centre is the district of Unyanembe--a delicious region, where some families of Omani, who are of very pure Arabic origin, live in luxurious idleness.

They have, for a long period, held the commerce between the interior of Africa and Arabia: they trade in gums, ivory, fine muslin, and slaves. Their caravans traverse these equatorial regions on all sides; and they even make their way to the coast in search of those articles of luxury and enjoyment which the wealthy merchants covet; while the latter, surrounded by their wives and their attendants, lead in this charming country the least disturbed and most horizontal of lives--always stretched at full length, laughing, smoking, or sleeping.

Around these excavations are numerous native dwellings; wide, open spaces for the markets; fields of cannabis and datura; superb trees and depths of freshest shade--such is Kazeh!

There, too, is held the general rendezvous of the caravans --those of the south, with their slaves and their freightage of ivory; and those of the west, which export cotton, glassware, and trinkets, to the tribes of the great lakes.

So in the market-place there reigns perpetual excitement, a nameless hubbub, made up of the cries of mixed-breed porters and carriers, the beating of drums, and the twangling of horns, the neighing of mules, the braying of donkeys, the singing of women, the squalling of children, and the banging of the huge rattan, wielded by the jemadar or leader of the caravans, who beats time to this pastoral symphony.

There, spread forth, without regard to order--indeed, we may say, in charming disorder--are the showy stuffs, the glass beads, the ivory tusks, the rhinoceros'-teeth, the shark's-teeth, the honey, the tobacco, and the cotton of these regions, to be purchased at the strangest of bargains by customers in whose eyes each article has a price only in proportion to the desire it excites to possess it.

All at once this agitation, movement and noise stopped as though by magic. The balloon had just come in sight, far aloft in the sky, where it hovered majestically for a few moments, and then descended slowly, without deviating from its perpendicular. Men, women, children, merchants and slaves, Arabs and negroes, as suddenly disappeared within the "tembes" and the huts.

"My dear doctor," said Kennedy, "if we continue to produce such a sensation as this, we shall find some difficulty in establishing commercial relations with the people hereabouts."

"There's one kind of trade that we might carry on, though, easily enough," said Joe; "and that would be to go down there quietly, and walk off with the best of the goods, without troubling our heads about the merchants; we'd get rich that way!"

"Ah!" said the doctor, "these natives are a little scared at first; but they won't be long in coming back, either through suspicion or through curiosity."

"Do you really think so, doctor?"

"Well, we'll see pretty soon. But it wouldn't be prudent to go too near to them, for the balloon is not iron-clad, and is, therefore, not proof against either an arrow or a bullet."

"Then you expect to hold a parley with these blacks?"

"If we can do so safely, why should we not? There must be some Arab merchants here at Kazeh, who are better informed than the rest, and not so barbarous. I remember that Burton and Speke had nothing but praises to utter concerning the hospitality of these people; so we might, at least, make the venture."

The balloon having, meanwhile, gradually approached the ground, one of the anchors lodged in the top of a tree near the market-place.
By this time the whole population had emerged from their hiding-places stealthily, thrusting their heads out first. Several "waganga," recognizable by their badges of conical shellwork, came boldly forward. They were the sorcerers of the place. They bore in their girdles small gourds, coated with tallow, and several other articles of witchcraft, all of them, by-the-way, most professionally filthy.

Little by little the crowd gathered beside them, the women and children grouped around them, the drums renewed their deafening uproar, hands were violently clapped together, and then raised toward the sky.

"That's their style of praying," said the doctor; "and, if I'm not mistaken, we're going to be called upon to play a great part."

"Well, sir, play it!"

"You, too, my good Joe--perhaps you're to be a god!"

"Well, master, that won't trouble me much. I like a little flattery!"

At this moment, one of the sorcerers, a "myanga," made a sign, and all the clamor died away into the profoundest silence. He then addressed a few words to the strangers, but in an unknown tongue.

Dr. Ferguson, not having understood them, shouted some sentences in Arabic, at a venture, and was immediately answered in that language.

The speaker below then delivered himself of a very copious harangue, which was also very flowery and very gravely listened to by his audience. From it the doctor was not slow in learning that the balloon was mistaken for nothing less than the moon in person, and that the amiable goddess in question had condescended to approach the town with her three sons—an honor that would never be forgotten in this land so greatly loved by the god of day.

The doctor responded, with much dignity, that the moon made her provincial tour every thousand years, feeling the necessity of showing herself nearer at hand to her worshippers. He, therefore, begged them not to be disturbed by her presence, but to take advantage of it to make known all their wants and longings.

The sorcerer, in his turn, replied that the sultan, the "mwani," who had been sick for many years, implored the aid of heaven, and he invited the son of the moon to visit him.

The doctor acquainted his companions with the invitation.

"And you are going to call upon this negro king?" asked Kennedy.

"Undoubtedly so; these people appear well disposed; the air is calm; there is not a breath of wind, and we have nothing to fear for the balloon?"

"But, what will you do?"

"Be quiet on that score, my dear Dick. With a little medicine, I shall work my way through the affair!"

Then, addressing the crowd, he said:

"The moon, taking compassion on the sovereign who is so dear to the children of Unyamwezy, has charged us to restore him to health. Let him prepare to receive us!"

The clamor, the songs and demonstrations of all kinds increased twofold, and the whole immense ants' nest of black heads was again in motion.

"Now, my friends," said Dr. Ferguson, "we must look out for every thing beforehand; we may be forced to leave this at any moment, unexpectedly, and be off with extra speed. Dick had better remain, therefore, in the car, and keep the cylinder warm so as to secure a sufficient ascensional force for the balloon. The anchor is solidly fastened, and there is nothing to fear in that respect. I shall descend, and Joe will go with me, only that he must remain at the foot of the ladder."

"What! are you going alone into that blackamoor's den?"

"How! doctor, am I not to go with you?"

"No! I shall go alone; these good folks imagine that the goddess of the moon has come to see them, and their superstition protects me; so have no fear, and each one remain at the post that I have assigned to him."

"Well, since you wish it," sighed Kennedy.

"Look closely to the dilation of the gas."

"Agreed!"

By this time the shouts of the natives had swelled to double volume as they vehemently implored the aid of the heavenly powers.

"There, there," said Joe, "they're rather rough in their orders to their good moon and her divine sons."

The doctor, equipped with his travelling medicine-chest, descended to the ground, preceded by Joe, who kept a straight countenance and looked as grave and knowing as the circumstances of the case required. He then seated himself at the foot of the ladder in the Arab fashion, with his legs crossed under him, and a portion of the crowd collected around him in a circle, at respectful distances.

In the meanwhile the doctor, escorted to the sound of savage instruments, and with wild religious dances, slowly proceeded toward the royal "tembe," situated a considerable distance outside of the town. It was about three o'clock,
and the sun was shining brilliantly. In fact, what less could it do upon so grand an occasion!

The doctor stepped along with great dignity, the waganga surrounding him and keeping off the crowd. He was soon joined by the natural son of the sultan, a handsomely-built young fellow, who, according to the custom of the country, was the sole heir of the paternal goods, to the exclusion of the old man's legitimate children. He prostrated himself before the son of the moon, but the latter graciously raised him to his feet.

Three-quarters of an hour later, through shady paths, surrounded by all the luxuriance of tropical vegetation, this enthusiastic procession arrived at the sultan's palace, a sort of square edifice called ititenya, and situated on the slope of a hill.

A kind of veranda, formed by the thatched roof, adorned the outside, supported upon wooden pillars, which had some pretensions to being carved. Long lines of dark-red clay decorated the walls in characters that strove to reproduce the forms of men and serpents, the latter better imitated, of course, than the former. The roofing of this abode did not rest directly upon the walls, and the air could, therefore, circulate freely, but windows there were none, and the door hardly deserved the name.

Dr. Ferguson was received with all the honors by the guards and favorites of the sultan; these were men of a fine race, the Wanyamwezi so-called, a pure type of the central African populations, strong, robust, well-made, and in splendid condition. Their hair, divided into a great number of small tresses, fell over their shoulders, and by means of black-and-blue incisions they had tattooed their cheeks from the temples to the mouth. Their ears, frightfully distended, held dangling to them disks of wood and plates of gum copal. They were clad in brilliantly-painted cloths, and the soldiers were armed with the saw-toothed war-club, the bow and arrows barbed and poisoned with the juice of the euphorbium, the cutlass, the "sima," a long sabre (also with saw-like teeth), and some small battle-axes.

The doctor advanced into the palace, and there, notwithstanding the sultan's illness, the din, which was terrific before, redoubled the instant that he arrived. He noticed, at the lintels of the door, some rabbits' tails and zebras' manes, suspended as talismans. He was received by the whole troop of his majesty's wives, to the harmonious accords of the "upatu," a sort of cymbal made of the bottom of a copper kettle, and to the uproar of the "kilindo," a drum five feet high, hollowed out from the trunk of a tree, and hammered by the ponderous, horny fists of two jet-black virtuosi.

Most of the women were rather good-looking, and they laughed and chattered merrily as they smoked their tobacco and "thang" in huge black pipes. They seemed to be well made, too, under the long robes that they wore gracefully flung about their persons, and carried a sort of "kilt" woven from the fibres of calabash fastened around their girdles.

Six of them were not the least merry of the party, although put aside from the rest, and reserved for a cruel fate. On the death of the sultan, they were to be buried alive with him, so as to occupy and divert his mind during the period of eternal solitude.

Dr. Ferguson, taking in the whole scene at a rapid glance, approached the wooden couch on which the sultan lay reclining. There he saw a man of about forty, completely brutalized by orgies of every description, and in a condition that left little or nothing to be done. The sickness that had afflicted him for so many years was simply perpetual drunkenness. The royal sot had nearly lost all consciousness, and all the ammonia in the world would not have set him on his feet again.

His favorites and the women kept on bended knees during this solemn visit. By means of a few drops of powerful cordial, the doctor for a moment reanimated the imbruted carcass that lay before him. The sultan stirred, and, for a dead body that had given no sign whatever of life for several hours previously, this symptom was received with a tremendous repetition of shouts and cries in the doctor's honor.

The latter, who had seen enough of it by this time, by a rapid motion put aside his too demonstrative admirers and went out of the palace, directing his steps immediately toward the balloon, for it was now six o'clock in the evening.

Joe, during his absence, had been quietly waiting at the foot of the ladder, where the crowd paid him their most humble respects. Like a genuine son of the moon, he let them keep on. For a divinity, he had the air of a very clever sort of fellow, by no means proud, nay, even pleasantly familiar with the young negresses, who seemed never to tire of looking at him. Besides, he went so far as to chat agreeably with them.

"Worship me, ladies! worship me!" he said to them. "I'm a clever sort of devil, if I am the son of a goddess."

They brought him propitiatory gifts, such as are usually deposited in the fetish huts or mzimu. These gifts consisted of stalks of barley and of "pombe." Joe considered himself in duty bound to taste the latter species of strong beer, but his palate, although accustomed to gin and whiskey, could not withstand the strength of the new beverage, and he had to make a horrible grimace, which his dusky friends took to be a benevolent smile.

Thereupon, the young damsels, conjoining their voices in a drawling chant, began to dance around him with the utmost gravity.
"Ah! you're dancing, are you?" said he. "Well, I won't be behind you in politeness, and so I'll give you one of my country reels."

So at it he went, in one of the wildest jigs that ever was seen, twisting, turning, and jerking himself in all directions; dancing with his hands, dancing with his body, dancing with his knees, dancing with his feet; describing the most fearful contortions and extravagant evolutions; throwing himself into incredible attitudes; grimacing beyond all belief, and, in fine giving his savage admirers a strange idea of the style of ballet adopted by the deities in the moon.

Then, the whole collection of blacks, naturally as imitative as monkeys, at once reproduced all his airs and graces, his leaps and shakes and contortions; they did not lose a single gesticulation; they did not forget an attitude; and the result was, such a pandemonium of movement, noise, and excitement, as it would be out of the question even feebly to describe. But, in the very midst of the fun, Joe saw the doctor approaching.

The latter was coming at full speed, surrounded by a yelling and disorderly throng. The chiefs and sorcerers seemed to be highly excited. They were close upon the doctor's heels, crowding and threatening him.

Singular reaction! What had happened? Had the sultan unluckily perished in the hands of his celestial physician? Kennedy, from his post of observation, saw the danger without knowing what had caused it, and the balloon, powerfully urged by the dilation of the gas, strained and tugged at the ropes that held it as though impatient to soar away.

The doctor had got as far as the foot of the ladder. A superstitious fear still held the crowd aloof and hindered them from committing any violence on his person. He rapidly scaled the ladder, and Joe followed him with his usual agility.

"Not a moment to lose!" said the doctor. "Don't attempt to let go the anchor! We'll cut the cord! Follow me!"
"But what's the matter?" asked Joe, clambering into the car.
"What's happened?" questioned Kennedy, rifle in hand.
"Look!" replied the doctor, pointing to the horizon.
"Well?" ejaculated the Scot.
"Well! the moon!"

And, in fact, there was the moon rising red and magnificent, a globe of fire in a field of blue! It was she, indeed--she and the balloon!--both in one sky!

Either there were two moons, then, or these strangers were imposters, designing scamps, false deities!

Such were the very natural reflections of the crowd, and hence the reaction in their feelings.

Joe could not, for the life of him, keep in a roar of laughter; and the population of Kazeh, comprehending that their prey was slipping through their clutches, set up prolonged howlings, aiming, the while, their bows and muskets at the balloon.

But one of the sorcerers made a sign, and all the weapons were lowered. He then began to climb into the tree, intending to seize the rope and bring the machine to the ground.

Joe leaned out with a hatchet ready. "Shall I cut away?" said he.
"No; wait a moment," replied the doctor.
"But this black?"
"We may, perhaps, save our anchor--and I hold a great deal by that. There'll always be time enough to cut loose."

The sorcerer, having climbed to the right place, worked so vigorously that he succeeded in detaching the anchor, and the latter, violently jerked, at that moment, by the start of the balloon, caught the rascal between the limbs, and carried him off astride of it through the air.

The stupefaction of the crowd was indescribable as they saw one of their waganga thus whirled away into space.

"Huzza!" roared Joe, as the balloon--thanks to its ascensional force--shot up higher into the sky, with increased rapidity.

"He holds on well," said Kennedy; "a little trip will do him good."
"Shall we let this darky drop all at once?" inquired Joe.
"Oh no," replied the doctor, "we'll let him down easily; and I warrant me that, after such an adventure, the power of the wizard will be enormously enhanced in the sight of his comrades."

"Why, I wouldn't put it past them to make a god of him!" said Joe, with a laugh.

The Victoria, by this time, had risen to the height of one thousand feet, and the black hung to the rope with desperate energy. He had become completely silent, and his eyes were fixed, for his terror was blended with amazement. A light west wind was sweeping the balloon right over the town, and far beyond it.

Half an hour later, the doctor, seeing the country deserted, moderated the flame of his cylinder, and descended toward the ground. At twenty feet above the turf, the affrighted sorcerer made up his mind in a twinkling: he let himself drop, fell on his feet, and scampered off at a furious pace toward Kazeh; while the balloon, suddenly
relieved of his weight, again shot up on her course.

CHAPTER SIXTEENTH.

Symptoms of a Storm.--The Country of the Moon.--The Future of the African Continent.--The Last Machine of all.--A View of the Country at Sunset.--Flora and Fauna.--The Tempest.--The Zone of Fire.--The Starry Heavens.

"See," said Joe, "what comes of playing the sons of the moon without her leave! She came near serving us an ugly trick. But say, master, did you damage your credit as a physician?"

"Yes, indeed," chimed in the sportsman. "What kind of a dignitary was this Sultan of Kazeh?"

"An old half-dead sot," replied the doctor, "whose loss will not be very severely felt. But the moral of all this is that honors are fleeting, and we must not take too great a fancy to them."

"So much the worse!" rejoined Joe. "I liked the thing--to be worshipped!--Play the god as you like! Why, what would any one ask more than that? By-the-way, the moon did come up, too, and all red, as if she was in a rage."

While the three friends went on chatting of this and other things, and Joe examined the luminary of night from an entirely novel point of view, the heavens became covered with heavy clouds to the northward, and the lowering masses assumed a most sinister and threatening look. Quite a smart breeze, found about three hundred feet from the earth, drove the balloon toward the north-northeast; and above it the blue vault was clear; but the atmosphere felt close and dull.

The aeronauts found themselves, at about eight in the evening, in thirty-two degrees forty minutes east longitude, and four degrees seventeen minutes latitude. The atmospheric currents, under the influence of a tempest not far off, were driving them at the rate of from thirty to thirty-five miles an hour; the undulating and fertile plains of Mfuto were passing swiftly beneath them. The spectacle was one worthy of admiration--and admire it they did.

"We are now right in the country of the Moon," said Dr. Ferguson; "for it has retained the name that antiquity gave it, undoubtedly, because the moon has been worshipped there in all ages. It is, really, a superb country."

"It would be hard to find more splendid vegetation."

"If we found the like of it around London it would not be natural, but it would be very pleasant," put in Joe. "Why is it that such savage countries get all these fine things?"

"And who knows," said the doctor, "that this country may not, one day, become the centre of civilization? The races of the future may repair hither, when Europe shall have become exhausted in the effort to feed her inhabitants."

"Do you think so, really?" asked Kennedy.

"Undoubtedly, my dear Dick. Just note the progress of events: consider the migrations of races, and you will arrive at the same conclusion assuredly. Asia was the first nurse of the world, was she not? For about four thousand years she travailed, she grew pregnant, she produced, and then, when stones began to cover the soil where the golden harvests sung by Homer had flourished, her children abandoned her exhausted and barren bosom. You next see them precipitating themselves upon young and vigorous Europe, which has nourished them for the last two thousand years. But already her fertility is beginning to die out; her productive powers are diminishing every day. Those new diseases that annually attack the products of the soil, those defective crops, those insufficient resources, are all signs of a vitality that is rapidly wearing out and of an approaching exhaustion. Thus, we already see the millions rushing to the luxuriant bosom of America, as a source of help, not inexhaustible indeed, but not yet exhausted. In its turn, that new continent will grow old; its virgin forests will fall before the axe of industry, and its soil will become weak through having too fully produced what had been demanded of it. Where two harvests bloomed every year, hardly one will be gathered from a soil completely drained of its strength. Then, Africa will be there to offer to new races the treasures that for centuries have been accumulating in her breast. Those climates now so fatal to strangers will be purified by cultivation and by drainage of the soil, and those scattered water supplies will be gathered into one common bed to form an artery of navigation. Then this country over which we are now passing, more fertile, richer, and fuller of vitality than the rest, will become some grand realm where more astonishing discoveries than steam and electricity will be brought to light."

"Ah! sir," said Joe, "I'd like to see all that."

"You got up too early in the morning, my boy!"

"Besides," said Kennedy, "that may prove to be a very dull period when industry will swallow up every thing for its own profit. By dint of inventing machinery, men will end in being eaten up by it! I have always fancied that the end of the earth will be when some enormous boiler, heated to three thousand millions of atmospheric pressure, shall explode and blow up our Globe!"

"And I add that the Americans," said Joe, "will not have been the last to work at the machine!"

"In fact," assented the doctor, "they are great boiler-makers! But, without allowing ourselves to be carried away
by such speculations, let us rest content with enjoying the beauties of this country of the Moon, since we have been permitted to see it."

The sun, darting his last rays beneath the masses of heaped-up cloud, adorned with a crest of gold the slightest inequalities of the ground below; gigantic trees, arborescent bushes, mosses on the even surface--all had their share of this luminous effulgence. The soil, slightly undulating, here and there rose into little conical hills; there were no mountains visible on the horizon; immense brambly palisades, impenetrable hedges of thorny jungle, separated the clearings dotted with numerous villages, and immense euphorbiae surrounded them with natural fortifications, interlacing their trunks with the coral-shaped branches of the shrubbery and undergrowth.

Ere long, the Malagazeri, the chief tributary of Lake Tanganayika, was seen winding between heavy thickets of verdure, offering an asylum to many water-courses that spring from the torrents formed in the season of freshets, or from ponds hollowed in the clayey soil. To observers looking from a height, it was a chain of waterfalls thrown across the whole western face of the country.

Animals with huge humps were feeding in the luxuriant prairies, and were half hidden, sometimes, in the tall grass; spreading forests in bloom redolent of spicy perfumes presented themselves to the gaze like immense bouquets; but, in these bouquets, lions, leopards, hyenas, and tigers, were then crouching for shelter from the last hot rays of the setting sun. From time to time, an elephant made the tall tops of the undergrowth sway to and fro, and you could hear the crackling of huge branches as his ponderous ivory tusks broke them in his way.

"What a sporting country!" exclaimed Dick, unable longer to restrain his enthusiasm; "why, a single ball fired at random into those forests would bring down game worthy of it. Suppose we try it once!"

"No, my dear Dick; the night is close at hand--a threatening night with a tempest in the background--and the storms are awful in this country, where the heated soil is like one vast electric battery."

"You are right, sir," said Joe, "the heat has got to be enough to choke one, and the breeze has died away. One can feel that something's coming."

"The atmosphere is saturated with electricity," replied the doctor; "every living creature is sensible that this state of the air portends a struggle of the elements, and I confess that I never before was so full of the fluid myself."

"Well, then," suggested Dick, "would it not be advisable to alight?"

"On the contrary, Dick, I'd rather go up, only that I am afraid of being carried out of my course by these counter-currents contending in the atmosphere."

"Have you any idea, then, of abandoning the route that we have followed since we left the coast?"

"If I can manage to do so," replied the doctor, "I will turn more directly northward, by from seven to eight degrees; I shall then endeavor to ascend toward the presumed latitudes of the sources of the Nile; perhaps we may discover some traces of Captain Speke's expedition or of M. de Heuglin's caravan. Unless I am mistaken, we are at thirty-two degrees forty minutes east longitude, and I should like to ascend directly north of the equator."

"Look there!" exclaimed Kennedy, suddenly, "see those hippopotami sliding out of the pools--those masses of blood-colored flesh--and those crocodiles snuffing the air aloud!"

"They're choking!" ejaculated Joe. "Ah! what a fine way to travel this is; and how one can snap his fingers at all that vermin!--Doctor! Mr. Kennedy! see those packs of wild animals hurrying along close together. There are fully two hundred. Those are wolves."

"No! Joe, not wolves, but wild dogs; a famous breed that does not hesitate to attack the lion himself. They are the worst customers a traveller could meet, for they would instantly tear him to pieces."

"Well, it isn't Joe that'll undertake to muzzle them!" responded that amiable youth. "After all, though, if that's the nature of the beast, we mustn't be too hard on them for it!"

Silence gradually settled down under the influence of the impending storm: the thickened air actually seemed no longer adapted to the transmission of sound; the atmosphere appeared MUFFLED, and, like a room hung with tapestry, lost all its sonorous reverberation. The "rover bird" so-called, the coroneted crane, the red and blue jays, the mocking-bird, the flycatcher, disappeared among the foliage of the immense trees, and all nature revealed symptoms of some approaching catastrophe.

At nine o'clock the Victoria hung motionless over Msene, an extensive group of villages scarcely distinguishable in the gloom. Once in a while, the reflection of a wandering ray of light in the dull water disclosed a succession of ditches regularly arranged, and, by one last gleam, the eye could make out the calm and sombre forms of palm-trees, sycamores, and gigantic euphorbiae.

"I am stifling!" said the Scot, inhaling, with all the power of his lungs, as much as possible of the rarefied air. "We are not moving an inch! Let us descend!"

"But the tempest!" said the doctor, with much uneasiness.

"If you are afraid of being carried away by the wind, it seems to me that there is no other course to pursue."

"Perhaps the storm won't burst to-night," said Joe; "the clouds are very high."
"That is just the thing that makes me hesitate about going beyond them; we should have to rise still higher, lose
sight of the earth, and not know all night whether we were moving forward or not, or in what direction we were
going."

"Make up your mind, dear doctor, for time presses!"

"It's a pity that the wind has fallen," said Joe, again; "it would have carried us clear of the storm."

"It is, indeed, a pity, my friends," rejoined the doctor. "The clouds are dangerous for us; they contain opposing
currents which might catch us in their eddies, and lightnings that might set on fire. Again, those perils avoided, the
force of the tempest might hurl us to the ground, were we to cast our anchor in the tree-tops."

"Then what shall we do?"

"Well, we must try to get the balloon into a medium zone of the atmosphere, and there keep her suspended
between the perils of the heavens and those of the earth. We have enough water for the cylinder, and our two
hundred pounds of ballast are untouched. In case of emergency I can use them."

"We will keep watch with you," said the hunter.

"No, my friends, put the provisions under shelter, and lie down; I will rouse you, if it becomes necessary."

"But, master, wouldn't you do well to take some rest yourself, as there's no danger close on us just now?"
insisted poor Joe.

"No, thank you, my good fellow, I prefer to keep awake. We are not moving, and should circumstances not
change, we'll find ourselves to-morrow in exactly the same place."

"Good-night, then, sir!"

"Good-night, if you can only find it so!"

Kennedy and Joe stretched themselves out under their blankets, and the doctor remained alone in the immensity
of space.

However, the huge dome of clouds visibly descended, and the darkness became profound. The black vault closed
in upon the earth as if to crush it in its embrace.

All at once a violent, rapid, incisive flash of lightning pierced the gloom, and the rent it made had not closed ere
a frightful clap of thunder shook the celestial depths.

"Up! up! turn out!" shouted Ferguson.

The two sleepers, aroused by the terrible concussion, were at the doctor's orders in a moment.

"Shall we descend?" said Kennedy.

"No! the balloon could not stand it. Let us go up before those clouds dissolve in water, and the wind is let loose!"

and, so saying, the doctor actively stirred up the flame of the cylinder, and turned it on the spirals of the serpentine
siphon.

The tempests of the tropics develop with a rapidity equalled only by their violence. A second flash of lightningent the darkness, and was followed by a score of others in quick succession. The sky was crossed and dotted, like
the zebra's hide, with electric sparks, which danced and flickered beneath the great drops of rain.

"We have delayed too long," exclaimed the doctor; "we must now pass through a zone of fire, with our balloon
filled as it is with inflammable gas!"

"But let us descend, then! let us descend!" urged Kennedy.

"The risk of being struck would be just about even, and we should soon be torn to pieces by the branches of the
trees!"

"We are going up, doctor!"

"Quicker, quicker still!"

In this part of Africa, during the equatorial storms, it is not rare to count from thirty to thirty-five flashes of
lightning per minute. The sky is literally on fire, and the crashes of thunder are continuous.

The wind burst forth with frightful violence in this burning atmosphere; it twisted the blazing clouds; one might
have compared it to the breath of some gigantic bellows, fanning all this conflagration.

Dr. Ferguson kept his cylinder at full heat, and the balloon dilated and went up, while Kennedy, on his knees,
held together the curtains of the awning. The balloon whirled round wildly enough to make their heads turn, and the
aeronauts got some very alarming jolts, indeed, as their machine swung and swayed in all directions. Huge cavities
would form in the silk of the balloon as the wind fiercely bent it in, and the stuff fairly cracked like a pistol as it flew
back from the pressure. A sort of hail, preceded by a rumbling noise, hissed through the air and rattled on the
covering of the Victoria. The latter, however, continued to ascend, while the lightning described tangents to the
convexity of her circumference; but she bore on, right through the midst of the fire.

"God protect us!" said Dr. Ferguson, solemnly, "we are in His hands; He alone can save us--but let us be ready
for every event, even for fire--our fall could not be very rapid."

The doctor's voice could scarcely be heard by his companions; but they could see his countenance calm as ever
even amid the flashing of the lightnings; he was watching the phenomena of phosphorescence produced by the fires of St. Elmo, that were now skipping to and fro along the network of the balloon.

The latter whirled and swung, but steadily ascended, and, ere the hour was over, it had passed the stormy belt. The electric display was going on below it like a vast crown of artificial fireworks suspended from the car.

Then they enjoyed one of the grandest spectacles that Nature can offer to the gaze of man. Below them, the tempest; above them, the starry firmament, tranquil, mute, impassible, with the moon projecting her peaceful rays over these angry clouds.

Dr. Ferguson consulted the barometer; it announced twelve thousand feet of elevation. It was then eleven o'clock at night.

"Thank Heaven, all danger is past; all we have to do now, is, to keep ourselves at this height," said the doctor.

"It was frightful!" remarked Kennedy.

"Oh!" said Joe, "it gives a little variety to the trip, and I'm not sorry to have seen a storm from a trifling distance up in the air. It's a fine sight!"

CHAPTER SEVENTEENTH.
The Mountains of the Moon.--An Ocean of Verdure.--They cast Anchor.--The Towing Elephant.--A Running Fire.--Death of the Monster.--The Field-Oven.--A Meal on the Grass.--A Night on the Ground.

About four in the morning, Monday, the sun reappeared in the horizon; the clouds had dispersed, and a cheery breeze refreshed the morning dawn.

The earth, all redolent with fragrant exhalations, reappeared to the gaze of our travellers. The balloon, whirled about by opposing currents, had hardly budged from its place, and the doctor, letting the gas contract, descended so as to get a more northerly direction. For a long while his quest was fruitless; the wind carried him toward the west until he came in sight of the famous Mountains of the Moon, which grouped themselves in a semicircle around the extremity of Lake Tanganayika; their ridges, but slightly indented, stood out against the bluish horizon, so that they might have been mistaken for a natural fortification, not to be passed by the explorers of the centre of Africa. Among them were a few isolated cones, revealing the mark of the eternal snows.

"Here we are at last," said the doctor, "in an unexplored country! Captain Burton pushed very far to the westward, but he could not reach those celebrated mountains; he even denied their existence, strongly as it was affirmed by Speke, his companion. He pretended that they were born in the latter's fancy; but for us, my friends, there is no further doubt possible."

"Shall we cross them?" asked Kennedy.

"Not, if it please God. I am looking for a wind that will take me back toward the equator. I will even wait for one, if necessary, and will make the balloon like a ship that casts anchor, until favorable breezes come up."

But the foresight of the doctor was not long in bringing its reward; for, after having tried different heights, the Victoria at length began to sail off to the northeastward with medium speed.

"We are in the right track," said the doctor, consulting his compass, "and scarcely two hundred feet from the surface; lucky circumstances for us, enabling us, as they do, to reconnoitre these new regions. When Captain Speke set out to discover Lake Ukereoue, he ascended more to the eastward in a straight line above Kazeh."

"Shall we keep on long in this way?" inquired the Scot.

"Perhaps. Our object is to push a point in the direction of the sources of the Nile; and we have more than six hundred miles to make before we get to the extreme limit reached by the explorers who came from the north."

"And we shan't set foot on the solid ground?" murmured Joe; "it's enough to cramp a fellow's legs!"

"Oh, yes, indeed, my good Joe," said the doctor, reassuring him; "we have to economize our provisions, you know; and on the way, Dick, you must get us some fresh meat."

"Whenever you like, doctor."

"We shall also have to replenish our stock of water. Who knows but we may be carried to some of the dried-up regions? So we cannot take too many precautions."

At noon the Victoria was at twenty-nine degrees fifteen minutes east longitude, and three degrees fifteen minutes south latitude. She passed the village of Uyofu, the last northern limit of the Unyamwezi, opposite to the Lake Ukereoue, which could still be seen.

The tribes living near to the equator seem to be a little more civilized, and are governed by absolute monarchs, whose control is an unlimited despotism. Their most compact union of power constitutes the province of Karagwah.

It was decided by the aeronauts that they would alight at the first favorable place. They found that they should have to make a prolonged halt, and take a careful inspection of the balloon: so the flame of the cylinder was moderated, and the anchors, flung out from the car, ere long began to sweep the grass of an immense prairie, that,
from a certain height, looked like a shaven lawn, but the growth of which, in reality, was from seven to eight feet in height.

The balloon skimmed this tall grass without bending it, like a gigantic butterfly: not an obstacle was in sight; it was an ocean of verdure without a single breaker.

"We might proceed a long time in this style," remarked Kennedy; "I don't see one tree that we could approach, and I'm afraid that our hunt's over."

"Wait, Dick; you could not hunt anyhow in this grass, that grows higher than your head. We'll find a favorable place presently."

In truth, it was a charming excursion that they were making now—a veritable navigation on this green, almost transparent sea, gently undulating in the breath of the wind. The little car seemed to cleave the waves of verdure, and, from time to time, coveys of birds of magnificent plumage would rise fluttering from the tall herbage, and speed away with joyous cries. The anchors plunged into this lake of flowers, and traced a furrow that closed behind them, like the wake of a ship.

All at once a sharp shock was felt—the anchor had caught in the fissure of some rock hidden in the high grass.

"We are fast!" exclaimed Joe.

These words had scarcely been uttered when a shrill cry rang through the air, and the following phrases, mingled with exclamations, escaped from the lips of our travellers:

"What's that?"
"A strange cry!"
"Look! Why, we're moving!"
"The anchor has slipped!"
"No; it holds, and holds fast too!" said Joe, who was tugging at the rope.
"It's the rock, then, that's moving!"

An immense rustling was noticed in the grass, and soon an elongated, winding shape was seen rising above it.

"A serpent!" shouted Joe.
"A serpent!" repeated Kennedy, handling his rifle.
"No," said the doctor, "it's an elephant's trunk!"
"An elephant, Samuel?"

And, as Kennedy said this, he drew his rifle to his shoulder.

"Wait, Dick; wait!"
"That's a fact! The animal's towing us!"
"And in the right direction, Joe—in the right direction."

The elephant was now making some headway, and soon reached a clearing where his whole body could be seen. By his gigantic size, the doctor recognized a male of a superb species. He had two whitish tusks, beautifully curved, and about eight feet in length; and in these the shanks of the anchor had firmly caught. The animal was vainly trying with his trunk to disengage himself from the rope that attached him to the car.

"Get up—go ahead, old fellow!" shouted Joe, with delight, doing his best to urge this rather novel team. "Here is a new style of travelling!—no more horses for me. An elephant, if you please!"

"But where is he taking us to?" said Kennedy, whose rifle itched in his grasp.
"He's taking us exactly to where we want to go, my dear Dick. A little patience!"
"Wig-a-more! wig-a-more!" as the Scotch country folks say," shouted Joe, in high glee. "Gee-up! gee-up there!"

The huge animal now broke into a very rapid gallop. He flung his trunk from side to side, and his monstrous bounds gave the car several rather heavy thumps. Meanwhile the doctor stood ready, hatchet in hand, to cut the rope, should need arise.

"But," said he, "we shall not give up our anchor until the last moment."

This drive, with an elephant for the team, lasted about an hour and a half; yet the animal did not seem in the least fatigued. These immense creatures can go over a great deal of ground, and, from one day to another, are found at enormous distances from there they were last seen, like the whales, whose mass and speed they rival.

"In fact," said Joe, "it's a whale that we have harpooned; and we're only doing just what whalemen do when out fishing."

But a change in the nature of the ground compelled the doctor to vary his style of locomotion. A dense grove of calmadores was descried on the horizon, about three miles away, on the north of the prairie. So it became necessary to detach the balloon from its draught-animal at last.

Kennedy was intrusted with the job of bringing the elephant to a halt. He drew his rifle to his shoulder, but his position was not favorable to a successful shot; so that the first ball fired flattened itself on the animal's skull, as it would have done against an iron plate. The creature did not seem in the least troubled by it; but, at the sound of the
discharge, he had increased his speed, and now was going as fast as a horse at full gallop.

"The deuce!" ejaculated Kennedy.

"What a solid head!" commented Joe.

"We'll try some conical balls behind the shoulder-joint," said Kennedy, reloading his rifle with care. In another moment he fired.

The animal gave a terrible cry, but went on faster than ever.

"Come!" said Joe, taking aim with another gun, "I must help you, or we'll never end it." And now two balls penetrated the creature's side.

The elephant halted, lifted his trunk, and resumed his run toward the wood with all his speed; he shook his huge head, and the blood began to gush from his wounds.

"Let us keep up our fire, Mr. Kennedy."

"And a continuous fire, too," urged the doctor, "for we are close on the woods."

Ten shots more were discharged. The elephant made a fearful bound; the car and balloon cracked as though every thing were going to pieces, and the shock made the doctor drop his hatchet on the ground.

The situation was thus rendered really very alarming; the anchor-rope, which had securely caught, could not be disengaged, nor could it yet be cut by the knives of our aeronauts, and the balloon was rushing headlong toward the wood, when the animal received a ball in the eye just as he lifted his head. On this he halted, faltered, his knees bent under him, and he uncovered his whole flank to the assaults of his enemies in the balloon.

"A bullet in his heart!" said Kennedy, discharging one last rifle-shot.

The elephant uttered a long bellow of terror and agony, then raised himself up for a moment, twirling his trunk in the air, and finally fell with all his weight upon one of his tusks, which he broke off short. He was dead.

"His tusk's broken!" exclaimed Kennedy--"ivory too that in England would bring thirty-five guineas per hundred pounds."

"As much as that?" said Joe, scrambling down to the ground by the anchor-rope.

"What's the use of sighing over it, Dick?" said the doctor. "Are we ivory merchants? Did we come hither to make money?"

Joe examined the anchor and found it solidly attached to the unbroken tusk. The doctor and Dick leaped out on the ground, while the balloon, now half emptied, hovered over the body of the huge animal.

"What a splendid beast!" said Kennedy, "what a mass of flesh! I never saw an elephant of that size in India!"

"There's nothing surprising about that, my dear Dick; the elephants of Central Africa are the finest in the world. The Andersons and the Cummings have hunted so incessantly in the neighborhood of the Cape, that these animals have migrated to the equator, where they are often met with in large herds."

"In the mean while, I hope," added Joe, "that we'll taste a morsel of this fellow. I'll undertake to get you a good dinner at his expense. Mr. Kennedy will go off and hunt for an hour or two; the doctor will make an inspection of the balloon, and, while they're busy in that way, I'll do the cooking."

"A good arrangement!" said the doctor; "so do as you like, Joe."

"As for me," said the hunter, "I shall avail myself of the two hours' recess that Joe has condescended to let me have."

"Go, my friend, but no imprudence! Don't wander too far away."

"Never fear, doctor!" and, so saying, Dick, shouldering his gun, plunged into the woods.

Forthwith Joe went to work at his vocation. At first he made a hole in the ground two feet deep; this he filled with the dry wood that was so abundantly scattered about, where it had been strewn by the elephants, whose tracks could be seen where they had made their way through the forest. This hole filled, he heaped a pile of fagots on it a foot in height, and set fire to it.

Then he went back to the carcass of the elephant, which had fallen only about a hundred feet from the edge of the forest; he next proceeded adroitly to cut off the trunk, which might have been two feet in diameter at the base; of this he selected the most delicate portion, and then took with it one of the animal's spongy feet. In fact, these are the finest morsels, like the hump of the bison, the paws of the bear, and the head of the wild boar.

When the pile of fagots had been thoroughly consumed, inside and outside, the hole, cleared of the cinders and hot coals, retained a very high temperature. The pieces of elephant-meat, surrounded with aromatic leaves, were placed in this extempore oven and covered with hot coals. Then Joe piled up a second heap of sticks over all, and when it had burned out the meat was cooked to a turn.

Then Joe took the viands from the oven, spread the savory mess upon green leaves, and arranged his dinner upon a magnificent patch of greensward. He finally brought out some biscuit, some coffee, and some cognac, and got a can of pure, fresh water from a neighboring streamlet.

The repast thus prepared was a pleasant sight to behold, and Joe, without being too proud, thought that it would
also be pleasant to eat.

"A journey without danger or fatigue," he soliloquized; "your meals when you please; a swinging hammock all the time! What more could a man ask? And there was Kennedy, who didn't want to come!"

On his part, Dr. Ferguson was engrossed in a serious and thorough examination of the balloon. The latter did not appear to have suffered from the storm; the silk and the gutta percha had resisted wonderfully, and, upon estimating the exact height of the ground and the ascensional force of the balloon, our aeronaut saw, with satisfaction, that the hydrogen was in exactly the same quantity as before. The covering had remained completely waterproof.

It was now only five days since our travellers had quitted Zanzibar; their pemmican had not yet been touched; their stock of biscuit and potted meat was enough for a long trip, and there was nothing to be replenished but the water.

The pipes and spiral seemed to be in perfect condition, since, thanks to their india-rubber jointings, they had yielded to all the oscillations of the balloon. His examination ended, the doctor betook himself to setting his notes in order. He made a very accurate sketch of the surrounding landscape, with its long prairie stretching away out of sight, the forest of calmadores, and the balloon resting motionless over the body of the dead elephant.

At the end of his two hours, Kennedy returned with a string of fat partridges and the haunch of an oryx, a sort of gemsbok belonging to the most agile species of antelopes. Joe took upon himself to prepare this surplus stock of provisions for a later repast.

"But, dinner's ready!" he shouted in his most musical voice.

And the three travellers had only to sit down on the green turf. The trunk and feet of the elephant were declared to be exquisite. Old England was toasted, as usual, and delicious Havanas perfumed this charming country for the first time.

Kennedy ate, drank, and chatted, like four; he was perfectly delighted with his new life, and seriously proposed to the doctor to settle in this forest, to construct a cabin of boughs and foliage, and, there and then, to lay the foundation of a Robinson Crusoe dynasty in Africa.

The proposition went no further, although Joe had, at once, selected the part of Man Friday for himself.

The country seemed so quiet, so deserted, that the doctor resolved to pass the night on the ground, and Joe arranged a circle of watch-fires as an indispensable barrier against wild animals, for the hyenas, cougars, and jackals, attracted by the smell of the dead elephant, were prowling about in the neighborhood. Kennedy had to fire his rifle several times at these unceremonious visitors, but the night passed without any untoward occurrence.

CHAPTER EIGHTEENTH.
The Karagwah.--Lake Ukereoue.--A Night on an Island.--The Equator.--Crossing the Lake.--The Cascades.--A View of the Country.--The Sources of the Nile.--The Island of Benga.--The Signature of Andrea Debono.--The Flag with the Arms of England.

At five o'clock in the morning, preparations for departure commenced. Joe, with the hatchet which he had fortunately recovered, broke the elephant's tusks. The balloon, restored to liberty, sped away to the northwest with our travellers, at the rate of eighteen miles per hour.

The doctor had carefully taken his position by the altitude of the stars, during the preceding night. He knew that he was in latitude two degrees forty minutes below the equator, or at a distance of one hundred and sixty geographical miles. He swept along over many villages without heeding the cries that the appearance of the balloon excited; he took note of the conformation of places with quick sights; he passed the slopes of the Rubembe, which are nearly as abrupt as the summits of the Ousagara, and, farther on, at Tenga, encountered the first projections of the Karagwah chains, which, in his opinion, are direct spurs of the Mountains of the Moon. So, the ancient legend which made these mountains the cradle of the Nile, came near to the truth, since they really border upon Lake Ukereoue, the conjectured reservoir of the waters of the great river.

From Kafuro, the main district of the merchants of that country, he descried, at length, on the horizon, the lake so much desired and so long sought for, of which Captain Speke caught a glimpse on the 3d of August, 1858.

Samuel Ferguson felt real emotion: he was almost in contact with one of the principal points of his expedition, and, with his spy-glass constantly raised, he kept every nook and corner of the mysterious region in sight. His gaze wandered over details that might have been thus described:

"Beneath him extended a country generally destitute of cultivation; only here and there some ravines seemed under tillage; the surface, dotted with peaks of medium height, grew flat as it approached the lake; barley-fields took the place of rice-plantations, and there, too, could be seen growing the species of plantain from which the wine of the country is drawn, and mwani, the wild plant which supplies a substitute for coffee. A collection of some fifty or more circular huts, covered with a flowering thatch, constituted the capital of the Karagwah country."
He could easily distinguish the astonished countenances of a rather fine-looking race of natives of yellowish-brown complexion. Women of incredible corpulence were dawdling about through the cultivated grounds, and the doctor greatly surprised his companions by informing them that this rotundity, which is highly esteemed in that region, was obtained by an obligatory diet of curdled milk.

At noon, the Victoria was in one degree forty-five minutes south latitude, and at one o'clock the wind was driving her directly toward the lake.

This sheet of water was christened Uyanza Victoria, or Victoria Lake, by Captain Speke. At the place now mentioned it might measure about ninety miles in breadth, and at its southern extremity the captain found a group of islets, which he named the Archipelago of Bengal. He pushed his survey as far as Muanza, on the eastern coast, where he was received by the sultan. He made a triangulation of this part of the lake, but he could not procure a boat, either to cross it or to visit the great island of Ukereoue which is very populous, is governed by three sultans, and appears to be only a promontory at low tide.

The doctor experienced some difficulty in guiding his course; he was afraid of being carried toward the east, but, fortunately, a current bore him directly toward the north, and at six o'clock in the evening the balloon alighted on a small desert island in thirty minutes south latitude, and thirty-two degrees fifty-two minutes east longitude, about twenty miles from the shore.

The travellers succeeded in making fast to a tree, and, the wind having fallen calm toward evening, they remained quietly at anchor. They dared not dream of taking the ground, since here, as on the shores of the Uyanza, legions of mosquitoes covered the soil in dense clouds. Joe even came back, from securing the anchor in the tree, speckled with bites, but he kept his temper, because he found it quite the natural thing for mosquitoes to treat him as they had done.

Nevertheless, the doctor, who was less of an optimist, let out as much rope as he could, so as to escape these pitiless insects, that began to rise toward him with a threatening hum.

The doctor ascertained the height of the lake above the level of the sea, as it had been determined by Captain Speke, say three thousand seven hundred and fifty feet.

"Here we are, then, on an island!" said Joe, scratching as though he'd tear his nails out.

"We could make the tour of it in a jiffy," added Kennedy, "and, excepting these confounded mosquitoes, there's not a living being to be seen on it."

"The islands with which the lake is dotted," replied the doctor, "are nothing, after all, but the tops of submerged hills; but we are lucky to have found a retreat among them, for the shores of the lake are inhabited by ferocious tribes. Take your sleep, then, since Providence has granted us a tranquil night."

"Won't you do the same, doctor?"

"No, I could not close my eyes. My thoughts would banish sleep. To-morrow, my friends, should the wind prove favorable, we shall go due north, and we shall, perhaps, discover the sources of the Nile, that grand secret which has so long remained impenetrable. Near as we are to the sources of the renowned river, I could not sleep."

Kennedy and Joe, whom scientific speculations failed to disturb to that extent, were not long in falling into sound slumber, while the doctor held his post.

On Wednesday, April 23d, the balloon started at four o'clock in the morning, with a grayish sky overhead; night was slow in quitting the surface of the lake, which was enveloped in a dense fog, but presently a violent breeze scattered all the mists, and, after the balloon had been swung to and fro for a moment, in opposite directions, it at length veered in a straight line toward the north.

Dr. Ferguson fairly clapped his hands for joy.

"We are on the right track!" he exclaimed. "To-day or never we shall see the Nile! Look, my friends, we are crossing the equator! We are entering our own hemisphere!"

"Ah!" said Joe, "do you think, doctor, that the equator passes here?"

"Just here, my boy!"

"Well, then, with all respect to you, sir, it seems to me that this is the very time to moisten it."

"Good!" said the doctor, laughing. "Let us have a glass of punch. You have a way of comprehending
cosmography that is any thing but dull."

And thus was the passage of the Victoria over the equator duly celebrated.

The balloon made rapid headway. In the west could be seen a low and but slightly-diversified coast, and, farther away in the background, the elevated plains of the Uganda and the Usoga. At length, the rapidity of the wind became excessive, approaching thirty miles per hour.

The waters of the Nyanza, violently agitated, were foaming like the billows of a sea. By the appearance of certain long swells that followed the sinking of the waves, the doctor was enabled to conclude that the lake must have great depth of water. Only one or two rude boats were seen during this rapid passage.

"This lake is evidently, from its elevated position, the natural reservoir of the rivers in the eastern part of Africa, and the sky gives back to it in rain what it takes in vapor from the streams that flow out of it. I am certain that the Nile must here take its rise."

"Well, we shall see!" said Kennedy.

About nine o'clock they drew nearer to the western coast. It seemed deserted, and covered with woods; the wind freshened a little toward the east, and the other shore of the lake could be seen. It bent around in such a curve as to end in a wide angle toward two degrees forty minutes north latitude. Lofty mountains uplifted their arid peaks at this extremity of Nyanza; but, between them, a deep and winding gorge gave exit to a turbulent and foaming river.

While busy managing the balloon, Dr. Ferguson never ceased reconnoitring the country with eager eyes.

"Look!" he exclaimed, "look, my friends! the statements of the Arabs were correct! They spoke of a river by which Lake Ukereoue discharged its waters toward the north, and this river exists, and we are descending it, and it flows with a speed analogous to our own! And this drop of water now gliding away beneath our feet is, beyond all question, rushing on, to mingle with the Mediterranean! It is the Nile!"

"It is the Nile!" reechoed Kennedy, carried away by the enthusiasm of his friend.

"Hurrah for the Nile!" shouted Joe, glad, and always ready to cheer for something.

Enormous rocks, here and there, embarrassed the course of this mysterious river. The water foamed as it fell in rapids and cataracts, which confirmed the doctor in his preconceived ideas on the subject. From the environing mountains numerous torrents came plunging and seething down, and the eye could take them in by hundreds. There could be seen, starting from the soil, delicate jets of water scattering in all directions, crossing and recrossing each other, mingling, contending in the swiftness of their progress, and all rushing toward that nascent stream which became a river after having drunk them in.

"Here is, indeed, the Nile!" reiterated the doctor, with the tone of profound conviction. "The origin of its name, like the origin of its waters, has fired the imagination of the learned; they have sought to trace it from the Greek, the Coptic, the Sanscrit; but all that matters little now, since we have made it surrender the secret of its source!"

"But," said the Scotchman, "how are you to make sure of the identity of this river with the one recognized by the travellers from the north?"

"We shall have certain, irrefutable, convincing, and infallible proof," replied Ferguson, "should the wind hold another hour in our favor!"

The mountains drew farther apart, revealing in their place numerous villages, and fields of white Indian corn, doura, and sugar-cane. The tribes inhabiting the region seemed excited and hostile; they manifested more anger than adoration, and evidently saw in the aeronauts only obtrusive strangers, and not condescending deities. It appeared as though, in approaching the sources of the Nile, these men came to rob them of something, and so the Victoria had to keep out of range of their muskets.

"To land here would be a ticklish matter!" said the Scot.

"Well!" said Joe, "so much the worse for these natives. They'll have to do without the pleasure of our conversation."

"Nevertheless, descend I must," said the doctor, "were it only for a quarter of an hour. Without doing so I cannot verify the results of our expedition."

"It is indispensable, then, doctor?"

"Indispensable; and we will descend, even if we have to do so with a volley of musketry."

"The thing suits me," said Kennedy, toying with his pet rifle.

"And I'm ready, master, whenever you say the word!" added Joe, preparing for the fight.

"It would not be the first time," remarked the doctor, "that science has been followed up, sword in hand. The same thing happened to a French savant among the mountains of Spain, when he was measuring the terrestrial meridian."

"Be easy on that score, doctor, and trust to your two body-guards."

"Are we there, master?"

"Not yet. In fact, I shall go up a little, first, in order to get an exact idea of the configuration of the country."
The hydrogen expanded, and in less than ten minutes the balloon was soaring at a height of twenty-five hundred feet above the ground.

From that elevation could be distinguished an inextricable network of smaller streams which the river received into its bosom; others came from the west, from between numerous hills, in the midst of fertile plains.

"We are not ninety miles from Gondokoro," said the doctor, measuring off the distance on his map, "and less than five miles from the point reached by the explorers from the north. Let us descend with great care."

And, upon this, the balloon was lowered about two thousand feet.

"Now, my friends, let us be ready, come what may."

"Ready it is!" said Dick and Joe, with one voice.

"Good!"

In a few moments the balloon was advancing along the bed of the river, and scarcely one hundred feet above the ground. The Nile measured but fifty fathoms in width at this point, and the natives were in great excitement, rushing to and fro, tumultuously, in the villages that lined the banks of the stream. At the second degree it forms a perpendicular cascade of ten feet in height, and consequently impassable by boats.

"Here, then, is the cascade mentioned by Debono!" exclaimed the doctor.

The basin of the river spread out, dotted with numerous islands, which Dr. Ferguson devoured with his eyes. He seemed to be seeking for a point of reference which he had not yet found.

By this time, some blacks, having ventured in a boat just under the balloon, Kennedy saluted them with a shot from his rifle, that made them regain the bank at their utmost speed.

"A good journey to you," bawled Joe, "and if I were in your place, I wouldn't try coming back again. I should be mightily afraid of a monster that can hurl thunderbolts when he pleases."

But, all at once, the doctor snatched up his spy-glass, and directed it toward an island reposing in the middle of the river.

"Four trees!" he exclaimed; "look, down there!" Sure enough, there were four trees standing alone at one end of it.

"It is Bengal Island! It is the very same," repeated the doctor, exultingly.

"And what of that?" asked Dick.

"It is there that we shall alight, if God permits."

"But, it seems to be inhabited, doctor."

"Joe is right; and, unless I'm mistaken, there is a group of about a score of natives on it now."

"We'll make them scatter; there'll be no great trouble in that," responded Ferguson.

"So be it," chimed in the hunter.

The sun was at the zenith as the balloon approached the island.

The blacks, who were members of the Makado tribe, were howling lustily, and one of them waved his bark hat in the air. Kennedy took aim at him, fired, and his hat flew about him in pieces. Thereupon there was a general scamper. The natives plunged headlong into the river, and swam to the opposite bank. Immediately, there came a shower of balls from both banks, along with a perfect cloud of arrows, but without doing the balloon any damage, where it rested with its anchor snugly secured in the fissure of a rock. Joe lost no time in sliding to the ground.

"The ladder!" cried the doctor. "Follow me, Kennedy."

"What do you wish, sir?"

"Let us alight. I want a witness."

"Here I am!"

"Mind your post, Joe, and keep a good lookout."

"Never fear, doctor; I'll answer for all that."

"Come, Dick," said the doctor, as he touched the ground.

So saying, he drew his companion along toward a group of rocks that rose upon one point of the island; there, after searching for some time, he began to rummage among the brambles, and, in so doing, scratched his hands until they bled.

Suddenly he grasped Kennedy's arm, exclaiming: "Look! look!"

"Letters!"

Yes; there, indeed, could be descried, with perfect precision of outline, some letters carved on the rock. It was quite easy to make them out:

"A. D."

"A.D.!" repeated Dr. Ferguson. "Andrea Debono-- the very signature of the traveller who farthest ascended the current of the Nile."

"No doubt of that, friend Samuel," assented Kennedy.
"Are you now convinced?"

"It is the Nile! We cannot entertain a doubt on that score now," was the reply.

The doctor, for the last time, examined those precious initials, the exact form and size of which he carefully noted.

"And now," said he--"now for the balloon!"

"Quickly, then, for I see some of the natives getting ready to recross the river."

"That matters little to us now. Let the wind but send us northward for a few hours, and we shall reach Gondokoro, and press the hands of some of our countrymen."

Ten minutes more, and the balloon was majestically ascending, while Dr. Ferguson, in token of success, waved the English flag triumphantly from his car.

CHAPTER NINETEENTH.

"Which way do we head?" asked Kennedy, as he saw his friend consulting the compass.

"North-northeast."

"The deuce! but that's not the north?"

"No, Dick; and I'm afraid that we shall have some trouble in getting to Gondokoro. I am sorry for it; but, at last, we have succeeded in connecting the explorations from the east with those from the north; and we must not complain."

The balloon was now receding gradually from the Nile.

"One last look," said the doctor, "at this impassable latitude, beyond which the most intrepid travellers could not make their way. There are those intractable tribes, of whom Petherick, Arnaud, Miuni, and the young traveller Lejean, to whom we are indebted for the best work on the Upper Nile, have spoken."

"Thus, then," added Kennedy, inquiringly, "our discoveries agree with the speculations of science."

"Absolutely so. The sources of the White Nile, of the Bahr-el-Abiad, are immersed in a lake as large as a sea; it is there that it takes its rise. Poesy, undoubtedly, loses something thereby. People were fond of ascribing a celestial origin to this king of rivers. The ancients gave it the name of an ocean, and were not far from believing that it flowed directly from the sun; but we must come down from these flights from time to time, and accept what science teaches us. There will not always be scientific men, perhaps; but there always will be poets."

"We can still see cataracts," said Joe.

"Those are the cataracts of Makedo, in the third degree of latitude. Nothing could be more accurate. Oh, if we could only have followed the course of the Nile for a few hours!"

"And down yonder, below us, I see the top of a mountain," said the hunter.

"That is Mount Longwek, the Trembling Mountain of the Arabs. This whole country was visited by Debono, who went through it under the name of Latif-Effendi. The tribes living near the Nile are hostile to each other, and are continually waging a war of extermination. You may form some idea, then, of the difficulties he had to encounter."

The wind was carrying the balloon toward the northwest, and, in order to avoid Mount Longwek, it was necessary to seek a more slanting current.

"My friends," said the doctor, "here is where OUR passage of the African Continent really commences; up to this time we have been following the traces of our predecessors. Henceforth we are to launch ourselves upon the unknown. We shall not lack the courage, shall we?"

"Never!" said Dick and Joe together, almost in a shout.

"Onward, then, and may we have the help of Heaven!"

At ten o'clock at night, after passing over ravines, forests, and scattered villages, the aeronauts reached the side of the Trembling Mountain, along whose gentle slopes they went quietly gliding. In that memorable day, the 23d of April, they had, in fifteen hours, impelled by a rapid breeze, traversed a distance of more than three hundred and fifteen miles.

But this latter part of the journey had left them in dull spirits, and complete silence reigned in the car. Was Dr. Ferguson absorbed in the thought of his discoveries? Were his two companions thinking of their trip through those unknown regions? There were, no doubt, mingled with these reflections, the keenest reminiscences of home and distant friends. Joe alone continued to manifest the same careless philosophy, finding it QUITE NATURAL that home should not be there, from the moment that he left it; but he respected the silent mood of his friends, the doctor
and Kennedy.

About ten the balloon anchored on the side of the Trembling Mountain, so called, because, in Arab tradition, it is said to tremble the instant that a Mussulman sets foot upon it. The travellers then partook of a substantial meal, and all quietly passed the night as usual, keeping the regular watches.

On awaking the next morning, they all had pleasanter feelings. The weather was fine, and the wind was blowing from the right quarter; so that a good breakfast, seasoned with Joe's merry pranks, put them in high good-humor.

The region they were now crossing is very extensive. It borders on the Mountains of the Moon on one side, and those of Darfur on the other—a space about as broad as Europe.

"We are, no doubt, crossing what is supposed to be the kingdom of Usoga. Geographers have pretended that there existed, in the centre of Africa, a vast depression, an immense central lake. We shall see whether there is any truth in that idea," said the doctor.

"But how did they come to think so?" asked Kennedy.

"From the recitals of the Arabs. Those fellows are great narrators—too much so, probably. Some travellers, who had got as far as Kazeh, or the great lakes, saw slaves that had been brought from this region; interrogated them concerning it, and, from their different narratives, made up a jumble of notions, and deduced systems from them. Down at the bottom of it all there is some appearance of truth; and you see that they were right about the sources of the Nile."

"Nothing could be more correct," said Kennedy. "It was by the aid of these documents that some attempts at maps were made, and so I am going to try to follow our route by one of them, rectifying it when need be."

"Is all this region inhabited?" asked Joe.

"Undoubtedly; and disagreeably inhabited, too."

"I thought so."

"These scattered tribes come, one and all, under the title of Nyam-Nyams, and this compound word is only a sort of nickname. It imitates the sound of chewing."

"That's it! Excellent!" said Joe, champing his teeth as though he were eating; "Nyam-Nyam."

"My good Joe, if you were the immediate object of this chewing, you wouldn't find it so excellent."

"Why, what's the reason, sir?"

"These tribes are considered man-eaters."

"Is that really the case?"

"Not a doubt of it! It has also been asserted that these natives had tails, like mere quadrupeds; but it was soon discovered that these appendages belonged to the skins of animals that they wore for clothing."

"More's the pity! a tail's a nice thing to chase away mosquitoes."

"That may be, Joe; but we must consign the story to the domain of fable, like the dogs' heads which the traveller, Brun-Rollet, attributed to other tribes."

"Dogs' heads, eh? Quite convenient for barking, and even for man-eating!"

"But one thing that has been, unfortunately, proven true, is, the ferocity of these tribes, who are really very fond of human flesh, and devour it with avidity."

"I only hope that they won't take such a particular fancy to mine!" said Joe, with comic solemnity.

"See that!" said Kennedy.

"Yes, indeed, sir; if I have to be eaten, in a moment of famine, I want it to be for your benefit and my master's; but the idea of feeding those black fellows--gracious! I'd die of shame!"

"Well, then, Joe," said Kennedy, "that's understood; we count upon you in case of need!"

"At your service, gentlemen!"

"Joe talks in this way so as to make us take good care of him, and fatten him up."

"Maybe so!" said Joe. "Every man for himself."

In the afternoon, the sky became covered with a warm mist, that oozed from the soil; the brownish vapor scarcely allowed the beholder to distinguish objects, and so, fearing collision with some unexpected mountain-peak, the doctor, about five o'clock, gave the signal to halt.

The night passed without accident, but in such profound obscurity, that it was necessary to use redoubled vigilance.

The monsoon blew with extreme violence during all the next morning. The wind buried itself in the lower cavities of the balloon and shook the appendage by which the dilating-pipes entered the main apparatus. They had, at last, to be tied up with cords, Joe acquitting himself very skilfully in performing that operation.

He had occasion to observe, at the same time, that the orifice of the balloon still remained hermetically sealed.

"That is a matter of double importance for us," said the doctor; "in the first place, we avoid the escape of precious gas, and then, again, we do not leave behind us an inflammable train, which we should at last inevitably set
fire to, and so be consumed."

"That would be a disagreeable travelling incident!" said Joe.

"Should we be hurled to the ground?" asked Kennedy.

"Hurled! No, not quite that. The gas would burn quietly, and we should descend little by little. A similar accident
happened to a French aeronaut, Madame Blanchard. She ignited her balloon while sending off fireworks, but she did
not fall, and she would not have been killed, probably, had not her car dashed against a chimney and precipitated her
to the ground."

"Let us hope that nothing of the kind may happen to us," said the hunter. "Up to this time our trip has not seemed
to me very dangerous, and I can see nothing to prevent us reaching our destination."

"Nor can I either, my dear Dick; accidents are generally caused by the imprudence of the aeronauts, or the
defective construction of their apparatus. However, in thousands of aerial ascensions, there have not been twenty
fatal accidents. Usually, the danger is in the moment of leaving the ground, or of alighting, and therefore at those
junctures we should never omit the utmost precaution."

"It's breakfast-time," said Joe; "we'll have to put up with preserved meat and coffee until Mr. Kennedy has had
another chance to get us a good slice of venison."

CHAPTER TWENTIETH.
The Celestial Bottle.--The Fig-Palms.--The Mammoth Trees.--The Tree of War.--The Winged Team.--Two
Native Tribes in Battle.--A Massacre.--An Intervention from above.

The wind had become violent and irregular; the balloon was running the gantlet through the air. Tossed at one
moment toward the north, at another toward the south, it could not find one steady current.

"We are moving very swiftly without advancing much," said Kennedy, remarking the frequent oscillations of the
needle of the compass.

"The balloon is rushing at the rate of at least thirty miles an hour. Lean over, and see how the country is gliding
away beneath us!" said the doctor.

"See! that forest looks as though it were precipitating itself upon us!"

"The forest has become a clearing!" added the other.

"And the clearing a village!" continued Joe, a moment or two later. "Look at the faces of those astonished
darkys!"

"Oh! it's natural enough that they should be astonished," said the doctor. "The French peasants, when they first
saw a balloon, fired at it, thinking that it was an aerial monster. A Soudan negro may be excused, then, for opening
his eyes VERY wide!"

"Faith!" said Joe, as the Victoria skimmed closely along the ground, at scarcely the elevation of one hundred
feet, and immediately over a village, "I'll throw them an empty bottle, with your leave, doctor, and if it reaches them
safe and sound, they'll worship it; if it breaks, they'll make talismans of the pieces."

So saying, he flung out a bottle, which, of course, was broken into a thousand fragments, while the negroes
scampered into their round huts, uttering shrill cries.

A little farther on, Kennedy called out: "Look at that strange tree! The upper part is of one kind and the lower
part of another!"

"Well!" said Joe, "here's a country where the trees grow on top of each other."

"It's simply the trunk of a fig-tree," replied the doctor, "on which there is a little vegetating earth. Some fine day,
the wind left the seed of a palm on it, and the seed has taken root and grown as though it were on the plain ground."

"A fine new style of gardening," said Joe, "and I'll import the idea to England. It would be just the thing in the
London parks; without counting that it would be another way to increase the number of fruit-trees. We could have
gardens up in the air; and the small house-owners would like that!"

At this moment, they had to raise the balloon so as to pass over a forest of trees that were more than three
hundred feet in height—a kind of ancient banyan.

"What magnificent trees!" exclaimed Kennedy. "I never saw anything so fine as the appearance of these
venerable forests. Look, doctor!"

"The height of these banyans is really remarkable, my dear Dick; and yet, they would be nothing astonishing in
the New World."

"Why, are there still loftier trees in existence?"

"Undoubtedly; among the 'mammoth trees' of California, there is a cedar four hundred and eighty feet in height.
It would overtop the Houses of Parliament, and even the Great Pyramid of Egypt. The trunk at the surface of the
ground was one hundred and twenty feet in circumference, and the concentric layers of the wood disclosed an age of
more than four thousand years."

"But then, sir, there was nothing wonderful in it! When one has lived four thousand years, one ought to be pretty tall!" was Joe's remark.

Meanwhile, during the doctor's recital and Joe's response, the forest had given place to a large collection of huts surrounding an open space. In the middle of this grew a solitary tree, and Joe exclaimed, as he caught sight of it:

"Well! if that tree has produced such flowers as those, for the last four thousand years, I have to offer it my compliments, anyhow," and he pointed to a gigantic sycamore, whose whole trunk was covered with human bones. The flowers of which Joe spoke were heads freshly severed from the bodies, and suspended by daggers thrust into the bark of the tree.

"The war-tree of these cannibals!" said the doctor; "the Indians merely carry off the scalp, but these negroes take the whole head."

"A mere matter of fashion!" said Joe. But, already, the village and the bleeding heads were disappearing on the horizon. Another place offered a still more revolting spectacle--half-devoured corpses; skeletons mouldering to dust; human limbs scattered here and there, and left to feed the jackals and hyenas.

"No doubt, these are the bodies of criminals; according to the custom in Abyssinia, these people have left them a prey to the wild beasts, who kill them with their terrible teeth and claws, and then devour them at their leisure."

"Not a whit more cruel than hanging!" said the Scot; "filthier, that's all!"

"In the southern regions of Africa, they content themselves," resumed the doctor, "with shutting up the criminal in his own hut with his cattle, and sometimes with his family. They then set fire to the hut, and the whole party are burned together. I call that cruel; but, like friend Kennedy, I think that the gallows is quite as cruel, quite as barbarous."

Joe, by the aid of his keen sight, which he did not fail to use continually, noticed some flocks of birds of prey flitting about the horizon.

"They are eagles!" exclaimed Kennedy, after reconnoitring them through the glass, "magnificent birds, whose flight is as rapid as ours."

"Heaven preserve us from their attacks!" said the doctor, "they are more to be feared by us than wild beasts or savage tribes."

"Bah!" said the hunter, "we can drive them off with a few rifle-shots."

"Nevertheless, I would prefer, dear Dick, not having to rely upon your skill, this time, for the silk of our balloon could not resist their sharp beaks; fortunately, the huge birds will, I believe, be more frightened than attracted by our machine."

"Yes! but a new idea, and I have dozens of them," said Joe; "if we could only manage to capture a team of live eagles, we could hitch them to the balloon, and they'd haul us through the air!"

"The thing has been seriously proposed," replied the doctor, "but I think it hardly practicable with creatures naturally so restive."

"Oh! we'd tame them," said Joe. "Instead of driving them with bits, we'd do it with eye-blinkers that would cover their eyes. Half blinded in that way, they'd go to the right or to the left, as we desired; when blinded completely, they would stop."

"Allow me, Joe, to prefer a favorable wind to your team of eagles. It costs less for fodder, and is more reliable."

"Well, you may have your choice, master, but I stick to my idea."

It now was noon. The Victoria had been going at a more moderate speed for some time; the country merely passed below it; it no longer flew.

Suddenly, shouts and whistlings were heard by our aeronauts, and, leaning over the edge of the car, they saw on the open plain below them an exciting spectacle.

Two hostile tribes were fighting furiously, and the air was dotted with volleys of arrows. The combatants were so intent upon their murderous work that they did not notice the arrival of the balloon; there were about three hundred mingled confusedly in the deadly struggle: most of them, red with the blood of the wounded, in which they fairly wallowed, were horrible to behold.

As they at last caught sight of the balloon, there was a momentary pause; but their yells redoubled, and some arrows were shot at the Victoria, one of them coming close enough for Joe to catch it with his hand.

"Let us rise out of range," exclaimed the doctor; "there must be no rashness! We are forbidden any risk."

Meanwhile, the massacre continued on both sides, with battle-axes and war-clubs; as quickly as one of the combatants fell, a hostile warrior ran up to cut off his head, while the women, mingling in the fray, gathered up these bloody trophies, and piled them together at either extremity of the battle-field. Often, too, they even fought for these hideous spoils.

"What a frightful scene!" said Kennedy, with profound disgust.
"They're ugly acquaintances!" added Joe; "but then, if they had uniforms they'd be just like the fighters of all the rest of the world!"

"I have a keen hankering to take a hand in at that fight," said the hunter, brandishing his rifle.

"No! no!" objected the doctor, vehemently; "no, let us not meddle with what don't concern us. Do you know which is right or which is wrong, that you would assume the part of the Almighty? Let us, rather, hurry away from this revolting spectacle. Could the great captains of the world float thus above the scenes of their exploits, they would at last, perhaps, conceive a disgust for blood and conquest."

The chieftain of one of the contending parties was remarkable for his athletic proportions, his great height, and herculean strength. With one hand he plunged his spear into the compact ranks of his enemies, and with the other mowed large spaces in them with his battle-axe. Suddenly he flung away his war-club, red with blood, rushed upon a wounded warrior, and, chopping off his arm at a single stroke, carried the dissevered member to his mouth, and bit it again and again.

"Ah!" ejaculated Kennedy, "the horrible brute! I can hold back no longer," and, as he spoke, the huge savage, struck full in the forehead with a rifle-ball, fell headlong to the ground.

Upon this sudden mishap of their leader, his warriors seemed struck dumb with amazement; his supernatural death awed them, while it reanimated the courage and ardor of their adversaries, and, in a twinkling, the field was abandoned by half the combatants.

"Come, let us look higher up for a current to bear us away. I am sick of this spectacle," said the doctor.

But they could not get away so rapidly as to avoid the sight of the victorious tribe rushing upon the dead and the wounded, scrambling and disputing for the still warm and reeking flesh, and eagerly devouring it.

"Faugh!" uttered Joe, "it's sickening."

The balloon rose as it expanded; the howlings of the brutal horde, in the delirium of their orgy, pursued them for a few minutes; but, at length, borne away toward the south, they were carried out of sight and hearing of this horrible spectacle of cannibalism.

The surface of the country was now greatly varied, with numerous streams of water, bearing toward the east. The latter, undoubtedly, ran into those affluents of Lake Nu, or of the River of the Gazelles, concerning which M. Guillaume Lejean has given such curious details.

At nightfall, the balloon cast anchor in twenty-seven degrees east longitude, and four degrees twenty minutes north latitude, after a day's trip of one hundred and fifty miles.

CHAPTER TWENTY-FIRST.

The night came on very dark. The doctor had not been able to reconnoitre the country. He had made fast to a very tall tree, from which he could distinguish only a confused mass through the gloom.

As usual, he took the nine-o'clock watch, and at midnight Dick relieved him.

"Keep a sharp lookout, Dick!" was the doctor's good-night injunction.

"Is there any thing new on the carpet?"

"No; but I thought that I heard vague sounds below us, and, as I don't exactly know where the wind has carried us to, even an excess of caution would do no harm."

"You've probably heard the cries of wild beasts."

"No! the sounds seemed to me something altogether different from that; at all events, on the least alarm don't fail to waken us."

"I'll do so, doctor; rest easy."

After listening attentively for a moment or two longer, the doctor, hearing nothing more, threw himself on his blankets and went asleep.

The sky was covered with dense clouds, but not a breath of air was stirring; and the balloon, kept in its place by only a single anchor, experienced not the slightest oscillation.

Kennedy, leaning his elbow on the edge of the car, so as to keep an eye on the cylinder, which was actively at work, gazed out upon the calm obscurity; he eagerly scanned the horizon, and, as often happens to minds that are uneasy or possessed with preconceived notions, he fancied that he sometimes detected vague gleams of light in the distance.

At one moment he even thought that he saw them only two hundred paces away, quite distinctly, but it was a mere flash that was gone as quickly as it came, and he noticed nothing more. It was, no doubt, one of those luminous illusions that sometimes impress the eye in the midst of very profound darkness.
Kennedy was getting over his nervousness and falling into his wandering meditations again, when a sharp whistle pierced his ear.

Was that the cry of an animal or of a night-bird, or did it come from human lips?

Kennedy, perfectly comprehending the gravity of the situation, was on the point of waking his companions, but he reflected that, in any case, men or animals, the creatures that he had heard must be out of reach. So he merely saw that his weapons were all right, and then, with his night-glass, again plunged his gaze into space.

It was not long before he thought he could perceive below him vague forms that seemed to be gliding toward the tree, and then, by the aid of a ray of moonlight that shot like an electric flash between two masses of cloud, he distinctly made out a group of human figures moving in the shadow.

The adventure with the dog-faced baboons returned to his memory, and he placed his hand on the doctor's shoulder.

The latter was awake in a moment.

"Silence!" said Dick, "Let us speak below our breath."

"Has anything happened?"

"Yes, let us waken Joe."

The instant that Joe was aroused, Kennedy told him what he had seen.

"Those confounded monkeys again!" said Joe.

"Possibly, but we must be on our guard."

"Joe and I," said Kennedy, "will climb down the tree by the ladder."

"And, in the meanwhile," added the doctor, "I will take my measures so that we can ascend rapidly at a moment's warning."

"Agreed!"

"Let us go down, then!" said Joe.

"Don't use your weapons, excepting at the last extremity! It would be a useless risk to make the natives aware of our presence in such a place as this."

Dick and Joe replied with signs of assent, and then letting themselves slide noiselessly toward the tree, took their position in a fork among the strong branches where the anchor had caught.

For some moments they listened minutely and motionlessly among the foliage, and ere long Joe seized Kennedy's hand as he heard a sort of rubbing sound against the bark of the tree.

"Don't you hear that?" he whispered.

"Yes, and it's coming nearer."

"Suppose it should be a serpent? That hissing or whistling that you heard before--"

"No! there was something human in it."

"I'd prefer the savages, for I have a horror of those snakes."

"The noise is increasing," said Kennedy, again, after a lapse of a few moments.

"Yes! something's coming up toward us--climbing."

"Keep watch on this side, and I'll take care of the other."

"Very good!"

There they were, isolated at the top of one of the larger branches shooting out in the midst of one of those miniature forests called baobab-trees. The darkness, heightened by the density of the foliage, was profound; however, Joe, leaning over to Kennedy's ear and pointing down the tree, whispered:

"The blacks! They're climbing toward us."

The two friends could even catch the sound of a few words uttered in the lowest possible tones.

Joe gently brought his rifle to his shoulder as he spoke.

"Wait!" said Kennedy.

Some of the natives had really climbed the baobab, and now they were seen rising on all sides, winding along the boughs like reptiles, and advancing slowly but surely, all the time plainly enough discernible, not merely to the eye but to the nostrils, by the horrible odors of the rancid grease with which they bedaub their bodies.

Ere long, two heads appeared to the gaze of Kennedy and Joe, on a level with the very branch to which they were clinging.

"Attention!" said Kennedy. "Fire!"

The double concussi0n resounded like a thunderbolt and died away into cries of rage and pain, and in a moment the whole horde had disappeared.

But, in the midst of these yells and howls, a strange, unexpected--nay what seemed an impossible--cry had been heard! A human voice had, distinctly, called aloud in the French language--

"Help! help!"
Kennedy and Joe, dumb with amazement, had regained the car immediately.

"Did you hear that?" the doctor asked them.

"Undoubtedly, that supernatural cry, 'A moi! a moi!' comes from a Frenchman in the hands of these barbarians!"

"A traveller."

"A missionary, perhaps."

"Poor wretch!" said Kennedy, "they're assassinating him--making a martyr of him!"

The doctor then spoke, and it was impossible for him to conceal his emotions.

"There can be no doubt of it," he said; "some unfortunate Frenchman has fallen into the hands of these savages.

We must not leave this place without doing all in our power to save him. When he heard the sound of our guns, he recognized an unlooked-for assistance, a providential interposition. We shall not disappoint his last hope. Are such your views?"

"They are, doctor, and we are ready to obey you."

"Let us, then, lay our heads together to devise some plan, and in the morning we'll try to rescue him."

"But how shall we drive off those abominable blacks?" asked Kennedy.

"It's quite clear to me, from the way in which they made off, that they are unacquainted with fire-arms. We must, therefore, profit by their fears; but we shall await daylight before acting, and then we can form our plans of rescue according to circumstances."

"The poor captive cannot be far off," said Joe, "because--"

"Help! help!" repeated the voice, but much more feebly this time.

"The savage wretches!" exclaimed Joe, trembling with indignation. "Suppose they should kill him to-night!"

"Do you hear, doctor," resumed Kennedy, seizing the doctor's hand. "Suppose they should kill him to-night!"

"It is not at all likely, my friends. These savage tribes kill their captives in broad daylight; they must have the sunshine."

"Now, if I were to take advantage of the darkness to slip down to the poor fellow?" said Kennedy.

"And I'll go with you," said Joe, warmly.

"Pause, my friends--pause! The suggestion does honor to your hearts and to your courage; but you would expose us all to great peril, and do still greater harm to the unfortunate man whom you wish to aid."

"Why so?" asked Kennedy. "These savages are frightened and dispersed: they will not return."

"Dick, I implore you, heed what I say. I am acting for the common good; and if by any accident you should be taken by surprise, all would be lost."

"But, think of that poor wretch, hoping for aid, waiting there, praying, calling aloud. Is no one to go to his assistance? He must think that his senses deceived him; that he heard nothing!"

"We can reassure him, on that score," said Dr. Ferguson --and, standing erect, making a speaking-trumpet of his hands, he shouted at the top of his voice, in French: "Whoever you are, be of good cheer! Three friends are watching over you."

A terrific howl from the savages responded to these words--no doubt drowning the prisoner's reply.

"They are murdering him! they are murdering him!" exclaimed Kennedy. "Our interference will have served no other purpose than to hasten the hour of his doom. We must act!"

"But how, Dick? What do you expect to do in the midst of this darkness?"

"Oh, if it was only daylight!" sighed Joe.

"Well, and suppose it were daylight?" said the doctor, in a singular tone.

"Nothing more simple, doctor," said Kennedy. "I'd go down and scatter all these savage villains with powder and ball!"

"And you, Joe, what would you do?"

"I, master? why, I'd act more prudently, maybe, by telling the prisoner to make his escape in a certain direction that we'd agree upon."

"And how would you get him to know that?"

"By means of this arrow that I caught flying the other day. I'd tie a note to it, or I'd just call out to him in a loud voice what you want him to do, because these black fellows don't understand the language that you'd speak in!"

"Your plans are impracticable, my dear friends. The greatest difficulty would be for this poor fellow to escape at all--even admitting that he should manage to elude the vigilance of his captors. As for you, my dear Dick, with determined daring, and profiting by their alarm at our fire-arms, your project might possibly succeed; but, were it to fail, you would be lost, and we should have two persons to save instead of one. No! we must put ALL the chances on OUR side, and go to work differently."

"But let us act at once!" said the hunter.

"Perhaps we may," said the doctor, throwing considerable stress upon the words.
"Why, doctor, can you light up such darkness as this?"
"Who knows, Joe?"
"Ah! if you can do that, you're the greatest learned man in the world!"

The doctor kept silent for a few moments; he was thinking. His two companions looked at him with much emotion, for they were greatly excited by the strangeness of the situation. Ferguson at last resumed:

"Here is my plan: We have two hundred pounds of ballast left, since the bags we brought with us are still untouched. I'll suppose that this prisoner, who is evidently exhausted by suffering, weighs as much as one of us; there will still remain sixty pounds of ballast to throw out, in case we should want to ascend suddenly."

"How do you expect to manage the balloon?" asked Kennedy.

"This is the idea, Dick: you will admit that if I can get to the prisoner, and throw out a quantity of ballast, equal to his weight, I shall have in no wise altered the equilibrium of the balloon. But, then, if I want to get a rapid ascension, so as to escape these savages, I must employ means more energetic than the cylinder. Well, then, in throwing out this overplus of ballast at a given moment, I am certain to rise with great rapidity."

"That's plain enough."

"Yes; but there is one drawback: it consists in the fact that, in order to descend after that, I should have to part with a quantity of gas proportionate to the surplus ballast that I had thrown out. Now, the gas is precious; but we must not haggle over it when the life of a fellow-creature is at stake."

"You are right, sir; we must do every thing in our power to save him."

"Let us work, then, and get these bags all arranged on the rim of the car, so that they may be thrown overboard at one movement."

"But this darkness?"

"It hides our preparations, and will be dispersed only when they are finished. Take care to have all our weapons close at hand. Perhaps we may have to fire; so we have one shot in the rifle; four for the two muskets; twelve in the two revolvers; or seventeen in all, which might be fired in a quarter of a minute. But perhaps we shall not have to resort to all this noisy work. Are you ready?"

"We're ready," responded Joe.

The sacks were placed as requested, and the arms were put in good order.

"Very good!" said the doctor. "Have an eye to every thing. Joe will see to throwing out the ballast, and Dick will carry off the prisoner; but let nothing be done until I give the word. Joe will first detach the anchor, and then quickly make his way back to the car."

Joe let himself slide down by the rope; and, in a few moments, reappeared at his post; while the balloon, thus liberated, hung almost motionless in the air.
